

“Step after step the ladder is ascended”—GEORGE HERBERT, *Jacula Prudentum*.

THE
TROPICAL AGRICULTURIST:

A

MONTHLY RECORD OF INFORMATION

FOR

PLANTERS

OF

Tea, Coffee, Cacao, Cinchona, Sugar, Cotton, Tobacco, Palms, Spices,
Rubber, Rice,

AND OTHER PRODUCTS

SUITED FOR CULTIVATION IN THE TROPICS.

[ISSUED ON OR ABOUT THE 1ST OF EACH MONTH.]

COMPILED BY

A. M. & J. FERGUSON,

of the “Ceylon Observer,” &c.

“It is both the duty and interest of every owner and cultivator of the soil to study the best means of rendering that soil subservient to his own and the general wants of the community; and he who introduces, beneficially, a new and useful *Seed, Plant, or Shrub* into his district, is a blessing and an honour to his country.”—SIR J. SINCLAIR.

A. M. & J. FERGUSON: COLOMBO, CEYLON.

The “TROPICAL AGRICULTURIST” can be obtained from or advertisements for it sent to the following agents:—

TO OUR READERS.

In closing the Tenth Volume of the "Tropical Agriculturist," we would once more direct attention to the large amount of useful information afforded and to the great variety of topics treated in our pages. From month to month, we have endeavoured to embody in these pages the latest results of practical experience and scientific teaching in all that concerns tropical agriculture; and our ambition has been to make this periodical not only indispensable to the planter, but of service to business men and capitalists, never forgetting that agriculture trenches upon every department of human knowledge, beside being the basis of personal and communal wealth.

While directing our attention chiefly to the products prominently mentioned on our title-page, we have always taken care to notice minor industries likely to fit in with sub-tropical conditions; and our readers have an ample guarantee in the pages before them, that, in the future, no pains will be spared to bring together all available information both from the West and East, the same being examined in the light of the teachings of commonsense as well as of prolonged tropical experience in this, the leading Crown and Planting Colony of the British Empire.

The Tea-planting Industry has sprung into so much importance in India and Ceylon, that a large amount of attention is naturally directed to this great staple, and we think it will be admitted by impartial judges that the *Tropical Agriculturist* should be filed for ready reference, in every Tea Factory in this Island and India.

A full and accurate Index affords the means of ready reference to every subject treated in this, the tenth volume, which we now place in our subscribers' hands, in full confidence that it will be received with an amount of approval, at least equal to that which has been so kindly extended to its predecessors.

We are convinced that no more suitable or useful gift can be made to the tropical planter or agriculturist, whether he be about to enter on his career, or with many years of experience behind him, than the ten volumes of our periodical which we have now made available. They are full of information bearing on every department and relating to nearly every product within the scope of sub-tropical industry.

In conclusion, we have to tender our thanks to readers and contributors, and our wish that all friends may continue to write instructively and to read with approval for them, indeed, must the "Tropical Agriculturist" continue to do well.

A. M. & J. FERGUSON.

COLOMBO, CEYLON: 1ST JUNE 1891

No. 1.

GEM MINING PROSPECTS IN BURMA.

WHAT DO THE RUBY MINES OF MOGOK PRODUCE?—
THE COMPANY'S MONOPOLY—SHANS SELLING RUBIES
—THE WORKING AND MISMANAGEMENT OF THE COM-
PANY—TRANSPORT DIFFICULTIES.

(Concluded.)

It is to be feared that a^s regards even testing the capabilities of the Ruby Mining concession, much less proving them, but little can be said of the past year's operations at Mogok. The shareholders will have to possess their souls in patience for some time yet apparently, and "soft words" which "turn away wrath" will be all they will get for their outlay for an indefinite period of the future.

It has often been asked "what amount of rubies are produced at the mines of Mogok, and the answer has varied from "nothing at all," to some impossible value not worth putting on record. In the report from which we quoted above there is an estimate of value required to purchase for the native miners "imported commodities." This amount is put down at £5,000 sterling per annum, so that at any rate that value of rubies must be set apart to meet the one item of expenditure at the mines; but "under the late kings of Burma these mines were a royal monopoly and very closely and jealously guarded from all foreigners and indeed from all natives as well, with the exception of the miners and officials engaged in working them. The king is said to have drawn from them an annual revenue of one and a half to two lakhs of rupees, apart from his absolute right to all stones found that were above a certain weight and quality. This mode of working must have restricted the output of these mines very considerably, and must have caused many of the larger stones to disappear altogether." This is all very indefinite, and it is equally impossible to find out what value if any at all—of large rubies are found now,

or were ever found in the time of the kings of Burmah; and at the present day the only thing absolutely decided is that, the Ruby Mining Company are not getting any valuable stones. Whether anyone else is doing so is a mere matter of conjecture; as also if discovered what value is to be attached to them. Sir Lepel Griffin had but little to say on this point, indeed it could hardly have been expected he should have ventured any remarks upon it. "As to the produce of Mogok, it is very difficult to say. I do not believe anybody living knows. A great authority at Mandalay, a dealer, who is accustomed to export in a small way, about a lakh of rupees a year (which it is supposed he smuggles out of our mines) says about fifteen lakhs worth are sold in Mandalay each year, quite independent of Rangoon. He is not in a large way of business but he is a broker for a great many firms. If what he says is true—and I am disposed very much to believe it for I don't think he wishes to deceive me—these native miners must make a great deal of money." It seems at present impossible to get any nearer to a correct conclusion about the outturn of these mines than it was at any time in the past, especially as it is supposed—or rather we may say well-known—that precious stones are not exclusively found in the district of Mogok. Sir Lepel Griffin affected to believe they were so exclusively found, and that his Company had without doubt a monopoly, or the equivalent of a monopoly in working them. He says:—"The Government do nothing except through us—that is our concession. They are not working rubies in Upper Burmah except in one place. They have not conceded—and will not concede—land to other people however much they may think of it. The Chief Commissioner will modify certain rules where necessary. There are said to be good rubies at Sagyan, a little way down the river, which I think may be worked but we have the preferential right. The Government gave us the right of taking it up if we choose, and

we certainly shall choose if the Government wish it worked at all. We shall not let anybody else work it. Even if we raise a subsidiary company to do it it will be worked." This is all very well in its way, but it is more than probable that if other Companies should choose to demand a concession, and applied to the supreme authority for it, they would sooner or later obtain what they asked for. It is not conceivable that in the present days of free trade a monopoly of a valuable trade, such as the ruby trade is supposed to be, should be monopolised by a few shareholders in London. Powerful no doubt the Company is, and large the powers of the Indian Government, but if it were made a public question and pressure brought to bear in the proper quarter there can be no doubt such a monopoly would cease to exist in reality as it has already done on paper. The Ruby Act gives the Chief Commissioner of Burma authority to grant concessions of mining rights to anyone, to whom he may choose to give them, and such option would have to give way to the demands of any powerful body who were in a position to make themselves heard and felt.

In the meantime however until the promises and pretensions of the present Company have been redeemed by the declaration of exceedingly handsome dividends, it is not probable that others will embark upon a similar venture. The future is still before them and they may yet prove a brilliant success and in such case no doubt their example will be followed by other wealthy and powerful syndicates. The market for really valuable rubies is said to have advanced a great deal in price. The Shan-trader said "the price of really fine rubies now is from R1,000 to R1,500 per carat. I saw R8,000 refused in Rangoon a few days ago for a ruby of about 7 carats. The owner said it had been about fifteen years in his family. His mother had bought it for R700. I have got a parcel of stones in the Mandalay Treasury which the Company did not care to purchase at the price I put on them, and they will remain there until I pay the thirty percent duty on the value, or until the value is obtained at auction."

From a private letter published however in one of the local journals we take the following paragraph:—

"Do you know if it is wrong to buy rubies from the Shans? I mean do Streeter's claims come into question? Perhaps this is a silly inquiry, but it is one that several besides myself would like answered, my bosom friend bought a stone last year but made me promise not to mention it. I should say that Streeter's rights are confined to the Ruby Mine tract only. Strangely enough, though the Shans ask such absurd prices for their ponies they part with their rubies for a mere song." The latter statement is by no means singular, for it is commonly made by most persons whose avocations have brought them in contact with the hill tribes of Upper Burma.

The pacification of the Ruby Mines district has made great strides during the past year, at great expense of life and money. Fever of a very fatal description was very prevalent amongst the troops and military police and the mortality was very deplorable. Dacoits in a small way are still

frequent, and the road from Thabyetkyin on the river bank to the sanitarium at Bernardmyo, is daily traversed by patrols who take charge of all travellers passing to and fro. Very recently we read in the journals of the day "Three Military Policemen were attacked whilst cutting jungle near Thabyetkyin in the Ruby Mines District, two of them were killed, the third managed to escape" and again:—"News has come to hand of a daring murder being committed in the Ruby Mines, an inspector of police was coming into his district with an armed sepoy orderly and a number of coolies who were carrying the camp kit. Suddenly the inspector heard a shot, and riding quickly up found the sepoy lying dead and his revolver and ammunition gone. The coolies dropped the kit and fled, but subsequently returned."

From many inquiries made from residents in the Ruby Mines district we gather there are always a number of evil disposed persons wandering about—ready to commit robbery and murder whenever an opportunity offers. There are no large systematised gangs of dacoits at present in the district, but it is not at all desirable to neglect taking every possible precaution when journeying through the country.

It is impossible to say where or when travellers may be attacked, especially when booty in the shape of arms or money is obtainable. That this state of affairs may continue for many years yet to come is highly probable seeing that Mogok lies on the outskirts of the great hill-country reaching far into Chinese territory, inhabited by wild tribes who will for ages to come be continually recruiting bodies of marauders to prey upon their more civilised neighbours, "for 'tis their nature too" as Dr. Watts writes of other animals but a shade more savage than those of whom we are writing.

The deductions we drew from our several interviews with Sir Lepel Griffin and Mr. Kirby, one of the directors of the Company, are expressed in a few paragraphs we addressed to one of the Burma locals and which we now reproduce for the benefit of our readers.

Sir Lepel Griffin has a straightforward way of giving expression to his opinions on public occasions, which carries conviction with it, though his hearers may not always relish the tenor of his remarks. His address to the shareholders at the first half-yearly meeting of the Ruby Mines Company, held in the middle of last year, is an example of this, as also his speech at the Burma dinner of the same time. We gather from his utterances, that he is of the same opinion now as he was then, and is able more clearly to realise the difficulties which beset the initiation of operations at Magok. Taking all the circumstances into consideration, and having seen for himself, and made every inquiry possible during his brief visit, he can, on his return to London, do but little else than emphasise the opinion he expressed six months ago. We should, however, be inclined to think that he is not altogether satisfied with some minor details in the administration of the Company's affairs in Burma. In saying so much we must be clearly understood to be stating our own deductions from the manner, rather than from the expressed tenor of his remarks. He evidently concluded that it was an error sending out too many European assistants when there was absolutely nothing for them to do, and before sufficient preparations had been made for their comfort and subsistence. Then again no doubt a considerable amount of incongruity had arisen from certain operations having been entrusted to men which were not appropriate to their special qualifications. In other words, the work has not been altogether

judiciously distributed amongst the employees and as a consequence, it had not made such progress as might otherwise have been expected. No special censure could, of course, be passed upon the individual though the system inaugurated at the mines could not altogether merit his approbation. Such, we take it, will probably be the tenor of the remarks with which Sir Lepel Griffin will meet the shareholders at the approaching half yearly meeting; and are only such as could well be expected by any one who has had the opportunity of gathering information from time to time since the commencement of operations in Upper Burma. The question of ultimate and brilliant success as a mercantile venture was one on which (of course) we cannot expect him to be explicit, but we imagine he will have to tone down to a considerable extent the confident tone in which the prospectus of the company was primarily put forward.

We learn that Mr. Kirby who accompanied Sir Lepel Griffin to the Ruby Mines was more inclined to take a serious view of the dangers and difficulties of a trip to Mogok than did the Chairman himself. The latter certainly made light of the journey, while as an Engineer, Mr. Kirby no doubt bore in mind that material as well as men have to be transported along what he termed "a wretched road." In regard to the staff of Europeans employed by the Ruby Mines Company, it would appear probable that there would shortly be a reduction rather than an increase in numbers. Europeans, for some reason or another not apparent to a casual visitor, seem to suffer very greatly in health, and a considerable percentage become physically useless in a very short time. This has been his invariable experience in regard to all large undertakings in India—and the Ruby Mines by no means proves an exception to the rule. Trained natives have eventually to be entrusted with the work—and it is with this class of men that it is completed. He, however, admitted that acclimatised Europeans would have to hold control over the natives, evidently being of opinion that something beside physical energy and endurance was required by those in command. People in England could not possibly comprehend the difficulty—in fact the impossibility—of the transport of the machinery and other material from Tabeitkyin to Mogok until the road was completed, and that was only within the last month or two. Then again the constant sickness of the native workmen, as well as their European superiors, created a difficulty almost as superlative as that of the want of roads and means of transport. It was only now that there was any chance of being able to make a commencement with the search for gems, and as the machinery was got to work no doubt rapid progress would be made.

Taking a general view of the country, and judging of course from what he has seen during the flying visit up to Mandalay and Mogok, he had not formed a very high opinion as to its immediate future. He did not see what there was to be done with a country of such immense proportions and no population, and with but exceedingly small provision for transport. Anything in the way of agriculture would naturally be attempted in the hills more immediately adjacent to the seaports or at any rate, as near to them as the nature of the country and the measure of rainfall would allow.

One point in Mr. Kirby's remarks must not be forgotten. In mentioning the delay that had taken place in forwarding the machinery sent up to Thabeitkyin over a year ago, he pointed out that this machinery was not sent out by the Company, but by Mr. Streeter himself before the Company

was formed, and was afterwards purchased by th⁶ latter. We leave it to our readers to consider whether this in any way affects the question, our own idea is that it may be classed as a distinction without a difference. If the Company's agents did not want the machinery they should have left it alone. In taking it over, they at the same time, took over the responsibility of its utility or otherwise.

ROYAL BOTANIC GARDENT, PERADENIYA, IN 1838 AND SUCCEEDING YEARS.

(From Official Records.)

(Continued from Vol. IX., page 835.)

His Excellency the Rt. Hon'ble the GOVERNOR.
Sir,—I have the honor to forward per this opportunity the "Melon seeds" required by Your Excellency for Mr. Dyke, also (enclosed) the interesting letter from that gentleman, and I beg to return Your Excellency my grateful acknowledgement for the kindness of transferring it for my perusal.

I have the honor to be, Sir, Your Excellency's very faithful Servant,

J. G. LEAR.

Royal Botanic Garden, 31st August 1839.

His Excellency the Rt. Hon'ble the GOVERNOR.
Sir,—I have the honor to acknowledge the receipt of your Excellency's note of 25th instant, and the "40 copies of orchidea drawings (which prove the same that I had the honor to request of your Excellency), also of two packets of "Cape and American seeds" which shall have my particular attention.

I have the honor to be, Sir, Your Excellency's most obedient faithful Servant,

J. G. LEAR.

Royal Botanic Garden, 26th September 1839.

His Excellency the Rt. Hon'ble the GOVERNOR,
Sir,—I have the honor to inform Your Excellency that I could forward the plants required for the Queen's House whenever the border there is prepared for their reception, but I beg to suggest that they had better wait until at least a short continuance of rain could be depended upon. With respect to my tour via Nuwera Ellia and Badulla, I have written Captain Kelson on the subject, agreeably to Your Excellency's wish, who is prepared to see me at any time; that gentleman has also written Captain Rogers, and in the event of an answer from the latter gentleman before that time, I shall proceed to Nuwera Ellia on the 4th proximo.

If Your Excellency requires the *evergreens* immediately, I will put them in readiness before my departure from Peradenia.

I have the honor to be, Sir, Your Excellency's most obedient faithful Servant,

J. G. LEAR.

Royal Botanic Gardens, Oct. 30th, 1839.

Memorandum called for by His Excellency the

Rt. Hon'ble the GOVERNOR.

Royal Botanic Garden Establishment.

Superintendent, Clerk, Draftsman and Storekeeper^r
2 Kanganies, 1 Gardener, 1 Plant Collector and
Specimen Maker, 2 Lascoreens, 30 Coolies, 8 Boys.

Cost of Establishment	£52
Artificers' work and other contingencies	4
			£56

per month.

Mr. Lear thinks it but just to himself to add that after collecting what is due to the Establish-

ment for the sale of plants, seeds, &c., since he has taken charge of it, he will be able to forward to the Government Treasury nearly £40.

The cost of the Establishment during the first year of each Superintendent's charge that has been there is as annexed:—

	Year.	£
Mr. Moon ..	1817	1750
„ Walker ..	1825	1639
„ McRae ..	1846	1563
„ Bid ..	1830	1498*
„ Watson ..	1832	1563*
„ Lear ..	1839	720

His Excellency the Rt. Hon'ble the GOVERNOR, Sir,—I have the honor to return the queries which Your Excellency was pleased to put to me, answered as near and correct as I possibly can, and Your Excellency's other directions shall have my best attention.

I have the honor to be, Sir, Your Excellency's most obedient and grateful Servant,

J. G. LEAR.

Royal Botanic Gardens, Sept. 18th, 1839.

Memo. FOR MR. LEAR.

Kandy, September 18th, 1839,

Question.—What is your present salary from this Government?

Answer.—£150 per annum.

Q.—Are 3½ths of the ground of the Botanic Garden, which was under jungle when you became Superintendent, cleared of the jungle and made fit for botanical purposes?

A.—No—half, with much alteration and improvement of that previously kept up by my predecessor.

Q.—Can you, and within what period clear what remains of the jungle, on the ground, whereon Mr. Moon had planted rare or Ceylon plants with your present force?

A.—No, not at all, without neglecting that which I have already cleared.

Q.—If you can't, what additional force will you require, and what would be the additional monthly cost of labour, and in what time with this additional force can you clear it?

A.—30 men, £22 10s, 3 months.

Q.—About how many acres (at a guess), and about what portion do they form of the whole garden, has Mr. Wright in lease?

A.—65 by the survey, one-half.

Q.—What is the endurance of his lease, its commencement and termination?

A.—6 years, February 1836, 31st December 1845.

Q.—Can you give me a memo. of your monthly establishment and its costs?

A.—Yes, herewith enclosed.

Mr. Lear will please to mark whatever Chinese plants, vines and other plants from London belong to H. E. by a small bit of wood or lead with "Governor" cleared marked on each.

The vegetable and other seed beds can at any time be known that have been sown with seed.

His Excellency the Rt. Hon'ble the GOVERNOR,

Sir—I have the honor to forward herewith the seeds as requested by Your Excellency's letter of the 1st instant, and hope they will prove satisfactory. Those seeds which I had the honor to notice to Your Excellency in Colombo as having been received from Mr. Knight are, of vegetables, a collection limited in quantity to that which would be neces-

* Some coffee returned to Government during these years, the amount of which is not ascertained,

sa y to prove by experiment what are best adapted to this climate, and for that purpose as suggested by me, Mr. Knight has had the collection made up very select, numerous, and in small quantities, and I think we could not have received them at a better season or in more excellent order. The *fruits, palms* and ornamental shrubs and trees are from Mr. Knight's collector in South America, and of that superior character which will justify my saying that it would be difficult hereafter to procure a similar or as good a collection, and certainly nowhere on this Island could they be expected to have that necessary attention which they would receive at the Botanic Garden. I hope therefore that Your Excellency will be pleased to allow me to bring them to account for this establishment, and not distribute them at present through the Island as was suggested by Your Excellency previously.

In the humble and sincere hope that this may meet with Your Excellency's pleasure,

I have the honor to be, Sir, Your Excellency's most obedient humble Servant,

J. G. LEAR.

Royal Botanic Garden, 3rd November 1834.

His Excellency the Rt. Hon'ble the GOVERNOR

Sir,—I have the honor to inform Your Excellency of my arrival at Newera Ellia, where I reached on the 4th instant. I saw Captain Kelson on the 5th, who has pointed out to me the land Your Excellency fixed upon for experimental purposes; he has also handed me a survey of the same. I have examined it well, and for the use to which Your Excellency intends to apply it I know of no situation where the choice could be improved. The soil of the *plain* is perhaps not strictly speaking that which general report gives the tea to delight on, neither does it exactly correspond with that recommended for the growth of tea in the popular works of the day, but soil apart (which by draining and otherwise can be greatly improved), every other circumstance seems *particularly* favourable to the production of that article, and eventually I should doubt not of success. Captain Kelson has sent me 8 coolies this morning, and I have commenced clearing on the S. E. side of the forest, jungle where I understood Your Excellency (by description) as the place where Your Excellency wished me to form the nursery for tea. I very highly approve of the spot, and hope soon to have it in readiness, but with respect to the quantity necessary, I should (most humbly) suggest 2 acres as quite sufficient at present for *that purpose*, and as land is apt to deteriorate by exposure, it is the more desirable that no more be cleared than is actually necessary. Should Your Excellency approve of my plan, I shall confine myself to the abovementioned quantity, and when the work necessary upon that is completed, I shall immediately proceed to Badulla as previously directed by Your Excellency. I expect the above work will occupy my time up to the 17th instant, and if Your Excellency has any further commands (independent of my duty) it will afford me the most agreeable pleasure to attend the execution of them.

I have the honor to be Sir, Your Excellency's very grateful and most obedient humble Servant,

J. G. LEAR.

Newera Ellia, 6th November. 1839.

Newera Ellia, 23rd Nov. 1839.

His Excellency the Rt. Hon'ble the GOVERNOR, Sir,—I have the honor to acknowledge the receipt of Your Excellency's letter of the 14th instant, and according to its tenor, I beg to hand Your Excellency the result of my investigation of the land referred to,

The tract pointed out to me by the Mohattal of the district as purchased by Your Excellency, is about 8 miles S. W. of Badulla, and is called Oodoorowawatte, in the Oodapalata of the Yatakinde of Oovah. It is about 4 miles distant from the road leading from Newera Ellia to Badulla, where it would be necessary to form a path, as it is now approached with difficulty by a track crossing several paddy-fields and streams.

It is supposed that a road could be made to it with comparative ease, as a stream of water passing through the land in question has its course in nearly a straight direction towards the main road to Badulla; which road it crosses at about $3\frac{1}{2}$ miles from that place.

The general appearance of the forest as it is approached from the Badulla road, is that of a deep narrow valley with steep sides rising to the summit of bare manna hills; easily accessible at its northern boundary, where the stream just mentioned leaves it.

The quantity of land approaching a level surface, is comparatively very little indeed; being confined to a narrow tract on each side of the stream, where the appearance of the soil is on the surface, blackish, with a substratum rather yellow, and freely mixed with sand or soft stone; and must be of a very superior quality, necessarily arising from its peculiar situation.

There is a greater proportion of surface of easy declivity, where the soil is, as may be expected, of a quality considerably inferior to the former; yet, partaking of the same formation, and this may be considered of an average quality compared with the soils of this country. The extent of both these descriptions may be roughly estimated at about 200 acres.

Of the remainder very little can be advanced to recommend it, being chiefly composed of very sharp or strong steeps difficult in approach and in application of labour. There are also small patches of chena lands having been cultivated by the natives, but the exhaustion of land attendant on their system of cultivation is notorious, especially on slopes which is the land they have chosen in this case.

The remainder is Patana or Manna hills and is unsuited for plantations.

It is barely possible at one visit to form correct ideas of its extent, but I should suppose the whole to exceed 600 acres.

Concerning the supply of labour that may be obtained at this spot, the testimony of the residents and the appearance of the circumjacent country suggest but a scanty or irregular supply; perhaps for 8 months in the year, an adequate quantity may be obtained, but during the remainder or when the scanty population are busily engaged on their own land the supply of native labour cannot be otherwise than defective; if indeed any could be obtained, and this unfortunately happens at the crop season when they are most required.

A regular supply of Malabars may possibly be located there, but of the practicability of this I cannot speak. With respect to the 2 acres of land at Newera Ellia, on returning last evening from Badulla I found that the said quantity is already nearly cleared, and if the weather continues as favourable as at present for 3 or 4 more days, the necessary work upon it for the present will be completed.

I have the honor to be, Sir, Your Excellency's most obedient humble Servant,

J. G. LEAR.

His Excellency the Rt. Hon'ble the GOVERNOR.
Sir,—I had delayed reporting to Your Excellency the condition in which I left the tract of land in process of clearance at Newera Ellia (now some 13

days past) until I should hear how Your Excellency approved that report which was the result of my investigation of and visit to Badulla. Put not having yet been honored with that expected and anxious intelligence, I beg forthwith to state for Your Excellency's information that the spot above alluded to is now ready for the reception of tea plants whenever they come to hand. There were 8 Caffre men employed 23 days, and the extent cleared is upwards of 2 acres, a good part of which is burned and entirely cleared of the fallen timber.

I have the honor to be, Sir, Your Excellency's most faithful and obedient Servant,

J. G. LEAR,

Royal Botanic Garden, Peradenia, Dec. 9th, 1839.

His Excellency the Rt. Hon'ble the GOVERNOR,

Sir,—I have the honor to acknowledge the receipt of Your Excellency's letter of the 11th instant and in answer beg to state as my opinion, that the tea plants intended for Newera Ellia could not arrive in Colombo at a better time than the month of March, to allow of their being taken to Newera Ellia early in April. With reference to the land at Badulla, I have no doubt but that Your Excellency's views, with respect to other produce than coffee, might be carried into effect with promising results but it is worthy of notice that the land objected to for coffee is very precipitate and difficult of access, which circumstance embodies many other objections. I should be most happy to have the honor of accompanying Your Excellency to the spot should Your Excellency have decided upon cultivating it, the commencement might be made immediately, but I wish too earnestly for the success of the undertaking, to recommend such a system of procedure as the one contemplated. It is much to be doubted and feared, that the performance of a native's contract, in a business of that description, would never bear the test of examination, or prove otherwise than conducive of great disappointment and regret.

There is a fine tract of forest land on the range of mountains called Namanakoolakanda, about 8 to 10 miles from Badulla, and the best of it I believe is on the S. W. side, facing the district of Allipoot. I am led to believe it is well suited for coffee cultivation, and that is the only land I know of any extent near Badulla, and there I believe are several thousand acres.

I have the honor to be, Sir, Your Excellency's most obedient humble Servant,

J. G. LEAR.

Royal Botanic Garden, December 14th, 1839.

The Rt. Hon'ble the GOVERNOR, &c., &c., &c.

Sir,—I have the honor to acknowledge the receipt of Your Excellency's letter of the 24th instant, and seeds therein specified.

I think it will be advisable to sow the tea seeds at Peradenia and remove them when germinated to Newera Ellia; in the meantime the ground there can be put in readiness for them.

I have some doubts of the success of those seeds, the albumen on examination appears unhealthy, but I shall sow them this morning, and the result will soon be known.

It is perhaps not known to Your Excellency that there is a pure tea tree at Caltura Botanic Gardens, and I have been told there are some young ones also; if so, Your Excellency might secure them. I have received two seeds from the original tree there, one of which has become a plant.

With very grateful acknowledgments, I have the honor to return herewith Doctor Wallich's most agreeable letter to Your Excellency.

Mr. Normansell having arrived, I should prefer remaining at Peradenia until I have given him over charge, after which I shall most willingly revisit Newera Ellia and Badulla, if Your Excellency requires it. I am extremely sorry that I know of no person whom I should like to trust, at liberty to take charge of Your Excellency's property at the latter place. I did not examine the soil on Namanakoolakanda, but I have been well informed of its capabilities for coffee.

I have the honor to be, Sir, Your Excellency's most obedient faithful Servant,

J. G. LEAR.

P. S.—The *whole* of the *tea seeds* now *swim on the surface* being put in water.

J. G. LEAR.

Royal Botanic Garden, December 26th, 1839.

His Excellency the Rt. Hon'ble the GOVERNOR.
Sir,—I have the honor to acknowledge the receipt of your Excellency's letter of yesterday's date and with respect to the mangosteen and nutmeg plants, the former I believe would succeed well, if put out in a border or bed at the Queen's House, with a little fresh *moderately* wet soil about their roots, occasionally watered, and for a week or two sheltered from the strong heat of the sun.

The nutmegs, if I may judge from the general state in which they arrive from the coast, had much better be sent immediately to the Botanic Gardens, where I would see that they received the necessary attention, which they require to have paid them, on their first landing in boxes; they would then be also on the way to Badulla, and gaining strength against the time that land was there prepared for them. I think they would not thrive so well, or be so *little* likely to suffer in Colombo as in Kandy, if the same attention could there be paid them; but if Your Excellency prefers their remaining in Colombo, my belief is, that they could not be materially hurt (if planted in close beds, where they could be conveniently covered with cadjans from the sun) in a month or two a compost should be made for them, rather free and strong, than rich; a loam, with a mixture $\frac{1}{3}$ of good vegetable mould, is the best, and as the plants are supposed to be small (about 6 or 8 inches high) the distance of 9 or 10 inches asunder every way would be quite sufficient for the time above specified.

Mangosteens require the same treatment if the same size, or increased distance in proportion as they are larger, until they are finally planted out, when they should be at least 20 feet asunder.

May I be permitted to enquire of Your Excellency, if the weather is now in Colombo, such as to warrant the safety of the plants required by Your Excellency to fill the borders in the Queen's House Garden, which are ready for dispatch at Your Excellency's pleasure, and accordingly shall have every attention.

I have the honor to be, Sir, Your Excellency's most obedient humble Servant,

J. G. LEAR.

Royal Botanic Gardens, Peradenia December

His Excellency the Rt. Hon'ble the GOVERNOR.

Sir,—I have the honor to acknowledge the receipt of Your Excellency's letter and 2 packets of *tea seeds*, which I am sorry to say (like the for-

mer) *swim* in water and otherwise appear somewhat unlikely to vegetate freely. They were sown this morning, and my constant best attention shall be paid to them. With reference to the culinary seeds from "Ronalds," upon enquiry I found that portions of those remaining had been sown by the Pavilion gardener at different times, and in the manner I had directed, but none of them after the first sowing succeeded, which I have but little doubt was owing to their age and bad condition when received, to which must be added the length of time they have been in the Island.

If there are any of them left, I will most gladly see to their being sown agreeably to Your Excellency's direction.

I think Mr. McGregor* would be *quite competent* to the charge at Badulla, if he had 6 months' instructions and experience from a coffee plantation now in its infancy, where he could get an insight of the regular routine of the business as it proceeded, and with a steady communicative person.

I have the honor to be, Sir, Your Excellency's most obedient grateful Servant,

J. G. LEAR.

Royal Botanic Garden, Dec. 31, 1839.

Newera Ellia, October 26, 1840.

The Rt. Hon'ble the GOVERNOR.

Sir,—I have the honor to enclose copy of a letter and a taxed bill for Your Excellency's information. I believe it is not required that the remittance alluded to should pass through my hands. I have also great pleasure in acquainting Your Excellency that I have received the seeds which you were pleased to entrust to my charge, and in a fine plot of ground in Your Excellency's lately purchased property I have sown them, and expect they will do well. The tea plants I am sorry to say are not so flourishing as could be wished; they have had, I find, to contend against a very bad season, and being rather weak when they were planted out, sufficiently accounts for their present appearance. A few of them are looking well which is proof enough that the climate is suitable and that they will eventually succeed. If I can be of any other service to Your Excellency during my stay at Newera Ellia, I earnestly hope you will please to command me.

I have the honor to remain with the greatest respect Sir, Your Excellency's most faithful obedient Servant,

J. G. LEAR.

Government Agent's Office, Colombo 21st Oct. 1840.

Sir,—I have the honor to enclose copy of a taxed bill received from the Surveyor-General dated 15th instant, amounting to £42-10-2 $\frac{3}{4}$, being fee due to Mr. Bagenall for surveying the piece of land at Palampittia in Lower Bulatgama purchased by you for the Right Hon'ble the Governor on the 30th ultimo, and to request that you will have the goodness to remit to this office the sum of £27-10-2 $\frac{3}{4}$ being the balance due on the above account.

I have the honor to be, Sir, your most obedient Servant,

C. R. BULLER,

J. G. Lear, Esq., Kandy.

Agent.

* Mr. Lewis Macgregor, one of our pioneer planters, who subsequently migrated to California and died there. His brother Roderick was better known in later times.

Newera Ellia, November 4th, 1840.
 His Excellency the Rt. Hon'ble the GOVERNOR, &c., &c., &c.
 Dear Sir,—I have great pleasure in acknowledging the receipt of Your Excellency's letter of the 30th ultimo, with a packet of seeds, all of which shall have my best attention. The great scarcity of coolies here will enable me, I fear, to proceed but slowly with the planting of the piece of ground you have mentioned; I hope nevertheless to complete it before my departure from hence.
 My return to Colombo previous to embarking in the "Tigris" I trust will be in time for the removal of the fruit trees intended for Kornegalle, when I

shall be most happy to superintend that or any other work Your Excellency may desire. Before leaving this neighbourhood I am anxious to instruct an old servant of mine, who already possesses some knowledge of the matter, in the mode of propagating the numerous and delightful variety of plants that abound in these regions, of which I wish to establish a moderate collection by the period of my return to this colony. Should that event take place as early as I am led to expect, to forward this desirable object, I require the temporary use of about 50 square yards of jungle land, and as it has occurred to me that the same person might be useful in giving an eye to the tea plants, I hope Your Excellency will not think me too presuming by soliciting permission to occupy a bit of land to the above extent, near the tea plantation, where I should feel rejoiced to offer so much of the services of my servant as Your Excellency would require for their protection, as in such case, from the proximity of both occupations, the one could interfere but in a very trifling manner with the duties of the other, and it would tend very materially towards furthering Your Excellency's views on the subject of tea cultivation, which I would most willingly do all in my power to assist.

I have the honor to remain Sir, Your Excellency's most dutiful Servant,
 J. G. LEAR,

Nuwera Ellia, November 23rd, 1840.

His Excellency the Rt. Hon'ble the GOVERNOR, &c., &c., &c.

Dear Sir,—I have great pleasure in acknowledging the receipt of Your Excellency's letter of the 21st instant, with a packet of seeds, which, assisted by Captain Kelson, I have sown this morning. The rains which daily threaten to visit this part will, I hope, greatly contribute to their doing well. Captain Kelson has kindly promised to see to the whole garden in the absence of my servant, who I am grieved to say has been obliged to return to Kandy, owing to an inflammation in the chest, proceeding from a cold. I had proposed to leave here myself on Saturday next, but in consequence of intelligence from Colombo to the effect that the "Tigris" will leave sooner than was expected (about the 15th proximo), I have arranged to do so on Wednesday next, and to arrive at Peradenia on Friday, where I shall have to make a stay of about 5 or 6 days before proceeding to Colombo. I trust Your Excellency will pardon the delay in forwarding the memo. on forming a coffee nursery, &c. It is now in preparation, and I am sure I need only offer my indisposition as an apology for its not being much earlier completed.

If I can be useful to Your Excellency on my passage to England or whilst there, I humbly beg you will be pleased to command my most willing services.

I have the honor to remain with the greatest respect, Sir, Your Excellency's very obedient and faithful Servant,
 J. G. LEAR.

For His Excellency the Rt. Hon'ble the GOVERNOR, &c., &c., &c.

MEMO :

On forming a coffee nursery in a forest intended for plantation, the first thing to consider is the extent requisite, and as a guide it may be borne in mind that one parah of seeds in the parchment skin will produce 40,000 plants; allowing for a moderate proportion of refuse, 3 parahas would therefore be more than enough for 100 acres. Seedlings from the tender nature of their cotyledons should be cautiously guarded from the full influence of the sun, in their early stage, i.e. for the first 6 months;

to do this effectually and at the same time on a simple and expeditious plan. (for 3 parahs of seed) half an acre of forest should have the underwood cleared away and be otherwise partially thinned, leaving only sufficient trees to ensure a light shade to the soil beneath them which should be roughly turned up with mamoties without regard to roots. In this state the seed should be sown upon it broadcast, and afterwards covered in with a rake breaking the lumps of earth &c. Should any seed appear above the surface, after this operation, they may be buried by a cooly going over the ground with a small stick and making a hole by its side so as to allow it to fall in. Judgment should be next employed in selecting proper and convenient sites for transplanted nurseries; they should be so chosen as to avoid as much as possible unnecessary waste of labour in removing them hence to their final situations. On every 100 acres three sites may be fixed upon of a little more than $\frac{3}{4}$ acre each, which being stocked with the now rising plants, at one foot asunder would be sufficient for that quantity. The soil for this purpose should be entirely cleared of brushwood and forest and as much of roots as may not prove too expensive and laborious; it should be also well turned up and renovated. If the seeds have been sown in November or December, the seedlings will be fit to transplant during the rains in April and May; care should be observed in raising them with a spade, they should not be forcibly drawn from the soil, but shaken out preserving all the fibrous roots; in selecting them from the seed ground, avoid any that are very weak; with a sharp knivesorten the tap root,* and also all long spreading lateral roots; they will be now ready for planting out, the ground having been prepared as directed, lines should be next drawn (with a spade),† a drill or small trench should be made by its side, and by hand the plants should be placed against it 1 foot apart, drawing and lightly pressing the loose and removed soil against them as the work proceeds; care should be taken that they are not placed deeper in the earth than about one inch below what they were originally. By this process the use of the dibble

* Many persons offer objections to the practice here recommended, but the motive for observing it in all establishments where transplanting is carried on to any extent, is obvious, the simple operation of cutting off the tap root, in rely weakens an unprofitable part to the greater useful ones, the lateral and fibrous roots are thrown out more numerous and with greater vigour, and it is from these alone that a tree derives its principal support from the earth. The tap root is rather an elongation of the stem downwards, and is a conductor of the returning sap that has been separated in the body of the plant from the necessary secretions formed for its growth (length is not an object in this process), therefore, in addition to other reasons, by chequering the probability of its penetrating a subsoil injurious to its health, we do a service to the plant. Tap roots often decay in bad subsoil and thus a disease is ingendered, which by its natural tendency to ascend, will in times destroy the plant; hence it is want of health and not deficiency in length or dimensions of a tap root (a) from which (if from this source at all) the plant receives its injury. It may be questioned, for what has nature provided a tap root? And much may be said in favour of its preservation when nature is left alone, but she only can know the true circumstances that call for its use, and when art is resorted to, its entire abandonment can be reasonably defended on a due consideration of known consequences.

† The word came before us as "shade," but we do not quite understand Mr. Lear recommending the use of a spade, an "agricultural implement" seldom used in the cultivation of coffee in Ceylon.—Ed. T. A.

a Cutting this root when plants are old, such as make stumps, makes a wound that seldom entirely heals; the same operation performed when the plant is young or overgrown and scarcely leaves a cicatrice.

is dispensed with, which is at all times objectionable when it can be avoided; there is no occasion for bedding as is commonly practised in this work. By following the preceding remarks, the now transplanted seedlings will be fine plants and fit for final removal in four months. In planting an estate, various plans are chosen and adopted by different individuals, who have perhaps equal pretensions to the right one, each following that which long custom may have dictated, and upon which they are capable of forming correct calculations, and this is so far right, but it shows an evident want of a general system founded upon enquiry into the clear truths of vegetable Physiology where it may be learnt that whatever course is found to be most consistent with the laws of nature is the most preferable one to pursue, and wise experience in Horticulture has most fully proved the fact. This is advanced merely to show the absurdity of that unsparing and unjustifiable mutilation which cannot be avoided in preparing and planting stumps. Seedlings are always preferable, and it is well to observe here that much depends upon the choice of seeds; they should be gathered when perfectly ripe, and if possible from young and vigorously healthy trees.

In planting, it is advisable to have holes made, and they should be rather wide than deep, say 9 or 10 by 16 inches.

J. G. LEAR

Peradenia, December 7th, 1840.

Colombo, December 18th, 1840.

The Rt. Hon'ble the GOVERNOR OF CEYLON, &c., &c., &c.

Dear Sir,—I beg to return Your Excellency my most sincere thanks for the flattering testimonial you have been pleased to furnish me with. In reference to Your Excellency's wish for my further ideas on Coffee planting, I have the honor to annex a memorandum, and which I trust will be found useful. With regard to the vines at Queen's House, I very much fear they are too large for removal to such a distance as Kurunagalle, particularly at this exceedingly dry season, and as cuttings root so easily, I should unhesitatingly advise some to be sent in preference to the old vines, the result I feel confident would be quite as satisfactory. The Mohandiram is also very unwell, so much so, that he cannot come into the Fort to see me, which circumstance I am most sorry to say forms an obstacle to the furtherance of the work Your Excellency was anxious I should attend to. I have however seen Mr. Venom with whom I hope to make such arrangements as will favour its completion under other guidance: Since my time in Colombo is now so very short, cuttings of all the vines I will not neglect. I have to offer my grateful acknowledgments for the kind enquiries Your Excellency makes for my health, and am rejoiced to say the change to Colombo had greatly benefitted me. I must now conclude by requesting that Your Excellency will condescend to believe my prayers will be constantly offered for uninterrupted health and happiness to your excellent self and family. With most dutiful respect, I have the honor to be, Dear Sir, Your Excellency's most obedient and faithful servant,

J. G. LEAR.

MEMORANDUM.

Coffee plants 9 or 10 months old are preferable to any others for plantation; they will be then about 10 inches or 1 foot high; it is not material that they should have begun to branch out, if the plants are stocky and healthy; I should nevertheless rather they had one pair of lateral branches. Distance in rows ought to be determined with a

due regard to the nature of the soil and locality. On very fine soil, and in sheltered situations distance in rows 6 feet apart and rows from each other, 7 feet is in my opinion not too much—in poor soils and exposed situations 57* square is about the medium, the former I would top at 6 feet high, the latter at 4 ft. 6 in. high; when this operation is performed it should not be when the top may be pinched off with the thumb and finger, but when it has grown 6 or 8 inches higher than the height intended, thus a plant throws a little of its luxuriance in a natural way, and in the other system a bundle of suckers is the inevitable consequence.

J. G. LEAR.

REPORT ON THE ROYAL BOTANIC GARDEN, PERADENIYA, NEAR KANDY.

(By the late Dr. W. C. Ondaatje, Acting Botanical Superintendent, 1st June 1843.)

Uses of Botanic Gardens.—In submitting my first Report on the Royal Botanic Garden to His Excellency the Governor, I beg very respectfully to avail myself of the opportunity to direct public attention to the great importance and utility of such an institution, both in a scientific as well as in a practical point of view. It is much to be regretted that so few seem to be alive to the benefits which may be derived to a country by the establishment of a Botanic Garden, which, while it assists men of talent and research in their studies of Natural Science, affords at the same time the best means of ascertaining the richness and variety of the vegetable productions, with which an all-bountiful Providence has adorned each land.

The excellent and learned Doctor William Carey in his introduction to the "*Hortus Bengalensis*" thus forcibly observes on the uses of Botanic Gardens: "By the formation of Botanic Gardens the labors of scientific men have been called forth and greatly aided, as these afford facilities for the improvement of Botanical Science, which might have been sought for in vain without the aid of such institutions. But the Botanic Gardens and other noble collections of plants in Europe could never have been brought to the perfection in which they now appear, had not public or private repositories of plants been formed in the different settlements in Asia, Africa and America;" and further that the great object of an institution of this kind is, "the propagating of useful plants, natives of other countries, and the consequent enriching of the country into which they are introduced."

These observations of Doctor Carey, a Botanist of no small eminence, and who was himself of the Utilitarian School of Philosophy, appear to be sound, rational and conclusive.

But if such be the advantages of cultivating Botanical Science in a general point of view, of what greater importance must the study of that Science be in this fine country, where plants, the most beautiful, singular and useful are found spread over its whole extent, and where every effort to become acquainted with its economical productions, will most certainly be attended with no small profit.

I shall now proceed to the various points which I am anxious to submit to His Excellency's consideration, noticing them in the following order:—

Subject of the Report.—1. The condition in which I have found the Garden.

2. A brief notice of some of the most useful plants at present growing in it.

3. The improvements I have been effecting.

4. A few suggestions for the advancement of the Garden.

1. *Condition of the Garden.*—It is with extreme reluctance that I enter on this point of my report

as it may perhaps be considered that I take occasion to reflect on the labors of my predecessors. I beg therefore that it may be distinctly understood that I have not the remotest wish of detracting aught from the merit of their services; but a sense of duty to the Government and my own anxiety for the advancement and success of the Garden, render it obligatory on me briefly to advert to the condition in which I have found it.

When I took charge of the Garden which was in February last, nearly a month after the death of Mr. Normansell,* I feel bound to state, that it presented to me no very encouraging aspect; nor was it by any means in the condition in which I expected to find it. Little attention appeared to have been given to conduct it scientifically and with a reference to public good; or to preserve it in order and extend its cultivation. Several portions of land, surrounding the small extent of cultivated ground, are covered with thick jungle, and such even as were in a state of cultivation, as far back as the days of the indefatigable Moon and some of his immediate successors, from having been sadly neglected, are now overgrown with weeds, &c.

This useless exuberant vegetation occupies various conspicuous parts of the Garden, and I need hardly observe, that it greatly impedes the improvements which I propose effecting, independently of its being productive of no small injury to the cultivated parts themselves.

On examining these jungles, I find traces of exotic plants, roads, &c. which are evident indications of their having been at one time properly cultivated. Several roads and walks in the Garden have also been totally obliterated from various causes.

It affords me however much pleasure to be able to notice, that Mr. Normansell made a commencement of labelling all the plants he cultivated and began setting apart portions of ground for the purpose of planting them according to the "Natural Order," and I cannot also in justice omit to remark that the Garden is indebted to Mr. Lear (one of its former Superintendents) for many of the beautiful arrangements and orderly disposition of plants, flower beds, &c. now found in it.

2. *A brief notice of a few of the most useful plants in the Botanic Garden.*—One of the chief objects of a Botanical Garden being the introduction and cultivation of rare and useful plants, it may perhaps be desirable that I notice a few of such as are at present growing in the Garden.

Sisso Seedlings sent to the Garden, by the Hon'ble P. Anstruther, Esq.—I have much satisfaction in being able to report on the success which has attended the introduction of the Sisso (*Dalbergia Sisso*, Roxb.) The seedlings of this most useful timber tree were chiefly obtained through the instrumentality of the Hon'ble P. Anstruther, Esq., and it will no doubt be gratifying to that gentleman to know the fact, as he has always felt an interest in the progress of the Botany of this Island.

From the vigorous growth of the plants (of which there are 160 in the Garden) it may be fairly anticipated that much benefit will be derived of the Colony, as they become generally introduced †

(To be continued.)

* To whose memory we believe we do no injustice in saying that during his short career in Ceylon he devoted much more attention to earning money by reporting on coffee land, than to the Botanical Gardens.—ED. L. R.

† For more plants, vide Appendix A.

‡ *Teak* and *Mahogany* thrive luxuriantly in the Garden, *Mesua ferrea* (Iron wood) and *Dodonaea viscosa* (Switch Sorrel) yield wood which is close grained, and I think may be used for wood cuts. They are natives of Caltura, but are also found in the Central Province

* 7' 5" square.—ED. L. R.

THE CULTIVATION OF ALOE FIBRE IN MEXICO.

At the end of an article on Aloe Fibre cultivation in the *Bulletin Du Musce Commercial* which gives very much the information embodied in our pamphlet, we find an estimate appended of which we furnish a translation. We have adapted the figures as nearly as possible to local conditions so as to inform and encourage any Ceylon cultivators who are interested in the subject:—

COST FOR A PLANTATION OF ALOES OF 10,000 MECATES
EQUAL TO ABOUT 120 ACRES.

	Piastres.*	equal to R
Value of 10,000 suckers	2,000	4,400
Enclosures with dry stones (fencing)	420	924
Clearing	375	825
Planting	250	550
During the 4 years of upkeep	1,250	2,750
Interest on the money engaged during 4 years	1,461	3,214
Total	5,756	12,663
Cost of working during 6 years.		
Steam engine, 3 horse-power	1,090	2,398
Machines for scraping	450	990
Shed for the machine	500	1,100
Outting and transport of 24 million leaves	12,000	26,400
Salaries: (1 machinist at 1 piastre per diem, 8 labourers at 0.50 piastres) per diem	9,000	19,800
Wood, oil, repairs of machinery for 6 years	2,400	5,280
Diminished value of machines after 6 years' wear	924	2,033
Interest on the capital engaged in manufacture	1,468	3,230
Total	27,832	61,231
Cost of planting	5,756	12,663
Total	33,588	73,894
Produce:		
1,200,000 lb. of fibre at 15 centavos	—	—
per lb. (price in January 1889)	180,000	396,000
Net product	146,412	322,106
* 1 piastre equal to R2.20		

There is surely enough encouragement here for either planters or merchants to make an attempt at business with Ceylon Aloes.

TO KILL CROWS.

TO THE EDITOR OF THE "AUSTRALASIAN."

Sir,—I have noticed several inquiries for methods for killing crows, and I find the following very effective. After skinning a carcass, thoroughly score all the fleshy parts (so that they will come away freely in small pieces), and well rub in fine strychnine; also poison all blood that is lying about, or if there is no blood, cut up the liver into small cubes (small enough for a crow to swallow), and place a little poison into the centre of each cube. Where there are no carcasses to be poisoned the following would be a good way; collect all blood when killing a sheep or bullock, and mix it with dissolved strychnine and then lay it down in favourable places; crows generally fly to trees when they feel the effects of the poison.—Yours, &c.

WILLIAM J. AUSTIN.

Mount Mercer, April 17.

—*Australasian*.

[There is just the danger that domestic animals or children might be poisoned.—E. D. T. A.]

PADDY CULTIVATION.

A Galle correspondent writes:—"We are glad to find that Mr. William Jansz's frequent agitation in the matter of improved paddy cultivation has now been without its beneficial results, if the recommendation of the Select Committee are to be carried out. Mr. Jansz's scheme to afford relief to the native agriculturist was submitted to the Government Agent, Mr. P. A. Templer in the first instance who brought the matter to the notice of Government. The Committee in recommending that seed paddy be advanced more systematically and on a larger scale than heretofore to cultivators in poor circumstances has adopted Mr. Jansz's suggestion. The importation of good kinds of seed is another recommendation which was practically carried out by Mr. Jansz who obtained seed paddy from Batticaloa for cultivation in Galle."

REPORTS OF TEA COMPANIES.

By last mail you will have received from me the report of the Eastern Produce and Estates Company which was presented to the shareholders at the General Meeting held on Thursday. With this is forwarded to you the report of what passed at that meeting appearing in the *Money Market Review*. There is not much in this report to which your attention may specially be called, nor need anything be added as to progress made by the Company to the remarks with reference to it given in my letter of last week. The Chairman's reference to a possibly bright future for the coffee remaining in Ceylon had unfortunately to be qualified with a very important and significant "if." "If" he said, "they could find out how to get rid of the green bug, he thought they would all consider that there was a new future for the remaining coffee in Ceylon."

A further document connected with Ceylon Companies forwarded to you with this is the Report of the Ceylon Tea Plantations Company. It had been hoped by me that it would have been possible for me to have sent you this by the last mail, but it did not reach my hands till after that had left. It was presented to the shareholders at the third Annual General Meeting last Tuesday. The Report does not contain much in addition to the items of it commented on by me when writing by the last mail. It may be noticed, however, that the average price realised for the Company's tea had been 11d per lb. during 1889 as compared with 10½d during 1888. Evidently the Company does a large business beyond dealing with the produce of its own estates. These yielded only 937,407 lb., while the amount cured by the Company, including its own produce, purchased tea, and for other proprietors, totalled 2,014,335 lb. The acreage of the properties is 5,446 acres, of which 2,673 are of tea in bearing and 993 of tea not yet yielding leaf. Very recently you were told by me of the intention of this Company to purchase more estates, and of the contemplated increase of the capital to £300,000 to effect this. From the report it appears that, on the 25th of March of this year, there were added to the properties owned by the Association the following estates: viz., East Holyrood, Waverley, Tangakelly, Cymru, Cameron's Land, Lochiel and Rosita; the acreage of these amounting to 2,314 acres. It is stated that Mr. H. K. Rutherford, the late manager in Ceylon, has been appointed Managing Director in London, and that Mr. G. A. Talbot has been appointed to succeed him in Ceylon. We have only seen a brief report of last Tuesday's meeting, but from it we gather that the proposals of the directors received unanimous adoption.—*London Cor.*

TEA SALES IN COLOMBO AND LONDON.

Surely "One Who Wants to Buy" must know as well as you and I do that considerably more than 2d is put down as the difference between London value and the Colombo equivalent. If he does not, this quotation from a valuation before me will teach him :

London Value	Colombo equivalent at 1 6 1/2 exchange,
1/4	Freight at £2. 72 cts.

At this rate of exchange 5 1/2 cts. to the penny will not be very far out, and this means a difference of nearly 16 cts., which allows for a tolerably good margin of draft and loss in weight expenses even after the 2d charge has been taken account of. Finally, I did not choose an account sale because it was an unusual one. I quoted from it in the first instance because it was the last one to hand, and when my statements were challenged I naturally stuck to that particular account for subsequent corroboration. I eliminated draft and loss in every case; so, as I said before, it was as fair for one as for another. I allowed for no drawing charges because I don't pay them; and, if I did, as "One Who Wants to Buy" suggests, and charged for drawing myself, I should deserve, and probably obtain, the "sack." Shipping charges are, I repeat, about balanced by brokerage in Colombo.—C. T. G. in local "Times."

The rise in the value of silver and in exchange is not pleasant for our planters who are all the readier to see their teas go to outside countries. To this end the local market, since our appeal, is being better supported, the offerings last week and this again being over 200,000 lb. The discussion continues over tea prices realized from sales locally and in London. Mr. Gordon Frazer writing to a contemporary contributes the following :—

C. T. G. writes that he does not consider loss in weight and draft, either in his own case or in calculating charges on Colombo bought teas. In this he is manifestly wrong, as a buyer *must* take it into consideration. For instance, in the case of the account sale he quotes from, had this tea been sold in Colombo the buyer would have had to pay for every pound invoiced, even including the samples taken out of the packages for the purpose of selling the tea here; yet, according to London custom, he receives payment for 1 lb. less than the actual weight in each package. The draft allowance must therefore be taken into account in calculating the cost of laying tea down in London. * * * The loss of 1 lb. per package from either the gross being just insufficient to turn the scale at home, or the tare being just over a certain number of pounds, frequently does happen. Taken all round, my opinion is that London charges on a ten-penny to a shilling tea in chests work out at as low a calculation as is ever safe to work upon, at about 1 1/2d per lb., half chests costing rather more; and this may be taken as about a basis from which to work, the cost of laying down in London rising or falling as the value of the tea is higher or lower. Of course, when freights are abnormally high, as sometimes happens this also must be allowed for.

"One who wants to buy" adds :—

It will be seen that "C. T. G." admits, as I surmised was the case, that no allowance had been made by him for draft or loss in weight. But is that fair! I therefore really cannot see why "C. T. G." should object to the amount put down by buyers here as the cost of shipping and laying down teas in London. By eliminating draft, loss in weight, drawing charges, commission, and shipping charges, he of course reduces the cost, but how many can dispense with these charges! I know lots of instances where 1 ct. per lb. is charged for shipping and in estimating 2d I have very often been under the mark.

Just come back from a mill where I have turned out and weighed 4 chests purchased at last public sale, marked 75 lb. nett. Result=72 lb., 73 lb., 75.4 lb.,

70.14 lb., total loss 8.14, equivalent to a loss of 3 per cent! And "A Direct Importer" writes :—

"One Who Wants to Buy" in his statistics of 10th Mey seems to pay higher charges than is necessary. My loss in weight and draft is never as high as 3 per cent, and rarely as high as 2 per cent. I do not pay 3/4 cent for shipping charges and export duty, neither do I pay more than 1 1/2 per cent. commission, nor do I pay a commission for drawing. My total shipping and London charges on one of my recent breaks of 8670 lb. allowing 60 cents per pound for loss in weight, and draft 122 lb. came to just 1 1/2d. I take it that if the ordinary common or garden planter can place his teas in London, for that sum, "One Who Wants to Buy" should be able to do it for less. Has he ever heard of such things as "return commissions"?"

PEARL AND CHANK FISHERIES.

The energetic Superintendent of the Madras Museum has issued a brochure of varied contents, combining a brightly written account of his recent visits to the pearl fisheries of Tuticorin and Ceylon with a more strictly scientific description of the marine fauna of the Gulf of Mansar. To these subjects he has added a general survey of Ramesvaram Island, its fauna, flora and geology, a brief note on the two pearl-producing mollusca of the Presidency other than the pearl oyster, and an account of the chank-fishery at Tuticorin. It may perhaps be suggested that the effect of these pieces is somewhat marred by their publication together and by the arrangement adopted. The reader's attention and interest is distracted by the transition from the Madras pearl fishery to the history of the chank industry and from that back again to the pearl enterprise of Ceylon. The pamphlet, as a whole, seems to lack a sufficient *raison d'être*, though the articles, considered separately, fully justify their existence. This, however, is a result attributable mainly to the absence, in Madras, of any Society devoted to Natural History whose Journal would have supplied a more appropriate medium of publication. Failing this vehicle, Mr. Thurston had been obliged to send forth his notes in their present form, and all who have read his previous writings will not be surprised to find that the result is an admixture of very readable narrative with valuable scientific record. The work is illustrated by several photographs, plans and woodcuts, and the printing of the numerous scientific names seems to be creditably free from inaccuracies. The Tuticorin pearl-fishery, to an account of which the first paper is devoted, commenced on the 25th February 1889 and, as is well-known, proved a comparative failure. Want of boats and divers and the existence of the oysters in deep water and at a great distance from the shore were the chief causes of this result, the men naturally preferring to take their labour to the rival Ceylon fishery, where the oyster bank was in only half the depth of water and was situated five miles from shore instead of ten. On leaving Tuticorin Mr. Thurston proceeded to visit this Ceylon fishery, which was carried on at a locality known as Dutch Bay, but the day after he arrived the camp was broken up, owing to the outbreak of cholera. Later in the year 1889 he accompanied Captain Donnan, the Inspector of Ceylon Pearl Banks, on his annual cruise of inspection, and gives an interesting account of his experiences. The condition of the banks is ascertained by means of divers, and in order to ensure a thorough examination the same plan is adopted as is followed by searchers for lapswings' eggs in England, viz., the divers work in a circle from a fixed centre, the distances being marked out by buoys. The oysters brought up are washed and valued by experts. After the inspection of the Mutuwartu bank it was estimated that there were 30 million oysters, worth five lakhs of rupees in revenue within an area of about 31 square miles. These oysters were of not less than five years growth, which was shown by the readiness with which they came away from the rock and were, therefore, ready to be fished; indeed, it would be little use valuing younger oysters, for so many are the foes to which they are exposed that the most promising banks

often completely disappear. On the various moot points connected with the history of the pearl oyster Mr. Thurston is able to give some valuable information. Referring to the theory which attributes the occurrence of pearls to the presence of parasitic worms in the oyster, he states that out of many hundred oysters which he examined in a few only were these worms present. He mentions that the attempts made in Ceylon to artificially cultivate the pearl-oyster have failed, but as to the causes which produced this result or which so frequently prevent the young oyster from attaining maturity, he has no certain conclusion to offer. "The life of the pearl-oyster," he observes, "must be a struggle not only during the time at which it leads a wandering existence on the surface and is at the mercy of pelagic organisms, but even after it has settled down on the bottom, where it is liable to be eaten up by fishes, holothurians, molluscs etc., or washed away from its moorings by currents; and comparatively few out of a large fall of 'spat' on a bank can reach maturity even under the most favourable conditions. Not, in fact, till a bank is thickly covered with oysters two years' old can any hope be held out that it will eventually yield a fishery."

The paper of most scientific importance included in Mr. Thurston's brochure is undoubtedly that entitled "Fauna of the Gulf of Manaar." The region thus designated is the gulf, or bay dividing the extreme south of the Indian Peninsula from Ceylon and continued eastward, after passing Adam's Bridge, by Palk Strait. Lists are given of the sponges, corals, echinoderms, crustacea, molluscs, etc., collected by Mr. Thurston, and among them is enumerated a considerable number hitherto unknown to science. As might be expected the fauna greatly resembles that of the neighbouring island of Ceylon, but in a large number of cases species which had previously been recorded from widely different regions were discovered, and their geographical range thus greatly extended. It does not appear that Mr. Thurston has been lucky enough to make any "find" of economic interest. None, he says, of the 31 sponges collected in the Gulf of Manaar are of any commercial value, and though he picked up several fragments of the red coral of commerce on the Pamban beach he seems to doubt whether they were not accidental occurrences. Among the stony corals collected he mentions one (*Heteropsammia cochlea*) in which a certain worm is always found living; the advantage which either animal derives from this association is unknown, but, as Mr. Thurston observes, some must exist, for a coral is never found without a goorm. A similar parasite occurred in one of the *Gorwinæ*, the stems of which were marked by diseased excrescences, or galls, inhabited by a Cirriped crustacean. These excrescences were perforated by an orifice, through which currents of water necessary for the respiration of the crustacean were admitted, the stream passing constantly in the same direction. Among the fishes the most characteristic feature of the fauna was the prevalence of the so-called coral fishes, being for the most part brightly coloured species which live over the coral reefs and feed either on the small delicate marine invertebrates which swarm on the living corals, or, if their teeth are adapted for the purpose, on the soft parts of molluscs, which they extract by gnawing or boring holes in the shell.

We have not space to follow Mr. Thurston's interesting description of the wealth of animal life to be found in the waves of these tropical waters, the Medusæ sometimes present in such numbers that the net became instantly filled with a thick jelly, the crustaceans rendering the surface of the water milky, the extensive banks of Alcyonians "of the luxuriant growth and size of which only a very feeble idea is obtained from specimens in Museums." Nor can we refer in detail to the very full account of Ramesvaram Island which is contained in another article. The paper on the chank fishery of Tuticorin tells us that about 200,000 of these shells, realising some R16,000 are unusually fished near the port of Tuticorin. The shells are sold by auctions and are used for various purposes, such as offering libations and as musical instruments

in temples, as armlets, bracelets, and other ornaments. A right-handed chank, *i.e.* one which has its spiral opening to the right, is much prized. Such a shell is said to have sometimes fetched a lakh of rupees, and in sober fact one is stated to have been sold in 1887 for R700. Dr. Thurston's note on the pearls derived from the *Mytilus* and *Placuna* does not suggest the probability of the trade in these molluscs ever rivalling the fisheries of the Indian pearl oyster—(*Avicula fucata*), but it gives some curious information on the present condition of the industry. Indeed, the whole of the pamphlet is full of interesting matter, and it can be recommended to all who want to know something of South Indian pearl-fishing, or of the marine fauna of the Presidency.—*M. Mail*, May 2nd.

THE CINNAMON INDUSTRY.

Kadirana, May 21st.

The rise in the price in the cinnamon at the London sales of the 19th instant, as telegraphed by Reuter, though only $\frac{1}{2}$ d to 1d per lb and that on the lower sorts, is so far good news, and points I hope to a further rise at the August sales; for by then the [effects of the partial stoppage of the exportation of chips should begin to be felt. Cutting for the new season has commenced on most estates; and now perhaps will arise the temptation to some—I hope there are none, who consented not to scrape chips,—to try and evade the agreement. As a rule two-thirds to three-fourths of the crop for the year is secured during the Maha Mosama, that is between May and November, and the pruning and preparation of chips finished by the end of December. Very little pruning is done before August, so that but a small quantity of chips of the new season will be exported before then. If therefore between August and next February there is a marked diminution in the quantity exported, as compared with the same months last year, it will be a proof that the agreement is being honourably carried out; if on the other hand there is no very sensible difference it will be as strong a proof the other way. I still believe that with very few exceptions those who signed the agreement intend faithfully to abide by it.

The rainfall in this district up to this morning is only 1.42 on seven days. All this has been from the north east, but this evening a heavy squall came from the south; and for the first time this year I notice the clouds southing from the west. There are ominous mutterings and growlings in the direction of the hills, so I suppose there will be a battle soon and the south-west enter on possession for six months. It seems a strange time for trees to blossom, but I notice many forest trees in bloom, and some in young foliage; conspicuous amongst those in bloom is the "milla" which is quite a pretty sight. The cinnamon bushes are out in "bud" which may interfere with peeling a little later on. 22nd 0.58 of rain last evening.

PAPER-LINING FOR TEA-BOXES.

Some time ago we gave a good deal of information about a specially prepared paper to supersede tea-lead for chests—being of course much lighter and cheaper. This was brought under our notice by Mr. Maitland-Kirwan who in fact, first introduced the paper into the East. Before he left this gentleman sent us a full chest of tea packed in his paper to send home to our agents, in order to test the suitability of the new packing. This mail brings us the London report on the same. Mr. John Haddon who, of course, knows nothing

of Mr. Maitland-Kirwan or the object he has in view, writes :—

"The tea appeared to arrive in perfect condition. I have put up the oiled paper in a parcel to be returned to you that you may see how little discoloured it is. We could not guarantee any information on the condition of the tea in any corner or side of the case, as it was probably turned out at the Customs to get the tare. Anyhow the tea was perfectly dry and seemed uniformly in good condition."

This is as satisfactory as could be desired: the tea was a pekoe-souchong from Elkaduwa. Mr. Maitland-Kirwan should now make known the prices, &c.

FIRE EXTINGUISHER.

(Taken from "Chambers's Journal," March 1st, 1887.)

20 lb common salt, 10 lb. crude salomoniac; mix in 7 gallons water; fill into bottles and cork and hang up in a convenient place. In case of a fire smash the bottles over the fire when it will put it out at once. Strong salt and water will answer if salomoniac cannot be got.—Please put this in for the information of others.—Cor.

THE CONSUMPTION OF PEPPER.

It is an unmistakable fact that the demand for White Pepper, more particularly when ground, is rapidly increasing in this country, for the Ground Black Pepper caster is, unfortunately, now rarely or ever to be seen on the table in private households, hotels, or restaurants. Indeed, Ground Black Pepper is little used—otherwise than occasionally in cooking, and the chief demand for it is for manufacturing purposes. Possibly the discontinuance of the use of Ground Black Pepper may, to some extent, be due to the better colour and appearance of White. But to a large degree, the falling-off in the demand for Black Pepper has undoubtedly been caused by the miserably common, husky, and inferior qualities of it offered to the public. These inferior sorts are sold wholesale at extremely low prices, frequently even at much less than whole Black Pepper can be bought at in the open market. The poor quality and wretched appearance of such parcels have, no doubt, caused the consumer to almost discontinue the use of Black Pepper as a condiment. That this should be the case is very much to be regretted, for the pungency and flavour of the finest qualities of the entire, or Black, Pepper Corn, when ground, are much preferable to the lower qualities of White Pepper, with which the better qualities of Black would have to compete, owing to the present small marginal difference in price. In fact, good Black Pepper is not only lower in price than White, but it is undoubtedly a better commodity as a Spice.—*Produce Markets Review.*

CEYLON TEA IN AMERICA.

We have been favoured with the following information respecting the progress of the business of the Ceylon American Tea Company, Limited, by the local agents of the Company :—

(Extracts from letters from Mr. R. E. Pineo, New York.)
March 1st, 1890.

Our store was opened for business on the 11th ultimo, but our advertising matter was not ready until the 15th, when a portion of it was mailed to residents of this city. The fittings of the store and the two natives attract considerable attention, and many ladies come in to satisfy their curiosity who before their departure, generally buy some tea. We have arrangements perfected for giving all a cup of tea, and ladies can sit down and drink it and have a chat with us at their ease. The chairs and tables are made of natural bamboo, the walls are covered with draperies and photographs, while on the floor there are skins, rugs etc. with arca and other palms and ferns placed about. The partition in the rear, dividing the room

represents the front of a Bungalow in front of which are four Electric Lights of sixteen candle power each. The fitting up is unique and original and the general finish is much admired. The store when lighted presents a pretty picture. Ladies invariably ask for our best tea and many will take no other. The question as to price does not appear uppermost in their minds and two dollars would be as readily given as a dollar and a quarter. The first week's sales were in proportion, as follows :—

Orange Pekoe at \$ 1.25 "Bud"	66 2-3rd	} = 100
Pekoe at \$.90 "Tiffin"	20 5-6th	
Pekoe Sou. at \$.65 "Bungalow"	12 1/2	

"The Indian Association of London is opening a store on 23rd Street and its price for Orange Pekoe is \$1.25 per lb. Mr. Davidson sells his 'Sirocco' tea up to a dollar a pound. I am of opinion that the ladies in the city will use our best tea and that our other grades will be sought for by people in the country. At this early stage it is not easy to judge what need of success awaits our efforts, but it is generally acknowledged that we are moving in a direction that ought to give the best results."

"It is unfortunate that we do not, in view of your limited capital, see clearly how my visit to the Pacific Coast can, as it ought to be, be followed by action on the part of the Company. Several firms and individuals at different points, desire to become the Company's Agents, but they all want certain guarantees, consignments etc, or demand salaries. We think you may cease for a time sending pekoe souchongs, when more is needed a cablegram can be despatched to that effect. So far we have felt it advisable to postpone entering into contract for advertising and beyond our sending out 'personal' 'tea secrets' and 'you may as well begin right', our only contract is with the *Century* a copy of which paper goes forward to you by this mail. This notice appearing in the *Century* would usually cost \$250 but our rate is \$187.50 per month and we go in for two months certain. If we find it pay we may continue to advertise in the *Century* not otherwise."

(Extract from New York letter dated April 4th.)

SAMPLES.—About 100 lb. of pekoe tea has been sent out in response to nearly one thousand applications. In addition to cost of tea two cents postage on each packet was paid.

TEA SECRETS.—The number of these little booklets sent out up to the present is about 6,000.

SALES.—Up to 1st instant we sold, to about one hundred and ninety people, two hundred and thirty three packages of tea, and we believe nearly all liked it and we hope that all will prove steady customers. We have also made sales in original packages and we are striving to attract the trade to our goods, but, for some time to come, or until the consumer demands it of his grocers, we cannot look for much support from the trade.

DRUGGIST HOUSES.—One of the largest wholesale Druggist Houses in this country is considering whether or no it will handle, on a scale commensurate with the magnitude of its business, our packet teas, but a decision is not likely to be reached for some weeks to come.

MR. STANTON OF THE FIRM OF—Messrs. Gow, Wilson & Stanton. This gentleman paid our place of business two visits, tasted our teas, and manifested considerable interest in the undertaking. He appeared pleased with the general arrangement of our store, and believes we were directing our effort rightly. He also saw Mr. Farr.

(Extracts from letters &c. from Messrs. Watson & Farr, New York.)

April 11th, 1890.

We have not yet made any effort to place shares as we have been waiting for the prospectuses and articles of association, copies of which have been received this morning, we also thought it best to get the shop well under way before doing anything

Mr. Pinco keeps a separate account of all cash receipts, and sends us weekly statement. The books of the company are written up daily and are well kept by him. The demand for the tea is showing decided signs of increase, and we hope before the year is out, to have a good paying trade established in the shop. While the sales are still comparatively small there is every reason to be encouraged by the increasing interest which is being taken. All shipments of tea up to that per "Glenorchy" have been received in good order, and delivered to Mr. Pinco.

Messrs. Watton & Farr telegraphed on May 6th that there is a fair chance of selling a large block of shares, and they asked for the firm offer of 3,500 till the end of the year. To this an answer was sent in the affirmative, and it is hoped that it will result in a large accession of shareholders and capital.

The Company's pretty "booklets for the American people" to which we referred the other day are most daintily got up: here are the contents of one of them:—

"TEA SECRETS."

American coffee is probably better than coffee anywhere else in the world *on the average*.

Tea is worse, for two reasons: first, your tea is not tea; and, second, you make it wrong.

The two secrets are: the tea itself, and how to steep it.

There is a third: good tea is in no way difficult in the brewing or uncertain in the result—you can always be sure of it—nor extravagant.

It is also easy—you can depend on it. All you have to do is to get the right tea and make it right and here is all the information you need for both.

Your money can go as far in \$1.25 tea as in 50-cent tea; that is, good tea can be cheap.

THE TEA.

Good Tea does not come from China or Japan; the good teas of those countries do not come here.

Good tea is grown in Ceylon by British planters. The strongest comes from India. India mixed with Ceylon is finer than India. Ceylon alone has the finest flavor.

India and Ceylon excel China and Japan so much that they have driven half those teas from the English market.

One pound of Ceylon or India goes as far as two or three of Japan or China; and every pound of British tea displaces two or three of the native products.

The American tea-trade favors Japan and China because its connections are there.

The tea industry in India is modern; in Ceylon it is new. But the adaptation of soil and climate to tea is so good in Ceylon that that island, half as large as the State of New York, already grows nearly half enough to supply the United States.

But, so long as the American people will drink Japan and China teas, so long will those teas come; for the trade is profitable.

Ceylon is the tea then.

THE MAKING.

Make it at table. (The American notion is that making tea at table is an English notion. It isn't a notion; but that is another subject.)

Heat the pot.

Pour boiling water into the pot already hot: fresh boiling water, water that has just come to the boiling point and has not been boiling so long as a minute; pour in as much as you want.

Immediately put the tea in on top of the water and, in from two to seven minutes, pour into the cups or into another pot. Don't let it stand on the leaves much longer than seven minutes.

Use half or a third as much tea as you are accustomed to using of China or Japan tea.

Now that is exactly right. If it is worth you while to have perfect tea, that is the way to make it. There is no other.

If you are satisfied with tea a little short of perfection, steep it as usual.

We are introducing the perfect tea of Ceylon.

We are the tea-planters themselves. We are interested in your knowing how to infuse our tea to get the perfect result.

The tea-planters of Ceylon are about four-thousand. Every one of them belongs to a local Association affiliated with a central Association. They have formed this Company (undersigned) to trade with the American people.

We have the duty of getting your taste upon our tea. The way to do it is to tell you how to prepare it for the table.

THE CEYLON PLANTERS' AMERICAN
TEA COMPANY, LIMITED.

No. 4 East 22nd Street, next Broadway.

Finally, the following is an extract from the advertisement in *The Century* and a form of order adopted:—

(Extracts from Advertisements and Circular.)

Our tea will be a revelation to you. You will say you never tasted tea before. It costs 65 and 90 cents and \$1.25 a pound; but, you use so little of it, you save a good share of your tea-money—in many a family all the coffee-money.

One of the reasons why Americans drink so much coffee is that your tea is abominable. You get China and Japan teas and steep them to death. Your teas are not good; they are not so bad as they seem; you spoil them with steeping.

We bring you better tea and tell you how to steep it—a primer full of tea-knowledge.

Please send to Mrs.

HORSE-POWER.

With the universal use of the steam engine the term horse-power has come to be very largely used, but, although its employment is so frequent and general, very many people are in doubt or ignorance of what the expression really means. Everyone knows that an engine requires a certain power or force to work it, differing, however, according to the nature of the engine. In order to measure this power it is necessary to adopt a certain standard. This standard goes by the name of horse-power. One horse-power is equal to 75 seconds-kilogramme-metre, that is to say, that in 75 seconds a weight of 1 kilo. can be lifted 1 metre high, or inversely, in 1 second 1 kilo. can be lifted 75 metres high. Take, for example, an engine, whether impelled by steam, gas, or compressed air, of 6 h.-p., according to the above rule such an engine must possess a power to raise in 1 second 6 x 75 kilos.=450 kilos. exactly 1 metre high, or, to put it in another form, a working machine which requires 6 h.-p. to keep it running must be worked by a falling weight of 6 x 75 kilos.=450 kilos., which in 1 second will have fallen exactly 1 metre. If the falling distance per second be greater than 1 metre the weight must be smaller; the motor raises in 1 second 75 kilos. 6 metres high, or 6 kilos. 75 metres or 25 kilos. 18 metres high, or, putting it in the other form, the working machine is driven by a falling weight which in 1 second falls 6 metres and weighs 75 kilos., or falls 18 metres with a weight of 1 kilo. The whole of these performances would represent 6 horse-power. The power of a man is reckoned at 13-18 kilogramme metre, according to the work required. In turning a wheel round six men are considered as equalling 1 h.-p. From this it will be perceived how advantageous is the employment of mechanical power, even when but a moderate force is required.—*Indiarubber and Electrical Trades Journal*,

COFFEE PROSPECTS.

Mr. Anton Hvistendahl in his review dated on February 19th thus summarizes the position of coffee: "Although I have every reason to believe that my estimate of the Brazil crop, 1889-90, will not be realized, I do not see that any good purpose will be served by reducing it. Assuming that 4,500,000 bags be marketed from Brazil during the present season, we have to face, for the year 1890, a minimum deficiency of 1,000,000 bags from Brazil, and 250,000 bags from other countries as compared with 1889. When the prospects of the next Java crop, which is reported to yield only one-third of the quantity harvested last year, or, say a deficiency of fully 500,000 bags are taken into consideration, the outlook as regards supply is gloomy indeed... After a very careful examination of all the circumstances bearing on the case, I have come to the conclusion that an advance of at least 10 per cent in coffee is not only necessary but imminent, and that such advance only will be maintained, but carried further, provided there hereafter should be good reason to assume that the present Brazil crop will not exceed 4,000,000 to 4,250,000 bags.—*Rio News*."

EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

COFFEE—CACAO—TEA.

(From the *Money Market Review*, May 3rd.)

The third ordinary general meeting of this company was held at the offices; 27, Clement's Lane, on Thursday; Mr. C. J. Lindsay Nicholson presiding.

The SECRETARY (Mr. Douglas R. Smith) read the notice convening the meeting and the report was taken as read.

The CHAIRMAN said: Gentlemen, in rising to propose the confirmation of the report of the second year's working of the Eastern Produce and Estates Company, the directors hope you will agree with them that the results show a marked improvement upon last year. The directors have been anxious at times throughout the year as to the results, but they are very glad that in the report now before you they are able to show that the profit for the year has amounted to £18,513 against something like £12,000 last year, and that after providing £11,749 for the payment of the interest on debentures and the preference share dividend there is a balance of £6,761 1s 10d to be carried to reserve fund in terms of the articles of association, so that the reserve fund will now amount to £7,199 15s 8d. The results have been improved by some of the produce doing better than we expected. The prices of tea, as you are all aware have been slightly lower in 1889 than they were in 1888, but as we point out to you, our coffee, which we really had despaired of doing very much in quantity, has during the past year resulted so well that it has, as we state in the report, been a material assistance to the year's profits. If you kindly turn to the balance-sheet now, I will briefly allude to the alterations, such as there are. On the debit side you will find that the estates reserve account, realisations and recoveries, amount to £5,050. That is a small increase, caused by the realisation of certain machinery. The other items on that side I do not think call for any comment. On the credit side you have the amount representing landed and other property acquired at January 1st, 1888, under the agreement sanctioned by the Court of Chancery, dated October 10th, 1887, which still stands at £436,117. The outlay on tea extensions and the acquisition of land has increased to £22,747 11s 3d, and this will probably increase as occasion arises, although not very materially. The balance of the outlay for machinery and buildings is now £4,592 16s 9d. The produce on hand is £27,377 11s 9d, and while on that point I may say that really at the present moment, with the exception of a very small amount, the whole of the produce has been sold. The advances against produce and supplies for estates amount to £14,541, against £9,000 last year. I do not think there is anything else in the accounts that I

have to refer to. As to the cultivation of tea during the year, you will see that the company has now 9,306 acres under cultivation, against 8,600 last year, of which about 4,700 acres are over four years old, against 3,600 last year. The yield of tea in 1889 was not quite up to our estimate, but amounted to 1,108,000 lbs., against 986,000 in the previous year, and the average gross price obtained, including purchased leaf, was 11½d per pound, as compared with 1s in the previous year. We have to ask you to join with us in thanking our representatives in Ceylon for the care with which they have brought the tea to market. We have often said that it really depends more on them than on any directions from here, and I think I may say from this side of the table that we have the greatest confidence in our representatives and recognise that they equally with ourselves are endeavouring to bring this company to a successful issue. We have to regret the death of our colleague, Mr. Stewart. If there is anything else I can add to these remarks I shall be very pleased to do so. I will now formally move "That the report of the directors, dated April 16th, 1890, be received and adopted, and that a dividend at the rate of 5 per cent per annum for the year ending 31st December, 1889, on the capital paid up on the preferred shares be declared and made payable, free from income-tax, on the 30th April." Before putting this to you, gentlemen, I shall be very happy, if it is in my power, to reply to any questions you may wish to ask.

Mr. NORMAN W. GRIEVE: I have great pleasure in seconding this resolution. I do not think our chairman has left very much for me to add, but perhaps a few words from me on the subject of the management of the estates might be of interest to the shareholders. The chairman has alluded to the great importance of having a thoroughly good and efficient staff of managers on our estates. As you may be aware, before I took my seat at this board I had the privilege and pleasure of visiting all the company's properties, and carefully reporting to the board upon them. I am, therefore able to testify to the thoroughly efficient men that we have in charge of our estates. I have had experiences in other companies besides this, and I can safely say that our men bear very favourable comparison with those of any other company in Ceylon and that I consider to be a very great advantage to us. We are also, as time goes on, building up a valuable agency business in Colombo, which we hope in course of time will be of great assistance in increasing the profits of this company. In seconding this resolution it is therefore a satisfaction to me to be able to assure you that we are doing all in our power to bring the affairs of this company to a successful issue.

Mr. C. LAWRIE said he observed that a company had been formed to search for gems in Ceylon. He would like to know whether there was any chance of any being found on this company's property. It struck him as rather an anomaly that they should have such a large balance at the bankers and have such a small amount of preference shares. With regard to the cultivation of coffee it seemed that it had nearly been given up altogether on account of the green bug, and he would like to know if anything could be done to remedy this state of matters, and again increase the cultivation of coffee, as it seemed to pay so well now. He understood that a machine had been invented to destroy the green bug.

Mr. LOWE asked what the advances against produce and supplies for estates consisted of.

The CHAIRMAN, in reply, said the directors had received information from Mr. Starey, their representative, who was at present in this country for a short holiday, to the effect that none of the Company's land was in the gem-bearing districts. They had received various offers for land, but up to the present nobody had distinctly applied for land with the idea of gem mining there; indeed, most of their land was more suited for tea than for producing gems. With reference to Mr. Lawrie's other inquiry as to the balance at the bank and why they did not pay off the preference shares, the hon. proprietor might not remember that they were bound to keep those preference

shares as they formed the qualification they were compelled under the articles of association to take. They had not issued any others, indeed they had only this small amount which really was held by the directors. If they could find out how to cure the green bug, he thought they would all consider that there was a new future for the remaining coffee in Ceylon. One of the directors was at Ceylon now, and he was very much interested in the machine that the hon. proprietor had alluded to. They were always on the alert to do anything they possibly could to destroy pests. The land was now so much under tea cultivation that it would be very difficult to reconvert it into coffee, and the opinion of those who knew Ceylon well was that coffee would be a thing of the past in a very few years. As to the advances against produce and supplies from estates, it was a very profitable one, and when they merely advanced on crops, and not on block, they thought they were doing the best thing; indeed, they hoped in the future to do very well in that branch of the business.

The resolution was then put and carried unanimously.

Mr. DAVID REID proposed the re-election of Mr. C. J. Lindsay Nicholson as a director. It required no words of his to commend the resolution to the notice of the shareholders, and he was quite sure it would meet with general acceptance.

Mr. WELTON seconded the motion, which was cordially adopted.

The CHAIRMAN returned thanks, and moved the re-election of Mr. Ralph A. Cameron, the managing director, to whose industry, intelligence, and zeal he specially referred.

Mr. MALCOLM seconded the resolution, which was unanimously agreed to.

Mr. RALPH A. CAMERON said he thoroughly appreciated the cordial assistance and help which his colleagues had afforded him, and they all worked with one object. He believed that the roughest part of the work was done, and that they might now look forward to the successful accomplishment of what they had undertaken.

The auditors, Messrs. Welton, Jones, and Co., were re-elected on the motion of Mr. Wilson, seconded by Mr. Malcolm.

A vote of thanks was accorded to the directors for their able conduct of the company's affairs.

The proceedings then terminated.

PROCESS OF REMOVING INSECTS FROM PLANTS.—A novel process, by Edwin P. Fowler, of National City, California, consists in dislodging the vermin and mealy-bug by means of a sandblast, which destroy yearly entire groves of Lemon and Orange trees in Florida, South California, and other tropical States. In carrying out the invention, a fan blower of any suitable construction, or any other apparatus capable of creating an artificial current of air, is employed. The artificial current of air thus created is directed against the tree or other plant, and in its transit from the fan blower to the plant, the current of air is charged with sand. Of course the force of the artificial air current must be carefully gauged, so that the sand which is projected by the same against the trees or plants will not destroy the plants together with the vermin or scale, and the sand must be sifted, so that no coarse particles or stones remain mixed with it. If the force of the air current is properly limited, according to the nature of the plants under treatment, the scale or vermin can be removed without injuring the trees or plants. In some cases it is desirable that the artificial current of air shall be heated, and for this purpose there is combined with the fan blower or other apparatus a suitable heater. It may also be desirable in certain contingencies that the sand which is used for charging the artificial air current shall be hot, and for the purpose of heating the sand before introducing it into the air current, any suitable heating apparatus may be used.—*British Mail*.

THE PROGRESS of the Gold-mining Industry in South Africa is very satisfactory, all things considered, as the following table of raw exports shows:—

First three months.	Cape Colony.	Natal.	Total.
	£	£	£
1890	309,510	116,438	425,948
1889	159,738	132,614	292,352
1888	86,820	81,429	168,249

Instead of the mining market being depressed it ought to be cheerful, but things often go contrary on the Stock Exchange. It is clear by the increased exports *via* Cape Colony that the Witwatersrand mines are eclipsing the De Kaap fields.—*O. Mail*, April 25th.

WEST AUSTRALIA has experienced many vicissitudes in connection with the reputed gold-fields there, Yilgarn and others. A fresh spurt will be given to gold-prospecting by the publication of the annexed telegram which appears in the *Western Mail* of the 12th April:—Ashburton, April 10th.—Wilson, Ford and Pat Bresnahan say they have got one thousand ounces of gold two hundred miles from here, fifteen miles from the river. My informant saw the gold, but had no means of weighing it. There is no doubt the find is a big one. Wilson who is a practical man, says it is the richest he has ever seen. The gold found consists of nuggets and coarse gold.—*Singapore Free Press*.

THE STOTT INSECTICIDE DISTRIBUTOR was to be seen in action in the Royal Horticultural Society's Gardens at Chiswick during the Daffodil Conference. The distributor consists of a metal cylinder, which is divided into several cells by means of perforated partitions. Into these cells the manure or insecticide, in solid or liquid form, is inserted. At each end of the machine is a length of tubing, one end being attached to the water-tap or garden-pump, and the other to an ordinary hose-pipe, and the water being forced through, becomes impregnated with the composition in the cells. The strength of the solution is regulated by the filling of one or more cells of the apparatus. A special form of spreader is fitted to the hose, which ensures a perfect spray. The apparatus is likely to prove of much service, and cannot well get out of order. An insecticide, "Killmright," supplied for use in the machine, is of a soapy consistency. The spray can be used for the destruction of such pests as green-fly, thrips black-fly, &c.—*Gardeners' Chronicle*.

CINNAMON AND COCONUTS.—Veyangoda, June 1st.—Some Estates have commenced peeling Cinnamon for the *Maha Mosama* or big crop, while others will commence harvesting shortly. With the rains we had last year, and are having this year, the hushes are in bud all the year through. Speaking for myself, a month of dry weather is preferable to the continuous wet we are having, for the soil is sodden and will be all the better for a bit of drying and aeration. From all I hear, some of those who declared on honour that they would cease scraping Chips seem to value their honour less than rupees. We lately heard that Chips were scraped on an Estate south of Colombo. I now hear that a proprietor of an Estate north of Colombo pocketed his "honour" with the rupees the Chips he is scraping is giving him. He too, when remonstrated with, will doubtless say that he will give orders to stop scraping. Be up and doing, Mr. Jardine, or the good work you have done will be undone by an unscrupulous few. In spite of this being the season when our largest Coconut crops are gathered, prices are keeping up. The Manager of the Desiccating Mills is the largest local buyer. Besides the 24- or 25,000 nnts he must be consuming weekly at his Factory, our Railway store is largely occupied with the Coconuts he is forwarding to Colombo for shipment to Europe. We have heard nothing definite of the Coconut Butter manufactory that was stated to have been started in Colombo. I hope the Superintendent of the School of Agriculture has not ceased his investigations into the Coconut leaf disease. The subject is worthy of his attention. His latest contribution on the subject is nothing more than an admirable essay on the general principles of agricultural science. He has not thrown one spark of light on the subject of his Report.—*Cor*; Local "Eaminer."

CEYLON TEA PLANTATIONS COMPANY
LIMITED.

The ordinary general meeting of this Company was held at the offices, 21, Mincing-lane, E. C., on Tuesday; Mr. David Reid (the Chairman) presiding.

The SECRETARY (Sir W. Johnston, Bart.) read the notice convening the meeting, and the directors' report was taken as read.

The CHAIRMAN said: Gentlemen, it is again my pleasing duty to render to the shareholders an account of our stewardship, and in doing so, I can sincerely congratulate you on the present position of the Company. In three years we have paid 45 per cent in dividends, have begun a reserve fund, and have reduced the capital cost per acre of our estates by 15 per cent, without lowering the intrinsic average value per acre of our property. On meeting the shareholders I have endeavoured, on every occasion, to make a clear and simple statement of the property we have, and what it has cost us, and to give you a short history of the year's operations, showing the main features of our policy. On this occasion I will follow the same course in as few words as possible. By referring to the creditor side of the balance-sheet you will see that our property has cost us, in round figures, as at 31st Dec. last, £135,000; and by referring to the statement of acreages, you will find we have 3,726 acres of planted land and 2,720 acres of unplanted land. Our planted land originally cost us £40 an acre. I have already told you that we have reduced that by 15 per cent, viz., £6 per acre, leaving the value as at 31st Dec. last at £34 per acre for our planted land and £4 per acre for unplanted land. In addition to this we have a tea manufacturing business of over 1,000,000 lb. a year, a commission and agency business which is profitable, and a small reserve fund of £3,000. You will see from this that our position is considerably improved from last year. (Applause.) The future of the company must always be a matter of anxious care to the shareholders, and the rapid expansion of the company has no doubt arrested your attention. Of course each step in the direction of new purchases has been taken with the special sanction of the shareholders, but the directors feel a great responsibility in a matter of that kind, since the duty falls to them of marking out the general line of policy, and recommending it to your acceptance. I feel confident that in all we have done we have acted with caution, and I hope with sound judgment. You have only to look at the statement of acreages to see the drift of our policy. It may be summed up in this, that we believe in good land and high elevation. An issue of preference stock is about to be made, and, as this is an important step, it is fitting that I should say a word on the subject. The original promoters provided in the articles for the issue of preference stock, because they believed a time would soon come when we should be unwilling to issue our ordinary stock at par, and that it would be desirable to bring in a class of shareholders who look mainly to the security which a preference stock gives them. We have made the preference holders very secure, for if the company issued preference stock up to the full extent of its powers, we should only have to earn 2½ per cent on our total capital to pay their interest, and our estates would require to possess a value of less than £12 an acre to secure them. Our new purchases are made on the assumption that they will give as good a return as the old ones. If this expectation is realised, and if we continue to make the profits we have hitherto earned, or even something less, it is clear that, without diminishing our dividend-paying power, we could place to reserve the difference between the preference interest and the profit actually earned by the capital so raised; and I think this policy should be pursued until a sufficiently large reserve fund is accumulated. That is to say, if we issued the total amount of our capital to acquire more property, and earned 15 per cent on the whole as at present, we should have £8,000 a year to carry to reserve, and thus strengthen the position of the company. Since the resolutions relative to the issue of preference

shares were agreed to by the shareholders, the directors have had several proposals for increasing the capital of the company under consideration, and they decided to allow the resolutions to lapse. At an early date the form in which the directors propose to deal with the issue of preference shares will be laid before the shareholders for their sanction. Our report has informed you of our appointment of Mr. Rutherford as the managing director of this company. The large expansion of the company's business rendered it essential that we should have a salaried officer with experience of Ceylon business, a knowledge of the value of Ceylon property, and the cost of work in Ceylon, always in attendance on the company's business. I am well satisfied that the shareholders have got the right man in the right place. (Applause.) The important post of manager in Ceylon has been entrusted to Mr. Talbot, who is a large shareholder in the company, and whose high character and ability are well known. It is therefore unnecessary for me to say more than inform the shareholders that I am well assured our interests are in safe hands. Our Ceylon staff continue to give the directors great satisfaction, and this year we have inaugurated a system of leave-rules on a scale which compared with other companies, is liberal, although I do not think it is too much so. Sick leave is also provided for. The estimates for 1890 are on the table, and are satisfactory, indicating quite as good prospects for 1890 as those obtained in 1889, but it has been my practice to deal only with achieved results, and to allow each shareholder to make a forecast for himself. The result will depend greatly on the price of tea and silver, and there are many here more competent than myself to form an opinion on these abstruse subjects. I may mention to the shareholders that it is the intention of the directors in future to pay only one interim dividend, probably in November, and the final dividend in May. I have now much pleasure in moving the adoption of the report and balance-sheet, and that a final dividend of 5 per cent. be declared payable forthwith. (Applause.)

Mr. HENRY TOD seconded the resolution.

Mr. H. K. RUTHERFORD: Gentlemen, the chairman has so fully entered into the various important points affecting the company's operations for the past year that there is little I can add that would further enlighten the shareholders as to our position. It might, however, be interesting to shareholders to learn that all the reports we have received from our manager in Ceylon, and from independent sources, assure us that our estates are being thoroughly well cultivated and the manufacture of our teas are receiving full and careful attention from our superintendents. It is satisfactory for me to be able to state that our low country properties, which have fields of tea eleven years old, are in good heart and bearing well, and that the historical 100 acres of that magnificent property, Mariawatte, still continue to yield 1,000 lbs. per acre. As regards cost of production, notwithstanding we charge the cost of cultivation of all young tea not in bearing to the expenditure, the Ceylon manager has been able to lay down the company's crop in London at the low figure of 6½d. per lb. and this we consider a very satisfactory performance. As to the new purchases, many gentlemen, who are shareholders, know these estates, and will bear me out when I say that from the suitability of their position as regards a favourable climate, from the general excellence of the soil, the water power available, and the advantages of road and rail communications, these properties cannot fail to prove in a very few years most valuable additions to the company's list of first-class estates. Before resuming my seat, I would desire to say a few words on behalf of our Ceylon staff, whose aid in a large measure has contributed to the satisfactory results of the year's working. Those who have been on Ceylon and Indian tea gardens know that the work of a tea planter, if conscientiously carried out, is no sinecure. He has a real responsibility and real hard work, and in many cases not over well paid. As your chairman has told you, this company has framed furlough and sick leave rules for their officers, and you are aware they have

extra to their salaries a commission on the net profits of the estate which they work, and that both superintendents and their assistants have been made shareholders in the company on easy terms. I trust, if times continue good, we may see our way to further better their position. By such like consideration for those who bear the burden and the heat of the day, we are only giving them what their valuable services entitle them to, and I am sure the confidence and reliance we have in our Ceylon staff, if we treat them well in the days of our prosperity, will not be misplaced should hard times ever fall upon us. (Applause.)

The resolution was then put and carried unanimously.

Mr. J. L. SHAND proposed the re-election of Mr. David Reid (the chairman) as a director of the company. Mr. Reid, he said, had been the great motive power of the company from its inception, and in its present successful position he did not think they could very well do without his services. He was very glad to hear the remarks that fell from the chairman and Mr. Rutherford about the improved position of the servants of the company. He had served in Ceylon himself for a good many years, and he knew that the way to secure good service was by being liberal masters.

Mr. DONALD MACKAY seconded the resolution, which was agreed to *nem. con.*

The CHAIRMAN, in returning thanks, said he gave a good deal of thought to the affairs of the company and it had always been a great pride and pleasure to be connected with it. He hoped that during his present term of office he would have as much pleasure in serving the company, and that its prosperity would be as great as it had been in the past. (Applause.)

Mr. G. W. PAINE moved that the remuneration of the directors for the current year be £500, coupled with a vote of thanks for the great care they had bestowed on the affairs of the company.

Mr. G. T. WHITE seconded the motion, which was cordially adopted.

Mr. DAVID REID acknowledged the compliment.

The auditor, Mr. R. H. Miller, (of Messrs. Harper Brothers), was re-appointed on the motion of Mr. E. PRITCHARD, seconded by Mr. W. S. P. MONCRIEFF.

A vote of thanks to the chairman (proposed by Mr. L. F. DAVIES, and seconded by Mr. G. T. WHITE) terminated the proceedings.—*Money Market Review*, May 3rd.

TEA AND CACAO NORTH OF KANDY.

Tea in the Knuckles has been doing very well. We have no cause to complain. I guess we will collar what we were behind last year and clap it into our estimate for this.

Heard that Mr. R. Boustead got an offer of £6,000 for "Maria": but would not take it—so much for cacao property. Don't know if it is true, but that is what I was told.—*Cor.*

TEA PLANTING NOTES FROM INDIA.—Sonari, May 11th:—But little is doing in the way of leaf. There is a touch of red spider here and there, but nothing to speak of. On the 6th, we were visited by a hurricane, and on one garden the tea-house was partly unroofed. Darjeeling, May 18th:—Have had some good rain within the last week, with a great change in temperature it having gone as low as 56° whereas last week it was 81°. Snow very low down the hills for the time of year. Rainfall to date:—7'69" 1890; 12'50" 1889. Mangaldai, May 13th:—Influenza has reached this, and many coolies are down with it; but now the excessive heat has given place to genial rain perhaps it may abate; let us hope so. From the apparent apathy of the Public Works Department, one would think that they had been down with Lagrippe for the last six months, as their portions of the road are still untouched, possibly waiting for the rains.—*Indian Planters' Gazette*, May 20th.

COCONUTS AND COTTON: HAPITIGAM KORALE, May 19th.—For the first sixteen days of May we had only one shower of '10 of an inch, but on the morning of the 17th thunder was heard to grumble in the distance, and in the course of the day and night '31 fell. On the 18th the clouds cleared off, and it appeared as if there was to be no more immediately, but at three this morning, it opened afresh, and deposited 1'83 inch in three hours, and it looks like more, so I think I may safely write, that the big monsoon has fairly set in here. There is nothing new to report about the one product of the district, but the price of copra is somewhat unsteady, and will probably fall considerably when the largest gathering of the year (now nearly due) comes forward.—I hear of no experiments in *cotton* in the district, but one by the stationmaster of Mirigama, and I am conducting another, with less success than I desire hitherto. The climate is too uncertain to get the plants satisfactorily established, and they suffer awfully from a variety of insects, that roll up and destroy the leaves, and bore into the pods. Great sickness in this neighbourhood and labour scarce.

THE CEYLON COMMISSIONER FOR RUSSIA.—Mr. Rogivne left Ceylon homeward-bound by the "Kaiser Wilhelm II" on Monday the 12th instant. So far the Association has voted him £100 for his expense, and £30 to be laid out in tea samples to be purchased in London after consultation with Mr. Martin Leake and others. Mr. Rogivne will travel via Genoa to London, and when in London will collect all the information possible regarding the Russian tea trade, the amount of Ceylon tea shipped for London thither, and its characteristics, so as to supply himself with samples only of such teas as may be most acceptable to Russian tastes. Leaving London thus fully equipped he will proceed direct to Moscow, which is the commercial capital of Russia, where Mr. Rogivne will interview all the buyers and importers, and, if a fair measure of success attends his efforts to push our teas upon their attention, he will probably go on to Odessa, Riga, and other centres. One thing is necessary—Mr. Rogivne should be furnished with a complete set of photographs shewing the process of tea manufacture in all its stages. These would prove of some help to him in his work, and would doubtless attract some attention from tea merchants. Mr. Rogivne is going on a mission of great importance to the colony, and we have no doubt the Tea Fund will treat him liberally, should a fair measure of success attend his efforts.—*Local "Times."*

TREES FOR STREET PLANTING.—Mr. William Holmes, of the Frampton Park Nurseries, Hackney, who has had considerable experience of planting in different parts of London, expresses the opinion that Planes and Poplars are much the best suited for street planting in cities and towns. He particularly recommends *Populus canadensis nova*, or Rumsey's Egyptian Poplar, as more likely to enable the planter to surmount the many difficulties experienced in the successful culture of trees in streets than any other. He has witnessed many illustrations of the fact, that this form of the Poplar will live and grow for years in positions where Planes will scarcely last for a season. The space in front of the London Hospital at Whitechapel affords an illustration in point. Planes were planted and died; they were renewed, and again died; when Mr. Holmes suggested the employment of this Poplar, and several were planted, with the satisfactory result that they have now stood for six and eight years, making a really splendid growth. Again at Silvertown where some reclaimed land had been filled up to a depth of from 12 to 14 feet with London clay and soil, vitiated by an atmosphere charge with impurities from the many chemical and other works in the immediate neighbourhood, Mr. Holmes had an opportunity of experimenting with trees, and he found that Poplars and *Ailanthus glandulosus* would alone endure; most of the others died the first season and the remainder, with very few exceptions, the second year. This is a valuable testimony, well worth the attention of planters.—*Gardeners' Chronicle.*

THE GOVERNMENT TEA GARDENS IN THE ANDAMAN ISLANDS.

By way of providing their Indian convicts at Port Blair with some employment which should prove profitable, and thereby lessen the annual expenses of the settlement, the Government of India has put down about 460 acres of tea in two estates, called respectively "Navy Bay" and "Goplakabang." The produce of these estates supplies all the requirements of the troops in Burmah—and from time to time the surplus has been sold locally, or put upon the market in Rangoon, where it appears to be rather a favourite article, selling from four and a half to twelve annas a pound. The amount of the Commissariat requisition in 1889 was 45,000 lb., and has this year risen to 72,000 which it is estimated can easily be supplied by the two gardens above-mentioned. It is not necessary to discuss here the correctness of a policy by which Government interferes directly in the markets for any produce, suffice it to say that cheap Andaman convict grown tea constitutes an important factor in the Rangoon tea market.

NAVY BAY.

This tea garden is by far the larger of the two clearings at Port Blair. The first clearing was opened in 1876—and during the succeeding 6 years the acreage had risen to 152—whilst another 150 acres was opened between that date and 1887—say 302 in all. The lower boundary is the shore of the harbour—some six miles down, and it rises to about 200 feet above sea level. The lay of the land is undulating with a very small proportion that could be termed steep. The soil over the larger area of the garden is very fair as a tea soil; deep and friable—with considerable mixture of decayed cabook and fragments of quartz. Over a small extent the soil is very poor—with a large admixture of sharply broken, angular fragments of a kind of sandstone, to be seen occasionally in the patanas of Ceylon and on the poorer knolls in Avisawella district.

With an annual rainfall of 174 inches (registered in 1889-90) and within 11 degrees of the equator—the climate is admirably adapted for tea cultivation, though unfortunately "Navy Bay" is a good deal exposed to the winds which coming from the ocean almost unopposed blows very strongly in both monsoon, and this no doubt militates to a serious extent against any very great yield. The system of weeding is the one generally adopted by tea planters in India. There is no attempt at keeping the fields permanently clean, and at times the weeds are allowed to grow nearly as tall as the tea bushes, being cut down by convicts with mamoties—and the bases of the plants being forked and hand-weeded. The bushes are allowed to grow up to three feet or more and do not appear to be kept thinned out so much as in Ceylon. The managers of these estates are both experienced men who have worked in India and no doubt know what they are doing. The convict labour is paid for at the rate of R6 per mensem—no provisions being supplied by the gardens. In the opinion of the manager of Navy Bay these convict labourers do as much work as free men would, and indeed more, unless it may be in the plucking. There being no women or boys allowed on the estate, it can easily be understood that plucking by able bodied men—might well fall short of the quantity which would be done by free labour including younger hands.

The Bungalow is a two storied one built—like all the others in Port Blair—after the Burmah plan. The factory is a substantial edifice of brick and tiles.

The roller—worked by hand—is one of the old type of Thompson's Challenge Roller—and though requiring a considerable power to work, it is considered capable of doing very fair work.

The jat is a good Assam Hybrid which appears to flush with more regularity than does similar bushes on the other garden which I shall notice by-and-bye.

The rainy season lasts from May to October, but the island is not subject to lengthened periods of drought such as occur in India and Burmah.

The crop of 1888-89 was something over 53,700 lb. and the estimate for the current year is 60,000 to 61,000 lb. which should pay well as the Rangoon contract is supposed to be between 9 and 10 annas a pound. The climate of Navy Bay is a very healthy one for Europeans though decidedly hot at times.

GOPLAKABANG.

The other estate on the opposite side of the harbour, though several miles from the landing place, is but little above sea level, and is situated between ranges of low hills, rising some 300 to 400 feet. The lay of the land is almost a dead level—with the exception of a recently formed clearing of small extent. Goplakabang comprises 165 acres of tea in bearing—and ten acres of new clearing.

The estate is a good deal cut up by a meandering stream and by belts and patches of bamboos and plantains, the latter being by no means advantageous to the adjacent tea plants as may well be understood in Ceylon from local experience.

The soil without doubt is better than that of the Navy Bay Tea Garden, being more friable and more free from the angular sandstone formation described above. On the slope of the valley, the surface loam is underlaid by a kind of decayed laterite, which should prove specially favourable to the tea bushes, as is indeed already observable in the one year old field, where a large proportion of the young plants already exceed three feet in height, and the whole of them exhibit a growth which I have not observed elsewhere.

The oldest tea in this garden is four and five years old and is planted five feet by five. The best fields are already pretty well covered, though topped rather high, say at three feet, and not having at first received anything like due attention.

As regards outturns of leaf, the yield for 1889 was nearly 23,000 lb. with an estimate for the current year of 28,000 lb. It must not be forgotten, however, that a very considerable proportion of the bearing area, put down at 165 acres—is detrimentally affected by the belts of bamboos &c. surrounding such small fields, and by the absence of practical knowledge of tea cultivation in the first years of its growth.

The practice as regards weeding is the same as that adopted on the Navy Bay estate, which as I have already explained is the same as obtains on most of the Indian gardens, viz. a deep hoeing after pruning and five or six light ones with mamoties followed by forking and hand-weeding immediately around the base of the bushes.

Pruning—as far as one may judge from a casual visit out of the season for that work—is not so severe as on the estates in Ceylon, but the tea being yet young it would be premature to make observations on treatment which may probably be altered as circumstances dictate in the future.

The jat on the older portion of this garden is a good hybrid, and that of the younger clearing pure Assam indigenous, which promises a larger outturn in future years.

The record of rainfall is kept from 1st April to 31st March of each year, the register for 1888-1889 being 175·18 inches, and in 1889-1890 154·18 inches.

With the exception of a small portion which is disposed of locally—or in Rangoon, the produce of these gardens is taken by the Burmah Commissariat Department of Burmah. The machinery at Goplakabang is Jackson's Manual Tea Rolling machine—with a breaker and sifter. The factory is a pukka brick-building with a single roof and built with two wings as recommended by Mr. W. Jackson in his "Notes on Tea Machinery" published by Messrs. J. Walker & Co., of Colombo.

The climate of this garden has not proved so favourable to Europeans as that of Navy Bay. In the hot weather a little fog creeps down the valley during the night and hangs about the garden till the sun comes over the hills, and this fog wherever it occurs appears almost invariably to bring with it malarious fever in some form or other. It is proposed to extend operations on a rather large scale in the neighbourhood of Goplakabang, there being plenty of suitable land adjoining the garden, and the present outturn of the estates being considered satisfactory. The position of the Superintendent of this property is by no means one to be envied. He is the only whiteman on that side the harbour, and his nearest European neighbour lives at a distance of seven miles of road and a mile of salt water. His men are all convicts—not under his control, but that of the prison warden who has charge of them in Government barracks. He—is so to speak—at the mercy of any runaway ruffian who may take it into his head to commit murder.

EDMUND WOODHOUSE.

TRADE IN HIDES AND SKINS.

Among the countries furnishing hides and skins to the United Kingdom, India takes the premier position, and the trade is yearly increasing, as the export of hides from Calcutta has trebled during the last three decades. As a fact, the trade in hides may be said to be monopolised by Bengal, while that in skins belongs to Madras, due to the fact that the total number of horned cattle is greater in the area served by Calcutta than in the area served by the ports of the Madras Presidency; while the tanneries of the latter Presidency have gained a superior reputation in the dressing of skins. Hides and skins for export are collected by the agents of the merchants who are in the trade, from all parts of India, and in the year 1889, the number of hides imported into Calcutta from the inner parts of India for export, amounted to a hundred and twenty lakhs.—*Madras Times*, May 23rd.

THE SOGAMA TEA ADULTERATION CASE.

At Worship-street, yesterday Thomas Paget and Robert Pigott, trading as tea dealers at 36 Middlesex-street, Whitechapel, appeared to summonses under the Merchandise Marks Act charging them with having sold or caused to be sold certain tea to which a false trade description had been applied, contrary to 50 and 51 Vic., cap. 28. Counsel for the prosecution said that the prosecution was instituted by an association called the Ceylon Tea Growers' Association. The article sold was tea in packets bearing the brand of "The Sogama Estate." Ceylon tea bore a high name for quality in the market, and it was found that a great quantity of inferior tea was sold as Ceylon tea. It was true there was an estate in Ceylon called the Sogama estate, owned by a company having offices

in Clement's-lane, City. The association, having ascertained that tea bearing the brand of the Sogama estate was being sold by certain persons, communicated with the company owning the estate, and these proceedings resulted. He proposed to prove the purchase and the analysis of the article purchased, and he would show that the tea sold as "Choice Ceylon tea, a blend of Ceylon and other choice growths," was in fact a mixture of inferior China and Indian teas. Mr. Avory, counsel for the defence, said that he was prepared to admit that the defendants applied the label and that it was not Sogama tea, but he could not admit that it was not Ceylon tea. Mr. W. J. Thompson, partner with his father as tea brokers at Mincing-lane, said he had had 30 years' experience in the trade. He had had a packet of the tea submitted to him (packet produced), and having tested it he came to the conclusion that the tea was composed of Indian and China tea. There might be some Ceylon, but he thought not. Cross-examined.—He knew there was a Sogama estate, but did not know that there was a whole district called Sogama. He understood there was not. The difference in value between Indian and China and Ceylon was about 3d. per lb. Some Ceylon tea could be bought at 11½d. per lb. He knew that the defendants were of old standing in the trade. Mr. Paget was an old friend of his own. He was not prepared to say that there was no Ceylon tea in it. Re-examined. The packets produced were ¼ lb. packets, sold at 6d. He would not expect to find tea bought at 11½d per lb. retailed at 2s. George Stehn, manager of Wilson and Smithett's tea department, Mincing-lane, said he had been in Ceylon and there was no such district as Sogama. It was more the estate belonging to a company. The witness confirmed the previous witness's opinion as to the tea sold being mainly inferior teas of Indian and China growths. A witness named Leek, [W. M. Leake] in the employ of the prosecuting association, gave evidence showing that the packets were bought from a retail grocer who was written to and who gave up the name of the defendants as the sellers to him, the defendants being blenders of tea. The witness added that the defendant Paget called on him and said he would be willing to pay the Sogama company a royalty to be allowed to use the name on the label. Mr. Bushby asked whether such a course was usual in the tea trade. The witness could not say. Mr. Avory, for the defence, denied any intention at all to defraud. They had used the label innocently and were prepared to prove that the tea was fine tea of Ceylon growths with a blend of other growths. The defendant Paget was then called, and he said he had carried on business, since 1852. The tea in question was Ceylon and Indian tea, no China being used. It was blended from teas costing from 10s. to 1s. 1d. per lb without duty. His firm had used the label without any knowledge that they were infringing any person's right. Cross-examined, he said that the firm made two blends—the "Sogama" and the "Queensberry." He knew there was a "Queensberry estate" in Ceylon; also that there was a "Sogama," for he had purchased their tea. He supposed the owners of the Sogama estate had some rights to the name. He was prepared to admit there was no Sogama in this tea. Asked why the name of a blender was not put on the packets the witness said that tea grocers did not like the public to know where they got the teas from. ("Shame" in court.) The witness was pressed as to the cost of the tea used in the blending, but he said he was not prepared to expose trade secrets. Asked what proportion of Ceylon tea was in the blend, he said he was not willing to answer and divulge a trade secret. Mr. Avory contended he was not bound to answer. Mr. Bushby said if the question was pressed it was unfortunate that the witness should have gone contrary to the law. He and the public would draw their own inferences. The question was not pressed, Mr. Avory remarking, amid laughter, that if the witness had to state the secrets of the trade any grocer could make the blends for himself. Mr. Bushby, in giving judgment, said the label "Sogama Estate" tea distinctly misled the public, and that was a serious evil, which must be put a stop to. He imposed a fine of £10, and allowed 25s costs. The court was crowded, and a

good deal of feeling and interest were exhibited during the hearing.

EDITORIAL ON THE ABOVE IN THE
LONDON "TIMES."

The remarks in the Chancellor of the Exchequer's Budget speech on the retail price of tea are curiously illustrated in our Police news this morning. Two tea-dealers, Mr. Thomas Paget and Mr. Robert Pigott, were brought before the magistrate at Worship-street on a charge of having sold tea to which a false trade description had been applied. The tea in question bore the brand of "The Sogama Estate," and it was not contented on the part of the defence that it was rightly thus labelled. What label it ought to have borne was left undecided to the last. It had been described by the vendors as "choice Ceylon tea, a blend of Ceylon and other choice growths." The first expert who was called stated in evidence that he had had a packet of the tea submitted to him, and that he had tested it, and had come to the conclusion that the contents were made up of Indian and China tea. He has not prepared to swear that there was no Ceylon tea in it, but he did not think there was any. The next witness spoke substantially to the same effect. He was confident that most of the "choice Ceylon tea" was nothing but inferior tea of Indian and China growths. Mr. Thomas Paget, on the other hand, maintained firmly that the tea which he had sold was Ceylon and Indian tea, and that no particle of China tea had been mixed up in the blend. But on the main charge he had no defence ready. He had sold tea with the brand of the Sogama Estate, and this he acknowledged it had no scintilla of a right to bear, since, whatever it was, none of it was Sogama tea. This admission was all that he could be induced to make. When he was questioned about the cost of the "choice growths" which he had used in blending his tea, his reply was that he was not prepared to expose trade secrets. On the amount of Ceylon tea in his blend he was equally reticent. It was a trade secret which he was not willing to divulge. But whatever the quality of his tea, and however much or little of Ceylon tea there was in it, it had certainly been misdescribed, and its purchasers had been thus misled. Some severe remarks from Mr. Bushby and a fine of £10, with costs allowed to the prosecutors, concluded the case.

Tea is a subject of very general public interest. We fear, therefore, that there will be widespread dismay and surprise at the amount of mystery with which the tea trade is shown to be surrounded. The object of those engaged in it seems to be to keep everybody in the dark. There are trade secrets at every stage. In dealing with the report this morning, we must begin with the wholesale tea blender, since the case in Court does not carry us any further back than this. He is unquestionably a man of mysteries. How his mixtures are made, and at what original cost he obtains the materials for making them, is his own private affair, and no one but himself is to know anything about it. His customers, the retail tea grocers, are men of like mind. They do not wish the public to know where they get their teas, and accordingly they prefer packets which have no blender's name upon them. The blender, we need hardly say, is ready to accommodate them in so simple a matter. That they object to packets with high-sounding titles upon them we are not told, and we should not believe it if we were. The evidence given yesterday at Worship-street is too clear to the contrary. But, however unwilling the defendants were to allow us a glimpse into their trade secrets, there was more than one revelation made in the course of the

case for the prosecution. It was stated, and it was not contradicted, that an offer had been made on the part of one of the defendants to pay a royalty to the Sogama Estate Company for the right to use their labels. Now, such a right as this would not need to be bought and paid for if the contents of the packets corresponded with the labels outside. Sogama tea could be described as Sogama tea with no risk of a penalty under the Merchandise Marks Act. The offence charged yesterday was, not that labels had been used on which no royalty had been paid, but that there was nothing in the packets answering to the labels. We come next to the quality and cost of the tea thus misdescribed. Choice Ceylon tea mixed with other choice growths is the blender's account of it. Inferior Indian and China tea is the corrected statement on the part of the prosecution, with perhaps some Ceylon tea added, but more probably without any. We must leave our readers to choose between the two stories. They cannot both of them be true. As regards the cost of the tea, much will depend on the version which we adopt as to its quality and place of origin. We learn that some Ceylon tea can be bought at 11^d per lb. and Indian and China tea for about 3^d less. If, therefore, the incriminated packets were rightly said to have contained little or nothing but inferior Indian and China tea, we may put the blender's outlay at about 8^d a pound. The price charged to the retail purchaser of the so-called Sogama tea was 2s per lb., so that there is a good margin for profit on the transaction. Mr. Thomas Paget's account was that the tea he used cost from 10^d to 1s 1^d per lb. * without duty. On the proportions used of each sort, and on the joint cost of his materials, he refused to say anything. Shall we be wrong in assuming that he put in the 10^d tea with a freer hand than that at 1s 1^d and that possibly the average cost of the whole was not greatly in excess of the lower of the two sums? This reduces the profit as shown by an adverse witness, but it leaves it tolerably high still. In the absence of complete evidence, we can come to no definite conclusions either way. The presiding magistrate, Mr. Bushby, has drawn his own inferences, but he has not told us what they are. The public, he adds, will draw theirs, so that we may be well content to leave the case as we find it, and to remain in ignorance about matters on which neither Mr. Bushby nor the public are in any need of our help. There is one point of interest on which Mr. Bushby sought to be informed, but on which the witness for the prosecution could throw no light. Is it usual in the tea trade to pay a royalty for the right to sell goods under the name of some one else, and with no regard to the truth or falsehood of the description? Possibly, the more usual course is for the fraudulent label to be used, with no money paid for it and with no leave asked. That this is sometimes done we are entitled to say—the case on which we have been commenting is proof of it. But a deception of this kind is only possible under certain conditions. There must be at least two parties to it—an unscrupulous vendor and an unskilled purchaser. This latter condition is very commonly met. The public, as a rule, knows very little about tea, and it can be put off accordingly with very indifferent stuff. The tipplers, as Mr. Goschen terms them, have a more formed taste. For tea drinkers almost anything will do, and as long as this state of things continues there will be shops found from which they will be served with almost anything—except, indeed, with good tea, sold frankly for what it is.

* This was a misreport: these are the prices of pure Ceylon tea.—ED. T. A.

LIBERIAN COFFEE IN S. INDIA.

A Planting Correspondent writes to us:—Whatever may be said to the contrary by owners of specially favoured properties, I think it is generally admitted by those who have been longest at the business, and have the widest experience of districts other than their own, that the "good old times" have passed away probably for ever. Almost any planter you meet is quite willing to admit this sad fact for other districts or even for his neighbours: but it is naturally hard for a young, sanguine man to force himself to believe that he is not to be the exception that proves the rule. His property, on which a lot of money, we will say, has been laid out is just at its prime, and has been liberally manured, prices are tremendous, exchange is much in his favor, and he fondly hopes that 25 per cent. on his capital can always be made at coffee "by a man who knows his work, and doesn't mind spending a little money." But some how, generally, the crops begin to fall off in spite of the liberal treatment, and of even greater expenditure in manure than was ever dreamed of in old days. "Next year" like the bird in the fable leads him on until at last he gets sick and weary of it, and instead of retiring from business with a small fortune as he fondly hoped in ten years, he heaves a sigh of relief which he sees what he thinks will be his bare expenses in the form of crop set upon the trees. Of course there are estates, even districts, which have been mines of wealth to their owners, and long may it be so. I am only writing of the general course of things which the statistics of coffee exportation will I fear show to be steadily, even if unevenly downward: like an ebbing tide, alternate years being better than the one before, but worse than the one before that. We all know what has happened to Ceylon and Java and it is believed that America about which it is extremely difficult to get any certain information is keeping up her figures from the yield of large new districts which have been opened up of late years.

In India the best land was taken first, and is now exhausted, or nearly so, new clearings on inferior land though opened with far more knowledge and skill, and expenditure of manure, shaded too when necessary are as a rule nothing like the old estates in quality, and not likely to last one quarter of the time. There can be but one reason for this, viz., that coffee Arabica is so deteriorated in health and strength by the continuous attacks of leaf disease during the past 20 years that, except under peculiarly favourable circumstances it is practically dying out, the only effect of heavy manuring being to put on a new crop of leaves which are promptly swept off by our enemy as fast as they are formed. It is sadly true that instead of passing away, as we fondly hoped at one time, this pest seems now more vigorous than ever, anything like even a very moderate crop is invariably followed by a specially severe attack, and sanguine indeed must be the man who really believes that the end of vastatrix will come while there is a leaf of coffee left to feed on. We know that in Europe an almost identical fungus has attacked the vines, and in some countries utterly destroyed the old European kinds. The American variety, however, I am told, is now being planted with success as it is found able to grow and flourish in the ground from which the other had been dug out and burned because its constitution is sound and strong, and it is able to resist the foe. After watching the thing for some years, I have come to the conclusion that a similar state of feebleness has been brought upon our Arabian coffee and that as regards low lying districts *anyhow* it will be necessary to replace it with the strong African variety called "Liberian" if we are to grow coffee at all. Now at this stage I know it will be said "why that wretched fraud was tried and abandoned long ago in the low country of Ceylon; not only did it get leaf disease but it gave a very bad sample of coffee and very little of that oven. No one now believes in it." To this I reply that various sorts of bad Afri-

can coffee were palmed off on the unfortunate planter at the time when attention was first called to this giant kind. These are somewhat similar in appearance at first, but are really very different to the true Liberian which is practically free from fungus (only the delicate seed leaves getting it) is a tree not a bush, a heavy cropper and yielding a good sample with no hollow beans.

Some 15 years ago I received a couple of Liberian plants from a number presented to a Planters' Association by Government. These had come out to the country, I believe from Kew direct, in a warden case. Planted in a back garden and almost unnoticed and uncared for, they grew broad and high till now they are about 26 feet and have apparently no intention of stopping. In the evil report soon after prevailing regarding Liberian coffee, I supposed there was nothing in it till at length I began to notice that the trees were bearing very well, and that there was no trace of leaf disease. Then I planted out 2 or 300 seedlings in a new clearing along with Arabica, and these, now 7 or 8 years old and in a more sheltered position than their parents have done even better. Planted 10 by 10 over Arabica they have now run up to 16 or 18 feet, all exactly of one type, and are bearing exceedingly well; the crop on them for this season cannot well be taken at less than 3 lb. of clean coffee per tree. The Arabica under eath them has suffered frightfully from fungus regularly every year, yet I challenge anyone to find a sign of it on them. A few of the old leaves every year turn yellow and tumble off as was the natural way of our old staple before the days of leaf disease as I well remember before 1868. We know that Liberian coffee will grow at the sea level; the ones above referred to are at 2,500 feet in sheltered bamboo land: whether they will do well at higher elevations remains to be seen, but so far as I can see I am satisfied, and only regret that I did not do eight years ago what I am doing now, viz., plant Liberian all over my clearings *with the Arabica* and let the best win. To sum up the points of difference between Liberian and Arabica I find as advantages:

- 1st. That it does not get fungus or only in such a way that the health of the tree is in no way affected
- 2nd. That it is a tree, not a bush, running up to 30 feet in height before 15 years old and in consequence is not injured by drought.
- 3rd. That judging by the trees in evidence and the way they go on growing, and by the fact that they do not come into bearing till 4 or 5 years old, this variety may be taken as much longer lived.
- 4th. That it is a heavier bearing tree when once fairly started; these in evidence now yielding 10 to 20 cwt. per acre, calculating on the clean coffee yielded, and admitting that only some 700 trees to the acre can be grown instead of at least double that number of the old kind.
- 5th. That being a deep-rooted plant, it is not affected by drought, while a very slight shower is quite sufficient to bring out and set the blossom; which moreover has the further advantage of fading and falling off within the day of its opening so that it is hardly possible that it can be injured by rain or hail as is so often the case with the delicate Arabica blossom. Even in the very driest season, when the other plants appear on the point of destruction, these look cool and green and not turning a leaf.
- 6th. That the cost of cultivation is comparatively little. There is *no pruning to do* beyond pulling off the suckers for 2 or 3 years to prevent the tree from running up into too many stems, the crop is carried on the same wood (and extensions of it) year after year, and there is therefore no old wood to cut out. The shade of a thick, tall tree like this where they pretty well cover the ground, would effectually prevent weeds from becoming troublesome, and as the roots are deep down the debilitating effects of weeds even if they did grow, would be very little felt.
- 7th. The berries (of the size of a walnut) remain firmly fixed on the tree for *many weeks* after they are ripe enough to pick, eventually they fall off, and may be gathered off, the ground. In case of a scarcity of labour this might be an advantage.

Against these good points we may set the following:—

1st. That this species gives very little return till at last the 5th year, while in low lying districts some return is got from Arabica in the 2nd year.

2nd. That the value in the London market from a sample lately sent home, is about 10 per cent lower than that of ordinary coffee.

3rd. That in Districts under the South-West monsoon, whose flowering season is in March and April, the crop instead of beginning to ripen in October and finishing in January or February, takes a whole 14 months to ripen. The flowering season is the same as the other, but though some berries will turn ripe in the following April, much of it will not be ready to gather till July. Thus the tree carries two crops at the same time, and all mixed together in the same branches. Sometimes at the end of the spring, we may see at the same time the crop of the previous season as large as plums, and partially turning red, the crop of the current season the size of peas, and a further sprinkling of the curious 8 petalled, hoavily scented blossoms as large as the palm of a child's hand. All these mixed together among the largo dark glossy leaves give the tree a most rich and handsome appearance.

There are now one or two points about which some information may be of interest.

Picking.—There is no difficulty about this, a notched bamboo enables the cooly to get up among the branches, and he then strips off all that is ripe, or nearly so (taking care not to rip off the small berries) dropping it all on the ground, and collecting afterwards into baskets.

It takes 4 bushels of these huge cherries to make one of Parchment (instead of 2 as with Arabica), but even so, the fruit being so large, a cooly can pick quite twice as much as of the other, and the cost per ton of clean, would be much the same.

Curing.—I have seen advertisements of special pulpers made in Ceylon for Liberian coffee and have no doubt that they are as effective as they are represented. Anyone growing a quantity of this coffee would have to employ machinery.

I have tried experiments on a small scale with my cherry, and found that it was no use to pass the stuff through an ordinary disc pulper (set of course very wide) because the husk never (at this elevation) gets soft enough to squeeze out below the chop but rolls up into a hard ball, and comes out with the parchment in front; and I found that when the chop was set wide enough to allow the husk to pass, the bean went with it. Moreover the work was so hard that four coolies were completely tired out in pulping 2 bushels! Then I found that the simplest way of getting at the parchment was to put it up in heaps in the pulping house to rot. This may seem barbarous, but the colour of the clean coffee so treated was quite as good as some treated in the ordinary way, indeed the parchment envelope of the bean is so thick and strong that it completely protects it from injury from heating. Moreover this kind of coffee will carry nothing but a dead whitey-green colour no matter how the curing may be done. If allowed to dry in cherry some heavy peeler might perhaps break it up, but it seems to me as hard and tough as the very best road metal, and I much doubt whether a coffee curing firm would undertake it on the usual terms.

As regards the drinking qualities of this variety, I can safely say that no one who had not previously been told would know that he was not drinking the pukka article, the same quantity of powder goes further and I cannot notice any inferiority of quality. Unsuspecting guests have often said "may I have another cup of this excellent coffee" and they usually look somewhat surprised when told what it was. If you try to sell it in the bazaars whole and clean (looking something like date stones in shape), natives decline to buy it. "This one kind bad imitation coffee" they will say, but if you smash it up and mix a little dirt with it they will take it readily, and never find out the difference.

Planting.—Owing to the seedling throwing out a strong, deep, tap root something like that of a jack tree, I am inclined to think that when a plantation has to be made it would be better to have the pits made ready by May, and then to put one or more seeds in each pit as early in the South-West monsoon as possible, so that the seedlings may get established before the end of the North-East monsoon in December. But if not grown to any great size they can be lifted with a little special care from nurseries in the ordinary way. Considering the fact that Liberian Coffee does not come into bearing till 2 or 3 years after the other, it may probably be a wise plan for one going in for its cultivation, to pit his clearing 4 by 4 and to plant Arabica, afterwards putting in the giant kind down every other row, making them thus 8 by 8. The Liberian is much too robust to take any notice of its little friend, while by the time it has come into bearing you may safely assume that the Arabica has given what it can in maiden crops, and unless heavily manured has already made arrangements for returning to a better world where there is no fungus.

It is said that the civilised but effete nations will one day (when magazine rifles are common) have to yield to the iron constitutioned African, who can more than hold his own physically, and multiply in any climate, and here shortly we may perhaps see our poor old worn out King, eaten up with disease, and quite unable to do anything but keep himself alive, deposed in favour of his strong and healthy African cousin. I shall be delighted at any time to show the trees on which my experience has been gained to any one who takes an interest in the subject, or to give any further information in writing. Enclosing my card as a possible means of communication.—*Madras Mail*, May 10th.

THE INDIAN TEA EXPORT SEASON it will be seen from our special telegram, elsewhere, has closed with a total of shipments to all quarters of 103,642,000 lb. This is about 3½ millions below the estimate for the season, which stood originally at 106,941,160 lb.

THE "SISAL HEMP" PLANT is a native of Mexico, and Dr. Trimen does not think it has been at any time introduced to Ceylon; it is therefore very unlikely that anyone should have seen it growing in the N. C. Province, as our correspondent Mr. F. Cummins supposed he had. But who is to be first to try the plant on a considerable scale, and still more who is to follow in the footsteps of Mauritius planters, in utilizing local aloe fibre and making shipments to try the market on a considerable scale?

THE VICTORIA REGIA in the "Gordon Gardens" has not only flowered and fruited, but is reproducing itself in an immense number of self-sown seedlings which Mr. Nock—who is in town for a day or two—describes as perfectly healthy. These seedlings will be available for distribution to applicants who will take the trouble to experiment with them. The seed in future might be scattered in the Lotus pond, near Skinner's road, and over other pieces of water in or near Colombo, in the hope of spreading so notable a plant in our midst.

CINNAMON.—A discovery has been made which shows that the love of our ancestors for drinks spiced with cinnamon was fully justified. What were not the Dutch ready to do to procure cinnamon and other spices for their mulled wines, and what wonders of navigation did they not accomplish in their lumbering vessels in order to fill the spice-boxes of their housewives? According to the Paris correspondent of a contemporary, Dr. Chamberland, M. Pasteur's chief assistant, has just discovered that cinnamon is fatal to the typhoid microbe, which must infest the sluggish waters of the Netherlands. This will be news for cinnamon growers.—*H. & C. Mail*.

JAMAICA.—The last *Bulletin* of the botanical department contains articles on the culture of *Coca Erythrolyon* (Coca), and on the abandonment of Orange culture in the Azores, due to a disease ("gumming"), and to the unremunerative prices obtained by the growers. Other articles refer to the manufacture of Lemon essence in Sicily, and fruit-candyng in Italy.—*Gardeners' Chronicle*.

In the Queensland Botanic Gardens, Rockhampton, which is under the Tropics of Capricorn, as a curiosity in the adaptability of plants, I may mention that last week we had Pine-apples and Apples gathered from the same bed, the Apples are small, but well flavoured. A few days ago, a station owner out West told me there was a species of *Ipomea* (*I. calabra*, tuberous rooted) growing in the scrubs on his station used as food by the blacks; he describes the flowers as deep purple, and promised to have some of the tubers taken up, and sent down the first chance. We are having a grand season here. I would like you to see how things are growing with us at present.—J. S. EDGAR, Rockhampton.—*Gardeners' Chronicle*.

COMPARATIVE SALES IN LONDON OF INDICA, CEYLON AND JAVA TEAS.—From the figures in Gow, Wilson & Stanton's circular, for packages brought to auction in the 11 months from 1st June 1889 to 2nd May 1890, it will be seen that while Javas decreased by 18,462 packages and Indians increased only 87,685 on 1,012,634 packages, the increase in Ceylons was almost 100,000, the exact figures being 99,997 increase on 345,255 packages. Taking percentages, Ceylon is very far in advance of India,—an increase in our case of about 30 per cent, against about 8 per cent for India.

A NEW FLOWER.—The latest *Field* gives the description of a flower which would appear to be admirably suited to adorn our Indian gardens in winter:—"A new plant, that seems to have a great future before it, is *Gerbera Jamesoni*, and from what we have seen of it, both in this and last season, it should become of use in private gardens. It flowered in the Royal Gardens, Kew, last June, in the cool house; but a plant was also tried in the border, and gave great hopes of this Transvaal wilding as a hardy plant for the border. It was found by Mr. Jameson, near Barberton, in the Transvaal, and to Mr. Tillet belongs the honour of first introducing and flowering it. The leaves are of the richest green, hairy on the under side, and arranged in a rosette way, the flowers each about 4 in. across, and borne singly on a stem about 12 in. high. The shape is distinct and striking each petal being narrow, and the whole so arranged as to form a large star, the colour of which is orange scarlet. Even if not of sufficient hardness to stand the winter, it will make a useful pot plant for the greenhouse, as not much heat is required."—*Pioneer*.

PLANTING TREES IN TOWNS.—Some time ago Mr. Robert Walker, the efficient and hard-working keeper of the Victoria Park, read a couple of papers "On the Planting of Trees in Towns." The papers were interesting, and fitted to be extremely useful; Mr. Walker's own experience in planting trees along the margins of streets and in other urban localities being considerable, while his information on the subject, including the choicer of proper varieties according to locality, character of soil and surroundings, &c., is extensive. We are now glad to see the papers, as "revised by the two Aberdeen members of Mr. Ruskin's Guild of St. George," issued in a very neat and attractive form, with some eight choice tree illustrations showing on plate paper examples of the Silver Birch, the Horse Chestnut, the Lombardy Poplar, the Spruce, the Lime, the Oak, and others. We commend the print to the attention of all interested in the highly commendable work of improving the amenities of the city.—*Aberdeen Free Press*, May 3rd.

ARTIFICIAL GEMS at the Paris Exposition are said to have surpassed anything ever before shown, some of the specimens puzzling even dealers and experts. The artificial pearls were especially successful, no means being found to distinguish the genuine from the artificial except the use of a file.—*Fiji Times*.

LONDON PURPLE.—A correspondent in Kent who has damaged his Apple trees by using the above substance with water in the proportion of one to twenty, thereby following the instructions given him by the firm which supplied it gratuitously, is much to be pitied. The safer proportion would be one tablespoonful of London Purple to one gallon of water, for use on trees in leaf.—*Gardeners' Chronicle*.

THE MANGO SEASON.—Those of us who have been looking forward to the mango season cannot but be disappointed at the poor specimens of this year's crop which are everywhere being offered for sale. We are, most of us, under solemn promise to our friends "to be euro to send them some good mangoes," and, though we would fain escape the mild vituperations and covert innuendoes of "pie crust promises" &c, which are sure to fall on our devoted head until we pledge ourselves more deeply for the future, we feel that we cannot send them the wretched things that are offered to us as mangoes. For the lover of the mango likes his mango good; a good mango is something to remember. It is as Mr. Elphinstone, the historian of India, says, the best Indian fruit, at once rich and delicate, and all other fruits are comparatively insipid beside its intensity of taste. There is something in it, which is nothing less than voluptuous.—*Madras Times*, May 23rd.

SILK.—In a review of the trade in silk for 1889, the *Weekly Mail*, an English journal of Yokohama, observes that this industry is becoming more important every year. New plantations are laid out, new filatures and re-reeling establishments are started, new firms and companies begin business, swelling the volume of the trade, and constant improvements introduced into the growing and reeling of silk are making the Japanese product more popular with manufacturers in Europe and America. Not only are "Japan raw" and "Japan waste" becoming universal favourites with the consumers of the world, but the goods woven in the Japanese looms are finding their way to Europe and America, where the beautiful fabrics of artistic Japan are greatly appreciated. In 1889 the great staple export, raw silk, figures in the returns for the large total of 40,808 piculs (of 133 1-3lb. each) valued at \$26,332,900, as against 46,963 piculs, valued at \$25,899,700, in 1888. In the month of June, when all attention was given to the harvest, a partial failure of the crop in Italy turned special attention to Japan. It was then believed that the Japanese export would be greater than that of any previous year and would amount to 50,000 piculs; but in the result neither the cocoon crop nor the autumn crop of *bioltini* turned out as satisfactory as was anticipated. The export of waste silk, including pierced cocoons, was 27,915 piculs, valued at \$2,509,500, against 34,332 piculs, valued at \$2,794,700, in 1888. The trade in manufactured silks grows year by year. Large factories, with new and improved machinery for warping, winding, weaving, and dyeing, are being constantly erected, and the industry is fast developing in Japan. The United States is at present the best customer for these goods, but England, France, Germany, Canada, and Australia are rapidly entering the field as competitors in the purchase of these fabrics. At the present rate of progress, the value of woven silks exported will soon exceed the value of the tea annually shipped from Japan.—*London Times*.

THE ECONOMIC USES OF LEAVES.

Of the three divisions of Nature's products, man is most chiefly indebted to the vegetable kingdom, whether for his food, medicine, or domestic comforts. Every part of plants and trees is more or less utilised by savage and civilised men, and a common category might be furnished by the various uses of the separate parts—the roots, stems, sap, bark, fruit and seeds, and leaves. If we take the last-named, the foliage, apparently the most insignificant part of the plant, how dependent are we on these for food, clothing, medicine, dyes, stains, and various comforts.

The miscellaneous application of leaves for different purposes as domestic appliances, and for manufacturing uses, of themselves, would furnish a long list; some few of these we may pass under notice, because their adaptability and usefulness are mainly confined to tropical countries. It is true that some leaves have been utilised by the papermaker, as in those of the dwarf Palm, Maize leaves, and others, but this is only on a small scale.

The leaves of many Palms are largely employed for making hats. Those best known are Panama hats, so named from being shipped from that port. These are made from the finely-plaited fibre of the leaves of a South American Screw-pine (*Carludovicia palmata*). These hats are much prized for wear in the Tropics, being light and flexible, and can be washed and bleached repeatedly. The tree has no stems, the leaves have long slender petioles, springing from the ground; they are some 2 feet long, fan-shaped, and four-parted, each segment being again ten-cleft, so that when folded in venation, each segment on its own rib, there are eighty layers in a young leaf. The tree occurs only on the slopes of the Andes. About 200,000 dozens of these hats are made in Ecuador and different States of South America. These hats are distinguished from all others by consisting only of a single piece, and by their lightness and flexibility they may be rolled up and put in the pocket without injury. In the rainy season they are apt to get black, but by washing with soap and water, besmearing them with lime-juice, or any other acid, and exposing them to the sun, their whiteness is easily restored. The plaiting of the hats is very tedious and troublesome; the coarse ones may be finished in two or three days, but the fine ones take as many months to plait. It commences at the crown, and finishes at the brim. The hats are made on a block, which is placed upon the knees, and requires to be constantly pressed with the breast. The hats vary in price, according to fineness and quality, from 20s. to as many pounds.

The unexpanded fronds of *Livistonia australis*, prepared by being immersed in boiling water, are dried, and the fibre thus obtained is much valued for the manufacture of hats in Australia, which much resemble the celebrated Panama hats.

The rough leaves of the Chumico (*Curatella americana*) and of *Davilla lucida* are used for cleaning iron, and polishing and scouring wood, *Curatella alata* is used in the West Indies for polishing bows, sabres, &c.; and *C. sambaiba* in Brazil—indeed, they serve all the purposes of sand-paper to the Indians for polishing their blow-pipes and war clubs. The leaves of *Celtis orientalis* are used for polishing horns in the East Indies.

The foliage of *Guaiacum officinale* is very detergent, and is frequently used in the West Indies to scour and whiten floors, which it is said to do better than soap.

Leaves sown together are much used in India as substitutes for the plates and dishes of more civilised life. It is not always poverty that leads natives to use them in preference to metal or porcelain articles, as caste or custom has often some influence in the matter. The leaves principally used are those of the Egyptian Lotus (*Nelumbium speciosum*), *Bauhinia* species, *Semecarpus anacardium*, *Butea frondosa*; those of the Banyan (*Ficus bengalensis*), by Brahmins, and the Plantain-leaf (*Musa paradisiaca*).

The leaves of *Bauhinia Vahlia* are used in the con-

struction of the curious, rude leaf-bellows in Sikkim with which the natives of the hills smelt iron. These leaves, when sown together, are used as plates, caps, rough tablecloths, rain-hats and caps. The leaves are heart-shaped, and above a foot in breadth, and the same in length. Sewn together with twigs, they also serve for baskets for holding pepper, turmeric, and ginger, and are likewise used for thatching.

Under the name of "Chattahs," a kind of umbrella-hat or sun-shade is made in the East of the leaves of the *Licuala peltata* and the Talipot Palm, or a Plantain leaf. These Chattah hats are much worn by the ploughmen, cowkeepers, and coolies of Bengal and Assam.

The large fan-shaped leaves of the Talipot Palm (*Corypha flabelliformis*) are like those of the Palmyra Palm, carried over the heads of people of rank as an umbrella, and are also used for making books, and for various domestic purposes. The leaves are also cut up into neat bracelets, worn by Santal girls in India. Those of *Vanda Roxburghii*, split, are also worn by them as anklets. Those of another species, *Borassus athiopicus*, occur as much as 12 feet across; they serve also for the manufacture of baskets, mats, ropes, and sieves. The leaves of *Nipa fruticans* attain a height of 15 to 20 feet, presenting a very handsome appearance, resembling the fronds of huge Ferns. This graceful Eastern Palm is utilised in various ways, the principal being in the manufacture of thatching for house-roofs, in the East called "Ataps." This manufacture is quite an industry of itself, and affords employment to many natives, chiefly women, the men simply bringing cargoes of the fronds to the women, to be stitched with split rattans, and made up. Atap roofs are the best adapted for these climates, for while the winds are never strong enough to blow them away, they afford the coolest protection against the sun of any kind of roofing known.

The leaves of the Palmyra Palm (*Borassus flabelliformis*) were formerly used like paper, to write books on, and to this day they are applied to this purpose in Orissa, Southern India, and Ceylon, where an iron style is employed to write upon them; in certain parts of Bengal young children use them to write the alphabet lessons on. They are largely employed for making pans, hags, winnows, hats, umbrellas, and for thatching, &c. The leaf takes a dye well, and is worked up in Madras into pretty coloured patterns in baskets and mats.

The slips of Talipot and other Palm leaves are coming into European commerce for the manufacture of ornamental braids, and in the construction of straw, or Leghorn hats. The fibre obtained from the base of the leaves of the Chusan Palm (*Chamerops Fortunei*) is used by the Chinese for making hats and coarse clothing. The sale of Palm leaves for decorative purposes in the towns of Elche and Alicante in Spain, produces a considerable income to the towns.

Kadjan mats, manufactured out of *Nipa* leaves, are indispensable for travelling purposes; packed up in the smallest compass when not required, each mat is capable of affording sufficient cover at night for two or three persons, either in boat or forest journeys. They also form, almost exclusively, the material for side-walls and divisions within houses. The young leaf unfolded and dried, under the name of Roko, forms the favourite covering for cigarettes in the Malay Peninsula in preference to paper.

The large leaves of the Teak tree (*Tectona grandis*) are used for plates, for packing, and for thatching. The leaves of *Cordia myxa* are employed as plates in Pegu, and to cover Burmese cheroots. In Bangalore the leaves of *Oanna indica* are used by the natives in lieu of plates, to serve their Ragi or Millet puddings and other dishes on.

The leaves of the Papaw tree (*Carica papaya*) are employed by the negroes in washing linen, as a substitute for soap. They have also the property of rendering meat wrapped in them tender, owing to the alkaloid papain which they contain, and which acts as a solvent.

For cordage and other textile purposes, numberless leaves are used, and they serve very generally for packing and wrapping up small parcels in India.

In Guiana, Tibisiri fibre is obtained from the inner surface of the spiral leaves of the Ita Palm (*Mauritia flexuosa*); it is used by the Indians for making hammocks, &c. The leaves are cut before they are open and the midrib separated by drawing each division of the leaf through the finger and thumb. After drying, the fibre is ready for use without further preparation. About a quarter of a pound may be procured from each leaf, and if the central leaf is left uninjured, no evil effect is produced on the tree. Bags or matting could be cheaply and easily made from this fibre, as well as hats, similar to those known as Panama.

The foregoing is only a brief enumeration of some of the many uses to which leaves are industriously applied.—P. L. SIMMONDS.—*Gardeners' Chronicle*.

MARSH-PRODUCED DISEASES.

It is not every one who has a proper conception of what malaria means and really is. Malaria really means bad air; but for some reason, difficult to define, it has been restricted to the emanations from swampy districts. For example, a man who has fever and ague (or, as it is known among professional men, intermittent fever) is said to be suffering from malaria; whereas a man suffering from the noisome effects of sewer-gas in his house is assuredly the victim of malaria, though not suffering from intermittent fever. The fevers, then, and the ailments following in their wake, that are produced in districts where there are warmth and decaying vegetable matter, are said to be malarial.

Malaria is a hydra-headed disease. Even that one form of it, "fever and ague," presents itself in various forms. It occurs most frequently in newly-populated districts; and in lands from which it has been supposed to have vanished it has been reproduced when their soil was turned. A man who has suffered once may suffer again, after a score of years, by simply running down in health. It may appear first as a chill, followed by intense fever, which, in its train, is followed by a sweating stage. It may appear simply as an intense neuralgia, and it may be noted that the most frequent form of malarial neuralgia appears over the brow, and is known as "brow ague." As if there was some similarity, distant, no doubt, between paludal fevers and sewer-gas poisoning, it may be noted that neuralgic symptoms characterize both, and quinine certainly seems beneficial to both.

Formerly, quinine, and, indeed, all the cinchona preparations, were more appreciated than they are at present. In the whole range of medical treatment nothing ever is encountered which is more wonderful than the action of quinine in malarial fevers. With its administration the diseases disappear, and that quickly. No doubt the dwellers in old countries and the residents of old towns would derive great benefit from a far freer use of quinine; and here we should take occasion to point out that the ordinary sulphate of quinine, the form usually used, is objectionable; it irritates the stomach, is quite insoluble, and is frequently not all absorbed.

The soluble quinine Tablets are the best preparation, inasmuch as one of them dissolves in a little water the minute it touches it. They do not irritate the stomach, can be taken without the taste being perceived, and none of the drug is lost in the system. Those suffering from enervated health, whether from sewer-gas or marsh emanations, overwork, worry, sleeplessness, or any of the thousand ills that go hand in hand with civilization, will find quinine useful—more useful as a tonic than any of the myriad drugs that glut the market.

Under ordinary circumstances a two-grain Tablet is sufficient. In malarial troubles as much as twenty grains should be taken in a day.—"Health," London.

TRINIDAD COFFEE.

The Royal Gardens, Kew, to Colonial Office.

Royal Gardens, Kew, April 1889.

Sir,—With reference to my letter of the 7th April, 1888, forwarding a Report on samples of Trinidad Coffee prepared at the Botanic Gardens by Mr. Hart, I am desired by Mr. Thiselton Dyer to inform you that he has recently received further specimens of Trinidad Coffee from Mr. Hart, consisting of Arabian and Liberian sorts in cherry, parchment and cleaned.

2. Mr. Hart has taken considerable interest in promoting a Coffee industry in Trinidad, and in these efforts he has been judiciously supported and encouraged by His Excellency Sir William Robinson.

3. It must be very gratifying to all concerned to find that during the interval since the last samples of Trinidad Coffee were submitted to London Brokers, a considerable improvement has taken place in the preparation and curing of the beans, and there is no reason to doubt that Trinidad Coffee could eventually be established as an article of Commerce on the same footing as Trinidad Cacao.

4. I have pleasure in enclosing a copy of a Report by Messrs. Wilson, Smithett & Co., furnished through Messrs. Shand & Co., on samples of Trinidad Coffee just received from Mr. Hart, and Mr. Thiselton Dyer will be glad if the information contained in it is communicated to Sir William Robinson so that it may be rendered accessible to those who are interested in Coffee growing in Trinidad.

I am, &c.,

D. MORRIS.

Description of Samples of Coffee from Trinidad Botanic Gardens.

1. Parchment. Grown in Santa Cruz—Prepared in Gardens.
2. Liberian. Grown in Gardens—Prepared by fermentation.
3. "Creole" *C. Arabica*. Grown and prepared by Machinery in the Gardens.
4. Pea-berry. Picked from above.
5. Parchment Coffee. Grown and prepared in Gardens.
6. Mocha. Grown and prepared in Gardens.
7. "Creole" *C. Arabica*. Grown at Santa Cruz—Prepared in Gardens.
8. Venezuelan Coffee, selling in Trinidad at 20c. per lb. or 83s. 4d. per cwt., retail.
9. Trinidad Coffee. Grown at Santa Cruz—Prepared by fermentation. Dr. Chittenden's.
10. Trinidad Coffee, dried in Cherry. Mr. Fitz Simons, considered fairly good by our Cocoa planters.
11. Montserrat District Coffee. Won 1st prize against all others, San Fernando.
12. Hybrid Mocha. Grown and prepared in Gardens.

Report on Samples of Coffee from Royal Botanic Gardens, Trinidad, By Messrs. Wilson, Smithett & Co., No. 41, Mining Lane, London, E. C.

1. In parchment of rather dull uneven colour, and this appears to be shewn also in the berry when the outside shell is removed. Considerable importations from various countries have taken place of Coffee in this stage, and a loss of 16 to 20 per cent. takes place in preparing it for market—allowance for which loss is made by Customs. Value about 75s per cwt. as it is, if London cleaned it would realize about 90s per cwt.
5. In parchment brighter and apparently better dried, the berries after shelling being also superior to No. 1, 78s per cwt. If London cleaned, about 93s per cwt.
- 2 Liberian, browner than the usual importations, of Ceylon Liberian. A yellow colour is preferred. The berry is of good size. 75s per cwt.
3. Flat boldish berry of dark colour with a tendency to fading. This is dullish and more nearly approaching some Central American kinds than Ceylon, 90s per cwt.
4. Pea-berry of uneven colour and too much mixed with split and ragged berries to command sale in Eastern Europe, where high prices are paid for even colory pea-berry. We doubt if this prepara-

tion would command a price that would compensate for the separation from the flat berry. Fine pea-berry is worth 110s. 90s per cwt.

6. Of small size, fairly even colour similar to small East India, would command a ready sale probably for admixture with Mocha, the berry being of that character. 92s per cwt.

7. Similar to Ceylon in shape of berry of fairly even colour, but dull and rather faded. 92s per cwt.

8. Pale yellowish and greenish, similar to LaGuayra. 83s per cwt.

9. Dull green pale of undesirable appearance and mixed with brownish berries which seem to have undergone slight decomposition which would make the liquor what is known as "unclean." 75s per cwt.

10. Brown and black berries, apparently over ripe. 60s per cwt.

11. Pale greenish rather uneven in size, similar to Salvador. 85s per cwt.

12. Good hard coated of fine colour and wellgrown. This would command a ready sale both for exportation and for home use, and has much of the character of high grown Mysore or Neilgherry Hills, 98s per cwt.

The liquor of all except Nos. 9 and 10 is good. No. 2 has the coarse African flavour which is never entirely eradicated.

WILSON, SMITHETT & Co.

Memo. from Superintendent Royal Botanic Gardens to Colonial Secretary.

Sir,—The Coffee samples to which the Secretary of State's communication relates are those which were on Exhibition at the Annual Show of Naparima Agricultural Society.

1. It will be seen that the Hybrid Mocha, as last year, maintains its superiority over all other samples.

2. There is an evident inferiority in all the Coffee prepared by fermentation. No. 1 and No. 9 being the same Coffee and from the same district, but the latter prepared by fermentation (No. 9) and the former by machinery (No. 1.)

3. The advantages of shipping in parchment are shown with much force.

4. The value of the 1st Prize Coffee at the Naparima Exhibition (San Fernando) is estimated at 85s per cwt., while the value of No. 12 Hybrid Mocha, shown against it, is given as 98s a difference of 13s per cwt. The decision of the local Judges is therefore reversed. Again, the Creole (No. 9) which took second prize at San Fernando is valued at 5s per cwt, over the Montserrat Coffee which was awarded 1st prize.

This of course shews that the value of the Coffee has been judged by different standards, but which is most reliable, is for growers to judge.

5. "Pea-berry" Coffee generally occurs in all classes of Coffee, and simply arises from the fact that one ovule is fertilized in the flower, instead of two, as is normally the case. The Broker's Report does not appear to favour any attempt to separate these berries from other sample.

6. Our Liberian Coffee is very favourably reported upon, and at the prices quoted, certainly deserves full attention. One important fact in connection with this variety is that the Coffee, after being ripe, will hang on the trees for several months without deterioration, and thus allow the grower to choose his own time for making his harvest.

7. The smaller yield of No. 6 would prevent any idea of its competing with such prolific kinds as No. 12, Hybrid Mocha.

8. The Report should be an inducement to plantors to give the industry a fair trial upon the improved lines of culture and preparation.

CINNAMOMUM CASSIA.

With Notes on the Collection of the Bark, from Mr. J. Humphreys.

Mr. J. Humphreys, recently a student of the Society's School of Pharmacy in Bloomsbury Square, on leaving for China a few months since, promised to send for the Museum of the Society the implements used by

the Chinese in collecting and trimming cassia bark. Mr. Humphreys has now sent them, and says in the letter accompanying them—

"According to our Chinese manager the mode of collecting the bark is as follows:—

"Transverse cuts are made round the branch or stem, which is only of the size of one complete quill (viz., about an inch in diameter) at distances of about a foot. Then two longitudinal cuts are made right down the stem on each side. This is readily peeled off, and when thoroughly dried presents the appearance of the sample. The chopper-like knife is used for most of the work. The other, a kind of spokeshave, which resembles a plane in its action, is merely to shave off the corky layer or periderm."

He then adds:—

"Our Chinese manager tells me that 'by far the best cinnamon' never gets to Europe and grows wild in a place in Annam. He tells me it differs altogether in appearance from Ceylon cinnamon, being in fact larger than cassia bark. The Chinese pay large sums for it."

I may now point out that until as lately as the year 1884, the exact botanical source of cassia bark was not known with certainty, although it was generally attributed to the tree which is now proved to yield it. The attention of the Colonial Office having been directed to the matter by the authorities at Kew in November, 1881, Mr. Charles Ford, the Superintendent of the Botanical and Afforestation Department at Hong Kong, was sent to the cassia plantations on the West River to procure living and dried specimens of the plant. These he succeeded in obtaining, and on November 16 the result of his investigations was brought before the Linnean Society of London by Mr. W. T. Thiselton Dyer. The information then made public has been already published in this *JOURNAL*, vol. xiii., p. 584.

Mr. Dyer remarked at that time that although the cultivation of the *Cassia lignea* tree has been carried on in Southern China, it does not appear to be indigenous there. In Cochin China, however, there appears to be some probability of its being wild. He also quotes Mr. Ford's statement to the effect that very thick cassia bark is sometimes obtained from the trees of ten years old and more, which are reserved for producing seeds to supply the places of the small trees, cut down every year, the ordinary trees being cut when six years old.

These statements throw some light upon Mr. Humphreys's remarks concerning the thick cassia bark from Annam, so that it appears probable that the bulk of the thick cassia bark used in China is obtained from wild trees in Cochin China, small supplies only being obtained from the cassia districts in China, when the older seed-bearing trees are cut down for any reason. The exact part of Cochin China where the cassia tree grows wild is mentioned in 'Pharmacographia,' 2nd. ed., p. 320, as follows:—

"The French expedition of Lieutenant Garnier for the exploration of the Mekong and of Cochin China (1866-68) found cassia growing in about N. Lat. 19° in the forests of the valley of the Se Negum, one of the affluents of the left bank of the Mekong, near the frontiers of Annam. A part of this cassia is carried by land into China, while another part is conveyed to Bangkok in Siam."

A specimen of the thick cassia bark so highly valued by the Chinese exists in the Hanbury collection of *Materia Medica*.

There are two other points in connection with cassia to which I may now direct attention.

1. Mr. Dyer remarks in the paper read before the Linnean Society (*Journ. Linn. Soc.* 1834, p. 23) that *Cinnamomum Cassia* is botanically closely allied to *C. obtusifolium*, Nees, one of the species from which a similar product is obtained on the Khasya hills in India. There are specimens of the bark of *C. obtusifolium* in the Museum of this Society from the collection of the late India Museum, received from Kew when the distribution of that collection was effected. This bark differs entirely from that of *Cinnamomum Cassia* in its distinctly fibrous character and in the remarkable coriander flavour it possesses, thus adding another to

the many well-known instances in which botanical similarity is dissociated from chemical and structural likeness. It is these curious exceptions that render it so difficult to lay down rules concerning the properties of any one natural order or genus of plants.

The Bark of *Cinnamomum obtusifolium* some years since was met with in the London Market, and there exists in the Museum of the Society a specimen obtained at the time which had been moistened by steam and bleached with the vapour of sulphurous acid, and was then offered for sale as cinnamon.

The coriander taste of this bark is very marked. Now in 'Pharmacographia' (p. 530) the authors allude to a variety of cassia "vera," occasionally found in the London market, which has a flavour more or less of cinnamon, often with some unpleasant addition suggestive of insects of the genus *Cimex*. This seems indicative of similar chemical changes taking place in this bark to those occurring in the coriander plant, the leaves and unripe fruits of which possess a most offensive odour of a cimex character and quite different from the agreeable fragrance developed in the ripe fruit.

2. I wish to direct the attention of members of our Society and of botanists living in the East to the elucidation of the botanical sources of the several barks so frequently met with in the London market under the names of *Cassia vera* and wild cassia, and which probably come to this country from Batavia, Singapore, Calcutta and Manila. These barks as a rule contain more mucilage than cassia, the cold infusion made from them giving a thick glairy liquid affording dense rosy precipitates with acetate of lead, but not with alcohol ('Pharmacographia,' 2nd ed., pp. 527, 528, 530).

OIL OF LAVENDER.

With Observations on the Cultivation of the Plant and the distillation of the Oil, by Mr J. C. Sawyer.

In the year 1885 I directed attention to the tentative cultivation of lavender and other medicinal plants at Brighton by Mr. J. C. Sawyer. He has now presented specimens of the oils distilled from lavender and rosemary, and thinking that he might possibly be able to add something to the already recorded facts concerning lavender, I asked him for any additional information* that he might be able to afford.

In reply Mr. Sawyer says—

"A mild damp winter like the present one does more harm to lavender plants than a hard seasonable frost, as the plants are apt to make green shoots prematurely, and late frosts nip off these tender portions, each of which would otherwise have produced a flower spike.

"It is necessary to grow the lavender sufficiently far apart to allow of ready passage between the rows, as he plants soon spread their branches, and it is otherwise very difficult, without injuring the plants, to carry the crop of flowers, if required for distillation. The collection has frequently to be done rapidly when the flower is arrived at a certain stage of maturity, and dry weather must be selected for the work. When the plant once begins to flower the blossoms are shed rapidly, and in damp weather the spikes carry much water and loose fragrance.

"Some florists in Sussex cultivate a variety of lavender for 'bunching' (i.e., selling in the streets), and they set the plants close together, and the rows also close together. The plants are not so liable to break or split from the stem, in this case, but it is almost impossible to mature the plants or to collect their blossoms without injury.

"The flowers deprived of as much stalk as possible should be distilled, *without previous maceration*, the same day as cut, and not left in heaps, as the flowers rapidly ferment and the character of the oil is quite changed. The still and copper basket employed for rosemary can be used, but of course the condenser and receiver should be different. The receiver should be deep, as the particles of oil passing into it are much

smaller than rosemary. If a shallow receiver they might be carried down into the water pipe. The use of the perforated basket is twofold: 1st. It enables the operator to pull out the charge clean, all at once, without 'drawing' the fire, so that the still is ready for a fresh charge. 2nd. It is most important to prevent the flower from scorching by contact with any part of the still. While the basket is being refilled the dirty water is syphoned out and fresh water let in at the same time by a pipe smaller than the syphon, but admitting enough to prevent the copper burning.

"The complement of water is run through the lid of the basket when that has been replaced. The supply of cold water to the condenser must be plentiful, so as to keep the lower half of it always cold. Nearly all the oil will have passed over in half an hour from the time the mass thoroughly commenced to boil; the rest is a heavier oil. The water passing over with the oil should not be returned to the still; the very small quantity of oil saved by doing so would not compensate for the herbaceous flavour communicated to the next running.

"The sample herewith (made as described) is clear, limpid, and pale in colour. It may probably be improved by drying out of it any particles of water held in solution.

"It is said that some consumers add 10 per cent. of S. V. R. to oil which they may have to keep in store, but I find if it be added to *new* oil, in which may remain any traces of water, a peculiar etherification sets in, the odour of which is very unpleasant.

"Mr. Cripps, of Birmingham, has kindly undertaken to examine samples of oil with a view of obtaining analytical data for comparison with other samples of the same oils; as, for instance, the iodine and bromine absorption equivalent, effect of age, etc.

"Of course tests for adulteration are known, also methods of taking the specific gravity, boiling point, etc."

INDIAN DRUGS.

The following specimens have been presented by Dr. W. Dymock, of Bombay, and the information concerning them is taken partly from Dr. Dymock's letter and partly from his work on the 'Materia Medica of Western India.'

Clerodendron infortunatum and *C. inerme*.—In the leaves of these plants Mr. D. H. Cooper has detected a bitter principle, and an acid which he identifies with chloratin and ophelic acid. This discovery is the more remarkable, since *chirata* belongs to the Gentianaceae, and *clerodendron* to the Verbenaceae, these natural orders being very distinct. The leaves of the *Clerodendron infortunatum* are mentioned in the Pharmacopoeia of India as an efficient tonic and antiperiodic, and are said to be used as a vermifuge. The leaves are cordate-ovate, 8 to 10 inches long and 7 to 8 inches broad at the base, hairy and dentate at the margin.

Those of *C. inerme* are much smaller, being only 1 to 2 inches long, oval, smooth and dotted on both sides with dark green dots. The leaves of this species are used as a febrifuge in intermittent fevers.

Alangium Lamarkii.—The root of this tree (which belongs to the natural order Cornaceae) is used in leprosy, syphilis, and skin disease. It possesses emetic, diaphoretic and antipyretic properties, and is, according to Mr. Moodeen Sheriff, a good substitute for Ipecacuanha in all diseases except dysentery.

Casuarina esculenta.—The root of this plant is stated by Dr. Dymock to be of great repute in Goa in cases of hepatic disease and hemorrhoids. Attention has already been directed to the drug in this country in a paper by Dr. Mootooswamy read at the British Pharmaceutical Conference (*Pharm. Journ.*, Nov. 1889, p. 377).

Chloroxylon Swietenia.—The bark possesses astringent properties, but does not appear to be much used in Indian medicine. The tree yields the Satinwood of India.

Kylinia monocephala.—This little Cyperaceous plant is given as an antidote to poison. It possesses aromatic properties.

* See *Pharm. Journ.*, [3] xvi., p. 125.

Herpestis Monniera.—Dutt states that this plant is considered to be a nerve tonic, and as such is useful in insanity and epilepsy. Ainslie says that it is diuretic and aperient and is serviceable in cases of dysuria accompanied with constipation.

Adiantum lunulatum.—Used by the Mahometans of India as a substitute for the ordinary maidenhair of Europe, and is employed as a deobstruent and resolvent.

Jatropha glandulifera.—The oil of the seeds of this plant is used as an application to ringworm, chronic ulceration, etc. An account of its properties was published in the *Journal de Pharmacie*, [3], xl., p. 16.

Calotropis gigantea.—The flowers of this Asclepiadaceous plant are used in cough, asthma, catarrh and loss of appetite. The bark of the same plant is used as an alternative, and is said to promote the various secretions of the body, and hence to be useful in skin disease, dropsy, etc.

Asafetida.—The tears sent are stated by Dr. Dymock to be the largest he has ever seen.—*Pharmaceutical Journal*.

REPORT ON THE ROYAL BOTANIC GARDEN, PERADENIYA, NEAR KANDY.

(By the late Dr. W. C. Ondaatje, Acting Botanical Superintendent, 1st June 1843.)

(Continued from page 9.)

Myristica officinalis, Linn.—The nutmeg is now covered with flower and fruit, and I have been already able to raise a pretty good number of seedlings (about 180) from the ripe fruits.

The nutmegs are of an excellent flavour.

Caryophyllus Aromaticus, Linn.—Clove trees are likewise growing remarkably well, and are all at this moment in full bearing. A vast number of seedlings have been obtained, and there are still a great many available at the Garden.

Amomum Cardamomum, Linn.—Cardamom plants are found here growing since the days of Mr. Moon. The Cardamom they produce is of an excellent quality, and I have no doubt will always find a ready market.

Eugenia Pimenta, D. C.—Allspice succeeds well.

Melaleuca Cajuputi, Roxb. *Croton Tiglium*, Linn.—*Melaleuca Cajuputi*, a well known and useful medicinal plant grows remarkably well, and has been introduced into this Garden from the Hon'ble Company's Botanic Garden, Calcutta. *Croton Tiglium*, Linn., a native of this Island, promises to be of much medicinal use, if only extensively cultivated.

Janipha Manihot, H. B. K.—*Janipha Manihot*, a plant from which the *Tapioca* is made, thrives well here.

Datura Stramonium, Linn.—*Datura Stramonium*, (In Singhalese, *Ratta atana*, *Rata* signifies foreign) grows in the Garden remarkably well, and I have seen several plants in the neighbourhood of Kandy growing wild with much vigour and luxuriance.

Theobroma Cacao, Linn.—The Chocolate plant grows exceedingly well, and with very little care:—Seedlings also of this plant shoot up spontaneously about the Garden; its beans, when prepared like Coffee, make an excellent drink, so that the well chosen name of "food of the gods" by which the illustrious Linnæus has designated it, holds good in the case of our own plants.

Vanilla Aromatica.—The sweet Vanilla is found in Peraderia on some of its noble hills; but I am sorry to state that it does not thrive so well in the Botanic Garden, as in its own locality.

West Indian Yam (*Arum Sp.*)—"West Indian Yam" grows abundantly in the place, it is excellent in quality and if only known as it ought to be, it will, I think, supersede the potatoe.

Mauritius Sugar Cane, *Coffea Arabica*, Linn.—It is very easily cultivated. Mauritius Sugar Cane grows well. I merely allude to this as it is a well known fact in this country. Several portions of the Garden are covered with Coffee plants, most of which are now in full bearing, and all applicants are most liberally supplied with seedlings.

The Coffee is most excellent in quality and equal to the very best kind.

Sansevieria Zeylanica.—Among plants producing vegetable fibre, the *Sansevieria*, *Zeylanica*, Linn. is deserving of particular attention, as it yields a very strong and durable cordage.

Sago and Date Palms.—The Sago and Date Palms grow well here, but as Ceylon is a country which is so remarkable for its fine majestic Palms, I need perhaps hardly notice the circumstance.

Tobacco.—I have recently succeeded in raising seedlings from the *Jibele* and *Rowsa* Tobacco seeds kindly given to me by Dr. William Griffith, the able Superintendent of the Honble Company's Botanic Garden, Calcutta.

3. *The Improvements I have been effecting*.—In the third place I beg leave to call His Excellency's attention to the improvements I have been effecting. One of the first things, to which my attention was called after I had taken charge of the Garden, was the putting in order the cultivated part, which I have almost succeeded in accomplishing.

I am also engaged in collecting chiefly from the jungles, the greatest number of species of indigenous plants and arranging them, as far as practicable, according to the "Natural Order," a system of great importance in every Botanic Garden, but which does not appear to have been generally adopted here.

It would seem however from the regular arrangements, of some plants, that the late Mr. Moon conducted his operations, to a certain extent, according to the Linnæan system of classification.

One great advantage of collecting together native plants will be the opportunity which will thus be afforded of examining and ascertaining, with the greatest facility and precision, their various properties and qualities, and it is perhaps the more necessary to do this, as I have good reasons to believe that this Island contains many plants which may serve the purposes of Commerce, and the Technical Arts, and be used as Mordants, also in Medicine.

Appropriation of a piece of ground as a Medico-Botanic Garden.—Considering the great utility of indigenous medicinal plants, and encouraged by certain works recently published at Calcutta and Madras, on the subject of Indian Botany and Materia Medica, I have devoted an extent of 5 acres of land for such plants.

There are not a few drugs of this country that may be substituted for those of Europe, which are costly, difficultly obtained, and very often are found to be inert from having been kept long.

A few instances in proof of this observation may here be adduced. The *Hemidesmus Indicus*, R. Br. is an excellent substitute for the *Sarsaparilla*, nay I am bound to say (as I have known its virtue practically) it is even to be preferred to the *Sarsaparilla* itself. In India this is extensively used with success, and the opinion of the Faculty in Calcutta is much in its favor.* Witness again the bitter tonic, † *Cocculus Cordifolius*, D. C. In *Plumbago Zeylanica*, Linn. a plant of this Island, we have a blistering

* By desire of the Medical Board of Bengal, the Hon'ble Company's Dispensary has been supplied with 1½ maunds of the root of the *Hemidesmus* from the Calcutta Botanic Garden.

Hemidesmus indicus, in Singhalese *Irmus*, in Tamul *Nannare vair*, in Bengalle. *Annet Mil*.

† This may supply the place of the *Quassia*.

agent; add to these the *Convolvulus Turpethum*, Linn. (*Ipomea Turpethum*, R. Br.) *Croton Tiglium* and *Hebradendron Gambogioides* of Professor Graham, which are useful Cathartic Medicines. Observe likewise the *Strychnos Nuxvomica*, Linn. a most formidable poison found abundantly in the jungles, but a valuable remedy in paralysis, rheumatism, neuralgia, &c. Many others may here be enumerated; but it is not necessary to do this on the present occasion.

I cannot take leave of this subject without inserting the just remark of the learned Professor Lindley, who observes, "No one will be bold enough to assert that the Physician already possesses the most powerful agents produced by the vegetable kingdom; for every year is bringing some new plant into notice for its energy, while others are excluded because of their inertness. In tropical countries, where a fervid sun, a humid air, and a teeming soil give extraordinary energy to vegetable life, the natives of these regions often recognise the existence of potent herbs, unknown to the European practitioner. We are not altogether to despise the experience of natives less advanced in knowledge than ourselves, or to suppose because they may ascribe imaginary virtues to some of their officinal substances, as has been abundantly done by ourselves in former days, that therefore the remedial properties of their plants are not worth a serious investigation; or that their medical knowledge is beneath our notice, because they are unacquainted with the terms of modern science."

Nursery established.—In order to possess the means of making more liberal distribution of plants, seeds, &c. to applicants, I have commenced, on a small scale, a Nursery, which, I beg to remark, is a very useful accessory to Botanic Gardens in India; for as my honoured Preceptor, the eminently learned Doctor Wallich, has justly remarked "From the absence of the facilities which exist in Europe, the Botanical Gardens in India are obliged to unite in themselves the Offices of Botanist, Gardener, Nurseryman and Seedsman."

Garden divided into Departments.—It thus appears that the Garden at present comprises the three following divisions:—

- 1.—Plants interesting in a purely *Botanic* view.
- 2.—*Medicinal* plants, chiefly natives of this country, to ascertain their true medicinal virtues.
- 3.—A *Nursery*.

With a view of obtaining an ample and faithful collection of plants of this Island, I intend forming an *Herbarium*, having duplicate specimens (if possible more) of such plants; which may be eventually disposed of in a manner the most advantageous to Botanical Science.

Measures necessary for the advancement of the Botanic Garden.—I have now in conclusion to suggest a few measures for the advancement of the Garden.

The first thing necessary to be done, is *clearing* the extensive portions of ground, which are now overgrown with jungle, and of course perfectly useless for any Botanical or Horticultural purpose, which, it must be evident, will require more laborers than are at present employed, as it would prove but mere fruitless effort to attempt such a work with those I have now in the Garden.

The establishment may however be reduced, as soon as the useless exuberant vegetation in the place is *destroyed*, and the Garden well laid out and duly organized.

I beg also to bring to his Excellency's notice the necessity of employing *two additional men* on the fixed Establishment for the Nursery, whose sole duty it will be to practise Horticultural operations under my superintendence.

In training these men for their work, I shall endeavour to adopt the excellent principles and practice laid down by Professor Lindley in his able work on the "Theory of Horticulture," a book which deserves to be more *extensively* known here than it is at present.

An additional *Plant Collector* is likewise highly necessary, I would say indispensable, to make proper collections of, and prepare plants for the Herbarium. There is at present but one plant collector.

The climate of Nuwera Ellia being so much allied to that of the temperate parts of the globe, and the vegetation on and around its hills resembling that found in those parts; I would respectfully suggest to His Excellency the Governor the establishment of a little experimental garden there in order to naturalize the most useful plants of Europe. I have been led to make this suggestion from having been kindly allowed access to Captain Champion's collection of plants made during his little excursions into Nuwera Ellia and Adam's Peak, where I find several plants, natives of a cold climate.

The Receipts of the Garden remitted to the Government Agent for the Central Province, from February to May inclusive, amount to £8 9 10½,

	£.	s.	d.
February.....	0	19	0
March.....	0	11	0½
April.....	1	7	10
May.....	5	12	0
Total....	£8	9	10½

The expenditure of the Garden for the same period amounts to £150 19 7½, viz:

Fixed Salaries.

For February.....	8	9	4¾
„ March.....	15	8	6¾
„ April.....	17	7	11¾
„ May.....	20	0	4¾
Total....	£61	6	3¾

Amount voted by the Legislative Council for the Botanic Garden, £500 per annum.

Herewith I beg leave to forward an interesting paper entitled "Remarks on the state of Botany in Ceylon with reference to the knowledge of it in April 1843, and an attempt at arranging its Flora, as known to Moon and resident Botanists, according to locality and elevation, commonly called Geographical distribution of a Flora, by Captain Champion, 95th Regiment." (Vide Appendix B.)

Wm. C. ONDAATJE,

Actg. Botl. Superintendent.

Royal Botanic Garden,
Peradenia, 1st June 1843.

(Appendix to be given.)

THE EURASIAN COLONY IN THE MADRAS PRESIDENCY.

The *Pioneer* writes:—

The President of the Anglo-Indian and Eurasian Association, Mr. Gantz, last year described the Eurasian colonies of Whitefield and Sausmond, the creation of the energy of the late Mr. D. Starckenburgh White as the *magnum opus* of the Association; but it is to be feared that, while they cannot with justice be said to be altogether a failure, they have been far from attaining the success or fulfilling the purpose their founder expected and intended. At the time of the inception of his scheme Mr. White stated that his object was "to settle Eurasians on the soil, to lead them into agricultural pursuits, and to remove for ever the feeling of anxiety as regards their future and that of their children; and again, in 1886, he declared his aim to be "to send the able-bodied destitute, old and young, only as labourers to be fed and paid, leaving it to them to rise by good conduct to the level of settlers: to send persons of slender means to carry on trades of various kinds, giving them each an acre of land: and to send persons of sufficient, yet moderate, means to farm, giving them allotments of land extending to twenty acres." Mr. White's idea, in short, was to found a self-contained community of Eurasians, consisting of three classes, agricultural, industrial and labouring, from which outside competition should be entirely excluded. The vision was fascinating, but like other dreams of idyllic communities it took too little account of the infirmities of the men on whom success depended and on the working of economic law.

What has really happened may be gathered from a very sympathetic description of a visit paid to the colonies last autumn by Lord Connemara, the writer of which is Mr. Rees, who has already given us so many agreeable narratives of a similar sort. The first view of the settlement at Whitefield was not calculated to excite enthusiasm. "It had not," says Mr. Rees, "a very flourishing appearance. Some of the cottages were moderately neat, but in no case had any settler apparently the time or inclination to cultivate the Graces. In the neighbouring town of Bangalore the bungalows and verandahs are generally covered with orange bignonia, violet petraea, various thunbergias and a wealth of convolvulus; but the Whitefield settler has not called them to his aid, and the village has a somewhat bare and unattractive appearance." Nor did personal converse with the settlers themselves serve to prove that the actual condition of the colonists was belied by this uninviting exterior. The oldest settler in the place said his lands had never paid him. He had had some capital and had come there expecting to make a living, but he had hoped for help from the Association which he had never received. The cattle were not strong enough for improved ploughs, and the ground was not good enough for large crops. Very similar was the story of a more recent settler—always the cry for external help: and the most cheerful accounts came from a colonist who did not reside in the village at all. The artisans and the able-bodied destitute, whom Mr. White pictured leading a frugal and contented life among members of their own race, were apparently nowhere to be seen. The only real success had been attained by persons with moderate capital who reared pigs and poultry and cultivated fruit.

From all this there seems to be but one conclusion possible. For the Eurasian pauper or even for the person of slender means Mr. White's scheme has done nothing, and in the nature of things could do nothing, for both classes are beaten at every turn by the native labourer and the native cultivator, and the idea of excluding competition was from the first chimerical. Pensioners, who have accumulated a certain amount of capital are in a rather better position, though even they can hope for success only by leaving the ryot in secure possession of his own ground and turning their attention to fruit-growing, arboriculture, and the like pursuits. In a word Whitefield and Sausmond have given to those who already had; but they have not, as their founder expected they would, provided the less fortunate members of the Eurasian community with a

means of livelihood; nor is there any reason to believe that their educational value has been greater, or that the experiment has developed that spirit of energy and self-reliance the lack of which is the worst defect in the Eurasian character. The case, Mr. Rees remarks, is one for kindly criticism and a helping hand; but he is at the same time quite uncertain whether the colonies will reach old age or even adolescence. Is this really to be taken as the *magnum opus* of the Eurasian leaders?

AGRICULTURAL AND INDUSTRIAL ASSO- CIATION OF FIJI.

SUGARCANE.—The acreage under this product during the past year has been from various causes, considerably reduced. The floods in the early part of last year not only destroyed large areas of cane which would, under ordinary seasons, be now turned into sugar, but deprived the soil of all fertility for some months reducing that which had escaped the floods to a mass of green unripe canes at the time most favourable for cutting and reaping.

On the Ba the returns so far have been satisfactory if report is to be taken as a guide.

BANANAS.—This product of the colony not only rivals the former but from a commercial point of view far exceeds it in importance to the colony. Your committee are within the mark when they say in reference to this product of the colony, that but, for its considerable extension, the colony would be in a very much worse condition than it is now. Notwithstanding the exactions levied upon this product from the ships outwards, the area under cultivation has been largely increased. The export value of this product for last year, was about £42,000, and there is no reason why it should not be more than double, and at remunerative prices to the grower. Care and attention has been latterly bestowed upon the cultivation and selection of fruit for the market and when this has been done the disease has not made much headway. There is as yet no specific for this disease. Baron von Mueller's recommendation is in one or two particulars impracticable: first too expensive; second, of too dangerous a character to be entrusted to irresponsible persons. The other particulars are valueless being too weak to destroy the fungus.

The exports of fruit for 1889 were, Bananas £42,526. Pineapples, about £2,500.

It is said that if the banana plantations of the entire tropical world were utilised as they ought to be, the market would be flooded with a textile material that would quickly influence the value of such rivals as hemp, flax, cotton and jute.

COPRA.—For the last year or two nothing but disaster appears to have overtaken this product. Hurricanes succeeding hurricane, attended with a very slack market and low prices.

Your committee, however, trust that an immunity from hurricane may be experienced by those depending upon a crop of this product for this year and the next. Prices have lately advanced a little.

Exports 1889, £39,158 12s 4d.

COTTON.—Your committee are of opinion that in cotton cultivation on a small scale remains a profitable experiment, where the climate is suitable. The kidney variety has been grown for the last two years under Government supervision with marked success; and, whilst there is no danger of overdoing or overstocking the market with this article of commerce, they would recommend the planting of an acre or two where the land is available. There is no tangible reason why cotton should not become one of the staple products of the colony; and, through the Planters and Fruit-growers Co-operative Association, the product could be delivered direct to the manufacturer, leaving a very fair margin of profit to the grower. That this latter suggestion is practicable we have evidence in the recent action of the Lancashire manufacturers and operatives in support. Rather than submit to the cotton ring in Liverpool the operatives elected short time and semi-starvation to support their

employers to break down the ring, which they ultimately did. A revival of the cotton industry is contemplated in Queensland, where the previous failures were similar to those of Fiji, not the actual reduction in price of cotton, but the charges of the middleman was the cause of failure in both instances. The wool trade of Australia is undergoing a similar metamorphosis. The continental manufacturers are getting a particular kind of wool direct from South America to escape the London brokers &c. and instead of buying so largely in London now of Australian wools, they send their buyers to Australia. Care, however, should be exercised in the selection of the variety of cotton to be grown, to suit soil and climate.

Export 1889 £787 19s 7d.

TEA.—This article of production still maintains its character of excellence. There has, however, been no addition made to the area under crop. Upon suitable labour supply depends the extension of the area or being able to compete with more favored countries in this respect.

Export 1889 £1,459 1s.

COFFEE.—It is a matter of regret that this article has all but ceased to be produced.

Export nil.

RICE.—Your committee are proud to say that, quite unexpectedly, it has been brought to their notice that about 20 acres of land is now planted with rice at Rewa, and, when visited by the President, looked vigorous and strong and promising a heavy crop.

FIBRE PLANTS.—It will be interesting to you to know that at last a machine has been invented to decorticate and prepare Ramie fibre for the chemical operation, which appears to be a necessity before the fibre of this plant can be used as a textile fabric. Ramie in the ribbon state is worth about £18 per ton. The author of a paper read before the Franklin Institute says of it "I will call it by no scientific name; I will simply name it as the richest of all plants, for it possesses wealth of growth, wealth of development and wealth of fibre; in ordinary light ground with a little watering now and then by rain or irrigation, no plant will grow so rapidly, no root will multiply more quickly and produce more stalks, no vegetable fibre is handsomer, richer, or more silky than Ramie." It is a perennial and when once put in the ground it grows for over twenty years without replanting and according to climate gives from two to four crops a year. There are from 10,000 to 16,000 plants in one acre giving in crude fibre dry 1,600 lb. or 700 lb. bleached fibre per crop, and as there would be three crops at least in Fiji the return per acre would be from £36 to £40.

Your committee regret the matter of paper making fibre, which was taken up by a committee specially appointed, has so far eventuated in nothing, not even in ascertaining the value of the fibres sent home as samples, and they believe that there is a profitable investment for the necessary capital to establish a paper mill in Fiji.

Exports fibre, 1889, £98 13s. 6d.

TOBACCO.—During the past year, tobacco, like maize, had to be imported to supply the demand. There is no country in the world better adapted for the growth of tobacco than this colony and the Association should be in a position to introduce an expert to cure the leaf fit for any market in the world, on getting a legal guarantee for a certain area and under conditions of mutual arrangement.

COCOA.—This valuable product has not as yet asserted for itself that position which it deserves, but it is pleasing to note that one or two have planted out a few trees and in a short time it is hoped that, though in small quantities, it may figure among the exports of the colony.

LABOUR.—This most important question is at the present moment in a more satisfactory condition than for some years past.—*Fiji Times*, April 16th.

RUBBER.—A New York contemporary states that there are more than 120 rubber manufacturers in the United States, employing 15,000 hands, and producing annually 280,000 tons of goods, valued at \$260,000,000.—*India Rubber Journal*.

THE FAILURE of the attempt made by the Indian Tea Supply Co., Ltd., to popularise tea among the natives of India, was probably a foregone conclusion. There is nothing more difficult, says the *Statesman*, than to induce people to consume as food what they have previously been accustomed to regard as medicine; and this is the light in which the people of India, in common with the French and the Italians, have always looked upon tea. Cheap, again, as the lower qualities of tea are, the cost of the beverage, as an article of ordinary diet, would be quite disproportionate to the scale of native expenditure among any but the wealthy.—*M. Mail*.

COOLIES FOR FIJI.—Early in April, 1,100 Indian coolie labourers were expected to arrive at Fiji for the service of the Colonial Sugar Refining Company, and eighty-nine Polynesian labourers have been allotted to them. This certainly looks as though they intended extending their operations in this colony. There is some talk about forming an agricultural department in the local administration, and its advocates declare that it is the only panacea for the present depressed state of affairs. Considering that the Government are now really trying to encourage the introduction of fresh capital and enterprise by offering unoccupied lands for lease, and publishing pamphlets on suitable agricultural products, it can hardly be expected to form in addition an agricultural bureau, at the expense of an additional 2½ per cent *ad valorem* on drapery.—*Indian Agriculturist*, May 10th.

GREEN TEAS IN THE COLOMBO MARKET.—We omitted to call attention to the fine average price realized by Mr. Drmond Deane for his Kintyre Green teas at the last public sale held in Colombo. The teas were sold by Messrs. E. Benham & Co. and realized the following prices:—

Kintyre—66 boxes	660 lb.	1c.
54 boxes	1,080 lb.	76c.
14 ½ chs.	741b.	59c.
25 boxes	532 lb.	49c.

3,056 lb. 64c. average.

Considering that this parcel includes the whole of the bulk, except 2 per cent of dust and 1 per cent of Congou, the average obtained, viz. 64 cents, is very satisfactory, and we take it is higher a good deal than would have been obtained for the same teas manufactured in the ordinary way.

HORTICULTURE IN COSSIPORE.—Babu Hem Chunder Mitter's Practical Institution of Horticulture, Floriculture, and Agriculture at Cossipore is a standing testimony to the enthusiastic pursuit of botany and gardening by a Bengali, and a gratifying instance of natives being trained in a profitable and pleasurable calling through the efforts of one of their own countrymen. The magnificent show of fruits and flowers at Seven Tanks, last February, demonstrated the success of Mr. Mitter's Institution as a nursery where scientific principles are both tested and practised. We now learn from the Annual Report how much quiet work of the most endurable kind is being accomplished at the same institution. Eight native students, undergraduates of the University, were admitted during the year, to be supported and educated free till they know enough to hold responsible positions in public or private gardens, or in connection with zemindari lands. Further, among a number of interesting experiments which were conducted with genuine enterprise, not the least hopeful were those with indigenous fibres. The result of these was to prove the great superiority, in strength and durability, of the fibre of the "Abel Moschus," a hibiscus scientifically known as *Malachra Capitata*, which is common in India in the rainy season.—*Englishman*.

BOMBAY ALOE FIBRE.

The following correspondence given in the *Bombay Gazette* of the 14th instant is of local interest in connection with the recent discussion in our columns. We suppose, it will require tea to fall a little lower, and the labour supply to undergo a very considerable increase, before some practical attention is given by our planters or merchants to the work of developing a trade in superior fibres such as those which are sources of so much profit in Mexico and the Bahamas.

The following correspondence is sent to us for publication:—

Letter from D. Morris, Esq., to J. A. Godley, Esq., c B, India Office, S. W., dated Royal Gardens, Kew, 14th February.

With reference to my letter of the 21st February 1887 and subsequent correspondence on the subject of Bombay aloe fibre, I am desired by Mr. Thiselton Dyer to inform you that the specimens of plants from India, advised in your letter of the 21st ultimo, have been duly received at Kew.

2. These specimens confirm the fact that the Bombay aloe fibre of commerce is prepared from the leaves of *Agave vivipara*, L., an American species of agave now widely distributed throughout the sub-tropical and tropical parts of the old world, and some parts of India. From the interesting report of the Officiating Director of Land Records and Agriculture (Bombay) we gather that the fibre is extracted by certain depressed castes of natives by crude and destructive methods, and that so far no attempt has been made to cultivate the plants. They are chiefly used as hedge plants and are "nowhere at present in abundance."

3. It is evident, however, that plants exist in Bombay in sufficient quantity to supply several hundred tons of fibre received in this country. After a consideration of the facts noted below it might be found advisable to cultivate this species of agave on waste lands in Bombay entirely for the sake of its fibre; or the Sisal hemp plant (*Agave rigida* var. *Sisalana*) might be introduced on a large scale. This latter yields the most valuable fibre of any derived from species of agave, and there is little doubt it would thrive equally well in India. The important fibre industry of Yucatan, created entirely within the last twenty years, is now of the annual value of about three-quarters of a million sterling. India has therefore good grounds for devoting attention to an industry which so far has established itself on a moderate scale in spite of adverse circumstances.

4. In order to test the quality of the fibre produced by *Agave vivipara*, when cleaned by machines similar to those in use for the preparation of Sisal hemp in Yucatan and the West Indies, a few of the broken leaves, about a foot to two feet long, taken from the larger plant received at Kew, were forwarded to the Death Fibre Machine Company, 147, Leadenhall Street, E. C. A sample of the fibre obtained by passing the leaves through the Death machine is forwarded herewith (marked A); while for purposes of comparison a sample of the ordinary Bombay aloe fibre as it comes into the London market direct from India, is also enclosed (marked B).

5. The great difference in quality and value between these two samples is well given in a report prepared by Messrs. Ide and Christie, a copy of which is herewith attached. The value of the machine-cleaned fibre ranges, according to length, from £25 to £30 per ton. The ordinary Bombay aloe fibre, cleaned by hand, is worth only from £5 to £12 per ton. These figures fully bear out the opinion offered in my letter of the 21st February 1887 that the Bombay aloe fibre industry was capable of being greatly improved. At the present time, there is in stock in this country a thousand tons of Bombay aloe fibre, which prepared roughly by hand will only realize about £3,000, a price that will probably hardly pay expenses. If this fibre had been cleaned by machinery and presented in the condition of the sample marked A, it would realize about £27,000 or more than three times its present value. It appears possible, therefore, without any extension of the present agave plants in Bombay, to

increase to a very appreciable extent the returns on the shipment of aloe fibre from that Presidency.

6. Mr. Thiselton Dyer has little doubt that the facts herein stated will prove of considerable interest to the Government of India, and they deserve to be widely known amongst those concerned in the aloe fibre industry.

Letter from Ide and Christie to D. Morris, Esq., M.A., F.L.S., dated 72, Mark Lane, London, E. O., 6th February 1890.

We have your favour of the 4th instant with sample of fibre extracted by Death's process from the leaves of *Agave vivipara*. This is an excellent fibre, of fair strength, fine colour (which, however, may change somewhat under continued exposure to the air), and were it three times as long, would be worth £30 per ton today in London; if twice as long £27; and as it is, it may be valued at £25.

The ordinary "Bombay aloe" of commerce presents a very different appearance to your specimen, as perhaps samples in your museum may show. Its value, today is—good £12, common £5 per ton.

LABOUR (COOLIE) SUPPLY IN CEYLON:

THE KANGANI AND "COAST ADVANCES"

SYSTEM ON CEYLON ESTATES.

Recently, when detailing the system of money and rice advances against monthly wages to coolies employed on estates, and of settlements for two or three months at a time, we alluded to the kangani system as having, equally with the system described, survived all outside objections. We did not then however, enter on the peculiar feature of this kangani system, that of "coast advances." "Coast" in Ceylon parlance means the opposite coast of India, and the "advances" are made primarily to Tamil kanganis to enable them to proceed to the coast of India and inland into the densely peopled districts, to obtain and bring over a force of labourers. By a now settled custom the advance made to the kangani, and for repayment of which he is responsible to the estate owner or superintendent, is R10 for each cooly. By another well established custom this advance of R10 per head has assumed to some degree a perpetual form. That is to say, the kangani of a gang of labourers employed on an estate owes the estate R10 for each of his labourers, while they are correspondingly indebted to the kangani. If there are 500 men, women and children (the latter able to work) employed on an estate, the books of that estate as a rule so general as to admit of few exceptions, will show R5,000 out in "coast advances." All this is simply a matter of custom and agreement, and in the rare cases where coolies cheat a kangani, or a kangani and coolies cheat their employer, there is only the civil remedy available, the labour laws providing no penalties for what they do not recognize. Under certain circumstances such as we heard of recently, the charge of "obtaining money under false pretences" could, we should think, be preferred. The honourable understanding amongst planters is that when a kangani and his gang leave one estate they shall not be engaged for employment on another unless the kangani produces a "tundu," that is a bit of paper from the previous employer stating that anyone paying such previous employer the advances due, the amount being stated, can take on the kangani and his gang. It is, of course, part of the honourable understanding that the previous employer acts *bona fide* and uses all his influence for the transfer intact of the gang to the estate of the person who has given him a cheque for the advances. As a general rule the system works

smoothly, because the vast majority of the planters are honourable men. But there are a few "black sheep" amongst the planting community, and of one of these we lately heard, that after apparently transferring a couple of gangs, whose advances had been repaid to him, he allowed a considerable proportion of the gangs to come back to work on his estate, protecting and encouraging the deserters, instead of assisting the kanganies to recover the lost men and aiding the estate proprietor whose money in repayment of advances he had received. Of course a person thus acting is not recognized as an honourable man, and it seems to us that all such cases should be taken up and publicly dealt with by the District Associations. It will be seen that paying coolies every cent due to them as wages each month tends to make the coast advances more and more risky, and on this subject and that of weeding contracts given to kanganies, as constituting an additional security, our correspondent "1873" writes largely today. His views are worthy of careful attention, but we are sorry to see him give so unfavourable an opinion of the class of labourers of Tamil origin who have been born and brought up in Ceylon and who are included in gangs receiving "coast advances." We had hoped that such coolies would have been amongst the best and most trustworthy labourers on estates, and we feel sure that in many cases old planters have so recognized them.

The system of "weeding contracts" may be briefly explained. In Ceylon, whether coffee, tea, cinchona or cardamoms are cultivated, the keeping of the ground clear of weeds is deemed essential. Gradually a custom has arisen of separating this work from the other operations on an estate, and entrusting it to the various kanganies, who, beside the labour they provide for general purposes of the estate, employ "weeding gangs" on their own account. On the understanding that the section of an estate for which a kangani gets a weeding contract is kept clean, by being weeded, as a rule, once a month, the estate owner pays the kangani a certain monthly rate per acre,—generally R1 per acre per mensem, or R12 per acre per annum. On these contracts the kanganies usually make an appreciable profit, in addition to head money which they receive for coolies in the gangs they provide for the general purposes of the estate. Kanganies will object to go to estates on which weeding contracts are not given out. It is evident, therefore, that the system is generally remunerative to the kanganies, while, so long as full weeding gangs are kept up and the land is kept clean, it saves the superintendent a great deal of trouble. When a weeding contract kangani fails to keep his section in a clean condition, the superintendent puts on a portion of the force at his disposal and charges their wages against the contract rates, paying the kangani only the balance due to him. Our correspondent "1873" indicates that this system of weeding contracts, beside adding to the emoluments of the kanganies, acts as an additional security to the estate owner for coast advances, in proportion to the amount due to the kanganies for weeding contracts which is kept in hand.

To outsiders all this may seem complicated, unscientific and not in accordance with strict law. But "custom," which suits all parties and of the working of which none but defaulters or the dishonest and those who suffer at their hands complain, has, as we stated when discussing the wages advance system, all the binding force of statute law with far more of the equity which is superior to all written law, whatever its penalties and sanctions may be. The fewness of the cases

in which the courts have to decide disputes between coolies and their employers, is a strong argument for letting well alone. The cooly is a free agent,—free to come and free to go,—except where he compromises his freedom by going into debt. This the cooly too generally does, borrowing of the kangani, while the kangani borrows from the chetty, high interest being charged in both instances. In this as in other cases of the kind "the borrower is servant to the lender." Some believe, with Sir Arthur Gordon, that a system of full settlement of wages at the end of each month would prevent this great evil. But the vast majority of those who know the people and their idiosyncracies best have no faith in the panacea. We largely share their scepticism, and we look for improvement only to time and education—giving this latter term a much wider meaning than mere schooling. One thing is certain: that no body of labourers in the world are, as a general rule, better treated than those employed on Ceylon estates, it being the interest of the planters as well as their duty to treat the class on whom their own success depends, not only fairly but kindly. Sinhalese labour is useful but not reliable; and if, from any cause, the Tamils of India ceased to seek employment in Ceylon, the vast majority of the estates would have to be abandoned.

TEA PLANTING IN THE NUWARA ELIYA DISTRICT—OVER 6,300 FEET.

(From a Resident Proprietor.)

You asked me to let you know how my yield turned out compared with my estimate. I estimated that I should get 20,000 lb. green leaf between 30th September 1889 and 1st October 1890. I shall exceed that this month considerably, and have 3 months to the good. This year's yield is added to slightly by tipping 5 acres planted in August 1888. But that is very little.

Acreage.	Garden.	Altitude.
12½ in the block	("Elephant Nook.")	6,200 feet
½ for reserve		

13

Less bungalow and gardens, two large ponds, lines, store, two cattedleds, pig-sty, &c., say two acres, giving in tea 11 acres.

11 acres planted *Attabage seed at stake*, after came up here in July 1885, has yielded as follows:—

	1889.	1890.
January ...	577	1,096
February ...	1,430	1,097
March ..	1,130	2,766
April ...	1,555	2,747
May ...	2,125	2,455
June ...	1,266	
July ...	1,645	
August ...	1,721	
September ...	1,683	Pruned (cut across)
October ...	1,710	in August 1888.
November ...	2,160	
December ...	2,088	

19,040 = 433 lb. made tea per acre.

The seed at stake was not a great success. Fully 25 per cent were supplied with plants (mostly plants from Abbotsford; seed from Inverness) in 1886. The black grub ate down the shoots time after time; otherwise the seed at stake germinated well.

When planted "seed at stake" it was all in cinchona, and the ground was dibbled not holed for the tea.

COFFEE PLANTING IN THE STRAITS SETTLEMENTS AND IN CEYLON.

An ex-Ceylon planter now travelling in the farther East writes as follows from the Straits:—

"Will you kindly oblige by informing me, whether there is any really good virgin forest-land in Ceylon up-country, in Haputale, or elsewhere, belonging to Government or private parties, that would produce good coffee if planted to pay, or would it be affected with leaf disease and not come well into bearing?"

"Is it proved that leaf disease exists in the seed or coffee bean? Leaf disease on Liberian coffee in Johore does not appear to do any harm; the trees appear to winter, and the leaves drop off, but fresh ones come in their place very soon afterwards and the coffee bears very well on very poor sandy soil close by the sea, but as you may know it is a large bulky tree and large cherry with very thick tough skin and the bean not large in proportion.

"From reports tea is not doing so well in Johore as might be expected considering the suitable climate: it does not flush well. Pepper and gambier appear to pay the Chinese well. I trust that tea is doing well in Ceylon."

There are no doubt some select blocks of forest land still left even in our hillcountry, notably one now offering in Haputale, and if our correspondent or his friends mean business, let them send an advertisement with their address, and replies from proprietors or agents are very likely to result. Coffee planting with shade should do in Uva as well as in Dambara. We are very much puzzled as to how Liberian coffee in Johore can escape injury from leaf disease: our old friend Mr. Turing Mackenzie should tell us all about it. In Ceylon the leaf fungus was so prevalent on Liberian coffee leaves in the lowcountry that it could be spooned off! It is quite possible as trees grow older they may do better; but unfortunately most of the Liberian in Ceylon was cleared to make way for tea.

CEYLON UPCOUNTRY PLANTING REPORT.

THE MONSOON AND EARLY PLANTING—COFFEE: GOOD

CROPS—CACAO—TEA—COOLIES.

June 5th.

What has come over the monsoon? It is to be hoped it will turn up by-and-by; meanwhile the times are rather rough on those men who, anxious to get in plants at the very first rains, began to put out a fortnight ago. It seems quite clear that in planting you can rise too early to catch the worm. When travelling the other day I met a man whose only reason for leaving his estate was, that he had started planting, and just wished he had not! He found life pleasanter away from the suffering plants. When a planter tries to be smarter than his fellows, it would seem as if Providence somehow steps in, and keep him humble!

The COFFEE this year is wonderfully healthy, and where it has been at all treated well there is a very fine crop indeed. There is hardly any leaf disease visible, and as for bug you have to look for it. I don't know that I have seen coffee looking so well for ever so long; but then nobody has any faith in its continuing to do so, and it may be covered with fungus and blackened with bug, ere many weeks are past. There have been four or five blossoms, all of which have set well: the last was out about a week ago, and ought to have been washed off by the monsoon, but wasn't.

CACAO still keeps throwing out its wealth of blossom, in a marvellous way, and is healthy and flourishing. The spring crop is coming in, and

seems to be rather better than last year. The borer is about as usual, and wants a lot of steady hunting to keep it in its own place. It is a sad plague.

TEA flushes in a moderate way. There is a want of rain. If there was more moisture we would do better.

COOLIES keep coming in, and from some parts of the coast there is a willingness to emigrate owing to the drought, which should be encouraged. Advances have shown better results this season than for some seasons back, provided the money has gone to the proper quarter. Where there is the least pinch in any of the recruiting districts of S. India the inhabitants thereof instinctively turn their eyes to Ceylon.

PEPPERCOORN.

TOBACCO PLANTING IN DELI.

(Pinang Gazette, 23rd and 27th May.)

A fermenting shed at Wamptoe Estate with 100 bales of tobacco has been burned to the ground. As kerosine oil was discovered about the place, the fire is believed to have been the work of incendiaries.

The Committee of management of the Soekaboemi Agricultural Company have petitioned the Netherlands India Government protesting against the recruiting of Javanese coolies for Australia, British North Borneo and the Straits Settlements. They ask the Government not to sanction the exportation of any more coolies to those places, basing their objection on the contents of the Government Directory for 1890, and state that if emigration be allowed to go on they will in a short time be under the necessity of applying for Indian labour, which at present is not allowed by the Indian Government to enter the Dutch Colonies. They therefore suggest the introduction of a law prohibiting the export of coolies from Java for places outside of Netherlands India.

Sumatra tobacco has been sold at Amsterdam at from 162 to 202 guilder cents per half kilo. The next sale will be held on the 3rd proximo, and the result will be known here on the following day.

At the yearly meeting of shareholders of the Amsterdam Deli Company it was resolved to declare a dividend for 1889 of 72½ per cent.

The free immigration of Chinese coolies direct from China has had no favorable results as yet, but what is a great thing is, that the Government have sent a Consul to the south of China, and judging from the ability of the person appointed to that post, a good deal may be expected in future. The importation of Indian labour is, however, recommended to the Government with the view of immediate steps being taken in the matter.

THE DISCOVERY OF RUBBER TREES in the great Aruwimi forest by the Stanley expedition is good news to electricians, for the existing supplies have been likely to diminish. In the meantime, an artificial substitute, which, according to Mr. Latimer Clark, F.R.S., promises well, has been brought out, and is to be subjected to searching electrical tests. There are five sorts of this new material—three soft and elastic like cured rubber, and two hard and elastic like wood or ivory. A sixth variety is lighter than water, but is not intended for electrical work. It is stated that the insulating property of the material is higher than that of gutta percha, and nearly equal to that of glass, while the cost is only about 2d per pound. Another advantage is that it burns with difficulty. Its colour is brown, black, or dark blue.—Globe.

RICE.

Does long habit develop a hereditary faculty of rice-tasting? Folks in London who use rice to make puddings or to eat with jam and cream, pay from 9s to 12s a cwt for Bengal white rice, while for Japanese they only give from 10s 6d to 11s 6d, according to the quotations of March 8th. Offer Bengal rice to a Japanese, however, and he turns up his nose at it with contempt. Even a common labourer speaks of imported rice as a miserable affair, and if he finds himself unable to purchase the home-grown article, prefers to have recourse to barley. To him foreign rice is insipid and even unpalatable, whereas to outsiders the difference is scarcely perceptible. This is why rice must go almost to famine prices in Japan before any prospect of profit presents itself to importers, and this is doubtless why so much reluctance has been shown by the Exchanges to admit foreign rice into their quotation lists. It appears that even on the Tokyo Exchange, where enlightened views are supposed to prevail preeminently, great difficulties have been raised with reference to foreign rice, the majority of the shareholders being averse to giving it any public recognition. The officials of the Department of Agriculture and Commerce have, however, combated these scruples successfully, and it is now determined that imported rice shall be quoted in the lists, ranking there with the inferior quality of rice known as *inazurimai*, and being put at from 2 yen to 2.80 yen below the Japanese product. Of course something of the reluctance shown by the Exchanges must be attributed to the novelty of the contemplated procedure. Foreign rice, under ordinary circumstances, is a drug in the Japanese market. Nobody wants to eat it, and nobody thinks of dealing in it. Consequently very little is known about the ruling rates, and merchants do not care to touch an article so unfamiliar. The Osaka folks still maintain an attitude of refusal, but as Tokyo has consented to act in the desired sense, its example will doubtless be followed ere long. It is not the price of rice alone that signifies so much, however. The trouble is that nearly all the necessities of daily life appreciate when rice is dear, so that great hardship results for the lower classes.—*Japan Weekly Mail*.

[This very objection to imported rice long prevailed in Ceylon, and many of the natives object to it to this day. At any rate they prefer the home-grown article. But long years ago the presence here of a vast body of Indian labourers gave imported rice an important position in our commerce which it retains to this day. For imported grain, chiefly rice, Ceylon makes an annual payment to India of about 1½ million sterling.—Ed. T. A.]

PRECIOUS STONES AT THE ROYAL SOCIETY CONVERSAZIONE.

The Royal Society held the earlier of its two annual *conversazioni* on Wednesday night in the rooms at Burlington-house, and this, one of the great scientific events of the season, was as usual, a brilliant success. * * *

No social function during the present season would be complete without including something connected with Mr. Stanley and his recent expedition; and the Royal Society *conversazione* is no exception. Mr. Henley Grose-Smith was able to show on Wednesday night a selection from the butterflies collected in the great African forests by Mr. William Bonny. Nine of the species collected by Mr. Bonny are new to science, and many of the species are West African. * * *

Professor Judd showed some interesting and beautiful specimens of minerals brought from Ceylon by Mr. C. Barrington Brown; the enormous beryl, between 5lb. and 6lb. in weight, attracted special attention. * * *

An exhibit by Mr. D. Morris, of the Royal Gardens, Kew, was of great practical interest; this was a sugar-cane seed and seedlings. As the

result of some experiments with self-sown seedlings, it is anticipated that, by cross fertilization and a careful selection of seedlings, it will now be possible to raise new and improved varieties of sugar cane, and renew the constitutional vigour of plants that have become deteriorated through continuous cultivation by cuttings or slips. Great importance is attached to the subject in sugar-producing countries, as it opens up an entirely new field of investigation in regard to sugar-cane cultivation. Of equal practical interest was Professor Marshall Ward's exhibit of a selection of transparent photographs, showing—(1) the habit, &c., of various trees from different parts of the world; (2) the comparative structure and anatomy of several European timbers; and (3), some of the more prominent features of diseases of wood, &c., and fungi causing them. * * *

Several Egyptian exhibits were very popular. One consisted of three pages of an ancient Egyptian book on medicine, written on papyrus by a scribe named Usertesens Sen, in the 26th or 25th century before Christ. It contains directions for the use of midwives, written in black and red ink, in hieratic characters. A translation was given of one passage on the "Treatment of a woman who is pained in her legs and in all her limbs as one who is beaten. . . . Do thou with regard to her thus: let her eat grease until she is cured." * * *
—*London Times*, May 16th.

THE BONE TRADE OF INDIA.

In the last report on Agricultural operations in the N.-W. Provinces there are some interesting particulars of the bone trade in India:—

The carcasses of cattle and other animals, with very rare exceptions are allowed to lie in ravines and waste places and it is the bones of these animals that are exported from the N. W. Provinces. The total number of horses and cattle in the provinces returned for 1888-89 was 23,608,455. Assuming the rate of mortality per annum at 10 per cent. and the weight of dry bones in a carcass at 20 seers, the total weight of bones which annually becomes available for use amounts to over 40,000 tons.

Mr. Holderness further reports:—The trade in bones, so far as these provinces are concerned, is of a very recent date, it is entirely in the hands of Eurasians and Mahomedans, who send out agents into districts adjoining the line of rail. These employ coolies, generally of the *Chamar* caste, to collect bones for them, and large stocks ready for despatch may often be seen in the neighbourhood of a railway station. The trade is evidently a profitable and growing one, for I have been surprised during a tour recently made through Southern Oudh and the Azamgarh, Jannpur and Allahabad districts, to see the number of persons engaged in bone-collecting. The town of Pbulpur, 17 miles from the nearest railway station, is an instance of the sub-dépôts which are spreading over the country. As "bone" does not form a head in the classified list of articles prescribed for registration of rail-bone traffic, the full extent of the traffic is not known. The following figures have been kindly furnished by the Assistant Auditor, East Indian Railway, for the stations on his line in the North-Western Provinces, from which the export of bones in 1888 exceeded 5,000 maunds. Similar statistics for the Oudh and Rohilkhand Railway and other Railway lines within the province was not available.

	Mds.		Mds.
Cawnpore	... 25,944	Sirsaul	... 7,275
Agra	... 20,189	Sirathu	... 6,604
Allahabad	... 89,986	Chola	... 6,372
Hathras	... 85,556	Mohar	... 5,134
Aligarh	... 84,686	Fatehpur	... 5,024

The total value of the bones exported by sea in 1888-89 is given in the note received with the Government

of India's orders quoted above at 17.49 lakhs of rupees, the corresponding weight of which in the monthly returns published by the Government of India is 35,567 tons. The annual statement of the trade and navigation of British India which gives the share contributed by each maritime province has not yet been received by me for 1888-89, so that the quantity exported from the Bengal Presidency in 1888-89 is not known. In previous years the exports from Bengal amounted to one-third of the total exports from India. Assuming that 12,000 tons were exported from Bengal in 1888-89, and that the whole of this quantity was supplied from these provinces, it would still represent only one-third of the total quantity which annually becomes available in those provinces through the normal mortality of horses and cattle. The drain, however, of the export trade on the bone supply of any particular district cannot be measured in this way. The northern districts which border the sub-himalayan forests and are essentially pastoral districts are still imperfectly served by railroads, and in them the bone trade does not exist. My inquiries lead to the conclusion that the trade is confined to the central and eastern districts lying along the East Indian and Oudh and Rohilkhand Railways, and that even in these the outlying tracts are rarely visited by the bone collector. The villages within a ten-miles radius of the railway stations mainly furnish the supply, and they are now being completely cleared of all old stores of bones which in former days used to decompose through a series of years near the inhabited sites.

The home collector confines himself to breaking up his spoil with a hammer so as to make it more portable, and no further treatment is usually attempted by the wholesale exporter or the shipper. Occasionally, however, the exporter employs a *dhehli* or stone-mill ordinarily used for grinding lime.

At present bones are not directly used in any form as manure by the native agriculturist. Indirectly, as they decay, a portion of the nitrogen and phosphates of which they are composed finds its way to the soil. But this process of nature is wasteful. Waste and super-stition would lead the Indian cultivator to reject bone manures even if he were to be convinced of their utility, and hitherto he has been without the knowledge of or the means of obtaining superphosphates, the ordinary form in which bones are now used for manure by the European agriculturist. The present export trade, therefore is economically defensible, since one portion of the world is thereby enabled to use with care and knowledge in relation to a special system of agriculture what another portion has for centuries allowed to go to waste. Again, as yet it has not been proved that in Indian agriculture bone manures can be profitably employed. A maund of bone dust costs Re. 1, thirty-five maunds or farmyard manure can be bought for this sum. According to the chemists, the 35 maunds of farmyard manure contain four times as much nitrogen as one maund of bone-dust, and nitrogen is the element conspicuously deficient in Indian soils. Experiments with bone-dust and bone superphosphates have been made for a series of years on the Cawnpore Farm with maize and wheat crops. The general result is that, as compared with the standard unmanured plot, there has been a loss on the crop, the cost of the bone manure overbalancing the value of the increased produce. This is especially the case where bone superphosphates are used, owing to the high price of sulphuric acid. Nothing can be inferred from these experiments as to the possible effect of bone-manures, on Indian soils other than the light loams common to the Doab or on special crops. But as regards soils similar to that of the Cawnpore Farm and the great staple crop of wheat, they suggest the conclusion that the Indian ryot, with a rupee to spend on manures, had better lay it out, as at present, on cowdung or indigo refuse than on superphosphates or bone-dust. In England the peculiar value of bone manures has been established in connection with the turnip, mangel-wurzel, and other root-crops. In India we have no turnips (save as a garden crop), and the area under carrots potatoes or other root crops is very limited. The matter is eminently one in which the advice of a really com-

petent chemist, on a full survey of Indian agriculture and a careful analysis of soils, might be most valuable. So much energy and enterprise, European and native are now engaged in the cultivation of indigo, tea, sugar and jute, that such advice would not fall on barren ground.—*Madras Mail*, May 30th.

THE ROMANCE OF TEA SELLING

is surely more conspicuously illustrated in the experiences of Mr. Thomas J. Lipton than in that of any other living man. It seems that a rule of his business life has been since he began to sell in a large way through multiplied agencies, to take up some one article in universal request and make it widely available. We refer to the mother country of course. Only about a year ago, did it strike Mr. Lipton to take up tea, and after so deciding, it was from reading about Ceylon and liking the article, that he made Ceylon tea a speciality. Mr. Lipton has by no means multiplied his tea agencies to the extent he intends: indeed in the Highlands of Scotland he has only lately opened and his forty tea packet stores in and around London have not all been in operation very long. Nevertheless in this, his first year, Mr. Lipton calculates he has sold 4 millions lb. of tea. It is quite possible therefore, that the progress in this department for some time to come may be after a geometrical ratio, especially when America is to be added to Britain as the scene of operations. In the old country, "Lipton's packets" consist of a blend, the preponderating tea being Ceylon, and although he has become the purchaser of Ceylon plantations, Mr. Lipton is not quite certain about entirely giving up the blend. He will, of course, add a packet business in pure Ceylon tea direct from the plantations, no doubt at a higher price than the "blend."

But in the case of America, beginning in a new field altogether, and with the object of winning so many people from a vitiated taste for faced and adulterated China and Japan teas, to the appreciation of a really superior article, Mr. Lipton is quite ready, we understand, to pledge himself to deal only in *pure Ceylon tea*. This is a most important fact; for if this great dealer begins on the principle of spending £15,000 in advertising Ceylon tea—and Ceylon tea only—from Chicago westwards to Denver and San Francisco, northwards into Canada, east to Philadelphia, and south to New Orleans—he will be doing more for this Colony in a short space of time than our Tea Fund Committee and the Ceylon-American Company could accomplish probably in a score of years. It becomes a question then whether the Ceylon tea planters should not do all they can to recognise, encourage, and back up Mr. Lipton. He evidently has abundant command of "the sinews of war"—he will want no aid in capital or tea. But it may be a question whether the North-American Continent should not be left entirely to Mr. Lipton's "Ceylon Agencies" and that our Tea Fund Committee should pledge themselves to encourage no competition. The necessary corollary from such a decision would be the winding-up and withdrawal of the Ceylon-American Tea Company, and this could best be arranged we should think by Mr. Lipton taking over the business—the New York shop, stock, staff and goodwill as they stand? We should think the directors and shareholders would only too gladly enter into such an arrangement, if a proposal were made to them so soon as Mr. Lipton has seen what has been done in New York, and decided on his

own course of operations. Then, finally, it remains to be considered as to whether the Planters' Association or the Tea planters of Ceylon could not give Mr. Lipton such an "official recognition" (if the term may be used) as could be turned to good account in his great campaign to win the people of the States and Canada for Ceylon tea? Could Mr. Lipton be nominated "Commissioner representing the Ceylon Tea Planters in America"? If so, we believe the designation would be acceptable, and very useful in advertising Ceylon tea up and down that country. All these are matters which the Tea Fund Committee may well consider at their meeting on Friday morning, and we commend them to favourable consideration. At the same time there is no occasion for haste. Mr. Lipton, as already announced, leaves by the P. & O. S. S. "Victoria" for Europe tomorrow. After a short interval he crosses to America and his decision about beginning the "tea campaign" will not be taken until he has the reports of his agents in America who have already been instructed to collect information and prepare reports on the proposed new business, against their principal's arrival. No doubt before the end of August, Mr. Lipton will be able to telegraph his decision to Ceylon and it is against that day, that the Tea Committee and the Company's Directors should consider what their course ought to be, in the event, as is likely, of Mr. Lipton undertaking the Ceylon Tea Campaign on a big scale in America.

DAVIDSON'S DOWN-DRAFT SIROCCO.

(BY THE "PERIPATETIC PLANTER.")

Thanks to the data thus obtained, Mr. Davidson has found that theory is borne out by practice in a remarkable manner in several directions. Thus the brokers report these teas *quickly* dried at a *low* temperature (some were dried in only four minutes) *1d.* to *2d.* per lb. better in the case of medium grades, and from *4d.* to *6d.* per lb. better on the fine qualities, than teas made from the same leaf, at the same time and place in other driers! That confirms the foundation theory, so to speak, of the "Down-draft." Then he has found, as theory led him to expect, that the greater the volume of air passed through the tea in a given time the more rapid the effect upon the leaf; in other words, by increasing the size and speed of his fan, a lower temperature may be used, with a consequent saving in fuel, so far as the fuel used in the stove is concerned. From this it is only a step to the corollary, if the fan be increased in size and speed, and if the stove be also increased in size, then a further vast increase in *output* and improvement in quality are to be expected. Hence, his new large "Down-draft" Sirocco, which is to turn out two maunds per hour. The economy of fuel as shown on the yellow circular referred to, is certainly remarkable. Last, but not least, comes the improvement in the construction of the stove itself. This has been completely reorganised, so far as the manufacture of the parts goes, the principle of beating, &c., being still the same. It would be difficult to describe the changes effected without diagrams; but they certainly appear very radical when explained by diagram, so much so that the life now anticipated by Mr. Davidson, *viz.*, five years, appears quite reasonable. This it will be acknowledged is no trifling advantage in itself. The fan, I might mention in passing has a monthpiece at the exit, so to speak, and it occurred to me, that employers of the Blackman system of withering could easily attach canvas pipe or tube to this, and thus convey the warm air to the withering room, *i.e.*, to the side opposite the Blackman Fans, and be thus able to employ the Blackman system even in houses apart from the tea-house proper; or in the case of upper-stories, convey the warm air to these without loss of heat in transit.—*I. P. Gazette.*

TEA IN THE AZORES.—The coming spring is looked forward to with lively interest by the agricultural classes in the Azores, and will long be remembered as marking a new era in the commercial prosperity of the Island. Tea planting has made such great strides there and the picking of the leaf is expected to be so considerable this season that the pioneer shipment will this year be made to the London market. It is affirmed that Madeira tea will in point of flavour beat the China leaf hollow, which is doubtless owing to the balmy climate of the Azores. It was only a decade ago that the tea plant was first introduced there by Viscount Pazo d'Arcos, then Governor of Macao, who made several shipments of the plant from almost all the tea districts of China. A few years afterwards when Senhor d'Arcos heard that the plant was already acclimatized in the islands, and that there was every reason to suppose that it will thrive, he engaged and sent a few Chinese tea planters to Madeira who taught the natives there how to manipulate the leaf.—*Ceylon Advertiser.*

THE "HAPUTALE" OR "DOWNALL" GROUP OF ESTATES—Dambettenne, Monerakande, and Laymas—has been purchased by Mr. Lipton, we are credibly informed, for £21,000 sterling,—a bargain which seems to take the breath away of not a few authorities who know the very great value attached to these plantations some years ago; and also the large extent of splendid tea now coming on, besides the good coffee remaining, making at least, the Dambettenne and Monerakande estates still very valuable. That Mr. Lipton has made a great bargain is shown by the fact that he was offered £2,000 on his price by a Ceylon planting capitalist before he left Colombo. Indeed, there is a general feeling of surprise at the places selling for £21,000, and it is supposed that if the group had been advertised for sale for some months in Ceylon and in London, at the upset price of £21,000, a considerable advance on that amount could have been obtained. Apart from other advantages, there are scarcely any Uva estates that will be so benefited by the Haputale Railway as this group—a tramway on the level, it is surmised, can be made very cheaply from a new Dambettenne factory to the goods station. The group contain the following areas in cultivation and reserve:—

	Culti-				
	Total.	vated.	Tea.	Coffee.	Grass.
Dambettenne ...	771	433*	112	313	8
Monerakande...	1,055	536†	274	242	15
Laymastotte...	473	336	138	171	27
Total acres ...	2,299	1,305	524	726	50

* With 12,000 cinchona trees.

† 5 acres cinchona.

It will be observed that the price does not make more than £16 per acre for the area in cultivation without counting nearly 800 acres of reserve.—Dambettenne estate has as yet no factory, the leaf of the upper estate so far having been all sold to Pitaratmalie and no tea sales can have appeared under that mark, so that it is difficult to see how a name can have been made for its delicately flavoured tea as a contemporary alleges. The Laymastotte factory—the largest in Haputale—has been working and Mr. Lipton's expert, Mr. Duplock, spoke very favourably of the tea being manufactured there. This factory is on the Laymas road, and it was thought that when completed, it would serve for all the group. But a Dambettenne factory would, as we have said, be very convenient for the railway,

OUT OF SIXTY-NINE COLLIERIES now being worked in India it is surprising to find that no fewer than sixty-two are in Bengal. These employ a daily average of 25,000 hands, and supply Calcutta and the railways to the west as far as Lahore. During the ten years ending 1888, the output of Indian coal increased from 229 to 478 lakhs of maunds. During the next ten years the increase will probably be still more rapid. Upper Burma possesses on the Chindwin river coal measures of great extent and value, and may be expected before long to add considerably to the supply.—*Indian Agriculturist*, May 10th.

TEA FOR NATIVES.—The Indian Tea Supply Company—we are glad to see from the *Pioneer*—at a meeting in Calcutta, decided to continue operations. It is felt that the object of wooing the natives of India to the use of tea is of great importance to the welfare of the industry, and that it is not placed beyond the range of possible achievement. The experiment will be watched with keen interest, and the knowledge that it might have been brought to a premature close may stimulate a feeling of sympathy into active co-operation. It is known that natives will drink tea readily enough; what they object to is the price. Anyone then who wishes to develop their taste can assist very materially by making gifts of tea among his native friends. Only let the taste spread and take root and the money obstacle will soon banish.

THE RAINFALL OF NORTH BORNEO FOR 1889 ranged from 73 inches at the driest station to 141 at the wettest, the figures for the capital, Sandakan, being 104 inches. Dr. Walker in his report stated:—

The rainfall for the year has been on the whole about twenty-five inches below the average of the last eight years. This is explained by the fact that the wet season 1888-89 was early and that of 1889-90 late, so that a smaller proportion than usual of each of the wet seasons fell within the year. The fall of 9.12 inches on 14th February is the second heaviest on record, being exceeded only by the 14th of January 1887 with 14.47; both these falls took place in Sandakan. It may be pointed out that these returns, so far as they go, bear out the remarks made in my report for 1887 as to the way in which the "Intermediate" wet season gets more marked the furthest west we go. In fact in some years the Intermediate wet season on the West Coast gets prolonged so far that it practically becomes continuous with the succeeding true wet season.—*Official Gazette*, May 1st.

MADAGASCAR TIMBER.—Strenuous efforts are being made to introduce timber from Madagascar into the English market. Hitherto the "Great African island" has exported but little in this direction, and most of what has arrived, chiefly smuggled ebony, seems to command good prices. Until quite recently the Malagasy Government prohibited the export of timber from the island, but at length a concession was granted to an Englishman, and a company has been formed to work it. This, the "Madagascar Company, Limited," entertained a large number of timber merchants and others at luncheon at the Cannon street Hotel on Thursday, the 20th instant, Mr. J. W. Shepherd (of Messrs. Seddon & Shepherd) in the chair, to inspect samples of the wood. Amongst those present who referred to the timber resources of the country were Mr. S. Procter (Consul for Madagascar) and Mr. T. Roe, M. P. The principal varieties exhibited were a kind of rosewood, yellow teak, mahogany, and a remarkable species of the last-mentioned called "natte." All were peculiar in being very heavy, and, at the same time not difficult to work. Subsequently the party went to the docks and viewed the materials in bulk. Judging from inquiries already made by merchants, it seems tolerably certain that Madagascar wood will soon become a conspicuous feature in the timber trade.—*Indian Engineer*, May 3rd.

BANGALORE MANGOES.—Col. Mallock, who has settled himself in Mombasa, Africa, has planted in the dark continent a lot of kernels of the mango he took with him from Bombay and Bangalore, which he reported were doing well. But time will shew whether they will flourish there. Six of the best grafted mango plants from Bombay were growing healthily. The cloudy prefers the climate of Mombasa with a "nice breeze all day" to that of Bangalore.—*Spectator*.

THE CANDLE PLANT.—In the Northern and Western parts of Mysore a species of cotton plant grows known to the natives as the *depathi mara* or candle plant. The seed pod is about two or three inches in length and divides in three sections when ripe, each section containing a cluster of seed closely packed with cotton wool. If the narrow end of the section be lighted it will keep aflame for about ten minutes, the seeds giving off a large quantity of oil. The cotton is of no use for spinning, the yield from each pod being extremely small.—*Bangalore Spectator*.

SUGAR CULTIVATION IN TAIPING DISTRICT OF THE STRAITS SETTLEMENTS.—There are 23,414 acres alienated for the purpose of sugar cultivation, distributed as follows:—Krian river 10,781 acres, Kurau 5,379 acres, Gula 6,000 acres, Bagan Tiang 254 acres. Of this land it is estimated that 7,190 acres are this year under cultivation as against 7,120 in the previous year; a slight increase, and a sign that this industry is flourishing. The estates under cultivation consist of 3,745 acres on the Krian river, 2,477 acres in Kurau, 900 acres at Gula, and 68 acres at Bagan Tiang. Estate owners have not found it so difficult to procure labour this year, as will appear from the fact that 1,199 Siu-keh were registered this year as against 561 in 1888.—*Official Report*, April 1890.

THE SAGO PALM.—The sago palm bears fruit but once. Its load of nuts is its final effort; it has fulfilled its allotted task in the great round of nature, and there remains nothing for it but to die. The nuts become ripe, and are strewn in thousands around the tree, until the fruit-stalk stands up by itself empty and bare. The great branches turn brown and drop one by one to the ground. Inside the trunk the work of decay is going on, until what at one time was a mass of white sago and pith becomes nothing but a collection of rotten brown fibres. One day the trade-wind blows perhaps stronger than usual, and the leafless column of the trunk falls with a crash, destroying in its fall many of the young palms that are already springing from the nuts scattered some months before.—*"A Naturalist among the Head Hunters,"* by C. M. Woodford.

MR. BARRINGTON BROWN evidently excites a good deal of interest in London with the fine Ceylon stone, a beryl of 4 or 5 lb. weight—a true "oriental emerald"—as well as other specimens which he was able to show at the *Conversazione* of the Royal Society. On page 36 will be found a brief account of the *conversazione*, and our London correspondent alludes to the large exhibit. This stone was found not far from Ratnapura and exhibited on velvet in an ebony case, it should make a pretty show. It is rumoured that the stone is likely to be bought for the Emperor of Austria, whose Crown jewels are specially emeralds and who has a London agent no doubt on the watch for any very fine or interesting emerald or beryl. In *Nature* of May 22nd we find the following reference:—

Specimens of minerals brought from Ceylon by C. Barrington Brown, exhibited by Prof. J. W. Judd F.R.S. Large perfectly crystallized and clear beryl 2650 grammes in weight. The specimen, though water-worn, exhibits the crystalline form. The colour is intermediate between that of emeralds and aquamarines. The specific gravity is 2.703. Fine crystal of yellow corundum (oriental topaz). Well developed crystals of corundum (sapphires, &c.). Crystal of chrysoberyl from the same district.

CALIFORNIA—WHAT FORTY ACRES WILL PRODUCE.—J. Gardella, writing in the *Oreville Register*, California, says:—I own 40 acres of land about half a mile from Oreville, which is planted in fruit and vegetables. The following is a list of the amount and kind of fruit and vegetables that I grow on it during the year:—On a part of the land I grow two crops potatoes, corn, cabbage etc., and three or four crops of lettuce, radishes, spinach, etc. Vegetables of some kind are growing all the year round, and my peddling wagons run every day in the year with fresh vegetables taken from the garden. I have given under and not above the actual amounts grown on my place. The land is kept well manured, and is irrigated during the summer. Eighty tons peaches; 12 tons apples; pears, 3 tons; apricots, 10 tons; nectarines, 10 tons; plums, 4 tons; blackberries, 10 tons; raspberries, 11 tons; strawberries, 2½ tons; grapes, 20 tons; quinces, 2½ tons; cherries, 2 tons; figs, 1 ton; potatoes, 30 tons; onions, 25 tons; cabbages, 20 tons; cauliflowr, 1½ tons; carrots, 5 tons; parsnips, 5 tons; beets, 3 tons; sweet potatoes, 4 tons; water melons, 100 tons; musk melons, 25 tons; cucumbers, 2½ tons; peas, 3 tons; beans, 4 tons; turnips, 7 tons; rutabagas, 2 tons; green corn, 10 tons; squash and pumpkins, 4 tons; tomatoes, 40 tons; green peppers and okra, ½ ton; lettuce, spinach, radishes, celery, asparagus, and artichokes, 10 tons in all. I have 80 olive trees not yet in bearing, and 500 orange trees, of which a limited number are now in bearing; will have from them this year 5,000 oranges, worth at least 2 cents each on the tree. The fruit and vegetables are sent to the mountains for sale among the people there, and my wagons peddle every day in Oreville. Fourteen men are employed in summer, and seven in winter.—“*Coloniensis*” in *Aberdeen Free Press*.

“A GUIDE TO THE LITERATURE OF SUGAR” being a book of reference for chemists, botanists, librarians, manufacturers, and planters, with a comprehensive subject-index, by Mr. H. Ling Roth, the author of several works on sugar, has reached us from the publishers, Messrs. Kegan, Paul, Trench, Trübner & Co., Ltd., London. From the Introduction we quote as follows:—

The features of the present compilation may be explained as follows:—

1. The titles of important publications are supplemented with brief abstract notes; works the titles of which are misleading or defective (as an indication of their contents) are similarly supplied with notes.

2. By a system of initialling references are given in order to indicate the library or locality in which the book referred to may be found.

3. The Comprehensive Subject-index refers to the notes as well as to the titles.

The work contains more than 1,200 titles of books, pamphlets, and papers relating to sugar. This number might have been considerably augmented had I included handbooks of chemistry, encyclopædias (one title only being excepted), etc. From amongst the numerous narratives of travellers only the more important are given, as works of this class are almost sure to contain some short reference to sugar. With the exception of Burn's Address and MacMahon's Plantership, which are inserted as an example of this class of sugar book, all works dealing with sugar from the slave or anti-slave trade point of view are excluded. There is also a large class of publications, chiefly anonymous pamphlets, which according to the title lead one to believe they refer to sugar, but which on the contrary are merely controversies on free trade and protection; these also I have endeavoured to exclude, but it is not always easy to determine which works have no right to appear in the list and which have. * * * This compilation extends to the beginning of the year 1885. I hope shortly to have ready a supplement bringing the work up to date, and then, if sufficient inducement offer, to bring out an Annual Guide.

We are surprised to find that though our Handbook is entered no mention is made of the *Tropical Agriculturist*;

PEPPER CULTIVATION has been fairly started we learn from the Perak *Government Gazette*,—in the Kuala Kangsa district, Straits Settlements, 195 acres of pepper land having been demarcated. In Larut, pepper cultivation has attracted a good deal of attention, seven lots, representing 5,733 acres, have been alienated for this purpose during the year. The number of applications were very much larger, but a good many were weeded out by requiring the applicants to demarcate or deposit the fees for demarcating the land they applied for.

PROGRESS IN FIJI: TEA AND SUGAR.—Mr. Henry Cave, of the firm of Cave & Co., merchants, Levuka, is now in Dunedin, en route to London. He has been a resident of Hevuka for the past 18 years, and during 13 years of that period he had been connected with the Levuka Chamber of Commerce, while for several years he was chairman of it. Mr. Cave, when questioned on the point, said that the tea industry, which had only recently been started, gives every promise of increase. One feature of the industry that made it suitable to the colony was that the plant was so hardly, and in consequence hurricanes did it little or no harm. The young budding leaves were the ones that were picked, and when there was a storm, which would denude the plant of the old leaves, the sun and rain that followed quickly brought out the new sprouts. It was a plant that required plenty of rain, and it got that in the islands. Of the sugar industry Mr. Cave also speaks hopefully. He thinks the progress of the industry has been simply wonderful, and that it will rapidly extend very shortly. The principal producer is the Colonial Sugar Refining Company, of Sydney, who also have a branch in Auckland. That company have large plantations, with irrigation works, on the Rewa and Ba rivers, and is about to occupy another part of Levuka for the same purpose.—*Otago Daily Times*, April 12th.

COTTON IN FIJI.—There is a very old friend of Fiji, slighted for many years past, which it would be well for the new generation of planters to know something about—Kidney Cotton. Sea Island Cotton deposed the Kidney twenty years since. Up to that period, planters thrived in Fiji, even on the moist Rewa River, from the proceeds of the growth of this snowy fibre, after paying the comparatively (with what they should be today) heavy charges of ginning, baling and shipping. In an evil hour, kidney cotton was rooted out, and supplanted by sea island, the demand for which is limited, with the result that the same planter who successfully grew kidney, grew poor in the production of sea island—even after capturing the gold medal from Philadelphia Exhibition—the seat of judgment in cotton. Nevertheless, strange to say, it is doubtful if a pod of sea island can be found in Fiji today. Kidney cotton has been grown spasmodically by an odd planter or two, and by the Native Department; but it is now almost on the extinguishing point. Can anyone say why? The drier positions of Fiji should be eminently suited for the production of cotton, and the meteorological conditions of this colony are now fairly well-known. As to whether it will pay to grow is another matter, and it is only fair to assume that the conditions existing in 1870 will hardly suit the conditions of 1890. Will some of the earlier planters of this colony write to the columns of this paper and, for the benefit of the would-be producer, state what they know for or against the production of kidney cotton. That enterprising colony, Ceylon, is just entering largely into the cotton industry; a considerable quantity of seed having been imported from Fiji for the purpose. A Ceylon paper lately stated that by the end of 1890, the production of cotton would be only second to that of tea and coconuts in that colony. The same paper also states that a large cotton spinning factory has been started at Colombo, with a 300-horse-power engine. Not a bad beginning. Australia requires calicoes, and why should not Fiji supply them? Anyway, why should not Fiji grow kidney cotton and make it pay, too.—*Fiji Times*.

PLANT GOOD COTTON SEED.

The intelligent farmer has often noticed in his fields of cotton some plants much larger than others containing a larger number of well-formed bolls, and with fibre whiter, more silky, and better in quality than on any other plant in the field. If he would select from this plant the bolls that are the largest, the finest and most perfectly matured; and, after ginning the cotton, carefully select the seed, rejecting all that are blasted or imperfectly shaped; and then carefully protect them to prevent fermentation or becoming in any manner damaged until the next planting season, the first important step would be taken. There is no chance in this matter, if we follow closely the laws by which nature performs her perfect work. The cotton seeds that have thus been carefully collected from the first plant must be placed in the best prepared soil, under the best conditions, and well cultivated. No cotton of an inferior grade must be planted in the immediate neighbourhood. In fact, it does not pay to cultivate inferior cotton, and it is best to send all such seeds to the oil mills. When blooms of low grade cotton open, insects and winds will soon transport the pollen from them to the pistils of the selected variety, and the germs will become depreciated by such inferior fertilization. There are a number of insects that visit the flowers of the cotton plant for the nectar they contain, and in the effort to reach the base of the flower, where the nectar is found, their bodies become covered with pollen that is transferred to the stigma where they come in contact with pistils of other flowers. It is readily seen therefore, that if plants of an inferior grade are growing and blooming in the immediate neighbourhood of the selected varieties, the insects will soon convey the pollen from the inferior to the superior plant, and the seed that will be produced will contain a germ with qualities of the inferior plant. This work of the insects might explain, to some extent, why it is that improved seeds in a few years degenerate so badly. If the selection of the seed is repeated from year to year, and no inferior cotton planted near enough to vitiate with its pollen by means of insects or wind, and if seasons are favorable, there seems to be no reason why practically perfect plants may not be produced.—*Alabama Experimental Station Bulletin.*

SUGAR FROM COTTONSEED.

The latest reported discovery in connection with cottonseed comes from Germany, where, it is said a process has been discovered for extracting sugar from cotton seed meal. The sugar is of a very superior grade, but cannot be sold in competition with the ordinary article. It is said to be inclined to ferment or sour, and, hence, better in use for preserving fruits. It is said to be fifteen times sweeter than cane sugar, and twenty times more so than sugar made of beets.—*Tradesman.*

TEA AT FOOCHOW.

(From the *Daily Echo*.)

We learn that prices for the new crop are much lower upcountry. Leaf is being offered freely at 9,000 to 12,000 cash per picul.

First crop teas have arrived in large quantities from the different districts, and we understand it is the intention of some of the tea hong to send their musters out on the 19th instant.

Our readers will no doubt remember that, some time ago, we made mention of the intention of a few upcountry teamen to establish a Tea warehouse at this port in order to enable them to sell their teas *direct* to foreigners. The scheme was not entirely abandoned; but owing to the heavy losses the promoters sustained last year it has remained in abeyance. From what we now learn, this scheme, which by the way has come again under consideration, is to be on the co-operative principle; and, amongst other novelties in

the working of it, the services of a foreign tea taster are to be engaged. It is calculated that if this project becomes an accomplished fact, teas will pass into the hands of foreign buyers at a far lower cost. The charges of tea hong, the commissions to middlemen, and other heavy expenses they have had to meet are said to be enormous, and there would be a saving to the buyers to this extent, or to the greater part of it at least. It is calculated that as much as two millions of dollars were paid, one way and another, to these middlemen every tea season! Though the promoters fully expected that the new scheme will meet with strong opposition at first from the existing old fashioned tea hong, we see no reason why, under good management, it should not be successful. Foreign merchants will certainly hail any change that is to carry with it a lower cost of tea. The arrangements between the Tea Guild and each firm of merchants with regard to weighing and the general conduct of the trade of the port, as well as the compact between the Tea Guild and the Chamber of Commerce seem to have worked so well that it is difficult at the first blush, to see how this new co-operative society is to work separately to the satisfaction of all concerned. It is true that an independent agreement could be made between this new Society and the merchants and Chamber of Commerce on the same lines as that in force with the Tea Guild. But we are touching on a point not included in the scheme; the promoters intend, we understand, to work quite unbound by any rules or regulations. Whether they will be strong enough to act quite independently and whether such freedom of action would meet the approval of foreign buyers remains to be seen. That the tea hong have fattened at the expense of the teamen ever since the trade commenced is certain; and it is equally certain that if the services of these middle men could be dispensed with, the cost of tea would to a great extent be lessened.

TEA IN FORMOSA.

Mr. Playfair's report contains some interesting comments on the course and prospects of the tea trade, which has formed so important a feature in Formosan commerce. The inception of tea planting in Formosa was, it is well known, due to the energy of an English merchant, Mr. Dodd, who started the industry in the island. The thing has passed, by inexorable competition, into Chinese hands; but a certain continuance of the good tradition which he inaugurated has maintained for Formosa teas an exceptional character that has secured them so far, against the disasters that have overtaken the trade on the mainland. The export from Tamsui, last year, showed, however, a decrease of 560,000 lb. and the result seems due to the same causes which are so largely responsible for the misfortunes of the China trade.

The teas of the island are, we are told, rapidly losing their distinctive character, owing to the reckless competition amongst Chinese buyers for the Amoy Market, and the careless preparation and fraudulent admixture by them of the teas after they come into their hands from the growers. This has told its tale on the consuming markets, and a lower basis of price than has ever been known before has been established, while the consumption shows a very marked decrease. With the yearly increasing competition from India, Japan, Ceylon, and Java, each of which countries fosters its tea trade, while China does nothing for it, but rather taxes it beyond its endurance, the ground that Formosa has lost on the consuming markets is unlikely ever to be made up; and in the opinion of those most competent to judge, the days of the trade are numbered, unless steps are taken by the Chinese themselves in the direction of radical reform. Under these circumstances it is gratifying to note that his Excellency the Governor has, in conjunction with a foreign merchant, procured the services of an experienced planter from India, who is to establish a model tea farm, and endeavour to show the people the advantages of the proper cultivation

and manufacture of tea. The idea is an enlightened one, but whether it will be presented with vigour, and receive enough official support to ensure its success, remains yet to be seen. It is also an open question whether the adoption of the most perfect methods can be attended with success while the inland and export duties on the article continue to be out of all proportion to its value, and so far in excess of the like imposts in all competing countries.

The paragraph is so pertinent that we have reproduced it at length; though we have left ourselves, in doing so, little space to review various other features in the reports that invite comment.—*L. and C. Express*, May 23rd.

NOTES ON PRODUCE AND FINANCE.

SILVER—TEA—PEPPER—COCOA—COFFEE.

The rise in the price of silver, and effect of American legislation on the value of silver, are events which are keenly watched by those interested in tea. Undoubtedly the depreciation of silver has stimulated the export of Indian produce, and every rise in the price of silver tends to check exports from India. The exporter from India sells what he exports in Europe for gold, and cheap silver means that he gets more rupees when he exchanges his gold. In addition, there is the enhanced cost of production. Tea has benefited considerably by the depreciated rupee, and the rise in its value, should that advance be considerable, will be anything but a matter of congratulation to garden proprietors. They must look for a rise in prices at home and a lowering of freights to compensate them. That which will prove a blessing to the Indian Civil servants is not likely to be regarded as a boon by Indian exporters.

Those who are responsible for the reports and accounts of tea companies must mind what they are about. The *citizen* has its eye on them, and if there is any weak point in the armour of their accounts our contemporary will doubtless discover it. The Balijan Company has not escaped criticism, and even the directors of the Doocars Company are reminded that 'the figures (of the report) are not convincing on the point of the 'far more' value of the estate. The estates comprise, according to official authority, 10,500 acres, and the cost per acre of about a third of this number is no proof of the present value of the whole acreage. If the directors will provide, as they should do, the particulars of the estates generally, in addition to the information they have given in the report, a better opinion could be formed upon the matter. It should also be stated in future reports that the preference shares are entitled to a cumulative dividend and priority in repayment of capital."

Those who find it profitable to adulterate Pepper are fertile in their application of adulterants. The latest is a composition consisting of the following ingredients—namely, rice-starch, chalk, barytes, and lead chromate—which are all reduced to a very fine powder and intimately mixed. The following is suggested as a useful process of treating a suspected sample:—Let a portion be well shaken with chloroform; this will give the mineral ingredients of the adulterant in their natural combination. The residue is well washed and then gently warmed, until every trace of chloroform has evaporated; it is then treated with a few drops of sodium carbonate solution, and allowed to cool. Having separately shaken a little ether with some aqueous hydrogen peroxide, a few drops of the prepared ether are added, and the mixture carefully acidified with hydrochloric acid. A delicate blue colouration will thus be obtained, and the barium and the lead can then be estimated by any of the usual methods.

During the delivery of the Cantor Lectures at the Society of Arts, the lecturer displayed a table showing the variation in the consumption of alcoholic and non-alcoholic drinks and sugar from 1856 to 1888. Tea had jumped from about 65,000,000 to 185,000,000 pounds; coffee had fallen slightly, sugar and cocoa showed almost a parallel rise, each faster than that of the population; spirits and wine rose rapidly until 1873, and beer until about 1876, since which time they had as steadily declined,

In 1873 the British East Indies sent us 20,326,882 lb. of tea; in 1889, 127,160,409 lb.; China meanwhile had fallen from 133,307,196 lb. to 88,848,574 lb. Our total imports were 162,344,395 lb. in 1873, rising steadily to 221,602,660 lb. in 1889. Corresponding figures for consumption showed 132,022,155 lb. in 1873, or 4.1 lb. per head; in 1889, 185,621,600 lb., or 4.9 lb. per head. In the Australian Colonies 7.66 lb. per head were consumed in 1884-5; in Spain, .01 lb. A large and varied assortment of teas—including brick tea—was on view.

In his lecture on "Cocoa" before the Society of Arts, Mr. Baunister said there was great difficulty in understanding how the name *cacao* had become changed into *cocoa*. Linnæus was so much struck by its properties that he regarded it as fit drink for the gods, hence naming it *Theobroma Cacao*. When Cortes visited Mexico, he found the cocoa beans being used as money, and one writer of his time remarked that it was better to have such money than silver and gold, for no one could possibly hoard it up, as it would not keep. The Emperor of Mexico received it as a tribute from various parts of the country, and he was said to have had no less than fifty pitchers prepared for his own use daily, so that, however small the pitchers were, he must have had great taste for it. The consumption in Mexico was very large, and it was said that about 2,444,000 cwt. were used, which must, however, have been an exaggeration. In 1806 from six to nine million pounds were used in Spain, and from fourteen to seventeen millions in the rest of Europe. In 1662 it was sold in London at 2s per lb. Clubs, where it was largely used, were formed, one of which was the Cocoa Tree Club in St. James's. These clubs became divided into Whig and Tory ones, and eventually deteriorated into gambling clubs and places of resort where the drinks were no longer of the non-intoxicating kind. There was a large proportion of fat in cocoa, the Trinidad variety possessing as much as 51.77 per cent. This was taken objection to, and starch and sugar was added to let down the quantity. The cocoa plant belonged to a very strange class of plants. The leaves grew at the ends of the branches, and the pod, or fruit, hung from the thick stem or trunk of the tree, and it was no uncommon thing to see ripe pods and flowers on the same stalk. The pod contained from thirty-five to forty seeds, enveloped in a soft pulp, which was often used by the natives as food. The process of fermentation to which the fresh gathered seeds were submitted was of great importance, as it not only removed the slimy substance surrounding the seeds, but it also tended to remove much of the bitterness of the seeds themselves. On reaching this country the seeds were roasted and the husk removed, leaving what was known as *cocoa-nibs*.

When cocoa was first introduced there was much difficulty in preparing it for drinking, owing to the thinness of the liquor and the amount of fat which rose to the top. Then some clever person thought of adding starch, which had the property of holding the cocoa in suspension, and so giving more body to the liquor. The next point which arose was how to make a cocoa free from starch and sugar, and yet to be soluble. They found that it was necessary to remove a considerable amount of the fat, which was done by grinding it in a warm mill, which caused the fat to melt, so as to be extractable by pressure, so that the percentage of fat was reduced to from 23.38 to 29.60. Flake cocoa, cocoa extract, chocolate, and the nibs themselves contained starch or sugar; while the Iceland moss cocoa, of all prepared cocoas, contained most, as there was only 23.74 of non-fatty cocoa present. Chocolate de santé contained 2 per cent. of starch, 61.21 of sugar, and 13.27 of cocoa. A further step in the manufacture of cocoa was the addition of alkalis, such as ammonia or potash, by which it was rendered soluble. The drink prepared from cocoa was a bland and wholesome drink, and there was a chance of its taking its position among the non-alcoholic drinks. When made into a sweetmeat it was far preferable to an inordinate use of sugar, and such a use was to be encouraged rather than condemned, as it nourished rather than

fattened, and was more wholesome than sweets. Passing on to deal with chocolate, the lecturer said that the derivation of the word was difficult to trace and the only suggestion that seemed to be at all valuable was to the effect that when the Mexicans ground the cocoa up with starch and sugar for the purpose of making chocolate, the pestle made a peculiar noise in the mortar which they tried to imitate in their speech by the word "chocolate." The chocolate which was supplied to the Navy contained 80 per cent of cocoa and 20 per cent of pure Demerara sugar. Chocolate creams were made of sugar and glucose spread over with a paste of chocolate—a process which was mostly done by hand. The quantity of cocoa imported into this country in 1873 was 19,661,247 lb., and the consumption was 8,311,023 lb. or 26 lb. per head. In 1883 the three quantities had risen to 22,632,694 lb., 12,868,170 lb., and 36 lb.; and in 1889 the quantities were 26,735,974 lb., 18,464,164 lb. and 48 lb.

In his lecture on COFFEE Mr. Bannister said that the chemistry of coffee was particularly interesting as affording a comparison of the beverage with tea. The almost entire absence of tannin fitted it admirably for after-dinner use. The presence also of fatty and oily substances rendered it to some extent a true food, while the alkaloid-caffeine C_8, H_{10}, N_4, O_2 —performed the function of a nerve tonic of the greatest value. Coffee, when properly roasted, did not suffer much loss of the most valuable constituents; the amount of caffeine usually present in raw coffee was about 1-1.3 per cent. and in roasted hardly less; in an ordinary infusion, 3 fluid ounces were reckoned to contain nearly 25 grains of caffeine. Naturally, the roasting of coffee was an operation requiring great skill and judgment. A good roaster must understand the peculiarities of the different kinds of coffee: some were tough and more moist than others. The perfectly roasted berry was of a rich chestnut colour, it had lost its toughness and become crisp, so that it readily disintegrated in the mill, and at the same time it had not that dark brown tint, which meant that it was over-roasted. However good the quality of the original coffee, over-roasting spoiled it. It might give a darker liquor, but it possessed little or no aroma, and had destroyed the natural constituents which make up the quality of good coffee. When properly roasted it lost 16 to 18 per cent. of its weight, mostly moisture, but in addition the constituents of the berry had been modified, and an aromatic oil was produced which had an intense flavour. A judicious blend of different kinds of coffee always produced a better liquor than any single coffee, but this mixture should always be made after roasting. The cooling of the roasted berry was also a very delicate operation.

The steady falling off in the consumption of coffee proved beyond doubt that coffee was not a popular drink, one reason, perhaps, being that its preparation for the table was more complicated than that of its rival—tea. Thus in 1873 we consumed 288,669 cwt., or 1.01 lb. per head; in 1889 this had fallen to 259,279 cwt., or .76 lb. per head. The total imports fell in the same period from 6,183,678 cwt. to 1,040,606 cwt.

A French professor claims that he has almost succeeded in producing artificial silk, which should render us independent of the silkworm. He says all the constituent materials of silk are to be found in the mulberry-leaf, upon which the silkworm feeds.

THE MERCHANDISE MARKS ACT:— CEYLON TEA.

In a few months' time we are promised a wave of litigation under the Merchandise Marks Act, more especially in connection with the adulteration of the three breakfast table beverages of tea, coffee, and cocoa. But a short time back, one offender was fined the small sum of £10 for selling "Sogama" tea. The inside of the packets containing the so-called Sogama tea was in reality a mixture of cheap Indian and China teas. This, at all events, was the opinion of Mr. W. J. Thompson, whose experience has extended over thirty years. Mr. Avory, for the defence, denied that Messrs. Paget and

Pigott, tea dealers, of 36, Middlesex-street, White-chapel, had any intention to defraud. The tea was sold in packets bearing the brand of "The Sogama Estate." The Ceylon Association having ascertained that tea, bearing falsely the brand of the Sogama Estate, was being sold by certain persons, communicated with the company owning the estate, and the proceedings naturally followed. Some mention was incidentally made of a Sogama "District." To anyone connected with the planting enterprise of Ceylon such a theory is peculiarly, not to say amusingly, absurd. The names of the districts in Ceylon are naturally in the Singalese language, whereas Sogama is clearly a Tamil word meaning "quite well," from *sogham*, health. We have known the estate for the past ten years, together with the entire district of Pussellawa, in which it is situated, and feel perfectly sure that its tea fully deserves the good price which is paid for it in the Lane. Mr. Bushby, in giving judgment, said the label "Sogama Estate" too distinctly misled the public, and that it was a serious evil which must be put a stop to. He imposed a fine of £10 and allowed 25s costs.

Now, this case is merely to be the forerunner of a dozen similar ones. For the protection of British-grown tea, the Ceylon Association in London intend to commence actions against other manufacturers of choice blends and mixtures, many of which are conspicuously labelled "pure Ceylon tea." That which we particularly desire to ask those of the public who may find themselves called as jurors in any of these cases is whether or not such an expression as "principally pure Ceylon tea" is or is not an actual contradiction in terms. To us it gives the most perfect example of oxymoron that the English can present, and would, we are sure, have been used by Mr. Lindley Murray in his grammar had he lived at the present day. No mention need be made of the fact that the word "principally" is printed in small letters in order to give that deceptive complexion to the label which is so profitable to the tea dealer and so disastrous to the palate and pocket of the small and ignorant consumer. Can we talk of diluted neat brandy, of alloyed virgin gold? We, indeed, hear of real paste diamonds and of real mock-turtle soup, but believe no harm is done by these terms; but the coupling of two such words as principally pure is, to our mind, wilfully misleading, besides being nonsensical. Surely "pure Ceylon tea" cannot be guarded in any way. If it is pure, then, what is the use of the word "principally"? If it is not pure, the word is nothing more or less than a lie.

As the law now stands, tea dealers can drive a coach-and-four right through it in every direction. The subtle alteration of a single letter can be made with impunity, with the effect of giving the public the idea that they are buying tea from the advertisers at fully 6d. a pound reduction on the price charged by other shops. So far, indeed, is this carried that if only the public were not, as Carlyle averred, "mostly fools," they would see that the tea offered them must be sold at an average loss of about 3d. a pound to the advertisers. "Sogama Estate" tea is only one example of the many frauds that are printed. As we have said, the usual plan is to seize upon the name of a well-known district or estate, such as Kaltura or Mariawattie, and to alter one or two letters. A large label is then affixed, with the false word well displayed, and guarded by a small-typed "principally" or "blend." The *mala fides* of this is so apparent that any judge on the bench or any twelve men in the jury box would be bound to give a verdict against the advertisers. Mr. Goschen, in his Budget speech, advised the poorer tea consumers to exercise more care with regard to the tea they bought. But he omitted to tell them how to set about doing so. Like Dr. Johnson, he can find them facts, but he cannot find them intelligence. When anyone sees the word "pure" printed in large letters on a packet, we think he should be able to obtain redress in a court of justice as soon as it is owned that the contents are not pure, or, in other words, are pure adulterations. We have in this office six different packets of so-called "Ceylon tea," the labels on all of which are, in our opinion, gross frauds on the public. They have been carefully prepared

under the eye of an unscrupulous solicitor, no doubt in order to fit well into the joints in the harness of the Merchandise Marks Act. The sooner this Act is enclosed in a new suit of armour the better for the public, and we will heartily coöperate with any association which has so meritorious an end in view. —*London Citizen*, May 20th.

SOME STRANGE AMERICAN TRADES.

Nobody can travel long in America without noticing the sign-plates of many curious occupations. Artificial ear-makers, nose restorers, leg-stretchers, sermon-writers, prayer-makers, child-adopters, salad-mixers, lamp-attendants were among the various businesses brought to my notice during a three-hours' walk this morning up town (writes a contributor to *Galignani*), by burnished brass signs on door lamps or bold lettering across the fronts of houses.

The artificial ear, nose and cheek-restorer came into existence shortly after the close of the Civil War. The disfiguring wounds of many soldiers taxed the ingenuity of the medical profession, and it was not long before advertisements in the public papers announced that Dr. So-and-So was able to repair all ravages by sword and shot. Many an old soldier with his nose shot away by a bullet, or cleft in half by a sword, willingly welcomed these announcements, and it is said that in the first few years after the war the spectacle of a man with a wax nose attached to a pair of green eye-glasses, was so common that it was hardly noticed. In the present day, however, a man's nose can be duplicated without the artificial attachment to his face being detected except on the closest scrutiny. I was talking to a gentleman whom I met in the office of an artificial ear-maker on this very topic. He was a man with a singularly sweet voice and a heavy black moustache beneath his delicately chiselled nose. "You are right," said he, "in saying that science has learned how to become almost a twin-brother to nature. Do you notice anything peculiar about my face?" I confessed that I did not, and he laughed as he said, "look here." He then put his finger in his mouth and touched something in his upper palate. The next moment his nose fell into his hand, a false palate dropped out of his mouth, and there he stood speechless and horribly hideous, with a deep hole in his face where his nose should be. The next moment he pushed the nose back; it was made with a shaft stretching into the skull. Then he put back the palate and fastened a small bolt connected with the nose-shaft, and again he was as good-looking a man as you could find in all New York. "You look amused," said he; "but I assure you that until my doctor succeeded in making me presentable I was not only the frightful sight you just saw, but, although I can speak six languages, I could not make myself intelligible in a single one. At the Battle of Cedar Mountain a ball went through my nose and upper palate, destroying both." Soldiers are not the only people who go to the feature-restorers for help when disfigured. Thin women succeed in having made cunningly contrived pads for their cheeks, and persons with hare-lips sometimes have the whole of the lip cut away and a false one substituted.

Ear-makers confine themselves to their own speciality. Ears are frequently lost in America in personal fistichuffs, for there is nothing your American enjoys more than a good chew at the ear of an antagonist, not to speak of the chance to slash it off with a bowie knife or a razor. Ears are also frequently lost through frost-bite. The restorer models them cleverly out of plaster of Paris,

taking the remaining ear as a copy, then makes them from a composition of wax, India-rubber, and a peculiar sort of gum, and affixes them by rubber suction to the side of the head. A family living in Illinois, which happened to be blown up on account of incautiously residing in the vicinity of a powder magazine, has only three noses and two ears between its members; nor has any member of the family, which consists of parents, three good-looking girls, and two strapping young fellows, more than one eye. Nobody would suspect any of these defects at a general glance, for the ear-maker, the nose-restorer, and the glass-eye manufacturer worked over the scorched and badly shaken family for weeks after the doctor had finished treating them for their burns.

There is a dentist on Broadway who calls himself a "tooth transplanter." This gentleman's occupation is as ingenious as it is romantic. A pair of lovers will go to him who are about to be separated for some time. Side by side they sit with open mouths in the surgery while he draws out a small and sound molar from the young man's jaw, and then immediately draws out the largest and soundest from the young lady's. The dentist then quickly inserts the feminine tooth in the masculine gum and the masculine tooth in the feminine gum, and in a day or so the two teeth are fixed as comfortably in their foster mouths as though they had grown there always. The tooth transplanter's charges are a little high, and sometimes he is called upon to undo his own work. He told me an amusing story. Last October a fine dashing young fellow about to join his cavalry regiment on the frontier, came with his sweetheart, a lovely little blonde, and requested to have their teeth transplanted. The job did not take long, although there was some little difficulty in drawing a tooth sufficiently small out of the officer's mouth to fit the girl's gum, and she suffered no little pain during the operation. She could not be induced to take ether as she said it would spoil the romance. In February the young lady came again, but alone and in tears. "She rushed at me," relates the dentist, "crying 'Take it out, take it out; he is a wretch and has deceived me.' I recalled her face readily, but I insisted on hearing her story before removing her sweetheart's transplanted tooth. And I was quite moved," continued the dentist, "by her recital of the infamous manner in which her cavalry lover had suddenly ceased corresponding with her and deliberately married the rich widow of an intemperate Lieutenant-Colonel. I took out that tooth, and advised her to write to her recalcitrant lover and insist upon her own tooth being restored to her. I hope he was well wrenched in the operation."

Leg-stretchers are men and women who fix their patients in a species of rack for an hour or two a-day and chafe the arms and limbs with weak whisky-and-water. Six months of this treatment will ensure an extra inch or two of height; but the operation is tedious and painful. Short men engaged to tall girls are the best paying customers for this business. —*Pioneer*.

THE SILVER INDUSTRY.

[By JOHN RICHARDS.]

During the last four years this new industry has made most marvellous progress, and may now be classed as one of Australia's chief sources of wealth. Its rapid and profitable development has lifted hundreds from comparative poverty to affluence, and has enabled thousands of miners, smelters, and labourers to earn a comfortable livelihood, beside

benefiting indirectly more or less all classes of the community. It is quite on the cards, judging from past progress, that in less than twenty years the output of silver will exceed in value any one of our long established staple products. This year I estimate that about three and a half millions sterling worth of silver and lead will be exported. A question of vital importance to all, but more especially to the silverminer and wheatgrower is. Will the metal maintain its price? It may be asked, how can the price of silver affect the Australian wheat-grower? That it does affect him will be presently shown. During the last few months silver has had a most remarkable rise. For about two years prior to the late advance the average price was a little over 3s 6d per oz. A few weeks ago it touched 4s, the present quotation being 3s 10½d. The main cause of the rise is no doubt the Bill introduced in the Senate and House of Representatives of the United States in February last, which virtually provides for the free coinage of all the silver (about half the total product of the world) produced in that country. Another cause is Mr. Goschen's proposal to abolish the heavy duty in Great Britain on silver plate, which will undoubtedly, owing to the beauty and durability of the metal, bring it into more general use. One of the principal reasons given for introducing this Silver Bill is the growing scarcity of gold, which means dear money, and that the expansion of trade and rapid increase of the world's population requires a much larger metallic currency. The United States has 426 millions of dollars (over £85,000,000) of paper money commonly called uncovered notes, behind which there is no gold or silver or bullion.

Now I will try to explain how cheap silver keeps down the price of wheat, the great staple export of this colony. The European market for foreign wheat is supplied chiefly from the United States, India, Russia, Argentine Republic, and Australia. Before the demonetization of silver in Europe in 1873 the value of the rupee there was two shillings in gold, six months ago it was only worth 1s 4d, but in a silver standard country like India the rupee lost none of its purchasing power owing to the adoption of the gold standard by the principal commercial nations of the world. India sends to Europe one million tons of wheat yearly. A person who wishes to obtain wheat in India can procure enough silver to make two rupees for 2s 8d; with it he can buy a bushel of wheat in India to sell in the English market in competition with the Australian farmer who must sell his wheat for the equivalent of two rupees in silver, or, what is the same thing, 2s 8d a bushel in gold. Silver being the only legal tender in India the Indian wheat-producers have experienced no material change in the price. In a late *New York Tribune* Senator Stewart writes—"The silver standard countries have ample resources to supply the European markets with all farm products. Why is it that all the silver standard countries continue to increase their exports of farm products, while the gold standard countries are compelled to surrender the markets of Europe which they have so long enjoyed. In 1880 the United States furnished 60 per cent. of the quantity supplied; in 1888 9 our country sent less than 23 per cent. The Australian Colonies are on the gold basis, and suffer equally with the United States. These colonies in 1880 sold in the European markets over 13,000,000 bushels of wheat, while in 1888-9 their contribution was reduced to 4,500,000."

Australia being the only silver-producing country of any importance in the British Empire, and, barring the United States and Mexico, producing more silver than any other country in the world, she has a perfect right to make her voice heard in

the great bimetallic controversy that is now agitating England, the Continental nations, and America. Australia should use every effort to induce England to return to her old bimetallic currency, which would make silver a legal tender for any amount. The recent rise in the price of silver is mainly owing to wise legislation, and Australia, so far as possible, should follow in the wake of America. A rise of only 4d an ounce means an extra profit to one Australian mine alone of £2,500 a week, or the dividends increased by £130,000 a year. This 4d an ounce may also mean the difference between struggling Companies making a call or meeting expenses. It may be argued that an advance in silver and increased dividends only add to the wealth of the lucky shareholders, but a good proportion of this increased wealth is bound to circulate in one form or another. The higher the price we get for any of our staple exports the better for all classes. The mine owner cannot enrich himself without enriching others. His wealth is taken from the ground and by his enterprise the country at large is made richer and no individual is made poorer. Very different to the man who speculates for a rise in sugar or wheat. His gain is another man's loss. Again, it may be said that if a high price for silver means a higher price for wheat, would that not be rather rough on the people of wheat-importing countries, such as England? No doubt it would; but, as a rule, nations like individuals generally act from purely selfish motives. The paramount duty of the legislators of any country is to strive to increase the prosperity of that country. And if this desirable result is accomplished how such legislation affects other nations is a matter of very secondary importance.—*Adelaide Observer*, May 10th.

PLANTING IN NETHERLANDS INDIA:

JAVA TEA, BANTAM PEPPER, SUGAR.

The present low quotations for Java tea have stirred up the planters there to put their house in order. The fall in prices has long been in operation and, all through last year, the situation remained unchanged. The planters, taking the alarm, set to work growing the Assam variety of tea in preference, and introduced sundry improvements in machinery and appliances. The fall in Java tea, properly so called, arises somewhat from quality being sacrificed to quantity, but growers' profits have been materially reduced even for superior kinds by the low rates offered by retail tea dealers in Europe. To remedy this, the planters have taken steps to start retail tea dealing on their own account, and they have also set about increasing the sale of the article in the island itself.

In Bantam, pepper cultivation, formerly a leading industry, has fallen off considerably through suitable land for carrying it on abounds. The people migrate elsewhere to work as labourers on pepper estates but shrink from growing it themselves, owing to difficulties attending the transport of cuttings and the mode of planting them out, which requires a particular kind of timber for poles hard to get. To meet the difficulty the Government has decided upon starting an experimental pepper garden there, which will also contain trees suitable for poles.

The Botanical Garden at Buitenzorg affords a striking instance of how Nature sometimes mocks at theoretical science. Scientists there put out by the canker attacking the sugar canes in Java, determined to experiment upon it by planting in an enclosed piece of land sound canes and stricken ones in alternate rows to find out how the disease spreads and its mode of attack. The plants were left to themselves until the day of examination, when the scientists found, to their amazement, that the diseased cane had not infected the sound ones, and that just that opposite had taken place by all

the sickly cane becoming healthy. Meanwhile the planters set great store by plant cane from abroad, and the Governor-General has been empowered to authorise its importation in vessels flying foreign flags.

The *sirih* or betel leaf, so much in demand among natives for chewing purposes, has been found on analysis in Europe to contain useful medical properties. The leaves produce a kind of oil which yields an active principle going by the name of *Chavicol*. Experimenting with the latter in a laboratory at Amsterdam has shown that *Chavicol* is a powerful antiseptic against bacteria, and is five times stronger than Phenol.—*Straits Times*, May 28th.

REMARKS ON THE STATE OF BOTANY IN CEYLON,

WITH REFERENCE TO THE KNOWLEDGE OF IT IN APRIL 1843, AND AN ATTEMPT AT ARRANGING ITS FLORA AS KNOWN TO MOON AND RESIDENT BOTANISTS ACCORDING TO LOCALITY AND ELEVATION, COMMONLY CALLED GEOGRAPHICAL DISTRIBUTION OF A FLORA.

BY CAPTAIN CHAMPION, 95TH REGT.*

On first arrival in Ceylon our Botanical griffin will feel very fairly puzzled as to what he is to regard as new and interesting in the vast mass of green jungle stretched before his wondering eyes. It may be that he can distinguish a Cocco Palm from a Jack tree at first sight, and if he has common intelligence he will shortly become acquainted with the mysteries of eating the various fruits served on the dessert table, and perhaps even enquire after the trees upon which they are produced, in which case I would recommend his consulting his black Appoo, as he may not always be successful in elucidating a correct answer from his companions of the preceding evening.

However this may be, a great deal is to be said respecting Coco-Palms, and Betlenut, Pumplemos and Forbidden fruit, the Bread fruit, Indian-rubber tree, the Banyan, Cashew and half a score more, and if he has not previously in England been the possessor of a little Pitcher plant, hermetically sealed and restricted to the last watering of the Hot-house gardener for six months to come, this pretty plant may be pointed out to him as one of the wonders of the Coast :† but here knowledge closes her ample store, and if he has not perseverance to wade thro' Lindley, Moon, Wight and Arnott, Roxburgh, and a few other tomes, studded like the sands of the seashore with hard names, he will have finished his education in six months, and know as much of botany as most of his neighbours do.

Economy and utility are the order of the day. Who has been in the interior and seen Sugar Plantations, and Coffee Gardens and Coolies clearing, until Coolies are scarce, and will not say that Mammion is hard at work; there is nothing like English labor and industry, and this we will say with three cheers whether in Ceylon, or the Park, or on the Thames with her forest of masts.

Ceylon is a moneymaking land, and many come out to make money and to live to save, but a few are here for a few years, and care less for money and more for agreeable society, and the many charms of the good old land; these regret to find but little of the dulce and society at a low ebb for we are all in the jungle, and just so many Robinson Crusoes with our man Friday.

* Who, as Col. Champion, received his death wound, while leading his regiment in a charge during the siege of Sebastopol.—Ed. T. A.

† The demands of visitors has led to the extirpation of the pitcher plant in the Colombo Cinnamon Gardens, where once it specially abounded.—Ed. T. A.

To the latter it will be no small pleasure to do as we have done in England. History, Literature and the Arts can agreeably vary the usual routine of life, let me also suggest Horticulture and her twin sister Botany, for its knowledge will enrich your grounds and house, with many a pleasing object, and pass many a dull hour whilst even the monotonous jungle becomes a source of delight.

(To be continued.)

SAPPHIRES IN KASHMIR.

Many persons will remember the discovery of a sapphire mine in Kashmir about nine years ago, writes a Calcutta contemporary, and the absurdly low prices at which the hillmen who first brought the gems to Simla were willing to sell the precious stones. The Maharaja of Kashmir was not long in placing a guard over the mines and raising a profitable revenue from them, and since then the work of collecting the stones has gone on from year to year. The spot where the sapphires are found is near the village of Soomjam on the Bhutna river. It is a small upland valley about 1000 yards long by 400 yards broad, and is thirteen marches from Srinagar. There are clear indications that in former times glaciers covered the whole of this region, but now they only descend as far as the upper end of the passes leading into Zanskar. About a hundred coolies are employed in working for sapphires, and the method at first employed was merely to dig up the surface of the earth and search for stones. At present, however, the earth is being washed in a spring close at hand, and by this means better results are obtained. The largest stone found in 1857 weighed about six ounces, and was partly of a very brilliant colour. In 1858 the largest stone only weighed 104 grains, and very few were found weighing more than 50 trains. These, however, are not to be compared with the stones brought down when the mine was first discovered. There are at present in the treasury at Jammu some of the first stones discovered measuring five inches in length by three inches in breadth, and though none of them are uniformly coloured but are shaded off into white at the ends, some fine gems might be cut from them. During the working season of 1888, that is, from the 17th July, to the 29th Sept., the total quantity of corundum obtained from the mines was 1,630 tolas, of which perhaps one-fourth would be commercially valuable, but the average weight of the stones was not more than ten grains. The beds, in fact, appear to be getting exhausted and before long the working may cease to be profitable.

Besides corundum other minerals interesting from a scientific point of view, but not commercially valuable, are found in the granite of this region. Though several attempts have been made to discover new localities for sapphires, in the region they have hitherto all proved unsuccessful, with one small exception. This was a block of granite found near one of the passes into the Zanskar which contained some stones of good size but poor colour. There was no doubt that this block of granite which is the only one visible in the locality had once formed part of the cliffs surrounding the head of the glacier. It was lying at a level of about 15,500 feet above the sea, and probably came from some point which was much higher and perhaps inaccessible. There are other places in Kashmir where rock crystal, iron ore, and other minerals exist, but none of them are worth the trouble of mining. There are also iron-works at Srup in the Kashmir Valley. The outcrop from which the ore is obtained extends for a distance of at least two miles along the hill side, and is sufficient to keep the small native furnaces supplied for many years to come so long as there is any demand for iron, but the ore is said to be of poor quality, and there would be no opening for large blast furnaces on the English plan. A good deal has been said of late regarding the great mineral resources of

Kashmir. It may be interesting, therefore, to refer to some remarks on the subject by Mr. T. D. La Touche, of the Geological Survey of India. He writes that in speaking of mineral wealth which might be brought to light by properly conducted prospecting it does not seem to be taken into consideration that the natives of the country have for ages had opportunities of discovering what minerals the hills contain. Even the Khasis of Assam have for years obtained iron from the granite of their hills, where a highly trained European geologist might have been sceptical about finding it. It cannot be doubted therefore that if minerals exist in Kashmir they are known to the natives. Accident may occasionally bring rarer minerals to light, as in the case of the sapphires, but then even an intelligent prospector might search for years in the mountains without making another such discovery.—*Morning Post.*

THE CYCLONE IN QUEENSLAND.

(By an ex-Ceylon Planter.)

I was at Woodlands at the beginning and at Bicton during the full brunt of the cyclone. Such a crashing and tearing up of vegetation it is almost impossible to imagine. The scrub or jungle is thoroughly torn up by the roots or denuded of tops and branches; trees two and three feet diameter torn up by the roots and laid flat are not uncommon. Earth-slips here and there on the mountains and creek banks washed out to sea. The following day at an elevation about 200 feet, and as far as the eye can see the ocean looks one huge mud-hole strewn with wreckage from the forest. Woodlands house had a very narrow escape, a two-story building; the lower story is tilted over to nearly an angle of 30 degrees while the top story stands erect giving the house a peculiar kink in it; their kitchen and stove, also a two-story building, went smash to the ground as also the Kauakas' huts. No life lost or much injury farther than a few scratches and a cold wet rough night of it out in the open. Two young ladies there, neither very strong, must have suffered keenly for they had to fly from the falling houses short of clothing and without any blankets, camping all night among the pineapples. At Bicton where I was, the early part of the night, a continuous hurricane with rain in torrents blowing through into the house until the whole place was well saturated, when shortly after midnight away went the roof of the dwelling-house with a noise stupefying. The four inmates afterwards scrambled out to the kitchen and dining-room and came in there fairly well clad and blankets; they fearing this house would go made for the packing shed at the beach, and took up shelter there, leaving another and myself in the dining-room; we stuck there until the roof and timbers were flying and falling a winnow blown out and out went I at it, escaping underneath the floor of the dwelling-house and had to cling on to the blocks in about 10 or 12 inches of water for about two hours, afterwards we scrambled on to the beach shed where we found the other four with a fire and camped there until daylight.

R. C.

PLANTING IN QUEENSLAND.

(By an ex-Ceylon Planter.)

CACAO AND LIBERIAN COFFEE.

Our agri-horticulture has suffered terribly through cyclone, insect pests, rats and the worst of the weather. I am hopeful and able to record that we now have a cacao clearing in Australia thanks to Messrs. Darley, Butler & Co. of your verdant isle; theirs were the only importation of cacao pods that seed germinated out of six lots. (This day, mail day, I expect another and final lot from A. H. T., Esq.) I lost a good few with the cyclone, and the jungle rats also misbehaved by breaking and eating some of the seeds as they germinated. Now the weather is fine we look for their rapid progress. Cacao and Liberian inter-

mediate quincunx fashion; they are now up to a foot high and look fair, healthy plants. I do not look for this industry to be of much favour with the noble working man of Australia, and in fact would not again attempt the pioneering of this product for a trifle; if I had not had enthusiasm it could not been carried out, for loss after loss, disappointment after disappointment, and your best and constant energy overthrown, was enough to turn the head of an iron man. However it is now a fact in the land of the noble working white man; query is not "noble" misplaced? Years will tell. This clatter of unions, strikes and equality tends to degenerate the white man. I am afraid the race will soon be in decade, their glass of prosperity is running very low. Unless a change comes soon you will find the colored and mixed races more prosperous, honest, virtuous, God-fearing and vigorous than the whites; instance the little colony, the Pitcairn Islanders.

MYSORE EMERY.—Some months ago, the *Bangalore Spectator* mentioned the fact that large quantities of corundum or emery were to be found in the Goribidnur Taluk, Tumkur District, Mysore Province, and that the right to collect this mineral was leased out to a native by the Government for quite a nominal sum. Our contemporary's remarks attracted the attention of a Bombay firm, who sent home a trial shipment of Mysore emery, which fetched almost double the price of the best Grecian emery. Agents are now in Bangalore endeavouring to place orders for this material, so that the price in the local markets has gone up 50 per cent. It is believed that this mineral could be profitably mined, and the large number of old corundum mines, near Banavar, in the Kadur district, is pointed to as being a likely spot.—*Indian Engineer.* [In Ceylon, also, corundum of no value by the gem test ought to be profitable as a metal-polishing substance.—*Ed. T. A.*]

BARLEY-GROWING on the Nilgiris, unlike many other similar experiments inaugurated or fostered by Government, is beginning to show a fair promise of future success, which must be exceedingly gratifying not only to Government but to the local Brewery Companies who have done so much to popularise the crop amongst the Badagas. Liberal prizes are being annually given by Government for the best samples, and these are further supplemented by generous contributions from the Murree and Arvaghath Brewery Companies. The competition for and award of the prizes for last season's samples form the subject of an interesting report recently submitted to Government by the Collector of the Nilgiris. The total awards for last season's samples amounted to a sum of R295, which was equally divided amongst the three "nads," namely Todanad, Merkunad and Paranganad, three prizes being given to each. The samples exhibited were generally of a most satisfactory character, the majority of the thirtynine from Merkunad being regarded as "of excellent quality and difficult to separate." All the samples for which prizes were given were grown from English seed and during the present season only, due care having been taken to exclude old samples. The good quality of locally grown barley is testified in a letter addressed by Messrs. Leishman & Co., to the Collector of the Nilgiris, in which they say:—"We are very pleased to have the honor to inform you that this season's Badaga barley grown from English seed malts very well indeed. In fact we are so satisfied with the barley that we have given instructions to our barley contractor to purchase 2,000 to 3,000 bushels more if it is obtainable. The barley requires a good deal of attention during malting and the malt gives a very high extract." Such testimony as this cannot but be regarded as very satisfactory, and encourages the hope that barley cultivation on the Nilgiris has a prosperous future before it.—*M. Mail.*

THE OKRA PLANT.—Considerable attention is being directed to the okra plant, an annual of South American origin, which, heretofore, has been known chiefly as an excellent vegetable for soups. It has recently been discovered, however, that this plant has an excellent fibre, and an inventor asserts that he has devised a process for extracting okra fibre at a cost not exceeding one cent per lb. It is believed that okra fibre, especially if extracted at this price, will largely displace jute, and it is also likely to come into competition with henequen.—*Industries.* [The "okra" is simply the bandakai, and the "discovery" referred to is by no means "recent."—Ed. T. A.]

PINE NEEDLE CLOTH.—We have already noticed the manufacture of cloth from Pine-needles as a promising young industry in some of our southern states. A correspondent of the *Atlanta Constitution*, writing from Wilmington, North Carolina, says that at a factory in a neighboring village may be seen specimens of colored matings made from the "Pine straw," which are excellent in quality and also attractive in appearance, as the straw can be bleached to a fine creamy tint and readily takes brilliant dyes. But the machinery for making this matting lies idle, so great is the demand for coarse cloth for cotton bagging.—*Garden and Forest.*

CINCHONA.—At the annual meeting of the Western Java Cinchona Agricultural Company the report was read, which shows that the cinchona prices were far from being favourable. Encouraging reports have been received regarding the estates, and the number of cinchona trees on the four undertakings is at present about 3,975,000, or 225,000 more than in the preceding year. On account of the low prices harvesting was confined as much as possible. The total gross proceeds of the parcels already sold is £19,963, and the unsold stock on the spot and afloat is estimated at £63,270, showing a total of £83,233 appearing in the profit and loss account at a net value of £65,083. The crop of 1890 is estimated at 150,000 kilos., and of 1891 at 220,000 kilos. 210 piculs of coffee were harvested. According to the profit and loss account, the balance profit, after writing off, amounts to £24,092, including the balance of the preceding year, and consequently a dividend of £24 per share, or 2 4-10 per cent can be declared.—*L. and C. Express*, May 9th.

"HEMILEIA VASTATRIX" IN AMERICA?—If so, coffee is doomed in the Western world as well as in the Eastern. This is what we find in the *Rio News*:—

The following paragraph appeared in yesterday's *Telegram*:—The Jamaica papers publish the following:—"His Excellency the Governor, by proclamation, has prohibited the importation into the island of seeds or plants, or any description of earth or soil, or any article packed therewith, that may have come either directly or indirectly from the republic of Brazil." No reason is assigned for this prohibition. Standing by itself this paragraph seems extraordinary, and calls for some explanation—which we are happy to be able to furnish. The Governor of Jamaica, however, is evidently unaware that the Brazilian coffee epidemic, *hemileia vastatrix*, he is thus endeavouring to ward off from the island has already appeared in Central America. This is the more strange since the fact is already known in England, as the following clipping from the *West Indian* of London indicates:—"The cultivation of coffee in Jamaica and some other islands of the West Indies, though on a smaller scale than formerly, is of sufficient importance to induce us to warn planters engaged in this industry of the undoubted appearance of the much dreaded and fatal *hemileia vastatrix*, or coffee leaf disease, in the states of Central America. How it was located in that part of the American continent is not within our knowledge; all we can do is to give timely warning to our West Indian planting friends who, if severely restrictive measures are not adopted, will assuredly find this most destructive pest amongst them before long, despite of expanse of sea between them."—*Panama Star and Herald*, March 8th.

THE BATAVIA Nieuwsblad says that the Java coffee crop this year will fall so short as to give rise to serious financial difficulties with the Government. The paddy crop too looks unpromising and the sugar yield is no better. "A deficit in the Budget looks alarmingly near, but the diminished tax bearing power of the impoverished people allows no hope of additional revenue."—*Indian Agriculturist*, May 10th.

BRAZIL.—Many complaints reach us from Brazil about the disastrous effects to the planters of the late slave emancipation. Some of the coffee plantations in the fertile district of Esperito Santo are utterly deserted by laborers, and are rapidly becoming overgrown with weeds. On others a few blacks still linger, and condescend to work for a day or two in each week, but very unwillingly. Similar conditions prevail more or less throughout the remaining provinces of Brazil, and a large number of planters are threatened with ruin. Meanwhile there is some talk of forming associations for encouraging the influx of European labour. But white workers, besides being dearer, are not suited to the hot, moist climate, and are found very inefficient helpers on a plantation. Some means must be found either of coaxing or coercing the recalcitrant negro, or many a Brazilian planter will find himself deprived of the fruits of a lifetime of labour.—*British Trade Journal*, May 1st.

COCONUT BUTTER.—The *Times* Calcutta correspondent forwards a somewhat strange account of another new butter, the trade in which, he states, has developed to extraordinary dimensions in India. It is reported to be made from coconut milk, and to be pleasant to the taste and smell, and of a clear, whitish colour, free from acids, and easily digestible. The curious part of his story is that the coconuts are sent to Germany, there to have the milk extracted for the manufacture of the butter, one firm turning out, it is said from 3000 to 4000 kilograms daily. We know that so many millions of the inhabitants of India are strict vegetarians in accordance with their religious ordinances, that vegetable butter is finding a large sale there, and already one or two varieties of such butter have been referred to in these pages. It would be interesting to know whether the milk of the coconut could not be made into butter in India itself, instead of being transported thousands of miles to be manufactured in Europe?—*British Trade Journal.*

ORANGE CULTIVATION ON THE NILGIRIS.—Besides the paper on Viticulture noticed by us the other day, Mr. Lawford has contributed one on the cultivation of the orange and other citrus trees in California. It is superfluous for us to dwell on the subject in detail, as the cultivation of oranges and limes, on the Nilgiris is carried on with marked success. Not an estate but grows scores of trees of this family; some of the very best varieties. They are planted either in avenues or scattered among the tea and coffee. Little of the fruit, however, benefits the proprietor as it is stolen and consumed by the coolies. On some estates orchards are formed and enclosed including orange trees marvelously prolific. As an example we may instance that at Billicul. The soil here is gravelly, but by years of preparation it has become rich and productive. The trees are umbrageous and healthy, sufficiently close to yield a dense shade, and when in blossom, the air is redolent with perfume and cool even during the hottest part of the day. The fruiting season extends from November to February, when the grove is a fine sight, every tree laden with thousands of the golden fruit, some of the branches so abundantly as to need propping up. The fruit at Billicul is mixed, but mostly of the thick skinned variety, juicy and sweet but alas! The demand for it has always been insignificant, and basketfuls every year, that could find no purchasers, were buried as manure.—*South of India Observer.*

SILK.

It is claimed by some manufacturers we know of, that our dyes—we cannot say very fast ones now-a-days—are unexcelled; that in the matter of plushes and velvets we stand alone. This may be so; certainly the qualities are gorgeous. And in the matter of economy, ask our friends in the North—say, by the Clyde side—what they fabricate from the “ends” that were formerly of such little use—whence they procure these nozles and chenille curtains. The gouty threads of Eastern raw silk have stimulated the ingenuity of our inventors, and now the automatic fingers step the wandering of gouty silk so soon as a knob is encountered in the process. Very many of our readers will doubtless avail themselves of admission to the St. James's Square ball room, and will judge for themselves on all the matters above mentioned. English ladies, certainly excellent judges in most matters, will fail in this instance. Raw silk from the East is very largely used here—much of it from an uncultivated worm. There are many observers now roaming over the Indian Archipelago and other places, promising surprises, or new sources of supply of articles of known value; it is to be hoped that an observant botanist or two may be found amongst the commercial roamers who possess an eye to the evolution of silk and the food of the evolutionists. Our Antipodean co'vouts might find it to their interest to bestow more attention on the culture of the Mulberry tree and the breeding of the silkworm than they have done.

From a recently issued Consular report on the trade of Italy, we glean the following particulars respecting silk. In passing, it may be remarked that, although this document consists of only eighteen pages of letterpress, the compiler has in them stowed away a wonderful amount of statistical matter. He says:—In the year 1888-1889 over 50,000 quintals (1 q. = 100 lb.) of raw silk were exported from Italy, which, together with the amount of cocoons form 9-10ths of the product exported under the denomination of materials necessary for industries (about 320,000,000 fr., or £12,800,000 sterling). The silk imported is consequently in a very favourable condition, both in a raw and in a manufactured state, while the import is steadily decreasing.

As to the *£ s. d.* aspect of the subject, doubtless information could be obtained from the President of the Association, Thomas Wardle, Esq., F.C.S., F.G.S., Leek.—*Gardeners' Chronicle*.

MULCHING FRUIT TREES, ETC.

There is one matter of modern practice which gets insisted on in and out of season, by gardeners in print and in speech, and which runs the risk of getting overdone, and that is mulching as applied to the roots of trees in our orchards and kitchen gardens.

Mulching, as applied to trees newly planted, is right enough, and is a help to speedy rooting, equally applicable to the forest tree or garden shrub. Even in these cases the amount should be small, and not extend much beyond the root area, its sole object being the retention of moisture in the soil; for if the latter becomes evaporated by hot sun and parching wind, the interstices of the soil become filled with air, which draws the moisture, or in other words the sap, out of the roots in a harmful degree, and the exhaustion of moisture from the soil is only partially replaced in the warm season by capillary attraction from below, or by uncertain rains. Before mulching became so generally advised, we were taught to rely on a crumbly surface to retain moisture in the laud, and for all subject not recently planted, I prefer it to mulching, as being better adapted to our moist climate and weak sunshine. For if mulching has its benefits, it also has the one great drawback of hindering the action of the sun in aerating and warming the earth. We look to the sun as the one source of heat whereby plants are enabled to grow, and yet we do much by putting on masses of non-conducting material like wet straw and Fern, and even short grass, to hinder the access of sun-heat to the soil surrounding the roots of our trees. I will remember an instance of

successful Peach, Apricot, and Fig growing in a garden 300 miles north of London, wheré the gardener—who, by the way, had never missed a crop in the thirty years he held the situation—never employed mulching to his wall trees after the first summer following replanting. The border was of moderate depth, of lightish loam resting on basalt rock, or the overlying strata of heavy loam inclining to clay. The soil of this south border was warm to the depth of one and a half feet, because there was no non-conducting medium spread on its surface; growth on the trees was moderate, and it ripened satisfactorily, forming plenty of blossom buds. The surface was pricked up twice during the summer, and hoed as often as became necessary to keep down weeds; and walking on it was by no means forbidden—and this was quite judicious, for nothing tends to good rooting, short growth, and fruitfulness like a firmly trodden soil. In wet weather only were the gardeners directed to keep to the row of rough plants, which stretched from end to end of the border.

Mulching, unless it be very light indeed, has a tendency to prolong growth in the autumn, and hinder its commencement in the spring, and is wanted only in the lightest of soils, at least so far as established trees are concerned. Rosarians will tell us that exhibition blooms cannot be got without mulching, and the season of bloom would be unduly shortened without it, and yet good Roses can be obtained without its aid. The Rose grower finds it an easy way of feeding his plants, as by employing strong farm dung for the purpose he is able to do that, and needs not to go round to his pets with a potful of stinking manure-water from the piggeries or the stable, but instead thereof waters his mulching with clean water. That is entirely a matter of convenience, and does not touch the real point of the case. He is satisfied if his Rose blooms beat those of his rivals, and, moreover, the Rose puts forth its shoots at an early part of the season, and become early matured even under this treatment; and the Rose grower does not look for a big crop, but only a few superlatively good flowers. Here, therefore, the man who mulches does but little harm, even from my point of view.

Where mulching is of the greatest use, and does scarcely any injury to the plants over which it is placed unless a great thickness is made use of, is on plants on the rockery, in the flower-beds, Strawberry beds, edible, and sweet Peas in beds or rows, Hyacinths, Tulips, Dahlias, Hollyhocks, Rhododendrons, &c., which in the main exist by means of roots near the surface of the soil. To encourage the growth of these roots by means of mulching containing little or no manurial elements, or still better in the case of the vegetables named, with one that may consist chiefly of dung and straw, is quite reasonable and legitimate practice.

Coco-nut fibre refuse is now greatly in favour as a mulching material, and for covering the soil beneath plants with small sparse foliage, as bulbs which flower in spring, beds formed of plants in pots for immediate and temporary effects, or where it is desired to hide the soil before the plants cover the same. The use of this kind of fibre rests chiefly on the nice contrasts of colour obtained, and the greater degree of finish and neatness its employment imparts to beds of plants; and as it contains nothing that is edible it is not disturbed by birds in search of food, nor do earth-worms throw their cast up through it. It contains no plant-food whatever, and may therefore never find employment as a feeding mulch.

To plants which are not expected to carry exhaustive crops of fruits, one of the best mulches is half-decayed leaves, or rather leaves left to decay about plants with many surface-roots. These should lay not more than 1 inch in thickness, and may be kept in place by a little soil being sprinkled over them. In beds of shrubs, the wind will disturb the leaves at the outside, and these parts only will require to be kept in place in the manner above stated. It may seem odd to many to recommend pieces of stone, boulders, or pebbles as a mulch—and yet these things rank among the best retainers of moisture and also of warmth—points of great importance. Our ordinary mulches are not bad moisture-keepers, but they are the worst of heat-keepers; whereas

dark-coloured boulders are about as good as could be found. Roofing tiles, and less so roofing slates, are excellent means of drawing roots to the surface, when laid down pretty close together over the soil. This was recognised by our forefathers in growing the Strawberry, for they lined the rows of plants with the common red tiles, and obtained clean fruits, and plenty of roots near the top. Of course, the tiles were only down in the summer-time. It is a capital plan for growing early crops of these fruits on steep sloping banks facing south.

Most Ferns are benefited by growing amongst stones, if the soil employed be suitable, or by having stones placed around them; and as a rule the more stone and the less soil the better do the plants grow. In cases where boulders or sandstone cannot readily be obtained, and the Ferns grow on the level land, it will be found good practice to employ a mulch of leaf-mould, which should be only partially decayed. In all that has been above stated, there is nothing whatever that can claim to be new; but it is obviously of benefit to bring out of the horticultural arsenal some of the old appliances, for fear they should become rusty and forgotten.—A. Y. E.—*Gardeners' Chronicle*.

MYSORE COFFEE-PLANTERS' GRIEVANCES.

A "European in Mysore" writes as follows from Munzerabad to the *Weekly Scotsman*:—

SIR,—I have been deputed by a circle of Coffee planters in the Hassan District of Mysore to air our grievances in your paper, which has a large number of subscribers in India.

People say that farmers and such like are always grumbling, and the same charge is made against us; but our troubles do not spring from the weather or low prices or short crops, quite the reverse. Still our grievances are very real, and we hope some of your readers will advise us how we may better our condition.

I have no tale to tell of atrocities or tyranny, but to speak of the labour question, and to say that the disregard by the judges in this native State of our rights with reference to this question are very annoying to true born British subjects.

1. THE LABOUR QUESTION.—Formerly labour was in abundance. The supply exceeded the demand, but with the rise in prices new gardens have been opened, and the demand is increasing every day. Labourers either come as individuals and offer their services, or are brought in gangs by *maistrees* or contractors, who borrow from the planter and procure coolies of a certain caste to work off the planters' advance on the estate. The contractor has to advance the travelling expenses of his gang from their home to the estate, and every coolie is the contractor's debtor until the advances are cleared off. In one district, Shimoga, a tribe called Lambani or Brendiani used to work without a *maistree* over them; but from South Canara (in British territory) labourers of the Buntras caste were brought in gangs to North Mysore, and these two classes of labourers were mixed together. At first the contracts to provide labourers to work for the money advanced were faithfully fulfilled, but as the demand for labour increased the contractors began to enter into contracts with several planters at once and disappoint them all. To make matters worse, the Lambani tribe followed their example, to the serious inconvenience and loss of the planters.

If the labour market could be controlled by the European planters no difficulty would be left; but with the rise in prices the native ryots have taken to coffee cultivation in their garden patches, and the Holyah labourers, whom they formerly employed for a mere pittance, are now able to earn good wages, and the ryots have adopted the system of making advances to the contractors; and, in short, competition has found its way into a labour market which in the good old time was ruled by custom. The native is demoralised by increasing prosperity, and if the law cannot interfere to enforce agreements, the system of contract must be abandoned.

2. Mysore is a native State. On 25th March 1881 the adopted son of a former Rajah was installed by the Governor of Madras, and the Government of the country was handed over by the Mysore Commission to the Brahman Diwan, or Prime Minister, the *ex-officio* head of every department. The Mysore Commission consisted of three British officers, the pick of the Bombay and Madras Staff Corps, and the State was splendidly governed in all departments. No finer roads were to be found in the world. The public bungalows were substantially built, and well conducted. Irrigation works were carried out on a large scale. In the Judicial Department the Courts were conducted by Judges who understood the native character, and could administer justice without suspicion of partiality for Europeans. The police were well-disciplined, and under the firm control of their superior. In short, the government was as good as British territory. But when the government came into native hands a change was felt by the Europeans in the country. The Judges are now recruited from a class of men who know nothing about the country, and will not go out of their way to inquire. It is useless for planters to appeal in questions about native labour to men of this stamp.

Our grievance has recently taken a very tangible form in connection with what are called the Labour Ordinances. Act XIII of 1859 has always been understood to have been passed expressly for the purpose of protecting employers of labour from fraudulent contractors, journeymen, artificers, &c. . . . With the return to native rule a new and serious cause of complaint has arisen. One of the Mysore judges has interpreted our agreement to be nothing more or less than a bond of slavery. . . .

Yet, in spite of all our grievances, coffee planting is a splendid life. It requires men of stamina and judgment to overcome the increasing difficulties of the coolie labour question, but if a satisfactory interpretation were put on Act XIII of 1859, and if there were some appeal to a competent Court from the childish objection of the Hassan *munsef* with regard to an agreement which is made every day, our troubles might soon disappear.—*Madras Times*.

NEW ZEALAND FLAX OR HEMP.

To the Editor, "Norfolk News."

Sir—No subject is of more importance to the dwellers in the Eastern Counties than the question of agricultural depression, its causes, and the best mode in which these can be met and overcome. This is a vital question to all in Norfolk as, until prosperity can be restored to Norfolk agriculture, there will be no general prosperity of our county population, either town or rural.

The agriculture of Norfolk is largely dependent on plants introduced into the country for growth as agricultural crops during the present century. I mean the sweet turnip, introduced about 1815; the beet root, about 50 years ago; and the kohlrabi and various cabbage plants, within the memory of the existing generation. Let any Norfolk farmer consider how he would now manage his farm without the aid of these plants.

I have for some time past kept a sharp look out to see whether any other new plant could be introduced into England which would be likely to be equally beneficial to Norfolk agriculture; and I think there is one as to which there is a strong probability of its being capable of being beneficially introduced, not only into this county, but into other parts of England. It is the plant with the name of which I have headed this letter, which holds out, I think, fairer prospects of profit to the farmer than jam.

New Zealand flax or hemp is a plant which grows naturally in the New Zealand Islands and in Norfolk Island only. It has a range as a native plant of 1 degrees of latitude, from Norfolk Island to the southern end of the middle island of New Zealand, a district which may well be compared, in range of variety of climate, to the same range of latitude in

Europe lying between Edinburgh and the southern coast of the Island of Sicily. It therefore grows in an intertropical climate as well as extends into and throughout the New Zealand province of Otago, which has a winter of frost and snow very similar to our own in Norfolk.

A short time ago I entered into correspondence with Mr. Daniel Morris, the Assistant-Curator of the Royal Gardens at Kew, asking information as to this plant. I received most courteous replies, and every aid that could be afforded by him. During the last week in February I called at Kew, and was shown by him the plants growing in the open air in the gardens, as well as in the temperate greenhouses, and I was also shown the scutched fibre and manufactured products made from the plant, and was referred for further information to the work issued by the New Zealand Government, written by Sir James Hector, which can be purchased at the office of the Agent-General of New Zealand, at No. 13, Victoria Street, London, S. W., for 2s., and I refer all persons who may take an interest in this matter to that work.

At Kew, I found the plant a most magnificent one, with broad rush leaves, even at this period of the year, of a green as brilliant as holly, but of a lighter hue. The leaves were on some plants at least eight feet long. The largest clump of plants at Kew was protected by tying the outer leaves together so as to shelter the inner ones, but about six other clumps of plants were wholly unprotected. I was informed that the oldest clump had been in the gardens for fifteen years, and had never been injured by frost. The other plants had not been there quite so long; but, although left quite unprotected, had never been injured by frost.

I find from Sir James Hector's book, and the information given me by Mr. Morris, that there are nearly eighty varieties of this plant growing naturally in New Zealand, that each variety grows in a different situation, soil, and climate, some in swamps, some high on the mountains in the northern island, and in every variety of soil and situation. The plant has evidently the capability of readily adapting itself to every soil and climate within a wide range. It is considered to be descended from one parent variety only, and, therefore, will probably readily adapt itself to other soils and climates within a similar range on this side of the globe, as it has done at the Antipodes.

The plant, although the one main variety is most prevalent in swamps, by the side of running water, or where the swamp has had the stagnant waters drained off from it, also grows, as do other varieties, on every soil, from the lightest sand to the heaviest clay. These plants vary in length of leaf according to the more or less fertility of the soil on which they grow and the variety of plant prevalent thereon.

The plant has from time immemorial had its fibres extracted from the leaves by the native Maories, and been used for weaving into various kinds of cloths and for very various purposes; but the process of extracting the fibre was a very slow one, and the article could only be produced in small quantities and at a high cost.

From the time of the early settlement of the colony down to recent times, machines have been invented for preparing this fibre for the various purposes for which it is available. Within recent years several effective machines have been constructed, and are now in operation in New Zealand. By this means fibre of several different qualities have been produced, and mainly exported to England. The lowest quality of fibre for rope-making is saleable in England for about £20 per ton, and of this about three-fourths of a ton can be produced from an acre of the flax plants, with about an equal weight of tow suitable and saleable for paper-making. But by a more careful process and selection of the best leaves, fibre of a silky, lustrous kind can be extracted which is of the value of from £50 to £70 per ton, and the very best silky, lustrous fibre made by the natives by hand is worth from £70 to £100 per ton.

It is not positively known for what purposes this fibre is used, but is believed to be used in England

in the manufacture of silks and poplins. I think I have stated sufficient facts to show that if the fibre can be produced in New Zealand, where unskilled labour is paid at the rate of 8s. per day of eight hours, bear the cost of freight to England, and then is sold in England for use in manufactures either of rope, paper, or woven fabrics so as to yield a profit to its producers in New Zealand, it can be produced so as to yield a larger profit in England, where the market for it exists, if the plant can endure the English climate.

That seems to be the only difficulty which will have to be surmounted, and that can only be decided after experiments in the possibility of growing it here have been made.

In Sir James Hector's book it is mentioned that experimentally, one plot was planted in the Domain Garden, at Christchurch, alongside of other plots, the plant having been obtained from the warmer climate of the northern island; and, while adjacent plots bore the cold climate uninjured, this one plot was totally destroyed by frost, evidently succumbing to the colder climate to which it had been introduced without having become first acclimatised. In making experiments it will, therefore, be requisite to obtain the seeds or plants either from the parts of the southern island which have a cold winter like our own, or from the mountain sides, which lie at such a height above the level of the sea as to have about the same climate as that existing at the southern end of the middle island of New Zealand, and the seeds and plants should be of the varieties which in New Zealand have proved capable of sustaining the colder winter climates existing thereon.

Although very little artificial cultivation has existed in New Zealand, what has taken place has been by planting off-sets or side-shoots taken off old plants in the same way as the sugar growers plant their sugarcane plantations.

It will be requisite, probably, to commence in England with plants raised from seed, because no stock of plants exist in England; and this will at first be a difficulty, because it is said that when grown from seed taken from a specific variety of plants the produce does not come true to that variety. It is said that the plant has been introduced for some years into the southern island, but I have no information as to its growth there.

When artificially grown in New Zealand, the plants have been planted at distances of six feet between the rows, with an interval of six feet between the plants in the rows, requiring about 1000 plants to the acre; but in some cases they are planted with intervals of three and four feet respectively, requiring a correspondingly larger number. To produce from seed it will be requisite that the plants shall be from three to four years old before they arrive at maturity. To solve the question of the power of acclimatisation in England, it will only be requisite to have small plantations of seedlings in corners of fields, and if they will endure the climate for the first two years, then to transplant them into regular plantations, the early nursery plantations being more closely grown than the later one, and therefore occupying comparatively very small space.

If the plant can be grown in England, it will be very suitable to be grown on lands held by the land owner in hand, like the plantations where underwood and hop poles are grown, and, like those plantations, the flax will make game coverts of the best description.

The plantation, when established, will require no annual labour expenditure, except to keep the ground free from weeds, to cut the leaves, and scutch out the fibre.

All that can be realised above this cost will be of the nature of annual rent, realised out of the plantation by the landowner.

It will probably be more suitable for growth on the fen lands than for any other, but there are varieties in New Zealand which grow on every description of soil although not so productive.

Having launched this question before the county, I think I may fairly leave it for the future in the hands of the landowners and tenants who are chiefly interested, merely suggesting that it is a case to be

taken up by both our county agricultural societie and the Royal Agricultural Society.—I am, sir, your obedient servant,
W. G. WINEARLS.
Swaffham, Norfolk, 4th March, 1890.

THE MICROSCOPIC STRUCTURE OF PLANTS, AND ITS RELATION TO CULTIVATION.

A very interesting discussion took place at the Paris Botanical Congress last August, and a report of which is now before us, on the employment of microscopical characters as an adjunct to classification. M. Vesque, who introduced the subject, was, we believe, perfectly right in insisting that the comparative study of the microscopical characters presented by plants should receive a due proportion of attention as other characters do. It does not follow that they are better or worse than others. We do not know at present what their precise value may be, whether they are as subject to variation as others; but their importance cannot be denied, and to allege that they are difficult and troublesome to investigate, though it may be true, is no argument against their intrinsic value. In so far as they are hereditary, and, therefore, relatively constant, they are known already to be valuable aids in discriminating the larger groups of plants, and what M. Vesque and some other naturalists are anxious to do, is to extend the use of these characteristics to each natural family of plants, so far as circumstances permit. Any arrangement founded on these characters alone, would, of course, be just as unsatisfactory as any other artificial or incomplete system would be. We do not suppose that M. Vesque has any intention of founding a system entirely on these characteristics. For classificatory purposes the congenital characters, more or less fixed by long hereditary transmission, are naturally preferable to those characters which are called "adaptive," because they vary according to circumstances. These are the characteristics, the possession of which enables a plant to sustain itself under new or adverse conditions; these are the endowments in the absence of which the plant cannot survive in the battle of life. Whether then, from the point of view of classification, of relative constancy, or from that of adaptation to varying conditions, the anatomical characters appear to be of the highest importance, and this is so obvious that it seems strange that any contrary opinion can be maintained. Such an opinion can only be entertained under a misapprehension.

But in these pages we are more directly concerned in the relation these characteristics bear to the cultural art. It is certain that many structural details are directly associated with variations in the conditions of life. The structure of a plant that passes its life in water is widely different from that of its near relative that grows on dry land. So intimate is the relation between the structure of a plant and the circumstances under which a plant grows naturally, that it is very often possible to recognise in a previously unknown plant the kind of life it must have been subjected to. Of course from our ignorance and limited knowledge, there are many exceptions and much that seems anomalous. But these facts form no valid argument for not availing ourselves as far as we can of what we do know, still less does it constitute a reason for not pushing our researches further in this direction. M. Max Cornu, in discussing M. Vesque's paper, seems to have objected to it as proposing a new system—a substitute for the natural system—but a perusal of M. Vesque's writings leads to no such conclusion. All that M. Vesque wishes to do, so far as we can make out, is to enlist anatomy in the work of perfecting the so-called natural system.

M. Cornu, too, also raises objections to the employment of anatomical characters as a guide to cultivators. M. Vesque said that the anatomical structure [sometimes] clearly indicates the natural of the physical conditions to which the plant is adapted, and which must be realised as much as possible under cultivation. To this M. Max Cornu objects, and says that

we cannot in general realise what conditions would be necessary in the case of plants removed from their natural surroundings and placed under other circumstances, to which they must adapt themselves or perish. Many of them live and prosper under the new conditions—conditions which are quite different from the natural ones. What information, asks M. Cornu, could the study of structure give us, since different conditions give results superior to the normal ones? Coffee, says he, requires a rich (*forte*) soil in the tropics; it would perish here if grown in such a soil. The *Nepenthes* cannot, he says, be grown here except in an extremely porous substratum, while in Sumatra the soil in which the *Nepenthes* grows is a heavy impermeable loam.

In replying to M. Cornu's observations, M. Vesque admitted his inability to reply to the two special cases—that of the Coffee and that of the *Nepenthes*, but stated that he was chiefly concerned with the relations of the structure to light and moisture, and doubted whether M. Cornu would succeed in making a plant adapted to grow in the shade flourish in full sun, and *vice versa*; nor a plant adapted to a dry climate thrive in a moist one. In support of his argument, M. Vesque called attention to the construction of plant-houses divided into separate compartments, allowing of variations of temperature and moisture. Anatomy often indicates what the treatment ought to be, or, inversely, in which compartment (*cal*) we ought to place a plant.

Great difficulties stand in the way, no doubt; the application of a knowledge of anatomical structure to cultural purposes is in its merest infancy, but that it is destined in future to play an important part in practical horticulture, seems to us as absolutely certain as that a knowledge of the letters of the alphabet will, under given conditions, enable a gardener to read the *Gardeners' Chronicle*! It is not to be expected that practical gardeners can as a rule become expert microscopists, but they can profit by the skill of others, and it is the duty of those who have the power and the means at their disposal to hasten and foster the progress to the utmost of their ability.—*Gardeners' Chronicle*.

INDIARUBBER.

In these days, when local horticultural societies are formed in almost every provincial town, and when botanical and horticultural novelties attract so much attention from scientists on the one hand and cultivators on the other, the practical value of the combined efforts of both seem likely to be lost sight of. The interest attached to the successful growth, or to the flowering of a rare plant like the *Amorphophallus* at Kew last year, is equally divided between the scientific botanist and the practical horticulturist, but the introduction and successful cultivation of some valuable economic plant in countries very far distant from its native home, does not secure half so much popular attention, though the benefits accruing from it to the world at large are infinitely greater and of a more lasting character. What is the production of a double flower where a single one was known before only to exist, or even the introduction to our stoves of such plants as the *Victoria regia* and the *Amorphophallus titanum*, or, if possible, the *Rafflesia*, and *Welwitschia*, to the establishment in India of the *Cinchona* plants which has been the means of bringing that most important medicine, quinine, within the reach of all.

The result of this successful enterprise will always stand as a monument of the union of science with practice, and one of the benefits to the world in which Kew has played so large a part.

Next to this achievement, the introduction of rubber-producing plants into the various possessions of the British Empire is undoubtedly of the greatest importance. Though the whole history of these experiments has been given in the Reports of the Royal Gardens Kew, ranging between the years 1878 and 1882, it may be of some interest to point out that whereas some

twenty years ago indiarubber, or caoutchouc, was known to be produced only from *Hevea brasiliensis*, then known as *Siphonia elastica*, from Para, and from *Ficus elastica*, from Assam, the researches of the authorities at Kew have since shown that the rubber of commerce is drawn from several different plants, belonging to the natural orders Euphorbiaceæ, Urticaceæ, and Apocynæ. The first-named family, including the Para sort, or *Hevea* rubber, which is still imported in large quantities, and holds its own as the best quality, though in its native forests the trees are said to be more and more difficult to get at, as the collectors have to penetrate further each year into the more inaccessible parts. The natural consequence of this is, that more attention has been given to other sources, and another Euphorbiaceous plant, the growth of which has become considerably developed of late, and which yields the rubber known in commerce as Ceara scrap (*Manihot Glaziovii*), has been introduced into Ceylon and other countries, where it has grown rapidly. This, as its name implies, is a Brazilian species, and though the rubber has been known in trade for a long time, the plant yielding it was not known till about fourteen years ago, when a consignment of plants was received at Kew, propagated, and widely distributed to India and Ceylon. The success of the plants in these countries has been recorded and fully detailed in the Kew reports before referred to; as also that of another well-known source, namely, the *Castilloa elastica*, which furnishes the bulk of the rubber from Central America, such as that known in trade as Guatemalan rubber.

Mr. Morris, in his little book on *The Colony of British Honduras*, gives some interesting notes on this tree, and details as to the cultivation and the extraction and preparation of rubber from it. He says:—"The tree is very abundant in some places, although daily becoming scarcer in the immediate neighbourhood of settlements. It grows to the height of about 40 or 50 feet, has a thick clean stem about 2 feet in diameter at the base, and in habit of growth much resembles a Bread-fruit Tree, to which, indeed, it is closely allied. . . . The *Castilloa* Rubber-tree is fit to be tapped for caoutchouc, or the elastic gummy substance produced by its milk, when about seven to ten years old. The milk is obtained at present from trees growing wild by men called rubber gatherers, who are well acquainted with all the localities inhabited by the Toonoo (under which name the plant is known in Honduras). The proper season for tapping the trees is after the autumn rains, which occur some months after the trees have ripened their fruit, and before they put forth buds for the next season. The flow of milk is most copious during the months of October, November, December, and January. The rubber gatherers commence operations on an untapped tree by reaching with a ladder or by means of lances, or tics-tics, the upper portions of its trunk, and scoring the bark the whole length with deep cuts which extend all round. The cuts are sometimes made so as to form a series of spirals all round the tree; at other times they are shaped simply like the letter V, with a small piece of hoop-iron, the blade of a cutlass, or the leaf of a Palm placed in the lower angle to form a spout to lead the milk into a receptacle below. A number of trees are treated in this manner, and left to bleed for several hours. At the close of the day the rubber gatherer collects all the milk, washes it by means of water, and leaves it standing till the next morning. He now procures a quantity of the stem of the moon plant (*Calonyction speciosum*), pounds it into a mass, and throws it into a bucket of water. After this decoction has been strained, it is added to the rubber milk in the proportion of one pint to a gallon, or until after brisk stirring, the whole of the milk is coagulated. The masses of rubber floating on the surface are now strained from the liquid, kneaded into cakes, and placed under heavy weights, so get rid of all watery particles. When perfectly drained and dry, the rubber cakes are fit for the market, and exported generally in casks."

"A large tree of *Castilloa*, say 2 feet in diameter, will yield 8 gallons of milk when first cut; each gallon of milk, in the proper season, will make about 2 lb. of

rubber. Hence, a tree of this size will give a return of 16 lb. of rubber, of the value of 10 doles."

Mr. Morris further refers to the use of the *Castilloa* as a shade-giving tree in connection with the cultivation of Bananas, Cacao, Liberian Coffee, Oranges, &c., and records the fact that at the time he wrote in 1883, the Cacao planters in Trinidad were gradually discarding their recognised shade-tree, the *Erythrina umbrosa*, and adopting others more suitable and more profitable, none of which, however, could compare with the *Castilloa*, "either in quickness of growth, in shade giving properties, or in the return which it is likely to give the planter year after year, if properly treated." Our engraving on p. 649, taken from a photograph kindly sent us by Mr. Hart, represents a *Castilloa* tree growing in Trinidad.

It will be sufficient to say that the plants already referred to are the principal sources of the American rubbers of commerce. Quantities, however, come from India, and from other parts of the East, the former from *Ficus elastica*, and the latter from various plants belonging to the Apocynæ, being species of *Willoughbea*, *Leuconotis*, and *Chilocarpus*; while on the East and West Coasts of Africa, several species of *Landolphia* yield rubber of excellent quality. A detailed account of these species, and of their distribution into various parts of the world, is given in the Kew Reports before alluded to, and it forms one of the most valuable and interesting records of work done at Kew.—J. R. J.—*Gardeners' Chronicle*.

CEYLON PLANTING ENTERPRISE.—An experienced planter who writes congratulating us on the completion of another Edition of the "Handbook and Directory," deals with the Planting Statistics as follows:—"220,000 acres of tea at 250 lb. are sure to give us 60,000,000 lb. of tea. Coffee,—Well, the less said about it the better. A crop of 3 cwt. one year and 1 the next, just about pays its way at present prices and that is only what you get off the best estates. Coffee is a *delusion* and a *snare*. Cinchona is ditto ditto unless it rises to 2½ d a unit." But what about Cacao and Cardamoms, and Rubber if the talked-of "boom" in the home markets comes on?

TOBACCO.—With all the able remarks made by Mr. J. Berry White at the meeting of the British Deli and Langkat Tobacco Company on the disastrous attempts to grow tobacco similar to that produced in Sumatra we fully agree. Borneo is the only other place that can cultivate it successfully but, in common fairness to that country, we would point out that the statement "if it fetched \$1 per lb. it would not cover expenditure," is scarcely accurate. It is almost too soon to say what Borneo will eventually do in the way of growing tobacco, for the country is now going through the difficulties of labour, sickness, &c., which the earlier planters in Sumatra know so well. But one company which has been established for three years, and whose 1888 crop was sold at an average of 1s 10d per lb. (covering a large proportion of broken leaf), earned and paid a dividend. Without laying down any hard-and-fast line, it seems that Borneo will be able to produce tobacco which, if sold at a guinea a pound, will yield a fair profit. In any comparison between the cost of producing tobacco in the two countries it must be remembered that there is no poll-tax on Chinese entering Borneo, and that food supplies in most of the districts are much cheaper than in Deli. We hear a rumour—though we have no confirmation of it—that an offer of 4s per lb. has been made for the 1889 tobacco crop of the Darvel Bay (Borneo) Tobacco Co., the estate which was launched by Baron von Stein.—*L. and C. Express*

Correspondence.

To the Editor.

CEYLON TEA IN AMERICA:
MR. STANTON'S VISIT.

Brunswick Hotel, New York, U.S.A., April 29th.

DEAR SIR,—I last wrote you from America on the 29th ult., and I have since that date visited many towns both in the United States and in Canada and wherever I have been, I am glad to say, I have been shown samples of Ceylon Tea. This tea is becoming known everywhere in both countries and is pushing its way—it may be slowly but I think there is no doubt that it is *surely*. The trade appears to have taken root, and now it is beginning to grow, and appearances point to a steadily increasing trade, and one which seems likely to be capable of great expansion. I think a very good work might be done by the Ceylon Planters' American Tea Company did their means permit of their distributing their energies in various towns. *Here* I think they will be a most useful factor, but I feel that still greater benefit would result to the industry if branches could be opened in other cities of the United States, or in some large town in Canada, such as Montreal or Toronto. It is so much easier to reach the actual consumer through an agency of this kind than in other ways and, naturally when once a demand is created and the consumer is caused to *enquire* for Ceylon tea—the trade will not be slow in responding, by purchasing themselves in order to supply this demand.

It will be perhaps specially interesting to Ceylon tea planters to hear that I have seen all kinds of Ceylon tea in my travels—not only all grades—pekoes, pekoe souchongs, and broken pekoes—in some cases also fine orange pekoes—but teas grown at all elevations—some possessing strength more especially, and others being bought entirely on account of their flavour.

Hence Ceylon tea planters may take comfort and encouragement from the present condition of the trade here, and I think they may look forward with confidence to a marked development in the trade. Although much of the tea now seems to be used for mixing, I am happy to say I have come across one or two places where it was being sold in its pure state—unblended with any other kind—and this not by persons interested in tea plantations—but simply and solely on account of the intrinsic merits of Ceylon tea which they had recognized to their personal advantage, because the result was a considerable demand for their teas!—I am, dear sir, yours faithfully,
A. G. STANTON.

CEYLON TEA IN CANADA: MR. STANTON'S
VISIT TO AMERICA.

Halifax, N. S., May 8th.

DEAR SIR,—The last letter which I wrote you was from New York on the 29th April; and since that date I have visited Boston, St. John, N. B., and Halifax, N. S. In Boston there is some demand for Ceylon tea, and its use appears to be on the increase. This town is an important tea market, and I find both Ceylon and Indian teas have a considerable sale there.

St. John, N. B., and Halifax, N. S., although both considerable tea markets use very little besides China tea. One of the largest tea firms here told me there was absolutely no sale for Ceylon tea, but

on going round to a number of retailers I found that a demand was commencing and that already business in Indian tea is being done to some extent—besides on a limited scale in Ceylon teas. I should think New Brunswick and Nova Scotia would soon become large consumers of Ceylon and Indian tea, because they take so much China congo that the same conditions which led to the increased use of Indian and Ceylon teas at home should apply with equal force here. I believe, on that account, it would be worth while for Ceylon planters to make a special effort to get their teas worked in these provinces—either through the Ceylon Planters' American Tea Co. or in some other manner.

In the United States where so much Japan and Oolong tea is used it is not surprising that Ceylon tea has made slow progress—but here it ought to make very rapid advances if only there were anyone to draw people's attention to it; the present also appears a specially favourable time for its introduction, as large quantities of very inferior China teas have recently been brought over here—and seem to have somewhat disgusted people. I believe it may be from this cause that just now more attention is being drawn here to British-grown teas amongst the retailers.

My tour in Canada and America has now almost concluded—I have visited all the towns which I came out to see; amongst other places Philadelphia, Baltimore, Chicago, Montreal, Ottawa, Toronto and Hamilton—besides those already alluded to in this letter. Wherever I have been I have seen a great deal that leads me to believe that the Ceylon tea trade here is but in its infancy and that it is certain to grow and to grow surely even if somewhat slowly. I have been surprised to see how much Ceylon tea is already used in Canada and the States—to a much greater extent than is generally supposed.

The prospects of Ceylon tea on this side of the Atlantic are therefore decidedly encouraging—and with efforts to force the trade—on the part of Ceylon planters—there should soon be an extensive and increasing market for their produce.—I am, dear sir, yours faithfully,
A. G. STANTON,
(of Gow, Wilson & Stanton).

COFFEE BLOSSOM—AND ETCETRAS—ABUNDANT.

DEAR SIR,—Any connection between mangoes, roses, fleas and mosquitoes! All are very prolific this year. A very fair *coffee blossom* and in and about Kandy—lucky owners! The fragrant berry will be up to £15 a bushel before the end of the year, or my name is not what it is.
OLD COLONIST.

THE MANUFACTURE OF "GREEN TEA"
IN PEERMAAD, TRAVANCORE.

May 26th.

DEAR SIR,—An article has lately appeared in our Indian papers copied from a Ceylon paper, greatly extolling the district of Peermaad, Travancore, as to soil, cheap labour, etc., with regard to tea culture, the result of an interview with one of the tea planters of the district; but when on the subject of "green tea" and the samples sent from "Bon Ami estate" the name of the gentleman to whom all the success and "kudos" of the green tea manufactured is due was some how forgotten to be mentioned in that interview

(anyway the name is not mentioned in the article). So surely it is only fair that it should be stated that "the green tea so favorably reported" on by Mr. F. F. Street was solely and entirely manufactured by Mr. Robert S. Imray (the son of an old wellknown planter in Ceylon), superintendent Bon Ami estate, the property of the late Mr. James Darragh of Aleppey. The writer of the article on "Tea Cultivation in Travancore" seems to be under the impression that all the credit of the green tea is due to Mr. F. N. Parker, whereas the samples were given to him by Mr. Imray to take to Ceylon, with the request that they should be shewn to some man of experience in tea matters. I may add green tea manufacture here in this district was never, I believe, even thought possible, till Mr. Imray started the idea; and that he has been most kind in shewing his brother planters, free of expense, this new process in making green tea, is surely the more reason that justice should be done him!

TRAVANCORE,

THE NEW ZEALAND AND SOUTH SEAS

EXHIBITION :

LETTER FROM MR. WATSON.

Kandy, May 30th.

SIR.—I beg to enclose copy of letter received from Mr. W. Watson regarding the New Zealand and South Seas Exhibition.—I am, sir, yours faithfully,

A. PHILIP, Secretary.

Dunedin, April 30th.

A. Philip, Esq., Secretary, Planters' Association, Kandy.

Dear Sir,—I wrote to you last on 13th March (press copy enclosed) and have since received your letter of 4th March. The Exhibition was closed on the 9th instant and was a success until the last. The following were gross receipts at the Ceylon Kiosk since my last account:—

Gross takings from 26th Nov. to 24th Feb. inclusive £265 13s 9d; 25th Feb. £3 9s 6d; 26th Feb., £3 18s 6d; 27th Feb., £3 8s; 28th Feb., £4; 1st March, £4 8s 3d; 3rd March, £2 7s 6d; 4th March, £3 13s; 5th March, £3 18s; 6th March, £3 15s 6d; 7th March, £3 2s; 8th March, £4 16s 7d; 10th March, £3 15s 2d; 11th March, £2; 12th March, £4 9s; 13th March, £3 15s; 14th March, £3 14s; 15th March, £6 1s; 17th March, £2 18s; carried forward £33 2s 9s, 18th March, £2; 19th March, £3 16s; 20th March, £5 7s 2d; 21st March, £2 11s; 22nd March, £4 1s 6d; 24th March, £5 2s 6d; 25th March, £2 4s; 26th March, £2 19s; 27th March, £1 15s 6d; 28th March, £2 5s 6d; 29th March, £3 10s 9d; 31st March, £3 12s 6d, 1st April, £2 0s 6d; 2nd April, £2 9s 9d; 3rd April, £2 17s; 4th April, £6 2s; 5th April, £6 11s; 7th April, £3 18s 9d; 8th April, £3 17s 3d; 9th April, £4 2s 6d; 10th April, £3 16s; 11th April, £4 3s; 12th April, £5 9s 6d; 14th April, £5 11s; 15th April, £4 4s; 16th April, £4 14s; 17th April, £4 16s; 18th April, £4 11s; 19th April, £11 2s 9d; closing days £4 5s 2d. Total £466 19s 2d.

THE KIOSK.—Messrs. Drummond Bros. of Adelaide have declined to purchase the Kiosk at my figure. I telegraphed to them to make an offer, but had no reply. A Mr. Gilchrist of Christchurch is at present corresponding with a view to purchase, and the price of £50 has been named to him, for the bare Kiosk, as the lowest which can be accepted. Mr. Joubert informs me that he has secured the management of an Exhibition to be held at Launceston in December next, and he offers to arrange for efficient representation of the Planters' Association, there for the salary of £3 per week to be paid to the person appointed by him. He suggests that one of the Sinhalese natives (Javanham) would be sufficient, the rest of the service to be by girls engaged on the spot at about 15s per week. He desires me to ask you to wire

as soon as possible if you desire to be represented as above, and if you will therefore wire to the address "Napoleon Duenedin" the word "agreed," I shall inform Mr. Joubert of it wherever he may be at the time. If Mr. Gilchrist does not take the Kiosk and you decide on exhibiting at Launceston, the Kiosk of course will go there, and I shall expect the Duenedin Exhibition to be credited £50 for it. In the meantime it is being taken to pieces and will be packed and stored here.

ACCOUNTS.—These cannot be closed up for a short time yet, as there are several items to collect, but at a rough computation, I should say (counting the Kiosk at £50) there will be enough money at this end to pay all bills and servants' wages and also passage fares of the natives to Ceylon. Pending sale of the Kiosk I may however have to ask Mr. H. McKenzie of Melbourne to draw upon you for the native passages from Melbourne to Colombo. Detailed copies of accounts will be sent to you as soon as possible.

NATIVE SINHALESE.—These men wished to receive their wages here, and I have accordingly paid them as per agreements with Mr. Carlyon. Please find herewith the agreements with full payments received thereon.

AWARDS CERTIFICATES.—I send in charge of Jayanhamy addressed to you a tin box containing certificates as per accompanying list. Jayanhamy has been instructed to leave the box with Mr. Carlyon.

KANDYAN ARTWORK.—I regret to say that these articles have not met with the public appreciation here which they no doubt deserve, and I am of opinion that they will not fetch in this market one half the prices placed against them in the list received by me. Two small articles have been sold, and pending your instructions I have had the rest stored here.

SALE OF OTHER EXHIBITS.—The tea exhibits have been sold to the Ceylon and Indian Tea Association at an average of 1s 4d per pound in bond, and the balance of the tea sent for use at 1s per pound. The coffee samples I purchased myself at 1s per pound.

These prices are higher than could be got by selling to others.

Photographs, mats, etc., are being sold by Mr. Begg. —I remain &c., (Signed) W. WATSON, Inspector, Colonial Bank of N. Z.

P. S.—Just as mail is closing I find the awards will not be signed in time to send. I shall forward them as soon as possible.—(Initialed) W. W.

TEA DEALERS AND BONDED WHARFINGERS.

TO THE EDITOR, LONDON "GROCER,"

Sir,—One effect of the late "rush" to clear teas has been to show up in its worst light the manner in which the London wharfingers and bonded warehouse keepers (who have mostly made considerable fortunes out of the trade) conduct their business, for their customers the wholesale dealers, when any extra pressure arises to clear out packages quickly. I do not hesitate to say that the difficulties and delays in obtaining delivery of our own teas have been a scandal, and the confusion and block at most of the docks all this month in spite of weeks of previous warning, reflect discredit upon the warehouse keepers.

How long are the wholesale trade going to tamely submit to a state of things so injurious to their business, and to the annoyances caused by the bad management of these gentry who make their profits out of us?

Numerous cases have occurred of teas with duty paid early and in advance on the last days of April, so as to be ready for the new rate on May 1st, not being delivered until a week or ten days after, with expense of carts or vans applying daily in vain; and when clerks and clearers are sent down again and again to find out the cause, the cooly told the carmen have never applied, or that warrants have been mislaid, or that the packages are lost; or, again, perhaps some important clearing is stopped for a few pence dock-rent because, by their own default, the packages have been detained so as to run into a fresh week!

But this is not the worst, for a system of blackmailing has grown up amongst the foremen and dock workers which ought certainly to be stopped. These "dockers," who, a few weeks ago, were striking for more pay, now are not satisfied by being paid for their work, but also, in cases of urgency being required, are not ashamed to demand "beer-money," or to have their palms greased by those requiring delivery or sampling, before they will trouble to exert themselves to do the work for which they are employed. Country dealers often wonder, and write and complain of delays, but they little know the trouble it often is, even after duties, &c., are all clear, to get delivery in reasonable time.

Then, again, there is the old and absurd practice of having a general midday dinner-hour, when all dock work, however urgent, must be suspended at the busiest time of the day! and this, too, when Custom House work must be done before half-past three o'clock! Fancy going into a bank, or some big store, to do business at midday, and being told you must wait for an hour, or call again after dinner! Yet this is what our trade have put up with for long years past.

What is the remedy? 1. To make the wharfingers understand they must pay better attention to the wants and requirements of the wholesale dealers, and not merely to the importers. 2. That the evils of a partial monopoly should be kept in check by some independent competition; and the best and most practical way of doing this would be by dealers establishing a wharf and bonded warehouse of their own, and managed in their interests, instead of in that of importers and proprietors.

We know, of course, that the members of the Tea Clearing-House have agreed for a time not to encourage any fresh bonded warehouses being established, but this rather short-sighted policy is one easily terminated by due notice for the benefit of the trade. A powerful and wealthy body like that of the wholesale tea trade could easily start a company for a "tea trade wharf," and bring immediate business to support it and thus many of the vexations and delays at present experienced would soon be remedied, and the undertaking produce a fair profit into the bargain.

Will our Wholesale Tea Trade Committee take the matter into consideration and see what can be done? They will find themselves well supported.—I am, &c.,

AN INCONVENIENCED DEALER.

London, May 21st.

COFFEE IN DUMBULA.—"The Patriarch" writes:—"What a glorious season; never in my period can I, so far as I can recollect, remember such a season. Now nearly six months' sunshine with ample moisture at periods when required! Tea flushing splendidly and wherever coffee is good it never looked more healthy than at this time, but I fear the next four months will show us our old enemy is still to the front when weather favours his development."

KALUTARA TEA AND PADDY DISTRICT, May 29th. — We had an awful night of lightning and thunder and rain which give us 5.26; lucky it was not strong wind. It has done a lot of damage to roads and drains. We had on Sunday last service at Culloden. The Rev. Mr. Bestall came down: I am sorry the weather prevented many from coming. Since then Mr. Bestall has paid us all a visit. I am afraid he has had a very rough journey. I need not say I am sure he received a hearty welcome from all. Influenza still had and am sorry to say labour is scarce, and regret more to hear that they are wanting more pay. I hope that no one will have to raise their wages, for the present price of tea won't allow it. I have never seen the paddy look so well, and should they get a good harvest, which I trust they will, no one will complain of paying the paddy tax: it is the very bad years of late that have been so much against them.

TEA PROSPECTS IN ASSAM.—May has again been a most disappointing month. The first few days were extremely hot with a tremendous sun, and the clerk of the weather has behaved to us very stably in the way of rainfall. Last year he swamped us with something over 30 inches to date, and this year he has left us thirsty and longing with something just over 12 inches, and without a single really heavy shower to record; the result being that all gardens in this district are very much behind their estimates and outturn to a similar date last year. Unless we are more favoured in June things will have assumed a really serious aspect, as the drought has now gone well on into the season.—*Englishman*.

CINCHONA CULTIVATION IN JAVA.—The report of the Director of the Java Government Cinchona Enterprise for the first quarter of 1890 is a somewhat gloomy one; for he speaks of much damage done to the plantations by wind-storms and still more by caterpillars, which are becoming a serious scourge. The only remedy seems to be close planting, and this is being carried out everywhere. The weather being favourable during the quarter, planting operations were carried out vigorously, there being a sufficiency of young plants available for the purpose. The crop of 1889 was all despatched to Tandjong Priok by the beginning of March, and amounted to 703 503 half kilozams of bark, of which 2,339 half kilos were reserved for the local military medical service. At the sales of 1889 bark at Amsterdam in January, February and March the prices averaged 9½, 10 and 9 cents.

THE INDIAN LIKE THE CHINA, TEA SEASON and Statistics close at end of April, and a great pity we now think it is, that the Ceylon Commercial Season when altered was not made to run in correspondence; for there will be this element of confusion with our Commercial statistics for the Calendar years, that they will never agree with the Customs returns to which so many authorities in the Commercial as well as Statistical world are apt to pay special attention. It will be very awkward to have two sets of figures, differing considerably, representing the Staple Exports of Ceylon for a series of calendar years. It may not be too late for the Chamber of Commerce to consider whether they should not make their Commercial Export Season run from 1st May to 30th April, so that the Tea Statistics may be available for precisely the same periods as those of India and China and the confusion of varying returns for the calendar years avoided. A May to April season is what was asked for by the London Brokers.

BLACK WALNUT.—One of the largest specimens of Black Walnut probably ever sent to an eastern market in the log may now be seen in the timber yard of Messrs Johnson Bros., 385 Albany Street, Boston. The tree which produced it grew near the falls of the Kenawah, in West Virginia, on the line of the China peake and Ohio Railroad. The trunk, which measured sixty-four feet to the first branches, has been cut into five lengths; the butt log, the centre of which is hollow from decay, measures at the base eight feet and a half across. The diameter of the log, cut twenty-five feet from the ground, is four feet two inches, and that fifty feet from the ground has a diameter of three feet eleven inches in one direction and three feet in the other. The upper end of the fifth log, at a point sixty-one feet from the ground, where the trunk had been a good deal flattened, measures four feet one inch through one diameter, and two feet nine inches through the other. These measurements are all made inside the bark. A thousand feet of lumber have been cut from the main branches and the five trunk logs are estimated to contain 10,000 feet. The wood in the butt log outside the central cavity is beautifully curled and marked. A superficial examination of the annual layers of growth shows that this great tree has grown on the whole with wonderful rapidity and that it is probably less than 300 years old.—*Garden and Forest*.

REMARKS ON THE STATE OF BOTANY
IN CEYLON,

WITH REFERENCE TO THE KNOWLEDGE OF IT IN APRIL 1843, AND AN ATTEMPT AT ARRANGING ITS FLORA AS KNOWN TO MOON AND RESIDENT BOTANISTS ACCORDING TO LOCALITY AND ELEVATION, COMMONLY CALLED GEOGRAPHICAL DISTRIBUTION OF A FLORA.

BY CAPTAIN CHAMPION, 95TH REGT.

(Continued from page 46.)

I have not however sat down to persuade; in all countries Horticulture and Botany are charms to but a portion of the community, but to a sufficient number to become subjects of public attention, and even to attract the notice of Government, this is the age for Botany as well as other pursuits. Kew re-established—and in the hands of the most accomplished Botanist of the day—the princely greenhouses of Dropmore, Chatsworth, Woburn Abbey, and many noble residences; whilst foreign countries are ransacked by collectors for private Greenhouses or public societies. We find the late Duke of Bedford importing from Mexico a waggon load of Cactuses, one of which an *Echino-cactus* weighed upwards of two cwt. and had to be carried for some distance on the shoulders of eight Indians. Another (*a cactus-senilis*) which some of us may have seen in England, was fourteen feet high. In Ceylon we know that the Duke of Northumberland has not been idle, he may possibly be better acquainted with its botany than our present residents. The *great Duke* himself, can boast of the best avenue of Beech trees in the kingdom at Strathfieldsaye, (better even than Sir Walter's.) It is related of him that when Loudon was engaged in the publication of his *Arboretum* "he wrote for permission to take drawings from some of the trees of Strathfieldsaye, the Duke mistook the signature for that of Ch. James, Bishop of London (J. C. Loudon) and supposing that the Bishop patronised the science of botany, wrote to him that His Lordship might do what he pleased with the giants of his famous avenue, except cut them down. The Bishop, we presume, must have been a good deal puzzled with this limited Church commission. Poor Mr. Loudon lost his chance." It is many years since Ceylon had attracted the attention of European Botanists. The great author of the Linnæan system with much taste and judgment, thus draws a comparison between the vegetation of Ceylon, and as it would appear that of his own native country Sweden:—"A delicious climate has granted to this Island plants of such variety and value, that scarcely any soil can vie with it, for the abundance of its aromatic productions. Whilst Pine Forests occupy our cold and sterile regions, in Ceylon the Cinnamon trees constitute whole groves, in such plenty indeed, that the inhabitants are accustomed to employ the wood for household furniture, for fuel and for cooking. Our orchards are planted with apples, pears, plums and cherries and other similar trees, but in Ceylon nothing is esteemed save the lofty Palms, among which the Coconuts chiefly afford the needful food, utensils and every thing necessary to mankind. The Caryota there yields a wine called Suri, and the Corypha or Fan Palms, extend their broad, smooth and plaited fronds, which serve for shade and shelter. They are most requisite for protection from the sun's rays, as well as from sudden showers, to the Natives, whose only garment is a scanty covering of linen. Date Palms and the superb Bananas decorated with wide spreading and glossy foliage, present in great profusion, racemes of the most delicious fruit, to say nothing of the more valuable productions with which the soil every-

where abounds, such as Mangoes, the Jack, Malay apples, Psidia Oranges, and Citrons, Cashewnuts, Averrhoas, &c. Our fields are sown with common Barley, and Rye, but those of the Cingalese receive nothing but Rice, which affords them flour and bread. Our marshes are covered with Cattle, their's with fragrant *Amonum*. *Persicarias* occupy our waste places; but with them grow different species of Pepper. In our meadows spring the *Ranunculus*, Plantains, *Convallarias*, and many other neglected plants; in theirs, numerous kinds of *Hedysarum*, *Galega*, *Hibiscus*, *Justicia*, *Clione*, *Impatiens*, *Amomum Myrtle*, and *Ricinus*, besides numerous climbers, as *Ipomœa*, *Dioscorea Basella*, *Aristolochia*, *Ophioglossum*, *Phaseolus Momordica*, *Bryonia*, *Vine*, *Cissus*, *Pothos*, *Loranthus*, and *Acrosticum*. In the room of the meadow sweet and mints, the pastures in Ceylon are scented with Basil and the woods with Cinnamon. Everywhere occur the most precious Aromatics, Ginger, Cardamoms, Galange, *Costus*, *Arcorus*, *Schenanthus*, *Calamus*, Aromaticus, and flowers of the most exquisite color and structure and fragrance, such as *Crinum*, *Pancreatum*, and *Gloriose* as well as those plants which saturate the night air with their delicious scent such as the *Tuberose*, (*Polyanthus*.) and *Nyctanthus*."—It was at this period that Burmann labored in Ceylon and the results were "*Thesaurus Zeylanicus*" a very creditable work at the period when published. Burmann lent his collection to Linnæus, who published descriptions from it, as appears from Sir J. Smith's tour on the Continent in 1793. The same author also mentions Herman's Ceylon Plants at Leyden and Copenhagen and that a copy was afterwards published by Sir Joseph Banks. Sir J. Banks seems to have been interested in Ceylon Botany, for Sir William Hooker studied in his museum preparatory to going out with General Brownrigg; unfortunately family occurrences prevented this taking place. In Wight and Arnott's *Prodromus* of Indian botany there is a very good account of the Indian Botanists; up to the time of Roxburgh, their works are of very little service in the present state of Indian Botany with exception of the edition of Roxburgh's Indian Flora by Wallich, which is very good. Royle, Wight and Arnott and Wallich are in India what Hooker and Lindley are at home, and we owe to them a most complete knowledge of Indian botany: all their works are most instructive. Meanwhile to return to Ceylon botany:—Moon the first Superintendent of the Botanic Gardens, established at Peradenia seems to have performed his duties in a most creditable manner. In 1824 he published a list of Ceylon Plants, which is too well known in the Island to require any recommendation; a few mistakes have crept in and many of the genera have been altered since 1824; other plants are to be added, but still it is most useful up to the present improved age of the science. He must have formed a good Herbarium, but only a few plants are now extant, so that no means are left of ascertaining the plants which were undescribed in Moon's time and consequently named by Moon—except by the Native names and they are fluctuating and not always correct where rare plants are in question.

Watson, Lear, and Normansell who succeeded Moon have done but little for Ceylon botany.

Previous to 1838 Colonel and Mrs. Walker paid great attention to Ceylon botany. Mrs. Walker had the advantage of being an excellent flower painter and her tracings of plants are considered very beautiful; their collection of plants went home to England in—1839 or—40 and is supposed to have added a very large list to our Flora.

Dr. Wight was on a visit to Ceylon in 1836: he made an excursion with Colonel Walker and

collected above 500 species of plants. After this a Mr. Nightingale collected for the Duke of Northumberland and a Mr. MacRae seems to have been in the Island: he has added to the grasses.

Mr. Bennett* on return from New South Wales visited Ceylon and has published some interesting particulars on the different varieties of the Coco Palm.

The Flora of Java is quite unknown here: the researches of Blume, Reinwardt, Dr. Horsfield and others might enable us to ascertain several of the species not indigenous to India.

Finally a Mr. Cumming brought an immense Herbarium of plants for sale from the Indian Archipelago about 1840 to London. A list of the Ferns have been published and probably contains many of the Ceylon species.

From the preceding remarks it will be observed that whilst in 1842 the state of knowledge of botany in Ceylon was at a very low ebb, materials had gone to England which may have enabled botanists in England or India to form a very good estimate of our Flora, and indeed it appears that Lindley has drawn very largely on Ceylon for Orchideous Plants, although our present list in Moon is very limited. The Gardens are possessed of drawings of a very beautiful series of Ceylon plants which cannot all be ascertained by the scanty references to be obtained from its indifferent library. Such is the state of our knowledge up to April 1843. But I have here the pleasing duty of remarking that a few months may see a very improved state of our knowledge, as the Government has most liberally come forward in purchasing books of Modern reference which have already arrived and will shortly be open to the public. It is also expected that the labours of Colonel Walker and the knowledge of Indian botanists will shortly be made known in Ceylon and it is in contemplation to publish a corrected list of plants indigenous to the Island. Possibly some years may elapse ere our knowledge is very complete, but it cannot fail but that yearly much will be added to our Flora.

Botany is by many people considered a very dry study, and undoubtedly it is the grammar to horticulture, agriculture and higher branches of a knowledge of vegetation, usually allowed to be important in the daily routine of life. To those interested in it as a pursuit, it opens a very curious field of observation in the structure of plants and for many other considerations; and those who have mastered its difficulties will turn their attention to all the higher branches of the subject with singular success and unravel many of the mysteries of agriculture and commerce. I will briefly give a few instances: Cinnamon and Cassia have been known as articles of commerce from a very early period, as far back as some of the earlier Greek Historians. As such our merchants are perfectly acquainted with their peculiarities, but not so with the sources from which produced. It is true that the Dutch had cultivated the true Cinnamon plant, and so it was known how we got Cinnamon and it was certain that Cassia came both from Ceylon and India and must be known to those who had prepared it for the market. Now just about the period that Cinnamon had begun to fall in value, people in England began to ask what Cassia was, some said it came from a different tree from that producing Cinnamon, others supposed it to be an inferior produce of the Cinnamon tree, the tree allowed to grow old, or the bark of branches of a different year's growth. Of course the old Dutch writers were referred to and then it appeared that certainly there was a Cassia tree, as well as a Cinnamon tree, but when botanists began to look

further, they found that scarcely two botanists agreed about the description of the Cassia tree although several had professed to describe it every correctly. Botanists in England began to fancy there might be many varieties of Cinnamon or of the true Cinnamon; so they got specimens of Cinnamon and Cassia and all the information they could on the subject, but just sufficient to leave a great deal to be said on both sides. In 1838 the question was at last taken up by the Madras Government and they went to work by obtaining specimens of Cinnamon and Cassia and reports upon them from the Government Agents of places where these articles were exported and were also so assisted by Colonel Walker and the Ceylon Government. The reports were very conflicting and unsatisfactory, but fortunately Government had always insisted on Specimens being sent and these were placed in the hands of Dr. Wight. Dr. Wight and other botanists were aware that a great many species of Cinnamon existed and many of these had been described by either Roxburgh, Blume or the Brothers Nees ab Essenbeck; so that although Dr. Wight could not in all instances determine the species sent, because they might be deficient in flowers or fruit, as the Government Agents might not in all instances be up to the requisites of a dried specimen for an Herbarium, yet in many instances he did discover what the species of Cinnamon was as described in books or as new species, and hence he at last was able to settle the question very determinately, and Cassia is found both to be an inferior preparation of the true Cinnamon tree and also the better portions of bark of a great variety of Cinnamon trees of different species and which do not yield true Cinnamon. Also that inferior Cinnamons are produced in various parts of the Indian Coast and these are of species differing from the true Cinnamon of Ceylon. Dr. Blume, enumerates in Java eleven species of Cinnamon-yielding aromatic barks and several of these are said to vie with the very finest Cinnamon of our market. Now I may here observe that Botany is certainly of some use. For when all the species shall have been described and the English merchants are satisfied that there are other good Cinnamons besides the true Cinnamon, many of the underrated Cinnamons will be estimated at their proper value, and if a Coffee Planter should find a good deal of Cinnamon on his estate and can discriminate his species, he will be aware of its exact value whether as Cinnamon or Cassia by ascertaining the name.*

A great many other instances might be cited with respect to our Medical Pharmacopeia. Drugs are purchased at a very high price from foreign countries, when it is probable that other species in our own Colonies are possessed of similar qualities, which might certainly supersede the more expensive articles, where indigenous. Sarsaparilla is one and various species of Convolvulus of this country might produce jalap without resorting to the Mexican or true jalap. It is only by a botanical knowledge of species that we could impart such knowledge or discovery to the public.

Gamboge is another article of commerce and there are Gamboges of various qualities produced from different trees which require botanical discrimination. It created a good deal of attention a few years previous and Colonel Walker was interested in the enquiry and in discovering the Ceylon species. Dr. Graham has at last settled the question deter-

* When Mr. A. M. Ferguson examined Weywelhena, Uva, in the early months of 1841, he reported that the undergrowth consisted largely of cinnamon, which had evidently been habitually cut for spice.—Ed. T. A.

* Dr. George Bennett, still living in Sydney.—Ed. T. A.

minately and the true Gamboge plant is found to be far more rare than the tree commonly supposed to produce the Gamboge of commerce. The latter is very rare and I believe not even indigenous to Ceylon, whilst the former (a common tree) produces a Gamboge which would be scarce saleable.

Some good articles have been written in the periodicals and newspapers of our Colony on articles of commerce or culture and it is reasonable to suppose that the Agricultural Society will do much for Ceylon on such points. It is also to be expected that Horticulture will extend thro' the exertions of individuals and that our Peradenia Gardens on the new footing will yearly add to the taste for improving fruits and vegetables and the introduction of foreign productions. Meanwhile it seems very desirable to ascertain the really indigenous Flora of Ceylon and the peculiar features of certain localities. With this view I shall lay before the public a few hints towards the Geographical distribution of our Flora, premising that it has been made up from a very short experience and from knowledge, derived, from my want of modern works of botany, from the older authors up to the time of Moon and the Prodrromus of Wight and Arnott. As this is about the amount of knowledge of the usual run of residents in the Island, it may serve as a groundwork until a better article on the subject from some more experienced hand shall have been published.

GEOGRAPHICAL DIVISION OF PLANTS IN CEYLON.

Part of the trees and plants in Ceylon (and these the most common in occurrence as forming the mass of vegetation) are found nearly all over the Island in favorable situations. Being of hardy growth few are peculiar to Ceylon but extend over India and the neighbouring Islands, of such plants I have made a selection in Table 1st, it includes many of the handsomer trees and shrubs of Ceylon. Many of these must be familiar to every resident. The Soursop tribe, Country Almond, Guava, Jamboe, Coronet-tree, Ceiba or Cotton, Thespesia, Indian Olive, Pumplemos, Lemon and Orange, Tree-spurge, Coral, Sappan, Peacock-flower, Horseradish-tree, Bauhinia, Cashew, Mango, Mulberry, Banyan, Jack, Breadfruit, Cassia, Cinnamon, Chaste trees, Teak, Jaggerry-tree, Temple-flower, Palmyra, Betle-nut, Indian rubber tree, Sago, Papaw, Bamboo, Tamarind, Castor, Annotto, with trees, shrubs and flowers of less specious appearance and many weeds. In some instances they have been introduced into hothouses in England, but not universally—for what is most common in tropical climates is sometimes neglected to be sent home and of this there is a very curious instance in the Banyan. No foreign production has been oftener quoted than the Banyan both in verse and prose by English writers and it has been well described by both Cordiner and Roxburgh some thirty years ago, yet two of the most popular writers of the day Lindley and Loudon have confused it with the Bo-tree (*Ficus religiosa*) a very different species, and Moon in his catalogue with *Ficus Bengalensis*, it really being the *Ficus Indica* and remarkable for its vast rooting branches, in which peculiarity it differs from both those other species of Fig. Major Forbes and the writer having sent Sir W. Hooker sketches of the Banyan under the name of *Ficus Bengalensis*, Sir W. published a detailed account of this tree, correcting the above errors, and stating that he suspected that English Herbaria are miserably defective in specimens of the true Banyan. His own, rich in the productions of our Eastern possessions, had not a single specimen in March 1841 and Dr. Arnott had but one in

different specimen. It is called Manuga in Ceylon. On the subject of Banyans I will pass over Southey's beautiful description in the curse of Kehama and Colonel Sykes' famous tree in the Poo-ah collectorate which has 68 stems descending from the branches and capable of giving shade,* but I will mention a circumstance which has lately struck me as curious. Somewhere in the Asiatic Transactions Sir Wm. Jones says "it is true that minute ants are hatched in the ripe fruit of the Udumbara (or racemed Fig) whence it is named gamtephale; and the Pandits compare it to the mundane egg"—now although I have always looked upon Sir W. Jones as a very enquiring personage and very clever man, I in this instance at once set him down as following the theories of the school of 1552, who believed that Insects were *spontaneously produced!* and therefore not very much astonished had noted his opinion as rather curious with three of the accompanying marks (!!!) exactly to denote my own opinion on the subject. We have the racemed Fig in Kandy and I had seen the fruit, but I must say I never took any steps to investigate Sir Wm. Jones' theory. However the other day I happened to bring home some of the fruit, of the Carpenter-fig, which I found growing on the root, and on opening some I found they contained nearly a tea spoonful of pure water, which is a curious instance of vegetable economy, and on opening another I discovered about a dozen ants inside. Now there was nothing remarkable in this had the fruit been penetrated, but on search I was obliged to confess that I could not discover any opening in any part of the fruit and consequently it is no wonder that Sir W. Jones thought the Pandits really correct. How they entered I shall leave you to determine, but suppose that the economy of the parent Insect is to introduce her eggs when the fruit is at a very early stage of growth, and that afterwards with the growth of the fruit the fissure becomes entirely obliterated. It is evident that the supply of water together with flowers and seed (all which are produced inside the fruit) are sufficient to support the ants, who are a very thirsty race. The Cingalese, who have naturally rather a turn for botany and the appropriation of all sorts of trees and leaves to medicine and curries, believe that Banyans have no flowers, and although you may not have sharper eyes than they have and can hardly point them out in the tree, a Botanist will shew a trick worth two of theirs, for on quietly turning the fruit inside out and attached to the inner skin you will find either the flowers or the seed which they afterwards turn into.

To return to the distribution of the Ceylon Flora, many of the trees and plants commonly spread over the Island are of great service and utility to the Natives and Europeans either as timber, fruits, medicines, dyes or economical purposes. In many instances the properties are known and have become available, but in other instances from what we read of respecting the use made of these trees and plants amongst certain tribes on the Continent of India or Burmese Territories it may be conjectured that they have been overlooked or neglected—through the spirited exertions of individuals in the Company's service most of these economical vegetable productions have been described under scien-

* Sixty-eight stems must be a mistake, as our comparatively youthful tree, near the Cinnamon Gardens, has hundreds of descending shoots. The concluding line of Southey's description are:—

"So like a temple doth it seem, that there
A pious heart's first impulse would be prayer."
—Ed. T. A.

tific names and descriptions and consequently when our Ceylon Flora is botanically named, we shall without difficulty avail ourselves of the experience thus to be acquired. The greatest exactness is often requisite in describing plants of common occurrence to prevent error. For instance much of the native steel of India is smelted by the use of a species of Mudar plant, the *Calotropis gigantea* (a common plant in Ceylon) and its root and bark is said by Lindley to be a powerful alterative and purgative and of importance in cases of leprosy and elephantiasis—but later researches prove the Mudar plant to be a different plant viz. the *Calotropis procera* which is not known in this Island and it seems very doubtful how far the *Calotropis gigantea* (or Curl flower) may share the qualities of the real Mudar plant, I think it was Dr. Wallich who published remarks on the real Mudar plant being the *Calotropis procera*. On the other hand Mr. Wilkinson in Feby. 1839 made known the native method of smelting steel, the ore used was magnetic oxide of iron 52 to 48 of quartz and was reduced in four hours by a furnace, to which was used charcoal fuel. Afterwards being placed in a crucible with dried wood of the *Cassia auriculata* and green leaves of the (*Asclepias*) *Calotropis gigantea* and a certain process used excellent steel is produced. If Mr. Wilkinson has made no mistake in this plant there seems no reason why the natives here should not convert old iron into steel with facility, both plants being of common occurrence on the Coast. It is not the intention of this paper to enter into the economical uses of the vegetable Kingdom of the Island. A very bulky volume might be produced on the many valuable resources that exist and that are known and made use of by the natives of other countries. I restrict myself to the botany with casual remarks to shew to how many objects of interest, use, or curiosity it will lead. Passing from Table I. we come to the plants of the Maritime Provinces or sea coast of Ceylon. It seems to have been partially explored at Trincomalee, and Mr. Moon has visited Negombo, Putlam and Jaffna, but so very little is known respecting their Floras, that we are really inclined to look upon them as unexplored botanically, so that in reality Table 2 is merely that part of the coast extending from Colombo towards Galle, and it is supposed that the general features will extend to the whole coast of Ceylon, but will vary in certain localities. Putlam for instance having saltwater lakes will have its peculiar characteristics in such localities, and Jaffna seems to differ considerably in climate and productions from the southern portions of the coast. In the neighbourhood of large rivers, it is possible that the productions of a more hilly country may casually occur, as transported in their seed vessels during floods and the monsoon season. However theoretical this view may at first appear it is known to be practically correct to a small extent and that in this way volcanic Islands and Coral reefs become vegetated in the Ocean and Islands thrown up by the embankment of sand in rivers. In connection with this subject, Lyell mentions Geology vol. II "Fruits indigenous to America and the West Indies, such as *Mimosa scandens*, the Cashewnut and others" (all natives of Ceylon,)* have been known to be drifted across the Atlantic by the Gulph stream, on the western Coast of Europe, in such a state that they might have vegetated had the climate and soil been favorable, among

* If "native", is used in the sense of indigenous, then the cashew is certainly not native. It came to Ceylon and India, like the pineapple, chilli and so much else, from the western hemisphere.—Ed. T. A.

these the *Guilandina Bonduc*, a leguminous plant, is particularly mentioned, as having been raised from a seed found in the West Coast of Ireland." The *Guilandina Bonduc* is very common all over the interior of this Island. But altho' this is a proof of the very great distance that seeds may be floated without destroying in every instance the vegetating powers, it does not seem sufficient for our purpose, and so I shall quote Mr. Darwin's description of the Keeling Lagoon Islands. He says "I will now give a description of the Natural History of these Islands which from its very paucity, possesses a peculiar interest. The Coconut tree at the first glance seems to compose the whole wood; there are however, five or six other kinds, one of these grows to a very large size but, from the extreme softness of its wood is useless; another sort affords excellent timber for shipbuilding. Besides the trees the number of plants is exceedingly limited and consists of insignificant weeds. In my collection, which includes I believe nearly the perfect Flora, there are twenty species, without mentioning a Moss lichen and fungus. To this number two trees must be added; one of which was not in flower and the other I only heard of. The latter is a solitary tree of its kind in the whole group and grows near the beach, where, without doubt, the one seed was thrown up by the waves. I do not include in the above list the Sugar Cane, Banana, some other vegetables, fruit trees and imported grasses. As these Islands consist entirely of coral and at one time probably existed as a mere water-washed reef, all the productions now living here must have been transported by the waves of the sea. In accordance to this the Flora has quite the character of a refuge for the destitute. Prof. Henslow informs me that of the twenty species, nineteen belong to different genera and these again to no less than sixteen orders." Darwin also mentions again respecting another of these Islands. "The following seeds are supposed to be driven by the N. W. Monsoon to New Holland and from it to the Island by the S. E. trade wind. The Kimiri of Sumatra and Malacca, the Coconut of Balei, the Dadap of the Malays, also masses of Java Teak and yellow-wood and red and white Cedar and the blue Gum tree of New Holland. All creepers retain their vegetating powers, softer productions as the Mangosteen do not germinate." In the tropics where certain trees and plants grow over the margin of the Ocean and the young saplings often vegetate in the sand and mud both of it and of rivers many may be supposed to be floated after storms far from their place of birth, whilst more inland productions are frequently transported by the agency of birds, or such as have winged seeds by the power of the winds. I can myself give what I believe to be an example of the agency of the Mahavillaganga. On the top of Adam's Peak and about Nuwera Ellia is found in abundance the gigantic *Lobelia excelsa*, a very handsome plant attaining the height of 12 to 15 feet. It is a mountain plant, excluded from the jungles, but delighting in bare elevations and the sides of rocky streams. Its nearest approach to the low country is I believe Pusilawe and Ambergammie, growing in the latter country in great abundance on the banks of the River. A few months ago in passing the Trincomalee ferry I observed this plant on the steep bank overhanging the river and I have little doubt but that the seed had been laid after one of the monsoons when the river is much swollen and the plant in seed. After some experience of the Kandyan country I am able to say it is the only plant of this *Lobelia* growing in the neighbourhood. Upon the whole it seems probable that several plants and

trees may thus migrate to a colder climate, but they are constantly checked in growth where circumstances and climate are unfavourable by the mass of vegetation, hence only a certain number of hardy plants will succeed. The same may be said of plants introduced by the Agency of man. Those of European growth rarely succeed in naturalising themselves in the low country, but South American are in many instances perfect weeds. *Asclepias Curassavica* would really be believed to be an indigenous weed, had it no native name and many of the productions of our gardens will be found in the same neighbourhood wild. Again at Nuwera Ellia the Cape Gooseberry, (*Physalis flexuosa*) originally introduced, has spread with the greatest rapidity and altho' a weed contributes to the scanty resources for cookery in that part of the mountains. In every uncultivated country plants best adapted to the climate of the place and soil will prove the more hardy, and will supplant the more delicate species. Thus in ascending mountains, vegetation will constantly vary first from changes of strata and secondly because the atmosphere becomes colder as you ascend; but there are other causes—Vegetation depends much upon effects of light and solar influence. Leave a barren gravelly soil to itself and it will first be covered with sedge and grass, but when once weeds have effected a footing many of these grasses will disappear, Next will come under shrubs and creepers, so that the cleared space is again converted into jungle. Justly should trees also spring up, by the time they have shaded the under shrubbery from the effects of the sun's rays, it will have materially altered in character. From such causes there must be a constant change of vegetation in mountainous countries and also in the lower tracts, but more especially in the former, I have been informed by Coffee-planters that after clearing jungle many plants and shrubs spring up which were not previously known in the Forests and it is easily accounted for on these principles. I have myself *Pavetta latifolia* from cleared Coffee land, after in vain searching for it in the neighbouring jungle.

WYNAAD PLANTING NOTES.

COFFEE AND CINCHONA.

The crops are a failure with very few exceptions. This is due to the unusual amount of rain, which, coming just when it should not, destroyed the blossom so that very little indeed of it has set. This misfortune was later on followed by another, in the shape of hail storms and hurricanes, so that trees without a berry on them are with a few exceptions, the melancholy order of the day. Of course there has also been any amount of leaf disease, and any amount of this to follow. The appearance of the trees is splendid (just now) for next year, the extraordinary early showers having forced forward an enormous amount of new wood. What will be the effect of this for next season, remains to be proved. Weeds are rampant and hardly a cooly has come in. Influenza and cholera are so bad in Mysore that the maistries declare they cannot make up their gaugs, in which case we must bid a fond farewell to our advances and our hopes of planting up new clearing. Influenza has also been pretty bad here, but not equally so in all places. The Chermas have suffered most, and curiously enough the locals, Moopas and so on, have very generally escaped. A neighbour graphically described his labour supply thus; "All my coolies are sick except six, and these are chiefly employed in digging graves for the rest!"

But we do not altogether despair. I think I have more than once commented upon the cork-like nature of planters. Fortune is amazingly fond of popping us under water, but somehow we always come up again, and though leaf disease and the elements have done their best to annihilate us this year, we can look at the "new wood," and congratulate ourselves on possibilities for next. It may even do the trees good to have a rest. At the same time it behoves us to look around for more strings for our overstrained bow. Liberian, is first favorite just now, and many experiments are being made with it, and good results are reasonably expected, in spite of the adverse criticisms of our Ceylon brethren. We, however, argue that it was bad management on their part which was more to blame than the Liberian itself. They acknowledge to planting it in the open, topping and pruning it, and otherwise treating it as we used *Arabica* long time ago; moreover they were not sufficiently particular in the selection of the seed. Our short experience goes to prove that Liberian must be neither topped nor pruned, and that although there are many varieties capable of getting leaf disease, but one exists which has hitherto defied the enemy. Time of course can only show if this will be the case when the Liberian is planted in large quantities. But no one can deny that it is certainly at present much more hardy and easy of cultivation than its Arabian brother.

We hear of projects for opening old land for tea on several estates where coffee and cinchona have been making a rapid exit. It is evident that tea grows well here, as proved by ocular and financial demonstration, and there is no reason to doubt the same results in other parts of the district. The working it is the chief difficulty, as just when the principal flushes are on the coolies have departed to their country, and labour is exceedingly difficult to obtain. And what am I to say about cinchona. Ichabod! Ichabod! The *succirubra* is suffering very much from canker, or some mysterious disease, apparently inexplicable. A great authority has lately come amongst us, who says the trees chiefly want rest—(like the coffee perhaps) and that we should only shave them *once in three years or so*. A very good practice doubtless for Government, which, happily for itself, does not depend on its plantations; but a poor look out for us, who evidently do. In the meantime *succirubra* is taking the matter out of our hands, and retiring into a blessed nirvana of its own. The ledgers seem inclined to fight it out, and the shaving so far has done them no harm. And finally, I will conclude by bracketing our condition after the manner of Robinson Crusoe when things were not very brilliant with him, and taking comfort thereby:—

No crop	...	High prices, and heaps next year.
Leaf disease	...	Liberian.
Canker	...	Tea.

So up come the planters—Heading the list of good things, and its no use for Dame Fortune to try and drown us out, yet a while at least.—*Madras Times*.

NOTES ON PRODUCE AND FINANCE.

THE SIZE OF TEA CHESTS.

The cry in the Lane is that some planters in India and Ceylon do not appear to pay any attention to the sizes of the chests or half-chests in which they pack their teas. The ordinary custom of the trade is to consider a chest as holding about 100 lb. of tea, and a half-chest as holding about 60 lb. It is pointed out that packages holding less than these weights are not so readily saleable, as a wholesale dealer, when he thinks he has sold say a dozen chests holding jointly 1,200 lb. is disappointed when he finds he has taken up his time in selling 900 lb. only. A large proportion of Indian and Ceylon half-chests of tea hold only from 40 lb. to 45 lb. of tea, the chests only 75 lb. to 80 lb. This involves an expenditure of much more wood in proportion to the weight contained than is at all necessary, more freight on the needless wood,

and considerably higher proportionate dock charges, as will be seen in studying the scale. These intermediate packages are also of not the slightest benefit to the retailers, who frequently have to make troublesome enquiries as to the weights and tares of parcels, now that the trade custom is departed from of boxes representing about 20 lb. of tea, half- chests 60 lb. and chests 100 lb. Larger sizes for either of these classes would also be objected to, though to a lesser degree, as they might be too heavy for the smaller buyer.

TEA RETAILED AT A SHILLING.

The competition amongst retail tea dealers is going on so merrily, that the question when and where it will stop becomes an important one. This is the description of the state of things in Wales sent by the correspondent of a contemporary:—"Any retailer, whether he does his business in a village or town in the principality, in an out-of-the-way corner or in the leading street, will tell you that tea above 2s per lb. remains a "dead stock" on his premises. There was, it is true, a period in the history of the retail trade in Wales when 3s was the average price paid for tea by the people, but now a large percentage of the people do not pay more than 1s 4d for their tea, and this is not to be wondered at when we find almost in every town 'the finest tea in the world' advertised at 1s 10s and 2s per lb. If the 'finest tea in the world,' as our large retailers inform the public can be bought at 1s 10s and 2s, one can hardly expect the public to go in for a high-priced article. The manager of one of the largest retail businesses in South Wales informed me, in reply to a question, that they sold more tea at 1s 4d than at 1s 6d, 1s 8d and 2s combined!—the one at 1s 4d being closely followed by a tea they retailed at 1s per lb." The tea retailed at 1s per lb. must be a refreshing and invigorating compound.

INDIAN AND CEYLON TEA IN AUSTRALIA.

The *Sydney Daily Telegraph* in a long article on the subject of Chinese v. Indian Teas in Australia says:—Indian and Ceylon planters are now making determined efforts to win this (the Australian) market, too, from what they are pleased to call the "post and rails" of inferior teas chiefly imported at present. Their efforts, at any rate as far as New South Wales is concerned, would seem to be meeting with some degree of success. Thus, out of a total import of tea in 1887 of 6,518,695 lb. only 161,584 lb. or 2.5 per cent. came from India or Ceylon. Next year 7,461,621 lb. were imported, 426,383 lb. or 5.7 per cent. being from the countries named, while in 1889, 549,535 lb. of Indian and Ceylon teas arrived, being 8.1 per cent. of the total importations of tea for the year. The significant changes which are taking place in the tea trade cannot fail to be of interest to Australians, for perhaps no other people in the world are to an equal extent tea drinkers. How deeply concerned the inhabitants of these Colonies are in all that affects the tea trade will be readily understood when it is stated that here the average consumption of tea per head of population is no less than 121 oz. per annum, as compared with 73 oz. in Great Britain, 21 oz. in the United States of America, and 1 oz. in France and Germany. Any changes, therefore, which bring to the market a cheap tea of good quality will be welcomed.

THE PREPARATION OF CEYLON TEA.

The *Grocer* calls attention to what it terms "an important defect in connection with the preparation of Ceylon teas," which has "just been discovered by the import trade," who are under the impression that this article is but imperfectly cured by the growers before it is shipped to England, and the consequence is that its commercial value is considerably less than it would otherwise be if tea were made as nearly perfect as possible while it was in the factory near where it was grown. The chief complaint is of the overfiring of these teas, which by being deprived of their best preservative qualities are rendered more liable to depreciation, and consequently are less appreciated by those dealers who would prefer to buy them for storing away rather than for immediate use. Messrs. I. A. Rucker and Bencaft, Mincing Lane brokers, in their circular of the 15th inst., speak very

strongly on the subject, where they say that "we feel called upon to warn our readers against a practice that has been in evidence lately, that of incompletely withering and partially fermenting teas, to give what is supposed in some quarters in Ceylon to be 'grip' or 'point' to teas which otherwise would be good thick coloury useful qualities. The consequence is that a good many parcels have come forward with a very mixed infused leaf, green and undesirable. These teas no doubt have a character of their own, and may here and there be useful for blending. They can, however, for this purpose only be used sparingly, for the incomplete withering and short fermentation cause an absence of 'colour' in cup. The trade don't like it, and the ultimate result will be loss to the planter. We are still of the same mind as we were when we wrote three years ago, that one general fault of Ceylon teas is that they are on the whole over-fired, and that this partly accounts for their non-keeping qualities." This "general fault," says the *Grocer*, is indeed a serious one, and ought certainly to be remedied without delay. There are persons, however, who have doubted the truth of this charge of defective curing in the manufacture of Ceylon teas, and have refused to be convinced of the alleged want of skill and judgment in preparing the different kinds for this market. To satisfy the minds of these people, and place the question beyond dispute, we are also informed by the same authority that last year it was determined to try an experiment for the purpose of ascertaining which of the two sorts of tea were really preferred by the trade here, the "over-fired" or the "under-fired," and accordingly instructions were sent out to Ceylon to prepare a special invoice for sale, one part to consist of tea less fired than the other, and the remaining half to be treated in the same way as heretofore. This plan being adopted, "under-fired" teas on their arrival in London were pronounced to be 2d to 3d per lb. better than those that were completely or, as it is termed, "over" fired. Further than this, the samples were carefully stowed away and sealed up for twelve months, and upon being opened and tasted the under-fired teas in each case retained the same advantage over the fully-fired portion, both with respect to their excellent keeping qualities and their colour in the cup. Nothing is easier to understand than that a delicate article like tea, when fired till it is extremely dry, is more apt than ever to absorb every kind of moisture with which it may come in contact, either in the steamer afloat or in the warehouse ashore, and if so, can it be the least surprising that deterioration should set in directly the tea is turned out of hand? It is well known that in firing their teas the Chinese do not extract the last drain of moisture from the freshly gathered leaves, but apply the heat so judiciously as to preserve all the principal virtues of the tea without impairing some or destroying others; and if there are still any individuals who doubt the efficacy of the method just described in giving the quality of the tea a more lasting character, let them bear in mind that, although China teas are none of the strongest, they will for years keep close to their original flavour and condition, even if they do not actually improve by being kept in reserve until they are thoroughly matured. The *Produce Markets Review* on the same subject says:—Complaints as to the falling off in the quality of Ceylon teas are, however, now extremely general, and it cannot be too strongly impressed upon planters that prompt steps are necessary, either by refraining from weakening the trees by overplucking, or by judicious manuring, or other means, to maintain these teas in the high estimation in which they have been held by the public. A great deal of this falling-off in quality is said to be due to the custom of under-fermenting and over-firing, which reduces the sap, and produces thin flavoured teas, very liable to rapidly deteriorate in quality. It is the thick juicy teas which have made the present reputation of Ceylon growths, and planters should remember this.

TEA AND COFFEE FOR THE PUBLIC.

"Why," it was asked on Tuesday by the *Daily Telegraph*, "on these great holidays (*videlicet* Bank holi-

days) is so little provision made for the supply of tea, coffee, and light refreshments." The enquiry has received a remarkably prompt reply from the peculiarly authoritative voice of Messrs. Spiers and Pond. That eminent firm of refreshment contractors have given a very plain and pertinent answer to the question of the *Daily Telegraph*. That question, say Messrs. Spiers and Pond, is not difficult to answer. "The great general public will not, and do not, when taking their holiday patronise in any appreciable number the places devoted to the supply of tea, coffee, and light refreshments only." It is said, but it is so. And of the fact that it is so Messrs. Spiers and Pond have had very practical proof at the Royal Military Exhibition. There they have erected two large pavilions, a temperance and an intemperance pavilion, with the result that, while the working expenses of the two are exactly the same, the temperance pavilion only does about one-sixth part of the trade which falls to the share of its rival. Moreover, the tea and coffee tents of Spiers and Pond at the Zoological Gardens, which were specially commended by the *Daily Telegraph*, were chiefly crowded on account of the bottled beer to be obtained within them. The experience of Messrs. Bertram and Co., of the Crystal Palace, appears to be the reverse of that of Messrs. Spiers and Pond. They write:—On the question mooted by Messrs. Spiers and Pond in their interesting letter as to the consumption of non-intoxicating drinks by the people on days when they most do congregate, such as bank holidays, we think it will be of interest to state that our experience at this present does not coincide with that of your correspondents. Whether it is due to the conditions of the Crystal Palace or the facilities that are given there for the easy practical supply of non-intoxicants, the proportion of money received in the refreshment department on such occasions for tea, coffee, cocoa, milk, aerated waters, and light refreshments is two-thirds of the entire receipts, a notable increase on the one-sixth calculated by our friends.—*H. and C. Mail*, May 30th.

"KEW BULLETIN."—The June number, now before us, contains an article on compressed or tablet tea, dealing with the methods of its manufacture at Hankow, and at Chungking in Thibet. Timber trees of the Straits Settlements forms the subject of another paper. It contains much useful information on a great number of different species, giving the weights of a certain number of cubic inches, and of a cubic foot of each and native names of the trees. Cotton in West Africa forms the subject of another paper.—*Gardeners' Chronicle*, June 14th.

SUBSTITUTE FOR IVORY:—A commercial reporter, writing from Sheffield, says:—"The hulk of thy ivory sold at the periodical sales finds its way here, and enormous quantities are used in the cutlery and silver trades. The growing scarcity and ever-increasing cost of ivory has, however, compelled manufacturers to turn their attention to the production of various substitutes. One of these is celluloid, and thousands of tons of this material is annually worked up in Sheffield. One firm alone who made a speciality of this article last year, sold upwards of 1,800 dozen table-knives with ivory-grained celluloid handles. Great improvements have been made in the manufacture of this material recently, and certainly the prejudice entertained against it is not shared by Sheffield cutlery manufacturers, who boldly assert that it is superior to ivory in some respects, although it only costs about one-sixth the money. No amount of heat will cause combustion unless the celluloid is brought into direct contact with flame. It stands hot water better, and retains its beautiful creamy polish longer than ivory, for which it seems to be a really perfect substitute so far as Sheffield trades are concerned."—*O. Mail*.

COFFEE IN THE KAREN HILLS.—A contemporary says:—"Among the attempts already being made to start the tea and coffee industries in the hilly districts of Burma, the Nancho estate in the Karen Hills seems to promise well. The coffee grown on this estate has been found to be of excellent quality and has sold at good prices, and tea could also be produced in paying quantities but for the great scarcity of labour which at present exists. In the early part of last year the prospects of the coffee crop looked remarkably bright but a calamity of an extraordinary and unforeseen kind nearly wrecked the small plantation. This was nothing else than an invasion of travelling rats, which in two nights nearly stripped all the trees of their fruit, cutting off the shoots and small branches and leaving the trees to all appearance as if severely pruned. The rats appear to have been animated purely by a spirit of destructiveness, for the fruit of the trees was untouched, but as the fruit was then only half-grown the loss was very great. The ultimate yield was only 5,400 lb. as compared with 12,000 lb in the previous year. It would be interesting to have some particulars about these migrating rats, and Mr. Cotes would do well to direct his attention to the subject, as the plague seems to be an entirely new one. Fortunately the trees on the Nancho estate have recovered rapidly, and the blossoming this year has been abundant and has set well, so that a large crop is expected."—*Pioneer*, May 22nd.

THE MAGAZINE

OF

THE SCHOOL OF AGRICULTURE,

COLOMBO.

Added as a Supplement monthly to the "TROPICAL AGRICULTURIST."

The following pages include the contents of the *Magazine of the School of Agriculture* for July :—

AGRICULTURAL THEORIES AND FACTS.

BEFORE Science and especially Chemistry lent its aid to explain the nutrition and feeding habits of plants, there was much speculation on these subjects, and a number of theories were put forward, which in the light of our modern scientific knowledge appear absurd enough, but judged with regard to the position of Agricultural science at the time they were propounded, are sufficiently plausible. We may notice among others the Excretory Theory of De Candolle, which after being long abandoned, a countryman of the author who came to this Island professing ability to cure the dreadful coffee-leaf-disease, was bold enough to revive. De Candolle founded his theory not only on a false analogy but on what we now know are fictions. Having observed that the excretions of animals were found useful and beneficial as supplying the food ingredients of plants, and that an animal will not thrive and indeed will steadily decline in health if it lived surrounded by its own excrement, he argued that certain families of plants could not continue to grow on the same land for an unlimited period owing to their excreting certain substances which are hurtful to the individuals of these families; but that this excrementitious matter would not be hurtful to other families, and in fact would be found beneficial. Clover or Beans for in-

stance could not be grown continuously for any length of time so as to produce healthy crops, but when grown at intervals together with cereals &c. they showed no signs of deterioration. This according to De Candolle was owing to the Leguminosæ excreting certain substances which, accumulating in the soil, became a source of harm—the crop then growing in what may be said to be unsanitary conditions; but the excretions of the Leguminosæ were supposed to benefit the Gramineæ and *vice versa*. It is granted that any crop grown continuously on the same land without artificial aids, to the exclusion of all others, will eventually become less productive and more weakly and unhealthy; but what is the reason of this? The theory we are at present concerned with, plausible as it appeared in De Candolle's day, did not continue so for long; for while the Botanist would not acknowledge that plants were capable of excreting substances through their roots (as De Candolle supposed), it was further objected by those who gave any attention to the matter, or made any attempt to test the theory, that no excretions of a noxious character could be pointed out as accumulating in a soil under the conditions indicated. Thus the excretory theory was shown to be based on suppositions and had no facts to support it. It was therefore no wonder that after a little time the mere mention of it was received with ridicule.

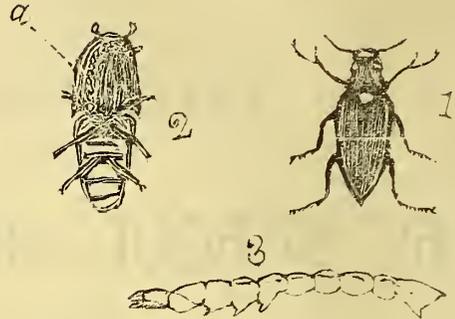

Another theory, which after being accepted with credulity inspired by the distinguished author of it, was also destined to be abandoned before long, was the Mineral Theory of Liebig. Baron Liebig held that plants got all their nitrogen from the atmosphere which was an unlimited source of this most important element of plant-food; the mineral

food which was derived from the soil was however liable to exhaustion, and hence the only manure a plant would need for its healthy growth were of a mineral nature. Liebig was so convinced of this that he went the length of preparing a standard manure which came to be most extensively sold for a time; but alas, further knowledge not only exposed the falsity of the Mineral Theory, but also blasted the prospects of a thriving trade. It was Liebig, however, who in spite of his mistakes brought home to Agriculturists the need they had for the help that science could give, and how Chemistry would be able to help them a great deal; and the year 1840 will always be remembered by Agriculturists as an important one, for in this year Liebig's great work was published. "If a person were asked," says Dr. Lawes, "what events had produced the greatest influence on Agriculture in Great Britain during the last half century, he would, undoubtedly, say the establishment of the Royal Agricultural Society of England, and the publication of Baron Liebig's work upon Agricultural Chemistry."

It is idle to theorize unless theory can stand the test of experiment, and it was only after Bous-singault started his experiments in France on his own farm, followed by Sir John Lawes at Rothamstead in Hertfordshire, that the facts of Agricultural Chemistry began to be established. Nothing could have reached the perfection of experimentation but energy and perseverance such as Dr. Lawes possessed. He is essentially an experimentalist, and every statement he puts forward is the result of close observation and has stood the crucial test of careful experiment under his own eye in his outdoor laboratory at Rothamstead. Hence it is that we would rather listen to what he has to say, innocent as he is of any distinctions or honours gained by a laborious University course than those of any other man. It is only last month that he furnished us with an epitome of the results of his experiments which have been given in detail by Dr. Feam, the Botanist to the Royal Agricultural Society, in the volume he published not many years ago on the Rothamstead experiments. This epitome as giving information as to how crops feed is worthy the perusal and study of every Agriculturist. With regard to the much vexed question as to the inability of crops to grow continually, yet in a healthy condition, on the same land without artificial aids, we now know that this depends on the peculiar feeding habits of different families of plants in virtue of which one kind of plant affects certain ingredients of plant-food and takes these up in larger proportions to others; the extent to which roots penetrate into the ground and the capability they have for availing themselves of food in the soil. However fertile a soil, the resources of plant food as far as a particular crop is concerned are bound to be taxed to an undue extent where that crop is grown on the same land without the intervention of a crop of a different species or without artificial aids—especially in the case of agricultural crops that have their produce carried off the land in some form. Thus the peculiar feeding habits of plants—discovered by careful experiments—have explained those conditions which Theorists vainly endeavoured to account for by such hypotheses as those which the Excretory Theory and the Mineral Theory were founded on.

LIFE HISTORIES OF INSECTS INJURIOUS TO VEGETATION IN CEYLON.

By ABA.

1. *Elater Lineatus*, Liun. (Sin: Tokka, ටොක්කා.) 2. Underside of beetle showing the situation of the spine, *a*. 3. The grub or "wireworm."

THE WIREWORM.

The wireworms are the *Larvæ* of several species of a coleopterous insect (*Elater*) commonly known as the Skip Jack or Click Beetle from its power of regaining its position when laid on its back by a spring or skip, accompanied by a sharp click. The name *Tokka* by which it is known to the Sinhalese is also descriptive of this sound or click.

The leading character of this insect is a strong spine (*a* Fig. 2) situated beneath the thorax, which fits at pleasure into a small cavity on the upper part of the abdomen. It is by means of this that the beetle is enabled to spring up with great force and agility and regain its natural position when laid on its back.

Wireworms are so called on account of their likeness in toughness and shape to a piece of wire. They are very smooth and shining and somewhat cylindrical, and perhaps resemble bits of wire that have been compressed, more than anything else. The colour is a sort of ochreous yellow, which turns into a darker tint after death. Wireworms have three pairs of legs and have also a sucker-foot below the tail.

Miss Ormerod says that "the egg from which this grub is hatched is laid either in the earth close to the root of a plant, or between the sheathing-leaves near the base of the stem. On being hatched the grub or 'wireworm' eats into the stem just above the true root, about an inch below the surface of the ground, and sometimes eats its way up the middle of the stalk, even above the surface of the earth."

"The wireworms are said to live five years in the grub state, but the length of time probably depends on the supply of food. Where they are well fed, it is supposed that they only take about three years before changing to the pupa. But however this may be, with the exception of any temporary pause in winter (when they go down deeper and deeper into the ground as the frost increases), they feed voraciously near the surface till the time has come to turn into the chrysalis (or pupa). Then they go deep into the soil and form an earth-cell in which they change, and from which the perfect Beetle comes up through

the earth in two or three weeks, probably appearing about the first week of August; or they may pass the winter in this state, and the beetles develop from the chrysalis in the following spring."

(To be continued.)

INDIGENOUS FOOD PRODUCTS:
CULTIVATED AND WILD. IX.

BY W. A. DE SILVA.

Anacardiaceæ.

20. *Mangifera Indica*, L. Sin. Amba.

This is the mango tree which grows commonly in the warm parts of the island. There are several varieties of this species, and only one appears to be indigenous, namely, *M. Zeylanica* known in Sinhalese as *Atamba*. This tree is seldom cultivated and grows wild, attaining very large dimensions, sometimes growing to a height of about a hundred feet, while the trunk reaches the circumference of about twenty feet. The stem is generally erect and straight with few branches and numerous twigs, the leaves being placed very near each other, and the petioles which are short having a rounded form at the place of attachment to the branch. The leaves are from eight to twelve inches long, of a dark green colour, with entire margins and of a lanceolate shape. The leaves of the indigenous variety are darker in colour than those of others. A peculiar acid principle is formed in the whole plant, particularly in the fruits and leaves. The flowers are large panicles and the fruits are in clusters, a single cluster sometimes contains no less than twenty fruits. The fruit is a drupe and in the indigenous variety is about the size of an egg. The seed is comparatively large and the fleshy portion or the mesocarp is very acid when unripe. When the fruit ripens the mesocarp softens and turns into a yellow colour. In this state it contains much sugary matter with a little of the acid property, and the mass contains much fibre.

The mesocarp of the ripe fruit is eaten; while the unripe ones are generally used for making chutneys, drying with salt, and flavouring curries. In the process of drying with salt, the fruits are first split into two and the kernel of the seed is removed, leaving the shell attached to the fleshy portion—the outer skin too being allowed to remain. After this, parallel incisions are made in the fleshy portion, powdered salt is sprinkled over, and the whole thing after being fermented for a day, is dried and put by for use. Mango thus prepared is kept without being spoilt for a long time. After the skin and stone are removed, the fruit boiled in syrup of sugar makes a fine preserve.

The wood of this tree is used for a variety of purposes, especially as planks for packages, &c., but it is not very durable, as it is easily attacked by worms.

The bark contains tan, but it is so much mixed with resinous matter and acid juice that it can't be economically extracted; still it is used for this purpose to some extent in India.

21. *Spondias Mangifera*, Willd; Sin. Embarella.

This is a tree met with in different parts of Ceylon, but not very common. The stem is round and grows to a good height with but few branches. The leaves are compound (pinnate). The fruit is green and is of the size of the mango. In taste too it is very much like the mango, but there is a peculiar flavour in it which is not very agreeable. A great deal of it is used for pickles and preserves. The outer-covering and the seed form a larger proportion of the fruit than in the mango.

The bark of the tree is used medicinally among native Medical Practitioners and is considered to be efficacious in Rheumatism.

CRUDE THEORIES REGARDING THE ORIGIN
OF CERTAIN PLANTS.

BY W. A. DE SILVA.

Under this heading I propose to deal with certain notions, still current in parts of the Island, which have been retailed to me in the villages, regarding the origin of the commonest among the food-producing plants of Ceylon. Most of these, though handed down by tradition and oft repeated, are by no means considered to be the true explanation; and I doubt whether even the most ignorant among the villagers give credit to these accounts. I should perhaps apologise therefore for electing to write on a subject of this nature, a consideration of which some would deem unprofitable. But I would urge in extenuation, firstly, that a subject of this kind would prove a not unpleasant change from those dealing with the hard scientific facts of Agriculture with which this Magazine abounds; secondly, that my paper should not prove uninteresting to those who wish to have a knowledge of all things bearing on local Agriculture, even the crudest and most antiquated notions that originated with the superstitious and ignorant tillers of the soil in the earliest times; and thirdly, that there is a certain significance about these theories which it would be interesting to trace.

To start with I will take up Paddy or the rice-producing plant, since rice is the principal food of the natives of this Island. My story relates how in the beginning of this *Kalpa* the earth was inhabited by two beings who descended to our sphere from the *Brahmaloka* (Heaven), and how they and their children had at first no difficulty in obtaining their food, as the soil itself was sweet and savory, and they ate of it gladly and thankfully. But as time went on, those qualities which made the soil palatable ceased to appear, and a growth which may be likened to an edible fungus sprung up which these early inhabitants were put to the trouble of collecting as their food; and hence, it is said, the necessity for work arose for the reason that wickedness began to appear among the members of this first earthly family, who had originally nothing but good in their hearts. And as the world grew older its inhabitants grew more wicked, and in proportion the greater was the difficulty in obtaining food. For the first growth which had merely to be collected and eaten gave place to another—a species of plant bearing naked grain—

in other words, rice, which the people were put to the additional trouble of collecting and cooking before it was fit for eating. Later on as the inhabitants grew more numerous and more wicked, the "rice" developed a covering or husk and evolved itself into paddy, thereby causing man greater trouble in having to separate the grain from the husk. But this was not the last of his troubles to the future Agriculturist, for now the paddy plant ceased to grow perennially with no help or attention on the part of man, and then came the necessity for the preparation of fields and the sowing of the grain in order to obtain the crop. This is the story of the paddy plant which as such has to my mind a charming simplicity about it. But on looking closer we will find a moral significance in it, inasmuch as it attempts to show how labour, trouble and care were the outcome of evil, and increased in proportion as the human race grew in wickedness. Again, there is as it were a scientific glimmer about the account, for it is evidently intended to indicate after a crude fashion that law of Agriculture according to which deterioration must eventually result when no attention is given to the soil, so that those qualities may be preserved upon which certain desirable effects depend.

ANIMAL PARASITES.

Another parasite of the *Tæniada* or Tapeworm family is the *Tænia Echinococcus* which occurs in man and the dog. In the dog it exists in the adult form as the full-grown tapeworm; and in man as the scolex, that is in the cystic form. This latter form, however, exists in other animals than man—in horses and cattle for instance. The worm itself is a small one consisting of 4 segments, one forming the head and three others the rest of the body. The eggs of the worm when taken into the alimentary canal of man gives exit to the embryo which bores its way till it occupies the position it chooses to establish itself in: here it develops from the bladder or cyst, the presence of which in man causes the disease known to medical men as "hydatids." These cysts may occur in the liver, lungs, &c. Smaller cysts may occur within a large one, which latter sometimes produces buds on its outside. Inside the bladder is found a fluid which on shaking assumes a turbid appearance. In the sediment of this fluid are found the embryo worms. In some cases a cyst when cut open is found to contain pus in which one odd hooklet or two indicate the embryo. It is needless to say that this parasite is most fatal to man. The disease is most common in Iceland, and is also known to occur pretty frequently in Victoria. Its presence in Iceland to so large an extent is explained by the close association of men and dogs, owing to the latter being so much used for sledge-drawing in the ice-bound regions of northern latitudes. The foolish habit which some persons have of kissing pet dogs cannot be sufficiently condemned when we consider that these animals lick themselves all over their bodies, and when suffering from tape-worm may carry in their muzzles the eggs of the *Tænia Echinococcus* which are to produce the future "hydatids."

All dogs suspected of suffering from tape-worm should be starved for twelve hours, dosed first with castor oil, and then areca-nut (dose from $\frac{1}{2}$ to 2 drachms). Six or eight hours after more castor oil should be administered to remove the dead worms. The great point is that the head should be removed, for the worm will continue to grow by producing proglottides or segments. The head which is very small, appearing like a little knob at the end of a thread, should be looked for. Everything passed out should be mixed with straw and burnt. The medicine often requires to be administered once a week for two or three weeks before the desired effect is produced.

Mr. Hutcheon, C.V.S., the Government Veterinarian of Cape Colony writing on measles in the pig caused by the presence of *cysticercus cellulosus*, the Scolex of *Tænia Solium*, the adult tape-worm in man, which we were noticing in our April number, says that if salt and sulphur be given systematically, they would act as preventative remedies, attacking the tapeworm ova while they remain in the digestive organs, and before they become distributed as cysts throughout the circular tissue of the body.

With regard to measles, Prof. Cobbold recommends the removal of affected pigs from all sources of infection, and placing them in a clean sty for 6 or 8 months: at the expiration of that time all the *Cysticerci* or measles that existed in the pigs at the time of transfer will have perished, and the flesh of the animals may be then eaten with impunity.

AN ACCOUNT OF THE MATARA MARKET GARDEN.

(Communicated.)

This garden was opened in September 1887. It was not originally intended to be either a market or an Experimental Garden, but as the following short account of it will show, it has gradually developed into a combination of both.

It was started for the experimental cultivation of dholl, and about a quarter of an acre only was fenced off (with the permission of the Local Board) from the Esplanade between the Star Fort and the Police Station for the purpose.

Dholl is a sort of pea or gram which on account of its being both highly productive as a plant, and nutritious as food, was thought desirable, should be introduced as a product for general cultivation. It was no new product, for it had already been successfully cultivated in several parts of the Island, nor was it even altogether unknown as an article of food, small quantities of the imported grain being generally procurable in any large native bazaar. It was however not sufficiently common nor enough known to be as popular an item of food as it deserved. A knowledge of the case with which it can be cultivated and of the profit to be derived from it, would, it was thought, lead to its general cultivation. The only disadvantage under which it started in comparison with most chena products was the length of time that elapses between its sowing time and harvest, namely twelve months. It was not thought that this would be an insuperable objection to its extended cultivation; but experience has shown that it was a much graver

objection than was anticipated. The Sinhalese villager, whether chena cultivator or not, requires "quick returns and small profits," and to this must be attributed his failure to at once appreciate dhol at its real worth, and our consequent failure as yet to introduce its cultivation on any extensive scale. A patch of it has now thrived with very little care, for three successive years in the garden, and it is still hoped that gradually profit will overcome prejudice, and that dhol may hereafter become one of the principal garden products of the district.

Shortly after dhol was sown, it was found expedient, partly from a desire to extend the usefulness of the garden, and partly from the necessity of finding continuous employment for the coolie in charge, to plant a small part of the garden with a few common vegetables. A few brinjals, bandakas and chillies were sown. These thrived so well that some common English vegetables were than tried. Lettuces, radishes and beetroot were all successfully cultivated, so that early in 1888 it became apparent that if further experimental cultivation was to be carried on, an extension of the garden was necessary. The quarter of an acre was thus extended to half an acre, and very shortly afterwards when cotton cultivation was proposed, the extent had again to be doubled.

While both Dhol and Cotton were thriving, vegetables, both native and English, continued to flourish, so much so, that early in the following year it was decided to enclose the whole of the remaining available space, a triangle in extent about 2 acres bounded on one side by a backwater of the river, and on the other two by the high road. A portion of this bordering the river being low swampy ground has to be raised three or four feet to be made fit for continuous cultivation. Sweepings and scavengers' collections deposited here have already reclaimed a large portion of this, and in another year it is hoped the whole extent of the garden will be available for cultivation.

The expenditure in the garden has been merely nominal, as the labour of four prisoners has almost uninterruptedly been supplied free. An orerseer at R10 a month and a garden coolie at R7-50, with the cost of seeds and tools have been the principal items of expenditure, which have been almost met by the sale of produce. The vegetables which have been found to grow best are tomatoes, lettuce, radishes and beetroot, while celery, cabbages, and carrots, though they grew fairly well, cannot be said to have been a success.

In 1889, Cotton and Dhol had both passed the experimental stage of cultivation, vegetables, both native and English, had been successfully tried, fruit trees had been kindly presented by the Director of the Royal Botanic Gardens at Peradeniya, and all that appeared necessary was to make the garden more attractive to visitors. This was attempted by the introduction of English flowers. Some of these, notably Zimias, Balsams, and Mignonette were grown most successfully, and the garden is now almost continually gaily coloured with rows of flowers edging each walk.

During the present year it has been found necessary to employ an additional coolie, and the growing importance of the garden has shown that

it will shortly be necessary to appoint some superior officer to take charge of the whole. With this view, a gardener's cottage in place of the miserable shanty in which the coolie has hitherto lived, is now being built. It is a substantial building of stone, and will, it is hoped be in time, in trimness and picturesqueness the very model of what a gardener's cottage should be.

With a garden already in a flourishing condition, and a gardener's house provided, it is hoped that ere long the Director of the Royal Botanic Gardens may be able to extend his sphere of usefulness in lowcountry cultivation by taking over this as a Government Garden, or by securing for it some small portion of the Government Grant voted for Botanical and Experimental Gardens in the Island generally. Out of five gardens now in his charge, there appear to be only two in the lowcountry, namely at Anuradhapura and Henaratgoda, so that it is not much to ask that the mere pay of a gardener for another lowcountry garden, and that in a district noted for its fertility, should be granted. The Head Gardener's attention and power to do good would not be confined to this garden alone; there are in the district four other gardens, at present in the charge of Mudaliyars or some subordinate headmen, in which cotton and dhol are still being tried, and which with occasional visits from a qualified gardener could be vastly improved.

A combination of this enterprise with that of Poultry farming would not seem impracticable, and if a suitable man can be found for the post, it is proposed to construct a spacious poultry yard, enclosed by wire netting, at the back of the gardener's cottage. In both schemes there is no doubt room for profit as well as philanthropy.

NOTES FROM A TRAVELLER'S DIARY.

I profoundly regret that I was unable to send my instalment of notes for the June number, and that my promise in my May notes should have so soon illustrated the proverbial untruthfulness of Travellers. The fact is that I was much engaged last month at Nikaweratiya, and when I found leisure at Wariyapola, I also found that I was too late for the June issue, and that the Magazine must have already been in the hands of the printer.

I find that the weeding of paddy-land in the Kandyan Districts, is confined only to certain areas. It seems to be nowhere carried on in the Province of Uva, and but to a limited extent in the Central Province. But I have never seen weeding more carefully done than in Kaduganawa District.

At Tulpegoda, a village in Lower Hewaheta, about twelve miles distant from Kandy, I was shown a liedda of paddy in the midst of a large tract of paddy-land, where the difference in the plants from those in the surrounding fields was quite striking. The plants in this liedda were hardy and erect, and the ears on them were well set with plump grain. The explanation given me by the owner was that these plants had been transplanted into their present situation. This owner seemed quite proud of his successful experiment which he intends repeating on a larger scale.

I find that Saltpetre (Potassium Nitrate) is prepared from the dung of bats in some parts of the island. The process as explained to me is very simple. The dung is dissolved in water with some clay obtained from ant-hills, and the mixture is strained; after which the liquid is boiled and left to cool, when the saltpetre separates out in crystals. This is how the natives obtained their saltpetre in past times for the preparation of gunpowder.

A good many coffee lands which one time brought wealth to their owners are now thick with *lantana* jungles, and the habitat of the wild boar and jackal. When coffee was king they say that gambling and drinking were far more common than they are now in the Kandyan villages: and an amusing story was related to me of these times which, apocryphal as it may seem, I was assured is a true one.

It seems that two Kandyan coffee landowners were at a loss how to dispose of the superfluous rupees which they possessed, and the novelty of the situation suggested to them an equally novel mode of relieving themselves of their useless cash, while at the same time it was intended to impress the world with an idea of the abundance of their possessions. These illustrious Agriculturists sought the interior of a hotel (which alas was a too common *rendezvous* for successful coffee planters), and after a sumptuous repast produced Manilla cigars—wrapped in silver foil? No, but in genuine "ten rupee notes." They could not, however, have been educated smokers, for they smoked their cigars with the foil round them, and even drew the attention of those present to the strange proceeding! Is there a better illustration of the height of smallmindedness? Doubtless, these two gentlemen, who I am assured are still alive, eking out an existence on a bit of paddy land, have by this learned the art of economy and—smoking!

Cotton cultivation is carried on to a large extent in Dumbara and Matale Districts by both Europeans and Natives. Lower Dumbara is well known for its rich soil, and a good deal of tobacco is also grown there. Several varieties of cotton have been planted, such as Sea Island, Kidney, New Orleans and Egyptian. Hmuketale plantation, belonging to the Spinning and Weaving Company, is also in the Matale District. The estate is 120 acres in extent, and represents several varieties of cotton. Egyptian has, however, been found best suited to the district, and there are 40 acres fully planted with this variety which grows freely and bears profusely. Two crops are obtained: the plants being pruned after the first crop, and pulled up after the second. Kidney cotton also grows well, but its yield is not so good as the Egyptian. New Orleans does not seem to do very well in these parts. Sea Island succeeds better in Dumbara owing to its humid climate, the dry climate of Matale favouring Egyptian. The seeds of Sea Island is said to deteriorate in Dumbara, perhaps, owing to the want of sufficient saline matter in the soil. Planting and pruning at the proper time seem to be the secrets of successful cultivation.

OCCASIONAL NOTES.

Mr. J. P. Lewis, in his Administration Report of the Vavunyanvilankulam District, writes of cotton:—"Some Fiji or Kidney, and New Orleans cotton was received, and was distributed to the headmen to be sown. The results of the experiment as regards the former variety were unfavourable, a large proportion of the seed not having come up, but the New Orleans variety of cotton seems likely to do well." Mr. M. S. Crawford, in his report on the Mannar District, says of cotton:—"Several lots of cotton seed were distributed and sown, but failed from want of rain. The soil of the district is admirably suited to the growth of cotton, and considerable quantities of the native variety are grown in the island, where it is used for the manufacture of nets. No new areas of cultivation were opened during the year."

Cattle disease seems to have caused much loss during the past year in the Mannar District. It is reported that cattle suffered much from a disease called *Kalliccal* (purging), and large numbers, particularly buffaloes, died. The disease is supposed to have been introduced from India. No remedies were tried. On this subject Mr. Lewis reports from the Mullaittivu District that the total number of deaths during the year 1889 were 266 buffaloes and 107 neat cattle. During the visitation of the epidemic over 40 per cent of the cattle of the district were carried off by it.

The following extract regarding the introduction of new varieties of cotton into the island, is from the Administration Report for 1889 of the Government Agent of the Western Province:—

COTTON.—An attempt has been made to introduce cotton cultivation, and, as in the case of Liberian coffee and other products, the special patronage of Government has been invoked to assist it.

If the Government or the promoters would pay the cost of all the experiments, I think the attempt to introduce it would be very laudable: but so far as I can judge what is done is this:—The native land-owner is assured by the Government Agent or the Assistant Government Agent that cotton cultivation is a most remunerative speculation, and he is induced to clear and prepare his land. This he does at some considerable cost, which he himself has to bear. He is then furnished with imported seed, which he is told is of a very excellent variety imported at great expense. Unfortunately, such seed has hitherto generally turned out to be very bad, and often utterly unsuited to the climate. Only about ten per cent. grows and produces a crop. This has to be watched and protected from rats and other enemies at some cost, and when the cotton is picked it is taken over by the persons who provided the seed, and paid for at a rate which could not possibly repay the producer even if he had a most magnificent crop, but which under all the circumstances leaves him a certain and considerable loser. If he complains, he will probably be told that everyone regrets that the description of seed supplied to him has been found not to be that best suited to the Colony, and he is advised to try a different variety which has just arrived, and is sure to be successful, and will be given to him remarkably cheap.

In my opinion, as I have already reported, the country kapok is the best suited for the country. It will grow well almost anywhere, and if the cotton when picked is well paid for, the industry will soon extend.

It would, I think, be good policy for the promoters of the Spinning and Weaving Company to pay three or four times the value of cotton at first, in order to stimulate its cultivation. First attempts to grow a commodity are always the most expensive. When the cultivation is well established, the cost of production will be reduced, and the ordinary laws of supply and demand will soon operate.

If the Government wish to assist the cultivation of this or of any other variety of cotton, a fairly large grant should be made to introduce it thoroughly and in earnest into some such districts as the Bintenna or the Kolomma and Meda Korales in Sabaragamuwa, but such attempts as have hitherto been made will, in my humble opinion, always fail, and do more to check than extend the cultivation of a product which, I believe, if once established would be of special benefit to the Island.

This complaint of bad seed comes from most parts of the Island, and it is a pity some trials were not previously made to test the value of the seed before distributing it to the villagers, who having once formed a bad opinion, will not easily be made to change it. Now that reports come from Germany that a sugar fifteen times sweeter than that from the cane, and twenty times sweeter than that from beet, can be extracted from cotton seed, there is all the more reason to encourage the extension of cotton-cultivation.

The visit of Mr. Lipton to Ceylon will be remembered for the great push that will be given to the trade in Ceylon tea. "The great tea-man" as he is now called has invested many thousands of pounds in tea-estates in the Island, the produce of which will be almost literally sown broadcast over a large fraction of the earth's surface. All who have lived any time in Edinboro' or Glasgow will be familiar with "Lipton's," where one got the best value for his money, and where business was carried on on the strictest principles. Saturday night at Lipton's used to be a great day for the poorer classes who flocked in crowds to avail themselves of the opportunity to get their groceries at reduced prices: and Lipton's monster cheese will not be forgotten in a hurry by the many who congregated at his windows in North Bridge Street to see, and read the particulars of the manufacture of, the cheese which Her Majesty was obliged to gracefully decline.

It is more than surprising that no one has started the idea of establishing dyeing and cleaning works in Ceylon, considering the extent to which such a business is certain to be patronised. What a saving in clothes there would be! If cleaning and re-dyeing of clothes be considered necessary in the West, how much greater is the need for such operations in the East, where the dust and heat do so much to soil dress material and cause it to fade. Dark clothes which have become dusty and faded, in half the time they do in a less trying climate, to a degree beyond remedy by the ordinary household methods, if sent to such an establish-

ment as Puller's and subjected to certain chemical processes, will return with the cleanliness, freshness and original gloss of a new article. What an advantage this would be to those whose means are limited! It is high time that cleaning, dyeing, and even bleaching works were established in a growing city like Colombo.

The cultivation of new varieties of Potatoes has been attempted in Nuwara Eliya. In the case of Aberdeen Kidneys, with 56 lbs. of seed a crop of 510 lbs. was got. Mr. Le Mesurier, Government Agent, had a good return with Tasmanian seed, and is of opinion that potatoes can be grown to perfection in Nuwara Eliya. The question suggests itself as to who first attempted the growth of potatoes in Ceylon. We remember reading in a local newspaper some years ago that Mr. Lorenz, the father of Mr. Advocate C. A. Lorenz, was the first to experiment in potato growing when in Matara. It would be interesting to know the details of these experiments.

GENERAL ITEMS.

Dr. James Clarke, M. A., PH. D., lately attached to the British Museum, has been appointed Professor of Natural History in the Downton College of Agriculture. Downton bids fair to be the leading College of Agriculture in England, to judge from the successes its students are gaining at the public competitive examinations in Agricultural Science.

The copyright of the well-known series of "Hand-books of the Farm" which are acknowledged to be the most valuable collection of text-books on the various branches of Agriculture, brought out under the superintendence of the late John Chalmers Morton, has been purchased by Messrs. Vinton & Co., the Agricultural and Sporting publishers of New Bridge Street, London.

The appointment of Agricultural Instructors is not peculiar to Ceylon. A Government Commission instituted to inquire into the condition of Agriculture in the Netherlands, and to suggest the best means of improving it, advise the appointment of "special government officials to be called Agricultural Instructors."

The number of applications for protection of Agricultural inventions in Great Britain amounted for the year 1889 to 21,000.

Professor Brown writing of Influenza in horses, says that good nursing, the administration of small doses of salines—as sulphate of magnesia—occasional employment of stimulating liniments to the throat and chest, and, in the convalescent stage, liberal rations, with tonics, constitute the favourite and successful system of treatment of influenza. Bleeding, purging and blistering, he says, which are the sheet anchors of the medicine man of the old school, are means which, in this disease, only tend to increase the prostration, and defeat the restorative efforts of Nature.

The latest report on the prospects of the Indian wheat crop for the season 1889-90, states that the failure of the winter rains has told severely on

the unirrigated wheat crop of the Punjab and the North-Western Provinces and Oudh, and an indifferent harvest must be looked for in about one-half the total area sown in the two provinces. In Bengal conditions are better than last year as regards both area and outturn. In the Central Provinces an average crop on an average area will probably be secured. In Berar a smaller area than usual has to be sown, and the outturn as reported will be poor. In the Bombay Presidency there is a considerable decrease in area; the Deccan crop will be a short one, but a fair harvest is anticipated in Gujarat and the Caranatic. In Sindh a larger area than usual has been put under wheat, and prospects are favourable.

Fruit-evaporation is carried on to an enormous extent in America, especially in New York State and California. The fruits evaporated are principally apples, but nearly every fruit is utilized. The value of evaporated fruit from California alone amounted in 1888 to nearly half a million pounds sterling. It takes 8 lb. of fresh fruit to make 1 lb. of evaporated apples. We get an idea of the work entailed in the operation of fruit drying and the scale on which it is carried out by the following particulars regarding New York State:—In 1888, 250 million lbs. of green apples and 50 thousand quarts of raspberries were operated upon, which produced about 40 thousand lbs. of evaporated fruit, valued at nearly 30 thousand pounds sterling. During the operation 19 thousand tons of coal were burnt in 1,500 drying-houses, and 45,000 hands were employed.

Babu Atal Krishna Ray, a graduate of Cirencester, has published a small work on the improvement of cattle in India. The evils caused by neglecting the principles of breeding and good feeding are, he says, so great in India, that they are almost beyond remedy.

The Agricultural Journal of Cape Colony of the 10th April contains much information under the headings of cultivation of sugar sorghum for manufacture of sugar in Cape Colony, steeping of grain in bluestone solution, measles in pig,

cheese-making, phylloxera, cultivation of vines of pleuro-pneumonia, agricultural prospects, &c.

The results of experiments to test the value of woodshavings as litter for cattle have been published. They are recommended for softness, dryness and cleanliness; while with regard to manurial value, they contain more nitrogen and phosphoric acid though less potash than straw.

Dr. Weismann states that the horse and bear attain an age of 50 years at the outside; the lion lives about 35 years, the wildboar 25, the sheep 15, the fox 14, the hare 10, the squirrel and mouse 6 years. On the other hand, whales live for some hundreds of years, and elephants for 200 years. The shortest life is found in the imagos of certain mayflies which only live four or five hours.

Horse-shoeing even in England is considered to be in a very backward state. A writer in the Royal Agricultural Society's Journal says that farriers as a body are sadly ignorant of the essential principles of their art, and valuable horses are often liable to be injured in consequence. The Worshipful Company of Farriers of London have just formulated an important national scheme for the improvement of farriery by the examination and registration of shoeing smiths, an example that might well be imitated.

The sweet potato (*convolvulus batata*) is a great staple in Natal, being much valued for its agreeable and nutritive qualities as food, growing luxuriantly everywhere, especially on light sandy soils. There is nothing better for livestock of all kinds than this useful root.

We have to thank Mr. Van Starrex, of Crystal Hill, Matale, for seeds of Anatto, Croton-oil plant, and the Musk plant. Our thanks are also due to Mr. H. D. Lewis, sub-inspector of schools, for seeds of Sun hemp and Cuttack paddy.

We acknowledge with thanks the receipt of the St. Thomas' College Magazine for May.

THE TROPICAL AGRICULTURIST MONTHLY.

Vol. X.]

COLOMBO, AUGUST 1ST, 1890.

[No. 2.]

TEA CHESTS.

THE complaint made by more than one of the most prominent among the London tea brokers, to the effect that recent arrivals of Ceylon tea had been greatly injured by having been packed in boxes

made of unseasoned wood, is one of particular gravity. It is one, indeed, to which the most serious attention of our planters should be directed: for if its cause be not removed it is likely to have a very injurious effect upon the reputation which our staple produce has now acquired.

For some years past the difficulty of obtaining in sufficient quantity thoroughly seasoned and otherwise adapted wood for the manufacture of tea chests has been generally acknowledged. With the extension of tea cultivation this difficulty is certain to increase, and equally certain is it—if only to judge by the complaints to which we have drawn attention—that even with the present demand it has not at this date been fully met and overcome. The question we may well ask ourselves is, whether there is any present prospect of a greater measure of success being attained in this direction? Many localities, both in and out of the island, have been searched in the hope of finding some solution of the difficulty, but hitherto these can scarcely be said to have afforded full satisfaction, except, perhaps, in the supplies from Japan. To be told that some of our teas reach London so impregnated with a “cheesy” flavour that they have to be turned out, thoroughly aired, and re-packed in fresh chests, is a most unpleasant revelation. We are all aware how our delicate teas must suffer from being submitted to such an operation, and we cannot fail to realize how injurious to their high repute must be its consequences. Very recently, when referring to the Stanley-Wrightson chests, our London Correspondent informed us of a prospect that the strawboard of which these

are made might ultimately be prepared from horse manure. Thereupon Mr. Creasy, in a letter which appeared in our columns, indulged in a plenitude of “epitaphs”—to plagiarize Mrs. Malaprop—in condemnation of such use; but we doubt much whether, even if that gentleman’s anticipations of evil and tainting smells to be expected from the use of a material so produced be realized, these could be worse than those due to the exudation of acids from unseasoned wood. In the latter case, it is not bad aroma alone that has to be feared, but the action of these acids upon the lead which is supposed to exclude the tea from the tainting effect of it.

It seems to be certain, that, if those who have endeavoured to serve our island interests in this matter of tea chests, from local resources, fail so far in their object as to leave it open for complaints of the nature stated to be made,—our planters will have to turn their thoughts to some substitute for wood. We hesitate to say as yet how far the new chests supplied by the Stanley-Wrightson Syndicate may be found fitted to take the place of the wooden ones at present used. These chests are as yet upon their trial, and so far the trial is only in its incipient stage. A few months, probably, will either reveal their superiority or condemn them as furnishing an alternative for escape from our present difficulty. Trial shipments have already reached the island, and our London Letter informs us that the manufactures are delaying the further development of their present limited means for the production of the chests until the verdict of tea planters and shippers and of the home tea trade should be fully given. It is but natural that we ourselves, being informed of this hesitation on the part of the Syndicate, should refrain from expressing any opinion with regard to the merits of this invention as affording a solution to this important question.

But there is one aspect in which we might well desire to express the hope that these Stanley-Wright

son chests may prove to be all that is claimed for them, quite apart from that in which our planters may regard the matter. Should it ultimately be found desirable to supersede the wooden boxes at present in use by this novel alternative, the decision may open to us another very valuable island industry, and much money which now goes out of Ceylon to pay for foreign woods and Japanese boxes may be retained in it to the great benefit of its community. It is known that the Syndicate working the patent for these chests looks forward hopefully to eventually conducting their manufacture locally. Ceylon, as does every other tropical country, possesses an abundance of almost wild growth which by means of modern machinery may readily be prepared for the production of this strawboard. We have before dealt with the prospect which is thus held out to us, and we need not therefore here further dilate upon it. But the complaint now reaching us brings this prospect nearer to us. It may be found that in its realization may lie the only road out of the difficulties which have given rise to that complaint. We would therefore express the hope that those of our friends who may now be making trial of the Stanley-Wrightson chests will favour us with as early information as to the results to their experience with them as may be practicable. We cannot fail to appreciate any new device by which the causes for the complaints we have dealt with may soon be removed. We shall deal with the good news of the successful utilisation of Maana grass reported by this mail, on another page.

THE PLANTING INDUSTRY OF THE COLONY (CEYLON) IN JUNE 1890.

The main results can now be given of the compilation of plantation statistics for our "Handbook and Directory," thus:—

Number of separate properties recorded	..1,930
Number of plantations cultivated	..1,452
Number of Superintendents and Assistants	..1,211
Total extent	.. 686,728 acres.
" cultivated	.. 324,765 "
In TEA	.. 219,487 "
" COFFEE (Arabian)	.. 53,454 "
" (Liberian)	.. 1,226 "
" CACAO	.. 12,050 "
" CARDAMOMS	.. 5,060 "
" COTTON (on plantations)	.. 293 "
" TOBACCO	.. 477 "
" RUBBER	.. 678 "
" PEPPER	.. 215 "
" ARNATTO	.. 419 "
" TIMBER AND FUEL TREES	
PLANTED	.. 1,589 "

In CINCHONA,—19,677,000 trees over two years old.

This last piece of information may appear rather startling to those who have been crying out that there is no cinchona left in the country; but the figures really mean that 16 millions of cinchona

trees have been cut down and uprooted since July 1888—no bad rate of harvesting. We have already dealt with tea. Poor old coffee has run out by 25,000 acres in the two years and what a change since 1877—thirteen years ago only—when coffee stood for 272,243 acres! Liberian coffee and cacao show little change; but the area under cardamoms has slightly increased. Of the minor products, there is no need that we should speak today. But it is interesting to note that while the total number of plantations cultivated has not increased (a number of old places "abandoned"), but is rather less, the total number of planters has gone up from 1,136 to 1,211 in the two years. Our highest number was 1,389 in February 1881, and then it went down to 1,079 in December 1885. In rather more than four years therefore, we have gained 132 additions to the list of managers and assistant superintendents or at the rate of 34 per annum.

IMMIGRANT AND NATIVE LABOUR IN JAMAICA.

The negroes and their friends in Jamaica have generally opposed immigration at the cost of the State on the ground that native labour is abundant and would be available for the planters if they gave equal wages and advantages to natives as to immigrants. The complaint of employers in Jamaica is in regard to negroes the same as in Ceylon is preferred against the Sinhalese,—unreliability: the absence of steady perseverance in work. The report of a recent committee on immigration seems to have dealt very fully with the whole question, as the following extracts prove:—

That they have duly considered the Messages of His Excellency the Governor and the several Petitions relating to Immigration and have heard all witnesses who have tendered their evidence on the subject.

They accept the statement that in many Districts of the Island there is an absence of that supply of continuous and reliable labour which is indispensable to secure the investment of capital and the development of the great resources of the Island.

Your Committee are of opinion that for the encouragement of the investment of capital on agricultural operations, a certainty of continuous labor is a necessity, and that in a country so sparsely populated as this is the establishment of a system by which such labour can be secured on fair terms to the employer and employed must work greatly to general prosperity. They attach considerable importance to the assertion of those who oppose Immigration that if the same facilities, terms and advantages now given to imported labourers are given to native labourers, the uncertainty now attending the supply of labour would be lessened. They therefore recommend that power should be granted to the Protector of Immigrants to enter into contracts with native labourers on behalf of employers and that only a sufficient number of imported labourers should be introduced as will with the native contract labourers meet the wants of employers. To encourage the native labourer to work under the protection of the Immigration Department your Committee recommend that an indenture fee of 50s a year for each native adult labourer entering into an annual contract should be paid to the Executive by each employer and that of this sum £2 should be paid as a bonus to the native labourer on the expiry of each year's faithful service under contract, and the remaining 10s should be available to yards reimbursing the Government the cost of carrying out the system. This would give the native contract labourer an advantage over any imported labourer.

They further recommend that no employer should be supplied with imported labourers who refuses to receive such contract labourers (native or second term Coolies) as the Protector is able to allot to him, or who after receiving, breaks his contract to them.

Your Committee are of opinion that as priority of employment would, under the system they recommend, always be given to native labourers who are willing to work under annual contracts which the Government would be responsible to see duly carried out as well by the labourer as by the employer, the public interest requires that any deficiency in the supply of labour necessary for the continuance or development of agricultural operation should be met by importing a sufficient number of labourers from elsewhere.

It must be borne in mind that if by the arrangement suggested there be a sufficiency of native labourers, willing to work under Government Supervision on yearly contracts—so as to ensure to capital a reliable supply of labour—no imported labourers will be required or introduced and that if enterprise and capital are driven away from Jamaica, because neither native nor imported labour is obtainable, it will be not only impossible for the Colony to advance but on the contrary it will retrograde.

Your Committee do not think there is any question of competition between the native and imported labourer because they cannot believe that an employer will ever resort to the employment of imported labourers if he can obtain reliable native labour.

Your Committee in closing their Report call attention to the fact that if it be, as maintained by many a gainst the assertion of others, that there is a sufficiency of native labour, and if that labour will declare itself and avail itself of the machinery afforded by these suggestions general prosperity will be secured at no cost to the State beyond the maintenance of the Immigration Department, for the benefit of native labourers.

One member of the committee in a separate statement said:—

Individually, I go beyond its recommendations and would urge upon the Government the necessity for taking immediate steps to meet the demand for labour not only on Estates—which now exists—but the demand which, in my opinion is certain to arise in carrying out the very extensive public works already decided on, and in contemplation and which must to a great extent deplete the present supply of agricultural labour. I also think that the Government ought to offer inducements to skilled laborers and tradesmen to settle in the Island who could teach their handicrafts (now nearly extinct) to the rising generation under a proper system of apprenticeship.

In my opinion it is idle to assert that native labour is now available on the terms given to the Coolie immigrant. Employers cannot expect to control continuous native labour—even on ruinous terms—while the labourer can become a freeholder with a facility unsurpassed anywhere and there are other well known reasons which account for the decreasing supply of labour, notably, the smattering of elementary education given to our youth, which has the tendency in the present transitional condition of the bulk of the population to disqualify them for field or other manual work.

DOMESTIC GEMS AND PRECIOUS STONES.

The following is from the New York *Sun*: "While it is a fact that nearly all the precious stones are to be found in the United States, the deposit of most of the varieties, so far as we know, are too meagre to warrant the application of capital and systematic labor to their production. In two States only, Maine and North Carolina, has a systematic search for gems been carried on. Of diamonds, for instance, 95 per cent. of the current supply comes from the Kimberly mines of South Africa. Over nine tons of diamonds, valued after cutting at \$500,000,000, have been taken from those mines

since their discovery in 1867. The South African mines are all contained within a radius of a mile and a half. The deposit is concentrated and its working profitable. Since Brazil, India and Borneo are to be included among the contributors of the remaining 5 per cent. of the world's diamond supply, it will be seen that the share of the United States as a producer is hardly recognizable. A few years ago a very lively hope was started of the existence of diamond fields in Kentucky. It was based upon a striking resemblance between certain earthy formations in Kentucky and those at the Kimberly mines. Theoretically, there is strong reason to believe in a Kentucky diamond bed, but the theory has not yet developed into fact. Less reason but a more brilliant plausibility was given to the promise of a diamond mine in Arizona some twenty years ago. Representations were made in San Francisco of the discovery of an immense treasure of diamonds and rubies in one of the neighboring territories. In confirmation there were exhibited so called rubies amounting to 80,000 carats, and numerous diamonds, one of 108 carats weight. The stones were deposited in the Bank of California, and the news spread across the continent. Capitalists became interested. A bill in the interest of diamond miners was passed in Congress. A great combination party from the east and from the west went prospecting. They carried along an expert from the Royal School of Mines, in Freiburg. They found the promised spot. Everybody picked up gems. In a week the party secured 1,000 carats of diamonds and something like 7,000 carats of rubies. Then Mr. Clarence King, director of the United States Geological Survey, went out and proved that the mine had been 'salted.' The rubies were shown to be ordinary garnets, and the 108-carat diamond a piece of quartz. Part of the salting had been done with a large quantity of rough diamonds bought by an unnamed American in London. The swindlers made by their venture \$750,000, the greater part of which was contributed by California capitalists. Of corundum, the mineral which, in some of its varieties, bears the names ruby, sapphire, Oriental amethyst, Oriental emerald and Oriental topaz, we have some specimens, but the country is not rich in stones of this order. The North Carolina corundum excels in variety of color. Many specimens have been cut and mounted, especially of the blue and red shades, and make good gems, though not of the choicer quality. The chief locality for gem sapphires in the United States is near Helena, Mont., where they occur as loose crystals, usually small but often transparent and of good colour. Turquoise we get from New Mexico, Arizona, Nevada, Colorado and California."—*Bradstreet's*, 10th May.

NOTES ON POPULAR SCIENCE.

BY DR. J. E. TAYLOR, F.G.S., F.L.S., &c.,

Editor of *Science Gossip*.

SUGAR-CANE.—A most interesting and highly important paper was read before the Linnean Society in March by Mr. D. Morris. Mr. Morris is one of the younger school of botanists, and is well-known for his extensive knowledge of economic botany, for which his training in Jamaica has well fitted him. He is now assistant director at Kew, and it is there he has made the discovery announced in the paper above referred to. It is concerning the growth and development of the sugar-cane. Hitherto the plan has been to propagate it by slips or cuttings and few planters knew or cared anything about the seeds. Mr. Morris had succeeded in obtaining seeds from the sugar-cane, and he believes he can

raise from them a great variety of improved canes. It showed by cross-fertilisation and artificial selection of the best seeds a richer sugar-yielding cane might be produced for growth in tropical plantations.—*Australasian*.

**COFFEE AND COCOA TRADES SECTION:—
LONDON CHAMBER OF COMMERCE.**

The annual meeting of the members of the Coffee and Cocoa Trades Section of the London Chamber of Commerce was held on Monday afternoon at the offices, Botolph House, Eastcheap, E.C., Mr. Robert Wales presiding.

The Coffee Committee was re-elected, with Mr. Game in place of Mr. Lerner, deceased, and Mr. H. Flower (of Messrs. J. Cook & Co.) in place of Mr. Major, also deceased. The Cocoa Committee remained as before, and the president and vice-president of the Section were also re-elected.

Mr. RUCKER then brought forward the question of the liability of fire insurance offices to the merchant and thence to the broker, who may have advanced money on the sale previous to prompt, and it was decided to fully discuss the matter at a future meeting, notice of which should be given.

It was further decided to accept the offer made on the part of Mr. Pasteur of a paper on the interesting subject of "Coffee Cultivation in Bechuanaland and Natal." It was stated that the paper would be read about the middle of June, on a date to be selected by Mr. Pasteur himself.

This concluding the business, a vote of thanks to the Chairman was carried, on the motion of Mr. W. W. ASSER, seconded by Mr. E. A. RUCKER.—*Grocer*, May 24th.

HOW PERFUMES ARE MADE.

Those dainty, delicate perfumes which the super-fine and the vulgar alike enjoy are obtained in a very prosaic way. They are produced in a land where the flowers are perennial, but the processes of manufacture include not only distillation and fermentation, but even boiling in fat. Consul Harris, writing from Nice, where the manufacture is carried on extensively, describes the processes. In distillation the flowers are boiled in a hermetically-sealed copper vessel. The steam as it condenses in its passage through a spiral coil exudes the volatile essence drop by drop, and it is collected in a small glass vessel. The water in the copper retains a small portion of the scent and becomes the rose water or orange flower water of trade. All flowers are not susceptible of this treatment, and those that are produce but a minute quantity, the orange flower, for instance, giving but one gramme of essence for one kilo. of flowers, or but one-thousandth part. The following table will show the proportionate yield of the different flowers:—

	1,000 kilos. of flowers	1 kilo. of essence
Neroli.....	1,000	do
Rose	25,000	do
Geranium	1,000	do
Mint	1,000	do
Orange leaf (bitter)	1,000	do
Lavender	100	do
Eucalyptus	100	do

The volatile essences thus obtained, combined and mixed together with a certain quantity of alcohol, are used in the preparation and as the basis of eau de Cologne, toilet vinegar, lavender water, &c.

The perfume from flowers which do not contain the volatile essence is extracted by two processes. In the first or cold process, cassia, jessamine, jonquils, tuberose, violets, and some other flowers, freshly gathered, are placed upon a layer of pure lard, a quarter of an inch in thickness, spread over glass trays. The flowers are changed every twelve, eighteen, or twenty-four hours, according to

* Absurd: the sum may be multiplied by 4.—*Ed. T. A.*

circumstances, until the lard is sufficiently charged with perfume. Jessamine and tuberose are changed as often as fifty times, and the other flowers from twenty to thirty times. When the hot process is resorted to grease is placed in a copper vessel, together with the flowers, and the compound is boiled. Additional flowers are added from time to time until the fat has absorbed the requisite amount of perfume. By another process the perfumes are extracted from the fats, and, by blending these with the different essences, the numerous scents are obtained. Certain perfumes which are of great use in the manufacture of scents can only be obtained by the fermentation of fruits, flowers, and roots.—*P. M. Budget*.

A RAILWAY FOR EAST AFRICA.

Lieutenant Weiss, who, together with the late Dr. Junker, explored the country from Pangani to Mount Kilimanjaro in 1885, discusses in the *German Colonial Gazette* a scheme for laying a railway in East Africa from the coast to the neighbourhood of that mountain. He points out that Usambara is very fertile and healthy, so that the construction of a railway there would be a splendid factor in the development of German East Africa. The line as proposed would start from the German station of Tanga, and touch at the following stations:—Amboni, a plantation of the German Planters' Company; Umba, an English mission station on the Ubumbine, a tributary of the Mkulumusi, which flows into Tanga Bay; and Mtangate, 4½ miles from the great English mission station of Magila. The line will then pass to the south of Lewa, the great tobacco plantation of the East African Planters Company, and will strike the Valley of the River Pangani, where it is 476 feet above the sea level. Korogwa (951 feet), a deserted station of the East African Company, and Masinde (1,679 feet), the residence of Limbodja, the chief of Usambara, will be touched, and the line will then be continued to the west along the Pare and Ugueno Mountains to Aruscha (2,421 feet), at the foot of Kilimanjaro. The total length of the line from Tanga to Aruscha is given as 223 miles. Lieutenant Weiss estimates the cost of building such a railway at 500,000l.,* and the yearly working expenses at about 56,000l. He asserts that the country at the foot of Kilimanjaro is so salubrious, in consequence of its altitude, that German peasants could settle there. He recommends also that a sanatorium should be built there for those Germans stationed on the coast who may suffer from fever.—*O. Mail*, May 30th.

THE BURMA RUBY MINES.

The following memorandum, drawn up by Sir Lepel Griffin, the Chairman of the Ruby Mines Company, on his return from visiting the mines, has been issued:—

At the request of the Board of Directors of the Burma Ruby mines, and some of the largest shareholders, I visited the mines at Mogok in March last in order to ascertain what were the prospects of the undertaking, the difficulties to be overcome, and to settle any important questions which might be under discussion between the Company and the Local Government.

I have returned within the last few days, and having spent a sufficient time at the head-quarters of the Company—Kyatpyin and Mogok—to make myself thoroughly acquainted with the state of affairs, pending the calling of a general meeting, the board consider that it is desirable to circulate a brief memorandum to inform shareholders of the existing position, and what and how near are the prospects of success. I may say at once that I have returned with a firm

conviction that the eventual prospects of the Company are exceedingly good. There is no doubt that rubies are being found in large quantities by the native miners who have an hereditary right to work under certain conditions.

The reason that rubies of high value and in large quantities have not yet been obtained by the Company are two—the non-arrival of the machinery required to develop the mines, and the wholesale smuggling of stones in defiance of the regulations under which the Company have the right of purchase of all stones found by the native miners.

Mogok is situated in a mountain region covered with dense forests, approached by 65 miles of exceedingly difficult country, over which a road has only been completed for a few months. Even now this road is unmetalled and only suitable for fair weather traffic.

It has been almost impossible to convey heavy machinery to the mines, and scarcely anything at the time of my visit had reached there in a complete and working condition. This state of things is being rapidly improved. Large quantities of machinery had arrived at Thabetyin, the terminus on the river, and at Khabine, midway between the river and Mogok, and were being pushed forward with all speed. It is a matter of regret that the arrival of the machinery has been so long delayed, but it has depended on physical considerations beyond the Company's control.

The second reason for the failure of the Company to obtain rubies from the natives was the universal and practically unchecked system of smuggling. The native miners were bound to produce their stones and dispose of them to the Company at a reduction of 30 per cent on their declared value. Smuggling was however so easy that the effect of this tax, which formed one of the rules framed by the Government under which the lease was taken by the Company, was that miners brought in no valuable stones for sale to the Company's agents; all such were smuggled and sent down country for disposal at Mandalay, Rangoon or Calcutta, and it is asserted that 20 lakhs of rupees' worth of rubies are annually disposed of in the town of Mandalay alone. These inefficient rules, which were absolutely inoperative to prevent smuggling, and which only caused loss to the Company instead of benefit, I have with the full concurrence of the Local Government and with the approval of all officers acquainted with the situation, abolished, largely increasing the tax which individual miners pay to the Company. The sale of rubies found by the native miners is now free, and it is expected that they will bring a large proportion of the best stones to the Company's agents for purchase.

It is estimated that the tax paid by them, will commence at the rate of R100,000 per annum, rise to R140,000 when the full complement of miners is employed, and may hereafter largely increase by the general raising of the tax. This system will, it is hoped, give the Company an assured and increasing income, and also secure to them a large proportion of the most valuable stones found.

Great progress has been made in the erection of houses for the staff and officers, and workshops, and the machinery is being erected as it arrives in suitable places, especially at Kyatpyin, which is the engineering head-quarters. The river which runs through the Mogok valley has been diverted, in order that the bed may be mined to a greater depth than the native workmen were able to go without pumping machinery.

The slow progress in development is partly due to the malarious character of the climate; almost the whole of the staff have suffered from fever, and some have resigned in consequence of continual attacks; even in March when the climate seemed excellent, I found several of the employes suffering. This difficulty will decrease as the staff become acclimatised, and as better food is procurable, for which arrangements have now been made. The town of Mogok has about 3,000 inhabitants, entirely supported by the ruby trade; it is a flourishing settlement and the great wealth of many of the inhabitants testify to the richness of the industry. Many of the wives and daughters of the miners wear valuable jewellery, and the houses are

substantial and well-built. The country around is however most sparsely inhabited and the labour, which is expensive, is mostly drawn from the Chinese frontier, and has only hitherto been available for a few months in the year. The staff at Mogok are thoroughly sensible of the necessity of exerting themselves to the utmost to obtain favourable results, and there is every reason to hope that this will ere long be attained.

The head of the Local Government, Sir C. Cross-thwaite (accompanied by the Financial Commissioner), was with me at Mogok during my entire visit. From them, as from the local officials, the utmost assistance has been received, and the Government are warmly interested in the success of the Company's operations.

In conclusion, while it would be unfair to look for immediate returns from an undertaking to which so many unfavourable conditions are attached, I have no doubt whatever, that before very long, when our machinery is in operation and as the staff become acclimatised, satisfactory results will be attained, and the anticipations formed respecting this property be fully realised. I am convinced that the rubies are to be found in the Company's concession in large quantities; and energy on the part of the Company's officials in Burma will ensure their being found, when approved machinery has been set up and sufficient and reasonable time has been allowed for the development of the property. An early meeting of the shareholders will be called, and any further information which may be desired will be fully furnished.—*Pioneer*.

MISNOMERS.—The Providence "Journal" calls attention to some curiosities of misnomer. Blacklead is not lead at all, but a compound of carbon and a small quantity of iron. Brazilian grass never grew in Brazil, and is not grass—it is nothing but strips of palm-leaf. Burgundy pitch is not pitch, and does not come from Burgundy—the greater part of it is resin and palm-oil. Catgut is made from the entrails of sheep. Cattle bone is not bone, but a kind of chalk once enclosed in the fossil remains of extinct specimens of cuttle-fish. Gorman silver was not invented in Germany, and does not contain a particle of silver. Cleopatra's Needle was not erected by the Egyptian queen, nor in her honour. Pompey's pillar had no historical connection with Pompey in any way. Sealing-wax does not contain a particle of wax, but is composed of Venice turpentine, shellac, and cinnabar. The tube rose is no rose, but a species of polyanth. The strawberry is no berry, but only a succulent receptacle. Turkish baths did not originate in Turkey, and are not baths, but heated chambers. Whalebone is not bone, and is said not to possess a single property of bone.—*Medical Record*.

ANOMALIES OF POISONOUS PLANTS.—The *Cicuta virosa*, or Cowbane, is poisonous to oxen but wholesome to sheep, goats, and horses, as Lucretius long ago recorded. White-ants feed with impunity on opium. The landerab feeds upon the manikeel tree, one of the most deadly of trees. The *boxia*, or grosbeak, of the Bahamas, eats the fruits of the *Amyris taxifera*, or poisonous ash. The berries of the spurge-laurel, *Daphne laureola*, are poisonous to animals, but birds eat them freely. The young buds of *Kalmia latifolia* speedily kill cattle if they browse on them, but afford abundant food to pheasants in early spring, and although the birds do not suffer, persons who partake of such pheasants show alarming symptoms of poisoning. A similar result is observed from bees feeding upon other plants of the same natural family as the *Kalmia* (*Rhodoraceae*). In the celebrated retreat of the ten thousand, the soldiers of Xenophon suffered severely from eating honey near Trebizond, collected from the *Azalea Pontica*. The darnel, *Lolium temulentum* (the *infelix lolium* of Virgil, the tares of Scripture), injures all animals, yet chickens eat the seeds with greediness. Horses feed with avidity and thrive on the *agrostis arundinacea* (Linn.), or reed bentgrass, which is destructive to goats. Many similar facts are noted by botanists, and they show the facility of defending cruel experiments on animals by appealing to the effects of substances on other organisms. What is food to one is often poison to another.—*Ibid*.

TEA AND CINCHONA IN CEYLON.

THE TEA AND CINCHONA ENTERPRISE OF MESSRS. KEIR, DUNDAS & CO. ON LOOLE CONDURA AND MR. JAMES TAYLOR'S MERITORIOUS PART THEREIN.

The discussion regarding a testimonial to Mr. James Taylor justifies the publication of the following letter. It was put into type and our note written in Feb, 1878, that is *twelve years* ago last Feb. (!); but it was held back, we think, because Mr. Taylor feared his employers might object to the publication of the details. Now, we consider that the document is an important contribution to the History of the Tea and Cinchona Enterprise in Ceylon.

Loole Condura, February 16th, 1878.

A. M. Ferguson, Esq., and J. Ferguson, Esq.

My dear Sirs,—I have to thank you kindly for your very favourable notice of our Loole Condura tea in a late *Observer*. It is now being made of a better average quality than before. But it will not be all it should be till we get it in larger quantity so as to require a European or good conductor to constantly supervise the manufacture. I can see only very little of it, and beyond that it is left to a kangany and the coolies. But such a notice of it in the *Observer* is very valuable. I must explain to you, however, that bad tins have been got by people frequently, not from any fault on the estate but by a mistake in Kandy. I used to send a lot of it to Kandy, to Messrs. Keir, Dundas and Co.'s office, in large caddies, not soldered up; understanding that they were selling it by the lb loose or untinned. But they took to putting it in tins and soldering these up in Kandy. I supposed that this would not do, and stopped it as soon as I heard of it, or heard of tea being so spoiled. It soon gets damp in the caddies, and I fancy got more damp still in being transferred from them to tins where they had no firing places to dry it first. Not only this, but they apparently tinned up "red leaf" too; and that also damp. I send several caddies of "red leaf" at the end of each year's crop, with special explanations of its inferiority and instructions to keep it apart and dispose of it in any way or at any low price they choose. Some of these tins it would seem were still in their hands recently, and may be yet. They themselves sent out three of them that had been returned by Dr. Thwaites, of Peradeniya, *quite recently*, and asked me to explain the matter! Two of these tins were red leaf *purely*, and perfectly mouldy; the other tin being proper tea but also perfectly mouldy. Seeing I never tinned any red leaf, I had no difficulty in saying that it was tea tinned in Kandy and spoilt in being so. But it is long since I stopped sending them any loose tea now, excepting the little "red leaf" collected during the year at the end of each crop, which will still go forward open. All of it is tinned on the estate now. I have also got the tins made so that they must be destroyed in the opening, as I found that people kept their tea in the tins, or let their servants do it, and consequently the tea got spoiled and often mouldy and musty before the tin was finished; especially in damp weather. This made some people believe that we put bad tea into the bottom of the tin and good tea on the top! K., D. & Co., too, stopped taking back our first style of tins with hinged lids, as they were generally returned filthy and stinking of oil and onions and salt fish, &c.

But now, I am going to be down on you! Although you have publicly given us credit for various things connected with tea and cinchona, some of which were so fairly due to us, yet you have never given us credit for the main things that are our due. I claim that both the tea and cinchona enterprises were first successfully started on Loole Condura. I do not admit the Messrs. Worms' old tea experiments into the matter, as they were failures; and long ago given up when we began. The plants were allowed to remain, but there were many tea plants in gardens, and so on, over the coffee districts besides them. The starter of the present tea enterprise was, to the

best of my knowledge, Mr. G. D. B. Harrison, who, in 1865, gave me orders to get all the tea seed I could from Peradeniya and grow it so as to have a supply of seed from it by-and-bye. I began in 1866, to plant out tea plants along the roadsides here. At that time I knew nothing of the Assam indigenous and hybrid varieties. Our first tea clearing of twenty acres was felled in the end of 1867, a year before the Ceylon Company felled any land of their estates for tea. Our clearing was mentioned in the *Kandy Herald*, at the time it was felled. The Ceylon Company felled small pieces on several of their places the year after, perhaps as much, or may be more, acreage than our clearing altogether. However, our first year's importation of seed from Assam completely failed to grow. We got our second importation of seed next year at the same time as the Ceylon Company got their first and both grew. So that they and we both began the actual planting out of *hybrid* tea at the same time, or same season. Then as for making tea I was making it from old bushes in the garden and from roadsides planting years before Mr. Jenkins, the Ceylon Company's tea manager, came to Ceylon. Some of what I made then was fairly good tea though I could not believe it was right because it did not taste like the China tea of the shops. I gladly confess that Mr. Jenkins, after he came, showed me how to do it better and gave me confidence in the article. But a sample made by me before he came, sent along with a sample of his making, was valued in Calcutta at only 3d a lb. less. Before Mr. Jenkins gave me confidence that the tea was correct, I spoiled large lots of it experimenting, trying to make it taste like the tea I bought in Kandy from shops.

You will see from this that a statement in one of your Directories of tea acreage planted is wrong for the earlier years. There was more planted than you state; but I cannot find that statement in the Directory now, else I would help to correct it. But on this place there were twenty acres planted, besides roadsides equal to a good few acres, before the end of 1869.

Then, as regards Cinchona: we were not the first to plant a patch of it, though we planted five or six acres of it pretty early. But the small lot mentioned in Howard's big book as the "first instalment from the Ceylon plantations" was peeled on Loole Condura in July 1867, both *Succirubra* and *Officialis*. But so little did K., D. & Co. trouble themselves about it that it only got into the market in April 1868. It was mentioned in several papers that I saw about the time and I knew it was our sample they referred to from the remarks made, being the same as Howard's report on it that I had got, and from dates and the quantities corresponding, and the words of Howard's report being quoted. One paper or magazine put it down as from the Ceylon Government experiment. Our first extensive peeling was in April 1870, of considerably over a ton of dry bark, partly *succirubra* and partly *officialis*. Long after this was sold in the London market, the *Observer* mentioned that it had discovered the fact from a Home paper and asked how such a thing could have happened unknown to it. We sent home further lots in 1871 and 1873. As a result of the sale of the first lots, we got all the *officialis* plants out of the Hakgala nurseries, even the old stock plants, about three hundred thousand altogether, and got them for nothing, as there was no demand for cinchona by anyone else. We then went in for planting cinchona extensively; but we had considerably extended our cultivation of it before that on the strength of the sales and Howard's report on our original sample. Not very long after cinchonas planted at Hakgala were being sold at high prices, but the demand was mostly for *succirubra* plants, of which we had taken none. So that our having cleared out the stock of *officialis* plants did not, I suppose, much matter. What we have done here has been a guide and a warning to others all along, and is so still, and a great deal of cinchona and also tea, I believe, has been planted on the strength of it. What we have learned here has been freely communicated to all who have asked information. If you will allow me to say it without thinking that I have any selfish object in view, I consider that, if the Ceylon Government had any sort of soul in it to encourage

European enterprise instead of simply existing to take advantage of it, Messrs. Harrison and Leake ought to get a free grant of a block of land for cinchona and tea, or be offered it.*—Yours very truly,

JAMES TAYLOR.

AUSTRALIAN PRODUCE FOR CEYLON.—We can testify that the cheese, bacon and butter consigned to Messrs. Anwardt & Co., as advertised, from the farfamed Illawara district of New South Wales is specially deserving of attention here. Each article seems good in its degree—good value for the price charged—and planters especially will favourably bear in mind that the proceeds of the sale of this produce is to be re-invested in Ceylon tea for the benefit of the Illawara farmers and other residents.

BRAZIL COFFEE.—The coffee crop now in course of shipment from Santos to the markets of Europe and the United States is estimated to reach 2,000,000 bags (132 lb. each) by June 30th, 1890, the end of the crop year. This is a falling short of over 1,000,000 bags on the production of last year, due to the fact that a small bearing generally succeeds a heavy one, the previous harvest of 1888-89 having been the largest on record. Although the present crop is a small one, its monetary value is in excess of the last, in consequence of the higher prices obtained.—*H. and C. Mail.*

THE SOURCES OF BEAUTIFUL COLOURS.—The *American Druggist* has formulated a list of the choicest colours used in the arts, as follows:—The cochineal insects furnish a great many of the very fine colours. Among them are the gorgeous carmine, the crimson, scarlet carmine and purple lakes. The cuttle-fish gives the sepia. It is the inky fluid which the fish discharges in order to render the water opaque when attacked. Indian yellow comes from the camel. Ivory chips produce the ivory black and boneblack. The exquisite Prussian blue is made by fusing horses' hoofs and other refuse animal matter with impure potassium carbonate. This colour was discovered accidentally. Various lakos are derived from roots, barks, and gums. Blue black comes from the charcoal of the vine stalk. Lamp black is soot from certain resinous substances. Turkey red is from the madder plant, which grows in Hindostan. The yellow sap of a tree of Siam produces gamboge; the natives catch the sap in cocoon shells. Raw sienna is the natural earth from the neighbourhood of Sienna, Italy. Raw umber is also an earth found near Umbria and burnt. Indian ink is made from burnt camphor. The Chinese are the only manufacturers of this ink, and they will not reveal the secret of its manufacture. Mastic is made from the gum of the mastic tree, which grows in the Grecian Archipelago. Bister is the soot of wood ashes. Very little real ultramarine is found in the market. It is obtained from the precious lapis-lazuli, and commands a fabulous price. Chinese white is zinc, scarlet is iodide of mercury, and native vermilion is from the quicksilver ore called cinnabar.

* And certainly Mr. James Taylor ought to get one of the best blocks in the country. Messrs. Harrison and Leake deserve credit for their enterprise, and it is much to be regretted that they suffered so greatly the usual fate of pioneers. But as regards both tea and cinchona the intelligent, energetic and persevering Superintendent of Loole Condera was the first man "to teach the English how to do it." Much of what Mr. Taylor now communicates reached the senior editor long ago and has been tied up with a mass of other matter on tea and cinchona to be worked when time could be got. But each day brings more than its work. One small fact will show how conscientiously careful Mr. Taylor is in his work. Strict cleanliness is of much importance in the preparation of tea; and when coolies are seen dressed in specially clean clothing, the remark made is, "Some of Taylor's tea coolies."—*Ed. T. A.*

FINE PRICES FOR COCOA.—Ceylon cocoa is now one of the most valuable products sent out of the island, and is in great request. Some cocoa from one of Mr. J. H. Barber's estate has just been sold, we hear, for R58 per cwt. This is a fine price considering the high rate of exchange at present, and should encourage all those who have suitable land for this very remunerative product.

MINERAL RUBBER.—The *Bulletin du Musée Commercial* gives currency to a report from an American source that an American has discovered a means of producing, by distillation from coal, a bituminous substance possessing all the qualities of rubber, and which may be equally well used in the manufacture of submarine cables. The cost of this article is said to be much less than that of vegetable caoutchouc.

COFFEE.—There have lately been frequent calls for Mr. W. B. Forsyth's report on coffee, and as the number of the *Monthly* which contained them is exhausted, it is reprinted in this issue with Mr. Kinney's—both of which are valuable to those intending to engage in coffee planting. Among all the minor industries adapted to our climate, there is none which will pay better than coffee cultivation. Kona coffee is worth to the grower twenty cents a pound, and probably will command that price for many years, as it has no equal.—*Planters' Monthly*, (Hawaiian).

GEMS FROM GAS REFUSE.—To make precious stones from gas-refuse is indeed—says the *L. & C. Express*—to squeeze out the romance which should cling to "pearls from the ocean and gems from the mine." Mr. Greville Williams, of the Gas Light and Coke Company, has made a perfect emerald from the refuse of a gas retort. That this was possible has been known to science for two generations. But although there is nothing new in this ingenious play with science—despite, too, that the cost of making the gem was ten times its highest value—the news has caused some alarm among possessors of fine emeralds.

PLANTING IN NORTH BORNEO.—At the ordinary general shareholders' meeting of the Labuk Planting Company at Hongkong on the 5th instant, the report presented was passed after the Chairman had said that he could add very little to it, except that the latest accounts from the manager were very encouraging, and although there must be numerous difficulties met with the first year he hoped they would vanish as time went on. The trouble in starting a plantation was getting labour—it was the case with all new estates. He admitted that the item of \$15,717 in the accounts under the head of "labour" meant squeezes to coolie brokers, but pointed out the impossibility of getting coolies without paying for them. He was hopeful of getting the money back in the form of labour.—*Straits Times*, May 18th.

DENDROBIUM MACCARTHY.—In copying the following paragraph from an American periodical, *Garden and Forest*, we may state that this plant was named in honour of Lady MacCarthy by the late Dr. Thwaites, who was the first to describe it:—

This magnificent plant is now flowering freely at Kew. It is one of the least common in gardens from the fact of its being hard to cultivate. It is found only in Ceylon, where it is much less plentiful now than it was a few years ago, owing, probably, to the visitations of the Orchid-collector. The Kew plants have this year made pseudo-bulbs over a yard long, and they bear near the top peduncles, three-flowered racemes, each flower being four inches across when fully expanded; the colour is pale rosy mauve, with a large blotch of maroon-purple on the lower part of the lip, and streaks of the same color on the front portion. The Kew plants are grown in a very hot, moist stove, where they are kept saturated at all times save when the leaves are falling. It grows all through the winter, the flowers pushing immediately after the leaves have fallen.

HOME CRITICS ON CEYLON TEAS.

It may be relied upon, we think, that, as a general rule, the verdict of the public is the most satisfactory test of the quality of any article of food consumption. If that reliance may be accepted, we may say that our teas have stood this test for they have received the warranty of public taste. It is, however, constantly the case that papers published at home offer to their readers comments upon the method of their manufacture which would seem to imply that there yet remains much room for improvement in that method. We are not at all disposed to offer objection to this. In the first place, whether what is advanced is or is not to be justified, there can be no doubt that the articles written bring our production well before the public and so constitute for our teas a valuable advertisement. In the second, if there be truth in the old proverb that "in the multitude of councillors there is wisdom," we are afforded by them an opportunity of discriminating for ourselves amid such diverse advice.

Nevertheless we must bear well in mind the character of the sources from which many of the comments referred to emanate. What may be termed trade journals are, we think, not unfrequently biassed by the interests—or the supposed interests—of their chief readers, the retailers of tea. Among these there must be many who are influenced by a variety of causes in favour of promoting the sale of some particular kind of tea. One such dealer, we will assume, has a large constituency among whom he has hitherto distributed chiefly the teas of China growth. Another may be so influenced mainly to support Indian teas. Such men have probably resorted to long established agencies for their purchases, and have secured by their long custom exceptionally favourable terms. They will have no pressing desire, therefore, to force the introduction of a new growth which, if successful, must disturb the even course of their trading arrangements. For men so situated the Trade Journals must purvey sympathetic matter, and for the reasons we may perhaps believe that much that appears in the columns of such papers may be the result of a concealed bias. The arguments that we have thus applied in the case of the retail-dealers are not wholly inapplicable to a higher grade of the distributing agencies. Among the brokers of London there are firms who, equally with the retail grocer, have long made a speciality of certain teas. When firms coming within such a category issue their circulars, they are just as likely to have their advice tinged by preconception as are the grocers in their dealings with their old-established customers. Of course we would except from brokers liable to such an influence, many well-known firms whose advice may always be accepted with confidence and whose comments should command our fullest attention. But even when such exceptions are made, there remains a residuum of the often-repeated complaints which should, we think, always be accepted with reserve.

But whether this caution may or may not be justified, one fact is certain, and that is that the constant and very often contradictory advice given is very perplexing to our planters. A very well-known firm of high standing has once more made public a statement that Ceylon teas are as a rule over-fired, and that statement has formal support by one of the trade journals to which we have referred. Our tea planting industry is now by no means a thing of today, and its production has stood the test of a good many years. The result of that test has been to secure the suffrage of an enormous number of tea drinkers

throughout the world. If we are to accept the counsel now tendered to us and alter our methods of preparation, is it certain we shall still retain that suffrage which has been accorded upon the experience of our present methods? We do not say that we feel confident that no better method is open to us; but for the reasons we have above stated we would advise caution in placing implicit confidence in the soundness of the counsel which is so constantly given to us by the distributing agencies at home.

INDIAN SOAPSTONE.—Steatite or soapstone is rather extensively used by gas manufacturers at Home but at present their requirements in this respect are met from Germany principally. Some time ago the value of Indian soapstone attracted attention, and experiments were made and promised successfully. A more extensive trial is now to be given to the Indian product, and the Madras Government are sending some tons of the material home, where the India Office will cause it to be experimented with and reported on.—*Indian Engineer*. [Steatite, we believe, is amongst our Ceylon rocks.—*Ed. T. A.*]

BRICKS SUPERSEDED.—A Madras contemporary makes the announcement that bricks are to be superseded. A composition called petronite has been discovered which, besides being cheaper than bricks, is of snowy whiteness, and of the hardness of granite. It is made of sand and silica, burnt, ground up, moulded with moisture under great pressure, and then re-burnt. As it shows neither expansion nor contraction after burning, and as it is capable, when in its moist condition, of being sculptured to any desired extent, it will be of high value for decorative as well as for ordinary building purposes.—*Indian Engineer*.

TEA IN JAPAN.—The *Japan Weekly Mail* of 31st May says:—

The tea trade goes on apace; 20,000 piculs of leaf were taken during the week, and some firms have been firing almost incessantly. As remarked as probable last week, the estimated weight of the first crop was somewhat erroneous, and this is now admitted, as the shortage, if any, will be comparatively slight. Second crop leaf will be on the market by the 5th of June, but as to quality nothing can now be said, though the weather reported from the principal districts is not unfavourable to good cup. The same paper in its issue of 7th June says:—

Tea has fallen off somewhat in demand, though firing is still general. Parcels of second crop have arrived, and are reported good both in leaf and cup, and in another week a large quantity is expected to be on the market.

PREVENTION OF SCALE IN STEAM BOILERS.—The *Chemical Trade Journal* recommends that water used for boiler purposes should be so treated before entering the boiler, that all formation of scale shall be prevented, and deprecates the use of substances which merely prevent the scale from adhering to the boiler. As an example of how various precipitating agents may be used in conjunction with one another a water which contained 5·2 grs. of calcium carbonate, 24·3 grs. of calcium sulphate, 0·15 grs. of magnesium sulphate, 4·27 grs. of magnesium chloride, 17·27 grs. of magnesium nitrate per gallon, was treated with a mixture of 17 grs. of caustic soda—77 per cent.—17 grs. of sodium carbonate, 5 grs. of tribasic phosphate of sodium, with the result that of 12·9 grs. of lime only 0·78 grs., and of 6·6 grs. of magnesia only 3·78 grs. remained to enter the boiler and this at a cost of 3½d per 1,000 gallons. The precipitate amounted to 25 tons semi-dry sludge—or nine tons dry—from 5 million gallons of this water per week.—*India Rubber Journal*,

ASSAM AND CEYLON AND THEIR TEA CROPS.

Assam-proper and Ceylon will this year be very nearly matched in the tea crops likely to be harvested within their bounds; and it should be extremely interesting to watch henceforward the development of each country under tea production and export. We are apt to regard "Assam" as if it really represented the great Indian tea enterprise altogether; but of 115 million lb. expected to be harvested in 1890-91 for all India, less than half—or 48,295,344 lb.—is put down for "Assam" proper. Now against this Ceylon may ship 47 millions in the present year—or possibly more? Already up to 19th June, the return is of 22 millions,—say 24 millions to 3rd July,—and the larger shipments have uniformly been in the latter half of the year.

The Indian Tea Association as we have indicated treat "Assam" separately from "Cachar and Sylhet," the current tea crop of the latter being given at 33,385,650 lb.; but unfortunately they do not give us the acreages of cultivated land on which their estimates are based; and when we turn to the official records we invariably find that "Assam" includes "Sylhet and Cachar." One official return, for instance, gives the area under tea in Assam in 1889 as 227,249 acres:—196,689 acres mature and 30,560 acres young tea. Another Indian Bluebook return makes the total for 1888-89 as 216,676 acres, but this extent, we find on going over the detailed statements is made up as follows:—

	Acres.		Acres.
Cachar	equal to 55,401	Sibsagur	equal to 47,377
Sylhet	" 44,145	Lakhimpur	" 32,141
Goalpara	" 367	Naga Hills	" —
Kamrup	" 6,227	Khasa and	" —
Dairang	" 20,012	Jaintia Hills	" 30
Nowgong	" 10,973	Garohills	" —
		Total acres	216,676

Deducting 99,546 acres for Cachar and Sylhet, we have only 117,130 acres for "Assam-proper" to represent the estimated current crop of 48,295,344 lb. and this shows an average outturn of over 400 lb. per acre. In the case of Cachar and Sylhet, the crop estimated is equal to 340 lb. an acre, and that without making allowance in either case for immature tea. Ceylon on the other hand will gather her 47 to 48 million lb. from a considerably larger area nominally; for even leaving out all tea planted within the past three years, we cannot reduce the area below 150,000 to 160,000 acres. Of course the Assam tea fields are on the whole much older than ours, and if we suppose that 105,000 acres represent the mature tea yielding 48 million lb., we may get a fair idea of the difference in yield. The explanation of course, is that Assam was all planted on virgin land (forest or otherwise), whereas the greater proportion of Ceylon tea is found on old coffee plantations varying from those that scarcely yielded any coffee crops to others so long heavily cropped with the fragrant berry that 200 lb. of made tea per acre is a liberal estimate of their yield in this new era. Although therefore, Ceylon may steadily compete with "Assam" (in the limited sense) in her total crops, it must be borne in mind that our harvesting will be from a considerably wider area in tea. The total extent in tea in Assam districts, Cachar and Sylhet,—whether 216,676 or more likely 227,249 (including 30,560 acres young tea)—is singularly close to the present return for Ceylon of 219,487 acres; but the difference is that the former is to give nearly 81½ million lb. tea this season against not more than 48 millions for Ceylon,

CROCODILE AND LIZARD LEATHER.

It has been said—and, doubtless, with full truth—that there is nothing in created nature which does not serve, or cannot be made to serve, some useful purpose to man. We confess that with regard to the crocodiles, or, as they are often popularly but incorrectly termed, alligators, which swarm in our inland waters, we have often found it difficult to recognize the part they have been destined to play in nature's economy. As scavengers they certainly exercise a useful function; but their wonderful fecundity carries them beyond the sufficient fulfilment of this object, and the enormous numbers of them, which may almost be said in some parts, such as the neighbourhood of Mullaitivu, to thicken the waters of our lakes, pools and tanks, constitute an undoubted nuisance, as well as a considerable danger to many of the native community. Some time ago we made reference to the demand which had sprung up in all European countries for the skins of these saurians; and having then drawn attention to the possibility of Ceylon usefully meeting that demand, we should have hesitated to have again advanced the subject, were it not for a further "craze" arising in those countries which might, we should say, be met with advantage from this colony.

We allude to the very extensive adaptation of lizard and even snake skins, in many articles of personal adornment. The category of these is almost an endless one; but we may specially instance such items as ladies' waist-belts and watch-bracelets, purses, whip handles, cigar and cigarette cases. In fact, a walk now through the principal streets of London or Paris reveals in their shop windows a vast variety of instances of the application of the skins of these reptiles to such and similar articles. We may be sure that these would not be exhibited in the profusion that may be witnessed were it not that they meet with a ready sale indicating a strong appreciation on the part of the public. Now Ceylon abounds only too profusely, not only with the crocodiles first referred to but with a great variety of many-colored lizards, and with the inducement now offering of a profitable market for their skins, why should not some of our native people undertake the collection and shipment of these?

We shall probably be told that the art of proper preparation is at present unknown in the island. But every civilized Government makes it one of its chief duties to stimulate new industries; and in tropical countries, in which the local authorities stand almost *in loco parentis* towards the natives, this duty assumes a special weight. We have but to read the reports of the consular agents of European countries to realize how important a part they are called upon to perform in suggesting new openings for trade or fresh industries likely to benefit the nationalities they represent. Ceylon, of course, has no such official representatives abroad. The duties therefore that are cast upon those to whom we have referred must naturally in our own and similar cases devolve upon the resident authorities. We can conceive of scarcely any case calling more strongly for the preliminary aid the authorities alone can afford the people than the one we are now dealing with. We have among us what, while unavailed of, is both a positive nuisance and a danger. It is possible to diminish this, and at the same time by doing so to place within the reach of a population not too well supplied with the means of earning a livelihood what promises to be an easily learned and profitable industry. What greater inducement could there be

to incite to action a Government which, as we have said, stands in almost a parental relation to the people over which it rules?

In this particular case the assistance to be asked for is light, and the cost of it must be trifling. We want instruction as to the right method of utilizing the supplies so ultra-liberally provided by nature. This it should be neither difficult nor costly to obtain. But perhaps it may be said that before seeking such instruction we want enlightenment as to the prices such skins as we have referred to fetch in the markets of Europe. This, however, we think, might probably be dispensed with, for we may be perfectly sure that those markets would not be supplied as they are unless a paying price was obtainable for the commodities. We may be equally certain that no country in the world produces these saurians and reptiles in more lavish abundance than does Ceylon, as also that their capture can scarcely anywhere be effected with a less expenditure of labour or at less cost than it could be among our own people here. There is *prima facie* evidence therefore that the systematic collection, preparation, and shipment of these skins should prove remunerative. What is wanted is only the knowledge of how to prepare them to suit the requirements of distributors at home. A reference through the Crown Agents to those engaged in the trade in London would secure all the preliminary information necessary and at the same time the services of an instructor competent to impart the required knowledge to selected individuals among the natives, through whom again such training might be distributed throughout the island. We may be told that if the prospect of success be so assured as we hold it to be, it should rest with our mercantile community to inaugurate and be at the expense of the earlier trials. But it will be recognized, that a novel departure of the kind referred to requires some initiatory fostering, and we think this might well be officially given, at any rate to the extent of seeking information through the Crown Agents upon which further action might be based.

THE CEYLON ESTATES INVESTMENT ASSOCIATION (LIMITED).

Report by the Directors to the Sixth Ordinary General Meeting, to be held on Wednesday, the 11th day of June 1890, at 12 o'clock noon, within the Accountant's Hall, 108 West Nile Street, Glasgow.

The Directors beg to submit herewith the Accounts for the year to 31st March, 1890, and they are glad to be able to report such very favourable results.

The most of the Coffee Crop was, this year, sold in London, the average price being 101/8 per cwt., which the Directors consider very satisfactory. The Crop was, Glencairn 1,404 bushels, MacDuff 1,123 bushels, or more than double the estimates.

This year only 22,235 lb. Cinchona was harvested, on account of our only having taken the bark from dying trees. The good trees were not touched as recommended by the Company's Agents in Ceylon.

The Tea Crop has again been very satisfactory, and the prices realised have been considerably better than those obtained the previous year.

In consequence of the great increase in the Coffee Crop, and the high prices realised therefor, and also the increased prices obtained for the Tea, the balance at the credit of Profit and Loss Account, including £55 4s 5d brought forward from last year is .. £3,515 8 8 The Directors think it advisable to reduce the sum appearing at the Debit of the Tea

Machinery and Factory Account, and they propose to apply the above Profit:—

1. In writing off that Account ..	£1,000 0 0
2. In payment of a Dividend of 7½ per cent free of Tax, ..	£2,306 5 0
	£3,306 5 0

Leaving a balance of £209 3 8 to be carried forward next year.

The addition to the Glencairn Factory, and the putting in of the Steam Engine and Boiler have been completed at a cost of £571 13s 11d, and the Directors anticipate considerable benefit will accrue to the Company therefrom, as working by water power was during the dry season very unsatisfactory, the supply being altogether inadequate.

The Directors authorised the conversion of the buildings on Macduff into a Tea Factory. The alterations have been completed and the necessary machinery put in at a cost of £447 5s 9d. The Tea, manufactured and sent home, has brought very good prices, and the Directors expect that this will also prove of great advantage to the Company, as a considerable sacrifice had to be made when the Tea was sold green.

From the Balance Sheet it will be seen that the outstanding Debentures amount to £2,850. These all fell due at Whitsunday last, and have been repaid, so that the Company is now free of Debenture Debt. It will also be seen that the Loans over property in Ceylon have been reduced during the year by £1,798 5s 9d.

The prospects for the coming year are not so favourable. Owing to the exceptionally large coffee crop this year, the Directors are advised that they need not look for much of this product during the current year. The estimate of the tea crop is, however, very satisfactory, and the Directors are hopeful the coffee crop may yet improve, and that a better yield than that now anticipated may yet be obtained.

The Directors have to record, with regret, the resignation of Mr. Nathaniel Spens, on account of his having left Glasgow for London. Mr. Spens was appointed Chairman on the death of Mr. Brooks Wright, and all along took a deep interest in the affairs of the Company. The Directors elected Mr. Hugh Brown Crum, Stock-broker, to succeed Mr. Spens on the Board.

The Directors who retire at this time, in conformity to the Articles of Association, are Mr. Robert King and the Rev. Dr. Grand. They are eligible and offer themselves for re-election.

The Auditor, Mr. Moore, C.A., also retires, and he is eligible to be re-appointed.

J. B. MACBRAYNE, *Chairman.*

BROWN, FLEMING & MURRAY, *Secretaries.*

THE LIBERIAN GOVERNMENT CONCESSIONS AND EXPLORATION COMPANY, LIMITED :

INDIA-RUBBER.

The prospectus informs us that "this company has been formed for the purpose of purchasing the valuable India-rubber concession, granted by the Government of the Republic of Liberia, West Coast of Africa, for the sole right of collecting the India-rubber grown on all the government lands and forests, and the sole right of exporting all India-rubber grown within the territories of the Republic of Liberia, such concession further granting the concessionaires 2,000 acres of land, to be selected by them, for the purpose of erecting warehouses, stores, residences, and establishing depôts, wharves, and trading stations, or for such other purposes in connection with the concession as the concessionaires may from time to time deem necessary or desirable, and to be held free of any charge whatever; and if hereafter thought desirable, work such concession, or to sell or lease the whole or portions thereof to companies or individuals; and also to take over, work, sell, or lease to companies or individuals, at the discretion of the directors, any other concession or concessions which may now or hereafter be obtained by the company from the Government of the Liberian Republic. The rubber concession covers the whole area of the government lands on which the gum elastic rubber tree is found, producing rubber of the best West African quality, and the Government estimate that a minimum of 2,000 tons can be collected annually, (and also the sole right of exporting all other rubber grown within the territories of the Republic of Liberia) which, delivered in London or Liverpool, including the royalty to be paid to the Government of Liberia, will it is estimated show a profit (if only realising 1s per lb.) of £112,000 per annum. Labour is cheap and plenti-

ful, and the natives of this part of Africa are industrious. The use of rubber is being very largely extended, and is being brought into general use for manufacturing purposes, and is now being extensively used in Berlin, Hanover, and Hamburg, in connection with other materials, for paving the streets, and no doubt will soon be applicable for many other similar purposes."

The area of the Republic is estimated to be about 150,000 square miles, or about 96,000,000 acres, most of which is of the richest character, yielding almost every known kind of tropical produce, whilst the value of its mineral wealth can scarcely be estimated.

But besides trading in India-rubber, the company propose also to procure further concessions for getting and working minerals; for cultivating fibre-producing plants, &c.; for collecting palm oils, indigo, timber, and dyewoods; for trading in ivory, &c.; and also for a chartered State Bank, and various public rights. The Liberian Government has undertaken not to grant these concessions without first offering them, through Mr. Ellis Parr, to this company.

The price to be paid to the vendor (Mr. Ellis Parr) for the India-rubber concession, and in respect of his interest in the other concessions which have been applied for, has been fixed by the vendor at £70,000, payable as to £7,000 in cash, and as to £23,000 in fully paid ordinary shares, £3,000 in deferred shares, and the balance in cash or fully paid ordinary shares, or partly in cash and partly in shares, at the opinion of the directors; the deferred share ranking only for dividend after the company has earned sufficient to pay a dividend on the ordinary paid up capital of twenty-five per cent, when the deferred shareholders, after receiving a dividend of twenty-five per cent, will be entitled to one-half of the balance of the remaining profits.

It will be seen that the proposed operations of the company are varied and extensive, and the prospects, as set forth by the promoters, are certainly sufficiently alluring. The capital asked for is £110,000, and if this is promptly supplied, and if the right men are put in the right place, and wise methods of procedure are adopted, we do not see why the glowing results anticipated should not be largely realised.—*Electrical Trades Journal*.

TEA GARDEN COOLIES IN ASSAM.

To the Editor of the *Indian Agriculturist*.

Sir,—Many of your readers are no doubt interested in this vast tea district where so many labourers from Bengal are employed, and would like to hear of their condition, and the treatment they receive from the *brutal planter*. First, as regards their pay; women receive on enrolment R4 per month, and men R5; after the expiry of 3 years of their 5 years' agreement the pay of women is increased to R5 and of men to R6 per mensem, besides which they earn on an average from R4 to 5 per month during the six most busy months of the year by doing task work after their daily allotted work has been performed. The day before yesterday I found that the coolies on one garden had finished their morning's allotted work by 9:30 a. m. they were consequently free to do what they liked until 1 p. m. These rates of pay compare most favorably with the rates received during the past year by able-bodied agricultural labourers, as published in the *Englishman* of 16th May 1890, in Jeypore and Rajpootana, where the average rate was from R2 to 3 per mensem, where rice was selling at 8 seers per rupee; whereas up here it is selling at from 10 to 12 seers, but the coolies are supplied by the planters with that necessary of life at the uniform rate of R3 per maund, or 13½ seers per rupee, although it invariably costs the planter more. According to the *Englishman* the highest wages paid to able-bodied agricultural labourers in Oudh was R4 monthly; in the North-West Provinces from R3:12 to 5:8, with a tendency to the lower figure; and in Bongal proper from R3:12 to 5:10. The coolies in Assam are well housed, and much attention

is paid to the sanitary condition of their lines and houses. When sick, the greatest care is taken of them and kindness shown them. In most of the tea gardens in North Lukhimpore an hotel system of feeding the coolies is carried out* by which, R3 per mensem per adult, and R1.8 per mensem for working boys (children too young to work are fed free) they obtain three meals per diem and as much at each meal as they can eat. In the early morning before commencing work each man, woman, and child is served out with a *chupattee* fried in *ghee*, a quantity of parched rice, and tea at 11 a.m., at which hour work ceases, until 1 p.m., they get a meal consisting of rice, *dhal*, vegetable curry, and tamarind chutnee, which is repeated at 7 p.m.; work ceases for the day at 5.30 p.m. Once a week they get mutton, and one chittack of mustard oil each, with which they *shampoo* themselves. I had the pleasure of seeing yesterday, 500 coolies men, women, and children, assembled in a capacious hotel building eating their mid-day meal. The waiters went round serving out the rice, *dhal*, curry, and chutnee until all had had sufficient, and refused further helpings. All seemed contented and happy, and on the manager asking them if they had any complaint to make about the food, he received a smile and reply from each man or woman he interrogated that everything was very good. The native doctor, who is much respected by the coolies, is present at each meal. I have noticed that on wet days most of the coolies turn out with good substantial grey blankets, and when working in the sun many of them wear large mat hats protecting their heads and a great part of their bodies. They own cows in great numbers,† and in the lines numbers of fowls and pigeons are to be seen. Without doubt the tea garden coolies are a happy and contented lot, particularly well cared for, and the greatest interest is taken in their welfare by the managers. After the expiry of their first five years' agreement an average of about 90 per cent enter upon a second agreement, which in itself is a sufficient proof of their contentment. Many time-expired men obtain grants of land from Government and open out on their own account. Influenza has been, and is still, rife among them; in one garden 400 were ill with it at one time; few deaths have occurred, and I am happy to say the epidemic is on the decrease. The greatest consideration is shown to the sick, and those in hospital are supplied free with fish, milk, sago, Liebig's extract of meat, &c. On one garden employment is given to two blind boys, and one man who is a cripple. These notes are made, Sir, from my personal knowledge and observation during a visit to North Lukhimpore, and I trust your readers will from a perusal of them consider that the adjective *brutal* does not apply to the Assam tea planter.‡ It is certainly not the opinion of the coolies as can be judged from the following incident. One night a few months ago a manager's house was burnt to the ground through the bursting of a lamp; he lost everything to his name. All his coolies came forward offering him money; he was presented with a watch, wearing apparel, numerous other articles. With these facts before them surely Government can see its way to modifying Act I of 1882, which quadruples the cost of the passage of coolies up here; but for this Act coolies could be comfortably landed at Dehrughnr at from R20 to 30 per head, whereas they now cost the planter from R80 to 100. The planters could then no doubt recruit in Jeypore, Rajputana, and the N. W. Provinces and thus help to ameliorate the condition of the underpaid and underfed labourers of those provinces.—VETERAN.

* We have frequently suggested some such system for Ceylon estates, but we suppose the curse of caste stands in the way. In Government hospitals, however, the obstacle is overcome, high caste cooks being, we believe, employed.—Ed. T. A.

† This could not be managed on Ceylon estates, where only the conductor and a few kanganyes generally have cows. The Indian estates are sometimes of large area, including grass and rice fields.—Ed. T. A.

‡ The whole class suffer in reputation from the undoubtedly brutal conduct of a few "black sheep." Of the latter Ceylon has known some.—Ed. T. A.

PROSPECTS FOR A NEW LOCAL INDUSTRY:

MAANA AND CITRONELLA GRASS FOR TEA BOXES.

Referring yesterday to the deterioration of our teas due to packing in chests made of unseasoned wood, we touched upon the prospect of an efficient alternative to the use of such wood afforded by the patent now being worked by the Stanley-Wrightson Syndicate. We said that this patent was still awaiting approval or condemnation, and we are not even to date able to say what the nature of the verdict upon it is to be. But intelligence conveyed to us in our London Letter to the effect that mana grass has been successfully applied to the manufacture of the board which forms the main constituent of the new chests must make us desirous to learn that the character of that verdict, when given, may be a favourable one. For, if it be so, there seems to be every chance, according to what our London Correspondent writes, that we may see established in this island two factories to undertake the making of the new material from what are now almost entirely waste products of native growth. With these would of course also be included workshops for the manufacture of the chests, which have as yet been made only at the trial factory near London.

The two items among our local products which have as yet received special mention are the mana grass which grows so freely in Ceylon and the citronella stalks which are now left as refuse after oil has been expressed from them. The first of these has already been subjected to successful trial at home, and our Correspondent has forwarded to us a small sample piece of the thick fibrous paper, resembling millboard, which has been the result of that trial. We are assured that so good an authority as Dr. P. Norman Evans, the expert of the London Paper Makers' Association, has declared as the result to his experiment that mana grass offers a more than efficient substitute for wheat straw; that it is, in fact, owing to its containing less of the silicate which is so potent a factor in producing brittleness, much more suited to the manufacture of the boards required than is the last-mentioned material. One has only to handle the specimen of the outturn to Dr. Evans's experiment to realize how far more flexible and homogeneous it is than anything we have yet seen produced from straw. Further trials, we are told, are to be made by Dr. Evans, and if these result in confirming first impressions and an official report to that effect is made by their conductor, it will be determined upon—contingently of course upon a favourable opinion being expressed as to the general suitability of the new tea chest to the needs of our tea planters—to establish factories for the manufacture of the board both at Gallo and Nawalapitiya; the first to undertake the working up of the waste from the citronella oil mills, and the second that of the mana grass which is to be found in such abundance in its neighbourhood.

We shall naturally be well-disposed to welcome the establishment among us of these two new factories, with, we should presume, their included industry of the making up of tea chests of the

material they are to furnish. All work of the sort contemplated requires the employment of great power. This could doubtless be obtained very economically by the use of the almost unlimited water power which can certainly be obtained in the neighbourhood of Nawalapitiya, and possibly also near to Galle. Mr. Stanley assured our correspondent that, given favourable results to the two experiments now proceeding, all arrangements were well forward to start the industry in this island, and we therefore look forward with very great interest to receiving the subsequent report which will doubtless soon be forwarded to us. It appears that the present cost of carriage of each box from London to Ceylon is sixpence, and therefore on this item alone a very considerable saving will be effected if the chests can be locally produced. But it is confidently anticipated, that beside that economy, a further one of very considerable amount will attend the local production of the strawboard. This has hitherto been obtained from Holland, but experts consider it to be of imperfect manufacture, and it is besides relatively too expensive. The change contemplated will therefore, if carried out, probably render it possible for the chests to be supplied at a cost considerably below that of the wooden boxes at present used.

We have referred above to what is termed the imperfect manufacture of the strawboard at present used. We are told that in order to obtain the required stoutness—*i.e.* thickness—of board several layers of the straw paper have to be pasted together. It is presumed that the siliceous character of the straw used opposes itself to the production of thick material. This difficulty, it is said, will not present itself in the case of manufacture from mana grass, and that, given sufficient power, it will be possible to make from it board of almost any required thickness. Although as yet the prospect of this new industry being established among us is still subject to conditions which may possibly not be fulfilled, there certainly appears to be very strong ground for hoping that before very long we may be able to welcome its advent.

It will certainly be a remarkable change, if the tall, coarse, lemon-scented grass which covers so large a portion of our upland prairies, instead of being burnt periodically to obtain cattle feed in the shape of the young tender shoots, should be cared for, cultivated and utilized for an interesting and profitable manufacture.

HOME CRITICS ON CEYLON TEA: OVERFIRING AND FERMENTATION. TEA CHESTS.

Having asked Mr. F. F. Street's opinion on this subject he is good enough to write as follows:—“In regard to the firing of tea, of course you allude to Messrs. I. A. Rucker & Bencraft's recent circular on this subject. I can only say that I entirely agree with their remarks as far as the fermentation and firing of Ceylon teas is concerned. My estate reports during the past five years would give you ample evidence that what they assert is perfectly true, and they confirm what I have repeatedly written on the subject during that period. During the past six months alone I may mention that I have reported on something like 1,200 estate samples, so that I have had ample opportunities of judging. This does not, of course, include teas that have come under my notice in other ways, and as a buyer and seller of tea on this market, I am perfectly convinced in my own mind that insufficient fermentation and overfiring

in a great measure, if not entirely, account for the non-keeping properties of Ceylon teas—of which we have heard so many complaints. I am however glad to say that the number of cases of overfired teas coming under my notice in the way of business are much less numerous than they were—this is largely due to the firing now being done at a lower temperature than formerly, especially the final-firing—which in most cases is where the damage is done. It appears to me that tea is exactly on a par with any other article of food that requires roasting before it is fit for consumption: it may and often is cooked to such a point of dryness that the sap or juices are more or less burnt out of it, leaving a dry juiceless article, deprived of all its quality and goodness. It is a noteworthy fact that under or short fired teas are invariably full and generally pure in the cup, while overfired teas are always more or less impure, thin or comparatively so; clearly proving that the additional firing has dissipated some of the juices of the leaf that would have remained in the leaf with slower and lower firing.

“*Tea Chests.*—I have not the smallest doubt that the ‘cheesy’ flavour complained of from home, originated from the use of some unseasoned and unsuitable Ceylon wood. Some two or three years ago I had some shelves put up in my office made of a cheap Ceylon unseasoned wood, the smell was perfectly offensive (I can only liken it to ‘rotten game’), and made it most unpleasant to sit in the same room.

“Japanese ‘Momi’ are undoubtedly the best packages we have, being free from smell, light of weight and for make and finish rarely equalled in Ceylon-made packages.”

We can understand underfermenting leading to absorption of moisture, but how over-firing can lead to such a result, we find it difficult to conceive.

MAURITIUS HEMP MACHINES.

(From the *Kew Bulletin*.)

The subject of Mauritius hemp has been discussed already in the *Kew Bulletin* (March 1887, p. 8). Since that time considerable interest has been taken in India and the Colonies in the production of fibres suitable for rope and twine making, for which of late years there has been a considerable demand. In connexion with this interest numerous inquiries have been addressed to Kew respecting the best machines for cleaning the leaves and stems of plants yielding such fibres. The plants in most cases have been various species of *Agave*, *Furcraea*, *Sansevieria*, *Karatas*, *Bromelia*, and other monocotyledonous plants whose fibre bundles yield the particular kind of fibre in demand.

It is well known that certain fibre machines, more or less effective, are in use in Yucatan in the production of Sisal hemp, yielded by one or more varieties of *Agave rigida*. It is very probable that some of these machines could be successfully introduced into other countries where *Agave* plants are grown for fibre [see *Kew Bulletin*, March 1887, pp. 38; March 1889, pp. 57-61; and October 1889, p. 254].

In the case of Mauritius hemp we learn that the fibre machines, locally known as *grattes* or scrapers, which have been generally in use in that island for many years, are manufactured in the Colony. These are exclusively engaged in extracting fibre from the leaves by the *Aloësvort* or foetid Aloe (*Furcraea gigantea*). The leaves of this plant are very similar in size and character to those of *Agave rigida* var. *Sisalana* received lately at Kew from the Bahamas. There is little doubt that the *grattes* or fibre machines as now used in Mauritius, or with some slight modifications, could also be used in the treatment of *Agave* leaves. In any case it was very desirable to obtain exact particulars of

the construction and capabilities of the Mauritius machines. They appear, so far, to fully meet the requirements of the Mauritius planters, and moreover, they have been adopted after careful trial with other machines which have been ultimately discarded. The particulars desired in regard to the machines in use have now been furnished in an exhaustive manner by the Government of Mauritius, and they are published in the *Kew Bulletin* with the view of placing the information within reach of a large class of people interested in the subject.

* * * * *

Answers to queries respecting machines in use at Mauritius for extracting fibres from leaves of *Purcra gigantea*.

1. The machine in general use in this Colony is a drum of 2 feet in diameter by 1 foot in width, upon which are bolted blades in 2-inch Σ steel, and which revolves at a great speed, the blades passing close to a guide in cast iron ("servante.") The machine is called a ("gratte") scraper. It is manufactured in the Colony by all engineers' shops, but chiefly by the "Forges and Fonderies de Maurice."

2. The weight of the drum is about 4 cwt., the cost, including the driving pulley and belts (exclusive of framework, masonry, and setting,) is about R250 per "gratte."

3. This gratte has been in general use in Mauritius for the last six years.

4. The machine is worked by steam or by water power.

5. The registered horse-power to drive one gratte is 3 h.p.

6. One gratte is served by two men who stand on each side of the gratte, and who work alternately. One of them must be left-handed. One carrier will bring in sufficient leaves from the yard to the gratte, and another man will suffice to remove the wet fibre produced by two grattes and to carry this fibre to the weighing machine and thence to the cleaning pits.

7. The out-turn of wet fibre for each machine per hour is, on an average, $42\frac{1}{2}$ kilog., that is taking eight hours' work per day, which is as much as the men can do, the work being very fatiguing.

8. The out-turn per day of eight hours is per machine (gratte) 340 kil. wet supplying on an average 97 kil. of dry fibre (or $28\frac{1}{2}$ per cent of the wet fibre.)

9. The average cost in laheur, fuel, &c. in cleaning a ten of dry fibre, packing, and transporting to the place of shipment is ... R 150

If to the above we add other charges, viz., collecting leaves, carting, mill management, interest on capital, &c., say about 75

The total average cost of one ton of fibre ready for shipment is R225

SUMMARY OF A NOTE ON THE FIBRE MACHINES GENERALLY IN USE AT MAURITIUS FOR ALOE CLEANING FIBRE, BY M. REGIS DE CHAZAL.

1. *Description of Machine.*—The machine generally in use in Mauritius for extracting fibre from the leaves of the green Aloe *Purcra gigantea* is known under the name of *gratte*. This gratte consists of a drum about 2 feet in diameter and 1 foot wide. On the circumference of this are bolted 2-inch L-shaped blades parallel to the axis. These blades are generally of iron, but steel is preferred. They are firmly fixed to the drum by means of bolts and nuts. The drum is mounted upon an axle and made to revolve with great rapidity close to and against the front or edge of a feed table (*servante*). The feed table is adjusted by means of screws so as to approach the revolving drum within a distance of quarter inch to an inch, as required. It is composed of a stout brass plate and lip fitted firmly to a piece of hard wood by means of bolt. The plate and wood are themselves fixed to two wooden bars, 6 inches by 6 inches, which serves as guides in the movement of the feed table backwards and forwards.

The most difficult task in connexion with working the gratte is the exact adjustment of this feed table. It is most necessary that the blades on the drum and the edge of the feed table are so adjusted that they work freely and evenly and at the same time bring every fibre in the leaf in contact with the heaters. The proper adjustment of the feed table in regard to the heaters is stated to be the secret of the success of the *gratte* as a fibre machine. This adjustment should be performed with the utmost care before the machine is started. When once adjusted it is important to maintain the feed table in its proper position and prevent any displacement during the process of working.

The drum should be turned at an average rate of 700 revolutions per minute, while a higher rate of speed may be maintained without injury, it is found not desirable under any circumstances to fall below 620 revolutions per minute. The best and most economical work is that done at 700 revolutions per minute.

Method of Working.—The Aloe leaf is presented tip first along the feed table, and is drawn down between the latter and the drum. It is thoroughly beaten by the grattes to about three-fourths of its length. By these means the pulp is removed and the fibre is left. The leaf is then withdrawn and the other end presented to the heaters until the whole is cleaned.

Two men usually work at each machine. They stand one on each side of the feed table and work alternately. It is desirable for rapid work that one of the men should be left-handed. Each man in turn presents his leaf to the machine and withdraws it as soon as possible. In a regular and efficient working of the machine it is arranged that one man or the other should always have a leaf in the machine in course of being cleaned. To avoid accidents the feed table is now provided with a wooden guard. This guard prevents the hands of the workpeople from being caught by the heaters.

Mounting the Machines.—The machines are generally mounted in pairs both working on the same axle, and driven by steam or water power. The driving wheel fixed midway on the axle between the two machines should have a minimum diameter of 18 inches, with a strap 6 inches wide. A single adjustment of the feed table should last from eight to 15 days. At the end of that time it is generally found necessary to readjust the parts to ensure good results.

The framework of the machine is securely attached to substantial masonry work by large bolts about 5 feet long. The machines must be thus firmly secured or the vibration during the process of working would soon cause them to become detached. The arrangement of the machines in pairs on the same axle could be extended in the same line indefinitely, provided the necessary distance is preserved between the centre of each machine. One of the largest fibre factories in Mauritius contains 12 machines, that is six pairs arranged as already described.

Out-turn of Fibre.—As already stated each machine is served by two men standing on each side of the feed table. One carrier supplies them with fresh leaves while another is engaged in receiving and removing the wet fibre. The task of a man, which can be easily accomplished in six to eight hours, is 250 lb. (or 125 kilos of wet fibre). The wage paid for this is one rupee. Sometimes, however, by extra work (for which the workman is paid at the rate of 50 cents per 100 lb.) as much as 800 to 900 lb. of wet fibre have been produced in a single day. This amount amount, however, is quite exceptional.

The proportion of dry fibre to the wet fibre as it leaves the machine varies from 22 to 30 per cent.

The yield of dry fibre in relation to the weight of green leaves varies according to the age of leaves and the characteristics of the season. The riper the leaves the larger the yield of fibre; a wet season producing leaves charged with moisture will also affect the result. To produce a ton of dry fibre ready for shipment requires from 80,000 to 150,000 leaves, varying according to the size and age of the leaves and character of the season. The cutting of the leaves costs from 50 cents to one rupee the 100 bundles of 25 leaves each. The higher price is paid when labour is scarce, or when the

ground is rough and difficult to traverse. The cost of baling the dry fibre costs from 40 to 50 cents the bale of 150 kilos. It may be assumed that a set of 10 to 12 fibre machines properly installed and attended by men accustomed to the work will turn out on an average about 1,200 kilos (2,645 lb. avoird.) of dry fibre per day.

Difficulty is sometimes experienced in obtaining pairs of right-handed and left-handed men for each machine. Right-handed men are, as may be expected, in excess. As already shown, it is necessary for economical working to have a right-handed and a left-handed man to attend to each machine.

Treatment of the Fibre.—When the fibre first leaves the scraping machine it is covered with mucilage possessing corrosive properties which dries on exposure to the air. The tendency of this mucilage, if left on the fibre, is to turn it of a yellow colour, and even sometimes of a reddish colour. To prepare the fibre with a bright attractive appearance the best plan is to place it, as soon as it leaves the machine (or as soon as it has been weighed, to check the amount produced by each man), in warm water of a temperature of 60 deg. to 80 deg. Cent. (140 deg. to 170 deg. Fah.), and leave it there for about two hours. It should then be washed in two waters, and finally exposed to the sun to be dried.

A treatment recently employed consists in washing the fibre in cold water only. In the first washing soap is used at the rate of 2 to 3 per cent. of the wet fibre. After being thoroughly washed with soap the fibre is passed through pure water until all the soap has disappeared, then exposed to the sun and dried. By these means a beautifully white fibre is obtained. When thoroughly dried the fibre is afterwards scutched, to get rid of pith and dust. This process is usually performed by a machine constructed on the plan of an ordinary *gratte*, but fitted with four blades instead of 12. These also turn away from the feed table instead of towards it. The fibre is inserted at an opening about 6 inches higher than the centre of the axle. It is carried away by the movement of the beaters, and remains on the top of the drum, where, exposed to the repeated blows of the beaters, it is cleaned of all dust and impurities.

It may be mentioned that, owing to the corrosive nature of the juice of the Aloe leaves, the workpeople are compelled to wear strong leather gloves. The gloves are fastened to the wrist by leather bands. As the gloves are provided by the proprietor, and they wear out very quickly, they constitute quite an appreciable item in the cost of working a fibre factory.

ADDENDA.—The upper half of the *gratte* is covered with a semicircular wooden cover, to prevent the "pulpe" from being splashed about the place; this "pulpe," which is semi-liquid, falls on an inclined plane standing about 1 foot below the *gratte*, and upon which it slides into troughs, wherefrom it is gradually removed and spread to dry.

There is a considerable quantity of this "pulpe" produce for one ton of dry fibre (about 20 tons), and large areas are required to stack it. The smell from the decomposing "pulpe" is anything but agreeable.

During the first years of Aloe fibre manufacture in Mauritius no use was made of the residue ("pulpe"), as it was found to burn the plantations when used as manure. Of late, however, it has been extensively employed by mixing it with other manure, and it has given good results in the cane fields.

February 17th, 1890.

STATEMENT OF WORK executed at ST. ANTOINE HEMP FACTORY, in District of RIVER DU RENPART, MAURITIUS.

		Year 1889.	
February	...	15 days' work with 9 <i>grattes</i> .	
March	...	18	11 "
May	...	20	11 "
June	...	7	11 "
		60 days.	

Equivalent to 630 days' work of one *gratte*.
The produce has been 213,371 kilos. of wet fibre,

which have given—

401 bales of dry fibre, 1st Quality.
6 " coarse fibre, inferior quality.
407 bales, weighing 61,050 kilos.

Mean day's work = 10,175 kilos.
Proportion of dry fibre to wet fibre = 28.61 per cent.

BRAZIL AND THE RUBBER TRADE.

"So the swooping down of the new Republican Government upon the rubber exporters at Para, has given the trade rather a twinge," said one of our representatives to a leading London importer the other day. The air was redolent of rubber, and before our reporter had had time fully to enjoy the flavour, the broker answered:

"No; say rather a spasm. But it is all over now. The Central Government at Rio has stopped the action of the Provincial authority which gave the monopoly to the *Companhia Mercantil*."

"You did not have to wait for the memorial to Lord Salisbury to take effect. Diplomacy is at the service of the City. Fifty or sixty firms importing yearly 6000 tons of rubber from Brazil always have ambassadors and ministers plenipotentiary at their beck and call."

"No doubt the Government would have acted in the question. But it is not necessary now. The French claim the credit for the abolition of the monopoly. That really does not matter. What we feared was that the new movement would not stop at caoutchouc. It might have treated coffee in the same way."

"Still, prices have been affected but very slightly by the monopoly."

"That is so. But the principle of the Republican Government's action was most unfair. All exporting houses in Para were compelled to pay a large percentage to one company, which in its turn was favoured with the monopoly by paying a very small tax per pound on exports. One of our chief complaints was that the additional taxation was payable not to the Government but to a private trading corporation which competed with the payers of the tax in the rubber trade. It was not business. It was sheer barbarism."

"So the new Government has not made a good impression!"

"No; but it has been taught a lesson, and may be expected to do better in future. It will reflect before it attacks the mercantile interest again."—*British Trade Journal*.

CONCRETE QUARTERS FOR NATIVE CLERKS, GUARDS, AND MENIAL STAFF ON INDIAN RAILWAYS, ETC.

By T. KER, M. INST. C. E.,
Executive Engineer, P. W. D.

The excessive cost of housing the Native Staff, owing to the necessarily, and by comparison with European Railways, large number of native employes required, has long occupied the serious consideration of Railway Administrations in India. The above difficulty, in effect, has led to temporary structures being resorted to in many instances, the repairs to which, every monsoon, cost in a few years more than permanent quarters could be erected for.

The author having had some experience in the designing and construction of various descriptions of dwelling houses in India, has, with the object of meeting the exigencies of the case, designed, a class of quarters suitable for native clerks, guards, plate-layers, pointsmen, gatemen, &c., the lower state generally, for which he claims the following advantages:—

1. The quarters being built of concrete throughout, walls and arched roof, can be erected almost anywhere.

2. The materials, lime, sand, broken stone, or brick or kunkur, are nearly everywhere procurable locally.

3. Very little skilled labour is necessary.

4. The cost is one-half that at present paid for the same area of stone or brick-built accommodation.

The quarters are water-tight and, if properly constructed, should never require repairs; those erected some years ago having withstood every test. The natives prefer the above, as being cooler than stone-built houses.

The style of construction adopted is specially suited to the natives, who are accustomed to light work, progressing by easy stages; it has also this advantage that, with the usually scanty supervision available in India, the due inspection of each course laid, is rendered possible, less opportunity of inferior materials being passed and a better guarantee secured that the work will be substantially carried out, than would result if European methods were pursued.—*Indian Engineer.*

BARK AND DRUG REPORT.

(From the *Chemist and Druggist.*)

LONDON, June 5th.

CINCHONA.—The auctions held here on Tuesday were the smallest which have taken place for many months, the total weight of the bark offered being less than two-fifths of what is announced for sale in Amsterdam on Thursday. The assortment of bark offered was rather a good one, one or two catalogues offering several very handsome parcels. The tone prevailing at the auctions was a very strong one indeed, and though it cannot be said that there was any actual alteration in value, the lots sold were well competed for, and holders showed no inclination to accept lower rates.

The following was the assortment offered:—

	Packages.	Packages.
Ceylon bark	...562 of which...	243 were sold
East Indian bark	...312	292
Java	... 11	11
South American bark	...634	122
Total	...1,519	668

The unit is generally placed at 1½d to 1¾d per lb.

The following were the principal buyers:—

	Lbs.
Agents for the American, French, &c., works	...28,314
" the Brunswick works	...19,819
" the Frankfort o/M. and Stuttgart works	...11,580
" the Auerbach factory	...14,390
Mr. Thomas Whiffen	...18,410
Agents for the Mannheim and Amsterdam works.	...22,215
Messrs. Howards & Sons	...26,109
Sundry druggists	... 2,560

Total amount of bark sold	...153,397
Bought in or withdrawn	...276,000

Total quantity of bark offered ...429,397
It should be well understood that the mere weight of bark purchased affords no guide whatever to the quinine yield represented by it, firms who buy a small quantity of bark by weight frequently taking the richest lots, and *vice versa*. Analysis of the catalogues gives the following prices for sound bark:—

CEYLON BARK.—Original.—Red varieties: Fair to good quilly chips 2d to 3d; rather dusty, but bright shavings 3½d; bold and dusty mixed root 2½d to 3d per lb. Yellow varieties: Good bold quilly chips 7d to 8½d; small branchy chips 5d; bright, but dusty mixed chips and shavings 7d; dull, but rich root 7½d to 9½d; low pale quillings 3d per lb. Small and dull grey chips 2½d to 3d; dusty to bold root 4½d to 7d per lb. Hybrid chips, small and dusty to good strong 3½d to 6d per lb. Renewed.—Red varieties: Sall woody chips 3d to 4d; good bright and mixed with small quill 4½d to

6d; fine bright shavings 7d per lb. Grey: Good chip 6d to 7½d; fine bold bright quilly ditto 8½d to 9d per lb. Hybrid chips 5d to 7½d per lb.

EAST INDIAN BARK.—Orgul.—Red varieties: Small to fair quilly mixed chips 2½d to 3d; fair bright shavings 3½d; dull weak branch 1½d; dusty root 2½d per lb. Yellow chips, dull and small 3½d to 4½d; good bold bright ditto 5d to 6d; good bright quilly shavings 5d per lb. Grey quilly chips 4½d to 5d per lb. Hybrid chips 4½d to 5d; fine bright shavings 6½d per lb. Renewed.—Red varieties: Small and dull to fair quilly stem chips 3½d to 5½d; good bright, but small shavings 5½d per lb. Yellow chips good quilly to fine bright strong 6½d to 10d per lb.

SOUTH AMERICAN BARK.—Of 32,336 lb. cultivated Bolivian Calisaya 12,110 lb. sold; good strong brown and grey quill 9½d; medium ditto 7d to 7½d per lb. A parcel of 34 serons old dull dusty Pitayo sold at 3½d per lb., and of 321 packages Cuprea 47 bales imported in 1889, sold at 2½d per lb. the remainder being held for 3d to 4d per lb. The imports here are rather heavy, 1,316 packages having been entered from all quarters since our last report. We understand that over 200 packages bought in at Tuesday's auctions have since changed hands at full prices.

QUININE.—The speculative business has continued during the early part of this week on a moderate scale, about 50,000 oz. B & S and Brunswick bulk, first-hand changing hands at 1s 1½d for November-December, and 1s 1¾d per oz. for August-September delivery. The A & S agents now say that they do not care to sell any more, and quote 1s 2d per oz. nominally. Meanwhile the market has become inactive, and the position today is about as follows:—Spot: Buyers 12½d; sellers, 13d; August-September, buyers, 13d; sellers, 13½d; November-December buyers, 13½d; sellers, 13½d per oz.; no business.

THE AMSTERDAM CINCHONA AUCTIONS.

(Telegram from our Correspondent.)

At today's auction 3,082 packages were offered for sale, and these were all disposed of with the exception of 5 packages. Holders offered freely, and the result of the heavy quantity thus pressed upon the market was a decline of fully 10 per cent as compared with the previous Amsterdam sales, and some slight fall on the last London prices. The average unit value was fully 8 cents per half-kilo, or a fraction below 1½d per lb. The following prices were realised: manufacturing barks in quills, entire and broken, and in chips, from 4 to 78 cents (= 3d to 1s 2d per lb.); manufacturing root 11 to 64 cents (= 2d to 11½d per lb.) Druggists' barks, chips and quills, broken and whole, 11 to 78 cents (= 2d to 1s 2d per lb.); ditto, root, 12 to 25 cents (= 2d to 4½d per lb.) The principal buyers, in order of their purchases, were Messrs. Mathes & Bormeester, of Amsterdam; Messrs. O. L. Schepp & Zonen, Rotterdam; the Auerbach Quinine Works and the Amsterdam Factory.

In addition to the analyses of the bark offered today, already given in last week's issue, the remaining 48 tons of bark were found to contain about 2 tons sulphate of quinine, so that the whole quantity of manufacturing bark offered today, viz., about 246 tons, contained about 335,000 oz. sulphate of quinine, or about 4 percent of the average.

ARTIFICIAL GUTTA-PERCHA.—We are informed by Dr. Purcell Taylor that he has succeeded in making a new insulating material, having all the properties of gutta-percha. The new substance is very tough and elastic. A piece of iron covered with this "Purcellite" was, he states, hammered out flat, then bent and twisted until it broke, without even cracking the covering. The cost is said to be considerably less than that of gutta-percha.—*Electrician.*

THE CULTIVATION OF CINCHONA IN SOUTHERN INDIA.

We call attention to Baron von Rosenberg's long, racy and practically interesting letter addressed to the "Editor of the *Tropical Agriculturist*" given in another column. We have not seen a copy of Mr. Lawson's report, which our correspondent so trenchantly and so ably criticizes; but before reading this letter we had written a note on the reference to Mr. Lawson's starvation theory in the report of the Wynaad Planters' Association, to this effect: "Surely stiff, damp, clayey, soil is a largely operative cause?" In our own experience, which has been extensive, we have traced canker in cinchonas to soil mechanically hard more than to any other source. The taproot of cinchona cannot pierce soil in such a condition, but curls round in the pit, and such roots we have found covered with liverworts. Through similar soil the much hardier tea plant forces, its robust taproot, to a depth of many feet, and we have frequently mentioned that in land thus opened up and drained by tea we have thriving (for the tea far too luxuriant) groves of cinchonas. If, therefore, it were commercially worth while to continue to cultivate cinchonas in Ceylon, we should advise putting the plants out amongst tea at least four years old. Even so, no doubt, many of the plants would gradually canker and die, as in the case of cacao, the zone for cinchonas seems limited, and amongst all that is worthy of attention in Baron von Rosenberg's remarks, and that is the whole of his utterances, we attach special importance to his advice that cinchonas should not be planted under 5,000 feet elevation. But if any new plantations are to be formed in Ceylon at and above that elevation it must be on grass-land, for the Ceylon Government will not, now, sell forest land above 5,000 feet altitude, lest, forsooth, the rainfall (dependent upon monsoon winds and mountain masses) should be diminished by forest clearing! All the clearing as yet effected has not diminished the rainfall a thousandth of an inch.

PLANTING IN THE SOUTH PACIFIC.

We have a letter from a New Zealand mercantile house inquiring about planting requisites in various forms, and from their manager—an old Ceylon planter—resident on an out-of-the-way island of the Pacific, who writes:—"I have recently arrived here on behalf of the firm of ——— to look after their coffee plantations. The island is a very small one and grows coffee luxuriantly, but it is almost all old and, like the native coffee of Ceylon, never touched by pruning knife. The firm is about to put some land under coffee after the Ceylon method of cultivation. I think of introducing some other products here which I think ought to succeed,—cacao, Liberian coffee, cardamoms and pepper. I should like also to introduce the jak tree."

TIMBER FOR MINE PROPS.

In view of the probability that large demands on our forest resources may ere long be made by gemming and plumbago companies in the shape of props for mines, the following details from the *Indian Engineer*, of experience in coal pits at Warora, may be interesting and useful:—

All the timber used is in the shape of props cut in the Government preserved forests, near Chanda, about 30 miles south from Warora. Timber in India is very expensive; teakwood costs 34 rupees a cubic foot, and is the only timber available for ordinary

work. Before 1883 very few props were used, and it was only on the introduction of a regular system of working and commencing the broken miee that the getting of timber on a large scale was gone into. In January 1884, the Government Forest Department sent six sorts of timber, in the shape of props, for trial, the principal variety being Garrari (*Lepidopteris orbicularis*), of which the props upto that time had been. The others were Thendu (*Diospyros melanoxylon*), Dhaora (*Anogeissus latifolia*), Mohka (*Schrebera Swietenoides*), Aouli (*Phyllanthus emblica*), and Seena (*Lagerstroemia parviflora*). Of these, Garrari was given up later, after trials with it in the pit; its wood is too fibrous, and it was found too flexible, and very often hollow. Thendu was found to be the best; it has as heart wood, ebony, and was found to answer well as a prop in the broken. Dhaora was found to be the next best, but its curious structure, in which the fibres looked like the twist of the strands in a hemp rope, made it less fit to stand pressure. Mohka was found to be a fair timber, while Aouli and Seena was pronounced bad. Unfortunately a large number of Garrari props had already been ordered, and they became of use by being split and used as lagging; Garrari is also more plentiful than other timber, being a quick growing tree. After this, two sorts only were ordered—Thendu and Dbaora with a little Garrari. Then the Forest Department complained that at the rate of consumption, the timber preferred could not be supplied without endangering the existence of the plantations, and asked that some other kinds of timber be tried for pit props and accordingly, a further assortment came and were tried. They were:—1.—Rohan (*Soymda febrifuge*). 2.—Saj (*Terminalia tomentosa*); locally known as Ain or iron wood. 3.—Mohka (*Schrebera swietenoides*). 4.—Suria (*Xyla dolabriformis*). 5.—Bahera (*Terminalia belle-rica*). 6.—Kahu or Argun (*Terminalia arjuna*); rather rare. 7.—Kini (*Albizzia procera*). 8.—Bhirra (*Swietenia chloroxylon*). 9.—Chichwa (*Albizzia odoratissima*); not recommended by the Forest Department for pit work. 10.—Mohwa (*Bassia latifolia*), not recommended by the Forest Department for pit work. Of all these specimens, Saj was the only additional timber recognized as good for mining, and accordingly from that date (1886), two sorts of props only were indented for Thendu and Saj. In 1888 the Forest Department complained again that if the colliery would still insist on being supplied only with two sorts of timber in such large quantities—about 5,000 props per annum, from 8 feet to 14 feet long, by 8 inches to 12 inches in diameter—they would be unable to keep up the supply, and again asked that other timber should be tried, and in November, 1888, eight samples were sent, of which three had already been tried, the others being—Bhirra or satinwood (*Chloroxylon Swietnia*), Kate or Kasei (*Briedelis retusa*), Hiyar or Kinj (*Acacia eucophlea*), Siras (*Albizzia lebbak*), Keni or Gorarh (*Albizzia procera*), and here the question stands. There is no doubt that the panel system of working, and the careful seeing to that no more than 8 feet of coal is worked in the whole mine, and the galleries kept their ordered width, and the narrowing of the boards of the headways, will still reduce the cost of timber per ton, especially when the broken is commenced in the large 60 feet pillars. The cost could be brought down to 1½s. or 1¼s. per ton. The timber for props should be cut in or before the rains, and after barking, allowed to lie two or three months in the jungle.

THE CHINA TEA TRADE.

The *Shen Pao* attributes the decline in the Tea Trade to the following causes. First foreign competition and secondly, the machine-made tea of India and Ceylon besides being nearer to the tea-consuming countries, cost far less to produce than China tea. Several large hong engaged in the tea trade lost heavily on last year's crop, but for all that there were in Kiukiang alone, something like 33 hong engaged in the trade on the year's first crop, no doubt with varied luck,

But in the second crop there were only 6 or 7 hongs engaged. The question is why is there this great dropping off in the second crop. The answer is to be found in the above reasons. But there is still another, and the greatest reason of all. It is the heavy duties levied by the Government on the article. The dealers are compelled by the enormous taxation to abandon the trade. Formerly when a picul of tea cost Tls. 50 or so, the duty was fixed at Tls. 5; but in consequence of the lowering of prices a picul of tea of the ordinary kind costs only Tls. 8 or 9, and of course on this the traders cannot afford to pay a duty of Tls. 5. There is no proportionate lowering of the duty with the lowering of prices, and unless the authorities take timely measures to redress this, the trade that has for so many centuries been the staple of China will be utterly ruined.

It is rumoured that on her last trip the *Whaan* carried a lot of fire bricks and all the necessary plant of tea manufacturing machinery destined for Kiukiang. It is to be hoped that by this the Chinese may be enabled to compete in the trade with other nations.—*China Mail*, June 12th.

PLANTING IN FIJI.

Alpha, Fiji, May 15th.

We escaped a blow this past season, for which everyone is thankful and feels more hopeful for the future. The plantations, coconut, have not yet recovered from the disastrous effects of the 1889 hurricane, and it will take some 2 or 3 years more ere they will give any return to speak of and even then they will not give the crops they used, as such a large percentage of the trees have died. The Colonial Sugar Co. are talking of putting up a mill in Vanua Levu on the Labasa. They have been taking levels of and surveying the land. Most probably they will first try 100 acres of cane, and if it grows and turns out well then launch out further. That old Ceylon planter Cottam has been up this way and spent some time with me. The country was not go-ahead enough for him, so he has cleared out to New Zealand.

Tea is looking A 1, but the crop has not been up to expectation on account of incessant rain for 5 months. I am hoping for better things this season. Prices of tea in the Colonies are very poor. Lanyon, an old Ceylon man, has gone to Sumatra to try and learn all about tobacco. He will return here, *i. e.* Fiji, to show us all how to do it. The colony grows good tobacco, but no one knows the secret of curing. Coolies can now be got for about £18 to £19 from India instead of costing £25 as formerly. The introduction of Polynesians is still heavy, £15. The Government is now prepared I hear to lease out land at a cheap rate and for lengthened periods. I am in a hurry to catch the mail, so must defer writing to you more fully on the labour and land questions till some other time. Wishing the Old Colony all prosperity.

A. J. S.

THE JAVA TRADE.

Though Java grows rice, the quantity raised does not meet home consumption, and yearly importations, more or less considerable, have to supplement local crops. The importation of petroleum has increased five-fold within the last fifteen years in Netherlands India. There, the average consumption per head of the population comes to four times the percentage in British India. The extension of steam navigation and railways of late years takes effect in steadily larger arrivals of coals from foreign lands. The export of sugar has fallen off a good deal. The coffee totals come to 370,000 piculs, which compare favourably with those for 1888. The figures for indigo mark steady and growing increase, a feature common to few Java export articles. It has doubled within the last twelve

years, and commands so much favour that many planters put that staple above sugar. The exports of tobacco remain stationary owing to the low prices ruling in Holland, and very little of the article finds its way to Singapore. Hides present the same state of matters but nutmegs and mace show a decline, hardly any being grown in Java. The same may be said of pepper, the quantities figuring in the trade returns coming for the most part from the Lampong districts, where its cultivation is a leading industry among the people. Jungle produce makes little show, gum dammar lessening in importance, and india rubber and gutta percha steadily figuring less and less. The yield of tea grows slowly compared with the leaps and bounds characterising its production in Ceylon and India. Cinchona shows more than 40 per cent increase, and kapok compares favourably with the figures in the returns of ten years ago. Decrease is noted under the head of rattans but the article comes from Sumatra and Borneo, Java itself being a non-producer. As will have been seen Java still holds a commanding position in the market, and may be trusted to recover ground when the times mend.—*Straits Times*, June 11th.

MAANA AND CITRONELLA GRASS FOR STRAWBOARD—TEA CHESTS—FIBRES.

A good deal was written you in my last letter about the prospect of successfully substituting mana grass and citronella stalks for the straw which is now worked up into strawboard, and the possibility arising from that prospect of the establishment of factories in Ceylon to give effect to it. Since writing you to that effect Dr. Evans and Dr. Wirtz have conjointly sent in a report upon further experiments conducted by them which opportunity has been afforded me to read. Analysing this report, it appears that when boiled under pressure with water alone mana grass yields about 50 per cent of fibre; but as of course these experiments have been made with grass that has parted with nearly all its moisture during its conveyance to this country, this percentage would not represent the proportion that could be obtained from the grass gathered wet for local manufacture. The addition of certain proportions of lime during the boiling process appears to have been possessed of but little value; while an experimental admixture of soda, made with the view of bleaching the outturn, proved to have the effect of seriously diminishing the amount of pulp obtained from any given weight of the grass.

Summing up the results to these experiments, the experts above-mentioned give it as their opinion that the grass is "well suited" for making into millboard, but that it would be useless for white papers from the fact that the admixture of soda above referred to largely diminishes the amount of pulp obtained, and that the material is, under other conditions, exceedingly difficult to bleach. However, what it was desired to ascertain has been definitely confirmed by this report,—*viz.* that in the mana grass—as probably in many other of your fibrous plants and grasses—Ceylon is possessed of admirable and abundant material for coarse paper making.

You will naturally be desirous to hear what result this report may be expected to lead up to. As yet, and until the success of the shipment of the Stanley-Wrightson tea chests to Ceylon has been confirmed, it is impossible for anything definite to be decided upon. But so far as discussion has at present proceeded, it would seem as if the syndicate manufacturing these chests was desirous of erecting a small factory here with the object of working up mana grass to be imported from Ceylon, before undertaking the establishment of manufactories in that island. Certainly, should that undertaking establish the value of the new substitute, it must ultimately find location in the land of natural produce

tion, but the undertakers will probably do wisely to restrict their first attempts to such as may be conducted under their own immediate supervision. To carry out this scheme the existing syndicate must form an allied company, and as to this we should say there would not be any difficulty experienced. But the whole matter must be held to be in suspense until it is pronounced whether or no the new chests can successfully supersede those of wood.

It caused me surprise to hear this week that the reply to the foregoing question is to be expected rather from the home traders in tea than from your planters. The verdict is dependent upon the opinion expressed on *this* side as to how the teas shipped in the new boxes have arrived in this country. It is not likely this verdict will now be long deferred, for advice of the first 200 chests shipped has already been received. Of course, as I told you, experimental chests have before been received from the Mariawatte estate, the contents of which were delivered in perfect order and with the boxes themselves as sound as when sent out from the home makers to Ceylon. If equally satisfactory results are obtained with the first shipment made on any extensive scale, you may expect to see all the anticipations I have mentioned to you realized before long. The opinion hoped for has been somewhat strongly anticipated by a London firm of tea dealers, which was so pleased with the boxes that it purchased the first 400 obtainable for rebulking and distribution to the retailers throughout the country. This purchase certainly justifies to a large extent the very confident hopes felt by the members of the Syndicate.

The specimens of the grassboard forwarded to you with my last letter had not, you must bear in mind, been subjected to pressure. When that has been applied, as it is to all millboards, by hydraulic power of an extreme character, the soft, pliable paper will become harder than wood itself. A specimen of the material made from waste newspapers was shown to me this week which was so hard that the surface could hardly be scratched. It is expected that the mana grass will yield an equally dense board, and be so superior in this respect to straw, that $\frac{1}{2}$ inch in thickness will suffice for tea boxes instead of the $\frac{1}{4}$ inch strawboard now used. It is estimated that, whereas the latter now costs the syndicate about £6-10-0 per ton, the mana grass board will cost even when made in this country, under £5 per ton, and of course materially less when worked up on the site of its growth. The board made from old newspapers that has been mentioned is sold in London, it has been told me, at £5 per ton.

During the week the pleasure chanced to me of meeting with Mr. Charles Shand after an interval, probably, of some 25 years. It would be absurd to pretend that during that period no observable change was to be noticed in him, but if signs of increased age may be omitted, there remains but little apparent to indicate any effect from his long residence in a tropical climate. Mr. Shand tells me he had not been many days in London before he managed to catch a chill owing to riding outside of an omnibus, but he recovered quickly through the immediate use of quinine. He recognises the danger of his residing here during the winter, and proposes, if he can conclude the business for which he is paying his present visit to us, to return to Ceylon before that season commences here; having also before his view the object of releasing his son after his twelve years of work in Ceylon for a much-needed holiday and run home. I discussed with Mr. Shand the question

of pulp from Ceylon fibres, a subject so cognate to the matter above discussed, and he tells me that the result of experiments made by himself was to prove that the grass or plant growing in your island which can be made to yield the largest amount of fibre is the *Yucca gloriosa*, which gives about 12 per cent of finished fibre out of the gross grown weight. Other plants and grasses, Mr. Shand told me, would not furnish above 2 per cent. Perhaps therefore it would be as well to send some of this *Yucca gloriosa* home for trial at the new board mill when established. It may be mentioned that Mr. and Mrs. Shand, with their son and daughter-in-law, are living in the Comeragh Road, West Kensington.

Tea has hitherto not afforded any food products save in the form of an infusion, but it has reached me that a patent has now been taken out for a beverage termed "Sparkling Tea." Indeed the manufacture of this has been commenced, but as yet my knowledge of it is confined to a sight of emptied bottles and the result of my smelling them three days after their contents had been drunk. Even after that interval the scent of tea was quite apparent. The new drink is said to class as one of the many so-called temperance drinks, that is to say that it is quite non-alcoholic, while it is so briskly effervescent that it is said it might delude a reformed toper into the idea that he had relapsed from his bettered principles and gone back to the days of champagne drinking. It appears that the patent has been taken out by Mr. Wrightson of St. Olave's Warehouse, who is also a co-patentee of the new tea chests. Probably opportunity will be afforded me of learning more about this "sparkling tea" before next writing, and of being able to record for your information my own tasting of and verdict upon it. We hear that it can only be produced satisfactorily from teas of a high class, those hitherto used having been of Ceylon growth.—*London Cor.*

CEYLON TEA IN 1889-90 :

ANNUAL REPORT OF MESSRS. WM. JAS. & HY. THOMPSON.

We extract the portion of the Annual Report of the above well-known firm of Brokers, referring to Ceylon. They deal with the twelve months ending 31st May 1890 for India and Ceylon, corresponding to the Indian Tea Season closing in Calcutta on 30th April, which ought to be the date adopted by the Colombo Chamber of Commerce. Here is the Report on Ceylon:—

CEYLON.—The rapid progress made by this branch of the Industry is again the feature of the year. Notwithstanding temporary checks and disappointment, caused at one time by drought, at another by excessive rainfall, the estimated increase in Production has practically been realized. It has been accompanied by an almost equal increase in Consumption, to which the stimulus was imparted by the low prices ruling last summer; when quotations rose in the autumn the high standard of quality then reached kept the movement going, which has been steadily maintained ever since.

A noticeable modification in the scale of values has occurred, not in the average result, but in the direction of a narrow range of quotation—which seems to be the expression of a feature which marks the Ceylon Tea of today, viz.: a more uniform character predominating throughout than used to be the case. There is now less tea of specially fine quality than was at first made, and a scarcity of the rich mellow liquoring varieties peculiar to Ceylon. On this and other points, what we have written under the head of Indian is equally applicable; and Ceylon, being a younger industry, can still less afford to risk the reputation

which real merit won for it. So long as that is maintained, there is every reason to think it will keep its position in the Home market; while, as regards its introduction elsewhere, prospects are encouraging in Russia, where price is no object, as well as in America and Australia. Export from London is now at the rate of 1½ million lb. per annum: and steady progress should follow the persistent efforts being made to attract buyers in other markets.

In their own interests producers should do what they can to lessen the number of separate invoices and breaks, for it is becoming difficult even for the most industrious buyer to examine all the samples offered. While estates are giving a small yield unsorted leaf might be shipped, but not where crops are large. Retailers like to select and blend for themselves: and demand from different parts of the country calls for tea of such different grade and type that it could not be fully met by unassorted leaf, devoid of distinctive character in cup. The great variety of Indian has been of primary aid in extending its use; and this will almost certainly be the case with Ceylon Tea.

The probable effect of the reduced duty on values has been much discussed. Judging from the active demand, coincident with the reduction and the advance in prices, the result has been favourable to the best teas, *i.e.*, to Indian and Ceylon, not to China. This tends to confirm the opinion held by some who are in close touch with consumers, that the public may take advantage of reduced retail prices to buy better tea; which agrees with our observation, often recorded, that tea-drinkers are learning to appreciate the benefit of using good qualities.

TRANSACTIONS IN CEYLON TEA AT AUCTION.

Twelve months ending 31st May,

pkgs.	lb.	per lb.
1890...450,000	equal to 31,500,000	Av. pr. about 11d
1889...381,500	26,500,000	10½d
1888...227,000	13,600,000	1s 0½d

INDIAN, CEYLON AND JAVA TEAS.

Having quoted above that portion of Messrs. Wm. Jas. & Hy. Thompson's annual tea review which referred to Ceylon tea, we now—see page 93—give the more extended remarks on Indian teas, to which readers of the review of Ceylons were referred. Planters will, no doubt, give due consideration to the advice proffered and the information afforded. Some of the figures appended are interesting. Out of 36,107,000 lb. exported in the season ended 31st May, the vast bulk was China, the proportion of Indian seems to have been about 3 millions and of Ceylon 1¼ million, or 4¼ millions of Indian and Ceylon kinds against nearly 34 millions China. It is, of course, a testimony to the better qualities of the Indian and Ceylon teas that so much should be taken of them for home consumption and so little left for export. But as production increases, so will the quantity available for export from Britain. The italics are used to remind our readers that the exports of tea direct from India and Ceylon to markets other than that of Britain are considerably in excess of the figures we have quoted. Altogether this year we suppose about 8 millions Indian teas and fully 4 millions Ceylon will be diverted from British consumption, by being consumed in the countries of production or sent direct to Australia, America and other countries. The exports from Britain for 3 seasons have been:—

1888	...	35,200,000 lb.
1889	...	39,500,000 "
1890	...	36,107,000 "

Total 110,807,000 "

Average 36,936,000 "

or close or 37 millions, of which, probably, for the 3 seasons, 34 millions have been China, against an average of 3 millions Indian and Ceylon. The figures for home consumption for the 3 seasons are *not*, as Messrs. Thompson say, altogether satisfactory, even if we take into account Mr. Goschen's statement that 7 lb. of Indian or Ceylon tea leaf are equal to 10 lb. of China. The progress in the 3 seasons has been as follows:—

1888	...	183,000,000 lb.
1889	...	185,250,000 "
1890	...	187,940,000 "

The increase in the 3 seasons has been only 4,940,000 lb., or not quite 5 millions of pounds. While the *home consumption* of Indian has increased steadily and that of Ceylon rapidly (from 12½ millions to about 32* in the 3 seasons), and while Java shows a slight decrease, China has gone down as rapidly as Ceylon has gone up, the decrease on the tea which had once the monopoly of the world having been from say 85 millions (home consumption) to 55, a decrease of 30 millions, against an increase in its outsters of

Indian	...	16,000,000 lb.
Ceylon	...	12,000,000 "
Total	...	35,000,000 lb.

—the equivalent of 50 millions of China, on the principle enunciated by Mr. Goschen. With the reduction of duty, let us hope that our British friends will henceforward drink as much of the stronger infusion as they formerly did of the weaker, and *more*; the abominable custom of putting the tea-pot on the "hob" being abolished, so that tannin may be imbibed in moderate and useful quantity and not at a rate which is injurious.

The figures for the course of prices in the three seasons are interesting. As deduced by the eminent brokers the figures for Indian teas show a commencement with 1s; a rise to 1s 0½d; and finally a fall to 10½d per lb. Ceylon began with a higher figure 1s ¾d, but instead of rising fell next season to 10½d, recovering to 11d, which is 4-7ths of a penny higher than the average of Indian for last season. Ceylon is likely for several years to go on gaining on India in total produce; but no matter what aggregations may be made in the formation of companies in our island, it is difficult to suppose that any one "concern" in Ceylon will ever approach the old Assam Company with 7,520 acres of land and a production equal to 2,674,000 of tea. The Jokat follows with 4,922 acres and 2,309,000 lb., while the Assam Frontier Company, although its acreage is only 3,300, shows an outturn of 2,380,000 lb. Besides these 3 above 2 millions, there are 3 more above 1 million, and quite a considerable number with between 500,000 and close up to 1 million. The average yield per acre for the Indian estates is 408 lb., against, for our much younger Ceylon estates, an average of between 200 and 300 lb. If, as in the case of India, "mature" tea only were counted, our average is quite equal to that of India.

In 1889, out of 34,346,000 lb. of tea exported from Ceylon, we find that 1,689,000 were diverted from Britain. This quantity added to 1,250,000 exported from Britain makes up a total of 2,939,000 lb. Local consumption will certainly more than make up the round 3 millions, perhaps 3½ millions? Our chief export was to Australia, 1,162,783 lb., against only 87,664 in 1885. Next to Australia we have, strangely enough, British possessions in India 383,544 lb. against only 5,000 in 1885. The United States come in a very poor

* Approximate figures for exports deducted from total deliveries.

third with 24,000 lb. This is an increase on 366 in 1885, but a great fall from 42,000 in 1888. But we are only feeling this market. To Mauritius we send nearly as much as to the United States, and not far behind in France, while Germany, with 33,000 lb. to the two ports of Hamburg and Bremen, is even in advance of the United States. The Straits Settlements are down for over 7,000 lb., while over 8,000 for Suez are not all for consumption in Egypt. Over 5,000 lb. actually went to Hongkong, to compete with China tea. Russia took 3,700 and Austria 5,300, Italy contenting herself with 2,281. A quantity equal to 2,884 went to Bushire, and 1,315 to Malta, while besides the quantity already credited to Hongkong 1,105 are down for "China"! Japan also took 450 lb. Who could have predicted such a reversal of trade, even ten years ago! In moderate quantities, at present, our teas find their way to every part of the world, and we may hope that thus a taste for what is pure and good in the shape of beverage may be created or extended.

Java teas have been hitherto of but little account for quantity or quality, but last sales show a wonderful spring upwards in prices. There can be little doubt that the improvement is largely due to the increase in the production of Assam kinds, which, grown in Java at low elevations, come rapidly into bearing. Java is likely to take a more important position than it now occupies.

INDIAN TEA: ANNUAL REVIEW.

MINING LANE, June 1890.

The record of the season, completed by the figures for the year ending 31st May, is a satisfactory one, from whatever point of view it is regarded.

Production has increased, but not at the cost of quality, for the crop as a whole has been rather above the average in merit—it we except the want of flavour which characterized a portion of it—and to this we attribute the fact that a great increase in consumption has been attained, without the incentive of lowered prices, notwithstanding the growing competition of Ceylon.

The question of quality is, indeed, the most important matter which can engage the attention of those concerned in production; for while there is evidence that Indian tea has taken a hold upon popular taste, so firm that it will not easily be shaken, there would be risk of reaction if quality were lowered in pursuance of a policy having for its principal aim a heavy yield. That some, attracted by the prices lately paid for the lowest grades, will adopt such a policy must be expected—and there are no doubt, many estates so situated that a large crop can be secured with more certainty than a fine one—but for those who have proved their capacity to make good tea, without unduly limiting the out-turn, it would be a hazardous experiment, and one affecting not themselves only, but the general interests of the industry. Reputation counts for much—and a crop is apt to be reputed good or bad, as a whole, from the character of those leading brands with which every considerable trader in the kingdom is familiar. This especially applies to Assam and Darjeeling teas, because the difference between their fine and common qualities is marked by a wider range of quotation than in tea produced elsewhere; but the principle is of general application, and operates with more and more advantage every year, as supplies increase, to those who have succeeded in establishing a high character for their brand. To those who have hitherto been less successful than others in this respect, it should be an encouragement to know that the season has afforded instances of teas rising to a high place in the market's estimation solely on their merits.

The inferior character of the China crop has contributed to the progress of the Indian trade at home—indeed, the point has been reached at which the buyers scarcely account the low current price of China congon a matter affecting the value of Indian—but, on the other hand, the rapid growth of supplies from Ceylon, and their popularity operate in the other direction. Good medium Indians, especially pekoes and braken pekoes—have unquestionably suffered from this competition, but not the finest qualities, which are too distinct in character to be displaced, whereas good Ceylon teas can be substituted in a blend for Indian of average quality whenever price permits.

The quality of the coming China crop, and the general character of Ceylon teas, remain the factors of uncertainty; but we have, so far, no indication that the conditions which have shaped the course of the market in the past are likely to be largely modified.

Matters of detail are so fully grasped by those who have the management in India and at home, that it is only needful refer to them briefly. The necessity, and the advantage, of putting large breaks upon the market have led to a gradual abandonment of factory bulking. From many points of view this is a retrograde movement; but on the whole we do not think it prejudices value. Careful observation of results in the case of large concerns which have resumed London bulking, shows that tea is brought to market in the highest condition, provided that no considerable period intervenes between hulking and sale. This of course implies that tea deteriorates after bulking here—and it may be asked how does that affect the buyers' estimate of value. As a matter of fact the "keeping quality" of what they buy is not studied by the trade so much as it was when they carried heavy stocks: the opposite policy now prevails, and is fostered—by the unbroken inflow of supplies. This necessarily tells against sellers in the months when pressure is heaviest—or when the crop is a poor one, as in 1888-9—but it has made the general position of the article sounder, and imparts an elasticity to the market when supplies are curtailed, unknown in former years. Prolonged periods of depression such as were experienced in times past, are now infrequent, and the reason is that the distributors, holding small stocks are constantly buying.

A subsidiary question, but one of the deepest concern to producers, is that of finding fresh outlets. Towards the 190 million lb. probably required for home use during the coming year, India and Ceylon together will contribute fully 150 millions; and the time is approaching when the combined crops may equal the total Home Consumption. As it is not likely that China tea will be entirely displaced, the contingency of a supply eventually heavier than can be taken at home must be faced. Taking as a basis the figures for the five months of this year recorded by the Board of Trade, the annual export of Indian tea is only about three million lb. Russia, the largest European outlet, will probably remain closed to us so long as it can get the China congon which popular taste demands. There remain Australia, Canada, and the United States. Good progress is being made in the former market from Calcutta: and systematic work, originating in London, is being done in the States and Canada, but much more would be effected if producers as a body applied themselves to it: meanwhile, we must hope that the enterprise of those who are advertizing and pushing the sale there may bear fruit. Unfortunately the American market does not yet see the merit in our finest tea, and demand is so limited by price that business is checked by any advance here; it will therefore be necessary to come into closer contact with consumers, in order to cultivate the taste for our tea.

The following figures for the past season, kindly supplied to us by proprietors, cover nearly 73,000 acres yielding 29,800,000 lb., an average of 408 lb. per acre, realising an average sale price of 11½d per lb.

Previous tables showed the following results:—

	Acreage.	Quantity. lb.	Per Acre.	Price per lb.
1888-9.....	66,000	27,200,000	412	0 10 -37
1887-8.....	60,000	22,664,000	377	1 0 1-20
1886-7....	56,300	21,500,000	382	1 0

W. J. & H. THOMPSON Brokers.

MINERALS AND GEMS.

The total value of minerals and gems produced in the Madras Presidency during the year 1889, was Rs.14,528. Gold is not returned by the Nilgiris, the total being 2,186 oz., valued at Rs.96,944. Iron was chiefly obtained in the Bellary and Malabar Districts. The total for the whole Presidency was about 119 tons, valued at Rs.11,614. Of quarry stones, granite and limestone are the chief sources of revenue, the former contributing 402,396 tons, valued at Rs.2,59,656 and the latter 1,421,752 tons, valued at Rs.1,83,605. Of other items laterite is returned at 178,592 tons, valued at Rs.86,094; sandstone 62,000 tons, valued at Rs.22,255; trap 228,412 tons, valued at Rs.77,002; 315 tons of clay, valued at Rs.495; 58 tons of slate in the Kistna District, priced at Rs.140; and other quarry stones 63,703 tons, valued at Rs.67,377,729 cwt. of corundum or balpum were quarried in the Anantapur district,

the price being R154. Of ochres, there were 1,026 cwt. valued at R336; six cwt of plumbago in Vizagapatam, valued at R15; and 1,954 cwt. of soapstone at R8,840. The largest amounts are contributed by the districts of Nilgiris (R1,51,870), Salem (R1,44,198) and Kistna (R1,09,482). In Kistna and Salem large quantities of granite and limestone are quarried, while gold is the chief item in the Nilgiris. 'Trap also forms an inconsiderable item of revenue in Salem and the Nilgiris.—*Madras Times*.

DURABILITY OF FENCE-POSTS.

To the Editor of "Garden and Forest."

Sir,—I am told, though not authoritatively, that a fence-post will last much longer if put in the ground upside down. Can you let me have either a confirmation or refutation of this? B.

Monnt Airy, Philadelphia.

[Some years ago Dr. W. J. Beal, of the Michigan Agricultural College, selected sticks of thirteen different kinds of timber. Each stick was cut in two in the middle, and each of these was split, making four sticks from each one. One set was placed in sandy land, and the other in clay land; in each place putting near each other a stick "top end up," and its mate "bottom end up." In some cases those with top down lasted best; in some the reverse was true, while in others there was no perceptible difference. The conclusion reached was that, so far as durability goes, it made no difference which end of the post was set in the ground.—*Ed.*]

THE WONDERFUL SLAG WOOL.

Slag wool is formed by causing a jet of steam to impinge upon the stream of molten slag as it issues from the furnace. This has the effect of dispersing or breaking up the slag into countless small bead-like particles, each of which, as it flies away, carries behind it a delicate thread of finely-drawn or "spun" slag. In order to collect the slag filaments thus created, and to separate the fibers from the bead or heavier portion of slag, the steam jet is arranged at the mouth of an open cylinder of sheet-iron, in which a strong air current is induced by means of additional jets of steam. The tube or shaft is furnished with a shield or striking plate which detains the heavier particles, the lighter slag-wool being carried by the draught upward and onward into a large chamber like a gigantic meat safe, having its walls formed of wire netting with about sixteen meshes to the square inch. Here the steam condenses and escapes, and the slag wool, which has the appearance of flakes of snow, is deposited on the floor and round the sides; the lightest portions being carried to the greater distances.

The filaments of slag formed this way, though of considerable length, are of such delicacy and fineness that they are broken up into numerous fragments and felted together into a substance much resembling cotton wool. This mineral wool is extremely light, and absolutely fireproof; it is a marvellous non-conductor of heat and of sound, and it is so porous that it will absorb large quantities of water and retain the same for a considerable time.

It has been found extremely valuable as a covering for boilers, water pipes, and such like—owing to its relatively low conducting powers—and for fire curtains for theaters, its lightness and resistance of fire and sound rendering it an excellent substance for such a purpose. It is, moreover, an antiseptic, and this property, along with its extreme porosity, renders it applicable for medical purposes.—*Newcastle (Eng.) Chronicle*.

MR. THOMAS CHRISTY has again come back into our midst from his Eastern travels. He has collected a wonderful variety of new and interesting drugs during his visits of exploration to the Constantinople bazaars, and may by-and-bye favour the drug trade with some notes concerning these.—*Chemist and Druggist*, June 19th.

COFFEE PLANTING IN TAVOY, BURMA:

PROSPECTING IN THE HOLIDAYS:

BY A SEARCHER FOR NEW PASTURES.

On arrival at Tavoy my first step was to possess myself of such information as papers in the Deputy Commissioner's office afforded, both with respect to lands where planting enterprise had already been attempted and available lands in the district in general. The situation of the former I found to be at the extreme southern end of the district, and the history of their election, demarcation, attempted cultivation, and abandonment is instructive. It would appear, then, that about the year 1882 Mr. Smeaton, Director of Agriculture of British Burma, happened to visit Johore, and there made the acquaintance of a gentleman from Ceylon who had been instrumental in opening out various coffee estates on lands leased from the Raja of Johore. Mr. Watson was invited to look at the lands in Tavoy, and proceeded thither. He was taken to a locality known as the Natyadong Range, which he pronounced as suitable for coffee; and, with the promise that he would come again, left after a brief stay of only a few days. Upon this encouragement a notification was issued by the Government inviting settlers, and orders were issued for the demarcation of a number of uniformly sized allotments, the provision of a couple of rest-houses, and the construction of a roadway leading from the town of Tavoy. There is evidence that the authorities were zealous in the matter. A base line five miles in length nearly north and south was cut, and a rectangular area marked off for plantations. The total area of this rectangular tract was thus 12 square miles, comprising twelve concession blocks of one square mile each, and in due course a topographical survey was furnished. At this time the ruin of coffee had driven many promising young men out of Ceylon, and two of these, Messrs. Dixon and Theobald, were endeavouring to obtain contracts for earthwork on the railway to Tongoo which was then being made. They came under the attention of the Chief Commissioner, and at his instance were induced to embark for Tavoy. They had little or no means, but they brought the promise with them of being assisted in all that it was possible for the Government to do.

On their way down they seemingly fell in with a Polish skipper, a Mr. Schwalky, possessed of some money, and who had had experience of tobacco growing in Sumatra. The two established themselves in adjoining blocks for a brief while only, and no vestige now remains of their work except a clump of caoutchouc trees planted by Schwalky, which have attained a good height and look remarkably fine. Incidentally it may be mentioned that the Pole came by his death in Sumatra shortly after leaving Tavoy. One of the visitors who came, and has stayed ever since, a Mr. James Watson from Ceylon, refused to take up any of the demarcated blocks, and was allowed to select a plot close to the town of Tavoy.

Mr. Watson has been 17 years in coffee in Ceylon, and has been endeavouring for now five years in Tavoy to turn his experience to profit. His difficulties have been many, arising from an absolute want of means to extend his cultivation. In his home plantation he has successfully reared many species of products, which evidence what can be grown in the district at a profit if undertaken on a large scale; and it is to Mr. Watson's credit that he always manages to keep on good terms with the natives, and is able to command ample labour, had he the means to employ it. Government have encouraged Mr. Watson by the payment of a handsome bonus for coffee grown by him, and have otherwise recognized his claims to consideration by the grant of a tract of 400 acres rent free for a period of twenty years. Mr. Watson has all this land upon his hands just at present, not having the means to work it, and Government have declined to help him with any money advance. This completes the history of planting enterprise in Tavoy up to date.

A great deal of money has been spent by Government, and some by private individuals upon the advice of the gentleman from Johore. Naturally, I went in this direction, first of all, to see for myself. I had the good fortune to be accompanied by the Deputy Commissioner, who was attended by an Extra Assistant Commissioner, a Burmese gentleman of many years' residence in the district, and who had accompanied Mr. Watson to Natyaydoug. We traversed the tract which had been aligned in 1882, which may be described. There is a good driving road from Tavoy to Thatyat-choung, 18 miles, which is the anchorage of the mail steamers. This was our first stage, halting for the night in a Public Works Department resthouse. The second day's journey was a hridle path through forest 11 miles to Pywehoogye, 28 miles on to Sousin, on the Mindat river. We passed the night in the house of a villager. The next day commenced with the business of getting ferried over the Mindat river, which in this part is a broad stream. On the opposite bank the path runs over raised earth through paddy fields, and winds its way through the village of Yayngai across one or two nullahs, one in particular large and deep, the haunt of alligators, to Khedive. From hence the most direct way would be onwards along the course of the old military road known as the Alompra Road, but the path here strikes to the east.

At Boktaung, literally on the sands, we breakfasted at midday. The track from here turns inland over slightly rising ground, and is entirely obliterated by numerous water channels impassable in the rains, and in which event at this, the most favourable season of the year, the water was sometimes up to the saddle. The last few miles of this stage run over open ground, offering poor pasturage from the inferior seed-bearing grass, and extending by a gradual slope to the base of the Natyaydoug range. The prospect is very picturesque. There is a perennial stream of good water dividing the lands which lie quite at the base of the range from the hither side, Kayinchoung, where we encamped for the night. This made three days' journey from Tavoy. On the following morning we visited the site of Mr. Schwalky's and the other plantations, and made the ascent of the hill side. The soil at the base I found to consist of clay and sand, each occasionally predominating, and at small depth the soil becomes gritty or gravelly. This arises from numerous concretions similar to kunker some of a brick red, some of a black colour, forming strata running in wavy lines through the soil. It was on land of this character that Mr. Schwalky attempted to raise tobacco, and Messrs. Dixon and Theohald coffee. The ascent of the hill and the existence of a large tank of water at the highest point, evidenced that the character of the rock was igneous. The forest growth was so dense that with a number of coolies cutting the way ahead we were unable to ascend beyond 1,600 feet (registered by the aneroid) without being belated or having to spend the night on the mountain side. But we obtained a sufficient view of the prospect to make it incomprehensible to my judgment how it should have been fixed upon as suitable for planters. There is no hill side, but a series of stony ridges as it were buttressing the hill with steep declivities in narrow gorges between the ridges. The blocks have a general westerly aspect, exposing them to the force of the S. W. monsoon and a saline breeze all the year round. Again, if the soil were of the finest, the absence of properly maintained communication places the locality quite out of touch with the town of Tavoy, 60 miles distant, where the settler must occasionally proceed for the transaction of business and for supplies. Supposing a party of coolies were sent down from Matyaydoug—the journey would take three days, and if they had to return with loads, not less than four or five days to get back. For four or five months in the year under existing circumstances it would be impossible for coolies to get down without many risks from the flooded state of the streams. Ten out of 20 coolies would never return, some would assuredly hoit, and others would be stricken down with fever. The coolie difficulty in a wild region where the coolies were alien to the soil, and where they could not

get their currystuffs and accustomed food, and where the climate is tropical, would occasion, in respect of labour imported from Behar, a certain failure. The latitude is exactly that of Jamaica, capable of producing coffee and various remunerative products, such as indigo, which I found to be growing wild on the land skirting the base of Matyaydoug. There is no doubt that it is indigenous, and could be cultivated with profit. But the prospecting of land requires special knowledge of the character of the soil and of the most suitable crop to be planted thereon; and in this connection the experienced planter will not so much regard the surface of the land in growing coffee and other fruit trees as that the subsoil must be friable and drainable. Clay land and rocky land is always water-logged, and especially detrimental to the cultivation of coffee and cinchona.

I have stated that the Burmese Extra Assistant Commissioner who piloted Mr. Watson accompanied the Deputy Commissioner on the occasion of my visit to Natyaydoug; and from this gentleman, who has resided in the district for more than 30 years, I was able to gather a mass of valuable information with regard to culturable lands elsewhere in the district. From what he told me I am inclined to the supposition that some confusion in two very similar names led to Mr. Watson visiting Natyaydoug in place of Nawadoug. At any rate, Moug Pet, the Burmese gentleman alluded to, was very pressing that I should visit Nawadoug, which lies in a valley at the head of the Mindat stream on the eastern side of the Oxhump or Nawalaho range. There are said to be miles of rich undulating land, the produce of which might be carried away by the water carriage afforded by the Mindat river. The journey to this spot, however, involved three days by boat and canoe, and I was anxious to prospect the more central part of the district and the land at the head waters of the Tavoy river in a northerly direction. But still, in view of the Nawadoug valley affording culturable lands accessible by the Mindat river, we proceeded to the mouth of that river, where it empties itself to the Tavoy river, as a likely site for the disembarkation of coolies and stores, and for the establishment of a depot. The channel here is stated to be six fathoms, and navigable for some 14 miles. We encamped on the river bank for the night, and returned to Tavoy by water in time for Christmas. It is noteworthy that there is an almost entire absence of roads, and the interior portions of this district, which covers an area of 7,150 square miles, have apparently rarely if ever been visited by Europeans. No Deputy Commissioner in recent times has been here sufficiently long to go much into the district, which is impenetrable during the rains, and malarious on their cessation. In these circumstances it cannot be too distinctly made known to the intending visitor desirous of prospecting for land, that he should provide himself with a complete camp equipment of furniture and cooking utensils, a cook, pony, and stores, and a well filled bag of rupees for the hire of elephants and coolies.

I have pointed out that the demarcation of a prescribed area for the location of intending settlers was a blunder from the unsuitableness of the site fixed upon, and a double-barrelled blunder in the sense that, while the varying soil of the district invites every description of cultivation congenial to the latitude and altitude, coffee cultivation would seem to have been alone contemplated. The moral of it is that, in a district the area of which is 7,150 square miles, the responsibility of selecting land should rest with the settler. The district officer is not in a position to help him, at any rate much. Frequent changes of the Deputy Commissioner have not allowed of the officer in charge gaining that knowledge of the district only to be acquired by personal visitation. It is an absolute fact that the greater part of the Tavoy district is *terra incognita*, and portions of it would seem never to have been visited by any European within the memory of local tradition. The absence of roads, the dense forest growths, and the consequent unhealthiness of the interior certainly do not invite the district officer to penetrate the country, and the obligation of his executive duties

as Chief Magistrate, unassisted by any competent European subordinate, chains him at headquarters. The district officer, furthermore, however ubiquitous cannot be accepted as an authority on the suitability of lands for planting purposes; and the Government can do no more than mark down the locality of waste lands and leave it to the intending settler to prospect for himself as to their suitability for his purposes. At the same time the difficulties in the way of an individual planter prospecting the district are almost insuperable, unless he is prepared to rough it very considerably and to pay heavily for every step he takes.

Only the magic influence of authority is able to command elephants and coolies and boats without vexatious delay and overcharge. All these difficulties, were smoothed to me, and there was, so to speak, only the bill to pay; but what money may not purchase was the wealth of information elicited on the questioning of villagers and headmen summoned to the Deputy Commissioner's presence in the evenings of our halts. Here I learnt many interesting particulars in regard to the nature and position of lands which my time did not allow me to visit. I have alluded to the waste of money naturally incurred by the mistaken demarcation of allotments for planters on the Natyaydong range, and the construction of a road therefrom from the town of Tavoy, 60 miles distant, all arising from an insufficient knowledge of the district and of the lands most suitable for varieties of cultivation, points which planters alone are capable of determining; and I would throw out the suggestion, although Government has little enough money to spare for such a purpose, yet that for just once in a way the Government might make up a party of three or four practical planters and send them all round the district on a cold weather tour with the Deputy Commissioner. The outcome of this might confidently be regarded as something practical. To my own observation I have seen thousands of acres of splendid lands lying in valleys and on the slopes of hills, forest grown, and inaccessible for want of road communication with a main track such as a systematic survey by planters would indicate to be both natural and convenient. The longest open route in the district is along the alignment of the telegraph line running from the town of Tavoy, 40 miles, to Muttra in the centre of the district and along the valley of the Tenasserim river for 40 miles more, until it strikes through a pass in the hills leading into Siam: This is commonly known as the old trade route, but as a matter of fact it has never been a trade route, old or new, and there never has been or is there any trade passing by this or any other way into or from Siam. As I am informed, there was of yore a track through the forest directly over the hills in the wondrous straight line of travel marked out by natives for themselves in primeval tracts where the D. P. W. is yet uncreated, which struck the Tavoy river some few miles above where it empties itself into the sea. This route presented many dangers by flood and field, from wild beasts, and hardly less dangerous now if the traveller escaped drowning from broad rivers and swollen streams. It was the known highway, but was rarely travelled on, and came to be altogether abandoned upon the construction of the road along the telegraph alignment. This road, which has cost a great deal in construction, and which involves a heavy maintenance charge to keep it in repair, serves no trade purposes. There are not, perhaps, 100 travellers passing along it in the year. It is purely for the quick repair of the international telegraph line communicating with Bangkok. The utility of this road for any trade purpose is problematical, seeing that Tavoy, which is capable of being made a port as good as Moulmein, at present offers no outlet or ingress for goods or produce, there being a wretched steam service supported by the mail subsidy. It is capable of tapping the district in various parts along the course of produce which might be grown; but for more than half its length, after crossing the water at Mitha at the confluence of the three rivers which unite here, it pursues its way along the bank of the Tenasserim river, overhung by a steep hillside.

The Tenasserim river runs due south from Mitha where it takes a bend and runs parallel to it under the name of the Bainchow, which has its source in the hills at the Natyaygoun end of the district. It is up the valley of the Bainchow that the principal road would have to be made. Here on both banks there are fertile lands sloping to the water and breasting the hills. It is here that the familiar expression of thousands of acres of rich lands lying uncultivated may be rightly applied. The valley is broad, open, and wide, and yet is shut in until at its southern extremity the mountain track already mentioned as the ancient highway to Siam shall have been adapted to wheeled traffic. But it is not here alone that thousands of acres offer, but all along the valley of the Kamounthway which is the name of the third river uniting at Mitha. The Kamounthway runs due north, finding its source on the hills which are as a wall between Tavoy and the adjoining district of Amherst, and from which the River Tavoy also derives its origin. At the head waters of the Tavoy river the Government has its principal Forest-reserve which is rather of the nature of a prospective reserve, not yet supplying timber in any quantity. Indeed, the two forest reserves, one in the north and the other in the south, appear to me to have been marked out in localities from which the timber can only be got out at greater cost to Government than it can be worth while to incur, viewing the proceeding in the light of an ordinary profit and loss transaction. Obstructions in the river necessitate blasting on a large scale at several points; and the art of timber felling by the employment of machinery has yet to supersede the rude methods practised by the Forest Department.

All down the Tavoy river there are lands suitable for the planter, that is to say, at various points, and standing back from the river almost until the town of Tavoy is reached, where the country is lowlying and alluvial, and for the greater part only capable of paddy cultivation. I have been asked what Tavoy is capable of growing besides paddy that would be profitable to the settler. The enumeration of crops and economic products is emphatically endless. All that the fertility of Ceylon and the Straits Settlements may produce is concentrated in Tavoy, with the advantage of latitude, and with the peculiarity that here will be found in more luxuriant growth, the flora of considerable altitudes on the Coromandel or opposite coast, and elsewhere in India. The *Quercus fenestra*, a species of oak common to the mountains in the vicinity of Sylhet, grows indigenous in Tavoy, not fifty feet above the level of the sea. The gamboge *garcinia pictoria*, which grows on the highest parts of the Wynad, is found at the foot of the hills in Tavoy, which border on tide water. The *Ardesia humilis* is a common shrub at Tavoy, growing down to the plains, but its habitat on the other coast is the eastern slopes of the Neilgherries in sub Alpine jungle. Indigo is seen growing in wild profusion all the year round. The flora reads a lesson as to the climate of the country which cannot be mistaken, notwithstanding the unfortunate conditions of heavy rainfall. There is not the least doubt that, with temperance, and avoiding unnecessary exposure, Europeans may live in Tavoy longer than in Assam, if, be it noted, an extensive clearing of forest, and drainage so as to divert flood waters, were systematically undertaken. This rich and great tract of country has never been opened out by private enterprise in the whole course of the 60 years that it has continued under British rule, and its head quarters or principal town comprises an inconsiderable village. The town of Tavoy stands in alluvial ground, and is hidden in the distance by tall palms and glossy-green jacks, and yellow-flowered cassias and twenty other flowering trees which overshadow its humble dwellings. From a neighbouring eminence the prospect is of undescribable beauty, a plain of encircling paddy fields intersected on the south by a silver stream fringed with the dark foliage of wild fig trees and the thick struggling bushes of a species of tribiscus covered with large yellow and red flowers. On the east "hills peep over hills" like the seats of a vast amphitheatre, bounded by Ox's Hump, rising in

a most picturesque outline four thousand feet above the plains. In the distance is seen a foaming cascade making a fearful leap from a gorge halfway up the highest mountains. Green forests are diversified with rugged rocks, while here and there a whitened pagoda lifts its conical head above the summit of an isolated hill, or the smoke of a solitary hamlet is seen curling upwards on the still air. It is beautiful, when seen on the coast, with the picturesque beauty of Scottish hills; but it is still more beautiful when seen around its mountain streams. The traveller's path often made up the middle of one of these streams, and every turn reveals something new and pleasing to the eye:

"Ferns, flowers, and grasses creep,
Fantastically tangled; The green paths
Are clothed with early blossoms; through the grass
The quick eyed lizard rustles, and the bills
Of summer birds sing welcome as ye pass;
Flowers fresh in hue, and many in their class,
Implore the pausing steps, and with their eyes,
Dance in the soft breeze in a fairy mass;
At every door the odorous jasmynes rise,
Kissed by the breath of heaven, seem fragrant for
the skies.

EAST AND WEST INDIAN SUGAR MAKING.

There is much scope for the establishment of large Sugar plantations in this country in places where the soil is good, labour cheap, and an ample and certain supply of water available. Land in Northern India, in the vicinity of the canals, would, I should say, be admirably adapted for this purpose. There the soil is good, with a perennial supply of water for irrigation, and a redundant population.

The soil and climate of certain portions of the Central Provinces where there is, or could be, considerable irrigation from tanks, as in the Sambalpur and Bhandara districts, and in some of the Feudatory States of Chhattisgarh, would also be suitable. The former would probably be more suitable than the latter, for while the Canes might occasionally suffer from frost in Northern India, in the Central Provinces the supply of tank water might fail in years of insufficient rainfall.

For the formation of a plantation after the model of those in the Mauritius and in the West Indies, the action of Government will, at any rate, in the first instance be necessary.

The small cultivators of India have neither the means nor the inclination for undertaking such a task. It would never occur to a large landholder in this country to make money by growing Sugar on a large scale by new and improved methods, and by the expenditure of a considerable capital. By the trading classes the whole thing would be regarded as entirely beyond their sphere of action. The only persons who would perhaps have the requisite enterprise and means to undertake such an industry on a large scale are European planters, who can command the necessary land and capital, but they have already profitable crops, like indigo, which do not involve the same expenditure, and which can be carried on without extensive irrigation. It would be impossible for a West Indian planter, supposing he could command the necessary capital, and was prepared to make the venture, to provide himself with the requisite land. There are, it is true, extensive waste lands in this country, but they are quite unsuited for such an undertaking. They are either far removed from inhabited tracts, or are situated in unhealthy countries, where no European could live, and even if accessible, they are rocky and barren. The natives of this country are only too ready to appropriate all land, which is at the same time fit for cultivation and fairly accessible, and they have already absorbed all such land as is available or worth appropriating. No native will willingly part with the land he cultivates, and if the whole area of an ordinary village could be purchased, a large portion of it would be in the cultivation of ryots, with occupancy and other beneficial interests in their

fields, who could not, in the ordinary course of law, be rejected to make room for Sugar cultivators. Under these circumstances, a Sugar-planter, who, whether he came from Barbados or the Mauritius, would be a stranger in this country, would find it difficult, if not impossible, to make satisfactory arrangements for the establishment of a plantation.

It will be necessary, therefore, for Government to take the initiative in this matter, and by means of the Land Acquisition Act, or other appropriate procedure, to acquire land sufficient for the establishment of a Sugar plantation of 500 or 600 acres. This might be offered rent-free or on easy terms to a practical planter under certain conditions for a term of years, and he might also be given a subvention to aid him in providing the necessary machinery for the manufacture of Sugar.

There must be many enterprising planters in the Mauritius accustomed to Indian coolies who would be glad to accept an offer of this kind. By making success dependent on the efforts of the person chiefly interested in the project, there would be a guarantee that everything would be done to make the scheme a success. But in the event of no practical Sugar-planter being willing to undertake the responsibility of a Sugar plantation on the above terms, it would be well for Government to establish a few model plantations of its own in different parts of India. I understand that some years ago the services of a Sugar-planter were obtained from the West Indies for the diara lands of the Khedive, and that a vast improvement followed the introduction in that country of the West Indian method of growing and manufacturing Sugar. With a plentiful supply of water, such as would be afforded by our canals and large tanks, a good soil and cheap labour, no great difficulties would be encountered in the establishment of a Sugar plantation. If the scheme were once shown to be successful, it is probable that many persons who can command large areas for Sugar Cane cultivation and the necessary capital would adopt it. The greatest difficulty to be encountered would be the securing of an adequate supply of manure. Much of the cowdung of this country is used for fuel, and consequently, good farmyard manure in large quantities is not readily obtainable. But if Sugar cultivation by the West Indian method were shown to be profitable, mineral and artificial manures would be available in India as they are in Barbados and in the Mauritius.

The value of such a plantation would not be confined to improving the production of Sugar. It has often occurred to me that in establishing model farms and placing at their head men trained in England and having a practical knowledge of the agricultural methods only of countries with a temperate climate, that we have somewhat overlooked the fact that the conditions of agriculture in the greater portion of India resemble those of the West Indies or the Southern States of America much more closely than they do those of Europe, and that it is in these former countries that those Indian crops which are most susceptible of improvement, such as rice, cotton, tobacco, Indian-corn, Sugar, tropical roots, vegetables, and fodder crops, are cultivated with the greatest success.

The West Indies, like Mauritius, import the greater portion of their food, but a good deal of Indian-corn and vegetables are also grown in these Islands. A plantation is generally divided into two portions: one is under Cane and the other is under preparation for Cane, and is in the interval used for growing short crops, sweet potatoes, yams, Indian and guinea-corn (juari)—the two latter, with guinea-grass, supplying the necessary fodder for the farm cattle. All of the above crops are capable of great improvement and extension in India. While in this country a few yams are to be found in pan bars, the plant is rarely in the West Indies in large open fields. The difference between the sweet potato of India and that of the West Indies is striking. The former is generally an elongated tuber, five inches long and three inches in diameter, and is grown on a flat surface. In the West Indies it is ordinarily an ellipsoid, with axes of ten and seven inches, and grown in rows on banks and

not on level ground. There are other striking differences in the systems pursued in rearing other crops in the West and in the East Indies. The establishment of a plantation on the West Indian model in this country could not, I think, fail to improve the cultivation of all tropical products, and to instruct the people in methods of which they have no idea at present. Some of the return coolies from the West Indies and the Mauritius might also be induced to take service in such plantations, and by instructing their countrymen would be of use to the manager in starting the work.

I might usefully recapitulate the above remarks as follows:—The improvement of Sugar production in India is not possible under existing conditions of scattered cultivation by numerous small cultivators, and in view of the fact that it is nowhere a staple but merely a subsidiary crop. I have further endeavoured to show—

(1) That cultivation on a large scale is essential, if the requisite supervision in growing the Cane and the necessary machinery for manufacturing Sugar are to be provided.

(2) That such a change cannot be brought about unless an adequate area of irrigable land in a healthy and well-populated country with cheap labour is first secured.

(3) That private effort and enterprise are probably unequal to the task of securing the conditions necessary for successfully starting the work.

(4) That it will therefore be expedient, in the first instance at all events, for Government to take the initiative, and to establish a model Sugar plantation.

(5) That the best method of working such a plantation would be to interest the manager in the success of the scheme by leaving the profits to him, Government assisting by finding the land and giving it rent-free or at a low rent, on certain conditions; and, if necessary by a subvention, to aid in the constructing of the necessary buildings, and in supplying the machinery needed.

(6) That in the event of no properly qualified person being willing to undertake the establishment of a Sugar plantation on the above terms, Government should itself arrange for the working of the scheme by a paid agency.

(7) That it would be absolutely essential for the success of any scheme of this kind, that the manager should be a successful and practical Sugar-planter, preferably from the West Indies or the Mauritius, and accustomed to deal with the Indian coolie.

(8) That the establishment of such a model plantation would not only prove the superiority of the West Indian over the Indian system of Sugar production, but would bring to the notice of Indian agriculturists the advantages of other modes of cultivation, many tropical crops, which, though of great value, have hitherto been much neglected in this country.

—*Produce Markets' Review.*

TOBACCO:—LONDON BORNEO CO. (LTD).

The first yearly general meeting of the shareholders of the above company was held at Cannon-street Hotel, on the 23rd Dec. 1889. The Hon. Charles Hedley Strutt, chairman of the company, presided. There were also present Mr. Thos. Palmer Chapman, Mr. Wm. M. Crocker, Mr. Henry Devitt, and Mr. Wm. Henry Read.

The Secretary having read the notice convening the meeting, the Chairman said:—Gentlemen, I hope that none of the shareholders have been disappointed or discouraged by the nature of the report which the directors felt it their duty to place before them at this meeting. We did hope that we should not have experienced the difficulties and troubles which always beset every tobacco planter. We hoped so because we adjoin the prosperous estate of Ranow, and the experience gained there by our managing director would, we thought, have entitled us to avoid the usual difficulties, troubles, and delays, and have placed us in a very favourable position. Things did not, however, quite turn out as we expected, and the reasons for it

are given in our report. The chief one is the amount of sickness which seems inevitable in opening out these fresh plantations. We have been specially unfortunate in the loss of our head manager by death, and the sickness of one or two of the sub-managers; and I believe at one time that Count Charles de Geleos d'Elsoo, our managing director, was the only European left, and upon that occasion he manifested the greatest energy, taking the whole management on his own shoulders, and even went so far as to sleep out in the jungle to prevent the desertion of the coolies. (Cheers.) Although our first year's operations have not been so successful as we could have wished, we are extremely desirous that the shareholders should bear this in mind—that we are only in the same position as every tobacco company that has ever been started on the same lines as ours. Even those flourishing companies in Sumatra which now are paying their 50 and 100 per cent., every one of them had the same opening difficulties which we have passed through, and I do not believe that any one of these successful companies ever paid a dividend on the first year's working; the truth is this, that those who invest their money in tobacco plantations, although they most likely will receive most satisfactory results in the long run, must always be prepared to exercise great patience at the start, and if they do so, and courageously hold their shares, I tell them that in the end they will be glad that they were not frightened at the first temporary troubles. Perhaps some of you may think, from my remarks, that our particular part of the country is more insalubrious than elsewhere. That is not the case. I believe Mr. Crocker will tell you that our plantations are in the healthiest part of Borneo—(cheers)—and that this is simply the initial sickness that always comes when opening out fresh land in that part of the world. Now, I have in my hand a report which is made by a medical officer out in Borneo—made for the Government—as to the health on the plantations, giving details about the health of the coolies on the different estates. The report to the Government deals with the health of the coolies on eighteen estates scattered over the whole east coast. The writer says:—"It will be seen that the Maruda Bay estates head the list for healthiness, Ranow coming out absolutely best, the London North Borneo Company being No. 7 on the list." Again he says:—"The Maruda Bay at an average come out first. In looking for the reasons for this state of things the following facts are apparent. In Maruda Bay the ground is recent paddy fields for one thing, and, secondly, there is a large supply of meat food at low prices." Again, in the memorandum just issued by the North Borneo Company, I read the following:—"All the reports which have reached us hitherto are most encouraging. It is true several estates have suffered severely from sickness amongst the coolies, which seems inseparable from opening new estates in tropical countries; but it is encouraging to find by the returns that plantations which have been established the longest have suffered the least. Later reports speak of a general improvement in the health of the coolies on almost every estate, and the crop prospects are good everywhere."

I should also like to read you the latest news as to the Ranow estate; it gives a very favourable account as to the crop on the estate. It is as follows:—"The Ranow estate, when I saw it a few days ago was a wonderful sight. Tobacco stretching away for nearly a mile—all as level as a regiment of soldiers. There is hardly any sickness on the estate. It is expected the crop will average ten piculs per field." Now our crop, I am afraid, owing to the difficulties, will not yield so well. At present we cannot tell for certain what it will yield. We had hoped to have had the accounts to-day from our managing director and to have told you exactly what the yield was. As I said, the difficulties we have had will affect the crop this year, owing almost entirely to the desertion and the sickness of the coolies, which prevented the land being got into proper order until too late. The early crops are always better, and this year our crop was not planted until very late. I mention the Ranow estate, as it is only simply divided from our

estate by a small stream. It is exactly the same kind of land in all particulars as our own, which should give exactly the same yield. I also mention the Kanow estate; they have gone through exactly the same difficulties and troubles as we have; they had a great deal of sickness there the first year, and the first crop was not very successful, I believe. They are now growing their fourth crop, which is so far good. The first crop was only a small experimental one; the second, grown after the formation of the company, returned no dividend to the shareholders. Last year the crop was good enough, I believe, to return a small dividend, and this year they have the crop, a description of which I have just read to you. (Cheers.) So good is the crop that they talk in Borneo of a return of 50 per cent. or even more to the shareholders. Now, I wish to point out that there is no reason why we should not have exactly the same results—(hear, hear)—in the same space of time as the Kanow estate. You will see in the report that we, the directors, have thought it wise to limit the cultivation of the fields to 800 fields. We have done so because the opening of fresh estates seems inseparable with the sickness of the coolies, and the loss of money. We shall keep opening out fresh estates, therefore, on as small a scale as possible. The coolies that we had last year were not very satisfactory; we have had to put up with some of the worst coolies. I hope we shall be able to adopt some better way in the future. We are completely in the hands of the coolie contractors in Hong Kong and Shanghai, who practically charge us what they like, and send out the coolies at so much per head. I am glad to be able to state that an organisation is being started in Borneo amongst the planters to try and get the coolies themselves firsthand, and not deal with the middlemen at all, if that can be adopted. We shall watch with great interest the trial of this plan, and if successful it will place us in a more favourable position in the future with regard to the coolies than we have been.

We expected from the natives considerable help; that is one reason, perhaps, why we have not done so well as we hoped to do, for the natives have not given us the help that we expected. The Borneo Government would, no doubt, had they not been harassed and troubled with a small war, have been able to help us by getting natives to work for us, and the natives would probably not have suffered, in opening up the ground, from jungle sickness and other sickness in the same way as imported labour. In one direction the natives have been a distinct hindrance to us. I believe that some of them told the Chinese coolies that if they would pay so much per head, they would promise to lead them back to Singapore. Having got so much per head, they led them into the thickest part of the jungle, and then left them, and went back to our managing director, telling him that they knew where the runaway coolies were, and claiming so much per head as the rewards offered for their recovery. (Laughter.) I think that those natives who get on the "windy side" of both a Dutchman and the Heathen Chinese have a future before them. (Renewed laughter.) The coolies that we have got now are of a great deal higher stamp than they were last year, but I am sorry to say that we have had to pay more for them. Labour in Borneo is generally very plentiful, but, of course, when the demand increases very suddenly, the supply is not always quite up to the mark. I have no doubt in the future that the supply of coolies will be quite equal to the demand, and that all the labour required will be forthcoming at a very moderate cost. Perhaps some of you may ask about the prices given now for tobacco, because so many new companies have started since our meeting of last year practically on the same lines as our own. Some of you may want to know, therefore, if the price is likely to fall. Well, there is no reason whatever to believe that, unless there are very much larger supplies than at present, the price is at all likely to fall. The demand increases year by year for this class of tobacco. Then the number of smokers in the world increases year by year. I see Mr. Chambers in the room, perhaps he will tell us something by-and-by about the prices for tobacco. (Hear, hear.)

The price during the past year has been satisfactory. You must always remember that Borneo tobacco is rapidly increasing in favour with tobacco manufacturers. (Cheers.) I should now like to refer to one or two points in the accounts. First of all, these accounts are for sixteen months. On reference to the profit and loss accounts, you will see £694 2s premium on reissue of the 210 ordinary shares not taken up by the original allottees. Now, there were some gentlemen in Java who wished to have shares, and they were applied for, and before we allotted one of the gentlemen died, and the other was unable to take them up, and the result was, under the advice of our solicitor, we considered that the shares belonged to the company, and we sold them, as you see, at a premium. (Cheers.) You will see in the balance-sheet, "Remittance to Borneo for the development and cultivation of the estate, £36,198 17s 8d." Of course, that is up to date (December 12); but up to October 1 last £21,000 had been spent on the estate, and of that £21,000 a very large proportion was for what may be called capital expenditure. Now, before I sit down I would like to say a few words about the land. The British North Borneo Company have already raised the price for their land to \$6 per acre. That makes our land worth about £25,000; but our land is not like ordinary tobacco land. It is picked land—the best in Borneo. In fact, I may tell you that I cannot get 26,000 acres anywhere else in Borneo like it for tobacco planting. I may tell you that at the present moment we could sell a large portion of that land at \$12 per acre. (Cheers.) This land, which we think is worth £40,000 to (£50,000 at the present moment, has not cost a farthing of our money. We do not pay for this land until we ourselves have received 10 per cent. for our money. Now I think that there is no other company in such a favourable position as that. (Hear, hear.) We have the whole of our capital for the encouragement and growth of tobacco itself. There is no portion has to be put by for preliminary expenses, as the expense of floating the company was extremely small. I hope with such a favourable position as that, our shareholders will not be disheartened by some little difficulties at first starting, but that they will hold tight to their shares. (Hear, hear.) If there are any question, I shall be happy to answer them, and I now beg to move: "That the directors' report and accounts from the formation of the company to December 12, 1889 be received and adopted." (Applause.)

Mr. Thomas Palmer Chapman seconded.

Mr. Joseph Cross said that he understood that the directors were not yet in a position to state to the shareholders with regard to the remittances of £36,000 to North Borneo for the development and cultivation of the estate. What proportion of that sum was on capital account and what proportion was on revenue account.

The Chairman said that up to Oct. 1 £21,000 had been spent, but more money had been spent since.

Mr. Joseph Cross said that he wished to divide the capital from the revenue expenditure.

The Chairman said that they were not in a position to show this at the present moment. They had had some accounts over, but they had not time to analyse them.—*L. & C. Express.*

AUSTRALIAN PRODUCE FOR CEYLON AND TEA BACK FOR AUSTRALIA.

Ann ex-Ceylon resident writes to us by this mail:— "New South Wales, June 5th.—By the next Orient steamer my son is sending to Messrs. J. Auwardt & Co. a trial shipment of Australian produce, including butter, bacon, cheese, apples and calf skin leather, all, excepting the apples, being the produce of the famous 'Illawarra' district. Australian butter, to keep well, must be made in the winter: this is unfortunate for exporters, for the price of butter in the winter is often nearly three times as much as it is in the summer. If

will be difficult to send butter if it sells for less than R1.50 per lb. in Colombo, for not only is the price here high but the bottles in which it is packed are expensive, and the rate of exchange is also against the exporters. You will find the butter to be superior to, and the bacon and cheese equal to, the best now in use in Colombo. The farmers in the district have taken a great interest in this venture, and if it pays it will certainly be repeated. As the nett proceeds of these goods will be invested in Ceylon tea for the Indian market, planters and tea merchants should do their best to encourage the sale of Australian produce sent from Milton."

LIBERIAN COFFEE IN JAYA.

A gentleman who has just returned from Java has presented us with two magnificent Liberian coffee leaves plucked from trees two years old. They are 16 by 7 inches, and are larger than any ever seen in Ceylon we believe of their age. Our visitor reports quite a revival of interest in coffee planting in certain districts in Java. Both the Arabian and Liberian kinds are being freely cultivated and there is some talk of a Hybrid, of which he saw four plants said to bear a much more marketable bean than the Liberian tree. Dr. Treub of the Botanic Garden without disputing the fact of hybridization, refused to pass an opinion until the experiments were further advanced. Meantime, the coffee planters especially in East Java find that planting in shade, their bushes of Arabica do not suffer appreciably from the once dreaded fungus, while returns of 12 to 15 cwt. an acre are spoken of from the rich volcanic soil. While Government has retired very much from coffee culture, private planters are likely to make up the deficiency. The Liberian coffee is also very free of the fungus although some planters have considerable areas under cultivation, the trees growing to 20, 25 and even 30 feet high, a pruning knife never touching them. They go on bearing all the year round and the Java planters profess themselves well pleased with their harvests which average 10 to 12 cwt. clean coffee per annum. One great advantage of the Liberian kind to the Java cultivator is that it grows readily on old coffee land—land abandoned during the height of the fungus panic. The only enemy at present dreaded by the cinchona and tea planters in Java is the *Helopeltis antonii* which does not trouble their cacao, but revels in their tea especially. Our present visitor heard of tea crops being greatly affected by the ravages of this insect. In cinchona, he also saw and heard of great mortality through a fungus attacking the roots, to check which the planters were using a dilute solution of corrosive sublimate.

How the coffee exports have run, may be seen from the following extract from a recent authentic report on the Export Trade of Java:—

COFFEE.—The export of coffee, which amounted in 1889 to 24,281,000 kilos., contrasts not unfavourably with the last four years, when this export amounted to:—1885, 14,646,000 kilos.; 1886, 16,668,000 kilos.; 1887, 13,377,000 kilos.; 1888, 22,612,000 kilos.; but in the preceding year, the export figures amounted to—1881, 23,093,000 kilos.; 1882, 24,135,000 kilos.; 1883, 32,369,000 kilos.; 1884, 24,400,000 kilos. Under the above figures are included an amount of 100,000 piculs, or 6,176,000 kilos. Government coffee, sold every year at Java, which amount, therefore, must be deducted from the figure of the export to obtain the export figure of the coffee grown on private account. Regarding the production, the following statements are given in the yearly colonial reports. (A shows the estates on grounds leased by Government to private

persons; B, the private estates west of the Tjimanok, and C, the estates on leased grounds in both the Vorstenlanden, Soerakarta, and Djokjakarta):—

	A	B	C	Total piculs.
1879	93,000	27,000	90,000	210,000
1880	72,000	9,000	85,000	166,000
1881	154,000	11,000	101,000	266,000
1882	172,000	30,000	71,000	273,000
1883	203,000	14,000	121,000	338,000
1884	199,000	24,000	36,000	259,000
1885	167,000	15,000	37,000	219,000
1886	225,000	27,000	21,000	273,000
1887	126,000	9,000	23,000	158,000
1888	298,000	13,000	30,000	341,000

STRAITS SETTLEMENTS: PAHANG NEWS.

(By an ex-Ceylon Resident.)

Pekan, June 21st.

The meeting of Pahang State Council was held some time back at the *Sthana Rupa* (in Malay, the Palace of the sultan). The meeting was opened at 5 p.m. It consisted of His Highness the Sultan, Ahmad Muatham Shah Ebni el Marhom Ally, who took the chair, Tunku Mohamed, the Regent of Pahang (son of Sultan), Raja Muda, the Sultan's younger brother, Orang Kaia Cheno-Unku Andah, Tuan Hitam-Tuan Hakim, the native magistrate, Orang Kaia Bakti, the late Treasurer of the State, Unku Bandahara and a few of the native Rajas and leading headmen, and Mr. J. P. Rodger, the British Resident. Amongst the subjects that were brought before the meeting for consideration, the question of slave trade was one of importance. After a long debate it resulted in the modification of the very stringent rules which are in force now. Having been approved and passed by the Council many suggestions made by the Resident for the improvement of the country, the proceedings were brought to a close at midnight.

Though the country was only brought under British protection in July last year, it is rapidly progressing, due to the immigration of foreigners, specially Chinese from China, Canton, Hongkong, Singapore &c.

THE "PAHANG CORPORATION," a Tin Mining Co. at Knantan, have already commenced operations in opening up a railway line from Knantan to Temerloh, and then to Lipis (a distance of some scores of miles inland), and then connect this line to that of Kwala Lompur, thus having one line of railway right straight up, from the western to the eastern shores of the Peninsula. This, in all probability, will answer for the better development of the gold, &c., mines at Lipis, and save large amounts of money which other mining Co.'s expend, for transport of materials, produce, &c., from, and to the mines owing to the present inaccessibility to certain parts of the country, as the River (the only way open for communication) when going higher and higher in the mountain districts, is not open to navigation—thus necessitating all passengers who go to the remote mines make the best of it through forests at great risk to health and sometimes to life itself.

MANY CONCESSIONS OF LAND (within the State) some extending over 100 square miles, have been granted by His Highness the Sultan, for working of gold, silver, lead, tin, &c. mines, both to European and native capitalists. Most of these lands were nounced by the grantees, perhaps taking advantage of His Highness' inexperience regarding the development of a patch of ground for mining purposes, when the time soon approached in July last, on the most unexpected arrival of a British Resident in the State, for, every such grantee to put his respective patch of ground in proper working order and to have on the spot necessary machinery for crushing, smelting, washing &c. of all minerals that may be found on such land, and much more when the "Pahang State Mining Regulations" came to force at the sanction and approval of Sir Clementi Smith, Governor of the Straits, in February last, which were most ably drafted out at the approval of the British Resident, by Mr. W. P. Towson, in an Australian

tone which sounds well for Pahang. This ground possesses various kinds of metals and ariferous minerals and as it is required by a certain clause of the regulations, if all the mines are effectively and continuously worked, this State will be the foremost in the Peninsula, and increase the Revenue of Government in abundance.

June 1st.

HIS MAJESTY THE KING OF SIAM is shortly expected at Pekan on his way from Bangkok, visiting Kelantan, Trengganu, Keta &c., Malay tributary States to Siam. His Majesty's forerunners Phya Bahanuwane and Phya Chandrawangsa, have touched Pekan on their way down the coast of the Gulf of Siam repairing the way for their Siamese Majesty.

A DISEASE OF THE COFFEE-PLANT.

A report has been prepared by M. Adolf Vendrell, a member of Belgian and Spanish agricultural societies, by order of the Government, on a disease that has attacked certain coffee plantations in the department of Amatitlan, Guatemala. The department of Amatitlan, consisting of some 200 square miles, has an elevation of some 3,990 feet, and in former years the principal industry was the cultivation of cochineal. On the decline of this industry it was succeeded to a great extent by coffee. Owing to the impoverished state of soil, defective cultivation (it not being the custom to manure the land), and, perhaps, the want of depth of soil, the coffee plantations of Amatitlan have not been famous, nor have these crops ever formed any great proportion of that product of Guatemala; and in 1880 to 1882 a disease appeared on the coffee plants, to which the planters at the present time attribute an annual loss of 50 per cent. of their crops. M. Vendrell states that this disease is an insect, nothing more nor less than a new species of cochineal* that has adapted itself to a different existence. The insect, he states, is a standing menace to the coffee industry, as at certain stages it is easily dispersed and transported by the wind to other plantations; and he implies that, although the present species does not thrive on, or affect to any great extent, luxuriant and healthy plants, yet it may adapt itself to other conditions. He recommends the intervention of Government to enforce the destruction of the insect, and suggests the manuring of the land with nitrate. It is considered questionable whether the production of coffee in Amatitlan would withstand the charges of a higher cultivation, should there be any considerable fall in the price this article at present controls; and also whether, without Government intervention, the agriculturists of that department would take effective measures to prevent the spread of the disease.—*Grocer*.

A NEW INDUSTRY, the manufacturing of malt vinegar, has been started in Dunedin, where a firm have a plant of work capable of turning out 500 gallons a day.—*Australasian*.

TEA IN MAURITIUS.—On at least two occasions the authorities in Mauritius have asked that a Ceylon planter should be nominated to take charge of a Government experiment in the introduction of the growth and manufacture of tea. On both occasions gentlemen were recommended and appropriate salaries indicated and we believe that each case has been with curious discourtesy, left without reply from the sugar isle. Now we find the following paragraph in the proceedings of the Legislative Council:—

Lying a report by the Chairmen of the Experimental Plantations Committee, relative to the employment of an experienced Tea curer for the Experimental Farm, and requesting the Council to vote the sum necessary to permit of the temporary employment in that capacity, of Mr. J. Corson, on the terms recommended by the Experimental Plantations Committee.

* That is, a scale insect or bug.—Ed. T. A.]

CEYLON TEA IN AMERICA.

"As I know them, the American citizens are the most ignorant people I have met. I refer to the New York citizens. 'Tis true, 'tis pity.' I have known them now for six months."

Such is the opinion of an advocate of Ceylon tea, who dispensed samples from a "tea kiosk at the American Institute Fair, from 10 a.m. until 10 p.m." During the process the poor fellow was "in deep mental distress; his nervous system overstrained, his emotions distorted. While he smiled pleasantly outwardly, he wept and—worse inwardly, and went through a most terrible ordeal."

All of this mental contortion, emotional dyspepsia and soul torture came from a dietetic discovery. The critic says—

"I had no conception that a people could be so woefully ignorant a daily article of diet as these people are of tea. 'Oh, 'tis pitiful!' Vast numbers think it is manufactured, and I dare say they are right, for your Yankee can manufacture anything. I must give him that credit. Let us 'give the devil his due.'"

This Ceylon missionary interested in the Gospel of Tea, has come, to use his own words "to save, to teach, to educate, and to tell what tea is, to induce them to leave the ensilage, which they have been enjoying so long (Oolong tea)—to drink really pure tea, quite an unknown quantity in this country." The task is recognised as "herculean." Undoubtedly so to one who does not appreciate the relation of climate to beverages, and that the two national drinks are coffee and beer, the former being the most popular and enticing. But our critic is heroic, and undaunted by difficulties. He tells us "the combat promises to be severe" but the effort is well backed by "British pluck, enterprise and capital," the latter indispensable and without which the Ceylon effort will be "utterly helpless." In order to keep the enterprise supplied with Ceylon gold, the tea planters are told in a letter to the *Ceylon Observer* about the efforts being made in this city to sell Ceylon teas and the difficulties to be overcome. This document is interesting, as it affords an opportunity to "see ourselves as others see us." Our critic, after describing the store that has been opened and its manager, proceedeth to fish for the goldencats of Ceylon, an island of which, he says, "perhaps two-thirds of the citizens of New York never heard; the remaining third probably from their hymn books," in this manner:—*American Grocer*. [Then follows a long extract from our correspondence columns.—Ed. T. A.]

MADRAS TEA AND COFFEE CULTIVATION.

During the year 1889 there were 110 Tea plantations in the Madras Presidency with an approximate area of 7,272 acres, which yielded a total of 884,916 lb. of tea. Ninety-eight of these plantations are in the Nilgiri District, 7 in the Malabar Wynaad, two in the Madura District, and three in Bonanghi tanna of Srungavarapukota Taluk of Vizagapatam District. Although about 8½ acres have been planted in the last three estates there was no yield, in consequence of the crop not being harvested as the plant is not thriving. The average yield per acre of mature plants was 400 lb. in the Malabar Wynaad, 190 lb. in the Nilgiris and 10 lb. in Madura.

The number of coffee plantations was 15,478, with an area of 184,125½ acres and an approximate yield of 12,382,580 lb. of coffee. This industry was confined to the districts of Malabar, Madura, Nilgiris, Salem, Tinnevely, Coimbatore, South Canara, Vizagapatam, and Anantapur. Malabar heads the list with 10,471 plantations with 90,647½ acres; Madura has 4,183 plantations with 6,065 acres; Nilgiris 695 plantations and 82,115 acres; Salem 49 plantations in the Javadi and Yelagin hills with about 25 acres; Tinnevely 49 plantations with 2,650 acres; South Canara has 8 plantations with about 71 acres; and Coimbatore 18 plantations with 1,808 acres. As with tea the coffee plan-

tations in Vizagapatam are confined to Bouanghi tanna, where there are three plantations over an area of 710 acres. There are two plantations in the Anantapur District, one at Sidhagiri and the other at Madaksira. The one at the latter village was opened out during the year and is the first attempt to grow coffee in the village. The two acres planted at Sidhagiri yielded 180 lb., the average yield per acre of mature plants being 720 lb., the best in the whole presidency. The average yield per acre of mature plants in the other districts were Nilgiris 312 lb., Coimbatore 276 lb., Madura 152 lb., South Canara 143 lb., Malabar 127 lb., Salem 76 lb., Vizagapatam 69 lb., and Tinnevely 9 lb. Several plantations in Malabar and the Nilgiris which were neglected and decaying were taken up again owing to the rise in the price of coffee. It is expected that the output this year will be in advance of the results obtained last year from the same cause.—*Madras Times*.

A TURTLE FAMINE IN LONDON.

As long back as June 1st, 1887, we devoted an article in this journal to suggestions as to the possibility of developing a market for the output of the turtle fisheries in the north and south of this island. We cannot say that what was then written was productive of any appreciable effect but we are not disinclined to think that some stimulant in that direction may be afforded by the news reaching us by last mail that London has been left almost entirely without any supply either of fresh or of dried turtle!

We think it very possible that the greater bulk of our readers are unaware of the really enormous demand which usually exists in that great city for both of these articles. Leaving out of consideration the section of this demand which arises out of convivial gatherings among the wealthy classes and for the more ceremonious banquetings of the great Civic Companies and similar Public Associations, it may be said that by far the larger quantity of the turtle reaching London either in a quick or dried condition is consumed as a nourishing restorative during or after debilitating illness. Turtle soup is, indeed, one of the most constant recommendations made by the doctors at home to their well-to-do patients. The price charged for this, either as freshly made soup or as a tinned preparation, is very high, and ranges quite beyond the means of the poorer among the sufferers from illness. We have learned that in the case of a friend recovering from severe illness, he reckoned that each breakfast cupful of turtle soup cost him three shillings at least, and that for the fresh soup from Gunter's he had to pay half-a-guinea a pint. What the price may have gone up to during the late famine of turtle in London we can hardly hazard a guess. Possibly it may have risen as exorbitantly as did the price of quinine in Mauritius during the severe outbreak of fever experienced some twenty years back in that island.

Without enlarging further on this point of costliness of the article, we believe we have demonstrated how high a value may be obtained for it at home and how very steadily expanding is the demand. From some cause or other as to which we have no information, the ordinary sources of supply hitherto relied upon have of late years shown symptoms of drying up. Chiefly, the London market has been dependent upon the turtle harvests of the West India islands, and these—possibly for want of an enforcement of a close time during the breeding season—have of late become very restricted. Irish Home Rulers are fond of quoting an adaptation of an old saying to the effect that England's distress may be Ireland's opportunity. May we not plagiarize upon this,

and say that London's distress (as to its turtle supply) should become Ceylon's opportunity? We note that it is remarked that "there is but little flesh on a turtle" as the reason why the retail price is so largely in excess of the wholesale buyer's rate of purchasing. From what is known locally of the turtle in the Colombo, Matara and Jaffna markets, we should not be disposed to agree to that statement. They appear usually to us to be full of flesh, and that of a highly nutritious quality throughout. We suspect that it is the cruel system of leaving the poor creatures without food all through the long journey homewards which accounts for their shrunken state on arrival. It is much to be wished that an experiment could be made in the conveyance of live turtle from Ceylon to England. During the voyage they might be cooped as are fowls and ducks and regularly sluiced with sea water and supplied with food. It is cruel and wasting to lay them on their backs with the head hanging down during a month's journey. We believe that, with proper care, turtle might be landed in London from Ceylon in almost as good a condition as when shipped, and if that were accomplished, no more profitable venture—at least at the present juncture—could be made than that of supplying the London market from our local breeding grounds.

IRRIGATION:—A SPECIOUS BUT IMPRACTICABLE PROJECT.

The Ulsoor Tank which supplies water to the Bangalore cantonment is the subject of a letter in the *Indian Engineer*. The writer is troubled about the loss of water from evaporation but especially from absorption into the soil, described as decomposing felspathic rock, exceedingly porous and friable. The remedy proposed is thus indicated:—

Can these underground streams be tapped in any way? If there are no impermeable strata within a moderate depth from the surface cannot something be done to make the gathering ground more or less impermeable? I will cite one method, proposed by M. Seguin, which, though only generally applicable to small areas, could be modified for adoption on large areas of several square miles. I translate from De baune's "*Distributions d'eau*" where M. Seguin's article is quoted. "Take a piece of land 3 or 4 acres in extent, where the soil is sandy, such as may be found in the Bois de Boulogne or in other woods around Paris, and which besides has a slight slope in some one direction so that you may at once get a flow of water. Excavate along its whole upper length a trench $4\frac{1}{2}$ to 6 ft. deep and about 6 ft. wide. Level the bottom of this trench and make it impermeable by macadamising it or by flooring it with asphalt, or, simpler still and less costly, by puddling the bottom with stiff clay. Alongside this trench cut another similar one, throwing out the earth to fill the first one. Treat it in the same way and then continue the process till you get a sub-soil completely impervious to rain water. Plant the land with fruit trees and especially with trees with low-hanging branches; which will shade the ground and will arrest currents of air that would tend to cause evaporation. Then at the lowest level of your land build a wall down to the artificially prepared sub-soil into an opening at the centre. You will infallibly find that you have here a fine spring which will flow without intermittence." My readers may perhaps here say, "Ah! this proposed method has quite a pastoral ring about it, but is quite impracticable on 5 square miles of drainage basin." Modified, I believe the method would be eminently practicable. Fill up all fissures on the higher parts of the basin, where fissures probably abound, and then, after close examination of the ground and of the directions of flow of the sub-soil water, dig

trenches in the way suggested and make them impermeable so as to lead the water into the tank where it is so much wanted. There may be insuperable obstacles to carrying out any such proposals to increase the run off into the tank; but if there are not, an expenditure which I might calculate at R30,000 to R50,000 a square mile or 1,50,000 to 2 lakhs in all, would give a supply ample to meet the present requirements of the town and render unnecessary for many years to come larger and much more costly schemes.

We submitted the above to one of the most eminent of our many competent and accomplished hydraulic engineers, whose deliverance is as follows:—

"The correspondent boldly recommends an expenditure of R150,000 or R250,000 over what would be only an experiment, and he adduces no facts in favour of it. I should say that no one is likely to try the French proposal on a large scale.

"According to the description of the soil of the drainage and of the Ulsoor tank I should be surprised if such works as the correspondent recommends were to materially augment the existing water supply. He cannot be an engineer, or he would not write in such a child-like manner regarding the filling up of 'all fissures in the higher part of the basin.' He states that the water 'cannot possibly be all evaporated,' but he brings forward no evidence in support of this opinion. During 6 months of the year, the total rainfall is under 6 inches, so that in this period the soil may become parched to a great depth, and ready to act as a sponge when the S.-W. monsoon rains fall.

"No doubt a great amount of water is wasted in Ceylon by passing under the embankments of the tanks, there being no puddle-trenches to intercept it. According to the correspondent's ideas it would be a very simple matter to stop to this flow and waste; but the expense would be very great,—probably more than the water is worth."

In April 1887, when, recording the impressions created by a visit to the Kaawewa tank, we specially noticed this question of percolation of water through the brands of tanks and the sides of canals, as requiring legislation such as was found necessary soon after the great Ganges canal was opened. Cultivators of lands adjoining the banks were equitably charged for the water which kept their fields perennially moist although it was not supplied directly from sluices. Nurseries of forest trees ought to exist under all our great tanks.

TASMANIAN APPLES.

(From the *Aberdeen Free Press*.)

June 12th.

Passing down Market Street yesterday I saw some beautiful apples in a fruiterer's window ticketed—"Tasmanian apples, grown and packed by S. E. Shoobridge." This is one product in which Tasmania can compete with any part of the known world. I have never seen better apples or better crops anywhere else; and, coming in at this season of the year, the export to this side ought to prove profitable. Apples will grow abundantly almost anywhere in Tasmania, but the favorite district is the Huon, 30 miles south-west of Hobart, where the soil and rainfall are peculiarly suitable. The trees are planted 20 feet apart, and after the sixth year will give average crops of 500 lb. up to the 14th year, when the yield begins to fall off. The orchards of the Messrs Shoobridge are, however, on the banks of the Derwent—a rich spot such as cannot be found anywhere else in the island. Amongst the eldest colonists the father of the Shoobridges went out "of his own free will" some 60 years ago. An intelligent, upright, and downright good man, he taught his sons habits of honest industry which ought to have been a pattern to all other settlers and

a fortune to themselves. While other farmers treated the poor assigned convict servants as beasts of burden and worse—frequently sending them to get lashes instead of wages due—the Shoobridges invariably treated them with kindness, were well served and well they prospered. Years ago they went into hop culture and I have seen as many as from 4000 to 5000 busy fingers picking their crops. But hops have caused to pay and these enterprising men are now turning their attention more exclusively to apples. The apple—like every other living thing—has its enemies, chief among which is the Codlin Moth (*Carpocapsa pomonella*). Like many more of our troubles the Codlin Moth is the sequel of sloth. In Europe orchards are, as a rule, kept cultivated and clean so that when an embryo moth falls from an apple a bird can pick it up, but in most of the so-called orchards of Tasmania this is impossible; and the worst of it is the most careful cultivator suffers by the garden of the sluggard.

COLONIENSIS.

TAMIL COOLIES AT THE STRAITS

The Indian Immigration Report for last year shows that the indentured inflow during that period stood at 2,747, a falling off amounting to 40 per cent compared with the figures for 1888. Decrease also has taken effect slightly on the arrivals of immigrants not under indenture, who reached the aggregate of 15,285. The Protector has taken measures aiming at a change for the better in this respect, and hopes to see matters further righted by curtailment of contract time and a rise in wages. In his opinion, low pay turns the weaker coolies into starvelings and incites to desertion, which also largely arises from the contract time being fixed at three years. It is alleged that the length of the term of service under the strict discipline of an estate discourages this class of coolies even to the point of death.—*Straits Times*.

THE GOLD TRUST AND INVESTMENT COMPANY:

A BIG DIVIDEND.

[We are indebted to a correspondent for calling our attention to the extract in the *London Globe* of June 6th with the above headings. The Company is a prosperous one, and as may be seen, it has been doing work for Ceylon.—Ed. T. A.]

An ordinary general meeting of the above company was held this afternoon at the offices, No. 184, Gresham House. Mr. P. E. Lintilhac presided, and in moving the adoption of the report, which showed that there was a balance of profit of £12,857, and that the dividend for the year was equal to 32½ per cent., said the result must be considered satisfactory when they remembered that for the greater part of the year the mining market had been greatly depressed; but still, the depreciation in the value of shares held by the company did not exceed £3,000. The company were entitled to a considerable amount of commission for making the issue of the Persian Investment Corporation, which amount was not taken into consideration in the company's accounts until received by them. The directors, after very careful consideration, had undertaken the formation of the Gemming and Mining Company of Ceylon (Limited). This company, although only issued a short time since, already looked like being a great success, and the directors had thought it wise to retain a considerable interest in the undertaking. The board might be considered rather conservative in their views, but they thought it wise not to take credit in the balance for any moneys not yet received. The shares of the company were highly

thought of both in London and on the Continent; and the £1 shares were now quoted at £12 premium. There was also every prospect of an even better dividend next year.—Mr. S. Bernard seconded the motion, which was unanimously agreed to, and the usual formal business transacted.

LOWCOUNTRY PLANTING: NEGOMBO.

WEATHER—CINNAMON—COCONUTS.

KADIRANA, July 1st.—We are badly in need of rain here. May was a dry month and June was worse; the former had 3.64 inches and the latter 1.61 inch of rain; so that for the south-west monsoon this year we have had only 5.25 inches. Even in the earlier months of the year there a smaller rainfall than usual. For the previous 4 years the average fall for the first six months of the year has been 44.50 inches, against 23.09 this year. Colombo, I see, for the same time has had over 33 inches, while the record on one estate in Veyangoda is a little over 60 inches. These three stations, all in lowcountry, and within about 18 miles of each other, show how unequal is the rainfall distribution. All estates are busy preparing cinnamon, but unless we have rain soon the peeling is likely to become difficult. Coconut crops all over the district are, I believe, better than they were last year, while prices continue to keep up. Can you say why coconut poonac has been so high in price for about twelve months past?

THE FORESTS OF EUROPE.—The forests of Europe according to a recent report of one of the State foresters of Prussia, cover the following areas:—Germany, 34,596,000 acres; Russia, 494,228,600 acres; Austria-Hungary, 46,951,700 acres; Sweden, 42,000,000 acres; France, 22,240,000 acres; Spain, 19,769,000 acres; Italy, 9,884,570 acres; and England, 2,471,000 acres.—*Public Opinion.*

THE PENANG SUGAR ESTATES Co., have recently got out a lot of machinery of the newest type for the manufacture of sugar. They have also fitted up their sugar factory at Caledonia with electric light, which was used for the first time on Saturday night and proved a great success. There are eighteen arc lamps of one thousand candle power each, which are worked by two Victoria dynamos supplied by the Brush Co. of London.—*Pinang Gazette.*

JAVA CINCHONA EXPORTS.—In respect of cinchona bark, the Java exports have been much more progressive than in the case of tea, as may be seen from the following figures:—

	lb.		lb.
1884 ...	447,000	1887 ...	2,429,000
1885 ...	1,074,000	1888 ...	3,588,000
1886 ...	1,836,000	1889 ...	4,965,400

Seeing that Java bark analyses about double the average for Ceylon, last year's export was equal to 9,930,800 lb. of our bark. During the current year, the exports of bark from Java show a further increase and may reach $\frac{5}{8}$ million.

BUCHANANIA LATIFOLIA.—Read the following letter from Surgeon-General G. Bidie:—"In the July number of the Society's Proceedings I see a brief but interesting notice of the seeds of *Buchanania latifolia*. They are very commonly used by natives as we use almonds. When Sir M. E. Grant Duff visited Oud-dapah they were brought to his notice (by, I believe, Dr. Iyasawmy Pillay Rai Bahadur), and he, recognising their great merits as an after-dinner dainty, introduced them at Government House. In this way their use became more general at European tables. They have a delicate nutty flavour, and the only defect that I know in them is that they do not keep very well, being apt to get mouldy. They are known in the local market at Oud-dapah as *Chara payum bijam*—From Report of the Agri-Horticultural Society of Madras, Sept. 1880.

VITALITY OF SEEDS.—I wish to place on record one instance more, illustrating this point. Twelve months ago I sowed a seed of *Abrus precatorius*, or the Liquorice tree. This was one of several others of the same kind which I know to be twenty-five years of age. I have had the seeds since the beginning of 1879; and the gentleman who gave them to me grew them in the West Indies, and be left there in 1855. The seed sown, as mentioned above, has vegetated this spring, and is growing vigorously.—G. PAUL, Knaresborough.—*Gardeners' Chronicle.*

AN HISTORICAL PALM TREE.—Visitors to Rome in past years who remember the gardens of the British Embassy, will be interested, says the *Times*, to learn that the Palm which stood in them, and which was not only the tallest in Rome but was historical, as having been pierced by a cannon ball during the attack on the city in September, 1870, has been blown down during a gale. It was strapped with iron where the ball had pierced it, and was the only object in the vicinity which showed the traces of the attack which opened Rome to the Italian army.—*Gardeners' Chronicle.*

PROFESSOR OLIVER.—It is with much concern that we have to announce that Professor Oliver resigns his post as keeper of the Herbarium of the Royal Gardens, Kew, at the end of this month. Professor Oliver has been connected with the Herbarium for about thirty years, and it is quite impossible to overate the services he has rendered to botany, and, incidentally, to horticulture, during that period. The Professor's modesty and retiring habits have prevented him from becoming so widely known to the general public as his merits warrant, but among botanists there is but one feeling of the highest respect for his perfectly unique knowledge, and of gratitude for the readiness with which he has always used it for the benefit of science and the public. We are glad to learn that the Professor will continue to reside at Kew, and to lend his invaluable assistance as Editor of the *Icones Plantarum* and in other ways.—*Gardeners' Chronicle.*

A SWEET ORANGE-POMELO is noticed in the *Florida Dispatch, Farmer and Fruit-Grower*. The grower writes:—

The fruit of this tree varies considerably, some individuals being as sweet as an orange and others almost as sour as the average grape fruit. Please sample these and see how they compare with the best that you have eaten. For my part, at this season, I prefer them to oranges, either sucked or cut through the equator, sprinkled with sugar and placed upon a glass for breakfast. I am strongly inclined to think them wholesome, and think that they need but to be known in order to be appreciated.

The editorial opinion is:—

The samples were very firm and smooth, though slightly rusted, but nobody could quarrel with their interiors. The only bitterness was in the core; the pulp was deliciously sweet quite to the rind, with a slight suggestion of coconut flavour.

Fancy a pomelo with coconut flavour!

PROFESSOR EISEN'S REMEDY FOR COFFEE LEAF DISEASE does not seem, from his own account of it, to have any marked superiority over Mr. D. Morris's remedy of sulphur and lime. That killed the fungus where it was applied, and this is all that is claimed for the professor's remedy. Our experience in Ceylon proves that no remedy short of complete extirpation of the ubiquitous fungus can be of any avail. The Professor had better address himself to the Government of Java, where coffee is still more of a staple product than, unhappily, it now is in Ceylon. Professor Schrotky was as fully satisfied in his own mind of the merits of carbolic acid as Professor Eisen is of the success of his simple remedy. But that is not enough. We fear the only remedy is effluxion of time and the extinction of the fungus with the disappearance of that which it feeds on. Then a non-fungus cycle may set in and coffee be once more profitably cultivated.

NORTH BORNEO NOTES :

PERSONAL—PEARL SHELLS—FLAX—SAWMILLS.

(From the *North Borneo Herald*, June 1st.)

Mr. E. P. GUERITZ who some seven years since was Assistant Resident in Kudat, and who left the service in 1884 has again entered under the Company's rule, and will take charge of Labuan, Mr. F. G. Callaghan being about to proceed to England on six months leave of absence.

In this issue we publish a most interesting lecture on the State of North Borneo its past, present and possible future given by Mr. Alexander Cook Treasurer-General before a meeting of the British Association at Newcastle on Tyne on September 10th last during his absence on leave in England last year. There is one slight correction which it may be as well to make. Mr. Cook states that during Captain Beeston's second Segama Expedition of 1887 the prospectors did not discover any "matrix" of gold but only the loose gold in the beaches. This is not quite correct. On both expeditions of 1886 and 1887 Captain Beeston successfully treated quartz for gold, finding the quartz very heavy with baser minerals. In 1887 several quartz reefs some of large width were found in the creeks above Weary George where the slate and diorite country came in. Samples from these were reduced to powder and washed a very fair prospect being the result.

It seems that attention is being given to the coast of British North Borneo as a suitable field for the pearl-shell fishing industry. The following extract is from a letter received by a firm at Thursday Island from one of the leading London brokers. The Torres Straits fishers referred to are probably from the North-West—"It has come to our knowledge that some Torres Straits fishers have been applying to the British North Borneo Company for leave to fish on the coast of that Island, and we think it well to call attention to this new ground, as we have seen some of the boldest and finest shell from there, and think it likely to have grand opportunities."

We append translation of a letter addressed to us by the Manager of the *Société de la Ramie Française*. All the samples alluded to can be seen at the office of the *North Borneo Herald* :—

Sir,—We received your letter of the 18th December and thank you for the flattering compliments with which you addressed us. According to your wish we are sending you, by this mail, patterns of ramie in the divers states in which it is utilised.

I. Stalk of dried Ramie.

II. Ramie unravelled by Chinese hand labour, and worth, in the European markets from 80 to 85 francs, per 100 k'los.

III. Ramie unravelled when green by the machine P. A. Favier, and worth in the European markets 40 to 45 francs per 100 k'los.

IV. Ramie unravelled when dry by the machine P. A. Favier, worth 70 to 75 francs per 100 k'los, in the European markets.

We add to these samples, some specimens of flax, after undergoing a certain preparation, and also some samples of tissue. We are also sending you some pamphlets appertaining to the culture and machines for working ramie. We are convinced that there is much to be done with the ramie but in a damp climate the disentangling cannot be promptly effected unless through the agency of our machinery, working it in its crude state that is to say immediately after the cutting of the stalk. If any powerful company would undertake the first cultivation of the ramie, we could easily come to an arrangement with them and would be willing to allow them the monopoly of our machinery, at the same time we would be assisting them at arriving at a result. As to our being able to give you an idea as to what revenue would result from the undertaking on a proper scale the following information may be useful. In a climate like Borneo three crops of ramie can be thoroughly calculated upon in one year, each crop should give from 13 to 14,000 k'los. of green stalks per acre which after undergoing treatment with our machines would give a return of 2,000 k'los of strips like the pattern herewith; we are buyers of these strips at the rate of 40 francs

per 100 k'los; this would represent a gross return of 800 francs per acre. One machine with two workmen could produce 2,000 k'los in a space of from 6 to 8 days. The power of the machinery does not come up to one horse power. The royalty we should ask, to give up the right of this patent would only amount in any case to 0. 75c. for every 100 k'los so unravelled. The material so delivered should be received free of all port charges in any European port, and the bales so delivered should average from 200 to 250 k'los to the cubic yard, the total cost of the machine amounts to 2,000 francs and we shall be very happy if this question should prove sufficiently encouraging to induce any of the companies in British North Borneo to take the initiative in developing this new industry which would certainly conduce to the profit of both grower and buyer and might develop into an industry of considerable importance.

A. FAVIER.

We publish the following communication with much pleasure, as it indicates the progress of the Saw Mill industry in Sandakan at the present time.

During the recent visit of His Excellency the Governor and Mrs. Creagh to the Saw Mill and Engineering Departments of the British Borneo Trading and Planting Company, it was the general subject of remark that energy and determination combined with sound practical knowledge had worked great changes in the prospects of these Departments, during the past few months, and what was formerly a ghastly mangrove swamp with a drowned Saw Mill in its midst was gradually assuming the appearance of a business centre, all the Saw benches in the Mill being hard at work on the execution of a large order for Railway sleepers for Manila, which are being turned out at the rate of 500 per day, and for which purpose the timber is specially adapted.

The energetic Manager Mr. W. A. Leach is at present busily engaged on the reconstruction and extension of the Saw Mill Wharf, which when completed will be 550 feet in length and will allow vessels drawing 13 feet to come alongside at dead low water. Another Wharf 500 feet in length is also in course of construction for the Engineering Department and alongside of this it is in contemplation to erect a patent Slipway for hauling launches and small steamers, and which will in junction with the New Machine and Boiler makers shops and Iron and Brass Foundries enable the Company to undertake and successfully carry out extensive repairs of all descriptions. In the course of conversation with the Manager that gentleman (who has had seven years' experience with Teak timber in Siam) expressed his opinion that Billian was for many purposes far superior to Teak, and could be supplied at 2/3rds of the cost of that wood, the forests which in Siam are in some instances 500 miles from the port, being an important item in the cost of production. Kayu Kapur or Camphor, and Kruen or Borneo Teak, are also woods which in his opinion are quite equal to Teak for shipbuilding and other purposes and can be supplied at little more than half the cost of that wood. Altogether the Company is to be heartily congratulated on its improved prospects and there can be little doubt that when the quality of the magnificent timber which abounds on the property of the Company, becomes more generally known, the present Milling plant will have to be further increased in order to supply the demand which will certainly exist for it.

The Government is corresponding with more than one of the leading members of the Western Australian Pearling industry who want to bring up a fleet of schooners to fish on our East coast during the Australian winter months when the inclemency of the weather prevents them from leaving the ports of that colony. For the information of those who are interested in the business we may say that the first comer has been offered the privilege of exporting pearls at half the ordinary export duty (*i.e.* at five instead of ten per cent) for seven years from the date he starts business. This privilege covers a fleet not exceeding twenty ordinary pearling schooners. Not only the mother of pearl shell of very fine quality, but also the real pearl oyster have been found off our East coast, but neither variety is regularly fished; both inhabit deep water and none of the natives understand dredging.

The Government is endeavouring to attract some of the pearl dredgers from Sulu but hitherto although they accepted the terms offered they show no disposition to come although some of their chiefs believe our East coast to be quite as rich as any other in the Sulu Sea.

CEYLON UPCOUNTRY PLANTING REPORT.

WEATHER—PEPPER-GROWING—LIBERIAN AND COORG COFFEE—ARABIAN COFFEE FREE OF LEAF DISEASE THIS YEAR.

July 4th.

Our present weather is simply too much of a good thing, and although Kamasami pretends to be up to a dodge which could bring about a change—that of having a day's outing with Muniandi, at the master's expense, rain to be certain after that!—things have not reached that point of despair with us yet, that would justify the adoption of it. Nevertheless it looks very like as if the south-west monsoon of 1890 was to be lost to Ceylon. It does not tend to make matters any more bearable to hear that other places were getting their S.-W. rain all right; and that at sea the weather is heavy with rain and to spare. Our monsoon must have gone galavanting somewhere, breaking through its character for steady respectability by thus adopting a profligate career. I wish it would repent and come back. It would be as welcome as the prodigal, and as rejoiced over. In these districts our streams are getting lower and lower, the rains we have had, proving wholly insufficient to meet the strain of such dry weather immediately after the hot months; plants which have been put out, are having a terribly rough time of it, and except that tea is flushing, all the usual work at this season might be said to be at a stand-still.

We will know 'All About Pepper' by and bye. Meanwhile some who have tried it, as an auxiliary to other things, are not so very enthusiastic as they were. A good healthy pepper vine is found to be more than a match for a sturdy jack, and seems to be capable of sucking the life out of it. In time the jack will show nought but bare poles after a struggle for existence, more or less prolonged. Some of us had not quite calculated on this masterful spirit on the part of the pepper and would have preferred to have seen a willingness to live and let live.

It becomes a question worth considering, if in a place where shade is needed, and pepper for a time may be successfully grown, it is wise to grow it and run the risk of having your needful shade killed out? Will the profit made by the pepper compensate? I don't pretend to be able to answer these questions; but there is no harm in asking them.

The under-current in favour of COFFEE still flows vigorously, and especially the one that makes for the Liberian variety. Every now and again you fall in with a man who has been agreeably surprised by what his Liberian coffee has done for him, and who is doing a little extending on the quiet. It wants so little culture, and can stand such an amount of hard usage, that Liberian coffee might have been expected to have been a favourite with the Sinhalese villagers. I fancy it is the trouble of planting which prevents its taking its place among the village favourites. If it had not had such an abominable bark-like pulp, very likely the monkeys would have proved useful, and gradually extended the cultivation! Coorg coffee too is being tried more extensively than it has been for some time, but what is it after all? Pretty much a kind of planting dilettanteism. A man

gets over a bushel or two of seed, and a few acres are put in, but the full-hearted loyalty which was given to king coffee in the days of old, has died out.

Coorg coffee seed comes up well, and if all who have ordered this variety have had as excellent results, as I have seen in nurseries grown from seed procured from Mr. Hunt of Mercara, they must be fully satisfied. Every seed seemed to have germinated, and the plants were vigorous and strong.

By the way what there is remaining of Arabian coffee has been singularly free of leaf disease this year. Not that the old enemy is not about, it is still there, but the old force seems to be diminished. Perhaps the abnormal season we have been passing through may have something to do with it.

PEPPERCORN.

COCONUT PLANTING IN CHILAW DISTRICT.

SUSPENSION OF ST. ANNA'S FESTIVAL THIS YEAR RIGHTLY URGED IN VIEW OF PREVALENCE OF CHOLERA.

RAJAKADALUWA, CHILAW, July 1st.

The S.-W. moonsoon has been almost a failure as regards rain, and while this is hard on vegetation (though our young trees are standing it remarkably well) the dry weather is all in favour of felling operations, which are pretty general throughout this part. Coolies are already talking of "St. Anna's" pilgrimage: surely Government will find it *convenient* to stop or restrict the festival for this year, on account of the fearful reports from Southern India. To have our labour enticed away at a busy time is bad enough, but of this we don't complain: the real grievance lies in the needless risk incurred of a general epidemic; and it seems almost miraculous that we have been so mercifully spared each year, so far. An outbreak of cholera would be but a poor commentary on physical cures said to be effected at St. Anna's shrine.—The coconuts hereabouts on the last clearing are giving great promise: they are better than any I have seen yet at that age.

INDIAN FISHES.*

[We have been meditating a notice of the book referred to in this review, but we feel we cannot do better for publishers or readers than quote the remarks of the writer in the *Indian Agriculturist*—Ed. T. A.]

A melancholy interest attaches to these volumes. When the Secretary of State for India determined to authorise the publication of a series of compendious handbooks on the vertebrate fauna of British India at a cost which should place them within the reach of all likely to be interested in such subjects, the fishes were committed, as a matter of course, to Dr. Francis Day, late Deputy Surgeon-General of Madras, the greatest living authority on the subject. He took up the work with characteristic enthusiasm, but a life spent in brilliant and scantily recognised services to the cause of science was even then drawing near its close. In pain and weakness he laboured on, finished his manuscript, and corrected the proofs of the first volume. Then he was obliged to desist, and almost on the day when that volume issued from the press he passed away. The second volume was put through the press

* "The Fauna of British India, including Ceylon and Burma," published under the authority of the Secretary of State for India in Council, edited by W. T. Blanford. "Fishes," by Francis Day, C.I.E., LL.D., &c., Deputy Surgeon-General, Madras Army (retired). Taylor and Francis, Red Lion Court, Fleet-street, London.

by the editor of the series, Mr. W. T. Blanford, who apologises for possible mistakes or omissions, but his name is a guarantee that the work has been as well done as it could be.

It would not be an easy task for us to criticise from a scientific standpoint, the work of one who was *facile princeps* in his subject, and happily it would be quite out of place to attempt such a thing in these columns. We have to consider the book from the point of view of those in this country who will make use of it, and if the number of Anglo-Indians who concern themselves about fishes (as distinguished from *fish*) is unfortunately very small, nothing is more likely to increase it than a clear well written manual, not too bulky to carry about, and not too costly to buy, which will enable any one, with a little trouble to identify and name the most important or remarkable forms which may come under his observation. With such a help we venture to think that many will be tempted to take up a subject which in point of intrinsic interest is scarcely second to any. A visit to the neatly kept little collection in the rooms of the Bombay Natural History Society will convince any one that whether the cast of his mind inclines him to the beautiful, the strange or the grotesque, there is a boundless field of interest before him in the fishes of India. And if we turn from the æsthetic or curious to the purely utilitarian aspect of the subject, it must be admitted that the study of fishes is beyond all question of more importance to mankind than any other branch of natural history. It is difficult

HOW TO GAIN IN WEIGHT.

ALBUMEN (*i.e.*, materials like meat, gluten, casein, white of egg, &c.) is the food which makes flesh, and a certain amount of it is made up in the system every day, no matter whether any of it is taken or not, and no matter whether work is done or not. It seems, then, that albumen is most closely associated with the vital processes, and a man will die sooner when deprived of meat than of any other food.

Now, to increase the flesh a full supply of such food as meat, gluten, &c., is absolutely indispensable, and, if it be given with plenty of fat and starchy or saccharine food, will increase the weight. In low states of disease the most useful food is meat, but as the ordinary meat-teas do not contain the nutritious part of the flesh, yzime should be employed to digest out the insoluble ingredients.

A practical question is,—Why do people who are taking a goodly amount of cod liver oil grow thin? It is because they take too little meat. To do most good, oil should be combined with farinaceous food, as butter on bread. The endurance of fat-eating people is proverbial, and no other food will yield the force that fat will. Therefore it is that in wasting diseases recourse is had to cod liver oil. Because the oil has been given as a medicine it has oftener disagreed than it would otherwise have done.

The new form of cod liver oil may be counted among the more recent medical innovations. Formerly it was the custom among physicians to prescribe this oil in emulsions. These emulsions were manufactured with alkalies, which, with essential oils, made them soapy or heavy, and, therefore, bad for the stomach. Now it is the order of the day to give cod liver oil with a food, such as malt extract, and not with drugs. Consequently, a revolution has taken place in the dietic treatment of consumption, scrofula, &c.

The initiative of all this was the discovery that cod liver oil could be dissolved in a good malt extract, and the Kepler Solution of Cod Liver Oil in Extract of Malt is now prescribed by physicians everywhere. It will fatten where cod liver oil would do no good, and where the person does not seem to be gaining so fast as is desired, see that plenty of meat is allowed, and success is morally certain; that is to say, there will be increase in flesh and fat, consequently, gain in weight.—“*Health*,” London.

to realise the extent to which the people of this country depend upon the never-failing harvest of the sea. All down the coast of this Presidency where rice is the only grain in use, and beef involves damnation, and mutton can scarcely be had, all except the highest castes of natives subsist largely on fish. In Canara, even the Brahmins, though they may not willingly avow it, are well known to resort very freely to a diet which is almost the only alternative from rice *congee* and coconuts. Besides what is eaten in a fresh state, enormous quantities of fish are salted or sun-dried, or cured with salt-earth and exported to other parts of India or sent up the Ghats for consumption inland. Fish cured by simple exposure to the sun becomes, as most of us have had occasion to know, highly aromatic, and is much esteemed by the natives as combining the qualities of nutritious food and an appetising condiment.* Mahomedan sailors seem scarcely able to imagine that life can be sustained without it, and all who love to go a-sailing in Bombay harbour on a balmy summer evening soon learn to shun the leeward of the native anchorage at the time the *molles sabai* of the Arab bungalows are preparing their evening meal. Along with the fish, which are dried for food, are vast quantities of very small fry, which are sold by the maund for manure. Then there is a considerable trade in the fins and tails of the shark-tribe, which yield gelatine, and are much prized by that eccentric epicure, John Chinaman. Finally, fish oil is manufactured on the coast more extensively than is generally known. There used to be a factory at Calicut for making oil from fish livers, which was under Government management. At this factory according to Dr. Day, no liver under 40 lb. weight was accepted, and he mentions one single liver which weighed 290 lb. Who can forbear to sympathise with that fish?

So far we have referred only to marine fisheries but every river in India, large or small, is incessantly worried with nets and weirs and traps, and here it is that the knowledge of the ichthyologist becomes of most value in detecting and devising means for counteracting the ruinous results of ignorant selfishness. For many of the fishes most valuable to man, like the salmon in Europe, spawn in fresh water and annually ascend rivers and streams for the purpose. In the sea they are only casually within the reach of man, but when they come into the rivers they are at his mercy, and he has none. He builds weirs and dams which render it impossible for any spawning fish to go up the water or else he contrives arrangements of nets which absolutely exterminate the fry as they come down. The wanton mischief done in these ways in India has been incalculable. The remedy is generally very simple when the habits of each species are properly understood. Weirs intended for purposes of irrigation can be rendered harmless by “fish ladders,” which allow the fish to ascend at spawning time, and by forbidding the use of nets with meshes below a certain size, small fry, which are useless for food, can be saved and allowed to grow. It is possible, also, to do much good in a positive way by stocking waters with the most valuable kinds of fish, and taking measures, as far as possible, to exclude predaceous species. The attention of Government has lately been drawn to the matter, chiefly through the influence of men like Dr. Day and the well-known author of “The Rod in India”; but as far as this Presidency† is concerned, we do not know that anything has been done beyond “inviting opinions.” At any rate, there is very much yet to do, and since accurate knowledge must be the basis of every successful measure, every Englishman in this country who turns his mind to the habits of its fishes may assure his conscience that he is serving his generation.

There remains the domestic side of the subject and this must not be passed over. We ought to know more than we do about the various kinds of fish which come to our table or which might come there. It is a sad fact, too characteristic of the Englishman in India, that of all the edible fishes to be had in the Bombay market there are only two for which we have yet

* A diet of such fish has been adduced as one of the chief causes of leprosy.—ED. T. A.

† Bengal.—ED. T. A.

found names viz. the Pomplet and the Bombay Duck. There are a few more which the Boy introduces to us under such title as "Lady Fish" and "e.Slic Fish": but he is, above all things conventional and tries nothing new. It will be in the memory of enicures that an enterprising secretary of the Bombay Club a few years ago introduced to the members of that institution a species of mackerel, which immediately rose into favour. It is one of the commonest fish on the west coast, but the club servants could scarcely be induced to bring it from the market. "It is not food for *sahibs*," they said. And how few of us suspect that a true sardine swarms on this coast, which according to Mr. W. F. Sinclair in a recent paper in the journal of the Bombay Natural History Society is far superior to the tinned article.*

These and many others we find in Dr. Day's book, with a passing comment on their edible qualities: but unfortunately the plan of the series necessitated so much compression, that miscellaneous matter had for the most part to be compressed out altogether. What was essential was a clear, concise, and yet complete description of every species, with such synonyms of families and genera as would enable the student to trace his specimen to its place in the system. This part of the work is done in a masterly way and illustrated by a very large number of beautifully executed drawings, which will aid the beginner more than anything else could have done. We regret to see that there is no attempt at any English index. Such a thing would have been very unscientific, but any book which appeals to the Anglo-Indian public, in its present state of advancement, must condescend to be unscientific. Anyone, however, who means to go into the subject even superficially will find it a profitable exercise to make his own English index, and also an index of native names for the district in which he resides. Our notion indeed of the best way to use a book of this kind is that it should be interleaved and converted into a note book for recording personal observations.

It only remains to say that the book is beautifully printed on good stout paper, and the binding is not showy, but substantial, and workmanlike, as befit a book which ought to be constantly under references.

JAVA PLANTING:

DISEASE IN SUGAR-CANE—COFFEE—RICE.

Consul McNeill reports as follows to the Marquis of Salisbury on the trade, commerce, and general matters relating to the Island of Java for the year 1889:—

EXPORTS.

SUGAR.—The past year has been quite an abnormal one, owing to the unprecedented continuance of the wet monsoon during the months of May, June and July which has exercised a very unfavourable influence on the outturn of the crop, and caused it to be a late one. The quality of the cane also suffered very considerably from the rains and from the "sereh" disease, which appears to be spreading in the eastward residencies, in spite of the planters' efforts to check it. The import of Borneo cane has not proved such a success as was anticipated and many planters are now contenting themselves with planting in the infected district sound cane procured from other parts of the island, where the disease has thus far not shown itself.

In the first months of the year it was expected that shipments would begin at an unusually early date; but owing to the inclemency of the weather at the commencement of the milling season, and the consequent delay in the grinding operations, deliveries were very late in arriving at coast stores and exporters who had concluded forward contracts for early shipment experienced great difficulty in carrying them out.

The past year's production, exclusive of molasses, amounted to 339,999 tons, as compared with 355,334 tons in 1888, and 375,784 tons in 1887, thus showing a decrease of 22,336 tons on last year.

* The seir fish is common in the Galentia as well as be Colombo market, and the sardines referred to bound in the seas around Ceylon.—ED. T. A.

The exports to various countries of the sugar-crops during the three years previous to 1889, exclusive of molasses, were as follows:—

	1886.	1887.	1888.
	tons.	tons.	tons.
Europe ...	242,359	250,036	175,141
Australia ...	13,486	17,269	26,175
China ...	59,944	72,848	85,148
America ...	5,657	5,891	39,208
Sundries ...	26,195	11,073	12,779
Total ...	346,641	357,117	338,451

Of the 1889 crop the following quantities in tons had been exported on December 31st last:—To Channel for orders, 62,996; to Port Said or Malta for orders, 84,180; to an Iherian port for orders, 3,468; to Marseilles, Genoa or Ancona, 10,072; to Australia, 20,208; to China, 31,210; to America, 22,980; to other ports, 7,169; total, 242,283.

The so-called "sereh" disease in the sugar-cane, which has appeared to such an alarming extent in Java since 1883, continues to be a source of much anxiety to planters. Commencing in the Cheribon residency, the disease gradually extended its ravages, proceeding eastwards, attacking the residencies of Tegal, Pekalong, Samarang, Solo and Djocdja. In 1889 it also made its appearance in a sporadic form in the east end of the island, in Madiven, Djomhang, Modjokerto and Sidhoardjo, but in these districts the disease did not perceptibly affect the production of sugar.

The disease manifests itself in the following manner, viz:—The joints of the cane remain very short growing much closer to one another than in the healthy plant; this causes the leaves to grow more closely together, thus presenting the appearance of a fan. The buds on each joint swell up and burst, forming new shoots, which in their turn produce others. Further, around the joints of the diseased canes fibres are frequently developed, similar to those at the root of the plant.

From the cane-shoot used for planting several canes spring up as in the healthy plant, and in the earlier stage of the disease one or two of these canes generally die off, whilst the remainder continue growing in the usual manner, and the presence of the disease is then only to be detected by the fibres growing around the joints, and by the swollen appearance of the buds; when the disease shows itself in a more palpable form the canes onely one stop growing, and remain poor and stunted; whilst in the worst stage of the disease the plant shows nothing but leaves, and the cane speedily dries up and dies. In the diseased plant the roots are invariably poorly developed, and harbour a parasite in the form of a microscopic worm (*Tylanchus sacchari* or *Heterodera radiculicola*), the same worm which is found in the roots of many plants in Europe.

The opinions as to the origin of the disease are very conflicting, and even the most competent persons cannot agree on the subject. Of all the reasons assigned as being the cause of the disease, however, the following are the two most probable:—1. That the disease is of an infectious nature, and has its origin in bacteriæ. 2. That the disease is caused by the small worms which specially attack the weakest roots, work their way in, and thus prevent these organs performing their proper functions of giving life to the plant.

As regards this last opinion, should the question arise as to why these parasites did not appear in former years, or at least did not affect the roots as is at present the case, it is contended that probably the worms formerly existed in other plants, and gradually worked their way into the sugar cane, upon which they have thriven and multiplied, the canes offering a large field for their depredations.

The susceptibility of the canes for the operations of these parasites is attributable to the weak condition of the canes, which is ascribed to the planting and re-planting of cane-shoots in the place of seed, coupled with a too intensive cultivation. Weakness owing to planting irrespective of sex has been frequently experienced, as, for instance, the poplar in Europe. As regards the treatment of the disease, the supporters of

the bacteria theory have attempted to destroy these insects by soaking the shoots in a solution of sulphate of copper or sublimate, which has so far met with little or no success.

On the other hand, the supporters of the worm theory have attempted to kill these parasites in the ground by means of sour sugar syrup, or the so-called Trisulfure de Carbone of Rohart, which latter treatment has given so far hopes of good success. In the absence, however, of any actual remedy for the disease, large quantities of cane cuttings from healthy canes are imported from places where the disease has not made its appearance.

This measure is naturally a very costly one, and in the residency of Djockdjokarta alone fl.500,000 were spent in this manner in 1889; this is, in the meantime, the only course to be adopted, although it is now very difficult to find grounds which have shown no traces of the disease. In the last few years a large extent of grounds has been planted out in Borneo in the hope that this cane would prove impervious to the disease; but this hope proved illusory, as germs of the disease appeared on the freshly-improved cuttings, whilst cuttings obtained from this cane, after planting in Java, gave 50 per cent. diseased plants. Attempts to obtain healthy cane from the Straits were equally unsuccessful, as the "seroh" has also appeared there, whilst traces of other disease were also found in these canes, and imports from this district were accordingly strongly discouraged. At present planters are growing canes in the hilly districts of Java in order to get cuttings, and the results obtained from this cane are encouraging.

Should bacteria, however, be the cause of the disease, it is feared that no remedy will be found, and that the disease will have to run its course just as any other epidemic, until it gradually dies out and disappears. If, on the other hand, it is caused by the presence of the worm in the roots, the experiments already made go to show that there is some hope of successfully combating the disease. At present it may be said that the disease is decreasing in the districts where it first made its appearance, of which proof is given by the increased sugar production in the westward districts.

In the latter half of January a meeting of planters and merchants interested in the sugar industry was held at Samarang in order to frame measures to be taken against the "seroh" disease, and to discuss matters of general interest. This Congress afforded planters an opportunity of exchanging their views, but so far no unanimous course of action has been resolved on. A plan was formed to obtain the services of a specialist from Europe to investigate the causes and means of combating the "seroh" disease, but owing to the necessary funds not being forthcoming it proved impracticable to carry out this project.

COFFEE.—The leaf disease, referred to in my previous reports, continues to prevail in middle Java. More encouraging reports are circulated regarding the course run by the disease in the east end of the island, where it is averred that, except in a few of the old low-lying plantations, the disease has disappeared. The Government crop amounted to 583,458, against 564,586 piculs in 1888, and 254,058 piculs in 1887. Heavy rains and strong winds have caused much damage to the coming crop, which it is estimated will not exceed 400,000 piculs. Government and private together, and in some quarters it is doubted whether this figure will even be reached.

RICE.—Want of rain in the beginning of the year seriously interfered with sowing, and affected the output of the crop. At one moment fears of a famine in some districts were entertained, and several small lots of foreign rice were imported by Chinese firms. Prices ruled high during the year. Prospects for the coming crops are favourable.

Tobacco Crop has been a full one, especially as regards scrubs, for which description higher prices have been obtained than usual.

COPRA.—The development in the production of this article had the effect of driving up the price of coconut oil, as a result of which less copra was brought to market.

Cocoa has been planted on a small scale in some of the mountain districts, and the yield of the trees,

though small, was satisfactory as regards quality. The plantations are being extended in Middle Java, but it is still doubtful whether the cultivation will assume large proportions, as the plant only thrives on a very few estates, 135 bales, weight unknown, were shipped from Sourabaya, and nearly 40 tons found their way to Samarang, of which about 4 tons found their way to Singapore, and the balance shipped to Holland. The export from this port was unimportant.

CINCHONA.—An increase of 642 tons in the exports of this article can be reported, the figures being for 1888 1,990 tons, for 1889 2,632 tons. Owing to low prices ruling at home results have not been satisfactory.—*T. and C. Express.*

A GRAND MANGO SEASON.

It is a wonderful season for mangoes. They were selling at Galsgedara the other day at eight cents a hundred, and of a good edible kind, and later on when they were said to be going out, I bought them at Teldeniya at 12½ cents the hundred. The natives usually couple a good fruit with a sickly season, and it is true in the present year but strange to see the sickness preceded the coming in of the fruit.—*Cor.*

REMARKS ON THE STATE OF BOTANY IN CEYLON.

WITH REFERENCE TO THE KNOWLEDGE OF IT IN APRIL 1843, AND AN ATTEMPT AT ARRANGING ITS FLORA AS KNOWN TO MOON AND RESIDENT BOTANISTS ACCORDING TO LOCALITY AND ELEVATION, COMMONLY CALLED GEOGRAPHICAL DISTRIBUTION OF A FLORA.

BY CAPTAIN CHAMPION, 95TH REGT.

GEOGRAPHICAL DIVISION OF PLANTS IN CEYLON.

(Continued from page 61.)

From this Table 2. it will be seen that various fruit trees of the tropics thrive on the coast which are less abundant or altogether disappear in the Kandyan Country. The Palm trees are also for the most part different. Coconuts thrive in the greatest perfection and become the leading feature of the Coast: sufficiently numerous to form topes: there are a considerable variety of the Coconut-palm—they have been mentioned by Bennett and other writers. The features of the jungle present but little change for the extent of table land running sixteen miles into the interior, when the country changes and becomes hilly and we are gradually brought into scenery the component parts of which are mentioned in Table 3. It seems to be similar in its Flora to that of the Circar Hills in India—Of indigenous fruits of any value, there are few; but the fruits of China and the Archipelago and many vegetables are cultivated with success. The stranger will be struck with the Talipot tree and want of the Coconut, except near villages and also with the Aleurites or *Kakuna*, the foliage of which has the peculiarity of appearing white after rain amongst other jungle trees. Its nut is much used for expressing lamp oil by the natives. Two species of Bramble will also be hailed as an approach to a colder climate, most of the plants and trees in this table will be found on the under features of the hills on the banks of the Mahavillanga, whilst on approaching the higher hills, some of which are mountains 4000 to 5000 feet above the level of the sea, we come to a forest vegetation, the details of which are in Table 4. Trees are no longer in those heights festooned by *Convolvuli* and *Ipomoeas* and *Lorantie* are less numerous; but their place is supplied by many a lovely air plants and the mag-

nificent *Solandra oppositifolia*. On the summits of these hills are found beautiful and rare plants—*Begonias*, *Martynia*, *Didymocarpus*, *Aginetia*, *Acrotrama*, delight in the cold and shady precipices. The *Betle-Palm* is here exchanged for a *Caryota* bristling with thorns. On reference to a map it will be observed that the ridge of hills, between Kandy and Gampola extends towards Rambodda so that most of the vegetation passed in travelling to Rambodda may be observed in a couple of hours' walk from Kandy to the top of its highest hills, which have nearly an elevation equal to that of Rambodda. Table 9 will however add a few other particulars, and leaves us now to comment upon the colder portions of the Island or its highest mountains, in which examples are given of the Nuwera-Ellia Flora in Table 6 and the Flora of Adam's Peak in Table 7.

The Nuwera-Ellia country is a series of small plains, surrounded by hills and mountains thickly clothed with jungle to the very summit. Its elevation above the level of the sea is about 6000 feet. Its highest mountain—the *Pedro-talle-galla*, rises to 8000 feet. Its soil is very black and turfy in the plain, being either marshy or reclaimed marsh—the slopes of the hills turn into meadow land. Before reaching the jungle, a curiously disposed and natural hedge of shrubs intervenes—it extends with great regularity, and is a very peculiar feature in the country. It were erroneous to suppose that either the climate or productions of Nuwera-Ellia are European—but it is our alpine tract and in losing the Palm, the Cinnamon and a thousand of the ornamental trees and shrubs of the Coast, we forget the tropics. In Europe, the gradations of Winter and Summer have a most powerful effect on the system of all perennials. In Winter the leaves fall—the tree is denuded of all its ornaments. In the mass of vegetation, the sap refuses to flow until the genial return of spring: the woody tissues harden and give rise to those concentric rings or zones, by which the Carpenter can calculate the age of his timber. But as Summer advances, the sap returning induces a fresh growth and the formation of flowers and fruit—the absence of a well defined winter is therefore the great difference between Nuwera-Ellia, and our native land, and a simple answer to the query, Why do not the large Cherry trees of its gardens produce fruit? In vain do we look for a single tree (unless introduced) of genera indigenous to our English climate: the trees, although not those of the Coast, are still those of the tropics—they are however of hardier growth, usually evergreen and adapted to our Alpine region, where frost excludes delicate species and the sun rarely shines except during the earlier months of the year. Analogy from such inferences leads us to expect the annuals of our Summer which die during the Winter season and the plants of our marshes, and accordingly I have to mention genera familiar to the British Botanist intermixed with Alpine Indian Plants. The sweet little *Hairbell* is perhaps as grateful to us from association as the curling smoke of cottage rising over the jungle. The European genera are *Andromeda*, *Vaccinium*, *Ranunculus*, *Thalictrum*, *Anemone*, *Viola*, *Rubus*, *Frogaria*, *Berberis*, *Scutellaria*, *Lysimachia*, *Polygonatum*, *Plantago*, *Lobelia*, *Cynoglossum*, *Alchemilla*, *Rhododendron*, *Magnolia*, *Potentilla*, *Hypericum*, *Impatiens*, *Monotropa*, *Neotia*, *Orchids*, *Drosera*, *Dipsacus*, *Valleriana*, *Utricularia*, *Campanula*, *Tradescantia*, *Oxalis*, *Polygala*, *Gnaphalium*, *Rhinanthus*, *Euphorbia* and some others—most of which have species growing in Great Britain. The character is scarcely Hymelayan, but I am inclined to believe that its Flora accords so closely to the tract of land on the Neilgherries that three-fourths of either would contain the same species. We have not their rose it is true, which is

described as very beautiful footooning trees, but in either the *Rhododendron nobile* forms the ornament of the plains. From the elevated portions of Java there seems to be a marked difference in the absence of Oak and Chestnut and of course of various other productions.

The Plains of Nuwera-Ellia are very destitute of trees with exception of the *Rhododendron*. It is very beautiful when it flowers from May to July—the scarlet blossom are relieved by the brown inside the bell of the Corolla and by the silvery underside of the stem leaves—at other seasons it is a dingy tree like the Apple in height, with crooked knotted trunk, varying from 10 to 15 feet or even 25 and 30. When Arboreta shall have been introduced and Villas in Nuwera-Ellia, we may expect gardeners to give us many pretty shrub varieties of this tree with English species. Lord Carnarvon gained a celebrated Mule species by fertilising *R. Cataubrinse* with the Himalayan sp. *R. Arboreum*. It retained the flowers and color of *R. Arboreum* and had the leaves and hardness of constitution of *R. Cataubrinse*.

I have already remarked that S. American species of plants became naturalised with great facility in the lower tracts of Ceylon—such is the case at Nuwera-Ellia with the productions of New Holland, and almost all the other trees of its plains have been introduced from that country by Europeans. Of the jungle trees, scarcely any thing is as yet known, but some are doubtless those of the Kandyan hills, and of the rest a few, and these good ones have been discovered. I was fortunate in finding an arboraceous *vaccinium*—a sp. of *agapetes* with pink flowers. A description of the genus will be found in a letter from Dr. Wight to Sir W. Hooker, dated Pulney mountain. There is a beautiful tree creeper belonging to the *Melastomaceæ*, possibly a *Medinilla*, Blume;* the balsams of those hills are certainly of 8 or 9 different species, some are of great beauty and size, and one species forms the entire under shrubbery of many hills, as well as the Nilla, which is a didynamious plant. Air-plants and magnificent ferns abound and dwarf bamboos—on the rocks, mosses and from the trees white mosses drenching in the drifting storms add to the wintry aspect. The Kino tree, both red and white, is much used for firewood. I am not acquainted with its botanical name.

Europeans have cultivated several of our English vegetables with success, most however requiring to be renewed from England or the Cape after some years. Potatoes and Cabbages are really source of profit and of importance to the residents of the lower orders. The Cape Gooseberry (now naturalised) makes an excellent tart fruit with the wild Bramble. English fruit trees probably require great care and particular mode of culture to produce fruit, hitherto retardation of the sap has not been attempted, or if so successfully practised, but it seems to be the key to success. They should try fruit trees from New Holland and New South Wales and the Raspberry and Gooseberry from England.

Mr. Stewart Mackenzie judiciously tried the introduction of the Tea plant I have not heard with what success, or what steps had been taken to insure the climate and locality it is used to.

From a perusal of Mr. Robinson's account of the Tea plant in Assam, the plant appears to be of hardy character with respect to climate. I am inclined to believe that that of the Kandyan hills would be very suitable, having very much the Assam style of vegetation—possibly better than Nuwera-

* The blaze of rose-coloured flowers on this creeper which always runs up a tree-trunk, forms one of the most beautiful sights in our Ceylon jungles.—Ed. T. A.

Ellia. The great difficulty however exists in a locality. The requisites are excess of humidity amidst forests of dense jungle, where it grows in ravines and hollows near rivulets or pools of water. The soil should be light and porous, yellow or yellowish red over sand; it contains no carbonate of lime and the iron of the soil is almost wholly in a state of carbonate of iron—hence even in Assam and China tea-soils are comparatively of rare occurrence. The plant requires much rain and a bright sun.

I am not aware that Hops have ever been attempted to be introduced at Nuwera Ellia, they surely would succeed. As the neighbourhood is becoming more populous, possibly a Brewery might succeed.

That the grasses at Nuwera Ellia are of very inferior quality seems notorious—but surely are capable of great improvement. Were their quality good, the country is well adapted for pasturage—Cattle and Horses have great animal spirits, and there are no leeches. Vetches of different kinds are also appropriate to the climate.

The Flora of Adam's Peak is probably entirely similar to that of Nuwera Ellia—but not having level ground near the summit of the Peak, many of the meadow flowers have to be excluded, and possibly there are species which do not exist in the Nuwera Ellia country, for instance a new *Monocera* or *Elæocarpus* with purple fruit and entire leaves. The existence of species of *Magnolia* is an interesting feature. It however is probable that all the Indian *Magnolias* should be classed with *Michelia*. The existing sp. (two in number on the Peak) have the type of *Magnolia punilla*.

It was my intention to have added a list of descriptions of Rare Plants not named by Moon, but those daily increasing, I shall reserve them for some future opportunity, when our knowledge of what has been done by Indian Botanists is greater, which will prevent the confusion that might otherwise exist.

In conclusion, one word respecting the Government gardens. Let bye-gones be bye-gones, as is said in the North. Little undoubtedly has hitherto been done, and some of the leading requisites have been neglected and the Gardens require great attention and severe application from its new Superintendent to place them on the footing they ought to hold—but thanks to the liberality of our present Government, the aspect is beginning to change, and order will soon rubbish out the many rare plants and trees which are at present unnamed, and consequently unknown both in the gardens and in the beautiful series of drawings which have been amassed from time to time without name. Let us therefore hope to see *Peradenia* re-established as Kew has been in the—40's, and a taste for Botany revive in the Island, and when our Indian friends find we are really in earnest—they will not be backward in imparting to us the many treasures yearly added to their own gardens, and in shewing us how many neglected resources of wealth or utility exist in what is at present,—Unreclaimed Jungle Kandy, May 29th 1843.

TABLE 1st.

GENERAL FEATURES OF CEYLON VEGETATION.

Plants which being common or growing in masses form the general character of vegetation; from the Coast to an elevation of 2,000 to 3,000 feet above the level of the sea.

General temperature 70° to 80° Faht.

1. Predominating Tree like Plants.

Dillenia Speciosa, *Aquatica* & Sp. *Annonacæ* Sp. *Terminalia Catappa* and Sp. *Memycydon ramiflorum* and Sp. *Psidium pomiferum*, *Syzygium caryophyllum*, *Eugenia* Sp. *Jambosa vulgaris* and *Malaccensis*, *Calophyllum Inophyllum*, *Sterculia Balanngas*, *Bom-*

bax Malabarica, *Eriodendron anfractuosum*, *Pterospermum subetifolium*, *Thespesia populnea*, *Elæocarpus serratus*, *Grewia* Sp. *Citrus decumana*, *Limonia arborea* and Sp. *Moloccosm* Sp. and others, *Aurantiacæ*, *Croton Moluccanum*, *Euphorbia antiquorum*, *Erythrina Indica*, *Cæsalpinia Sappan*, *Poinciana Pulcherrima*, *Moringa Pterygosperma*, *Bauhinia tomentosa*, *Semecarpus Anacardium*, *Anacardium occidentale*, *Mangifera Indica*, *Morus Indica*, *Ficus glomerata*, *Religiosa*, *Indica*, *Elastica* and others, *Celtis orientalis*, *Artocarpus integrifolius*, *Incisa*, *Pubescens*, *Cassia* Sp. *Hernandia sonora*. *Cinnamonum* Sp. *Morinda citrifolia*, *Clerodendron infortunatum*, *Callicarpa lanata*, *Vitex trifolia*, *Negundo* and Sp. *Tectona grandis*, *Tabernaemontana dichotoma*, *Plumeria acuminata*, *Borassus flabelliformis*, *Areca Catechu*, *Caryota urens*, *Cocos nucifera*, *Musa* Sp. *Pandanus odoratissimus* and Sp. *Bignonia* Sp. *Meliacæ*, *Metroxylon Sagus*, *Carica Papaya*, *Bambusa arundinacea*, *Tamarindus Indicus*, *Ricinus communis*, *Bixa orellana*, *Spathodea Indica*.

2. Predominating Shrubs and Plants.

Cissus and *Vitis* Sp. *Osbeckia Zeylanica* and Sp. *Mukia scabrella*, *Coccinia Indica*, *Langenaria vulgaris* and other *Cucurbitacæ* *Modecca palmata*, *Passiflora fætida*, *Cardiospermum Helicacabum*, *Schmidelia Cobbè*, *Hibiscus Surattensis*, *Urena lobata*, *Abutilon* Sp. *Sida* Sp. and other *Malvacæ*, *Triumfetta angulata* and annua, *Ammannia octandra* and *Indica*, *Zizyphus Enoplia* and Sp. *Phyllanthus Niruri*, *Urinaria*, *Emblica*, *Croton lacciferum* and Sp. *Jatropha Curcas*, *Euphorbia* Sp. *Portulaca*, *Mulluga* Sp. *Toddalia aculeata*, *Impatiens* Sp. *Crotalaria Verrucosa*, *Laburnifolia* and Sp. *Indigofera* Sp. *Tephrosia purpurea* and Sp. *Desmodium triquetrum*, *Polycarpæa* and Sp. *Abrus precatorius*, *Flemingia strobilifera*, *Phaseolus* Sp. *Acacia* Sp. *Guilandina Bonduc*, *Cassia occidentalis*, *Tora* and Sp. *Bohneria Alientata*, *Piper* Sp. *Cansiera Scandens*, *Aristolochia Indica*, *Amaranthacæ*, *Menispermacæ*, *Ipomæa Zeylanica* and Sp. *Mussenda frondosa*, *Hedyotis* Sp. *Ixora coccinea*, *Pavetta Indica*, *Elephantopus scaber*, *Vernonia zeylanica cinerea*, *Peiadia balsamica*, *Bidens Chinensis* *Ocimum* Sp. *Leucas zeylanica*, *Indica*, *Stachytarpheta Indica*, *Lantana* Sp. *Barleria Prionitis*, *Justicia adhatoda*, *Gendarussa*, *Ecbolium*, *Betonica* and Sp. *Gratiola* Sp. *Datura Metel*, *Capsicum annum*, *Minimum*, *Solanum Indicum*, *Nigrum*, *Jacquinii* *Carisa* Sp. *Asclepias Curassavica*, *Calatropis gigantea*, *Hemidesmus Indicus*, *Zingiber* Sp. *Alpinia Cardamomum*, *Costus speciosus*, *Canna Indica*, *Gloriosa Superba*, *Tradescantia cristata*, *Axillaris*, *Dioscorea alata* and Sp. *Arum*, *Caladium*, Sp. *Pothos scandens*, *Cyperacæ* and *Glumose*, many Sp. *Tragia Chamæla*, *Lycopodiæ* and *Filices* many Sp.

On Trees, *Loranthus* many Sp. *Epiphytal Orchidæ*.

In Marshes and Ponds.

Pontederia Sp. *Nymphæa* Sp. *Nelumbium speciosum*, *Justicia* Sp. *Hydrolea zeylanica*, *Exacum zeylanicum*, *Villarsia cristata* and Sp. *Gonvolvulus reptans*, *Eriocaulon* Sp. *Gratiola* Sp. *Torenia* Sp. *Diceros* Sp. and others.

TABLE 2nd.

General features of the Flora of the Sea Coast near Colombo; elevation level of the Sea to 500 feet.

Ther. 80° to 86° Faht.

All the trees and plants of Table 1st, large topes of the Cocoa Palm add.

1. On the Sea Shore.

Argemone Mexicana, *Heritiera littoralis*, *Convolvulus Pes Capræ*,* *Bignonia salina*, *Rhizophora can-*

* This is the "goat's foot ipomea," which in the north-east monsoon months is covered with beautiful purple-red bells. Tennent, on his arrival at Colombo, found

delaria, Kandelia Rheedii, Brugiera gymnorrhiza, Calanchoe laeiniata, Dilivaria ilicifolia.

2. Marshes, Ponds, Meadows.

Burmannia disticha, Nepenthes Sp. Pontederia hastata, Xyris Indica, Cuscuta reflexa, Justicia repens Tenella, Ereeta, Lumnitzera racemosa, Drosera Burmanni, Utricularia vulgaris, Cærulea, Menyanthes Indica, Nymphæa stellata, pubescens, Pedalium murex, Pancratium zeylanicum, Serpicula verticillata, Typha latifolia, Lemna minor, Pistia stratiotes, Potamogeton lateralis.

3. Tree like Plants.

Cassia auriculata, Sumatrana, Glauca, Melastoma Malabathrica, Sesbania aculeata, Flacourtia inermis, Calophyllum Calaba, Scheleichera trijuga, Barringtonia speciosa, Aoutangula, Raemosa, Melia Azederach, Limonia citrifolia, Feronia Elephantum, Agle marmelos, Strychnos nuxvomica, Guatteria suberosa, Korinti, Grewia orientalis, Hippoeratea India, Dalbergia arborea, Acacia odoratissima, Cæsalpinia Mimusoidea, Ardisia solanacea, Mimusus Elengi, Kauki, Bsssi longifolia, Spathodea longiflora, Uvaria Narum, Eugenia parviflora, Averrhoa Carambola, Bilimbi, Cinnamonum Zeylanicum, Aromaticum, Annona squamosa, Nauclea Sp. Randia Sp. Phoenix farinifera, Caryota urens, Elate sylvestris, Cerbera manghas, Ichnocarpus Sp.

3. Shrubs and Plants.

Vinca rosea, Osbeckia aspera, Cissus villosa, Vitis latifolia, Repanda, Quadrangularis, Alysicarpus Sp. Nerium zeylanicum, Carissa spinarum, Olax zeylanica, Capparis horrida, Hibiscus cannabinus, Viti-folius, Phyllanthus rhamnoides, Multiflorus, Flemingia lineata, Glycine labialis, Parviflora, Dicerma pulehellum, Adananthera pavonina, Connarus monoearpus, Pinnatus, Rourea santaloides, Ixora latifolia, Parviflora, Ionidium enneaspermum, Bengonia tenera, Hugonia mystax, Indigofera viseosa, Enneaphylla, Aspalathoides, Canthium Rheedii, Gmelina asiatica, Heliotropium Indicum, Clerodendron phlomoides, Inerme, Premna Sp. Solanum insanum, Ferox, Sodomeum, Epaltes divaricata, Eclipta ereeta, Gynura lycopersieifolia, Loranthus loniceroides, Trichosanthes cucumerina, Bryonia, grandis, Momordica charantia, Antidesma Sp. Phaseolus earacalla, Trilobus, Sadiatus, Celastrus emarginatus, Abelmoschus ficulneus, Moschatus, Melastoma repens, Bumelia oetandra, Embryopteris glutinifera, Evolvulus Sp. Scavola Tacca, Koenigii, Sesamum Indicum, Ruellia Sp. temodia camphorata, Buchnera Sp. Hoya Sp.

TABLE 3rd.

Flora of the lower tracts of country surrounding Kandy 50 to 70 miles from the Coast, Elevation 1000 to 2000 feet.

Ther. 70° to 80° Faht.

All the trees and plants of Table 1st. The Cocoa Palm gives place to the Tallipot, Palmyra, and Areca Palms—add:

1st Tree like Plants.

Michelia Champaca, Uvaria odorata, Annona reticulata, Lcea stapylea, Cupania canesens,

the Galle Face ablaze with the blossoms. It was properly cleared away from the esplanade, but poor Wm. Ferguson, when living, cultivated and protected this binding plant on the seashore sands opposite the Galle Face walk. To the disgrace of the Municipal authorities they are now allowing the plant to be exterminated and the sands left bare to the action of the waves. In our drives we constantly see men and boys not only tearing the plant up but rooting it out with their dagger-like knives. It is taken away as food for rabbits and goats.—Ed. T. A.

(To be continued.)

MYSORE COFFEE PLANTERS' GRIEVANCES.—The agitation of the coffee planters in Mysore is at last likely to bear fruit. It will be remembered that the planters complained year after year that the working of the Breach of Contract Act was very defective and involved them in much loss. The Mysore Durbar have now partially redressed this long-standing grievance. It has been laid down that all *maestries* who take advances from the coffee planters and, in consideration of these, undertake to provide them with *coolies*, should register their names in the taluq cutchery and no one will be allowed to pursue the trade of a *maestrie* unless so registered. The effect of this ruling will be that the planters will be saved from the trouble of insinuating inquiries in each case as to the antecedents of *maestries* who volunteered to provide coolies, and erring *maestries* can also be easily called to account in case of default.—Cor., Madras Times, July 3,

CEYLON TEA IN LEAD PACKETS—
TEA AND THE HOME DUTY—
AERATED TEA.

LONDON, June 20th.

The following letter, which appeared in the *Grocer* for last week, shows how little the retail traders who deal in your teas have done to make themselves acquainted with the terms and conditions of the Merchandise Marks Act. It seems impossible to believe that any man, knowing how readily the provisions of that act may be transgressed and of the liabilities he may himself incur, should fail to carefully read it and guard himself in accordance with what he may find in it. And yet this "country grocer" seems to have got hopelessly muddled over the reports of the recent Segama case, and never to have thought of examining the act itself to find a solution to his difficulty. Mr. Leake, as Secretary to the Association, has this week sent a letter to the above-mentioned paper which will doubtless resolve the doubts of its not very bright correspondent, and it will prove to that individual that, provided he can prove innocence as to all intentional deception, and *bona fide* belief on his own part as to the genuineness of the teas he sells, he will be held scatheless under the provisions of the act. The following is the text of the letter referred to:—

CEYLON TEA IN LEAD PACKETS.

Sir,—Like many other grocers, I have undertaken the sale of the above, packed and labelled with high-sounding titles by well-known London dealers. I am pestered with appeals to take up other brands of the same class. These teas are variously described as "pure Ceylon," "Ceylon blends," "guaranteed three-fourths pure Ceylon," "a blend of Ceylon and other choice growths," &c.

But some recent proceedings in the law courts, reported in your columns, have awakened in my mind and, as I happen to be aware, in the minds of many other retailers, apprehensions which may be exaggerated or perhaps entirely unfounded. Suppose the Ceylon Tea Planters' Association—always on the alert to protect their interests and to pounce on the unscrupulous, the fraudulent, the mendacious, or the unwary vendor of tea—should take me before the magistrate on a charge of selling tea bearing a false trade description, could I be called upon to prove that the incriminated packets contained pure Ceylon or that there was, at any rate, some Ceylon tea in them?

No doubt I should be able to get half a dozen experts to swear that my tea was "pure Ceylon," or "three-fourths Ceylon," or whatever the exigencies of my case demanded and it is equally without doubt that the Ceylon Tea Planters' Association would be able to produce an equal number of duly qualified judges prepared to swear that my packets did not contain a leaf or a particle of Ceylon tea. The wholesale dealer from whom I bought the tea might then be called, and he being a man of mysteries, would reply that he was not prepared to divulge trade secrets, &c.

The point to which I would direct your attention, and upon which I hope to elicit practical trade opinion, is thus:—Whether misdescription—even if purchasers are not misled by it—as to quality and place of origin, without the assumption of the name or brand of any particular estate, is actionable and punishable?—I am, &c.,
A COUNTRY GROCER.

June 11th.

The leading men in the tea trade seem to think that there are at last some indications as to how the different tea-growing countries are likely to be affected by the late reduction by twopence of the tea duty. Few of us had thought it possible that these could be furnished

within so short a time, but it is evident that—whether due to the reduction or not—there has been a manifest change in the relative position of the various teas within the last fortnight or so, and it may be that experts have been right in the conclusions they have drawn from it. If these are correct, the view taken by myself and many others, that the reduction would prove to be favourable to China rather than to Ceylon or Indian teas, was a wrong one. This is what Messrs. W. J. & H. Thompson have written recently on this topic:—

"The probable effect of the reduced duty on values has been much discussed. Judging from the active demand, coincident with the reduction, and the advance in prices, the result has been favourable to the best teas, *i.e.*, to India and Ceylon, not to China. This tends to confirm the opinion held by some who are in close touch with consumers, that the public may take advantage of reduced retail prices to buy better tea; which agrees with our observation, often recorded, that tea-drinkers are learning to appreciate the benefit of using good qualities."

We hardly think, however, that you would do wisely to rely too unreservedly on this expression of opinion, though it has the *imprimatur* of such high experts as Messrs. Thompson. So many circumstances may contribute towards a disturbance for a time of the balance of the tea trade, that it is rather optimistic perhaps to found a decision without awaiting the result to a more lengthened experience than has as yet been available since the duty was reduced. The mere fact of that reduction alone can hardly be held to account for the late boom in Ceylon teas, which have gone up fully twopence the pound during the last fortnight or three weeks.

My last letter made reference to the new drink prepared from your staple production and which we have here called Aerated Tea, and not Sparkling Tea as previously mentioned by me. During the week opportunity occurred for me to taste this new drink, and my verdict upon it is decidedly very favourable. It opened as briskly as any champagne could do, and presented in the glass the appearance of the finest and clearest Alton ale—the aroma of the tea was quite perceptible to the nose, and equally apparent to the palate on drinking. It had something of the flavour of a raspberry sherbet, but without the cloying taste that beverage possesses. An old Etonian told me that, were his cricketering days to come over again, he could desire no more refreshing drink, it being in his opinion quite as staying, and infinitely more palatable, than the cold tea he always used to drink when playing. It is probable that it may be manufactured cheaply enough to warrant its being retailed at twopence the bottle; and should this be accomplished, we really believe it will run other temperance drinks very hard as a competitor in public favour and so conduce largely to the wider consumption of teas. We are assured that to obtain the delicacy of flavour so much appreciated by those who have as yet tasted the new drink it is necessary to use teas of the higher grades only. The commoner sorts would impart a roughness which would be much disliked. Mr. Wrightson, the patentee, gave me several particulars respecting his endeavours to produce this beverage which were of interest. He told me that former attempts made in the same direction have failed, as tea in solution is a very difficult article to guard against turbidity and requires most careful manipulation. He and the chemist who has been assisting him have been engaged on the required experiments for some years, and they believe they have now achieved complete success, and that the drink can be kept sweet and clear for almost an unlimited time. They are sending samples to the

principal doctors and analysts for report, and expect their full support, I am assured that "aerated tea" is made out of *pure tea*, no chemical essences or flavouring being used in its manufacture. By a novel process, an extract (which is also patented) is obtained, and from this—which will keep bright indefinitely by a preservative which is also a sweetener—the aerated liquor is finally prepared. It is entirely non-alcoholic. Mr. Wrightson further informed me that it is in contemplation to at once start a syndicate with a capital sufficient to thoroughly advertise the drink all over the country and then to sell to a larger company the patents obtained whenever it is thought desirable to acquire them. The patentees are now in treaty with certain moneyed parties, and have reserved the right to offer £1,000 of the capital to members of the Stanley-Wrightson Syndicate which manufactures the new tea chests. I think most certainly that the drink may become very popular, and that it is therefore likely to aid materially in the sale of tea both in this country and in those wherein cooling drinks are even more in demand than they are among ourselves.—*London Cor.*

JAVA COFFEE.

In view of the unfavourable accounts received recently concerning coffee production in Java a report on the subject to the Turkish Minister for Foreign Affairs at Constantinople by M. Werdmüller d'Elgg, a Dutch resident at Passeroan (Java), is of special interest. He deals with the production of coffee in Java during the last 30 years, and transmits with his report a note on the *Hemileia vastatrix*, the phyloxera of the coffee shrub, which has caused and is causing such great damage in the Indies. The *Board of Trade Journal* says that, according to the documents furnished by M. d'Elgg, the average production, in piculs, of coffee in the 19 residencies of Java has been, for periods of five years, as follows:—893,400 piculs in 1859-63; 797,000 piculs in 1864-68; 831,000 piculs in 1869-73; 899,000 piculs in 1874-78; 983,000 piculs in 1879-83; 635,000 piculs in 1884-88.

It will be seen that production has been very irregular during this period of 30 years; but until the 1884-88 period it was to be attributed to the ravages of the *Hemileia vastatrix*, the presence of which has been officially noted in Ceylon since the year 1869, but which has only penetrated to the heart of the plantations of Java towards the year 1884. In fact the three residencies which have most suffered from the insect are those of Semarang, Oberion and Madioen, which, having produced on an average during the 1864-68 period: the first 52,700 piculs; the second, 24,900 piculs; the third, 60,300 piculs; have produced during the 1884-88 period, no more than 27,300 piculs, 11,760 piculs, and 33,275 piculs, so that the average production of these three residencies has diminished by 50 per cent. for that of Cheribon, 53 per cent. for that of Madioen and 54 per cent. for that of Semarang.

M. d'Elgg adds that it has been found from researches and experiments that in Java, where coffee has been cultivated for 200 years, there is little ground for supposing that the cause of the decadence of this culture and the spread of the coffee disease lies in the soil or in the variations of temperature, but that it is simply due to the presence of the *Hemileia vastatrix*, a small insect borne by the wind, and which spreads quickly in every direction. A preventive method for combating this enemy of the coffee shrub need not be despised of, as people have tested the experiments of Doct'or Burek, director of the Buitenzorg Botanical Garden, who has used with success different solutions, such as borax, chloride of iron, tobacco juice, &c. ment- while the struggle is going on, but the use of the different methods has increased the general expenses of the culture and maintenance of the coffee plant.—*L and C. Express.*

GEMS AND PRECIOUS STONES OF AMERICA.

We have received from the Scientific Publishing Company of New York, a copy of a truly magnificent work, the scope and value of which are truly described in the accompanying letter, thus:—

"We take especial pleasure in announcing the publication of 'Gems and Precious Stones of North America,' by George F. Kunz. This book is pre-eminently the standard work of its kind and is indeed the only one which treats of the subject in a detailed and thorough manner. It is a systematic and at the same time a popular description of the several species and varieties of precious stones and pearls; their occurrence, value history and archæology. For the collector of precious stones and minerals it is especially valuable, the illustrations being all drawn from the finest known examples, and reference being made to the collections in which they may be seen. No work has ever appeared which furnishes to the archæologist and antiquarian so many references to the precious stones and pearls which have played an important part in early history.

"This magnificent work is profusely illustrated with the finest colored plates ever prepared for a book of this kind. The publishers have spared no expense to make this in every respect the finest example of American art."

Neither the value of the letterpress nor the exquisite beauty of the coloured illustrations is in the slightest degree exaggerated by the publishers, who have, with the author, reason to be proud of the addition they have made to the literature of America in general and of the science of mineralogy in particular. We hope, ere long, to have the pleasure of giving a more extended notice of this unique work.

ESTATE AND PLANTING NEWS.

The new Adjutant-General, Sir Redvers Buller, has severed his connection with Ceylon, having sold the estate Agrakande, so long managed by his late brother, to Lord Oheimsford, who, we are glad to see, is steadily extending his plantation interests in this Colony. Agrakande is a very desirable compact Dimbula property of 300 acres of which 257 are cultivated:—122 in tea, 110 in tea and coffee, 25 acres in coffee alone and with cinchona scattered over the place. The price paid has not transpired.

The experimental cotton plantation in the Matale district is named Florida and has 123 acres cultivated with cotton, out of a total of 152. The result of this experiment will be looked forward to with much interest as guiding future investments in plantations of cotton. If only the rich tank-irrigated lands farther North were made more accessible—by a railway—there can be no doubt that a large area would be put under this product.

THE CEYLON TEA PLANTATIONS COMPANY, LIMITED.

The following extract from the Prospectus published in connection with the call for preference shares is of general interest:—

The Ceylon Tea Plantations Company, Limited, was incorporated in December, 1886, and, for each of the three years since its formation, has declared dividends amounting to fifteen per cent per annum. The Company, the Ordinary Shares in which are held by comparatively few shareholders, has decided to increase its Capital by offering Preference Shares to the Public, and so provide funds for the cost and development of Estates recently acquired, and also to place it in a position to take advantage of favourable offers which from time to time may present themselves for pur-

chasing other properties. From the Chairman's long and close connection with Ceylon, and from the intimate knowledge of the planting districts possessed by the Managing Director and the Ceylon Staff, the Company has had exceptional opportunities of selecting and securing some of the best Tea Estates in the Island, and the Directors believe that these properties will materially strengthen the Company's position. The Estates are all Freehold, and the following is a Schedule giving the acreages, districts, and elevations. Those marked thus * are the more recent acquisitions. (Then follows a list of 14 estates aggregating :—

Tea in bearing Dec. 1889.	Tea not in bearing.	Approximate acreage to be planted with Tea in 1890.	Coffee.	Jungle, Pareira, Waste, &c.	Total Acreage.
acres.	acres.	acres.	acres.	acres.	acres.
3,815	1,095	392	127	2,328	7,760

The small acreage under *Coffee*, at the present value of the product, yields satisfactory returns, and in addition to the area planted with Tea and Coffee, there are many thousands of *Cinchona* trees on the properties, which are also expected to prove a source of revenue, as practically no further expenditure is necessary for their cultivation.

The Company is doing a large and remunerative business in manufacturing Tea for other proprietors, and also as agents, making advances against crops, and in carrying on a commission business in all matters relating to Tea Estates.

The net profits earned last year were £23,370 14 8, and, it is expected, with the additional area under Tea, the profits for the current year, on a carefully prepared estimate will amount to £29,000. This would leave fully EIGHTEEN per cent available for dividend on the Ordinary Shares and for Reserve, after setting aside sufficient to pay interest on the Preference Shares now offered.

OUR INTERVIEWS.

THE BUDGET AND THE TEA TRADE.

A TALK WITH A TEA EXPERT.

Whether Mr. Goschen foresaw the extensive development of the tea trade which would follow when he made his Budget proposal to reduce the tea duty by 2d per pound, is open to question; but the fact remains that there has been a very substantial increase in the deliveries, for on comparing the months of April and May (that is the month before and the month after the introduction of the reduced duty) with the same months of last year we find the important increase of more than five million pounds. In fact, the result of the reduction of the duty justifies the contention of the free traders that increased trade follows removal of duty, although no doubt something is also due to the growing popularity of "the cup that cheers," and the increased, sobriety and temperance of the people. The increase which during recent years has taken place in the production of tea has entirely revolutionised the tea trade, for the total supply of this country, which not long since was derived from China and Japan, is now principally drawn from India and Ceylon. The greater portion of the China crop has been gradually diverted to other countries, in many of which, even at the present time, it continues to be more appreciated than the less known produce of India and Ceylon.

These facts were accentuated in an interview which the representative of *The Oracle* had a day or two ago with Mr. Wilson, a well-known tea broker, and a member of the firm of Gow, Wilson, and Stanton of Rood-lanc.

"Yes," commenced Mr. Wilson, "the deliveries for April and May were immensely heavy as compared with previous years, though it did not surprise me, as I know the way in which the trade has been growing. Some of the increase may be accounted for by the fact that a good deal was held over for the Budget, but even making allowance for that, the increase was very heavy."

"What will be the effect of the reduction of the duty?"

"It will benefit good classes of tea at the expense of the bad ones, by causing the demand to increase for the former, and decrease for the latter, hence it will help British grown tea, and the result will be that eventually China tea will be

SQUEEZED OUT OF THE MARKET.

Indian and Ceylon teas are much stronger than the Chinese article, so that it is really a battle between the weak and the strong, and we know which must go to the wall."

"What do you think is the position of the public in regard to the reduction of duty?"

"I think the public are buying better teas; that is to say, they are paying the same price, but getting better tea for their money. The 2d. is really, at this moment, being divided between the planter and the consumer, but you must not forget that owing to the rise in the price of silver, the cost of production has gone up quite to the extent of 1d. in the pound of tea. I think the Silver Bill will have an effect on prices generally. The exact figure is 12½ per cent added to the cost of production by a rise of 2d. in the exchange value of the rupee. All produce which comes from the East will feel the results of the rise in the price of silver, and if it goes too far there are many tea gardens which will not pay to work. That will very likely make

A CRISIS IN THE TEA TRADE.

In all the principal tea-producing countries, labour, and everything else, is paid for in silver, and if the price of silver goes up, it will make everything dearer, machinery and all.* To show you the growing importance of the Indian tea trade, and the decay of the China trade, I will give you the figures for April and May in this year. In April the deliveries in China tea amounted to 4,685,000 lb. which increased in May to 11,510,000 or about double. In Indian tea, in April the deliveries were 5,155,000 lb. which increased in May to 14,492,000 or nearly three times the amount of last year; while in Ceylon tea the deliveries rose from 1,334,000 lb. to 5,019,000, or nearly four times more."

THE ANNUAL RETURN.

"These figures complete the statistics for the season 1889-90, and show that India and Ceylon have expanded their deliveries—India having increased 16 million pounds within the last two years, and Ceylon having more than doubled in that period. On the other hand, the deliveries in China teas have fallen from 116,810,000 lb. in 1887-8 to 87,600,000 for the season just closed. The Foreign Office report, just issued, on the trade of Tamsui for the past year, says: 'The tea season of 1889 has been most unsatisfactory, both to foreign and native merchants. The teas of the island, which formerly had a distinctive character, are rapidly losing it, owing to the reckless competition amongst Chinese buyers for the Amoy market, and the careless preparation and fraudulent admixture by them of the teas after they have come into their hands from the growers. With the increasing competition from India, Ceylon, and Java, in the opinion of those most competent to judge, the

DAYS OF THE CHINA TEA TRADE ARE NUMBERED, unless steps are taken by the Chinese themselves in the direction of radical reform."

"Will the loss of the English trade affect China to any appreciable extent?"

"Oh, no! 100,000,000 lb. of tea is but a small drop in the ocean of what China could produce. Their own population consumes hundreds of millions of pounds. There is no necessity for China to send us tea at all." †

* Most of the machinery is imported and paid for in rupees the full equivalent of its gold price, so that we cannot follow Mr. Wilson here.—Ed. T. A.

† Except in this way: that not being able to pay in tea for English goods, she will have to pay more in the shape of silk or some other product, or in money. Or the Chinese will cease to consume much of English manufactures which they now use. In Canton, a city of over a million people, we saw very little of English goods in the shops.—Ed. T. A.

"How is the tea arranged for?"

"It is done in this way. A middleman goes up the country early in the year, and arranges for so much tea to be sent down to a given port. This is brought down and prepared for the European market by being what is called "fired," that is, dried on a plate. This process fixes the active principle in the tea, and kills the fermentation which would otherwise take place, and allows it to be shipped and carried to its place of destination. It depends on the price got for the first crop as to whether it is thought worth while to bring down other crops."

THE BATTLE OF THE TEAS.

"Twenty-five years ago," proceeded Mr. Wilson, "our supply of tea was drawn almost entirely from China and Japan, and British-grown tea was then struggling into existence, though the cultivation of the plant in India was just becoming known in the commercial world. The growing appreciation of Indian tea by the British public so steadily encouraged this new industry that the article gradually cheapened: tea was thus brought within reach of the masses of the population, and its consumption greatly increased. Indian tea was found to possess qualities which imparted such strength and character to the weaker liquors China teas, that it was largely used for blending. China tea reached its highest point in 1879, when about 130,000,000 lb. was consumed in this country, but since that time it has rapidly decreased, while Indian and Ceylon teas have as rapidly grown. You can see quite clearly this fact in this diagram, which shows the rise and fall of the two classes of tea with black and red lines."

"Do you think the reduction of the duty will continue to benefit British-grown tea?"

"Yes; we think it will do Indian and Ceylon teas good at the further expense of the China tea. Notwithstanding an advance in price, since April, of from 1d to 2d per pound in Indian and Ceylon tea, there has been no advance in the price of China tea, even when the Budget proposals became known. There was a strong feeling when the reduction was announced, that China tea being cheaper, there would be a run upon them, but the public evidently know when they

GET HOLD OF A GOOD THING,

and having to let Indian and Ceylon tea they do not care to go back to their old love."

"You think the public taste is now settled in favour of British-grown tea?"

"Oh, yes, and a man who once gives his customers Indian tea cannot get them to return to China tea."

"Where do the greatest tea drinkers exist?"

"In Australia and New Zealand, where the annual average consumption in pounds per head is 7-66. In England it is only 4-70, while in Canada it is 3-69. No European country approaches that amount of tea drinking. But in spite of the increase in the use of tea the production has run ahead of consumption, and no high but the speedy opening of new markets can check the downward course of prices. Russia in spite of her large consumption takes very little Indian or Ceylon tea, but confines herself almost entirely to China tea, and consumes large quantities of the very finest and medicinal flavoured descriptions. Indian tea have now been introduced all over America and Canada, and are doing well, and their teas are now making the same strides abroad as at home."

"Are there special advantages in the preparation of Indian tea?"

"Yes, it is a perfectly clean tea. It is prepared entirely by machinery, and is never touched by the coolies from the time it is picked to the time it is drunk. There is machinery for everything. The China tea is manipulated by hand entirely, with no European supervision at all. It is never seen until it comes to the ports for sale, and they can put any sort of leaf in, and pass it off for tea. At one time green tea was

FACED WITH STEEL FILINGS,

and we used to keep a magnet in the office to test it with."

"As to the future of the trade?"

"Well, he who deals with futures is generally wrong, but my opinion is, and I think I am right this time, that Indian and Ceylon tea will gradually abolish the Chinese article. Mr. A. G. Stanton, a member of our firm, has just returned from a visit to the United States and Canada, undertaken in a great measure to ascertain the present position of the trade in British-grown tea. He says it is surprising to see what rapid strides have been made there by these teas. The industry is taking firm root there, and he feels sure that before many years have passed, the United States and Canada will be markets of considerable dimensions. Ceylon tea, he says, has certainly hit the American public taste, and the development of the trade will no doubt give better average prices to the planters."—*The Oracle*.

PLANTING IN DELI.

Throughout Deli in May the weather proved highly favourable for planting, though heavy rain fell on several estates. Most of the planters profess themselves highly satisfied with the outlook. The growing crops bear a promising appearance. On some estates, where planting had begun early, the tobacco is already in the drying sheds: Holt's company this year shipped 118,000 bales of tobacco against 87,000 during the corresponding period of 1889. The Deli Company reports a career of prosperity in 1889 on the sixteen estates in its hands, and congratulates the shareholders on the success of the efforts to secure coolies direct from China, though at excessively high rates which are expected to fall ere long. The quality of those from Amoy leaves so much to desire, that the planters will not have any more from that port, but the Government sets so little store by this feeling as to choose that city as station for the Netherlands Consul in South China. The company has not yet been able to engage Tamil coolies, owing to the Government delaying in concluding an immigration convention with the Indian authorities. It has too, an eye for higher things than tobacco planting, and has co-operated in a movement to station among the free Battaks in the interior a Protestant missionary to counteract the Mohamedan propaganda now busy among them. A worker has already been chosen, and funds for three years' trial under his supervision have been collected. The continuation of the work after that period depends upon results.

The Chinese coolie who murdered Dermont, the estate assistant in Assahan, has been sentenced to death by the Criminal Court there. The execution will take place at the scene of the crime.—*Straits Times*, June 25th.

THE WESTERN FRONTIERS OF CHINA AND THE RIVAL INDIAN AND CHINA TEA TRADES.

A lecture delivered last month before the Society of Arts, by Mr. D. C. Boulger, the historian of China, will be read with much attention by everybody who is interested in the relations between China on the one hand and the three great European powers that are now, as it were, knocking at her western and southern gates, that is, Great Britain, France, and Russia. Apart from the desire of Great Britain to see the expansion of Russia checked in Central Asia, the Tibetan question will be watched with great interest by Indian traders, and principally by the tea planters of Assam, who are at present debarred from competing with the Chinese monopolists of one of the best tea markets in the world. On this subject, however, Mr. Boulger does not touch. Writing over twenty years ago on this point, Mr. T. T. Cooper, in his well-known 'Pioneer of Commerce,' said that, with an open trade route, the Assam teas would drive

the China brick tea from Thibet. Chinese exclusiveness and the desire to preserve their monopoly has shut out Indian teas up to the present, and we fear that, having regard to the great injury done to the China tea trade in the foreign markets by the teas of India and Ceylon, the planters of Assam and Darjeeling must be content with casting longing, lingering looks at the mountain barriers of Thibet, and must not hope for any immediate opening for their teas in that market. That Mr. Cooper's view is the correct one is shown by the recent annual report of the Imperial Customs of China, where it is pointed out that Indian teas have quite driven Obinese teas out of Turkestan, where they latter had a practical monopoly a few years since.—*Rangoon Gazette*, June 16th.

FAILURE OF COFFEE ROASTERS.

(Official Receiver's Department.)

RE J. AND C. COLLIER.

Accounts have been issued under this failure showing liabilities 37,078*l.*, of which 9,380*l.* is unsecured, and assets 8,163*l.* The debtors, trading as "James Collier & Sons," coffee-roasters, &c., of the Commercial-street Steam Mills, also as "Walker and M'Letchie," manufacturers of liquid extract of coffee, at Great Pearl-street, joined their father in partnership in June, 1877, the capital of the firm amounting to 7,824*l.* The failure is attributed to losses by depreciation in the value of their business premises and plant, &c., to losses by consignments, to bad debts, and to heavy interest on mortgages. The "fully-secured" creditors hold mortgages on the debtors' freehold premises, and those "partly-secured" hold dock warrants for cocoa and chicory and a second mortgage on the Commercial-street premises. The first meeting is fixed for the 24th instant.—*Daily News*, June 19th.

PLANTING IN NETHERLANDS INDIA.

(From the *Straits Times*, June 18th.)

The Planters' Association at Sukabumie in Java have petitioned the Governor-General to allow the army in Netherlands India, in future, to draw its supplies of tea from local producers. The Chinese tea in use among the soldiers turns out to be bad and of low quality. The planters call attention to the strangeness of the fact that, while Java produces excellent tea, the army purveyors give the preference to inferior Chinese kinds.

The indigo outturn in Java shows signs of being 20 to 25 per cent below the crop of 1889. The falling off is said to be due to degeneration in the plants under cultivation.

Mr. E. L. Gordon, the pioneer concessionary of the Western Borneo Goldfields, has been recently to Batavia after starting a mining company in London with a capital of £300,000. The Company has eight Europeans at work in Montrado, who have already prospected with promising results.

In East Borneo, by last advices, European enterprise has made further headway than is generally known, but want of labour works as a drawback and trammels success in prospecting the gold and diamond mines there. The *Batavia Nieuwsblad* states that both the Rajah of Pasir, and the Rajah of Cotie in East Borneo, have decided upon leasing wasteland in their dominions on easy conditions but, unfortunately, delays of office which demand the consent of the Governor-General to each concession stand in the way of much advantage being taken of their liberality.

Mongoosees have been imported from India into the province of Kedirie in Java, to clear away field rats and other vermin which destroy the crops there.

On the 1st May last, the blockading squadron on the coast of Acheen consisted of nineteen vessels.

COOLY LABOUR.

(From a Planting Correspondent.)

The question of cooly supply for the coffee districts is getting beyond a joke, and Planters cannot cope with it without assistance. Do what we can with our Planters' Associations, appeal as we will to Government, the deaf ear is always turned to us, and help in any shape or form denied us; and yet if Government would only look at it in the light of Rs. As. Ps., it would see that the coffee industry has more to do in filling the treasury in coffee districts than it seems to imagine, besides the benefit that other districts derive therefrom. How many coolies do the coffee districts in Southern India annually employ, how much money do those coolies take away yearly to spend in their country? Almost every head of a house now owns land, and how did they accumulate the money to pay for it, and the yearly tax? Why, only by working on coffee estates. The advance they get buys the land, and one or two of a household are left to attend to it and one or two come to work off that advance, and help to pay the tax. What are the imposts in grain, fruit, salt, coconuts, beetle leaf, cloths, glass, bangles, &c., &c., &c., in a place like Coorg whilst the district is in full swing? Let Government enquire of the Commissioner, and then judge whether or no coffee as an industry is a thing to be lightly passed over. Take an estate of 300 acres, which should have one cooly an acre by rights for its proper working, and given that each cooly spends R4 a month in the district itself, that gives R1,200 a month, or a given sum of say, in eight months, of R9,600. Then say that each cooly saves R2 a month, that gives—to be taken to their country or held pay off the advance given,—say R4,800. This is only on one estate, and the number of estates in Coorg include large acreages now, belonging both to Europeans and Natives, so that the annual amount spent for working alone is immense, besides the work given, during crop; to bandy contractors for the conveyance of crop to Mangalore, Tellicherry and Bangalore. In fact if Government would only choose to take a little trouble and go carefully into things, it would be astonished at the figures, and the amount of money expended by coffee planters for the benefit of the country, exclusive of the very handsome amount paid into the Treasury on coffee assessment, income tax, bani tax, &c., &c. What was Coorg years ago before the country was opened out, and what is it now? This I will leave to Government reports. Yet now a crisis is coming, and it is either recovery or death, as the planter cannot fight on singly much longer, for the want of labour is telling most emphatically on most valuable property. The planters have no hold over maistries to whom money has been advanced has been shown over and over again; and planters as a body have again and again tried to get help from Government in such cases. The last endeavour was that all maistries should have a registered certificate from the parpityar, or subadar of their villages as to their being persons to be trusted to bring in labour. Not a very great request this, but we might as well appeal to the gods of the heathen, as to a Government which takes all it can get from its struggling off-pring and gives nothing in return.

What is the use of planters struggling on against such odds? In bad years ryots get a deduction in tax money. Do we? No, our places may be going back from short crops and not sufficient labour to work them, but to ask for a reduction in tax would be the height of insult, and the reply would be equivalent to, "No, you are not natives, to them we grant every thing asked, to you not the stretching forth of a little little finger." Where is the use of planters spending money year after year in supplying their estates when it is too late? At the beginning of June everything should be ready for this all-important work, but now-a-days there is not a cooly in, they are quietly reposing in their country, daily attending to their fields, and eating the planters' advance whilst we are longing for them to come. Our work is all behind, our coffee is all in weeds, which are eating all the manure we have put in for the benefit of the

coffee; not a pit has been made for next year's supply, that should have the whole benefit of the short monsoon we have, and so another year is lost. Nothing can be done to the maistry for breaking his agreement by not coming in by the 15th of May, and so we are the losers year by year. And what is the consequence? Fields that could have been planted had labour been in have to be abandoned, for there is no use of thinking that it is borer that is decimating the estates; it is want of labour at the right time. Where is the use of supplying at all when it has to be done at the end of July, and after the middle of August, when the place, too, is as full of weeds as it can be, that only choke the supply before a weeding can be done; and how can pitting be done properly in weeds three feet high? Every work must be done in its order, and yet this is an impossibility now. If we do not get supplies up, there is no use continuing in coffee, and that we have a poor enough chance of getting them up is universally felt by all. Besides when the first and principal work is so far behind, all the other works suffer in consequence. Shade is, to a large extent, required and must also be planted out early, but this has to be given up generally (a work second to supplying). Then digging and all turning of the soil, should be done during the rainy season, and this has to be left till the end of the monsoon. And why is there all this loss of time, simply owing to the fact of the labour supply not being sufficient or rather no labour in at the first, and whose fault is it? Superintendents are blamed, but it is no more their fault than the man in the moon's. Cooly pay has been increased this year as an inducement, but the Mysore cooly is far too well off in his country (having fattened on his gains, from the coffee district) to trouble about coming in, and when the maistry, from whom he has taken advance, goes to his village to call him to go to the estate, he flatly refuses, knowing very well that he cannot be compelled, although he has signed an agreement to work from a stated time to a stated time, generally from eight months to a year on the estate. Coolies, before being paid off in March, are only too eager to take an advance; but let them go to their country, and it takes no end of persuasion to make them make up their mind to return. Can nothing be done to help the maistry, when in his country, to force the cooly to return or have him fined, there and then or imprisoned? What is the use of warrants being issued when the maistry must first go to the coffee district to a Magistrate there before he can get one for the cooly, and then the warrant never can find him, and the maistry is so far from him, he cannot go to look for him, as his work is on the estate, looking after what coolies he may have brought in with him. The evil that this men-catching by warrant is invoking is now widespread, as coolies are knowing enough now to elude any warrant sent, and so laugh at the whole proceeding. Now, I ask, is it just or fair that Government should let valuable properties suffer by not giving some small assistance to the planters, for in the end it will be the loser as well as the planter who has done his best, and yet lost money by spending it in this country in coffee when so heavily handicapped. Let there be a famine in the Mysore district, as there was some years ago (which God forbid) and we will have shoals of worthless people come to us for the sake of food, and Government will be glad that the people are provided for and off its hands, and that the planters who have been so in need of labour will now have their estates worked for them. What would Government not have given to have had some thousands of people provided for during the famine in Ganjam, and that we can employ thousands there is no doubt. Why should Government send cooly labour to foreign countries when it is so much needed nearer home? Coolies don't like to leave India, then why not arrange with us? We can employ them but must have as good arrangements made with us as is made for those who got labour sent them outside of India. There is an immense field here, for Mysore labour is failing us utterly, and to get labour from over-populated districts would be a boon to distressed coffee planters.—*M. Mail*, June 27th.

NOTES ON POPULAR SCIENCE.

BY DR. J. E. TAYLOR, F.L.S., F.G.S., &C.,
Editor of *Science Gossip*.

PLANTS—GUM TREES—CORAL.

A German botanist, who has been for some time engaged upon the mathematical study of the contrivances for hindering the descent of parts of plants to the ground, and for favouring their aerial transit, sums them up as follows:—1, Dust-like (Schizomycetes, fungi, and fern spores, &c., and the pollen of wind-fertilised flowers); 2, fruits furnished with bladders (as in many of the orchids); 3, hair-like seeds; 4, disc-like and flat (like the fruits of the elm and some of the lilies); 5, parachute seeds (like the hosts produced by composite plants, and others in the Dipsaceous and Plumbaginaceous orders); 6, cylindrical and winged (like the fruits of many of the Polygonaceae); 7, fruits with ridges giving a sail-like form (like those of *Allanthus*); and 8, samaras, as the well-known fruits as the ash, maple, &c., are called, whose structure enables the wind to carry them away with the screw-like motion. The remarkable thing is how so many plants which have not the slightest botanical relationships to each other have managed to hit upon the same identical devices—to take out the same patents, in short.

You do a good deal of "ringing" in your gum-tree forests in Australia. There is no sight which struck me more out there (with rather a melancholy impression) than the dead, standing forests of ring-barked gum-trees, looking so weird that Gustave Doré would have been delighted to have sketched them some moonlight night. They seemed to me like so many vegetable ghosts. I am reminded of my experience by reading some remarks made by a German professor of forestry on the subject. He goes in for "ringing" scientifically, and shows that the ringing of branches produces a more active growth above, and a less active growth beneath the ring. Starch is usually entirely absent from the portion below the ring, whilst oxalate of potash is usually most abundant there. Of course, the German foresters "ring" their trees to do them good, not to kill them so as to clear the land.

In a recent paper read before the Royal Society of Edinburgh, Dr. John Murray, of "Challenger" fame, discussed the question at the origin of coral reefs and other calcareous formations in recent seas. Calcareous remains are found in great abundance at the sea bottom in shallow waters, but the amount steadily diminishes as the depth increases, until at four thousand fathoms almost every trace has disappeared. Dr. Murray thinks this is due to solution as the organisms slowly fall to the bottom. Within five hundred fathoms of the surface the ocean everywhere teems with life. This is an important fact to record, as the ill-fated "Greely Expedition" actually starved within ten feet of abundant food, which might have been obtained by breaking a hole in the ice and using a shirt as a drag net. Dr. Murray is of opinion that the chief reason why there is such an extraordinary growth of coral in tropical regions is because carbonate of lime is continually produced in large quantity by the action of sulphate of lime in solution on effete products, and that the absence of coral reefs on certain shores is explained by the uprise of cold water due to winds blowing off shore.—*Australasian*.

COMPRESSED TEA.—The *Kew Bulletin* for June contains an account of the manufacture of compressed tea at Hankow. This tea is in use throughout Russian Siberia, and is made of tea dust compressed by steam power, and differs from the brick tea of Tibet, which is made of the entire leaves pressed together. The Timber trees of the Straits Settlements are next passed in review, the notice being founded on the collections of the late Dr. Maingay. The remainder of the part is taken up with correspondence, showing the desirability of extending the cultivation of Cotton in West African colonies.—*Gardeners' Chronicle*.

BARK AND DRUG REPORT.

(From the *Chemist and Druggist*.)

LONDON, June 19th.

CINCHONA.—The fortnightly auctions were held on Tuesday, and consisted of a moderate assortment, the catalogues comprising the following quantities:—

	Packages	Packages
Ceylon bark	1,455 of which 1,172 were sold	
East Indian bark	524 do	435 do
Java bark	46 do	45 do
South American bark (Calisaya)	370 do	132 do

Total 2,395 do 1,784 do

A fairly satisfactory tone prevailed throughout the auctions, and occasionally competitions become rather brisk, a great many lots being divided among two or more buyers, one firm cutting in as soon as another attempted to drop the price. The prices realised were rather irregular, but the average unit is placed just a trifle above that of the last Amsterdam sales, say at 1½ to 1½d per lb. for fairly good bark. The Ceylon barks offered did not include anything of particular interest, although there were several parcels of good *Officialis* bark among the supply. From India there was a fair assortment, and several parcels of renewed red shavings and chips sold at unusually high rates. The South American barks consisted exclusively of Bolivian Calisaya quills, which are gradually becoming a feature of some importance at our auctions. It may be mentioned that the supply of root bark at the sales was comparatively heavy, the total weight of this description of bark being nearly 50,000 lb.—mostly *Succirubra* from Ceylon.

The following are the approximate quantities purchased by the principal buyers:—

	Lb.
Agents for the French, Italian, and American works	110,588
Agents for the Mannheim and Amsterdam works	106,089
Agents for the Brunswick works	65,693
Messrs Howards & Sons	56,373
Agents for the Auerbach works	45,445
Agents for the Frankfort o/M and Stuttgart works	23,651
Mr. Thomas Whiffen	18,485
Sundry druggists, &c...	37,245

Total quantity sold	463,569
Bought in or withdrawn	117,416

Total weight of bark offered ... 580,935

It should be well understood that the mere weight of bark purchased affords no guide whatever to the quinine yield represented by it, firms who by a small quantity of bark by weight frequently taking the richest lots and *vice versa*. An analysis of the catalogues gives the following prices for sound bark:—

QUININE.—Lower. At the beginning of the week no business was reported, but yesterday and today about 40,000 or 50,000 ounces; B. & S. and Brunswick have been sold by second-hand holders on the spot at 1s 1½d per oz.; that is the market quotation today.

TEA SCALE-INSECT.

Mr. E. C. Cotes wrote regarding the tea scale insects received from Kangra, that Mr. Atkinson identified them as of the family *Coccidæ* and Genus *Ceroplaster*, probably a new species, and that they had been sent to Mr. Maskell for examination and descriptions, if new. Mr. Cotes also asked for further specimens, especially those showing the different stages.

Mr. W. H. Miles sent the following note on the Tea Scale-insect which has been recently observed in the Kangra Valley. As coegenous pests which have attacked the Orange and Coffee have done such serious damage, members observing this new enemy to tea are requested to communicate with the Society on the subject, and to collect specimens of the insect in all its stages so that it may be identified, and more of its life history known:—

Since 1868 when they first began to attract attention,* the family of Scale-insects have made themselves notorious as one of the most dreaded and destructive of all the known enemies of plant life. First noticed in Australia, they travelled on to Cape Colony, and finally appeared in California, and as soon as they had established themselves in a new district proceeded to spread in all directions. In Cape Colony and California the principal sufferer was the Orange tree,

* The ravages of black or brown bug on Coffee were noticed in Ceylon nearly thirty years earlier than 1868, and were the subject of an elaborate report in 847 by the government botanist, Dr. Gardner.—Ed. T. A

and so great was the damage done, that many owners of Orange groves were ruined. In Ceylon, the Scale-insect has done immense damage to the coffee-plant, and many plantations have been closed in consequence.

In order to mark its coming of age, so to speak, it has turned its attention to tea, and already it has done no inconsiderable amount of damage to the hushes. It first appeared on two gardens in the Kangra Valley in the early part of this year (1889) and has since been reported from Assam, but there is nothing to show the manner of its introduction in either district. There is reference in Part I, Vol. 1. Indian Insect Pests, to a new coccid found on Cinchona in Sikkim which matures about April, and as the Scale-Insect was first observed on tea about that time, there may be some connection between the two.

There is little to describe about the [actual] insect, as it has not yet been observed in a free state. When a plant is attacked it soon becomes covered with little brown scales about one eighth of an inch in diameter, which adhere closely to the stem of the plant, but can be easily removed by inserting the blade of a penknife under them. Under the microscope these appear to be cases only, as there is no structure apparent, and in several I have detected a small puncture through which I imagine the imago escaped. The insect appears to be most active in bright weather and almost disappears in the rains. Some specimens forwarded to me in November last were of quite a different character to those described above, the scale being soft and pulpy and covered on the outside by a thick coating of soft white wax-looking substance. This may prove to be the female.

Its effect on the tea-plant is somewhat similar to that caused by the tea-bug, but more marked, as the Scale-insect appears to absorb the juices of the plant through the stem, and the bush immediately begins to sicken, and would soon die down unless prompt measures were taken.

The most effective remedy is the kerosine emulsion which has been used with very good results in the United States and Ceylon, against the forms of Scale-insect attacking the Orange tree in the former and Coffee in the latter country.

The formulæ for preparing the Kerosine emulsion recommended by the U. S. Department of Agriculture, were reproduced in Vol. VII, Parts II and III of the Society's Journal.

I have already discovered a parasite of the Scale-insect which closely resembles *Coccophagus californicus*, figured in the Periodical Bulletin of the U. S. Department of Agriculture, division of Entomology, for March 1889. Though it may take some time for it to develop properly in order to be an effective enemy of the Scale insect, it is satisfactory to know that it is in existence.

This short note is merely intended to draw attention to a subject which may occupy a prominent position in the near future. Though not wishing to appear as an alarmist, I fear that tea is threatened with a new danger, which may do more harm than any of its predecessors, judging by what has happened in other parts of the world. I would seriously impress on all connected with this great industry, more especially managers of gardens, to be on the alert, and at the first indication of this pest, to adopt remedial measures at once to stamp it out, otherwise there is no telling what the consequences may be.—*Proceedings of the Agricultural Society of India.*

COTTON.—In the Northern and Western parts of Mysore a species of cotton plant grows known to the natives as the *depathi mara* or candle plant. The seed pod is about two to three inches in length and divides in three sections when ripe, each section containing a cluster of seed closely packed with cotton wool. If the narrow end of the section be lighted, it will keep a flame for about ten minutes, the seeds giving off a large quantity of oil. The cotton is of no use for spinning, the yield from each pod being extremely small.—*Indian Agriculturist.*

THE RISE IN CEYLON TEA EXPORTS.—Very striking is it to see in printing off a table of Staple Exports of Ceylon for 53 years from 1837 to 1889 inclusive, for our Handbook, that *Tea*—now the greatest of all—is first entered in 1873 for 23 lb. exported, and this has developed in 17 years into 34,346,432 lb. valued by the Customs at £1,786,014 in 1889!

CINCHONA BARK FROM FIJI AND THE WEST COAST OF AFRICA was offered at a recent London sale; and Messrs. Brooks & Green report on the same:—113 packages from West Africa, weighing about 6 tons, were included in the auctions 22nd April: the quantity was rather above the recent parcels and sold from 4½d to 6d a lb. 6 bales Fiji bark, quality poor, 4 bales sold at 2d a lb.; 2 bales at 3d a lb.

GRASS CROPS AS AFFECTED BY MANURE.—Good feeding grass and shelter are the main desiderata in stock rearing in Ceylon, and it is interesting to find Sir James Caird in a review of British agriculture stating that the experiments of Sir John Bennet Lawes had shown that the natural produce of grass may be doubled and even trebled by the continuous use of special manures. Trials in this direction and in that of growing superior pasturage by irrigation are needed in Ceylon.

CREOSOTED TIMBER.—We occasionally receive complaints from gardeners and their employers concerning the injury done to plants when creosoted timber is employed in the construction of plant-houses, and the impossibility of minimising the injury by any known means. Mr. Archibald Mackie, gardener, Rosehaugh, Avoch, Ross-shire, writes, that his structures, consisting of Orchid and Melon-houses, vineries, ferneries, are constructed with creosoted timber, which causes no injury to the plants contained in them, although the creosote oozes through the paint, and is very perceptible to the sense of smell. We should be glad to have the experience of gardeners and others who have had charge of plants in houses built of timber similarly treated.—*Gardeners' Chronicle*.

QUININE.—It is a curious fact—says the *H. & C. Mail*—that while the annual supply of quinine for the whole world is estimated at about 6,000,000* oz., more than 3,000,000 oz.—one-half of the entire quantity—are consumed in the United States. Owing partly to over-production, partly to the substitution of other drugs for quinine, the price of the article has fallen so much of late years that large plantations of the cinchona tree have been uprooted in Ceylon, and the tea plant cultivated in its place. The exports of the bark from Ceylon, in which island the cinchona is extensively grown, declined more than one third between 1885 and 1887.

THE GRIEVANCES OF MYSORE COFFEE PLANTERS.—Ever since the rendition, the European coffee planters of Mysore have been complaining of the remiss manner in which the Breach of Contract Act is being worked in the Mysore Province. Those who know how much capital has been sunk by them in opening coffee plantations wish that every help should be given to them, so that the resources of the country may be developed as much as possible. The Mysore Government has not however, till now, paid any heed to their grievances. The fact that *maistries* take large advances from the planters undertaking to supply them with coolies and then deceive them, is well known, and the sooner therefore some more efficacious and speedy remedy is found the better. The Breach of Contract Act is too antiquated and it requires revision so that it may be adapted to the present changed circumstances.—*Cor., Madras Times*.

* Our estimate of the world's consumption is nearer 8 million ounces.—*Ed. T. A.*

TWO LARGE CONSIGNMENTS of Canadian seed grains—wheat, barley, oats etc.—have just arrived in India for experimental cultivation, and the experiments will be made in the North-West and the Punjab.—*Indian Agriculturist*.

MYSORE, July 3rd.—Crops will be short this coming season in Mysore, and the same is reported from Coorg. We had a heavy downpour latter end of December which kept the trees green all through the hot weather, and the blossom showers were unusually early this March, which prevented the bud-bearing wood to winter, and April turning out a heavy rainfall, the blossom that came out did not set as satisfactorily as was looked for.

PLANTING IN NORTH BORNEO.—The report of the Directors of the North Borneo Co. just out when the mail left, has the following paragraph:—

The Directors are glad to report that the progress which set in last year in consequence of the attention given to tobacco planting shows every prospect of continuance, as evidenced by the large sales of land and the marked improvement that has taken place in almost every item of revenue. Attention is also being given to the cultivation of other products: the suitability of the company's territory to the growth of Liberian coffee has been successfully demonstrated in Marudu Bay. Altogether the prospects of the country are encouraging.

CALIFORNIA CORRESPONDENTS, says *Gardens and Forest*, speak of the great success which has attended the "colony system" recently introduced in the southern part of the State. Tracts of land are laid out in small holdings and apportioned among a body of immigrants, who, upon their arrival, find everything ready for work. A body of colonists from Holland who arrived not long ago at Merced, found houses built and gardens and orchards arranged, more than two thousand acres having been planted with fruit-trees and vines; and fifteen English families were established a few weeks ago at Bakersfield, in Kern County, each receiving a forty-acre holding similarly prepared.

ARRIVAL OF PEPPER FROM EDIE.—The steamer "Hok Canton," which arrived from Edie on Saturday, and the steamer "Washi," which came in the following day, both brought shipments of pepper from that port. We understand that these consignments having been contracted for last year, were allowed to be exported without extra duty being charged, and that there are still some 13,000 bags of such pepper to come here. Pepper contracted for this year will not be allowed to be shipped until the hostilities against the Achinese in Edie are brought to a close, when an extra duty will be levied on it to recover expenses incurred by the Dutch in consequence of the recent fighting.—*Pinang Gazette*, June 24th.

AN IMPORTANT MEXICAN SCHEME.—We (*London Times*) understand that a new undertaking on a large scale has been formed on the principle of a trust company, whose sphere of operations will be in South America and Mexico, the present time being considered favourable for occupying the ground in that quarter. The capital will be £3,000,000 in £10 shares, of which 200 are founders' shares. Apart from the investment of its funds, the Company will undertake the acquisition of concessions and other business connected with the above mentioned countries. The directors, we are informed, believe that a satisfactory profit will also be made by co-operating in public issues, and for that purpose the Company will work in close alliance with the Trustees, Executors, and Insurance Corporation, Limited, and with Messrs. C. de Murrieta & Co. Two of the members of Messrs. Murrieta's firm will it is stated, be on the board.—*Public Opinion*, June 13th.

CEYLON TEA IN AMERICA.

We now call attention to the full report of yesterday's meeting (page 122.) There can be no doubt that the Company is fortunate in getting Mr. Grinlinton to represent them in New York; for besides his well-known business capacity, he has a direct personal interest in the fortunes of Ceylon tea and will, we feel sure, do nothing to risk its good name. It was mentioned at the meeting that if the negotiation with Messrs. Watson & Farr fell through, the Company must cease operations through its capital running short. Now this was a blunder—and worse, in a small way,—a crime! How is the Ceylon Agent to hold his own in New York, if this is the intelligence given to the other side? The fact is that the further capital has not been forthcoming, because the interest which yesterday's meeting and much more Mr. Grinlinton's trip Westward, will arouse, was wanting. Let our Agent only report back that the promoters of the new Company refuse to bind themselves to *sell none but pure Ceylon tea*, through their "Ceylon Planters' Company," and at the same time demonstrate that there is a profitable business to be done,—and we may be sure the further capital required would be forthcoming. In fact, we should then vote for closing the Tea Fund—and devoting that self-imposed tax and all spare capital to the Ceylon American Tea Company. Let our New York friends therefore make their mind easy as to our Company being handicapped, and our agent in a corner. He goes with a free hand and will, we feel sure, not commit his brother tea planters to any conditions not fully to be commended on mature consideration.

CEYLON AT THE NEW ZEALAND EXHIBITION.

Dunedin, June 7th.

A. Philip, Esq., Secretary Planters' Association, Kandy.

Dear Sir,—Since writing to you on 30th April (copy of letter herewith) I have received your favour of 1st May. In reply I am sorry that the case shipped by Mr. Geo. D. Jamieson did not reach me, and I can find no trace of it.*

AWARD CERTIFICATES.—By this mail I send to Mr. Carlyon parcels receipt for a box addressed to you and covering a tin lined case, containing the whole of the Award Certificates as per list enclosed herewith.†

I have asked Mr. Carlyon to clear the box and forward it to you.

ACCOUNTS.—Enclosed please find a statement of receipts and disbursements by me on account of your Court. I send you herewith Draft on London for £37 10s, the balance being not yet fully collected. There are still some photographs in frames and a few other small things to dispose of for which I trust to send you a remittance shortly. Valuing the kiosk in my hands at £50 it will be seen that after all disbursements here, and including the passages of the native servants to Ceylon, the net outlay defrayed by you for disbursement in this colony will be under £90, which I trust your Committee will consider satisfactory.

KALUTARA CARVED WORK.—I regret to state that four sets of articles forwarded by Mr. G. M. Fowler, C.C.S., on account of Sinno Wadu Arachchi and in-

* We omit the correspondence between Mr. Jamieson, Mr. Philip and the Wharf and Warehouse Co., on this subject: it is very unfortunate that a special assortment of fine teas from Mariawatte failed to reach Dunedin—appropriated in Melbourne doubtless?—Ed. T. A.

QUININE-WORKS FOR SALE.—As will be seen from an announcement in our advertising columns, another quinine factory is about to be offered for sale by public auction. This time it is M. L. Viennot who desires to dispose of his factory at Ivry-Port, near Paris, where he has carried on for many years the manufacture of cinchona derivatives and other medicinal alkaloids.—*Chemist and Druggist.*

SPECIAL MEETING OF THE CEYLON
PLANTERS' AMERICAN TEA COMPANY,
LIMITED.

PROPOSALS FROM AMERICA FOR THE
RE-ORGANIZATION OF THE COMPANY.

In accordance with due notice a special general meeting of shareholders in the Ceylon Planters' American Tea Company, Limited, was held at the offices of the Company in Queen St. yesterday, commencing about 1 o'clock. Mr. L. H. Kelly (Chairman of the Company) presided, and the other directors present were Messrs. G. A. Talbot, Harry Whitham, C. Spearman Armstrong, W. W. Mitchell, J. J. Grinlinton, and Thos. North Christie; the shareholders present were Messrs. J. H. Renton, C. Oswald Mackwood, H. J. Vollar, Sholto G. D. Skrine, F. G. A. Lane, W. H. Davies, Eastern Produce and Estates Company by their attorney, C. B. Smith by his attorney, F. M. Mackwood, H. D. Deane, A. Vanrenen, Gilbert F. Traill, F. G. Bewes, A. Bethune, H. V. Lushington, H. L. S. Ingles, J. F. Headrick, H. Bois, P. Bois and V. A. Julius.

The Hon. W. W. MITCHELL, who acted as Secretary, read the notice calling the meeting, and the minutes of the last meeting held on the 12th February 1890, which were confirmed.

The CHAIRMAN said that he would make a few remarks to point out the necessity of calling the meeting. The necessity had arisen from a letter which they had received from Messrs. Watson & Farr of New York, dated May 15th. The letter would be read to them presently, but its main object was to point out Messrs. Watson & Farr's opinion that a very much larger business might be done in Ceylon tea in America by the co-operative system, as they called it in America. There were many ways of doing things in America which were strange to them, and which might at first seem beyond their ken, but Messrs. Watson & Farr's idea was to make a number of persons in fairly good circumstances shareholders in this Company, to allot them so many shares, and to supply them with tea, holding their shares fully paid up as security, and to make them, in fact, the Company's agents; to appoint them in all the various small towns, and to get them to travel about and do as much as they could to increase the volume of the sale of Ceylon tea. The directors had given the proposal of Messrs. Watson & Farr their deepest consideration. They proposed to raise a capital of one million dollars, and to apply to the present shareholders two shares of 20 dollars each for every one share that they now held, so that the holder of a share worth R50 would, at the present rate of exchange, get an amount equal to about R108 for his share, provided he chose to remain and amalgamate with the American Company. Messrs. Watson & Farr proposed to reserve 10,000 shares as the working capital of the concern, and they proposed to take 28,000 shares for themselves and the promoters of the Company. The Directors thought that a great deal too heavy an amount: they objected to it, and telegraphed to Messrs. Watson & Farr pointing out their objection. He would ask the Secretary to read the telegram that was sent.

The SECRETARY said that the following telegram was sent on the 1st of July:—"Directors provisionally approve—promotion shares deemed excessive—shareholders called—writing." In reply to that came the following telegram:—"Promoters fully considered all points—cannot alter conditions—Delay likely prove disastrous—Prompt confirmation most

important." An answer was sent:—"Will cable you on 11th"—this date.

The CHAIRMAN, continuing, said they would see that although the directors immediately took steps and objected to so large a proportion of the shares being allotted as promotion money, the promoters in New York seemed to think they would require that large sum of money in order to promote the Company and to push the concern. There was no doubt that a very large sum of money would be necessary, but whether the sum named was absolutely necessary or not it was very difficult for them to say. But they did think, as a Board of Directors, taking all matters into consideration, that whatever was done must be done promptly. Their great object was to push the Ceylon tea enterprise, and they considered that they would be able to do a very much larger and much more extended business in accepting this scheme. (Hear, hear.) One thing was perfectly certain, and that was that the Company had not been supported either at home or in Ceylon as well as it ought to have been, seeing the very heavy expenditure in working anything of the sort in America, and they thought it would be to the mutual advantage of the shareholders if they would agree to amalgamate the Company under the proposals made by Messrs. Watson & Farr. The directors wished to take the shareholders entirely into their confidence in the whole matter that had been laid before them, and therefore he would ask the Secretary of the Company to read the letter which had been received from Messrs. Watson & Farr, and then to read the reply which was sent.

The SECRETARY then read the following correspondence:—

New York, May 15th, 1890.

Messrs. Darley, Butler & Co.,
Agents and Secretaries, Colombo.

Dear Sirs,—Since last writing you we have your esteemed favours of March 26th and April 8th, contents duly noted, and all enclosures in order.

Mr. Pineo has continued to use his best efforts in increasing sales of Tea, and we see signs of a growing interest amongst those who have given the article a fair trial. At same time the increase is very slow; and to make the Company a success, some vigorous and extended effort must be made.

We have been, as we have already written you, much interested in the experiment, and have given the matter our very careful attention, but must say that had we known how small a proportion of the Company's shares would have been taken we should have hesitated about accepting the agency, and would most probably have advised that the attempt to start the business should not be made. We have done our best with the funds provided, and feel that all the money spent has been used to the very best advantage, but with the present resources of the Company it is only a question of a few months, when all the money will have been spent and the business simply started.

It has been, therefore, a matter of considerable thought with us to advise the best way to avert the impending disaster to the Company, and make the efforts and money already expended the stepping-stones to a permanent success.

You may or may not be aware that the co-operative principle in many forms of business is taking great hold of our people at the present time, and after careful investigation of the matter, we are of the opinion that this co-operative idea can be used with marked success in the promotion of the plans of this Company.

We have in this country a very large class of people, who have some means and are able to live without going in for any very engrossing business, but who in many instances would be very glad to add to a small income by some clean and reasonably profitable occupation, without losing their independence. These

people live in the small towns throughout the country, and would be in a position to have a horse and waggon at their command, to drive about through the country soliciting trade.

We have secured the interest of parties here whose business it has been to reach this class of people, and who have the necessary machinery and experience to interest them in any good legitimate enterprise; and our plan is to secure an agent and stockholder from amongst this class, all over the country, commencing in our more thickly settled States, near at hand, and lying within a convenient radius, around our principal cities.

No agent will be appointed who does not subscribe to some shares, and he must be qualified and undertake to push the interests of the Company in the territory that may be assigned him. The amount of shares would vary from \$100 to \$1,000, and he would be allowed to deposit his shares (fully paid up, of course) as security for tea sold to him which would be hilled at a price to enable the agent to make a handsome profit, at the same time giving the Company a handsome return. He will have the double incentive of a profit on sales and a dividend on his stock, besides which his ownership of stock will give him an interest in keeping at work in his territory even should sales not prove large at first, as he would realize that his investment in the stock would prove valueless, unless himself and his fellow agents all continue to work for the common good.

Whilst working up the class of people we have referred to above, we do not by any means propose to neglect the principal cities, but would work them into co-operation in the general business either by means of local agents or by establishing branches of the Company itself.

Our idea in brief is as follows:—To incorporate a Company (American) under the same title as the present with a capital of (\$10,00,000) one million dollars, divided into shares of (\$20) twenty dollars each fully paid up, and non-assessable, incorporate under the law of this State, and without liability to the shareholders. The shares to be divided as follows:—

10,000 shares to be placed in the Treasury of the Company to be sold at par—say \$20,00,000 for the working capital of the concern.

12,000 shares to be paid to the shareholders of the present Company, say 2 shares for every one, and 28,000 shares to be paid to ourselves and the parties who will work with us in raising the capital and floating the enterprise, and we would all have to give much time and labour to the matter, and advance a great deal of money for advertising, travellers, &c. &c. before we could look for any returns.

It is not by any means our desire that any of your present stockholders shall part with their holdings, but rather that you may get increased subscribers, but we can doubtless arrange that any who do not wish to accept the 2 shares of the new Company for the one of the present Company shall receive the amounts they may have paid in, upon surrendering their shares. Still less is it our desire that any of the present Directors should be displaced, as we wish to have the new Company to be the outgrowth and harmonious result of the present one, and only such changes or rather additions to the Board of Directors would be made as might be found necessary by our local laws and to enable us to have the proper working board and officers here, where the work would have to be done.

As we understand the matter, the present Company was gotten up, not with much idea that the shares would be directly profitable, but with the prospect that they might, and the direct object of exploiting Ceylon tea in this country. The money that has been so far paid in has been, or soon will be, used up and unless some decided steps are taken, will be lost. Our friends who are back of us in the proposed new Company say: Why should we bother with the old Company at all? We can buy all the Ceylon tea we want, make our own boards, &c. &c.—and have the whole matter in our own hands, as well as any profit. We have insisted, however, that as we have been your agents, and through you have become interested

in the matter, that we would have nothing to do with the business, unless the present Company was merged or in a measure continued in the proposed new one, as we wish it to be a representation *strictly* of Ceylon industries.

Our proposed plan may seem visionary to you, but this is a large and growing country, with an active and speculative population, who are always ready to take up a good scheme on a big scale, and we have with us men who have made a study of introducing Companies such as we propose, and who will give their time, money and experience, with the hope of making their interest in the stock valuable, which of course would be equally shared in by all stockholders. If the Company should succeed, and we think it will, Ceylon tea would be more thoroughly and successfully introduced into this country than by any other means we know of.

Mr. Pineo is fully in accord with the matter stated herein, and as we shall have to commence operations as soon as possible, we will ask your very careful consideration, and would request you to cable us your decision, say "approve," if, as you are authorised by Article 7 of your bylaws, you will give us the option of buying out your Company, for say 12,900 shares of the new Company, we (personally) agreeing that if the new Company is undertaken, that we will take up any shares of parties who may now be stockholders, should they not wish to accept the proposal.

—Yours very truly,

(Signed) WATSON & FARR.

1st July 1890.

Messrs. Watson & Farr, New York.

Dear Sirs,—We addressed you on the 26th ultimo, and have now to report that a meeting of Directors of the Ceylon Planters' American Tea Company was held this day and we were desired to express their obligations to you for the great interest you have throughout manifested in the welfare of the Company and in the introduction of Ceylon Tea into America which have led to the proposals you have made with regard to the new scheme put forward in your letter of 15th March. Whilst recognizing the desirability of carrying on the Company's operations on a much more extended basis than at present, some of the Directors do not regard the position of the Company in a desponding manner and as one liable to end in disaster at an early date as you seem to think, but however this may be, they expressed themselves generally in favour of the scheme and we telegraphed you today "Directors provisionally approve—promotion shares deemed excessive—shareholders called—writing."

The only matter connected with your proposals about which there seems to be a difficulty, is in regard to 28,000 shares to be appropriated to yourselves and the parties who will work with you. There seems to be a difficulty in understanding what the reservation of such a large number of shares as 28,000 is for; what equivalent the Company is to get for such a large allotment which amounts to more than half the proposed capital of 50,000 shares; and we are desired to ask if it is the intention that the 28,000 shares are to be allotted to you for your services in placing the 10,000 shares, the proceeds of which alone will be placed in the coffers of the Company to form its working capital? We understand that you would take up the balance of shares in the old Company that is unallotted, and that you would make yourselves liable to refund to any shareholders in the present Company the value of their shares if they did not agree to the new scheme. We presume it is your intention to expend a large sum of money—and if so about what amount?—in raising the capital and floating the new concern, advertising, travelling &c. in connexion with the promotion of it, and the appointment of local agents, recouping yourselves from what you may obtain by selling some of the 28,000 shares, and not repaying yourselves from the proceeds of the 10,000 shares which will remain and form the working capital of the concern?

We would have been glad to have had an explanation of this from you prior to the meeting of the share-

holders which has been called for the 11th inst., but of course this cannot be. At this meeting it is intended that the Directors shall obtain the permission of the shareholders to amalgamate if they agree to do so; and if they so agree, Mr. Grinlinton, the Managing Director of the Company, who will, as we have advised you, proceed to New York, will be authorized and empowered to discuss matters with you, and to finally conclude such terms as you may mutually agree upon. In short, as the matter presents itself to us, at present the feeling is, that the payment in shares for promotion should be less, and that the number of shares to be sold for the benefit of the Company should be more; otherwise 4-7ths of the share capital will have been paid away or alienated outside the Company, whilst at the same time, dividend is payable upon these shares out of the earnings of a working capital of 1-5th plus the 12,000 shares to be held by the old shareholders of the present Company. We conclude that Mr. Pineo's services would be taken over by the new Company.

Mr. Grinlinton will take a full Power of Attorney with him so that no more time will be lost than is unavoidable, and, as his time will be very limited in America (not more than a fortnight at the outside), it is highly desirable that whatever preliminary steps may be necessary should be well in hand, and all prepared by the time he arrives. He will leave here by the "Parramatta" mail steamer (P. & O.) on 24th instant, expects to arrive in London on the 14th August, and he hopes to leave for America a week afterwards, arriving there about the end of August or within the first week of September.—We are, dear sir, yours faithfully, DARLEY, BUTLER & Co., Agents and Secretaries.

The SECRETARY also again read the telegrams given above.

Mr. SHOLTO SKRINE inquired as to what would be the liability of a shareholder in this new Company. It appeared that a shareholder would have two shares for every original share he possessed.

The SECRETARY.—He will have no liability whatever: 20 dollars will be the value of the shares.

Mr. SKRINE.—But the shares in the old Company will have to be paid up before a shareholder can have the new ones.

The CHAIRMAN.—When the whole amount of R50 is paid up those shareholders who wish to remain in the new amalgamated Company would receive in exchange for their one R50 share two 20 dollar shares, at the value of R108, which is taking the present rate of exchange. That would be the limit of liability, and there would be none beyond it, because you receive those two 20 dollar shares for the one R50 share you already hold. There is one other matter I want you to take into consideration, and that is the question as to the advisability of carrying on this Company in the way proposed. Myself and my brother directors think it is the most advisable course, after giving it all the consideration we possibly could, because it is quite open for any other body of men to form a Company and carry on business without us, as Messrs. Wattson & Farr say in their letter. I think our object all through has been to push Ceylon tea and to do the very best we could for it, and I think that if this Company is amalgamated with the new Company as is now proposed, we should not only achieve the object which we had from the first in view—that of pushing our tea, but I see no reason at all why it should not prove a profitable speculation also to the shareholders, as long as the terms are adhered to: *i. e.*, that the value of 10,000 shares is to be kept entirely as the working capital of the Company. It would be open at the same time to any shareholder who wished to withdraw from the amalgamated Company to withdraw from it. He has the option either of receiving two 20 dollar shares for his one R50 share, or he can withdraw from the

Company by receiving the amount that he has paid up here for his share. If he has paid up R50, he can withdraw by getting his R50 back.

Mr. F. G. A. LANE.—Will the control of the Company then be in New York?

The CHAIRMAN.—Certainly.

Mr. LANE.—Not in Ceylon? Then what assurance should we have that they will buy and sell pure Ceylon tea?

The CHAIRMAN said that that was the condition on which they would be made agents, and they agreed to that. In the letter which had just been read Messrs. Wattson & Farr said: "As we wish it to be representative strictly of Ceylon industries."

Mr. LANE.—Will the tea as heretofore be bought in Ceylon, or in London?

The CHAIRMAN said that that was one of the minor arrangements which Mr. Grinlinton would make when he went to America, but they would have to make themselves perfectly sure that Ceylon tea alone would be sold.

Mr. SKRINE assumed that a large proportion of the 20,000 shares went to the Directors in America, or did the Directors here get any share? (Laughter.)

The CHAIRMAN.—No, I am afraid they do not.

Mr. HENRY BOIS asked if the object of the meeting was to elicit from shareholders an expression of opinion as to whether the proposal should be accepted or rejected, because it seemed to him utterly impossible for a body of men to seriously consider the figures put before them. The point that struck him more than anything else was the enormous proportion which Messrs. Wattson & Farr proposed should be allotted to themselves for promotion money. If he followed the figures correctly it amounted to this—12,000 shares to be allotted to the present shareholders in the Company in respect of the capital they had subscribed; then they proposed to get 10,000 more shares taken up by the public in America; and they allotted to themselves 28,000 shares—for what?—their services. Did they propose to pay nothing in respect of them, or were they to be 28,000 fully paid-up shares, as promotion money? What it meant was that they, as the promoters of the Company, would have a claim upon the dividends to the extent of 58 per cent, the balance going to the shareholders who had subscribed the capital. He did not think that was a matter they could consider and give an answer to in the course of a few days. He, for one, most certainly was not prepared to commit himself either to an acceptance or rejection of the proposal at that meeting. No information was put before the shareholders, so far as he was aware, until they heard the letter which had just been read, and he thought the matter was far too important for them to come to a decision upon it at the present moment.

The Hon. T. N. CHRISTIE said what Mr. Bois had referred to was very much what they had to consider, but it was not a matter of merely granting time that would enable them to arrive at a satisfactory conclusion. What they really wanted was more information. It was hardly credible that a firm like Messrs. Wattson & Farr should propose to them that they should receive as promotion money shares representing nearly a quarter-of-a-million sterling. It was hardly conceivable that they could possibly imagine that they should agree to terms such as those. They used the rather ambiguous expression that they required that money for the floating of the enterprise. If they meant floating the Company he had no hesitation in saying that the request for 28,000 fully paid-up shares was monstrous; if by "floating the enterprise" they meant floating the business of the Company, advertising and pushing the business,

then it might or might not be a reasonable demand. The Chairman had used the expression "promotion money" as applied to those shares, but he could hardly imagine that Messrs. Watson & Farr regarded it as such, and he would take it that when they used the expression "floating the enterprize" they must mean to devote a great deal of time and a great deal of money to the pushing of the business of the Company, and not the mere promotion of the Company. He would point out to Mr. Bois that the one saving clause in the whole of the proposed arrangement which would justify them in provisionally accepting the offer that day, giving Mr. Grinlinton all powers to conclude, was the offer to return their money to those who, when they really learnt what the details were, were discontented, and preferred to have their money rather than to have deteriorated and depreciated shares in a concern which was burdened with having to pay a dividend upon a quarter-of-a-million sterling which had not been devoted to pushing the business of the Company.

The CHAIRMAN pointed out that what was stated in this letter was "that 28,000 shares were to be paid to ourselves (Messrs. Watson & Farr), and the parties who would work with us in raising the capital, and floating the enterprize, and we would all have to give much time and labour to the matter, and advance a great deal of money for advertizing &c. &c., before we could look for any return." One thing he would point out to Mr. Bois was that they were not really presenting Messrs. Watson & Farr with the value of 28,000 shares, but they had got to raise those shares, and the value of those shares, themselves, and although he used the words "promotion money" he used the word "promotion" as meaning the pushing of the interests of the Company. He did not mean that it was to be handed over to them as a lump sum for simply getting up the Company. The letter, he thought, was fairly clear,—it was for floating the enterprize, which included the advancing of a great deal of money for advertizing, travelling &c. It was clearly intended that this money, which they should obtain by 28,000 shares, was to be used for the pushing of the Company, advertizing and travelling on its behalf &c. They had to find the money, and probably would have to advance it for some time.

Mr. SKRINE asked if they were to understand that Mr. Grinlinton would be in a position when he arrived in New York not to close with them at all if he thought it undesirable, and whether that meeting would only result in handing over the power to Mr. Grinlinton, in whose hands they would put their interests?

Mr. TALBOT:—With an expression of opinion.

Mr. SKRINE:—I understood that Mr. Grinlinton would have the power of attorney either to close with the Company, or, if he saw fit, to reject the proposal.

The SECRETARY:—I think you are referring to the terms of the letter which was written on the 1st of the month. A telegram was sent in reply to that, and the reply to that telegram makes it impossible to leave the question open. The telegram says they have considered all points, and if we delay in sending a reply we shall lose the opportunity. I assume that if we decline Messrs. Watson & Farr will go on with the matter themselves. If we want to make better terms, and wait for a time, the opportunity very likely will have passed from us. As it is we have not got money to go on with very much longer, and then we lose everything. Here we have the opportunity of achieving the object for which the Company was started.

Mr. F. M. MACKWOOD said that there seemed to him to be two views of this question,—first of all the purely financial view, as it concerned themselves, and the broader view in which they would probably have to be content to sink their personal convenience in the matter as to whether this was the best company and means for introducing and pushing Ceylon tea in America. From the latter point of view it appeared to him to be a great improvement on the powers and scope of the present Company. On the other hand the majority of them had subscribed for a number of shares, and a very great number of them had practically looked upon it as a sort of contribution on which they expected to get no return, merely as their share towards promoting the prosperity of the Company. They did that on the assurance of the working Board of Directors—men whom they all knew, and who were working in their midst. To transfer that work to America, amongst a body of men whom they did not know, and whose figures, as Mr. Bois had stated, were, to say the least, rather staggering, was a different matter, and he was rather inclined to say that if it were not for their offer to give anybody's money back if they did not care to go in for the new Company, that it was a proposal not altogether satisfactory.

Mr. HENRY BOIS asked if it was intended that that meeting should accept the offer of Messrs. Watson & Farr, simply giving the power-of-attorney to Mr. Grinlinton to carry out the details of it, or was it intended that he should have authority either to accept or reject the proposal when he arrived at New York.

The CHAIRMAN said that the position in which they were at present was that they had to reply to Messrs. Watson & Farr's telegram. The Secretary of the Company has just stated that the Company would not be in a position to carry on very much longer. It became a question with the shareholders as to whether it was advisable to let slip this opportunity of amalgamation with a large Company to be formed in America, and if they approved of the amalgamation then they would distinctly have to telegraph to Messrs. Watson & Farr that they were prepared to accept their terms, but qualify it by stating that Mr. Grinlinton would be sent over with power of attorney, deputed as their Managing Director, to go into minor details with them. But he thought that if they attempted to gain longer time, and to put them off in this scheme, that they might just as well give up the whole idea, and he was afraid unless fresh support came in that it would simply mean the closing of the Company. When the Company was originally started with 6,000 shares they expected a very much larger number of shares to be taken up. Stress had been laid both by Mr. Bois and Mr. Mackwood on the large number of shares the promoters in America required. The directors saw that at once; it was the first thing they caught hold of, but it was such a very difficult thing to tackle in a country like America. If Messrs. Watson & Farr meant that the value of the shares was to be devoted to advertizing thoroughly, travelling throughout the country, and appointing agencies in all the small towns, it really and truly was not so very big a sum as it at first appeared, but if it were simply to go into the pockets of the promoters of the Company in America it would be simply monstrous. But in the face of their letter they could not take that view of it. That meeting must come to some conclusion. The letter which had been read was only received on the 18th of June; a directors' meeting was called at once; notice had to be given of

the present meeting, and they had been called together at as early a date as they possibly could be, to discuss the matter and form an opinion about it.

Mr. SKRINE thought the redeeming point about the whole thing was the fact that the American Company were prepared to meet the shareholders here by saying—"If you do not like it we will pay you up." Few of them expected to see their money back, and if the American Company paid them back they would be in a better position than they ever expected to be. For that reason he would suggest that the proposal be accepted and carried through. There was no doubt that the great object of that Company was to push Ceylon teas, not to make money out of the Company, and if they could get people in America to push Ceylon teas for their own interests, even if they did make a good thing out of it, they would indirectly make their fortune.

The CHAIRMAN said it must show confidence on the part of Messrs. Wattson & Farr in their being able to do something, for they need not have offered to pay them back their R50 per share. They could start their own Company, and pay nothing at all. He thought that the very fact of their offering to pay a shareholder a sum equal to R108 for his R50 share, or if he did not care to stay in the Company the money which he had already paid for his share, showed their belief in the company which they were prepared to start. In Ceylon they did not understand the mode of doing things in America. They launched out into enormous advertisements. Mr. Pineo had paid 100 dollars for one advertisement alone—he forgot how many times it was put in—in one magazine. The money was been very soon swallowed up, and if Messrs. Wattson & Farr were going to do the thing as they professed they would do it, and as they sincerely hoped they would do it,—they were a well-known firm—they would have to use a large proportion of those 28,000 shares.

The Hon. J. J. GRINLINTON, said he thought at this stage of the meeting it would be well if he made a few remarks on the subject of the power of attorney for the information of the shareholders. His object in going to America had nothing whatever to do with this Company. He decided on the trip long before that Company had any existence. He went there on his private business, and nothing else, but it was thought desirable by the Board of Directors, as he was a director of the Company, that if he were going to America he should render such assistance as was possible to that Company. His primary object in going was his own private business, and he would very much rather have nothing to do with the power of attorney or anything else connected with the Company, but he allowed to have his fortnight there to run about as he pleased. But having been asked by his co-directors to accept this responsibility—and it was a very heavy responsibility,—he might tell them that he should not accept it at all unless his position was defined, and defined in such a manner that he could not run away from it. He did not want to do anything outside the Company. He wanted to act, if he acted at all, within the decision arrived at, and not to be left with but's and if's and and's, or anything. He must have it stated distinctly what his powers were, and he would not exceed them, but he would much prefer not having anything whatever to do with it.

¶ The Hon. T. N. CHRISTIE said that it might be concluded from what Mr. Kelly had said, which had been more or less supported by the Secretary, that the New York firm were dealing rather generously with them, and that they could have started quite as well without them. That was rather out of it. To the New York firm it was very essential that

they should get the same name that they had, and it was obvious that their desire was to secure the prestige which attached to the name, and from the patronage which that Company gave. It was their very natural desire to continue that Company, and not go against it. With reference to the remarks made by Mr. Grinlinton it would be obviously impossible for the shareholders to define what he should do in New York. What the shareholders had to do that day was to authorize the Board of Directors to give instructions to him. It was not likely that the conditions would be made known generally that day, and at such a meeting.

Mr. H. BOIS:—May I ask how many shares have been subscribed for in the local Company?

The SECRETARY:—1,747.

Mr. BOIS:—Are there any calls unpaid?

The SECRETARY:—There are 31 defaulters, owing R1,740.

Mr. BOIS:—Otherwise the capital is all called up?

The SECRETARY:—R35 paid up, R10 payable on the 1st of October, and R5 to be called up after that.

Mr. MACKWOOD:—I understand you to say that if we did not adopt this proposal, even with the call that has to be made, we should have to stop in a comparatively short time. It would almost seem, if this is the state of affairs, that we have absolutely no choice, and the proposal of Messrs. Wattson & Farr offers as the only chance of ever seeing any of our money back, for if the Company should stop there are practically no assets that could be converted into capital. It is not as if we had a stock of tea on hand.

Mr. LANE quite concurred in their Company being taken up by this American Company, and of the directors being empowered to accept their terms, but at the same time he thought it should be distinctly stated by their directors, and they should say to their directors that day, that the tea that had to be bought should be bought from Ceylon and not in London, so that they themselves might know what sort of tea it was that was being sold in their name. He thought Mr. Grinlinton should make that a *sine que non*.

Mr. C. S. ARMSTRONG was afraid, in the present condition of the Colombo market, that they would be unable to supply the demand.

Mr. SKRINE said that it appeared to him that they were hardly in a position to carry out Mr. Lane's suggestion that day, because Messrs. Wattson & Farr, as he read the telegram, had told them distinctly that they must either accept the terms offered, or they must let the thing slide. That being the case, considering the circumstances, he thought it was far better to accept the position, and he proposed that Messrs. Wattson & Farr's suggestion be accepted.

Mr. LANE had pleasure in seconding the motion.

The CHAIRMAN said that they had already shipped 32,962 lb., 12,499 lb. of which had been sold, and in shipping that quantity they were not able to obtain all the tea of the description they required in the local market, and had to get some of it in the London market, so that if the proposed American Company were to be a big concern, which they wished it to be, he trusted it would be a bigger concern that the local market could supply, at present at all events. As long as they made it a *sine qua non* that the whole of Messrs. Wattson & Farr's transactions were to be in purely Ceylon tea, he thought they must trust to the honour of the firm.

Mr. GRINLINTON thought it might well be put, as a request from the shareholders, that the Ceylon market—i. e. the local market—should be availed of as much as possible. He might mention that on

two or three occasions when they went into the market with samples they had furnished from America, they had been unable to get those teas, and had been obliged to put it off for another season.

The CHAIRMAN also pointed out that the present Company was trading under the auspices of the Planters' Association. Naturally they were only interested in the pushing of Ceylon tea, and if for a moment it were discovered that other than Ceylon tea was being pushed that patronage would be withdrawn at once.

Mr. LANE said he would be content if it were a *sine qua non* that the tea sold should be Ceylon tea, but he agreed with Mr. Grinlinton that it might be a recommendation to Messrs. Wattson & Farr to buy as much as possible in the local market. The inducement offered in the local market at present was not sufficient, so that many planters had to send their teas to London.

Mr. HARRY WHITHAM said that as far as he could see from Messrs. Wattson & Farr's letters they did not desire that the directors should be replaced, and they could buy the tea here. He would make it a *sine qua non* that the tea should be bought through the present directors.

Mr. SKRINE, having formally worded his motion, proposed—"That this meeting authorizes the directors to arrange the amalgamation with the American Company if they are satisfied with the terms offered,"—so that the onus of the thing rested on the directors. (Laughter.)

No amendment being proposed, and no further remarks being offered, the Chairman put the motion, and it was carried unanimously.

The CHAIRMAN then said that having carried that resolution there were some other resolutions which were merely formal. They had been drafted by their legal adviser, Mr. Julius, who had gone carefully through their Articles of Association. The resolutions were as follows:—

I.—That the Directors of this Company are authorised to arrange terms for the sale or disposal of the business estate and effects of this Company to a Company about to be promoted in America for the sale of Ceylon tea upon such terms and in such manner as the Directors shall think fit.

II.—That the Directors of this Company are authorised to delegate their powers of arranging terms for the sale or disposal of the business estate and effects of this Company to any one member of their body and to grant to such member a Power of Attorney to act in America for the other Directors of this Company and for this Company and to arrange and enter into terms for the sale or disposal of the business estate and effects of this Company to a Company about to be promoted in America for the sale of Ceylon tea and to sign all necessary contracts and agreements on that behalf with any person or persons acting for or on behalf of the said proposed Company.

III.—That a Power of Attorney be granted to the Hon'ble J. J. Grinlinton by the Company under sec. 44 of the Joint Stock Companies Ordinance No. 4 of 1861 empowering him to arrange terms for the sale and disposal of the business estate and effects of this Company to a Company about to be promoted in America for the sale of Ceylon tea and to sign all necessary contracts and agreements on that behalf with any person or persons acting for or on behalf of the said proposed Company.

These resolutions having been separately proposed, seconded and carried, proxies were handed in, and the meeting concluded with a vote of thanks to the Chairman.

There was one slip made by both Mr. Bois and Mr. Christie—they said that the 28,000 *promotion shares* represented "¼ of a million sterling." They were wrong—at twenty dollars each it is £116,000 sterling.—*Secretary.*

PLANTING IN NEW GUINEA.

A DIRECTOR OF A NEW PLANTATIONS COMPANY.

A German gentleman named Mr. Kendt, with his wife and five children, arrived at Colombo on Saturday in the N. L. steamer "Nürnberg." They are at present staying at Mount Lavinia Grand Hotel, and intend to remain in the colony for a fortnight, when they will proceed by the "Preussen" to Singapore, and afterwards to New Guinea, where Mr. Kendt will act as director of the New Guinea Plantations Company. Mr. Kendt, we believe, has really been engaged by the German New Guinea Company to plant cacao and introduce other products. He has been in Trinidad, and besides being a specialist as regards cacao he is what may be called an all-round planter. Coconuts are the principal product of New Guinea at present, but there are also experimental plantations of tobacco, cotton and coffee. With the object of improving the cultivation of these things in New Guinea, and introducing new products, Mr. Kendt will spend most of his fortnight in Ceylon up-country, visiting various estates of cacao, coconuts, tea, &c. He will probably try the latter on the New Guinea plantations, and the industry generally will receive an impetus on his arrival.

THE AFRICAN FOREST.—Since I have made my map I have taken the trouble to measure the extent of the area covered by this forest, and I find it to be something like 224,000,000 acres; and if we allow each tree 30 feet around for sufficient space, and only forty-eight trees to the acre, we have the colossal figure of 10,752,000,000 as the total number, and if we calculate the plants and saplings of the impenetrable undergrowth we shall be among the incalculable billions.—*Stanley's Address to the Royal Geographical Society.*

PLANTERS AND COOLIES.—A Province Wellesley planter writes to the *Pinang Gazette* to remove misapprehensions arising from the recent discovery of alleged ill-treated coolies on a Chinese estate there. He accounts for the neglect of sick labourers by the fact of Chinese being callous in cases of illness and putting no faith in medicine. He points out that the so-called debt slavery comes to nothing more than requiring coolies to work off the advances, without which they would not engage themselves, a system authorised by Ordinance. On his showing, employers want more protection than Chinese coolies who, so he says, are more rogues than fools.—*Straits Times*, May 18th.

BRAZIL COFFEE.—There is a considerable touch of exaggeration in a recent report of Mr. Consul Cowper of Santos which has been going the round of the London papers, speaking of São Paulo district—or rather series of districts which find their outlet at Santos as likely to put those shipping through Rio de Janeiro completely into the shade. Last year July 1888 to June 1889, Santos exported 3 million bags; this year 1889-90 the total is likely to be a million short (the alternate crop) or 2 million bags; but Consul Cowper expects over 3 millions in 1890-91 and that the immense districts now being brought into cultivation will soon assure 5 million bags (132 lb. each) and therefore equal to nearly 6 million cwt. But when the worthy Consul values the current crop of 2 million bags or 2,357,000 cwt. at £12,000,000 sterling we can see that he "draws the long bow" or has a good deal to learn about coffee. The day has not come when coffee at Santos can be valued at over 100s per cwt. all round.

BENNETT ON TEA AS INDIGENOUS TO CEYLON.—"Old Resident" writes:—"As it is highly improbable that even as a garden plant the true tea existed at Batticaloa, it does not seem likely that Crawford could have sent Bennett a specimen of real tea in flower, or that Bennett's sketch was made on such a specimen. The strong suspicion is that instead of sketching Crawford's specimen he copied a picture of the true tea plant and then wrote positively of its existence in Ceylon."

JAVA: THE EXPORT OF TEA FROM JAVA is officially reported as follows:—

	lb.		lb.
1882 ...	5,900,400	1886 ...	7,385,400
1883 ...	5,852,000	1887 ...	7,026,800
1884 ...	5,572,600	1888 ...	7,477,800
1885 ...	5,328,400	1889 ...	7,682,400

Java does not therefore make much progress as a tea-producing country, and her tea is also of poor quality still, notwithstanding the introduction of late years of good Assam seed, and of machinery for preparation.

IRRIGATION AND SANITATION.—An interesting point in the recent report of Colonel Skipwith on the irrigation of the North-Western Provinces is the result of a deputation made last January to examine the country between the East Kali Nadi and the Burh ganga, in order to ascertain, as far as possible, the extent the saturation level had been raised by the Fatehgarh Branch Canal, and to report on the measures necessary to relieve the land suffering from swamping. The report, which is now in the Press, ought to be of general as well as special value, for the problem of which it treats is one of the most difficult with which the irrigation authorities have to deal. There are many districts where a succession of dry seasons would bring starvation on the people were they not served with canal water, but where, also, it canals be constructed and there come one or two seasons of excessive rain, the land becomes water-logged, and fever and sickness are stimulated. The construction of canals being necessary, the question is how to keep down the water-level in rainy seasons. The problem is mainly one for drainage experts to settle, but the solution is of the greatest importance to the cultivating community. —*Indian Engineer*, May 31st.

FUEL CONSUMPTION ON INDIAN RAILWAYS.—One of the heaviest items in the working expenses of Indian Railways has been that of fuel and consequently the railway authorities have endeavoured from time to time in every possible way to reduce this expenditure. Mr. C. E. Phipps, the Acting Locomotive Superintendent of the Madras Railway, has recently devised a means of securing economy in fuel expenditure, and his experiments in this direction on three of Sharp Stewart's engines hauling the mail trains during the past few months have been comparatively successful. Mr. Phipps' expedient consists of a small masonry arch of fire bricks of the thickness of three bricks, erected on brass plugs just underneath the last row of tubes of the engine, in the copper fire-box of the locomotive, as also the provision of a double damper. The result of this is that the heat which heretofore passed off quickly is now thrown back by the arch and re-utilised before quitting the engine's fire-box; and as a resultant the consumption of fuel is less. After some further experiments Mr. Phipps it is understood, will take out a patent. But not alone on locomotives has Mr. Phipps' attention been engaged in regard to the consumption of fuel but also in respect of stationary engines at the Perambore Workshops. Hitherto the saw-dust from the saw mills at the workshops was either given away or sold for a trifle. Mr. Phipps is now utilising the saw-dust for fuel in a stationary engine at the shops, and has succeeded in raising with it 80 lb. of steam, a quantity sufficient to work the saw mills there. —*Indian Engineer*, June 7th.

NORTH BORNEO TOBACCO.—The report of the Labuk Planting Company, Limited, to be laid before the first ordinary general meeting of its shareholders at Hongkong on the 5th, stated that 250 fields were under cultivation for this year's crop, which is expected to be large and good, provided the weather prove favourable. —*Straits Times*, May 18th.

NITRE DEPOSITS.—Caves containing deposits of earth with from 4 to 30 cent. of calcium nitrate and 5 to 60 per cent. of calcium phosphate are common in Venezuela not only in the littoral mountain chains, but also on the flanks of the Cordillera of the Andes. In these deposits are embedded remains of mammalian bones, preserving their form, but so friable as to fall to powder when they are extracted. They consist solely of calcium phosphate; the gelatine has been nitrified and dissolved out, and the calcium carbonate of the bone has been used up in neutralising the nitric acid produced. The nitric ferment is found in abundance throughout the deposits in a very well-developed form. Some of these deposits are ten metres thick. —*Jour. Soc. Chem. Ind.*

COTTON GROWING AMONGST THE DON COSSACKS.—The persistence with which Russia struggles to make the country self-contained and the people a self-sustained one is a phenomenon which has long been noted, and to the permanence of which contributory evidence of the most recent date is seldom wanting. Our Consul at Taganrog reports that trials were made during the past year's season for growing cotton in the Don Cossack territory, and, as the results received were very favourable, further experiments will be made by members of the Agricultural Society during the present year. It thus appears that Russia has by no means abandoned her intentions in these districts of her widely extended territory. —*Teutic Mercury*.

CALEDONIAN BALSAM.—At a recent meeting of the French Société de Thérapeutique, Dr. Forne called attention to the advantages presented by a preparation that he had named "baume calédonien," and which appeared to consist of a solution of Kauri gum in an equal weight of 90 per cent alcohol. He stated that it had been used with great success in the treatment of wounds and ulcers of all kinds. When applied to a well cleansed and dried wound it causes a very slight, but brief sensation of burning, but after a few moments the solvent evaporates, and the resin is left as a very adherent varnish, which is not affected by friction or contact with water. The preparation can also be used advantageously for fixed bandages in the place of the soluble silicate. It was also said to be superior to tincture of benzoin for the obturation of the cavities in carious teeth. Lastly, a liniment made with equal quantities of baume calédonien and olive oil was recommended as an application to burns. —*Oil, Paint and Drug Reporter*.

NOTES ON AGRICULTURE IN BALASORE.—*Wild Paddy.*—Mr. Oleghorn presented a drawing of wild paddy, which is very common in Orisa where it constitutes a serious evil. It flowers at the same time as the cultivated kinds, and appears to cross fertilize them to such an extent, that in a few years the cultivators have to import fresh stock from other districts. The wild paddy is not readily distinguishable from cultivated kinds in appearance, but it sheds its seeds so readily that it cannot be harvested; and this peculiarity is imparted to the kinds which it cross fertilizes. When importing fresh stock the cultivators select kinds with stems of a different color to that which they had in cultivation. Thus assuming that a light colored stem paddy has been cultivated, and deteriorated from cross fertilising; the stock chosen is dark stemmed, when this in turn deteriorates, light stem kinds are reverted to the difference in color being of material assistance in weeding out undesirable kinds. As Mr. Oleghorn has left Balasore, members on the spot will be asked to further investigate the subject. —*Agricultural and Horticultural Society of India*.

A FEW PRACTICAL SUGGESTIONS CONCERNING QUININE.

BY PROFESSOR DR. C. BINZ OF BONN.

The study of the employment of quinine in uncivilised fever lands leads to the conclusion that in such countries it is to the traveller as essential as gunpowder. The one he must have to protect his existence and property against greedy and treacherous native chiefs, and the other to secure his life against the malaria fever.

G. Schweinfurt relates that he rendered himself proof against the effects of a prolonged sojourn in pestilential swamps by the fortifying influence of quinine taking $\frac{1}{2}$ gramme* three times a day. It was an extreme case. For by the very nature of his occupation, namely, botanising in the swamps and wading among the papyrus, he was completely exposed to the malaria, and constantly inhaling its fatal breath. Nevertheless his health remained unimpaired until by return to the pure air of the interior he was enabled to dispense with the further use of quinine. (Im Herzen von Africa. Reisen und Entdeckungen 1874 I. 137 und 352.)

In his work "Through the Dark Continent," H. Stanley tells us how three attacks of fever reduced him seven pounds in weight. But he "quininized" himself thoroughly from dawn till sunset, and came out on the fifth day pale, weak, trembling, with jaundiced eyes, beating heart, and ringing ears, but the fever was overcome. And in his book on the Congo he speaks of another fierce attack of fever which he also conquered by large doses of three, and three and a half grammes of quinine, together with a few drops of hydrobromic acid and a little Madeira. He felt the strong medicament stream like lightning through his veins, and gradually creep with overwhelming force over his senses. But twenty our hours sleep followed, the fever was gone, and though terribly reduced in strength he was able to slowly recover.

C. Nachtigal briefly terms quinine "the greatest of treasures to travellers in tropical regions."

I give the above as only a few voices among countless others. Respecting the value and importance of quinine, the evidence is vast and unanimous.

It teaches us that in preparing for a journey to fever-stricken lands, quinine should be obtained in the very best, purest, most effectual form. This is however very rarely the case. The consequence is that the most serious risks are constantly incurred. Travellers and officials even lose their lives, or have to change their plans, or give them up altogether. To remedy this so far as lies in my power, I beg to submit to you (Deutsche Colonial-Zeitung) the following observations. They are the result of years of constant practical and experimental study of the subject.

The two chemists who first produced quinine from the Cinchona bark, did so in the form of the sulphate, and probably more by accident than intention. At all events in that form quinine passed into commerce, and so has remained for the last fifty years. Most physicians from habit and custom know and prescribe only the one salt; most pharmacopoeias even know no other, and in the last Prussian, it also remained the only recognised form of quinine, until on my proposition, the hydrochlorate was also included in the German pharmacopoeia of 1872. Since then the consumption of the hydrochlorate has gradually increased, but still remains considerably smaller than that of the sulphate, about 1,750,000 oz. of the former being consumed in the world, against about 5,250,000 oz. of the latter. There are civilised countries, as North America for example, where even now the sulphate is exclusively in vogue.

Without being a chemist, one can easily understand the difference between the two kinds, remembering their difference in solubility in water. The sulphate demands about 800 times its weight of distilled water to dissolve perfectly, whereas the hydrochlorate requires only 50 times.

By the addition of a little free acid the solubility is increased, but also in such case greatly in favour of the hydrochlorate over the sulphate. What is the consequence? As long as the human stomach is in a healthy condition it develops of itself free hydrochloric acid sufficient to change even the sulphate of quinine into that form in which it can be more readily assimilated. But whenever the stomach becomes subject to disorders involving the diminution, or even total disappearance of such natural acid, the power of solution and assimilation of course terminates, and the medicament that by reason of its low specific gravity is very voluminous, remains as so much worse than useless ballast in the already weakened stomach. This is one reason why so many lives are lost annually notwithstanding administration of quinine. It is clear that with the sixteen times greater solubility of the hydrochlorate, the risk of its remaining inoperative in the stomach is considerably diminished. In numerous cases the hydrochlorate will dissolve and enter the blood, while to the sulphate this is impossible. It is precisely its insolubility in weakened stomachs that explains why in so many cases of fever, the otherwise so potent and reliable quinine is absolutely useless. The quinine passes for the most part into the lesser intestine where the conditions for assimilation by the blood are the more unfavourable, since the reaction here is purely alkalic, rendering solution even more difficult.

The addition, or the drinking afterwards of any acid beverage that is otherwise suitable or congenial to the stomach, of course greatly tends to facilitate the assimilation of the quinine. Stanley was quite right in taking hydrobromic acid and Madeira. The former, however, that is in general difficult to procure, and an acid moreover that readily decomposes, was not absolutely necessary. Diluted muriatic acid would have done equally well, or any agreeable fruit acid. All good spirituous drinks are also energetic solvents of quinine. Such however are not always obtainable when travelling in fever countries, or for other reasons may not seem advisable to administer. In such case, the best of all aids is strong carbonic acid water. One should, however, take with one that preparation of quinine which in all cases is the most easily assimilated, and that is the hydrochlorate.

Up till within the last few years impure or even intentionally adulterated quinine often changed hands in commerce. A criminal suit in Berlin in 1886, and another in Paris in 1883 on account of such adulterations created some sensation at the time. The most frequent surrogate were the subsidiary alkaloids of the Cinchona bark that are much cheaper than quinine itself, but also much less effective against the Malaria poison. Things in this respect have grown better, the more so since quinine has seemingly fallen permanently from the high price to which it was driven by speculation. Yet whoever visits the interior of Africa must not rely simply upon the improved quality of quinine. He must obtain his supply from the best sources and even then submit it to the prescribed tests.

Much has been lately spoken on the question whether quinine has a preservative influence against fever. It is obvious that this question is of the greatest practical importance. In my opinion the matter lies thus.

In consequence of imperfect trials, one came to the conclusion that quinine exercised no really prophylactic influence, and this opinion was accepted and promulgated by certain careless editors of medical handbooks. In reality, however, too little quinine had been administered, or if enough, in inappropriate form. Other physicians who had examined the matter with more care and attention met with better results quite in accordance with Stanley and Schweinfurt's own personal experience. I am inclined to lay the more stress upon this, since the errors in treatment referred to can be easily recognised. Fresh experiments have been recently made by Dr. C. Graeser who published the results in the Berliner klinische Wochenschrift 1888 No. 42. As navy-surgeon in the Dutch service he had ample oppo-

* About $7\frac{1}{2}$ grains.—Ed. T. A.

† 23 grains.—Ed. T. A.

tunity of studying the question at the notorious fever port Tandjong Priok near Batavia. His experience completely asserts the prophylactic, or preservative effect of quinine, and is moreover confirmed by that of his successor, as I learn by personal communication from him. Every time his ship arrived at Tandjong Priok, Dr. Graeser gave every one of the crew one gramme of quinine dissolved in Geneva, and repeated such dose on the 8th, 12th and 16th days after arrival, administering also on the intervening 10th and 14th days half a gramme. His successor Dr. Buwalda varied the treatment somewhat. Already three days before arrival at the port named, and also during the whole sojourn on the coasts of Java and Sumatra, a period of five weeks, every man received a gramme of quinine three times a week. The quinine was likewise dissolved in Geneva. With Graeser the interval between the first and second dose was somewhat too great. His successor by shortening the term obtained also better results. The Geneva was employed chiefly with a view to inducing the sailors to submit to their regular dose of physic. With educated patients the use of alcohol might be dispensed with, provided that a moderate quantity be not demanded by weakness of the digestive organs.

Unless the country to be inhabited, or passed through is not altogether too pestilential, two doses of quinine a week may be sufficient. The effects should however on no account be frittered away by too small doses. All reports before me teach the uselessness of that, and the scientific view confirms it. On the other hand one need have no fear of any injurious consequences from such doses as those prescribed by Dr. Graeser and Buwalda. The evil effects often attributed to quinine should be rightly ascribed chiefly to the illnesses against which it is taken, or to unsuitable methods of administration. In these must be included, as before said, the passing of the insoluble sulphate into a weak stomach, and in no better medium than a volume of water.

Springwater is almost always employed and of this, according as it is impregnated with lime and other substances, much more than the 800-fold volume will often be found necessary to get the quinine to dissolve.

That the prophylactic or preservative effects of quinine have their limit, is a matter of course, and we expressly mention it here in order that the failure of exaggerated expectations may in no wise affect our faith in what is really feasible. Whoever lives permanently under the influence of intense malaria may at last find the further employment of quinine impossible, since after all it is a substance foreign to our organisation, even though yet more hostile to the malaria poison. Like other things quinine is limited in its effects. Water is an excellent means of extinguishing fire, yet may be powerless against a conflagration, and though wool is a good preservative against cold, one may perish in the thickest clothes.

The well known fact in the present day that the malaria poison proceeds from decay of vegetable matter, and is itself in reality a species of lowest organism that affects us by penetrating into the blood, renders the preservative action of quinine perfectly intelligible. For if such organism on reaching the blood encounters that chemical substance to which it is especially sensitive, its development and increase is arrested, and the consequences that would otherwise follow, fever, swelling of the spleen, disintegration of the blood are prevented. Quinine is not as formerly supposed, simply a tonic to the nervous system enabling better resistance to disease; only indirectly does it exercise such bracing effect.

No value should be attached to the many medications recommended as substitutes for quinine in cases of fever. Not one of them is at all equal to it in efficiency. Only arsenic can be sometimes substituted with advantage, whether however it can be so in general, and under such fluctuating conditions as a journey in wild countries carries with it, is unknown to me.

Hydrochlorate of quinine is somewhat dearer than the sulphate. In one of the latest price lists I find the former given as costing 2/3 and the sulphate 1/8 the

ounce. The difference is owing chiefly to the factories being arranged principally for the production of the sulphate on a large scale, and the hydrochlorate involving a further process. To the consumer however the difference in price is almost neutralised by the larger contents in the hydrochlorate of the pure alcaloid, 83 parts being contained in the hydrochlorate against only 74 parts in the sulphate. An equal weight of the hydrochlorate goes therefore much farther, apart from its greater solubility and easier assimilation by the stomach. Lastly the hydrochlorate of quinine is much more rarely adulterated than the sulphate.

GERMINATION OF SEED.

It is a common mistake to suppose that in order to produce a mature plant we must allow the seed to germinate, and the resultant plantlet to fix itself in a soil and draw nutriment by means of roots from mother earth. Any plant will grow as well in water if it contains the proper food stuffs in the proper quantities, as it will in soil of the very richest and most fertile kind. All that has to be done is to germinate the seed on a piece of moist flannel, and then transfer it to a jar containing to every litre (about 1½ pint) of water the following quantities of the following substances:—1 gramme of nitre; ½ gramme of each of the following—sulphate of lime (plaster of Paris) sulphate of magnesia (Epsom salts), and phosphate of lime. An iron nail must also be kept in the water to give to the plant the almost infinitesimal amount of iron which it requires. This mixture of water and salts must be renewed about once a fortnight. Of course the root portion only of the plantlet is to be immersed in the water; the stem part which bears the green leaves must be allowed to stand out freely into the air. In Germany it has been the custom for many years to set aside some portion of the botanic garden for the growth of plants of all kinds, from the smallest herbs to the loftiest trees, in food solutions of the kind described above, i.e., by what is commonly known to botanists as the system of water culture.—*Indian Agriculturist*.

A NEW BAMBOO.

(BAMBUSA PALMATA, HORT.)

One of the most noble and distinct of all the Bamboos, so far as its foliage is concerned, is one sent to us under the above name by M. Marliac, the well-known specialist of Temple-sur-Lot (Lot-et-Garonne), France. Without flowering material, Bamboos are exceedingly difficult to make out specifically; but so far as leafage goes, the plant resembles *Guadua* or *Dendrocalamus latifolia*, as illustrated at plate vi of General Monro's *Monograph of the Bambusaceae*.

So far, B. *Ragamouski* has been our largest-leaved species, but B. *palmata* has much finer leaves, and is more erect in habit. As sent by Mr. Marliac, the stems are 5 feet in height, with from five to seven leaves at their apices only; the largest of these leaves are 12 to 13 inches in length by 4 to 5 inches in breadth at their widest part. The figure (106), shows the stems and the leaves about one-third of their natural size. Above, the leaves are of a rich yellowish-green tint, finely lined or veined and below they are of a soft blue or glaucous hue. The plant is said to be hardy, but even if it should not be so under all circumstances, the plant is so noble and distinct in habit and leafage that it is well worth pot or tub culture in the greenhouse or conservatory.

It would be very interesting if the growers of Bamboos in continental gardens would tell us something as to the species and varieties they cultivate. Again, how many species are there hardy in Great Britain and Ireland? My own experience with about a dozen kinds is, that they will withstand a good deal of cold weather and actual frost, but that they will

not endure drought or dry scathing winds. In moist rich soils and sheltered positions they grow rampant, and add a grace to ordinary shrubs that no other hardy exotics can do.

Again, I should like to ask whence and from whom may seeds of Bamboo be obtained? The seeds germinate so readily, and, as General Munro pointed out in 1866 (*Trans. Linn. Soc. Lond.*), the young plants grow so rapidly that it seems a pity the hardier kinds of North China, Japan, the Himalayas, and the Andes cannot be reared in quantity.

Where is *Arundinaria macrosperma* of the Southern States of America now cultivated in Europe? One of the most distinct of all the dwarf kinds is one from Japan growing 2 feet high. Its leaves are about 3 to 5 inches in length by 1½ inch in breadth, and it acquires a variegated aspect from the withering and bleaching of the Margins of its leaves. Can anyone tell us the name of this peculiar species?—F. W. BURBIDGE, [*Bambusa tassellata*, hort., see p. 578.]—*Gardeners' Chronicle*.

LIBERIAN COFFEE, VANILLA &c.

Experimental cultivation has been carried on for some years at the plantation at Mergui in Burmah, but according to the report of last year, it cannot be said to have achieved much success. Liberian coffee was fairly successful, though the plants were attacked by white ants, and the crop was less than in the previous year. Great difficulty has been experienced in introducing the coffee for sale, as the first year's crop which was sold to a Burman was not properly prepared, and some persons declared that it was not fit for consumption. When the present Sub-Assistant Conservator of forests took charge he suggested that the coffee should be prepared by the department itself and sold locally, which was done; and though at first there was some difficulty in finding purchasers owing to the bad name acquired by the produce of the previous year, it was gradually sold off, and the purchasers were all pleased with its flavour. The crop of last year at once found a ready sale at R1-8 per viss, and the supply was not sufficient for the local demand, the coffee being pronounced much superior to that sold in the bazars. The experiments with Arabian coffee proved a complete failure, and have been abandoned. The cocoa seedlings and plants suffered severely from the attacks of white ants, so that only twenty remain of 161. Only two of these produced pods, which have not as yet been collected. The vanilla plants grew well and flowered, but the flowers all died without coming to maturity owing to the absence of insects to disseminate the pollen, but an attempt is now to be made to fertilise the flowers by hand. There were 172 tea plants, but nothing is said about their produce, and the four cardamom plants all died, while specially selected seed sent from Mysore did not germinate. As the total receipts from the sale of produce amounted to R.272, and the expenditure to R617 it cannot be said that the experiments have proved profitable; but as the plantation only cost such a small sum it is to be continued.—*Indian Agriculturist*.

MORE TEA DEALERS PROSECUTED.

(Special Report for the "Ceylon Observer.")

At Greenwich Police Court, on Saturday, 21st June, George Westover, grocer, of 247 Lewisham High Street, and Kearley & Tonge, trading as tea merchants at Mitre Square, Aldgate, appeared before Mr. Marsham in answer to summonses under the Merchandise Marks Act, charging them with having sold or caused to be sold certain tea to which a false trade description had been applied, contrary to 50 and 51 Vict., cap. 28. Mr. Albert Gray, instructed by Messrs Sanderson, Holland, and Adkin, appeared to prosecute, and Mr. Asquith, Q. C., instructed by Messrs. Lewis and Lewis, defended Kearley and Tonge.

Mr. LICKFOLD asked that the case against the defendant Westover might be postponed, on the ground

that the summons had only been served on the previous day. Mr. Gray said he had understood that the summons was served some time back, as the information was laid on 6th June. However, if the case against Westover was postponed, he would ask that the case against the other defendants should also be held over, because the former case should come first in order of priority. Mr. Asquith remarked that it was clearly the intention of Mr. Gray to use the conviction he hoped to get against Westover as a means of putting the screw on in the case against the other defendants.

Mr. GRAY explained that the Act distinctly provided for what his learned friend termed "putting the screw on." And the charge against Westover would never have been brought if he had only availed himself of the means of exemption provided. By a special clause the retailer was exonerated from blame if he could prove "that on demand made by or on behalf of the prosecutor, he gave all the information in his power with respect to the persons from whom he obtained such goods or things." This the defendant had been asked to do but had refused, and the prosecutors had been reluctantly obliged to proceed against him.

Mr. MARSHAM said that as the summons had not been served until the day before he thought that the request for postponement was very reasonable and he must grant it. He thought the case against the other defendants might very well be proceeded with at once. In reply to Mr. Gray His Worship added that he had no objection to the admission of the defendant Westover as a witness provided there was no objection by defendant's counsel.

Mr. ASQUITH:—My friend Mr. Lickfold may have something to say on that point presently.

Mr. GRAY, in opening the case against Kearley & Tonge, said the prosecution was instituted by the Ceylon Association in London. It was not a trading body, but an association of gentlemen connected with Ceylon formed for the purpose of protecting the interests of the Island.

Mr. MARSHAM:—I understand, then, that it does not represent any particular firm in this case.

Mr. GRAY:—Certainly not. Counsel proceeded to quote the sections of the act under which defendants were charged, and referred to "Storey v. the Chilworth Gunpowder Company" and "Wood v. Burgess," two cases that had been decided in a superior court, as bearing some interpretation of the act that was of value in the present case. The defendants Kearley & Tonge were tea blenders, and they supplied tea in packets to a large number of retailers. The tea in question (packets produced) was described on the label as being from a "Blackmoor Vale Estate." On the upper surface of the label were the words "imported by Kearley & Tonge" followed by "Pure Ceylon Tea." By paying close attention to the label, and perhaps with the aid of glasses, the words "Blended with India and China" might be discovered, but they were so hidden by a signature of "Kearley & Tonge," one flourish being scrawled heavily through them, that the words denoting a blend were certain to escape the eye of the purchaser. The packets in Court were bought of Mr. Westover, a grocer, and the tea had been analysed by professional men of the highest standing in London, who said that it was not Ceylon tea at all. If there was any Ceylon tea in the packets it was so small a part of the whole as to be undiscoverable. If that could be proved to the satisfaction of the magistrate, the question was whether the description upon the packets was a false description within the act, and whether that description was false in a material respect and such a false description as the Act was passed to prevent. It seemed to him (Mr. Gray) that that was clearly so. On the face of it, it was indicative, when they looked at the label on the packet, of the fact that the tea was the pure Ceylon tea. For while the words "Pure Ceylon Tea" were in large clear type, the words denoting that the tea was a blend were not only in very small type, but were practically scored out. This was indicative of a design to deceive, for the latter words were quite imperceptible to the ordinary purchaser. What was the impression on the mind of a person who asked for Ceylon

tea? He would get one of these packets given to him, and the question was whether he ought not to suppose, from the visible description on the label, that he was buying pure Ceylon tea, unless he was actually told at the time that the tea was a blend. When the word "pure" was used with the word "Ceylon" in important-looking letters across the front of the label, he (counsel) would submit that the sellers were not entitled by means of words tucked away and concealed to be exonerated from blame if they sold a blend to the purchaser. When it was considered that the description on the label was not the effect of accident but of design, he felt that a conviction was bound to follow. He would point out that it was not a question of infringing the trade mark of anybody; that was an altogether different charge. The analysts and professional experts to whom the tea had been submitted would pronounce it to be composed principally of Indian tea, with very little Obina, and hardly any, if any, Ceylon.

Mr. SKIRROW was then called and examined by Mr. Gray. He said he was a traveller for a firm called the Ceylon Tea Growers, Limited. On 24th May he had purchased packets of tea at Westover's shop in Lewisham High Street. He had sealed four packets in the presence of a witness; the packets were all closed when bought. He then took two packets to Mr. Leake, Secretary of the Ceylon Association; one he handed to his witness, and the fourth he retained.

Mr. Wm. MARTIN LEAKE, examined by Mr. Gray, said he was the Secretary of the Ceylon Association in London. He had received, some time after May 24th, some packets of tea from the previous witness; and samples of that tea were handed by him to the experts for testing.

Mr. GEORGE STEHN was then called, and said that he was manager of Messrs. Wilson, Smithett & Company's tea rooms at 41 Mincing Lane. In answer to Mr. Gray he said his experience extended over 13 years. On 27th May Mr. Leake brought a packet of tea to his place of business, and gave him some of it. He submitted it to the usual tests and tasted it. He found it to be a blend principally composed of Indian tea, with a little China. It was possible that there might be some Ceylon in it, but if so it was very little. He had been to Ceylon.

Mr. GRAY:—Do you know of the existence of a Blackmoor Vale Estate in Ceylon?

WITNESS:—There is no such estate there.

Mr. ASQUITH:—We don't pretend that there is.

In CROSS-EXAMINATION witness said that more than a tea-spoonful of tea was used in testing. Asked as to the method of testing, witness explained that it was done in the usual way—by pouring boiling water on the leaves and tasting the liquor, and by smelling the leaves both before and after infusion.

Mr. ASQUITH:—But do not Ceylon and Indian teas belong to the same class or family?

WITNESS:—They have marked characteristics of their own. There is a great difference in flavour.

Mr. ASQUITH:—That is strange. Are you sure of it? Yes; you wouldn't think it strange for there to be a difference between the flavours of a glass of sherry and a glass of port.

Mr. ASQUITH:—Do you mean to say that there is as much difference between Ceylon and Indian teas as between sherry and port?

Yes; the difference would be as apparent to a practical tea-taster.

Continuing, witness said that the price of the lower grades of Ceylon tea was about 2d higher than that of the corresponding grades of Indian in the market. It was one of the lower grades of Indian tea that had been used in the packets in question. The flavour of China tea was very different from either Ceylon or Indian. Pressed for his view as to the actual proportion of Ceylon tea in the packet, witness said that it might be as high as 5 per cent; but in his opinion there was not so much.

Mr. ROBERT ANDERSON was examined by Mr. Gray, and said that he was manager of the Indian and Ceylon tea department of Messrs. Arthur Capel & Company. Mr. Leake came to him on the previous day with a packet of tea, some of which he gave

him. Witness turned it out and weighed it up, and then submitted it to the usual test and tasted it. His opinion was that the tea was mostly Indian with a little China. He could not find the least trace of Ceylon in it. He was engaged in tasting tea every day, and he might say almost every hour of the day. His taste would naturally become acute with so much practice.

By Mr. ASQUITH:—There was no difficulty whatever in distinguishing between Indian and Ceylon teas. He would certainly be able to detect the presence of Ceylon in the mixture unless the quantity used was quite insignificant. There was China in it—an appreciable dash; but no appreciable quantity of Ceylon.

GEORGE WESTOVER was called and examined by Mr. Gray. He said he carried on business as a grocer at 247 Lewisham High Street, and remembered Mr. Skirrow calling on 24th May and buying some tea.

Mr. LICKFOLD here asked the Magistrate to caution the witness not to say anything that would incriminate himself. There was a summons banging over him, and it would not be right to allow the witness to prejudice his case.

After a short consultation the summons against Westover was withdrawn, Mr. Marsbam remarking that he should be unable to compel him to answer questions in the witness-box unless that course was adopted. (Examination continued.) Asked where he obtained the tea in question, witness refused to answer the question, but ultimately said he got it from Kearley & Tonge. He went personally to their place for it; sometimes he brought the goods away with him. The teas complained of were sent down to him, however. The order was given at the firm's house, and the terms were cash; the money being paid at the time when the order was given. He had no credit for tea. The price paid was 1s 5d per lb., and he sold it at 1s 10d. The carriage of the tea was paid by Kearley & Tonge.

Mr. GRAY:—Do you sell it as Ceylon tea or as a blend?—I sell it as a blend.

By Mr. ASQUITH:—He bought it at the office in Mitre Square in the city of London, and paid for it there. It was delivered to him in Greenwich at 1s 5d. Asked, "Did Mr. Skirrow ask for Ceylon tea?" witness said he was not in the shop at the time, but there were other witnesses present who could give evidence on that point.

Mr. ASQUITH, addressing the magistrate, said that the sale having taken place at Mitre Square, the offence, if any, was not committed within the jurisdiction of the court. He should be very sorry if this was so, because he felt that it would be much more satisfactory to have the matter disposed of by a learned magistrate than by an alderman of the City; and in this he was sure he expressed the sentiments of his learned friend as well as his own. But his only fear was that if a conviction was obtained it would not stand.

Mr. GRAY contended that the sale did not take place outside the jurisdiction of the court. The goods were sent in defendants' own van, and the sale was not completed until the tea was delivered at Greenwich, the price paid including delivery.

Mr. MARSBAM supported this view, remarking that he thought Mr. Asquith would not deny that if the tea had been damaged in transit Westover would have had a claim upon the defendants.

Mr. ASQUITH admitted that there was some force in the argument, and said that as the magistrate held that he had jurisdiction, he would gladly proceed with the merits of the case. He contended that the label on the packets was not a false trade description. It truly described the contents of the packets. No one was entitled to expect from the description that there was any large and appreciable quantity of Ceylon tea in the blend.

Mr. MARSBAM (interposing):—Well, one would expect that the majority was Ceylon, would he not?

COUNSEL, continuing, said that the experts had declared that there was no difficulty in deciding the proportion of Ceylon in the packets. It seemed another instance of the unreliability of expert evidence. He intended to shew by the books of the defendants and by evidence that there was a very

large proportion of Ceylon tea in the blend. His clients never bought China tea.

Mr. MARSHAM:—Then why do they say on this packet that it is "blended with India and China?" (Loud laughter.)

Mr. ASQUITH:—I shall come to that later on. Proceeding: Counsel said the tea was really a mixture of Ceylon and Indian. Of course, the quantity of Ceylon used varied from time to time. But it was always as much as 40 per cent of the whole and sometimes rose to 80 per cent. Ceylon and Indian teas did not differ so much as one of the witnesses had stated. The first named was used to give greater body to the blend, and to suit the palate of the consumer. In the tea before the court the Ceylon preponderated. The experts had differed somewhat from each other. In fact on one point their evidence was irreconcilable, for while one said that he could discover no Ceylon tea at all, the other had admitted that there was perhaps as much as 5 per cent. But assuming that he (Mr. Asquith) could establish that what he had stated about the contents of the package were the facts, where was the false description? Counsel for the prosecution had somewhat exaggerated the difference in the size of the letters on the label. Ceylon tea was a recent introduction which had attracted public attention; his clients would not deny this, and they naturally had the more attractive name printed in rather prominent type. It had been said that the signature of the defendants was made to hide the words signifying a blend. But he could prove that the signature was really the usual one adopted by defendants, and that the flourishes were genuine. Gentlemen in the city were often fond of adorning their names with long strokes and curls (laughter), and this was one of that kind. Now as to the words "Blackmoor Vale Estate": it was never intended that they should be understood as implying that the tea was grown on an estate of that name. Everybody knew that Blackmoor Vale was a charming spot in Wiltshire, famous for hunting. No one ought to be better aware of this than the gentlemen interested in that case, whom he suspected of a weakness for sport of that nature. (Laughter.) The words "Blackmoor Vale Estate" were registered as a trade mark by defendants before the Act was passed, and he could prove this by producing the certificate. It was purely a fancy description; and although he would admit that it was a rather eccentric form of trade mark, he denied that it warranted any assumption of fraudulent intentions. He would proceed to call his witnesses.

At this point Mr. MARSHAM said that it would be impossible to finish the case in the time at his disposal, and it was adjourned for further hearing on Saturday, 28th June, at 12 o'clock.

On Saturday, 28th June, at Greenwich Police Court, Kearley & Touge, Tea Merchants, again appeared before Mr. Marsham in answer to a summons under the Merchandise Marks Act charging them with having sold certain tea to which a false trade description had been applied. It will be remembered that the case was partly heard last week and was then adjourned.

Mr. GRAY again appeared to prosecute, and Mr. Asquith, Q.C., for the defence.

Mr. HUDSON KEARLEY was called and examined by Mr. Asquith. He said he was a partner in the defendants' firm, who dealt largely in Ceylon and Indian teas. Ceylon tea was introduced into the English market about five years ago. That was the first time that any considerable quantity of Ceylon tea came to this country, and his firm began to deal in it at once. They had a label designed and made bearing the words "Pure Ceylon Tea," but without any reference to its being a blend. The signature running across the label was an exact facsimile of the signature of the firm signed by himself, and the flourish to which attention had been called was a customary part of that signature.

Mr. MARSHAM:—Was the flourish usually made so far away from the name as it is on this label?

WITNESS:—Yes; I can prove it by producing some of the firm's cheques (cheque handed to the Magistrate.)

Mr. MARSHAM remarked that the flourish was not quite the same as that on the label, where it extended farther beyond the name, than it did on the cheques.

WITNESS explained this by saying that when the plates for the labels were engraved the signature contained also the name of a Mr. Heseltine. On his leaving the firm his name was erased from the plate, but the flourish remained unaltered. The signature was on the label at the time when it was used for pure Ceylon tea and nothing else. Referring again to the commencement of his firm's dealings in Ceylon tea, witness said that in course of time they came to the conclusion that it was coming down in reputation and in quality, and they formed the opinion that it would be improved in flavour by blending. They therefore mixed with it Indian tea, and had words added to the label signifying that the tea was a blend. The only difference between the original and the later labels was the addition of the words "Blended with India and China." The tea had always since that time been Indian and Ceylon, and the firm had never sold tea with that label attached of which Ceylon did not form a part. Although the label said "India and China," China tea had never been used in the blend. The word "China" had been added to the new label with a view to putting China tea into the packets if it should ever sufficiently improve in quality and rise in public estimation. But that eventuality had not yet happened. In evidence of this, witness quoted statistics showing that although the quantities of Indian and Ceylon teas imported had largely increased, the imports of China tea had gone on steadily diminishing.

Mr. MARSHAM said he wondered that the defendants should have put the word "China" on the label if they did not fully intend to put China tea into the blend.

WITNESS explained that they had not used China because Indian had always been better value in the market. He had not personally taken any part in the actual blending since 1888; prior to that year he had supervised it. Asked for his view as to the market difference in the prices of Indian and Ceylon tea, witness said it was nothing like twopence per pound in favour of the latter. Such a statement was simply ridiculous. The prices varied from time to time according to the issue of the market governed by supply and demand. For instance, if the Ceylon crop were inferior, it would have the effect of making Indian tea dearer in the market. Prices were constantly fluctuating and were not steadily in favour of either Indian or Ceylon. There was always a sea-saw movement. To say that prices were always in favour of Ceylon tea was altogether untrue; in fact, until quite recently the very reverse had been the case, the average prices of Indian tea being above the average prices of Ceylon. At that moment, however, the relative prices were in favour of the latter; this having been so for some weeks past.

Mr. GRAY, interposing, said it was not claimed by the expert Mr. Stehn that there was a uniform difference of 2d per lb. between all Ceylon and Indian teas; he had stated that this difference existed only between the low grades.

Mr. ASQUITH thought not; but on reference being made to the notes of the evidence given at the previous hearing, Mr. Gray was found to be correct.

Continuing, WITNESS said his firm also sold tea under the "Ceylindo" brand.

Cross-examined by Mr. Gray, witness stated that the "Blackmoor Vale Estate" label was registered in 1886. That might be the year in which the Indian and Colonial Exhibition was held in London, but he did not know. Pressed on the point, he said he supposed there had been such an exhibition about that time; it was no concern of his to try to recall the exact date. The signature was on the label when sent for registration, but it had to be taken off because the authorities refused to register signatures. Defendants had used no China tea in the "Blackmoor Vale" blends. They rarely bought China tea: probably once in three months. But it was never used in blends of which Ceylon tea formed a part, only in cheap blends sold at about 10½ per lb. He had examined tea similar to that in

the packets in dispute and would assert that it contained not less than 40 per cent of Ceylon. A matter of fact the whole of the tea was Ceylon sometimes; the proportion depended altogether upon the state of the market. The firm did not only study prices in buying tea; their object was always to give good value in the packets, and to accomplish this they always made careful comparisons of the real values of the tea they purchased for blending. Of course it was the natural tendency for the percentage of Ceylon tea to run down if the price rose.

MR. GRAY:—Now, supposing that there is 40 per cent of Ceylon in the packets: do you think that the label, as it is arranged, is a correct description of the contents?

WITNESS:—Certainly.

MR. GRAY:—Do you suggest that a person buying a packet like the one before the magistrate, after seeing the label, gets what he expects?

WITNESS:—I decline to suggest anything to the magistrate.

MR. GRAY:—I am asking for your opinion. If you asked in a shop for coffee.

WITNESS (interrupting):—We don't deal in coffee.

MR. GRAY:—I am not supposing that you do. But if you privately purchased what you believed to be coffee, and found that only 40 per cent was coffee, the remainder being chicory, would you be satisfied with your purchase?

WITNESS:—I have told you that I know nothing about coffee; I cannot say.

Asked what date the tea in question left defendant's warehouse, WITNESS could not say precisely, but it would be after May 1st, because the tea duty was reduced from that date and a small label was attached to the packet produced notifying that the price was reduced in consequence. As to the brand "Blackmoor Vale Estate," that was simply a fancy name. He refused to say whether the words printed on the label did not imply that the tea was actually grown on an estate called "Blackmoor Vale."

Pressed by Mr. GRAY to say what the words were intended to imply when they put on the packet, WITNESS asserted, with some warmth, that they were intended to imply nothing at all. He repeated that "Blackmoor Vale Estate" was purely a fancy name. Asked if he thought that the ordinary purchaser would consider it to be so, he answered in the affirmative.

MR. GRAY:—Then you think that the old lady who goes into the shop for a packet of tea would suppose that the name of an estate printed on the package had no connection with its contents?

WITNESS:—My experience of old ladies has been that they think more about the interior than the exterior (Laughter.) The tea was sold on its merits, and those who bought it did so because it had a reputation.

MR. GRAY said it seemed to him that as the proportions of the ingredients were constantly varying, the reputation could not always be the same.

WITNESS replied that the value of the blend never varied although the proportion of Ceylon did. It was putting the case rather unpleasantly to suggest that when the label was made defendants intended to use China tea if it would pay them to do so. They intended to use it if it improved sufficiently to justify them in making the change. Witness would admit that no China had ever been used, although the label with "China" upon it had been in use for three years. He did not know when "Ceylindo" tea had been first blended. The certificate of registration would show, but it had not been brought to the court. Pressed as to whether it was not the fact that the "Ceylindo" brand was adopted in consequence of a warning letter from the Ceylon Association, witness denied any knowledge of such a letter. He did not know even of the Association's existence at that time.

MR. GRAY proposed to read a copy of Mr. Leako's letter to defendants, but Mr. Asquith objected.

Continuing, Witness said that the "Ceylindo" blend had been used for about 18 months. It was composed of Indian and Ceylon teas only. He was not prepared to admit that "Ceylindo" and "Blackmoor Vale" were practically the same tea. The latter was not, by a great deal, the most largely-sold blend; in fact "Ceylindo" had completely eclipsed all other brands sold by defendants. The "Ceylindo" label did not give any prominence to the word "Ceylon;" the brand having been introduced because the trade at that time were becoming rather doubtful of Ceylon tea. He admitted that the firm had a great many retail shops of their own. The shops of the "International Tea Company" belonged to them, and they also owned the shops carried on under the name of "Hull & King." The name was as well-known as St. Paul's Churchyard. (Laughter.)

MR. GRAY:—You have half-a-dozen shops under that name, I believe?

WITNESS:—You are only about sixteen short. (Laughter.)

MR. GRAY:—Now, to go to another point, you say on your "Blackmoor Vale Estate" label, "Imported by Kearley & Tonge." Is that correct?

WITNESS:—No; we do not actually import the tea. But it is a very usual thing in the trade, and in all trades, to use that expression.

Pressed by counsel as to what meaning the words were intended to convey when they were put on the label, witness said that they were intended to convey no meaning at all. He certainly could not justify their use under the circumstances. The label so printed three years ago was still in use.

Counsel here produced a large show-hill, bearing a brightly coloured picture representing a tea estate, surmounted by the words "Blackmoor Vale Estate." Witness did not think the show-hill implied that the picture was a representation of the estate where "Blackmoor Vale" tea was grown and packed; it was merely an attractive form of advertisement. His firm did not buy their teas at public sales; they bought them from other people who did buy at public sales on commission.

MR. GRAY:—Then the importation is two removes away?

WITNESS:—I have already admitted that we did not import the tea.

MR. GRAY:—You heard the evidence of the experts last Saturday?

WITNESS:—I heard the evidence of the so-called experts.

MR. GRAY:—Never mind that; we call them experts.

Continuing, WITNESS said he had no independent experts to give evidence rebutting the testimony of Mr. Stehn and Mr. Anderson. But he had in court the actual mixer of the teas and the person who had given him instructions as to the proportions to be used. He did not agree with the witnesses who had said that it was possible, and easy, to distinguish between Indian and Ceylon teas. It was very difficult; often Ceylon tea was so "Assamy" that the most experienced men could not decide whether it was Ceylon or Indian. To say that the two growths were as distinct in flavour as port and sherry was absurd.

MR. GRAY:—Then if Ceylon tea were wrongly catalogued as Indian the buyers would be unable to tell the difference?

WITNESS:—Sometimes not. (Laughter.)

MR. ASQUITH, re-examining witness, produced certain contract-notes giving particulars of teas bought by the defendants.

MR. GRAY said that these particulars gave no information as to the proportions used in the packets in question; and Mr. Marsham shared this view.

WITNESS proceeded to state that between January and May in the present year his firm had bought about 100,000 pounds of Ceylon tea and 150,000 pounds of Indiaa.

MR. GRAY again remarked that this was not material evidence; the magistrate concurring, and pointing out that evidence as to the quantities of tea purchased was no proof of what the tea was in the packets.

In answer to Mr. Asquith witness asserted that there was no ground whatever for the suggestion that "Ceylindo" was adopted under a threat of prosecution by the Ceylon Association.

Mr. THOMAS LILLICOE, examined by Mr. Asquith, said he was the buyer and blender of teas for defendants.

Cross-examined by Mr. GRAY he said that he kept a record of the proportions of each kind of tea used in blending. A small pocket-book was produced from which witness proceeded to read figures to show that the proportion of Ceylon tea used in the "Blackmoor Vale" packets had varied from 40 to 80 per cent. Sometimes 100 per cent had been used. There was never any China in the blend.

Addressing the magistrate, counsel for the prosecution said that the book produced was perfectly unintelligible.

In answer to further questions witness said that all the tea was mixed on the firm's premises by men in their employ. He was not present when the tea was mixed; but he gave instructions as to what was to be done. The change in the proportions from time to time was caused by the rise and fall of the market. He had not thought it necessary to do more than make an entry when any change was made.

Mr. GRAY remarked that only the months had been put in the book for the dates when alterations were made; the day of the month had not been entered.

WITNESS went on to say that the firm had never kept any record of the actual quantities of the different teas used from time to time; only the proportions being made a note of. Those entries were made at the time when the blends were altered.

FREDK. SHARPE was called and examined by Mr. Asquith. He said it was his duty to receive the teas to be blended, and to superintend the putting of them into the mixture. He had to weigh them up; about 2,000 lb. would be blended at one time. His instructions came from Mr. Lillicoe in writing; he had not brought any specimens of these to the court. After the instructions had been carried out, he had to return the written papers to Mr. Lillicoe, accompanied by a sample of the tea. Witness had been engaged in the same workshop for about two years; he knew the blend called "Blackmoor Vale." During the whole time he had superintended the mixing of that tea, there had always been used, as one of the ingredients, a substantial proportion of Ceylon, varying from time to time. He did not superintend the putting of the tea into the packets; the system was that the packers should come to him and ask for the particular teas they were required to pack, and they were given to them. There had never been any China tea in "Blackmoor Vale Estate" blend; the only ingredients were Indian and Ceylon. In answer to Mr. Gray, witness said he always got written instructions from Lillicoe, and these instructions were always handed back to him when they were carried out. Mr. Gray, addressing the magistrate, said he would call for the production of those instructions. Witness said it was not the practice to keep the instructions when done with; they were destroyed. Mr. Gray submitted that there was no documentary evidence whatever as to the quantities of the different teas used in the blends for the packets before the court.

Mr. MARSHAM:—That may be, but it can't be helped. He says the papers were destroyed.

Mr. R. O. HEARSON, examined by Mr. Gray, said he was a label designer and had designed the label for the packets in question. (Plates produced.) Mr. Kearley wrote the signature on the label; the name of Mr. Heseltine was formerly also on the label, but it was afterwards removed. Instructions as to the wording of the label were given him by Mr. Kearley; the design was witness's own. When the words "blended with India and China" had to be added, witness was told to add them without altering the character of the label.

Mr. ASQUITH, addressing the magistrate, said he did not know what better proof could have been given that the tea was a pretty equal mixture of Ceylon and Indian, than that which the witnesses for the defence had brought. It had been shown that the tea was bought by Kearley & Tonge, and actually

delivered in the chests into their warehouse. Then one witness had said that he himself took the tea out of those chests and superintended the mixing of the various kinds according to instructions given by Mr. Lillicoe. What else remained? The tea was put into bags with a label attached to each, and the bags were taken by the men whose duty it was to pack the tea for the grocers, and they made it up into little packets like those in court. These being the facts he did not see what more proof could be given. He did not know what other evidence could be required. No instance had been produced in the evidence in which less than 50 per cent of Ceylon tea had entered into the "Blackmoor Vale blend." Of course, an accident might happen in the packing; but he thought that there was no reason why all the packets should not be alike. As to the signature, he would remind them that the flourish was exactly the same on the labels before the words about the tea being a blend were added, and therefore at that time the flourish could not have been used for the purpose of fraud. It had struck him, when he first saw the label, that the sentence "blended with India and China" was printed in very small letters as compared with the words "Pure Ceylon Tea." But he had gone very minutely into the label. He would point out that if the words in small type had been printed so in the first instance the case would be different. The defendants, however, were dealing with an existing label, in which a great deal of artistic talent had been displayed, and they had to adapt the label to altered circumstances. They did what was natural, they took as much room as they could for the words relating to the blending. That accounted for the difference in the size of the type used. It had been said that the words "Blackmoor Vale Estate" added to the falsity of the description. Now, it was well-known that Blackmoor Vale was a place in England, and nobody ought to suppose that the tea in the packets came from an estate in Ceylon of that name. It had been admitted that no China tea had been used; but he thought it would be stretching the Act very considerably if it was held that the defendants were blameable for not depreciating the quality of the tea by putting in a growth of a lower quality and price.

Mr. GRAY rose to reply, but Mr. MARSHAM said that he need not do so unless he had anything of importance to explain.

In giving the judgment Mr. MARSHAM said that after the evidence he did not think he could hold that the flourish of the signature was extended with an intention to obscure the small words about the tea being blended. But it was certainly true that the words "blended with" were not visible to the ordinary purchaser, and of the other words—"India and China"—one was admitted to be falsely used. Considering, in addition to this, that the words "Pure Ceylon Tea" were printed very prominently across the label, he thought that the label was deceptive. The charge of false description was proved, and he would impose a fine of £10, allowing £5 5s costs.

The case created considerable interest in Court.

CASTOR OIL.—We are indebted to a planting correspondent for a correction in the quotations we give monthly in our *Tropical Agriculturist*. He writes:—

"In your June number I noticed that castor oil was quoted at 3d to 4d per oz.; it struck me then as incorrect, but I now see the same statement made in the new publication about aloe and ramie fibres. This rate surely means per lb., as castor oil can be bought at 1.50 per gallon, which would equal .01 cent per oz."

We have had "lb." substituted for "ounces" at once in our list. In a recent Nuwara Eliya Report, Mr. LeMesurier speaks of the castor oil plant as growing at Walapane like a weed and he is anxious to encourage the natives in regular cultivation more especially as one Colombo firm is prepared to take 400 gallons of the oil per month—no doubt for lubricating purposes?

THE MADRAS GOVERNMENT BOTANIST ON
CINCHONA CULTURE.

To neither the Madras Government nor Mr. Lawson, its botanist and quinologist, are we, as yet, indebted for a courtesy which might very well have been expected, in the shape of a copy of Mr. Lawson's Report on Cinchona Culture in the Wynaad. Baron Rosenberg, however, indicated its chief points, in the letter we published, and now we find the report substantially quoted in the *Madras Times*. We see no reason to alter our opinion that the Madras quinologist attaches too much importance to "food starvation" as he calls the supposed effect of the absence of humus or its deficiency, and too little to the mechanical condition of the soil. We long ago discovered in Ceylon that in stiff clayey soil, largely impregnated with iron,—soil in which tea flourishes,—cinchonas cannot be grown. Also that soil rich in humus, but water-logged, was equally fatal to the fever plants. But we have had no confirmation of the principle which Mr. Lawson so positively propounds, that "what kills coffee kills cinchona." Although cinchona is of the same natural order with coffee, it has never been attacked by, far less has it died from, the effects of *Hemileia vastatrix*. The trees have grown together side by side in the same field; and while the coffee has been debilitated to death by repeated attacks of the fungus, the cinchonas have never suffered from this cause.

Now that the price received for ordinary bark scarcely pays gathering and sending to market, it seems like mockery to be told that the more manure used the better, and to be advised to resort to costly cross-trenches mulched with hill grass. The latter is said to be collected at small expense. But in the days when mana grass was used largely for cinchona nurseries in Ceylon, and the grass had to be conveyed any distance, we know that the cost was not small but very serious. Recommendations to manure and till liberally; to plant widely; not to take bark until the trees are six years old, and subsequently to harvest only at intervals of three years, are no doubt excellent in theory. But practically the question is will such cultivation pay, now, or at any period in this nineteenth century.

THE CEYLON AMERICAN TEA COMPANY.

We are by no means favourably-disposed to the proposal made by Messrs. Wattson & Farr for the re-organisation of this Company. If the enormous proportion of shares required for themselves really mean a return for very large expenditure, they ought for the sake of their good name at this end, among people not accustomed to American ways of doing business, to be much fuller and more explicit in their explanation of how they proposed to spend the money in order to secure the floating of the New Company and its profitable support over all the States of the Union. But at the same time we most fully recognise the difficulty in which the local Directors of the existing Company were placed. What is there, for instance—according to the law of the United States—to hinder Messrs. Wattson & Farr starting their own "Ceylon-American Tea Company" any day they please, free of the encumbrance of paying back (as they offer to do) the capital in the existing Company? There is no power at this end to prevent their trading with the name of "Ceylon" or "Ceylon planters" in the States, and it would seem wise therefore not to cast them off, but to make the best of the

responsibility attaching to a Company working in co-operation with a local Directorate. A planting shareholder who takes this view and who criticises a contemporary's utterances, writes as follows:—

July 18th.—I do think the local "Times" leader on the Ceylon American Tea Co. Ltd., as given on the 12th, in good taste, and is not very misleading? Of the 6 000 shares of the original Co. only 1,747 are subscribed for, leaving 4,253. To buy those and assist in the formation of the New Company, looks to me very like buying R2 for R1. For every share held at present by stockowners, the New Company will allot 2 shares of \$20 each or \$40 = to say R108. So the present holder of a R50 share will get in the New Company's stock worth R108, for each share, or he has the option if he prefers it (read last paragraph in Wattson & Farr's letter) of retiring from the concern and receiving from them the R50 he has paid. They say—"We personally agreeing that if the new Company is undertaken, we will take up any shares of parties who may now be stockholders should they not wish to accept the proposal." Surely this is good enough; at any rate I shall stick to my stock, and think it worth while just putting a trifle more in. Your contemporary further says something about exigencies of trade compelling the new Company whose name is registered, to sell other than Ceylon teas. But the writer forgets it is a Company to be formed "strictly for the representation of Ceylon Industries." (See Wattson & Farr's letter last para but 2.) And to watch this, there will be the Board on this side.

The 28,000 shares to be handed over for getting up the Company and for advertising, travelling &c., &c. (see Wattson & Farr's letter) only mean £112,233. And what is this for an American Boom! especially if as the local "Times" editor says, it is "to register the Company in every State in the merican Union"? At any rate it may be said that "the £112,233" are not to come from Ceylon, but from the countrymen of Messrs. Wattson & Farr who are generally credited with remarkable acuteness about their investments. We suppose the prospectus of the new Company will be laid for approval before the Ceylon Directors, and clearly there must be a better guarantee for this new Association dealing in pure Ceylon produce under the joint arrangement, than if Messrs Wattson & Farr established a tea business of their own without reference to the existing Company.

DAVIDSON'S SIROCCO.—Can any of your readers tell me how a steady heat is kept up on a Davidson's large size Down-Draft Sirocco Tea Dryer. I find that the temperature drops from 385 deg. to 210 deg. before it hits the tea on the lowest tray. I also find that it takes 5 maunds dry wood too each maund of tea, that it does not turn out anything like 2 maunds per hour. Each one of these points contradicts Davidson's advertisement. Can anyone with practical experience tell me how to remedy them? A Darjeelingite, P. S.—I do not find that it puts price on tea, it only enables you to dry with other material than charcoal.—*Indian Planters' Gazette*, July 1st.

RAKWANA, July 12th.—Gemming operations are not progressing in such a satisfactory manner as was expected, and Mr. Baddeley does not seem to be at all satisfied with his Sinhalese laborers. To tell the truth, tempted by the liberal wages offered by Europeans, several persons of questionable character with no knowledge whatever of gemming took up work under the Gemming Syndicate. Mr. Harding of the Gemming Syndicate is expected here tomorrow. The plumbago mine on Barra is paying very well. Recently a sapphire weighing 19 carats was found by one Adonis Perera either on Spring Vale or Know Hill Estate in Kukulu Korle. The finder, not knowing the value of the gem, sold it to a Sinhalese boutique-keeper for R350. The later, who has a good knowledge of gems, had an offer of R1,900 for it; but he declined to part with it, and expects a much larger sum.—*Cor.*, local "Times."

Correspondence.

To the Editor.

BARON VON ROSENBERG ON MR. LAWSON'S
THEORY OF CANKER IN CINCHONAS
IN INDIA:

PRACTICAL EXPERIENCES AND ADVICE.

Tulliar, Devicolum, June 6th.

SIR,—Some time ago Mr. Lawson was asked to report on the canker and general decay of cinchona trees in the Wynaad. A good many of your readers must be interested in this question, I trust therefore you will find space in your columns to insert these few lines.

I have now seen Mr. Lawson's report, and from a planter's point of view it is not in any way satisfactory.

It is short, it is not very much to the point, it certainly seems misinformed in its premises, and illogical in its deductions. To us this would matter little, we could content ourselves with saying "Mr. Lawson is wrong;" certainly "we have learnt little from Mr. Lawson."

But there are planters who may be opening out cinchona estates, or taking them over from others; or agents, who, knowing little about planting, may insist upon taking Mr. Lawson's report as gospel, having the policy he advocates carried out. For the sake of these a note of warning should be sounded. Mr. Lawson's first conclusion is that cinchona estates are not sufficiently worked. Granted! But who is to blame for this: not the producer in this, that, or the other district, but the large cinchona-producing community all the world over. The prices obtainable for produce are so low, that estates cannot be thoroughly worked.

And it is here, at the very outset, that Mr. Lawson tumbles into his first error. He says that in former times, when the product paid better, it was right that cinchona trees should be planted close; well it is just because prices are so low, that now only close planting pays. If we planted wide apart, how many lb. per acre should we get off clearings under 15 to 20 years old? how could we make those few lb. per acre pay at a minimum profit?

Again Mr. Lawson insists upon the necessity of preserving the soil. Very well indeed! But how can the soil be better preserved than by covering it as soon as possible, *i. e.* by close planting and thinning out afterwards if necessary? But where Mr. Lawson is surely entirely mistaken, is when he ascribes the canker in the Wynaad to poverty of soil only. If Ooty were unknown to Mr. Lawson, if he had not seen the Government and other plantations there, thriving in soil so poor, under circumstances so wretched, one might forgive him. But as it is the arrogance of the statement is delicious. He virtually seems to say: "You in your Wynaad lands which are rich enough to have supported magnificent forests, and undeniably fine coffee, are not on a par with us the children of the higher mist whose lands never supported anything but scrubby grass and stunted rhododendrons; for lo and behold, with us cinchona thrives, with you it dies, therefore (*i. a. a.*) we have soil, you have none!"

Mr. Lawson deigns not to go into the varieties of canker or diseases so named or misnamed. He contents himself with insinuating that those foolish old men, who imagined a specific disease, were utterly mistaken. There is none. Manure your plants

sufficiently, and they'll grow equally well on the top rock of Dodabetta, yea down unto the quay of Calicut.

Mr. Lawson goes on to inform us, the ill-informed, that coffee and cinchona belong to the same species. He deduces therefrom that they thrive under like conditions only. Let him plant a coffee bush on the windblown steeps of Dodabetta, or a cinchona tree in the club compound of Madras, and they'll thrive as much as a Lapp would in the Sahara or Bamaswamy on Mount Hecla. And yet Lapp and Bamaswamy belong to the same or forked radish species. And though it be true that both coffee and cinchona belong to the cinchonaceae they differ in most particulars, such as flower, seed, quality of bark. And chiefly they differ in the purposes for which we grow them, for we do want coffee to flower and seed, we object to it in cinchona.

To sum up, I am positive that they cannot and do not necessarily thrive in the same soils and localities.

And to these generalities I will add from my own observation. I am now living on an estate at from 4-5,000 ft. elevation, on which both cinchona and coffee have been largely planted. Well, a few years ago, there was among them a magnificent field of cinchona *var. condaminea*. Some 4 years ago canker showed in a few patches, and these were planted up with coffee. The canker is now spreading, has indeed assumed alarming proportions, and it has been decided to plant up the whole field with coffee. And why? Because in the soil which according to Mr. Lawson must be too poor to support its equal feeder cinchona, it thrives remarkably.

Again, to take the reverse of the picture. Cinchona (a strong grown hybrid) was planted among young coffee, it shared all the manuring of the coffee, it was planted fairly far apart, it had every advantage that Mr. Lawson claims for it, yet it died; the coffee died not, but is flourishing.

Again, there is a small bit of cinchona here (mostly *Condaminea*), planted in a landslip, *i. e.* land entirely denuded of its topsoil, and which has been considerably neglected, yet the plant seems thriving.

Let us take another estate next to the foregoing. This was felled and planted up with cinchona, Ledger and Hybrids. The soil is remarkably rich, and good pits were made, yet now in its fifth year there is hardly a stick left standing. I has since been, and is being planted up with coffee, and the coffee is remarkably vigorous.

And now let me turn to another side of the district, a few miles away, a few hundred feet higher. There cinchona, though closely planted, is perfection, such as probably Mr. Lawson has never seen. It has gone out in a patch here and there, but the rest after 10 years and several croppings looks perfectly healthy, and this in spite of the fact, that in one two places that I know of, it was not even pitted for, but only dibbled in. And there cinchona even now pays, but it would not pay, if it required cultivation, beyond weeding, and perhaps an occasional surface digging.

Mr. Lawson's report in fact comes to this, he says: the patient is sick because he is starving as for any sickness, he cannot discover it, and therefore cannot diagnose it. There is no harm in the latter: we may be as unable to give the diagnosis as Mr. Lawson is, but we will eat our hats, and planters' hats are proverbial, if actual disease does not exist or if it is due to want of food material chiefly or only.

Cinchona does thrive in poor soils, as far as absence of canker is concerned—poor at all events in *humus*, viz. on the Pulney Hills or even on

Mr. Lawson's own Dodabetta. That there may be *mineral* ingredients sufficient in these soils is not denied, but analysis of the Wynaad soils shows no lack of these mineral ingredients either.

One of our overseers, who has been at planting for many years, takes the very opposite view to Mr. Lawson and says "canker is due to richness and not poverty of soil." I am not inclined to go all the way with him in this statement, but I think he is nearer the truth than Mr. Lawson. Why else is there so little canker in cinchona planted in sterile grassland, such as that of Liddle-dale, Bellevue and other estates at Neduwattam, and Ooty? Very much to the point is a clearing near here, at Devicolum, where a patch of grassland cinchona adjoins, and is under the same conditions in every way, as a plantation in felled forest land. The latter has suffered from canker here and there, the former not at all. And here I would call Mr. Lawson's attention to a fact he is either ignorant of, or has ignored. I mean the fact, that there are certain jungle trees, the dead roots of which will kill out tea, coffee, and especially cinchona. Perhaps this is the explanation of patches among otherwise healthy cinchona, planted in forest land, and their non-appearance in grassland.

I would also add that for the actual growth of the cinchonas, and for the analyses of their barks, a rich soil, either naturally so, or produced artificially, is no doubt preferable, but these questions are wholly apart from that of canker.

After all this denial of Mr. Lawson's theory on canker, you will expect me to pronounce a theory of my own, yet I must own, that I hardly have one, and every planter worthy of the name will approve me, when I say that all theories on the subject are and can at present be mere guesswork, or at the best an honest attempt at deducing from visible facts. Such, however, as my opinions, on the subject are I will give them, and your readers must take them for what they may be worth. It is then my belief that there are three diseases that attack cinchona and can prove deadly to it, call them canker, or anything else you like:—

1stly, a disease which begins at the top of the tree, sometimes at the end of the branches in the shape of a withering and drying up of the leaves and younger wood. I would ascribe this to not enough sun; in some clearings to a windy aspect. This rarely, hardly ever proves fatal.

Secondly, there is the disease which attacks the roots of the tree, sometimes working from the feeders upwards, sometimes from the collar downwards. This is always fatal in the former case. In the latter, if the evil be perceived before the whole of the collar is affected, a cutting away of the affected part which outside has a red or black, inside a rotten white appearance, may save the tree, at all events for a time. This disease I attribute to a clayey subsoil, a lack of drainage in the sub or surface soil or, to the effect that wind has had on the plants when young, bending them to and fro, and thus hardening "ultra fas" the tissue at the point of resistance, *i. e.* the collar.

Thirdly, there is the disease, which attacks any part of the stem from the collar to the second or even third set of primaries. This is a sort of desiccation of the bark in parts, followed by a congestion in others. We planters, in perhaps unscientific, but very expressive language, say this is due to the plant being hidebound. Taken at an early stage, and other circumstances being favourable, it can sometimes be remedied by running a knife up the stem, thus liberating the flow of sap. But circumstances as a rule are not favourable, when this species of disease sets in, and I would, from my experience, attribute by far the

greater proportion of the mortality among cinchona in India, at all events, to the latter form of canker. That it is due to a stoppage of the flow of sap, is proved by the fact, that exudation sometimes sets in below, or beside the part affected, and that principally at the times of year, when sap rises abundantly.

I would attribute this disease to drought principally, such drought as is general in India during January, February and March. It stands to reason that it is far worse at low elevations where the heat is greater, and high and intensely dry winds usually prevail during these months.

At such lower elevations the desiccation of the bark is more or less universal (though less felt in sheltered parts) the cambium is so "hidebound" by the shrunk bark, that it cannot pass the rising sap: hence the latter exudes or is dried up in the bark. "Pas de sang pas de vie," and the tree dies. At higher elevations this form of canker is rare; when it does appear, as a rule it only desiccates the outer bark, and is therefore often remedied by above process of running a knife up the stem.

Even at lower elevations, I have kept a clearing of cinchona alive for a year or two, when suffering from this disease, by ripping up the bark on both sides of every tree. Not that I expected those trees to live indefinitely, that I knew was hopeless, but because I hoped to and did get a crop of renewed bark. Such then is my theory, faulty no doubt, but the result of past and present observation and experience of my own, and my brother planters in this district, which must, in its lower elevations, resemble other districts, among them the Wynaad.

As for the cinchona planters of the latter district, I have no message of hope for them. I would not, as I may have seemed to argue, advise their planting up their grasslands with cinchona, but on the other hand, I cannot advise their planting up their forest land or trying to keep up their present clearings, at all events those parts affected by canker.

Mr. Lawson argues from the fact, that there are still enormous cinchona trees in the Wynaad, and tries to deduce therefrom that thousands of other giants may yet be reared. But Mr. Lawson's premises must be statistically strengthened before we can accept them. Those giant cinchonas are probably the result of the survival of the fittest, both as to plant and locality. They were probably planted with others, and the others died. And so in the future, only with larger numbers the *others* will die, and some few remain. Beyond all this, however, there is a circumstance, which Mr. Lawson has not even touched upon. I mean the possible, nay the certain deterioration in the seed, from which present plantations have been reared, as opposed to that, from which the older plantations have grown up.

Those old giants of the Wynaad and elsewhere are no doubt the result of seed, either imported direct, or taken from trees not barked. This, unfortunately, has not been the case with seed used for most of the later plantations, which has, as a rule, been taken from trees previously weakened by cropping, and that too of the old stripping kind.

In proof of this I will only mention, that a few years since when there was such a scramble for Ledgeriana, seed was sold, stated to be off trees giving from 7 to 14 per cent sulphate of quinine, *i. e.* not only must the parent trees have been barked, but the analysis must even have been obtained at least after the second barking from renewed bark. Let this vitiated seed be put among circumstances somewhat adverse and disease will immediately fasten on the plant nor will the latter have strength to rally. Put it among healthy circumstances, and, like a puny child well cared for, it may pull through.

In conclusion, my advice to cinchona planters in this Presidency and probably Ceylon also, is: Do not plant cinchona of any kind below 5,000 feet. If needs you must plant cinchona, go up, up, up, and plant some good hybrid.

Do not try and preserve your cinchona, if you see it going out from stem or root canker, at a lower elevation, it would merely be throwing good money after bad. And even if you tried to, and succeeded in preserving it for some few years, by the expensive means advocated, look at your accounts, and see whether present and near future prices will reimburse you for such cultivation.

For all this I am simply giving my opinion for what it may be worth, and for the sake of the Wynaad planters I sincerely hope I may be wrong. Even for my own sake and the cinchona I still have at lower elevations, I shall be glad if my opinion is refuted.

Finally, hard as I may seem to have been on Mr. Lawson in my statements, it is not for my own benefit that I express them. It is for the sake of my afflicted brother (cinchona) planters, that I have written. I therefore trust Mr. Lawson will not take my remarks amiss, and if he cares to come up here and, if possible, change his opinion he will find us not bad hosts, and growers of Al cinchona.

I am also very willing to admit that Mr. Lawson's advice, in other directions than those touched upon, is excellent. But a better market must rule before we can carry it out.—I am, sir, yours faithfully,

J. v. ROSENBERG.

TEA IN CEYLON.

DEAR SIR,—You are not quite accurate in your leading article of the 20th inst. under the heading "The Earliest References to Tea in this Island" and you do Bennett an injustice when you say, his botanical blundering was speedily exposed." Bennett says (pp. 276-7.) "The late Asst. Staff Surgeon Crawford in 1826 sent him from Batticaloa a very fine specimen of what Crawford considered the real tea, it fully answered the generic description of *Thea Bohea* of Linnaeus, and he gives a colored plate of the sketch he took of it, and then adds "but I was altogether unsuccessful in my own researches for the plant in the jungles of Mahagampattoo." Percival (1805) pp. 330-1 says the tea plant was found native in the forests and growing spontaneously in the neighbourhood of Trincomalee. He further says the soldiers of the garrison sundried the leaves and boiled them and many preferred the decoction to coffee! &c., &c. On the other hand Cordiner (1807) says (p. 285.) "The real tea tree is not indigenous in Ceylon, but the island produces several species of that genus," &c., &c.

E. B. CREASY.

[We are obliged to our correspondent for his interesting notes, but we scarcely think we have done Bennett an injustice, for in publishing the plate he took the responsibility attaching to the belief that the true tea plant had been found growing wild in Ceylon. This will we think be seen from a perusal of the full passage in Bennett. He ought to have taken steps to verify Dr. Crawford's supposed "find," before he lent his authority to the statement that the tea plant existed in Ceylon.

(From "Bennett's Ceylon and its Capabilities.")

The jungles adjoining this place, and throughout the Mahagampattoo district, abound with the "wild tea tree," as it is called, but which, I am informed, is a species of *Orchis*. It bears yellow flowers; and the poorest people are accustomed to use the leaf both for food and drink; for the former, boiled and mixed with Tyre, and for the latter, an infusion of the green leaf. It

is called *Gal-Kuroo* by the Sinhalese; who also employ the leaf of another plant, which greatly resembles that of the *Thea Bohea*, L., and is called by them *Rata-The-Kola*, (or Red-Tea leaf,) in a similar manner.

Although the infusion of the green leaf is a very bitter drink, it is an excellent tonic, and its taste may be greatly improved by the addition of the indigenous lemon grass (*Andropogon Schenanthus*, L.) and sugar; but that made with the dried leaf, is a tolerable substitute for Bohea tea.

The late Assistant Staff Surgeon Crawford, at the time he superintended the hospital duties at Batticaloa, in 1826, sent me, by a native *Dhoney* bound to Hambantota, a collection of insects and plants; and among the latter, a very fine specimen of what he considered the real tea, in flower. It fully answered the generic description of the *Thea Bohea* of Linnaeus; and, as it both flowered and seeded freely, I made a sketch of it, of which an engraving is annexed, but I was altogether unsuccessful in my own researches for the plant in the jungles of the Mahagampattoo.

Mr. Crawford did not assume any merit to himself as having made a new discovery, and it is very clear that the Dutch were well aware of the tea plant being indigenous in the eastern province; but it is to be wondered at, that the Government has not long ere this, directed its attention to so important an object of commerce; for if it be worth while to cultivate tea in so distant a country as Assam, with all its inconveniences and dangers, surely it would be a more lucrative speculation, in a colony so much nearer home, and with increased facilities of export. But this, like the bread fruit tree, is another chance discovery; and a better acquaintance with Ceylon in 1787-1789, would have rendered the two expensive trips to Otabeite, for supplying the West Indies with bread fruit plants, inexpedient; for they could have been obtained in any quantity from this island, and have obviated all the disastrous consequences of the mutiny on board His Majesty's ship "Bounty."

Captain Percival, in his "Account of Ceylon," published in 1805, informs us, "that the tea plant has also been discovered native in the forests of the island. It grows spontaneously in the neighbourhood of Trincomalee, and other northern parts of Ceylon. General Champagné informed me that the soldiers of the garrison frequently use it. They cut the branches and twigs, and hang them in the sun to dry; they then take off the leaves, and boil them to extract the juice, which has all the properties of that of the China leaf. I have in my pocket a letter from an officer in the 80th regiment, in which he states that he had found the real tea plant, in the woods of Ceylon, of a quality equal to any that ever grew in China, and that it was in his power to point out to Government the means of cultivating it in a proper manner."

—ED. T. A.]

JUTE MESH FOR WITHERING TEA.

Ivies, Yatiyantota, June 25th:

SIR,—Referring to your note attached to my letter *re* Jute Mesh for withering I wish to say that the coarse sample sent you is that of the cloth that the Calcutta firm say the Indian tea estates have been using for some time for withering. It weighs 16 ounces per yard and would cost 17 to 18 cents. I do not think it suitable for withering tats, though it might be useful for drying wet leaf or for covering reeper floors; but I hope that *Jute Twist Mesh* weighing 10 to 12 ounces will be found to be as strong and cheap and consequently superior for this, the purpose for which I intended it.

The fine sample sent you is one of those I had made in England, but I consider it rather too light for withering tats. If it were made as described in my previous letter under the name of *Jute Hessian Mesh* I think it would be about equal in weight and strength to the hessian now used; and I see no reason why it should be dearer out of proportion to its weight.

I am awaiting further information from Calcutta, which I shall be glad to send you when received.—
Yours truly, E. F. DAVIS.
[We shall be glad to hear further.—Ed. T. A.]

THE BEGINNINGS OF TEA IN CEYLON.

Central Province, June 26th.

DEAR SIR,—In a late leading article reviewing the names of earlier shippers of tea you have entirely omitted the names of Messrs. Saunders, Mercers and Scovells. Yet Blackwater and Adam's Peak should not be forgotten. Blackwater tea is older than most Ambagamuwa tea. Blackwater, Strathellie and Galboda are about contemporaneous, with a call in favor of Blackwater, I think.

Adam's Peak averaged a fraction over 1s 5d all round—and all tea shipped but red leaf—in 1883.

A portion of Mariawatte was planted from Blackwater seed. None of the gentlemen, proprietors, or superintendents, connected with the estates I have mentioned are, as far as I know, expecting testimonials from the public. Nor does Mr. Armstrong. Do not Mr. Jas. Taylor's proprietors reward him as he deserves? If not, why not?—
Yours truly, M. D.

[We are obliged to "M. D." for his corrections—which have just come in time for the last sheets of the book—but not for his snarl about the Loole Condura testimonial. Does he mean to place any of the names he mentions on the same footing as the pioneer of the "Sixties" and "Seventies" in cinchona as well as tea?—Ed. T. A.]

TEA PARCHMENT V. TEA LEAD.

SIR,—Can tea planters any longer afford to give away expensive boxes and lead linings? We sell tea, not wood and lead, and it is quite time a fixed charge was made for packages, at least as much as the dealers can sell them for. What power is there in the trade to enforce this customer? If no other power, let the growers themselves make the necessary stand. Again, why continue to use expensive lead for lining our chests, when farch eaper and equally efficient substitutes are available?

In the face of the profits and commissions that are made on lead by importers and agents, the planter has much to contend against in his efforts to make this change, or changes of any kind, but surely as a body, moving as one man, much could be effected. I have seen a returned lining of parchment in which the tea went home and kept perfectly sound and sweet. Where then is the obstruction to its general adoption seeing that the cost is about one-half?—Yours faithfully,
TEA PLANTER.

TEA PACKED WITH PREPARED PAPER IN PLACE OF TEA LEAD.

London, June 27th.

DEAR SIR,—I have pleasure to inform you that the break of Elkadua tea sent home in the prepared tea paper has met with every success.

The break, as I think I mentioned to you when in Ceylon, was divided in two.— $\frac{1}{2}$ being packed in paper, the other in the ordinary lead. The result of sale was precisely similar, each break fetching exactly the same figure viz. 10½d (pekoe).

The trade has made no objection whatever to the paper, and as it will cost about 40 per cent less than the lead, there does not appear to be much doubt as to its ultimate success.

I have recently had an application for samples from the Kangra Valley Planters' Association along with other Indian concerns.

I have today written the Chairman of your Planters' Association and sent him further samples at his request.

I propose substituting this paper entirely for tea lead on the Elkadua estate, where we have close 1,000 acres of tea, and where the saving will of course be very considerable.—Yours truly,
J. MAITLAND-KIRWAN.

A QUESTION FOR ROSE CULTIVATORS.

Kandy, July 1st.

DEAR SIR,—I shall be glad if you can tell me if it were ever known before that the rose could be propagated from the leaf. I have tried this mode of cultivation and have found it eminently successful—indeed leaves seem to strike more surely than slips.—
Yours faithfully, J. DUNBAR JONKLAAS..

IGUANA SKIN FOR SHOE LEATHER IN CEYLON: WHAT ABOUT OUR CROCODILES?

Jaffna, July 2nd.

DEAR SIR,—Perhaps you are not aware that the skin of the iguana is made into shoes, though not extensively, in Jaffna. I saw a pair of child's shoes made of its leather, and was struck with its novelty and the ingenuity of the local shoemakers, who, in Jaffna, are invariably Moormen. It is evident from this that one use of it at least is known to the natives of this province, and that they cannot be quite strangers to the mode of dressing the skin, if such nice soft shoes as those I saw could be made out of the local preparation. I trust your remarks will commend this industry to the authorities, and this poverty-stricken, though industrious, people will have another means of earning a subsistence when such means are not many and where nature has been niggardly in bestowing her benefits.—Yours truly,
A STRANGER.

MINERALS IN CEYLON; BERUWALA.

Anuradhapura, July 12th.

DEAR SIR,—Your editorial note in the *Observer* of the 8th instant headed "Mineralogical" calls to my mind certain passages on the same head occurring in the works of two Ceylon authors which do not ever appear to have been sufficiently regarded, if at all.* I enclose them herewith, as they may be of some interest, even if of no value. I also enclose a short notice of a historical event which happened at Barbareen, Barbaryn or Beruwala, which place is briefly referred to in your issue of the 10th instant.—Yours truly, in haste. C.

Bennett's Ceylon, published 1843.—Extract (chap. xli, p. 331):—"The late Mr. Reckerman, Fiscal of Colombo, informed me that coal had been discovered in the island by the Dutch; but from there being such an abundance of wood, and charcoal the only fuel used by the native cooks, no notice whatever was taken of the discovery that mineral is now become an object of such great and general importance, as to be worthy of the most particular research, for the purpose of supplying fuel to steam-vessels, touching at Ceylon, on their voyages to and from Madras, Bengal, and the Red Sea, and would be one of the greatest acquisitions to the colony that discovery has ever produced." [For the argument that neither ordinary coal nor anthracite exist in Ceylon, see monograph on plumbago in transactions of local Asiatic Society.—Ed. T. A.]

*They have often been carefully examined and disposed of. See our notes to passages quoted.—Ed. T. A.

Percival's Ceylon, published 1803 and 1805, Extract, chap. xvi, p. 357 (1803 edition):—"There were several mines of quick silver wrought by the Dutch in Ceylon. In 1797 Colonel Robertson found one at Ootta about six miles from Colombo. The quantity we procured from it did not exceed six pounds but it afforded a most useful and seasonable supply to the garrison, as at that particular time all we had was exhausted, and mercury was the principal remedy resorted to in all liver complaints.

"Although some quicksilver was still procured from this mine, yet the labour and expense attending it was so great, owing to the want of experienced and skilful workmen that it was judged proper to give up working it altogether before I left the island. I have since been informed that the undertaking has been resumed at the same place with more success."

[See the paper already referred to.—Ed. T. A.]

Percival's Ceylon.—Extract, chap. vi, pp. 129, 130:—Six miles onward from Calturalies Barbareen, a small village, with a sort of harbour formed by a projection of land where the river runs into the sea. This is almost the only place when the high surf and rocky shore on this coast permits shipboats of the European construction to land.

This place was signalized by a shocking catastrophe which took place here in 1795. A boat from his Majesty's ship "Orpheus" having been sent in here to procure fresh provisions, the sailors, confiding in the peace which then subsisted between the British and Dutch Governments, came ashore without any apprehension, and began to look out for water, a few fowls and vegetables. They were at first received with much apparent civility, and many promises that they should be plentifully supplied with the articles they required. This, however was only intended to amuse them, while a party of Malays stole unperceived between them and the boat, and fell upon them unexpectedly. Few of our men escaped this shocking treachery which was a-piece with the jealous and barbarous policy usually practised by the Dutch towards strangers who approach their colonies. The Malays who were the instruments of their cruelty on this occasion, were afterwards in dread of its being revenged upon them when our troops came before Colombo. Indeed it was a fortunate thing for them that the town was taken by capitulation as our men were very much exasperated against them both on this account, and their repeated attempts to surprise our camp before Trincomalie and Colombo.

[A different and, we suspect, a more truthful account of the Malays than that given by the same writer in his account of the massacre of the British troops at Kandy.—Ed. T. A.]

At Barbareen there is a principal manufactory for making cordage and cables from the cocout tree. Large quantities are sent from hence to Colombo and Point de Galle, to supply the vessels which trade to these Ports.

GREEN TEAS: PATENT PREPARATION OF, IN CEYLON.

DEAR SIR,—Some particulars of our invention which renders the manufacture of true green teas simple and inexpensive may be of use to your readers. We have, as you are aware, patented the method as well as the machine in Ceylon, and hope shortly to do so in India. Our patent covers, 1. A method of rendering tea leaf pliable for purposes of rolling or twisting without resort to the process known as withering.

2. A machine for carrying out this method on a scale large enough to suit the largest factories. Green teas may be divided into two classes Oolongs or semi-green teas which are partially fermented, and true green teas which are wholly unfermented. These teas are the most popular class of tea in use in North America as shown by the fact reported to the inventors by Mr. F. Street, the local

tea expert, that out of a total export of 51,000,000 lb. of China tea to the United States last season up to the middle of November only a very little over 1,000,000 lb. of tea corresponding to the ordinary Ceylon black leaf was imported, while of Oolongs there were imported 14,000,000 lb., and of the unfermented class which are the true green teas no less than 32,000,000 lb.

In view of the desire in Ceylon to introduce teas of this island into the American market, it is thus shown to be highly desirable that teas should be manufactured of the unfermented class, and that a method and apparatus for insuring the manufacture thereof should be perfected.

OOLONGS consist of tea leaves withered either artificially or naturally by hot air or on hot plates, sufficiently to enable them to be rolled, when they are straightway fired.

The result of this process is that the effect called by some fermentation and by others oxidization is partially produced, and this effect prevents the leaves from being uniform in colour and causes them to vary from an olive green to a light brown.

TRUE GREEN TEAS are made only of leaf which has never been fermented or oxidized and when infused should show a uniform yellowish green colour which could never be obtained had either oxidization or fermentation taken place. The production of these teas has hitherto been found impracticable in Ceylon because leaf could not be rendered sufficiently soft or pliable to be rolled or twisted unless by its being withered either naturally or artificially by hot air or hot plates, which withering is in itself a degree of fermentation or oxidization.

It was therefore requisite to find a method of obtaining pliability necessary for the rolling or twisting process by other means which would prevent all fermentation or oxidization. The inventors claim to have discovered after long experiment, and to have been the first in Ceylon to practise their discovery, that leaf could be without resort to any process heretofore used in Ceylon causing fermentation or oxidization, be rendered sufficiently pliable for rolling by a method heretofore entirely novel in Ceylon, which process not only produces pliability but absolutely checks all fermentation or oxidization. Full particulars of the machine can be obtained from Messrs. Brown, Rae, & Co., our agents at Hatton, and with each machine, instructions necessary for its use will be issued.

(Signed) H. D. DEANE,
J. T. RAE.

RAMIE MACHINERY EXHIBITION.—Another exhibition of ramie preparing machinery is to be held in the Agricultural Section of the Paris Universal Exhibition in August next.—*Industries*, June 14th.

TILE DRAINAGE.—Prof. J. F. W. Johnston, of Edinburgh, has said in his lectures on agricultural chemistry that "with the disappearance of the permanent state of moisture, the coldness of many soils also rapidly disappears. The backwardness of the crops in spring and the lateness of the harvests in autumn are less frequently complained of, for the drainage in many localities produces effects which are equivalent to a change of climate." He says further that "in consequence of the drainage which had taken place in the parish of Peterhead, Aberdeenshire, during the previous twenty years the crops were arriving at maturity ten to fourteen days sooner than they formerly did, and that the same was true in many other localities."—*Louisiana Planter and Sugar Manufacturer*, June 28th.

SEED PEARLS IN BORNEO.—From an official report we quote as follows:—"The Seed-pearl fisheries at Tetabuan and Lingkabo are in a more than flourishing condition, the Bajows tell me there is no fear of the present crop being worked out under two years. A good worker can make a dollar a day.

"KEW BULLETIN."—The June number, now before us, contains an article on compressed or tablet tea, dealing with the methods of its manufacture at Hankow, and at Chungking in Thibet. Thibet trees of the Straits Settlements form the subject of another paper. It contains much useful information on a great number of different species, giving the weight of a certain number of cubic inches, and of a cubic foot of each and native names of the trees. Cotton in West Africa forms the subject of another paper.—*Gardeners' Chronicle*, June 14th.

VARIETIES OF TEA.—In a lecture on Tea before the Society of Arts, Mr. Richard Bannister has the following:—

The youngest leaves made the best teas, and starting from the end of the shoot, and numbering the leaves as they came from *a* to *f*, the following varieties would be obtained:—*a*, flowery pekoe; *b*, orange pekoe; *c*, pekoe ("poco" means "white hair" or down of tender leaves); *d*, first souchong; *e*, second souchong ("souchong" means "small plant"); *f*, Oongou (means "labour," expressing the care required in preparation); *a b c*, Mixed Pekoe; *a b c d e*, mixed pekoe, souchong. Hyson means "before rain," or "flourishing spring;" Kyson skins, refuse of tea (native term "tea skins"), coarser refuse (native term "tea bones.")

COFFEE ON THE BELLGERRY RUNGAN HILLS.—The high price realized for coffee last year (average of 103 to 108 shillings per cwt.) and the firmness of the market for the last two or three years, have induced speculators to invest more largely in coffee lands. Instead of buying up coffee estates of some standing, it is better to open out new coffee in new localities. "Bug," "leaf disease," and other pests make the upkeep of old properties more expensive than opening out fresh lands. We hear there are several applications for lands on the Bellgerry Rungan Hills, Mysore Province, for coffee cultivation. At present a solitary planter—Mr. Morris—has opened out some 200 acres on these hills, but the search for fresh lands has induced several others to apply for blocks in this locality. We hear that Mr. Sanderson of Keddah fame purposes opening out coffee estates here.—*Bangalore Spectator*.

RUBBER CULTURE IN COLOMBIA.—A report by Mr. Wheeler, on the agriculture of Colombia, forwarded as a Consular report, by our Minister, and of the country, states—as we learn from a home journal—that various sorts of trees producing caoutchouc, mostly *castilloas*, are indigenous to Colombia, but only one sort is cultivated, and that, at present, to a very small extent. This is a hitherto undescribed species of the family of the *Euphorbiaceae*, allied to the *Ceará* and the *Hevea* of Brazil, but it grows at greater elevation than any of the Brazilian species. In Chaparral there is a plantation of 70,000 trees, at 6,500 feet, which are doing well. They are ready for tapping in six years from the time of planting. This report lends additional interest to a communication which a M. P. Durand has recently made to the Paris Commercial Geography Society, in which he states that in April last he purchased 10,000 hectares (24,711 acres) of land at Monteria (Rio Sinu), Colombia, which is "incomparable" for cacao and rubber tree growing. He has since then planted a portion of the property with cuttings from the rubber trees in his neighbourhood, and hopes to hand over to his *société* in three years 100,000 young rubber trees which may be tapped from the sixth year.

A BUSY TEA FACTORY IN UVA.—It is not so long ago that some people thought that Uva would not be suitable for tea cultivation, but the experience of the last few years seems to show that as a tea-producing district it will be second to none. Nothing, for instance, can be finer than the tea on Glen Alpin estate, where as much as 400 and 500 lb. per acre is obtained off 4-year old tea, whilst the factory on that estate is turning out large quantities of tea. Up to date over 230,000 lb. of made tea has been turned out of it during the year, and by the 31st of this month, when the financial year closes, the total will have increased to 250,000 lb., of which a small proportion is bought leaf. We hear that a wire tramway 2½ miles long is about to be constructed from Badulla town to the estate, for the purpose of conveying manure from the town depot, where it is collected, to a point high up the estate, where it can be easily distributed. With a fine crop of coffee, with tea doing so splendidly, and with magnificent facilities for manuring, Glen Alpin ought to be a most valuable property for the shareholders of the Company.

"INDIAN CORN" is suggested by His Excellency the Governor as a product that ought to be freely cultivated in Ceylon, in his remarks to the people of Matale. This is a very natural thought to an Administrator who has seen how largely Indian corn forms the food of the people in the West Indies as it does in Brazil and other American States. And even in Ceylon, Sir Arthur Havelock will learn that maize or Indian corn is grown to a limited extent; and as we have repeated time after time in our "Agricultural Review" a great deal more should be done with it here in suitable localities. It requires however a moist good soil, although it has the widest range of all cereals. Bertolacci so far back as 1816 reported that "Turkish corn" or maize had been proved to succeed well in Ceylon: it was then grown freely in the Matara and Batticaloa districts and exported to other parts of the island. He hoped to see culture extend to the supersession of dry grain. There can be no doubt that much might be done in Ceylon to increase the production of maize, more particularly if better means of communication were established from Polgahawela and Dambulla, northwards and eastwards.

MINERALOGICAL.—Mr. George Armitage, to whom we referred the very pretty specimen of silver-like iron pyrites recently sent to us, in returning it states:—

"The bright faces are evidently the facets of the natural; crystal and judging from the angles, the crystal was I consider forming into a combination of the cube and tetrahedron, such as you will see figured in any good book on mineralogy."

A correspondent wrote to us:—

"No mention is made of arsenic in 'Gold, Gems, and Pearls.' I have been told that it exists in large quantities in parts of the island, and should be glad to know something about it as a marketable article."

On this head Mr. Armitage writes:—

"There is doubtless lots of arsenical pyrites in the island though I have not come across it. The ordinary pyrites does not contain arsenic. Arsenopyrite, mispickel, or crystal pyrites which are different names for the same mineral, has a silver-white colour inclining to steel gray and is composed of arsenic, sulphur and iron with at times part of the iron replaced by cobalt. There are a lot of other minerals, such as sennopyrite, solingite, orpiment, realgar, &c., containing arsenic. I shall be glad to show anyone the specimen I have of arsenopyrites. It tarnishes outside, but shows the silver-white colour on a fresh fracture. Native arsenic is formed in veins in the crystalline rocks and often with ores of realgar, antimony, &c."

"Re your remarks about steatite in a recent *Observer*, it is I believe common in Ceylon. You sent me specimens to name on two occasions."

It seems doubtful if arsenic exists in a marketable form in Ceylon.

MARKET RATES FOR OLD AND NEW PRODUCTS.

THE MAGAZINE

OF

THE SCHOOL OF AGRICULTURE,

COLOMBO.

Added as a Supplement monthly to the "TROPICAL AGRICULTURIST."

The following pages include the contents of the *Magazine of the School of Agriculture* for August :—

PLANT FOOD AND ANIMAL FOOD.

It is a common error to suppose that chemical analysis, and this alone, is necessary for finding out the nature of manures to be applied to crops, and the nature of foods to be supplied to animals. It was one of the unfortunate results of the teaching of Liebig that agriculturists came to believe that when the composition of the ash of plants was ascertained, farming would be reduced to a simple equation :— Given the elements of the soil and the composition of the plant, required the manure. They now know, however, that there are other considerations to be taken into account in deciding what manure should be supplied to a crop. The leguminosæ, for instance, are found by analysis to be rich in nitrogen, and yet nitrogenous manures produce but little effect on leguminous crops: while, though the cereals are most benefited by nitrogenous manures, they contain less nitrogen than roots and leguminous crops. Thus the composition of the crop is not a sufficient guide to the character of the manure to be applied, even when the analysis of the soil on which it is grown is known. We require to know in addition the power of the crop to assimilate the ingredients of plant food.

In the same manner there are other considerations besides the chemical composition of the food supplied to animals which must influence our selection of food-stuffs. Just as the food

ingredients of the plant may be present in the soil in a condition in which they cannot be made use of, so also may the nitrogenous and non-nitrogenous parts of food exist in a form in which little nutriment is derived from them by animals. For a long time all the nitrogen in the food of animals was supposed to be in the form of albuminoids; but during the last few years it has been shown that a part of the nitrogen of vegetable foods exists not as albuminoids, but as amides, and, in some cases, as nitrates. Thus it is quite possible that a food which was supposed to contain more albuminoids (reckoning all the nitrogen as albuminoids); than another, may turn out, when the true albuminoids only are taken into account, to be inferior in value. Having ascertained the amount of true albuminoids, we are able to find the "albuminoid ratio," that is the proportion of digestible albuminoids to digestible non-albuminoids in food. For the best feeding results a certain proportion between these two must be observed: and it will be readily admitted that to supply animals with an unlimited amount of food without considering the ratio of albuminoid matter to carbohydrates will not give us the best feeding results. The results of the analyses of vegetable foods are generally given under the heads of water, nitrogenous substances (the albuminoids being reckoned separately), fat, soluble carbohydrates, fibre, and ash. In calculating the albuminoid ratio the fat is reduced to its equivalent in starch by multiplying by 2.5, and the result is added to the soluble carbohydrates. The most important consideration in the matter of feeding, however, is the digestibility of foods, which can only be ascertained by experiment; and the general method adopted is to supply an animal with weighed quantities of food, the composition of which is known, collect and weigh the solid excrements and analyse them, and thus obtain almost the exact amount of

each constituent of the food which has passed through the animal unabsorbed, and by difference the amount digested. The proportion of each constituent digested for 100 parts is known as the "digestion co-efficient." There are some foods which, though chemical analysis proves, they have less of the valuable ingredients of food than others, are superior to these latter from the fact that they show a larger digestive co-efficient. For instance, linseed cake from the large proportion of fats and albuminoids which it contains would be expected to occupy a higher position as a heat-producing food than maize; its lower rank is due to its less perfect digestibility.

The necessary proportion of albuminoids to carbo-hydrates in the food of animals is analogous to the proportion of food ingredients necessary for the healthy growth of plants. Plants will not take up any more of an ingredient that is supplied to them in excess than they require in order to maintain the proportion to be observed between the amounts of the various elements of food. As different species of animals require different kinds of food, that is foods of different composition, so plants too require the ingredients of their food to be supplied in different proportions. Some take in more of one element of food than another; while some are able to attack substances in a little soluble form, as some animals have a greater power of assimilating little digestible parts of food.

There are yet many considerations to be taken into account, such as the influence of one element of food on another. The presence of an excess of water results in a certain amount of waste of the nitrogenous part of food; the addition of oil to a diet of fodder results in most cases in improved digestion; common salt hastens the conversion of starch into sugar. The digestion of vegetable fibre differs in different animals, and according to the source from which it is derived. Cattle and sheep have the greatest power from the fact of their being ruminants, horses and pigs come next, while poultry seem to have no power of digesting vegetable fibre. Flavour, too, has a great influence on diets; an agreeable flavour stimulates the appetite and promotes digestion. The reason for sowing a small quantity of yarrow with pasture grasses is no doubt this, and the fact of cattle greedily devouring bracken ferns and thistles after being made into silage that has acquired an agreeable flavour from fermentation, amply proves it. Even smell has some influence on appetite. The sweet smell of *anthroxanthum odoratum* in hay is greatly appreciated by cattle, though the grass is not very palatable and by no means very nutritious; while the aversion of cattle for fodder contaminated by the excrements of their own species is evidently owing to the peculiar odour it has acquired.

Thus the feeding of animals with the best results must be looked upon as an art that requires the help of chemistry, and calls for a knowledge of the results of experiment and observation by no means limited. And it is the total ignorance, or utter neglect of the principles of feeding animals that are specially intended for drawing heavy loads, laying on beef, and secreting milk, that has brought the cattle of this country into the degenerate condition in which we find them.

INDIGENOUS FOOD PRODUCTS: CULTIVATED AND WILD.

BY W. A. DE SILVA.

Sapindaceae.

22. *Schleichera Trijuga* Wild; Sin. Kón.

This is a tree common in the warmer parts of the Island. It attains very large dimensions, but the special feature of a Kón tree is the dense mass of foliage which covers it. The stem is thick and has a hardy appearance, the bark being grooved as it were. The main branches are few, but the minor branches are many. The dense leaves of this tree are compound (pinnate), and the leaflets have entire margins with prominent veins: in general, the leaf may be said to have a desiccated appearance. The trees shed their leaves once a year, after which young leaves begin to spring up. The young leaves of the Kón tree are of a pink hue, whilst the ordinary ones are of the usual green colour. The fruits are borne once a year in large bunches containing hundreds of them. They are round and small, about the size of small marbles, and are covered with a rather brittle leathery pericarp of a dusty colour. The mesocarp is a succulent mass of pulp encircling the seed. This succulent mass is of a yellowish colour and contains an acid substance. When unripe it is very acid and also has a little astringent taste, whilst when fully ripe the astringency is replaced by a sweeter taste, and the acid character too disappears to a certain extent.

This pulp is much eaten when ripe, and wherever the trees are met with, the fruits are not allowed to waste. In some places they become a marketable article where a hundred is sold for a few cents. The pulp of the Kón fruit is also made into curries and eaten along with rice, but this curry, though liked by some, is not to the taste of many on account of its acid nature. A palatable jam may also be prepared from the pulp of this fruit by boiling it in a syrup. A large quantity of oil is found in the seeds of *Schleichera*, and is extracted in some parts of the Island and used for burning. It is also said that a considerable quantity of lac is produced in the young branches.

The timber of this tree is known as the Ceylon oak. It is very durable as well as elastic, on account of the latter property the wood is in much demand for making native oil mills (chekkús), and for many other purposes as planks, beams, &c.

The medicinal properties of this plant unlike many other native plants are known to be of a definite nature, as the juice expressed from the leaves is always recommended for disorders of the brain, giddiness, biliousness, &c.

23. *Nephelium Longana* Cam.; Sin. Mora.

This tree very much resembles the one described before, but it does not appear to be of such a hardy character. The leaves are greener in appearance and the fruits are smaller. The epicarp or the outer covering of the fruit is leathery and smoother than that of the Kón. The mesocarp which surrounds the seed is of a blackish tint, and instead of its being sour as in the Kón, it is of a very sweet taste rather more than is pleasant. The fruits when ripe have a smell of ether. Bats are very fond of this fruit, and it is difficult to preserve them from their attacks. The fruit is eaten much and is in demand always. The seed is of a very black colour and light, and it

does not contain oily matter to any appreciable extent. The timber is also good, and is used for a variety of purposes especially in building.

The bark of this tree is used in cases of mild fever, and the fresh juice is reputed to be a successful remedy in curing earache.

OCCASIONAL NOTES.

We have before us Bulletin No. 6 of 1889-90 of the Agricultural Department, entitled "South Indian Fodders." This paper consists of a series of analyses of the chief kinds of straw on which the cattle of the Madras Presidency are fed, with explanatory remarks appended; and the work is that of Dr. VanGezel, M.B., C.M., F.C.S., F.I.C., Chemical Examiner, Madras. After giving the average composition of the straw of paddy (*Oryza sativa*), Cholom (*Sorghum Fulgare*), Ragi (*Eleusine corocana*), Cumbu (*Penicillaria Spicata*), Varagu (*Paspalum Scrobiculatum*) and, for the purpose of comparison, analyses of English and American wheat and oats, English Barley and American Maize, he remarks:—"The first point to observe is the apparently extraordinary poverty of the Indian straws in albuminoids. This brings down the "albuminoid ratio" in all cases to a figure much below that given for any English or American fodders. That this is misleading will, however, be evident, if the nitrogen found in the non-albuminoid compounds be calculated in the usual way into albuminoids, and the nutritive relation worked out on the result. The results are then, except in the solitary case of the analysis of oat straw where the non-albuminoid nitrogen is separately given, generally much more favourable to the quality of Indian fodders. In comparison with the English and American straws shown in the table, and judged by the figures representing the "albuminoid ratio" (*i.e.*, the total nitrogen being regarded as albuminoid); the South Indian fodders examined do not appear to be inferior; they also compare favourably in respect of the total amounts of nutriment contained in them, *viz.*, the sum total of albuminoids, the starch, and the starch equivalent of fat, excluding the fibre, which is in this case usually regarded as non-assimilable. What proportion of the total nutriment is actually assimilable being unknown, it would be unsafe to condemn these fodders, though regarded absolutely as food in the light of their albuminoid ratios, the analysis show that these fodders, on which South Indian cattle mainly depend are not of high value. Of the fodders generally obtainable, ragi straw appears to be the best, while varagu and cumbu straw are but little inferior to paddy straw, and cholom straw is the worst."

So far back as 1869 we find Mr. Laurie, the Director of Public Instruction at that date, suggesting in his Special Report on the state of Public Instruction in Ceylon, that "an Agricultural class should be initiated in connection with each school," and recommending the appointment of "a Master of Design and Technical Science." The carrying out of the former project, however, was left to the energy and determination of our present Director, who, we doubt not, will not rest satisfied till he sees the latter suggestion also *un fait accompli*.

From the Director of Public Instruction's report we quote the following:—"There are now altogether eleven Schools of Agriculture in Ceylon; that is to say, there is the parent Colombo School of Agriculture, which I opened in 1884, and there are ten branch institutions officered by young men trained in the parent school, the object of which is to spread into the districts the knowledge hitherto confined to those who came in to Colombo to the parent school.

"In 1887, the first of their existence, there were only six branch schools. The progress is therefore satisfactory, especially when it is considered that the government continues to pay for only six Agricultural Instructors; but the Government Agents of the Eastern and North-Western Provinces, of Sabaragamuwa, and Kegalla have come forward, recognising the usefulness of my Agricultural Instructors, and have themselves arranged for the payment of the four new Agricultural Instructors, who are usually attached to ordinary Schools, giving a few hours of theoretical instruction each week during the School Session, and, with the help of the bigger boys and such labour as they may engage on hire, cultivating plots of land upon improved principles. The profits are divided into two halves. Half goes to the Instructor and the remaining half divided amongst the boys who work on the paddy-fields or highlands cultivated. These lands are re-rented and paid for, so that my Instructors may be in no better position than the native cultivator, excepting that they cultivate on improved principles. Otherwise the native cultivator would lay our success down to having free government land."

Mr. Dunstane, a well-known American Naturalist, has brought back from Central America some horrible details of the "la sagenas de diable," the devil's snare, a plant or vine composed entirely of bare, interlacing stems of a very dark hue and covered with a thick viscid gum that exudes from its pores. There are many stories current in the vicinity of Nicaragua lake, where the plant is found in the swamps of San Sebastian, of human victims to its voracity. These must be taken for what they are worth; but as to the carnivorous nature of the plants there seems little doubt, for Mr. Dunstane had this proved to his satisfaction by the attack made on his dog, and on his own hand, while attempting to rescue the animal. The meshes of the vine were found to twist and twine in a most life-like fashion whenever anything came within their grasp, and from experiments made with raw meat &c. it was found that whenever any animal matter came within reach, it was sucked dry of its blood in a few minutes and then thrown aside. The gummy secretion seems to serve the purpose of increasing adhesion and overpowering the victim by its nauseating odour.

We are in receipt of the annual report of the Department of Mines, New South Wales, for the year 1889—a voluminous Blue Book of 253 pages. From it we find that the number of applications dealt with in 1889 amounted to 4,155, of which 1,640 were for gold leases comprising an area of 13,768 acres, and 2,515 were for mineral leases covering an area of 160,700 acres. The number of appli

cations for leasing crown lands for mining purposes (including applications for special gold leases) for 1889 falls short of that for 1888, which, however, was quite an exceptional year. The minerals to be mined for comprise gold, silver, copper, lead, tin, antimony, cinnabar, iron, cobalt, bismuth, crome, ochre, plumbago, diamonds, coal, marble, slate, manganese, kerosine, and alum. The geological survey of the Colony is progressing rapidly under the two geological surveyors, Messrs. David and Anderson, and by their work not only are the hidden stores of coal and the wealth of minerals being reached, but a knowledge of the geological history and formation of the Colony is being gathered, while most useful palaeontological work is being prosecuted under Mr. Etheridge.

The report of the Director of Botanical Gardens for 1889 was published in June, and the accounts of the Gardens at Peradeniya, Hakgala, Badulla, Henaratgoda and Anuradhapura show how much is being done by Dr. Trimen for the improvement of these places, and the highly satisfactory condition to which he has brought them. The foundation of a Museum in the Peradeniya Gardens will supply a long felt want; and already a good start has been made with a splendid collection of Ceylon woods. It is a great consideration that lovers of gardening are able to secure such plants as are available in the nursery at a very moderate price, but it is very desirable that some responsible person should be stationed at the lodge by the gateway, who can receive payments for plants purchased. As it is, the coolies who carry the plants are authorised to receive money, and it has happened on more than one occasion that they have disputed about prices which had been previously arranged, and endeavoured to extort more than the value of the plants. Neither these men nor the gatekeeper it appears can be commended for their civility to visitors, and this, as occurring in a public resort so largely frequented by foreigners, is a matter of regret, and calls for redress.

A caterpillar, said to cause serious damage to the coconut tree in Batticaloa, was sent to us with some affected leaves. The caterpillar appears to feed on the softer tissues of the coconut leaves which it rolls up into cylinders spun together by its threads. It feeds within these cylinders leaving the epidermis intact, which give to the leaves that scorched up appearance which is characteristic of trees attacked by the caterpillar.

The caterpillar is about half an inch long, of a slightly greenish colour when young, but becomes rosy when full grown. It has a dark red line along the back and along each side, and a brown head. The back of the segment behind the head is also brown. When full fed the caterpillar turns into a chrysalid, of a deep brown colour, in the folded leaf.

The parent of the caterpillar above described is about a little more than three-quarters of an inch in the spread of its wings, shiny, of a pale ashy colour, the upper wings freckled with darker spots. The under wings are of a yellowish grey, satiny, and fringed. The moth may be known

by its long and narrow upper wings being laid flat one over the other when at rest, and by the abdomen being depressed or flat. It evidently belongs to the genus *Depressaria*, commonly called the flat-body moths. It is not figured in "Moore's Lepidoptera of Ceylon," and we shall name it temporarily *Depressaria Cocos Nucifera* (?). We hope to give an illustration of the moth in our next.

WATER-LIFTS.

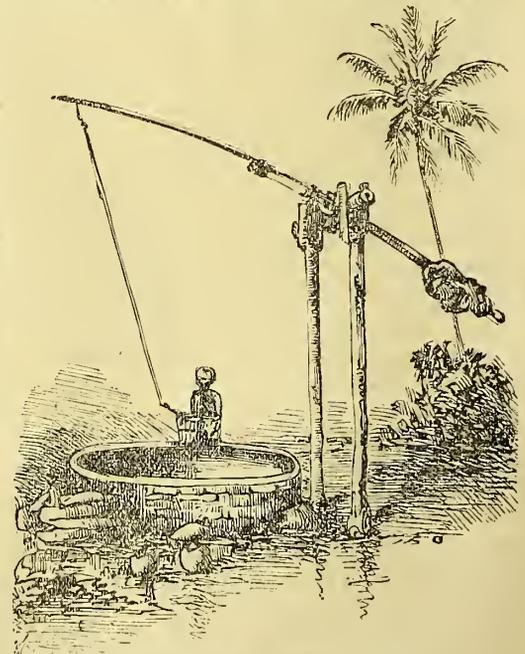

By ABA.

The restrictions put upon chena cultivation by the authorities, and its natural decline owing to the scarcity of forest land to carry on this pernicious system of cultivation makes it desirable to extend the cultivation of those crops which have hitherto been grown on chenas, under wells in parts of the Island where tanks do not exist.

This branch of husbandry is carried on extensively in India where the ryot is enabled to grow his crops during the dry weather or in droughty seasons, and indeed it has been said that "it is also the one practice in native farming to which most care and intelligence is devoted."

The invention, application and introduction of economical means of raising water from wells belongs more properly to the subject of Mechanical Engineering, but the object of this paper is to lay before my readers a description of the three modes of raising water from wells in general use in India.

1. The *Picotta* or *Latha*, the water-lift common to all Oriental countries, is a lever with a bucket at one end attached by means of a pole, and a counterpoise at the other. It works very well and cheaply too for lifting water under 12 feet, but above that height it becomes expensive. It is worked by two men who will work at it from 6 to 8 hours and raise about 700 cubic feet of water

1. The Picotta or Lever Water-lift.

from a depth of 11 feet. This kind of lift is not unknown in Ceylon. It is used for raising water from wells in the public bathing-places of Colombo, and to some extent in the irrigation of tobacco and other crops in Jaffna, and a few other places by the Tamil inhabitants.

The following calculations are from *Professional Papers*, Vol. I.

Water raised 16 ft. Content of bucket=45 c. ft. No. of discharges per minute=3. Discharge per hour=81 c. ft.

Actual discharge per hour=72.9 c. ft.=455.4 gallons.

(To be continued.)

ABOUT THE GROWTH OF TREES.

Dr. William Somerville who made a special study of Sylviculture in Germany,—where so great attention is paid to this subject,—and who was last year appointed lecturer on Forestry in the University of Edinburgh, has published a most useful paper on the growth of trees: in which the results of foreign workers are noted. That the crude sap of trees ascends by the wood, and that the elaborated sap descends by the bast, he says, can be well proved experimentally. If a ring of bark (which contains the bast) be removed from a tree at the height of a few feet from the ground, and if the stem below be destitute of branches, no growth will take place below the ring after the first year—the little that does take place being due to the consumption of reserve materials; above the rings ordinary growth takes place. The upward flow does not support cambium activity, and is thus practically not plant food till it is elaborated in the leaves.

Death of a "ringed" tree however will occur before very long owing (1) to the death of the exposed alburnum under the action of minute fungi, or (2) what usually puts an end to it, the death of the root hairs which are no longer nourished owing to the check given to the downward flow. This can be proved by ringing one of the limbs of a forked stem. The behaviour of this limb will be similar to that of the stem, only that the tree will continue to grow for a much longer period, for the limb or limbs which were not ringed will send down nourishment to the root to keep them healthy so as to send up water and mineral matter.

Under the most favourable conditions of growth a tree produces more nutriment than is actually required to supply the want of the cambium. If a cross-section of a healthy tree be examined with the microscope, it will be found that the cells of the medullary rays as well as certain cells lying parallel to the axis of the stem hold large quantities of reserve food, especially starch, these being scarcely found near the centre of large trees, but abundantly so towards the outer parts especially in the alburnum. Experiment tends to prove that the capacity to bear seed is regulated by the amount of reserve materials collected by the tree.

The almost total absence of starch in duramen, and its presence in alburnum, is a circum-

stance connected in a very direct manner with the difference in durability of these two parts of tree. It is well known that the outside wood has not the same power of resisting the attacks of fungi as the wood lying nearer the centre. The fungi which cause decay cannot live without food, and the food best suited to the growth and development of many fungi is just the kind found in the storehouse of the tree. When the spores germinate on heartwood the young fungi do not find the means to sustain life and quickly die; whereas in the sap-wood all is present that they require, and consequently if moisture and heat be forthcoming, rapid increase takes place and the wood is soon destroyed. The absence of starch from the duramen is not the only cause of its greater durability—the depositions of gums, resins, &c., being even more influential.

In an annual ring of wood the spring-wood is known to be not so firm as the autumn-wood. The preponderance of the latter it is that regulates the specific gravity of woods, and specific gravity is probably the best test which can be conveniently applied to discover their quality. Two theories have been advanced to account for this peculiarity of this wood-ring. The older and more generally accepted one is known as De Vries and Sachs' "Bark-pressure Theory." Put shortly it is as follows:—In winter owing to the mollifying action of water, to its freezing and thawing, and to changes of temperature generally, the bark is considerably loosened, so that in spring when activity of the cambium recommences, much less pressure is offered to the growth of new cells than is the case in the latter parts of the season, when the bark presses on the cambium very tightly, owing to the wood having increased in volume. In the early part of a growing season the cambium rapidly produces wood under reduced pressure, the wood being consequently very porous, whereas in autumn the wood produced is very dense, because the cambium is then working under greater pressure. The other and newer theory may be called Hartig's "Nutrition Theory," according to which the spring-wood is not so firm as the autumn-wood, because, in the early part of a growing season, the conditions are not present which enable a tree to assimilate rapidly, and therefore there is not so much plant-food available for the formation of cell-wall materials.

An argument in support of the "Bark pressure theory" is, that if the pressure on the cambium be relieved, naturally or artificially, the part of ring formed at the point of relief is broader than any other. For example, if the outside rings of a section of an old thick-barked stem be examined, it will be seen that they do not follow a regular course, but pursue a more or less undulating one. A careful examination will show that the points of swelling correspond to places where deep fissures occur in the bark, that is to say, places where pressure is reduced—while the points where the rings bend in towards the centre correspond to places where the bark is firm and entire. The same thing may be seen on a larger scale, where by any means a tree has been longitudinally cracked. If the rupture is of long standing, the circular

character of a cross-section is more or less departed from, for, owing to the excessive growth in the neighbourhood of the cracks, induced by reduction of the pressure on the cambium, the tree shows a striking protuberance on that point.

THE PLOUGH AND DRAUGHT ANIMALS

One great objection raised at first to the use of the Improved Plough in paddy cultivation was that the weak and puny cattle commonly used by our farmers could not draw the heavy iron implement. But this objection has been in a large measure met by the introduction of light ploughs, such as the "Vitis" and the "Cingalee" made by Messrs. Howard & Co. at Bedford, and the "Indian Ryot" and "Patent Pipe" ploughs by Messrs. Massey & Co. at Madras. These ploughs, while they retain the mould-board &c. essential for the inversion of the soil, are much in keeping with native taste in point of lightness, and in having a single handle so as to admit of being worked without an extra driver. But still native farmers will complain that the draught animals find it more tiresome to draw these new ploughs; and this is not to be wondered at when we see that the work done by the iron plough is more thorough by far than that done by the wooden village ploughs or rather cultivators.

But this state of things naturally suggests that improvement is needed in the other direction as well:—I mean in the draught animals. And how is this to be done?

1. The importation of stronger foreign breeds of cattle might be suggested. But this can only be done by rich farmers who can afford the purchase and upkeep of these animals.

2. Again we might obtain better draught cattle by crossing our country ones with some suitable foreign breed. This can be done even by the poorer class of farmers, provided they can get the opportunity of crossing their cows with superior breeding bulls belonging to their richer neighbours. Such bulls are not, however, so common here as they ought to be; and this method of obtaining improved draught cattle could only be effected gradually. Some of our rich native landlords have indeed, I am aware, imported good strong foreign cattle, and the services of their breeding bulls are, I believe, readily lent when applied for. But as yet this sort of improvement is being carried on only to a very limited extent, and there seems no likelihood of its being extensively adopted in the near future.

3. While the two previous methods of obtaining superior draught animals are very good in their proper place, it is easier by far, and is practicable by both rich and poor alike, to make the most of the animals which are to be had at present in our country, and which are already in use.

The improved plough demands a greater draught as it turns over the soil; and therefore the cattle should be fed with good nourishing food so as to nerve them up for the work. Forage crops must be grown; and fodder must be suitably preserved for dry weather.

All animals used in breeding stock for draught purposes should be carefully selected and properly fed.

Improvement is also possible in the method the animals are yoked to the plough. It has been

suggested to me by a European Government official in Jaffna that the animals should be yoked so as to place the line of draught more horizontally, as in the case of the harnessing of horses. This method of yoking would balance the weight properly on the body of the animal, and enable it to use its full force in effecting the draught. This would be especially true in the case of the buffalo. It has no hump; and it is very clear that when provided with a collar such as is used for the horse, the buffalo would draw the plough much better than it now does. Of course a little extra training might be necessary then. In China the plough is drawn by a single buffalo or ox harnessed in this manner. What might we not expect then from a pair of huge strong village buffaloes when their draught power is economized in this way to the best advantage?

Haputale.

E. T. HOOLE.

(To be continued.)

[The force "absorbed" by the different parts of an ordinary swing plough has been calculated as follows:—

Resistance by Share & Coulter	.44	per cent
Sole-friction	.15	"
Friction on land side, i.e. on		"
cheek plate	.35	"
Mould-board	.6	"

The directions of resistance are in 3 planes: (1) Perpendicular as in cheek-plate, (2) Horizontal as in sole, and (3) Curved, following surface of mould-board.—Ed.]

NOTES FROM A TRAVELLER'S DIARY.

The cultivation of cocoa, in districts where the tree thrives, by natives who have the land, is a commendable industry. In Lower Dumbara, for instance, the natives go in a good deal for cocoa-growing. A full-grown tree will yield on an average nearly 100 lb a year, and three hundred trees will more than supply the wants of a family possessing an acre of land.

Now that coffee is allowed to grow under less artificial conditions than it used to, the trees (and particularly those growing under shade) look quite robust, and are not affected with leaf disease to any appreciable extent, while a splendid crop of berries is generally to be seen. In fact some proprietors are planting coffee, and I have seen the old discarded pulping machines being brought into requisition once again.

My attention was drawn to a tract of paddy land bordering the Rattota road, about 3 miles from Matale, and reputed to have very fertile soil. At the time I visited the place, the ground was almost completely covered over with a growth of weeds known in Sinhalese as *Peti-thora*, the botanical name of which is *Cassia Occidentalis*. The plant belongs to the order leguminosæ, and it struck me that it was more than probable (from the fact that the plants of this order have the peculiar property of fixing nitrogen from the atmosphere and accumulating it in the soil) that the fertility of the soil may be due to the land lying periodically fallow under a crop of these weeds. *Peti-thora* is commonly met with in most parts of the Island, and if experiment confirm my theory, it would be an inexpensive

and commendable means of improving poor soils to have land under a crop-fallow of this plant and use the crop as green manure. The leaf of the plant is sometimes made into a curry by the natives.

A good many goiyas attribute their unfortunate condition to coffee-cultivation for more than one reason. They depended too much on coffee in its good days, and neglected their paddy-fields, and now that they are obliged to return to paddy cultivation, they find that owing to the destruction of forests (the influence of which they are intelligent enough to recognise) the streams which once fed their *élas* have dried up, and they are unable to get a sufficient supply of water to irrigate their fields at the proper season.

At the time of the native Rajas, they say that a man who possessed a very small area of paddy land—even a *péle* sowing-extent—had his *vi-atuwa* or paddy-barn for storing the grain. At that time, too, his wants were few, and he lived, what seemed to him, in affluence. Now, however, owing both to small returns and the comparatively expensive habits of life he acquired in the prosperous days of coffee, he finds it a difficult problem to make both ends meet. Once a palm-leaf was a sufficient protection from the sun, now he must have his umbrella and such articles of apparel to which his so-called civilization has introduced him. The apathy generated by the luxurious life of the past clings to him still, and while he can, if he is industrious, make a comfortable living out of arecanut, pepper or cotton, he is unequal to the effort.

INDIAN CORN.

Zea Mays of the natural order *Graminaceæ*. It is also called maize and Turkey corn. The male and female flowers are found on the same plant (hence monœcious). The male blossoms are produced in elegant loose wavy spikes at the summits of the stems, some of a cream colour, other varieties with a limit of red.

The fertile flowers are produced from a compound sheath arising from the bosoms of the leaves, deep set in their axils; they are two, three or more in number on each plant. The corn is arranged in upright or spiral ranks, firmly embedded in a receptacle which is termed the cob.

This is sufficient to convey some idea of the botanical character of this truly interesting and beautiful plant; and as it has lately been spoken of and noticed as worthy of attention, I am impelled to take up this subject with which I am familiar. As His Excellency the Governor desired the people of Malale to grow Indian corn, and the season of the year is somewhat favourable to the setting apart and preparation of an experimental plot, I think it advisable to adduce so much of my own experience as may enable those who are interested in the attempt to make a trial of a method which cannot mislead.

1. Select the best and softest loam of the garden. Such a soil is always fertile if duly tilled, and to none is it better suited than to maize, particularly if the site be open and fully exposed to the sun.

2. At any favourable period during the early

part of the year, make trenches three or four feet asunder, taking out six inches of the earth, and digging into the trench a good three inch layer of rotten manure. Let the trenches point south and north, or nearly so as possible, and leave the work to settle for a few weeks, being guided herein by the warm and dry state of the weather, because a cold rainy season would be just as inimical to Indian corn as to cotton crops.

Taking the 1st of July as a suitable time, fill the trenches with fine soil to within three inches of the previous level, stretch a rope and dot in three seeds in a triangle, five or six inches apart, at every foot throughout the length of the rows. Cover them with an inch of earth and press firmly. If the weather become very dry it will be advisable to soak the soil with water two or three times till the plants germinate, and to cover the trenches with mats or leaves during the heat of the sun. Most of the seeds will germinate, but they are liable to accidents, and are often devoured; and as every foot should contain one plant at least, the precaution should be taken to sow a few dozens of seeds in small pots, so that a blank may always be filled up when it has become evident that the seed sown has been destroyed.

When growth appears to be fully established and the plants stand at regular distances, a light hoeing must be made along the trenches; and at the same time the practice of the Peruvians may be safely imitated, particularly in dry seasons, by forming a small ring or basin round the stem of each, sprinkling a little manure in the cavity so as not to touch the stem, and flooding the ground with water.

3. After a time, when the plants obtain a foot in height, three inches of the earth removed from the trenches should be returned, so as nearly to level the ground. In a short time the remaining earth should be brought against the stems, to protect them from the force of high wind.

4. When the male spikes are formed at the summits, it will be beneficial to cover the surface between the rows with an inch of manure or to sprinkle a little liquid manure.

Whatever be the dressing, it should be dug in with the fork, care being taken not to injure the roots and stems. This manuring will cause the foliage to assume a dark rich green, which it will retain during the hottest and driest season.

When the farina from the male spikes shall cease to be discharged, the plants can safely be cut back to within two leaves of the upper ear, and the corn will equally advance to maturity.

My experience proves that as an average December is the harvest month. The plants begin to ripen by losing the green colour, and assuming a pale brown tint; and then the seeds acquire their gloomy yellow-cream colour, or pale brown. Birds are very fond of the seed and will penetrate husks till they reach the cob; therefore it is desirable to pull off every one as it becomes ripe.

Whether Indian corn can be profitably introduced, is somewhat questionable. One objection is the lateness of the ripening season and the irregular maturing of the ears. The cultivator will find in the above directions which will guide him in undertaking

an experiment, and it is advisable to make trials in different localities. The grain is truly valuable, is an excellent food for cattle and fowls, and makes good bread with wheat flour.

In India it is often sown as a catch crop before the rabi crop of wheat or barley. It is seen growing to great perfection, says Prof. Wallace, in the neighbourhood of Darjeeling as well as in areas of wider extent in the plains. Along with amarantas it may now be considered the chief food of the hill tribes of the North-Western Himalaya.

Bandaragama.

J. A. J. RODRIGO.

GENERAL ITEMS.

We omitted to mention our good fortune in securing a young plant of the *Victoria Regia* which has been placed in a tank in the School of Agriculture grounds.

It is worthy of record that the culms of a giant bamboo in the Peradeniya Gardens shot up at an astonishing rate in April last year. One of these is said to have grown at the rate of 13½ inches in 24 hours.

The case of a ruminant man is mentioned in the *British Medical Journal* for May. Dr. Leva of Zürich at a meeting in that city exhibited a man of 22 who possessed the power of rumination. From 5 to 30 minutes after each meal the ingested food continued to rise up into the patient's mouth, to be masticated and swallowed again and again, the lad relishing the cuds all through. The process lasts from 70 to 90 minutes. The patient has no control over the process. A careful examination of the pharynx, gullet, and stomach failed to reveal anything abnormal. He states that rumination first appeared about 6 years before his coming under observation, when he had been in the service of a very stingy master. The meals being scarce and the lad's appetite very keen, he acquired the habit of swallowing again the morsels of food which came up into his mouth!

The New B. I. steamer *Alaska* is, according to the *Indian Agriculturist*, to be specially employed in providing steam communication between Negapatam and Colombo—the duration of the voyage, during which 4 or 5 intermediate ports will be touched at, being about a day and a half. The principal trade will be in rice. For coolie emigrants from Indian ports to Colombo the charge will be R4 per head, from Ceylon ports R2 and under.

The trade in ground-nuts is reaching enormous proportions. The estimated value of the ground-nut export during 1889 in India was 122 lakhs of rupees, of which 99 per cent was produced in British India.

Professor Wallace has brought out a revised edition of his "Live Stock of the Farm," and is now engaged on another work on the Rural Economy of Australia and New Zealand, which will very shortly appear.

Much curiosity was aroused at the Nawalapitiya Railway station during the latter end of May over

a tree which had been cut down to some 3 or 4 feet from the ground, from the exposed section of the stem of which there was a continual drip of water. The tree in question was, if we are not mistaken, a *Thunbergia* creeper, with a stem not more than 2 or 3 inches in diameter. According to the Station-master, the dripping had been going on for a fortnight, and showed no signs of ceasing.

A curious case was reported from Mutwal the other day. It seems that a bull commenced bleeding most profusely, and that the blood which issued from the region of the penis continued to flow for more than 24 hours, despite all the efforts of the local Vederalas to stop it by copious draughts. The case coming under the notice of a Medical gentleman in the neighbourhood, he, instantly guessing at the cause of the hemorrhage, syringed a strong solution of salt into the sheath of the penis, when the bleeding almost immediately ceased. The *fons mali*, as may be inferred, was a leech.

The Swanley Horticultural College has for its main object the encouragement and improvement of fruit farming in Great Britain. The principal of this institution is Prof. Frank Cheshire, and among the lecturers is Mr. Cecil Hooper, F.H.A.S., who was a student both at Cirencester and Edinburgh. Mr. Hooper has just written a very able paper on Fruit Farming, the possibility of its extension, and the remuneration to be derived from it, which appears in the last number of the Highland and Agricultural Society's transactions. The Swanley College has an experimental garden of 43 acres attached to it.

It is reported by a correspondent in the *Field* that at Inveradoch, Doone, on the 24th May, a single egg produced two pheasants.

A copy of the *Bosphore Egyptien* to hand gives a sketch of the plan upon which the Agricultural Department and College about to be founded in Egypt are to be established. Mr. Williamson Wallace, the Director, is actively engaged in making himself acquainted with the needs of the country and the means of improvement to be adopted. In a chatty letter received from him from Cairo he says, "I have a lot of hard work—up early in the morning, and off to see the agriculture of the country. The Government have given me a house-boat in which I go about all through Egypt, and have a look at every thing."

The local Governments of India have been asked to send delegates to an Agricultural Conference proposed to be held at Simla in October this year, before the return of Dr. Voelcker to England.

The mummified cats exhumed from an ancient cemetery not far from Cairo—some 20 tons—have, it is said, been brought over to England with the intention of selling them for manure.

Selenotropism is the proposed name for the phenomenon of plants turning towards the moon. M. Musset has made careful observations on this subject, and concludes that the stems even

of adult plants undoubtedly turn towards the moon on fine clear nights.

Mr. Kanes-Jackson has lately written a sensational letter to the London *Times* on "The Earth losing Primal Fertility." He asserts that in about a hundred thousand years or so there will be nothing produced on the earth. Not long ago another alarmist endeavoured to show that phosphoric acid at least would be completely exhausted in the soil before long. We have really had enough of these pessimistic theories already.

Hyriyal (ஹிரியல்) *Arsenicum auripigmentum* is sulphuret of arsenic, and sadilingam (සාදිලිංගம்) is vermilion or mercury sulphide which occurs native as cinnabar the chief ore of mercury. The former is of a reddish-yellow colour and is largely used by the natives in painting, the latter is of a reddish hue and also used by the natives in painting images, &c.—the hyriyal, according to a correspondent, being sprinkled over the vermilion to give it a gloss. Both these substances are sold in the native bazaars.

SCHOOL NEWS.

The Agricultural Improvement Society met on Friday the 11th July for the first time after the holidays, when a paper on the past and present state of paddy cultivation was read by Mr. Estagoepillai. The subject was ably dealt with by the writer, and many interesting points were brought out, and discussed by the members. Mr. Mendis consented to read a paper on the opening out of new land by agriculturists in Ceylon at the next meeting.

We acknowledge with thanks the receipt of a packet of geological specimens from Mr. Theodore Gooneratne of Matara, and a mat of gorgeous design made of the fibre of Niyande (*Sansivera Zeylanica*) from Mr. E. M. B. Seneviratne.

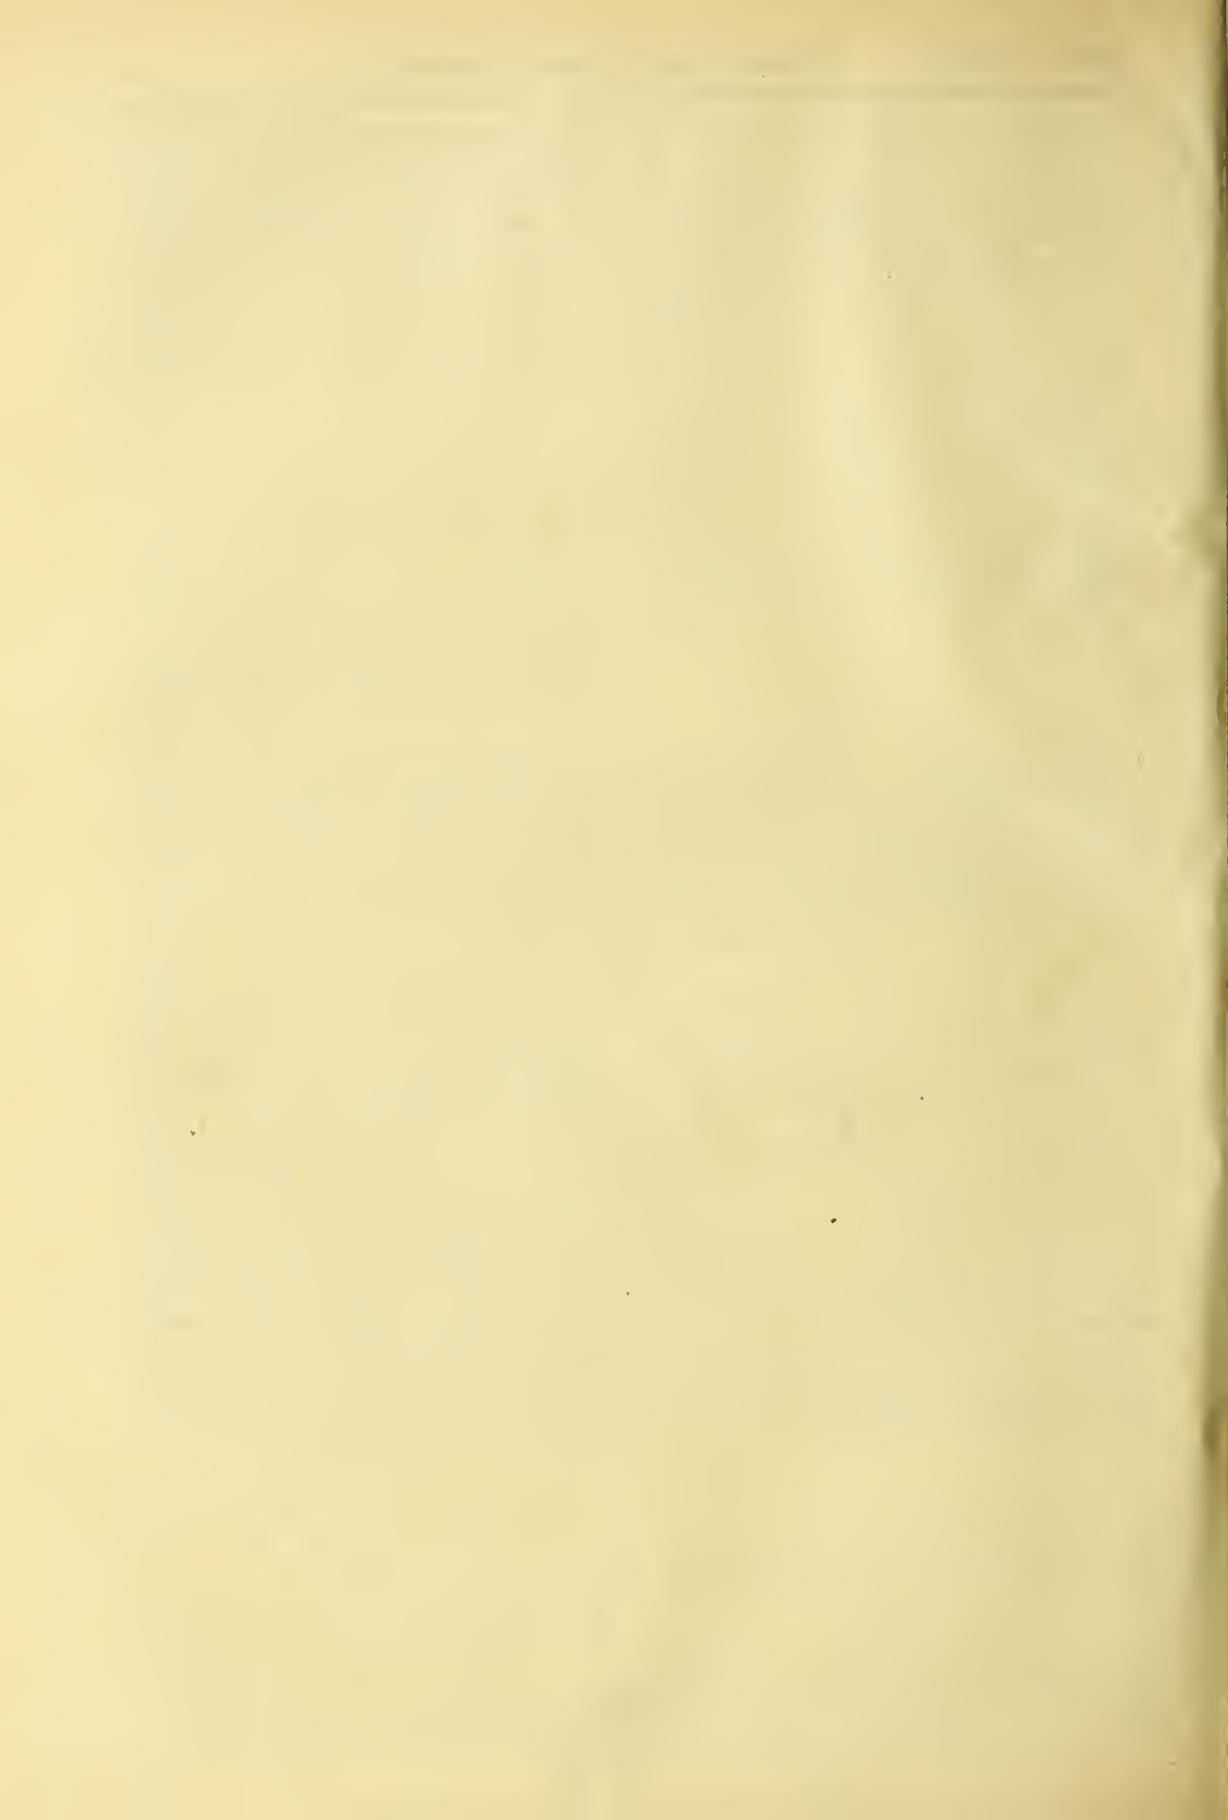

The results of the half-yearly examinations held in May show that Mr. J. Kodipilly and Mr. Johannes stand at the head of the Senior and Junior classes respectively.

The Seniors are having a few special lectures in Zoology as bearing on Agriculture before the end of the session, which also terminates their connection with the School.

The printed Syllabus of the school is now ready, and is got up with the neatness characteristic of the Government printing press.

During the *Maha* season (July to November) of last year seedlings grown from four seers of *Ma wi* paddy were transplanted. The field was prepared, as has been the case since the introduction of the iron ploughs, by ploughing before the setting in of the regular monsoon rains and leaving the soil exposed to the action of the weather for six weeks before the final preparation of the land for sowing. No manure was applied. The seedlings were planted 6 inches apart each way. The plants tillered and grew very well. The crop was reaped towards the end of March last and yielded 9 bushels of paddy.

In May a small plot of ground was planted with Indian Corn. The soil is a free sandy loam. It was twice dug over with the mamotie and thrown into ridges 3 ft. apart. Trenches were made on the top of these ridges and well-rotted cowdung was applied and covered over with soil. The seed was dibbled in on the top of the ridges 4 inches apart. The seed used was procured from the bazaars, but it is hoped that a better variety as the Queensland or Cuzco would be obtained for regular cultivation. The plants came up well for a time, but the very dry weather which prevailed in May and June killed most of them. The plants that survived have grown vigorously and are now flowing three months after planting. The crop was hand hoed once and watered three times. Indian Corn occupies an important place as one of the best food crops, and there is no reason why it should not be more extensively grown. Under ordinary cultivation 200 lb. of grain may be grown per acre on good soils, besides 2½ to 3 tons of straw may be expected per acre. This straw is rich in saccharine matter, and is a valuable food for all kinds of farm-stock. Indian Corn is admirably suited for growing in the intermediate spaces left in cotton cultivation. It only occupies the land for about 4 months, and will pay at least all the expenses and leave the cotton which is sold for profit, thus obviating the usual objection of the unprofitableness of cotton cultivation. Indian Corn may be successfully grown as a fodder crop. About 12 to 13,000 lb. of fodder may be expected per acre, and this fodder is highly prized in America as a food for milch cows. On a previous occasion a small plot of land planted with Indian corn was entirely destroyed by field mice which dug up and ate all the seeds in the night. It is advisable therefore to tar the seed before sowing to preserve it from the attacks of mice, squirrels, &c. If Indian Corn is grown alone, the seed should be sown in rows 3 feet apart at the rate of about 30 lb. per acre. If cultivated with cotton, the rows of corn should be 4 ft. apart, and those of cotton the same distance alternately.

THE TROPICAL AGRICULTURIST MONTHLY.

Vol. X.]

COLOMBO, SEPTEMBER 1ST, 1890.

[No. 3.

THE BARREN SOILS OF CEYLON.

We have been asked for information as to the nature of any experiments hitherto made with the object of restoring fertility to the soils met with in various parts of this island, which seem to be generally regarded as being in their present condition of no use to the agriculturist. It is unfortunately the case that a very large area of land is to be met with in widely scattered districts that seems for some reason or other to be possessed of that character, and those districts differ greatly in the appearance of their soils, and, also in the constituents composing them. There are the well-known extensive patanas of Uva and our higher lands generally, and there is a very extensive acreage of what is commonly known as the black cotton soil met so largely in the Mannar and other districts of the Northern and North-Central Provinces and in the neighbourhood of Puttalam in the North-west Province. Much of this soil, while of the consistency of soft mud in the wet season, is hard, at least on the surface, and scored by innumerable cracks in the dry season. It is pointed out to us by our querist that, as the population of Ceylon increases—and we know that this development proceeds at a fair average pace—the greater part of these lands now lying waste must come into demand for cultivation. The question raised is, as to what forms of growth these soils may be adapted to and by what means that adaptation may be secured and extended.

Probably the only view that can be advanced in reply to such a query must be an economical one. We should doubt exceedingly if there could be found any soil in Ceylon which, by some forms of treatment, could not be improved to some degree of fertility. We have seen in English experience how even the siliceous sands of lands recovered from the sea have, by the

application of sewage, been converted into smiling fields, yielding in due season their plentiful harvests. If such an apparently hopeless recipient can be made the basis for the admixture of fertilizing constituents, it is certain we need not fear that even our poorest soils in this island would be unsusceptible of similar treatment, to be followed by similar success. But the 'drenching' so to speak of long untilled lands with an almost unlimited supply of manurial stimulants, such as has converted as above described the sands of the sea into cultivable fields, is, for very many reasons, of course impracticable with us. We only cite the case as an example to show how needless would be the fear that the barren lands of this island must, all of them for ever remain in their present condition of uselessness. There is more of physical as well as intellectual improvement wrapped up in the future than "has been dreamed of in our philosophy."

But it is suggested to us that—as is well-known to be the case—a good deal of the land that comes within the category we have mentioned has in former times been under cultivation which ceased with the existence of a population adequate to continue it. It is the fact, we believe, that land of a certain character and in certain conditions, which cannot be classed as "virgin," deteriorates rapidly from want of cultivation. This is not the case with soils that have never been disturbed by man, and it is suggested that the deterioration in instances when such disturbance has occurred is due to the cessation of aeration of the subsoil. We cannot profess, of course, to write upon this subject with the authority of an expert in such matters; but it is known to all of us what different results follow deep ploughing, and the consequent free exposure to air of the soil and the immediately underlying subsoil, to those which attend mere surface scratching. The theory advanced, therefore, that these lands of ours which in a bygone time were probably under full annual cultivation now fail of fertility owing to the absence of free aeration, may not be altogether wide of the mark. At all events, as it has been suggested to us, experiments might well be tried by Government Agents and their Assistants in different localities with the object of testing this theory. A few acres of patana, black cotton, and other at present unproductive soils, might be ploughed deeply, and left in that state to aerate for one or two successive seasons, after which some sort of cultivation deemed likely to be most suitable might be tried upon them. Should success follow, a clue might be gained to the secret by which these lands might be rendered serviceable, independently of any attempt—which we

should deem to be, for the present at least, economically impracticable—to restore their fertility by manuring. There are doubtless scientists among us who could say whether the suggestion made to us may or may not be of a hopeful or possible character.

The patana soils are many of them barren from the presence of iron in forms most unfavourable to fertility, while considerable portions are composed of quartzite. Then in such places as Nuwara Eliya and in swamps near Colombo and elsewhere, there are black pseudo-peat soils, which are unproductive from the opposite cause: the absence of mineral matter amongst the humus. In each case improvement might be effected by aeration, as we have already indicated; by a full dressing of lime (especially in the case of the black vegetable soils); and by tillage. The experiment of draining, liming and carefully tilling of some of the Nuwara Eliya swamps, ought to be amongst the measures adopted for the improvement of our sanatorium, now the subject of discussion. Experience thus obtained might be a valuable guide for the reclamation of similar formations elsewhere. In attempts which have been made to cultivate portions of the upland prairies called patanas, we are bound, however, to state that for the first few years at any rate, a perfect plague of cockchafer grubs has had to be contended with. On Meddecumbers, we believe, that even aloe plants were destroyed by these pests, which, we know, played havoc with cinchonas grown on grass land in another part of Dimbula. But caustic lime ought to go far as a remedy for the beetle larvæ.

GAMBIER IN CEYLON.

A planting correspondent wrote to us the other day about an article in the "Magazine of the School of Agriculture" (incorporated with our monthly issue) which, according to him, stated that.

"Gambier (*Uncaria Gambier*) is indigenous to the island and a common plant near Colombo, Galle, Detota and Dumbara and that the late Mr. W. Ferguson made an extract from the shrub,—but he omits the native name—and I see no mention of gambier in your new book. As this is cultivated so largely in Singapore, it appears strange that it is comparatively unknown here, and now we are told that it is a common plant."

A correspondent favours us with a fuller summary of the Magazine paper as follows:—

The identity of the plant which produces the valuable substance known as gambier or Terra Japonica has been the subject of a good deal of discussion and has well illustrated the old adage of doctors (in this case botanical doctors) *disagreeing*. While Dr. Thwaites held that the species of *Uncaria* found in Ceylon was the *Uncaria Gambier*, leaving it on record in his "Enumeratio" that he cannot doubt that the indigenous plant is identical with that of Roxburgh, Dr. Trimen avers that the two are distinct. [No, there has been no *disagreement* whatever, only an advance in knowledge.—Ed. T. A.] Mr. William Ferguson, F.L.S., in his interesting notes on Ceylon timber trees, states that the extract from the indigenous *Uncaria* is the gambier or terra japonica of commerce, and what is more, he claims to be the first to have prepared the substance from the Ceylon tree.

Dr. Trimen, however, says that Sir Joseph Hooker has shown that the indigenous species is not *Uncaria Gambier* but is to be referred as a variety *Thwaitesii* to *U. dasycarpa*, and moreover that it affords no gambier, at least that he (Dr. T.) was unable to produce anything like the substance. Up to this time then, to gather from Dr. Trimen's last report, there is no plant of the true gambier in the island,

and all efforts to introduce it have been unsuccessful.

So much for the identity of the plant: but if a substance with all the valuable properties of the true Terra Japonica can be extracted from our indigenous variety, then we may well exclaim "What's in a name!" and go in for cultivation as hard as ever, for did not Evans of Stackpole Street promise to take 8 to 10,000 tons of gambier from us every year?

On this subject, Dr. Trimen is good enough to write:—

UNCARIA EXTRACT.—As regards the extract from our wild Ceylon species of *Uncaria* my experience was recorded in the Report of the Royal Gardens Kew for 1880 (p. 37) as follows:—"Dr. Trimen, Director of the Royal Botanic Gardens, Peradeniya, writes (September 24th):—"In the urgent demand for "new products" here, one of the first things I tried was to make some Gambier for our plant. It grows commonly not far from the Garden. I followed the account given in the books but could not succeed in producing the correct article. A very excellently astringent extract is easily obtained, but it is black like liquorice or the *acacia catechu* exactly, and not at all like terra japonica."

What the extract was like that was made by the late Mr. W. Ferguson (as recorded by him in 1863) it is not now possible to discover, but in all probability it was the same as that obtained by me. The true Gambier, catechu pallidum, or terra japonica of commerce produced at Singapore is a pale yellowish-brown earthy substance.

It should be borne in mind that at the time Mr. Ferguson experimented, no one had any reason to suppose that our plant was not the same as the Singapore one; it was not till 1880 (Fl. Brit. India III. p. 31) that Sir J. Hooker showed the botanical differences.

I may add that I have recently received a case of living plants of the true *Uncaria Gambier* from Singapore, and that young specimens are now growing at Peradeniya and Heneratgoda Gardens.—HENRY TRIMEN.

At the same time it is quite possible that the "black extract" from the local plant might be found of some commercial value, and Dr. Trimen quite agrees that it would be worth while to try the market with it. Here again is a paragraph with some practical information bearing on the subject:—

GAMBIER-PLANTING IN JAVA.—The cultivation of gambier in Java has been tried many times, but although the plant grows excellently, extraction has on every occasion yielded a kind of gambier inferior in quality to that produced by the Chinese around Singapore. It is believed that the cause of this inferiority must be sought in the fact that the Chinese during the boiling process add a decoction of the poppy, but the preparation of this decoction and the parts of the poppy used in its manufacture are a secret. As the sale of opium is a strict Government monopoly in the Dutch colonies, and the cultivation of the poppy is not permitted there, it is believed that there is no possibility for the Java planters to compete successfully in this industry.

It is quite possible therefore that even when the true plant becomes plentiful in Ceylon we may have to send to Singapore to obtain the secret of the best means of preparation of the extract for market. We may add that gambier cultivation in Singapore has led to almost as great exhaustion of soil as tobacco cultivation in Java has effected.

CEYLON TEA IN LEAD PACKETS.

To the Editor of the "Grocer."

4, Mincing-lane, E.C., June 18th.

Sir,—It may calm the apprehensions of your correspondent, "A Country Grocer," to learn that by section 2 of the Merchandise Marks Act of 1887 he cannot be held guilty of an offence under the Act, if he proves—

(a) That having taken all reasonable precautions against committing an offence against this Act, he had

at the time of the commission of the alleged offence no reason to suspect the genuineness of the trade mark, or trade description; and

(b) That on demand made by or on behalf of the prosecutor he gave all the information in his power with respect to the persons from whom he obtained such goods or things; or

(c) That otherwise he had acted innocently.

Under these provisions "A Country Grocer," if only he has acted innocently and will give such information as he can about the goods that he sells, need not fear that he will have to rest his case on the evidence of experts as to quality or the country of origin.

The answer to his question, "Whether misdescription—even if purchasers are not misled by it—as to quality and place of origin, without the assumption of the name or brand of any particular estate, is actionable and punishable," is that the Act does not require that the purchaser or the public should have been in fact deceived.—I am, &c.,
W.M. MARTIN LEAKE.

PAPER V. LEAD FOR TEA PACKAGES

To the Editor of the "Ceylon Observer."

Kandy, July 17th.

SIR,—At the request of the Chairman I enclose copy of letters regarding Mr. J. Maitland Kirwan's prepared paper for tea packages.—I am, sir, yours faithfully,
A. PHILIP, Secretary.

(Copy).

Billiter Square Buildings,
London, June 27th.

Dear Sir,—I have now pleasure in sending you by this mail another sample of the prepared paper to take the place of tea lead. Since I last corresponded with you I have had a break of Elkadua tea sent home in this paper, one half of the break being packed in this paper and the other half in the ordinary load, the result of sale being precisely the same.

Neither the trade nor anyone else has made any objection to this paper, and as it will cost about 40 per cent less than the lead, there will be little difficulty in introducing it.

I have had application for samples of the paper from Kangra Valley Planters' Association and other firms. You will no doubt now bring this matter before your Association at an early date. I may mention that I intend entirely substituting this paper for the lead on my Elkadua estates where I have close on 1,000 acres of tea.—I am, &c.,

(Signed) JNO. MAITLAND KIRWAN.

L. H. Kelly, Esq., Chairman, Ceylon Planters' Association.

Copy.

Castlereagh, July 16th.

Dear Sir,—In reply to yours of June 27th I shall bring the matter before the Association at our meeting on 8th of next month. You do not give cost of paper or how it should be fastened together. I have asked the Secretary of the Association to publish your letter, as the best means of giving publicity to the merits of the paper.—Yours very truly,

(Signed) L. H. KELLY, Chairman, C. P. A.

P.S.—I may mention that when I received the first samples I brought the matter before the Tea Fund.

DARJEELING PLANTERS' ASSOCIATION.

Proceedings at Committee Meeting of the Darjeeling Planters' Association, held on Saturday 14th June at noon. Present:—Messrs. J. Johnstou, F. De Momet, W. Ager, G. G. LeMessurier, J. Calvert, J. Court, G. Nasb, A. Wernicke, J. D. Gwilt, R. Harrison, Hony. Secretary.

Read letter No. T. A. 3435 dated 27th May 1890, from General Manager, D. H. Railway, offering 7½ per cent, rebate under five years agreement with various Tea Concerns, on all classified goods upwards and downwards over the D. H. Railway, the item of coal being subject to 5 per cent rebate only. Resolved: That these terms be accepted, and be made known to every member of the Association by printed Circular.—*Indian Planters' Gazette.*

NOTES ON PRODUCE AND FINANCE.

A NEW DEPARTURE.

Mr. Lipton, who is in his way a provincial Whitley, and has shops and stores all over the country, began the sale of tea, chiefly Indian and Ceylon, about a year ago. During the first year his sale have reached 4,000,000 lb., and he is now turning his attention to America. Mr. Lipton is now in Ceylon, where he is purchasing tea estates for the purpose of growing and supplying his own shops direct with Ceylon tea. We understand that in America Mr. Lipton will sell Ceylon tea only, and thus render material aid to Ceylon planters in the campaign in the United States.

CONDITIONS OF PUBLIC SALE.

The dealers have had their way over the question of the new public sale conditions, and future catalogues of tea will contain the new conditions, by which it will be clearly provided that the tea is ready for delivery, excepting packages which may require to be coopered; and, as some chests are on show before the sale, it is only reasonable that a short time should be given for nailing up such packages. Indian importers have objected to the proviso that all tea must be ready for delivery at the time of sale, but the dealers were equally firm the other way. The importers have yielded, and it is hoped that the new arrangement will work satisfactorily.—*H. and C. Mail.*

COOLY LABOUR ON COFFEE AND TEA ESTATES.

In our issue of the 27th ultimo we published a letter from a planter under the above heading and since then we have received several other letters containing the same complaints. The writer, in the first letter, it will be remembered, complained of the difficulty in procuring labour and in dealing with coolies who, having received advances, keep the money and refuse to work. The estates are in consequence eaten up with jungle and weeds, or as our correspondent put it, "our work is all behind, our coffee is all in weeds, which are eating all the manure we have put in for the benefit of the coffee; not a pit has been made for next year's supply," &c. The grievance is one of long standing though the Government is now less to blame for the state of things giving rise to these complaints than it was formerly. The position of the planter at the present day is very different from what it was in years gone by. He is better provided with police and roads, and in the Breach of Contract Act he possesses the means of obtaining summary justice in cases in which advances have been paid without any work being done for them, and for which formerly a remedy could be sought only in the Civil Courts. Nor is he slow in availing himself of the Act, for as was stated in our review of the annual Report on the administration of criminal justice in Coorg for the year 1889, there were in that year no fewer than 1,648 cases out of a total of 3,624—a large increase of prosecutions as compared with the preceding year. Whether this constant appeal to the law is on the whole a wise policy and likely to conduce to the interest of the planters is doubtful. In any case our correspondent should not complain that "help in any shape or form" is denied planters by the Government to whom "we might as well appeal as to the gods of the heathen." What further assistance do the planters need? The difficulty of finding men against whom warrants have been issued is one incident to all legal procedure and not peculiar to Coorg, or any other planting district.

The emigration of the labouring classes is no doubt a thing to be deplored in the interests of planting industry in this country. "Why," asked our correspondent, "should the Government send cooly labour to foreign countries when it is so much needed nearer home?" The Government does not send cooly labour to Ceylon, Burma, the Mauritius, &c., as the emigration is entirely voluntary; all that the State does is to take care that the coolies are not enticed

by false and fraudulent representations, or ill-treated on the voyage to their place of destination. This draining of the population does seriously affect coffee and other speculations in India; but how is it to be avoided? So long as the wages offered by foreign planters are generally so much higher than those that obtain here; so long as the emigrant coolies are also properly housed, bedded and provided with medical aid, and, in a word, treated with every consideration, emigration will continue as heretofore, and labour in India remain scarce. And nothing is better calculated to promote this result than the frequent prosecutions above alluded to. As to the inducements held out to emigrate, the following, from an old issue of a Trinidad paper, will serve as a sample. "The rates of wages for work, which is principally weeding with the hoe, vary from 8 annas to 10 annas for a fixed portion of work, which may always be performed by an adult of average strength in five hours at most. A day's work of nine hours' duration is paid at for the rate of annas 13½ and during the crop (the season for manufacturing the cane juice into sugar) the ordinary work for all employed is paid for at the rate of annas 13½. Those employed in keeping up the fire boiling the juice of the cane, superintendents of work and trenchers, are paid annas 16½ as those descriptions of work require greater attention." The Emigration Agent at Trinidad also offers the coolies houses, gardens and medical attendance free of charge, and states that after ten years' residence they will be provided with a passage home, and that thrifty coolies have been known to return with as much as R1,000 to R1,500 each.—*Madras Mail*, July 9th.

COFFEE CULTIVATION IN THE TRANSVAAL.

On Monday afternoon Mr. H. M. Pasteur read a paper upon this subject at the Chamber of Commerce. Mr. Robert Wales, who presided, in introducing the lecturer, stated that the coffee question was one of vital importance. There could be no doubt that the consumption of the article was overtaking the growth, and anyone who could point out a region yet unoccupied, which would produce coffee, was a great friend to the trade.

THE CONSUMPTION OF COFFEE.

In England we did not appreciate fully the extent of the coffee trade, for our portion of the consumption was so exceedingly small that people were apt to think it a very small trade in consequence. England only consumed 15,000 tons per annum; the yearly consumption, however, of the United States and Europe was no less than 600,000 tons. The coffee trade deserved more attention from English traders than it had hitherto received. Mr. Pasteur, who has recently visited the Transvaal, stated that many parts of that State were exceedingly well suited to the production of coffee. The Transvaal was a vast tract of country situated between 22 and 27 degrees of latitude, and the regions of that country in which coffee could be grown, viz., the central and northern districts, occupied 2 to 2½ degrees. These districts were Waterburg, Knatenburg, Lydenburg, and Zoutpansburg. The districts of Waterburg and Lydenburg were surrounded by mountain ranges from 2,000ft. to 2,500ft. above the valleys, which were themselves 2,500ft. above the sea level. Some of the land between these ranges was very rocky, and grew nothing but coarse grass and stunted mimosas; but there were also fine stretches of deep, rich alluvial soil, in which almost any kind of tropical produce would grow. In the course of a journey he had made in the western and northern district, he had seen some very fine coffee trees—large and healthy—from twelve to fifty years old, without a sign of leaf disease on them, and bearing a heavy crop. The proprietor of these trees stated the average production per tree was 2lb. per annum, and this without any care being bestowed upon them. They were protected from the sun and cold winds by a shadow plantation.

LUXURIANT COFFEE PLANTATIONS.

At a farm belonging to Mr. de Beer, seventy miles north of Pretoria, he had seen coffee trees fifteen to twenty years old presenting a very much more luxuriant appearance, being from thirteen to fourteen feet in height. These trees must have yielded five tons an acre, taking the acre to contain 5,000 trees.* In this instance the plantation was protected from the sun and cold wind by a belt of banana trees. The lecturer also gave several other accounts of luxuriant coffee plantations he had witnessed in the Transvaal. In the future development of coffee, the question of labour was likely to be the greatest difficulty to contend with. Kaffirs were very erratic in their habits, naturally indolent, always talking and laughing, without the least idea of the value of time, and required constant supervision. The best way to obtain sufficient labour would probably be to come to some arrangement with the chief of the locality. If his goodwill was secured, his hold over the people was almost certain to be powerful enough to induce them to work on a plantation instead of tramping to Johannesburg and Kimberley the more so if they found they were paid regularly, and got good food. Coffee had been, and was still, cultivated in Natal, where it had suffered much from leaf disease. The plantations there had been much neglected during the years of low prices, and possibly in this way a good deal of damage had been done. The elevation of Natal, however, from the experience of India and Ceylon, was found not to be conducive to the best cultivation of coffee. In the somewhat tropical districts, where coffee cultivation could be introduced the rains took place in the months of January and April, with occasional showers between October and December.

TEA AND COFFEE CAN BE GROWN.

Mr. Pasteur stated that the remarks he had made respecting coffee applied equally to tea, and he considered there was a fine opening for many of our countrymen who had acquired experience as tea planters or coffee growers in India or elsewhere. The development which was bound to follow the opening up of the goldfields would make it unnecessary for the Transvaal coffee growers to export for many years to come. Sir Frederick Young stated briefly that his experience of South Africa entirely confirmed Mr. Pasteur's remarks. The country was capable of growing anything. Mr. Hume asked if the shadow trees were essential to the growth of the coffee tree. Mr. Pasteur replied, "Not absolutely necessary, but greatly conducive to the well-being of the plant." Mr. A. G. V. Conybeare, M.P., also stated that in the extreme west of the Transvaal, sugar, oranges, and tobacco, as well as coffee, could be grown in any quantity. Mr. E. A. Rucker moved a vote of thanks to Mr. Pasteur which was seconded by Mr. Parker, and the proceedings then terminated.—*H. & C. Mail*, June 28th.

ENDLESS WIRE-ROPEWAY AND ESTATE TRANSPORT.

We are requested to publish the following description of "wire-ropeway" with reference to the utility of the invention for planting districts in Ceylon. But is Mr. Davis aware how far the system has been already utilised in Ceylon? For instance on Spring Valley estate, Badulla, for many years now, a wire-ropeway worked by a water-wheel has been steadily at work, utilised regularly for the transport of grass and manure and possibly of produce. It may be that "Roe and Bedlington's improved system" may be an advance on that of Spring Valley. It certainly behoves Ceylon tea planters to

* 5,000 trees 13 to 14 feet in height per acre 500, probably, nearer the mark.—*Ed T. A.*

give attention to every available means of economising labour. Here is the description:—

Roe and Bedlington's improved system of wire rope way consists of an endless rope from which the load is suspended and by which it is also carried along. The rope is driven by power at one end and is supported along the line of transport by trestles (of iron or wood) the load is carried by buckets or clip hooks: these are attached to the rope by a saddle which converts the weight of the load into the required grip. The sheaves on the trestles are so arranged that there is no danger of the saddle becoming unshipped as it passes over them and to take long spans and varied gradients there are double, treble and quadruple balanced sheaves, mounted tandem wise, which automatically adjust themselves to an equal share of the pressure. The saddles are provided with two grooved wheels at the outside (of the rope-gripping part) which run on to shunt rails at the station and thus remove the load from the rope. Should the required power be available in water (or steam) at some point in the required line of transport, a rope can be worked from either side and the load transferred from one rope to the other by shunt rails. Curves of large radius may be worked, but one of the great advantages of the invention is that the way can be laid in a straight line over rough country (without high and expensive trestles) thereby reducing the distance to be travelled to a minimum.

CEYLON UPOUNTRY PLANTING REPORT.

CACAO—JAK AND PEPPER—BLACK BUG ON COFFEE—
WEATHER—A DISAPPOINTED PLANTER—ARRIVAL OF
COOLIES.

July 18th.

The awful gulf between the prices paid for most West Indian cacao, and what the Ceylon lots get is awaking inquiry on the other side of the world, as to how the thing is done. It is not a little flattering to Ceylon men and their methods of curing, that an official communication has been received from the West Indies, asking for information on all points connected with cacao curing. It does look like teaching your grandmother to suck eggs, for if experts in cacao culture were to be found anywhere one would naturally look for them in the other colonies, where the chocolate tree has been long a stand-by.

One of your correspondents, referring to what I said in my last as to sturdy jaks being killed out with pepper, seems to think that the jak is coming in for a bad time, and that vigorous trees are not to be seen. All I can say is that I have not seen anything like weakness among jaks, and since I read his remarks I have been particular when going about to specially observe them.

The jak of course won't stand abandonment: and on estates or portions of estates which have gone out of cultivation, and where jak has been growing, there you will see the slow stranglement of the tree by the vigorous undergrowth.

But where the jak is getting anything like ordinary treatment, I find it as sturdy, its foliage as glossy, and its fruit as plentiful, as ever I knew it. So inimical is the jak to utter neglect, that its presence on a piece of land is I understand accepted by our Courts as evidence of cultivation or recent cultivation.

That a pepper vine can kill a jak, I find disputed by one who has a very extensive agricultural knowledge. When a jak dies that has been supporting pepper, he would not attribute that to the effects of the pepper, but would be inclined to look elsewhere for a reason. He has known jaks which have supported pepper vines for a quarter of a century and more and there was no evil resulting from the association. I was

glad to get this opinion, for although it goes against my own observation and what other men have told me, it will prevent a too hasty inference, and the total condemnation of a valued auxiliary.

Black bug has within the last three or four weeks come very much in evidence in what little patches of coffee there remain. This is very disappointing, for it has been looking so well for months back, that hope induced one to believe that it had turned over a new leaf. What hecatombs of hopes have been sacrificed to coffee, and are still. I fancy as long as a few patches remain, and a few bushels are to be gathered, the old methods will continue.

The weather has changed to showery, but we want a good twenty-four hours downpour to get a proper soaking. All the same we are thankful for what we are getting, as the long continued drought was shutting everything up. A planter calling at a store which was rather famed for "Sorry, but just out of it at present," asked for marmalade. Alas! there was none: and the storekeeper when intimating the fact, and expressing regret, carried with him a stone jar in his hand. "This" he said, "holding the jar up, is the nearest we have." The planter glanced at it, read Day & Martin's Blacking, and then fled. I wonder if it can be true?

Coolies are plentiful and healthy, and arrivals from the coast continue to come in small batches. But for this abominable exchange we might be happy. It is at present most in our thoughts. A fine dance it is leading us.

PEPPERCORN.

THE WEALTH OF INDIA.

From Mr. Birkmyre's curious pamphlet* we make a few striking extracts:—

Little has hitherto been said concerning the wealth of India. *Prima facie* a country must be wealthy which sustains, without the aid of a poor law, two hundred and fifty millions of the human race. Moreover, a country possessing only a million and a half square miles of territory, and having the ability to support thereupon 20 per cent of the estimated population of the entire world, cannot be otherwise than wealthy. To those who hold fewness of wants, and not extent of possessions, constitute wealth, from such a standpoint India is indeed wealthy. A country which annually receives and pays for, from 20 to 30 per cent of the entire production of the precious metals, and which, in addition to this large absorption,† imports in increasing quantities articles of luxury such as precious stones, spices, corals,‡ &c., cannot by any stretch of the imagination, be considered as becoming gradually poorer.

Judging from the extent of her national debt, India may be said to be wealthy; for, although large, it is balanced by revenue-earning assets, equal in the opinion of many, to the amount of the debt. This is all the more extraordinary when it is considered that India has paid for every farthing of her conquest—that she continues to pay for an expensive military occupation, that she has borne the expense of many fruitless frontier wars (notably the Afghan war, which cost about twenty-four millions sterling), and that she has assisted the United Kingdom, in some of her military

* The Wealth of India and the Hindrances to it Increase; by William Birkmyre, of Calcutta and Port Glasgow. Glasgow: M'Naughtan & Sinclair, 24 West Nile Street.

† Quanborough's "Primer on Commercial and Economic Education," page 26.

‡ Barbour on "Bi-metallism," page 14.

enterprises. Moreover, when we think of the great pecuniary loss which famines have entailed upon the country, and the unbusiness-like—I had almost said stupid—methods by which she has acquired her assets, when in spite of all these ordeals, the country has emerged from them, almost free of a national debt, it is surely a proof, if not of wealth, yet of an elasticity of resource (with the exception of America) unparalleled in the history of any other country.

That India, in common with other countries, is afflicted with much poverty cannot for one moment be denied. There, as elsewhere, there are, alas, too many who fall in their strife with fortune. It is easy to paint a dismal picture of the poverty of a nation, but to solve the problem is a different matter. I often think it would be well for India, were her officials to devote more of their energies in ameliorating a condition, which India shares in common with every wealthy country, instead of dwelling constantly, in season and out of season, upon her so-called poverty. On the other hand, one cannot but respect the opinion of those, however mistaken, who are profoundly impressed with the poverty of India, and who ascribe this poverty to the expensive foreign organizations which we have imposed upon her. There is no doubt much truth in the contention that the civil and military services might be conducted upon a more economical basis: this may be said of all countries. The hardship with India lies in the fact, that those services are conducted principally by foreigners, and are, necessarily, more expensive. Still, in the face of all this, the broad fact remains, that judged by large and comprehensive issues, such as the increasing consumption of luxuries, &c., &c., India is not a country bleeding to death, as some would have us believe. Were this so, the process has been going on for upwards of two hundred years; and the evidence at which I have had time merely to hint, all points in the direction of increasing wealth.

* * * * *

At the outset I said, that with one exception, India had in abundance everything which constitutes the wealth of the United Kingdom. The exception I referred to is the weak executive ability of the race; it is this principle, this ever present characteristic, which in my humble opinion is the main hindrance to the development of the wealth of India. The Indian people are admirable administrators, exact copyists, when placed in a groove; but they are lacking in the self-adaptive faculty of suiting themselves to the ever changing requirements of new developments. The individual has his pace fixed for him in society by the rigours of caste, and thus his individuality is lost in that of the community, which in its turn is lost in looking to Government. There is a want of self-reliance, of that bold and sturdy spirit which leads individuals and communities to lean upon themselves, rather than upon those who govern them; hence, as stated, the weak executive ability of the race is the main hindrance to the creation of wealth in India. This may be illustrated by the fact that upon our acquiring the country we found it all but destitute of roads, by which the inhabitants could communicate with each other. They were practically shut off from selling to themselves, or to the world, the fruits of their labours; in consequence of their weak executive ability they were unable to appreciate the necessity for roads, so as to give their wealth-creating faculty full scope. Hence, also, the hoarding propensities of the race, and their inability as a nation to associate capital, or to combine and organize themselves as one against an enemy.

The paramount power in India is, and has always been, the centre from which all social and public works emanate. The people look to the Government to see everything, know and provide everything, whereas with the strong executive faculty of the Western races they are themselves the centre, and the Government is but the organ of their wishes.

The good qualities of the Indian people—their patience, their courtesy, their contentment—all serve to accentuate their weak executive ability. In their religion, there is nothing like what we understand by dissent, nor is there the ever restless ingenuity to discover new and improved methods, so typical of Western races.

It is easy to criticise, but not so easy to suggest a remedy. As has been well observed, "You may alter the conditions of the race but never their characteristics." So in the case before us, I fear a remedy is impossible, and to defer the development of the wealth of India until this national weakness is overcome is simply postponing indefinitely all measures for the promotion of its growth. Nor is it necessary in this instance that we should make the attempt to alter this characteristic, for have we not as a nation, assumed the executive of India? We have assumed the trusteeship of the people, and no country has ever taken upon itself such responsibilities to another as England has towards India. If India has suffered since our possession, for want of proper communications with which to develop her resources, the fault clearly lies with the Executive which we have imposed upon the country, and if we desire India to become wealthy, and to take her place among progressive nations, it is upon this Executive that our attention must be concentrated.

I have attempted to show you wherein the wealth of India consists—namely, in her wealth-creating faculty applied to a marvellous number and variety of products. I have tried to interpret to you a few of the national characteristics of the race, the chief one being an innate desire to better their condition. I have endeavoured to show you wherein mainly consists the hindrance to the country becoming wealthy—namely, the weak executive faculty of the people and the feeble Executive which the House of Commons has given to the country. I fear things cannot improve unless this country can be roused to take a more active interest in the affairs of India.

When one thinks of the millions of families in this country, who receive their daily bread in virtue of our connection with India, and how, were the inhabitants of this country, but to take a greater interest in the affairs of India, the number of these families could be indefinitely increased—when one thinks of the millions of the Indian race who receive their daily bread in virtue of our connection with their country, and how, by a more active interest on our part in its affairs, their number could be largely increased. In meditating over these things and the apathy of this country towards India, I am sometimes inclined to estimate such neglect as almost criminal. India ought to be considered as an integral portion of this Empire. It was so viewed a few years ago when Russia threatened her frontier. With how much more reason should it be so regarded in relation to all those peaceable economic questions, common to all progressive countries.

[There is another side to parliamentary interference with India. For instance: Bradlaugh representing as a martyr of tyranny the Maharaja of Kashmir, who was deposed because of his tyranny and oppression. There is another side also to the character of the administrators of India. There are exceptions, of course, but on the whole no conquered people were ever more ably, righteously and benevolently governed than the people of India.—Ed. T. A.]

GARDENING IN INDIA.

There seems to be a prevalent idea among those who have not been to the tropics, and especially India, that gardening there must be a very simple affair, just in the same way as some imagine that tigers prowl about the streets, and cobras meet you at every turn; but the reverse is actually the case: good gardens, like tigers, are, in fact, not plentiful, and it is possible to live in India a long time without ever seeing a cobra outside a snake-charmer's basket.

Before I went to India, I had similar erroneous notions, particularly as regards Indian vegetation. I fancied I was going to see a Kew Palm-house-like aspect everywhere; mighty Palms, and rampant climbers; in short, just like the choice "bits" of jungle scenery that travellers in the tropics are wont

to beguile us by pen and pencil. It is true that when we entered Bombay's magnificent harbour at sunrise, and I saw the towering groves of Palmyras (*Borassus flabelliformis*), that stand like giant sentinels on the amphitheatre of hills overlooking the harbour, I began to think that the dream of my life of seeing a tropical jungle would soon be realised. The same day I visited the Victoria Gardens and others among the principal gardens of Bombay, and I was enchanted with all I saw, for though it was November, the gardens were at their climax of beauty; their spring-tide of flower, in fact, after the monsoon, as the long rainy season is termed.

I think it is pardonable in a young gardener if, on first seeing a tropical garden, he goes wild with delight, and otherwise shows signs of temporary insanity. I have a distinct recollection of being in that condition when I entered the Victoria gardens in Bombay, and saw growing in the greatest luxuriance in the open air plants that from childhood I had been accustomed to see crumbed in pot, and confined in a glass-house. So great is the difference between pot-grown plants in a stove and those growing in unrestrained vigor in the tropics, that they are often scarcely recognisable, and I blushed at my ignorance when, on asking the names of certain plants, Mr. Carstenson, the Curator, mentioned the most familiar names. The things that struck me most were such well-known stove climbers as Bougainvilleas, Bignonias, Allamandas, Ipomeas, Passifloras, which send their lissom shoots from tree to tree just as the Traveler's Joy and Honeysuckles do in our hedgerows, and the brilliant colour they give to an Indian garden scene is quite indescribable—it must be seen to be understood. The groves of tall Palms give support to shade-loving Philodendrons and other clinging Aroids, and in the shade below grows a multitude of smaller things—Pancratiums, Crinums, Alocasias, various Bromeliads, Begonias, and such-like, while there is a dense lawn-like carpet of the creeping little Artillery plant, *Pilea muscosa*, or whatever its latest name may be. I could not better describe the Palm grove than by comparing it with the central part of the Palm-house at Kew, supposing the roof was away, and the high Palms spaced out more widely.

What we term "fine-foliage" plants are no less remarkable, especially the higher-coloured shrubs, like Croton, Acalypha, Caladium, Dracena; for there they develop such rich tints, especially the Crotons, that even the famous Liverpool Croton growers could not approach. I saw a shrubbery of Crotons—a hundred or more—planted in the full sun, close to a wall at one of the railway stations; and I thought I had never seen such a marvellous sight in the way of leaf-colour; and the sorts included most of the newest—all dense, symmetrically grown specimens.

I thought of Mr. Baines and his famous "elephant" specimens, the result of years of patient skill, when I saw in a sample forecourt in the Bombay suburbs some gigantic specimens, faultless in training, and crowded with bloom, of *Ixoras*, *Jasminum sambac*, *Bignonia v-nusta*, *Bougainvillea leteritia*, *Petrea volubilis*, and others. The owner, a railway man from Lancashire, seemed unaware that he was doing anything very remarkable; he liked flowers, and liked to see the front garden "look a bit smart."

It is not only in the Victoria Gardens that one sees such luxuriant vegetation, but you see it everywhere—in the city gardens, of which the Elphinstone Circle Garden is a noteworthy example; in the Fort where European commercial life is carried on; as well as on the picturesque height known as Malabar Hill where the wealthy natives as well as Europeans have their bungalows, and, in most instances, beautiful gardens about them; but all this is due to the perpetually moist atmosphere and high temperature that prevails throughout the year, so that when you leave the seagirt island of Bombay and its Ceco-nut woods, you enter upon quite different scenery whichever direction you take. Going south towards Madras, you have to climb the ghats, as the western range of mountains are called, and there you see Nature's gardening in

its grandeur, until you reach Poonah, and beyond that city you pass through the trackless wastes of the Deccan. Going up country towards Guzerat, the train takes you through a marvellously rich Agricultural country, where the fields of Cotton and cereals are measured by the square mile. On towards Baroda, you come to what is aptly called the "garden of India," where the rich farm lands are interspersed with magnificent timber trees, where the Tamarind and the Mango give a distinctive feature to the landscape, diversified now and again by natural groves of the Teddy Palm (*Phoenix sylvestris*) and Palmyras, and this kind of scenery goes on in a more or less varied way right through the vast stretches on to the Punjab and the North West.

It is thus that the stranger derives his first impressions of India, and if he enters it by the other great gateway, the opening scene is even more impressive as he goes 100 miles up the Hooghly before reaching Calcutta. The banks of the Hooghly are typical of an Indian jungle, abounding in vegetation of the wildest description, and where the tiger, moreover, is not a stranger.

The further you go inland the less tropical the vegetation becomes, and the more difficult it is to make and maintain gardens, and the difficulties attending gardening, in the sense that we understand the term, accounts for the comparative rarity of fine examples. These difficulties arise purely from climatic causes, the long period of drought and the excessive rainfall spread over a comparatively short period. It is, indeed, not an easy matter to maintain an inland garden in freshness from one monsoon to another, which interval varies from eight to nine months. But by the ordinary native system of irrigation, much may be done; and those who can afford a more costly system, can keep their lawns green throughout the year.

As regards the subject-matter of these discursive notes of gardening in India, I think it best to divide it, as methodical London did in his *Encyclopædia of Gardening*, where he treats on the state of gardening in different countries. His divisions are—gardening as an art of taste and design, and gardening as an art of culture. As regards India, so far as my scant knowledge goes, there is very little to say about one, and a great deal, more than I can go into here, about the other. About the gardens I saw, the majority exemplified very little design, and the tasteful bits resulted more from accident than design. Europeans unquestionably are leaving their marks everywhere about the country in the matter of gardens, as well as on the buildings, and everything else; but the want of intimate knowledge of the principles of design are too apparent. The fact is, that in India, as indeed in this country, too, everybody thinks that he can lay out a garden, a simple matter say they, what is there in it? The results too often show that there is a good deal in it. But in India this is more excusable, because professional gardeners are scarce, and very rarely you find a native capable of designing even a flower plot well. Consequently, you get the military officer or the civil servant with spare time, essaying to do what he knows very little about; but for that matter he would build you a steam-engine or make a fiddle, for a man in India must be more or less a "Jack-of-all-trades." I heard of a German out there who qualified himself for a landscape gardener by being an expert at house-decorating, and sure enough he transferred his elegant scrolls and aimless confections to the walks and roads of a public garden he designed. Among the gardens that stand out prominently as fine examples, are the great public gardens of Calcutta and Bombay, the botanical garden in the former place being probably the finest in the world; while remarkable also are the Government House gardens at Barrackpore, and the picturesque Eden Gardens. Those in the Nilgherries at Ootacamund and Bangalore, favoured as they are by a delightful mountain climate, are highly spoken of by everyone who has seen them. The gardens at Poonah, which, like the other great centres has been long under the influence of the British, are famous throughout India, for the climate there favours the growth of plants that will not thrive in the plains. I was much

pleased with the Government House garden at Ganesh Khind, which were for many years under the management of an old Kew student, Mr. Woodrow, now Professor of Botany at the College of Science. The Bund garden, too, struck me much, both on account of its design—a series of terraces—and for the high keeping of it by a native superintendent.

At one time the best gardens were confined to British territory, but in future we shall have to go to the native States for fine gardens. Already great progress has been made, doubtless the outcome of the periodical visits to Europe of the native princes, who have seen for themselves what English gardening is. Among States that can boast of famous gardens is Oodeypore, under the direction of Mr. Storey, who has, I hear, done wonders in making the State gardens there what they are now. I have not yet seen them, but a friend who has travelled throughout India tells me that they are really fine, enriched by magnificent tree growth, and embellished in a costly yet tasteful way. I am told that the lakes alone are worth the 70 miles ride on camelback to see, being of great extent, and have delightful surroundings. The view in the Oodeypore Gardens (see Supplement in present issue) shows a fountain of simple yet massive design; and doubtless Mr. Storey has it full of Water Lilies, that give such a charm to water basins in India. The trees in the back ground are Tamarinds, which are among the finest trees in India, as stately and massive as an Oak, yet as graceful as an Acacia. I have measured some with boles 27 feet in circumference. Noteworthy gardens in other States include that of Jeypoor, over 70 acres in extent, designed by Dr. De Fabek; Durbuigha, which was at one time under the direction of Mr. Maries, but who is now, I hear, doing a great deal in gardening at Gwalior, also a native State. There are also fine gardens at Patila and Chikalda, while I hope that the various palace gardens and parks that I am designing and laying out for H. H. the Gaekwar of Baroda will in time compare with any in India. I have said nothing about native gardens pure and simple. Judging from what I have seen, there is very little to say about their design; the native idea of a garden is a square plot with his bungalow in the centre of it. The plots varies in extent according to the importance of its owner, but there is no variation from the straight lines and symmetrical figures he delights to portray on the ground. After the diamonds, squares, and trapezoids are cut out and duly edged, he proceeds to plant them with masses of the things he most requires; but the stock things are Limes, Guavas, and such like fruits, and with flowers like Jasmine and Roses, of which a prodigious quantity are required for religious festivals and ceremonies. But there is a good deal of commonsense in all this, for a garden so laid out is easily irrigated and kept in good order. He is not troubled about aesthetics, "breadth of effect," or "picturesque skylines." A garden to him is a place to grow things to eat, or use in some way, and that is all that he wants. In the unregenerated gardens around the palaces, you see much that is absurd according to our canons of taste, but invariably there are fountains, often of beautiful design; but as a rule, out of all proportion as regards size to extent of the garden. I think it was Bishop Heber who said that the natives of India built like giants, and finished their work like jewellers, and this is true of their buildings; but in the matter of gardens they seem to be like pigmies, incapable of originating any broad design, which alone can set off to the fullest advantage their wonderful buildings.

Gardening in India, as an art of culture, is such a wide subject that I will not attempt it here. The methods of cultivation and propagation, which, though primitive, are often highly ingenious, and altogether I have a good opinion of the native mollee. He is skilful, and generally very painstaking, but it takes him some time to get into European ways of doing things. Mr. Woodrow, in his book, *Hints on Indian Gardening* deals with the practical part of gardening in a very thorough way, which cannot fail to influence the future condition of gardening in India.—W. GOLDRING.—*Gardener's Chronicle*.

PLANTING OF TREES IN STREETS, from a sanitary point of view, cannot be over-estimated. Trees not only afford shade and shelter, but adorn the landscape and purify the air. They improve the heart as well as the taste; they refresh the body and enlighten the spirit, and the more refined the taste is, the more exquisite is the gratification that may be enjoyed from every leaf-building tree.—*South of India Observer*.

CARRIER PIGEONS.—An interesting experiment to test the utility of Pigeons is about to be made in Canada. Ten pairs of birds are being shipped to the Dominion this week, and then attention is to train them for the purpose of establishing and maintaining a line of communication between Sable Island and Halifax. Sable Island lies in the Atlantic Ocean, about 90 miles from Nova Scotia, and in the track of vessels passing between the American Continent and Europe. A station is maintained on the island with provisions and other necessaries for the relief of shipwrecked mariners, but there is no regular communication between it and the mainland. The experiment has been initiated, as likely to be of service in cases of emergency, by the Canadian Minister of Marine and Fisheries.—*H. and C. Mail*.

TEA IN CEYLON.—Mr. John Brown, of the Uva Coffee Company, is well pleased with all that he saw during his long tour in your island, where he travelled fully a thousand miles, having visited every tea district. He has great confidence in the capabilities of the Uva districts for the production of good tea; but, as regards quantity per acre, he believes that in all parts of the island the longer an estate has been under coffee cultivation the slower will be its progress to full bearing, and the less will be the annual yield, especially in those cases where a long course of mamoty-wedding has denuded an estate of most of its top-soil. There is reason in this opinion for, though it is true that tea is a deep feeder, which coffee is not, time must be allowed for the tea roots to make their way down to a good feeding soil, and of course the quality of that soil will always be a matter of uncertainty. Mr. Brown regards the fuel and timber questions as of serious import, and agrees that materials for packages should be imported, and that where water power exists in quantity it should be utilized as a motive-power for machinery. He is thoroughly well satisfied with the averages of his Company's teas, but on many of the old coffee places patience will be needed before ample yields are secured.—*London Cor., local "Times."*

TOBACCO IN INDIA is thus referred to in the Official Report on Inland Trade in 1888-89:—

This narcotic is widely cultivated by the agricultural population for domestic consumption and in most provinces for inland export also; but it is only in tracts possessing a moist hot climate and a rich soil that the finer varieties suitable for European consumption can be grown. Such conditions occur in the coast districts of Madras and Beugal; and it is from these tracts that most of the tobacco exported from the country (a small quantity) is obtained. The principal barrier against a larger trade lies in the ignorance of the natives of the art of curing the leaf. A sufficiently profitable market might be found for ordinary Indian tobacco if it were properly cured; but the manner in which the narcotic is usually consumed by the natives themselves does not encourage a knowledge of curing. It is either chewed as a dry powder mixed with lime, or smoked in the form of a conserve or paste mixed with treacle and other ingredients. In either case pungency rather than aroma or delicacy of flavour is the chief desideratum. The best prospect of improvement in Indian tobacco manufactures lies in the steadily increasing consumption among the richer classes of natives as well as the European population, of the country cheroot and pipe tobacco. Measures are being taken to introduce a knowledge of American methods of curing in Madras, and the cigars of that Presidency are gaining in reputation. The area cultivated with tobacco in all India is put down at 800,000 acres; the crop at 406,000 tons, or over $\frac{1}{2}$ ton per acre.

THE PROSPECTS OF QUININE AND CINCHONA BARK.

The figures we published a few weeks ago indicating the steadily increasing exports of cinchona bark from Java, created a very unfavourable impression locally and not a few have been heard to say that there is little use now in anticipating better times or a better price for bark. Without doubt Java is fast assuming the position lately held by Ceylon as arbiter and controller of the bark market. Her richer barks, averaging double those of Ceylon in quinine, are now being shipped to the extent of from five to six million lb. per annum. And if we are to believe our latest visitor, Dr Wilson, there is no prospect of her export falling off for a good many years to come. At the same time, it is quite a question whether the total supply of Bark for the next few years will be equal to the World's demand, unless prices rise sufficiently to warrant the harvesting of bark from indigenous trees in South American forests. The exports from Ceylon are unmistakably falling back year by year; those of India are at best stationary—indeed they have also lately fallen off. Wild bark from America has ceased to come toward save in the better alisayas, apart from the Belivian bark from cultivated trees. The total result therefore even making allowance for an increase of Java bark is far from discouraging to cinchona planters. Supposing that Java this year supplies 5½ million lb. 4 per cent bark, Ceylon 7½ million lb. of 2½ per cent, and India 1½ million lb. of 2 per cent bark, we only get the equivalent of 7¼ million ounces of quinine, while the consumption is likely to be in excess beyond what the American bark can make up, not counting the quantity of bark required for other purposes than quinine.

As regards consumption, Mr. John Hamilton in 1888 estimated that 9 million ounces would be required in 1892, the demand increasing annually by 10 per cent. But last year's experience—owing a good deal to the influenza epidemic and the cheapness of quinine—showed an advance much beyond the estimate. The United States last year increased her imports largely; the figures being for 1888 imports 1,904,206 oz.: 1889=2,245,941 oz., while five months of 1890 saw an import of 1,611,000 oz., or at the rate of at least 3,200,000 oz. for the year. All this apart from over a million ounces manufactured annually at Philadelphia. With the world's consumption at 9 million oz. next year (in place of in 1892), we cannot see where the bark is to come from for more than 7¼ million oz., unless the price per unit goes up considerably. We believe there is a general impression that before the end of this year there will be a considerable change for the better, and although with Java overshadowing us, there is no room for "great expectations" being encouraged among the Ceylon bark holders, still we cannot but think that at least a better time is approaching and that we have touched the lowest depth in quotations.

So far our view of the near future's on the basis of the laws of supply and demand and a normal market. But what are we to say if the following story published in the *Chemist and Druggist* be correct? It contains, at any rate, a very curious revelation. The contracts referred to are, of course, perfectly legitimate, but undoubtedly the system is one-sided and enables the manufacturer to say, in effect, to the producer:—"Heads I win; tails you lose." The question is, Can any number of

the Java cinchona planters have lent themselves to such one sided and damaging contracts? We quote as follows:—

QUININE MANUFACTORIES DEPRECIATING QUININE.

Mr. H. A. Van Overzee, jun., cinchona broker, of Amsterdam, sends us the following notes on the subject of the depression in the price of cinchona bark.

Some years ago, when the Amsterdam market began to gain importance, there were many who prophesied that the average percentage of quinine in the Java bark would become so high (10 to 12 per cent) that one was inclined to question the possibility of placing such quantities of quinine as those barks would yield.

Since then the imports from Java of Ledgers and Hybrids—which two kinds were predicted to be the barks of the future—have shown us that these expectations were greatly exaggerated.

The following quantities of Ledgers and Hybrids have been offered in Amsterdam at the regular auctions.

	kilos.	p. c.
1888 at 10 auctions about	1,131,000	averaging 4 0/2
1889 " "	1,688,400	" 4 1/2
1890 5 " "	1,220,302	" 4 2/0

It is true that some plantations have not stripped as much rich stem and root bark, as they would have done if the unit value had ranged higher—still the above figures show clearly that the fear of overproduction through the increasing richness of the barks is unfounded.

The stock of cinchona in London, according to the official accounts has declined from 99,600 packages in 1883 to 57,181 packages in 1889.

The stock in Amsterdam in first hands only consists of a few parcels withdrawn from the last sales, whilst in second hands there are never any supplies of any importance. Comparing the stock of cinchona with price of quinine, as follows:—

	1883	1884	1885	1886
London bark stock (per kilo.)	99,600	80,500	61,700	62,350
Quinine (florins per kilo.)	135	75	57	24
London bark stock (per kilo)	59,619	56,754	57,181	
Quinine (florins per kilo)	36½	27½	25½	

It is evident that some powerful factor must have operated to produce the constant decline of the price of the manufactured product, concurrently with the diminution of the supply of the raw material. What is this factor? I am inclined to think that it is found in the existence of contracts for cinchona between some large plantations in Java and quinine manufacturers direct, in which the price of bark is fixed only upon arrival of the parcels in the factories, according to the then ruling value of quinine.

Such contracts may seem profitable to some planters, as the producer receives the quinine-value of his barks without any expense except the remuneration of a specialist (who, in conjunction with the quinine manufacturer, adjusts the percentage and value of the bark on arrival), taking into consideration a certain fixed figure for the cost of manufacturing. The planters, as a body, may be sure, however, that by such a mode of operation they are digging their own graves, for this reason—such contracts enable the manufacturer to sell considerable quantities of quinine for future delivery at low prices, without loss or even without risk, because he has the guarantee that however low may be the price at which he sells the quinine, when delivery time comes the necessary quantity of bark will be at his disposal at a correspondingly low figure.

The depreciation in value of quinine is thus actually borne by the planters, yet it is a fact that such a contract exists between a German manufacturer and Java planters, and that this has enabled him for years to sell quinine on future delivery with a profit at the lowest figures, causing at the same time a general depression of the article, to the detriment of the producers. Whenever this manufacturer lowers his prices, other makers have to follow suit, should they not wish to lose their customers, and they have therefore to make

lower bids in the bark auctions where their sales are covered.

It is known that this manufacturer receives every year, under such conditions, cinchona bark with an equivalent in quinine of some 8,000 to 10,000 kilos. (280,000 to 350,000 oz.)—a quantity amply sufficient at all times to bring about any desired fall in price. In January, 1889, when London quoted quinine at 1s 3d with a slow demand, this manufacturer could sell "future delivery" at 1s 2d without the slightest danger of being caught by an eventual rise in bark values, being certain of receiving direct from Java the necessary quantity of cinchona to cover his sales. As soon as the price of 1s 2d became known, buyers would not hear of any higher figure, and other manufacturers had to follow suit if they wished to have any chance of doing business. The consequence was that in the following bark sales no more could be paid than the equivalent of a quinine price of 1s 2d for the barks; the unit in London was thereby reduced from 1- $\frac{3}{4}$ d. in Jan. to 1- $\frac{1}{4}$ d. in the following month.

When, after this, in February, sales of quinine at 1s 2d were not so easily accomplished, future delivery was again lowered to 1s 1 $\frac{1}{2}$ d which other manufacturers had to concede, and a further depression of bark values was the result. It was not till some manufacturers paid higher prices for bark to sustain the market that manœuvring was put a stop to, and it became possible to effect a slight improvement.

The holders of bark may try what they like to keep the markets free from abnormal pressure, by judiciously regulating the quantities to be exported: they will always be outdone by the power of manufacturers who hold contracts as described above. It is evident that the bark statistics give no reason whatever for a position such as exists at present, and it is only the finessing of a few manufacturers which since 1883 has driven down the prices of quinine and the value of cinchona to the loss of the planters, whose care it should be to render such things impossible for the future. In the long run, a sound state of affairs can only be brought about by free competition, which under present circumstances cannot possibly exist.

OTTERS AGAIN :

TOBACCO SMOKE v. HOUNDS, &c. &c.

Nuwara Eliya, June 30th.

The graphic reminiscence of an orthodox *otter hunt* in the *Observer* of the 26th inst. was interesting. The "tailing" of the otter at the ford, however, and the throwing him on to the bank, to be torn to pieces by perhaps some 10 or 15 couple of hounds, savours to me uncommonly like foul play. Why! "*tobacco smoke and brimstone*" could not be much worse than this, though far be it from me to defend such a mean device for the destruction of an animal which affords such excellent sport.

I have been familiar with *otters* and *otter hunting* from my boyhood, and in this connection I can't help relating, how I once closed with one whilst a *barley rick* or *stack* was being removed, and which notes I am sure will bring to the memory of many of your readers some similar scenes of boyhood days. 'T was on a winter's frosty morn, when several inches of snow lay on the ground, and I had just been round my rabbit hutches feeding my pets on green kailand carrots, and admiring the last litter of beauties, nestling in their cosy bed of fur. The sparrows and finches, half tamed with cold and hunger, were hopping about all around on the crisp white snow, and robinredbreast was begging in sweet low notes for his morning repast of crumbs. Looking towards the stable yard, I see James Johnstone (a fine specimen, by the way, of the old proverbial minister's man, so well described by Dean Ramsay), and Davie the "loon," yoking the horse to the cart. The barn-door opens, and the forks are got out.

Hurrah! thinks I, they are going to take in a stack of barley or oats, a rare occasion of rejoicing with Snap the terrier and myself. The news spreads, and some of the boys from the village collect for the *rat* hunt. Sheaf after sheaf is forked into the cart in quick time, and as the stack goes down, down come the rats, to be caught in our hands, as the cricket ball is caught by the wicket-keeper.

A squash and a dash on the ground, and the varmint is no more; an occasional bite is nothing; that only adds zest to the sport.

But sec—the rick is getting lower, and it is not *rats* alone that frequent the stacks, for a home or a shelter. At times, weasels, stoats, otters, and semi-wild cats, &c., find snug retreats there. Snap and I as usual take up our station at the ventilating flue of the stack all attention and ready for any comer. Out bolts a great brown thing, right bang on to my chest; Snap has him by the ear, and I by the throat—over we go—heels over head—down the slope—a bundle of dog, otter and humanity, James Johnstone bawling out from the rick "Haud laddie, haud, if ever ye haud i' yr' life." And faith the "haudin' o' 't," is rough and tough work!

But Davie, my staunch henchman, is off the cart and down the incline like a lamplighter. Just as I am pretty well out of breath Davie collars him by the scruff of the neck and plants his knees over the chest of the otter. I follow suit, and get on behind with all my weight. You may rest assured it did not take us 3 hours to polish off our otter! I should say we had him carried into the back kitchen, within 15 minutes from the bolt, and where we had our wounds dressed. But what cared we for hites or bruises, wounds and contusions? Davie and I had the stomachs of cassowaries in those days, no such things as nerves I believe, and stout hearts. Davie went to Canada and prospered there, and, if still above the sod, will no doubt remember as well as I do the tussle we had with the "water dog."

Now, Mr. Editor, this is what I call legitimate otter hunting—no tobacco smoke or brimstone here; no pulling of a poor half-winded thing on to the bank of the stream to be torn to pieces by a pack of strong hounds!

By all means, as you suggest, let us go at the *otters* in an orthodox way. We have got the men, and there is no great difficulty in getting the dogs. How many right worthy successors of Palliser, Downall, and Baker have we not got all around us? One of the new improvements or attractions to Nuwara Eliya, our lovely Sanatorium, will undoubtedly be the *pack of otter hounds*, and, if spared, we hope to read the announcement:—"Otter hounds will meet at the Bridge, Rosebank, 5 a.m., 1st Jan. 1891."

DECREASE IN CANE SUGAR.—The *Grocer* in calling attention to the decrease in the supply of cane sugar, says:—The principal feature in the existing supply of sugar in this country now is the diminished imports of cane as distinguished from beet descriptions, as, whilst consignments of the latter predominate to a greater extent than ever before, arrivals of the former have been lighter up to the present period of the year than they have been for many seasons past. It is years since the London market was well supplied with sugar from the East Indies, consisting of various useful kinds suitable either to grocers or refiners, when public sales of Mauritius, Bengal, and Penang were regularly held, and passed off with readiness at better prices duty paid than they would now entirely free of a customs' charge if any of the same sugars were to be offered.—*H. & C. Mail*, June 6th.

REMARKS ON THE STATE OF BOTANY
IN CEYLON.

WITH REFERENCE TO THE KNOWLEDGE OF IT IN APRIL 1843, AND AN ATTEMPT AT ARRANGING ITS FLORA AS KNOWN TO MOON AND RESIDENT BOTANISTS ACCORDING TO LOCALITY AND ELEVATION, COMMONLY CALLED GEOGRAPHICAL DISTRIBUTION OF A FLORA.

By CAPTAIN CHAMPION, 95TH REGT.

GEOGRAPHICAL DIVISION OF PLANTS IN
CEYLON.

(Continued from page 112.)

TABLE 4TH.

GENERAL FEATURES OF CEYLON VEGETATION.

Capping the Hills, facing Kandy and Peradenia.

The Flora of Table 3rd is intermixed with:
1st. On the under features and lower Hills about 1,900 feet.

Memecylon Sp. Eugenia Sp. Cyminosma pedunculata, Mezoneurum cucullatum, Holigarna Sp. Litsea trinervia, Solanum verbascifolium, Solandra oppositifolia, Cerbera parvifolia, Strychnos Sp. Tylophora paniciflora and Sp. Carissa carandas, Zizyphus Sp. Artabotrys odoratissimus, Miliusia Indica, Annona Asiatica, Gyrinops Sp. Pothos gracilis, Csesalpinia paniculata, Epidendrum pendulum, Wendlandia Notoniana, Heyneana, Exserta, Bicuspidata, Stylocoryne densiflora, Tradescantia paniculata, Achimenes sesamoides (Wild.) Torenia asiatica, Rosca santaloides, Rубia cordifolia.

2nd Slopes of the highest hills, about 3,000 feet above the level of the Sea.

Rubiaceæ, many good Sp. Grumilea vaginans, Psychotria curviflora, and 2 other Sp. Anonaceæ Sp. Myristica Iriya (Moon) Clypea hernandifolia, Xanthochymus ovalifolius, Rhus decipiens, Convolvulaceæ Sp. Begonia Malabarica (red & wh. fld.) Marynia lanceolata, Didymocarpus Sp. Solanum decumbentatum, Ferox, Giganteum, Curculigo pauciflora, Arum pentaphyllum, Huge forest trees (Echinocaryus?) Ternstroemiaceæ? Caryota horrida. Ammannia Sp. Elæagnus latifolia, Cissampelus Sp. Dianella nemorosa and graminifolia, Asparagus falcatus, Smilax latifolia, Arum campanulatum, many tree Orchidaceæ, Filices and Lycopodii, Limodorum Sp. The Wana Rajah, Pavetta hispida (W. & A.) Maba buxifolia, Convolvulus Learii, Ophiorhiza tomentosa (Roxb.) The Nilla (Plectranthus Sp. stunted Impatiens 2d Sp. Geophila reniformis, Hedyotis Leschenaultiana, Acrotrema Sp. Boraginæ Sp. Arum 2d Sp. Gymnopetalum Sp. Nauclea cordifolia, Æginetia bicolor, Vernonia Sp. Capparis grandis, Medicinilla Sp.? Curcuma 2d Sp. Zizyphus cylindricum, Alpina sericea, Malaxis Rheedii? Sterculia guttata? Elæocarpus Sp. (entire leaves).

3rd, Grassy knolls on the flanks;

Are covered with Lemon grass—Careya arborea, and Phyllanthus Emblica (the only trees); intermixed are Impatiens oppositifolia, Gnaphalium Indicum, Hedysarum triquetrum, Cassia angustissima, Crotalaria anthylloides (var.) and Sp. (type of C. Hirsuta) Polygala Sp. Stenodia lutea? Tetranthera cauliflora? usually borders the jungle in such places.

4th, On the very summit of the highest hills.

Grassy knolls with masses of Osbeckia Sp. Hedyotis fruticosa, Vernonia?, Evergreen shrubs and trees with small leaves such as Eugenia Sp. Sethia Indica, Salacia Prinoidea, creeping (Rawana's Broom) Rubiaceæ, Ardisia humilis, Ternstroemiæ, Memecylon ramiflorum, Bambusa Sp. Solandra oppositifolia (both a tree and creeper)—The Nilla shrubby.

TABLE 5TH.

Localities of some good plants as given by Moon

SAFFRAGAM.

Liriodendron (Sphenocarpus Wa.) liliifera, Begonia rupestris, Elæocarpus oblongus, Soyimida febrifuga, Cluytia collina, Indigofera hirsuta, Ficus stipulata, Dorstenia radiata, Bassia latifolia, Ceropegia juncea, Curculigo recurvata, Areca dicksoni, Bambusa spinosa.

WALLASSE.

Grewia tilliifolia, Melia pumila, Acalypha betulina, Butea frondosa, Rottboellia, muricata.

WALAPANE.

Psoralea corylifolia, Knoxia corymbosa, Sycas circinalis.

KATRAGAM.

Hugonia mystax, Pavonia zeylanica, Dichrostachys cinerea, Gyrocarpus Asiaticus, Anacanthus Maderaspatensis.

MATURATA.

Grislea tomentosa, Crotalaria tenuifolia, Alysia-arpus monilifer, Solanum giganteum.

OOWA.

Terminalia Chebula, Psidium pyrifera, Myrsine tomentosa, Viola hastata, Impatiens biglandulosa, Pterocarpus marsupium, Andromeda flexuosa, Anagallis esculenta, Campanula zeylanica, Rубia secunda, Premna procumbens, Martynia nervosa, Dracontium pinnatifidum, Andropogon cymbarius, schœnanthus, Agrostis diandra, Cynodon ciliaris, Avena sativa, Hordeum vulgare, Triticum aestivum.

DOOMBERA.

Jonesia pinnata, Galaxia tenuiflora, Desmodium gyrans.

BENTOTTE.

Mucuna gigantea.

TABLE 6TH.

Flora of Nuwera-Ellia, July and August, 6,000 feet above the level of the Sea.

The Flora of Table 1. disappears.

1st, Marshes and Margin of the Nuwera Ellia River.

Exacum tere's, Orchis 2d Sp. terrestrial, Neottia Sp. very like N. spiralis, Drosera peltata, Monotropa Sp.—Thalictrum glyphocarpum, (Meadow-rue) Ranunculus 2d Sp. Rhinanthus Indicus, Butomus Sp. Xyris Indica, Gratiola Sp. Smithia Indica? Dipsacis inermis, (var) Roxb. Valeriana Hookeriana, Utricularia Sp.

2nd, Meadow lands.

Rhododendron nobile and its parasitical Loranthus, Campanula zeylanica? and 2 other Sp. (one tetrandrous) Justicia repens? Bupleurum virgatum, Celsia Sp.? Tradescantia axillaris? Commelina nudiflora, Potentilla Kuliniana and Sp. Bidsens Chinensis, Hyppicium mysurense, Japonicum, Andromeda ovalifolia? Oxalis corniculata and Sp. Polygala Sp. Viola mysurense, Serpens Euphorbia Sp. Cynoglossum decurrens, Piper Sp. Crotalaria anthylloides and Sp. Venouia Sp.? Sida rhomboides? Ruta angustifolia, Arum pentaphyllum, Thunbergia fragrans, Lobelia excelsa, Lysimachia 2nd Sp. Hedyotis fruticosa and Sp. Anemone dubia, Exacum sulcatum? (var. wh. and light blue fld) Alchemilla Sp. (Lady's mantle), Galium asperifolium, Osbeckia truncata, Gnaphalium, Indicum, Aristatum, Nephelium zeylanicum, Echinandra rostrata, Eupatorium zeylanicum, Physalis flexuosa, Parochetus major.

3rd, Borders of the Jungle.

Berberis tinctoria (var), Ceropegia acuminata, Rubus rugosus, Lasiocarpus, Goureaephul, Photinia

Sp., *Osbeckia* Sp. *Agapetes* Sp. *Crotalaria* Sp. (type of *C. Notonii*) *Crotalaria* Sp. *Euphorbia* Sp. *Hedyotideæ* tree Sp. *Phyllanthus* Sp. *Polygonum* Sp.

4th, Jungle.

Undershrubbery of Nilla and a creeping Bamboo: also *Curcuma* Sp. *Eginetia* Sp. *Polygonatum* Sp.? (Solomon's seal) *Solanum Indicum*, *Nigrum*, *Ferox Giganteum*, *Smilax* Sp. *Orchidææ*, a handsome terrestrial Sp. *Cerbera parviflora*, *Piper* Sp. *Toddalia aculeata*, *Ardisia humilis*, *Eugenia laurina*? many *Rubiaceæ* and evergreen shrubs, *Biophytum sensitivum*, Forests of the Red and White Kino, *Croton Moluccanum*, the trees of the mountains of kandy and many unknown Sp. *Magnificent Filices*, *Epiphytal Orchidææ*, *Hedychium angustifolium* and *flavum*, *Medinilla* Sp. a creeper, *Hedyotis Lesbenaultiana*, *Geophila reniformis*.

TABLE 7TH.

Flora of Adam's Peak—March Summit of the Peak.

Rhododendron Nobile, *Hedychium flavum* or *coronarum*, *Gnaphalium hypoleucum*, *Utricularia* Sp. *Exacum sulcatum* (Roxb)? (wh.) *Valeriana hirsuta*? *Moon*, *Cynoglossum decurrens*, *Calyptranthes densiflora*? (Arboreous) *Orchis* (N. E.) and Sp. *Sinapis capsella*, *Viola serpens*, *Osbeckia truncata*, *Magnolia* 1st. Sp. *Lobelia excelsa*, *Sonerila* 1st. Sp. *Hedyotideæ* Sp. (shrub.) *Scutellaria* Sp.

Lower down Cone.

Osbeckia buxifolia, *Monocera* Sp. *Osbeckia* Sp. N. E.) *Sonerila* 2nd, and 3rd, Sp. *Scutellaria Indica*.

From the Cave, over the lower features, Ambegam-mowca side.

Sonerila 3rd Sp. *Ardisia humilis*, *Magnolia* 2nd Sp. *Dillenia dentata*, *Vaccinææ* Sp. (white fld.) *Begonia tenera*, *Impatiens biglandulosa*? *Moon*.
Runs into the flora of the Kandyan Mountains.

From Moon's List.

Agrostis panicea, *Impatiens serrata*, *Nauclea triflora*, *Martynia crenata*.

TABLE 8TH.

Remarkable Plants, near the source of the Mahavillaganga.

Acrotrema costatum and Sp. *Boraginææ*—N. Gen? Plants of Table 4 and probably many other good ones—
Didymocarpus Sp.

TABLE 9TH.

Road from Kandy to Nuwera-Ellia.

The lower Kandyan vegetation to *Gampolla*; add *Melastoma Malabathricum* and *Hedyotis fruticosa*.
Vegetation of the lower Kandian hills towards *Pusilawé* add—*Lobelia excelsa* (river), *Hedychium coronarium* and *angustifolium*.

Vegetation of *Lemon grass tracts* in Table 4 add,
—*Hopea zeylanica* and *Impatiens Balsamina* and Sp.

Pusilawé to Ramboddah.

Burmannia disticha, *Eginetia bicolor*, *Pedunculata*, *Physalis flexuosa*, *Gnaphalium Indicum*? The rock plants of Table 4 abundant.

Bambera-gaha.

The lower Kandyan vegetation has entirely ceased—*Palms* and *Plantains* not found. Forests of evergreen shrubs with small coriaceous leaves, *Undershrubbery* of the Nilla add—

Myristica Iniya, *Hernandia sonora*, *Callicarpa lanata*, *Oroton Moluccanum* still sparingly, *Impatiens* 4 Sp. *Hedychium angustifolium* *Lobelia excelsa* and *Solanum giganteum* very prominent in the vegetation, *Boehmeria alienata*, *Mussaenda frondosa*,

Fubiaceæ, *Cynoglossum decurrens*, *Epiphytal Orchidææ*, magnificent Forms.

To Nuwera-Ellia.

Medinilla? Sp. on trees, *Impatiens* 4 more p. Some forming the undershrubbery (top of the Pass) *Osbeckia* Sp.

Runs into the vegetation of Table 6th.

MAY, 1843.

CINCHONA CULTURE IN CEYLON AND JAVA.

We have been a good deal surprised to see the following deliverance in a contemporary:—

"Cinchona is an unfailling resource, in respect to which we feel our pride touched whenever we think that Ceylon is beaten by our neighbours in Java, who have endured all our troubles and disappointments, but have risen superior to them, not, we think, by virtue or a better soil or climate, but by means of better methods of propagation and selection. The fact that these are as available to the planters of Ceylon as to those of Java causes us to chafe over the first and only defeat Ceylon men have suffered in their enterprise."

We believe we have the advantage of the writer in having visited Java and seen its cinchona culture, as also its deep, rich soil of volcanic origin. Of course the Dutch colony started with the advantage of having obtained by purchase from *Ledger* the very best species of cinchona, to which attention was directed by the researches of *Moens* and his experiments in grafting the delicate *C. ledgeriana* on the more robust *C. succirubra*. As time went on plants and seeds of *C. ledgeriana*, showing high analysis, became readily available in Java, and the culture spread. But we feel confident that, with all the circumstances mentioned in its favour, Java would not have so far excelled Ceylon in the culture of the cinchona richest in quinine, had not a suitable, rich, volcanic soil been available to the planters of the Netherlands Indian colony. In the matter of soil, it is only the part of candour and truth for us to confess that Java has, undoubtedly, the advantage over Ceylon, except, perhaps, in regard to some exceptional localities in our island. In climate, on the other hand, Java, which is in the corresponding latitude south which Ceylon occupies to the north of the equator it is quite true has no advantage over Ceylon. The case is rather the other way, for in Ceylon we know but little of the severe droughts with which Java planters have so frequently to contend. Insect pests, too, bear heavily on the Java planters. With us in Ceylon *helopeltis* has principally affected the cacao culture. We are not aware that this destructive juice-sucker has ever meddled with the leaves of our cinchonas; and only in a few isolated instances, and that not recently, has tea in Ceylon been affected by "mosquito blight." In Java, however, cinchonas suffer much occasionally from *helopeltis*, while on tea plantations the insect is even a greater curse than it is in India. We recorded what we saw on the occasion of our visit to Mr. *Kerkhoven's* estate at *Sinagar* in the end of 1881. The tea bushes had been cut down within a few inches of the ground, and still beevies of children were busy collecting masses of the destructive insects. This fact, and the exemption of tea in Ceylon from insect and fungoid pests, with the discouragement induced by the low prices of our bark, may account for the absorbing attention paid to tea and the comparative neglect of cinchona culture in our island. If the prospects of cinchona became more encouraging, we cannot doubt that the care and skill of our planters

would largely overcome such inferiority as exists in our soil of gneissic origin as compared with the volcanic soil of Java; but it would be wrong as well as absurd to contend that in soil suitable for the growth of the best species of cinchona Java has not a real advantage over Ceylon. It is the undoubted fact that she has.

PAPER LINING FOR TEA CHESTS.

An Assam planter writes:—"I see someone advertising paper for lining tea chests, instead of lead. A man in Darjeeling called Linbury (I think) patented this years ago. Mackinnon, Mackenzie and Company tried it on 'Sookim-barry,' but they found the glue a bother and gave it up. The other Ceylon patent, lead and paper combined, is the thing if it can be produced cheap enough."

GEMMING AND MINING.

We are glad to learn that the work begun by the Everton and Barra Company is being actively prosecuted. Mr. Badalay has come on the *illan* in his Everton mines, while the Barra plumbago deposits are being elaborately developed and very fine samples of what seems to be large deposits have been valued at £12 a ton on the cart.

It will probably not be long before we hear of the Company for whom Mr. Barrington Brown reported. The London Syndicate has by no means lost heart, but is rather more interested in the work before them. They have secured by lease extensive plumbago lands and there can be no doubt of their Company being floated and work being commenced in Ceylon.

ARTIFICIAL PRECIOUS STONES.

We wonder if Mr. Charles Bryant, whom we assume to be the well-known mineralogist and jeweller, is quite as confident as in his letter, published in Monday's *Standard*, he proclaims himself to be. However sincere he may wish to be, we should doubt it a little. It was recently announced as most of our readers will have seen, that Mr. Greville Williams had actually made real emeralds out of the refuse of a gas retort, and could, if he thought it worth while, make other gems—not imitations, be it understood, but the real articles—with all the qualities by which experts usually test the genuineness of precious stones. That was rather a shock to the buyers of emeralds, and accordingly Mr. Bryant steps forward to say that the process costs a great deal more than a stone purchased from a jeweller would, and that experiments of the kind have during the greater part of this century been occasionally successful. As long ago as 1837, Gaudin the chemist produced artificial rubies; sapphires have been made repeatedly; the spinel ruby has been evolved in such perfection as to deceive the most experienced buyers; while even diamonds have been manufactured—if that is the right word—though in sizes too small to be of any practical value in commerce. Nevertheless, the market for precious stones has never been affected, and it will not be, Mr. Bryant thinks, by Mr. Greville Williams's very interesting experiments. That is true, and will doubtless be comforting to jewel-owners; but, as Mr. Bryant is much too clever a man not to perceive, it does not quite cover the whole case. Mr. Williams may not have solved the great problem, which is,

of course, to produce precious stones by artificial means at a profitable rate; but surely every successful experiment is a step forward towards the realisation of the ideal? The usual course of inventions is for the man of science to discover a method, for the practical chemist or mechanic to apply it, and for the trader by gradual pressure to secure any needful reductions in the cost; and we do not know any reason why precious stones should escape the law which is at this moment, if we may believe prospectuses, operating in the case of the rarer metals, such as osmium. With all respect for Mr. Bryant, we should say, judging merely as outside observers, that the danger to jewel owners, though not pressing, was both real and considerable, and that a bad quarter of an hour was for them quite within the limits of possibility. They may suffer as landlords have done, and will probably make more fuss. They have rather a serious stake in the matter, too. No one, not even Mr. Bryant, would venture to offer a serious estimate of the value of all the precious stones in Europe and America—we purposely exclude the enormous quantities scattered over Asia, the "buckets of jewels," for instance, known to be in the possession of the Shah—but guessing by the light of the diamond statistics, a hundred millions sterling would be far too low a figure to assume. That is a large mass of property, and a great chemist who happened to understand mineralogy, and devoted himself for a few years to the manufacture of precious stones, might some fine morning run its value down to a quite unexpected degree. He would try, we dare say, to keep his process secret, and would avail himself of the Patent Laws; but this is the nineteenth century, nothing remains secret long, patents do not last for ever, and the cost even of a premature panic in the jewel market would be represented by millions. We may be told that such a discovery is impossible, even by an Edison of mineralogy; but we should like to know more precisely why. The constituents of every precious stone are perfectly well known, and are all obtainable; and the writer in the *Standard* who points to the difficulty of ascertaining the exact proportions in which such constituents should be used, underrates the patience of scientific analysts. If they were at work on the subject with a great object, and with the sort of passion with which electricians and mechanics are now working to overcome the last difficulties in the way of the electric motor, they would find the right formulas soon enough. Mr. Williams has found them, according to the *Standard*, for making emeralds, and there is nothing to make the manufacture of emeralds more easy than that of other stones. The only active agency wanted is transcendent heat, and the chemists and electricians between them are now, we fancy, in full possession of the means of producing that. We bow to experts at all times on their own subjects, but it is not clear to the lay mind why, as jewels are already made, they should not be made in quantities, or why the processes should be so enormously costly as they are invariably, and to our minds rather too eagerly, represented to be. Wherein lies this element of inordinate cost, if the process is once so well known that ordinary manufacturing chemists can venture to attempt it? We are inclined to think that the great obstacle is not that, but the idea that the manufacture of any precious stone must be useless, because if once it could be manufactured readily, its value would disappear. No, being, it is supposed, would want made emeralds, any more than they would want those often really wonderful imitations which sometimes perplex even experienced jewellers. Now, is that fancy quite well founded?

The question is a curious one, for it involves a good deal of human nature. Is the value of a precious stone wholly dependent upon its rarity, and the consequent proof it affords that its owner is possessed of unusual wealth, or, at all events, of wealth which he can afford to waste? That is a nearly universal assumption, especially with those to whom wealth is in itself an offence, and it has this support at least, that many a woman who would despise pretence thinks, if she actually has the diamonds at her bankers', she may wear their copies in paste. We venture, nevertheless, to question its entire correctness. The enormous market price of precious stones, as compared with their bulk and utility, is no doubt due to their rarity, and the consequent gratification to vanity which their possession affords; but their whole value does not consist in that. The desire for them is provoked also by their inherent beauty, as of flowers gifted with an attribute of permanence, and possibly also by that instinctive taste for shining things which has made dewdrops strike all races as exquisitely beautiful—nobody ever paid for a dewdrop—and which, as many doctors know, rises in some men and women to a well-marked kind of insanity. Many kleptomaniacs can control themselves against their temptation so long as the coveted article does not glitter. No possible case of manufacture can make an eternal dewdrop other than beautiful, or take away the ruby's gift of setting off flesh, or dim the strange flash of the opal, so utterly unlike anything else that Nature has produced. [By-the-way, the reference to the opal may be a mistake, for the beauty of that jewel, being the result of Nature's failure and not of her success—for she can hardly have intended those hiatuses which yield the iridescence—may be wholly beyond even the ablest chemist's art.] The taste for jewels would be universal, if only the people ever thought of them as possibly procurable; and if they sank heavily in price, they would be universally worn, as, indeed, the cheaper jewels and the imitations are already. What would happen, we believe, therefore, if jewels became cheap, is that the rich would abandon them in their present form, which tends more and more to a costly simplicity,—the stones being, as it were, bared of all other ornament—and that whole populations would take them up, thus constituting them once more a great article of commerce. Every woman above the poorest would use the stones for ornament. It is Birmingham jewellery that would die, not the real article. The rich, moreover, would defend themselves by calling art to their aid, and we should see not only a wonderful improvement in goldsmiths' work, now often devoid of even a pretence of art-feeling, but a sudden and splendid revival of the art of the gem engraver, now so nearly dead. The ruby collar of the Marchioness would be almost as costly as ever, as a triumph of design and workmanship—even Socialists could hardly make the first designer in Europe use his gift with a willing heart for a pound a week—while diamonds would become with the women of the people what pearls used to be in some parts of Italy, ornaments with which it was almost indecorous, certainly quite bad form, on high occasions to dispense. The jewel trade would be destroyed as it is, and all jewel-owners would feel as if they had bought Irish land or the bonds of a repudiating State; but there would be a new jewel trade embracing entire populations. Plain people would be too wise for such folly? That is not quite so certain. Plain people now are very like the select people of a century ago, and it is the picked "classes" of earth, the first in wealth and taste and the means of enjoyment, who in all

ages have admired the flash apparently so self-derived, though it is as much a reflection as if it came from a mirror, that makes the first beauty of precious stones. We do not believe that the enlightenment of mankind will alter the taste for them much—it has certainly not done it yet,—nor do we see why, when the Smith of tomorrow has been raised to the level of De Vere of today—a consummation still some way off—Smith's tastes and De Vere's should be so utterly unlike. The jewel trade will not die; but we do not feel quite so certain as Mr. Bryant apparently does, that it may not be totally transformed, to the pecuniary injury of present holders. Fortunately, if science should produce such a catastrophe—and since, though usually favourable to the capitalist, is not invariably so—the area of ruin and misery would be comparatively limited. Dealers now rich would be pauperised; but the mass of those who possess precious stones would lose only potential wealth. Their gems produce no interest, and if destroyed in value, would still in one way remain as valuable as they are now. They are only gold in the mine so long as they are locked up.—*Spectator*.

IMPORTATION OF ADULTERATED TEA.

A bill (H. R. 10,720) has been reported to the House of Representatives as substitute for H. R. bill 8,744. It is to amend the act entitled "An Act to prevent the importation of adulterated and spurious teas," approved March 2nd, 1883. The bill prohibits, after July 1st, 1891, "the importation of the article commercially known as 'tea dust' in separate packages * * * and all 'tea dust' so imported shall be destroyed under the direction of the Collector of Customs." We will publish the full text of the bill in our next, it having been received too late for the present issue.—*American Grocer*, June 18th.

[We fear this will shut out genuine tea dust which is really wholesome and good tea.—*Ed. T. A.*]

COCONUTS.—It must be gratifying news to coconut estate proprietors to note advices received by wire of coconut oil being quoted at £28'10 per ton, the price having been a long time at a standstill has £25. This, together with the fact that two mills preparing nuts for confectionery purposes utilize about 20,000 nuts per diem between them, must be considered good news by all those interested in coconuts. The shipping of husked and unhusked nuts seem to be steadily increasing, but in this particular line, owing either to ignorance or dishonesty of many entrusted with the choosing and buying of ripe nuts, complaints often reach the shippers of the bad quality of the nuts when they reach their destination. I see the Tamil member is utilizing the time when Council is not sitting to frequently visit his different allotments of coconut land in Western Province and to put on a spurt to work them up.

A VERY INTERESTING PAPER has been published in the Burma official *Gazette* from the Deputy Commissioner of Bhamo. Mr. G. W. Shaw, on the Myauk Kudoung division of Momeik, a tract some 50 miles long and 30 broad, unknown until the other day when our troops were acting against Kau Hlaing, a noted outlaw of those parts, and his following of Kachins, Shans and others. Mr. Shaw describes the tract as a mass of hills some 7,000 feet above sea-level. The only flat ground consists of elevated valleys found here and there between the hills. Rice is cultivated and a little tea. The tea, however, is said to be bitter and of small value, fetching only one-fifth the price of Taungbaing tea of the same kind. The people say they are sufficiently occupied with growing rice for home consumption and have not time to look after improving their tea.—*Pioneer*, June 21st.

PATENT STONE IN PENANG.—A Penang paper says: "We understand that the floor of the General Hospital has been recently laid with Indian patent stone by a representative of the Indian Patent Stone Co., Ltd., of Calcutta. This new material, which is being largely used in India, is composed of iron slag mixed with a small quantity of cement, and is especially suitable for flooring purposes, having a smooth surface and being very hard and durable. Among its other advantages are its non-absorbent properties, which is so very desirable from a sanitary point of view."—*Indian Engineer*, July 5th.

THE HEIGHT OF AN OLIVE TREE is usually twenty feet, but it is sometimes as high as fifty feet and it reaches an almost fabulous age. One lately destroyed at Beaulieu had a recorded age of five centuries and it was thirty-six feet in circumference. The olive tree is exceedingly prolific under cultivation; the fruit yields about 70 per cent of its weight (exclusive of kernel) in oil. Italy is said to produce 33,000,000 and France 7,000,000 gallons of oil annually. The tree does not vegetate readily beyond 2,000 feet altitude or 45 degrees of latitude.—*South of India Observer*.

CEYLON TEA USED IN THE HOUSE OF COMMONS.—Mrs. Florsnee Fenwick-Miller, writing in the *Illustrated London News* of 28th June, says:—

An interesting little pamphlet on the culture and preparation of tea has just been issued by the United Kingdom Tea Company, of 21, Mincing-lane, who have recently received the appointment of Teamen to H. R. H. the Prince of Wales. Incidentally it is mentioned in the pamphlet that tea as supplied to the House of Commons refreshment-room, a mixture of Ceylon and Darjeeling, can be had for no more than two shillings the pound. What a change from the prices within the memory of most of us, and yet more from those of a century ago! It is hard to realise how our ancestors existed without that delightful beverage, which, as Mrs. Frank Leslie says, "the English woman regards as a panacea for all ills, from headache to heart-ache." Yet it is quite certain that when the same tea that we now get for two shillings was sixty shillings per pound, only millionaires could afford to have "a good cup" every afternoon.

JAPANESE LACQUER.—The wood used in Japan for lacquer work is a light coniferous one known as *hinoki*, and is prepared to receive the lacquer in various ways. For inferior work it is covered with paper, but in the finer qualities of lacquer work paper is not used. The wood is first carefully smoothed, all joints and imperfections are filled, as with putty, with the raw tough lacquer mixed with rice paste, which soon hardens so that it can scarcely be cut with a knife. The whole is then covered with a mixture of inferior lacquer and coarse yellow powder, and is left a few days in the open air to dry, after which it is placed in a moist-air closet to harden. A hard, gritty surface is thus obtained for the next coat. The next process is to cover the whole with two evenly spread coats of lacquer mixed with a fine ochre powder, so as to get an even, smooth-grained surface for the subsequent work. This is rubbed down with a stone and the parts which are not to receive any decoration, are ready for the finishing application of the lacquer. The other parts are covered with two coats of black lacquer the first, applied with a broad brush, dries, with a brilliant, reflecting surface; when this is quite hard the second coat is applied, and on this the designs are impressed. In Wakasa-ware there is no painting or drawing; the white decoration is applied by dropping egg-shell powder skilfully by hand here and there, and other designs are produced by pressing various forms of leaves on the soft surface. To get the surface completely smooth again is the next operation, and then a transparent lacquer, coloured yellow, is applied with the object of affording a yellow ground for the gold which is to follow. This is covered by successive coats of the same lacquer until a smooth surface is again obtained, beneath which are the gold and decorations.—*Indian Engineer*.

CULTIVATION OF EGYPTIAN COTTON.—The cultivation of Egyptian cotton is to be tried in the Ludhiana district in the Punjab. The Executive Engineer of the Division will superintend the experiment.—*Indian Engineer*.

A NEW BARK FOR CLEANSING WOOL, &c.—At a recent meeting of the Linnean Society Mr. T. Christy exhibited specimens of the bark of *Quillaja saponaria* from Chili. An extract of this bark has been used for some time for cleansing silk and wool, and in special preparations for cleaning gloves, &c. It is however, stated that it will solidify the hydrocarbon oils, even benzoline, and thus insure safe transport on a long voyage. The addition of a small quantity of citric acid renders them liquid again.—*Public Opinion*.

THE SUGAR TRADE OF MAURITIUS.—In his report on the Mauritius Blue Book for 1888, just issued, Sir J. Pope Hennessy remarks that Mauritius is, as far as he can judge, the most flourishing sugar-producing colony of the British Empire. The total value of the exports of the produce of the Colony in the year in question was R30,335,545, showing an increase of R6,000,000 against the previous year, and of the total sum R28,754,798 represented the value of the sugar exported, including R15,000,000 the values of the sugar sold in India, R7,000,000 in Australia, R2,000,000 in Cape Colony, R2,000,000 in the United Kingdom, and R1,000,000 in the United States. The relative greater prosperity of the sugar trade of Mauritius compared with that of the West Indian islands is partly owing to the Mauritius planters having the command of the Indian and Australian markets, which are too remote from the West Indies for competition by the planters there. The greater facility for obtaining cool labour from India is also probably an advantage. The most important economic difference between Mauritius and the West Indies, however, is the fact that nearly all the owners and managers of the sugar estates are natives of the island in the former case, absenteeism being much more characteristic of the West Indies. The great fall in the price of sugar in recent years has been met by the Mauritius planter, to some extent, by means of a prudent reduction of expenses and the adoption of improved processes so as to increase the yield of sugar from the cane.—*H. & C. Mail*.

MANILA TOBACCO.—The American Consul at Manila in the course of a recent report on tobacco cultivation in the Philippines, remarks that the abandonment of the Government monopoly in 1882 gave the trade a great stimulus by the investment of private capital in it and a more equitable system of dealing with the native cultivators. There has therefore been a marked increase in the production. Formerly each unmarried native was required to set out 4,000 plants a year, and each married man 8,000, the crop to be delivered to the officials at a standard price, which was just 50 per cent, below that now paid. The gross revenue received from the monopoly was about £300,000 per annum. At present there is a licence tax of about £20 a year for manufacturing tobacco. The principal company engaged in the trade now is the Compania General, which owns large tobacco estates, has a capital of about three millions sterling, employs 10,000 hands, and produces 80,000,000 cigars, 40,000,000 cigarettes, and 5,000,000 lb. of cut tobacco annually. It is a Spanish company; there are also two large German firms, six Spanish, and a number of Chinese. The best tobacco comes from the provinces of Cagayan and Isabela, in Luzon, the annual produce from these being 60,000 to 100,000 tons. The method of cultivating and curing differs but little from that followed in other tobacco-producing countries. All Manila tobacco is made into cigars and cigarettes, plug, fine cut, or pipe tobacco being unknown there. It is classified in six grades according to the size and quality of the leaves. The total area of land under tobacco is about 60,000 acres. Last year the total export of cigars was 112,074,000, of which 26,715,000 went to Spain and 17,871,000 to Great Britain and the British possessions. In 1887 the total export amounted to 121,350 tons, and in 1888 to 184,548 tons.—*London Times*.

CINCHONA BARK was exported from Java between 10th June and 12th July as follows:—

369,630 lb. for Holland.

21,821 lb. for London.

4,302 lb. for Marseilles.

398,654 lb. total.

THE INTRODUCING OF THE SUGARCANE INTO CEYLON is, in Dr. Lippmann's great work, credited to A.D. 600, or nearly thirteen centuries ago, the authority being "Ritter." The introduction of the sweet cane into those portions of India beyond the Ganges is fixed so early as 327 B.C., on the authority of Nearchos. To our surprise China (whence our native term *sini* or *chini*) has a later date assigned it, B.C. 250.

IMPORTANT DISCOVERY IN THE RUBBER TRADE.—A M. Morellet has made a discovery which is of considerable importance to those engaged in the rubber trade. He has found that when vulcanised indiarubber is dipped suddenly into boiling glycerine it acquires the character of non-vulcanised rubber—i.e., its parts can be readily united, and it dissolves in the common solvents of caoutchouc. The glycerine must be boiling at the moment of contact.—*European Mail*, June 13th.

FLOWERS AS AN ARTICLE OF FOOD.—The new *Kew Bulletin* contains a memorandum by Mr. Duthie, botanical director for northern India on the use of the flowers of the *Calligonum* for food in North-Western India. The use of flowers such as those of the lily in China as a condiment is not uncommon, but it is quite unusual to find them used as food. In the present case they are hardily the poorer classes only, and are either mixed with flour or are eaten separately with salt and condiments, to which a little ghee is added by those who are able to afford it. The flowers are swept up from the ground, and are kept for a night in a closed earthenware vessel, so as to fade. They may be kept for a long time. Usually they are eaten as a vegetable, but sometimes they are kneaded with thin alta and baked in cakes. An analysis of the flowers which has been made shows that their chief peculiarity from a dietetic point of view is their richness in nitrogenous compounds, and consequently their importance as an addition to foods which are poor in nitrogen. There is said to be a close resemblance in composition between pflug and the seeds of the edible amaranths and buckwheats, only sugar replaces starch.

PRESERVING FISHES.—When Professor A. C. Haddon visited Colombo in passing through from Torres Straits, he was much struck with the success of the Director of the Colombo Museum in preserving fishes in a way to display their natural colours. He considered the result would interest home scientific men and arranged for an exhibit where it would be certain to attract attention. Accordingly at the *Conversazione* of the Royal Society held on the 18th ult. under the presidency of Sir Geo. Stokes, in the descriptive Catalogue which only covers 40 exhibits, we find the following:—

"Exhibited by Prof. A. C. Haddon, M.A., on behalf of Mr. A. Italy, Director of the Colombo Museum:—

"Teleostean Fishes preserved in a mixture of gum and glycerine, as a means of displaying their natural colours.

"The fishes were bisected and eviscerated, and they are mounted, for exhibition purposes, in pure glycerine. Specimens thus treated have been observed to remain unchanged after two years' exposure to the light."

Since this exhibit was sent home, however, we believe Mr. Italy has been experimenting with a different preparation and with the prospect of even greater success than was considered so noteworthy by Professor Haddon.

CALIFORNIA is a rich honey country, and the fact is largely owing to the cultivation of the *Phacelia tanacetifolia*, a plant with a blue flower of which the bees are fond. Experiments on a practical scale have recently been made with it by a German bee-master, and the results are given in the *Bienen Freund*. Some six weeks after the seeds are sown the *Phacelia* blooms, and it is then rilled by the bees. But it also serves as fodder for cattle, either before it flowers, or in a dried condition afterwards. When used for green fodder it is necessary to reserve a portion for the bees, and the production of seed grain. The roots as well as the stems and leaves are devoured by cattle.

HOW TO DESTROY BUGS IN PLANTATIONS, &c.—By a curious coincidence, immediately after writing the concluding lines of the article which appeared in yesterday's issue, about soil and tillage generally, we came upon a paragraph in "Garden and Forest," an American periodical, describing a method of destroying the cockchafers, which are known in the United States as "May bugs." We quote as follows:—

It is well known that the larvæ of the May-bug or Dor-bug do an immense amount of damage by eating the young roots of grasses, Strawberry and other delicate rooted plants. In France, especially, their ravages have resulted in great losses, and energetic attempts to destroy them are made. The destruction of these beetles is a matter of such importance that a word, "Hancetonnage," has been coined to express the action of hunting them. It appears, according to the *Revue Horticole*, that during the year 1889 the Department of Seine-et-Marne paid no less than 113,000 francs in prizes for the destruction of the beetles, which were collected to the amount of more than 500,000 pounds. They are trapped by suspending lights over shallow vessels of water. The beetles fly against the glass covering of the lamps and drop into the water below, and are then collected and destroyed. The experiment has been tried in this country with success, and it is worth doing on a large scale wherever these insects abound. As the presence of the larvæ is not known until the damage which they inflict is completed, the only way to attack them is to trap the beetles. A little kerosene-oil poured on the water placed in the vessels into which they are intended to fall will deprive them of all chance of escape.

TREATMENT OF CATTLE.—We have to acknowledge the receipt of a pamphlet on the treatment of cattle in Sinhalese, by Mr. W. A. de Silva of the School of Agriculture. The work is dedicated to Sir E. Noel Walker as President of the Society for the Prevention of Cruelty to Animals; and the author says in his preface:—

In presenting this pamphlet to the public, the Author begs to state, that he has endeavoured, as will be seen to draw up short, simple and explanatory facts, on the improvement of the condition of the native cattle of this Island, which would recommend themselves, to the means and requirements of the village cattle owners. It is well known that the prosperity of a country where agriculture is the main industry of the inhabitants, depends to a great extent, on the number and nature of the cattle of that country; and it is a matter for regret and apprehension, that the native cattle of this Island are both degenerating and decreasing in number. * * * The individual efforts which are being made by such as those who have the welfare of the people at heart, to improve the condition of cattle, are only partially successful or sometimes totally fail, to their great disappointment, owing to the comparative ignorance on the subject of the villagers. I am far from claiming for my pamphlet the merit of effecting a radical reform, but I shall be satisfied, if my feeble attempt in the interest of my countrymen would at least tend to a more humane and considerate treatment in health and disease of the most useful animal in this country.

We hope that this pamphlet will be the means of effecting the improvements which its author desires.

THE ORIENTAL BANK ESTATES COMPANY, LIMITED.

Authorised Capital ... £566,700.

DIRECTORS.—Alex. William Crichton, Esq., Andrew John Macdonald, Esq., William Cotton Robde, Esq., Grant Heatly Tod-Heatly, Esq.

Report of the Board of Directors for Thursday, July 17th, 1890, at noon:—

The Directors have much pleasure in submitting to the Shareholders their report of proceedings during the fourth year of the working of the Company. The net profit as shown in the audited accounts annexed hereto amounts to £26,628 11s 6d (including £159 2s 4d brought forward) as against £25,803 16s 11d last year. An interim dividend of 3s 6d on the Preferred Shares and of 6d on the fully paid Ordinary Shares, and of a proportionate amount on the partly paid Ordinary Shares was paid in February last, and the Directors now recommend the payment of a similar further dividend making a total payment of 7 per cent per annum on the issued Preferred Shares, and of 5 per cent per annum on the Ordinary Shares, in proportion to the capital paid up thereon for the year ended 31st March, 1890. The further dividend now recommended as above, will, if assented to by the Meeting, be payable on the 1st August, 1890, at the Loudon Office of the Company's Bankers.

The estimated yield of Tea from the Company's Estates has been fully realised, but owing to the low ranges of prices ruling during the first three months of the year under review, purchase of leaf was restricted during that period. The average price obtained for all tea sold has been the same as in the previous year—viz., 11d. The expenditure on manning and otherwise improving the plantations has been continued, as results obtained from these works have proved most satisfactory. The supplying of vacancies has been carefully done, but during the past season it has not been deemed advisable to extend the area of land planted with tea. The increase of the yield of cocoa during the past year from the Company's Estates has been considerable. The crop has been harvested in good condition, and the prices realized have been such as to indicate its good quality and the care taken in its preparation. The Directors have sanctioned extensions of this cultivation in suitable localities on the estates, which additions, when they come into bearing, will materially increase the value of the properties. As the Directors anticipated last year, the price for cinchona bark has ruled throughout the year above that obtainable at the last meeting of the Company; but the supplies, although considerably smaller, have not yet sufficiently diminished to impart a sound tone to the market. The crop of coffee has been larger than last year and good prices have been obtained for the same.

In Mauritius a satisfactory crop of sugar has generally been secured on the estates in which the Company is interested, and, notwithstanding the decline in the value of this product in the European markets, good prices were obtained by the Company for its sugars. The cost of labour and supplies for coolies has been somewhat higher during the past year than previously experienced, but it is expected that the increased cost, if it should continue, will be met by the results to be obtained from the improvements in cultivation and in the manufacture of sugar.

Shareholders will be interested to learn that five prizes were awarded at the Dunedin, New Zealand, Exhibition for sugars made on estates under the management of the Company.

BALANCE SHEET TO 31st March 1890.

Dr.	LIABILITIES	£	s	d

COCONUTS AND CINNAMON.

VEYANGODA, June 18th.—The effects of the season are rather serious on cinnamon crops, as harvesting has ceased. The harvests are during the two monsoons, or to be more accurate during the continuance of the monsoon rains, for it is only then that there is a free flow of sap between the bark and wood. No rain, no crops is the almost universal cry this season.

The prospects of coconuts are very much brighter. This is the season for big crops, and big prices are netted for them. The demand for coconuts is very brisk, as there is much competition between the local and Colombo Dedicating Mills. That this may continue is the earnest wish of coconut growers. The consumption at the local Mills, judging by the strings of carts that wend their way thitherwards, cannot be far short of 200,000 nuts per month. If report speaks true the Colombo concern consumes an equal quantity, though I am inclined to think it consumes more, judging by the fact that its agents come so far afield as Veyangoda to buy nuts, while they have the run of the districts clustering round Colombo to draw supplies from. It cannot be that the nuts on that side are converted into copra, for the price offered for the nuts precludes such a possibility. I have heard that one of the coconut contractors of the Colombo Firm intends going far into the famous coconut district of the Maha Oya Valley for nuts. Hurrhah! may the demand for nuts grow. The Oil Mills in Colombo I suppose will continue to draw their supplies of copra mainly, as hitherto, from Negombo and the Districts North of it and by water, while the bulk of the trees South of Colombo will be devoted to toddy drawing.—Local "Examiner."

PAPER is made in France from hop vines; and it is claimed that the fibre secured is the best substitute for rags yet obtained, as it possesses great length, strength, flexibility and delicacy.—American Grocer, June 18th.

EARLY PLANTING DAYS IN UVA.

The following was written by a Badulla correspondent some seven years ago, the MS. getting mislaid. We have put some notes correcting what is out of date as far as possible:—

The first estate opened in Badulla district was Ridipane* by Major Rogers, and it still goes by the name of "Major Totum." It is on the old Batticaloa road and only a couple of miles away from town. It afterwards passed into the hands of George Boyd Tytler, the brother of our good friend the late R. B. T. He died in Badulla, and his remains awaited his brother's arrival from Kandy nearly three days before they were buried. He came up by the Lower Badulla Road. There was only one European beside the brother of the deceased at the funeral, Mr. Mercer, the Assistant Government Agent. This estate is now the property of the big native firm of Annamalay Chetty who own several other estates in the district. Maryland and Ooduwere were opened by Mr. Galland the Swiss doctoor,† who was induced to it, by the success of Major Rogers in coffee planting. The former is now called Kottagodde; much of it is abandoned. These were afterwards taken up by Mr. Anthony Bertlin, who is still hale and hearty in the old country. Ooduwere keeps up to the front. It is admirably situated, having the facility of transport, as the Ratnapura-Batticaloa road passes through it. Wewesse and Debedde were opened by Dr. Sortain. These estates at one time seemed to have been neglected, but coming under the able management of Mr. George Morice, the "Patriarch of Uva," they became very valuable, and some years ago fetched a large sum. They have come back again to the Parsees and Mr. Morice. With Spring Valley the name of Sir William Reid is connected, and afterwards with Mr. Bannatyne who would not proceed further than Nuwara Eliya, when he came to see his property, thereby very nearly causing a split between himself and his very independent manager, the late Mr. Thos. Wood, Of Nahavilla and Gourakelle, much need not be said: the name

* The following are the present proprietors of the estates mentioned by our correspondent, as given in the "Ceylon Handbook and Directory, 1890-91."—

Redipane	...Anamalay Chetty
Ooduwere	...F. R. Sabonadière & Heirs A. Bertlin
Wewesse } Debedde }	...Mrs. Cowasjee Eduljee

Koskelle	...Haputale Coffee Company, Ltd.
Haputale } Sherwood }	...Haputale Coffee Company, Ltd.
Gongaltenne } (now Serendib) }	P. F. Hadow.—Ed. L. R.

† Staff Assistant Surgeon Galland was not a Swiss, but a Maltese, who, when Sir Walter Scott visited Malta, in his last and vain pursuit of health, acted as interpreter between the great writer and some Arab chiefs. Our authority was Dr. Galland himself, who was in medical charge of the detachment of Ceylon Rifles stationed at Badulla, when, in December 1840, the senior editor of the *Observer* first visited Uva, examining forest and outlining boundaries until May 1841. Capt. Rogers, the great elephant hunter, was Commandant, with Lieut. Hodges as second in command. Dr. Galland's brother-in-law, Mr. Bertlin, was on charge of the estates.—Ed. T. A.

of your senior is associated with the former, and the names of Mr. William Walker Shand and Mr. John Reid Shand are also connected with them. The waterfall on Nahavilla is still there. Gonakelle, or rather Pallagolla, was opened by Geo. Bogue, a brother of John Morris Bogue, a partner of the late firm of Brodie, Bogue & Co. The names of Bertlin, Byers, Linton, Morice, Wood, Irvine, and Knowles come up later on when Glenalpin, the remainder of Spring Valley, Ballagalle, Grahamland, Kenakelle, Narangalle, Hindegalle, Unagalle, Koskelle, Gongaltenne and others were opened. There is rather a rich story told of Major Rogers. He urged on Government that a road should be cut from Ratnapura by way of Haputale to connect with Badulla, but the Government declined on the plea that the Major would be the principal beneficiary as he had two estates on the Pass, viz., Haputale and Sherwood. It was reserved to Sir Hercules Robinson to make this line on to Batticaloa, thus connecting the west with the east. The produce of Badulla in some instances was conveyed to Hambantota to be shipped to Colombo.*

In the account of the building of the Badulla church, it was Rambukpotta Disava who brought out the idea of a Christian place of worship in memory of the late Major Rogers. He and his fellow chiefs—all Buddhists—the Ratemabhatmayas of Udukanda, Bintenna, Wiyaluwa, Kandapolla, Kandukare, and Wellassa contributed each a month's salary towards the object, and the minor headmen also according to their means. The Disava, besides his subscription, gave nearly all the timber for the building. Pakeer Tamby constable, as the head of the Muhammadans, got large subscriptions from that community, and the chetties also followed suit liberally. The foundation stone was laid in 1846, and in the bottle was put in a coin of the date of 1750 by the late Mr. Solomons. The various officials who were connected with the building of the church were Messrs. Mercer, Braybrooke and Bailey. The first churchwarden elected was Mr. G. H. Orloff. It was distinctly understood that the church was to be open to all Protestant denominations, but how it went over to the Episcopal Church this deponent sayeth not, and it was convenient that no questions should be put. The contributions to the church being principally heathen, it is rather rough on them to be told that "thus far shalt thou go, and no further" into the church, if they intended to pay their last respects to the dead.†

INDIAN TEA COMPANIES: THEIR PRODUCTION AND EARNINGS.

Messrs. Barry & Co. have compiled a "Summary of Audited Accounts of Joint Stock Tea Companies registered in Calcutta: Seasons 1885 to 1889." A note explains that

Expenditure includes cost to grow and fetch to market, account sale charges, interest on the season's outlay when incurred, depreciation on machinery and buildings when charged. But commissions on profits, income-tax, and interest on debenture capital are excluded. Income is given gross, i.e., the auction-room price. Debenture Capital is not included in the Capital column.

The Assam Companies rose from 18 in 1885 to 23 in 1889, and the paid-up capital from Rs. 5,668,000 to Rs. 10,248,000. The crops began at 2,740,000 lb. and rose to 6,406,000. The realized gross average per lb. went down from annas 10.9 to 9.2. The cost per lb. also diminished from 8.7 to 7.10. The profit per lb. went down from 2.2 to 1.3.

* The late Mr. Alex. Brown took an active part in this operation.—Ed. T. A.

† Allusion is made to a rule that non-Christians were not to enter the church.—Ed. T. A.

The Cachar and Sylhet companies began with 23 and ended with 19, and the profits per lb. went down from 2 annas to 0-7.

In Darjeeling and the Dooars 37 Companies rose to 40 and went down to 31. The profit per lb. began with 3-1 and went down to 1-9. In Darjeeling alone 31 Companies in 1889 realized annas 1-4 per lb. profit; 9 Companies in the Dooars having the same experience.—In the above we have left out fractions which, however, we give with reference to the total results. These show that the average profit per lb. of 78 Companies in 1885 was annas 2-5-75 which, for 82 Companies went down to 1-1-80 in 1889. Our readers will more readily appreciate the figures for dividends: the average in 1885 was 5-21 per cent, going down to 4-18 in 1889.

With all the improvements introduced, therefore, and all the economies practised, profits have diminished with enhanced production and lowered prices, until returns are not equivalent to the interest which money in India ought to command. The acreage cultivated by the Companies included, had risen in the five years from 42,700 to 53,500 and the crops had increased from 12,154,000 lb. to 17,512,000.

The results are not very encouraging, but the capital expenditure had in many cases been heavy. Our Ceylon Companies seem immensely more prosperous. May that prosperity continue and may it be shared by individual planters.

PUBLIC COMPANIES.

LIBERIAN GOVERNMENT CONCESSIONS AND EXPLORATION.

Mr. A. C. Ponsonby, chairman of the board of directors, presided yesterday afternoon at a meeting of this Company, which was held at the Cannon-street Hotel. The Chairman said that the Company had 350 shareholders on their list, and he hoped, whether the stock went up or down, they would not dispose of their shares, because he believed there was good business to be done. He believed the East Coast of Africa was more healthy than the West Coast, but the latter was more wealthy, and many people were willing to go and work for the company. Some gentlemen who held Liberian bonds of 1871 had approached them with the object of purchasing their indiarubber concession: and an Indiarubber Estates' Company had been successfully put before the public, the Liberian Company having some part of the payment in shares and a considerable portion in money. They hoped to make arrangements with Sir John Pender, by means of which they would obtain direct telegraphic communication between Liberia and England, and this would greatly tend to facilitate an interchange of commerce. Apart from the indiarubber there was every reason to believe that the territory would yield large quantities of cotton available for the English markets. Some alterations in the articles of association were adopted on the motion of the chairman, seconded by Mr. Johnson.—*Daily Chronicle*, July 11th.

THE TEA LEAF.

There is in my mercantile nature nothing so entirely and absorbingly interesting as a tea leaf, and I trust I may be forgiven for considering this alien subject worthy of a few lines of sentiment. I must confess to begin with, that to do this subject the justice it merits would require the fine poetic genius of a Shakspeare and the delicate word-painting of a Howells, and being only an ordinary everyday grocer intent on seeing that the multitude is supplied with pure and unadulterated goods (and plenty of them) I trust my stumbling lines will not ruffle the feathers of the literary jays too much. In the words of the aged, but repentant sinner, "Them's my sentiments, anyhow."

"The poets sing of beauteous flowers
In sweet and touching rhymes,
They sing of Love and lovers' bowers;
Of wars and peaceful times.
They sing of Nature's princely gift,
Of Sorrow, Grief, and Pain,
They sing of vales and mountain rifts
Of Power and Wealth and Gain
They chant their songs and hymn the praise
Of Ocean, Earth and Sky,
Of Lethe's stream and Pluto's realm
And of Parnassus high.
And yet their Muse, the partial jade!
Withholds her smile from thee,
And leaves to me of plebeian trade
To chant the praise of Tea.
And though my lame and limping lines
Be void of finished Art,
They still, though rough-hewn, bear the signs
Of all that's in my heart.
Thou meek, mild herb, man's humble friend,
Thou fragrant, soothing flower
That cheer'st the world from end to end
And comfort bring'st each hour,
From China's fields and India's hills
And Ceylon's humid shores
Thou com'st to ease our earthly ills
And ope Contentment's doors.
Of Heaven's many gifts to man,
And myriads though they be,
There's none so all divinely great
As thou, oh wondrous Tea.
Thy little, twisted curly leaves,
Thy fragrant, balmy breath,
Thy soothing, cheering, gladd'ning touch
Robs half the fear of Death.
The prince, the pauper, rich and poor,
The great, the strong, the weak,
The learned men of mighty minds
Thy cheering cup must seek.
The soldier worn with warring cares,
The sailor on the deep,
The humble delver, with thy aid
Obtain refreshing sleep.
The patient watcher by the side
Of fever's fitful bed
Would surely find her task too great
But for thy blessed aid
The weary seamstress, evening come,
Her humble home regains,
And in thy strengthening fluid finds
Great solace for her pains.
The ladies, Fashion's fluttering birds,
Dear gossip-loving dames!
How round thy post-meridian board
They sip—and ruin names,
Oh! wondrous leaf, oh, beauteous flower!
Thy virtues are untold—
From immemorial time, each hour,
New joys thou does unfold.

Accept these humble lines from me—
And know I love and worship thee
Oh, Tea!!

WILLIAM HENRY SEYLER, in *Canadian Grocer*.

THE TEA TRADE OF FOOCHOW.

A LAMENTATION.

The following 'communicated' article appears in the *Foochow Echo*:-

It is with an ever-deepening regret that we watch the decay of the principal trade of this port—Tea.

There is no blinking the fact that each season sees a smaller business in our staple, and that even with the lessened receipts of the leaf, there is annually more trouble and difficulty in the purchase of it at this side, and shall we say—loss in its sale at the other. The reasons for this gradual falling off of what should be one of the best, most remunerative, and cleanest of trades, are not far to seek. They have been again and again brought to the notice of those most concerned in the business, they have been made as public as print can make them, and with what result?—absolutely none. Is the case then hopeless? We answer, unhesitatingly, Yes, whilst present conditions last. Let us first look to the quality of the article now exported. It compares most unfavourably with what we were accustomed to see, say 15 to 20 years ago. The 'make' is not so good, more brown and with red leaves are left in the bulk, less trouble is expended over the twisting, and more dust is found. The firing, formerly performed with great care, is now hurriedly done, and to please

the 'rose' of buyers, is frequently left little more than half done. The result in the 'cup' can be easily guessed.

We are told by the native Tea Hongs that it is now impossible to perform the various manipulations through which the article has to pass before it reaches the foreign buyer, at the same cost as in years gone by; that, as we find it in civilised Europe, so it is in this country, the cost of living and of work has increased much in the last two decades, and with the usual shrug of the shoulders we are informed as a final argument, 'no can help.' Another cause of the falling off in quality is, from the native view, the uncertainty of the foreign demand, and strange as it may seem, the introduction into the Tea districts of the telegraph. Before the wire reached the garden districts, the native buyer knew his instructions, and bought such leaf as he approved of, conveying it to his central factory, where it was speedily turned into the 'fragrant herb'—now—what is the case! He goes up with instructions, it is true, but the 'telechit' controls them. No seller has the command his purchases, than the result of previous seasons' shipments to London, or elsewhere having been received by the foreigner, with anything but satisfaction, (or some other cause for alarm) is at once either directly conveyed to the 'Hong,' or filtered through our own native staff to it, and—a little message flies up country, 'wait while,' or the equivalent of such words. The recipient of the message obeys—his purchases up to the time of its receipt are too small to make a chop—whilst he is waiting for permission to buy further, what becomes of the leaf so bought?

So far as we can learn, it is half rolled and half-fired, and laid aside for a few days, until the first alarm having subsided, the requisite permission is accorded, further leaf bought, and a 'chop' is made. We readily concede that we may be some-what in error over the 'modus operandi,' but some such process occurs and is partly responsible for the falling off in quality. Of course the utter neglect of the plantations is one of the primary causes of this falling off, the excuse for such neglect, in the mouth of the grower, is the small price received by him for his leaf, which makes the growth of the succulent sweet potatoe quite a remunerative, and less precarious. Or the causes affecting the cost of laying down Tea from the country at this port, it is unnecessary to speak at length;—to the tale or 'lekin' and subsidiary squeezes, often told the Chinese Authorities are deaf as adders, and their deafness and blindness are increased by the utter, or might we say, intentional stupidity of their foreign adviser. When one so highly placed refuses to see any possible amelioration of these causes, and consoles himself, and the Native Authorities with a shrug of the shoulder, and the consoling remark, that if the duty receivable on Tea 'is' falling off, that on silk &c. is increasing, what hope is left? As to any such suggestions that the 'L-ki,' being a war tax, should long ago have been withdrawn, and that the export duty is now ridiculously in excess of the percentage intended at the time of its imposition, our own high officials are much too suave, and much too tender of the friendly relations of the two Empires to hunt at any such disagreeable items.

Again, why so much dust and broken leaf should be found in every package of Tea brought to this port we fail to understand. We believe we are right in saying that the percentage found in Teas at Hankow and Kukiang is smaller than at this port, whilst to compare either with that found in Teas from Ceylon is interesting, and—instructive. To praise Ceylon Teas, and to laud their cleanly manufacture, and the cheapness with which they are made, and to instance their fast increasing consumption not only in Europe but in our stronghold, Australia, is nothing to the point and only calls up envious feelings, may even sometimes make us cast a malevolent glance at the 'figures' relating to the increased export from the 'spicy isle,' which are so persistently set before us in the *Echo*; and indeed we have an idea that the worthy purveyor of those figures may occasionally cast a wary look around him when returning from some festive board to his lair, lest perchance the 'bitter cup' may some day overflow and he—the most approximate cause, be—but we forbear.

Bitter it is to see—certain it is to predict the continued decay of our trade and our living, unless—what? Unless a miracle happens, the floodgates of Chinese restriction removed, foreigners permitted to own, or at least to superintend Tea gardens, and generally, this portion of the globe of most interest to us, to make a complete somersault. Is it at all likely in our time?—*China Mail*.

PLANTING IN NETHERLANDS INDIA.

(From the *Straits Times*, July 9th.)

The sugar cane disease in Java still defies the experts, who find all the suggested remedies break down. The importation of plant cane from abroad has proved utterly unavailing to stay the evil. The nature and causes of the disease baffle inquiry, and appearances point to no more satisfactory result in the near future. The *Surabaya Courant* gives particulars of the sugar yield in Java of late years, which shows that the outturn in 1887—375,000 tons—has not been exceeded since. This year's crop is likely to fall four per cent short of those figures.

In the Java ports, the supply of estate managers, assistants, and overseers largely outruns the demand, and applicants swarm when chances of employment as such even in other lands offer themselves. British North Borneo, especially, has proved so attractive that it draws a steady flow of the unemployed. For instance, by last advices, several Europeans had started from Java for that country to fill situations on coffee and sugar estates.

The island of Engano, near the southern end of Sumatra, has been applied for from Government by a Mr. Van Gogh on lease. Recent legislation has simplified applications for concessions of whole islands by dispensing with the need for preliminary survey.

CEYLON BOTANIC GARDENS.*

By PROFESSOR HARVEY OF TRINITY COLLEGE, DUBLIN.

*Royal Botanic Gardens,
Peradenia, Ceylon, October, 10th, 1854.*

I propose sending you a short account of the present state of the Ceylon Botanic Gardens, now under the able management of G. H. K. Thwaites, Esq. The gardens are situated at Peradenia, four miles from Kandy, on the high road to Colombo, and at an elevation of about 1600 feet above the sea. They cover an undulating surface of 140 acres, a considerable portion of which is occupied by an arboretum, into which, from time to time, the native forest-trees are introduced, and where eventually will be brought together most of the arborescent plants of the island, and such valuable forest trees as will stand the climate. The river Mahawelle Ganga flows round three sides of the garden. The opposite banks are steep, gradually rising into wooded hills of various heights; some reclaimed and planted with coffee, others still covered with the jungle.

The approach to the garden, from the Kandy road, is through an avenue of tall India-rubber trees (*Ficus Elastica*), hung with various creepers, such as *Bignonia*s and *Ipomoea*s, and nearly opposite the entrance gate, a remarkably fine specimen of *Bauhinia scandens* (jungle rope) throws its strangely compressed and twisted rope-like stems from branch to branch, and stretches fairly across the road. Immediately within the gate the broad gravelled road divides round a circular bed of palms, such as at some future day the new Crystal Palace may exhibit, but which, for luxuriance, is as yet unrepresented in England. The group comprises the tiliptot (*Corypha umbraculifera*), *Livistona chinensis*, *Carota urens*, dense clumps of *C. horrida*, *Borassus flabelliformis*, *Arca catechu*, *Seaforthia Dicksonii*.

* From the "Literary Gazette and Journal of Science and Art" of 26th November 1853.

Cocos nucifera, *Oreodoxa oleracea*, *Phoenix dactylifera*, and *Ph. farinifera*, a fine unnamed Malayan palm, two species of *Calamus*, and very large specimens of *Cycas circinalis*. Some of these are twenty, some forty, some sixty feet high; some have fan-shaped, some pinnate, and some much divided fronds; and being brought together into a definite clump of gigantic foliage, forcibly arrest the stranger's attention, particularly when his glance also falls on the beds at either side, where large *Scitamineæ* and *Yuccæ* are overtopped by two huge traveller's trees (*Ravenala speciosa*) with palm-like trunks at least 35 feet to the base of the leaves and fully 50 feet to the extreme top. The specimens of this noble plant in English stoves, where the caudex is either not at all, or scarcely formed, give no adequate idea of the port of a full grown plant, with its fan of 40 or 50 distichous leaves, each leaf 12 to 15 feet long, mounted on a column 30 to 40 feet high, as formally as if the whole had been cast in bronze. I can think of no better comparison for this grotesque, and yet noble object, than the great fans of peacock's feathers which are borne on each side of the Pope on festival days. The leaves, like those of the banana, are usually torn to ribbons, which makes them look still more like feathers as they wave to and fro in the wind.

On passing the group of palms you enter a straight road, running through the garden to another palm-circle recently planted at the farther end. This road has wide side-borders well furnished in front with flowers and small flowering shrubs, and in the rear with larger shrubs and trees, among which, here and there, are scattered palms and *Pandani*, the latter conspicuous for their snake-like stems and branches, terminal screw-like tufts of sword-shaped leaves, and abundant ropes and cables. These borders are at all times gay with bright-leaved plants and flowers. Among the former, *Dracæna ferrea* and *Poinsettia pulcherrima* supply the brilliant pinks and crimson, and a variegated form of the mop shaped *Croton longifolium*, the bright yellows. The flowering shrubs and trees are much too numerous to mention; a few, now in flower, must suffice. Many fine species of *Cassia*, particularly one, recently imported from Trinidad, every branch of which bears a panicle of bright golden flowers at least 15 inches in diameter, and *C. alata*, with its large fern-like foliage, dense, erect racemes, and orange bracts; *Allamanda cathartica* and *A. Schottii*, ever displaying a profusion of golden bells; *Ixora coccinea* and *I. rosea* *Hibiscus rosa-sinensis*, *Plumbago*, several *Clerodendrons*, *Bauhinias*, *Gardenia florida*, *Crossandra*, *Eranthemum*, and other *Acanthaceæ*; *Bignonia stans* and *Tecoma capensis*, several *Ardisiæ*, more remarkable for handsome foliage and fruit than for showy flowers; these, and many others, with abundance of roses and small flowers, keep the borders perpetually sweet and gay, *Lagerstroemia Regina*, here a tree, bearing superb panicles of purple flowers has just shed its leafy honours; *Barringtonia racemosa* still displays a few of its pendent crimson tassels, *Dilleniæ* and *Wormiæ* 20 to 30 feet high, with dark plaited leaves and white flowers; *Astonias*, *Poinciana pulcherrima* and *P. regia*, the umbrageous *Solanum macranthum*; *Jouesia Asoca*, laden with rich bunches of orange flowers; *Humboldtia laurifolia*, *Culosanthes indica*, now hung with great sword shaped pods, &c. are among the larger border shrubs and small trees. *Beaumontia grandiflora* climbs the tallest trees, flowering among the upper branches; and *C. apparis Mooni*, a fine Ceylon creeper, almost covers one large tree with its glossy leaves and white flowers. Two fine trees of *Phyllanthus Madagascariensis*, planted at a crossing, diffuse the

smell (rather than the fragrance) of boiled potatoes, while well grown cinnamon and camphor trees, not far distant, remind you that you are in the land of sweet spices and gums.

There is no Banyan tree in the garden; but there are several fine examples of the larger species of *Ficus*, particularly of the epiphytic fig trees which abound in the lower jungles of the Island. These species, though not necessarily epiphytic, often vegetate either at the base or in the crevices or hollows of old or half decayed trees; and in either case, the fig, growing rapidly, adheres to the supporting tree, at first modestly, like an ivy, but at length completely encloses the trunk and larger branches in a thick wooden coffin. The attacked tree, now hidden under a dense conglomeration of adnate branches and adnate aerial roots, which compose the false trunk of the fig, languishes, while the fig grows proportionably luxuriant, and at length far exceeds in size the tree, to which, as an humble parasite, it had at first affixed itself.*

But perhaps the most remarkable isolated figs in the garden are two fine India-rubber trees (*Ficus elastica*) at least 80 feet high, planted apart, one on each side of one of the walks. The girth of the largest is nearly 30 feet at the base, but it soon divides into three trunks, each 10 feet round. Its most remarkable feature, however, is not the height or girth of the stem, but the grand display of exposed roots which radiate from its base, stretching, like the spokes of a wheel, ten or twelve yards in every direction. Where they issue from the base of the trunk they form vertical plates, from 2 to 3 feet high, and from 3 to 5 inches in thickness, but they gradually diminish in height to the extremities. They are connected, here and there, by cross plates, which anastomose in a tolerably regular manner; and the whole display of roots reminds you (comparing great things with small) of the under surface of the leaf of the *Victoria regia*, if you take the trunk of the tree for the leafstalk, and the radiating and anastomosing roots for the ribs and veins.

Among the ornamental or remarkable trees the various species of *Artocarpus* deserve particular notice. *A. incisa* (bread-fruit) is sufficiently known in England by the fine specimen at Kew, which imagination may easily carry into a tree 40 to 50 feet high. *A. integrifolia* (the jack,) a tall-forest tree, 60 to 80 feet high, with excellent wood resembling coarse mahogany, dark polished oval leaves, dense well-covered branches, and large fruits hanging on short shoots, from the trunk or principal limbs; and *A. pubescens* (wild bread-fruit,) with plaited leaves of large size, are very handsome. A native species of *Antiaris* (or upas) from whose tough inner bark excellent sacks are made, has recently been introduced into the garden. Other ornamental trees are—*Schleichera trijuga* (Ceylon oak,) which at a little distance strikingly resembles *Quercus ilex*; *Carallia ceylanica*, *Careya arborea*, *Kleinhowia ceylanica*, *Michelia champaca*, &c.; but none exceed in beauty the fern-leaved *Nephelium* and the *Rhus decipiens*.

In a country where few trees are deciduous, a sameness of tint in the forest is to be expected; and to a considerable extent this is the case in Ceylon, if we confine ourselves to the fully formed leaves. But though distinct seasons, affecting all nature at once and strongly, are here wanting, the change of leaf often exhibits colours as bright as those which tinge the autumnal woods of America

* Professor Harvey forgot to add that the parasite, grimly named in Ceylon "the Colombo Acent," ultimately exhausts the life out of the supporting tree. —ED. T. A.

with broad washes of crimson and yellow. Here, however, it is not the old, but the young leaves which are highly coloured; and as the older leaves are still freshly green on the body of the tree, the ends of the branches clad in clear tints of white, pale yellow, pink, crimson, or purple, appear to support clusters of showy flowers. If all trees changed their leaves at the same season, these tints would be as famous as these of America. The most beautiful are exhibited by *Mesua ferrea* (bright crimson), the *Fugentia* (crimson), *Nephelium Mora* (deep red), the *Semecarpus* (bluish purple), the *Lauri* (rich sienna brown) *Symplocos* (rich brown), *Garcinia* (fulvous), *Ingabigemina* (very pale), a *Mesua* (whitish), *Aleurites Moluccana* (white), &c., &c.

The commonest of the indigenous palms in this neighbourhood are the kittool (*Caryota urens*) and the *Areca catechu*. Both grow almost as weeds in the garden, and nothing can be more dissimilar than their aspect,—the one bold and massive, the other all grace and beauty. The *Caryota* must not be judged by the attenuated specimens seen in English palm-houses. Here its decomposed fronds are peculiarly dense and heavy, forming an oblong, compact head of drooping, sad-coloured plumes, like gigantic hearse-plumes. Its trunk is from 40 to 60 feet high, thick and columnar, strongly contrasting with the slender *Areca* by its side, which nevertheless rears its glossy plumes to quite as great a height. The largest talipot (*Corypha umbraculifera*) in the garden has a trunk upwards of 60 feet high to the base of the leaves, and measures 12 feet at the butt, and 9 or 10 at five feet from the ground. It looks exactly like a column of solid masonry supporting a leafy crown.

Several fine clumps of bamboos, like tufts of ostrich feathers, 40 to 50 feet high, exhibit the family of grasses in their grandest form. The close-shaven lawns of England must not be looked for, but the grassy slopes of the arboretum, intersected by broad gravelled walks and ornamented with scattered trees, may well be compared to English park scenery. The grounds themselves are naturally of beautiful shape, and have been well laid out. Particularly to be admired is a new road, recently opened along the river banks, from one point of which is caught a charming view of the Peradenia Bridge, spanning the Mahawelle Ganga with a light open-work arch of *satinwood*, the garden affording a foreground, with wooded hills for a middle distance, and the eye ranging, beyond the bridge, far away into the open country.

But it is high time to speak of the more important departments of the garden—namely the nursery, the spice-ground, the orchard, and the experimental garden.

In the *nursery* a stock is kept up of all useful and ornamental plants suitable for distribution in the colony; and young plants and seeds are sold, at very moderate prices, to the colonists, the proceeds being paid regularly into the public chest. Flowers and flowering shrubs are in much request, both by natives and planters, and the introduction of a handsome novelty of this description attracts many purchasers. Annual plants of the warmer parts of the temperate zone generally succeed well, but shrubby kinds are apt to form leafy branches only. Sweetbriar grows long and lanky like a dog-rose, and rarely blossoms: *Fuschias*, unless care be taken to destroy the lateral leaf buds, do not blossom; but the apple-tree is perhaps the greatest caricature, existing merely as a root stock, which throws up tufts of slender twigs like those of a raspberry-bush, like which it is propagated by division of the roots. Of course it never flowers.*

* Half-a-dozen really nice apples were recently gathered from a tree on Abbotsford, at 4,700 feet altitude.—ED, T. A.

The *spice-ground*, about a quarter of an acre in surface, is planted with nutmegs, cloves, all-spice, cardamoms, and pepper, all of which succeed well. At present the nutmeg-trees are laden with fine ripening fruit, and are also fragrant with a profusion of flowers.

Six or eight acres are set apart as an *orchard*, and a considerable number of fruits grown with more or less success. Among these are the mango; the hog plum (*Spondias dulcis*); the rambootan (*Nephelium longan*); the litchi (*Nephelium litchi*); the durian; the bilimbi; limes, citrons, oranges, shaddocks, lemons, and wampi (*Cookia punctata*); the star-apple; the sour-sop, custard-apple, and bullock's-heart; the rose-apple, jambos, guava, and pomegranate; the loquat; the numnum (*Cynometra cauliflora*); avocado pear; bread-fruit and jack; mulberry; granadilla and papaw; pine apples; bananas of many kinds; lovi lovi (*Flacourtia inermis*), which makes a good preserve, Ceylon almond (*Terminalia catappa*), and *Canarium commune*, &c. Melons have been frequently tried; but though the plant grows freely, and the fruit swells well, the latter rarely comes to perfection. Pumpkins succeed much better.

In the *experimental garden* new objects of colonial culture and new varieties of fruits are raised and propagated for future dispersion. The tea shrub (*T. Bohca*) succeeds well, and might be grown to any extent at 1000 feet higher, if sufficient labour could be cheaply had. The chocolate (*Theobroma cacao*) bears abundantly, but almost every fruit, as it ripens, is destroyed by squirrels, which are extremely numerous. The Shiraz tobacco, a recent introduction, through the garden, to the colony, has been grown with much success, and bids fair soon to supplant the bad varieties in cultivation. Cotton has been long, and is still, under experiment here and in other parts of the island; but it does not flourish, apparently owing to an insect which attacks the ripening pod, destroying the seed, and greatly damaging the wool. The Manilla hemp (*Musa textilis*) grows well, and may eventually become an important item in colonial export. Arrow-root and tapioca, judging from the specimens grown in the garden, might be raised to any desired extent and of the best quality. Mr. Thwaites has recently introduced, and is carefully cultivating, the best West India ginger, that commonly grown in Ceylon being of very inferior quality. There have also been procured from Mauritius, and recently from Kew, the best varieties of pine apples, and great improvement in this fruit may consequently be anticipated.

So far for the Peradenia garden out of doors. But this notice would be very imperfect were I to omit to mention what is doing by Mr. Thwaites in his study, and, under his superintendence, at his office and in his house. Here a herbarium of Ceylon plants commenced by his predecessors, but arranged and greatly enlarged by himself, now contains about 3000 species; and novelties still come in, and must be expected, till the southern provinces of the island in particular have been fully explored. Two native draftsmen, in Government pay, are constantly employed in making coloured drawings of all the plants, as they flower in the garden, or are brought in from the jungle.

Their work is confined to representing the plant of the size of nature; for all the magnified portions are drawn, and all the dissections made by Mr. Thwaites himself, who devotes the best hours of almost every day to this most necessary, but laborious task. Many hundreds of carefully prepared and accurate drawings show what has been done in less than four years, and are a promise

of still greater things to come. Should they be published (as is much to be desired) they will not only form an enduring monument to the author's fame, and also to that of the Peradenia Garden where they have been prepared, but they will be a most valuable contribution to botanical science.

Their great value, above most other similar botanical plates will consist in this, that the floral analysis has been in all cases made either from the living plant, or from specimens preserved in spirit, by the author himself, and not by his draftsmen. The errors incident to making dissections of dried specimens are hence avoided.

W. H. H.

BARK AND DRUG REPORT.

(From the *Chemist and Druggist*.)

LONDON, July 10th.

ANNATTO.—Fifty-two bags Ceylon seeds sold at very low prices indeed; bright at 3s, dull to ordinary low at from 1d to ½d per lb.

BARK FRUIT.—A parcel of 94 packages partly mouldy and shelly fragments was shown today, and bought in at the nominal price of 2d per lb. There is very little chance that that price can be realised.

COCA LEAVES.—No South American leaves were offered today, but there were two parcels from the Kelvin estate in Ceylon, together 78½ lb. The quality was excellent, and the leaves (of the dark-green Huancoco variety) were beautifully cured, and of fine taste and flavour. One-half found buyers at the comparatively cheap rate of 1s 2d per lb.

ESSENTIAL OILS.—There is very little alteration in any of the essential oil quotations this week. Several lots of Citronella oil in bottles, tins, and tanks (the latter holding about 9 cwt. each), mostly mixed with petroleum were offered today, bought in at nominal prices.

QUININE.—Lower: early in the week a sale of 15,000 oz. second hand Brunswick bulk at 1s per oz. was reported. Today there do not seem any further sellers at that price though we think there would be buyers at the figure named.

THE AMSTERDAM CINCHONA AUCTIONS.

Amsterdam, July 10th.

At today's public auctions 2,843 packages cinchona were sold at unit prices ranging from 8c to 8½c per ¼ kilo, equal to 1½d to 1¾d per lb. The following were the prices paid:—Manufacturers' barks: Quills, broken quills and chips 6c to 7c, equal to 1d to 1½d per lb.; root 15c to 50c, equal 1½d to 9d per lb. Druggists' barks: Quills, broken quills and chips 11c to 5c, equal to 2d to 10½d per lb.; root 12c to 2c, equal to 2½d to 3½d per lb. The principal purchasers were the Auerbach, the Amsterdam and the Brunswick factories.

NORTH BORNEO PROSPECTS; A VISIT TO TEA BONDING WAREHOUSES; TEA BOXES; MR. MAITLAND KIRWAN AND HIS PATENT TEA PACKING.

So many Ceylon men have left you at various times to try their fortune in Borneo that information as to the progress of the British North Borneo Company will certainly be possessed of interest to those of their friends whom they left behind them in your island. Sir Rutherford Alcock, K.C.B., occupied the chair at the half-yearly general meeting of this Company on Wednesday last, and he told his auditors that the revenue had gone up by £14,850, or nearly 60 per cent, the total income—apart from land sales having risen from £24,986 in 1888 to £39,850 in 1889. Besides this revenue they had sold land during the year to the amount of £39,836, this amount having been received for 202,800 acres. The expenses, however, had mounted up, chiefly because of the cost of two expeditions sent out. This was an extraordinary expenditure, and would not be of frequent recurrence, Sir Rutherford said; but

the directors thought it advisable not to add to the dividend which had been paid *ad interim* in January last. They hoped great things from the tobacco planting, which was going on vigorously and with most satisfactory results. The chief difficulty of their planters was scarcity of coolies, but steam communication with China had now been established, and the Chairman said he had no doubt an ample supply could be drawn from that country by its agency. He told his audience that a scheme for the construction of a railway across their territory under the land grant system was under consideration, but that until matters were more advanced he held it would be premature to enter upon any details. There was much to be hoped for from mineral products, and mainly as to coal; in the development of the sources of which last, considerable advance had been made. The closing of Sir Rutherford Alcock's address was followed by a good deal of rather warm discussion, the proprietors being anxious that power should be obtained enabling dividends to be declared upon land sales. This course the auditors decline to permit, and insist that receipts from such sales should be placed to and retained as a special reserve fund. You will recognise the important relative bearing this decision has upon the course hitherto adopted by the Ceylon Government in considering its receipts from land sales as revenue applicable to the most general purposes, an error the gravity of which, now that the end of your tether as regards available land is being rather closely approached, has come to be fully acknowledged.

My regret was expressed when last writing that space was not available for me to make some remarks upon what was observed by me during my visit to Mr. Maryetti's Tea Bonding Warehouses. On that visit I was enabled to realize for the first time that there might be some justification for the heavy charges which home agents make upon teas shipped to them from Ceylon. These have repeatedly been made the subject of complaint in your columns, and I with others have always had to acknowledge that they seemed to constitute a great and justly complained of grievance. But really, when one comes to see what has to be done with respect to tea before the chests are issued from the warehouses, the same disposition for acknowledgment does not remain. In the first place, the handing out of samples to the trade is a most laborious job, and however great may be the care exercised to escape loss it cannot be altogether avoided. Dozens of boys were constantly rushing in and demanding samples for this or that broker, their employers. To each of these an ounce of tea was carefully weighed out, and they were expected to return the same weight. Just fancy, however, what it must mean in the way of labour to work such a system so carefully as to guard against serious loss through non-return of samples! Turning to another department of the work one is confronted by the heavy charges for labour involved in unpacking the chests,—and this is particularly heavy in the case of the metal chests—turning out the contents, a job involving much delay if there be any obstruction such as framing *inside* the chest; weighing before the Customs officers, and refilling to the exact weight mentioned on the chests. By the way, I may tell you here that with some chests of Ceylon tea recently turned out their contents weighed two pounds *more* than the figures shown they should contain! Who is responsible for this out with you? The idea is here that too much reliance is placed on the boxes holding exactly a given weight, and that they are filled

without any weighing at all. This should be seen to if such a practice prevails, for two pounds excess in a quarter chest is a serious one for your shippers and planters.

After this digression by way of warning statements, I may get back to the third heavy item of expenditure to be incurred by the bonders, and that is the repair of broken boxes. When a bad voyage has been experienced, probably a dozen out of every hundred of metal or wooden boxes receive injury and require repair before being issued to the trade. I saw some of the metal boxes so bulged as to crack, and others with the lids so dented in, that, if left out in the rain, water stood in a pool on the surface and gradually leaked through the disturbed joints to the tea. As for the China wooden boxes, some of them scarcely deserved the name on arrival, and all of these had to be made good by the bonder's staff. So you can realize that the charges made on tea received here are not representative by any means of clear profit, though very probably some agencies manage to add considerably to the warehouse charges when their accounts of receipt and expenditure are made up for consignment to their constituents.

My reference to tea boxes reminds me to make mention of the fact that all the tea received ex "Carthage" in the Stanley-Wrightson chests has been sold this week at full prices, it being in "real good condition." This fact being ascertained, and confirmation to it having been afforded by the price paid by experts for the tea, the next step the Syndicate will take will soon have to be decided upon. You have already had sketched out to you by me an outline of what is contemplated by it, viz., the establishment of a factory for the manufacture of the board required from mana grass in order to avert the existing uncertainty attending the importation of the board from Holland. To carry out this programme efficiently, more capital than is possessed by the present Syndicate will of course be required, and the first step for consideration must be how this money is to be obtained.

We observe that you have been noticing lately the use of a lead paper introduced—so we understand you to say, to the Ceylon planters by Mr. Kirwan. When reading your observations upon this new material, I felt desirous of learning if anything was known about it by the tea trade here. As the result to my inquiring I found that this lead paper is well-known and freely sold in London, and that it is the same as that in which the tea arriving home in the Stanley-Wrightson chests was packed. My examination of the paper of those chests proved to me that it was an admirable substitute for lead, and of course far less weighty and costly, while to those advantages it adds that of economy in space occupied. An expert who examined the chests with me told me he believed the days of the use of lead for packing tea to be fully numbered.—London Cor.

THREE SAMPLES OF TOBACCO, grown in Madras, were recently submitted for the opinion, in regard to their quality and value, of the leading tobacco brokers and manufacturers of the United Kingdom. The reports of the 14 specialists to whom the samples were sent, including among others Messrs. Sales, Pollard and Co., and Messrs. Charlesworth and Austin of London, Messrs. Cope of Liverpool, Messrs. Lloyd and Son of Exeter, and Messrs. Thomson and Porteus of Edinburgh, seem to afford encouragement to the efforts which are being made to improve the cultivation of tobacco in the Madras Presidency.—*M. Mail*, July 24th.

INDIAN, CEYLON AND JAVA TEAS IN LONDON.

Owing to differences of climate, Ceylon tea has appeared in the Mincing Lane markets, since the commencement of the tea season, in larger quantity than Indian, while the increase this season in Java has shown well in proportion to the increase in Indian. The figures for Indian from 1st June to 11th July were:—

India:—Season 1889-90	...	Packages.	40,118
Do 1890-91	...		51,325
Increase	...		11,207
<hr/>			
Ceylon:—1889-90	...	Packages.	68,429
1890-91	...		93,111
Increase	...		25,682

In absolute quantity Ceylon shows not far from twice the number of packages of Indian tea, while her increase on last year is considerably more than twice the increase which Indian tea shows.

Java is advancing, the comparison being:—

1889-90	...	Packages.	5,001
1890-91	...		7,751
Increase	...		2,750

The exports from Britain of Indian and Ceylon teas are increasing, but as yet the vast proportion of teas exported are China kinds. The deliveries of tea in June were 8,630,000 lb. of Indian and 5,163,000 of Ceylon,—the aggregate being 13,793,000 lb. against 6,059,000 China. The change since June 1888, three years ago, has been remarkable. The deliveries of China, then, instead of being less than half those of its two competitors compared thus:—

Deliveries of China tea	...	lb.	8,438,000
Indian	...	5,360,000	
Ceylon	...	1,594,000	6,954,000

Difference in favour of China ... 1,484,000

The difference against China in June of this year is indicated by the following figures:—

Deliveries of Indian and Ceylon teas	...	lb.	13,793,000
China	...	6,059,000	

Difference against China ... 7,734,000

There has seldom been so complete a revolution in a trade and in public taste.

SUGAR IN FIJI.—Among the passengers who left Suva for Sydney by the S. S. "Waroonga" was Mr. Wm. Good, Sydney manager for the Fiji Planters' and Fruit Growers' Co-operative Association and Agency Company, who returns to the scene of his operations. Mr. Good takes with him some splendid samples of an accidentally obtained variety of cane which he has cultivated recently to some extent, and which is called the Muanawini (after the plantation). This new variety shows remarkable strength and vitality, united to good density, and is so straight in growth as to render less expensive many of the operations of cultivation and subsequent handling during conveyance to the mill. Doctor Kottman, Chemist in Chief to the C. S. R. Co., also returns from a visit of inspection to the scene of the Company's operations in Fiji, in reference to the disease which has appeared among the 'Honolulu' cane. The new Muanawini variety, referred to above, may meet the difficulty.—*Fiji Times*, June 21st.

PUMICE STONE.

The Belgian Consul-General in the Canary Island states that a very important mine of pumice stone exists on the Teneriffe Peak, of which the working was only started in 1888. The stone is found in that part of the peak called "the Canadas," at about 2000 feet above sea level, which has an area of some 6000 hectares, out of the middle of which rises the highest part of the peak. The Russian Consul at St. Croix bought this property of the Spanish Government in consideration of an annual payment for the pumice stone working. The Russian Consul has associated himself with a Belgian, and they under the firm styled Aguilar and Valcke, commenced operations in 1888, but it was only last year exportation was really started. At the Paris Exhibition the Consul-General states that this stone obtained a silver medal, and in view of the requirements of England, France and America, he believes it will develop a trade of great importance before many years. So far the Lipari Islands have practically furnished the world's supply of this product, exporting about 100,000 tons per annum. The Teneriffe stone being recognized as of excellent quality and its extraction being a much more simple matter than in the Lipari Islands, it follows that the price is much less. More capital will, however be wanted to extend the working operations. —*Chamber of Commerce Journal*, July 5.

TEA PACKING, BULKING, &c.

(By a Very Old Colonist.)

THE MINCING LANE TEA MARKET AND PROSPECTS—WEIGHING, BULKING AND PACKING OF TEA—TEA LEAD—MR. DENSHAM'S FACTORY—WHEAT PROSPECTS—RISE OF EXCHANGE.

London, July 5th.

Naturally, the first thing I did when I got to London was to visit Mincing Lane to see our brokers, Messrs. Gow, Wilson & Stanton, and learn from them all about the tea market and what was thought about its future prospects: at present the feeling is "bullish" and in favour of a steady market for some months to come. On inspecting some samples of tea after it was bulked in London, which I had seen before shipment, I was very much disappointed with their appearance: they did not look like the same tea at all they were much more dusty and broken than when they were shipped. On inquiring the cause, I was told, it was owing to the rough way in which tea is repacked in the tea warehouses after bulking. Mr. Wilson suggested that I should go to the warehouses and see the process of working a parcel of tea from beginning to end. Accordingly accompanied by Mr. Davies, who has taken much interest in the matter, I went to Cntler's Wharf to inspect the working of a parcel of our own tea ex "Chyebassa." It was first weighed gross, package by package, the weight being chalked on each; the boxes are then opened and a sample of each taken out for inspection. If they run even in appearance, at this point bulking might be saved, but in this case the samples did not run even in appearance, so the parcel was taken into the bulking room: there the top lead cover, cut up in sampling, was torn off and the tea turned out on the floor. The lead lining of the box generally comes out too, and is shoved back into it in a very crushed state. The tea on the floor is turned over several times with shovels—this is the method of bulking, machines have been tried for mixing the tea, but they have not been found to facilitate the work and have been given up. The empty boxes are then taken back into the weighing room and the tare is ascertained, by weighing each package. All the weighing is done in the most careful way, and the scales were tested several times whilst I was there!

Whilst the lot of tea weighed out well, there was a loss of about 1 per cent in the tares from inequality of the weights of the boxes. The tared boxes are then taken back into the bulking room. The tea after being again turned over is shovelled into them; and if pos-

sible inside the lead lining. When the box is nearly full a piece of gunny is placed on the top and a man tolerably heavily shod got on to it and stamped the tea in the box with all his energy. What wonder, then, that crisp tea is broken in the process and much dust made?

Who adopt a similar process in packing in Ceylon, but it is done more carefully and gradually. By this way of packing we get more tea into the box than the warehouse laborers can without stamping it in. The stamping operation has generally to be done twice. There is no doubt in my mind that in packing the tea as we do in Ceylon, we are penny wise and pound foolish: we save a trifle in freight and lose a penny per lb. in price, owing to the deterioration in appearance from crushing. Unless we bulk on the estate I think no more tea should be put into the boxes than can be got by thorough shaking, then the warehouse people can get the same quantity into the boxes without stamping. No care can be taken in repacking to adjust the lead lining: if it slips into its place well and good; the tea goes into it, if it does not, it is crammed in; the tea on the top of it; and its want is supplied by sheets of paper placed next the wood and as the torn lead cover is useless, its place is also supplied by paper. The lids of the boxes being prized open with a chisel are generally much broken and are nailed on again anyhow. We are told that our tea does not keep well. How can it keep exposed as it is to the effects of a damp climate? I should say now that in my opinion the rough usage of our tea and packages in the warehouses is unavoidable. It is impossible to give the time necessary to repack as carefully as we pack: the remedy I think is in our own hands—either let us bulk on estates or pack in such a way as to admit of the tea being repacked without treading and stamping. With such enormous quantities of tea to be handled in the way I have described, time cannot be given to do the work carefully. The mischief, I should say, hurts us most with exporters: how can we expect them to buy and ship our tea with all the chances of deterioration from imperfect protection from the damp atmosphere? What is the use of packing tea in lead at all, if it is only for the voyage? The sooner some other way of hermetically packing tea can be devised or some method of making the tea lead adhere to the boxes when the tea is turned out the better.

Messrs. Gow, Wilson & Stanton gave me a piece of their tea lead laid on thick paper, which has been used by Mr. T. C. Anderson and is much approved of by the dealers.* If I can find out where it is made I will send out a supply, because it could be passed on to the sides of the boxes before they are made up, and then it could not be rendered useless by the men in the warehouses.

After seeing the bulking and repacking process, Mr. Davies took me to see Mr. Densham of Mazawattoe celebrity. He kindly took us through his factory from top to bottom and showed us the whole process of blending and packing from beginning to the end. I was much pleased and interested in what I saw. All the tea is now, I believe, honestly described on the packages, and I think he has done much to push the sale of Ceylon tea. The quantity he buys and sells is very large: he has about 4,000 agents, and packs tea as directed for a large number of retailers who have their own names put on the packages. I was particularly struck with his blending machines and especially with his cutting and sorting machine: it cuts and sorts more evenly than any of our machines. The establishment is a very large one. The steam engines to work the machinery are at the top of the warehouse which is some six stories high.

This letter is intolerably long, but I do not care to apply the pruning knife to it or to rewrite it: so you must just try and make commonsense out of it. If the weather does not change very soon for the better

* A sample sent to us by Mr. Anderson some time ago was very favourably reported on by Messrs. Somerville & Co. We are not aware of the cost compared with ordinary tea lead.—*Ed. T. A.*

the farmers will have a bad time of it and there will be very dear money before the end of the year to pay for corn, &c.—Yours truly,
C. S.

P. S.—The price of silver is creeping up again. People are predicting a rise to 60d, which means a par exchange. It will be for a time a bad thing for the East. Capital invested there during the last ten years will be called up and sent back, and people will be afraid to send out money at an exchange of 2s., which they may have to get back at 1s 5d when the production of silver increases or when the demand for American currency is satisfied. Remember me kindly to all inquiring friends, especially those at the Mount. This climate is at present simply detestable.
C. S.

QUININE, & c.

(From C. F. Boehringer & Sohn's Report.)

WALDHOF NEAR MANNHEIM, July 1st, 1890.

QUININE during the greater part of last month was very quiet and second hand holders accomplished the resolution to sell at 12½d per oz. In course of last week however, the market improved.

In 1880 Dr. Laveran of Paris reported that in Algiers he had constantly observed peculiar protozoic organisms (*Plasmodium malariae*) in the blood of patients suffering from malaria fever. This discovery that was much disputed at the time has recently been confirmed by Dr. F. Plehn at the Moabit Hospital in Berlin, who in proof of it adduces the treatment of patients with quinine, the organisms in question gradually disappearing from the blood, and the patients therewith becoming convalescent.

COCAINE.—Just as in civilised lands general prosperity is accompanied by increased consumption of spirituous drinks, so in Bolivia and Peru the natives under such circumstances indulge more largely in coca chewing. Such has been the case this year. Having got much better prices for their wool, the natives have consumed coca very freely, and the surplus of leaves for manufacturing purposes has consequently been small, and commanded high prices. Raw cocaine and cocaine hydrochlorate have nevertheless fallen. In face of the fact referred to, this decline cannot be expected to last, and either coca-leaves, must become cheaper, or cocaine quotations must be and of the former eventually there is no prospect whatever at present.

A report in the *Révue Chir. Thér.* recommends in case of croup the following solution:—

Cocaine hydrochlorate	1 part
Solution of Perchloride of Iron	8 "
Water	1000 "

A tablespoonful to be taken every two hours. For children the quantity of cocaine should be reduced by two fifths, and a teaspoonful administered every two hours with ice. This remedy removes the membranes and renders any operation (cauterisation,) unnecessary. —

In course of the series of articles summing up the observations of European and American physicians concerning the subsidiary effects of the new remedies, and to which we referred in our April report, Dr. Falk of Berlin has since dealt with Antifebrine, Phenacetine and Methacetine.

ANTIFEBRINE (Acetanilid) the most frequent effect is cyanosis that occurs sometimes even after the smallest dose. The fall of temperature is often unexpectedly great producing even collapse, especially in typhus patients and children. Antifebrine frequently causes violent perspiration, and in many cases shivering fits. Unlike antipyrine it does not often affect the digestive organs, but on the other hand with children produces diarrhoea and inclination to vomit. Dr. Falk notices eleven cases of acute antifebrine poisoning the symptoms of which are faintness, giddiness, dread of death, palpitation of the heart, abdominal pains, vomiting, shivering fits, unconsciousness and in some cases delirium.

PHENACETINE.—Judging by the comparatively few recorded observations, the occasional subsidiary effects of phenacetine are rare and unimportant. The most frequent appears to be excessive perspiration sometimes accompanied by shivering. Cyanosis and exanthema also often occur. By prolonged treatment with phenacetine, the patient grows so far accustomed to it that large doses become needful, and these are by no means free from danger.

METHACETINE is closely related to Phenacetine, but its subsidiary effects are much more disagreeable. It occasions most violent perspiration, and as often remarked at the same time also collapse and cyanosis, and great caution should therefore be observed in prescribing it.

THE NEW JAPANESE MINISTER OF AGRICULTURE AND THE TEA-MEN.

Mr. Mutsu has made it very plain to the tea-men who were so fortunate as to obtain a subsidy of 200,000 *yen* from the late Minister of Agriculture and Commerce, that he is not at all disposed to pursue the policy of official interference with trade. These gentlemen, probably feeling doubtful about the permanency of such a favour, sought an interview with Mr. Mutsu and asked what opinions he entertained on the subject, whereupon, according to the *Jiji Shimpō*, the new Minister told them that he was entirely opposed to official meddling with trade concerns, and that, entertaining such views, he proposed, if not to cancel, certainly to greatly alter the Tea Company's charter. Subsidies and bounties were all very well, he explained, as means of giving a vigorous impulse to some particular enterprise and putting money into the pockets of favoured persons. But the impulse could only be temporary, while the inevitable consequence of such a system was to interfere with and check the sound development of trade, since the enjoyment of official assistance and protection by one set of traders effectually strangled competition on the part of men not similarly favoured, and thus, instead of encouraging private enterprise, official aid was ultimately fatal to it. With respect to the sum of two hundred thousand *yen* which had been granted to the Company and lodged for the uses of their business in the Bank of Japan, Mr. Mutsu explained that of course no question could be raised. But he told them that he should not disapprove of their placing the money with some sound bank where good interest was procurable. The tea-men have accordingly decided, we read, to transfer the money to the First and Third National Banks, where 7 per cent. is given on fixed deposits. They will thus be in receipt of an income of 14,000 *yen* annually, which, they expect, will meet their requirements.—*Japan Weekly Mail*.

MR. A. SCOTT BLACKLAW ON BRAZIL.

SÃO PAULO REVISITED.

DOM PEDRO SEGUNDO RAILWAY STATION—FASHIONABLE DRESSES—EMANCIPATION—DEPARTURE OF TRAIN: LEAVE-TAKING—COFFEE—BEAUTIFUL RESIDENCES—WANT OF CULTIVATION—GRAND SCENERY OF THE SERRE DO MAR PASS—A 100 MILE NAVIGABLE RIVER—COFFEE DISEASE IN THE CAMPOS DISTRICT—METRE GAUGE LINES—LEOPOLDINO RAILWAY COMPANY—EXPRESS TRAIN—SÃO PAULO TRAIN—MINAS AND RIO RAILWAY COMPANY—IN CACHOEIRA—CANE AND COFFEE—FROM BROAD TO NARROW GAUGE—COMFORTABLE RAILWAY CARRIAGES—BROAD AND NARROW GAUGE LINES—ABANDONED COFFEE ESTATES—A CENTRAL SUGAR FACTORY—JAWBREAKING NAMES OF STATIONS—A CONCESSION FOR A RAILWAY LINE—BITUMINOUS SHALE—SÃO PAULO STATION—HÔTEL DE FRANCE—CONVERSATION ON "GOOD OLD TIMES."

One reason of my long silence is that I have been for some time almost out of the bounds of civilization in the interior of Minas Geraes.

I started from Rio one cool September morning—the day just breaking when I got on to a train-car which was to convey its load of passengers to the Dom Pedro Segundo railway station, for a train which was to leave for the Capital of the Province of S. Paulo at 6 a.m.

Arriving some half-an-hour before the time for the train leaving, one had time to enjoy a cup of warm black coffee, made with a strength which one only finds in Brazil—milk there was in abun-

dance, but such is the force of habit—after a long residence in these parts—coffee with milk seems a tame drink, compared with the black enervating beverage well-sugared—which is the “eye-opener” for everyone, rich and poor senator and beggar, in this part of the world.

While seated in the refreshment-room one is visited now and then by well dressed young men, who seem of the class employed during the day as clerks in wholesale houses or retail dealers’ assistants—and is asked in a whisper to buy from the visitor the unexpired half of a return ticket to Sao Paulo. The ticket lasts for a month and has date of issue stamped on it. Negotiations are continued in a whisper, and the ticket may be bought for some ten or twelve shillings less than one can buy a single ticket for. From the numbers of those who present themselves afterwards one is inclined to think a better bargain could have been struck by exercising a little patience. The clandestine nature of the transaction leads one to believe that it is illegal. This however those who benefit by the affair do not care to inquire into. Tickets are not given out until a short time before time of train leaving, and the gates leading to the platform are not opened until that time. The waiting-rooms seem ample, but as the approaches are well covered, most of the passengers prefer waiting about the doors, no doubt looking for those whom they expected to accompany them or to see them off. There is not much pushing and crowding. The newsboys and shoe-blacks are kept outside, and your business with them is done before you enter. Luggage is a thing that does not bother the passenger much, for the day before the passenger intends to leave, it can be sent to an office of the railway department in the centre of the city of Rio de Janeiro and by giving particulars as to destination, and paying according to weight, he has only to present the card or receipt received at the end of his journey. Small parcels or such as do not inconvenience other passengers are allowed into the carriage.

While waiting for the train to leave, one is struck with the costly fashionable dresses of both ladies and gentlemen of the better class, but all are well protected from dust while travelling, the science represented by Worth is even exercised in the formation of ladies’ “dusters” from unbleached linen or silk. Gentlemen protect their French-tailor-made suits by long over-coats of a material similar to the ladies’,* and they put a white washable cover on their felt hats. Only 1st and 2nd class carriages are run; this being a fast train there are few of the latter, and what there are of varied colour, position, and dress.

Emancipation does not seem to diminish the retinue of coloured people of both sexes, which those included in the upper ten require when travelling in this country; a few German, Portuguese and Italian girls are seen accompanying families, but the bulk of lady’s maids and children’s nurses are taken from those who were formerly slaves. The dresses of some of these which before the 13th May 1888 were supplied by their masters and mistresses are not much inferior in either cut or material to theirs, and more costly than those of the same class in Europe.

No one seems to be allowed to enter by the regular platform entrance without a ticket, and I cannot explain why before the train leaves so many people are there to take leave of friends and these seem as many as the passengers, the carriages get filled up, and the stranger thinks he cannot get a seat,

* In Melbourne there is an enormous consumption of “China silk” for male and female “dust coats” in summer time. The prototring dresses look, in the case of ladies, almost as nice as the dresses they cover.—*Ed. T. A.*

but the checking of the tickets soon undeceives him. Then the parting! Ladies give a kiss to each other on both cheeks and gentlemen embrace each other, some tears are shed by those on the platform, by-and-by the whistle of the locomotive blows, the train begins to move, white handkerchiefs are waved from carriage windows in reply to those on the platform, the speed increases, the beautiful suburban villas are passed, we pass through the wide expanse of fodder-grass fields, and off we are at forty or fifty miles an hour, and but for the splendidly convenient carriage arrangements we have here, one might fancy he was on one of the London and North-Western, the Great Northern, or Midland fast trains:

Gradually all settle down to our seats and morning newspaper. A great many small stations are passed, but the train does not stop until it has run for more than an hour, and this it does at a place called Belem (pronounced *Be-leng**). Here one can get coffee and some passengers stretch their legs on the platform. There is a refreshment-room; all take coffee; ladies and those who had not slept enough before leaving get it handed in at the windows. So as not to have to mention it again I may notice that this custom of coffee drinking is repeated every time the train stops: boys come with the cups on trays, the passenger helps himself and pays twopence-halfpenny for a cup.

After leaving Rio the country is flat. The hills to the south of Rio where the Tijuca, the Corcovado, the Gávea, on the sides of all of which up to near the summit are some beautiful private residences, hotels &c. are gradually left behind, and in front we see the lofty ranges forming the Serra do Mar through the defiles of which the train has to pass. In this low country there is very little cultivation. Here and there are to be seen cane-fields, but the juice is turned into rum. The costliness of machinery for sugar-making prevents the farmer with small capital from making anything else of it, and the low price ruling for sugar for some years past prevents large capitalists from assisting by means of central sugar factories. Patches planted with mandioca, maize and beans are also seen. Land seems in the hands of people who do not care to rent it, or to sell it, else a great deal of it could be covered by market gardens, and small farms worked by European colonists, who could find a ready market for their produce in the city of Rio de Janeiro. With the exception of a few small dry looking knolls covered with grass, the soil looks as if it could grow anything suited for a latitude of 22½ degrees and a country having an average supply of rain distributed more or less all the year through of 120 inches. At Belem the ascent of the Serra do Mar commences. The gradient of the line is one in fifty, some thirteen tunnels cut out of solid gneiss are passed through. I am not poetical enough to offer to describe the grand views to be seen from many parts of this pass, but steep hills covered with virgin forest amongst which are trees of enormous size, and smaller shrubs showing flowers of every hue and filling the air with their fragrant scent, grassy hills, and grassy valleys, near and far are to be seen; while silvery streaks of waterfalls rushing over high rocks and disappearing, as if ending in spray, in the forest valleys below, and these brightened up by the sun; streaks of cloud showing pieces of mountain below and pieces above; showing a tremendous height for a short time to the Peaks, but these snowlike masses are soon to be dispersed by Sol’s influence. These and a great deal more are to be seen and enjoyed, and then, as enjoyment heightens,

* And meaning Bethlehem: compare the English form ‘Bedlam.’—*Ed. T. A.*

how delightfully cool and pleasant the air gets, as one gradually ascends to a height of 2,000 feet. After the last tunnel has been passed through and the train has gone sounding through the last rocky defile, a descent is made to Barra do Pirahy. Here we come to the Rio Parahyba which takes the drainage of a large tract of country; that on the north side of the Serra do Mar from near Santos 200 miles south of Rio to Campos 150 miles north. The Parahyba has also a large watershed on the north, as it receives the drainage of the high hills which have a *water parting* on the north towards the large river San Francisco, and also to those rivers which go to supply the river Paraná which goes to form the River Plate. The river Parahyba is navigable for about 100 miles from its mouth, and by it some of the coffee from Cantogallo, and St. Fedelis districts, and sugar from the Campos district find their way to a seaport. The hills on each side of it are covered with coffee plantations, and it is principally on these where the coffee disease has been playing havoc for the last few years. This is a disease or insect which attacks the roots of the coffee tree, in old districts. Government has tried what it could by sending specialists to study this pest, but as yet no cure or preventative has been found. Fortunately it has not as yet visited the new coffee districts in São Paulo and Minas Geraes. Barra do Pirahy, means the *bar* of the river Pirahy where it enters the river Parahyba. This first section of the Dom Pedro 2nd railway ends here, the trunk line goes north to the province of Minas, and receives traffic from many small lines of metre gauge formed by companies whose shareholders are, or at least many of them, people who live in the localities through which these pass. The main line is opened to the capital of Minas Geraes—OURO PRÉTO—altogether it has an extension of some 900 kilometres—750 kilometres (465 miles) of which is broad (5 ft. 3 in.) gauge, and 150 kilometres (97 miles) narrow 1 metre say 3 ft. 3½ in.* The gauge was broken after reaching so far (750 kilometres) into the interior for reasons which satisfied the Government, and which I do not care to enter into at present. It was the old question of "the battle of the gauges," and the narrow was victorious.†

From the Dom Pedro line about 3 hours' ride from here strikes off a metre gauge line worked by a powerful Company called the Leopoldino Railway Company. This line has a larger mileage than its parent the Dom Pedro 2nd, which is a Government line, and forms a network all through the northern part of the Province of Minas. It now threatens to take away a great deal of the traffic from its progenitor, having bought the Cantogallo Railway (gauge 3' 6") and made a branch to connect its old line with the latter, which has its initial station and terminus for unloading coffee and other produce at Rio de Janeiro, thus securing to itself all the goods traffic with which it formerly fed the Dom Pedro 2nd. Surmounting hills and crossing deep ravines seem nothing to the engineers of this Company, who do not hesitate on their metre gauge to locate on gradients of one in thirty-three (3 per cent) and lay down curves of three chains' radius.‡ The Leopoldino Railway has 900 miles open—cost of construction &c., £5,000,000.

* There have been spent £12,000,000 on the 465 miles of broad and £1,200,000 on the 150 miles of narrow.

† The highest station on the Dom Pedro railway above the level of the sea is Barbacena, say under 3,700 feet and distant from Rio 235 miles.

‡ Three chains radius! This means very slow speed or danger and rapid wear of rails from the effects of super-elevation.—ED. T. A.

The express for the main line passengers—those going towards Minas Geraes—and for the small feeder lines I have mentioned above leave Rio de Janeiro at five in the morning. The train with São Paulo passengers leaves at six: there is thus not the same scrambling and pushing for breakfast at Barra de Pirahy as formerly. The main line train leaves Barra de Pirahy before the other arrives. The distance of Barra de Pirahy from Rio opened 1858 is 67 miles and height above level of the sea 1,200 feet.

It is 8-30 a.m.; the refreshing air of the hills gives everyone a good appetite; there is a beautifully clean refreshment-room, and the table is loaded with good things hot and cold to eat, of which one may eat his fill, and wines &c. are for the ordering—the charge is moderate, and sufficient time is given to finish up with a cup of black coffee.

The line for São Paulo branches off here towards the west, but it is still the Dom Pedro 2nd or Government line the same gauge (5 ft. 3 in.) and passengers do not change carriages here, nor until they change into a metre gauge at the end of this line. The railway now follows the right bank of the Rio Parahyba, the train passes the small stations, and with few stoppages reaches Cruzeiro—where there is a junction with a railway (metre gauge) made and worked by a British Company, called the Minas and Rio Railway Company. The Minas and Rio line goes due north until it reaches a river, the Rio Verde, in Minas Geraes which is navigable. The districts through which it passes are more pastoral than coffee producing. Other lines are being made as feeders to it, and if it do not pay, it very soon will. The Company enjoys a state guarantee for the line at present open, and a provincial guarantee for some 200 kilometres of extension till to be made. After leaving Cruzeiro and continuing on the side of the river Parahyba for other 14 miles in due time we reach Cachoeira, which is the terminal point of the Dom Pedro 2nd on this side. We are now 165 miles from Rio, altitude 1,720 above sea-level—opened 1876. Passengers and goods have to be changed to the São Paulo and Rio railway, a metre gauge line. The valley of the Parahyba from Barra do Pirahy offers little variety: first we pass through some cane-fields for half-an-hour or so, the bulk of these canes are grown for a large central sugar factory which has a guarantee of interest from the Government of 6 per cent per annum. This ought to do good to the district, for the most of the coffee seems dying out and cane is growing very well on what were coffee plantations. Further up the valley there are fewer cane-fields, and the coffee fields, although not looking fresh and young, are not reduced so far as not to be able to pay their way. Nearer Cachoeira, but up on the hills, we pass some very well arranged coffee estates said to be bearing fair crops the present year, with plenty of young wood for the next. Being nearer some very high hills—one Itatiaia said to be the highest in Brazil—6,600 feet, the climate is more moist, and has not suffered from the late drought, which has devastated whole provinces in the north and from the ravages of which few districts in the south have escaped. On the lands near the river cane is planted where coffee-fields were—more or less all along the valley. I may also mention that several metre gauge lines branch off to the left but on the right bank of the river. These lines go south towards the Serra do Mar and into a second valley of the Rio Parahyba which lies parallel with this some 30 miles to left and south of us and some of them have concessions from Government to enable them to extend to the sea port towns situated between Rio and Santos. The

cost of construction, as they get near the sea, must be heavy, as all along the coast from Rio to Santos the steep sides of the Serra seem to come right down to the coast. There are at present three of these lines working off the Dom Pedro 2nd—their mileage is not great as yet, but all are being extended.

At Cachoeira we leave the nice roomy carriage of the broad gauge and enter that of the narrow. There is a difficulty at first in finding places for the small parcels, and convenient seats. As it is now afternoon the old hands look out for the side the sun will beat least on. We cannot venture on a cup of coffee until these arrangements are made. The new hand had better not ask the time for the train starting: if he do and be guided by his watch he will have some time to sit in an empty carriage. From Rio we have come on Rio time, here now we have São Paulo time, which is somewhat later,—some 15 minutes. Better for him to ask "How long do we wait here?" and he may look at his watch when the train starts, he will have time enough to look about, for changes of everything at break of gauges, even with the most improved railway systems, take time. Time! that is nothing to compare with the annoyance.

From here to São Paulo the metre gauge line belongs to a company having its head office in Rio de Janeiro, and the capital was raised in this country. It was opened in 1876 and has paid fairly well to the shareholders.* For goods traffic from Rio to São Paulo it has to compete with the line of steamers between Rio and Santos. Passengers, even those to Santos, who have by steaming this route to stay a night in São Paulo, and go by train some three hours' journey to Santos next day, prefer it, for in some seasons the sea voyage between these two places Rio and Santos is far from pleasant.

We have come out of luxurious carriages fitted up with all sorts of comforts for the traveller which our American cousins can invent, and we enter others less roomy no doubt, but clean, neat and comfortable. The extra heat we experience is not *all* owing to the lowness of the roof, but the sun is beating right down on us, and it is the hottest part of the day, and the small windows which only open half-way would not inconvenience us much, if we had entered the carriage at 6 o'clock in the morning. There is width enough in the seats, for the broad gauge held two on each seat with a passage down the centre, making four passengers in the breadth of the carriage; here you have two passengers on one seat at one side, and one passenger on one seat at the other, the single seats extending one half-way down the carriage on one side and half on the other, the double *vice versa*, and although the passage in the middle has a quick turn half-way down the carriage to suit this arrangement of seats, there is room enough for seats for gangway and all. The facility with which the backs of the seats can be turned to enable two people, if on the single, and four on the double, to have a quiet *tête-à-tête*, is a good arrangement; if you don't like your face to the engine, turn the back of your seat and you have your back to it. The lavatories are kept as clean on one line as on the other. On this line where curves do not seem to be less than six chains radius they could easily have higher roofed carriages which would give better ventilation, and enable windows to be open their

full height.* They could be opened by pulling down instead of pushing up. Do not let us growl: in a new country a metre gauge railway is not to be despised. The metre gauge has been such a success that here they will have no other, but I do not say that it is right to have two gauges in any country. [The question of gauge is largely a question of traffic, but break of gauge means increased cost of working, with inconvenience and danger.—Ed. T. A.] For through traffic the break of gauges is the greatest annoyance imaginable, and the saving in cost of construction does not compensate for loss of time—*first* in the slowness of the trains, and *second* in the time required for changing from the wagons of one line to another, entailing risk of damage to goods, delays and discomfort to passengers. The 5 ft. 3 in. gauge lines run up to 60 kilometres per hour, while the narrow 3 ft. 3 in. seldom exceeds 30 kilometres, and it is a very fast train that will run 40 kilometres: indeed I think there is a regulation which makes it punishable for a driver to exceed the latter distance let his train be ever so late. They tell me the express on this line runs 40 kilometres per hour. With the exception of the Government line in the Province of Ceará, constructed under directions of Engineer Charles Morsing, this is the best made metre line I have been on in Brazil. Although your 5 ft. 6 in. is an enormously wide gauge, now that you have a good extension of it, and through the most difficult part of your country, you should stick to it. [No fear of that. Apart from all the inconveniences of break of gauge, experience in India has conclusively proved, that any gain on construction is rapidly lost in the higher proportionate cost of working narrow gauge lines.—Ed. T. A.]

Economy in the construction of metre gauge lines here has reached a point as fine as it is possible to cut it. £3,000 a kilometre is the maximum on which guarantee is given by the Government, and the applicant for a concession must prove that it will pay 3 per cent, *i. e.*, if the line should not pay 3 per cent the quota to be paid by Government would not exceed 3 per cent on capital guaranteed.

A pretty long stretch of line to connect the city of Rio and that of Campos along ground similar to your lowcountry and a gauge of 3 ft. 6 in. was contracted for at £1,920 per kilometre; the work included everything but rolling stock. Gradients not over 1 in 100 and minimum radius of curves 200 minimum or 10 chains radius. Bridges above 12 feet to be of iron, stations of stone or bricks, and covered with tiles platforms of cement, &c. Rails steel 45 lb. to a yard—all was finished to the satisfaction of Government, and it is said the contractor made a fortune on it.

But to return to our journey towards S. Paulo. Leaving Cachoeira, we pass through what had at one time been an important coffee producing district, for we see numerous abandoned coffee estates, and cane struggling to give a fair crop from the already washed and exhausted soil. Government have tried to improve agricultural matters, by giving a guarantee to a central Sugar Factory beside the Lorena station. The factory has been working for three years, but the Government have had to assist in paying the dividend to the shareholders. This will gradually be remedied, as it was owing to the planters' not planting sufficient cane; they being uncertain if the price the Company offered would pay them for cultivation, and they not being sure if means for transport would be provided when the cane was ready for cutting,

* Since writing the above I have been told the low roofed carriages are few in number, the others have high roofs with double ceilings, 7 windows opening full, and downwards.

* Length of line 232 kilometres—146 miles—7 per cent guarantee from State on £1,000,000.—All was spent on construction,

judging by the number of tramway lines seen, one would suppose this fear on their part no longer existed. The factory is a large building close to the railway, and is fitted with first-class French machinery and appliances, for the turning of the produce of the cane to sugar and rum.

After Lorena we pass some stations with names quite as "jawbreaking" as the designation and title of some of your Sinhalese nobles. We have first "Guaratingueta," pronounced G-wara-tinge-tah. We pass the stations Aparecida, and Kozeira, suggesting the formerly devoted labours of the brotherhood of the Society of Jesus, and then we have Pindamonhangaba—pronounced Pinda-monyangah-ba. The name might be associated with the last two as having reference to the lower regions, but it is not so. It is an Indian name and looking at its termination has something to do with the name of a tree. The next station is Taubaté: here there is a considerable town, and no fewer than two hotels close to the station, and as the *down* train passes about breakfast time, and the *up* during the afternoon, passengers are notified in ornamental lettering on the walls, that they may enjoy a "square meal" at reasonable rates, and the railway arrangements admit of those who are inclined to take breakfast or dinner." We did not avail of the invitation so prominently offered to us to dine on paying, first because we did not wish to altogether destroy the enjoyment of what would be provided for us in the Hôtel de France in São Paulo—now run by an old acquaintance, Guilherme Lebeis, a German by birth who was a particular friend of our lamented G. A. C., when he made his pleasure trip here in the seventies, and second we had been presented—handed into the carriage window—from the platform in Rio with a sandwich loaf by a friend who is a partner in the large confectionery and dinner supplying establishment of Pascoal in Rio. Now this is not the sandwich loaf you mean—made of the closegrained material the product of fermented flour and water only, but a loaf which had been made like a roly-poly, the dough had been rolled out and beautiful slices of legitimate copeland applied formed into a loaf and cooked or fried all in one piece in the oven. This was simply delicious, and it had been broken on several times before we reached Taubaté.

An English gentleman has a concession for some 250 kilometres of railway line—on metre gauge and guarantee of 6% on the capital—which is to connect this town with that of Ubatuba on the coast between Rio and Santos. Already the line has been surveyed, and he expects soon to raise a company to carry out the construction. Another has a concession for a line to go direct north from here into the Province of Minas Geraes. By this means the produce of a large tract of country which has to find a seaport by going a roundabout way to Rio or to Santos, and suffer knocking about and delay at each change of gauge, will be immensely benefited.

Here also at Taubaté are layers close to the surface of bituminous shale, from which, if properly worked, paraffin and lubricating oils could be extracted. This has not altogether escaped the attention of some enterprising British and American gentlemen, and it to be hoped that after it has passed the experimental stage a large Company may be formed to develop this industry.

We stop in passing at a large town called Jacaraya with a large bridge in the middle of the town crossing the river Parahyba. The line continues on the right bank of the river, but some 10 kilometres farther on near the station Guarerema we cross to the left, and passing through

some heavy cuttings we enter on the watershed of the Tiete, which runs westward towards the tributaries of the River Plate.

As I have already mentioned we have been running parallel with another valley of the Parahyba separated from us by a range of hills on our left to the south of us and north of the Serra do Mar. This valley has its commencement north-west of the range of mountains in which we passed through the 13 or 14 tunnels, which I have mentioned on the Dom Pedro Segundo line after leaving Rio. Its sides are formed on the south by that southerly extending barrier the Serra do Mar, and on the north the south side of the range of hills which jointly with the river have been our companions for some eight or nine hours.

The head waters of the noble river are collected in this rugged valley. The river which they form runs north in a winding and rocky course, catching up the dark waters of many a mountain stream, draining thousands of acres of black and impenetrable looking virgin forests on the north side of the Serra do Mar, whose steep and rocky sides do not admit of cultivation of any kind; then it takes a bend to the north, issuing through many ugly-looking gorges and near where we are, Guarerema takes its eastern and southerly windings along which we have been passing since we had breakfast at Barra do Pirahy.

There are not many more stations to pass, soon the lamps are lighted in the carriages and São Paulo is reached about 7 p. m. The station is large, commodious and well lighted up with gas, from the supply furnished by an English company which has a concession for the lighting of the town, for a number of years. But the station is at an out-of-the-way corner of the town, and there are no good hotels near. The passengers who have no luggage rush to the tramway cars, and many of the knowing ones who have join them after giving their despatch note to some known porter. I and my companion are not so sharp, for by the time the parcels are all on the large table, and we notice all ours are in one heap by themselves, the tram-cars have got filled up and are gone. The cabs here can take only small things, so we have to engage a porter whose number we note. Cabby knows Hôtel de France well, and behind a pair of beautiful trotting mules we rush through well lighted streets past brilliantly illuminated shop fronts. The cab has scarcely time to stop when the door is pulled open, our bundles are seized, and before we have time to collect our wits the retiring appropriators of them are disappearing up a large staircase; but on our alighting in the porch a polite waiter informs us we are at the Hôtel de France, that our rooms are ready, and that on our intimating dinner will be served.

Guilherme Lebeis the present proprietor had not seen me for some eight or nine years, but he was prompt to recognise an old customer. He had been "mine host" for some years on pretty frequent occasions in the provincial town of São João do Rio Claro—generally known as Rio Claro,—now an ornamented and flourishing town some 120 miles farther into the interior. The regular dinner hour had passed, and there were very few who had come here of our fellow-passengers; the hotel owner was thus free to entertain us in conversation on "the good old times," on the changes which had taken place, the comings and the goings, and alas we had to mention the names of a good many who had gone to another place. Then railways had now spread themselves over the large elevated plateau which forms the Province of São Paulo. The number of coffee trees on a large plantation could oftener at that time—1873 to 1880—be re-

presented by five figures. Now nearly all fazendeiros count their hundreds of thousands and some exceed the million. Calculate ye old hands three hundred trees to the acre, calculate the high price of coffee and most of it cultivated by slave labour assisted before 1887 by only very few European colonists' families, and you will not be surprised that many who were formerly reckoned poor are looked on now as millionaires, and many who were then the most obstinate of slaveholders had latterly been amongst the foremost of emancipators who has given unconditional liberty to their people before the law of 1858 compelled them to do so. One can scarcely believe the rapid strides the Province has made in such a short number of years. Hear it oh ye stubborn use-and-wont permanent Secretaries of the British Colonial Office, and wait-a-bit Dictators of the British Crown Colonies: the moving cause is Railways.

It did not require the wine to inspire our "after dinner" chat, but by-and-by, I am nudged by my companion, who reminds me that this is his first visit to São Paulo, and he wants to see some of the town. Unfortunately it was past 8 o'clock and all shops were shut, the streets were lighted only by the gas lamps, and as we had to leave by train in the morning early, we soon returned to the hotel. We could not spare a day for sight seeing and visiting old friends, as the other members of the Commission on which we were engaged had preceded us into the interior some days before, and were waiting us there.

The rest of our journey must remain to be described in my next. A. SCOTT-BLACKLAW.

THE ORANGE GROVES OF FLORIDA.

There are many beautiful things amongst the wild plants and shrubs, some of which are occasionally seen under cultivation, and are known to English gardeners also. These include *Lantana crocea*, *Ipomea Quamoclit*, two or three species of *Opuntia*; three kinds of Fan-leaved Palms, one of which resembles *Chamaerops Fortunei* very closely, and is very abundant; the others grow to heights of 20 feet and upwards, and are very pretty when seen growing in large clumps. *Callicarpa purpurea* forms a fine object, laden with its purple berries, when seen in quantity. Magnolias form large trees, but none was in flower at the time of my visit. *Yucca filamentosa* is occasionally found. Oranges grow wild in some parts, but they are sour and worthless. *Quercus cocinea* (the Scarlet Oak) is very fine in December, when its leaves put on their bright tints; and two or three other species, which are evergreens, make very fine trees in some parts of the country, but where the sand is of very poor quality they are generally found only as low bushes, while underneath them the sand, if too poor to grow grass, is covered with a finely cut leaved species of *Lichen*, similar to what we sometimes find on Apple trees in England. *Opuntias* also grow in these places, and their roots extend 10 and 12 feet horizontally a little below the surface, while the whole plant may not be more than 6 inches high. In the more moist parts some of the grasses are very pretty, but they were all dried up when I saw them, and in this state they are often mischievously set on fire, causing wholesale conflagration. A few acres of a Pine forest when on fire forms at night a weird and strange sight, but it is not often the trees take fire from the burning grasses, unless they have been previously injured or are decayed; but the grass and herbs are cleared off for a time only, to spring up again after the first shower. These forest fires do a great deal of harm by consuming all the decaying vegetable matter that would otherwise go to enrich the sandy land.

Many of the wild flowers of Florida are pretty, and belong chiefly to Composite. Very few plants wild in Britain are found, but *Pinguicula vulgaris* is abundant

and beautiful. Two Ferns similar to *Pteris aquilina* and *Osmunda regalis*, a *Drosera*, which I believe to be *D. rotundifolia*, a *Rumex* resembling *R. acetosa*, a *Polygonum*, perhaps *P. persicaria*, and *Sphagnum Moss*, were all that I observed. *Poa annua* was nowhere to be seen, and Florida has none of our worst garden weeds, although I do not consider their own any improvement.

In the best vegetable grounds Cane-grass is very abundant, growing in the manner of our Couchgrass, but it is far stronger, the underground stems being as thick as lead-pencils, and the stems 18 inches in height. The creeping roots of this grass soon fill a piece of ground, if left alone for a time, when it is peaty and moist. Another species of grass has stems which ramify on the top of the sand, and grow at a great pace until they reach a length of 30 feet, rooting, and sending out sidshoots as they advanced, and in moist places this soon covers the sand completely, if left undisturbed. A kind of grass, or Sedge, called the Sand-spur, which seeds very freely, is also very troublesome. It derives its name from the fruits, which are covered with sharp spines, and have an uncomfortable trick of getting into one's boots, and other like places, and never let go their hold without much persuasion.

The timber is chiefly composed of *Pinus cubensis*, a coarse-grained hard wood, containing a good deal of turpentine. Another species of *Pinus*, but which is very local, is *P. inops* var. *clausa*, whose cones remain on the trees a great number of years, and give them a very peculiar appearance. *Taxodium distichum* is abundant in some parts, and is always found growing in the water, or close to it, sometimes it may be found where the water is 3 or 4 feet deep, but in such positions it is generally in a state of decay. The curious excrescences, or outgrowths, from the root, called "knees" in England, are abundant, and are dangerous to small craft. This tree gives the largest timber of any that I saw, and some specimens measured from 10 to 12 feet in circumference, while the species of *Pinus* are not found of more than 5 feet in circumference. I measured a dead tree of *P. cubensis* which was 102 feet high, and 4 feet 8 inches in circumference at 4 feet from the ground. *P. inops* does not grow so tall or so large as this. Evergreen Oak is occasionally seen of large size, but the wood is so hard they cannot work it up. It is called Live Oak, to distinguish it from *Quercus cocinea*, a tree which is also occasionally seen of a good size. Other kinds of timber, Hickory, Ash, and Cherry, are found in some parts of Florida, and the Red Cedar, which is so much used for making pencils; but I found on inquiry that this is scarce in large size, although often used as posts for fencing.

The chief drawback to the trade of the country is the bad state of the roads, which are so loose that it is impossible to walk any long distance, and riding or driving becomes a necessity; and there are no means of improving this state of things, for not a stone of any kind is to be seen, and in the larger towns the footpaths are made of cement, and in some instances of shells, which are spread on the sand, the streets being sprinkled with a water-hose, which causes some little improvement.

Among wild animals, deer, rabbits, tortoises—called by the negroes "gofers"—wild cats, opossums, skunks, &c., are more or less abundant; and away in the swamps bears and panthers are occasionally met with; snakes are abundant, and for the most part harmless. Doves, turtle-doves, quails, butcher-birds, mocking-birds, hawks of several kinds, buzzards, water-turkeys, herons, woodpeckers, storks, &c., and some rarer kinds, are found in the uninhabited portions.

Anyone intending to settle in Florida as an Orange-grower, &c., should be previously well instructed in the first principles of horticulture, as the most of the persons engaged in Orange growing out there have vague ideas as to what is required, and it is difficult to get from them any definite information. On the whole, I found the country very enjoyable and healthy; but intending settlers should be very careful to get on the highest land, towards the centre of the State. A good amount of capital is required, in order to get good returns, as it costs quite 50 per cent. more for

food than it does in England, and many other things are dearer than here. The work is mostly performed by negroes, who are paid at the rate of 5s. 2½d. per day, and they are not, as a rule, very industrious folk. There is a fair amount of English society in some parts, and a good many Americans from the North, who in many instances live in the Northern States during the summer.—W. H. DIVERS, Ketton Hall, Stanford.—*Gardeners' Chronicle*.

THE USE OF INSECTICIDES.

The following details are taken from current American publications:—Professor Lake's experiments upon spraying Apples and Pears with London Purple for the Codlin moth, give some interesting results. Four sprayings were given, the last one being August 12. The treatment had a decided benefit until "the latter part of August, but from that time to the date of picking (October 1), the affected fruit increased so rapidly, that the final results on some trees of both sprayed and unsprayed were about the same. We had considered it unsafe to spray later than August 12, but the results would indicate that had we omitted the first spraying, and given another in the latter part of August, effective work would have been done." The first spraying immediately after the falling of the blossoms, seemed to accomplish little or no good, as observations made for two weeks after the first spraying failed to give any indications of the moth's work in the fruit of either sprayed or unsprayed trees." The Codlin moth must behave differently in Oregon than in the eastern states. The summary of the season's work is as follows:—"1. Early spraying—just after the blossoms fall—is useless. 2. A mixture of 6 oz. of London Purple to 100 gal. of water is better than a stronger one. 3. The mixture should be kept thoroughly stirred while being used. 4. Young and vigorous foliage is more susceptible to injury by burning from the application of arsenite than is older or less vigorous foliage. 5. Spraying as late as September 1, or even later on winter Apples, is desirable as far as fighting the moth is concerned. (There may be some danger in such late spraying, however, and this is one phase of the subject for next year's work.) 6. All fallen Apples that are affected should be destroyed daily. 7. The cost per tree for each spraying will average, in small orchards, about 3 cents. In larger orchards it would be less." *Bulletin No. 3, Oregon Experiment Station.*

Woolly Aphis.—Woolly aphis upon Apple trees was destroyed by a spray of lye-water—1 lb. of concentrated lye to 3 gal. of water. Kerosine emulsion was not found to be a satisfactory remedy.—*Bulletin, Oregon Experiment Station.*

Fighting Codlin Moth in Iowa.—Mr. Gillette controlled a small and isolated plantation of Duchess Apples, upon which careful experiments were made with London Purple and water, Paris Green and plaster, and carbolised plaster. In every case treated trees gave better fruit than untreated trees. The poorest results were obtained from the use of carbolised plaster, there having been a saving of 34 per cent. of fruit liable to injury. "This remedy could hardly be recommended, even if very good results were obtained, as it does not kill the insect in any of its stages, but simply repels the moths, which seek the fruit of neighbouring trees, on which to deposit their eggs." Next best results were obtained from the London Purple, which saved about 80 per cent. of the fruit. One pound of poison was used with 128 gallons of water; some of the trees were sprayed once, and some twice. Best results followed the application of Paris Green and plaster. This saved 94 per cent. of the fruits liable to attack. "I believe that no one has ever reported on a remedy for the Codlin moth, which, by careful counts, has shown as good results as this." One pound of Paris Green was used with 100 lb. of plaster. This was thoroughly dusted over the trees, from one to three times. Mr. Gillette thinks that two applications are ample. "Poisons cannot be applied by this method

as rapidly or easily as by means of a force-pump, but it has the advantage of costing nothing for apparatus, and the trees can be dusted quite rapidly from a wagon, by driving on the windward side of the row. This method of applying the poisons would be especially useful where only a few trees were to be treated, and where it is thought that a pump cannot be afforded." These results with the dry poison are certainly remarkable, and they indicate that a distributing-machine like the lately perfected Strawsonizer, of England, may yet find use and favour in our orchards. At all events, these experiments afford a new proof of the efficacy of arsenites in the combatting of the Codlin moth. *Bulletin No. 7, Iowa Experiment Station.*—*Gardeners' Chronicle*.

STRAWBERRY LEAVES AS TEA.—A new industry has sprung up in Germany with the young leaves of the wild strawberry plant. Having been carefully dried, they are used instead of Chinese tea, and are said to approach that beverage very closely in taste. An addition of young bramble and wood-ruff leaves is said to add to the excellent flavor of this most inexpensive of teas.—*Manchester (Eng.) Grocers' Review in American Grocer.*

PISCICULTURE.—Some time ago Mr. Le Mesurier of the Ceylon Civil Service, was deputed by his Government to proceed to Madras and secure the fry of the *Labeo*, a species of fresh water carp, and of the *Gourami* native of the Malaccan Islands, and introduced into Madras by Sir William Denieon while Governor of the Presidency. The fry was wanted to stock the fresh waters of the colony with. This mission Mr. Le Mesurier successfully accomplished with the aid of Dr. Thurston, taking back with him a number of fry not only of *Labeo* and *Gourami*, but of other fish much esteemed as food. The introduction has evidently been successful, for we find that Dr. Thurston has been requested by the Ceylon Government, through the local authorities, to procure and forward the fry of the *Cirrhhina Chirrhosa*, or "white carp."—*Pioneer*, June 9th.

The writer of an article in the *New York Forum* entitled "When the Farmer will be prosperous," looks forward to an early date when the United States will have to import large quantities of which to feed its ever growing population. The acreage per head of population necessary to produce cereals and other agricultural produce required for home consumption is calculated at 3.15 acres. In the ten year's preceding 1884 the cultivated area had been extended at an average rate of something over eight million acres a year, the result being that at the close of that period there was a surplus of 20,248,000 acres under cultivation beyond the aggregate required according to the above calculations. But during the succeeding four years the rate of extension fell to a little under three million acres a year, so that the surplus area was reduced to 12,888,000 acres between 1888 and 1894, the writer is of opinion, the rate of extension will undergo a still further diminution, but taking it at three million acres per annum, and the ratio of increase of population at 27 per cent per annum, there will at the end of the period remain only three acres of cultivated land per head of population, instead of the required 3.15 acres. To keep up this cultivated area to the requirement of the growing population would necessitate an annual addition of six million acres of arable land, and the writer does not believe that it can be found, though of course higher prices would bring inferior soils under the plough. This is, indeed, good news for both the British farmer and the Indian ryot.—*Indian Agriculturist*.

GOLD MINING IN SOUTH AFRICA.

A correspondent writing from Barberton says:—

"These fields ('Delaap'—or Barberton) though old^{er} are of very much less importance than those at the 'Rand' (or Witwaters Rand) which have sprung so wonderfully into prosperity—and now lately are under such a deep wave of adversity. This gold mining is a wonderful sort of business, scarcely business at all; it is a mass of speculation and manœuvring on a thin basis of actual mining. I often wish I was in some other line. I was not sharp enough to make a lot when the first rush occurred, and money could have been made; and since then, the reaction has been continuous and severe. Everything is very dull, and no one can predict when the next wave of prosperity will be. Capital seems to fly about the world like a swarm of insects, alighting now on one industry or locality and now on another, alternately helping and blighting. At present South African mines are out of favor with capitalists, but I suppose their turn will come again, when they increase the output of gold. That is the great thing, and it takes years of work and experience like building up any great business."

NOTES ON PRODUCE [AND FINANCE.

WHAT IS A BLENDED TEA?—The action of the Ceylon Association in prosecuting tea dealers for selling tea not correctly described has caused a flutter in the retail trade. One correspondent asks:—"May I ask what is a Ceylon blend?—or, as we are now learning what some so-called Ceylon blends are, I will vary the question, and ask—What should a Ceylon blend be? Should it be a blend of various Ceylon teas, or a blend of which Ceylon tea forms a prominent or principal part? Men are going round and trying to frighten grocers by saying that if they sell as a Ceylon blend an article containing any other tea than Ceylon they can be prosecuted. Now, the decisions in the cases of Paget and Figgott and in Kearley and Tonge were given upon issues differing from that now raised. For years grocers have safely sold as an Indian blend teas that were Indian only in part. If the word blend protected the mixture of Indian and China tea why should it not protect the mixture of Ceylon and Indian? Although the scare which is being created is ostensibly in the interests of Ceylon planters, it may be questioned if it will ultimately prove to be so. Another point raised in Kearley and Tonge was that this firm did not import their own teas though their label said they did. But surely it is not an indictable offence to style oneself an importer. Is every aspiring baker, or notable porkbutcher, or enterprising milkman, or worshipful greengrocer, who on the strength of having purchased a dozen pounds of tea from a neighbouring grocer calls himself 'an importer of tea' to be hauled before a magistrate for this heinous offence? This is mighty fine for the lawyers, but I hope you, sir, will protest against this dangerous and revolutionary doctrine. Should not these assertions be taken in a Pickwickian sense? It is something new for tradesmen to be called on to prove their assertions or be mulcted £10, and cos' £5 5s." Another correspondent writes to the *Grocer*:—"In consequence of the prosecution of two firms of wholesale tea dealers at the instance of the Ceylon Tea Growers' Association (Limited), under the Merchandise Marks Act, for misleading descriptions of Ceylon packeted teas, there is a deal of misunderstanding among grocers as to what they should and should not sell. I am selling a packeted tea bearing the following description:—"Ceylon Blend." The firm from whom I buy the tea guarantee it to contain 70 per cent. of pure Ceylon. Taking it for granted that such is the case, can I be convicted of false description under the aforementioned Act?"

ENEMIES OF TEA AND COFFEE.—Dr. Mendel, of Berlin, a well-known physiologist, has made an attack on coffee and tea, especially the former. So far from believing that two pence off the pound of tea or coffee will reduce the "drink bill," he contends that, by

permitting the poorer classes to buy more of these stimulants, the cheapness will conduce to the spread of what he has described as "coffee inebriety," a form of intoxication which very frequently leads to the more alarming, but not actually more dangerous, form produced by alcohol. Dr. Mendel does not say much about tea but he infers a great deal. Eminent physiologists must attack somebody or something, otherwise their occupation would be gone. Tea and coffee, like other good things, require to be taken in moderation. The increase in the consumption of tea vexes the souls of believers in the good old days of John Barleycorn in this country. A correspondent of the *St. James's Gazette*, who might—by reason of his sentiments—be a brewer or distiller, writes as follows:—"Any one who watched the recent procession, especially the teetotal varieties, must have been pained to notice the stunted forms and poor physique of the greater part of the crowd composing them. Stalwart men were conspicuous by their absence, and the greater number would fail to fulfil even the present very easy conditions of military service. A hostile foreigner would have rejoiced at witnessing what, if not checked, may prove the ruin of England. Though much has been done for them by increasing wages and lessening hours of labour and paying more attention to sanitation, still the habits and mode of living of our town population fully account for their degeneracy. They marry while in their teens and rear their squalid children on tea. The women especially drench themselves with tea to the ruin of their nerves and digestion. Though no one is more willing than I am to admit the evils of intemperance, I firmly believe that tea has done more harm to the working classes than beer, and nearly as much harm as spirits." The inference that our national decadence has set in and that we are becoming a nation of dwarfs because we drink too much tea, is droll.—*H. and C. Mail.*

THE PRECIOUS METALS.

The idea propounded by a correspondent, that the supply of silver in the world and its annual production are limited rather than excessive, is novel and startling. Most of us have been under the impression that nations on the Continent of Europe were embarrassed to know how, without enormous loss, they could dispose of the accumulated silver which they had demonetized; while recent legislation in the United States was undoubtedly promoted in the interests of the "Silver Kings" of Nevada, who found their product depreciated by the demonetizing policy in Europe and over-production in America and Australia. It would require more and better authenticated facts than have been yet adduced to lead us to abandon this conviction, and the additional one that when the present boom caused by the proceedings at Washington has abated, the value of silver and that amount of "exchange" which depends on it will revert to the standard which recently prevailed. While the production of silver has largely increased in the past forty years, that of gold does not seem to have much exceeded an average of about twenty to twenty-five millions per annum. This limited production of an article which in Britain has been long the sole standard of value, and which has now been adopted as such by many of the leading Continental nations, has naturally led to an appreciation of gold over silver, far beyond the proportions which once prevailed, and which bimetallicists fondly hope they can restore, of 1 to 15 or thereabouts. Mulhall, in his "Progress of the World," published in 1880, brought together what we suppose are fairly accurate figures regarding the world's accumulated wealth and the annual supply of the precious metals, at which it may be interesting

to glance. Under the heading "Gold and Silver," it is stated:—

"These two metals, which have materially aided the cause of progress, have suffered such mutations of fortune in the nineteenth century, that it may be worth while to study their antecedents. Michael Chevalier is of opinion that at the period of the discovery of America the total amount of gold in Europe was only £12,000,000, and of silver £28,000,000. At that time on ounce of gold was worth ten of silver, but as soon as the conquest of Mexico and Peru by the Spaniards poured a flood of silver into Europe this metal lost one-third of its value. In the seventeenth and eighteenth centuries gold stood for fifteen times the value of silver. A new epoch occurred with the discovery of gold in California and Australia, but silver never recovered its position as a precious metal."

We can remember the fears entertained of the depreciation of gold when California and Australia began, each of them, to add nine or ten millions annually to the supply of gold in the world. But such was the simultaneous expansion of commerce that no such result followed, and gold has retained a quality of permanency most valuable in an article adopted as a standard or representative of value, which really rests in the goods which nations or communities barter. Mulhall gives a table, the figures of which show that since the era of Columbus, 1492, the world's wealth in gold has risen in value from £20,000,000 to no less than £1,120,000,000 in 1880. The progress of silver in the same period of nearly four centuries has been from £40,000,000 to £1,612,000,000. The aggregate increase has been from £60,000,000 to the enormous value of £1,832,000,000. We quote again:—

"During 300 years of the Spanish dominion in America the mines of Mexico, Peru, and Brazil yielded a little over £1,200,000,000, of which three-fourths were silver. Since Marshall's discovery of gold in California (1848) there has been an increase of £950,000,000 in precious metals, as follows:—

	Gold.	Silver.	Total.
	£	£	£
United States	282,000,000	74,000,000	356,000,000
Australia	252,000,000	...	252,000,000
Spanish America	20,000,000	160,000,000	180,000,000
Russia	93,000,000	3,000,000	96,000,000
Other countries	11,000,000	55,000,000	66,000,000
	653,000,000	292,000,000	950,000,000

Mulhall calculates that the production of the two metals had, in the case of gold, gone down from £27,000,000 per annum in 1852-1861 to £16,000,000 in 1872-78; while the production of silver had risen from £8,000,000 per annum in the former period to £12,000,000 in the latter. Since 1848 the calculation was, that notwithstanding gold had doubled in quantity and silver increased only one-fourth, the purchasing power of gold was only 20 per cent reduced against 33 per cent depreciation in silver. Increased production of silver and the demonetization of the metal both contributed to lower the value of the secondary precious metal. To meet the wants of increasing trade, coinage had in the thirty years trebled, the figures in 1878 having been, for

Gold coins	£959,500,000
Silver "	£620,000,000

Total...£1,579,500,000

To meet the demand for coinage, stocks of the precious metals in excess of the yield of mines had been drawn upon. But a process of melting down coins goes on continually; and it was known that between 1840 and 1880 India had absorbed £105,000,000 of gold and £238,000,000 of silver. Were the precious metals hoarded in India released, the value of gold would be somewhat

and that of silver considerably affected. Mulhall calculates that about one-sixth of the bullion of the world is locked up in banks, mainly as representing paper in circulation, of course. All the nations of Europe import bullion except Russia, which possesses gold mines, the produce of which does not seem to be very accurately reported. And in dealing with imports and exports of bullion and the balances in different countries, we must never forget the large sums of money carried by passengers to and from all parts of the world. If the silver is, as our correspondent tried to make out, not over-abundant but the reverse, conditions must have greatly changed since Bismarck stopped the sale of the German demonetized metal because such sales were being made at a loss of 15 per cent. American legislation, demanded by the farmers, who believe that plenty of currency means good prices, as well as by the owners of silver mines, has, for the time, given silver a boom; but bimetalists and others must not "lay the flattering unction to their souls" that this is likely to last or that silver is likely to recover its former relation to gold.—The extract from the *Encyclopadia Britannica* appended to the letter we are noticing affords further information on this complicated question. While the value of silver fluctuates so greatly and is so uncertain, no wonder if the great and wealthy countries of the world refuse to use it as, alternatively with gold, a second standard of value.

CEYLON UP-COUNTRY PLANTING REPORT.

THE PLANTER AND HIS COLOMBO AGENT—RISE IN EXCHANGE—PRICE OF TEA LEAF—MR. LIPTON AND HIS TEA TRADE—WHAT WE MAY HEAR NEXT—A CASE OF ALCOHOLIC FAMINE—WHAT THE WRITER FEELS RESPECTING IT—COFFEE CROPS—WEATHER.

July 31st.

The planter has long regarded the Colombo agent as his natural enemy. He could drill into his profits with as little consideration as a hard-headed borer makes its way into a cacao pod; and when the planter showed any tendency to exuberance of flush, the Colombo agent was able to keep it well in hand, and put the best sucking bug to shame by his powers of absorption. For keenness in looking after number one he was held to be unique: his like not easily to be found in creation. When a story of mean smartness was told upcountry, if it were fathered on the Colombo agent it took at once and became a portion of the orthodox canon which was regularly recited when planters were wont to gather together. Of late, however, the Colombo agent's notoriety has been somewhat on the wane, and—it is with grief I have to record it—his place is being taken by the planter who buys leaf. Before the rise in exchange, leaf was fetching from nine to ten cents a pound; but when the Americans meddled with our silver and we had to face the dearer rupee, the planter who buys leaf fixed his own price. In doing so, he very often not only covered the difference of exchange but so much for his panic as well; and it became pretty evident to the seller that whoever was to be cornered, it was not likely to be the man who was buying the leaf. "Talk about the rapacity of Colombo agents," said one to me who was told that 8 cents was all that he was to get in place of the decent 9½ cents—"talk of rapacity: why, when you begin to sell leaf to your neighbour, and prices fall or exchange rises, nothing can beat him for extortion." I suppose that there have been more disagreeables among planters over the purchase of tea leaf than over everything else put together. The

only way which I know to get out of the difficulty is the Central Factory, which is the property of the contributing estates, and which runs and divides its profits, as a separate concern.

The following about Mr. Lipton is from a home correspondent:—"I intended sending you a cutting out of an evening paper about Mr. Lipton's great purchases in Ceylon, but you seem to know all about him already. He is a wonderful man, and I don't think you would know the tea he sells to be pure Ceylon tea. It may be pure when it leaves the island, but not when it reaches the tea-pot. Mr. Lipton has quite a regiment parading the Glasgow streets just now advertising his goods. About twenty or thirty men rigged out in white suits, red turbans, red and yellow umbrellas, and a commander on horseback with his face coloured to match his turban. There must be a good profit off the tea after all." The next thing we shall hear of will likely be that an arrangement has been made with Mr. Lipton's men in Ceylon, that when at any time they go home on leave, part of that leave will require to be spent in pushing the tea trade in the ranks of the above-mentioned corps. Only the V.A.'s should be mounted, and this privilege should be granted on the understanding that while on duty all orders should be given, with the view to impress the public, in a stentorian voice, and in the Tamil tongue; uniforms to be supplied at Mr. Lipton's expense, and like the historical toothbrush to "belong to the ship"!

A friend of mine has a pathetic tale to tell me of a popular resthouse run out of drink. It seems that this poor thirsty soul arrived after a journey of something like twelve miles in a pony-bandy with bad springs. He had been smoking all the way to keep himself cheerful. The boy as usual was nowhere, and a thirsty throat was made drier, in shouting around for him. When he did appear, a whiskey-and-soda was ordered: but there was none. The visitor then said he would have beer, but the reply was "Beer all done, sir." "Then what have you?" "Got nothing, sir! plenty of gentlemen here yesterday, everything drink!" My friend, I suppose, must have looked desperate, when this awful truth was made known, for the boy immediately assured him that they had plenty of empty bottles! He has been puzzled ever since to know what there was in his appearance to justify that boy in fancying that a smell alone would do him good. It is rather funny the idea of his expecting sympathy from me when an alcoholic famine is on, as my settled opinion is, that it would do a lot of good if this kind of scarcity were more general.

I was at one time visiting the menagerie of an Indian Rajah, which was a poor, poor affair. The place was badly kept, the animals few and dirty, and the attendants were numerous. As I was leaving in disgust the guide pressed me to wait and to see the tiger. Reaching his haunt, the fellow stopped and pointing to a big empty cage, said, "This is the tiger's cage, but the tiger is dead!" I fear my friend looked with as much disdain on the empty bottles as I did on the vacant cage, and to this extent only can I enter into his feelings.

Coffee is ripening up a little, the fruits of the first blossom. The sample of bean however is somewhat small, but if there will just be plenty of it, that need be no cause for complaint. Liberian dried in the cherry sells locally very much better than when pulped. The Moor buyers readily give R5 a bushel, and as it takes about three to make a bushel of parchment selling it as cherry coffee is very much more profitable.

The weather is simply perfect for planting purposes.

PEPPERCORN.

GOLD IN AUSTRALIA AND INDIA.

The following extracts from recent letters on the Victorian gold fields by a special correspondent of *Engineering* may be of special interest at the present time:—

That some of the Sandhurst people have learned to mine and crush quartz economically is beyond dispute; in fact, in a few cases, the mine records are astonishing, and point a most useful lesson to miners and millmen all over the world. The *St. Mongo* Mine at Eaglehawk being notably one of this class, some particulars concerning its work for the past half-year supply the lesson. The quartz in this mine is not in a defined lode, the western wall is the only one marked; the eastern wall is entirely broken up; from 600 ft. to 803 ft. the deposit is almost vertical, then it underlies west. The quartz is nearly pure white intersected by bands of slate, and both show pyrites but little or no gold, the width of the deposit varies from 3 ft. to 35 ft.; a general fair average would be about 14 ft., and of this only about 6 ft. is put through the battery, the remainder being barren bands of rock. For 3½ years this mine has worked on quartz, giving a yield of under 5 dwt. of gold to the ton; on this return some £28,000 has been paid in dividends; the machinery has been kept in thorough repair, and the mine properly worked and developed.

Another of the typical mines on Sandhurst is "Land-sell's 180," the depth of the shaft was on July 31st, 2,590 ft. This is the deepest mine in the Southern Hemisphere, and if I mistake not the deepest gold mine in the world.* When the property came into the hands of Mr. George Landsell, the present owner, the shaft was at a depth of 460 feet, and no machinery on the ground; all the winding was done by a horse "whim." During Mr. Landsell's tenure of the property, he has taken out over 160,000 tons of quartz which have yielded 88,346 oz. of gold the value being about £353,384, and he is still working the mine vigorously. The correspondent of *Engineering* concludes his article as follows:—"Where mines have to bear the burden of supporting boards of ornamental directors each drawing £100 or 200 per annum, together with highly paid secretaries, managers, consulting engineers, staffs of clerks, and costly offices, &c., other and richer fields than those of Great Britain or even the majority of the present fields of Australia, must be sought before subscribing shareholders can expect a return in the shape of dividends." These extracts contain both encouragement and warning to our local gold Syndicates. It is evident that if quartz containing only 5 dwt. of gold to the ton can be raised 2,000 ft., and crushed probably in Australia with expensive labour, to contend with quartz at least equally rich should yield a handsome return here, with care and economical supervision. The Mysore mines, which are only 200 or 300 feet deep are said to require 20 dwt. to the ton to cover cost and we believe the special correspondent of *Engineering* has pointed out the cause of this, in the concluding paragraph which we have quoted.—*Indian Agriculturist*, July 19th.

COCHINEAL.

The Belgian Consul-General in the Canary Islands devotes a very considerable portion of his report to cochineal, describing in detail its production, the different commercial classes of the product, and its analysis, also enumerating the various substitutes which are now in use in place of cochineal, as well as a tabular statement of the exports, price per pound, and total value for each year from 1831 to 1888. In 1831 only eight pounds were exported, for a value of 80 francs; the maximum export was reached in 1869, when it amounted to 6,076,869 lb. for 19,749,824 francs, fluctuating then for several years between four and five million pounds, declining in 1886 to 2,330,947 lb., in 1887 to 2,169,341 lb., and in 1888 to 1,735,200 lb.—(*Recueil Consulaire*, vol. lxxix, part 4, 1890).—*Chamber*

* The deepest mine of any kind in the world, we suppose, unless the record is beaten by a salt mine in Germany?—*Ed. T. J.*

of *Commerce Journal*, July 5. [The dye is yielded by a coccus allied to our coffee bug, but which feeds on a species of cactus. The aniline dyes have adversely affected the trade in this substance as well as that in Indian and other madder.—Ed. T. A.]

CATTLE AND CATTLE MURRAIN IN CEYLON.

Our correspondent "Truth" is very much mistaken if he supposes that we do not appreciate, as much as he does the value of cattle for industrial and food purposes. The difference between us resolves itself into a question of the effectiveness of measures of quarantine in stamping out disease. Such measures and the destruction of affected herds have proved efficacious in countries like Britain, where the humane principles of Christian civilization are applied to the treatment of animals and where cattle are warmly lodged and amply fed. In such countries cattle disease is not indigenous, as it is in the Russian steppes, in most parts of India, and most certainly in Ceylon, although our correspondent writes as if, like cholera, cattle murrain was always introduced from India. We can prevent cholera from assuming an epidemic form in Ceylon by segregation and other measures, more or less heroic, because the dreadful disease is not of local origin and we are able generally, at once, and effectually to deal with the first cases introduced from India. But as regards rinderpest and other forms of cattle disease we are comparatively helpless, because disease, in the germinal form at least, is ever present and ever will be until the natives learn to feed and fold their cattle according to the dictates of humanity and the principles of enlightened science. In recent letters from Nuwara Eliya the writers have contended that the measures of quarantine and restriction as to feeding grounds eventuated in a greater destruction of cattle than was due to the epizootic disease against which the precautions were taken. The difference between Britain and Ceylon is accentuated by the fact that in the one country cattle are bred and "byred" and fed with reference to consumption as beef. Here their chief value by far is with reference to their employment in agricultural operations and, notwithstanding the advance of railways, for draught purposes on roads to a very large extent. Some years ago we had to point out to this very correspondent that the stringent measures he advocated for the repression of an epizootic, if carried actually into effect, would put a stop to the principal traffic and commerce of the island. The difficulties still remain, as the Nuwara Eliya case shows, and we confess that our own hopes of improvement rest on the gradual disappearance of disease, as the natives are taught by Government measures and individual efforts and as they profit by such teaching, to add adequate shelter to plenty of nutritious food in the treatment of their cattle. Our readers are aware that we have frequently advocated the utilization of some of the tanks which have been constructed and reconstructed of recent years, in the irrigation of grass meadows for the provision of cattle food as well as for the growth of rice to feed the owners of cattle. Then much could be done by clearing rice grounds left fallow and also village reserves of all low jungle and weeds so as to encourage the growth of the more nutritious of our native grasses some of which are excellent. In addition to these, why should not the cultivation of the valuable water grass, so common in Colombo be extended to the swampy lands of rural districts? Government, through its Agents, could do much to help on reform by

offering prizes for such culture; for the best and cleanest kept village feeding grounds; for the best constructed and most carefully attended cattle sheds, as well as for the best bred and best fed, largest and strongest cattle. At present so-called wooden ploughs which merely scrape the surface soil in the shape of mud are used to the exclusion of real ploughs calculated to stir effectually six inches of earth, however light such ploughs may be, because of the chronic weakness of the badly-fed and ill-tended draught cattle. In a private letter our correspondent denounces Sir Arthur Gordon who did so much for irrigation, because he did nothing calculated to improve the breed of cattle. We suppose our late Governor would adduce the supply of pure water in so many places as a great step in advance for the improvement of the health of cattle; and there can be no doubt that the more rice is grown by irrigation, the greater is the supply of food for cattle in the shape of straw, husks and occasionally grain. But we quite feel that in addition to due attention to irrigation as well as other modes of culture, our new ruler would do wisely and well in taking up with energy the cognate and no less important problem of improving the breed and condition and saving from periodical destruction by disease the cattle on which so much of the agriculture and internal traffic of Ceylon is dependent. We feel sure that it will be the inclination as well as the duty of Sir Arthur Havelock to initiate and further all the direct efforts possible to secure such desirable objects. It is for this reason among others, that we have urged the widening of Irrigation into Agricultural Boards, but if a permanent change of that kind is not contemplated at present there ought to be a special effort made in reference to cattle disease.

Meantime let it be specially noted that not only every tank constructed, but every mile of railway, carriage road, bridge and village path by which the country is opened up and intercourse and commerce facilitated, tends not only to improve the condition of the people of Ceylon, but to render possible such measures as will lead to the improvement in breed and condition and the protection from disease of the cattle, which are not merely a source of wealth in themselves, but on the presence of which in sufficient numbers and in good working condition the prosperity of the country's agriculture and commerce so largely depends. One of the ablest of Sir Arthur Havelock's predecessors, Sir Hercules Robinson, who did so much for systematic irrigation, recognized so fully the importance of this cattle question, so closely allied to the other, that he appointed a Commission to report on the subject. That Report, which embodied matter of considerable interest, might well be reprinted as an extra Sessional Paper now, and made the basis for the conduct of investigation, report and recommendations by a fresh Commission, of which Mr. Wm. Smith ought to be a member as he was of the previous one. With him might well be associated Mr. Green of the Department of Public Instruction, Mr. Driberg of the Agricultural College, and Messrs. Ramanathan and Seneviratne as representing the two great sections of the native community. If a Commission of seven should not be deemed too unwieldy, another civilian who has taken special interest in the subject might be added, as well as a well qualified member of the general community. On this occasion the Commission need not be peripatetic. It can collect much and valuable information, suggestive of wide improvement, while sitting at Colombo.

After having written the foregoing we read for the first time the English version of Mr. W. A. de

Silva's pamphlet on the treatment of cattle, with the manuscript remarks of our correspondent "Truth." Considering that Mr. de Silva, writing for natives, was bound to deal with the very elements of the subject, we think his performance creditable and calculated to be of considerable use. We find that he anticipated our suggestions respecting the cultivation of water grass and the clearing of village feeding grounds. Amidst much stringent comment our correspondent approves of a good deal of Mr. de Silva's observations and recommendations on the treatment of cattle in health. But, as we anticipated, when epizootic disease comes, "Truth" would not palter with it by treatment: he would stamp out disease with the life of the animals affected. The extent to which this would have to be done and the enormous amount of the remuneration necessary would be the difficulties.

When cattle murrain breaks out in Ceylon (generally in years of abnormal weather), it does not appear in one or a limited number of localities, where a few affected herds could be sacrificed and the disease stamped out. Disease occurs in so many centres simultaneously, and becomes at once so widespread, that the stamping out process would require the extermination of the cattle of whole districts, a process which would be too costly for Government to resort to (if the principle of compensation were recognized), even if popular opinion amongst the native cattle-owners did not take the form of serious and active resentment against measures which they are not yet advanced enough to understand. Our correspondent "Truth," evidently holds the opinion that rinderpest is no more indigenous than cholera; that it always comes to us from India with imported cattle; and that, therefore, it is capable of being cordoned, stamped out and prevented from spreading. A Commission might now do valuable service in collecting evidence and instituting research such as would settle differences of opinion on this question. The Commission of 1869 were unable to say when or whence cattle murrain came to Ceylon, only suggesting that with increased imports of cattle from India in the years following 1840, it may have been "re-introduced." For the minor diseases, treatment and medicines such as Mr. de Silva recommends may be more or less efficacious, although some of the recipes do look empirical. But surely Mr. de Silva has reason on his side when contending that the small, wiry Sinhalese cattle have merits of their own, such as agility and swiftness when used in the native carriages called hackeries, and that with good shelter, pure water, nutritious food and careful and humane treatment generally, they are capable of considerable improvement. These small but symmetrical and lively "zebus" (not zebras, as sometimes printed) have been greatly admired by visitors. One of the chief measures recommended by the Commission of 1869, the provision by Government of bulls of superior breed, failed from the apathetic indifference of the natives. This immobility it is which has to be conquered, in regard to all and every proposed improvement, and in an oriental country like this we expect servants of Government not only to hold out inducements such as we have already indicated, but to use a certain amount of benevolent coercion: compelling people who occupy very much the status of children to do what is beneficial to their own interests and the public weal, and to abstain from practices which are injurious to both. The difficulty, as all experienced persons know, is to obtain a native agency which would not pervert powers of compulsion into an instrument of oppression. The Nellore and some other breeds of Indian cattle are beautiful milkers and splendid for

draught, and there can be no question of the superiority of British and Australian cattle. But Mr. de Silva is correct in indicating that in proportion to superiority of breed as judged by size, so is the cost of feeding and keeping the animals. At Pallekelle in Dumbara; in the once famous sheds on the Mattakelle patanas in Dimbula; and in other places in Ceylon, we have seen as fine collections of pure imported and half-bred cattle as eye could wish to look upon; but the question for a Commission to ascertain would be,—did such cattle, kept, as they were, at large expenditure of money,—pay, either as manure or milk yielders or as converted into butcher meat? The history of experiments in connection with that unfortunate failure, the Prince Alfred Model Farm, is not in popular estimation encouraging, after all qualifications are made. The difficulty in this country is to get even Europeans to give a good price for a superior article. Demand is, after all, so limited amongst the beef, milk and butter using section of the community that supply can easily be made to outrun it. Such are some of the difficulties to be contended with, in cattle keeping and dairying. In the days when heavy manuring of coffee was in vogue, we heard of a case where the bearing of an estate was brought up from a normal yield of 5 or 6 cwt to 13 cwt per acre! When all the cost of cattle keep, with preparation, carriage and application of manure, was calculated, however, the balance sheet shewed a considerable loss! When the bad times of the coffee enterprise came, magnificent establishments of cattle were broken up, and the animals, thrown in large numbers on the market, were sold for a song. There can be no doubt of the benefit which tea would derive from liberal applications of cattle manure, but it does not accord with our observation that cattle are often kept on tea estates, save where the existence of adjacent patana and other circumstances are exceptionally favourable. Grain, especially leguminous grains and poonac, with cotton seed, are valuable as cattle food, but price puts a limit to the use of rice, maize, pulses, poonac (especially gingolly poonac), except for animals used for heavy and steadily profitable draught purposes, or by well-to-do persons for dairy produce. Our correspondent will think we are acting the part of "devil's advocate", but it is well that all sides of the question of cattle breeding and cattle keeping should be looked at.

We proceed to notice some of the criticisms of Mr. de Silva's pamphlet by our correspondent, who asserts that native meadow grass is unknown to him. It requires courage for a mere lay editor to differ from an expert, but we venture to assert that if our native grasses got fair play by being kept clear of weeds, and especially if they were irrigated by ordinary water, or better still with liquid manure, they would supply excellent cattle feed. That they could be converted into beautiful coverings for lawns, the writer knows from the fact that in the green turf of the grounds of the Melbourne Exhibition of 1880-81, he recognized one of the grasses most common in Ceylon. We would remind our correspondent, too, that, included in the Report of the Commission of 1869 was a paper on the value of Indigenous Grasses supplied by the late Mr. Thwaites of the Peradeniya Gardens. We are not speaking of the wiry grass common on some of the mountain patanas, which in its natural state is about as "fusionless" stuff as could be found in the shape of grass. But even this, like the still more common mana grass, yields fairly good cattle feed in the shape of the young stalks which spring up after a patana burning. But as to the merits and demerits of the prairie grasses of Ceylon, so

undoubtedly inferior to the prairie grasses of America and Australia, no one can speak with so much authority, founded on experience, including the application of fertilizing substances, as our correspondent himself. He can tell us whether Thwaites was correct in stating that the wiry patana grass, and other coarse grasses, so poor in nutriment in their growing state and so little relished by cattle, were capable of great improvement when converted into hay and then chopped and pounded? Mr. de Silva advances the proposition that "the cause of local cattle being generally of a poor type is not owing to any imperfection in the variety itself, but because they have degenerated by bad treatment." Our correspondent must surely have written rather rashly when he penned the following criticism: "Not so: they are the product of the soil." Surely the cattle are as much the product of treatment as of the soil? The Report of the Commission of 1869, to which we shall refer in another article, explicitly recognized the degeneracy of the local breed of cattle as due to bad treatment which specially predisposed them to disease. Beyond question the Sinhalese breed of cattle, during ages of starvation, in the two senses of inferior food and insufficient protection from the weather, have degenerated, and are capable of very considerable improvement, with reformed treatment, as draught animals, as flesh suppliers, and even as milk yielders. To come to the opposite conclusion would be the pessimism of despair; for we do not suppose that our correspondent contemplates improving the indigenous cattle off the face of the earth and superseding them by introduced stock? The country is scarcely prepared for measures even less revolutionary. We have always felt that the Sinhalese people were inexplicably indifferent to the value of milk as food, and we have not the slightest doubt that to neglect of this most valuable source of nutriment is due a large portion of the excessive mortality amongst children in Ceylon. But we know that native cattle, when properly fed and treated do become fair milkers, and it requires only a little sum in arithmetic to prove that a Sinhalese cow yielding half-a-dozen bottles of milk per diem and consuming food only in proportion to its bulk and yield may be as good an investment and a far safer one than a big European, an Australian or an Indian animal, the first cost of which is heavy and which is costly to keep. Let us have better breeds introduced by all means, but surely on the improvement of the native cattle, and on measures founded on faith in their capability of improvement, our main hope of successful effort must rest? On some points our correspondent is at one with Mr. de Silva; and while he characterizes cotton seed as one of the best feeding stuffs for cattle, he is still more emphatic in his approval of poonac, the local term for oil cake. Referring evidently to coconut cake, he writes: "Poonac is the only indigenous artificial food we have, and too much cannot be said of its valuable nutritious properties. When fresh and sweet, it is, in my opinion, second to no cake, linseed or cotton seed not excepted." Such being the case, can our correspondent tell us why so large a quantity of gingelly poonac is imported into Ceylon from India and used as food for milk and draught cattle in preference to the coconut cake? The qualification "fresh and sweet" is important as regards coconut poonac, which even in its freshest condition is possessed of an odour that so tells on the milk of cattle fed on it, that such milk is not considered suitable for children. What has our correspondent to say on this point? As a flesh former, no doubt coconut poonac is a valuable cattle food, but is it equally valuable as food for

cattle yielding "the lacteal fluid"? On cattle disease our correspondent remarks: "Our two contagious diseases are rinderpest, (murrain) and, second, vesicular epizootic (foot and mouth disease)." The word "our" sounds as if our correspondent agreed with the view that the diseases referred to are practically indigenous to Ceylon, which we shall certainly hold until we have evidence to the contrary. Some years ago we dealt with a mass of reports and recommendations, by the head of the Medical Department, amongst others, which showed that (contrary to the deliverance of the Cattle Commission of 1869,) cattle disease in Ceylon: was as prevalent and destructive in the early period of British rule at the beginning of the century as it is now. Then as now it was traced to poor food, foul water and specially exposure to the influences of the inclement monsoon weather. The real remedies are more obvious now than they were at the period referred to. Our correspondent will say: "Yes: quarantine and stamping out." We also say: "Yes, if the latter were possible. But as we fear it is not, and as the disease is, now at least, as native to the soil as the cattle themselves, we must resort and trust mainly to less heroic measures of gradual improvement in breed and treatment of cattle, and largely in improved pasturage." We are very much surprised to see the adverse criticism on what we consider a very sensible passage in Mr. de Silva's pamphlet, which runs thus:—

"The principal causes which lead to the spread of cattle murrain and the destruction of such a large number of cattle in this island may be attributed to the want of proper shelter from the extremes of weather, their degenerate condition, protracted droughts and the want of a proper knowledge of preventative measures.

"The great hardships and the evils attended on cattle for want of shelter was dwelt upon at length in a previous section. When cattle suffer on account of exposure to night air, &c., and hence become weak, they are liable to get the contagion easily. A weak animal is always liable to disease."

Now it is quite true that when rinderpest breaks out amongst animals, as in the case of cholera amongst human beings, the strong and healthy are liable to attack with the weakly and diseased; but certainly not in the same proportion, and to deny that a degenerate state, arising from bad treatment, as well as unfavourable meteorological conditions, predisposes to disease, is to go counter to experience and commonsense. As a comment on Mr. de Silva's recommendations that diseased animals should be segregated and treated, our correspondent interjects the exclamations, "Kill them at once! and bury them!" That, of course, would be effectual, (if the carcasses were not, as they have been, dug up and used as food!) were there only one, or even half-a-dozen centres of contagious disease; but if, as we contend, the germs of the disease and the tendencies to contracting it are widespread and general, stamping out by destruction is impossible. Of course we are writing of rinderpest, the equivalent in the bovine race of cholera in the human being; for even our correspondent concedes that foot-and-mouth [disease, which in veterinary nomenclature becomes "vesicular epizootic," may possibly be best treated by segregation.—Let our position as regards the much more serious and fatal disease be clearly understood. We most thoroughly believe that the true remedy is "stamping out,"—were it possible. But if, as we believe, it is not, then we must address ourselves to so altering existing conditions in the treatment and condition of cattle as to render its appearance and ravages gradually rarer and rarer, and ultimately impossible.

COFFEE IN UVA.

(From an Old Planting Visitor.)

Coffee looks wonderfully fresh on the Spring Valley and Uva Companies' estates as well as in Haputale, and in many places, only close inspection reveals the presence of the lurking enemy green bug. It is, however, very apparent that all estimates must be more or less "shaky" as long as this pest displays such vigour as is seen on almost any field of coffee.

MANGOES AND MONKEYS IN AFRICA.

From the proceedings of the A. & H. Society of India we quote as follows:—

Colonel Pollock, writing from *Mombassa*, says:—"The mango here is excellent, almost as good as any graft, and of a very large size: The trees as soon as one crop is all but ripe, begin to flower, and go on flowering at intervals: so, on the same tree may be seen fruit from the size of a large goose egg to fruit just forming. There is, therefore, on the same tree, fruit which ripen in succession, and the same tree gives mangoes for upwards of two to nearly three months, and virtually it bears all the year round.

The trees are never bare, but for six weeks, from August to middle of October, there is very little ripe, but plenty of unripe fruit, fit for tarts, pickles, &c. I have planted a lot of kernels which I brought with me from Bombay and Bangalore, and they are getting on well. I have also some 6 of the best grafts from Bombay; time will show whether the plants are affected by the climate, or whether the African mango is different from the Indian. I am going to graft some best kinds of Africans on to the Indian grown from seed, and will let you know, if I remain long enough, the result. Please let me know if the mango kernels I sent you germinated. I can send you hundreds and hundreds, for the place is a mass of mango trees. Some of a delicious variety, as large as an ordinary musk melon, and others, equally as sweet—not much larger than a duck's egg and all but free from fibres; but the Africans pick them too soon, and they sicken in the ripening, but if they did not thus pick them the monkeys would save them the trouble, for they abound in thousands and are most destructive. If they see the ground has been disturbed, they immediately scratch all round, and if they find grain, devour it. I have had a large area planted with Indian corn utterly ruined. The seed they failed to find came up only to be destroyed by these mischievous brutes, by being plucked up in pure devilry. Could you send me some blue gum and other Australian seeds to put down. It is puzzling here, for the seasons are just opposite to what they are in India, and having lived there so long and been used to plant in October and November, I can scarcely restrain myself from doing so here. But December is our hottest month, and though the heat under shade is nothing to speak of, the sun is very hot, the earth becomes almost red hot. Even the Indians or rather Africans, with hoofs like that of a Rhinoceros, can scarcely walk over it, and plants crumble up. Can you tell me what will destroy the large black ant? They are here in millions and kill everything. The climate here is delicious out of the sun. There is a nice breeze all day, and I prefer it to Bangalore. Twenty miles from this, easy to get at, is a plateau 1800 feet high, with a climate like that of Shillong."

FIBRES.

Read a letter from Mr. W. H. P. Driver of Ranchi, referring to an article in "*The Englishman*" on Yucatan hemp, and asking whether the Society could supply the seed, or where he could obtain some. The following is the article referred to:—

"Where is Yucatan? Probably few people could lay their fingers on it on the map at a moment's notice, but it is worth while to look for it. It is asserted by the correspondent of the leading Commercial organ of South American trade, that Yucatan is now so prosperous that money is a drug, people

do not know what to do with it, and they are willing to buy all kinds of goods even the most costly."

The *Morning Post* states that this assertion is backed up by official information, since made public, relating to the material progress of Yucatan. We are thus informed that the abnormal prosperity which the country is enjoying is entirely due to the successful culture of the 'henequen,' or, as it is generally termed, the 'Sissal' plant of commerce, which yields one of the finest varieties of hemp extant. The population of the whole Republic of Yucatan does not exceed 3,000,000 souls, but the value of the 'Sissal' crop annually exported exceeds ten million dollars. There is an unlimited demand for the article in Europe, as well as in the United States, where it fetches from fifty to fifty-five pounds sterling a ton. The plant, we are told, is indigenous to the country and grows wild. It is easily propagated, and will thrive in the worst soil. In fact, it does best in rocky and impoverished ground, where nothing else can be grown, and in such situations it yields the best fibre. It cares nothing for drought; cattle have an objection to it, and avoid the spots where it grows. It suffices to dibble in the young plants in any barren and exposed plot of ground. Three years after planting the leaves are large enough to furnish a supply of fibre, and then the plant yields abundantly for 15 or 20 years. The produce of an acre of land is estimated at 1,000 lb. to 1,200 lb. of clean fibre, and the money value of this produce is estimated by a Jamaica planter, who has spent several years in growing Sissal in Yucatan, at eighty dollars or £16 sterling. But if all this information is correct, why should not an attempt be made to cultivate the Sissal in India? Every body cannot emigrate to Yucatan to try his fortune there; so it would be preferable to begin by trying if Sissal cannot be acclimatized in India. The climate is not dissimilar, and there is a fine area in the Sonthal Parganas where an experiment might be made on the rocky, barren, and exposed soil which the Sissal is said to love in Yucatan."

According to Mr. Baker, the three plants yielding the Sissal hemp of commerce are varieties of *Agave rigida*, Mill. Full information respecting this hemp has been published in recent numbers of the *Kew Bulletin*, a note embodying all known on the subject appeared in one of the earliest numbers, No. 3, for March 1857, and additional notes as recently as March and again October of the current year. From the short allusion made to the machine in use for cleaning the fibre, by Mr. D. J. Stoddart of Jamaica, whose pamphlet is quoted in the *Bulletin*, it appears to be similar in form to one of those in use in Mauritius for cleaning the aloe fibre (*Furcraea Gigantea*, Vent) there. This machine would, no doubt, be equally applicable for cleaning aloe fibre in this country, and as the raw material can in some places be had for the cutting, its capabilities could be readily tested and cost of working, &c., exactly ascertained. A model of the machine was obtained some years ago and is still in the possession of the Society.

It may be as well here to quote the *Kew Bulletin* for March last as to the prices for Sissal:—"The market value of this class of fibre, and the permanency of demand for it, has been fully investigated at Kew, and in a note on page 3 of the *Kew Bulletin* for April 1887, there is a summary furnished by Messrs. Ide and Christie which gives the average price per ton for Sissal hemp in London for the years 1879-86 inclusive. These are 1879, 27*l.*; 1880, 27*l.*; 1881, 28*l.*; 1882, 28*l.*; 1883, 27*l.*; 1884, 21*l.*; 1885, 19*l.*; 1886, 21*l.* The highest price paid was 32*l.* 10*s.* 0*d.* in December 1879 to February 1880, the lowest price was 17*l.* 15*s.* 0*d.* in January and February 1886. Recently there has been an increased demand for white fibres, with a corresponding rise in prices. There was no quotations for Sissal hemp in Messrs. Ide and Christie's London monthly circular for December 15th, 1888. The only remark being 'in retail supply, and selling at fancy prices.' In the United States, Messrs Crockens' statistics, dated the 1st December, gave the price at 8 to 8½ cents, per lb. (equal to about

37l. to 39l. per ton). A rough Agave fibre from Bombay (probably prepared by hand) was valued last December at 15l. to 17l. per ton. Mauritius hemp prepared by machinery, *Furcraea Gigantea* (known as the green aloe or Green Agave), was valued: good 34l. to 35l. per ton; fair, 33l. per ton; common 30l. per ton.—*Proceedings of the Agricultural and Horticultural Society of India.*

FUEL PLANTATION IN MYSORE.—The Forest Department of the Mysore State supplies the Mysore State Railway with fuel, and the Inspector-General of Forest Plantations, having in view the increasing demand of the railway and the mills in the province, has made arrangements for maintaining fuel plantations on a large scale.—*Indian Engineer.*

TEA MACHINERY.—The Commercial Co. in Slave Island are adding extensively to their engineering establishment, by means of extending their workshops &c. The work of this particular branch of their business has been steadily increasing owing to the great demand for Mr. John Brown's patent tea machinery which has sprung up of late, so much so, that the Engineer in charge of the workshop, Mr. W. Pottie, is now turning out as many as ten and twelve patent desiccators per month, which occupies three European Engineers travelling about the tea districts from estate to estate supervising the erection of them.—*Cor.*

THE PRICE OF LAND IN CALIFORNIA.—A writer in *Bradstreet's*, in concluding a series of articles on the various fruit industries of California, has given some remarkable figures respecting the price of land in that State. At Riverside, which is one of the centres of the orange trade, the prices are almost fabulous. A choice grove was lately in the market there at £600 an acre, and £400 would be called an under-valuation. At Pomona, where oranges, lemons, peaches, apricots, prunes, and nectarines are grown, the upset price for land suited for growing fruit is £40 an acre. About Fresno, the centre of the raisin production, the prices are the same. But when the profits are considered these prices are, perhaps, none too high. Twenty pound to £50 an acre is the usual average, and the cost in labour is very small. The 3,000 acres under oranges around Riverside last year yielded an average of £50 an acre, including orchards not yet bearing. One grower in San Bernardino county put his case in this way:—"I came to this place in the spring of 1882, purchased 40 acres of land and planted it all in orange trees, and muscat grapes. The third year from planting the orange trees bore about £10 worth of fruit to the acre, the fourth year about £25 per acre and last year the orchard produced £60 per acre. Many people are making from two to three times that amount." Another who grows raisins says:—"My 20 acres of raisin vines yielded me this year 50 tons of raisins, which I sold for £1,000 or £50 an acre. I have five acres of orchard the proceeds of which I also marketed green for £60, but my trees were young, this being the first year of bearing. I do not work my land myself, but hire all my labour. My one Chinaman takes care of the ploughs and cultivates my forty acres, and does all the work with the exception of harvesting and pruning, when I have several Chinamen to help him." But the writer concludes by warning his readers that fruit-growing on an extensive scale for commercial purposes is a pursuit for the wealthy and not for the poor man. No land can be got under £20 an acre; the cost of planting is considerable, and then follows a period of from three to five years of waiting for the first crop. Brains, energy and capital are all needed and the chief of these is capital.—*London Times.*

[There is a large market for the fruit close at hand, while the competition of foreign fruit is now prevented by heavy protective duties.—*Ed. T. A.*]

THE USE OF INDIA-RUBBER for erasing pencil marks was first suggested in or just prior to 1752 by an academician named Magellan, a descendant of the great navigator.—*A. F. Press.*

TEAMEN are, we understand, losing heavily at present, and we have been assured that no more picking will take place in the country, owing to the discouraging state of the market.—*Foochow Echo*, in *China Mail*, July 17th.

HOW THEY RAISE BANANAS IN HONDURAS.—It seems that they plant them there 18 by 18 feet, which is a very wide distance apart, and a great waste of land. Here the Chinese rarely plant them more than from six to eight feet apart each way, and produce from each hill two large bunches annually for three or four years. A good specimen of a small Chinese banana patch may now be seen opposite Mr. Paul Neumann's residence on King street. They are planted six feet apart, with not a missing hill in the entire patch. They allow but two stalks to the hill, and when the fruit is nearly ripe suckers are permitted to grow, so that they are enabled to get two large bunches from each hill every ten or twelve months. At the end of the fourth year, having taken off three good crops of from 500 to 600 bunches to the acre, they plow up the land and replant with new roots, generally manuring the ground well before plowing.—*Honolulu Planters' Monthly.*

AGRICULTURAL COMPANY OF MAURITIUS.—The annual meeting of the shareholders in this company was held at the offices in Change Alley on June 30th. Mr. J. Longridge presided, and in moving the adoption of the report said the company had been very prosperous during the past year, despite the state of the sugar market and the exchanges. There was scarcely anything in the accounts which required notice. Their debenture capital had increased during the twelve months by about 9,000l. The stock of sugar in hand this year only amounted to 16,000l., against about 50,000l. in the last account. Of course that was an asset which they could not absolutely estimate, but that which they did form on last year's stock was more than realised. There was a net profit of 7,599l. for the 12 months, the largest ever made. They proposed now to pay a final dividend of 1s per share, making 10 per cent for the year. They would put 2,000l. to the general reserve, bringing it up to 40,000l.; 2,000l. to the exchange reserve, making the total of that fund 50,000l.; and carrying forward 1,933l. Lieut.-Col. F. Thurburn seconded the adoption of the report, which was agreed to unanimously.—*O. Mail.*

COOLIES IN COORG.—In Coorg the Coffee planters have as much difficulty in obtaining coolie labour as the tea planters have in Assam, and last year's criminal administration threw some curious light on the caution that has to be exercised in dealing with perverse coolies. Second class Magistrates in the Coorg district were some time ago impowered to try cases of breach of contract, and the immediate result of the increased facilities thus afforded was a marked increase in the number of prosecutions of coolies who had obtained advances on contract deeds and then failed to comply with the terms of their agreement. It might be supposed, says the *Englishman*, that the justice of these proceedings would commend themselves to the coolies, who do not, as a rule, deliberately contemplate breaking their agreements at the time of signature, but rather yield to temptation afterwards, when things do not look so promising as they had hoped. The Coorg coolies, however, do not take this view of the case. They regard the prosecutions as a serious risk attending emigration to the coffee estates, and the effects of efforts of the Government to assist the planters has been a serious increase in the difficulties of obtaining coolie labour. It seems hard to the planters that they should be unable to recover advances for which no work has been done, yet the fact remains that the prosecutions necessary for bringing to justice those who offend are likely to defeat the very objects which the prosecutors have in view.—*Madras Times*, July 15th.

Correspondence.

To the Editor.

PEPPER CULTIVATION AND JAK TREES
IN THE KANDY DISTRICTS.

July 9th.

DEAR SIR,—Your correspondent "Peppercorn," in his letter of 4th inst., remarks that "a good healthy pepper vine is found to be more than a match for a sturdy jak tree, and seems to be capable of sucking the life out of it." Where has he lately found the sturdy jak? I am afraid that most planters in the Kandy districts will concur in my opinion that since 1885 a healthy jak tree has been hard to find: every one of them has been in a more or less debilitated condition, with jaundiced foliage and dead and dying branches, and some trees, even without pepper being grown up them, have died outright.

A V. A. with some knowledge of botany might have been expected by this time to have noticed their condition, and to have suggested offhand a remedy; but the common planter is at present in doubt whether the decadence of jak trees is due to the ravages of cockchafer grubs, to borers, to abnormal weather, to root canker, or to the new mysterious complaint called 'mal-nutrition.' We appeal to the press.*—Yours faithfully,

SIO PASSIM.

"£20,000 ANNUAL LOSS TO CEYLON PLANTERS THROUGH CARELESSNESS IN TEA FACTORIES."

London, July 18th.

DEAR SIR,—Take a crop of 40,000,000 lb. tea equal to 400,000 chests. Two-thirds of this equals say 260,000 chests. The dock charge for taring is 1s 6d, and bulking and taring 1s 3d per chest, and it is computed that quite two-thirds of the Ceylon crop has to undergo one or both operations in the London warehouses, and putting this proportion at 260,000 chests the above enormous sum (twenty thousand pounds) approximates the charge incurred.

Why is it Superintendents and Factory Assistants are so careless in these matters of good bulking and even taring of their chests? It can be no great hardship to see that the chests of a break do not vary more than 2 or 3 lb. in their tares, and nailing on pieces of wood or shaving the chests here and there as may be required to obtain even weights. Factory bulking is useless if tares are uneven, for frequently when a break has passed the bulking ordeal the Customs order is, to be turned out and separately tared, the charge for which, as shown, is only 3d per chest less than the charge for bulking.

As to factory bulking, it is often most carelessly done, and a break of say 50 chests pekoe often exhibits three distinct teas; yet all are marked "Factory Bulk" and shipped home as one tea. These irregularities, which add so much to London dock charges, are easily preventible, and carelessness is practically their only origin.

MERCHANT AND PROPRIETOR.

GREEN TEAS FROM CEYLON.

Kintyre, Maskeliya, July 19th.

DEAR SIR,—The extract to which you give prominence in your paper of 17th from Messrs. Geo.

* Or rather to Dr. Tiimen, if there are any such suffering "jak trees" in his neighbourhood.—ED. T. A.

White & Co.'s circular might lead your readers to suppose that it was all u. p. with Green Teas as a class. As a matter of fact the three lowest grades were sold, viz., pekoe souchong, fannings and dust at an average of 10½d; the average of all black teas being 10s 7½d. For the 65 per cent of fine teas unsold the bids ranged from 1s 7½d to 1s 1½d against valuations from 1s 9d to 1s 2d. I think the bids should have been accepted, but even with a still farther fall of 2d or even 3d per pound, the break would still be above the average of black teas of that week. It will be interesting to know the prices fetched for the two finest grades of green tea sold by me locally on 16th June for which 81c and 70c were paid, exchange at about 1s 6d at that date.—Yours faithfully, dear sir, H. D. DEANE.

GAMBIER.

July 19th.

DEAR SIR,—I was glad to read the interesting particulars you gave about gambier, but still the native name has not transpired. I am anxious to get this to make my own experiments. Now that Dr. Trimen has got plants of the Singapore gambier, he is in a position to define the botanical difference between the indigenous and exotic.

Christy in his book No. 5 on Tanning Materials says that in Malacca the better kind (cube gambier) is prepared more carefully, and to insure consistency (?) starch or some kind of farina is mixed with it to consolidate it and dry it more easily.

If starch were mixed with a dark extract it would tend to lighten the color, and if such admixture is permitted by the trade I can quite understand that producers would only too readily resort to it, gambier being about three times the value of starch.

Christy also says that as imported into England in its rough state it is very much adulterated, sticks, stones, and large quantities of elephant's dung being mixed with it in the manufacture. PLANTER.

CACAO CULTIVATION: PRACTICAL
EXPERIENCE.

DEAR SIR,—I have often heard and seen such erroneous ideas expressed about the profits of cocoa or rather cacao cultivation in this island that I wish to give my experience, with some statistics taken from your valuable Directory, for the benefit of those who may think of embarking in this pursuit, believing it to be very profitable and, as I have somewhere read, a "grandchildren's patrimony."

I came here in 1878 with a certain amount of capital, and after careful investigation concluded that I could not do better than invest in the cultivation of cacao. The conditions of the land on which I commenced operations were exactly those said to be required by the manuals on the subject: Messrs. Jardine and Barber's wealth of information was not then available. The soil was generally a good chocolate loam, three to five feet deep, and the land well-watered, one of the streams having rich alluvial banks: elevation from 400 to 900 feet; the average annual rainfall 90 inches fairly distributed; and the land well-sheltered from wind by ranges of hills and by no means steep. Part of the land had many years previously been for a short time under coffee, part was jungle or heavy forest. The land was opened in 1879 in the ordinary way, many of the jungle trees being left for shade wherever required.

My expectations were for a long time fulfilled: everything grew with truly tropical luxuriance, even the Arabian and Liberian coffee of which I had planted a small quantity. As for cardamoms, their growth was marvellous: planted in the open without any shade whatever, and without any holes being cut, the plants, nine feet apart, at the age of two

years were touching one another and gave a maiden crop of 160 lb. per acre. My flower garden and vegetable garden were highly successful; nothing was blighted, nothing failed to grow. And the cacao grew equally well on level ground and in hollows, on slopes and on ridges, better without shade than with it, if only sufficiently protected from wind. I have seen it growing well in those days up to 2,000 feet elevation in poor quartz soil.

As I had a large reserve, I selected land every year to extend the cultivated area. My clearings were equally successful in the north-east and the south-west monsoons; many parts never had to be supplied at all, the failures being *nil*.^{*}

On May 1st, 1884, on visiting an estate near Polgahawela, I saw for the first time the signs of what I thought to be a serious blight or disease; large-sized trees looking as if they were scorched by fire, the ends of the branches dead or dying. The superintendent told me that, to make sure whether it was due to *helopeltis*, or not, he had covered one of the few remaining healthy trees after careful fumigation with fine gauze, but that the tree, after some days, had shown the same signs of disease while nowhere on it could any signs of *helopeltis* be discovered. There were two nurseries in close proximity, one of the ordinary Ceylon kind, the other of the hardy variety called *Forastero*; the first was in a miserable state of disease, the other perfectly healthy. Not many months had elapsed before this disease had spread in several districts, and a meeting was held in Kandy, with the ordinary result that everyone who had an opinion went away with it, without converting or being converted by his neighbour. But the catching of *helopeltis* and the planting of shade were generally thought to be the panacea. *Forastero* and hybrid varieties were not then attacked, and many planters used only those kinds for supplying or for planting new fields.

But to come back to my personal experience. It was only in 1885 that I noticed the first signs of disease in my fields, and by the end of that year I had made up my mind that I should soon see the end of my enterprise, such was the virulence of the attack, and I was not very far wrong.

I have made experiments with manures: digging, forking, holing, trenching; with quicklime and gaslime, with sulphates of copper and iron, arsenic, corrosive sublimate, with kerosine &c., without success. The only palliative is shade, and the best is the *dadap*, which was introduced some years ago from Assam by a Dimbula planter and by him first planted as shade for cacao.† I say that shade is only a palliative with good reason, because it only mitigates the disease. Near Polgahawela the cacao under shade was severely attacked as well as that in the open, but when the shade trees were cut down three or four years ago and tea planted the cacao recovered and has since given good crops.

Since the year 1885, all my attempts at planting *any products*, in the best of soils, with good weather and with greater care than formerly have been comparative failures. The weeds themselves as well as the jungle trees and the undergrowth of the forest show unmistakable signs of sterility. The *Forastero* cacao, which for a time

* A neighbouring plantation gave in 1883-84 a crop of 4 cwt. per acre over 200 acres planted in 1878-79. The trees, planted 9' x 9', were interlacing so much that it was thought necessary to sacrifice the alternate ones, and shade trees were in some places thinned, with good reason as the cacao in the open was growing much better.

† Mr. Robert Fraser's introduction of the best *erythras* from Trinidad must surely have been anterior to the import of the Assam "*dadap*"—the Java name for *erythras* being "*dadap*."—Ed. T. A.

had resisted the disease, followed suit, and trees of the ordinary Ceylon kind, which were known to have given good crops regularly for twelve years, were attacked and very soon became barren skeletons.

In your "*Ceylon Directory*" of 1883-84, p. 40, you state:—"As regards the area planted in 1877-78, it was 500 acres: in March 1881 this had increased to 5,460 acres, and this area in three years has increased by 4,500 acres, and from the 10,000 acres now growing (at end of 1883) of this valuable product we may look for an export of 50,000 cwt, before Sir Arthur Gordon's term of office expires. Of cacao planted alone the area is 4,711 acres; of coffee and cacao planted together we have 10,709 acres" (or a total of 15,420 acres).

If we admit that cacao gave generally its first crop of 1 cwt. at four years of age, of 3 cwt. at five years, of 4 cwt. at six years, and after that age 5 cwt. per acre, we find the following table:—

ACRES		Cacao PLANTED.		Cwt.
1876	... 122	gave in	1879-80	122
1877	... 113	"	1880-81 plus the above	479
1878	... 191	"	1881-82	1,018
1879	... 1,953	"	1882-83	3,588
1880	... 2,065	"	1883-84	9,863

Thus the 5,460 acres said to have been in cultivation in March 1881 ought under the same circumstances to have given in 1884-85 a crop of 17,153 cwt., but the exports fell to 6,758 cwt.! With a large yearly increase of land coming into bearing, the highest export (1886-87) was only 16,638 cwt., and the acreage has fallen, by your latest computation, from 15,420 at the end of 1883 to 11,772 acres, although new land has been opened yearly (1,500 acres would be a moderate estimate). This would have brought up the acreage planted with cacao to 16,920 acres, so that 5,548 acres must have been abandoned almost before they had come into bearing.

If now we assume that of the 11,772 acres only 10,000 are in bearing this season, now nearly ended, we shall find from the exports that the average crop this year is only a little over 1½ cwt. per acre, which shows conclusively that cacao cultivation is not an

ELDORADO.

[This tale of disappointed hope is only one of many in regard not only to cacao but to Liberian coffee and cinchona. In certain select or fortunate localities, however, cacao seems still to flourish.—Ed. T. A.]

DAVIDSON' SIROCCO: PRACTICAL HINTS.

Colombo, July 21st.

DEAR SIR,—With reference to "*Darjeelingite*"'s query taken from the *Indian Planters' Gazette* of the 1st July, *re* difficulty in working a large-sized Down-draft Sirocco, I have much pleasure in giving him the required information. In the first place he says, "I find that the temperature drops from 385 deg. to 210 deg. before it hits the tea on the lowest tray. I also find that it takes 5 maunds of dry wood to each maund of tea, that it does not turn out anything like 2 maunds per hour.

"P.S.—I do not find that it puts price on tea, it only enables you to dry with other material than charcoal."

The temperature at which "*Darjeelingite*" is working is very much too high. Pure hot air cannot be passed through tea roll at the same high temperature as the charcoal furnishes from a chula.

A pure hot air tea drier worked at 385 deg. F. will in the first place consume a large amount of fuel, and in the second will not produce a high quality of tea. But with the Down-draft Sirocco it is utterly impossible to raise the temperature over the

top tray in the drying-box, to anything like this degree of heat, if the fan is working. "Darjeelingite" must be working his drier with his fan stopped or more likely with the valve behind it shut, which of course would have the same effect.

With a temperature on the thermometer of 385 deg. and say 8 or 9 lb. roll charges on each tray the exhaust air would indicate about the 210 deg., which is the same temperature as that which strikes the bottom tray.

This reduction in temperature of the air after passing through a number of trays of wet roll is essential in any drying machine whatever, as unless the hot air gives some of its heat up in passing it could not absorb any moisture from the roll whatever.

If "Darjeelingite" holds a thermometer over the exhaust of any tea drier, he will find that the temperature has been considerably reduced from that indicated on the drier thermometer; or even if he places a thermometer over and under the trays of his charcoal chulas he will obtain similar results. In order to work Davidson's Large Down-draft properly, the following points should be attended to:—

First.—See that the fan is running at 800 to 900 revolutions per minute at least 1,000 rev. gives very good results and the difference required in power to drive at the increased speed is imperceptible.

Second.—The fuel used should be split up small and cut into 1'—6" to 2' lengths. Large round logs make very expensive fuel, as they do not burn well, therefore generate heat slowly. The drier the fuel is, the better.

Third.—The stoking should be properly attended to. A coolie has a natural inclination to cram the furnace full of fuel so that he may have no further trouble with it for half an hour or so. The stoker should stoke lightly and constantly, putting small pieces of wood in at a time and keeping a good light, even blazing fire, instead of a black, on the top, and a glowing red fire in the heart of his furnace.

Fourth.—Immediately after the fire is lighted, the fan should be started and the lever handle working the tray-lift and the fan valve should be lighted, thus partially closing the valve and therefore deducting from the suction power of the fan and enabling the temperature to rise quickly. This handle should be lifted to within an inch or so from the top of the slot in which it works.

Fifth.—The charge per tray must not be too heavy—6, 7, or 8 lb. according to the amount of moisture contained in the roll would be about right. The wetter it is, the lighter it should be spread on the trays.

If the trays are drying too quickly for the coolies to keep up with the work, on no account decrease the fan speed.

To reduce the rate of drying a tray, increase the charge of roll per tray.

The trays should be spread as evenly as possible. Coolies have a tendency to spread thickly in the centre; in that case the sides would dry first as is the case in any drier. If this is attended to, I find the trays are dried perfectly evenly all over. After work is finished, the fan should be allowed to work on for 15 or 20 minutes in order to carry away the heat which the stove would still be producing. When the fan is shut off, the door over the stove should be opened. If these points are attended to, "Darjeelingite" will have no further trouble in the working of his machine, but will be bound to confess, as numbers have done and are doing every day, that the Down-draft Sirocco is a complete success, especially the new large size, not only in quantity of outturn, but also in the quality of same.

The outturn of these machines vary from 140 lb. to 200 lb. per hour tea made, with a fuel consumption of about $\frac{1}{2}$ lb. per lb. tea.

The quantity of out-turn depending on the fan speed, the moisture of the roll and the moisture in the fuel.

Hoping that these remarks may be of use to "Darjeelingite" and to any others who may have taken an interest in his letter.—I remain, yours truly,

F. G. MACGUIRE,

c/o Messrs. Mackwood & Co., Colombo.

PLANTING IN TRAVANCORE: PROSPECTS FOR SUPERINTENDENTS.

July 21st.

SIR,—Having had a few inquiries and heard of others having been made by Ceylon men as to the advisability of seeking or accepting employment in the planting districts of Travancore, I would be glad if you would kindly give publicity to the following. To such enquiries I would most emphatically say "Don't," and for these reasons:—

Individual salaries are small.

Superintendents' prospects, with few exceptions, are not encouraging.

Vacancies are, as a rule, filled by persons having interest.

There can be no doubt that Travancore, as a tea-producing country, has fair prospects indeed before her; but for a man of fair abilities and prospects to leave Ceylon and come to Travancore without having his position, salary and future more or less guaranteed would be madness indeed; while again some districts are so unhealthy that a superintendent may never hope to develop the resources of his charge and so gain credit to himself, that with a fair amount of guarantee he would be badly off; and in the event of his wishing to reinstate himself in his old position in Ceylon might find some difficulty after a sojourn of a year or two on this side, to say nothing of time lost.—Yours faithfully,
TRAVANCORIENSIS,

PEPPER AND JAK CULTIVATION.

July 23rd.

DEAR SIR,—I am glad to find from "Peppercorn's" letter of 18th instant, that the sickness amongst jak trees is more local than general. But I think most planters will admit that there has been, if not serious illness, at least a want of tone in their systems for some years, and this has been shown as much by their poor foliage as by the irregular yield of fruit. I do not refer to tree growing in gardens or specially favoured places, but to those planted on estates. But the debility is not confined to the jak trees. Leaving out of consideration the coconut disease, which Dr. Trimen has disposed of, there has been a marked decline in the vigour of areca trees, pepper, vanilla, annatto, cardamoms, cotton and even of the worthless Ceará rubber. None of these planted during the last four years have grown as freely as they used to; and as regards the last, whereas its seedlings used to germinate in hundreds under the trees, for some years past the self-sown seedlings have not been seen.

Is it not possible that a severe attack of cockchafer grubs has been followed by a root fungus which has impaired the vitality of all vegetation? The effects, of course, would vary according to soil and other surroundings, and would be modified as "Peppercorn" suggests by high cultivation.—Yours faithfully,
SIC PASSIM.

WHAT "BI-METALLISM" AND EXCHANGE
AT PAR MEANS IN RESPECT OF
CEYLON PRODUCE—(1) COFFEE.

Colombo, July 23rd.

STR.—Herewith is mem: showing the result of our coffee crop of last year at the then rate of exchange and what the result would be at the bi-metallic rate of exchange 2s.

We in Ceylon can in no wise affect the question of bi-metallism, but the statement shows the effect it would have for planters.

The change of currency has powerful influences in its favour at home,—Manchester and the farmers,—and so may probably come to pass.

In "Hazzell for 1887" there is a very good article on bi-metallism explaining the matter in short space and showing how the present bi-metallic countries—the United States and the Latin Union—get over the difficulty.—Yours truly, NEMO.

STATEMENT showing the result in sterling of a coffee crop (year 1889) at the then average rate of exchange and the result as it would be at the bi-metallic rate of exchange 2s.

The coffee sold averaged ..R66'85 p. cwt. f.o.b.

R66'85 at exchange (the average rate) 1s 4½d92s 7½d
92s 7½d at 2s bi-metallic rate ..R46 31

The cost of the crop f.o.b. was ..R31'97 p. cwt.

The value of crop as above ..R66'85 p. cwt.
Less cost 31'97 .. "

Leaving available for remittance R34'88 .. "
R34'88 at exchange 1s 4½d .. £2 8s 3d .. "

Value of crop as above 92s 7½d
at bi-metallic rate of exchange 2sR46'31½ p. cwt.
Less cost 31'97 .. "

Leaving available for remittance R14'34½ p. cwt.
R14'34½ at 2s exchange £1 8s 8d .. "

Summary.

If the crop sold at the same rupee price, R66'85 per cwt., when the exchange was 1s 4½d, there would be £2 8s 3d per cwt. to remit to England; when the exchange goes to 2s there will only be £1 8s 8d per cwt. to remit to England.—N.

[This is very interesting; but we should expect to see sterling prices "harden" and advance if exchange went still further against us.—Ed. T. A.]

BUSHEL MEASURES AND ORDINANCE
NO. 2 OF 1836:

DEAR STR.—I am sorry you have made no comment on case No. 3,326 P. C., Panwila, as reported in *Observer* of 26th July last.

In discharging the accused the Magistrate said: "The evidence of the complainant only goes to show that the accused was in the possession of the bushel measures described in the plaint; and I hold that mere possession without proof that these measures were used by accused is insufficient to maintain a charge against him."

What, however, says Ordinance No. 2 of 1836 clause 5? "Any person or persons selling by retail who shall use or attempt to use, or in whose shop, house, stall standing place, or premises shall be found any weight or measure of length or capacity not being in conformity with the standards hereby established, shall, upon conviction, forfeit and pay for every such offence," &c.

Coolies are so frequently cheated by dealers in the issue of rice, that as desirable punishment should be sure as inspection should be effective.

A. G. K. B.

"Jove" sometimes nods! The acting Magistrate referred to is, of course, hopelessly wrong. Section 257 and 258 of the Ceylon Penal Code amended by section 1 of Ordinance 11 of 1887 makes it a criminal offence for anyone to fraudulently use or fraudulently to possess a false measure, &c. The mere possession of a false weight or measure however by a boutique-keeper, or shopkeeper is of itself a criminal offence, and no proof of any use or intention to use is necessary.—Ed. T. A.]

THE INTERMINABLE SILVER QUESTION.

July 26th.

STR.—Who will be able to agree when doctors differ? Will you try your hand?—or if you have not the data (although I have no doubt it is, being so important a question, already in your new Handbook) perhaps some of your readers may be able to throw light on this inquiry as to the silver production of the world.

In the *Observer* of the 19th instant appeared a long statement from the *Economist*, London, 28th June last, in which figures are given as follows:—

United States. All other Countries.	Total.	
Fine ounces	Fine ounces	Fine ounces
"1889 50,000,000	76,000,000	126,000,000."
Now at 48d per ounce this would give in sterling		
£10,000,000	£15 200,000	£26,200,000.

The *Economist's* figures for 1878 were as follows, in ounces:—

34,960,000	38,516,000	73,476,000,
showing that in twelve years the increase under the above headings was say roughly		
50 per cent	100 per cent	70 per cent,

—a vast increase without doubt, when it is considered that it has been accomplished at a low rate per ounce during the period mentioned. But our eyes are opened further by the Chairman of the New Oriental Bank Corporation, for in the *Ceylon Observer* of the 21st inst. appears his statement as follows:—"The amount of silver coined last year throughout the world is given as 26½ millions sterling" (i. e. all the silver produced in that year, according to so reliable a source as the London *Economist*, was positively coined!) Then he proceeds to tell us, on his own authority apparently this time, that "the whole produce of silver throughout the world was only 32½ millions sterling." I suppose he used the word "only" advisedly.

It thus left, says the N. O. B. C. Chairman, only over six millions for making spoons, &c., and therefore it does not seem that there is any enormous overplus of silver!

Well, then, I turn for consolation to the *Tropical Agriculturist* for July last, and this is what I find, on page 45, written by one John Richards, whoever he may be, to the *Adelaide Observer* of May 10th:—"It is quite on the cards, judging from past progress that in less than twenty years, the output of silver (from Australia) will exceed in value any one of our long established staple products"—something very vast no doubt, but extremely visionary, yet it is consoling as far as it goes, for it indicates a cheap rupee—but I am afraid Mr. Richards' figures are more or less the result of a dream, for he says further on that the silver produced in the United States is equal to "about half the production of the world"! My confidence in his statements is further weakened by his saying (upon what authority I know not) that "426 millions of dollars" (i. e. 426,000,000 ounces of silver) issued by the United States in paper have got "no back," i. e. they are not represented either "by gold, silver or bullion." A rotten state of things to be sure, and if true the United States Government's demand for silver is not likely to go on unchecked for a long time to come: as Mr. Richards admits, "the cause of the introduction of the Silver Bill is the growing scarcity of gold which means dear money."

Mr. Richards then comes to figures (which I do not like) with regard to the production of silver in Australia. He says: "This year I estimate that about three and a half million sterling worth of silver and lead will be exported"—what a "blend" to be sure!*

Proceeding, Mr. Richards goes on to say: "Australia being the only silver-producing country of any importance in the British Empire and, barring the United States and Mexico, producing more silver than any other country in the world" &c.

I will not make any more extracts from Mr. Richards' figures, who states that (through him) "Australia has a perfect right to make her voice heard in the great bi-metallic controversy that is now agitating England," but I will accept his figures for "silver and lead" as referring to *silver only*—viz. $3\frac{1}{2}$ millions sterling for 1889; all I want to know is where the balance of the silver now being produced in the world, estimated by the Chairman of the New O. B. C. at $32\frac{1}{2}$ millions sterling, is to come from?

At £900,000 sterling per month the United States is now bound to coin *annually* actually more silver than she is said to produce, viz. £10,800,000 sterling! It is clear that other countries have got to produce (out of $32\frac{1}{2}$ millions) 22 millions, and yet Mr. Richard declares that "barring the United States and Mexico," Australia comes the next in the list as a silver-producing country. I give him full credit for lead as well as silver, and yet the value amounts to only $3\frac{1}{2}$ millions sterling. Having 18 millions still to trace I would fain know what Mexico, Spain and other countries can offer to fill up this tremendous gap. With, it is said (in a recent telegram), China about to enter the silver market to the tune of 30 million taels (=45 million dollars) the rupee is evidently destined, ere very long, to give Ceylon tea planter a twinge—any way they should be prepared for it.—Yours, N. D.

[Gold is used by 264,000,000 people as their monetary standard; silver by 749,000,000. In some ancient States—ancient Arabia and ancient Germany for instance,—the value of silver was superior to that of gold: and so late as the 17th century silver and gold were valued equally in Japan. From the *Encyclopædia Britannica* we quote as follows:—

Production.—In the principal producing countries—the United States, Mexico, Chili, and Peru—mining is free, and there are no official returns of the production, which is therefore mere matter of conjecture. In the United States it is the custom to value silver bullion a one-sixteenth that of gold. This unduly swells the value of the conjectural product of that country more than one-fourth (see *Report of the United States Monetary Commission of 1876*, Appendix, pp. 1-66). From a careful consideration of the bullion movement the total annual product of silver throughout the world at the present time is estimated at between 50 and 60 million ounces, at which figure it has remained steady upwards of ten years.

Consumption in the Arts.—Direct inquiries as to the quantity of silver used in the arts have met with little success, and the statistics so obtained are defective. But the total production of silver in the Western World from the discovery of America to the present time, has been, in value, about 1,400 million pounds sterling of which about 300 million pounds remain in coins. Consequently 1,100 millions, or nearly four-fifths, have been consumed in the arts, lost, &c., or exported to Asia. There are estimated to be about 50 or 60 million pounds sterling worth of silver coins in India, and some trifling amounts each in China, Japan, Persia, &c. On the whole it appears quite safe to estimate the average annual consumption of silver in the arts and through wear, tear, and loss as fully equal to three-fourths of the production. Lowe in 1822 estimated it at two-thirds. Silver is principally used for

* The explanation is that the ore as it is mined is, in large proportion, sent to Europe to have the silver separated from the lead, that course being found more economical than refining locally.—Ed. T. A.

plate and jewellery; it is also consumed in photography, and in numerous chemical preparations, such as lunar caustic, indelible ink, hair dyes, fulminating powder &c.

This was written in 1886-7, we may say.—Ed. T. A.]

CACAO CULTIVATION.

July 31st.
DEAR SIR,—Your correspondent "Eldorado" opens up a very wide question. For several years past there have been very serious discrepancies between the crops seen on the trees and the crops said to have been gathered. At various times I have heard certain Dumbara estates credited with such splendid returns that the Customs export returns looked quite silly in comparison. I hope some of the planters whose estates have lately yielded 3, 4 or 5 cwt. per acre will come forward and explain why their crops have not been despatched to the London or to Continental markets: the local demand, we all know, is trifling.

"Eldorado" dates the disease in his cacao from 1885, but he omits to mention in what year he commenced to plant shade. There is no doubt that the most experienced men, when they began to take an interest in cacao, made very serious mistakes: some adopting plantains as the only possible (and profitable) shade, while some thought the cacao trees, if planted close enough, would shade one another!—and others fancied jak trees were the great desideratum. The apostle of the Trinidad system, to whom you refer as having introduced the "hest erythrinus," in his pamphlet, published in 1879, says:—"In Trinidad, of course, the Bois Immortelle is their favorite shade tree, on account of its rapid growth; but I cannot say that the ideas of the school in which I have been brought up quite reconcile me to its use, as it seems to me that it is a surface feeder, for if its large surface roots be cut, a great quantity of water will ooze out of the ground." The writer was quite right in condemning this tree as shade for cacao; and the *Pithecolobium Saman*, even if planted very wide apart, is no better. But the *dadap* referred to by your correspondent is undoubtedly good: it grows faster than either. Hundreds of acres of cacao that a few years ago were nearly dead have been saved by it; its lower branches, as they drop off, can be used as fuel, and the stems furnish good charcoal. As shade for cardamoms, too, this tree has no equal: I believe it will be found of great use in cinchona clearings also.*

"Eldorado" gives facts and figures which seem very strongly to support another recent correspondent as to the general sterility of all vegetation of late years. If the falling-off, not only in crops but in growth even, has been common everywhere and to all lowcountry products alike, then it must be conceded that there is something *radically* wrong.—Yours faithfully,
UT PROSIM.

PATENT TEA LEAD-AND-PAPER FOR PACKING: MR. T. C. ANDERSON'S EXPERIENCES

Colombo, August 1st.
DEAR SIR,—In view of your remarks in your footnote to your correspondent "C. S."s letter

* But the *DADAP* is simply an *erythrina*, used in Java as a shade tree. Those we saw in Java we described correctly as shabby-looking, and perhaps their non-luxuriant habit is in their favour. The Trinidad *erythrinus*, on the other hand, which, a few years ago, we saw growing amidst the cacao at Warriapolla, were masses of rich vegetation. It would be interesting to learn what Mr. Robert Fraser's opinion of the *madre de cacao* now is, after full trial.—Ed. T. A.

appearing in last night's issue of your paper, for your information and that of planters generally, I beg to send you a description of the paper lead lining referred to, together with a number of certificates in its favor, which you can publish or not, as you think proper. I have used the lead now for nearly a year in the packing of Gartmore and other estates teas, and the reports on the condition of the tea on arrival in London have all been most favourable. Hitherto the lead has been prepared on the estates by the factory coolies, so that necessarily it has cost more than the ordinary lead, 4 oz. lead being used, but I anticipate that the manufacturers in England, when they learn that there is a demand for it, will produce it cheaper, *i.e.* by utilizing *thinner* lead they will produce a thicker and stronger lining with the aid of the paper. The paper can be purchased in Colombo by those who wish to try it in the meantime, and the cost will be found to be about 12 to 15 cents per chest in addition to the cost of the lead.—Yours faithfully,
T. C. A.

[We give the description, and select one or two from a number of certificates:—

"CLARK'S PATENT TEA LEAD."

This is a new lining suitable for tea chests, boxes and packets, patented about a year ago in Ceylon and the United Kingdom and applied for in other countries. It consists of the ordinary tea lead used in packing tea, lined with *paper* which may be of any degree of thickness, *paper and cloth, calico &c.*, combined, or any of these materials with that paper. The objects are to better preserve the tea; to prevent the contact of the tea with lead which is injurious; and to provide a stronger and more easily workable lining, which cannot be damaged so easily when opening and re-packing tea chests. The paper being *inside* the lead lining allows of the lining being soldered and hermetically sealed in the usual way.

Gow, Wilson & Stanton, April 3rd.—"All the Teas we have seen so far packed in the new patent lead have arrived here in *capital condition*, fresh, crisp, being free from any flatness or damage whatever. In other respects we like the lead: it is neat and light, and from the accompanying letters it would seem likely to become popular with the trade."

(One of letters referred to.)

From Messrs. Somerville & Co., April 25th.—"The teas we have tested with the patent lead kept just as well, if not better than the ordinary lead in use."

From Messrs. Layton & Co., to the Chartered Mercantile Bank of India, London and China.—"Patent Lead Lining.—We have examined very carefully the lead used in packing of tea from above estate (Gartmore), and so far as the condition of the tea is concerned we are unable to find any particular objection to it the smell and taste being sound and good, &c."

Messrs. G., W. & S., London, June 27th.—We have the following report on your lead from our friends, Messrs. H. & E. Musgrave, one of the largest dealers in the North of Ireland:—"We have a very satisfactory report from our customers in favor of the new lead lining of 'Gartmore' chests. Lead is kept in better position and tea not so liable to get between lead and wood."
—Ed. T. A.]

CATTLE AND CATTLE DISEASE IN CEYLON.

Kandy, August 1st.

DEAR SIR,—I have just heard of a new introduction, into Colombo of cattle murrain, no doubt caused by the cattle coming over from India at this inclement season, and being left to stand under drenching rains.

As cholera is developed and propagated among human beings, so are animal diseases. Will we, in this poor country ever learn that our cattle are our wealth? Where is the Mayor of Colombo?

and where W. A. de Silva? who has been *teaching* ere he has learned himself. Has a whole 12-month's murrain not taught anything? are we to be subjected again and again, until the cattle of the country are exterminated?

A few days ago I met a herd being driven along the road (our beef supply), coming from the lowcountry tanks, where they had been fattening—driven under our drenching rains, penned into a cold upcountry cattle shed at night; murrain developed no matter as long as the tamby gets rid of them, he cares not.

See what the *diseased drove*, which arrived in Nuwara Eliya last May or June, did for the country: the contagion they brought is still at work; after thousands and thousands of our village and cart cattle have been swept away, now another centre of contagion has (as report goes) been formed in Colombo.

It seems to be no one's interest and less anyone's duty to put a stop to this ruin which will sooner or later be the means of killing out the *goiya* of Ceylon.—Yours faithfully,
TRUTH.

MR. LIPTON AND THE TEA FUND.

Kandy, August 16th, 1890.

MAKING KNOWN CEYLON TEA.

SIR,—With reference to the minutes of proceedings of the Standing Committee of the "Tea Fund" recently published under the above heading, I think it right to give the same publicity to the enclosed copy letter from Mr. Lipton's representative received today.—I am, sir, yours faithfully.

A. PHILIP, Secretary.

(Copy): Colombo, Aug. 15th, 1890.

A. Philip, Esq., Secretary,

Planters' Association of Ceylon, Kandy.

TAYLOR TESTIMONIAL.

Dear Sir,—Before leaving for England Mr. Lipton instructed me to forward you a small donation to this fund, and I have now the pleasure to send you a cheque for R35 (R25 on Mr. Lipton's behalf, and R10 on my own).

Allow me to take this opportunity of cordially accepting the resolution passed at the recent meeting of the Tea Fund Committee with regard to Mr. Lipton's estates subscribing to its income. Mr. Morison's letter of withdrawal being written under a misapprehension, I am happy therefore to tell you that these subscriptions will be continued as before.—I am, &c.,

(Signed) FRANK DUPLOCK.

SUCCESSFUL CACAO CULTURE.

Uva, August 12th.

SIR,—Your correspondent "U P" wishes to learn the whereabouts of cacao estates giving their 3, 4, and 5 cwt per acre all over.

Of the last named class I know of none, and though there may be half-a-dozen exceptions in Ceylon—*o fortunati numium agricolae*—they are situated chiefly, I fancy, in some imaginary Eldorado (the pagoda tree being grown for shade) existing chiefly in the minds of sanguine proprietors.

But it may interest him to learn that all the older cacao under shade in Monaragala district gave last year crops of 2½ to 3½ cwt. per acre, even the former leaving a handsome profit at present prices.—Yours, &c.,
102s 6d.

COTTON IN UDAPUSSELLAWA.

Public Works Bungalow, Delmar Estate,
Udapussellawa, Aug. 1890.

DEAR MR. EDITOR,—I send by this post cotton from 10 pods of Pernambuco or kidney cotton grown here, as also 4 pods and some seeds I have

not weighed the cotton, but if you think the information is worth giving to the public, please give weight. The tree grows for years. I have seen trees near Kegalla and Nawalapitiya loaded with pods and said to be from 10 to 15 years old. The oil from seed is used as medicine by the natives, the refuse I should think would be as good as castor cake. During the cotton famine I sent a sample through Messrs. C. Shand & Co. to Liverpool and was offered 2½d sterling more per lb. for it than was being paid for Tinnevely at the time. The sample I sent was grown on Cadurnally, Dumbara. I had 25 trees each, Sea Island, Barbados, Nankin, Pernambuco, I got the latter name from Dr. Thwaites of Peradeniya.

I gave a lot of the seed which was given to the Cotton Spinning Company, perhaps the Managing Director of the cotton trinity might inform us of its worth as compared to other cotton now grown in Ceylon.—Yours very truly.

JAMES ROBERTSON.

[We referred the cotton to the Hon. Mr. Mitchell, who writes:—"I return Mr. Robertson's letter you sent me with the Pernambuco cotton, sometimes called Peruvian and Kidney. The seed weighed 748½ grains and the clean cotton weighed 282 grains. The percentage of clean cotton was thus about 28. This kind of cotton is about the best the natives can grow as it is hardy, bears well, and is a perennial. The difficulty is to get seed in quantity. The cotton is of similar value to the Egyptian sort, and we value it locally at 30 cents per lb. clean."—Ed. T. A.]

"TEA FOR PRICE."

SIR,—Will you inform me through your columns what is the correct definition of the term so often used by London brokers in their circulars "Tea for price."—Yours truly,

INTERESTED IN TEA.

[We referred to a leading tea buyer, who replies:—"I cannot give you an exact definition for teas coming under this heading of 'Teas for price'—so much would depend on market and range of values. All classes and qualities selling at and under about 10d I should consider 'Teas for price' now.—Ed. T. A.]

MR. JOHN HUGHES ON TANNIN IN TEAS.—

Until the appearance of Mr. Hooper's paper and figures, the popular idea certainly was that the delicate flavour, so conspicuous in high-grown teas (Darjiling and Kangra Valley teas, for instance), was due to the smaller proportion of tannin contained in such teas, compared with low grown Assams and others of similar character. Mr. Hooper's experiments led him to an opposite conclusion, and he was induced to believe that the tea which contains most tannin is the most valuable. Mr. Hughes, in his letter to the Planters' Association, which we publish further on, is not willing to receive Mr. Hooper's conclusions, because the facts do not seem sufficient to justify them. Mr. Hughes is specially not prepared to receive Mr. Hooper's dictum that the proportion of tannin in tea can be affected by neither altitude nor process of manufacture. The questions at issue are so interesting and so important that we cannot doubt the ready acceptance by the Association of Mr. Hughes's offer to conduct, at a specially moderate scale of remuneration, analyses of Ceylon teas with a view to determine the proportion of tannin in such teas. The results compared with average selling prices will justify conclusions as to the points at issue, and may lead to improvement in modes of manufacture.

TEA BLENDS.—"What is a tea blend is the question agitating the minds of tea dealers in the old country and the *Home and Colonial Mail*—see the *Tropical Agriculturist*—discusses it at some length. Of course grocers can sell any blend they like if they truly describe it. But it is melancholy to see the immorality of the pleas put forward. Deliberate falsehood is condoned as merely Pickwickian story-telling!

TEA IN JAPAN.—The *Japan Weekly Mail* of 28th June says:—The Tea trade has slacked off somewhat, which may be attributed to two causes, the quantity already fired—nearly 20,000 piculs more than at the same date last year, and to the inferiority of the second crop leaf, which is said to be decidedly poor in cup. Notwithstanding that sales have dragged to some extent, prices remain unaltered.

MILK.

Cow's MILK has a stronghold in our dietaries. Its plastic powers are considerable, and with its richness in butter the equilibrium of this plastic power is maintained by a corresponding amount of carbo-hydrates (*i.e.*, sugar).

With regard to the characters and qualities to be sought for in the milk when drawn from the cow, the supply presents different characters during the three successive periods of the operation. The milk, of a bluish tinge at first, chiefly consists of whey or serum, with a small proportion of casein, and no butter. In the second period the secretion is white, containing less whey, a larger proportion of casein, and very little butter. The fluid during the third stage acquires a yellow colour, due to the presence of the butter; some casein is present, and the amount of whey considerably diminished.

One of the disadvantages of cow's milk is the peculiar solid character of its curd, which irritates and inflames the infant or invalid stomach. This disadvantage, however, is obviated by the use of a Zymine Peptonizing Powder, which has the property of predigesting a pint of milk, and so rendering it fit for any stomach, no matter how perverted the digestion may be.

The milk of the cow when predigested by means of such a powder yields a product almost identical in physiological, chemical and physical properties with human milk. So remarkable a resemblance to woman's milk is yielded by this digestive agent that it suggested to Prof. Leeds the term "humanized milk," as aptly descriptive of the product.

Artificial feeding is far from being considered as necessarily prejudicial to health. The conviction is more and more frequently finding utterance from physicians specially acquainted with this subject that feeding by means of a good bottle, such as the Burroughs, Wellcome & Co.'s Patent Thermo-Safeguard, is to be preferred to the services of a wet nurse; and thus, if cow's milk can be made to agree with an infant, it is to be preferred to mother's milk, in cases where this is not of normal quality and quantity.

Cow's milk, owing to its variable quality, its tendency to undergo putrefaction, and its absorbent character, ought to be obtained from a good dairy where it is not likely to absorb germs of disease. We have known scarlet and typhoid fever traced to milk standing in the houses of farmers whose families happened to be suffering from one of those diseases, and from its afterwards being delivered by the milk dealer to his customers. Again, adulteration and dilution are generally widespread, and in towns are often a just subject of complaint. *Health* London.

THE IMPERIAL BRITISH East African Company have appointed Mr. J. R. Dudley McAllister their engineer to carry out the construction of the railway to which Mr. Stanley alluded in his speech at Newcastle, extending from Mombasa on the coast to Lake Victoria Nyanza, a distance of about 400 miles. Mr. McAllister has left London for this object.—*Public Opinion*, July 18th.

CEYLON HALF-CHESTS OF TEA.—The question of the absurdly small contents of Ceylon "half-chests" continues to exercise the minds of both dealers and grocers. As has been frequently pointed out, when ordering a half-chest, the buyer expects to obtain not about 30 lb., but from 50 to 60 lb. of tea, and makes his purchase accordingly. From the importer's point of view, the dock rate of charges makes the half-chest of 60 to 70 lb. by far the cheapest package to handle; and from the grower's, there is to be remembered that the larger the package the less wood is of course required to hold the same amount of tea. It is, therefore, everyone's interest to maintain packages of reasonable size, and although this has often been pointed out, no steps have apparently been taken to meet the wishes of the trade.—*Produce Markets' Review*.

THE NETHERLANDS INDIA SUMATRA TOBACCO COMPANY have issued a circular to their shareholders stating that the total of the 1889 crop is somewhat smaller than originally calculated upon, as in the process of fermentation the tobacco lost a higher percentage in weight than was expected. The prices realised for the parcels already sold are highly favourable; and, although the quality of the tobacco not yet arrived is not quite so good as that of the portion already sold, the directors feel confident that the result of the company's first year's operations will prove satisfactory, and an interim dividend will be declared as soon as possible after the sale of further parcels. Reports about the 1890 crop continue to be of a favourable nature. By last mail advices, dated May 15th, 2,497,300 trees had already been planted, and the head administrator states that unless anything very unforeseen should happen a much larger crop can be expected for the current season.—*O. Mail*.

SOME PALM TREES furnish a sweetening juice. The most famous of these is probably the *Areng*, or sugar palm of Amboyna (*Arenga saccharifera*) which grows in the Indian Archipelago. * It is a superb tree, with pinnate leaves twenty-five feet long and is as handsome as it is useful. A number of species belonging to the different genera furnish a kind of hair of finer or coarser texture. It is found in the fibrous sheaths of the leafstalk and in the jagged edges of the leaves. Cables made of the black tough fibres of the *Areng* are preferred by the coasting sailors of the Spanish colonies on account of their elasticity and durability; and they are, moreover, very fine. The hemp palm of Japan and (*Chamerops excelsa*) is available in the hands of the industrious people of those countries for making the finer brooms, light strings and a thousand articles of daily use. Palms of coarser fibre, like the *Piagaba* of Brazil (*Leopoldinia niassaba*), furnish material for blinds, brushes, brooms, and the rollers of mechanical sweepers, which are much more durable than rollers fitted with steel teeth.—*Indian Agriculturist*.

* Specimens of this the great sugar palm of Java are growing near the banyan tree close to Muirburn, Colombo. It is closely allied to our kital palm, but there is the difference that the fruits of the arenga are edible, while those of the kital are not. Old trees in the Peradeniya Gardens have borne fruit. For ornament as well as utility the *arenga* ought to be extensively cultivated in Ceylon.—Ed. T. A.

THE TEMPERATURE OF THE GROUND.—At Calcutta the soil is, on the average, 2.7° hotter than the air, at Allahabad 2.4° hotter, at Jeypore (where the soil on which the instrument is placed is almost pure sand) 5.8° hotter, at Lahore 6.6° hotter.—*Indian Meteorological Report*.

MASKELIYA, July 20th.—Paper lining will never do, however cheap, for tea boxes; tea must be hermetically sealed to keep. A voyage from the estate to London now-a-days is no test. Look at the sample tins sent by post. All open, and yet for the short time the tea keeps fairly well. Navy and Army contractors have to guarantee the tea to keep for 2 years!—Heavy rain here for last 3 days.

QUININE.—According to the annual report of the directors of the Amsterdam Quinine Works, the results of the year 1889 were satisfactory. The deliveries of quinine sulphate (irrespective of other quinine salts) from the works during the past year have been about 400,000 ounces, and the accounts show a profit sufficiently large to admit of the payment of a dividend of 6 1-5th per cent.—*Paramatrical Era*, June 15th.

TEA IN JAPAN.—The *Japan Weekly Mail* of 24th May says:—"The Tea Trade has been large—nearly 23,000 piculs of leaf having been taken during the week. It is estimated that first crop pickings will be all in hand by the end of the first week in June, and then show a shortage of production as compared with last year of 20 per cent. Another week, however, must elapse before anything like a trustworthy statement can be made as to the probable first crops return."

COCOA ADULTERATION.—Mr. T. A. Pooley, the county analyst for Essex, reported to the Essex County Council, on Tuesday, that the only sample of cocoa examined was also adulterated. Butter came next to milk in number of adulterations, but most of the cases are offences against the Margarine Act. Flour was added to the mustard, and starch and sugar to the cocoa. In the cocoa case no proceedings were taken, as it is doubtful whether to use the constituents found really constitutes adulteration, since commercial "cocoa" is a compound article, and is never made in a state of absolute purity. The value of this article as a food, however, is greatly reduced when more than half of it is made up of starch and sugar, as was the case in this instance.—*London Grocer*.

MANUFACTURES IN MALABAR.—There are a variety of manufactures carried on in the Malabar District. The Basel Mission has four cotton weaving establishments, which turned out during the year 1889-90 about 150,000 yards, valued at R80,000. It has also a tile factory at Calicut, the value of the output being estimated at R40,000. It employs 200 workmen. There is also a tile factory at Ferok, owned by an enterprising Parsee Firm, Messrs. Maneckji & Co., employing 100 individuals. Messrs. Volkart Brothers and Messrs. Pierce, Leslie & Co., have extensive coir manufactories at Oochin and Calicut respectively. Messrs. Volkart Brothers' output is about R20,000 annually. There is a cotton mill in Calicut taluk established in 1888-89 under the name of the "Malabar Spinning and Weaving Company." It has not yet commenced weaving but it employs 400 individuals and turns out annually 1,185,900 lb. of yarn estimated at R487,790. Messrs. Henke & Co., have a cigar factory which turn out cigars valued at R5,000 per annum. Palghat is noted for its fine mats, the best kind fetching very high prices, and brass vessels are manufactured at Kunhimangalam in Chirakal and Cherpolcheri, in the Walawanad Taluk.—*M. Mail*, 22nd July.

SPRING VALLEY COFFEE COMPANY,
LIMITED.

REPORT.—To be presented to the Twenty-fifth Ordinary General Meeting, of the Company on Thursday, the 24th day of July, 1890, at 12 o'clock noon.

CROP 1888-89.

The out-turn of the Coffee crop for this season proved satisfactory, the total weight sold in London being 2,607 cwt., 1 qr. 11 lb.; this brought an average of 96s 9d per cwt., the value of the crop amounting to £13,065 7s 10d.

The yield of Tea on Spring Valley amounted to 86,458 lb., and this, altogether with the Tea bought from neighbouring estates sold at an average of 10½d per lb., the value of the proceeds being £4,425 5s 4d.

The weight of Tea sold in London from Oolanakande estate was 13,128 lb., at an average of 8½d per lb., the total value of Tea from this property being £511 19s 3d.

Cinchona Bark to the extent of 36,969 lb. was harvested on Spring Valley, which sold for £585 11s 1d, or an average of 3½d per lb.

The total value of all produce sold during the season was £18,588 3s 6d, while the year's expenditure in Ceylon and London, after allowing for profit on exchange, amounted to £13,498 11s 11d, thus showing a profit on the season's working of £5,089 11 7d; to that has to be added the balance of £586 5s 8d brought forward from last year, giving a total of £5,675 17 3d at the credit of Profit and Loss.

On the 10th January last an interim dividend of 2½ per cent. was paid on the capital of the Company, absorbing £2,000 of the above amount, and the Director now recommend the payment of a further dividend of 1½ per cent., making 4 per cent. for the year, free of income tax. To meet this dividend a sum of £1,200 will be required, leaving a balance of £2,475 17s 3d to be carried forward to next year.

CROP 1889-90.

When the interim dividend was paid in January, and indeed up till quite lately, the Directors had every reason to believe that they would be able to recommend the payment of a dividend at the same rate at the present time, but from Reports lately to hand from Spring Valley it is seen that the Coffee Crop for the above season will fall far short of estimate. The original estimate was 1,200 cwts., but it is feared that a total of only 800 cwts. will be secured; so large a shortage on such a small crop is very disappointing, and with the present good prices ruling for Coffee means a very considerable reduction on the year's returns. The Board, therefore, think it judicious to carry forward a much larger sum at the credit of Profit and Loss than would under other circumstances be necessary.

It has been the policy of the Board to retain the Coffee on Spring Valley as long as possible, and everything that skilful cultivation could suggest and the means of the Company permit, has been done with this object. Up to the present time this policy had been attended with success, sufficient revenue having been obtained from the area under Coffee to enable the Company to pay fair Dividends, and also to provide considerable sums of money for the necessary outlay on planting up large areas of Tea, and on the erection of factories and machinery for the manufacture of the leaf.

The season for Crop 1890-91 opened well, the Coffee being healthy, and there being every indication that good blossoms would result which the trees would be well able to mature, they being comparatively free from disease. The Directors, therefore, are much disappointed with the recent reports from Spring Valley announcing severe attacks of green bug and leaf disease which may materially affect the Coffee crop.

It was hoped that these pests were disappearing as the Coffee looked so healthy, but the regularity of their return, thus rendering the trees too weak to mature their crop, coupled with the small yield to be secured for season 1889-90, viz., 800 cwts. off an area of 970 acres, has compelled the Directors to give instructions to plant up 108 acres of the weakest and least remunerative Coffee in Tea, thus leaving 862 acres still under Coffee, while it is very possible that, year by

year, this area may have to be gradually converted into Tea, unless, as is hardly to be expected, the pests which are attacking Coffee should disappear.

The Tea on Spring Valley is now maturing well; the crop for 1889-90 is estimated at 113,000 lbs., and from the way in which the bushes are improving as they gain age, the crop for 1890-91 should show a material increase on this figure.

Extensive manuring operations are being carried out on Spring Valley, both on Coffee and Tea, and as tea responds in a remarkable way to applications of manure, the best possible results are anticipated from this work.

The market for Ceylon tea is well supported, and the average price for crop 1889-90 will show an improvement on that obtained last year.

The following table shows the total area now under tea on the Company's properties:—

TEA.		acres.
Planted Nov./Dec., 1884, on Spring Valley	...	271
" May, 1885, on Oolanakande	...	143
" Nov./Dec., 1885, on Spring Valley	...	230
" May, 1886, on Oolanakande	...	7
" Nov./Dec., 1888, on Spring Valley	...	20

Total area under tea 671

To be planted during 1890 on Spring Valley 108

UVA COFFEE COMPANY, LIMITED.

CAPITAL £100,000, IN 10,000 SHARES OF £10 EACH.

Report to be presented to the Twenty-seventh Ordinary General Meeting of the Company, to be held at No. 5, Dowgate Hill, London, on Thursday, the 24th day of July, 1890, at 1 o'clock p. m.

CROP 1888-89.

The Coffee Crop for this season was estimated in the last Report at 1,500 cwt., and it will be seen by reference to the Accounts that the actual outturn, as nearly as possible, amounted to this quantity. The average price of the Coffee sold in London was 96s per cwt.; the total proceeds derived from the sale of this product being £7,183 2s 3d.

The estimate of Tea Crop was 177,000 lb.; the actual yield from the Company's estates being 170,150 lb. The Tea brought an average price of 11s per lb., and inclusive of that bought from neighbouring estates, the total proceeds amounted to £21,320 18s 3d.

Cinchona Bark, to extent of 147,715 lb., was sold at an average of 4½d per lb., producing £2,678 5s 10d; 22 cwt. of Cocoa were also sold for £92 7s 10d, making the total value of all produce for the season £22,274 14s 2d.

The total expenditure for the year in Ceylon and London, after allowing for Profit on Exchange, amounted to £20,426 1s 9d (inclusive of not less than £2,700 spent on Tea factories, machinery, &c., and over £400 in adding 67 acres to the Tea area). There is thus a profit of £1,848 12s 5d on the season's working. To this has to be added the balance of £220 0s 3d brought forward from last year, giving a total sum of £2,068 12s 8d at the credit of Profit and Loss Account.

An interim dividend of 1 per cent on the capital of the Company was paid on the 10th of January last, which absorbed £1,000 of the last named sum, and the Directors now recommend the payment of a further dividend at the same rate, making 2 per cent for the year free of Income Tax. To meet the dividend now proposed the sum of £1,000 will be required, leaving a balance of £68 12s 6d to be carried forward to next account.

CROP 1889-90.

The outlook for this season is fairly good. The Coffee Crop is estimated at about 1,400 cwt., and the yield of Tea from the Company's estates is expected to reach a total of 250,000 lb., exclusive of bought leaf. The good prices which have ruled for Coffee for some-

time past still continue, and it is thought that the whole of the Crop will be disposed of at very satisfactory rates. The Tea market is also well supported, and it is hoped that the average price of the whole Crop will certainly not be less than last season's. Should the Directors' expectations as regards Crop and prices be realised, a fair profit on the year's working should result.

Bearing in mind the present value of Coffee, everything possible has been done to retain this product on the Company's estates, and in spite of the yearly disappointment brought about by steadily diminishing crops, hopes have been entertained that the two pests, Green Bug and Leaf Disease, might in time disappear, but it is difficult to entertain such hopes any longer. The Coffee trees looked vigorous and healthy, and everything was in favour of a good Crop for season 1890-91, but last accounts to hand from the Estates report very severe attacks of both Green Bug and Leaf Disease, which cannot but affect the out-turn of that Crop.

Under these circumstances, the Directors have resolved to plant up in Tea 270 acres of the weakest Coffee, still leaving 942 acres under Coffee, which may gradually have to be planted up in Tea in future years.

It is satisfactory to report that all the Tea on the Company's properties is thriving well, and from past results the Directors have every reason to anticipate a continued improvement, both in point of yield and quality as the Tea gains age. As Ceylon Tea daily increases in favour, there is no reason why the present range of prices should not be maintained.

The Company have on their estates Wire Tramways and other appliances which enable manuring operations to be carried out most expeditiously and cheaply, and from this work, which is now being undertaken on a large scale on the Company's properties, the best possible results are looked for, as the Tea bush responds to manure in a most marked manner, and within a few months of its application.

The area under Tea is as follows:—

		TEA.		
Planted Nov.	Dec.	1883

To be planted during 1890				270 acres

TEA AND DARJEELING.

Sixty-five inches of rain had been gauged since the 1st January to date. Taking the average rainfall to be 120 inches in the year, it will be seen that a little more than half our usual allowance has reached us, while if the season is at all a normal one we may count our rain until the first week of October. A very considerable amount of damage, as was to be expected, was done by the deluge, and for a few days through booking of passengers on the D.-H. Railway had to be suspended. The line was completely blocked near the 38th mile by a huge rock. With the help of dynamite the obstruction was removed in a little over 48 hours. It was rather amusing, though excessively aggravating, to notice how very quick the local petty shopkeepers were in taking advantage of the line being blocked. Up went the price of their wares fully 50 per cent. and at once: so that the public loss was their gain. The line has been damaged near Kurseong, and again near Gyabaree Station, where the Puggla Jhora—very appropriately so called—broke loose and carried away a large portion of the retaining wall, which had stood so well almost since the line was completed. Your readers will see from this rough sketch that the traffic branch of the Railway have had by no means an easy time of it in

keeping communication open with Silligorie. From what I have seen the quality of tea is very satisfactory. Davidson's Sirocco tea drier does require four men to look after it, and does not dry off the leaf in the time stated by the prospectus. I say this after watching one of them at work several times. Still, the new drier is an improvement on his earlier driers, and no doubt when these points have attracted Mr. Davidson's attention—it has been drawn to them already I know—he will set to work to remedy these undoubted defects.—*Indian Planter's Gazette*, July 22nd.

TANNIN IN INDIAN AND CEYLON TEAS.

Analytical Laboratory, 79, Mark Lane,

London, E. C., July 18th.

John Hughes, Agricultural Analyst, to A. Philip Esq., Planters' Association, Kandy.

"TANNIN IN INDIAN AND CEYLON TEAS."

Dear Sir,—In the *T. A.* for last February there is on page 562 an abstract of a paper on the above subject. The original paper was communicated to the "*Chemical News*" of December 27th, 1889, by Mr. David Hooper of Ootacamund, and as the analytical results are interesting and worthy of being confirmed or refuted I send you a copy of same.

You will observe that out of 65 samples of tea examined for tannin, only six represent estates in Assam at the comparatively low elevation of 600 feet. All the others represent tea grown at an elevation ranging from 2,500 feet in Travancore to 7,800 feet on the Nilgiris, the tannin per cent being 19.95 in the former and 13.55 in the latter. Practically, therefore, these teas represent the hill gardens, and not the plains of lowlying gardens of Assam, and as such it is not at all remarkable that the proportions of tannin should agree closely with that produced on the Ceylon hills.

In the 13 Ceylon teas examined by Mr. Hooper in his report the tannin ranged from 15 per cent in a sample of pekoe souchong from Yellangowry estate 2,500 feet, to 20.87 in broken pekoe from Kanangama 200 feet. Here we have a difference of nearly 6 per cent in favour of the low grown tea; though curiously enough in a sample of broken pekoe from Glenorchy 5,700 feet Mr. Hooper found as much as 19 per cent: Before, therefore, disputing Mr. Hooper's conclusions, namely that the amount of tannin present in tea is not influenced either by *elevation* or *manufacture*, I would respectfully ask, Are his facts correct? At present his conclusions are certainly in advance of his facts, and the very opposite of popular opinion based on practical experience.

Mr. Hooper tells us that the figures for tannin given in the list of the 65 samples represent the total amount of this constituent obtained by perfectly exhausting the leaves, and do not represent the amount taken in domestic use. Further that the usual teapot infusion of tea minutes removes only one-third of the total amount.

Therefore all the 65 examinations for the total amount of tannin present in these several specimens are of little practical use in showing the actual available tannin for domestic requirements.

What would be really useful information to the planter, and also interesting to the tea-drinking public, might be obtained if the proportions of tannin were carefully determined with a 1 per cent infusion after standing for ten minutes.

With our present information it is only reasonable to conclude, that not only the *elevation*, but the mode of cultivation, manufacture, season of the year, variety of plants and general skill brought to bear upon the industry, must exercise a very great influence on the quality of tea produced, and on the strength of same as indicated by the proportions of what I may term the available tannin.

According to Watt all tannins are remarkable for the avidity with which they absorb oxygen, especially in the presence of alkalies. This remark, I think, should be considered in connection with the operations of withering and rolling.

The temperature as well as the humidity of the atmosphere must have an important influence in increasing or retarding the chemical action set up after rolling. Again in regard to firing it is quite possible that over-firing many render a considerable portion of the tannin insoluble, and so reduce the proportion of available tannin in the made tea, causing it to have less strength than it otherwise would have had. I understand from Mr. Leake that reliable samples of Ceylon tea from well known estates could easily be obtained in London together with the actual market value of same, so that there would be no necessity to send samples from Ceylon more especially as such samples would not represent the bulk delivered this side, so perfectly as samples expressly drawn for market purposes on arrival.

If the Association should desire to have such a series of determinations of tannin made I may mention that the expenses would not be great, and I should make the analyses at a specially low rate of charge for the members of your Association.—Awaiting your reply, believe me, dear sir, your's faithfully,
(Signed) JOHN HUGHES.

THE TOMATO-CURE FOR DYSPEPSIA.

Don't talk to me of colocynth or famed cerulean pill,
Don't mention hyocycamus or aloes when I'm ill;
The very word podophyllin is odious in mine ears,
The thought of all the drugs I've ta'en calls up the blinding tears:

The Demon of Dyspepsia, a sufferer writes to say,
At sight of the Tomato-plant will vanish quite away.

The Faculty will diet you till indigestion stops,
On what have always seemed to me interminable slops;
A dainty dish is sure to be the worst thing you can eat;
The bismuth and the charcoal come like nightmares after meat.
Away with all restrictions now, bring mutton, beef, and veal,
As long as ripe Tomatoes come to supplement a meal.

Hepatic action, doctors say, is very hard to start,
And if you have too much of it, that also makes you smart;
And so the fate of many folks, especially in town,
Is first to stir the liver up, and then to calm him down.
Now he can trouble us no more, although we go the pace;
A diet of Tomatoes keeps the tyrant in his place.

Away with deleterious drugs, for here's a plant been found,
Worth all the weird concoctions that dispensers can compound:
Get fresh Tomatoes, red and ripe, and slice and eat, and then—
You'll find that you are liver-less, and not like other men.
Come ye who dire dyspepsias' pangs impatiently endure,
It cannot hurt, and may do good, this new Tomato-Cure.

—Punch.

INSECT PESTS: THE HELOPELTIS PESTS OF CEYLON CACAO AND INDIAN TEA.

Vol. 1, No. 4, Indian Museum Notes, edited by Mr. Cotes, possesses a painful interest, in its very full and copiously and carefully illustrated descriptions of the species of *Helopeltis* so destructive to cacao in Ceylon and to tea in India. In Ceylon, as yet, we have happily escaped the prevalence of "mosquito blight" on our tea, and we trust the exemption may continue, for it is deplorable to read of the ravages of this species of *Helopeltis* in India, where the crops of tea are on some estates reduced by one half or more by the tapping and sucking operations on leaves and stems of swarms of the insects. No fewer than 25 pages of the number we are noticing are taken up with Mr. E. T. Atkinson's paper on the genus *Helopeltis*. Readers specially interested ought to obtain copies of the Calcutta publication. For the information of our readers we reproduce the engraving of *Helopeltis theivora*, in its various stages, with the characteristic horn shown separately. We also quote some of the most interesting portions of the text:—

HEMPTERA. BY E. T. ATKINSON, B.A., C.S., C.I.E.
MOSQUITO BLIGHT.

In this paper, reference is made principally to the species of the genus *Helopeltis* of the family *Capsidae*,

belonging to the sub-order Hemiptera-Heteroptera of the Rhynchota. The genus comprises the insects so well known as the 'mosquito blight' in Assam and Sikkim, as the 'roest' or 'rust' in Java, and under similar names wherever the tea plant is cultivated. Species of this genus have been reported from the Philippine Islands, Java, the Eastern Archipelago, Ceylon and India, and are of considerable economical interest from the ravages that they commit. It was my intention to prepare a monograph of the entire genus, but this could only be done with fresh materials, and it appears to be desirable to summarise here what is known regarding the genus, and ask those interested to forward fresh specimens in weak alcohol for a fuller description of the species.

Genus HELOPELTIS, Signoret.

Ann. Soc. Ent. France (3s.), vi, p. 502 (1858).

First joint of the antennæ as long as the head and the pronotum taken together, second joint longest, 3-4 joints short; scutellum with a spine on the disc: side of the abdomen reaching beyond the hemelytra. Signoret placed this genus in the subdivision 'unicellules,' formed to contain those genera in which the membrane has but a single cellule the head transverse and truncate beyond the eyes, the antennæ long and slender, ocelli wanting, and the pronotum narrowed anteriorly. The division to which *Helopeltis* apparently belongs is represented in Central America by Distant's '*Valdasaria*' (Biol. Cen. Am. Hem., p. 242).

Then comes a notice of *Helopeltis antonii*, Signoret:—

Black varied with red: head black, rostrum yellowish: antennæ black, yellow at the base: pronotum and pectus sanguineous: scutellum red, spine yellow cup-shaped at the apex: hemelytra brown-yellowish deeper at the base than at the apex, median portion transparent: abdomen yellow, with a basal spot and apex, black: feet black: femora nodulose, the first pair, with a yellow ring at the base, intermediate pair of a lighter colour, varied with yellow; last pair with a yellow ring at the apex (Sign.) Long, 11 broad, 2 mill.

A description by Waterhouse of specimens received by him from Ceylon is given, and we quote thus:—

Reported from Ceylon. Dr. Trimen, in *Nature* for October 23rd and December 25th, 1884 (Vol. xxxi, p. 172), remarks that this species is found on the cacao and is its only formidable enemy. In the same *Journal* for October 30th, 1884, Mr. W. L. Distant states that he had received from Ceylon mutilated specimens of a Reduviid which doubtless occurred with the Capsid *H. antonii*, easily known by its nodulose femora and the spine on the scutellum. The Reduviid, however, probably feeds on the Capsid, and from its similar form and size may be confounded with the really injurious insect, so that in taking measures against these pests the Reduviid should be spared.

Next comes a description of *Helopeltis bradyi*, Waterhouse.

Mr. Waterhouse obtained this species from Java, where it was reported to have done much mischief on the Cinchona plantations.

Next we get *Helopeltis niger*, Walker. Then follows *Helopeltis braconiformis*, Walker, reported from New Guinea.

Helopeltis febriculosa, Bergroth.

This species was found amongst a number of *Disphinctus humeralis*, Walker, sent by me to Dr. Bergroth for identification. All were collected on the Cinchona plantations at Mungphu in Sikkim by Mr. Gammie, where this species was found on *Cinchona calisaya*, and occasionally on *Cinchona succirubra*. It has not occurred yet in sufficient numbers to do much damage; but as it belongs to the same genus as the destructive 'Mosquito pest' of the tea, its operations should be carefully watched. *H. febriculosa* is allied to *H. theivora*, Waterh., but is distinguished by the erect, very little curved scutellar horn; in *H. theivora*, ♀, the horn is much curved: this difference, however, appears to be merely of varietal importance.

Helopeltis pellucida, Stål.

Reported from the Philippines. *Helopeltis collaris*, Stål.

Reported from the Philippines. *Helopeltis podagrica*, Coes.

The habitat is not recorded. *Helopeltis romundei*, Waterhouse.

Hab Java: on tea.

We can testify from personal observation the truly fearful effects of *Helopeltis* on tea in Java; and the following full account of the Indian species shows how heavily it handicaps the Indian tea planters:—

Helopeltis theivora, Waterhouse. Plate XII, fig. 2.

Helopeltis theivora? Moore, Wood-Mason, Tea-bug of Assam, p. 12 (1884); Proc. Agri. Hort. Soc. Calc., 20 Nov. 1873, and v. p. xviii, xxviii (1878); Westwood, Gardener's Chronicle, Feb. 21, 1874. *Helopeltis theivora*. Waterhouse, Trans. Ent. Soc., p. 45, t. xi, f. 3 1866.)

♀ Black; pronotum orange-yellow, with a black line near the anterior margin, the base margined with black; scutellum brown, black at the base, spine or horn long, much curved, black, at the apex brown; antennæ dark brown, basal joint paler, yellow at the base; femora dark brown, mottled with light brown, with a light-yellow ring at the base; tibiæ light brown, speckled with dark brown (*Waterh.*) Reported from Assam, Sikkim. Easily recognised by the long and curved spine on the scutellum. Mr. Moore does not appear to have described this species, so that Mr. Waterhouse must be considered as having named it. There does not appear to be any fixed time for the appearance of the insect or seasonal broods. The eggs are found apparently both in the axils of the young buds and on the lower leaves, but this is a point requiring further examination. The larva is about 1-16th inch long, obtuse, soft with a very small, clavate caudal appendage; colour amber-hyaline, but after sucking the juices of the green leaf for some time it becomes of a greenish colour. The head is horizontal; the rostrum is about one third to three eighths of the length of the body, and in repose lies quiescent on the pectus: two eyes, no ocelli; antennæ purplish, hemelytra rudimentary: gradually the insect increases in size and becomes of a deeper amber or orange colour, the antennæ become longer and turn to black, and the insect is less active, though furnished with complete hemelytra, which with the head and pronotum is black, whilst there is a broad white band on the abdomen. An observer informs us that the insects seem to commence tapping in February and go on till the end of August. A young larva procured by nipping off the shoot, a leaf or two below the place where it was seen, was placed in a bottle with a shoot containing a pekoe bud and leaf and a pekoe-souchong leaf. After 21½ hours it was found that this single insect had made 58 taps on the pekoe-bud, each marked by a discoloration of the epidermis; there were 48 marks on the pekoe-leaf and 18 on the pekoe-souchong leaf. The spots at first were of a brown colour but soon changed to black. Dr. Aleyboom states that these insects, in Java, repose during the day near streams and in moist ground, and feed by night, though a few may be found during the day in shady positions on the shrubs, but not on the ground. The garden referred to was surrounded by paddy-fields and near a river, and seemed to be more liable to attacks in cold and wet weather. The insects in Assam are to be found to repose in shady positions beneath the shrubs, and do not leave the area of attack. The observations of Dr. Aleyboom would therefore appear to be not of general application, but to have reference to the particular position of the garden referred to.

H. theivora is the form with which we are chiefly concerned in India, and Mr. S. E. Peal of Sibsagar was the first to bring to notice (Journ. Agri.-Hort. Soc., Calcutta, IV (i), p. 196, 1873) that the "black blight," "smut," &c., on tea was the work of this insect and not a spontaneous fungoid growth. Further investigations have shown that the attacks of these insects occur under all conditions of soil and climate, in high land and low, dry or wet, rich and poor, in a dry, season as

bad as in a wet one, and as frequently with good culture and clean tea as with the reverse. That it is not due to "shade" or "want of cultivation" is shown by the fact that in the two worst cases, one had the garden particularly open, and in the other it was quite clean. It is difficult from one year's attack to say where the insect will appear the next year; all places appear to be equally liable to its ravages, but it seldom is seen over an entire garden at once.

Mr. Peal states that the young leaf alone is first attacked, and the more tender and succulent the shoots are, the more they suffer. The shrubs show the shoots brown and withered in a garden that has for some time felt the attacks of the insect; but if only recently attacked, the general appearance is normal, and only on the youngest shoots and twigs are a few small brown spots seen, the size of the spots varying with the age of the insect causing them. If the insect be very young, the punctures are minute and close, and the consequent discolorations coalesce and become continuous. When the larva attains its full growth, these spots become one eighth of an inch in diameter. When the punctures are recent, the colour is pale brown and darkest at the edges; but if one or two days old, the spots are dark brown, verging on black, the entire leaf curling up and withering completely if they be at all close. Where the shrub has suffered for some time and severely, the symptoms are often less visible at first sight. The dead leaves have for the most part fallen off and the minute shoots at the leaf-axils above show the damage, all being dried and dead; there is less dead leaf showing, but dead "tips" appear everywhere. Further examination will show that the affected shrub, ere it ceased entirely to shoot out, had made many efforts to grow, all of which had proved abortive, and a branch that has not yielded a single leaf presents all the appearance of having been very severely plucked. On the tips of the young vigorous shoot being punctured and its juices withdrawn by this insect, it has died as certainly as if nipped off. When the eyes below the leaf-axil shoot out, and before the insect can do serious damage, one or two shoots may attain some size and bear several leaves, but as the insect increases in size, these tips are attacked: other shoots start from other eyes, attaining, however, less vigorous growth; these too, in a short time, succumb, and the shrub becomes leafless. When this occurs growth ceases, as every shoot requires from 40 to 50 days to mature so as to be fit for plucking, and the recovery of the tea is slow unless pruned.

Dr. O. Aleyboom of Java in the same Journal (v. i), p. 55, (1878) describes the attacks of this insect on tea-shrubs there much in the same manner, except that he states that it attacks the under side of the leaf. He adds that the insect inserts its rostrum and remains for a long time on the same spot, and some hours afterwards the leaf shows a brown puncture that slowly turns black on the very spot where the puncture has been made. If the leaf be punctured closely it becomes black and so dry that it can be pulverised by rubbing between the fingers, and examination shows that the insect has removed all the juices from the soft part of the leaf. As in Assam, so in Java, the insect attacks first the buds and then the young leaves, and last of all the old thick leaves, until the shrub becomes leafless, and to prune it in this state is hurtful. The denuded shrubs seldom make new shoots, for the insects after having destroyed the leaves return to the parts of the twigs where the juices are gathering to send forth new shoots, and by sucking the juices there effectually prevent the development of buds. By remaining leafless the bark whitens and the wood becomes dry, and if the attacks continue for two consecutive years, the branches become covered with moss and die.

As already stated, these insects are reported in Assam to occur in all sorts of soils and under all atmospheric conditions. In Java, too, Dr. Aleyboom's researches have led to a similar result. There the soils may be divided into two classes—(a) those containing humus, and (b) those composed of red clay.

The first series comprise a mechanical admixture of humus, clay, and sand; it has a black hue, sometimes a depth of eight feet, and, when heated, it becomes red from the presence of oxide of iron, and gives off an ammoniacal odour. There are several varieties, due to the varying proportions of the constituent parts, but they usually contain mineral substances and from eight to twenty per cent of humus. The humus soils absorb and preserve moisture, and old shrubs usually thrive on them and produce a rich foliage. Young plants, however, easily fade and perish, and seeds do not develop, but rot.

The clay soils are of a brown hue, and are usually composed of fine clay and from ten to fifteen per cent of the oxide of iron, with some proportion of sand. These soils are arid, and during the rains absorb much water, drying up to the depth of two or three feet immediately afterwards, and also becoming heated. Here the tea-shrubs do not thrive except in moist seasons.

From 1869 to 1873, the shrubs in the humus soils were always affected by blight, which first attacked the leaves and the best-developed shrubs in the best parts of the garden, also the shrubs in the alluvial portion lying at the base of or between the hills. The shrubs in the red soils were at first free from blight, but they were also attacked when the fine leaves on the shrubs in the humus soils had been destroyed. Several experiments were then undertaken in order to ascertain the cause. Where the humus was thin or absent, the roots of the shrubs were top-dressed with good earth, which led to a new flush that was again attacked and destroyed by the blight. A very fertile part of the plantation was dug to a depth of 18 inches and thoroughly cleaned; in another place, furrows to the same depth were made and filled with branches of other trees; again another patch was drained; in another sticks smeared with tar and *oleum cornu cervi fetidum* were placed amongst the shrubs; tar was also put in the ground; but none of these experiments proved successful. Large quantities of *calcium sulphuratum* were also placed on the ground, and in another part freshly-made phosphates, but the rust did not diminish. Fumigation with sulphur burned to windward only resulted in the destruction of the leaves reached by it; whilst fumigation by burning bad-smelling wood and leaves to windward had no influence at all. Pruning only gave temporary relief, and when potatoes were planted in the neighbourhood of affected shrubs, they also blackened and died.

Picking off the insects as they appear has been recommended and tried. When it is considered that if only moderately bad there are ten to twenty insects on each bush and if very bad thirty to forty, and the shrubs are planted 6' x 3' the number of insects to an acre—and therefore the numbers in a considerable garden—will preclude recourse being had to this procedure on an extensive scale. The insects are most injurious in the larval state, even when they are of microscopic dimensions, and when disturbed, however slightly, drop through the bush to the ground, where it would be useless to follow them. Picking would therefore be too expensive and unsatisfactory, as only partially clearing the bushes. In this connection Dr. Aleyboom recommends the early plucking of tips and tender leaves, so as to diminish the food-supply of the insects, which as already noted, attack those parts first. Another suggestion that cannot be recommended is to place bird-limed strings or light cotton bags smeared with some similar sticky substance in the affected areas.

Syringing as a prophylactic would be of little use in the rains, as in a day of heavy rain the substance used would be washed away. Spraying infected tips when the attacks first appear with kerosine emulsion as an insecticide appears to promise good result. It has been of practical value in the case of coccid pests on coffee, and is very simply made. The proper course suggested by the life-history of the insects is to search for the eggs, and to spray those places where they occur, for, as a rule, in the earliest stages, the larvae are found only where the eggs have been deposited.***

Amongst the many remedies proposed, cutting down the forest and grass jungle adjoining plantations has found some favour. A writer in the Calcutta Journal already quoted suggests that *toon* trees may harbour the insect (November 1885), another that spear grass and other similar growths furnish the shelter. There is no doubt that in this country grass harbours vast numbers of *Capsida*, and it is quite possible that the original food-plant of the insect may be discovered and eradicated. It is, however, for the planters themselves to discover this, and there can be no harm in removing and burning during the cold weather grass jungle in the neighbourhood of plantations. Some support is given to this remedy by the statement of a planter that "even if destroyed on the tea plants, the insects come in from the neighbouring jungle, which should be burned down." Others say (Journ. l. c. vii, p. xlii) that clearing the jungle is of no value. There is no precise record, however, in the whole of the correspondence regarding this pest of the persistence of the insect on any plant other than tea or cinchona.

[This *Helopeltis* seems to be as specially and exclusively a tea pest, as *Hemileia vastatrix* is exclusively a coffee parasite.—ED. T. A.]

Anointing the bushes with "tar" has been recommended and tried, but abandoned, as it flavours the tea. Fumigation by burning bad-smelling weeds is reported in some cases to have kept down the pest, "but to do this successfully, the *tila* surroundings where they harbour and breed must be cleared away and burned during the cold weather."

Mr. R. B. Walker, Manager, Sookerating Tea Estate, Doom Dooma, Dibrugurh, writes:—

"Now to reply to your inquiries about what we did to get rid of the 'Mosquitoes.' To begin with, before we stopped plucking last year, and while the blight was at its worst (about September and October), I started cutting down a 'belt' of jungle 80 yards wide all round the edge of the garden; this 'belt' was completed about the same time as the pruning of the garden was finished (the end of February this was): well then I commenced lighting fires all over the place: in the tea the prunings were being reduced to ashes as rapidly as the cut-down jungle in the 'belt' was being burnt up; by the middle of March I finished all the burning I wanted to do, and then every soni was put on to hoe round the bushes, *take away all stale earth from near the stumps of the plants, and fill in fresh earth.* The pruning I went in for last cold weather was most severe: the whole of the garden nearly was cut down to within eight inches of the ground: all knotty and gnarled wood was removed and nothing but straight wood left. During the pruning, immediately following up the pruners were gangs of women and children armed with small knives whose only work was to rid the bushes of every leaf and small twig. To protect the plants from the flames (while the prunings were being burnt) a drain fifteen inches deep by a foot wide was made in every alternate row of tea, and into this the pruning leaves, &c., from round about were carefully brushed before being set alight to.

"Up to date not a trace of the blight is to be seen; this time last year about 100 acres (or more) were completely ruined; the tea is looking as healthy and nice, and growth is as vigorous as though the plants had never been blighted. So successful have we been so far in combating this destructive pest, that I am convinced now we will not be troubled with it at all this season, and that we will make our 8 to 8½ maunds an acre against a miserable 4 maunds an acre last season!

"The theory of letting tea run has been tried without the slightest signs of doing any good, for the simple reason the bushes can't and won't run! Bushes that I left alone during the three months (middle of April to middle of July) were, if anything, smaller at end of this period than at commencement of it, because not a vestige of growth had been made during the whole of this time, and the long healthy shoots chiefly in the very centre, therefore the tallest part of the

bush) died gradually down to the parent stem. I have measured some of these dead shoots occasionally and have found them in some cases to be over 18" long.

"The shoots that I have found to so die down have always been of this year's growth *viz.* those shooting out from just below last cold-weather pruning.

"Now, as blighted patches here have been found to have a large number of the young of the Bug (which by the bye are in appearance like red ants, with two feelers apiece, and are wingless) in all stages of development (from the size of a pin's point to almost a full-grown bug) on nearly every bush, and as these young live right away inside the bushes and feed on only the 'minute shoots at the leaf-axils,' the theory of pruning is to give the bush pruned a severe check and so stop for a time the rising of sap (and, of course, the production of the 'minute shoots at the leaf-axils') in the hopes this brief period of the bushes' dormancy will be sufficient to kill the young bugs of starvation. Whether we have succeeded or not in destroying *any* young ones by starvation it would be difficult to say, but that pruning is doing good is quite certain. Three days ago I got 25 maunds of leaf off the piece of tea that was pruned (5 acres in June last) in July; previous to pruning, this bit of tea was *completely* shu' up' for about 2½ months.

'Of course we know it is o.k. right to cultivate and keep extra clean any tea that may be hanging fire' or doing at all badly. I reversed the order of things with a bit of about 5 acres of very badly blighted tea: I allowed it to go into 'howling jungle,' the bushes were out of sight for over a month; strange to say when I hoed and cleaned it up after a fortnight, I found the bushes quite recovered and with a very decent flush on them. The lock of tea of which these 5 acres are a part presents a peculiar spectacle with its small piece of bright green healthy tea surrounded by dismal-looking acres and acres.

"Some weeks ago I tried sprinkling kerosine and water ($\frac{1}{4}$ of k. to $\frac{3}{4}$ of w.) over a piece (about 2 acres) of tea: on two occasions the day the mixture was squirted I found a young dead mosquito, evidently killed by the oil having reached them. I will with pleasure report results of all experiments to you.

"I forgot whether I have mentioned to you the fact of my having found mosquito eggs on the lower and seed-bearing branches more frequently than I have come across them on any other parts of the bush: *always* the old leaves have I found covered with eggs and never have I seen an egg on a young shoot. I have more than once found eggs on the tea seed itself. To give you some idea of the number of eggs there are knocking about I'll just mention:—I ripped off from a bush near the hungalow all the leaves with eggs on them: on counting the leaves I found I had 1,741. Some of these were smeared on both sides. This particular bush was about an average one, and was not picked out by me, because I thought it had a larger proportion of egg-leaves than its neighbours.

"Young mosquitoes are very plentiful too; I have picked off more than 70 from one bush.

"On one occasion I pulled a seed-bearing branch off a bush and counted 33 leaves on it; *every* leaf was smeared on *both* sides with eggs, and besides this the main branch itself and the smaller ones too had any quantity of eggs sticking to them. This will show you mosquitoes are not very particular where they lay their eggs. This is quite in opposition to what others say about mosquitoes depositing their eggs in the young shoots between pekoe and suchong leaf."

Then follow descriptions of three homopterous insects found on the mango.

We quote what is said of a Cotton Pest:—

In February last Mr. E. E. Green, of Punduloya, Ceylon, sent me a small Lygacid which, he states, infests the ripe pod of the cotton, discolours, and cakes the cotton. I find it is the *Ozyarcenus lugubris*, described some thirty years ago by Motschulsky. Hab. Ceylon.

A coccid is noticed, the *Coccus ceriferus* of Anderson, found on the Mango, Arjun, Pipal and other trees, and now on tea.

Signoret,* in his paper on the Coccidæ, merely quotes the imperfect description of Anderson, and gives no details. Under these circumstances I have sent examples to Mr. W. Maskell for description, as I have not leisure to take the work up myself. I do not think that there is any danger of this insect doing much damage to tea. If it does become troublesome, the application of kerosine emulsion by spraying to the leaves containing the larva will quickly destroy them and prevent their spreading. The waxy portion of the adult female may possibly be used as an article of trade like the insect-wax of the *pela* in China, but of the uses of the Indian wax we know nothing yet.

A butterfly destructive to fruit is described as *Virachola isocrates*, Fabricius, a butterfly of the family *Lycaenide*, of the suborder *Rhopalocera*, of the order *Lepidoptera*. It is found almost throughout the plains of India (except the desert tracts), and in Ceylon, but not in Assam or Burma.

Every fruit that is attacked by the larva dies before it is full-grown and has ripened, as the heart of the fruit is entirely destroyed by the insect. Were this pest to increase largely in numbers, it would certainly do a vast amount of damage to fruit, as is now the case with the Mango beetle.

The most effective remedy against this pest, if practicable, would be to catch the female butterflies and to destroy them before they have laid their eggs. When once an egg is laid on a fruit, that fruit is almost certainly doomed. As a further prevention against attack for the coming year, if all the fruit with holes in them were gathered and destroyed (burnt or buried), there would be but few butterflies left to lay eggs and to carry on the species during the following season.

In Miscellaneous Notes by E. C. Cotes, there is much that is interesting, but we can find room only for a few extracts:—

From Messrs. Octavius Steel & Co. were received, 11th October 1889, some specimens of a caterpillar covered with urticating hairs. The specimens, though too much decayed for precise determination, were obviously the larvæ of a moth belonging to the group Bombyces.

The following is an extract from the letter of the Manager of the tea estate in South Sylhet where the insects were found:—

"By today's post I send you in a bottle a number of caterpillar-looking insects that have been giving me a lot of trouble this year, not destroying the bushes but laming the coolies. I have sixty coolies incapacitated from work owing to this. The caterpillars, or whatever they are, lie under the edge of the bush and the coolie treads on them when picking, his foot begins to pain, and if not on the hard sole a blister rises, and until this forms into a wound and suppurates he suffers agony and can't walk at all."

Information has been received through Mr. Lionel de Nicville of injury done during the past year to tea in Sikkim by *Helopeltis theivora* (Mosquito blight) and *Tetranychus bioculatus* (Red spider).

The Red spider attacks the tea in spring and early summer, while the Mosquito blight is found during August and September and confuses its ravages chiefly to elevations below 2,000, feet. On one tea estate alone the loss caused by the Mosquito blight in the past year was estimated at 300 maunds of tea, valued at Rs20,000, that done by the Red spider being even greater. It is said that the Mosquito blight has only appeared of late years in Sikkim, with the cessation of the practice of annually burning the jungle.

Preparations are being made in one garden, on a considerable scale, for sprinkling bushes attacked by the Red spider with Flour of sulphur, with a view to the destruction of the pest. Sprinkling with flour of sulphur has been found useful in Florida for destroying the Rust mite *Typhloronus oleivorus*, which attacks orange trees. This treatment would therefore be promising for use against Red spider.

* Signoret, *l. c.* (5s.), ii, 1872, p. 40, t. 7, f. 3; Atkinson, in *Jl. As Soc. Calc.*, iv² (2), 1886, p. 279.

Washing the orange trees with a solution of whale-oil soap (1 lb of soap to 5 gallons of water) has also been found useful against the rust mite, it is therefore suggested for Red spider, in case the sulphur treatment is not found to be successful.

Through the Officiating Director of Agriculture in Assam were received, in the latter part of August last, (1) specimens of a caterpillar which had proved destructive to castor-oil plants, (2) specimens of Eri silk-worms (*Attacus ricini*) which had died of disease which had been very fatal to them in Cachar.

The caterpillar proved to be the larvæ of the Noctues moth, *Achea melicerte* of Drury, a species which has previously been reported as destructive to castor-oil plants in Lower Bengal and in Madras (*vide* vol. I, pp. 52 and 104 of these *Notes*). The insect is a common one and occurs in India, Ceylon, Celebes, and Australia.

Millions of these caterpillars are described as emerging from the jungle in one night and eating up acres of castor-oil plants, grown for the feeding of silk worms.

The following extract from the Annual Report, 1888-89, of the Bhadgaon Experimental Farm has been furnished by the Revenue and Agricultural Department of the Government of India:—

"In pursuance of Government Resolution No. 6093, dated 9th September 1887, Revenue Department, experiments were made to test the efficacy of C.S.₂ as a preservative of grain from the attack of weevils, and upon which a separate report was submitted in August last. The observations were continued this year.

"A summary of the results of the experiments is given below:—

(a) That soft varieties of grains such as soft wheats and jowari are sooner attacked with weevils than hard varieties, as *banst* wheat, *bajri*, &c.

(b) That C.S.₂ is a perfect preservative against the attack of weevils upon grain.

(c) The action of C.S.₂ lasts in cases not hermetically closed six weeks, after which period a fresh charge of the reagent is required.

(d) That even in samples which have been attacked with weevils the effect of C.S.₂ is immediately felt, the weevils disappearing *en masse*.

(e) That C.S.₂ does no harm to grain as regards its colour, smell, and cooking properties, &c.

(f) That the poisonous property of C.S.₂ need in no way interfere with its introduction into Indian villages, as, unlike arsenic, its strong and repugnant smell will act as a sufficient safeguard.

(g) With the dismantling of the old granary, which had been used as a store-house for grain for the last nineteen years, weevils have almost disappeared from the farm. After a long and diligent search, I succeeded in observing only a few under the heaps of jowari ears in the threshing yard, so late as the 20th of the last month. This proves beyond doubt that wheat is damaged most by weevils in city godowns, where a large quantity of it is stored every year before being shipped to Europe.

(h) It is therefore fair to conclude that painting the interior of the godowns with poisonous paints and charging the grain with C.S.₂ (in the proportion of 1½ lb of the reagent to a ton of grain) will reduce the damage caused by weevils to wheat and other grains to a considerable extent.

In a letter, dated 13th July, Mr. E. Green of Ceylon wrote:—

"The larva mines below the cuticle of the upper surface of tea leaves. I do not know that the pest is of any real importance, as it only attacks leaves too old for plucking. The habits of the larva are interesting, however. From its being laterally compressed, it accordingly rests upon its side beneath the cuticle of the leaf. It feeds very rapidly, clearing a space more than twice its own size in half an hour's time,—the head and anterior segments moving in regular sweeping curves like a mower with a scythe. Before pupating, the larva assume the usual horizontal position, so that the preparium rests upon its abdominal surface."

The specimen was submitted to M. Bigot, who determined it as a Dipterous insect (Fam. Muscida) belong-

ing to a hitherto undescribed species of the genus *Oscinis*.

Specimens of the Hesperid butterfly, *Gangara thyrsis*, Fabr., have been received through the Director of the Forest School, Dehra, from the District Forest Officer, North Malabar, who reports that the caterpillar is very destructive to young coconut palms. The following is extracted from his report:—

"The egg, which is spherical in shape, is laid on the upper surface of the frond. The larvæ appear in from 8 to 10 days, and immediately draw a section of the leaf together, first cutting it laterally to enable it to be drawn into a cylinder by means of fine silken thread. In this cylinder the larvæ live, travelling out at night to feed.

"In appearance the larvæ somewhat resemble that of *Attacus atlas*, but are, of course, very much smaller. They are covered with white filaments which appear as if powdered with flour. There are two patches of scarlet on the segments near the head placed laterally."

Mr. E. E. Green furnishes the following notes regarding the identification of the species described in the paper by the late Mr. Nietner on coffee pests in Ceylon:—

Orgyia ceylonica, Nietner, is probably synonymous with *Orgyia postica* of Moore, the larvæ of the latter often occurring in large numbers upon coffee trees:—

Trichia exigua of Nietner corresponds to *Somena irrorata*, Moore, or *Somena scintillans*, Walker:

Agrotis segetum of Nietner is probably either *Agrotis conspurcata*, Walker, or *Agrotis suffusa*, Fabr.; the true *Agrotis segetum* not having been observed in Ceylon:

Boarmia ceylanicaria is probably *Boarmia*, Walker; *biffusaria*, while the identity of *Glycerionorpha lichenoides* has, it is feared, been completely lost.

It is much to be regretted that representatives of the various coffee pests that were described by the late Mr. Nietner were not deposited at the time in some local museum where they could be examined and their identification settled. It is hoped, however, that as specimens and information accumulate in the Indian Museum, it will be possible to determine and to publish accurate figures of at least the more important of the insects described by Mr. Nietner.

From Messrs. Mitchell, Reid & Co., of Calcutta, were received, on 29th June 1889, specimens of a scale insect determined by Mr. E. T. Atkinson as *Leeanurum theae*. Messrs. Mitchell, Reid & Co. wrote:—

"We have received from our Holta Tea Garden in the Kangra Valley, some prunings from a tea-bush showing a species of blight, which, our manager advises us, has made its appearance and threatens to spread. The manager says it was first noticed in a garden which largely used castor cake for manure, and he expresses his opinion that the blight resembles that which affected and ultimately ruined the coffee industry in Ceylon . . . The prunings, which we send herewith, show the blight referred to."

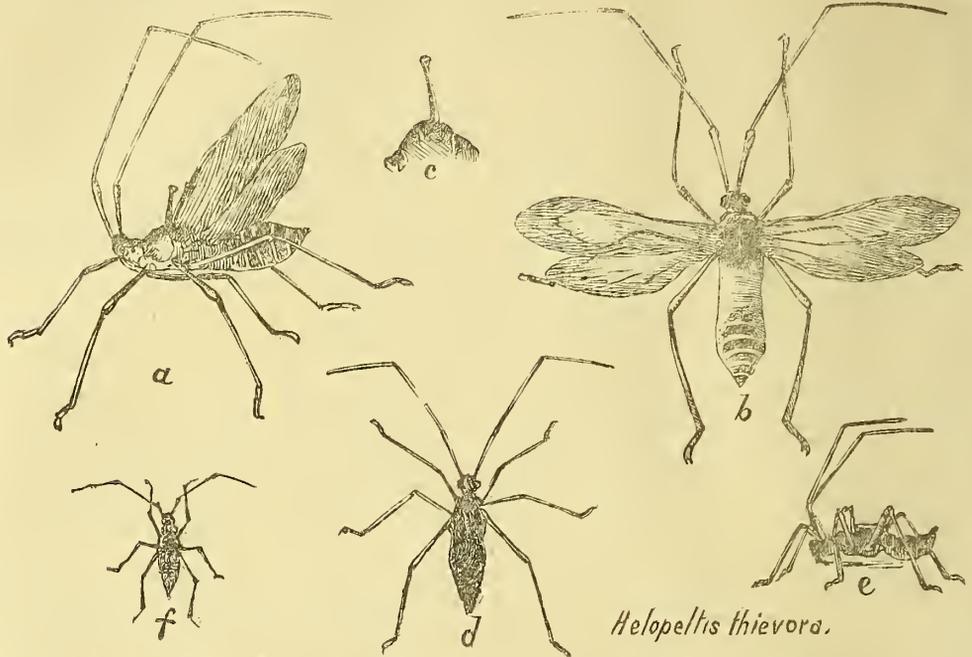

Or 3rd July Messrs. Mitchell, Reid & Co. again wrote:—

"In a letter received from the manager this morning he informs us that the pest is distinctly spreading, though in a most irregular manner. Healthy and weak bushes are alike attacked; a few bushes may be attacked in the middle of a plot in the valley and the pest not appear again for miles, while some gardens have it in a much more aggravated form."

This insect belongs to the same genus as the well-known Coffee scale of South India and Ceylon, and there is little doubt but that it can be destroyed by the kerosine and soap solution recommended for destroying that insect.

We have thus extracted matter locally interesting; but all tea planters, we repeat, ought to secure copies of the number we are noticing for the sake of the plates, which includes no fewer than 13 pictures of the insects and their parts, prominence being

given to the horn-like spine which rises from the head of that most deadly of all tea pests, the *Helopeltis*. Our engraving—executed by Messrs. H. W. Cave & Co.—fairly reproduces the characteristics of this deadly insect.

a—b.—Imago $\times 4$; c.—Scutellar horn $\times 6$; d—e.—Pupa $\times 4$; f.—Larva $\times 4$.

NUTMEGS IN GRENADA.—A West Indian planter in ordering the *Tropical Agriculturist* and offering to send us an occasional letter—an offer we gladly accept—adds:—"The staple on this estate is nutmegs, and we have lots of trees from 70 to 80 years of age, fine sturdy old fellows which bear enormously and look 'good' for another century."

PLASTER.—A new process of hardening plaster, so as to make it available for the construction of floors in place of wood, has been brought before the French Academy of Science by M. Juite. A mixture of six parts of plaster of good quality and one part of finely sifted recently slaked white lime is employed like ordinary plaster. After it has become thoroughly dry, the object manufactured from it is saturated with a solution of any sulphate, &c., whatever, whose base is precipitated in an insoluble form by lime. The sulphates specially recommended for the purpose are those of iron and zinc. In order to obtain the maximum of hardness and tenacity, it is necessary to temper the lime plaster well in as brief a space of time as possible, and with no more water than is strictly necessary.—*Indian Agriculturist*.

UVA PLANTING COMPANIES.—We have received copies of the Reports of the Spring Valley and Uva Coffee Companies Limited, details of which will be found on p. 201. Meantime we may mention that besides spending money on tea planting and Factory machinery, the Uva Company declares a dividend equal to 2 per cent per annum. The Company has 927 acres under tea and 270 more are to be planted this year, while 942 acres will then be left under coffee. The prospects for both coffee and tea are satisfactory.—The Spring Valley Company is able to declare a dividend of 4 per cent notwithstanding the falling-off in coffee and extensions in tea. Of the latter, 671 acres are planted and 108 acres to be done this year leaving 826 acres still under coffee.

HOW TO INFUSE AND DRINK TEA.—One who knows writes:—"The Norwegian tea cans (sold for a trifle in Vienna) should be sold by millions to the British working men: they keep tea piping hot for quite 3 hours." Specimens should be got from Vienna for inspection by the Ceylon Tea Fund Committee and then if approved of, the advantage of such tea cans could be "officially" proclaimed in England and especially in America where the new Company would only be too glad of a novelty of the kind to accompany their crusade in favour of Ceylon tea.

TEA BOXES.—During a conversation lately held by me with a member of the Stanley-Wrightson Syndicate it was mentioned that it is not only tea planters that are patronizing the boxes made by it. The soap manufacturers and other traders requiring packing boxes have shown a great interest in the progress of the new undertaking and are likely to aid it extensively. Until the raw material is produced in this country, however, the extension of the manufacture must certainly be delayed. The prices hitherto charged for the tea boxes sent out to India and Ceylon have been below the absolute cost of making them. It is the heavy duty charged on the strawboard exported from Holland that handicaps the Syndicate at the present time. But once let the supply of board become reliable and cheap, and the capacity for manufacture may be extended almost indefinitely. There is one detail as to the making of the chests which at present creates some difficulty. The strawboard is so tough that the ordinary punches break in many cases where they have to be driven through two or three thicknesses of it. A tool which shall partly screw and partly punch seems to be a necessity for working in this particular material.—*London Cor.*

THE COLONIAL COLLEGE AND TRAINING FARMS.

[The institutions referred to in the following report are so important and calculated to be so useful, that we feel bound to lay the details before our readers. Young men passing successfully through the College and Training Farm, will be well equipped for the battle of life in the Colonies, which they cannot help benefiting while benefiting themselves.—Ed. T. A.]

Lord Knutsford, Secretary of State for the Colonies, distributed the prizes at the college, Hollesley Bay, Suffolk, on Wednesday. A large company was present, among the most prominent being Sir Graham Berry, Sir F. Napier Broome, Sir Rawson Rawson, Sir Arthur Hodgson, Sir Augustus Addenley, Sir Frederick Young, Mr. Braddon (Agent-General for Tasmania), the Hon. A. J. Clarke, Lord John Hervey, Hon. Lionel Holland, Mr. Landale, Mr. W. N. Wallor, Mr. Abraham Scott, Major Oraigie, Mr. C. S. Read, General Montagu, General Lowry, Major Barnardiston, Major Howey, Major Windham, Captain Stirling, Captain Hopo, Captain Boughey Burgess, Mr. Hunter Rodwell, q.c., Mr. Tylston Hodgson, Mr. T. Holmes, Mr. Frank Garrett, Mr. F. Dutton, Mr. F. M. Dutton, Mr. Percy Borrett, Mr. Dunoan Thomson, Mr. E. K. Blyth, Mr. Charles Burrell, Mr. Stancomb Dunn, Mr. Seth-Smith, Mr. Anley, Mr. Rutherford, Mr. Francis B. Baker, Mr. R. Butler, Mr. H. J. W. Jervis, Rev. R. Lawrence, Rev. J. A. Clowes, Rev. A. S. Morse, Rev. J. F. Hervey, Dr. Eager, Mr. J. R. Wood, Mr. O'Halloran (Secretary to Royal Colonial Institute), Mr. C. R. Steward, Mr. G. H. Garrett, Mr. David Johnson, Captain Moor, Mr. John Sherwood, and Mr. Robert Bond. Letters were read from the following gentlemen who had accepted invitations, expressing regret at being prevented from attending:—The Marquis of Bristol, Sir Charles Nicholson, Sir Saul Samuël, Sir Charles Mills, Sir Frederick Weld, Sir F. Dillon Bell, and Sir G. Baden-Powell.

The college is situated on Hollesley Bay, about two and a half hours distant from London. The estate contains about 1,330 acres of pasture, arable, heath, and woods, the college in addition hiring and farming 500 acres of fine arable and pasture land adjoining. On the estate there are 1,600 sheep, mostly of the pure Suffolk breed, 100 bullocks, 50 cows, and 66 horses. The institution, which was established in January, 1887, is intended to provide the intending colonist with suitable training, with advice as to his future career, and so far as possible with an introduction to it. A course of instruction is provided in field cultivation, the making and repair of agricultural implements, gardening, bee culture, forestry, tree planting, the care of horses, bullocks, sheep, swine, and poultry, veterinary practice, riding, land surveying and levelling, engineers' and smiths' work, carpentry, and ambulance work. At present there are about 70 pupils under instruction.

After luncheon in the dining hall the company proceeded to make an inspection of the college, gardens, and workshops. At the distribution of prizes which afterwards took place, Lord Knutsford took the chair.

Mr. JOHNSON (the resident director of the college) said that the class work of the college was of a practical character. It was important for young men intended for colonial life to know the reasons why a thing was done and how to do it, and it was a great gain to approach one's work with an enlightened mind instead of approaching it in the dark. The object of the system followed at the college was to turn out good all-round men who should not only be a credit to the college, but whom the college would be glad to recommend afterwards. Their object was to familiarize the pupils with all the circumstances of rural life, whether at home or in the colonies.

The following prizes were then presented by the chairman:—General farm work, L. H. Parker; ploughing, H. A. Wells; dairy work, H. A. Wells; veterinary work, R. B. Baron and M. Deans; surveying, G. Honeywood; levelling, T. Rutherford; carpentry, A. E. Richardt; smith's work, G. Honeywood; smith's work

and carpentry (combined), G. Honeywood; best collection of grasses, T. Rutherford; gardening, E. N. Howard.

Lord KNUTSFORD, in addressing the students, said that it had given him great pleasure to be able to come to the college that day and to exchange the rather heavy, and perhaps official, air of the Colonial Office for the breezy and much fresher air of the Colonial College. He was very glad to be present, not only to show his own personal interest as Colonial Secretary, but to assure them of the interest which Her Majesty's Government felt in the institution and in the increasingly good work of this kind. (Cheers.) It had been very pleasant to him to present the prizes to those who had earned them by hard work. At the same time that pleasure was somewhat diminished by the fact of being called upon to say a few words of advice. It had been said that the giving of advice was a privilege which was very often exercised by one to say foolish things under the pretence of preventing other people from doing foolish things. But he appeared before them without that pretence, because he believed that, in going to cast in their lot with the colonies, the students were doing a remarkably wise thing. They were aware that there was no royal road to success; but there was a royal road against defeat, and that was by perseverance and good work. (Cheers.) He had seen a warning given by some one to emigrants who were going out to other countries without any practical knowledge, without previous training, without studying the climate, the local habits, and the customs of the colonies, and the warning was couched in these words:—"If you are going out unprepared to fight a wilderness—a mighty, tongueless, obdurate, mysterious adversary—he will give you opulence if you conquer him, but a grave if he conquers you." It was a pleasure to him to know that such a warning would be absolutely lost in the case of the students of this college, because they were receiving that practical knowledge with which they would be able to meet the adversary, to secure a victory and not a grave, a competence and happiness if not opulence. (Cheers.) That was the great advantage of the work performed at this institution. In the time of James I, a learned maiden was brought before the King and pointed out to him as a rarity because she could speak Hebrew and Greek. The King immediately turned round and asked, "Can she spin?" (Laughter)—in other words, he did not depreciate the Hebrew and the Greek but he wanted to know whether she was fitted for the work she had to do in life. (Cheers.) The students of this college gained practical knowledge by a variety of instruction, this instruction including a knowledge of ambulance work. That might possibly be next to the shoeing of horses, the most useful work they would have to do, because many of them would be stationed in the colonies far away from medical assistance, and therefore they would be enabled by this instruction not only to help themselves, but others as well. (Cheers.) It had been hinted to him that he should give the students some advice about the colonies. Frankly, he could not assist them in that respect. The only two colonies he had seen were Malta and Heligoland (laughter), and therefore his knowledge was likely to be still further reduced, because they were just parting with the last-named possession.* He was afraid that he could only speak of the colonies as an old writer, Fuller, spoke of the shires of England—"Some of them," he said, "Joseph-like, have a better coloured coat than others; others, like Benjamin, have a more beautiful mess of meat." (Laughter.) In other words, some of the colonies are very good for agriculture and crops; others are better for cattle and ranches. On a previous occasion Lord Lorne, in addressing the students of that institution, advised them to take work in the colonies, but as a general rule to look around them before they began working on their own account. He

* The time may come when practical knowledge of the colonies will be deemed as much a qualification for the office Lord Knutsford holds, as the practical knowledge imparted at this college is deemed essential to the success of a colonial career.—Ed. T. A.

felt that to be sound advice. One of the characters in one of Trollope's novels, on being asked how he got on, replied, "Dogged does it," and he gave the students the advice "Be dogged." They would have misfortunes to contend with. Their crops or their cattle might be destroyed; but they ought not on that account to fold their arms and sit down under the misfortune. Let them, on the contrary, stand up like gallant men and fight so as to recover their losses. (Cheers.) In this respect they had an example before them in this country. If they looked around them they would see how the farmers of this country during a succession of bad years had had to fight gallantly against misfortune, and the students in similar circumstances could not do better than imitate that example. He heartily wished them all success. (Cheers.)

SIR A. HONGSON also addressed the students. He said that he went out to Australia when he was 21 years of age, knowing nothing about agriculture. All that he had learned before this was most unwillingly learned as an Eton boy studying Virgil. (Laughter.) Afterwards he entered the Navy, and then went to Cambridge, going ultimately to Australia. He had enjoyed no advantages similar to those now enjoyed by the students of this college, and he impressed upon them to take advantage of this great and golden opportunity to learn. He urged them when they went to a colony not to shift their ground without good and sufficient reason, to stick to the man with whom they might be for the time engaged, to study his character. In the long run their good sense, good feeling, good character, and sound education would stand them well in the hour of difficulty. (Cheers.)

SIR GRAHAM BERRY also thought that young men entering colonial life from the preparation of such an institution as this possessed a great advantage over their predecessors of the olden times. He urged the students who might go to the colonies to be brave, firm, persevering, resting assured that success would be their reward.

SIR F. NAPIER BROOME said that his latter days as Governor of Western Australia had been everything he desired, because he saw that his colony was on the point of obtaining everything it wanted. The Constitution Bill, as soon as it had received the assent of the House of Lords and her Majesty, would allow the colony to enter on a career of free institutions enabling it to take a place side by side with the other great colonies. Western Australia was a new colony, and there was plenty of room in it, and as an old practical colonist he thought that some of the pupils of this college might do worse than turn their attention at this juncture to it, especially when the colony might be said to be starting on a new career. He thought that in Western Australia they could start on a smaller amount of capital than in the larger colonies. A young man with £2,000 could begin his career as a squatter or pastoral farmer. On behalf of the colonies he expressed their great obligations to the Colonial Secretary. (Cheers.) If the Western Australia Constitution Bill had not been handled with great tact and judgment and with great consideration for colonial interests and the guardianship of Imperial interests, it would have been a much more delicate matter to overcome the opposition which a short time ago existed throughout the country.* Almost the whole of the Press was more or less opposed to the Bill giving control of the lands, but now, owing to the way in which the measure had been handled, there was no voice raised against it at the present moment. The chief credit for this was due to Lord Knutsford, and he knew that this feeling was felt in the Australian colonies. (Cheers.) The colony was also very sensible of the support which it had received from the Agent-General of Victoria and the representatives of the other colonies, and who had backed it up so well. Hundreds of young men had come to him with letters

of introduction, but on inquiry he found that they knew nothing of practical affairs concerning agriculture, their thoughts being in the direction of obtaining some small post in the Government. (Laughter.) Any one, however, who arrived in the colony having passed through such an institution as this possessed a market value the moment he landed, and his future was assured. (Cheers.)

SIR F. YOUNG also spoke a few words of encouragement.

MR. BRADON (Agent-General for Tasmania) bore testimony as a colonist to the immense advantage which students derived from such a college. He advised students to go to some British possession rather than throw in their lot with those who were not of their own race and blood.

A vote of thanks to the chairman brought this part of the proceedings to a close. The company afterwards inspected the farms, dairy, cattle, and sheep. —London Times, July 18th.

TEA FOR PERSIA.

From an official report on the trade of Khorassan for the year 1889-90, we note that the total value of British goods imported there during the year *via* Trebizond and Tabriz was about 82,000 tumans (23,429*l.*), and of British goods, *via* Bander Abbas, 213,050 tumans (60,871*l.*). This last total does not include the value of China tea, the larger proportion of which should, however, be fairly included, as there is no doubt that most of it was purchased and brought from China by English merchants. No less than 118,571*l.* worth of China green tea and 5,143*l.* worth of China black tea came from Bombay, while the value of the India green tea was only 7,143*l.*, and of the Indian black tea, which is universally drunk in Khorassan, 112,000*l.* Thus the total value of China tea was 123,714*l.*, against 19,143*l.* of Indan. A Peshawar tea merchant, just arrived at Meshed to arrange to forward his goods by that route in future, states that the Amir of Afghanistan levies 80 Indian rupees (5*l.* 13*s.* 4*d.*) on every camel-load of goods passing through his territory (*via* Kabul) to Bokhara. The Amir of Bokhara also levies 2½ per cent. He further states that a pound of tea, costing 12 annas in India, will cost about 16 annas when it reaches Meshed, 18 annas when it reaches Bokhara by this route, and 21 annas by the Kabul route. He says two-thirds of the green tea imported into Bokhara is Chinese, and one-third Indian. If this is so, a great quantity of Indian tea must travel there by Kabul, the most expensive route, and the Indian merchants must be unaware that the Persian route is the cheapest.—*Grocer*.

TEA IN JAPAN.

Researches on the Manufacture of Various Kinds of Tea. Bulletin of the Imperial College of Agriculture and Dendrology. By Y. Kozai, Assistant in the Agricultural Chemical Laboratory. (Tokio, 1890.)

Y. Kozai is a Japanese chemist who performed his researches under the control of Dr. Kellner, the Director of the Chemical Laboratory at Tokio. His paper includes the chemical constitution of tea, the effect of tea on mankind, the principal methods of manufacture employed in Japan, and the methods of preparing tea for consumption. These subjects are all treated mainly from the point of view of the analytic chemist. The author appears fairly well acquainted with what the German chemists have done in the matter of tea.

We need not abstract much of his account of the constitution and properties of tea, as it is largely taken from European sources. "The chief action of tea, after it has got into the blood, is to excite the nervous system; it thus harmonizes the mind, drives out drowsiness, and awakens thought, stops hunger, and cures repletion, refreshes the body, and prevents head-ache" —and (it might be added) if taken too strong keeps you awake half the night. As to its constitution, tea

* The objection to handing over one million square miles of territory, even though much of it is sterile, to 46,000 persons was certainly natural, and the concession required to be carefully safeguarded.—ED T. A.

contains (besides the common plant-constituents) theine, a volatile oil, and tannin. Theine is a rank poison, in toxic doses causing convulsions and paralysis, in lethl dosesa death; but in small quantities is (like strychnine) a delicate tonic. Of the volatile oil, Y. Kozai can affirm little beyond its well-known exciting action upon the organs of taste and smell; nor is it easy to follow it analytically through the processes of manufacture; the hot steaming employed (at near boiling temperature) in the green-tea manufacture does not appear to diminish the volatile oil sensibly, though Y. Kozai intimates that preparing green tea by hcling does dissipate the aroma. As to the properties of tannin, it is an astringent remarkable for its strong affinity for the albuminoids; hence, if taken in excess, it may, by precipitating the ferments of the digestive fluids, cause indigestion.

The account of the chief Japanese methods of manufacture is of more interest and instruction to the European planter.

We may premise that there are two (main) kinds of tea, viz. black and green. In the manufacture of black tea there are four essential processes, viz. (1) withering; (2) rolling, (3) fermenting, (4) drying. In the manufacture of green tea, the fermenting is omitted, and in Japan (for some kinds of green) the rolling also.

For the manufacture of black tea there is no real difference between the Japanese method and that practised by English planters in Bengal. The fresh picked leaf (*i.e.* tips of the young shoots) must be first withered, or the petioles and leaves break under the rolling; the exposure of an hour or two in strong sun withers the leaf sufficiently; if there is no sun, the leaf must be withered by the aid of fire-heat. The rolling is done, even in Japan, by the aid usually of a box, and in Bengal often by steampower (and very roughly). The juices are thus expressed, and the leaf given a "nice" twist, *i.e.* a twist pleasing to the fancy of the tea purchaser. What perhaps renders rolling so essential in the manufacture of black tea (for it is not essential in the manufacture of green), is that it masses the leaf in a state conducing *without delay* to fermentation. Neither Y. Kozai nor the best Bengal authorities like to lose the juices more than can be helped. He also hazards the view that, by rolling, the juice is expressed from the cellular tissues of the leaves and impregnated upon their surface; thus is produced fine aroma, and the leaves are more easily infused. Fermentation is the most important point in the manufacture of black tea, and by it (*vide* Y. Kozai) the leaves lose their raw smell, and the tea acquires its fine flavour. The fermentation is really only carried a very little way: Y. Kozai says it should be allowed, in a temperature of 104° F., to proceed only for about an hour. He thinks the process is a true fermentation, because if permitted to run too far the tea acquires an acid taste. He thinks it probable that the ferment is caused by a living organism, but he adduces very slight ground for this opinion; and it has, in fact, been questioned whether there is any true fermentation in the process at all. But the English tea-makers are agreed with the Japanese in the importance of stopping the fermentation exactly at the proper point by drying the tea, which is usually done by placing it first in the sun and turning it over till it is fairly dry, and then thoroughly drying it by fire-heat.

The result of all the Bengal experience is that the black tea is at least as good when these four processes are done simply and rapidly, as when much labour and time are expended in complicating them. In the early days of tea manufacture by Anglo-Indians, great pains were taken to imitate with tedious minuteness the careful hand-processes (and repetitions of portions of the processes) as practised in China; but all planters now follow rapid short cuts to the finished tea.

The manufacture of green tea is nothing more than drying the leaf; it is so little practised in British India as to be of no commercial interest there, but Y. Kozai describes in detail three kinds of green tea manufactured in Japan.

(1) *Japanese (not China) green tea.* In this, the leaf

is steamed in order to remove the raw flavour; it is then rolled and fire-dried, the two last processes being usually done together.

(2) *Chinese green tea.* In this, the leaf is roasted (while stirred with a stick) in an iron pan over a fire, then rolled a little, then roasted again; these processes being repeated even six or eight times, and the tea is then finally dried off.

(3) *Flat tea,* the highest class tea of all. For this tea, the shrubs are usually kept shaded for three weeks before picking, so that the leaf is partly etiolated. The choicest leaves are selected before the manufacture is commenced. They are steamed, but never rolled; nor, indeed, touched by hand at all, but carefully turned by the aid of a bamboo stick. After sufficient steaming they are simply dried.

The author finds by analysis that there is 30 per cent. more theine in etiolated leaves than in the leaves of the same plants grown in the light. He tried many experiments to test the chemical effect of the manufacturing processes. Among other tables given by him is the following; a quantity of leaf was divided into three portions, whereof one portion is A, another portion is manufactured into green tea B, the third portion is manufactured into black tea C. Y. Kozai analyzes A, B, C, and finds—

	A.	B.	C.
Crude protein ...	37.33	37.43	38.90
Crude fibre	10.44	10.06	10.07
Ethereal extract ...	6.49	5.52	5.82
Other nitrogen-free extract	27.86	31.43	35.39
Ash	4.97	4.92	4.93
Theine	3.30	3.20	3.30
Tannin	12.91	10.64	4.80

He remarks that the general result of the green-tea manufacture is merely to dry the leaf; the black-tea manufacture alters materially its chemical constitution. The principal change is the remarkable diminution of the tannin. He does not explain how this is brought about, nor is it easy to see how the incipient fermentation should affect the tannin.

The only teas exported to Europe from Japan are of low class; they are frequently "faced," and sometimes mixed with the leaves of various Japanese plants. Any plentiful leaf, not too unlike the leaf of tea, will do for this adulteration; the leaves actually employed are (Y. Kozai assures us) all harmless; and several contain tannin, but none of them any theine. As to the "facing," he says it can hardly be called adulteration; the quantity of Prussian blue employed to improve the appearance of green tea is (according to Y. Kozai) about 0.001 per cent. the weight of the tea, perfectly innocent, and pleasing to a purchaser.

The author concludes with an account of the different ways of taking tea in Japan, with some analyses of the prepared liquor.

(1) In the case of flat tea, or of the very finest quality of Japanese green tea, the tea is ground to fine powder, and the whole infusion drunk.

(2) In the case of superior (*i.e.* from the Japan point of view) tea, the leaves are infused for two minutes in water at 120°-150° F.

(3) In the case of a medium tea, the leaves are infused for one minute in boiling water.

(4) In the case of inferior tea, the leaves are boiled in water.

The object to be aimed at in the preparation is to get the largest possible quantity of theine without dissipating the aroma, and accompanied by only a moderate amount of tannin. Y. Kozai gives analyses to show that this is effected (in the case of superior teas) by the infusion in water at 120°-150° F. for two to five minutes. By superior teas, he understands teas worth five to seven shillings a pound in Japan. It is probable, therefore, that the highest class teas we ever have to deal with in England come under the medium teas of Y. Kozai, which require infusion in boiling water—for one minute at least. The majority of English people like a good deal of chicory with their coffee, and probably a majority also like a good deal of tannin with their tea; and to them

the analyses and recommendations of the Japanese writer are of small importance.

The paper will be of more use as food for reflection to the Anglo-Indian planter than as direct instruction. The palate of the Englishman is as yet only very roughly educated in tea. There can be very few Englishmen who would greatly prefer the superior tea of Japan and China to the ordinary Kumaon or Ceylon tea; most persons used to drinking the latter would probably prefer it to the most expensive tea made—say China tea worth forty shillings per pound in China. The English planter in Bengal has a tea garden of 200 acres (possibly still larger). His objects, by the aid of a steam-engine or other coarse help, to put his tea through—to keep his factory clear when he has a strong flush on. He has to carry the daily make through by the aid of uncivilized labourers and overseers. He must reduce every step of his manufacture to a routine; he must have no special tea separately and differently manufactured, and no current experiments. Few planters have made much profit by Pekoe; and the green tea hardly exists commercially in India. There are no doubt many Englishmen who, having not a plantation but (literally) a garden with some tea in it in India, have manufactured, not un-successfully so far as the flavour of the tea is concerned, green tea, Pekoe; &c., but this has been a fancy article for their own drinking or for presents, and has never been put in any quantity on the market. To plant successfully in India, the Englishman has to proceed on a broad scale; his large cost and high expected profit cannot be got out of the close superintendence of elaborate hand manufacture. Or, at least, it will be a long time before the public tea taste at home is sufficiently elevated to be willing to pay so large a price for such teas as would remunerate the English planter. For the present, the object of the planter must be to produce the maximum quantity of tea that the English grocer can sell at 1s. 6d. to 2s. 6d. a pound. Hence to planters the utility of the paper of Y. Kozai must be mainly future.—*Nature*.

CONCERNING COCOA.

Cacao seeds, or cacao beans, or "cocoa nibs" as they are commonly known in the trade, are the fruit of the cacao tree. They grow in large fleshy round pods. The cacao tree belongs to the natural order of the *Stercularia*, and its botanical name is *Theobroma cacao*. This name was assigned to it by Linnaeus, the great botanist, as an indication of the high appreciation in which he held the beverage prepared from the seeds. The word *theobroma* really means "food fit for the gods." There are nearly a dozen varieties of the cacao tree, and these flourish in the West Indies chiefly, but are also cultivated and grow wild in the northern part of South America, and in Central America north as far as Mexico. The best kind is indigenous to Venezuela, and the cocoa which it produces is known as Caracas; that which comes from Trinidad perhaps ranks next in quality. The cacao tree is being cultivated in various other parts of the world, wherever the climate is found suitable, for there is an ever-increasing demand for the "nibs" on the European markets. History relates that the seed of *Theobroma cacao* were first described by no less a personage than Captain Gonzalo Fernandez de Oviedo y Valdes. About the middle of the sixteenth century he writes that Columbus found the natives of Yucatan using these seeds as money, just as some of the aborigines of Africa use cowrie shells. In those times the Spaniards were rapidly extending their conquests and colonies in the New World, having received *carte blanche* from Pope Alexander VI., who issued a bull granting all east of a line one hundred leagues west of the Azores to Portugal, and all west of this imaginary line to Spain! In Spanish literature of the latter part of the sixteenth century there are frequent references to the uses of the cacao seeds.

Cacao seeds are very rich in oil; in the shelled state they yield nearly 50 per cent. of a thick buttery oil,

which is known in trade as cacao butter. At ordinary temperatures this oil is nearly solid, in fact is much like soap in consistency and general appearance. The average composition of cacao seeds, according to Wanklyn's analysis, is shown by the following percentages:—Fat or cacao butter, 50.00; albumen, fibrin, and gluten, 18.00; starch, 10.00; gummy and mucilaginous matters, 8.00; colouring matters, 2.60; water, 6.00; theobromine, 1.50; ash, 3.60; loss, &c., 0.30; total, 100.00. The husk of the seed is usually stripped off before exportation; it is composed of three distinct layers or membranes. By means of the microscope the outer layer is seen to consist largely of elongated cells, the middle layer consist of angular cells containing mucilaginous matter, whilst the inner layer is a mere membrane or pellicle, and is composed of angular cells which contain oil. The starch is located in the seed proper, or "nib," which is built up of small cells distended with grains of starch: delicate reagents will detect traces of inulin in these tissues. Wanklyn's averages put the percentage of theobromine rather high, and he must have examined a number of exceptionally fine samples; other observers state that the seeds only contain about 0.5 per cent. of theobromine, and doubtless their results are not wrong, but have been compiled from the examinations of different varieties of cacao. It is wonderful what a difference slight variations in the constituents of the soil or in the species of a tree will make in the chemical composition of the crop.

The question naturally arises, What is theobromine? Now, although it exists in such very small proportions (from about one-half to about one and a half per cent.) in the cocoa nib, it must not be supposed therefore that it is insignificant; indeed, it is to the presence of this substance that cocoa owes its peculiar properties as a beverage. Theobromine bears to cocoa an analogous relation to that which exists between caffeine (or theine, as it is also called) and tea or coffee. It is a rather remarkable fact that caffeine is very closely connected with theobromine, considered from a chemical point of view, for both these substances belong to what is called the uric acid group of chemical compounds. They only occur in the vegetable kingdom, and were formerly classed amongst the alkaloïds, that is, amongst such poisonous substances as strychnine, morphine, &c.; but the recent researches of several well-known scientists have demonstrated that they are both analogous to uric acid and to other similar bodies which exist in the animal organism. These facts seem at first to provide matter for unpleasant reflection, but we must remember that we are only dealing with chemical analogies.

We can represent the composition of theobromine by a formula, that is to say, by "chemical shorthand"—it is $C_8H_{10}N_4O_2$, which implies that seven atoms of carbon, eight of hydrogen, four of nitrogen, and two of oxygen have all united together to form this substance. The honour of having discovered theobromine is due to Woskresensky. By extracting the pounded "nibs" with boiling water, precipitating with lead acetate, then treating the clear liquid which remains after filtering with sulphuretted hydrogen, and finally boiling with alcohol, theobromine will separate out from the cooled liquid in the form of beautiful microscopic crystals. These crystals are slightly soluble in cold water, and the solution possesses a curious bitter taste, which becomes perceptible after a time. The bitter principle, of coffee and tea, namely caffeine, is strictly speaking, methyl-theobromine, $C_8H_{10}N_4O_2$. Theobromine has actually been found along with caffeine in the young leaves of the Himalaya tea. Its effects upon the human system are mildly stimulating.

Cocoa, as we understand it nowadays, is the roasted and ground cocoa nib, the husk having been previously removed. Everyone probably knows that although the "nibs" can be obtained whole or broken, most of the cocoa sold is either rock cocoa, flake cocoa, or prepared powdered cocoa. Cocoa is too rich in fat to suit the digestions of the general public, hence many manufacturers eliminate more or less of it. Others incorporate a certain amount of starch

with the ground nibs, thus producing a cheaper article which is not so gross. Chocolate is merely cocoa to which a large quantity of sugar and more or less starch has been added, together often with various flavouring essences. Cocoa really partakes more of the nature of an article of food than of a beverage; it is very rich in warmth-producing and flesh-forming constituents, and in these respects it compares favourably with tea and coffee. The term "soluble cocoa" is a misnomer: it should rather be "miscible cocoa." Anyone can demonstrate this by allowing a cup of cocoa to stand and settle for a few hours. The experiment is best performed in a glass tumbler.

The mixture of cocoa are now made chiefly with sugar and starch, and these are not regarded as adulterations by the manufacturers who make some of the "prepared cocoas." Venetian red, chicory, cocoa husks, and various flours and ground cereals are sometimes met with in low-grade cocoas; but starch is "the thing," and to provide this the potato, sago, arrowroot, maize, &c., are laid under contribution. Chocolate is made to contain a great deal of sugar, hence sophistication is more easily concealed from the taste. Chevalier states that chocolate is largely adulterated, but that as the public generally understand that it is merely a preparation of cocoa, it does not much matter so long as the added ingredients are wholesome. Still there is no excuse for such substances as the following being present, viz.:—Lime, ground lentils, maize and bean flour, foreign fats and oils, various gums, and such colouring matters as cinnabar, red earth, and even red lead. Most of these sophistications can be detected by the microscope if they be of vegetable origin, and if of mineral origin they can be identified by means of the usual chemical reagents. Wanklyn states that the mineral matters ought never to exceed 5 per cent. He recommends the determination of the phosphoric acid in the ash as a means of detecting the adulteration. Fat is best estimated by extraction with ether.—*Grocer*.

NOTES ON POPULAR SCIENCE.

By DR. J. E. TAYLOR, F. L. S., F. G. S., &c.,
EDITOR OF "SCIENCE GOSSIP," &c.

Whilst on the subject of chemical experiments and investigations of a practical character, I should do well to notice those on the physiological value of what may be termed "commercial foods," such as the different kinds of oil-cake, &c., in relation to their milk-producing power. The experimental cow received 15 lb. of clover hay and 3 lb. of cake per day. It was found that rape-cake produced an increased amount of milk the first day, and the same fact was recorded when this was exchanged for coconut cake. Indeed, in both cases, the increase was very considerable, but that produced by coconut cake lasted much the longer. In other experiments, in which 20 lb. of green fodder was given per day, an addition of 3 lb. of linseed cake gave an increase of 12 per cent. of milk. The same weight of coconut cake raised the yield to 11 per cent, but lasted longer. Hemp-cake had no effect at all. The increase of milk was also produced by giving the cow (in addition to its green food) sun-flower cake, poppy-seed cake, coconut cake, &c.; the yield of milk being most increased by the last, and least by the sun-flower seed cake.*

For several years past I have been suspicious about the use of nitrate of soda. Many farmers don't know what to do with it when they have purchased it—and it is rather an expensive article. Artificial manures want mixing with the same sort of thing that Sir Joshua Reynolds said he mixed his paints with—brains. Then success is sure. I have long been of

opinion that an excessive use of nitrogen, whether organic or artificial, tended to promote and encourage the rapid growth and development of such parasitic funguses as moulds, mildews, and rusts. Thus, in the published results of some Rothamsted experiments on the growth of potatoes, I observe that those manured by ammonium salts and soda nitrates, although they yielded splendid crops, had the largest proportions of diseased potatoes. What is the good of producing a diseased crop? A manure of superphosphate of lime, although it only produced an average of three and a half tons of potatoes to the acre had only two and three-quarter hundred-weight of these diseased, whereas ammonium salts and mixed mineral manures, and a mixture of sodium nitrate and other minerals, although they actually produced a heavier crop of Potatoes (nearly six tons in the former instance, and almost approximating to that in the latter), nevertheless yielded eight and a quarter and nine and a quarter hundredweights of diseased tubers respectively. The fact is nitrates of soda, as well as ammonium salts, in nearly every instance ought to be used sparingly (hand sown), and when the crop is just appearing above the ground. Then they are stimulants as well as food for the baby plants.

Notwithstanding my criticism regarding the use and abuse of nitrogenous manures, the above-mentioned Rothamsted experiments distinctly brought out the fact that the use of nitrogenous manure gives rise to a great increase of starch in the potato, just as in the case of root crops there is an increase of sugar under these conditions; and in that of cereals an increase of starch and cellulose. The real cause of the potato disease is the fact that the fungus converts its starch into sugar, and stores up in itself a large proportion of the nitrogenous juices of the potato.

The influence of the electric light upon vegetation has manifested itself in a very remarkable manner in the case of the large lime trees on the Leipziger Platz, Berlin. On the branches of those trees which are opposite the electric light, a few days ago the development of the new leaves had advanced considerably, whereas on the other side, where the light does not strike upon the branches the buds had only just begun to form.

I have frequently referred to the idea of the late Professor Ville, of Vincennes, to the effect that the natural order of plants Leguminosæ have the power directly to fix the nitrogen of the atmosphere. This appears also to be the belief of Sir John Lawes and Dr. Gilbert, based upon their experiments at Rothamstead. It is further thought this nitrogen-absorbing power is largely brought about by the micro-organisms growing on the roots of the Leguminosæ.

Here is a chance for wealthy young Australians to form a syndicate. M. Daubree, the well-known French geologist, has expressed his opinion that the deeper formation of the earth's crust contain abundance of diamonds. Diamond powder, as I have already shown, has been found in meteorites. Professor Daubree has made observations in all the diamond-bearing regions, and finds the stones occur in the oldest and most deeply-seated rocks. Why not start a company and bore down a mile or so?

Two of our young and rising chemists—Messrs. H. T. Brown and G. H. Morris—have just given to the scientific world the results of a long-continued and most delicately manipulated series of experiments on the germination of some of the grasses. Their investigation was undertaken with the view of throwing some light upon the complex metabolic processes which take place during the germination of seeds. This their first paper on the subject (read before the Chemical Society), is almost confined to barley. Some years ago the great German botanist, Professor Sachs rather startled the botanical world by the statement that in a seed the relation of the embryo to the endosperm is that of parasite and host. Messrs. Brown and Morris's experiments confirm Professor Sachs' generalisation. More, in their experiments, they availed themselves of this suggested relation by cultivating the embryo upon suitable media after separating it from

* This supplies a full and satisfactory answer to our question in discussing cattle disease and cattle feed, as to the suitability of coconut ponac for milch cows.—ED. T. A.

its endosperm. In this manner they obtained special information with regard to the secretory powers of the embryo, and the chemical modifications of its absorbed nutriment, which it would have been impossible to have obtained by any other means.

As the result of cultivating the excised embryos upon various nutrient solutions, more specially of the carbohydrates, Messrs Brown and Morris showed that while cane sugar, invert sugar, dextrose, levulose, maltose, raffinose, galactose, and glycerol have all more or less nutrient value, milk sugar and mannitol do not in any way contribute to the growth of the tissue of the young plant. Of all the substances they tried they found cane-sugar had by far the greatest nutritive power. Maltose, although the natural food of the embryo when attached to its endosperm, is decidedly inferior in this respect to cane sugar. This may be due to the fact that the maltose, directly it is absorbed by the growing embryo, becomes transformed into cane-sugar in the living cells, and in this form is passed from cell to cell. When cane-sugar is supplied ready formed to the young plant there is a saving of chemical energy to the living cells, which receive it in a form in which it is directly available for its requirements. The two young experimenters expressed their opinion that the transformed starch of the endosperm is absorbed by the embryo in the form of maltose, and that the seat of production of the cane-sugar which germinated grain contains is the tissues of the embryo itself.

A new green vegetable colouring matter has just been announced by Mr. O. Michie Smith. It has been extracted from the green pulp of the fruits of *Trichosanthes palmata*, and has therefore been christened trichosanthin. It yields a solution nearly resembling chlorophyll, but possesses a very different spectrum. It is thought that in trichosanthin we have in the colouring matter a substance in which the "blue chlorophyll" of Sorby and the "green chlorophyll" of Professor Stokes are replaced by some other substance easily decomposed by reducing agents and acids.

A new and dangerous parasitic fungus on the vine has just been described by M. Lagerheim to the Paris Academy of Sciences. It is a *uredo*, and accumulates in dense clusters on the leaves. So far it has only been met with in the neighbourhood of Kingston, Jamaica.

The following fact is worth everybody making a note of. We imagine we have done our duty by the water we drink when we filter it. Now, it has been just demonstrated that when filters (or rather the filter-beds) have been too long in use, they are nothing better than germ-disease breeding-beds. One of the best and simplest filtering-beds I know of is composed of common cinders. It ought to be taken out and made red hot (or calcined) about once a month. That will destroy anything. Then a fresh and calcined layer of fine sand should be strewn over (if red sand all the better, as the iron will fix decomposing organic matter). I have never had the slightest difficulty with my filters, beyond the trouble involved by treating them as above mentioned; and a man who will not take the trouble to keep his drinking water clean would not take the trouble to keep his face clean.

At length it seems that the frequently talked-of idea of utilising the motive power of Niagara Falls will come into operation and turn the spindles of commerce instead of serving no other end than that of allowing fools to go over in barrels. It is intended to bore a tunnel from the water level below the falls under the high bank of the river, extending through the rock to the upper river at a point about a mile above the falls. There a head of 120 ft. of water can be obtained. The tunnel is thence to extend parallel with the river for a mile and a half at an average depth of 160 ft. below the ground, and about 400 ft. distant from the navigable part of the river. The fall of water thus obtained is estimated to produce 120,000-horse power. Mills will be supplied with the power at some distance from the falls, so that the scenic features of the latter will not be interfered with.

—Australasian.

INDIAN TEA COMPANIES.

Mr. Ernest Tye, Secretary, Indian Tea Districts Association, has compiled for the *Home and Colonial Mail* a list of the Indian Tea Companies in London, numbering 63. No fewer than 10 of these Companies own such large areas of land as from 3,500 acres in the case of the Tarrapore, Cachar, to no less than 9,185 opposite the Assam Company. There are two Companies below the colossal Assam, with over 8,000 acres, one with 7,000, one with 5,096 and one with 4,715. Of course, with such areas, there can be no scarcity of timber or fuel. Indeed we believe that in many cases the coolies employed have lands on which they cultivate rice,—portions of the areas owned by the Companies being swamps or irrigable.

Out of the 9,326 acres owned by the Assam Company the proportion under the heading of "acreage and mature plants" is 7,520, and the yield per mature acre is given at 356 lb. The cost of producing the tea was 9½d per lb., and the value in bond, including seed, &c., was 11½d. The dividend of this Company, which some years ago ranged about 20 per cent, was, for 1889, 10 per cent. The capital per acre is put down at the low sum of £20, due to the fact that the present Company purchased the property at a very small sum in comparison with what it cost the originators of the enterprise, who suffered the fate so common to pioneers. The Land Mortgage Bank of India is in a very different position, owing, no doubt, to loans on estates which had to be taken over. The capital per acre, in this case, is so high as £43, and although a profit of nearly £14,000 resulted from 7,467 acres mature plants, yielding 306 lb. an acre, value 10½d per lb. no dividend was declared. We have next four Companies in succession which divided 10 per cent in the case of three and 12½ per cent for the fourth. The values of tea in these cases ranged from 10d to 11½d, while the cost ranged from so low as 7½d to 10d. The Company which produced its tea at 7½d got 452 lb. per acre, while the Company which shows the very highest yield per acre in the list, viz. 721 lb., has 8d down as the cost and 11½d as the value. This was the Company which divided 12½ per cent. The highest dividend of all, however, 18 per cent, is opposite the Cherra Tea Company, Limited. The capital of this Company is down at £114,500, for an area of 2,836 acres, or £40 per acre. The acreage in bearing is 2,645, from which a crop of 1,389 was gathered, or at the rate of 489 lb. per acre. The cost per lb. was only 6½d and the value 10½d. It thus appears that the best dividend was not declared by a Company having the highest yield or the teas of which sold at the best price. A cost of production equal to only 6½d per lb. seems low enough, but the next figure for cost of production is only 5½d. But, alas! the tea was of a value only one penny higher, so that the surprise is that even a dividend of 2½ per cent was declared. A Company which produced its teas at 6½d and sold them for 9½d, divided 10 per cent. So did another Company although the tea cost 10d and sold for 1-0,½d. Another Company which divided 10 per cent, produced its teas at 7,½d and sold at 10½d. The Shumshernugger Company gave a dividend of 13 per cent. The capital of this Company is down at £21,000; acreage 812; capital per acre £26; acreage mature plants 677; yield 313,000,

at the rate of 462 lb. per acre. The tea was produced at a cost of only 6d, and sold for only 8½d. The result, as we have said, was a dividend of 13 per cent, notwithstanding the low price at which the teas sold. The Moabund Company showed a dividend of 15 per cent. Its capital is down at £35,007; acreage 713; capital per acre £49; acreage mature 596; yield 322,000 lb. at the rate of 542 lb. per acre. The tea was produced at 9d and sold for 1/2½, the very highest value in the list. The Doom Dooma Company divided 14 per cent. The capital of this Company is down at £116,100; acreage 1,671; capital per acre £69; acreage mature 1,403; yield 877,000, a rate per acre of 625 lb. The tea was produced at so low a cost as 7½d per lb. and sold for 1/0, ⅞d. For the 34 Companies of which the working results for 1889 are given, we get the following details;—

The paid up capital ranged from £354,644 to £20,000. The total acreage ranged from 9,326 to 600 acres. The capital per acre ranged from £154 to £21. The mature acreage ranged from 7,520 to 510 acres. The crop of 1889 ranged from 2,674,000 lb. to 143,000 lb. The yield per mature acre ranged from 721 maximum lb. to 246 lb. minimum.

The cost of tea per lb. ranged from 11½d to 5½d. Value of tea per lb. in bond (including shed etc.) ranged from 1s 2¾d to 6½d.

We must not omit noticing the generally high bearing rate of the mature acreage. We have already noticed the maximum of 721 lb. per acre. Then we have 645, 632, and 625; next come 575, 563, 542, and 515; below 500 but above 400, we get 489, 486, 467, 466, 462, 452, 441, and 427. So that there are 16 companies out of the 34, or nearly one half, the average yield of whose estates is over 400 up to over 700. The number of estates which range below 400 but above 300 lb. are 10, so that 26 out of the 34 companies got average yields above 300 up to over 700. In looking at this yield and comparing it with that of Ceylon estates, it must be remembered that the vast proportion of the Indian tea estates were opened on virgin soil of special richness, there being no old coffee estates, more or less washed and worn, to lower the average. Considering how our average yield is affected by the low yield of old coffee estates, we compare fairly well with India; in specially favourable cases, such as that of Mariawatte "beating creation."

The results under the head of dividends for the year show that, of the 34 companies, 1 gave 18 per cent; 1 gave 15; 1 gave 14; 1 gave 13; 1 gave 12½; 7 gave 10 per cent; so that 12 companies, or more than a third of the whole, divided 10 per cent and upwards. We have a dividend of 9 per cent in case of 1 company; 1 gave 8; 1 gave 7; 9 gave 6 per cent; 1 gave 5½; and 1 gave 5. So that 14 companies gave dividends from 5 per cent up to 9; and 26 out of the 34 gave dividends ranging from 5 to 18 per cent. A dividend of 3 per cent is opposite 1 company and 2½ per cent against another.

In the first case, that of the Land Mortgage Bank of India, where no dividend was declared, the profits were nearly £14,000. There were good reasons in this case for not dividing any of the profits, as the losses of previous years had to be made up. In the second case of no dividend, the profits were £11,116. Then comes a case with £748 profits; two others with £1,502 each. The only case of absolute loss, the sum being £2,531 is that of the Endogram Company with £40,000 capital; 1,089 acreage; £36 capital per acre; 1,064 mature acreage; yield 272,000 at the rate of 255 lb., the lowest yield recorded. The tea cost 10½d to produce it and sold for only 8d.

Leaving this exceptional case out of view, the

results of the working of the leading Indian Companies seems by no means discouraging, especially in view of the considerable fall in the selling prices of teas compared with those which prevailed a few years ago. Not many planters in Ceylon, we suspect, can beat the Indian record of minimum cost of production, 5½d per lb. But in this direction of economical working, so as to reduce cost of production it is evident we must proceed, if the Ceylon tea enterprise is to continue profitable. Meantime efforts to open up new markets must not slacken.

CATTLE DISEASE IN SOUTHERN INDIA, CEYLON AND THE STRAITS.

While waiting for the disposal "a press of other matter," in order to resume our discussion of the question started by our correspondent "Truth" as to the necessity for stringent measures of quarantine, stamping out and so forth, to combat cattle disease in Ceylon, evidence as strong as it was unexpected has been afforded of the correctness of the views we expressed, by a resolution of the Government of Madras. In this resolution the expenditure for a lengthened period in attempting to carry out measures such as "Truth" demanded and the Ceylon Cattle Commission of 1869 recommended is declared to be money wasted, and the whole machinery for watching and segregating cattle has been abolished. The Government of Madras has come to the conclusion we expressed that stringent measures of repression are impracticable, looking at the circumstances of the country and the character of the people, and that we must look for gradual improvement with advancing intelligence. We deem it quite probable that "Truth" will say: "The action of the Madras Government only renders stringent quarantine and other measures on our part the more necessary." What would better please our pro-bovine friend are the details of very stringent legislation in Persk, following that in force in the Straits Government, whereby quarantine precautions are applied equally to cattle and human beings, power being reserved to "stamp out" the former, with or without compensation. The subject is so interesting and in many aspects so important, that we shall devote another article to its discussion. The misery, of course, is that when rinderpest breaks out amongst the wretched native cattle, badly fed and worse tended, it does not confine its ravages to animals comparatively worthless but destroys valuable imported animals, treated in the most liberal and humane fashion as they may be. The following is from the *Madras Times* of August 5th:—

The fiat lately went forth for the abolition of the Cattle Disease Department in this Presidency. Government was led to take this step, on the report of the Agricultural Committee that the money expended upon attempts to cope with cattle-disease had been practically wasted, and that until the spread of education has effected a change in the attitude of the ryots, it would be wiser to suspend the attempts to directly combat the evil. The Agricultural Committee stated, that "in dealing with diseases which, owing to the customs of cattle-management and the conditions of the country, spread with immense rapidity, and find a victim in every stall, we deem it hopeless for many years, to attempt directly preventive and curative work over the whole area of the country, and we are absolutely convinced, that the present method of placing solitary inspectors, themselves insufficiently educated and trained, in charge of a whole district, with but little supervision and no possible chance of obtaining local influence over so vast an area, is radically wrong. We look forward to a time, when

there will be a highly trained Stock Inspector with a staff of saluistry subordinates in every taluk, when the sense of the country will be actively on the side of the preventive and curative staff, and when better stock management will remove the predisposing causes of epidemics. This is not yet within measurable distance, but we consider that the Department should at once bend its efforts, to obtain as quickly as possible a considerably strengthened staff of Stock Inspectors." But the proposal did not meet with the approval of Government, which considered such a policy impracticable, as it would require a whole army of Stock Inspectors and Saluistries, and even then but little good would result, in the present state of opinion of the farming classes, unless the former were entrusted with wide and stringent powers of compulsion, which would be an evil to be avoided; for taking into consideration the classes from which the staff is recruited, their low salaries, and the opportunities they have for oppression, they would gravely abuse the authority entrusted to them. Government also alluded to the fact, that there were doubts whether the effects of disease are so serious as they are represented. Mr. Robertson, for example, is of opinion, that losses of cattle result from the impoverished condition, into which the stock frequently get and not from the severity of the diseases that prevail. From statistics, it is found that cattle mortality from disease is not high, while cases of epidemics, seriously affecting ploughing cattle, or the more valuable animals, are comparatively rare. Government agreed with Mr. Benson, that cattle must die of something, and as very few in this country are slaughtered for food, they would multiply far beyond the means of subsistence, if epidemics were stamped out, so that besides further deteriorating in quality, they would die from sheer starvation in as great numbers, as they now do from disease. The efforts of officers of the Cattle Disease Department were further handicapped by the passive and even active obstruction offered by the ryots to all efforts to assist them. With this opposition, religious scruples, apathy and ignorance of the ryots to deal with the Department was utterly useless, unless a very expensive staff was entertained, with summary powers, which was not expedient at present, and would be fraught with great danger to the people. Government therefore come to the conclusion that the amount already spent on the Department had been literally wasted, and it directed operations in this direction to be closed at once.

MAIZE OR INDIAN CORN.—"Old Resident" writes:—"No doubt Sir Arthur Havelock was thinking, when he made his remark at Matale, of the almost universal cultivation of maize in south Africa, in contrast with the scarcity of the culture here. But the cause of this you have already explained."

NUTRITIVE VALUE OF FOODS.—Speaking roughly, a quart of oysters contains, on the average, about the same quantity of actual nutritive substance as a quart of milk or a pound of very lean beef, or 1½ pounds of fresh codfish, or two-thirds of a pound of bread. But while the weight of actual nutriment in the different quantities of food material named is very nearly the same, the quality is widely different. That of the very lean meat or codfish consists mostly of what are called, in chemical language, protein compounds, or "flesh formers," the substances of which make blood, muscle, tendon, bone, brain and other nitrogenous tissues. That of the bread contains but little of these, and consists chiefly of starch, with a little fat and other compounds, which serve the body as fuel, and supply it with heat and muscular power. The nutritive substance of oysters contains considerable of both the flesh-forming and more especially heat and force-giving ingredients. Oysters come nearer to milk than almost any other common food; their values for supplying the body with material to build up its parts, repair its wastes, and furnish it with heat and energy, would be pretty nearly the same.—*Century*.

BAMBOOS were sold last year by the Forest Department in Bengal to the number of nearly fifteen millions. As compared with the previous year, there was a falling-off of more than a million in the number of bamboos sold. The decrease was pretty general in all the forest divisions, but occurred chiefly in Chittagong, where the fear of raids kept men from going into the forest.—*Pioneer*.

ARTIFICIAL TEA.—The Calcutta *Capital* for May 20 has the following:—"A new industry has sprung up in Germany with the young leaves of the wild strawberry plant. Having been carefully dried, they are used instead of China tea, and are said to approach that beverage very closely in taste. An addition of young bramble and woodruff leaves is said to add to the excellent flavour of this most inexpensive of teas."—*Grocer*.

SUGAR is cheap enough now, as every sugar-planter knows. But hitherto we have only thought of it as a sweetening agent. Now we are discovering it has other properties, which may tend to raise its market price. An Italian engineer has proved that if sugar be introduced into the water of steam-boilers it will retard (if not prevent) incrustation. In a boiler of 20 horse-power, possessed of 126 tubes, 4lb. of sugar a week was found sufficient to retard incrustation. In Butler's *Trenchon* we have a delightful chapter devoted to the period when our machines will become sensibly automatic, and take the place of supposed rational creatures. The above fact seems to be moving in that direction. Our steam-boilers are getting as fond of sugar as children.—*Australasian*.

ONIONS.—For a cold on the chest there is no better specific for most persons than well boiled or roasted onions. They should be sliced and boiled in milk till soft enough to smash up and form a sort of gruel. Drink or sup just before or after getting into bed. They may not agree with everyone, but to persons with good digestions, they will not only be found to be a most excellent remedy for a cough, and the clogging of the bronchial tubes, which is usually the cause of the cough; but if eaten freely at the outset of a cold, they will usually break up what promised, from the severity of the attack, to have been a serious one. A writer in a medical journal recently recommended the giving of young raw onions to children three or four times a week, and when they get too large and strong to be eaten raw then to boil or roast them, but not to abandon their free use. Another writer, advocating their use, says: "During unhealthy seasons when diphtheria and like contagious diseases prevail onions ought to be eaten in the spring of the year at least once a week. Onions are invigorating and prophylactic beyond description. Further I challenge the medical fraternity or any mother to point out a place where children have died from diphtheria or scarletina, ruginosa &c., where onions were freely used."

DISEASES IN PLANTS.—A capital paper appears in the last number of the *Gardener's Chronicle* by Mr. H. Marshall Ward, a naturalist who has come rapidly to the front, on the important subject of the diseases of plants. His essay is on chlorosis or "yellows"—that is, the absence of green in leaves, and the substitution of yellow instead. Unfortunately there are several different kinds of chlorosis, but that usually affecting plants is a diseased condition of the leaves, in which the absence of the green colouring matter is due to the deficiency of iron salts in the soil. It should be remembered that leaves affected by chlorosis are incapable of assimilating carbon. If the leaves are young, watering them with a weak solution of iron salts will restore their greenness; although, of course, the best plan is to apply the solution of iron to the roots. There is usually plenty of iron in all soils, but it is in a fixed or stable condition, very little of it being available by the plants in the soluble state. Iron sulphate is, perhaps, the best applicant to the roots of affected plants, inasmuch as it dissolves slowly and yields up its iron in an available condition. Garden or cultivated plants which grow rapidly are much more liable to chlorosis than field and wild plants which grow slowly.—*Australasia*.

CATTLE AND CATTLE DISEASE IN CEYLON.

Our correspondent "Truth" having, apparently, retired from the discussion which he initiated, another writer comes forward with suggestions, some at least of which would be useful, if the combined apathy and stolid prejudice of the people would permit of their being carried out in practice. With the precautions and action now proposed it may be well to compare the recommendations which were the result of the extended enquiry and the voluminous report and evidence of the Commission of 1869. The summary was as follows:—

1. All cattle arriving from India at any port in Ceylon to be subject to a quarantine of fourteen days, which may include the period occupied by the voyage.

If during that time disease breaks out, the animals should be treated as in any infected district. If no sickness appears, license to travel may be issued to the owners.

2. No cattle to be allowed to graze on the Crown pastures about the old Irrigation Works, without license from the Government Agent of the District.

3. No bull more than a year old to be allowed to graze on any public pasture grounds.

4. Castration of cattle to be allowed by European mode alone.

5. Owners of cattle to report any suspected cases of sickness. Headmen to inspect the herd, and if murrain exists to separate the sick animals, and report to the Government Agent of the district.

6. Locality to be declared infected and placed in quarantine, and other cattle not allowed to pass through the same.

7. Restriction to be removed only by order of Government Agent or other superior authority.

8. Hospitals and medicines to be provided for sick cattle, and Keepers appointed.

9. Owners of sick cattle to pay for their keep and treatment.

10. Tavelams to be subjected to inspection, and restriction when deemed advisable.

11. Regulations to be made by the several Government Agents suitable for each Province, and proclaimed in the usual manner.

Of all the above recommendations, we believe the only one which was carried out was the provision by Government of male animals of a superior breed for the use of cattle owners; but the result was so discouraging that even this effort at improvement was, after a time abandoned. The quarantining of cattle imported from India seems never to have been seriously entertained by Sir Hercules Robinson's government. At this we cannot be surprised; for although the Commissioners lean to the opinion that murrain was often introduced into Ceylon from India, they yet felt compelled to admit that

Murrain as it exists in Ceylon is not the mere temporary outbreak of an epizootic, as has been the case during the late cattle plague in most parts of Europe, but that it has existed in, we may say (for all practical purposes) on indigenous state for years.

This consideration and others equally cogent prevented the recommendation of specially stringent measures. The summing up of the treatment recommended to prevent the outbreak of disease and its spread when it had appeared was:—

Thorough cleanliness, both of the cattle sheds and personally among the attendants. Removal of all filth which is continually accumulating, and the sprinkling the contaminated parts of the floor with lime or wood ashes, or both. The free and frequent use of carbolic acid, for the purpose of destroying all germs of contagion which are floating in the air or contained in the excretions. Or, in the absence or scarcity of carbolic acid, the substitution for it of sulphur vapour and tar. The prevention of all communication with unhealthy cattle. The consumption by fire of all rubbish, whether bedding or dung, as often as possible. All excellent measures if only the natives, amongst whom ignorance is the parent of so much cruelty,

could be induced to carry them out.—In looking over some Administration Reports for 1870, the year after the report of the Cattle Commission had appeared, we find opinions quoted in one of them, which we expressed in 1869 and which, at an interval of twenty-one years, we can but repeat. Mr. L. Liesching was in 1870 Assistant Government Agent of Nuwarakalawiya, a district which, with accretions, was formed by Sir Wm. Gregory into the North-Central Province. Mr. Liesching wrote and quoted thus:—

Cattle disease has been the subject of much discussion and correspondence during the year. It is one on which it is easy to be eloquent; but it is exceedingly difficult to devise any suitable means of checking the evil, and the most plausible theories are easily demolished by those who know the practical difficulties in the way. It is therefore a subject for sincere thankfulness that Government has strenuously refused to pass any Ordinance that would be inoperative because it could not be carried into effect. Much that has been said and written on the subject relates to black cattle; but what is to be done with those incorrigible vagrants and determined fence-breakers, the buffaloes? How are they to be kept from forcing their great bodies through any impediments, and making their way through thorny jungles to their favourite haunts and much-loved marshes?

In this District all agricultural operations are carried on by means of buffaloes, black cattle are only bred—or, to speak more correctly, are allowed to breed—for sale. It has often struck me on seeing the large herds of these latter running about the villages, of no use for agricultural purposes, and perpetually trespassing on the cultivated lands, whether they really are not on the whole a greater nuisance than an advantage—whether, taking into account all the damage one of them does from his infancy until he has arrived at bull's estate, he has not cost more than he will ever realize. I should not however have ventured to give utterance to an idea so heterodox, but for the following passage which I met with recently, quoted from an Indian Journal:—

"We cannot help thinking that Indian villagers are under some kind of delusion that cattle are in themselves wealth, without reference to their use. At this season of the year, when the most familiar sight is a herd of cattle browsing on the grass and under every group of trees, each accompanied by the never-failing companion, the assiduous bird, *Pastor*, a passer-by cannot fail to be astonished at the number of unserviceable animals he sees grazing around him:—under-sized oxen, that are of no sort of use for the plough; old cows that are a mere framework of bones, guiltless of milk, and long past toil; and numbers of unwieldy buffaloes which are stupid and slow for draught, and whose cows yield a very inferior article for the dairy. Then, too, it must be remembered, that a dead ox is of no value to the ordinary peasant. He cannot eat him, he will not skin him, he knows not that hoofs make glue, and horns combs; and his only wish is to throw the carcass somewhere where the *chumars* or the *pariah* dogs may easily get hold of it. Altogether, it seems to us that there is a large element of the national shiftlessness in cattle-keeping, and that many of the small farmers would only be able to assign custom or village reputation as a reason for the retention of so many animals they do not want, and which are neither ornamental nor useful."

On this the Editor of the *Ceylon Observer* says—

"There is immense cruelty in the inconsiderate ignorance of attempting to rear cattle without the means of properly feeding them. In such cases the wretched animals, with vitality at its lowest ebb, drag on a weary existence, to yield it up at the first attack of inclement weather or disease. * * * * *

"To convince the ordinary jungle natives that they are morally responsible for the proper feeding and sheltering of the animals they attempt to rear, will be a work of time, but the work can be expedited indefinitely by the action of really conscientious servants of Government in the higher positions, who can exercise not only 'moral suasion,' but a good degree of benevolent despotism. That the natives can be kind to their animals, on the principle which actuates slave-

holders—self-interest—is shown by the attention paid to the feeding, and the consequent general condition of the cart bullocks. It is quite right the Government should be urged to do its best to prevent disease, which originates where natural laws are neglected, from spreading and inflicting loss where those laws are fairly observed. But the difficulties here are greater than in Europe, owing to some extent to climate, but mainly to the gross ignorance and stolid conservatism of the people. While, therefore, demanding that all that is possible should be done, we must not expect the evils of ages to be cured in a day. We have great hope in the extension of irrigation works. They will lead to large supplies, not only of grain for human food, but of straw for cattle. Experimental farms, well conducted, too, ought to do good."

It is not buffaloes alone (the species of cattle really useful for agricultural purposes) which do mischief by straying and trespassing. Ordinary cattle go prowling about of their own accord; and the investigation of cases of alleged cattle stealing are frequently complicated by the fact that cattle-owners, who deliberately turn out their cattle at night to feed on the fields of their neighbours, bring false cases of theft against those who capture and impound such trespassing cattle. As a rule the natives own far more cattle than they ought, with reference to means of feeding and shelter, the latter often non-existent, and murrain which sweeps away the debilitated animals, predisposed by inanition to attack, may be regarded, often as merely Nature's agent employed to restore a just balance. One of the most extraordinary statements in the report of 1869 was to the effect that "The Pali records of Ceylon contain no allusion to cattle plague or to cattle." As to cattle plague the assertion is probably correct, although the non-mention of the disease is by no means evidence of its non-existence. We may take it for granted that ever since human beings commenced to keep flocks and herds, the diseases to which aggregated animals are liable appeared at intervals and were fatal in proportion to the violation of the natural laws which apply to such cases: neglect of cleanliness and fresh air, or the absence of abundant food and sufficient shelter. But the ancient literature of Ceylon, whether written on palm leaves or recorded on rocks, pillars or brasses, in noticing grain culture by irrigation, does not fail to mention the animals essential to such cultivation. Having referred the question to Mr. D. W. Ferguson, he has furnished us with the following note:—

"In the Mahāvānsa there are frequent references to oxen and cows, the former being used for draught purposes in kings' chariots as well as in the farmers' plows. Cows' milk and milch kine are also often mentioned; so that there cannot have been any prejudice against milking amongst the ancient Sinhalese. One reference to a cow and calf is a curious one. We read that Elāra, the Tamil usurper, was so just, that, his own son being pining to kill a calf accidentally by running over its neck with his chariot wheel, on its mother's coming to make complaint by ringing the bell which the king had caused to be suspended at his bed-head for those who sought redress, the monarch struck off the prince's head on the same wheel! In the ancient inscriptions translated by Dr. E. Müller there are a number of references to cart buffaloes, as well as to cattle. I do not, however, find any reference to cattle disease in the Mahāvānsa or the inscriptions."

The Commission obtained evidence that cattle disease was not unknown during the Sinhalese period, and it would be interesting now to ascertain, what notices if any of epizootics occur in the Portuguese and Dutch records of their occupancy of the Maritime Provinces. We have already corrected the statement in the report that the murrain was not noticed as prevalent in the

early days of British rule. It is "an owre true tale" which the Commission told, true now as in 1869, that native cattle are degenerate, liable to disease, and in many cases have been exterminated by disease, results which they believed to be

Attributable to the following causes:—promiscuous and premature breeding, insufficient and inferior grazing, want of care of animals on the part of villagers, and more frequent work necessitated by reduced herds. The same neglect of ordinary precautions, the same indifference to results which distinguish the Sinhalese in all that regards the cultivation of paddy land, are equally manifest in their proceedings in reference to their herds. Except in certain parts of the Maritime and Kendyan districts, we have seen no instances of cattle owners providing shelter of food for their animals in inclement weather, or during seasons of prolonged and severe drought.

With such utter neglect of all the conditions conducive to the existence of a strong and healthy and useful breed of cattle, the wonder ought to be, not that disease is so frequent and so fatally virulent, but that any of the animals are left to perpetuate their miserable kind. A case is mentioned of a landed proprietor in the Eastern Province who at one time possessed 1,000 head of cattle, and who, in one year of murrain, lost all except 5. It is quite possible that the 1,000 exceeded by at least 50 per cent the proportion which ought to have been kept, with reference to the means of existence available for them. The Report of 1869 said: "Too much stress cannot be laid on the evil results of the existing means of cattle feeding." With this we quite agree, and although other measures of reform are of importance, this question of a better provision of pasture and forage for cattle outweighs them all. Abundance of nutritious food must be available, or all precautions to prevent disease with measures of cure will be in vain. But this question of cattle food must be treated in another article.

FORMOSA AND TEA.

If Formosa were in the hands of the British, it would probably be the most formidable competitor in the world with India and China in the production of tea. But the following details show that this naturally beautiful and fertile island is a scene of internecine strife and anarchy:—

News from China leaves no doubt that the outbreaks of the aborigines in Formosa have culminated in a general rebellion. Disturbances in that part of the island, which is inhabited by the native tribes (mainly the eastern and mountainous half), have become chronic, but the most serious of recent years were those in the south, which it was hoped were settled amicably a few months ago. Simultaneously the tribes in the north-east broke out in revolt, and the expedition despatched against them, although the Governor himself accompanied it, has been compelled to return, having suffered heavily both from the enemy and disease. The general in command has been degraded, a colonel has been beheaded for appropriating the pay of the troops, and it appears that the Chinese lost some of their guns. Soon after its return to Tamsui news was received of another formidable rising in the south, where the tribes, it was hoped, had been pacified. It seems to have been produced, like most other disturbances in Formosa, by the treachery of the Chinese local officials. The magistrate of the city of Hungcheng, which adjoins the territory of what the Chinese call "the savages," arrested two of the chiefs after the pacification, whereupon the Bhotans rose *en masse* and besieged the city. The magistrate not only gave up the men at once, but feasted the besiegers with abundance of pork and liquor, and on their departure promptly asked for troops to punish them. Five thousand men were

hurried up by sea and land, the general vowing that he will now exterminate the whole tribe and make a clear way to the east coast. The Chinese are said to be well armed with modern weapons of precision as well as with rockets for jungle warfare, the latter of which, however, they are unable to use. So far "the savages" appear to be triumphant all along the line from the south to the north-east; their borders have of late been extended, and it has only been by means of heavy bribes that they have been induced to keep within them. It is quite impossible to predict the result of the campaign now proceeding in the south. To judge by the majority of recent efforts to subjugate the aborigines the quarrel will be patched up for a moment, the troops will be withdrawn, and then the imprudence and arrogance of some local official will cause the flame to burst out anew.—*Times Weekly Edition.*

THE BRITISH NORTH-BORNEO COMPANY.

Mr. W. D. Gibbon, the local agent for this company, sends us the annual report and balance sheet for 1889, and also the report of the 15th half-yearly meeting held last month. Our London correspondent, in his letter of 11th July, mentioned several of the chief facts given by the chairman in his speech at that meeting; but we make a few additional extracts, as follows:—

From an official return of the tobacco sales in Holland last year, it would appear that no country produced tobacco which sold for more than 70 cents of a guilder per pound, with the exception of British North Borneo; whilst the price of the whole of the 1888 crop from our Territory averaged 125 guilder cents. Large sums of money have been spent in planting experiments in Zanzibar, Ceylon and other countries; in most cases with disastrous results. In Deli land is getting scarcer, whilst the price of tobacco is getting dearer. The sales of Sumatra tobacco this year have realized in some cases over 4s per pound; and I believe that a sample of Borneo tobacco has also been valued at this high figure. Under these circumstances, in spite of the difficulties in the early days of planting, there is every reason to believe in a great future for British North Borneo. ...

Next to tobacco, timber takes the second place in our list of products. This industry has greatly increased during the year. ...

It may be further stated that negotiations are in progress with an influential syndicate which may lead to the formation of an Exploration Company, and possibly also to the establishment of a bank in North Borneo, so that there a prospect of the country being more thoroughly and rapidly exploited in the near future than has been possible in the past. ...

The aggregate tonnage inwards was 67,623, and outwards from Sandakan 70,343, and I am glad to say our ports have been frequently visited by Her Majesty's ships of war, the influence of which is very acceptable, as evidence of the interest of Her Majesty's Government in the progress of the protected State. ...

As a further evidence of increasing business, the returns from the Treasurer-General show a large increase both in the note issue and in the demand for our copper coinage; thus the value of notes issued on the 31st Dec. last was over \$100,000, as against \$53,494 at the end of 1888. The Sandakan correspondence is returned for the year—in letters 17,998; papers and books, 14,677 parcels, 105; showing a considerable increase in 1888 under all the three heads.

We notice that a number of the shareholders at the meeting expressed dissatisfaction at not receiving any dividend, 12 voting that the report be not adopted, and 22 against this motion.

NUTMEGS IN GRENADA.—A West Indian planter in ordering the *Tropical Agriculturist* and offering to send us an occasional letter—an offer we gladly accept—adds:—"The staple on this estate is nutmegs, and we have lots of trees from 70 to 80 years of age, fine sturdy old fellows which bear enormously and look 'good' for another century."

PLANTERS' ENEMIES IN THE (FAR EAST) THE STRAITS AND WEST (GUATEMALA).

Mr. E. Woodhouse writing, from Penang on 22nd July, says:—

"Read, mark, learn and inwardly digest the herewith-mentioned 'bug,' which I guess is our old enemy (or new one perhaps I should say) green bug. The male, however, of the latter is a very minute little fellow, not more than half the length of a full-grown female. I regret to say I have renewed my acquaintance with the green bug during my travels lately; and saw a remarkably fine specimen of *helopeltis* in Perak."

A New Insect.—M. Adolf Vendrell, a member of the Agricultural Societies of Belgium and Spain, has at the order of the Government of Guatemala, prepared a report on a disease that attacks the coffee plantations of the department of Amatitlan, in that country. Coffee was planted in Amatitlan at the time of the decline of the cultivation of cochineal. Owing to the poverty, want of depth, and perhaps neglect, of the soil, the coffee disease in question made its appearance about ten years ago, and the farmers attribute to its ravages the annual loss of half their crops. M. Vendrell states that the disease is an insect, "nothing more nor less than a new species of cochineal that has adapted itself to a different existence." M. Vendrell, after carefully considering the manner in which the insect should be classed places it in the coccidos family named by Dr. Claus of Vienna University. To the individual insect he gives the name of "coccus coffeæ." He describes the female as being "of the shape of a coffee bean, with a central line across the length, three pair of feet, a sucker or spur at the thorax, very conspicuous small eyes, and two or three whitish lines on the body." The male is similar, save that he sometimes, has wings, and is slightly larger. The insect settles upon the tender shoots of the coffee, and absorbs the nourishing juices as they flow towards their destination in the tissues of the plant. M. Vendrell advises the use of nitrate manures on the plantations, and recommends the intervention of the Government on account of the poverty of the cultivators.

CEYLON UPCOUNTRY PLANTING REPORT.

THE NEW "CEYLON HANDBOOK AND DIRECTORY"—A COMPLIMENT.

Aug. 14th.

The reception which your big book has received on all hands must have been very gratifying; for from the Governor downwards testimonials to that work have been both hearty and numerous, if I may judge by what has appeared in the *Observer* columns. No one who has taken the trouble to study the book will think this praise has been misplaced.

There is one remarkable feature in "Ferguson's Ceylon Directory," and that is that every succeeding issue seems to be an improvement on the preceding one. It goes on too increasing in bulk. I had the curiosity to put the volume for 1887-8 into the scale as against 1890-91, and the latter comes out *nine ounces heavier*. This increase is all new matter, for it seems as far as I could make out that the advertisements in both books are pretty nearly equal; in fact the older volume rather has it. Of course a test of this kind is of no value, in judging the merits of the book as a book; but when you begin to wander through its pages and note the wide range of the information therein contained, and more especially the practical nature of it; also the marked absence of anything which might be classed as "padding," it would appear that these nine ounces of new letterpress have a critical value, even when put in this avoirdupois way. The question is, if over half a pound weight of the book were to be cut out, could an excision of this kind be made without very much impairing its worth?

What one might be inclined to sacrifice another would refuse to: so that on the whole this added weight is all pure gain to the public. Speaking of so many ounces of new letterpress does not perhaps convey to the general reader a very clear idea of the extent of this added matter; but when I say that the ordinary *Observer* weighs somewhat less than two ounces, and that the increased size of the *Handbook* is equal to about five *Observers* or say about a week's newspaper reading, the advantage to the public should be pretty manifest. For all this, there does not seem to be an increase in price. How is it done?

The get-up of the *Directory* is highly creditable to all concerned. When one remembers the style of binding of some of the earlier issues, looking for all the world like a fat boy in a jacket too small for him—and contrasts it with the finish of the 1890-91 edition, the advance is very marked. It adds very much to the pleasure of using a book to have it well bound.

In the "Planting and Agricultural Review," which forms the first portion of the *Handbook*, every product of Ceylon has its share of attention, and the information is brought well up to date. Under the heading "Sugar Cultivation in Ceylon," when, one would hardly have looked for late information, or indeed felt the need of it, there occurs the following passage:—"We had about two years ago (July 1888) an enquiry from a European at Nagpore who wished to try new machinery in manufacturing sugar in Ceylon; while one of the first questions asked by H. E. Sir A. E. Havelock after assuming the Government (May 1890) was, why sugar was not grown in Ceylon with its cheap labour supply." A big book like this, which is issued to the public in August, to bring its information on such a minor matter as sugar up to May of the same year, shows considerable enterprise. Since the last *Handbook* was published, cotton and tobacco have been very much in evidence in Ceylon agriculture, and the articles on these two products are well up to date, and very full in the information given. This is especially so in the article on cotton.

It is not a little interesting—and I would commend it to my brother planters when the rain prevents work and they don't know what to do with themselves,—to go over the Planting Review of the last "Directory" and compare it with the new edition. Although there is not much in the different articles that we don't know, still it is easy in comparing the different summaries to trace where there has been progress or retrogressive; and the marshalling of the many facts and figures, which individually don't seem to count for much, has a pleasing and enlightening effect. It is like a big field-day, with its march-past.

In a book of this size brought out in a busy newspaper office there needs must be errors. Several have been pointed out in the *Observer* columns, and more will be I doubt not. At page 654*, some six surveyors are down as licensed auctioneers—but perhaps they are that besides being the other.

Even with all the mistakes—and their number twice doubled—"Ferguson's Ceylon Handbook and Directory 1890-91" is a credit to the colony, and especially to the hard-working editors who have compiled it.

PEPPERCORN.

A MYSTERIOUS AFFAIR.

With reference to the paragraph under the above heading which appeared in our issue of yesterday we give below all that we can find on the subject

* This is corrected in the Errata.—Ed. T. A.

in our files of 1875. The following appeared in our issue of February 24th, 1875:—

We are sorry to learn, from the last Ootacamund paper, that nothing has yet been discovered of Mr. Broughton's, the Quinologist's, whereabouts. He reached Madras safely after leaving Ootacamund on the 7th December, for on the 11th of that month he wrote from here to the Manager of the *Neilgherry Courier*. It appears that Mr. Broughton sent in the resignation of his appointment in December, giving six months' notice, but that Government, in reply, offered him the option of retiring before the expiration of that period. It is conjectured, therefore, that he may have taken advantage of this offer, and proceeded to England. The Police authorities at Ootacamund telegraphed to Bombay at the end of last week for information regarding a Mr. Broughton who had taken his passage for England at that Presidency: but the result of the inquiry is not known. In connection with Mr. Broughton's name, it may be mentioned that a sample of amorphous quinine, manufactured by the Quinologist's Department, has been condemned, and that Government have directed the discontinuance of the manufacture: but our Neilgherry contemporary is informed that the condemned sample was prepared during Mr. Broughton's absence, and should not be taken as a specimen that Mr. Broughton's superintendence and skill might have produced. In the issue of March 2nd, 1875, we find the following:—

We have received the following letter from Mr. O. B. Irvine, the District and Sessions Judge of South Arcot. 'As from a paragraph which appeared in your issue of the 25th instant it would appear that the friends of Mr. Broughton, the Government Quinologist, have cause for anxiety on his account, and that the latest tidings received of him were contained in a letter to the Manager of the *Neilgherry Courier*, dated from Madras, 11th December, I wish to inform you that Mr. Broughton was a passenger with me on board the B. I. S. N. Steamer "Ava," from Madras to Pondicherry on the 14th December, and that he then informed me his intention was to make a tour in Ceylon. This accounts for Mr. Broughton's movements up to a date nine weeks ago, and seems to prove that he did not meet with any misadventure in India. The opinion prevails in Madras that he has returned home in a rather informal manner, and has no idea of returning to the lucrative appointment that he held for some eight years as Government Quinologist at Ootacamund in connection with the Neilgherry Cinchona Plantation.'

—Madras Mail.

MANA-GRASS FROM CEYLON FOR MANUFACTURING BOARD—STANLEY-WRIGHTSON TEA CHESTS—MR. HUGHES ON MR. HOOPER'S ANALYSES OF TEA—TEA TASTING AND WATER—CLOVE CULTURE IN ZANZIBAR AND PEMBA.

Fourteen hundredweights of mana grass having arrived in England from Ceylon, the Stanley-Wrightson Syndicate met on Tuesday last to discuss its future arrangements. It was determined that this shipment of grass should be handed over to Messrs. Ibbotson, who have large mills at West Drayton, to be made by them into quarter-inch boards. The method of preparation consists in boiling the grass under great pressure, and then passing the pulp resulting from that operation through powerful rolling machines. Dr. Evans—who, as you have before been told by me, is the Consulting Chemist to the Paper Makers' Corporation of Great Britain and Ireland, and who carried out the first experiments with mana grass as you have been informed,—is to supervise closely the progress of these operations. Dr. Evans was present at the meeting of the Syndicate referred to above, and

thereat expressed his opinion as to the singularity of the grass for the purpose required.

The Syndicate, after coming to the resolution above mentioned, then discussed the after-course to be followed by it, and a proposal,—should Dr. Evans's report be as satisfactory as it promises to be,—to form a company for manufacturing the board in Ceylon and to take over and work the Stanley-Wrightson patents for tea chests therein, was most favourably entertained, and there seems to be every probability that this will be the course which will receive ultimate adoption. You will fully recognize that this arrangement, so full of hopeful promise for the creation of a new industry among you, is dependent upon the success of this second series of experiments; but no one here feels any doubt as to this being achieved, and I shall feel equally surprised as disappointed if, before another twelve months have passed, the new company's mills are not in full work among you.

Intimately allied to the subject treated of in the two foregoing paragraphs is the verdict now obtained as to the condition in which the first shipment of Stanley-Wrightson tea chests has arrived at home; for the prospects of the industry above referred to are, of course, mainly dependent upon the success likely to follow that verdict. You have already been informed in these letters of what I had myself seen of these chests, as also of the satisfactory sales made of the tea which came home in them. We have now further learned that on the shipments made home by the "Carthage" and "Oopack" there was a gain respectively on the landing and sale weights as compared with those of similar tea packed in the same number of ordinary wooden boxes of the same external cubical measurement, of 2.4 lb. of tea per package, and 3.12 lb. of tea per package. That is to say, that, whereas the 46 lb. of tea packed in the Stanley-Wrightson chests sold (roughly) as 48 lb., the 45 lb. packed in wood chests sold only as 44 lb. Freight and warehouse charges were the same for both kinds of packages, and you will be able to estimate from these figures one very material advantage obtained by the use of the Stanley-Wrightson chests. So far as my inquiries have as yet been replied to, I have not received a single expression of opinion in opposition to their use. It is, however, admitted by members of the Syndicate that, while the boxes seem to be a success, the lead paper linings used instead of lead have not so far proved to be so; but no opportunity has yet occurred for me to learn in what way or degree these last have proved to be defective.

If it had been possible for me to do so I should certainly have endeavoured to be present to watch the process of treating the mana grass during its conversion into board at Messrs. Ibbotson's mills. Unfortunately, absence from London will prevent my doing this, and I regret the fact exceedingly, because I foresee that very probably the introduction of this new industry into Ceylon may have a marked effect on the welfare of many of its inhabitants, for those well acquainted with the various purposes to which strawboard is now applied assure me that it is scarcely possible to over-estimate the many services it may be made to render.

During the present week opportunity has occurred for me to learn from Mr. John Hughes's opinion upon what we read in the *Tropical Agriculturist* not long back as to the efficacy of analyses of tea as stated by Mr. David Hooper in the paper by him abstracted in that journal. Mr. Hughes tells me that he wrote by the last mail but one to the Secretary of your Planters' Association directing

attention to Mr. Hooper's paper and the conclusions stated in it, and suggesting that it would afford useful information to planters if some investigations were carried out in order to determine the amount of tannin present in the ordinary domestic infusion of ten minutes. Mr. Hooper, according to Mr. Hughes's view, contends that elevation has nothing to do with the proportion of tannin, but the latter gentleman considers that this opinion is in advance of facts ascertained by Mr. Hooper in his researches; for out of the 65 samples reported on in the paper, only 6 were from Assam at an elevation of 600 feet, the other Indian teas analysed representing estates at an elevation ranging from 2,500 feet in Travancore to 7,800 feet in the Nilgiri ranges. Most of these Indian teas therefore represent hill estates, and as such it is reasonable to conclude that the proportions of tannin should in such cases represent about the same quantities as are found in tea grown on the hills in Ceylon.

Mr. Hughes continued the expression of his views to me by pointing out further that Mr. Hooper's results give the total amount of tannin present in the teas, and not the amount extracted under ordinary circumstances. Mr. Hughes regards this as being a fact to be regretted, because Mr. Hooper, in a small set of experiments subsequently made, showed that only about one-third of the total amount of tannin contained in the tea is usually extracted by the ordinary teapot infusion, and he holds that this constitutes the practical side of the question which calls for further analytical investigation. He quoted to me one sample of tea so dealt with by Mr. Hooper which yielded 3.04 of tannin, while another gave twice as much, viz. 6.26. What Mr. Hughes therefore thinks to be desirable is a thorough examination of reliable samples with a view of definitely deciding, not only how far the amount of tannin is influenced by elevation, but also by the various processes of manufacture, the time allowed for fermentation, different conditions of temperature, and other circumstances which effect the flavour and probably also even the constituents of tea. He mentioned to me that tea making depends on chemical reactions carried out under certain conditions of temperature, and that as the strength of tea depends on the proportion of tannin, a careful determination of the constituents would be useful to planters as well as interesting to the general public.

So far as my own very deficient knowledge can justify me in forming any opinion upon the points treated of by Mr. Hughes, it would seem to me that it is the last mentioned body, *i.e.* the general public, to whom such an investigation would prove to be first useful. The utility to your planters would, I should say, follow upon indications of appreciation shown by the public of certain growths which might comply most closely with results obtained by the investigation proposed. As a matter of fact, when A. purchases tea he can receive but little aid to his judgment by any published analysis of it at present available to him. He may buy a pound of tea of a kind said to contain but little tannin under full analysis, but from which his system of domestic infusion may extract tannin in far larger proportion than would be yielded by another description of tea stated to contain a far larger proportion under analysis than that bought by him. It is therefore not to be doubted that if a standard for analytical examination was established and worked upon which should approach closely to the ordinary conditions of domestic practice, A would obtain a far more reliable guide than he has at present. We hope your Planters' Association will take this matter up, because it is important for your planters to learn

with some degree of certainty what growths and what processes will the nearest meet the tastes of consumers. These vary so much in different countries that probably tea required by users in America or Russia might demand a different system of curing altogether to that which satisfies the English palate. What your planters want, as it appears to me, is reliable data upon which to found—and vary as need may arise—the practice of their treatment of teas for the several markets, and this it seems natural to expect could best be afforded by the results to such experimenting as Mr. Hughes suggests.

But that gentleman, during the discussion of the foregoing topic, mentioned to me a further circumstance which must have a very important bearing upon the question. A little time back my letters mentioned to you how greatly at variance was the judgment of tea-tasters here with those of similar experts in Ceylon. At the time of my then writing, I ventured on an expression of my view that this might be due to the difference in the constituents of the waters used for infusing here and in Ceylon. At the same time such evidence as was procurable in support of that view were mentioned to you; but I had not then secured the authoritative evidence which Mr. Hughes has now afforded to me. He tells me that he has been informed by a gentleman largely interested in the tea trade, that some London firms who do a large business in Ireland actually import Dublin water to London for the purpose of testing teas intended for Ireland. It is scarcely possible to imagine a stronger evidence of the important results which the use of different waters for infusing teas may have than is this. The Irish have a great reputation as connoisseurs of tea, and it is known that they will pay a higher price for particularly fine teas than people on this side of St. George's Channel are willing to give. Very probably, if tea intended for the Irish market were selected here upon tasting done with London water, a shipment so determined might be altogether refused in Dublin.

Indeed it does not seem improbable that water has as important an effect upon tea as it has upon malt and hops in the manufacture of beer. Dublin stout we know to be famous, and Allsopp's has achieved its reputation mainly owing to the character of the water derived from the Trent. Now you cannot select the waters for your customers to use with your teas, but you may prepare for them teas which you can assure them will yield less of tannin according as they are infused with hard or soft water. So important are these two main divisions of water characteristic that Mr. Hughes tells me that along the whole of the south coast of England, where the water is for the most part hard, being derived from the chalk formation, tea grown on hill estates finds a marked preference by purchasers. This fact illustrates pretty accurately what should be aimed at by your planters, and very probably with the experiments suggested by Mr. Hughes others might be usefully combined to show how their results were affected by the use of different kinds of water. I feel this subject to be one of so important a character that no apology is necessary from me for the length at which it has been here dealt with.

Has the culture of the clove ever been tried in Ceylon? * Somehow or other it seems to me that we have heard of such a trial having been made. Anyway, in view of the great usefulness of suggestion for new industries, it may be worth while

just to give you the following extract from the *Times* relating to the culture of this spice in and about Zanzibar:—

CLOVE CULTURE IN ZANZIBAR AND PEMBA.—The United States Consul at Zanzibar in a recent report states that the culture of cloves is the principal industry in Zanzibar and Pemba, the latter producing three-fourths of the total harvest, while Zanzibar produces the best quality cloves. The culture was introduced into the island in 1830, and today they are the principal sources of the world's supply. The clove of commerce is the bud of the clove-tree. It takes five or six years from the time of seeding for a tree to bear the buds. At two years of age the trees are 3 ft. high. They are planted 30 ft. apart at that time, and left with only ordinary care until they are ready to produce the buds. The latter do not ripen all at once, but at intervals during six months. They are then spread in the sun until they become brown, when they are warehoused, ready for market. A plantation ten years old produces an average of 20 lb. of cloves to a tree. Trees 20 years old frequently produce 100 lb each. The crop for the present year, which is the largest on record, will amount to 13,000,000 lb., averaging a local value of 5d a pound. A duty of 30 per cent *ad valorem* is levied by the Sultan. The only other parts of the tree which are utilized are the stems, which are gathered and are sold for about a fifth of the price of cloves, and with about the same percentage of strength. These go to make what is known as ground cloves. The plantations have hitherto been worked with slave labour, but the stoppage of the supply of slaves from the mainland involves increased expense for harvesting, as well as the risk of loss from failure to harvest quickly when the buds appear. —London Cor.

THE JENOLAN CAVES IN NEW SOUTH WALES

have been described in a nicely got-up publication, by Mr. J. J. Foster, a presentation copy of which has been sent to us, by its recipient, for notice. These marvellously extensive caves are within easy distance of Sydney by railway across the Blue Mountains and otherwise, situated amidst charming scenery, in a district fertile, rich in varied vegetation and salubrious. The formation is limestone in which the shapes of fossil corals, shells and many other interesting marine objects can still be traced, the eroding agencies being mountain-born streams which flow through and form cascades in some of the caves. Stalagmites rise like marble pillars on all sides while stalactites assume the forms of exquisitely beautiful curtains and shawls, striped black, brown, cream color, yellow and white, and which are arranged in graceful folds. In some cases a diamond-like sheen is imparted by light reflected from the facets of thousands of crystals, white and amber-coloured. In one instance a depth of nearly 500 feet has been traced, but it is impossible yet to calculate the extent, size, or depth of the cavities. It is claimed for them that they are amongst the largest, the most numerous and the most beautiful in the world. Portions of the caves are bright with a marble polish, produced by the passage over them, during countless ages, of the numerous animals which made their abode in the caves, wallabies (a small species of kangaroo) especially. In a notice of the geology of the limestone stratum (interbedded with sandstone and shale) in which the erosion of water has produced the wonderful series of caves, it is stated:—

"It is not uninteresting to reflect that the limestone, now a compact grey marble, was once a mass of living corals, "stone lilies," and molluscs, revealing the former existence, in the Siluro-Devonian epoch, of conditions of marine life somewhat resembling those which support the beautiful living forms which build

* See Planting Review in our new Handbook.—Ed. T. A.

up the reefs in the coral seas of the present day; and it is significant of the vast changes this part of the surface of the earth has undergone, when we see fresh-water streams, at an elevation of several thousand feet above the sea, now flowing through rocks that were originally formed beneath the waves of the ocean at a very remote period of the earth's history. These silent rock-teachings give additional charm to the many interesting features of these caves."

Again:—
"There appear to have been two distinct periods during which stalactitic growth formed: one of comparatively remote age, and very local in character, being chiefly confined to the caves known as the Lurline and Bone Caves, and another but recent and still in operation. The older growth is essentially of a stalactitic type, and the salacitites are remarkably thick; though in one or two cases, as in Chamber No. 1, a huge stalagmite is to be seen. The newer growth exhibits every fantastic and beautiful form known, from the thin hollow reed and transparent veil to the snow-white dome stalagmites, the crystal-fringed pool the wave-lined floor, and the crooked-fringed shapes that are turned in all directions."

Some of the names of the various caves (which, by the way, were discovered by the pursuers of a noted bushranger) are curious and some poetical:—The Grand Arch; the Devil's Coach House; the Nettle Cave; the Imperial Cave; the Lily of the Valley; the Fairies' Paradise; the Bushranger's Cave; McEwan's Hole (the haunt of the bush-ranger); the Glass Cave; the Mammoth Cave; and the Bottomless Pit! We cannot help quoting a passage from the description of one of the caves:—

"At once the vastness and silence of this chamber will rivet the attention of every observer, also the ripple-marked boulders all over the floor. Blocks of beautiful black marble may be seen in several places; many fossil shells are noticeable, embedded in the rocks; and fine chalk-like rock, both pink and white, may be found here. Now and then the noiseless wallaby may be seen continuing his stealthy flight from ledge to ledge up the walls; occasionally the wild mimicry of the lyre-bird re-echoes through this arch, though he himself may be safely hidden in the forest slopes outside. All these things combined make up one of the most wonderful and exquisitely harmonious pictures of nature's handiworks."

One cave, the specially beautiful objects in which are carefully protected, is lighted by electricity! In exploring the others the magnesium light is used. Mr. Foster, in concluding his description, writes:—

"Having visited most of the important caves throughout the world, viz., the Ajanta, Ellora, and Elephanta Caves in India, the Great Moulmein Caves in Burmah, others in Java and Japan, and the principal ones in Europe, I can with confidence say none of them can compare with the Jenolan Caves for their marvellous variety of formations, dazzling brilliancy of lustre, and exquisite colouring."

There are caves in Ceylon in our ancient limestone, in the modern lime formation near Point Pedro, and in our gneiss, as at Damhulla and elsewhere, inhabited by swallows, bats, and Buddhist priests; but we have nothing with natural attractions to compare with the water-worn caves in the ancient upheaved limestone of New South Wales.—The nearest approach must be the mammoth caves of Kentucky, and those we saw of Luray, Western Virginia, but Mr. Foster in his list does not mention the American caves.

TEA CULTURE IN BURMA during the past year showed a considerable improvement, although the industry is of trifling extent. The area under tea had increased from 14 to 164 acres and the approximate yield of tea from 1,600lb. to 12,250 lb. The cost of cultivation was R30 per acre, and of manufacture five annas per pound. Last year Burma produced no less than 2,764,457 tons of beet sugar.—*M. Mail*, July 29th.

CERTAIN TEA-PLANTERS of the Kangra District have petitioned the Local Government against the proposed assessment of land under tea in their possession, which was formerly held revenue free. The petitioners further ask that orders may be issued completely exempting the acreage under tea from assessment from the present time for a period of at least ten years.—*M. Mail*, July 18th.

EXPORTS OF INDIAN COTTON.—The following table published by the *Times of India* is instructive and useful for reference. It will be observed that there is a considerable increase in season 1889-90 over 1888-89, distributed over all the ports; but as respects the cotton export trade, the figures show that Bombay is first—and the rest comparatively nowhere—holding as it does about 80 per cent of the whole trade? The table is as follows:—

SAILINGS OF COTTON FROM ALL INDIA, TO EUROPE, CHINA, AND OTHER FOREIGN PORTS, INDIAN PORTS EXCLUDED:—

From	1889-1890.		1888-1889.			
	July to Dec.	Jan. to June.	Total bales:	July to Dec. Jan. to June.		
Bombay	188,111	1,348,238	1,528,349	143,884	1,151,837	1,295,721
Kurrachee	4,533	28,332	32,865	5,567	41,563	47,130
Calcutta	29,671	129,204	158,875	25,891	88,651	114,542
Madras	51,573	26,215	77,788	34,118	33,639	67,757
Coconada	26,336	7,770	34,106	13,967	2,823	16,790

THE MAGAZINE

OF

THE SCHOOL OF AGRICULTURE, COLOMBO.

Added as a Supplement monthly to the "TROPICAL AGRICULTURIST."

The following pages include the contents of the *Magazine of the School of Agriculture* for September:—

NITRIFICATION.

IN the year 1877 Schloesing and Müntz gave to the world the results of their interesting experiments which went to prove that the conversion of nitrogen

found in the soil in an inorganic form as ammonia, and in an organic form as decayed vegetable matter, into nitrates was effected by the agency of a living ferment. While these experiments have been verified by the English chemists, Warrington and Munro, no further light has been thrown on the nature of this germ since the continental chemists made their discovery concerning the minute organism which they considered assignable to the family of bacteria, though much interesting information has been gained as to the conditions under which the nitrifying germ works.

It is well known that different forms of nitrogenous substances applied to the soil act at different rates. Nitrate of soda acts more quickly than sulphate of ammonia; sulphate of ammonia than the nitrogen in guano, bone-dust, dried blood, &c. But what is the explanation of this difference in the rate of action of manures as plant food? Plants absorb the nitrogen they take as food from the soil in the form of nitrates, and in the first-mentioned manure the nitrogen is of course in this form. In the second the nitrogen exists as ammonia, which has first to be converted into nitrate before it becomes available as plant-food, and time is required for this

conversion. The production of nitrates either from ammonia or from organic nitrogen is by the agency of the minute bacteria, whose importance was, as mentioned, only discovered in 1877. Till that year the production of nitrates in the soil was believed to have been brought about by a simple process of oxidation. The following experiment supplies the grounds for belief in the existence of the nitrifying germ as the cause of nitrification. If we take a dilute solution of ammonia, containing other plant food, and sterilize this solution, *i.e.*, kill any living germs that it may contain by submitting it to a high temperature for a lengthened period of time, we will find that such a solution will keep for any length of time without showing, on being chemically tested, any traces of nitric acid. Introduce, however, a very small portion of fresh soil, and nitrification will at once set in.

By experiment also it has been found that the nitrifying organisms are almost entirely limited to the surface soil, and that they are not uniformly much below a depth of 9 inches. They may, however, exist at a greater depth, but when they do so, they are found in a very feeble condition. Even in the surface soil their distribution depends on the nature of the soil, for the presence of these bacteria is favoured by certain conditions which may obtain to a greater or less extent in different soils. For one thing they require a large amount of oxygen, and hence it is only in the surface soil that their

complete development takes place. Here then we see one important reason for the need of the plough and other tillage implement for breaking up and thoroughly aerating the soil. Other conditions being equally favourable then, the more thoroughly the soil is aerated the more freely will nitrification take place. The presence of moisture is another necessary condition, and hence during a period of extreme drought nitrification is at a standstill. On the other hand if the soil be unduly charged with water, nitrification is again reduced to a minimum, as in the case of heavy, badly-drained clays, and this for more than one reason. Proper aeration cannot go on in a soil of this nature; while the presence of a large amount of moisture in a soil tends to reduce its temperature, and the temperature of the soil is another very important consideration. The action of the germs totally cease at a temperature below 12° C., while it goes on best at blood heat, that is about 98° F., and ceases again if the temperature be raised to 55° C., the germs being totally destroyed at 90° C. They are not killed by frost in the winter time in temperate regions, but only remain inactive and revive when the temperature rises, their action to any appreciable extent commencing above freezing point. Of course the presence of nitrogen in an organic or inorganic form is necessary, as also that of some salifiable base to combine with the nitric acid and form nitrates, the form in which plants take in their nitrogenous food. Thus we see the importance of preserving a proper mechanical condition in soils by ploughing, harrowing, draining and such operations as bring about this very necessary result; for, the elaboration not only of nitrogenous plant food by the agency of nitrifying germs, but also that of mineral food by oxidation is greatly dependent thereon. With regard to the theory—claimed severally by Hellriegel and McAlpine—that special organisms, to which the name of bacterioids has been given, are contained in the root tubercles of leguminous plants, whose function is to work up the nitrogen in the atmosphere into compounds and fix these in the soil. A great deal has been written of late; and much as one is inclined to favour this plausible theory when the peculiar feeding habits of this order of plants is considered, yet a good deal has yet to be proved before it can be accepted as an agricultural fact, and this is the view of Sir John Lawes in his latest deliverance on the subject in which he details his own experiments to test the theory.

INDIGENOUS FOOD PRODUCTS. CULTIVATED AND WILD.

BY W. A. DE SILVA.

Leguminosae.

24. *Dolichos Biftorus*, L.; Sin. Kollu.

This is a cultivated legume largely grown in the warmer parts of the island in chenas and other open spaces, generally with other crops. The leaves which are compound and somewhat large are green in colour and are hairy. The legumes are small and flat, and contain from 3 to 6 seeds. The seeds when ripe have a reddish polished appearance, and they are flat. In culti-

vation the crop is gathered three months after sowing. This legume is considered to be good cattle-food, the seed being boiled and given to stock for fattening. The stalks and leaves of the plant, when preserved, also form good and nourishing food for cattle.

As a food product this grain is not much used, except in some localities where it is boiled, and eaten.

25. *Cassia Fistula*, L.; Sin. Ehela.

This is a tree growing abundantly in the warmer parts of the island, and is especially abundant in the dry districts of the South-east and North-west. The trees attain to a good height, the leaves are compound (pinnate), and the leaflets which are green and entire have a smooth appearance on the upper surface, and are slightly greyish on the lower surface, being pointed and of an ovate shape. The fruits are long cylindrical pods from 9 to 18 inches long, and sometimes more. The pod is divided into partitions inside, and the seeds are found in these. Along with the seeds a black pulpy substance is found which is of a peculiar sweet taste.

The young leaves are cut into small shreds, and a dry curry (mellun) is made with scraped coconut and other curry stuffs. The whole plant, including the leaves, have slight purgative properties. The bark as well as the root is given in native medical practice in cases of rheumatism.

The heartwood of the tree forms a good timber and is used for various purposes.

26. *Cassia Occidentalis*, L.; Sin. Peti-tora.

This plant is very abundant in the uncultivated places of the lowcountry. Though found in uncultivated places, it always prefers patches of land which are fertile. The plant is very small and much branched. The leaves are compound pinnate, and the leaflets are smooth. In shape the leaflets are obovate, having the ends round and the margins entire. The flowers are yellow, and the pods which are cylindrical, are thin and from 3 to 4 inches long. The seeds are rounded in appearance and long.

The tender leaves are made into dry curries, and sometimes they are boiled and eaten along with coconut, &c. The seeds roasted and pounded are used like coffee, and are said to possess medicinal properties. The leaves have cooling properties, and are used, boiled in water for fomenting in cases of swellings and wounds. The seeds also are used externally in skin diseases. The decoction of the leaves is held as a good remedy for purifying the blood. The dry twigs are used in making brooms.

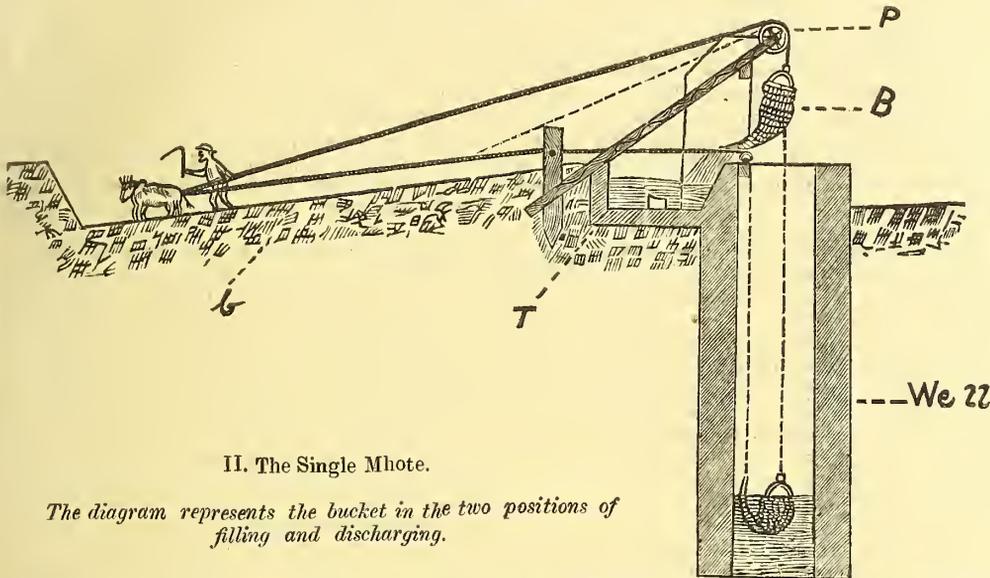

27. *Cassia Tora*, L.; Sin. Peni-tora.

This plant resembles the one described above in its habits, but the plants themselves are a little more erect and less branched. They grow to the height of about 3 feet, and the pinnate leaves are attached to a dark coloured stem. The base of the petiole is swollen at the place of attachment. The same character is observed in the attachment of the leaflets. The leaflets are pointed and ovate, and the veins show a black streak. The flowers are yellow and are borne in panicles.

The tender leaves are used in making a dry curry. The seeds are externally applied in skin diseases, and the leaves are used in cases of cough.

WATER-LIFTS. II.

BY ABA.

II. The Single Mhoite.

The diagram represents the bucket in the two positions of filling and discharging.

The single mhoite or inclined plane water lift which is well known throughout India has been described as follows:—

"The water is lifted from the well in a skin bucket (B.) (those used in the Sydapet Farm are iron ones); to the bucket is attached a rope which is fastened to the yoke of a pair of cattle; a roller or pulley (P.) is fixed about 4 or 5 feet higher than the discharging trough (T.), over this roller or pulley the rope travels as the bucket ascends or descends. The bullock path (b.) is an incline. When raising the bucket the cattle walk down the slope until the bucket reaches the full height and discharges its contents; the cattle are then backed up the slope and the bucket sinking into the water, to be again raised by the forward motions of the cattle, and then the process is again and again repeated. This arrangement is certainly very simple, it is however equally certain that the cost of raising the water by it is very great. With this machine a pair of cattle while raising only 6,900 gallons of water in a day are exceedingly hard worked in doing it; whilst backing up an incline with a slope of about 45 degrees, about 40 times per hour, is a most effective way of rendering cattle worthless."

I am not aware of this water-lift being in use anywhere in Ceylon. The above illustration is from a set of models presented to the School Museum by Mr. C. Krishna Menon of the Madras Agricultural College.

NOTES FROM A TRAVELLER'S DIARY.

I lately had the pleasure and advantage of visiting, in company with an Agriculturist of some repute, the successful estate known as "Crystal Hill" situated about four miles from Matale on the Rattota road. The estate is about 320 acres in extent, and represents nearly all the

products grown in the island. The first thing that strikes the eye of the visitor is the picturesque grove of areca-nut palms in full bearing, which covers about 30 acres. Annatto and cocoa are among the principal products, while several varieties of cotton have also been grown—the Egyptian having been found to be the best suited to the district. A large quantity of annatto is prepared for export, while the cultivation of the plant among the villagers is also encouraged by the estate buying up all the seed. Much credit is due to the energetic superintendent, Mr. A. Van Starrex, for the economical and successful manner in which he is working the estate, and the natives of the surrounding villages have an admirable example to copy, for on this estate they see how a variety of minor products may be remuneratively cultivated if they go about it in the right way.

I also touched at a place called Laggala, about 30 miles east of Matale. A part of the journey thither was made through splendid tea land, which at one time possessed some of the finest stretches of coffee in the island. The forests through which I had to pass were as grand as they were interesting from a botanical point of view, but as my journeys need to be expeditious (for I do not travel from mere love of travel) I could not make more than a few cursory observations.

Terminalia chebula (Sin. Aralu), *Terminalia Belerica* (Sin. Bulu), and *Phyllanthus Emblica* (Sin. Nelli) which are so much used in native medicine were plentiful here, while ebony and other timber trees were also common. The inhabitants of the district are comparatively ignorant and uncivilized. Kurakkan is their chief food, though paddy is also cultivated after a primitive fashion. Much damage I was told is often done to crops by wild elephants. The ubiquitous

Moorman is often met with even here, carrying goods in *tavalams*, with the object of bartering.

Wahakotte is a place about 20 miles to the North of Matale. The inhabitants are supposed to be the descendants of some Portuguese who settled here during the persecution by the Dutch—a large number being Roman Catholics. Here I had the pleasure of visiting the garden of Father Assauw of the R. C. Mission, who has by a judicious system of cultivation, converted an abandoned area of coconut property into a charming estate.

The palms on this estate are as healthy and fruitful as any I have seen, but the most interesting result of his agricultural operations is his vegetable garden, where a large number of English vegetables have been grown to advantage. Father Assauw's success is almost phenomenal, considering the dry climate of the district and the other odds he has to contend against. Carrots and turnips grow almost to perfection, tomatoes bear profusely, and cabbages show well-formed heads. The cultivation of these are, of course, limited to a certain part of the year.

What struck me most was a robust grape vine, which had been grown experimentally, laden with fruit. Pruning appears to be the secret of successful cultivation. Father Assauw encouraged by his success, is about to extend his vineyard. In truth, the garden I have described is "a model farm" for the district.

A VISIT TO A TANNERY.

In the course of last month the students of the School of Agriculture took advantage of the opportunity of visiting a tannery, and making themselves acquainted with the process of tanning hides. Few of the meat-consuming public in Ceylon can be aware of what becomes of all the skins of the animals that are slaughtered for food. Only a part of the hides produced in Ceylon find their way to the hands of our Ceylon shoemakers, the larger balance being exported mostly to England, though some reach France and Germany. The skins obtained in and around Colombo are all used up in the tanneries established by native traders (some four or five at the most) in the capital. The establishment about to be described is about the largest and most complete of these, turning out nearly 2,000 prepared hides per month, and employing about 30 coolies. A place of this description would compare unfavourably as regards size with an English tannery, such as may be seen in Bermondsley, but we must recollect that in Ceylon the supply of skins is very limited, and that there is no scope for extending the enterprise. It is with the greatest difficulty that Mr. D. Carolis, the courteous proprietor of the tannery situated not far from the Jawatte Asylum, gets a sufficient number of skins to keep the work going in his establishment, and he finds it necessary to go far from Colombo and make heavy advances to butchers and others before he can get what he requires. Mr. Carolis' tannery is admirably situated in a part remote from dwelling houses, the road leading to it being little availed of by the public.

The principal tanning materials used at this establishment are, the bark of *Cassia Auriculata* (Sin. Ranawara), *Rhizopora Mucronata* (Sin. Kadol), and gall-nuts from *Terminalia Chebula* (Sin. Aralu). The first costs 3 cts. per lb., the second only 2½ cts. The skins of neat cattle, buffaloes, dogs, deer, and cheetahs are all prepared here. In tanning the skins three methods are adopted. The skins which produce the best hide are tanned by means of *Cassia Auriculata*, another coarser variety by the use of *Rhizopora Mucronata*, while the white leather used for some kinds of ladies' shoes is prepared by using alum.

The skins which are bought from the butchers and others every day, are steeped in water for a night, and next morning the fleshy tissues are scraped off. They are then immersed in tubs containing lime and water and kept in that condition for a week, the water and lime being frequently changed. The skins which are now swollen and soft, are washed well and subjected to a process of scraping with knives to remove the hair &c. If the skins are to be tanned by means of the two barks abovementioned, they are put in small tanks holding 30 to 50 skins, and the bark, which has been reduced to very small pieces, is spread in layers between the skins. The tank is then filled with water and covered up, the skins getting fresh bark and water once or twice, and being finally removed after four or five days and well washed. If up to this stage *R. Mucronata* (Kadol) has been used, the skins are subjected to no further process except drying; but if *C. Auriculata* (Ranawara) has been used (and a really good quality of hide is arrived at) the skins are tanned further by means of gall-nuts. The gall-nuts are smashed and placed in a tub in which boiling water is poured, and when the water is tepid the skins are put in and steeped for one or two days. Gall-nuts cost 3 cts. per lb.

The skins being now finally removed from tanning materials, are well dried and undergo oiling. The hides are spread on a large table and well-rubbed with gingelly oil. They are again air-dried and then put away for baling. Only good skins got from neat cattle undergo this latter process, and the preparation of a pound of hide of this sort costs on an average 12½ cts.

Those skins which are prepared only with *R. Mucronata* are said to cost on an average only 2 cts. per lb.; and buffalo-skins are only prepared in this way. The market price in England is about 6 pence per lb. for this latter variety; the first quality fetching 10 pence per lb.

The alum process is used for sheep-skins and dog skins, no other material for tanning being there used. The dog skins are got from the animals condemned to death by Municipal authority—the value of a carcase being 3 cents. Dog skins are much used in England for gentlemen's gloves. The buffalo hides are used for saddlery and harness manufacture, while the first quality leather is utilized for shoes, boots and other purposes where finer leather is required.

Buffalo skins are also prepared for exportation without tanning them. In this case the skins are soaked in water, and after the flesh is removed, they are salted (8 lb. going to a skin). The saline liquor left was found when sprinkled over the surrounding coconut land to keep the land free

from grass and weeds. In this mode of preparation the hair is left on the hide.

The skins of very young calves and *fetus* are also beautifully prepared with the fur on. They are used for slippers and fancy articles, fetching 5 shillings and upwards per skin. Bellows-skins are also prepared.

The offensive odour of a tannery is almost proverbial, but medical men give it as their opinion that it is by no means noxious. The coolies who were seen working were, according to the Manager, never the worse for the foul smells they inhaled.

This visit to a tannery impressed one with the idea of how much may be gained by energy and perseverance. Mr. D. Carolis has no easy time of it in working his establishment, and he well deserves the reward which he gains for his labour. In him his countrymen have an admirable example to imitate. We should not be surprised to hear in time of the by-products of Mr. Carolis' tannery yielding such valuable substances as glue and compost-manures.

CRUDE THEORIES REGARDING THE ORIGIN OF CERTAIN PLANTS. II.

BY W. A. DE SILVA.

In my first instalment of this paper I gave the mythological origin of the paddy plant; in this, I propose to deal with the coconut tree which is only second in importance to the people of Ceylon.

The story runs, that at one time, there lived in a kingdom of the East a mighty king, resplendent with glory and surrounded by a large retinue of ministers, among whom were several wise men—both physicians and astrologers. These latter, by observing the stars and the courses of the heavenly bodies, professed to predict events and fix on "lucky" days and hours, and made reports of the results of their observations to the king. The astrologers royal, though well remunerated, were in no little dread of His Majesty who, if ever their predictions proved incorrect, immediately condemned them to be beheaded.

One day a learned astrologer of the Berawaya (tom-tom beater) caste, noted for his erudition, discovered after careful observation and calculation, that a certain day was exceedingly "lucky" for planting trees—in fact he went so far as to declare that anything, no matter what, planted at a certain hour on that day would be sure to grow into a tree which would be a great boon to humanity. The king being informed of this, though much gratified, was yet not altogether pleased with the bold assurance of the man, and thinking to puzzle him, enquired whether the astrologer's head, if laid on a stone, would there develop roots and grow into a tree. The answer was in the affirmative, and to the great astonishment of the astrologer, the king forthwith ordered the experiment to be carried out. The severed head was accordingly laid upon the stone, and after a time lo! the noble coconut palm—the tree of a thousand uses—sprung up. And to this day, it is supposed the resemblance of the coconut to the head of the astrologer is preserved, for taking the husked nut as repre-

senting the head, the fibre represents the hair with the top knot (*kondè*), while the eyes and mouth are also supposed to be represented by three depressions.

There has been a good deal of discussion as to what was the original home of the coconut palm. Some claim this honour for Egypt where it was grown some 2,000 years ago, others for the Eastern Archipelago. There are reasons for believing that the coconut was first known in Ceylon, and its uses recognised in the 13th century of the Christian era, as no mention of the palm is made previous to this in the *Mahāvansa* and other standard native works, though mention is made of the palmyrah. Its introduction to Ceylon is attributed to a king of South India, who visited the southern part of our Island, suffering from a skin-disease, and whose image is still found sculptured in a rock near Weligama, where he is said to have resided, to which the name of Kustarajagala was given in remembrance of the great service he has rendered to Ceylon.

OCCASIONAL NOTES.

The newly-issued number of the Royal Society's Journal contains an article on the ten lessons of the "Eighties" by Prof. Wrightson, the Principal of Downton College. The first lesson which the Principal deduces is the value of combination and association by means of Societies, Chambers of Agriculture, and such like. The second lesson is the necessity for systematic instruction in agriculture in all its branches, and notes in this connection, the power and influence of the Agricultural press as an educational agency. The third lesson is the necessity for having the most improved systems of dairying taught and practised. The fourth lesson is that pasture land is now a more profitable investment than arable land. The fifth, that the withdrawal of three million acres from arable cultivation to one of pastoral inactivity must be an indication of the increased value of all fodder crops, including roots. The sixth lesson, that farmers must now look to their livestock rather than to their corn crops for their profits. The seventh, that economy in farm management must be better attended to than it has been in the past. The eighth, that ensilage may be made successfully and at very small cost and is decidedly useful. The ninth lesson is that science has done much for the farmer. And the tenth, that infectious diseases amongst stock must be rooted out.

"What," asks the *Agricultural Gazette*, "is the true position of an Agricultural teacher, and what is the class of knowledge which he should endeavour to impart? The question is a difficult one, for certainly is very large indeed, and there is in it scope for any amount of scientific lore. Of one thing we may be certain, that no knowledge can come wrong to an agriculturist. Even politics, political economy, astronomy, mathematics, engineering, &c., all on agriculture, so that the teacher's range cannot be too extensive or varied. And yet it is necessary to limit him, in some degree, in what he has to teach, if only to save him from despondency. First, he must be what he pretends to be—an agriculturist. If he is this, he is at least qualified to speak on

agriculture. He must also be so trained in the sciences as to be able to explain the methods of agriculture. This is not asking too much, as the same thing is successfully done in many other branches of knowledge." What the *Agricultural Gazette* insists on is that the agricultural teacher must not be expected to range beyond such limits as are placed on science, so as to include only so much of it as he requires for explaining the principles and phenomena of agriculture.

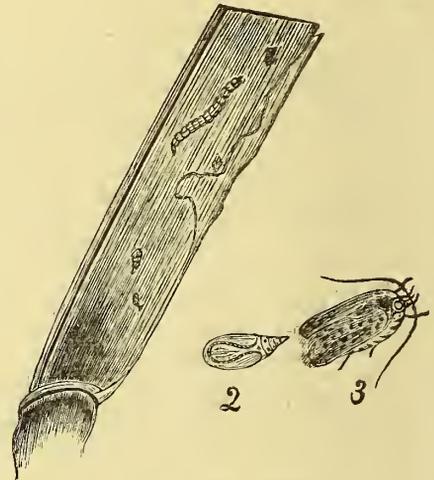

The *Law Journal* for January 25th reports a case decided by Judge Barber at Bakewell, Derbyshire, which is interesting from an agricultural point of view, and teaches the lesson, that an occupier of land who does not fence for himself must take his chance of his neighbour's cattle straying on his land, unless he can show by a long course of practice that the occupier of the neighbouring land has not only repaired the fence but was repaired for his neighbour's advantage as well as his own. We are ignorant of the law on this point in Ceylon, but it is well known that those who are annoyed by trespassing cattle generally take the law into their own hands and levy fines on the owners of such cattle—whether there be boundary fences or no—if they do not shoot the poor animals.

"Let me attempt to show," says Professor Drummond in his paper on the White Ant, "the way in which the work of the termites bears upon the natural agriculture and geology of the tropics. Looking at the question from the large point of view, the general fact to be noted is, that the soil of the tropics is in a state of perpetual motion. Instead of an upper crust moistened to a paste by the autumn rains, and then baked hard as adamant in the sun: and an under soil hermetically sealed from the air and light, and inaccessible to all the natural manures derived from the decomposition of organic matters—these two layers being externally fixed in their relation to one another—we have a slow and continued transference of the layers always taking place. Not only to cover their depredations, but to dispose of the earth excavated from the underground galleries, the termites are constantly transporting the deeper and exhausted soils to the surface. Thus there is, so to speak, a constant circulation of earth in the tropics, a ploughing and harrowing, not furrow by furrow and clod by clod, but pellet by pellet and grain by grain."

The *National Farmer and Home Magazine* in enthusiastic terms writes thus of the "pleasant phases of farm-life":—"It is a common complaint that the farm and farm life are not appreciated by our people. We long for the more elegant pursuits or the ways and fashions of the town. But the farmer has the most sane and rational occupation and ought to find life sweeter, if less highly seasoned, than any other. He alone, strictly speaking, has a home. How can a man take root and thrive without land? He writes his history upon his field. How many ties, how many resources he has: his friendships with his cattle, his teams, his dog, his friends with his trees; the satisfaction in his growing crops, in his improved fields, his intimacy with nature, with bird and beast and the quickening elemental forces; his co-operation with the [clouds, the sun, the

seasons, heat, wind, rain, frost. Nothing will take the various social distempers which the city and artificial life breed out of a man like farming, like direct and loving contact with the soil. It draws out the poison. It humbles him, teaches him patience and reverence, and restores the proper tone to his system.

Dr. De Laval whose cream separators are now so well-known wherever dairying is carried out on a large scale, has invented an Instantaneous Butter-maker. Hitherto it has been generally held that a speed of more than 50 revolutions per minute was fatal to the making of good butter, but since the Plymouth Show it has been shown that butter of the very highest quality can be produced by the Instantaneous Butter-maker, the dasher of which revolves at the rate of 3,000 revolutions per minute. As a cheap and very simple labour-saving machine, and one that will enable any one to produce, at all times, a uniform and first-class quality of butter, its introduction to the dairy public at the Royal Agricultural Society's Show may well be said to mark an epoch in the history of dairying.

1, Caterpillar. 2, Chrysalis. 3, Moth (*Depressaria Cocos Nucifera*).

[The illustration of the coconut-leaf caterpillar which we are enabled to lay before our readers this month was drawn from life by J. P. Manchanayeka, a student at the Agricultural School. We are indebted to him also for most of the other illustrations appearing in these pages.]

It would be interesting to ascertain how many broods of the coconut-leaf caterpillars are produced in a year, and we shall be obliged to any of our readers for information, as to how many times a year the blight appears on trees. The scorched appearance of coconut trees in Captain's Garden and other parts of Colombo is also due to this caterpillar.

Before any definite suggestions could be made by way of prevention, it is desirable that more information about the life history, habits, &c., of the insect be gained. In the meantime it may be mentioned that the natural enemy of this

caterpillar, as also of a great many others, is the yellow and black-striped wasp called by the Sinhalese Kumbala (කුඹලා). These wasps, as our readers are aware, collect caterpillars for the food of their own larvæ. Their nests are built of mud and are found attached to doors, windows, &c. of dwelling-houses. The nests are composed of several cells or chambers, in each of which the parent wasp lays an egg, and fills the cell with caterpillars. It is considered a very great fault by the Sinhalese to destroy one of these nests, not from any superstitious belief, but from the great service these insects render to the agriculturist.

DESTRUCTION OF CATERPILLARS.

Miss Ormerod, Consulting Entomologist to the Royal Agricultural Society of England, reporting on the infestation of trees by caterpillars, says that much attention has been lately directed to ascertaining what reliable measures could be adopted in order to destroy the hordes of caterpillars which now appear almost as a regular yearly recurring cause of serious loss to fruit growers. "It has become more and more plain each year," she says, "that although sticky banding is so far of services, that in many cases the foliage of orchard trees would have been totally destroyed if the banding had not been done, yet still it is only a partial protection against wingless moths gaining access to the trees for egg-laying, and is no protection at all from the many kinds of attack originated by winged infestations; also it is expensive, needs renewing at intervals, and, without special arrangements to insure safety to bark, is detrimental to the health of the trees. Measures were found to be absolutely necessary of a kind which could be brought to bear on any or all sorts of caterpillars together (whatever their various natures or previous histories may have been), and would kill the whole collection of ravaging hordes at once, but without damaging the leafage. . . . In my own suggestions as to applications I limited myself to advising trials of "Paris green" spray, as with this application we had clear information from the U. S. A. and Canadian Government reports of the exact proportions in which it was to be used, and of every detail concerned, and also of its success, and warnings as to requisite caution in use, it being a poison; for those who did not care to try it (by advice of the Dominion Entomologist) I suggested the use of washes of soft soap and mineral oil."

The Experiment Committee wisely made a trial and recorded the results of many applications, and of these the Committee recommended the following for spraying on infested trees:—Paris green paste one ounce to from 8 to 20 gallons of water (strength varying according to nature of tree); London fluid (that is a mixture of a preparation sold as "London purple") one part to twenty parts of water. Both of these the Committee recommend as effective in destroying the caterpillars, while they do no material harm to the foliage. The value of Paris green (arsenite of copper) has been attested by numerous private correspondents of Miss Ormerod. The syringing, according to the recommendation of the Committee, should be done when the leaf-bud is first de-

veloped, before the blossoming period, and then again after the blossom had disappeared and the fruit was forming. More than one correspondent concerned in fruit-farming says that, "Paris green is the only thing which we have found really efficacious—it has not damaged the foliage, but killed the caterpillar." The spraying is done by means of a pump and nozzle. It is noted by the Secretary of the Experiment Committee that were no such precautions were taken, "the trees were looking desolate—as bad as if fire had been scorching the trees." Messrs. Salmon, the well-known fruit-growers, writing to Miss Ormerod, says: "All that we can say about it is to its advantage. It has succeeded admirably. The trees look healthier and better, with as much (if not more) on, as anywhere else. They are beautifully clean. It has not injured them in the slightest degree. We shall always use it in cases of blight."

The above information comes most opportunely at this time when caterpillars are threatening harm to products in this island. The only objection to the spraying remedy in the case of coconut is the height of the trees which would require powerful pumps to do the work. One spraying ought however to be sufficient when the leaf bud is first developed, as no injury is to be apprehended to the fibrous drupes of the coconut palm as in the case of succulent English fruits. A gentleman writing from Batticaloa district mentions that smoking the trees by means of large smother fires showed an appreciable effect on the caterpillar blight.

GENERAL ITEMS.

Prof. McAlpine of Edinboro', botanist to the Highland and Agricultural Society, has invented an apparatus for testing the germinating power of seeds. By the ordinary system, from three to five weeks are required before a reliable decision can be arrived at, but by this new method Prof. McAlpine claims to be able to tell in five minutes not only the percentage of seeds that will germinate in any sample of grass seeds, but also the percentage of chaff, the percentage of seeds affected with parasites, and the number of weakly seeds. Already there is a deal of testimony from independent sources proving the accuracy of the claim.

We are in receipt of the following:—Journal of the Royal Agricultural Society of England, part second of vol. 1, Third series; Report of the Stewards and Judges at the Kempton Park Show; and No. 6 of the "Universal Market," the International Journal of Industry and Commerce; the new Trinity College Calendar, and the Richmond College and Jaffna College Magazines.

The following were the subjects treated of and discussed at the meetings of the Agricultural Improvement Society during the month:—"The Opening of New Lands in Ceylon," "Is it Advisable for Ceylonese Agriculturists to Colonise Abroad?" "The Improvement of Poor Soils."

We cannot, (says the *British Medical Journal*), hear that any satisfactory progress has been made in

starting the investigation which Mr. Chaplin promised some time ago should be undertaken into the very grave question of the prevalence of tuberculosis in cattle and milch cows used for human food. The frequency with which such tuberculous cattle have been seized in the market, the certainty that a much larger amount is sold and enters into our daily food, the grave consequences which are believed to follow the drinking of uncooked milk from tuberculous milch cows, invest this promise of the Minister of Agriculture with serious importance. It is very desirable that the matter should not be indefinitely hung up.

Veterinary Surgeon Robert Mitchell states that ten ounces of chloroform and six ounces of ether were required before a bull (on which he operated for tumour in the throat) succumbed to the influence of the anæsthetics.

Prof. Duncan of Glasgow gives two instances of food adulteration which came under his personal observation. An analysis of a sample of milk proved that it was a compound of about 70 per cent of pure milk, 30 per cent of water, and an emulsion composed of borax, and coloured with annatto. The other case was one of adulteration of preserved vegetables with sulphate of copper—a subject which was engaging the attention of the French authorities. As a matter of fact, the Professor states, every large grocer in Glasgow sold green tinted articles of that kind which owed their colour to sulphate of copper. The vendors alleged that their customers would not buy peas unless they had the green colour, and they could not have that colour without the sulphate of copper. Many cases were on record where poisoning had occurred through the par-taking of food containing the salts of copper.

Mr. N. N. Banerjee, M.R.A.S., and F.H.A.S. having studied Pasteur's system of inoculation for anthrax has been employed at Seebpore in experimenting on Indian cattle with great success. He is now working for the Government of India, and his laboratory has been transferred to Poona.

The lint which clings to cotton seed, after it has gone through the gin, is being utilized to make felt, which it is said, will be greatly used for hats &c., as the process of felt-making in this manner is inexpensive and the material used has up till now been considered a waste product

The Indian Agricultural Conference at which representatives from all parts of the Empire will be present, is expected to meet at Simla about the end of November.

Fromentine is the name given to a new alimentary material which consists of the embryoplant to be seen as an oval structure at the base of the wheat grain, which is discarded in the process of milling. By analysis it has been shown to contain 51.30 per cent of albuminoids, 29.08 of carbo-hydrates other than cellulose, 12.03 of cellulose, and 6.98 of mineral matter or ash. The richest kind of meat—that of sheep—contains only 21 per cent of nitrogen. The digestible matter in fromentine is 87 per cent of the total weight. Owing to its high nutritive value and easy digestibility it is claimed for fromentine that it possesses special qualities as a food for infants, convalescents, and anaemic subjects. It is suggested that the germs of barley, oats, maize, &c. may be similarly utilized. It is, in any case, interesting to learn that in fromentine, a substance of exclusively vegetable origin, there exists a percentage of nitrogen much higher than those contained in the best kinds of meat.

The latest horse-shoe in Berlin is constructed of layers of paper glued together and subjected to hydraulic pressure; each layer is treated with oil, turpentine, &c., rendering it impervious to moisture, and the specially manufactured glue is insensible to the influences of moderate heat and water. This paper shoe is attached securely to the hoof by means of gutta-percha, and being very elastic, permits of the expansion of the hoof. It is very tough and durable, and wears rough, this greatly preventing horses slipping.

S. W. H., in the Jaffna College "Miscellany," says that the word "paddy" (corresponding to the Tamil word *nellu*) is evidently the same as the word *batta*, which is used to denote the allowance for money for daily food to persons away from home. They are both the Tamil word *padi* which means a measure. A measure of rice is the daily allowance for a man; thus the word came to mean the rice which is allowed and hence rice in general; and further (as *batta*) an allowance whether in rice or its value in money.

Received with thanks for the School Museum, samples of coffee (parchment, peaberry, and Liberian), and a mature miniature coconut about the size of an ordinary marble.

THE TROPICAL AGRICULTURIST MONTHLY.

Vol. X.

COLOMBO, OCTOBER 1ST, 1890.

[No. 4.]

THE FUEL QUESTION IN CEYLON.

ALTHOUGH matters are not in the critical position which Mr. Berry White in his left-handed benevolence toward Ceylon represented ("the wish being father to the thought"), and although the tea enter-

prise is not likely to fail because there is "not a stick of firewood left," yet the fuel problem is undoubtedly a serious one, from the fact that so large a proportion of the tea estates were formed on the sites of coffee estates, whence nearly every trace of timber had disappeared. If the heavy demands of the railway are included, we can easily believe in the correctness of the estimate, although it was questioned by our good friend, Mr. A. H. Thomas, that the produce of 100 acres of forest per annum would be required to supply the demands of the one district of Dimbula. That is with reference to the present consumption: but be it remembered, that while the demand for tea furnaces increases with the increasing yield of tea, there will soon be a large additional requisition on the Government reserve forests for railway purposes, when trains begin to run from Nanuoya across "Summit Level" to Uva. One of the speakers at the Nuwara Eliya meeting evidently understood by the felling of 100 acres of forest for fuel that a clean sweep would be made of the standing trees, large and small, young and old, on the space indicated, and he contemplated the passing of the cleared Government forest into private hands by sale. No wilder idea could be entertained, and that apart from the rule, prohibiting sales of forest land at an altitude exceeding 5,000 feet. The authority who estimated the extent of felling required undoubtedly meant the equivalent in firewood of 100 acres of Government forest, as dealt with on proper scientific principles, such as have been adopted in the treatment of the forest above Nanuoya, on the right hand of the road to Nuwara

Eliya. It is only the mature, old and damaged trees which have, in the blocks dealt with, been cleared and converted into timber and firewood, while the younger and healthier trees and the saplings have been spared. In the spaces thus partially cleared of trees and thoroughly cleared from *nitu* and other undergrowth, fast growing Australian trees, such as gums, acacias and, we suppose, casuarinas, are to be planted, with reference to future supplies. It is not probable that any portions of the Government forest reserves will be alienated, unless indeed some enterprising capitalist, able and willing to wait for deferred returns, came forward and offered to take land on the condition of at once planting it up with trees, calculated, when grown, to yield supplies of timber and especially fuel. We fear there are few in circumstances to face the risks of an enterprise which would probably pay in twenty or thirty years, in view of the demand which must increase for timber suitable for railway sleepers and other purposes; and for railway and tea estate fuel. The danger as regards the speculator would consist in what we all so earnestly desiderate for the benefit of the tea enterprise, the discovery of some cheap artificial fuel which would render unnecessary the present fearful waste of wood by combustion in furnaces and for the production of charcoal. When discussing this question some years ago, we noticed the fact that under the advice of their sagacious Visiting Agent, the proprietors of the group of tea estates known as K A W purchased forest sufficient to enable them to possess one-third forest for two-thirds cultivated land. We also quoted Mr. Rutherford's strong recommendation that trees good for fuel should be planted on every tea plantation not possessed of forest reserves. We now add advice which we are carrying out in practice: that is, as the reserve forest connected with an estate is denuded of the natural growth, to supply the clearings with good fast growing fuel trees. On estates possessing no forest reserves and where supplies of fuel from outside are not readily obtainable, it might be wise to plant up pieces of poor tea, the sides of streams (specially favourable for red gums), and exposed knolls. In calculating the amount of fuel available in 100 acres of forest in Dimbula, the character of the greater proportion of the forest reserves must be taken into account. In those elevated woods tropical luxuriance of growth does not take the shape of large trees thickly planted over the surface. The sparseness of well-grown trees, and the rarity of forest monarchs (hollow-hearted monarchs too often when they do exist,) strike the explorer of those mountain forests, as well as frequency of open spaces in the heart of the woodland, down into which the sunlight streams. In some cases these retreats of elephants and deer in the

solitudes of the forests, are merely covered with coarse grasses, with osbeckias and a few other shrubs scattered about. Generally, however, the sparseness and the small size of the trees is compensated for and the good character of the soil vindicated by dense and in some cases very tall undergrowths of *nilu*, the stems of which often furnish, in a convenient shape, "waratches," which, tied to posts, form wattle and daub buildings of more than a temporary nature, when thoroughly plastered, well roofed and protected by verandahs. Judging from our personal experience the hill forests of Dimbula and other districts with similar conditions, are likely to be increased manifold in value, when trees introduced from Australia, the Himalayan regions of India, Japan, &c., are substituted for most of the indigenous trees, and when really scientific methods of thinning, pruning and coppicing are resorted to. The readiness with which the Australian gums coppice and their tenacity of life make them valuable additions to our sylvaculture. A very considerable number of foreign trees have been introduced and are being tried, from the eucalypti and acacias of Australia to the oaks, birches and pines of the Himalayas and Japan. As regards the Australian casuarinas and several of the eucalypti, we know that they are reckoned good fuel yielders in their native habitat and we suppose we may calculate on their retaining their characteristics as grown in Ceylon. But experiments such as have been conducted on a large scale in the United States in connection with the census would be valuable here. Specimens of all the American timbers have been subjected to combustion after a mode best calculated to test their calorific qualities and the results have been published. Something of the same kind effected, especially in regard to introduced trees—for the qualities of most of the native timbers have been settled by railway and tea furnace experience—would be valuable. Meantime Mr. Wright's experience with coal is exceedingly interesting; and although coal alone may be too expensive for tea drying, it may be a question whether a small quantity of coal added to wood in a furnace might not largely increase the heat evolved without proportionate addition to the cost. In connection with the vast quantities of coal handled at the range of supplying stores on the Colombo beach, there must surely be a considerable quantity of waste in the shape of small fragments and dust, which might be sold at a moderate price for use on tea estates; pressure being applied to the loose stuff before it is carried by the railway at third-class rates, such as are applied to manure, cement and other like goods, sent in quantities of 4 tons and upwards. Then there is the prospect now of Indian coals of a fair quality being available at a price considerably lower than the "black diamonds" from Cardiff and Newcastle can be sold for.

What the fuel demands of the railway are and are likely to remain, may be judged from the fact that to supply fuel for the 45 miles between Colombo and Polgahawela, Col. Clarke in his recent report proposes to appropriate 10,000 acres of forest along the line. That means over 222 acres for each mile of railway.

SUGGESTION IN RE CATTLE-DISEASE.

The figures published in Administration Reports and in the local newspapers of late, representing the loss of cattle through disease, have not been without their effect on the public mind; and once again remedial measures for the suppression of cattle-disease have begun to be discussed.

There is little doubt that every time there is an outbreak of murrain among cattle, the condition of the native agriculturist becomes more critical. The present distress in the Batticaloa district has the mortality among cattle for one of its causes, while the poor condition of draught animals in the agricultural districts directly bears upon the depressed state of paddy cultivation.

The question now exercising the minds of those who have the welfare of the agricultural population at heart is—what are the remedial measures to be adopted to minimize, if not to extirpate, the evils arising from a degenerate condition of the cattle of the country? Some would say, destroy all animals affected by, and predisposed to, disease; others, enforce stringent quarantine measures in times of disease; and others again, go to the root of the evil and endeavour to improve the breed and condition of stock. It has been conclusively proved, I think, that the first two methods can be carried out neither perfectly nor successfully in this island, the state and interests of the country being opposed to the adoption of these measures which may have proved efficacious elsewhere.* Choosing the alternative, let us inquire how the condition and breed of our stock are to be improved. Various useful suggestions have been thrown out; and good work has been done in some quarters by collecting the advice of those who have had experience in these matters, and the suggestions of the commissioners who inquired into the state of cattle in 1869, also by putting these into a simple and popular form, translating them into Sinhalese and scattering this knowledge as far as practicable among the villagers. But the question is, will the people for whom all this has been done fully avail themselves of the advice and suggestions that have been offered them? From a knowledge of the people one cannot but answer "No," and if he matter is to rest here little will have been done. But more must be done, and can be done if the subject of the improvement of stock received official recognition. Private efforts, however, honest and earnest, will never be successful, unless they received the *imprimatur* of the Government. There is no doubt that before long the legislature will become alive to the necessity of enforcing certain measures relative to the protection of cattle; and if, of the three alternatives to be adopted in dealing with cattle, either of the first two were favoured there will be a grave mistake, but if *the condition of stock is to be improved* there are ways in which the Government can help native agriculturists and other cattle owners. Firstly, it should be secured that cattle are kept under proper sanitary conditions: their surroundings should be cleaned, and they should be protected from undue exposure to rain and wind. The neglect of such treatment is nothing but cruelty and is worthy the attention of the Society that is concerned with suppressing such cruelty. But what is wanted is that certain minor officials—police, municipal, or special officers—should be empowered to charge cattle-owners (whether in towns or villages) who neglect to carry out orders enforcing the proper treatment of cattle as laid down by the legislature, with an offence involving a fine. It was only within the last few days I became aware of the existence of murrain in two large cattle sheds in the heart of the town. The condition of especially one of these is shockingly filthy; and yet it seems that no action is being taken in these cases. Cattle are sold and removed, and I am informed that milk is supplied to two

* Not in the Madras Presidency, where utter failure is confessed.—Ed. T. A.

large Government institution! At times when murrain is pretty general, especially in towns, why, I ask, should not the cattle-sheds where the disease exists be visited and disinfected, and the cattle as far as possible segregated. Municipal inspectors, when they hear of a case of smallpox or cholera, go armed with disinfectants and remove the patient to a hospital far away from town. Why should not the same thing be done in the case of cattle affected with murrain? An animal that shows the first signs of the disease should be immediately removed to the hospital for cattle, situated on the outskirts of the city at one or more than one point, and there treated according to the most enlightened system. The proper feeding of cattle is, however, a matter that it must be hoped cattleowners will come to see is compatible with their own interests, and the desirability of which can be only impressed upon the careless villager by semi-official influence.

But there is yet more that can be done, and that in the direction of more careful breeding. Each district should be provided with a stud bull (one selected for specially good qualities), which should be at the disposal of the people of the district. This would obviate the evil of cows being mated indiscriminately, and would probably lead to a desirable result, viz., the gelding at any early age of males which are herded promiscuously with females in village pasture grounds. The studbull should be under the charge of the headman of the village, who should see that proper care and attention is paid to it. Where practicable a small fee may be charged for the use of the animal, which would go towards the expenses of its upkeep, but the use of it should be given free to the poorer villagers. This plan, I think, would be the best; but it might be suggested in its place that a number of stud bulls should be stationed in the capitals of the provinces, and that these should travel through the country at stated periods. There is a precedent for the Government coming to the rescue of the agriculturist at a critical time, and even now this is being done in "that most distressful country," the Eastern Province, in the matter of paddy cultivation. So that it would not be too much to expect at a time when the extinction of our stock is threatened by disease, mal-nutrition, and bad-treatment, that the Government will supply stud-bulls and even give the use of them free.

If there are any better suggestions to be made let him who can make them speak; but these are the convictions of
 AGRICOLA.

NOTES FROM THE NORTH COUNTRY.

GLASGOW, July 24th.—Just a line to hand you the enclosed advertisements by Lipton & Stuart Cranston & Co. :—

LIPTON IN CEYLON.—To Lovers of the Fragrant Beverage.—Mr. Lipton who has just returned from Ceylon, has pleasure in intimating to his customers and the public in general that the extensive purchases he has made in Tea Estates enables him to supply the most delicious Tea the world can produce, at prices impossible for any other tea dealers to sell at. His estates, which cover many thousands of acres of the best tea in land in Ceylon, are at an elevation of 5,000 feet, where nothing but the choicest teas are grown; and, to give an idea of the labour required in the cultivation and manufacture of tea on these estates, there are upwards of 3,000 natives, independent of Europeans, constantly employed. In buying Teas from Lipton, you get them at Planters' Prices. Consumers of the fragrant beverage thus save not less than six or eight intermediate profits, or 1s to 2s per lb. Note the Prices. Magnificent blends, rich, pure, fragrant.

1s and 1s 4d per lb. Extra choicest Ceylon and Indian blend, 1s 7d per lb.

☞ This is the finest and most delicious Tea the world can produce, and is equal, if not superior, to what is sold by most Tea dealers and grocers at 2s 6d to 3s 6d per lb. 5, 7, 10, and 20 lb. Packed in patent air-tight canisters, without extra charge. Lipton's Teas have a more exquisite aroma and delicious flavour than any Tea ever introduced into Britain. They have undoubtedly reached a pinnacle of success never before attained by any Tea in the world."

"DELIBERATE FALSEHOOD is the only term that can be applied to those who are familiar with the long prices obtained for fine Tea at Public Auction and by Private Treaty, and who yet strongly advertised the 'Finest Tea the World can Produce,' 1s 7d per lb., We prove the falsehood by offering our blend of Indian, Ceylon, and China Tea at 1s 6d per lb. Those strong, dark, bitter Teas—which grip the palate—are doing more real injury to the digestive organs than would result from the same money's worth of Raw Grain Whisky consumed within an equal time. Our Teas are mild and refreshing, and, like old matured whisky may be drunk with relish, and are followed by no evil effects. To clench this argument, We Stuart Cranston & Co., Trained Tea Tasters of 25 years' experience, admitted to be the keenest buyers in Scotland of fine China and fine Darjeeling, still pay regularly in the open market—patent to every Teaman in Mincing Lane—2s 10d, 3s 3d, 3s 10d, and even 4s 7d per lb. (duty paid) for the choicest China and Darjeeling Teas, buying them in lots of £300, £500, and £1,000 sterling in one line for one kind. The 4s 7d was a small lot, but long after it was sold out our customers came back, eager to purchase more—a clear proof that the quality and value were not fictitious but real."

Will it do the Ceylon planter any good for Lipton or any other man to advertise that he can sell the "finest (Ceylon) tea the world can produce at 1s 7d"? I very much doubt it, and I find many here of the same opinion. Ceylon folks at home have been greatly amused to read of Lipton's reception in Ceylon. When honorable members of Council and the leading members of the planting and mercantile community have vied with one another in doing honor to Glasgow's principal retail ham dealer, I suppose we may reasonably infer that caste prejudices are destroyed and the once despised "shopkeeper" is no longer to be looked down upon as a social outcast. If this be the result of Mr. Lipton's visit to Ceylon, then I for one will indeed rejoice. You remember the story of a visitor who, unable to understand the fine distinctions drawn by Colombo Society, asked a member of the mercantile community what was the difference in Colombo between the merchant and the tradesman as it seemed to him (the visitor) that they were all in trade. "The difference," replied the merchant, "is that the tradesman 'arfs 'is 'ams!'" Great Scot! what will the members of Ceylon Society say now after bowing the knee to one who not only "arfs 'is 'ams" but will sell you a much smaller quantity of ham any day you like to step into his shop just round the corner from where I now write. Well done Lipton, if he has helped to knock this nonsense out of Ceylon folk's heads. May he prosper abundantly by his Ceylon investment. At the same time I would ask him not to attempt to enrich himself by doubtful advertisements and by ways which can only injure his brother planters.

Enclosed is advertisement from the Edinburgh *Gazette in re* "The Indian Tea Bazaars Company Limited," of which Andrew Polson is chairman :—

(Excerpt from *Edinburgh Gazette* of 3rd June 1890.)

In the matter of the Indian Tea Bazaars Company, Limited. Notice is hereby given, that at an extraordinary general meeting of the above-named Company held in the office of Messrs. H. & R. Lamond & Lang, Writers, 93 West Regent Street, Glasgow, on Friday the 30th day of May 1890, the following extraordinary resolution was passed viz. :—"That it has been proved to the satisfaction of the Company that the Company cannot, by reason of its liabilities, continue its business,

and that it is advisable to wind up the same, and accordingly that the Company be wound up voluntarily."

It was thereafter proposed, and unanimously agreed to by the said meeting. "That Mr. Robert Dempster, Chartered Accountant, 149 Hope Street, Glasgow, be, and he is hereby appointed, Liquidator of the Company for the purpose of the winding up."

ANDREW POLSON, Chairman.

THE DETERIORATION OF IRISH STOCK.

Miss Cooper, in a paper in the *National Review* entitled "Some Curiosities of Irish Farming," ventures, woman though she is, to lay her finger on the most serious point of the Irish difficulty, namely, the deterioration of Irish stock. Ireland, it should never be forgotten, is a great farm, and the lack of good sires is as much and more serious a matter to the Irish people than even the lack of good land laws or good landlords. Miss Cooper says:—

It became the general custom for landlords to keep a good bull, ram, or boar for the benefit of their tenants, and one of the evil effects of the land agitation and the Bill of 1881 has been that the practice is now given up, and the consequent deterioration of stock is becoming quite perceptible, it is said, in many parts of the country. There is great reason to fear similar deterioration in all branches of agriculture, now that the landlords and their agents are powerless to insist on some degree of good farming.

Miss Cooper does not say so, but one of the first duties of the first Irish Minister of Agriculture will be to establish a good bull, ram, horse, and boar in every district in Ireland. The first Coercion Act needed under Home Rule will be to compel the peasants to discontinue resort to "the shilling bull."

There is much in Miss Cooper's contention. To get rid of landlords is to banish capital and the benefits which follow on its use. The crusade has been against all landlords, good and liberal as well as bad and grasping. What Ireland wants is what she is frightening away: capital in abundance and well applied.

OOLONG TEAS—NEW USE FOR QUININE.

The following paragraph from a daily paper seeming to me to be likely to have interest from your planting readers, I give it place in this letter:—

FORMOSA OR OOLONG TEA.—The statistics for last year show a reduction in the export of tea from Formosa, which had hitherto escaped the depression in the China tea trade generally. On this subject the British Consul at Tamsui, in his last report, says that the tea season of 1889 has been most unsatisfactory both to foreign and native merchants. The teas of the island which formerly had a distinctive character are rapidly losing it, owing to the reckless competition amongst Chinese buyers for the Amoy market, and the careless preparation and fraudulent admixture by them of the teas after they come into their hands from the growers. This has told its tale on the consuming markets, and a lower basis of price than has ever been known before has been established, while the consumption shows a very marked decrease. With the yearly increasing competition from India, Japan, Ceylon, and Java, each of which countries fosters its tea trade while China does nothing for it, but rather taxes it beyond its endurance, the ground that Formosa has lost in the consuming markets is unlikely ever to be made up; and, in the opinion of those most competent to judge, the days of the trade are numbered, unless steps are taken by the Chinese themselves in the direction of radical reform. The Governor, who is one of the most energetic and liberal-minded of Chinese officials, has, in conjunction with a foreign merchant, procured the services of an experienced planter from India, who is to establish a model tea farm, and endeavour to show the

people the advantages of the proper cultivation and manufacture of tea. The idea is an enlightened one, but whether it will be prosecuted with vigour and receive enough official support to ensure its success, remains yet to be seen. It is doubtful also whether the adoption of the most perfect methods can be attended with success while the inland and export duties on the article continue to be out of all proportion to its value and so far in excess of like imposts in all competing countries. America takes 90 per cent. of the Formosan tea, but there are indications of a growing change of popular taste in the matter of tea. As Oolongs seem to be little appreciated elsewhere than in the United States, any change of this nature would be the death-blow of the Formosan tea-trade as at present conducted. Hence the scheme already referred to is intended to include the preparation of teas of the Indian, Ceylon and mainland types, a market for which will, it is hoped, be found in London and elsewhere. It is merely peculiarity of preparation which produces the variety known as Oolong; the raw material is the same as that of Foo-chow, Hankow, and India, and a proper manipulation will produce a tea of precisely similar quality to the Souchongs and Oongons of other tea ports of Obina.

It has never occurred to me to hear that quinine has been supposed to have the effect of absorbing actinic rays. My knowledge of such subjects is too defective to enable me to discuss the matter of the following paragraph cut from a scientific journal; but there may be those in your community to whom the subject treated of in it may be possessed of special interest, and who may be able to inform you of this property alleged, or presumed, to be inherent in the sulphate of quinine.

Dr. E. Liesegang says, in the *Photo Archiv*, as translated for *Wilson's Magazine*, "The expedient of covering a window with a fluorescent solution of quinine sulphate has not proved sufficient to keep out all actinic rays. This is better accomplished thus:—It is known that an aqueous solution of three parts green chloride of nickel, and one part red chloride of cobalt, is colourless by transmitted light, and quite clear when dilute. The two colours are complementary, and completely neutralise each other. Hence the light passing through the mixed solution has no effect on the salts of silver. Although it is quite white it is perfectly nonactinic, and does not any longer affect the sensitive film. To completely neutralise any possible rays in the ultra-violet, another glass is coated with a solution of quinine sulphate in collodion somewhat acidified with sulphuric acid. The quinine cannot be used in the same solution because it is precipitated by the cobalt salt. As the cobalt chloride, red when containing water, becomes blue when free from it, the mixture must not be allowed to dry. It may be made with gelatine and glycerine, but even a high temperature around the window may dry it. Silver paper which was left exposed for a week behind a thin layer of the cobalt-nickel solution thus prepared, did not show the slightest alteration. I have not as yet experimented with plates, but with sufficiently concentrated solution these also should not suffer change."

THE CHEMICAL ANALYSES OF TEA.

Any opinion expressed by Mr. John Hughes, the well known chemical analyst, we may be sure to be deserving of the fullest consideration. We need not, therefore, apologize for recurring to Mr. Hughes' opinions as to the tannin test of the quality of tea. The opinion he has given to our London Correspondent on the subject of the analyses of tea should therefore be well weighed by us. We, therefore, recapitulate the facts. In the *Tropical Agriculturist* for February last we published an abstract of a paper read by Mr. David Hooper on the subject of the propor-

tion of tannin in Indian and Ceylon teas, the main object of that paper being to proclaim the results obtained by analyses of high-grown and low-grown teas. We need not here enter upon the details of Mr. Hughes' references to what Mr. Hooper advanced. This has been sufficiently done in our London Letter; but the main point raised by him we think it to be desirable to offer some remarks, and to ask for fuller discussion by those interested in the subject.

Mr. Hughes' contention, as we understand it, is, that the conditions under which analyses of our teas have as yet been made have produced results which—although highly interesting in a certain sense—are practically useless as a guide to the great body of consumers of tea. These desired to be guided in their purchases, not by the outcome of what we may term "exhaustive analysis," but by that obtained by analysis performed under the conditions of general household use. Mr. Hughes thinks that the amount of tannin chemically found to be contained in teas affords no trustworthy data of what the results to household infusion may be. This infusion varies with most users only from five to ten minutes, though, as the rule we should ourselves recommend a limitation to but three minutes only provided the teapot be previously heated and the water boiling. It is contended by Mr. Hughes that what is required is that a systematic analysis of the results to infusion evidencing the proportion of tannin yielded by various teas during such brief treatment should be made to enable ordinary purchasers to decide what they would wish to buy for their household consumption. The time generally allowed by professional tea tasters for the "brew" to draw before tasting is five minutes. Probably this time might be adopted for the purpose we have referred to as being a safe medium. Ten minutes is certainly too long, while some deem three minutes too short. The medium of five, therefore, that we have suggested would probably meet the generality of tastes. Our Planters' Association has already been addressed by Mr. Hughes on this subject. It rests with that body to decide whether the course he has recommended shall be adopted by it. It certainly, for the reasons given, seems to ourselves to be one which might be with wisdom followed. To make our tea popular to the fullest possible degree we cannot take the public too much into our confidence. That public has now before it the statement that all that it has heard said about the proportions of tannin in the several varieties of tea offered to it is unreliable, in so far that it relates to conditions with which it (the public) can have nothing to do. To offer to consumers the results of analyses which shall afford them a guide, must surely seem to be a desirable course.

There is a second point in Mr. Hughes' communication to our London correspondent upon which we should desire to offer a few remarks in amplification of what we have in previous articles written on the subject. From what that gentleman has now and on former occasions stated, it would seem to follow that, however carefully analysis under the conditions above referred to may be made, its results must at all time be subject to the variable qualities of the water used for infusion. Our space will not admit of what we have before written on this topic being here recapitulated. We have, however, before expressed the opinion that the differences between the waters of different localities must form an important factor in forming judgment upon teas. But we were scarcely prepared to learn how highly necessary consideration of this point is deemed to be by experts at home. Mr. Hughes informs us—to quote from

our London Letter—that "some London firms who do a large business in Ireland actually import Dublin water to London for the purpose of testing teas intended for Ireland." The conclusions to be drawn from this added testimony are important in considering the case upon which we have been writing. It will naturally be asked whether infusion in different waters may not altogether neutralize the results obtained from the short-time analysis of the liquors that are recommended? Indeed Mr. Hughes further tells us that in localities in England deriving their water supply from the chalk, it is found that high-grown teas meet with the most demand. Therefore conclusions based upon analysis with a single class of water will probably not hold good universally. These are matters claiming much attention. It was only lately that we criticized the variety of advice tendered to our planters by home experts; but it would seem from the facts above stated that but little else could under all the circumstances be expected. Of great value to us would therefore be some method of research which should place our procedure with regard to the growth and preparation of tea on a sound scientific basis, now apparently wholly wanting to us.

While the question of tannin is thus engaging our attention, the *Pharmaceutical Journal* of July 26th brings us interesting information in regard to the distinctive principle *theine*. Recent research, it will be seen from the extract we place below, shows that the proportion of this principle in tea is higher than was previously supposed. It is appreciably higher in "dry" than in "original" tea, meaning by the latter, no doubt, tea with the ordinary amount of moisture in it. The unnamed tea, we are unable, of course, to identify, but Ceylon dust shows well. Very strangely, however, the premier tea for theine is a 1s 2d Java tea. Cheap China and Japan show badly. It may surprise some readers to see that teas as originally received from retail dealers and brokers contained from 5.40 to 8 per cent of moisture in the first case and from 6.28 to no less than 8.98 in the second. As a rule the highest priced teas were richest in theine, the Java tea being a striking exception.

AMOUNT OF THEINE IN TEA.

BY DR. B. H. PAUL AND A. J. COWNLEY.

In the March number of the *American Journal of Pharmacy* there was a report of some results obtained by Mr. John Hamilton Small in the analysis of Japanese and other kinds of tea, according to which it was shown that the amount of theine in the Japan tea examined was from 1.79 to 2.30 per cent, while that in the samples of Chinese and Indian tea varied from 2.38 to 3.54 per cent. The method of analysis adopted by Mr. Small was that described by us in this Journal* and the results published by him are in accord with those obtained by ourselves for average tea. However, in a reference to Mr. Small's figures by a writer in a recent number of the *Apotheker Zeitung* it is remarked that the amounts of theine indicated there are "remarkably high," but that since the description of the samples analysed was given in very general terms, and there was no statement made as to the final purification of the theine obtained, further criticism was impossible. Obviously the suggestion was thus conveyed that Mr. Small's analytical results were too high, owing to impurity of the theine weighed, and the writer did not appear to have been aware of the fact that the amount of theine in tea is generally much higher than had been supposed on the bases of the older analyses which were made by methods unsuited for the complete extraction of theine in a pure state. We have, therefore, made a further series of analyses of different kinds of tea for the purpose of obtaining additional evidence as to the amount of

* *Pharmaceutical Journal*, Nov. 19th, 1887.

theine, and it will be seen from the following table that the conclusion we had previously arrived at as to the presence of theine in greater proportion than had been assumed is fully sustained by the analytical data there given.

CRYPTOMERIA JAPONICA.

This timber tree which has flourished in and around Darjeeling at 7,000 feet and down to 3,000, ever since FORTUNE, nearly sixty years ago, brought the seeds from China, has been planted to a considerable extent in and around Nuwara Eliya. Dr. Trimen has expressed a fear lest the climate of our hills should be too wet for this tree; but in the latest report of the Royal Botanic Gardens, we have Mr. Nock's testimony regarding a specimen cut down at Hakgala, when only sixteen years old. It yielded 90 feet of 1 inch boards, measuring in width 16 inches at bottom to 6 inches at top. This is surely an encouraging result, considering the age of the tree, and until now all the accounts we have received of the Japan pine have been largely favourable. Mr. W. R. Tringham, of Nuwara Eliya, however, sends us the following extract to "show that the tree is not of such rapid or big growth, or the timber of such value, as was supposed":—

(Extract Notes upon Useful Japanese Timber, by J. N. T. Turner, A. M. I. C. E.)

The Sugi (*Cryptomeria japonica*) has a coarse fibre, and the annual rings of growth are distinctly marked. The heart-wood is ruddy brown, and the sap-wood straw colour. It is a feeble and perishable timber; but being very straight grained, it opposes considerable resistance to longitudinal stress. This property renders sugi a useful timber for uprights in houses of light construction; though it is most extensively employed in the characteristic scaffolds of the country. For timber, the felling age is about 35 years, when the average girth is 3 to 4 feet; but for poles it is felled much younger. When full grown, a girth of 15 feet is not uncommonly attained. The present price is 25 sen, or 9d per cubic foot.

All the above timbers are inferior in strength to their European analogues, as they are, under the climatic conditions of Japan, of more rapid and exuberant growth. The trees are generally felled long before their full growth has been attained. Felling is carried on through all seasons, the summer months being the favourite &c. &c.

Taken from minutes of proceedings of the Institution of Civil Engineers, vol. 89, issued July 1887.

What is above stated, if accepted fully, does not disprove the value of the tree as yielding fuel from its prunings and thinnings, and timber suitable for tea boxes and packing cases and for such indoor work as ceilings and posts of houses and like purposes. We saw Mr. Nock's planks and they seemed

to us to be equal to good fir or spruce fir deals. It seems probable that a twenty-year old tree in Ceylon may be equal to one of thirty years' growth in Japan. If grown extensively, it might yield soft wood railway sleepers which could be creosoted, vulcanized, or otherwise preserved locally. Gamble, in his Manual of Indian Timber Trees, writes of a specimen of the wood from Darjiling, "wood soft, white, with a brown, often almost black heartwood. Very uniform, with narrow bands of firmer and darker tissue at the edge of each annual ring. Medullary rays short, fine and very fine, extremely numerous." Of the tree he says: "Its growth is extremely rapid: One specimen shows an average of 1.2 ring per inch of radius, and many of the rings are one inch wide. * * It is brittle and the tops and branches are broken by high winds." Close planting may protect the trees from such misadventure. Von Muller gives a very favourable account of the trees thus:—

The Sugi or Japanese Cedar, Japan and Northern China. The largest tree in Japan, the trunk attaining 35 feet in circumference (Rein) and 120 feet in height. Stem long, clear, of perfect straightness; the plant is also grown for hedges; in Japan it yields the most esteemed timber, scented like that of Cedrela (Christie). It requires forest-valleys for successful growth. The wood is durable, compact, soft and easy to work; more extensively utilised in Japan than any other. In the Azores the tree is preferred even to the Pinus Halepensis for timber-culture, on account of its still more rapid growth in that insular climate. Several garden-varieties exist.

It would thus appear that the tree (which is easily propagated from seed or cuttings) is valuable in many respects and for various purposes. Teak, about the best timber in the world, if tested by the breaking weight strain, compares very poorly with Australian iron and stringy bark timber. But teak is still the superior timber, one of its merits being that it is easily worked. That is also one of the merits of *C. japonica*, and its perishableness in Japan may be due to the fact that the timber is not properly seasoned. It is curious that a tree which grows to a height of 120 feet and a circumference of 35 feet should be capable of being treated as a hedge plant. But the Japanese are great in the art of dwarfing vegetation.

CATTLE AND CATTLE DISEASE IN CEYLON.

Nothing could be more appropriate to the discussion of this question than the appearance of the amended Ordinance relating to Village Communities. Here we find, as we anticipated, that the native tribunals and committees are vested with very large powers for the repression of cattle trespass, cattle stealing and cattle disease. All that is needed is that the natives, to whom so large a degree of self-government has been conceded, should, under the judicious guidance of the Government Agents and their Assistants, use the powers entrusted to them wisely, actively and courageously, without fear or favour. They can make such rules as they deem expedient for places for the slaughter of cattle, sheep or swine, for taking care of waste and other hands set apart for the purpose of the pasturage of cattle or for any other common purpose; and for breeding, registering and branding cattle, for regulating the sale, removal and slaughtering of cattle, and for preventing cattle trespass, cattle disease and cattle stealing. The gamsabawa courts, too, in their criminal jurisdiction can deal with cases of cattle trespass under the Ordinance No. 9 of 1876. Wide powers are thus given to the natives to deal

with matters so deeply affecting their interests as the breeding and tending of cattle, measures for the prevention of disease and for its limitation and cure, when it has appeared. All that is wanted, we repeat, is that the powers vested in the people should be intelligently used by them for their own good. Government will, of course, see to it that while the Forest officers are demarcating reserve forests and repressing wasteful chenaing, a sufficient area of ground is left in connection with villages for purposes of common pasture. On such commons those interested ought to be compelled to bestow labour in clearing the ground of jungle and weeds, so giving the nutritious grasses fair play in the struggle for existence of various forms of vegetation. This measure alone will in most cases suffice, in ordinary seasons, to secure good pasturage on high lands, while water grass can be cultivated on portions of swampy land to which village labour ought to be applied for drainage purposes. The breaking up of cabook (laterite) by means of mamoties, or the application of a small quantity of good cabook as a top dressing to sandy or inferior soil, has an excellent effect. The late Dr. Thwaites of the Peradeniya Gardens, in the paper to which we have already referred as contained in the appendix to the report of 1869, stated:—

Taking into consideration the secondary interest, as compared with his paddy fields, which the native cultivator appears to take in his cattle,—these being allowed to roam about, to pick up food where they can find it—on paddy fields when the crop is off, on the sides of roads, and on scrubby ohena lands,—without any attempt, so far as I have observed, to keep them in fenced-in pastures, or to improve the pastures by freeing them from weeds,—I hardly see what better step, as a preliminary one, can be resorted to, than to endeavour to induce the villagers to increase the extent of their pasturage by converting into grass land large areas of chena, which are now covered with lantana and other comparatively useless vegetation. The park-like portion of the Peradeniya garden has been formed by merely keeping cleared ground free from weeds, allowing any grass plants that shewed themselves to remain. After a few weedings the latter became so numerous by spontaneous growth (no seeds being artificially sown) that a fine grass sward, on which cattle thrive well, is produced. The subsequent weedings which are necessary to keep it clean, are effected with a very trifling expenditure of labour. If arrangements could be organised for a similar process of clearing and weeding certain portions of the waste lands throughout the Island by village communities, who might be allowed to pasture their cattle, on certain conditions, upon such cleared land, an important addition would be made to the wealth of the Island, and, it may certainly be added to the beauty of its scenery.

Were systematic cattle rearing a more prominent part of the industrial occupations of the native population, more attention would doubtless be directed to the providing food for their cattle during the dry season, and in sufficient amount to meet any exceptionally long rainless period that might occur. Paddy straw appears to be a capital fodder, and to be extensively used as such. It is probable that some of the coarser grasses of the Island, which on account of their harshness in a fresh state are then unpalatable to cattle, might if dried into hay and then chopped or pounded, be found capable of furnishing nutritious fodder for cattle. Clearing away the small vegetation from the banks of rivers and streams, and planting them with Mauritius grass would be a most useful proceeding in very many parts of the Island.

As a tropical country, Ceylon is highly favoured in the amount of its grass land, and in the quality of many of its indigenous grasses. A superior description of pasture might no doubt be produced by sowing upon cleared land seeds of the most nutritious species of grass collected for the purpose. It would also be desirable to procure if possible, seeds of esteemed tropical grasses which we do not already possess, to be used for a similar purpose.

It must be borne in mind that for different zones of elevation different species of grass would, respectively be found to be best adapted; and the same would apply to differences of climate as respects excessive dryness or superabundant moisture. Investigation and experiments therefore, if thought desirable to be made in this direction, would have to be carried on in various localities in the Island, and with different kinds of grasses.

On the cleared pasture grounds of these gardens (without the addition of any other food) with Sinhalese and Coast varieties of cattle thrive exceedingly well, bringing forth strong and healthy calves, and yielding milk and butter of good quality. Very little attention is required to prevent ill effects arising to young calves from the bites of leeches. It is true that sheep cannot easily be pastured where leeches abound, owing to the leech-bites becoming fly-blown, and in this way incurable sores are frequently produced; but this particular obstacle to the breeding of sheep would hardly obtain in the drier parts of the Island.

Here we have the necessary measures for securing good pasturage and forage indicated. The one thing wanting is that the natives should voluntarily or under benevolent compulsion, bestow labour on the preparation and conservation of pasturage for their cattle instead of allowing the wretched animals to wander through jungles and swamps or fallow paddy-fields, picking up a scanty and precarious subsistence. It is gross exaggeration to describe the soil of Ceylon as "poor in the extreme." It varies, of course; but everywhere, if weeded and kept free of useless or noisome vegetation, it is capable, under the influence of our tropic sun and our tropic rains, of yielding very fair pasturage. The recommendations in the report of 1869 as regards food for cattle were as follows:—

Believing that the cattle of this country suffer greatly from the want of good and sufficient grazing during seasons of drought, and from exposure in their search for food in the rainy months, we would suggest the desirability of inducing village cattle owners to husband their paddy straw under shelter, to serve as fodder for their animals during the inclement seasons of each monsoon, as there can be no doubt that their herds would be much benefited by stall-feeding during such periods.

Mauritius grass dried and stored against seasons of prolonged drought or excessive rain, would form an admirable adjunct to paddy straw for purposes of stall-feeding, and we strongly urge its introduction into the rural districts of the country. It is a grass easily acclimatised, requiring no cultivation and of rapid growth, and it would be well suited for ravines in the hill districts and for swampy ground in the low country. The slight trouble involved in protecting it by fence or ditch from destruction by wild cattle would be amply compensated for in the valuable supply of excellent dry fodder it would afford, whilst the manure that would be accumulated in the cattle stalls at such times, could be employed in aiding the fertility of adjacent paddy lands, a matter to which native cultivators have hitherto paid far too little attention.

We believe that the "Prairie Grass" of Australia is also well suited to the climate of this country, and might be extensively introduced in pastoral districts with great advantage. It is a very hardy perennial,* grows to a great height if left uncut, and when grazed over makes a fine compact and enduring sward, capable of withstanding the effects of severe droughts. The grass is now being successfully grown on the Company's Farm at Peradeniya.

* "PRAIRIE GRASS."—This most valuable plant has become well and favorably known; it is a very hardy variety, stands drought as well as if not better than any other grasses, can be kept constantly under the scythe, and is well relished by all kinds of stock. It is most valuable to squatters, who by sowing a few bushels broadcast over their runs well secure a most permanent grass. The quantity required per acre is about two or three bushels.—*Melbourne Circular*, 1869.

With a view to providing better and more extended grazing in certain localities, such for instance as in the Badulla, Hambantota and Matara districts, we would suggest that a sufficiency of Crown chena land in the vicinity of each village or group of villages be set apart for this purpose, and the cultivators allowed to clear it from underwood, leaving only a few of the larger trees for light shade: beneath these, if the ground be kept free from undergrowth and weeds, good nutritious grazing could soon be obtained, which would be available for cattle in seasons when the grass on the lower and more exposed lands would be parched and burnt up.*

It would no doubt be very desirable if some of the European roots employed for cattle feeding could be introduced into this country, for stall-feeding during seasons when the ordinary grazing failed. Mangold Wurzel has been grown at Peradeniya with complete success, and, contrary to expectation, it has been found that this root is not attacked by pigs, or rats, which swarm in abundance on the land on which it was produced. The question of its preservation after digging, during certain seasons of the year, would soon be determined by a few experiments.

In republishing the papers on the Grasses of Ceylon, contributed by the late Mr. Wm. Ferguson to the Journal of our local Asiatic Society, in 1880, we are simply amazed to see what a wealth of plants, indigenous and introduced, is available for cattle and horse food, if they were only properly treated and cultivated. Our attention is first attracted to *Hygroryza aristata*, which grows floating on water, and is a grass of which, according to Roxburgh, cattle are fond. This grass and others of a like habit, of which many are enumerated, might be encouraged to grow on the undrained water-covered swamps which occupy so large an area in the lowcountry extending inland from Colombo, along the route of the railway and by the sides of the Kelau river. *Coix-gigantea*, "kirindi mana" of the Sinhalese, although a tall coarse grass is freely eaten by cattle. *Paspalum scrobiculatum* in its wild state is common from the seashore to Nuwara Eliya, and cattle are very fond of it, whether green or dry. *Panicum sanguinale* is one of the most abundant grasses in the island. Cattle are fond of it and it forms one of our common pasture grasses. Of *P. ciliare* cattle are very fond. *P. javanicum* is greedily eaten by cattle. Of *P. Burmani* it is recorded:—

This is the Pagister grass, and Scotch grass of the West Indies. Writing about Jamaica, Loudon in his Encyclopædia of Agri. alludes to this grass as follows:—The island abounds also with different kinds of grass, of excellent quality, the artificial grass called Scot's Grass (*Panicum hirtellum*, fig 199, a. p. 195) grows spontaneously in most of the swamps and morasses of the West Indies; and it is so productive, that a single acre of it will maintain five horses for a whole year. *P. Crus-galli*, cultivated as a millet, grows wild as a grass, of which cattle are fond. So with *P. hirtans*, which floats on water and grows on the edges of sheets of water. Of *P. distachyum* and *P. prostratum* cattle are fond. *P. trigonum* is very abundant from the seashore to several thousand feet elevation, and forms with *P. ovalifolium* and *P. curvatum* the principal part of the fodder collected by the grass-women for horses in the Cinnamon Gardens. Of *P. repens*, "ætora tana" of the Sinhalese, it is said:—

This is one of the most common grasses in the island, and highly valued as fodder for cattle, large quantities of it being brought into and sold in Colombo. It is indigenous to Europe, Africa, Asia and America, and in Ceylon grows equally well in the dry sandy soil as it does in marshes, or water, its long creeping underground stems enabling it to endure the hot dry

weather. It is one of the most difficult plants to get rid of once it establishes itself in any locality, and in this respect resembles the *Triticum repens* of Europe. It is found from the sea coast up to Nuwara Eliya, and is a common weed on some coffee estates.

Of another grass it is written:—

Roxburgh states that the *P. paludosum* is of a coarse nature and that cattle are not fond of it, but it is eaten greedily by them, and a supply of specimens collected by me for the Peradeniya Gardens was eaten during the night by a stray bullock. Of *P. nyurus* it is said:—

This is a very in grass found in the edges of canals or growing in the water with large swollen culms, and light green foliage. Cattle are fond of it. It is one of the grasses which rapidly spreads over shallow bits of water and helps to choke them up. Cattle also eat *P. interruptum*, *P. asperum* and *P. sordidum*.

We now come to the very best of our introduced and cultivated grasses, *P. jumentorum*, of which we are told:—

This is the famous *Guinea Grass* so well-known in the West Indies, in India and Ceylon. It is the Rata (foreign) Tana of the Sinhalese. When and by whom it was introduced to Ceylon I find no record, though it is probable there may be one in the Royal Gardens at Peradeniya. It was grown in Ceylon in Moon's time, 1824, at any rate. The late Dr. Gardner introduced the seed of what he supposed to be a new fodder grass to Ceylon, but in 1843 or 4, he gave a full description of it in the *Ceylon Observer*, proving that it was identical with the Guinea Grass. It was introduced to Jamaica about 1744, from the Coast of Guinea. The following is an extract from Lunau's *Hortus Jamaicensis*:—

This most valuable grass is a native of Africa, and was introduced into the island many years ago by the merest accident. Mr. John Ellis got some birds from the coast of Guinea, and with them some seeds for their support: the birds dying soon after, the seeds were thrown out of doors as useless. From these seeds grew some luxuriant grass, which attracted Mr. Ellis's notice, and he had a horse and a cow brought where it was, when both of them greedily ate of it. It was then transplanted into a garden and gradually cultivated, until it has become one of the most lucrative and useful plants in Jamaica. It agrees with almost every soil and situation, and has rendered many rocky and otherwise barren spots of Jamaica very valuable, as affording support to herds of cattle and horses. The growth of this grass is quick, for in wet weather, and in a favourable situation, it may be cut once in a fortnight. It resists dry weather for a considerable time, and even, when parched up, the slightest shower will revive it. It rises from five to eight feet high. When of proper strength it is a very excellent food for horses and cattle, which, when considerably lean and reduced, will be restored to flesh and fatness in two or three months by feeding upon it.

There can be no doubt that the Guinea Grass, and what is most erroneously called in Ceylon *Mauritius Grass*, are the two most valuable fodder plants growing in Ceylon.—I have seen the Guinea Grass grow in what seems to be the pure white sand of the Cinnamon Gardens near Colombo, to a height of 6 to 8 feet, and if well manured and kept free of weeds, it will in rainy weather give a very fair crop monthly. It grows freely up to an elevation of 5,000 to 6,000 feet on the Coffee estates, but though a valuable fodder grass at these elevations, it does not grow to such a height as it does at lower elevations. It is extensively planted along the edges of foot and bridle paths on Coffee estates, but Mr. Morris gave his opinion against this practice, as the grass is supposed to harbour the mycelium of the Coffee leaf fungus.

When coffee flourished, the paths of many estates were, as Mr. W. Ferguson indicated, defined by this grass. But it attracted numerous hares which proved destructive, and when the bad times for coffee came and it was proved that manure merely encouraged leaf-disease and white grub, the expensive culture of Guinea grass was very generally abandoned.

* See letter from the Director of the Botanical Gardens, Appendix, p. 70.

Next comes the grass which is even of more importance than Guinea grass, inasmuch as it is, though not so saccharine or nutritious, far more easily cultivated, growing readily in swampy lands in the lowcountry and in ravines on estates amongst the hills. Like all vegetation which is frequently cropped, this "Mauritius" or "water grass" requires to be liberally manured. Its cultivation in the swampy parts of the Cinnamon Gardens and in and around Colombo generally has now attained dimensions of very considerable magnitude, bundles of the grass being carried about in carts and sold as fodder for cattle and horses. Its history as recorded by Mr. W. Ferguson is very curious, thus:—

Panicum barbinode Trin. Sp. Gr. 3 t. 318. P. sarmen-tosum, Rox. fl.-ind. l. p. 308. This is the grass so well known, but very erroneously, as *Mauritius Grass*. It is not given in Bojer's *Hortus Mauritianus* dated 1837, and Moon does not give it a place in his Catalogue dated 1824. By whom and when introduced to Ceylon I do not know.—It has been a well known fodder grass for several years past, grown in ravines and on the sides of streams in Coffee estates, but in Colombo the cultivation and supply of this grass were nearly confined to the Firm of Wilson, Ritchie & Co., until their failure some years ago, when the natives, Tamil and Sinhalese, began to cultivate it extensively and now supply Colombo with this most useful grass. Unlike the Guinea Grass, this one grows best in swampy or low grounds, but which must be well drained and manured to produce good crops. The owners of Mauritius Grass fields near Colombo send their carts into town and carry out a large portion of its scavenging refuse as manure for this grass, and a very considerable trade is carried on by the sale of this and Guinea Grass in Colombo.

Trinius gives Brazil as its native place, but as far as I know Roxburgh's description is the first given of this grass, and that it originally came to the Botanical Gardens at Calcutta from Sumatra upwards of seventy years ago there can be no doubt, though I notice that it is referred to by one Botanist as a native of Behar and the mountains of Parasnath. That it has spread from the Calcutta gardens to the various places in which it is now cultivated is very likely. Roxburgh's account of its introduction is as follows:—"A native of Sumatra, and from thence introduced by Dr. Charles Campbell into the Botanic Garden in 1804, where it grows luxuriantly and blossoms throughout the year."

Of *Pencilaria spicata* the record is:—

Introduced from India to Ceylon many years ago. This plant is extensively cultivated in various parts of India and Egypt, and is said to be the staff of life in the Deccan, Kandeish and Gujarat. It is grown by the Tamils in Ceylon and springs up in rubbish heaps about Colombo. Its grain is so like Canary seed, that it is sold as such, and small birds seem to thrive on it. The late Dr. Elliott used it in feeding Carrier Pigeons, so successfully employed in carrying news from Galle to Colombo for many years before the telegraph was introduced. Cattle are fond of the straw.

Of *Stenotaphrum complanatum* it is stated:—

Mr. Moore, of the Sydney Botanic Gardens, told me that this was the *Kangaroo Grass* of Australia, but that is generally given as the *Anthistiria australis* and now said to be identical with the *A. ciliata* Retz. The *Stenotaphrum* is a very common grass near Colombo covering moist banks and sometimes forming the entire sward of lands on the banks of rivers and under the shade of coconut and other trees. It is an excellent fodder grass and cattle are fond of it.

Arundinella nervosa is one of the poor patana grasses we referred to. Of it we are told:—

This is a very common grass in the Patnas in the higher ranges, but I do not think cattle care for it, though when cut and dry amongst other grasses it forms a good fodder.

Aphuda aristata when cut and dried amongst other grasses is a good fodder. Of *Ischamum muticum*, we are told:—

Large quantities of this grass are collected by the

grass women for horse food in Colombo, but it is a coarse fodder.

Spodiopogon obliquivalvis is one of the most important of our native grasses, and of it we have a full record:—

Common throughout the island. A very variable plant, and the extreme forms of it very different in appearance, but, from the examination of a large number of specimens, I feel satisfied they may be safely arranged under one specific name. The larger hairy form occurs at a considerable elevation on the hills.

One form of this grass reserved in fields and under the shade of coconut trees in and near Colombo, and extensively brought into town as fodder for cattle, is well known as the *Rat-tana*, literally red grass, of the Sinhalese. This grass, the *Ætora* (*Panicum repens*, Liu.), Guinea, and Mauritius grasses, are the four grasses sold separately in cart loads as fodder grasses in Colombo, and perhaps the best known to the natives. I am quite familiar with several forms of this grass from the dry sand of the Cinnamon Gardens in Colombo up to an elevation of 6,000 feet in the plain of Nuwara Eliya, and if all these are one species it may be considered one of the most protean of grasses in existence as far as I know.

Details are given of the varieties, and of one it is said:—

It affects damp shady places from the coast up to the Kandyan country, and is very seldom found in flower. It is an excellent and abundant fodder.

We now come to the principal grass of our upland prairies or patanas, *Anthistiria ciliata*, regarding which we quote as follows:—

This is a very abundant grass in many parts of Ceylon but especially in the patnas in Upper Dimbula, in many of which it is the principal grass, and is often cut and dried for fodder for cattle. This was especially done by Mr. William Smith on the patnas near the group of estates at Mattakellie. It is perhaps in this respect the best substitute for hay of all the grasses found in Ceylon. Several years ago large quantities of this grass used to come from Bombay with batches of horses for sale. In the Bombay Flora, Dalzell states that this species, and *A. cymbaria*, Rox. are generally found together in the same field; and that they form the greater part of the best specimens of hay in the country, whilst he thought that the *A. ciliata*, which is also a native of South Africa, differed scarcely, if at all, from the famous Kangaroo Grass of New Holland the *A. australis* of Brown. I notice that Mr. Morris refers to the *A. australis* having been introduced to Ceylon as a distinct species from *A. ciliata*, but the following extract from Baron Ferd. Von Mueller's Introduction to the Botanic Teachings of the Schools of Victoria, p. 125, show that this eminent Botanist considers the Kangaroo Grass identical with *A. ciliata*:—"Every one is acquainted with our Kangaroo Grass (*Anthistiria ciliata*), long known before Australia became colonised in South Asia, and all Africa. Why the younger Linne should have connected the flower-festival of Bacchus with this plant, if really the name was changed from *Anthestheria*, is difficult to conceive."

Another, but a creeping patana grass is *Anthistiria heteroclita*, "an excellent fodder in a green or dried state."

We now come to the citrus-scented, great and prevalent grass of the patanas, known as *mana*. Its scientific name is *Andropogon martini*, and Mr. W. Ferguson gave the following details regarding it:—

I refer here to the best known and most remarkable grass in Ceylon, which covers thousands of acres of the patnas of the interior of the island up to 5,000 feet altitude, and which are supposed to have resisted the encroachment of the forests upon them time out of mind. The Rev. Mr. Abhay, the late Mr. Nietner and others have written fully on these patnas, and their soil. In the open exposed patnas it grows to a height of 6 to 7 feet, but in moist shaded places and amongst trees and small clumps of jungle it grows tall enough to conceal

elephants. It is used extensively as thatch for coolie lines and other buildings where to be had, and for this purpose and for litter for cattle is grown on some estates. It is grown in several portions of the Western Province on the embankments of ditches as a sort of fence. Cattle eat this grass when it is young, and for this purpose the patnas on which the natives graze their cattle are annually burnt, but the milk, butter, and even the flesh of cattle fed on it have a peculiar aromatic flavor. The following remarks by General Martin who sent Dr. Roxburgh the grass from Balagant named after him is applicable to our Ceylon one, if the grasses are not the same species: "I took particular notice of a sort of long grass which the cattle were voraciously fond of, which is of so strong an aromatic and pungent taste, that the flesh of the animals, as also the milk and the butter, have a very strong scent of it." I keep this separate in the meantime from the Citronella Grass, and what is called Lemon Grass in Ceylon.

We may add that mana-grass has been very largely used on estates to cover nursery seed beds, also as bedding for cattle, and now a new interest attaches to the product from the prospect of its being utilized as "strawboard" for the manufacture of tea boxes, in regard to which we have a separate article in type.

Andropogon pertusus "is an excellent fodder either in a green or dry state and cattle are very fond of it." Again we have a notice of one of our best native grasses in *Cynodon dactylon*, of which we are told:—

This is the famous *Huryalee* of the Deccan, and the *Arugam-pillu* of the Tamils in Southern India and Ceylon. It is the grass supposed to be the best fodder of the indigenous ones, and is invariably selected by the grass women who may be seen all over Colombo scraping the whole plant from the roadsides and swards, to the very great injury of both, as it is one of the best grasses for binding the roadsides, and for forming swards. It is quite common everywhere in Ceylon, from the sea-coast up to the plains of Nuwara Eliya. It is the Panicum Dactylon, Linn., *Agrostis linearis*, Retz. and has been described under about a dozen other names. It seems to be common over a great part of the world. It is found in England, and other parts of Europe, India, China, Thibet, Australia, South and Central America, and the Cape of Good Hope, and said to have been introduced into Farz and Khuzistan, by the British Expedition of 1856-7, according to Birdwood p. 126. Col. Otley has written fully on the cultivation of this grass as a fodder for cavalry, in the Madras Literary Journal, but some trials made by me near Colombo did not bear out the Colonel's recommendation. It is the Durva, Sans. Doorba, Doobla, Beng. Doob, Ganer, Hind, and Gherika. Tel. "It is the *Agrostis* of the Greeks according to Frzas. Its flowers in their perfect state are among the loveliest objects in the vegetable world, and appear, through a lens, like minute rubies and emeralds in constant motion from the least breath of air. It is the sweetest and most nutritious pasture for cattle; and its usefulness added to its beauty, induced the *Hindus*, in their earliest ages, to believe that it was the mansion of a benevolent nymph. Even the veda celebrates it, as in the following text of the *A'harvana*: "May Durva, which rose from the water of life, which has a hundred roots and a hundred stems, efface a hundred of my sins, and prolong my existence on earth for a hundred years."

Other grasses are mentioned, but we have quoted sufficient to show that Ceylon possesses, besides the straw of paddy and other grain, an abundance of fodder grasses, suited for "dry" and "wet" cultivation; so that, with industry and care, provision could be made for periods of drought as well as normal seasons. Besides the *gramineae*, wild and cultivated, there are other fodder substances, such as sugarcane tops, manioc and other roots, and the very valuable foliage of the jak tree. Then in the higher mountain regions there is the small, dense-growing bamboo of the forests which when properly treated is eaten by horses. The gorse *ca* furze (the "whins" of the Scotch) flourishes

in Nuwara Eliya; and a Highland gentleman who visited Ceylon some years ago suggested that this apparently most unpromising of plants might be made a source of fodder. In the Scotch Highlands expanses of whins are fired as the patanas are here, and while the shoots which spring up are still tender, they are cut, carted to the farmers' barns, and after being subjected to a thorough *flailing*, the bruised and juicy stuff is fed to horses and cattle. We mention this as a matter more of curiosity than of probable practical value; but there can be no question that, even apart from the possibly successful cultivation of such fodder substances as clover, rye-grass, lucerne, mangolds and the like, there is a large choice of grasses and other plants, native and introduced in Ceylon, to keep cattle in good condition (not to speak of coconut and gingelly cake and cotton seed), were the available resources only utilized with conscientious, steady industry. The problem is how to create and bring into operation these moral qualities amongst the natives. Government cannot do the work of the Christian Missionary; and after thousands of years of debasement we cannot expect that the regeneration of the people will be other than a comparatively slow process. But Government can do a good deal by legislation, and has done and is doing much that is useful and good by industrial education and by training and scattering agricultural instructors over the land. But individual servants of Government (especially those of European origin) can further the march of agricultural and pastoral improvement indefinitely, by personal zeal and interest, by encouragement and moral suasion, and occasionally by benevolent coercion.

Before parting with the report of 1869, there are a few details of interest to which we may advert. The idea with a large proportion of Europeans is that the whole population of India are vegetarians, or that they confine their consumption of animal products to milk, ghee and curds. Europeans in India, however, know that the masses—the millions of Hindustan—are only too ready to eat all the flesh they can get hold of, including that of swine, and without fastidiousness as to the condition of the meat. The Report noticed the spread of murrain in Ceylon by the habit of the natives digging up and carrying away for consumption the flesh of animals which had died of disease and had been buried, instead of being burnt or chemically consumed. The lower caste Tamil coolies are special offenders in this respect and so common did this offence become at one time in Southern India that Missionaries of the American Presbyterian Church (sons of Dr. Scudder, so well-known in Ceylon) considered it their duty to regard the digging up and eating of diseased and putrid bodies of cattle as an ecclesiastical offence, of which if native Christians were proved to be guilty they were excluded from the Church. We are not aware whether our penal code or common law provides for the punishment of this offence against nature and the commonwealth, but punished it certainly ought to be. The difficulty of coping with the evil of cattle disease is shown by the statement that "in nine cases out of ten it will be found perfectly useless to expect that any directions as to food, cleanliness or the administration of medicines will be properly carried out, except under the immediate eye of a person of intelligence." Until the intelligence desiderated is far more prevalent than it now is the difficulty of coping with disease and the conditions which lead to it will remain. When there is an outbreak of true rinderpest amongst cattle

here or anywhere else, the proportion of deaths of seizures are as nearly as possible the same as amongst human beings when Asiatic cholera becomes epidemic; that is, three-fourths and more of the earlier cases are fatal. Hence the value not so much of treatment, as of preventive measures, in the shape of nutritious food, shelter, especially at night, cleanliness and the free use of such disinfectants as carbolic acid and other chemicals. The following is characteristic:—

On the Arachchi [in the Matara district,] being questioned as to the reason why garden cultivation was nowhere attempted, he replied that the want of water prevented any cultivation of this kind. He was reminded that in Jaffna, where less rain fell than here, a most thriving agriculture was carried on by means of well water. He remarked that such was not the custom here, and there was no one to show the people who to proceed in such a matter. To the question why did not the Headmen instruct the villagers in this, the characteristic reply was, "The Government had not given orders."

Again:—

A circumstance occurred here which illustrates very forcibly the peculiarity of native character. The owner of one of the sick calves, a woman, had besought the assistance of the Commission for the sick animal with an importunity that showed her deep concern for it; as she said, she regarded it as one of her children. The utmost attention and deference was paid to the Commission: chairs were placed on a mat in front of the house, and coconuts were brought out in profusion. On returning from Dikwella and calling at this house, the woman peeped out of the door with a vacant stare, but no signs of recognition, and resumed her occupation: the eldest son lay stretched at full length on his back in the front verandah: hearing footsteps he turned half around, grunted, and resumed his former position, taking no need of any one. We knew by these infallible tokens that the calf was quite well, and so it proved. It was beyond all danger, and the Commission was no longer an object of civility to its owners!

The difficulty of obtaining correct information from the natives here and in India, even when a census has to be taken, from their inveterate belief that all inquiries are made with a view to fresh or enhanced taxation, is curiously illustrated in the following passage:—

An extensive cultivator, from whom some information was being obtained in regard to herds and agriculture, enquired when the new tax on cattle was to be levied, and how much was intended to be charged. On his being assured that no tax was contemplated, he enquired why Government was so anxious to ascertain the number of cattle in each district and village if not for the purpose of taxation, and listened with evident incredulity to the explanation that the information sought was for no other purpose than as a guide to the extent of losses suffered by the people in this respect, and as an indication of the necessity for some measures being adopted to prevent the spread of the disease. When reminded that the Government had undertaken an enquiry into Cattle Disease at the public cost, the rejoinder was that no doubt the new tax would pay for the Commission.

The opinions of the late Mr. R. B. Tytler, who kept fine herds of "Coast" cattle at Pallikelle, were thus delivered:—

Murrian of a variety of types may be looked for after every cycle of drought when succeeded by wet years and nothing I can think of can be done to prevent or alleviate it, beyond housing, separation of the attacked, dry warmth, good dry food, rock salt, scrupulous cleanliness, and such care as common sense dictates; all these would doubtless be beneficial, but will the people attend to it?

The commonsense of the whole matter was thus summed up by Mr. E. J. Browne of Melfort estate:—

So far as I have been able to judge, well-fed and carefully tended cattle do not appear to be so liable to the disease. Were cattle kept in good condition, and occasionally well groomed with a curry comb and brush, and above all kept *warm* and *dry* at night with a sufficiency of bedding, the cases of murrain in a herd, would, I believe, be reduced to a minimum. A fruitful cause of disease is the practice which native cattleowners have, by tying up their bullocks in the open air at night, wet or dry, without food or bedding; and then after over-working them the following day, turning them out into poor patna grass, where they eat ravenously the unwholesome food to be found there. "Prevention is better than cure," and good food, plenty of water, housing in warm and dry sheds in bad weather, and cleanliness, will do more to arrest the cattle disease than all the specifics that have yet been discovered. The late Dr. Thwaites (the well-known medical man, and not to be confounded with the botanist) contributed a paper on cattle disease in which he wrote:—

"Dr. Ferguson suggests large doses of Quinine, I understand, and, no doubt were Quinine accessible to the natives, even conveniently available to the Planters, in such large doses as Cattle would require, it would certainly be the best constitutional remedy we could propose; but we must look elsewhere for our resources among the remedies with which the natives are familiar, and which are not within their reach, and such as they would feel disposed from their own prejudices to employ. The Alkaloid preparation, termed Peperin, derived from common pepper is now attracting great attention at home, as a substitute for Quinine as a tonic and stimulant, being equal to it in efficacy and immeasurably cheaper. The natives are perfectly conversant with the use of Black Pepper as a febrifuge, and I have often employed it myself among them with great advantage. I would therefore suggest the following prescription.

"Whole Pepper well reduced to a powder one table-spoonful, *boiling* water one pint, to be well mixed and allowed to stand for half an hour, then given all together, and repeated every two hours until the Fever subsides.

The reference to Dr. Ferguson; as he spelled his name, then head of the Medical Department, arose from the fact that the present writer, as editor of the *Observer*, had recommended the use of quinine in cattle disease. There can be no question of the value of cinchona alkaloids as tonics and febrifuges, in the treatment of the lower animals as well as human beings, and now that those remedies can be obtained at so low a cost, we repeat the recommendation with more confidence than ever; that is where the symptoms are manageable debility or feverishness.—A passage from a report on murrain in the Matara district, by Mr. E. Elliott, may well be quoted. He recommended:—

The enforcement of more attention to the cattle by their owners, if not for their own sake, for that of the proprietors of other property, especially growing crops. A good deal of attention is paid to black cattle in the Gangaboda Pattu, where they are regularly tethered out whenever there is any cultivation likely to attract them in the neighbourhood. But in the other parts of the district very little trouble is bestowed on them; this is the case nearly everywhere in the Island, except in the Jaffna Peninsula and in the Wanny and Tamankadoowa, where the animals are driven home and tied up or kraaled for the night to protect them from the ravages of wild animals. One Mudaliyar here reports that he does not believe there is a single animal in his Pattu which has not done damage worth several times its own value.

There is much else of interest which might be quoted or noticed, but we have already dealt with the subject at such length, that here we must close,—at least for the present. We have done our best to summarize the information available; and if legislation is really resorted to it will be our duty to examine the regulations, impositive or prohibitory, which may be proposed.

THE PLANTING ENTERPRISE IN JOHORE AND THE MALAY PENINSULA GENERALLY.

(From our Special Correspondent)

There are several groups of coffee estates in Johore, but those visited on this occasion lie at the southernmost point of the Malayan Peninsula. Having been told by the proprietors that there was nothing in the way of soil, it was an agreeable surprise to find that, compared with the majority of the estates visited in Perak and Selangor, there was some very fair soil in parts of the property in Johore. The coffee is Liberian and planted on undulating ground, close to the seashore, a narrow belt of coconut palms and native gardens separating it from the open sea. The highest points are probably a couple of hundred feet above sea-level, and the higher you go, the worse the soil and the greater proportion of cabook gravel. This is exactly the opposite to what may be found in the hills of Perak, where the higher you go the better the soil as a rule, of course there are pockets of fine *surface* soil in the hollows. Amongst these little hillocks and sloping fields in Johore there are great stretches of swamp with black soil, and in these positions sago palms flourish, and great numbers (some hundreds of acres) have been planted up. The Liberian coffee is very much exposed to the winds from the sea, and is without shelter from the tropical storms that come tearing across the Straits. Very bad weather prevailed at the time of our visit. In spite, however, of this drawback and the want of richness in most of the soil, the coffee bushes looked very well—fine fields of dark-green trees, bearing a good crop. They had been a long time growing before they gave any appreciable profit, but there were many other reasons for this, apart from the conditions of soil and climate. The coffee is peeled on the estate by means of hammer pounders, working in mortars, and the superintendent could well be congratulated on having obtained the highest price for Liberian in the London Market. This estate can boast of an engine and steam-worked machinery.

These properties are unfortunately completely isolated from civilization and society, being some sixteen to twenty miles by sea from Singapore. Considerable extensions have been made and are still in progress, and before long the company to all appearance will possess a very valuable property. A number of Javanese coolies are employed, as well as Tamils, Malays and Chinese. Large numbers of nutmeg trees are planted at intervals through the coffee, and the produce is now coming in. Another source of revenue is cubebs, the vines of which appear to be flourishing and doing well. Ipecachuana is also grown on the estate and is said to prove a profitable cultivation. As regards the common enemy leaf disease with the green bug—these estates are no better off than those in the protected states, in fact are to all appearance rather worse. It may be mentioned that the green bug can be seen in Penang on a guava tree right in the middle of the town.

Speaking generally of the impression received during a trip through Perak and Selangor and a short visit to a small portion of Johore, it would appear that the Liberian variety of coffee is admirably adapted to the soil and climate of the country throughout the Malayan Peninsula, and that the Arabian coffee does very well on the higher slopes of the hills in Perak. With present prices the estates are paying well, and future prospects are very brilliant. The great question at the present day is that of labour. Present prices may admit of a daily

wage of twenty-five cents of a dollar, but that amount is a very heavy one on which to estimate the working of the estates as a general rule for the future. Railway and road communications will shortly be such as never at any time advantaged the opening of any new district in Ceylon. The terms on which jungle land is offered to *bona fide* investors are extremely favorable more to what has obtained in Ceylon during the present generation of planters in the island.

There are many other products for which suitable land can be found in these settlements, such as sugar, pepper, tapioca, sago, tobacco, gambier, rice, coconuts, &c.

Of these the favorite amongst Europeans seems to be pepper. The method of supporting the vines adopted by Europeans usually differs from that of the native planters, who train the vine up the stem of a living tree. As a rule the *dadap* (*Erythrina indica*) is used for this purpose, it being a fast-growing tree and easily propagated either by seed or cuttings.

The European custom however is to train the pepper vines upon pieces of roughly split hardwood timber, which is said to withstand the weather and the attacks of white ants as long as will be required for use as supports to the vine, that is to say as long as the vine can be made to give profitable crops. In one Chinaman's garden we saw some very old pepper vines said to be twenty years old clinging to these supports; though in many cases it seemed as if the vine supported the remains of the decayed posts rather than the posts supporting the vines. It is moreover advanced by the advocates of the post support system, that the vines are more prolific when exposed to the sun than when grown under the shade of living trees, and it may well be that there is a good deal of truth in this statement. Pepper vines have their natural enemies like every other product. A little beetle lays its eggs in the knot from whence the new shoots spring. The egg develops into a maggot, which bores its way into the young shoot, and a foot or more in length of course dies away. Gangs of coolies are employed cutting off the affected shoots and putting them into buckets of boiling water. Some of the pepper fields are bearing heavily and should give a handsome return. They are mostly treated with manure of various kinds. The bats' dung guano found in the Batu limestone caves is said on analysis to be wanting in phosphates, but however this may be it seems to be very suitable for manuring pepper vines: some that had been treated with this guano were bearing a very heavy crop. An experiment was being tried on one estate. Dipping the clusters of pepper berries into boiling water before drying them is a common practice, but this experiment consisted in exposing them for some minutes to the smoke from a wood fire. It has not transpired what has been the result, but one would suppose great care about the selection of the wood should be exercised, especially if it were in a green state. Many woods produce a disagreeable pungent smoke—sometimes of a very disagreeable odour, and the pepper might become unpleasantly tainted either as regards taste, or smell, or both. In Selangor large extents of land covering thousands of acres in the aggregate have been opened up by Chinese principally for the cultivation of pepper, tapioca and gambier. Their success has been great and a large trade has sprung up, so much so that an enterprising firm of Chinese at Singapore are running small steamers to bring out the produce and carry it to the markets at Singapore to be thence transhipped probably to other parts of the world.

There can be little doubt that in the course of time the whole of the Malayan Peninsula will become a British province including all the protected states and probably Pedah and other districts nominally under the King of Siam. At present life and property in the protected states are just as safe as they are in Ceylon or Burma: in fact more so. Consequently investors of capital need not fear anything beyond what is naturally inherent in any unopened country.

SÃO PAULO RE-VISITED.

TRAVELLING TOWARDS THE INTERIOR—VIEW OF THE CITY AND OUTSIDE—TRAMWAYS—TELEGRAPH AND TELEPHONE WIRES—GAS VERSUS ELECTRICITY—BUSY STREETS—NEWSPAPER BOYS—BAKERS—BUTCHERS—BREWRIES AND ICE MANUFACTORIES—HOW MILK IS SUPPLIED—COOKS—SUPPLY OF PROVISIONS—ROTURING A PIG—FUEL FOR DOMESTIC USE—EARLY RISING HABITS OF THE PEOPLE—THEIR COSTUMES—HOUSES FOR WORKMEN—THE RAILWAY STATION AND TRAVELLING ACCOMMODATION—WANT OF IMPROVEMENT—TRAIN SERVICE—PHYSICAL FEATURES OF THE COUNTRY—DESCRIPTION OF THE JOURNEY—DIFFERENT GAUGE RAILWAY LINES—CULTIVATION—FESTIVITIES AND OTHER AMUSEMENTS OF THE PEOPLE OF CAMPINAS.

Travellers by the early train from São Paulo to the interior have to be on foot at 5 a. m. Some little time is spent on fortifying oneself with coffee and bread and butter—the latter quite a luxury, fresh and firm, procured from the European colonists who live on estates near by or who have small farms of their own in the vicinity. Although we had seen few guests at the hotel the night before, we found them numerous now wishing to pay accounts. It is well that carriage fare to the São Paulo railway station be included in the hotel bill, for then one of the many carriages in waiting is secured by a waiter, and the luggage being put in, we have only to step in at the porch of the hotel, and there is no haggling with the coachman on arrival at the station. Four shillings looks a big sum for a four-wheeler, when a single passenger could go by tram-car for five pence, but there are two of us, and as each has a portmanteau, a saddle, and small things, the cab is preferable.

I mentioned that the station at which we arrived last night was near the outside of the town on low ground at the east end, the second nearest Santos and close to the São Paulo railway line owned by an English company. The comfort of the public could have been easily considered by making both stations at one place, with little cost to either company, but railway directors here make public convenience a secondary consideration; so the traveller from Rio has to find his way from the east end uphill to the centre of the city, and then descend to the west end where the other station is. The English company's station was made some years before the São Paulo and Rio de Janeiro railway was projected.

By the time we leave the hotel daylight has broken, and we can see from the open carriage what a delightful site has been chosen for the city. It is on rising ground facing the east. About 200 feet lower, and at some two miles distance, is the River Tiete, which is here little more than the outcome of a mountain stream which comes from the hills between São Paulo and Santos, and as the ground in the valley is flat the river winds slowly amongst small, artificially-made woods and natural pastures towards the west. The streets of the town are laid out regularly, at the outside part of the town, but in the centre they partake of the irregular Portuguese style, and some are not

very broad. All are clean, and well paved with square granite blocks, the shape of bricks, with kerbstones and side paths of large granite blocks or of concrete.

Churches form the most imposing buildings, and they also monopolize the most conspicuous spots. Government buildings are also conspicuous by their massive forms, and large sums seem to be spent in elaborate houses of business, and retail-shops. The upper-floors of these are used as dwelling-houses, and one can observe that all are, inside and out—an imitation of the European style. Outside the business part of the town, and as we drive down towards the railway station, there are some very neat palaces with surroundings of trees and shrubs of a kind not often seen in the same latitude as São Paulo. Very little indeed is seen to give one an idea of being in the tropics. It is rare to see a house with a verandah, yet at some seasons of the year the sun must beat strongly against these granite walls, and turn the inside rooms into an oven. Verandahs do not seem to have attracted the first settlers in this country, for certainly the warmer parts at the foot of the hills or the sea coast do not show many houses with these valuable additions to a house. Even in the warm seaport towns in the north they are conspicuous by their absence.

The city has a nicely arranged tramway service which seems to conveniently suit the dwellers of almost every street. The cars are all open, seats across with reversible backs, and for four have plenty of room on each seat; at the end of each seat is a support for the roof. The gauge looks to me to be one metre, certainly not exceeding 3'6", and the motive power is supplied by two mules abreast, and an extra one is put abreast at the foot of the hills. These tram-cars run far out of the busy part of the town to the regions of quiet "chacaras" (as they call a house situated in the midst of a piece of pasture, shrubbery or garden ground), where the business man can spend his spare hours in domestic bliss, and the lady of the house can amuse herself with her poultry, her flower and kitchen garden.

One can observe by the number of wires suspended above the houses that there is an extensive telephone service, and in the centre of the town are several telegraph stations. I have already mentioned that the gas for lighting and for gas engines is supplied by an English company, and this is threatened annihilation when the contract time has run out by the substitution of electricity. I think the sensible people in S. Paulo will, before changing the system of illumination, examine well whether the electric light has been a success in the towns in the same province where it has been and is being introduced.

The numbers of people one sees in the streets at this early hour are not confined to those seeking the railway station. The streets are ringing with the cries of newspaper boys, and numbers of shoe-blacks are accosting pedestrians, and pointing to their feet. The bakers' van is seen rattling along with supplies of bread to their customers; the small provision shopkeepers in the various streets, bearers of large square willow-baskets, with the contents carefully wrapped in red blankets, are distributing hot muffins to houses as they go along, while others are stationed at the corners of the streets selling the same kind of wares "to such as choose to buy 'em." By a wise arrangement beef is distributed to the butchers the night before, after having been inspected by competent authorities. There is more than one brewery in S. Paulo judging by the number of springcarts one sees conveying bottled beer. Nor is the aerated water

manufacturer less alive to the advisability of delivering his full syphons, and soda water and lemonade bottles, and taking away the "empties," early in the morning. Cool as the weather is, large blocks of ice, the shape and size of paving flags, are to be seen conveyed in spring vans, exposed to the air. In some towns in the interior one notices at this early hour milk boys with bottles in square baskets of perhaps two dozen, on each side of the mule on which he may be mounted, or he may see single bullock hackeries laden with vegetables as well as milk, and these all sent from farms in the vicinity of the town, but here the milk distribution is different. There are to be seen large black and white cows with short horns and with udders reaching to near the ground; a man goes before with the halter in his hand, and a calf with a piece of leather fixed over its mouth is tied to the cow's tail and follows behind. These go in solemn Indian file through the streets; the buyer of milk hears the tinkling of the bell which is tied to the cow's neck; and presents the man with a tumbler or a tin vessel; the milk is drawn directly from the cow up to the quantity required, and then the procession resumes its course until another customer appears. There are also houses at which he calls daily. Now, my good housewives, is not this a capital plan? No chance of baby's milk being mixed with chalk and water here, and if "child's milk" should be always drawn from one cow, here you have it in its unadulterated purity and your temper does not get ruffled in the early morning.

[In this matter of milk certainly Brazil is far in advance of India and Ceylon.—Ed. T. A.]

Cooks, both male and female, of all colours, from the white-skinned, olive-eyed native of Southern Europe to the rolling-in-fat ebony-black, descended in indirect line from the land owners of Angola or Mozambique, are to be seen returning from the market with the daily supplies, for both large and small culinary establishments, conspicuous amongst which are beef and vegetables of local production. Nor are New Zealand products wanting, for the frozen-meat steamers, which call at coal at Rio de Janeiro twice a month, leave each time a large quantity of potatoes, butter, cheese, game, salt-beef, salt-mork, hams, bacon and other things which are all sold cheaper than the same kinds; the produce of this country; carcasses of fresh mutton are also left. The cook's reticule willow-basket is a recipient for a varied assortment of eatables, and live produce is often seen hanging outside in the shape of chickens, ducklings, etc. Live pigs are bought and carried to be killed at home. One beautiful twenty to twenty-five pounder, a good specimen of pure Berkshire, was dangling by the hind feet at the end of a stick, which was slung over the shoulder of a stout negro who was every now and then stopping and turning round to give his very unruly charge a lecture as to the advisability of giving expression to its sentiments in a less noisy manner, and threatening to reduce the term of his life by a couple of hours by letting him fall at once on the hard stones, which lecture the pig did not mind much; and the negro did not carry out his threat.

Railway freights seem to make coals scarce for culinary purposes, for boys are seen carrying bundles of firewood split in sticks of a metre long, and two to three inches thick; a bundle of ten will cost about a shilling. Charcoal enters largely into consumption in the laundry, and is also a costly item in the S. Paulo household.

Brazilians are noted for their early rising, and we are not surprised to see many well-dressed people enjoying an airing, ladies and gentlemen

walking, rosy-faced children being driven about in perambulators under charge of clean tidy looking Italian and German maidens, youths on bicycles are flying about, and there are also to be seen the lords of the soil on thorough-bred English horses with English grooms with cockades in their hats, and the regulation groom-clothing.

As before mentioned, everything suggests a temperate climate, and a people bent on copying European customs. Top-coats, Scotch plaids, and muffler shawls are general amongst the male portion, and beneath these are suits of West of England black, or Scotch tweed, the head cover being either a Parisian chimney-pot or a Christy or Townend stiff felt hat.

The dresses and outside coverings of the fair sex are similar to what one would see in the large towns in Europe in spring. The newest Parisian styles are always adopted, and the *artistes* in ladies' dresses are either of French nationality, or have had a training in Parisian establishments. An American gentleman who lived at the same hotel with me told me he had been over the *whole world*, and he "never saw women dress so *mighty* fine, and whose looks were so *mightily* improved by their dress as in Brazil." There is some truth in these remarks, but as regards these São Paulo *brunettes*, the erect carriage, the correctly formed figure, the healthy glow shining through the slightly tinged features, the long raven locks hanging down behind often a long way below the waist, offer very little exercise for the improver's art. I know a great difference since I was here some eight years ago. Then there were large empty spaces near the railway station which are now filled up with large buildings, the lower portions of which are used as warehouses for country produce, particularly coffee, and the upper floors as counting-houses for commission merchants, or dwelling houses for commercial men, Santos, the seaport, which is distant some 56 miles by rail, has turned so very unhealthy of late years, that much of the business which was done there is done now in São Paulo.

There are many neatly built houses for European artisans near the railway station. These are kept very tastefully. The occupiers are employed principally in the workshops of the São Paulo Railway Company and many are in service of large mechanical, and industrial establishments which have sprung up near the railway station of late years. There are iron foundries, brass foundries, machine-shops, sawing and woodworking shops, employing principally English speaking people, while amongst those employing a mixed population, and in industries heavily protected by an import duty, are cotton mills, breweries, distillers of spirits, and makers of natural and artificial wines, French tile works, granite and marble works, lucifer match-makers, hat making establishments, boots and shoe-making factories, potteries, glazed pipe makers and many other occupations which have had an existence of only a few years as yet. There was always an ice manufactory, and lately to the list of labour-saving establishments is added a laundry filled with the most modern steam appliances.

The railway station itself shows little improvement on former years. It has not half the accommodation which the large increase of traffic demands. The trade of the province has increased at least ten times ever since this station was made, and the railway being the great trunk line, which is fed by all the various branches whose ramifications extend through the length and breadth of the province for many hundreds of miles, has to receive all the passengers and goods, either to and from the seaport, Santos or to and from the capital of

the empire, Rio de Janeiro. The luggage department is too small, and is constantly filled by unruly crowds of people; porters, barrowmen, and mule cartmen, are continually fighting round a single weighing machine, placed on a narrow verandah about 20 feet by 10, open to the street and divided from the platform by an iron railing. A single clerk has to do duty of writing out the receipts and receiving the money at a window opening from the end of the verandah beside the weighing machine. Passengers have to pay for all that goes into the luggage van, a rate per kilogramme.

The passenger has to depute someone else to see after his luggage, and all he knows of it is from the receipt which may be handed to him in at the carriage window, just as the train is starting from which he supposes it is safe. The platform is broad but not enough of it, and there is a crush at the arrival and departure of every train; and it colonists, newly arrived from Europe, are going with the same train, there is scarcely moving about at all on it. The refreshment-room is a dark dismal looking place, and the lavatories are repulsive. A new station ought long ago to have been built, and the engineer of the line told me he had planned and estimated for one year ago, but the sanction of Government had always been withheld. Although the fiscal engineers allowed liberally for general upkeep of the line, they were always averse to improvements which were to cost a large sum of money. On all guaranteed railways the Government have a fiscal engineer who watches over all expenditure, so as to keep down to a low limit the Government quota for interest on capital guaranteed. The contract with the São Paulo Railway Company allowed 8 per cent to go to the shareholders, but all above this, in the net profit, had to go to the Government, to repay it for, interest paid during construction, or on account of other expenses connected with the guarantee. The Government have now been paid up all that had been so spent, and I daresay São Paulo will soon have a railway station built on British lines with grand accommodation for all.

As few carriages are run, in proportion to the number of passengers, there is some difficulty in securing room for ourselves, and for the small parcels which we are allowed to take into the carriage, but at the junctions with other lines we find more room as we go along. The old cross-seated English carriages formerly on this line have been turned into saloon carriages with one door in the middle opening directly on to the platform, but the barbarous practice of locking the passengers in still prevails on this line and on others in the province of São Paulo. This was adopted at the commencement of railway traveling in this country, because of the dread that the ignorant native would be often opening the door, and accidents might happen. Now that the native is educated, the railway officials stick to it because it eases them both in having to wait for passengers who may get out at small stations on the line from mere curiosity. This being the starting point of the train it starts punctually to time at 6:20 a.m. I had met no old friends in São Paulo, as I arrived too late at night and had to leave early next morning. A white mist lies low on the valley of the Tiete, but the hills beyond towards the north are clear; from these at a distance of some twelve miles comes the water which supplies the city. The water company although having its head office in São Paulo has many British shareholders, and the engineering of the work was executed by British engineers, and piping and other materials not found in the country, were imported from England. The river Tiete is crossed by an iron

lattice bridge about six miles from São Paulo. Here the elevation is about 2,380 feet above the sea.

The physical features of the country are not very remarkable. From Rio de Janeiro as noted formerly after crossing the Serra de Mar we arrived at Barra de Pirahy. The latter place is 67 miles from Rio and the height above the sea is 1,180 feet.

From Barra de Pirahy we go alongside the river Parahyba for 196 miles to Guararema, which is 1,824 feet above the sea. We pass over some hilly ground on our way to São Paulo, which is 46 miles further on, and has an elevation of 2,503 feet. We have had the range of the Serra de Mar to our left and east of us, and the Serra de Mantiqueira the highest peak of which is Statiana on our right and west of us. The hilly ground alluded to forms a sort of connection between these two great ranges of hills, and the hills we notice to the north of the city of São Paulo are some of the spurs of the Mantiqueira, and these join on to another range which runs east and west called the Serra Negra, and forms for some distance the division between the Provinces of São Paulo and Minas Gerás. These do not rise to a great elevation but they form the water-parting between the river Tieté, which flows through the centre of the Province of São Paulo and the Sapucahy which runs through the southern part of Minas Gerás, and both run into the Paraná. It is in the smaller ranges of hills scattered over the Province of São Paulo where coffee, the principal agricultural product grown for export, is cultivated. These hills and mountains both large and small which we have at present under notice are all more or less of the same formation, granite or gneiss forming the foundations; and laterite sometimes sandy often chalky but generally shaly and largely impregnated with oxide of iron, underlies the cultivatable soil. As we go further west in the Province of São Paulo the formation partakes largely of this latter description, and it is of this slaty clay that the famous *terra rocha*, a red waxy soil, is formed and which is the most valuable for coffee growing. Indeed we do not find much coffee grown in the Province of São Paulo until we go west, where this soil is to be found. We notice the improvement in agriculture as we go west owing to this superior quality of soil.

At Belem, 24 miles from São Paulo and 2,544 feet above the sea, we go through a tunnel perhaps 200 yards long. The hill it passes through is not over 150 feet above the level of the railway. At 30 miles from São Paulo, Campo Limpo is the junction of a line to Bragemea, a metre gauge called the Bragança Railway. It goes direct north towards the Serra Negra, a distance of 32 miles. At 37 miles from São Paulo we come to Sundiah, 2,330 feet above the sea, and here the English Company's railway ends. At Sundiah is a beautifully commodious station and finished quite in the English style; here is the junction with the Stuaña Railway. The Stuaña goes south to the town Itü, famous for its schools and convents, and has an extension to the river Piracicaba on which are small steamers. To Itü the distance is 44 miles and the extension is 57 miles more: the gauge is a metre. It was first opened in 1874 to Itü and has been going on gradually extending. The guarantee is 7 per cent on £200,000. The branch towards Piracicaba taps a large coffee producing district. There are also three sugar factories on the side of the line, enjoying a Government guarantee, but the planters do not supply them with enough cane.

The São Paulo Railway which ends here starts from Santos, and has a length of 93 miles: the gauge is 5ft. 3in. It cost £2,500,000, and the Government

guarantee was 7 per cent which is all repaid and the line gives now an excess of receipts over expenditure, £400,000 a year.

Railway communication is extended from here by a Brazilian Company called the Paulista Railway Company on the same gauge, 5ft. 3in. and has no guarantee. The English Company had the preference for extending some 80 miles farther into the interior—to Rio Claro—but in these days, in 1870, the coffee crop was not more than a quarter of the present yearly yield, and they did not feel their capital would be secure, and contented themselves in being the trunk line through which all the produce has to pass on its way to the sea-coast from the interior. The Paulista Company opened the first section from Sundaíahy to Campinas, a distance of 28 miles in 1873, and to Rio Claro 55 miles farther in 1876 and to the river Magy-quassu some 40 miles more in 1878. Magy-quassu was made navigable by clearing out the rocky obstructions with dynamite for some 120 miles farther, at the expense of the Company, and they put appropriate steamers and barges on some three years afterwards. The Company has never paid less than 9 per cent per annum.

The train stays only the length of time at Jundiáhy to change engines and take out the luggage of presses going by the Ituana line. Carriages are not changed; the English and the Paulista Company are the same gauge, and accommodate each other as regards passenger and goods wagons. Between Jundiáhy and Campinas we see the first of the large coffee plantations, and we enter into the region of *terra rocha*. What a falling-off is there! In the Seventies these coffee fields by the side of the railway used to be loaded with coffee every year, and judging then from the healthiness of the trees and the strength of the soil one would have thought the planter was secure of a large income for a long lifetime; but weeds and wash tell on the best soils, and on even the best formed fields, and many of these are giving only as much crop as pays expenses. All available forest-land had been planted up years ago, and no young coffee could be seen.

Campinas was reached in due time and here we had to change carriages from the wide gauge of the Company Paulista to the narrow of the Mogana. There was time for us to take breakfast, but there was a crush in procuring seats. The tickets were checked at once, and the doors were locked and the train did not start for more than half an hour. This was annoying as we calculated on breakfasting at Campinas; but fortunately some of the sandwich loaf we bought from Rio the day before, was still to the fore, which stood us in good stead. Campinas still shows signs of having been the coffee capital of São Paulo, for there are no fewer than four large foundries, with machine shops attached. These are all new to me, for when I was here before, machines were made in Europe or the United States, and merely fitted up here. Now only steam engines, boilers, and iron water-wheels are imported, and what is properly called coffee machinery is made here. The workshops are all beside the railway station. In these four large establishments and in the repairing and erecting shops of the railways there are said to be some five hundred mechanics, comprising fitters, boiler-makers, copper-smiths, millwrights, moulders, carriage builders, and painters, and these are nearly all British subjects. Here in Campinas I had many friends in "the days of old," but for reasons stated before I could not wait for a day to see them. The station is on rising ground—above the town to the south of it. The town itself is in a lowly hollow: a sort of birds-eye view of it is got from the railway. Here as in all

other places, the increase in size and the improvements in buildings are all on the side of the railway station. When I knew it before the station was surrounded by green fields; the hotels were all down in the hollow where all the houses of the planters were, and all the places of business. All this is altered; quite a new city has sprung up. Spacious hotels and lofty mansions and neat cottages cover a large piece of what was waste common.

Although coffee has well nigh abandoned the Campinas district, and the extension of railways has sent cultivators of the berry into the interior, where soil is much superior, and available land plentiful, still a great many of the old wealthy planters retain their establishments in Campinas and live with their families, alternately on the fazenda and in the town. They used to have their seasons of balls and parties, their race meetings, and above all their great church feasts, at which as much money would be spent in fireworks and tomfoolery, as would clothe and educate all the poor in the district; and there was the Carnival when for some three days all the youth of the town would turn out in masquerade and processions formed of emblematical pageants parade the town in fantastical dresses, caricaturing. Local and political events play all sorts of antics, and cut all sorts of practical jokes. Chief amongst the latter would be to blow with a tinhorn into the ear of some inattentive person or squirt scented water on the face or neck of some unsuspecting fair passenger. Nor are these fair ladies without their "bisnagas" (as they call them, made of lead which they squeeze to eject the water) and lemons filled with water which they apply in return. Then they will have their fancy balls in the evening where all classes mix in disguise, and dancing, mirth and fun go on till early hours of the morning. Easter week sends all to town to enjoy Newfoundland cod-fish for three days (as the only food allowed) and finish up with balls from which the faithful—which include nearly all those attending those luxurious functions—sally out to meet the midnight processions at which the images carried, the prayers read, and the sermons preached on the street are intended to impress the people with the death, burial, and resurrection of our Saviour.

Christmas week also sends many to town. I have always thought there was less warmth of demonstration amongst the people of this country than in those of Europe at their Christmas festivities.* Europeans, especially Germans, do their best to imitate the doings at these Christmas celebrations, and by them the priest is not put forward as the most important personage. Many other occasions send the planter to his town house.

It is considered fashionable to have a taste for music, particularly of the lyrical order, represented by Italian opera; and to secure good companies the rich people subscribe large sums which entitles them to boxes or stalls for their families during all the recitations. Often European operatic companies visit Rio de Janeiro, and some of these are induced—particularly since railway communication became so general—to visit the towns in the interior, when success is secured by a large subscription list. Nor must I forget to mention that Campinas is the birth-place of a contemporary composer—Carlos Gomes—author of some very good operas, which have been performed in Europe. Among these are "Salvador Rosa," "Fosca," "the Guarany," and "Lo Schiava" The slave. Carlos Gomes had early developed

* This may be accounted by their having so many festivals during the year, and the great yearly feast which takes place at different times for each town or district, which outvies all other feasts.

musical talent, and the Emperor knowing of this sent him to Italy to be educated. He has visited Brazil several times, and last time a few months ago a committee arranged with a talented Company then in Rio to play his operas in Rio, S. Paulo and Campinas, which they did to crowded houses.

Campinas has its service of tramways, its gaswork, and at present a water supply is being provided for. But we must now leave Campinas and continue our journey farther on, the account of which we must leave for a day or two. A. SCOTT BLACKLAW.

PLANTING IN THE MALAYAN PENINSULA: PERAK.

(From our Special Correspondent.)

PERAK AND SELANGOR—WANT OF BRITISH ENTERPRISE AND CAPITAL—PERAK SUITED TO TEA AND COFFEE—ROAD COMMUNICATION AND OTHER CAPABILITIES FOR PLANTING—GOVERNMENT OFFERING LAND AND CAPITAL ON EASY TERMS TO ENCOURAGE CULTIVATION—THE CLIMATE AND SOIL—GENERAL FEATURES OF THE HILLS AND THE LAY OF LAND—FORESTS—COFFEE ON WATERLOO ESTATE AND ON ADJOINING PLANTATIONS—INSECT PESTS NOT SO VIRULENT AS IN CEYLON—LIBERIAN COFFEE—CACAO CULTIVATION—SQUIRRELS—INDIARUBBER—CINCHONA—THE HERMITAGE BUNGALOW—PERAK TEA—PLANTING PROSPECTS.

The good people in the Protected States of Perak and Selangor apparently don't make noise enough—they don't shout out sufficiently loud to attract British enterprise and capital. Possibly the greater number of the residents in these States do not particularly care to have a lot of outsiders running over the country, criticizing the position and comparing one State with another; but if we are to suppose that the authorities are wishful—as they say they are—to facilitate the development of the resources of the country and to attract European settlers, it may respectfully be suggested they should take the trouble to say so, and say so in such a way that planters in the colonies and capitalists in Europe cannot fail to hear them. Let them take Ceylon for example and follow suit in the policy which has made her capabilities known to the uttermost parts of the earth.* How often have we heard discussions about suitable localities for agricultural investment, and when these Protected States were mentioned the reply has been: "Oh! those native States, you never know where you are; neither life nor property is safe when a ruffian of a native has the chance of getting anything by interference in your affairs." To this assertion there is probably no reply, simply because people don't know what in reality is the fact, that the Sultans of these states have no more to do with their administration than have the editors of the *Ceylon Observer*. The young Sultan of Perak is a mere nonentity, and the decrepit old man who nominally holds a similar position at Selangor hardly ever visits the seat of Government (Kuala Lumpur), and has only done so three or four times since the British Government quietly intimated that he must be content to stand down. Were this state of affairs more widely known, and could capitalists at home realize the fact that life and property are as

* How? Not by Government, but by the Planters and Press—and very notably through the *Tropical Agriculturist*, which has sent the name of Ceylon and her planters and products all round the world. But Mr. Swettenham, in his recent report, contends that Government has done all that was possible to attract planters who refuse to come. The labour difficulty is the lion in the path.—Eo. T. A.

safe in the States as they are in Ceylon, there would without doubt be a better chance of speedy development of the resources of the country than will otherwise be the case for many years to come. And then again as regards communication with the outer world, how very few there are—unconnected with the trade of these localities—who are aware that steamers run daily between Penang and Port Weld in Perak and three or four boats a week between Selangor, Penang and Singapore.

Naturally in Ceylon more is known about these matters than is the case elsewhere, because there are so many Ceylon men in the Straits in all kinds of positions, from the Governor of the Straits Settlements to the cook at the Government Tea-garden Resthouse in Thaiping.

In Perak there are hundreds of thousands of acres of fine forest inviting the axe of the planter—forest which the local Government is anxious to see taken up by suitable men with money enough to turn it into plantations of tea and coffee. They have led the way by going to great expense in planting experimental gardens and growing tea, coffee, cacao, cinchona, pepper and indiarubber, as well as many kinds of fruit trees. The sites of these gardens, perhaps, have not been in every instance selected with great care, and are certainly in some cases very unsuitable for the purpose for which they were chosen; but even in this they were not without their use in showing what should be avoided as well as what should be availed of. Perak is already traversed in all directions with capital roads, and these are being extended as opportunity demands. A new road is now in course of construction through an immense block of forest adjoining Thaiping, where the well-known property—Waterloo—stands as a sample of what can be done with coffee in that quarter. This road will be about thirty miles in length, made, be it noted, through the forests in advance of its probable sale at some future day.

It is understood that the Government will alienate blocks of forest, up to 500 acres each, to the first five applicants, at the rate of one dollar an acre. It has even gone so far as to advance money towards the working of gardens and would probably do so again if a good case for assistance was made out in the case of those who took up the above-mentioned blocks; but of course men are wanted who have sufficient capital to bring into profitable cultivation the lands they have acquired on such very easy terms. The climate seems admirably adapted for the cultivation of such products as tea, coffee and cacao, there being no long periods of drought nor yet any long spells of cold and wet, such as characterize the hill-country of Ceylon during the South-West monsoon. The climate naturally differs slightly in distant parts of so extensive a country as Perak, but certainly not in the degree we are accustomed to in Ceylon, Mauritius, and India.

The soil over the great extent of the hill-country of Perak closely resembles that of parts of Dimbula, Upper Ramboda and Madulsima,—a yellowish clayey soil which grows more red and more friable the higher you get up on the ranges. This soil is of immense depth, but there is apparently an absence of any large extent of rich brown mould, which we should call really fine soil in Ceylon.

The general features of the hills are not sufficiently broken by precipices and rocky debris to admit of pockets and fields of rich soil which we find in most mountainous tracts of country. The lay of the land is often steep, but the surfaces not very rough. The rock that crops up is a fine white granite, with

large crystals of felspar,—the latter, perhaps, it is which adapts the soil to coffee cultivation. Large blocks of limestone rock appear here and there throughout the country, and dark close-grained trap crops up as well in the same locality, precisely as it does in the Andamans. Before leaving the magnificent forests of Perak it must be noted that to the botanist—and perhaps even more to the casual observer—they possess especial interest, not only because they differ so much from the forests of Ceylon and Penang but because they exhibit vegetation in so many unique and startling forms; the creepers especially are most beautiful in form and colour, but where all are lovely it is impossible to award the prize to any particular variety.

Waterloo estate coffee is entirely of the *Arabica* species. A few trees only of Liberian coffee near the bungalow give sufficient proof of how this variety of coffee suits this part of the country. Those who in years past have followed the history of the Waterloo property are aware that it was almost abandoned when old friends Logie and Tom Fraser undertook to resuscitate its fortunes, and so well have they succeeded that the old coffee is again bearing well and the weeds and jungle stuff, which at one time almost choked the coffee, have disappeared, and the coffee bushes—now in the form commonly known as umbrella trees—are bearing well and at the same time are in vigorous condition. The two and a half years old field at the top of the estate, some two thousand and odd feet in elevation, is a very fine field indeed—as good as the best I have seen anywhere during my thirty years' experience of "the fragrant bean."

The young plants in an adjoining clearing have made a grand growth during the time they have been planted out; and with a sufficiency of labour to carry on operations the outlook of Waterloo is extremely satisfactory. As a fair sample of what may be expected by planters taking up land for coffee in the adjoining forests Waterloo amply proves that there is every prospect of success and a bright future before investors. The pests that have proved so disastrous in Ceylon are not unknown in Perak, but the testimony of those who are most interested and who have watched them for years past tends to prove that their attacks are not attended by the virulence and devastating effects with which we are unhappily so well acquainted. Of this a casual visitor is necessarily but a poor judge; and were it not that it is but right to mention their existence as a matter of fact connected with coffee cultivation in Perak, they would hardly have been alluded to at all.

Liberian coffee on a few bushes at about 1,900 feet flourishes exceedingly, as also down at almost sea level. At Kamouning, probably 500 feet above the sea, there is an estate of some 140 acres in different stages up to eighteen months or two years, and the coffee is looking vigorous and promises to do well. There is some fine soil on this property, and plenty of limestone available in one part of the estate. As far as could be ascertained there is no estate of any size in Perak at present where Liberian coffee has been proved to be a success, but the proprietors of Kamouning have estates in bearing in one of the adjoining states and are very confident of similar results from its cultivation in Perak.

Around Lady Weld's bungalow—some 15 or 16 miles from Thaiping—a variety of trees have been planted as an experiment, and amongst them are some very fine specimens of Liberian coffee, say fifteen feet in height, bearing well, with flower and fruit in all stages, as becomes the nature of the plant. The situation of the garden is not well adapted for

cacao, being flat and at times of high flood actually under water, but some of the trees have evidently grown well, but are now much diseased and decaying away.

The squirrels from the adjacent jungle which surrounds the garden evidently make short work of the cacao pods.

Ceará indiarubber has grown to a height of 20 to 25 feet—perhaps more—and the seedlings have begun to show themselves amongst the dense jungle round about. This gives a hint of what might yet be done in Ceylon: a few bushels of seed collected year by year by those who still have Ceará trees on their properties, thrown broadcast in the belts or useless jungle adjoining their estates, might in a few years prove a profitable investment, in the same way as the cinchona seedling; promise to do in the forest around the Kandapola estates, or at any rate did some half-dozen years ago.

The Hermitage is a bungalow built on an isolated spur of the Buboo mountain, some 3,600 feet above sea-level, and is reached by a riding road nine miles in length, cut through the jungle from Lady Weld's bungalow which is 15 or 16 miles from Thaiping. On the steep sides of the knoll on which the Hermitage stands, tea, coffee and cinchona have been planted and have apparently done a great deal better than might have been expected, considering the steepness of the land and its exposed situation. The bungalow was originally intended as a sanatorium for the Resident, but another one has been erected on the summit of one of the hills overlooking Thaiping, and the Hermitage is occupied by an old Ceylon man, Mr. J. F. M. Cock, in the position of Superintendent of Government Gardens. Nothing much is now done immediately around the Hermitage, but half-way down the hill is an estate called "Cicely," where tea is made and coffee is grown in a small way. Just now the Perak Government is advertising 1,000 lb. of tea for sale; but it is understood that the garden has been rented out to a Chinaman. Some of the tea made at Cicely is very nice indeed, and fully justifies the encomiums showered upon it by some of the home journals; but, again, some of it—as served at resthouses and other places—is very poor weak stuff.

There can be no doubt that the moist warm climate of the Peninsula is especially adapted to tea, but in the meantime there is no possibility of its taking any place in the London market simply because there is none to send at present.

Perak has, no doubt, a great future before it when the labour supply is put on a better footing and capital is attracted by the advantages that are offered by the administration.

TROPICAL CULTIVATION IN SELANGOR, STRAITS SETTLEMENTS.

KWALA LUMPUR—LIBERIAN COFFEE CULTIVATION—SOIL AND CLIMATE—HANDSOME RETURNS—GEOLOGICAL FORMATIONS—A GREATLY-FELT WANT—COFFEE PULPERS—LEAF-DISEASE AND GREEN BUG—ARABIAN COFFEE—FORESTS AND LABOUR SUPPLY.

Selangor adjoins Perak on the East and South, lying nearer Malacca and Singapore. As yet tin mining has constituted the principal industry of Selangor, but large tracts of land have been taken up for cultivation of various tropical products—coffee, pepper, sugar, tobacco, tapioca, &c. &c.

To begin with, however, reference will be confined to coffee and what was learnt about it from personal observation. Kwala Lumpur is the capital town of Selangor, reached by nineteen or twenty miles of

railway from Bukit Kudu. In the neighbourhood of Kwala Lumpur there are two Liberian estates in bearing and a number of promising young properties lately opened. The largest of the two estates in bearing is Weld's Hill, some two hundred acres more or less in bearing and some young clearing. The lay of the land is (generally speaking) of an easy gradient on both sides of a valley. The oldest coffee, a few acres, is about ten years old, but the bulk of the bearing coffee is from six to seven and is planted rather too close to allow of the trees doing their best in crop, say seven and a half to eight feet square and topped at five to six feet. These fields of dark green coffee, covering the slopes of the valley, are really a fine sight for a planter, who has seen the best estates in Ceylon. It is difficult for an outsider not accustomed to Liberian coffee—to make an estimate of the crop on the trees, but it must come to a great deal, considering the picking goes on all the year round. There has been some correspondence in the Singapore papers about this estate and others belonging to the same proprietors calling in question certain statements which had been made about the crops. You have doubtless utilized this correspondence for your *Tropical Agriculturist*. There can be no doubt that large crops have been gathered, but there was no hesitation in admitting that they were produced by the aid of manure, so that putting them forward as an example of what the land is capable of producing in the way of coffee is not altogether a fair proceeding. Manure of the right description and properly applied can be made to produce almost anything you like in the way of crop, provided the experiment is made under favorable conditions of climate, position, &c. What capitalists want to know is what the land will do by itself unaided by manure and stimulants.

The soil of Selangor taking it all round is no better than that of Perak, especially as regards lowly undulating country where new clearings are being opened up. In all probability a better soil will be found further away from the coast, at the foot or on the lower slopes of the higher hills. The railway is now being pushed on twenty-seven miles or so beyond Kwala Lumpur, and would be available by the time estates came into bearing, were any now commenced in the direction in which the line is being made.

In spite of the poor appearance of the soil on the knolls, the young Liberian plants are coming on fast and doing extremely well. In fact the younger estates are very promising indeed and should give handsome returns in a few years. The other property in bearing is Batu Cave estate, and here again large crops have been taken off a twelve-acre field. In the present year, as far as could be learned from inquiry on the spot, the yield will be about eight hundredweights an acre or thereabouts. It must not be forgotten that this little field is about five years old, and lies at the foot of an enormous limestone rock, in which are the famous caves full of bats' dung manure. One of these caves is open at the top, and the rain washes out the manure into the jungle at the foot. In fact this field may be said to be a "pocket" of the best possible soil, most favourably situated, with only one drawback, if it may be so termed; and that is its being on a level instead of on a slope. There are no long spells of very wet, cold weather in Selangor as there are on the hills of Ceylon; if there were, in all probability, the coffee in the field now under reference would do from "wet feet." The younger coffee on this property promises to do as well as that which is now in bearing; but in the same way as Weld's Hill the

Batu estate has been manured, and the yield can hardly be quoted as a fair sample of what coffee should do unaided. On the principle of taking advantage of a favourable market manuring in order to insure handsome returns cannot be taken exception to; with present crops and current prices, a few years should give the proprietors a very handsome profit indeed. The greater part of the soil in Selangor is laterite, in various forms and stages of decay. There is plenty of limestone in huge masses cropping up in various directions. The principal rock is the white and grey granite, which seems to be present in all parts of the Peninsula. It may be added that the limestone is of very close, fine grain without presence of other gritty material; some is pure white and some of dark slaty blue. It seems rather unfortunate that the authorities at Selangor do not see their way to the appointment of a Superintendent of Agriculture, part of whose duty it would be to report upon the agricultural capabilities of the several districts of the interior of the country, with notes of climate, trees, indigenous products, &c., &c. Such reports would be of interest to all who had any wish to make investment in the country. It will be remembered that the Ceylon planters found such difficulty in pulping Liberian cherry, that it was said no pulper that had been invented was of any real use. This difficulty arose from the absence of the juicy saccharine matter so abundant in the berry of the Arabian variety. On the estates at Selangor and other places in the Straits this difficulty does not seem to exist, at any rate in the same degree as in Ceylon. It naturally requires more powerful pressure to break the tough, thick skin of the Liberian berry than the Arabica does; but when the skin is broken, the bean easily separates itself, there being a sufficiency of juicy mucilage to admit of its being squeezed out. Consequently an ordinary pulper, especially adapted for the larger berry, is made use of, and the bean can be sifted out in the ordinary Ceylon method. The pulper at Weld's Hill is an adaptation of the "Gordon's Breast" principle, the movable grooves being adjusted by screws.

Leaf-disease and green bug are by no means conspicuous by their absence, and on some of the fields powdered lime has been sprinkled over the trees, and acts in a double capacity at the same time being a manure and an agent for destroying the insects and fungus. There is but little *Coffea Arabica* in the vicinity of Kwala Lumpur, a few trees only in a native garden having fallen under observation.

It would certainly be wise before entering upon any venture of the kind in Selangor to wander further afield than the pioneers in coffee cultivation have ventured to do; that is, of course, if a permanent settlement is required. If it is thought sufficient for the coffee to last ten or fifteen years, and to get as much as possible fruit by manure or otherwise, after which it may be sold or abandoned, then, of course, by all means take the best piece of land you can get close to the source from which supplies can be drawn, say immediately around the Batu caves and on the neighbouring hills. There is plenty of fine jungle in that direction which the Selangor Government is prepared to lease or sell on easy terms, and there are roads of various kinds either made or in course of construction in all directions. Labour, no doubt, is dear, but not so much so as it was at one time, and a number of old Ceylon coolies are taking employment for a cultivation they have been accustomed to and which they prefer to learning something new as they have to do in Ceylon at the present day.

THE PROPOSED UTILIZATION OF MANA-GRASS.

We so very recently wrote relative to the proposals of the Stanley-Wrightson Syndicate as to the establishment of a factory or factories in Ceylon for working up mana-grass into the strawboard required for the manufacture of the patent tea chests, that we should have hesitated to so soon again reverting to the subject but for the information received from home by the last mail. We have thus learned that what has hitherto been but a prospect is now advanced to the position of almost a certainty. The Syndicate, when the last mail left, had resolved on submitting fourteen hundredweights of the grass just then received from Ceylon to treatment at a certain London mill for conversion into quarter-inch boards. If this experiment results satisfactorily, the Syndicate has decided to establish a Company to start a factory in Ceylon for the preparation of the raw material and to, at the same time, acquire the rights of the patents of the Stanley-Wrightson chests and work these up locally from the material prepared from the mana-grass which covers our hill waste lands in such profusion.

This decision having been taken, and knowing as we do in what reliable and influential hands this Syndicate is, we may look forward most hopefully to the approaching commencement of operations here. These, we feel almost confident, cannot but prove to be as beneficial to their undertaking as we have every reason to expect they will to our planters and to the natives for whom a new source of remunerative employment will be opened up. As we have recently pointed out, our difficulties as to maintaining an adequate supply of wood properly suited for tea chests are now great and are certain largely to increase. The establishment of a factory for the manufacture *ab initio* of these chests on the spot will enable them to compete very readily in price with the wooden chests at present in use. The objection to some of these last we have of late had forcibly demonstrated by complaints reaching us from the trade at home. We must, therefore, be fully ready to welcome the improved prospect presented to us of an alternative at once efficient and cheap becoming shortly available. But the hopes that may legitimately be entertained need not, we are told by a friend who has made close inquiry into the matter of the manufacture of this so-called straw board, be limited to this one function of usefulness. What *papier mâché* is to the Japanese, that frierd tells us, this strawboard may become to Ceylon and its people. Once the substance can be produced cheaply it may take the place of many objects for which wood is now used by us, and scarce and dear as this latter article is becoming a chance of superseding it is not to be despised.

The whole question of such comparative supersession, our friend tells us, depends upon two points only. The first of these is the cost of the raw material, the second that of—and the amount of—the power available. Given, as in the case of mana grass, an almost costless raw material,* and the unlimited power which may be derived from our upland waters, that question, our friend believes, is solved as regards Ceylon. With its unlimited supplies both of material and power it would only be a question of size and strength of

* Since writing the above we have seen in the proceedings of the Haputale Planters' Association reference to a charge being made for mana-grass taken from Government patanas, but we should think areas of such grasslands would be leased on the most liberal terms to the introducers of a new manufacture.

machinery to turn out a board, absolutely jointless, of size and strength sufficient to form an end wall to a moderately-sized bungalow! Perhaps it may be that some day our upcountry planters may be living in bungalows altogether constructed of painted and varnished pasteboard! We are assured that there is nothing ridiculous in such an idea. Why should there be, while we know the Japanese to live in paper houses the material of which is formed by pasting sheets together. With adequate power, our boards would be both homogenous and water-proof, and by the addition of tungstate of soda during manufacture might be rendered practically fireproof. However, we must bridle our inclination to prophesy the possibilities of the future opening out to us, though when we know of railway wheels of compressed paper working satisfactorily, we can set no practical limitation to what the Stanley-Wrightson Syndicate may yet accomplish with the wild grasses of Ceylon.

PLANTING IN NETHERLANDS INDIA.

(From the *Straits Times*, Aug. 13th.)

The Planters' Association at Sukabumie in Java have petitioned the Governor-General of Netherlands India for a Labour Ordinance in that island, so far as mining and planting go. They also urge the passing of a law forbidding the engagement of labourers in Netherlands India for work in foreign lands, so long as the local demand for coolies in Java remains brisk. The Governor-General has returned a deaf ear to their prayers.

The Residents in Java have been officially directed to encourage the cultivation of useful fruit trees in their respective districts.

THE LATE MR. McIVOR ON CINCHONA CULTURE IN CEYLON IN 1876.

The following report, copy of which was supplied to Mr. A. M. Ferguson by Mr. McIvor, has never, we believe, been published, as it was regarded as confidential. It will still be read with interest as illustrating the history of a great and in certain senses a successful enterprise. We may say that ultimately the Poomong plantation, alluded to by Mr. McIvor, turned out a very successful enterprise, and that on the British plantations in Sikkin Mr. Gammie has been very successful with the yellow barks, including ledgerianas.—*Ed. T. A.*]

Government Gardens,

Ootacamund, 9th May 1876.

From W. G. McIvor, Esquire, Supdt. Government Cinchona Plantations, to J. R. Cockerell, Esquire, Commissioner of the Nilgiris, Ootacamund.

Sir,—With reference to G. O. dated 27th January 1876, No. 239, I have the honor to inform you that on the 10th February last I proceeded to Ceylon to ascertain the condition of Cinchona cultivation in that Island. During the last three years a large extent of land has been brought under Cinchona cultivation by private planters; but prior to this period only a few acres were put down on Coffee Estates here and there, while on many Estates the boundaries are marked off by lines of Cinchona trees.

2. I shall first notice the plantation of the Ceylon Government at Hakgalla, begun in 1861 under the able management of Dr. Thwaites, the Director of the Botanic Garden at Peradenia. This plantation is now under the immediate superintendence of Mr. E. J. Thwaites. The site has been selected with great judgment; it lies near the East limit

of the South-West monsoon, and therefore receives the South-West and North-East rains, but in moderate quantities only. The elevation is from 5,200 to 5,500 feet, situated six miles South-East of Nuvera Eliya, and is well protected from the South West by mountains rising to upwards of 6,900 feet. In this favourable position Dr. Thwaites succeeded early in 1861 in raising 350 plants of Red Bark (*C. Succirubra*) and 10 plants of Grey Bark (*C. Micrantha* and *Peruviana*), which together with plants of other varieties made 800 in all. These were the first Cinchona plants raised in Ceylon. In the same year the Yellow Bark (*C. Calisaya*) was received from Kew. In 1862 there were in all 2,434 plants at Hakgalla. In October 1865, these had been increased to 354,026. In 1862, 194 Red Barks, and 110 Grey Barks were placed in permanent plantations. In 1863-'64 the plants in permanent plantations were increased, the Red Barks to 1,345, Crown Barks to 1,474, Grey Barks to 300, and Yellow Barks to 82. After this date there seems to have been but little extension of permanent planting, as the object of the Ceylon Government was not to produce bark, but to multiply the best varieties of Cinchona plants in order to meet the great demand of the enterprising and energetic Planters in the Island.

3. At the date of my visit the plants in permanent plantations at Hakgalla were from 12 to 14 years of age. The Red Bark plants were healthy with a growth resembling that which obtains on the Neilgherry Hills at similar elevations. The Crown Barks were less healthy, a considerable number had died, perhaps one-tenth, and many were affected with canker. The Yellow Barks of the early planting were all in an unhealthy and unpromising condition. This was also the case with the Grey barks. In Ceylon as with us last winter was one of exceptional severity, and at the date of my visit some of the plants at Hakgalla had been injured by frost, and all of them had suffered more or less from the cold and exceptionally severe drought. They were therefore not seen to advantage. The surface soil is rich and fertile, but, unfortunately it is shallow, and when the roots penetrate into the subsoil, the growth becomes less vigorous, and the plants less healthy. This I fear in many of the localities in Ceylon will prove an impediment to Cinchona plantations attaining a great age and will possibly necessitate the cutting down of the trees in the earlier stages of growth. Mossing has been tried to a small extent, but the necessary precautions seem to have been omitted in its application.

4. Seedling Cinchona plants spring up in myriads all over the plantations and under the trees on the neighbouring forests. Advantage has been taken of these to form stock plants for propagation, and I was much impressed with the great success attained by Mr. E. J. Thwaites in the propagation of cuttings in beds, formed in the open, and simply covered with coir-matting, placed on a pandal about 18 inches above the ground. The skill shown, and the attention bestowed by Mr. Thwaites on the propagation of the plants has been rewarded by unequalled success. On looking over the nursery beds it appeared to me that not one cutting in a hundred had failed.

5. Coffee Planters have entered into the cultivation of Cinchona in Ceylon with much zeal, and foremost in their ranks stands Mr. Corbett. This gentleman in 1862-63 formed a plantation of 3 or 4 acres on the famous Rothschild Coffee Estate, and also planted avenues along the main roads, and here and there lines of Cinchona trees among the Coffee plants. I understand that Mr. Corbett afterwards opened a tract of land for culti-

vation in Dickoya, and is now opening a large tract near Nuvera Eliya. The Rothschild Estate is situated in Pusilawa at an elevation of 3,200 feet. The plants are principally red bark, and the growth is fairly satisfactory, much resembling the growth of this species in the Wynaad. The plants I observed on other plantations in Pusilawa and in Rambody were much in the same condition. On the Nana-oya Coffee Estate, situated in Dimboola at an elevation of about 4,000 feet, is a very fine patch of about 4 acres of red bark. Here the plants were very healthy, and had made perhaps more vigorous growth than any I saw elsewhere. Some Crown barks also had been planted on the same patch; these however were unhealthy, the greater part having died, and the few remaining plants were all more or less affected with canker, and this I found to be the case with all the old Crown bark plants which I saw at low elevations in Dimboola.

6. In September 1873 a number of the larger *Succirubra* plants on Nana-oya were coppiced and the bark sent into the London market. Those plants have thrown fine vigorous shoots from the coppiced stools averaging about 7 feet in height, so healthy and vigorous that they give promise of a fair return by this method of cultivation. The ordinary size of the coppiced stools is 12 inches in circumference, and the largest I could find was 25 inches in circumference at a foot from the ground.

7. There are a number of very fine young plantations in Dimboola, especially on the higher portions, but, as the plants had only been in the ground 2 or 3 years, it was impossible to form any opinion as to their permanency.

8. Lool Condura is an extensive Cinchona Estate situated in Lower Hewahette and under the able and skilled management of Mr. William James Taylor. Here a large extent of land is now under Cinchona cultivation, and the young plants are healthy, and promising, although here and there the symptoms of Canker are evident in plants 3 and 4 years of age. The older plants on this Estate seemed to me in an unpromising condition, especially the Crown and yellow barks. On this property the cultivation was maintained in an exemplary manner, and every care and attention bestowed on the plants.

9. On the New Forest Estate, at a high elevation I observed some of the most healthy old crown bark trees which I saw in the Island; so far as I noticed there was scarcely a trace of disease among these plants.

10. On a consideration of all I saw in Ceylon. I was impressed that the cultivation of red barks in well-selected localities may be made profitable and to a certain extent permanent. With Crown barks the difficulty will be greater. The position of the plantation must be selected with great judgment if permanency is required, but if the intention is simply to grow the plants for 5 or 6 years, and then cut them down for the bark, the result would be different, and this system of cultivation may prove remunerative. The cultivation of the yellow and grey barks did not promise either permanency or profit. As a whole the plants in Ceylon are inferior to those grown on the Neilgherries, although the growth of the red bark is more rapid at low elevations in Ceylon than with us, but the deficiency of a rich deep surface soil, and the nature of the subsoil will, I fear, (with only a few exceptions), render cinchona cultivation somewhat hazardous.

11. On the 11th July 1866 Mr. J. Elic Howard in submitting an Analysis of Ceylon bark observes, "I must remark in the first place that they contrast disadvantageously in appearance with the

specimens of cinchona bark received from Mr. McIvor. It looks as though the climate of Ceylon were less favourable than that of Ootacamund for the cultivation of this plant. No. 1 in particular, and next to this No. 3 would be considered poor and badly grown barks in commerce, and moreover they have not had the advantage of mossing which tends so much to increase the product of the alkaloids." Time appears to have established the correctness of these observations. In appearance the Ceylon barks are thinner, and deficient in the markings which are valued in the home market, and although these barks are really rich in alkaloids, they are in this respect also a little inferior to the barks of the Nilgiris.

12. On my visit to the Cinchona plantations of the Bengal Government in 1871, I observed disease in the plants and certain conditions of soil and climate, which forced on me the conviction that cinchona would not form a permanent and profitable cultivation in British Sikkim. My report detailing these facts was unfavourably received by the Government of India, the Bengal Government, the local authorities in charge of the plantations in British Sikkim, and especially condemned by Mr. Munro, the Superintendent of the Poomong plantations of the Darjeeling Cinchona Association. Time seems however to have led the Proprietors of the Darjeeling Association to acquiesce in the conclusions arrived at in my report of 1871, as I observe that referring to the Poomong plantation the *Darjeeling News* says:—"The present owners of this large cinchona garden, Major-General Angus and Mr. Lloyd have spent a large amount of money on the estate which was commenced some 14 years ago, and up to date received no return. The Government has larger cinchona gardens alongside, and may be said to have swamped the private enterprise. Any way we learn that the Superintendent of the Garden has received orders to cut down the trees and send the bark to the London Market. The trees are to be destroyed so as to get the bark from the roots, said to be rich in alkaloids, and the land is then to be put up in small lots for public sale among the tea planters. In this way the owners expect to get back the R325,000 they have spent, though they will never see the interest of the money they have been spending all these years. It seems a pity to destroy what has cost so much time and money. One would have thought that these gardens, which had been made far cheaper than any others in India, and were a great success would have paid well, but it seems that cinchona is not a paying speculation." I believe that the work of destruction has begun, and in a few months 1,800 acres of our Indian grown cinchona will have disappeared. I mention this fact as it may be worthy the consideration of Government when deciding what permanent course it may be desirable to adopt in reference to the disposal and future management of our plantations.

I have &c.,

(True Copy.) (Sign W. G. McIvor.)

MR. McIVOR ON TEA AND CINCHONA IN CEYLON IN 1876.

The following letter by Mr. G. W. McIvor, amongst the last he wrote, was addressed to Mr. A. M. Ferguson, senior, and will be read with interest, now that cinchona in Ceylon has had so vicissitudinous a history, and that tea has become, as McIvor anticipated, a great success:—

Ootacamund, 11th May, 1876.

My dear Mr. Ferguson.—I was very much pleased to get your letter of 27th April, and although I

missed you in Ceylon, I fully expected to have the pleasure of seeing you here, and regret time would not allow you to pay us a visit. I hope however as you suggest you will be able to finish off our Indian trip, by a visit to the Neilgherries.

Your son and nephew both showed me much kindness when in Ceylon, and were of great assistance to me, and I hope you will come over, so that I may show you what we are doing both here and in the Wynaad, in coffee, tea and cinchona.

I was much pleased with the tea, I saw in Ceylon. It offered promise of success, and you have some fine varieties which, if propagated from cuttings, would give fine stock. The finest kinds I saw were on the New Forest estate, and as these were large trees, any number of cuttings could be procured from them. You will have learned a great deal about tea during your trip to the North. It is likely to prove a profitable investment here also. The fact is the plant is very hardy and thrives best in a wet climate.

I could not understand until I visited Ceylon how it was you could not grow coffee at a high elevation, say 6,000 feet, as we have some fine coffee estates at that elevation; but I find that it is the wet climate of Ceylon, which causes plants not to bear at high elevations, and it is the same on the wet side of our hills also, where plants above 5,000 feet bear little or nothing.

* * *

It rained nearly the whole time I was in Sikkim, and you were fortunate to have had fine weather there; the fact is, as I stated at the time of my visit, Sikkim is unsuited for the growth of cinchona, the latitude is too high, the soil too thin and the climate too damp. I saw patches of 30 acres together with scarcely a healthy plant. As you will see when you come over here, our plantations are quite different; of course I do not like to depreciate the labours of any one, but we are bound to speak out, because if the conditions are unfavourable the results must be unfavourable, however skilful the management.

I am glad you have had favourable rains at Abbotsford and that you already have begun to plant. I was much pleased with the place, and especially the fine garden and house. Dimboola seems to have an excellent climate.

I have no objection to the cultivation of ledgeriana as it is a variety of great value, and if it was suited to our climate, I would cultivate it as extensively as they are doing in Java, but here it is quite useless, it is unsuited to the climate and liable to disease. With you I fear it will be the same. This plant is found in Bolivia, between 15° and 16° south, Java is also south about 6° or 8°, and the plant does better there, but I am informed that it is even there very liable to disease.

I will prepare a case to send over to your son some of our best plants. It will be better to send them in a vardin case. I left with him seeds of all the best varieties we have.

In Ceylon you are north of the line. The varieties which do with us are likely to do with you also. However, there can be no harm in trying the different varieties of calisaya, but all the plants I saw in the island are unpromising, and I fear it will only be time and labour wasted.

I am sorry to say that I have been seriously ill. I had a great deal of exposure after my return from Ceylon, and got laid up with liver and dysentery from which I am but now slowly recovering.* * * * —Believe me, yours very sincerely,

W. G. McIvor.

* The recovery was but temporary, a relapse ending in the death of this able and useful man.—Ed. T. A.

MR. CLEMENTS MARKHAM ON CINCHONA IN CEYLON.

The following letter addressed to Mr. A. M. Ferguson, senior, by Mr. Clements Markham, whose name is so honourably associated with the introduction of the fever plants of the Andes to India and Ceylon, forms an interesting supplement to Mr. McIvor's report:—

India Office, S. W. April 27th, 1876.

My dear sir,—I have to thank you very much for kindly sending me the interesting photographs of the cinchona trees on the Dimbula estate, and for the pamphlet on the climate of the locality where they are growing. You will be able to obtain seeds of *C. Calisaya* from Mr McIvor, at Otacamund; but I think *C. Officinalis* is the best for Ceylon, and will always fetch a high price from quinine manufacturers. The *C. Succirubra* (red bark) is the best of all in a utilitarian point of view, because it yields the largest percentage of febrifuge alkaloids; and it is certain that cinchonidine, its chief product, and the other alkaloids, are as efficacious as quinine. But it will take some time to overcome ignorant prejudices among doctors in England on this point. About this I am now taking a great deal of trouble, and I have already got the excellent febrifuge medicine from the red bark, manufactured by Mr Wood at Calcutta, introduced into the London hospitals.

I am sorry to say that the authorities here, since the change of ministry, object to the full information given in my "Progress Reports"; and have taken their preparation out of my hands. Now a mere abstract of reports received from India is prepared by a clerk. It is a sad pity.

I shall, however, be glad to receive from you any Reports respecting cinchona and coffee plantations in Ceylon which I could utilize in other ways.

We have already got all the best kinds of *Calisaya*, including the variety *Ledgeriana*; and plants or seeds can be obtained from the Nilgiris; so that it would be a waste of money to send again to South America.

Ever yours very truly,

CLEMENTS R. MARKHAM.

PLANTING IN DELI.

(From the *Straits Times*, Aug. 13th.)

The *Delhi Courant* of the 2nd August can hazard no definite opinion as to the prospects of this year's tobacco crop. No wonder when even experts differ in the forecast and find it hard to foretell the turn of events. The disturbing element in the calculations arises from a recent long drought in the planting districts, and many growers fear that they are much the worse for it. So far as appearances go, the coming crop will fall below the average in quantity, but a few smart showers in the present month may materially improve the outlook. Langkat, this year, has fared better in weather than Deli where several estates, in consequence of early planting, have turned out very badly. Upper Serlang, too, has lost heavily by the drought, but Bobongan not at all. In Assahan, there is every prospect of getting 6 to 7 piculs from every field, but Siak, save on an estate or two, makes as dismal a show as in the past. Planters report favourably on crop prospects in Labuan Batu. The drought has taken effect in a predominance of dark quality in the yield. In fermenting the product, the managers will be hard put to it how to give their tobacco that light coloured appearance which alone takes with consumers in Europe and America. Though planters

can do little in this line, shareholders and directors in Europe will not see it, and continually cry out for the more taking colour, and complain of other estates being more fortunate in this point than theirs. A manager who gets put out by this becomes a marked man. Managers too find a big estate with hosts of coolies no easy matter to handle. Experience has proved that the size of an estate has its limits to admit of profitable working. Four hundred fields to an estate seem to be the maximum limit, which cannot safely be overstepped. The Deli Company has profited by it, and its managers show that they do not hesitate to curtail extension when circumstances prove adverse. Other managers manifest less prudence and to deem the more coolies in the fields the merrier, but the results of such unreasonable extension speak sufficiently for themselves to deter others from following the example.

In Assahan the planting outlook takes such a bright appearance that applications for railway concessions there begin to be talked of.

Two East Sumatra planters have just been called upon to answer for themselves before the Criminal Court at Batavia on charges of ill-treating coolies. Facts like these happening now and then come in handy to those who want to make out that planters on the East Coast of Sumatra are a rough lot, given to harsh dealing with their labourers. But it should be borne in mind that this report only holds good in newly opened districts, where the absence of police and the weakness of government authority lessen security. Planters finding themselves in the midst of coolies mostly of bad character as well as naturally turbulent and unruly, have to depend upon themselves to keep order among such a mixed multitude. That under such circumstances they should take the law into their own hands and administer rough and ready justice is nothing surprising. They may be mistaken in so doing, but the Government must bear the blame of driving them into it, by neglecting to station police in districts which planters and coolies have begun to open out.

A TRAP TO CATCH THE INDIAN MARKET.

(By the "PERIPATETIC PLANTER.")

An attempt is being made to get Indian tea dealt in in the Clearing House, like China teas. A few days ago, a number of representative importers and Indian tea brokers were invited to meet the authorities of the Clearing House, it was understood by those invited, to discuss the feasibility and advisability of Indian teas being so dealt in. No sooner had they entered the room, however, than they were informed that the feasibility was already decided; and, moreover, that Indian tea would be dealt in from the 1st Oct. next! Some had held aloof from attending, but a good many were induced to attend under the idea that it was well at all events to hear what could be said in favour of the scheme and not to abstain out of mere prejudice or preconceived notions; the more so, as they were led to understand that the conveners of the meeting promised a way to improve the Indian market, attempting enough fait. This radiosity was convinced will show, that if the scheme fails to obtain the support of those who have heard its details described, and who at the same time were deemed experts—or they would not have been invited—the scheme should be looked upon with suspicion at least, if not condemned offhand by those who, whilst interested, were not able to attend the meeting. Instead of suggesting any means of introducing new capital or legitimate new development of real business, it at once became evident that Indian Tea was merely to be made the battledore and shuttlecock of a small group of speculators, like China Tea. There were to be 5 or 6 "typos" as standards, and a committee of valuers and so forth. A very little consideration has already induced a good many of the Importers and Brokers present at that meeting to already withdraw their names from the enterprise; and the

belief is held that most, if not all, will soon do the same. It is the opinion of some of the objectors that the scheme is a mere trap into which to drag Indian Tea to the ultimate advantage of China Tea. It should be understood, to make the reasons for this opinion clear, that outsiders are rarely tempted to speculate in tea, and that the market thus made is the sport of a small group who play shuttlecock with contracts between themselves, and create a fictitious quotation at their own sweet will. Thus they can at any time send up the prices. It is not by any means impossible that the uncertainty thus created in the case of China Teas, has not done much to disgust Grocers with the vagaries of China Teas of late, to the great advantage of India Teas.—*Indian Planters' Gazette.*

THE KOLA NUT AND ITS PREPARATIONS.

Amongst the vegetable products of the Great Dark Continent, perhaps none are more interesting than those which, under the various names of *kola*, *gourou*, *ombéné*, *nangoué*, and *kobkorokou*, are used as articles of consumption throughout tropical and equatorial Africa, and for preparing beverages equivalent to our tea, coffee and cocoa. African explorers have often described the uses of the kola nuts. They are used medicinally in the cure and prevention of disease; they play an important part in the social customs of many of the tribes, figuring as emblems in the formalities of declaring war, making peace, and marriage. So high a value is placed upon these nuts in certain parts of Central Africa, where they are not grown, that they are readily purchased for an equal weight of gold-dust. The kola nut is the fruit or seed of the *Sterculia acuminata*, a tree which grows to a height of from thirty to sixty feet, and in its general aspect resembles that of the English chestnut tree. There are at least two varieties of the kola, so-called, which are yielded by two families of plants, and differ very much in appearance, but the kind which is most widely distributed is the "true kola," which is called by some of the natives the "female kola." The true kola grows wild upon the western coast of Africa comprised between Sierra Leone and the Congo or Lower Guinea, and extending inland some five or six hundred miles, when it appears to follow the limits of the palm. It is also found growing wild in the country of the Momboutous (24° E. long., 3° N. lat.), and in the moist hot woods near the southern coast of Venezuela, but is believed to have been sown in this latter country by African negroes about the same time as it was introduced in Martinique.

The kola tree commences to yield a crop about the fourth or fifth year, and by the time it is ten years old the tree is in full bearing. Like the orange tree, the flowering is continuous, blossoms and fruit occurring at the same time. The crop is gathered in October and November, and again in May and June. The ripe kola nut consists of a brownish-yellow capsule, inclosing both red and white seeds, which vary in number from five to fifteen. They are collected with great care by women, who remove the husk and epispem and pick out all damaged seeds. The sound seeds are placed in large bark baskets lined with "bal" leaves, and then are ready for transport. In Africa, the kola nut is an important commodity in the caravan trade, and the great centres of this trade are in Gorce and Gambia. In the form of a dried powder these nuts find a ready sale at fabulous prices even so far away as the remote Soudan and Timbuctoo. In addition to those native uses of the kola to which we have already referred, it is used, fresh, as a "masticatory," for improving foul water, and for rendering tainted meat edible, also for enabling persons to undergo prolonged exertion without fatigue. Some of the tribes of the interior make a very agreeable, stimulating and nourishing beverage by mixing the powdered nuts with milk and honey. As to the chemistry of the kola nut, this has chiefly been investigated by Iffekel and Schlagd-n-laffen, who have made a large number of experiments.

The dried seeds were finely powdered and treated with chloroform, and also exhausted with alcohol and boiling water. In each case a careful examination of the matters taken up in solution was made. These analyses revealed high percentages of caffeine (the active principle of tea and coffee) and theobromine (the active principle of cocoa), and at once suggested the suitability of preparing a beverage from kola nuts, of the same character as tea, coffee, and cocoa. And in view of this it is instructive to compare typical results obtained in the analysis of these substances. In each case the authority is given.

	Cacao (Mitscherlich).	Coffee (Payen).	Green tea (Peliglot).	Black tea. (Peliglot)	Kola (H. and S.).
Fat	53.00	13.00	0.28	—	0.585

We may fairly conclude that the yield of caffeine from the kola nut is greater than in most commercial teas and coffees, and that the proportion of theobromine is greater than that contained in cocoa. By a special process a paste is made from the nut, called kolatina, which produces a refreshing and sustaining drink with boiling water or milk. It is also stated that kola is of use to tea-tasters in counteracting the effects resulting from their occupation, and that it can be used for "improving" low-grade cocoas. The analytical table shows that kola does not contain anything like the quantity of tannin that tea does, nor the fatty matter that cocoa does; hence people having weak digestions will find none of the inconvenience in the use of kola preparations which they experience when they take certain other beverages.

If kola paste is mixed with cocoa it gives a chocolate of good quality, which is nutritious, and, according to the chemists, five times more sustaining than cocoa. Kola chocolate again is said to be ten times more nutritious than the best kinds of ordinary chocolate. Mr. T. Christy, F.R.S. &c., to whom the introduction of the kola into this country is due, has a large number of testimonials from cyclists, journalists, and others, which speak in terms of praise of the beneficial effects of using kola preparations during extreme muscular or mental exertion. Kola was used by the director of telegraphs of Egypt on his journeys into the Sudan, where bulky stores could not be carried. The French Alpine Club has just adopted it as a stimulant and nutrient in their mountain-climbing expeditions. The German War Office has recently ordered thirty tons of the nuts, owing to the beneficial results of experiments with them during the autumn manoeuvres of last year. The British Government are also giving their attention to the kola preparations. Kola is made up in various forms: first, there is the kola paste, or kolatina; then it is made up in tablets as kola chocolate. According to the *Cycling Record*, "it is a fact that a single cake of kola chocolate contains sufficient nourishment for a cyclist to ride from morning till evening without requiring other food." Another form is the kola lozenge, which can be carried in the vest pocket. There is also a kola cordial; and Mr. Christy is shortly going to bring out a kola "cocoa" and a kola "coffee."—*London Grocer.*

VULCANIZING TIMBER.

The *Indian Engineer*, in writing on railway sleepers, says:—

The only way in which inferior descriptions of timber can be made useful is by using some preservative, and great interest has been taken in this matter by the American Forestry Congress, who were specially appointed to consider the best method of relieving the forests from the heavy calls made upon them for sleepers, trestles, and other railway works. Kyanizing, Crocoting, and Burnettizing, have each been found wanting, but "Vulcanizing" bids fair to prove a success in every way, and it is thought that the difficulty has at last been grappled with. The *Inventor* says of this process:—"The curing or *drying* of wood until the discovery of the vulcanizing process, had received no new idea or improvement from the earliest time; while in the matter of working other materials, such as the amalgamating of metals, the making of steel, &c., the records of the past century show a marked advance; but for wood, the greatest product, the consumption and uses of which overshadow all other useful products of the earth, substantially nothing of any value has been accomplished." To properly preserve and cure wood and lumber, we have only to consider a few simple and self-evident facts. In its growing state wood is stronger and more elastic than when dry. It contains in its fluids all the antiseptic qualities and elements of self-preservation. The tree in the forest, exposed for centuries to atmospheric changes, does not decay; but gird and deplete it of its fluids and the disintegration of the fibre commences. This then is the basic idea upon which the new discovery of vulcanizing is founded, and the results obtained accomplish more than is claimed by all previous inventions and discoveries. In the application of the vulcanizing process a cylinder made of boiler plate, one-half to three-quarters of an inch in thickness, sufficient to withstand a pressure of two hundred pounds to the square inch, is used. This receptacle is made of any desired length and diameter, according to the number of feet of lumber required to be treated daily. The wood is piled on small iron cars, in a shape to conform to the contour of the cylinder, and the cars are then run into the tank on small rails fastened in its bottom. A number of cars are made into a train sufficient to charge the tank, and the door is closed making an air-tight fastening. From a large compressor air is pumped through pipes into the cylinder until the gauge registers the desired pressure, varying from 100 to 175 pounds to the square inch. After leaving the compressor, and on its way to the tank, the air, by a system of pipes, passes through a small stove or furnace and is heated to the required temperature—varying from 400 to 600 degrees Fahrenheit, according to the kind of wood in treatment. The air pressure holds the sap or fluids in the wood, effectually preventing their evaporation, or the charring of the fibre of the wood, while intense heat passing through and clear to the centre of the stick, so sublimates and attenuates the fluid matter of the wood that a new compound is formed, or rather the constituent elements of the sap are now in combination which otherwise are, under lower and different degrees of heat, distilled separately. All preconceived methods of curing timber are here reversed, and instead of distilling out these valuable antiseptics, they are distilled in the wood itself, a sufficiently high degree of heat being used to allow of their complete affiliation as a new and oleaginous compound. The heat and pressure then being removed, the door is opened, and the tank is emptied and ready for the next charge. Thus it will be observed that no foreign material being necessary, the process is not only rapid but so inexpensive as to recommend its adoption to all users of wood. When the timber is removed from the cylinder, the new compound now permeating the entire fibre, a chemical change or oxidation takes place while the wood is cooling down, rendering it impervious to moisture, never affected by the changes of the atmosphere, or the alterations of wet and dry; consequently it cannot rot; cannot shrink or swell;

offering no point of attack like seasoned or kiln-dried lumber; its pores are filled with its own material,—a material composed of the best known antiseptics, and in such shape as not to be soluble in water. Wood vulcanizing, from ample proofs during the last seven years, establishes the fact that it not only prevents the rotting of wood in the most exposed situations, but also prepares any kind of green wood for immediate use. Vulcanized cross-ties (sleepers) can be supplied in America at a cost of from 40 to 80 cents each, according to locality and variety of wood, and will last at least 30 years.

Cotton-wood is the worst wood known for railway sleepers, but it is claimed that by vulcanizing this wood it can be made as durable as the best oak.

Taking the prices quoted for this process in America, we should be able to vulcanize deodar, or any other soft wood, sleepers at a cost of Re 1 each, and as the present price of this class of sleeper—for broad gauge lines—is from R3-4 to R3-8, the total cost of vulcanized sleepers would still be ten per cent lower than is now charged for *sal* sleepers.

POSITION OF THE CHINA TEA TRADE AS COMPARED WITH INDIA AND CEYLON.

Foochow, 21st July, 1890.

To the Editor of the "Foochow Echo."

DEAR SIR.—I am sure that we are all under obligations to you, for the interesting articles on the tea trade of this port which have lately appeared in your paper, and I beg your forbearance whilst I make a few remarks on that in your issue of 19th instant. And firstly, as the author of the original article which appeared on 5th instant, allow me to thank you for the gratuitous addition by you of the words "Communicated," and the introductory and deprecatory paragraph which you so *kindly* inserted regarding it. Curiously enough, I cannot find either of these two "cautious" in your last issue pertaining to what I may presume to be a reply to my remarks.

May I assume from this that you endorse and adopt the views contained in that reply? I will be as brief as I can in my review. I pass over the first portion of your article and come to the question asked therein "Are our teas so very bad after all?" Then follow the words "We only know this that there are several markets in the world which will still have them, and *no others*." Why not name those markets? If Australia is alluded to, I must ask what means the export from India and Ceylon of some 4 millions of pounds to that Continent? What mean the figures in Greig and Murray's Circular of 28th May last? Stock in bond 24th May, China 3,408,389 lb., Indian and Ceylon 1,031,895 lb.

If America and Canada be meant, there is no foundation for the statement, because Messrs. Gow, Stanton & Co. of London, assert in the public papers that the consumption of Ceylon Tea is spreading quickly. If the "Cape" be meant, the statement is probably true, but affects only a total quantity of about 1½ million pounds. As for saying that in London in spite of the tyrant "fashion," they cannot do without them, see what Rucker and Bencraft in their Circular of 5th June last say, "The increase in the deliveries of Indian, 10 millions, and "Ceylon," 8 millions—18 millions has displaced 18 millions of China Tea." I come now to the paragraph speaking of the marked superiority of the Souchongs and Soomoos this season, and arguing therefrom that other kinds may improve in the future.

Souchongs, formerly a vory paying item in the London Trade, have now, alas, become of very slender importance, the taste for them dying out, and the losses on their shipment last season being exceptionally heavy.

Soomoos and Ohiangloks are it is true superior to last seasons, but they form but a small proportion of our crop, for out of a total of 312,000 chests of Congou to hand up to date, they only number 26,000 chests.

Per contra, I may ask, are the Saryunes superior to last seasons, or the Suey Kuts, or the Yung Hlows, or

the Paoklings? Decidedly *No*, and your contributor admits the inferiority of the Paoklums and Panyongs, which latter figure for 128,000 chests out of the total of 312,000.

Now for the remarks concerning India and Ceylon. Granted that the rise in exchange will prejudicially affect returns from estates, but it will not do so to the extent hinted at in the question asked by your contributor, "*How about the Dividend?*" Let us take the case he instances. An estate producing Tea to sell in London for £10,000, must yield some 220,000 lb. weight. To give that, the estate should be say 800 acres, the expenditure on which would be about Rupees 50,000 per annum. Take a loss of 15 per cent on that sum we have only Rupees 7,500 or say £650, which is about 6½ per cent only on the sum realised for the Tea. So that, to go further, assuming that the capital required for the above estate to be £30,000 we have under 2¼ per cent as the actual loss in dividend arising from a rise in Exchange of 15 per cent. As to your contributor's remark that we have not much to fear from Ceylon in "*the long run*," I can afford to pass it over, facts being stuhhorn things, and proving that the decline in the China Tea Trade is due in a great measure to the increase of Ceylon Tea. Tea is a hardy plant, and one which nothing seems to injure, not even the utter neglect of the Chinese;—why then when it is cared for scientifically should it, "*in the long run*," meet disaster in Ceylon? Touching on the drawbacks alluded to by your contributor as those which China Tea has to contend with, I notice he mentions a *higher rate of freight*. A glance at the Colombo papers would have shewn him that freights there are as often 30/- to 40/- per ton for tea, as in China.

"*The Chinese are wonderful adepts at meeting the inevitable*," continues your contributor. Granted, but not in the spirit in which the article views the point, the inevitable means rather the decline of the Trade, witness the descent from 800,000 chests, 12 years ago, to a probable 360,000 chests this season. This is indeed adapting themselves to the inevitable! Again, the rate of wages paid to the pickers in this country, we are assured on good authority, cannot well be lowered, it is paid on the amount plucked per day by the picker, and if the production of Tea continues to decrease it follows that fewer pickers will be needed. As it is, the plantations on which any labour but that of the owners family is used, are already few and far between. Only with the introduction of railways and the abolition of the Lekin tax will the cost of carriage to this port ever be reduced. I come now to a still more sweeping statement in the article under notice. It is that "If we cannot beat India and Ceylon in the matter of the very peculiar flavours imparted to their Teas through the *unsavoury manures they use*, we shall at any rate be able to compete with them and perhaps outdo them, in the cost of production."

Your contributor evidently knows little of the subject concerning which he makes such bold statements. Will he be surprised to hear that not *one twentieth* of the acreage under Tea in Ceylon, *ever receives any manure, savoury or unsavoury*, and that he must therefore seek elsewhere for the reason of their peculiar flavours?

Might I ask him what unsavoury manures are used in China to produce the marked and peculiar flavours shown in the comparison of a Tong Foong Tong and a Panyong, or a Saryune and a Paoklum?

From all one can learn, and it is at best perhaps, somewhat unrealistic, the reduction of the *cost* of producing tea in this country, has, excluding the subject of Lekin and taxes, reached its limit.

I will conclude by disclaiming any desire to injure the trade of this port, but rather assuring that it is only by baring our wounds and endeavouring to find their remedies that we can hope ever to see a healthier state of business.

Apologising for trespassing so much on your valuable space.—Yours faithfully,

FIAT JUSTITIA, RUAT OCEUM.

THE FINANCIAL AND GENERAL POSITION OF PERAK,

as exhibited in the report of the British Resident for 1890 shows that

The Revenue of the State amounted to \$2,776,583, a sum \$236,376 in excess of the Estimates and \$766,343 over the actual revenue received in the previous year.

The expenditure for the year amounted to \$2,090,116, a sum \$223,634 less than that voted in the Estimates. The year's expenditure was \$686,466 under the year's revenue.

The trade returns for the year give the following result:

		\$	c.
Value of Imports	...	7,048,045	78
Do. Exports	...	10,812,673	00
Total	...	17,860,718	78

Decrease over value of Trade in previous

year... .. 1,937,298 51

The decrease is more apparent than real, for there is reason to believe that the statistics of previous years were not thoroughly reliable and, owing to the price at which tin (the chief export) is officially valued, the returns of 1889 show a decrease of \$850,000 on this item while the actual export exceeded that of the previous year by 16,812 piculs. There is also a decrease of \$850,000 on the import of specie.

The excess value of Exports over Imports is noteworthy.

From the 1st September Mr. Spence Moss was appointed Government Engineer for Railways in Perak as well as Selangor, and gave his attention to the surveys for the proposed Kinta Valley Railway.

The total area of land alienated to the 31st December last was—

Mining Land	..	11,995	acres.
Agricultural	..	145,674	acres.
Town Lots	..	4,829	lots.

During the year 6,500 acres of land were demarcated, against 2,600 acres in the previous year; 10,000 acres were surveyed against 8,000 acres in 1888.

In all districts of the State, except Krian, the difficulty is to keep pace with applications for land so that even temporary titles may not be issued until the ground applied for has at least been demarcated. It is by no means possible to do this, for in the Kuala Kangsa District 2,982 lots of new land were alienated during the year, and in Batang Padang 1,326 acres of mining land were given out, though undemarcated.

The most notable features of the year are that the experiment of pepper cultivation, begun in 1885, with the sanction and approval of His Excellency the present Governor, has proved so successful that there is a general desire, not only in the Kuala Kangsa District but elsewhere, to take up large quantities of land for this purpose. The danger is rather that some who have undertaken this cultivation without much knowledge should be discouraged by the time which must elapse and the trouble that must be taken to nurse the vines before any return can be gained. There are many thousands of acres in Perak admirably suited for pepper, and it is difficult to over estimate the advantages of making this cultivation generally popular with our large Malay population.

The success of Liberian coffee has been demonstrated by Messrs. Hill and Rathborne, who have done so much for agriculture in the Native States. Their Kamuning Estate, in the Kuala Kangsa District, promises to be the finest Liberian Coffee Estate yet opened. An experiment in tobacco proved that a leaf of excellent quality could be grown in Perak, and I trust that efforts will not be relaxed till it is also shown that the cultivation of this plant can be made a financial success.

A Chinese has taken up a block of land in Larut on which he proposes to grow mulberry and rear silkworms. The mulberry trees grows here like a weed and the experiment is one of much interest; if successful, the Malays, who are skilful weavers, would probably take to it as a congenial industry.

A sample of tea grown in the Government Plantations was sent to London, and very favourably reported upon, while the future of Arabian coffee is so far as

sured that I am told the only estate in existence in Perak (Waterloo) showed a profit on last year's working, and its experienced Manager (Mr. Fraser) expresses a most decided opinion in favour of Perak as a coffee-growing country. As an independent and reliable opinion on a subject of much interest I quote Mr. Fraser's words:—"The cultivation of coffee promises well and, where land is judiciously selected and opened, it cannot fail, in my opinion, to be a success."

The sugar estates of Krian exported 59,762 piculs during the year, and as the price has improved on the very low figures of past years it may be hoped that there are fair prospects for cane growers.

I am, however, specially pleased to be able to report that throughout the State (always excepting Krian District) a larger area of padi (rice) has been planted this year than for many years past and so far the harvest promises to be an unusually good one. I have had special opportunities for seeing this myself and the native headmen are all agreed on this point. I still think it would be an immense gain if we could introduce into Perak a number of Chinese rice growers with their families, and, though the State does not grudge money voted to relieve the distressed agriculturalists in China it might benefit them as much, and Perak more, if a large sum were devoted to assisting them to settle in a country less liable to flood and famine. There are, however, great difficulties in the way of the emigration of Chinese with their families, and last year these difficulties seem to have greatly increased and even to a noticeable degree interfered with the usual exodus of the Chinese male population, a fact perhaps not altogether surprising considering the extraordinary reluctance of some to let the overflow of British Indian labour find a profitable field in these States; but, failing the immigration of a foreign agricultural people, it is at least encouraging to find that the Malay rural population is giving more attention to agricultural pursuits.

Piculs 235,651, or about 14,000 tons, of tin were exported during the year, an increase of 16,812 piculs over the export of the previous year. The price of tin averaged \$34.93 per picul (about £92 per ton), and the large production is extraordinary in the face of the tightness of the local money market and the remarkable falling off in the numbers of Chinese immigrants. The fact is that times being hard the miners worked better and for longer hours.

This is much like the increased export of cinchona from Ceylon in the bad times. The report goes on:—

The Government Geologist (Mr. L. Wray, jun.) undertook a lengthened search for minerals in the neighbourhood of the Pish river, in Upper Perak, where he found numerous traces of gold, and the Magistrate of that district now writes to me that, having dug a pit 12 feet deep in his garden, he began washing with a wooden tray and found gold at every trial.

One hundred and twenty miles of cart-road and 254 miles of bridle-road were maintained, while 41 miles of new cart-road and 13 miles of bridle-road were constructed, and 11 miles of bridle-road converted into cart road. Over 24 miles of unmetalled cart road were metalled, and a large number of bridges constructed and maintained. It is matter of public remark that the cart roads throughout the State, most of them maintained by contract are in excellent order.

The estimated receipts of the Larut railway were exceeded by \$12,670, a satisfactory result, in view of the fact that some of the rates were considerably reduced from the first January, 1889, and the year, as regards trade, has not been a particularly prosperous one. The total receipts amounted to \$82,670 against \$45,558 cost of working expenses, which left a profit of \$37,112, equivalent to 8.36 per cent on capital invested.

Details of railway working and extensions are given, and Mr. Hanson, formerly of Ceylon, receives praise for his energy.

The sanitation of the various townships in the State is being improved, everywhere as to drainage and, where possible, in water supply, and the result, as might be expected, is better health. This is especially the case in Larut where, owing to better sanitation, the insidious beri-beri, which some years ago filled the

hospitals and headed the list of fatal diseases, is no longer the dread scourge of Chinese miners and occupies a position of comparatively minor importance.

As far as the Government of Perak is concerned, it is difficult to see what more can be done except to find cheap labour, without which no planting enterprise is likely to succeed. The native of the country works little for himself and absolutely refuses to hire himself out as a labourer on any terms that a planter could accept. The mines absorb the attention of the Chinese, who prefer failure there to steady work and steady wages on an estate, and the planter's only chance of a labour force on which he can rely depends on the natives of Southern India, whom he must import into the State on certain conditions for a term of months.

There are many European employers of labour in the Native States who prefer to pay double the wages to an able-bodied free man who knows his work and will do it to whom wages are paid for labour performed, and who can be dismissed at an hour's notice, rather than be saddled with all the trials attendant upon the employment of the State Indian immigrant. Unfortunately planters are differently circumstanced, and it is absolutely necessary for their success that they should always have a large labour force at command to take advantage of the propitious moment for planting, to turn the variations of weather to the best account, or to save a crop from ruin. Under such circumstances the planter cannot afford to pay the same rate of wages that is given in the open market for much harder work, and he is therefore driven to engage his labour for a term of months and to accept all the responsibilities imposed upon him by special legislation. The interest that the State takes in his success or failure is due to the fact that he cultivates the soil, and for that reason it seems to me that he deserves all the assistance that can reasonably be given to him.

A COMING TEA DISTRICT.

"Ex-Planter" writes from Peermaad, Travancore to the *Asian* as follows:—"In your issue of July 18th 'Smoothbore' remarks: 'Ceylon has a great future before her in her tea; and India, Southern India at all events, cannot successfully compete with her.' If this remark refers to the growth of tea, I beg to inform 'Smoothbore' that if he will undertake a journey of some twenty-four hours from Kodaikanal, viz., to Peermaad, in Travancore, he will find himself in a district which far surpasses most in Ceylon and can compete favourably with the best. My own experience of Ceylon is limited to a thirty hours' stay in Colombo. I make the above statement on the authority of Peermaad planters who have visited Ceylon, and of a leading Ceylon planter who has visited Peermaad. A fact, which speaks for itself, is that a Ceylon paper has begun to speak of Travancore as 'a promising offshoot of Ceylon,' or something to that effect! Should 'Smoothbore' wish to see some really good tea I shall be happy to render him every assistance, and if I am still here, to put him up, if he will so far honor me."—*Madras Mail*.

THE TEA-BLENDER BLENCING.

(A LETTER FROM MR. VERDAUNT GREENE TO HIS FRIEND DONNE BROWNE IN CEYLON.)

LONDON, July 25th, 1890.

DEAR B,

There has been such a row in town as seems very likely quite soon to bring down some of the houses at which you frown

As an owner of tea plantations.

For it seems that some of the 'upper crust' of the grocer class have got mixed with the dust of their blended teas, through an indiscreet trust in their own sophistications!

And one of their number, presented at Court Quite lately, has very despairingly sought To put himself right with the people who've bought

His teas and encouraged transgressions; And it's quite on the cards that your courtier friend, Unless his mind and his manners shall mend, Will be affably asked his way to wend To the coming Quarter Sessions!

From all I can gather, the facts are these :
 He has been in the habit of selling teas,
 Indian or others, but mostly Chinese,
 For several years in the city,
 And had feathered his nest, so people say,
 It's a business, you know, where skill comes into play,
 And is helped in rather an imbecile way
 By the Government, more 's the pity.

For it seems they omitted to note the fact,
 When they lately tinkered the Trade Marks Act,
 That earlier registered marks would attract
 The ignorant public buyer ;
 And having forgotten to cancel these
 They have left to the dealer in ' blends ' of ' pure teas '
 A chance that his natural talents will seize,
 Although not a regular liar.

So a man with a label of ancient date
 Has no occasion for washing his slate,
 But can still remain in his former state
 Of sin and still gather his profit ;
 And may use, if he wishes, a label of lies
 With the words CEYLON TEA printed more than life
 size,

And with all the seductions of type to disguise
 Each word that he ought to take off it !

Let me give you a case, my friend : suppose
 I'm a dealer in teas : I prefer, of course, those
 That give the best profit : it's this that shows
 The gifts of a genuine grocer ;
 So I start as a specially honest man,
 'T is the principal part of my plausible plan,
 And I hire the best assistance I can
 From a deeply-lesigning engrosser.

In a specious circular I decry
 All other grocers to show that I
 Have the general welfare under my eye,
 Of Purity, Sole Apostle !
 And though, like the lark at heaven's gate
 I never can sing, if you'll only wait,
 I am sure I can nobly imitate
 The note of a Seven Dials' throistle !

And I rake my head for fanciful names
 For the teas I create, for a blender proclaims
 Himself above Nature, and modestly shames
 When praising his own production ;
 And he wildly raves of the strength intense
 Of his " Broken Leaf " and " Spring Pickings " : all
 sense

He will outrags in lust for the purchaser's pence :
 Plain truth would mean simply Destruction !

My Registered Trade Mark is to me
 As dear as my own morality,
 And I'm hound to sell under it all the tea
 That I buy in the course of trade, so
 I call myself an ' importer,' the force
 Of circumstances compels me : of course
 The buyer can't trace the tea to its source,
 And what doesn't seem true is made so

By the Registered Trade Mark. Trust art lends
 Herself to a fraud sometimes, but the ends
 Of Justice are met in the case of the ' blends '
 Made by myself as ' importer,'
 For, aided by Art, I soon design
 A label and wrapper that you would define
 As ' misleading' perhaps, but you see *they are mine* :
 To me they are bricks and mortar.

With these a reputation I build
 As sound as the tea in the packets I've filled,
 And with trust in myself and in all of our guild,
 I start as an honest retailer :
 And I issue teas to the public as ' PURE,'
 I hope they are so, but I cannot be sure,
 For I trust to a buyer the stuff to procure
 And he may be another black mailer !

My label, of course, I decorate
 With a lovely sketch of a tea estate,
 For a picture gives to the label weight,
 And Art on the label runs riot !
 And into the picture we introduce
 A harbour, roads, carts and such items of use
 In procuring the tea we are thought to produce,
 And a name, to keep everyone quiet !

And, although we may stupidly show our Tea
 As covered with flowers, which it ought not to be,
 Or even in casks send it down to the sea,
 The public have no one to guide them ;
 And if any who fancy themselves to be skilled
 Should enquire of their grocer, who's one of our guild
 And of course with a fine fellow-feeling is filled,
 For assistance, woe betide them !

The grocer can only point out the mistake
 That the paltering purchaser 's prone to make
 In supposing he would, for lucre 's sake,
 Indulge in dishonest dealing,

And will warmly add that he can't understand
 How anyone can, with a Registered Brand,
 Suspect any dealer of tricks and underhand ;
 Why, it's little short of stealing !

I have wandered away from the point, I fear ;
 I was going to explain what has taken place here,
 But I hope my digression has made things clear
 As regards our commercial morality
 And I hope you won't think we are all of the stamp
 Of this rascal retailer, this scandalous scamp
 Whose reputation no tailor can vamp
 With his vicious and vengeful venality.

He had lived, it appears, by the tricks of the trade
 And on ignorant people for years he had preyed
 With his gaudy Trade Marks and his labels displayed
 Selling trash to the purchaser willing,
 Till at last it was found that the hopes he had nursed
 Were a little too bright, and the bubble then burst
 And he by his customers roundly was cursed,—
 You can get a good lot for a shilling !

Now, it seems that some people who somehow appear
 To look on Ceylon as their influence-sphere,
 Have lately combined as associates here
 In a filahustering faction,
 And their time and resources they seem to devote
 To the utter destruction of all who may doat
 On the value a Trade Mark is thought to denote,
 And they threaten a legal action

To all who refuse to accept their terms :
 Do they think that the grocers are growling worms ?
 That the soul of the tradesman squeamishly quirms ?
 Or, dubious, fears detection ?
 He has a name to lose, not they
 The mushroom growth of a darkened day,
 What can they possibly have to say
 Against Government Protection !

These parties, it seems, had accused the old gent
 Of using a label with wrongful intent,
 A label on which I believe he had spent
 A large sum of money. He pleaded
 His label was only intended to please
 The eyes of such persons as cared for his teas :
 The words and the picture meant nothing : than these
 What further plain statements were needed ?

But the Magistrate took a wrong view of the case,
 So the grocer opines, and it seems a disgrace
 For a grocer, who held such a prominent place,
 To be fined for fraudulent dealing ;
 But it seems he admitted *in toto* the fraud
 Though disclaiming its motive ! and gravely implored
 That the import of words he might use be ignored,
 But the finer had no fine feeling,

And the double-dealer was stashed to the hilt
 By the Magistrate's order : his hood was not spilt
 Though the Court had endeavoured to strip him of
 g(u)ilt,
 But it seems he can never recover.

He cries in the streets, and to drown his distress
 He plays on the Middleman's Organ ; the Press
 Is deaf to his cries and the doctors confess
 That a cure they can hardly discover.

The disease is obscure and the case is unique,
 And they know not as yet by what means they can seek
 To check the sad symptoms ; they hope that a week
 Of low diet may be beneficial.

The strangest sign, perhaps, in the case
 Is this, that he feels no more the disgrace
 That years, one would fancy, could hardly efface
 After such a sentence judicial,

But he stares at the people with jaundiced eyes
 And asks if they would n't express surprise
 If he were beguiled by his enemies' lies
 To purchase the teas they offer ?

Though these very teas which he now derides
 Are the teas upon which himself he prides
 He has built up his pile with rapid strides,
 This jerry-building scoffer !

The medical men are inclined to think
 His mania due to excessive drink
 In the form of ' lie ' tea, but a grocer should shrink
 From drinking his own preparation ;
 It is certainly strange that a subtle sense
 Of justice survives a long course of pretence
 And leads a man charged with a grievous offence
 To utter his own damnation.

(Note by Mr. Donne Browne.)
 Can nobody save this wandering child
 And lead him forth from Honest's wild
 Lest to further disclosure he be beguiled,
 This wretched, clerly striping ?
 As the Balacava men applied
 To the Poet for help ere the last o' them died
 Let him go, if he only can pocket his pride
 To Mr. Rudyard Kipling !

FORESTRY IN CEYLON:

REPORT OF THE CONSERVATOR OF FORESTS FOR 1889.

Col. Clarke's report is on this occasion very elaborate, dealing with the many subjects to which attention has been directed so as to conserve the Forest rights of the Crown, without injury to the prescriptive and equitable rights of the people; to render the existing timber resources of the forests available and to provide supplies for the future wants of the country. Col. Clarke, with the assistance of an experienced Forest officer, whose services have been courteously lent to the colony by the Indian Government, has at length been able to organize the Forestry Establishment on a footing somewhat adequate to the largeness and the importance of the interests at stake. Col. Clarke, as Acting Conservator of Forests, is assisted as Deputy by Mr. F. A. Broun of the Indian Forest Department and commands the services of 8 Assistant Conservators and 5 Foresters, of whom one is specially devoted to the conservancy and provision of fuel; while 3 Probationers are going through a course of instruction in the Forest School at Dehra Dun. There are 8 Forest Rangers and 11 Forest Guards. Col. Clarke's report of the services of the officers during the past year is that

The officers of the Department have with few exceptions worked well. The prospects of the Department have been much improved by making its members eligible for pensions, and it is hoped that the scale of pay, which is quite inadequate to secure good men, will next be put on a proper footing. During the past year the work in every Province was more or less minutely inspected either by myself or by Mr. Broun, the Deputy Conservator. Clerical Staff.—Early in the year it was found necessary to increase the clerical staff at headquarters by carrying out reductions elsewhere. Even now it is as much as the present staff can do to keep pace with the work.

Of course good pay is necessary, as a rule, to secure zealous and efficient service, but regard must be had in this as in other cases to the means available, and as the Department becomes increasingly useful and profitable, its officers may rely on their just claims being recognized. Even more, perhaps, than Surveyors and Public Works Officers are they exposed to danger from malaria in their exploration of the often distant and, as regards population, desolate jungles. There is a vast amount of work to be done in the survey and demarcation of the forests. As yet only 102,000 acres have been surveyed at a cost of Rs50,000, or at the rate of 50 cents per acre. Of the areas surveyed 68,000 acres are in the new Province of Sabaragamuwa which is rich in forest resources, 15,000 acres in the North-Western Province, 11,000 in the Central, 6,500 in the Western and only 500 in Uva. Readers will be surprised to learn that

The area of forests reserved since the coming into operation of the Forest Ordinance (No. 10 of 1885) is very small, the total area, exclusive of the Walapane forest, of which no survey has been made, being only 809 acres.

Besides the forests actually proclaimed, however, 32 have "been taken in hand," and it is added: I would urge that an officer of some revenue and judicial experience be appointed settlement officer, to proceed from one forest to another until all the arrears are worked off. Some of the settlements hitherto made are not worth the paper they are written on. The Assistant Conservator of Forests, Eastern Province, reports that the forests abutting on Batticaloa lake should be reserved at an early date before they disappear. The Assistant Conservator, North-Central Province, reports that as a rule there is no urgency for reserving forests, but that the forests near Ritigala should be taken in hand. The Assistant Conservator, Northern Province, asks that the

forests near the sea in the Mullaitivu, Punarin, and Mannar districts and those in Iranamadu should be surveyed as reserved forests as soon as circumstances permit. The Assistant Conservator, Sabaragamuwa, goes exhaustively into the question of reserves, and gives a map showing the position of the reserves he desires to have. The Assistant Conservator, North-Western Province, also gives a list of the most important forests for reservations, and deprecates any forest sales in Wuda Hatpattu. The constitution of reserved forests in the Southern Province is urgently needed.

Recently in discussing the fuel question we adverted to the principles on which existing forests, reserved by the Crown, were dealt with so as to reconcile the supply of present requirements of timber and fuel with conserving and specially providing for the interests and wants of the future. The principles we adverted to are illustrated in a very interesting manner in the following extract:—

WORKING PLANS.—Nanucya Forests.—No complete working plan was drawn up during the year, but a preliminary plan of operations was made for the forests between Nuwara Eliya and Nanucya. These forests, as mentioned in my report for 1888, are of paramount importance for the fuel supply of the Railway, and at the same time being of indifferent growth, at high elevation, much exposed to wind, and situated on steep ground, are somewhat difficult of treatment. In altering the growth from ill-growing and stunted indigenous stock to exotics yielding a maximum of timber in the minimum of time, care has to be exercised during the work in protecting the forest against the effect of wind, in minimising the action of rain on the newly planted steep ground, and in preserving the natural beauty of a forest which forms so marked a feature on the road to Nuwara Eliya, our most frequented hill station. To attain these objects it was decided to adopt the following plan:—The forest was blocked out in parallel strips, two chains in breadth, and at right angles to the prevailing winds, broad belts being also left untouched on the windward side. The strips were again divided into rectangles ten chains in length, and the rule followed of leaving a rectangle untouched lengthwise, and two rectangles crosswise between every two exploited rectangles. In the rectangles or "coupes" thus marked out for felling, only such trees as were badly grown, crooked, hollow, suppressed, or of inferior species were taken out, while the finer specimens were spared. Thus the leaf canopy was by no means entirely removed, and between the standards thus left plants of *Eucalyptus globulus* and *Acacia decurrens* were put in at intervals of 6 ft. by 6 ft. By this arrangement of having narrow rectangles of exploited land alternating with untouched hands of forest, and having the rectangle so short that the rush of rain water cannot get up much impetus, while the mixture of exotics with indigenous species is not likely to be inharmonious, the object we have in view will in all probability be attained. It is proposed to work over the whole forest in 25 years. This year only a commencement was made, and the plantations were unfortunately taken up at the wrong moment, with the result that a large number of plants died.

RAILWAY SUPPLY FORESTS.—The first steps were also taken in the year under review for elaborating a methodical treatment of the forests set apart for railway fuel supply in the section Polgahawela-Colombo. These forests stretch on both sides of the line between Mirigama and Pelcawela, and lie within the Western, Sabaragamuwa, and North-Western Provinces. The Deputy Conservator, accompanied by the Superintendent of Fuel Supply, visited the forests about Mirigama and Amhepassa, made a few rough enumeration surveys, and submitted a report proposing to set apart 10,000 acres of forest for the section Polgahawela-Colombo. The report contains a proposal for working the forests on a 25 years rotation, utilising, as far as possible, a system already tried with considerable success in the Western Province, viz., that of giving out indifferent forest to the villagers to cultivate in dry grain and other food crops for three or four years and plant at the same time

useful timber trees. This system has been tried at intervals for years past, as already mentioned, near Mirigama, with good results, the areas so dealt with being now covered with a vigorous growth of young jak trees. It is proposed to modify and extend this system wherever the conditions are favourable and the villagers willing, and where it cannot be adopted the forest will be coppiced. Late in the year two surveyors were detached to make surveys of the available Crown forest and waste land in the neighbourhood of the villages above mentioned, separating the village claims and holdings, with a view to constituting these forests permanent timber and fuel reserves. By the end of the year they had surveyed an area of 3,850 acres.

It is a matter for regret that so much land has been alienated in the past that our nearest source of supply of fuel by rail for Colombo from Crown forests lies more than thirty miles distant from the city.

SAMPLE PLOTS.—The Department is at present without reliable data as to the rotation on which our forest should be worked. This is of course due to the infancy of the Department, and time alone can supply the information that is wanted. Instructions have been sent to the Assistant Conservators to select here and there sample areas, in which all the trees of more valuable species are to be measured at breast height once a year at the same season, and a record kept in order to ascertain the rate of growth. The data derived from these sample plots will enable us to determine the exploitable age of the trees and consequently the rotations on which the forests should be worked. Up to this the Assistant Conservator of the North-Central Province has alone made any progress in this work. He cut out two blocks of one acre each, the blocks being again sub-divided into two, one half being left untouched, the other half thinned of the useless trees.

ENUMERATION SURVEYS.—A memorandum has also been circulated showing the different ways of making enumeration surveys so as to ascertain the value of a standing crop in a forest. None have as yet been made except some rough ones in the Mirigama forest. These were carried out in order to ascertain the number of cubic yards of firewood obtainable from different classes of forest, including the jak plantations. Those of the jak plantations were also useful in order to determine the probable annual volume increment per acre of this particular kind of timber.

All this is in accordance with the established principles of forestry; and as the local experience of a series of years is collected, a body of information regarding the best timber trees, indigenous and exotic, to cultivate, and the best mode of treating such trees so as to render them most successful in growth and most profitable at maturity, will be available to the general public as well as the officers of the Department and the Government. For the provision of steady and plentiful supplies of fuel, it is obvious that trees which most readily coppice will be preferable, provided the calorific qualities of the timber are good.—Col. Clarke deals at length with the protection and improvement of the forest staff and as an illustration of the value of watchers who do their duty he states:—

For our reserved forests paid watchers are an absolute necessity. The Assistant Conservator, Eastern Province, reports that since the appointment of a watcher for the eastern shore of the Batticaloa lake, a large amount of timber theft has been stopped, and the result has been to compel buyers to come to the depot for timber which they had previously purchased from the regular timber thieves.

Col. Clarke agrees with the general opinion that the Forest Ordinance requires important amendments. Amongst the rest, provisions ought certainly to be made for securing the punishment of thieves who steal timber from the Government forests although such forests may not have been proclaimed as reserved. Prosecutions, it appears, have sometimes failed for reasons which seem inexplicable:—

In the Eastern Province a bad character received six months' imprisonment for threatening a forest

watcher with a knife. A contractor was mulcted in R100 compensation for damaging Crown property by unnecessarily felling trees to get at other ones.

In the Northern Province five men were proved to have felled and been possessed of eighteen logs cut in Crown forest, but they were acquitted, because the wood was not cut from reserved forest.

In another case, in which a wealthy Sinhalese proprietor had been helping himself on a large scale to thousands of saplings from Crown forests, for use on an extensive coconut estate in the Chilaw district, his agents and carters being caught red-handed in my presence, the prosecution fell through owing to some legal technicality.

Col. Clarke then proceeds to discuss the very important and difficult question of chena cultivation. On this subject widely divergent opinions have been and no doubt are still held by officers of Government, some leaning exclusively to the side of Crown rights, while others, in their zeal for the cause of the too often half-starved people (largely because they shirk the hard work of cultivating "wet lands" with rice), make no account of the interests of the Crown, which are, however, the interests of the general community. In this as in other cases there must be a happy mean, in which the interests of both parties meet. If the cultivators are expected to provide pasturage for their cattle, sufficient areas of suitable land must be left in connection with villages for the purpose. Exceptions, too, must be made in times of distress, such as protracted drought has now produced in the Eastern Province. On the other hand it is intolerable that well-grown and valuable timber trees, which cannot be replaced in a generation, or more, should be sacrificed for the sake of a few crops of Indian corn, millets and pumpkins. This is how Col. Clarke deals with the question:—

REGULATION AND CONTROL OF CHENA CULTIVATION.—The cultivation of dry grain in their henas or chenas, although one of the most wasteful forms of agriculture and belonging to the rudest condition of society, is a necessity for the people of those districts where rice cannot be cultivated for want of water. So long as this form of cultivation is kept within proper bounds, that is to say, so long as the people cultivate dry grain in the waste lands set apart for that purpose and do not abuse their license by clearing valuable forest, not much harm is done. But unfortunately the headmen have in the past connived at the destruction of valuable high forest by hena cultivators. A case in point may be seen in the report of the Deputy Conservator on the Eastern Province, extracts of which are annexed to this report (Appendix C.) It is quite true that in the case above quoted the chief headmen was only recently appointed, but this shows the danger of leaving a matter of such importance in the hands of inexperienced men. The Government Agent has now consented to let a forest officer accompany headman inspecting jungle for which hena applications have been sent in. In order to bring this class of cultivation under better control, the period of hena rotation for each district of the Island where paddy cultivation is precarious should be fixed, and a block of hena for each village, calculated on the number of inhabitants in it, should be permanently marked off and assigned to it for cultivation, a margin even being allowed for slight expansion. Owing to the vigilance of the forest staff, cases of illicit hena cultivation were brought up repeatedly in the magistrate's court, but the fines being in some cases nominal, not only were the officers disheartened, but the people were emboldened to repeat their offence where the infraction of the law was so lightly regarded. The Southern Province, especially Giruwa pattu east and Hambantota district, is now a vast sea of hena, owing to the reckless manner in which villagers have been allowed to devastate the country in the past. Even some of the old forest reserves set apart by Government Proclamation in 1865 have been attacked and ruthlessly

destroyed, nothing remaining in some instances of large forest reserves but a clump or two of trees surrounded by miles upon miles of *lantana* or scrub.

In view of the reckless devastation thus noticed it is certainly time that the wealth which the colony possesses in its remaining forests of standing timber should be duly protected. What follows is very interesting and important in its bearing on timber and fuel supplies in the future:—

NATURAL REPRODUCTION.—On this important subject Mr. Broun confirms the opinion that I ventured to give in my Administration Report for 1887, that natural reproduction is not unfavourable in this Island. Mr. Broun further says that "it has hitherto not been sufficiently studied. It is, nevertheless, one of the most important items of forestry; for, with an abundant reproduction, fellings can be made with the knowledge that the place of the trees felled is at once taken by others, and without the necessity for filling up the gaps by artificial methods. As, however, seedlings of different species do not spring equally readily under the same conditions, it is essential to ascertain what are the conditions most favourable to the natural regeneration of certain species, and how these conditions can be promoted by forest operations."

It appears, for instance, that the swamp mendoza (*Vatica Rosburghiana*) seeds abundantly at the time when the floor of the forest is several feet under water. The seeds are thus distributed in a fairly even layer over the surface where the leaf-canopy is complete, but where the fellings have been made with too heavy a hand, and the soil imprudently hared, the local rush of water carries away all seeds and no reproduction takes place.

Satin seedlings, on the other hand, are hardly ever seen in dense forest, but appear in chenas and in well lit localities on dry, sandy soil under the low shelter. Palu, milla and margosa require similar conditions, and in order to encourage reproduction fairly heavy fellings should be made not far from the seed bearers. Halmilla also requires light and a well-drained soil. If the latter is liable to floods all the better for this species. A gap caused by the removal of one or two trees is in favourable localities sufficient to cause numbers of halmilla seedlings to spring up and struggle towards the light. For this reason halmilla is one of our valuable species which reproduces itself most easily without much help from man. Pehimba reproduces itself very much like halmilla. The forests between Passara and Nakkalla in Uva are full of seedlings of this timber. Na seedlings and saplings abound in some of the dense forests of the Southern Province and in parts of the Pasduu-korale. Ebony reproduces itself fitfully. What circumstances are requisite for its reproduction are not yet known. This tree requires careful study.

Data are much wanted for a great number of important species, and I trust that all Forest officers will study and make a careful record of the most favourable conditions to the natural regeneration of the more valuable timbers.

The Assistant Conservators, Central Province and Eastern Province report that the year was a poor seed year for trees of valuable species, as compared with 1887, which was good; but the Assistant Conservator, Northern Province, says that the reproduction of satin and palu has been satisfactory. The Forester, Nuwara Eliya, brings to notice that natural reproduction in his district is good on slopes not exposed to the south-west monsoon, e.g., Kandapolla and Maturata. Heen nilla is absent, and liyan, sapu, kina, mihiriya, and damba reproduce themselves well.

ARTIFICIAL REPRODUCTION.—It is a popular belief that the Forest Department should occupy itself chiefly in planting trees. Although plantations have certainly to be made where a quick return has to be obtained, or where other means of reproduction are not available, the Forest Department must depend for its continuous supply of timber more on the natural reproduction of the forests assisted by operations properly conducted than on plantations which cost much time and money, and require much supervision. In fact so costly are they that very good reason must be shown for their necessity before they are undertaken.

Up to the present time the areas planted have been small. They are as follows:—

Eastern Province.—Teak chenas.
North-Western Province.—Teak plantation, Puttalam.
Central Province.—(a) Blue gum and *Cryptomeria japonica*, Nuwara Eliya; (b) Plantation in strip felling, Nanu-oya.

Western Province.—(a) Old teak garden, Hanwella.
(b) Jak chenas, Mirigama.

Province of Uva.—(a) Patana plantation, Eadulla.
Details of areas, cost, &c., are given in table (Appendix D).

The teak chenas of the Eastern Province were started in 1876, and have been added to at regular intervals up to the present time. The system followed has been to hand over forest land for chena cultivation to Moormen, on condition that after three to five years they should give back the land planted up with teak, for which purpose seed is supplied to them. Such chenas are to be found at Tumpalancholai, Divilana, Palukanawa, and in the Samantara and Koralai patus.

Mr. Broun, who has inspected these chenas, reports that they are not generally in a flourishing condition, the trees being flat topped, stunted, and far from vigorous. Some have been injured by fire, others by the bursting of a bund, and one large area has remained bare for want of sufficient seed, while in most cases illuk grass springs up as soon as the land is handed over by the cultivator. The earlier chenas are in better order than the more recent. To obtain these indifferent results, fine stretches of high tumpalai (*Vatica obscura*) forest have been sacrificed. Mr. Broun is of opinion that these chenas should be discontinued unless the cultivator is prepared to be contented with a forest of a class a good deal inferior to that which he has hitherto received, and I fully concur, as tumpalai is likely to turn out a useful timber for public works. In any case, conditions of soil and drainage should be more carefully studied, companion species of quick growth and light foliage introduced with the teak, while the neglect of the conditions imposed upon the cultivator should bar him from any future grant. Every chena cultivator should be required to keep up a small nursery to repair blanks. The total area of the teak chenas in the Eastern Province is 639 acres, or nearly one square mile, and the total expenditure, so far as can be ascertained R353'53. The cryptomeria and blue gum plantation at Nuwara Eliya is situated behind the Assistant Agent's house. It was started in 1885, and covers about twelve acres, over which all low jungle had been cleared with the exception of saplings of the more valuable indigenous kinds. The plantation is on the whole successful. A record of the growth should be kept year by year. The plantation in the strip fellings in Nannoya forest has already been mentioned. The planting, commenced in 1889, has not been very successful, about 50 per cent of failures having been reported. The old teak garden near the resthouse at garden near the resthouse at Hanwella is some three acres in extent. It was originally opened by the Dutch, but about eight or ten years ago all the trees were felled and sold for R1,000, a very small sum compared with their real value. What now remains is coppice growth from the stools, which had not been trimmed for that purpose; and the plantation is now stocked with a crop of coppice poles of seedy appearance, such as might be expected from the age of the parent trees and the bad shape of the stools. The poles will probably never grow into trees of fine dimensions.

The jak chenas at Mirigama have been already mentioned (see paragraph 24) in connection with proposals for fuel reserves. They have been planted in two separate blocks, one on Hatigankanda, forty acres in extent, and seven to ten years old; the other on Ponarrhuakanda, thirty acres in extent, and eight years old. The former block is planted with jak mixed with domba and wild almond; but of the three kinds jak is by far the fastest grower, outrunning completely the others. There are one or two patches of pure domba which do not seem to thrive at all. The average

height of the 10-year old jak trees is about forty feet, and the average girth about eighteen inches, a very good growth considering that no thinnings have been made. Light thinnings could now be made with advantage. The other block at Ponarrhua is also on the whole successful, except towards the top of the ridge, where the soil is inferior. The plantation is in some parts pure jak, in others jak mixed with *Lunumidella*. Wherever the latter appears the jak is suppressed. *Lunumidella* is therefore not a good tree as a mixture with jak, and should be omitted, especially in a fuel plantation, its quality as a fuel being indifferent. Creepers in this plantation are pulling down the young poles and saplings, and should be cleared at an early date.

The teak plantation at Puttalam is, in Mr. Broun's opinion, the most successful of our teak plantations. It was started in 1880 by Mr. Maggiolini, Forester of the North-Western Province, who, with the help of his baggage coolies, and sometimes of road defaulters and jail prisoners, planted up a small plot of ground with teak 14 ft. by 14 ft. This distance apart proving too great for proper growth, the distance apart of the plant in the plantation made in the following year was reduced to 6 feet by 6 feet. The area was successfully extended in 1883; but the extension made in 1888 had rather a large percentage of failures, owing to the season (November) being too dry for proper germination and survival. Twenty acres more were taken in hand in 1889, at a cost of R1,082. The seeds on this occasion were put in 5 ft. by 5 ft., as even when six feet apart they did not form leaf canopy early enough. Seeds of satin were mixed with the teak, as the latter species seems to thrive better when in mixture.

The total cost of the plantation up to date is R1,573, and the revenue obtained by sale of thinnings in 1886 was R203, leaving a net expenditure up to date of R1,370 for a total area of 37 acres.

To the twenty-seven acres of patana plantation mentioned in paragraph 52 of my last annual report, the Assistant Conservator, Uva, has added another thirteen acres at a cost of R792, or about R56 per acre. The blanks in the older plantation have been filled with grevillea and casuarina, and the newer plantation consists of casuarina, sapu, and ingesaman. The plantation is a very successful one, and reflects credit on the Assistant Conservator.

The total expenditure on the Badulla plantation from the commencement amounts to:—Twenty-seven acres in 1888, R2,195.45, upkeep of do. 1889, R425.78; thirteen acres in 1889, R735.93, in all forty acres—total expenditure, R3,357.16, or nearly R84 per acre, rather a high figure considering the prices at which forest land has been sold in the past: Mr. Moss considers that weeding should be kept up for three years, and, although this is the cause of the great cost of upkeep, it is indispensable on account of the encroaching nature of grass roots.

At Haputale about a quarter of an acre was planted up with iron-bark by the depot cooly. The Assistant Conservator, Northern Province, again brings to notice the proposal originally made by Mr. A. Clark of making plantations of palmyra on the vast expanse of sand near Jaffna. A large amount of this timber is exported to India annually by private parties, and the supply is now very limited. This wood has a pre-eminence in strength over Moulmein teak, is in great request for building, and white ants will not touch it. The food products of the tree are too well-known to require mention.

IMPROVEMENT FELLINGS AND CREEPER CUTTINGS.—Little systematic work has been done in this respect, but several of the forest officers when making their inspections are accompanied by two or three coolies with catties, and these cut down the creepers met with on and near their routes through the forest. As regards improvement fellings, they are badly wanted, especially in the halmilla forests, where a little light should be given to seedlings, in order to encourage them to grow up. When the dominating tree belongs to a species not worth felling, sufficient light can be usually let in at small cost by girdling the trees. This is especially wanted, Mr. Broun reports, in the Verani forest, Eastern Province, between Putuvil and Panawa, which is crowded

with halmilla advance growth. A beginning should now be made in most Provinces.

EXPERIMENTS IN EXOTICS.—By desire of Government this Department will undertake before the commencement of the south-west monsoon of 1890, a plantation of Para rubber (*Hevea brasiliensis*) from seed supplied by the Royal Botanic Garden, Heneratgoda. The place selected for the plantation is near Nambapana in Sabaragamuwa, where the climate is considered by Dr. Trimen to be suitable, and whence export will be easy.

The Conservator of Forests, Travancore, has been asked to supply this Department with seed from localities in the hills where teak grows most vigorously. The seed having arrived, a site with similar conditions of soil and elevation to that of the Travancore hills will be selected, probably near Kadugannawa.

The Conservator of Forests, School Circle, North-Western Province and Oudh, has also been asked to supply us with small quantities of seeds of some Himalayan conifers, viz., *Cedrus deodora*, *Pinus longifolia*, and *Pinus excelsa*, for trial near Nuwara Eliya, where, if the trees succeed, they will be as ornamental as they are useful.

The Assistant Conservator, Northern Province, reports that a mahogany tree planted in Jaffna in 1852 is now 7 feet in circumference at breast height, and with a clean bole of 16 feet. This means an annual average increment of 2.3 in. in girth, or .74 in. in diameter, or in other words, the annual concentric rings are on an average .37 in. thick.

We have extracted at such length because the passage taken over supplies just the kind of information which many planters and others are anxious to obtain. It will be seen that jak is one of the best trees to cultivate on the plains and in the lower hill zones. As regards *Pinus longifolia*, the appearance of a beautiful specimen in the Hakgala Gardens affords strong proof that it will do well at Nuwara Eliya and in its neighbourhood. This tree yields excellent timber. Encouragement ought also to be derived from the fact that a tree of *Cupressus torulosa* about 20 years old, cut down last year by Mr. Nock, gave 176 feet of 1 inch boards, much like white pine in appearance and easy to work. Why *Cedrus deodora*, which is the Indian representative of the cedar of Lebanon, has not been a success in Ceylon we cannot say, but this tree and *Pinus excelsa* would be acquisitions. One of the best and most satisfactory trees which we have borrowed from Australia is *Grevillea robusta*. The *swamp mendora* alluded to is one of the most curious in its growth of our trees. Specimens may be seen at Kalutara, growing out of the water by the side of the Kaluganga, with roots springing up several feet in height, like vast sharp wedges. Satinwood, ebony and the allied "calamander" and ironwood deserve large attention from our Forest Department. There are half-a-dozen young *na* trees near the plot where the band plays in Victoria Park, Colombo, which promise to vie in beauty of foliage with the splendid specimens of iron wood trees on the edge of the Kandy Lake. This and similar trees, some of the red-leaved *Eugenia*s especially, ought to be largely used for the adornment of our towns. We are glad to learn that the blue gum and cryptomeria plantation at Nuwara Eliya is a fair success. Both trees coppice well, we believe: of the blue gum we are certain. The difficulty, indeed, is to stop the growth of the numerous shoots which spring from the stocks of felled blue gum trees. It is well to know that *Lunumidella* which grows very rapidly and supplies a pretty cedar-like timber for ceilings and curiously enough for canoe outriggers, although it is said not to stand exposure to weather, ought not to be grown with jak, if the latter is to get fair play. Satinwood and teak, on the other hand, grow well in association. What is stated of a mahogany tree at Jaffna is

certainly encouraging with reference to the cultivation of this valuable tree. Meantime experiments at Nuwara Eliya and around it prove that an allied tree, the *red toon*, grows rapidly and beautifully in form and vegetation. In rapidity of perpendicular growth it excels the *cryptomeria* and vies with the Australian *Eucalypti* and *Acacias* ("wattles"). The *margosa* (the *neem* of India) is closely allied to this tree.

We trust the idea of plantations of that most useful timber and food palm, the *palmyra*, which is rapidly becoming scarce, will be seriously taken up. We shall look with interest for accounts of the result of an experiment which is being tried in the arid Hambantota district. *Palu*, which combines, like the *palmyra*, the valuable qualities of food bearer and timber yielder, ought also to receive special attention.

Communications and buildings are dealt with, and Col. Clarke shows a desire to alleviate the hardships to which the forest officers are exposed:—

Foresters' bungalows are much required in the uninhabited portions of the Island, where their work takes them, *e.g.*, in the southern part of the Eastern Province, the Uva Bintenne, and the eastern part of the Southern Province. These I propose to supply by degrees, as it is not fair upon the officers to require them to endure greater hardships than are preventable by a reasonable outlay. A Forester's life is not by any means a bed of roses.

Under the head of "Yield and Working" Col. Clarke notices disadvantages at which the Forest Department is placed in being compelled to hold large stocks of timber to meet the requisitions of the Public Works Department, without the certainty, for want of estimates, of such stocks being indented for. The prices paid, too, were inadequate:—

For instance, the Public Works Department in the Northern Province was supplied with *palai* at 50 cents per cubic foot, which would have realised R1.12½ if sold to the outside public for export to India.

It might seem to some persons that, the timber being the property of Government, it could not be of much consequence at what price it was accounted for. But any such loose system of accounting would cause confusion and worse. The Public Works Department would obtain undue credit for economy, while the Forest Department would appear to be conducted at a loss great in proportion. It is not surprising, therefore, to learn that a revised scale of prices has been framed. The report of the Committee on sleepers for the railways, which we some time ago reviewed and quoted from at great length, is adverted to. The result of the deliberations of that Committee was that a trial is to be made this year of 200 sleepers of each of 25 species of Ceylon timbers. Our readers may recollect that the two railway members of the Committee suggested that the trial sleepers should be supplied gratuitously by the Forest Department. This proposal Col. Clarke emphatically resisted, on the ground that the good quality of the larger proportion of the timbers was beyond question. Meantime 10,000 *doon* sleepers (*doon*, not to be confounded with *toon*, being our hardest and best wood) were supplied for the Bentota extension. The details regarding timber supplied to other public departments and to the public generally are so interesting and calculated to be so useful to many of our readers, that we feel justified in making a lengthened quotation:—

Timber of the value of R39,590.63 was sold to the Chief Resident Engineer, Haputale Railway Extension for the construction of bungalows, &c. Among the

other Public Departments the Postal is probably the next largest buyer, for telegraph posts, 503 of which were supplied during the year. Smaller quantities of timber were requisitioned by the Colonial Store for the Harbour Works, by the different Road Committees, by the Military authorities at Trincomalee, and by the Railway Department. The Railway Department applied to us for a timber which, while equally durable as *jak*, should be somewhat lighter in haulage. We supplied them with "kina," and it is now being tried for the flooring of railway carriages; but as it has been used when green it is hardly receiving a fair trial. It would be worth while to try *hulanbik* and *margosa* in lieu of *teak* for the interior of railway carriages, as *teak* has gone up considerably in price. *Halanhik* has a beautiful satin lustre, while *margosa* is not only a handsome wood, but insects will not touch it owing to the essential oil it contains.

The timber sold to private parties is usually for export either in the log or converted into casks, boxes, &c. The woods most in demand are *ebony*, *satin*, *halmilla*, *palu*, *hal*, and *hora*.

Ebony and *satin* will be mentioned later, under Central Depot.

Hal and *hora* are much used for tea boxes and *plumbago* casks, respectively.

The *palu* and *satin* sold for export come chiefly from the North-Western Province and Eastern Province. *Halmilla* is largely bought for India, and has a considerable sale in Ceylon. The Indian Government was supplied with 3,229 cubic feet of picked *halmilla* at R2.50 per cubic foot, realising R8,062.50. That sold locally comes from private land, frequently from temple land in the North-Western Province, Central Province, and Eastern Province, and some from Crown forests in the same Provinces. The supply from private sources is now becoming limited, and as the oil mills do not offer as good prices as purchasers from India, most of that timber is shipped for that country. A number of native coasting craft, which carry the paddy grown in the Eastern Province to India for clearing and winnowing, load up with timber of this and other kinds, for which they pay remunerative rates.

CENTRAL DEPOT, COLOMBO.—After considerable correspondence an arrangement was come to between the Engineer of the Harbour Works, the Railway authorities, and the Master Attendant, whereby the Forest Department was permitted the use of the southern half of the Breakwater yard as a timber depot, and a portion of the roof of the Breakwater as an *ebony* stacking yard. The object of having a separate yard for *ebony* at the harbour was to avoid expenditure in the movement of it between shore and ship. It now remains on the spot to which it is brought from the interior of the Island until wanted for loading on board ship. As our occupation of the Breakwater yard is conditional, and has to be given up in the event of the Northern arm being constructed, there is an element of uncertainty in our tenure, and we cannot set up permanent sheds and saw mills. As a consequence, the sawing of timber at this depot was done in an irregular manner, and we had in the long run to ask the Government Factory to saw the timber for us.

No business was done in *ebony* until the close of the year. The English market was reported continuously throughout the year as flat, large stocks were still unsold in the docks, and there was very little demand either for Europe or China. A small quantity was offered in the Colombo market collected from private land and from temple land, but chiefly of indifferent quality. By the middle of the year some 500 tons of Government *ebony* had been collected from all parts, and after shaping and trimming was divided into lots to suit the European and China markets. The highest price offered early in the year had been R80 per ton at Trincomalee, but with the approval of Government the *ebony* was held until the close of the year, when 102 tons were sold for R14,280, or an average of R140 per ton for all classes, bad, good, and indifferent.

Then follow details connected with the difficulties of obtaining supplies of timber from distant parts of the island for the Colombo depot. The

"Lady Gordon" is often not available, and we regret to find it stated:—

Getting timber by rail from Matale is almost prohibitive, the rates being 33 per cent. more than the steamer rates, and we never use the railway unless we are absolutely driven to it.

We should think this was a case for special rates, and if rates at which timber can be cheaply conveyed from the great north-central and northern forests cannot be arranged for a northern extension, such as is now under consideration, that fact will be "a heavy blow and great discouragement" to the enterprise. As matters stand, the Forest Department is compelled to resort to private sailing vessels for lower rates of transport.—Not only the tea planters with the demand for their tea factories, but all fuel-consuming establishments in Colombo and the general public who have year after year to pay high prices for firewood used for domestic purposes, are interested in the question of fuel supply. We need, therefore, make no apology for another long extract:—

The supply of fuel to the Government Railway remained throughout the year in charge of Mr. W. H. Clark. As a rule there have been no complaints about the quality of the wood supplied, but on one occasion a large amount was rejected by the Railway Department among the deliveries at Veyangoda. Most of it, however, was accepted at reduced rates.

During the year 19,964½ cubic yards was supplied from Crown forests at a cost to Government of R22,666.21, and 58,321½ cubic yards from private forests at a cost of R79,553, or a total of 78,285½ cubic yards at a cost of R102,219.53, exclusive of cost of establishment and other expenses. The revenue obtained from this firewood amounted to R118,180.70, which sum covers costs of establishment and sundries, and leaves a margin to expend on the re-afforestation of the Crown forests set apart for the railway supply.

As seen from the above figures, the amount supplied from private forests is about three times as great as that from Crown forests. There is no doubt, however, that the supply available from private sources is diminishing rapidly and the time will come when the bulk of the supply must be drawn from Crown forests. The cause of this is due partly to the denudation of private forests without corresponding re-afforestation, and partly to the indirect results of the establishment of a Forest Department. There is no doubt now that much of the so-called private wood of a few years back really came from Crown forests. For instance, the supplies delivered at Kalutara came almost entirely from the Crown wattranas on the Kaluganga and its affluents, but since these forests have been more closely watched, it has become exceedingly difficult to get tenders for the supply of private wood to be delivered at Kalutara.

It is the intention of Government to increase gradually the proportion of fuel yielded by Crown forests until, if possible, the entire supply comes from that source. Obviously this cannot be done at once, for until we know what amount of Crown forest there is available, risk would be run in over-working our forests on the mere supposition that the supply is sufficient. A survey is now being made of the Crown forests bordering on the railway, commencing near Mirigama, and the surveyors are working gradually eastward.

Later on it will be necessary to make fuel plantations on the upper section of the Railway above Kadugannawa, as it would be too costly to transport firewood up the incline from the lowcountry forests.

The rates per cubic yard at which firewood was supplied to the Railway during 1889 were as follows:—

	Class I.		Class II.		Class III.			
	R.	c.	R.	c.	R.	c.		
Upper Section ..	1	65	..	1	50	..	1	37½
Lower Section ..	1	50	..	1	37½	..	1	25

It is considered that so long as first class firewood remains below R2 per cubic yard, firewood can com-

pete successfully with coal. This rate, however, takes no account of wear and tear in the boiler tubes, which is far greater with coal than with wood.

The other Public Departments in Colombo supplied with firewood were the Convict Establishment, the Harbour Works, the Government Factory, the Master Attendant, and the Government Printer. The amount sold was R17,844. In Uva R61.70 was realised by the sale of charcoal to the Public Works Department.

FUEL SUPPLY TO THE PUBLIC.—In the towns of Jaffna and Trincomalee, the fuel for the residents is supplied from Crown forests. In Jaffna the wood is brought to depot, and retailed to purchasers. The rate at the beginning of the year was R4 per ton of dry firewood, but this was subsequently raised to R5. The quantity sold amounted to 2,187 1-7th tons, realising R10,103. In Trincomalee a system of licenses was introduced which leaves the establishment free for supervision. During the year R380 was realised on this account, a license fee of R10 being levied on each single bullock cart. Besides the above R66.40 was recovered for royalty on 332 tons, at 20 cents per ton. At Galle the firewood for the town supply comes almost entirely from Crown forests, but the Crown derives no revenue from the removal of firewood.

A wasteful system prevails in the Galle district of allowing the villagers to sell, after the harvest is over, the fence sticks out by them from Crown forests. As fence sticks will last at least three years, if this practice were stopped, as undoubtedly should be the case, a large saving of straight and valuable saplings would be effected.

In Uva 143½ cubic yards of firewood were sold for R290.60. A royalty of R35.05 was paid for 701 bushels of charcoal, and the Assistant Conservator sold for R196.75, 583 bushels prepared by the Department.

On receipt of a valuable memorandum prepared by Mr. Broun, the Assistant Conservator tried some Indian methods of charcoal burning, and eventually devised an improved kiln, which not only gives as large an output, but requires less care in construction and in supervision after firing.

As regards the supply of firewood to tea estates rules have been drawn up and passed during the year, which prescribe the conditions under which estates can lease tracts of Crown forest for the purpose. The notice of charcoal and improved methods of preparing it suggests the question, which, we suppose, must have been well considered, of the use of this substance in the locomotive furnaces, in which case it would seem that the carriage up the Kadugannawa incline of so light a substance ought not to be costly? Then again if, Indian coal of a fair average quality continues to come in at moderate rates when compared with the cost of the black diamonds from Cardiff the proportion to coal of wood fuel at R2 per cubic yard may cease to apply. Of course the quality of coal as well as its price have to be taken into consideration, and we suppose that coal of an inferior quality for calorific purposes will be damaging to boiler tubes in proportion to the degree of inferiority? Col. Clarke does not touch on petroleum waste, the use of which, if it could be cheaply supplied from the fire regions of the Caspian, or other sources, Indian perhaps included, would considerably affect the demand for firewood by tea planters, as well as by the railway and foundries and factories generally.

The royalty and share systems of dealing with forest produce are noticed, and here, as in India, North Borneo and other places, it is felt that the public have a right to some share in the value of minor products removed from the forests, jungles and patanas, or the grass lands which correspond to the latter. On this subject the report states:—

A great deal remains to be done by the Forest Department in bringing to market the minor produce

of our forests. Only in two or three Provinces has a commencement been made at present. In Uva R3,010 was realised for the right of collecting gall-nuts (*Terminalia chebula*), R17 for the right to quarry limestone, and R81'68 for the sale of mana grass growing on the Crown patanas. Certain planters have thought fit to object to paying for this grass, but considering that some of their members remove from two thousand to five thousand bundles (head-loads) per mensem, and are only asked to pay the very small fee of R2'50 half-yearly, and that they have no right of user whatever, there is no substantial ground for complaint. The Assistant Conservator, Sabaragamuwa, complains that although endeavours have been made to lease the collection of aralu nuts, these efforts had failed because the villagers have been accustomed to help themselves. This is another argument in favour of reserving forests without loss of time, and having the rights and privileges defined. In the Eastern Province the forest produce sold realised R1,252.

As already mentioned the sale of minor forest produce requires development. The right to tap inferior trees for resin, gums, gamboge, &c., might be leased out. The bark of ranawara (*Cassia auriculata*) is largely exported for tanning from the Hambantota district, and there are other trees which yield tanning material, such as the fruit of bluu and nelli, the leaves of dawa, and the bark of many trees, all of which should bring in revenue. Velan bark (*Acacia leucophloea*), a large article of export, is freely taken from trees growing on Crown lands, the bark being stripped to the unnecessary damage of the trees. No royalty is of course paid, and the Treasury is a great loser.

In the Northern Province R336'80 was realised from the sale of green leaves from the commoner kinds of trees for manure for tobacco gardens. This is not a kind of practice which deserves much encouragement. The ruthless destruction of palu trees for their fruit, the natives of the Northern Province being allowed to break off large branches in order to obtain the fruit more easily, still goes on unchecked in this Province. Mora trees in the Eastern Province and beraliya trees in the Southern Province suffer in the same way. By allowing the people to break off the branches, rain-water penetrates into the holes so formed and rot speedily sets up. Our fine palu trees in the Northern Province are threatened with extinction, if the practice be allowed many years longer. Another pernicious practice is that of felling trees for the sake of getting at honeycomb. As the procedure is quite unnecessary, there is no doubt that it should be stopped.

FREE GRANTS AND REMOVAL UNDER RIGHTS AND PRIVILEGES.—Owing to our principal forests being situated in districts where there is little population the forests are not much burdened with rights, and where natives are allowed certain privileges, these must be regarded as concessions rather than as rights. Besides grants of timber for purposes of public worship, public institutions, and so forth, by far the largest amount of timber really given away consists of permits to cultivate chena. If the amount of timber given away annually in this way were calculated, the figures would be startling.

With reference to mana grass from the patanas, a fee of R2'50 per annum for, we presume, unlimited cutting does not seem unreasonable; and Government, in replying to the Haputale Planters' Association on the subject, seemed to indicate that the object of the exaction was mainly to secure the continued rights of the Crown in the land. Should a factory or factories be established for converting the patana grasses into "strawboard," for the manufacture of tea chests and for other purposes, we can only repeat our belief that all possible encouragement will be given to an enterprise calculated to utilize produce which now runs almost entirely to waste over hundreds of thousands of acres of our upland prairies.

The gall-nuts produced by *Terminalia chebula*, and

the bark of the ranawara (*Cassia auriculata*), the latter a pretty yellow-blossomed shrub, are amongst the most highly valued substances used for tanning hides, an enterprise for which Madras is famous. This *Cassia* must not be confounded with the *Acacias* (popularly mimosas) so common in the jungles of the arid regions of the north and east of the island, the marked characteristics of which are formidable thorns and beautifully coloured flowers of sweet odour. The bark of one of these, *Acacia leucophloea*, is amongst the minor forest produce which Col. Clarke desires should contribute something to the public revenue as well as to the profit of the persons who in stripping the bark, kill the trees. In this case, but much more in the practice of breaking down the branches of the palu tree to secure the edible fruit, the natives exemplify the moral of the fable of the goose and the golden eggs. Stringent rules, especially as regards the palu trees, can be defended on the ground of benevolent regard for the interests of the reckless natives themselves.

On the whole the report indicates satisfactory progress:—

The transactions of this Department show a considerable increase in 1889 over those in 1888, the value of timber and other produce sold being R280,199, as against R173,820; while the value of stock in depôt has increased by R83,796, being R244,264, as against R160,468 at the end of 1888.

Details of stocks of timber and firewood in the depôts of the various Provinces are given, and Col. Clarke observes:—

It is satisfactory to note that only in one Province—Uva—is the stock less than in the previous year, due in this case to increased sales involving the emptying of the depôt more quickly than it could be replenished. By adding the value of the stock in depôt to the value of sales for the two years respectively, it appears that the timber transactions amounted in 1888 to R333,849, and in 1889 to R524,380, thus showing an increase of R190,531. As regards the actual sales, I shall now endeavour to show, so far as the very unsatisfactory returns permit, that there has been increased activity in sales of timber, firewood, charcoal, bamboos, and cane, and minor forest produce.

Then follow the details, with the remark that the increase of firewood supplied by private forests is not taken into account, any more than "Drift and waif wood and confiscated forest produce." Col. Clarke then deals with returns of timber imports and exports supplied by the Customs Department:—

Excepting satinwood, it will be seen that the imports consist chiefly of timbers which have equally good representatives in this island. Teak, the chief import, has now risen in price to such an extent that a considerable saving would be effected by substituting indigenous timbers for it. For ordinary railway construction, balmilla, satin, milla, and palu would all be suitable, while for railway panneling, halmilla, margosa, hulanhik, paanaka, and many others would answer the purpose of teak. Flowered satin cannot be excelled for panneling.

Large quantities of teak from Burma, and "white cedar" from Cochin, are imported for oil-cask staves and shooks, but experiments are now being conducted to find cheaper substitutes for such purposes. Halmilla is considered by oil-cask makers as good, if not better than teak. The price offered to the Department by the oil-mill proprietors for halmilla is not, however so high as those obtainable from Indian traders. Timber traders in Burma and elsewhere are constantly sending trial timbers, but up to the present, whether owing to brittleness, porosity, or to colouring matter, none have been accepted. It is imperative that something should be done to prevent this trade passing out of the Island, and a circular was sent to the Provincial Forest officers inquiring what woods would be likely to be suitable, and asking them to send enough timber of the species selected to make half a dozen casks. As yet only doon has been submitted to trial, and a report on its merits is now awaited.
