 ESSENTIAL OILS.—Small sales of Citronella oil are reported at 3d, and of Lemongra-s oil at 1 9-16ths d. per oz on the pot.

THE EXPORT TRADE OF CHINA FOR 1891.

was the highest in value ever known, even tea showing a large increase over the previous year. Curiously enough India takes an appreciable quantity of China green tea. We quote as follows from the *China Mail*:—

The total value of exports abroad for the year aggregated Hk. Tls. 100,947,000, which is the highest point ever reached, and shows an advance over the figures of 1890 of Hk. Tls. 13,800,000. The majority of products enumerated in the table of exports on page 10 compare very favourably with the shipments of the previous year; but the three great staples—tea, silk and cotton—contributed most to the increase in the total given above. In value and quantity the grain in favour of 1891 yielded by teas of all sorts was Hk. Tls. 4,365,000. White and yellow silk added Hk. Tls. 5,928,000, with 24,574 piculs over the export given in last year's returns, and silk piece goods, Hk. Tls. 1,143,000, representing 2,028 piculs above the total of the previous twelvemonth; while raw cotton, with an increased export to Japan of 56,698 piculs over 1890, added Hk. Tls. 852,000. Wool, camels' and sheep's, from the northern ports exceeded the shipments of 1890 by 36,625 piculs, estimated at Hk. Tls. 258,000. The other articles, which should be noted as showing conspicuous gains over previous statistics, are paper for Chinese consumption abroad, camphor from Formosa, matting from Canton, and musk—each of these exports contributing more than Hk. Tl. 170,000 over the figures of the previous year to the total for 1891.

The shipments of raw silk were: white and yellow silk, 84,948 piculs; wild silk, 17,043 piculs; and refuse silk, 60,703 piculs—these amounts being much over those of 1890, a low rate of exchange favouring the consumption of Chinese silks in Europe.

The export of tea of all kinds, including the shipments from Kowloon and Lappa to Hongkong and Macao, amounted to 1,750,034 piculs, showing an advance of 84,638 piculs over the total for 1890. From Kowloon and Lappa the export of black tea in junks to Hongkong and Macao is more than double that of the previous year, the large increase being ascribed to a reduction in the provincial duty on that article when shipped by junks. The addition of this junk-borne tea to the total quantity sent abroad in foreign vessels raises the export to more than the shipments of 1890, and for the time being has arrested the decline which characterised the black tea trade of recent years, the excess in favour of this year being 52,565 piculs above the crop of 1890, which is returned at 1,149,311 piculs. Green tea also shows an improvement of 7,256 piculs, and brick tea for Russian account 31,693 piculs. Russia appears to be the only large market in Europe where the demand for China black tea is maintain-d. Supplies continue to be sent by sea in increasing quantities, shipments having risen from 93,467 piculs in 1887 to 189,025 piculs, or double the quantity; and while the consignments by sea and land to Russia in 1887 aggregated 267,000 piculs, they now amount to 287,000 piculs, representing a gain of over 20,000 piculs. It is worthy of note that the demand for China tea (chiefly green) from India has doubled within the last five years—13,947 piculs being credited to the Empire in 1886, against 30,819 piculs during the year under notice.

From the *North-China Herald* we take the figures for tea exports, with comments on the still great tea trade of China:—

	1891.	1890.
	Hk. Tls.	Hk. Tls.
Tea Black.....	24,979,259	20,579,818
„ Green.....	3,545,911	3,700,488
„ Brick.....	2,328,755	2,136,720

The three great staples, tea, silk, and cotton, gave, it will be seen, the highest increases, Japan being the most eager customer for cotton; the large increase in silk is to be attributed to a great extent to the lowness of exchange; but the large increase in the value of the black tea exported will come as a surprise to many. Judging by the falling-off in the demand for China tea in England, we have come to think of the whole China trade in tea as a declining one; but fortunately for China she has one customer, Russia, that has not yet been affected by the craze for Indian and Ceylon teas, and thus the export for 1891—although none of the numerous suggestions that foreigners have made for the rehabilitation of the trade have been put into practice—from all China shows an actual advance of pls. 52,565 over that in 1890. Green tea also shows an improvement of pls. 7,256, and brick tea for Russian account pls. 31,693. The proportion of tea sent to Russia by steamer via Odessa continues to increase rapidly, for while only pls. 93,500 were sent by that route in 1887, rather more than double that quantity took that route in 1891. Of the large consumers of tea we find that the principal were in 1891:—

Russia, Siberia, and Russian Manchuria.....	Pls. 636,000
Great Britain, Hongkong, and India.....	540,000
United States.....	276,000
Australia and New Zealand.....	106,000

In the Russian figures are included some pls. 330,000 of brick and tablet tea; but they do not include some p's. 50,000, which are sent from Hankow up the Han river for overland carriage to Siberia. The total export to foreign countries of pls. 1,750,034 in 1891 has to be compared with pls. 2,217,295 in 1886, the largest in the past ten years.

THE ALLEGED QUININE SYNDICATE.

We have received the following from Germaay, dated, by the way, April 1:—"A project has been formed by London importers to establish, in conjunction with the Amsterdam importers, a ring for the maintenance of the price of quinine. The capital to be invested in this object is 300,000 florins (25,000l.). The representative of a large London firm has been staying in Amsterdam since the beginning of this week to bring the project to a conclusion. If he succeeds in his object the quinine-makers might easily be forced, through the reticence of the bark-holders, to ask for quinine a price very much in excess of the present one. It is reported from America, by certain persons well acquainted with the market, that some German quinine-makers have sold large quantities of quinine (1,500,000 oz.) for future delivery at from 1 1/2 to 1 1/2 cents, c.i.f. New York. Such sales would prevent any substantial increase in the price of quinine, as quantities of such magnitude placed upon the market at regular intervals would provide second-hand holders with an abundance of cheap material."

THE AMSTERDAM VIEW OF IT.

We have made inquiries from some of the best-informed persons in Amsterdam concerning the truth of the report above alluded to, and are told that it is believed to be a fact that a London gentleman interested in cinchona has tried to persuade the chief importers in Holland to consent to the formation of a combination, to embrace planters in Java, Ceylon, and British India, for the object of strengthening the bark market. It is not denied that "something like a meeting" may have been held with this object just before the last Amsterdam bark sales, and that this meeting may have had something to do with the

firmness of certain importers, which led to the buying-in of about one-third of the bark catalogued. But, notwithstanding all this, the representatives of the Java planters in Holland, without it is believed, a single exception, are convinced that if the Java growers were now to ally themselves with those of Ceylon, they would in the words of the fit Napoleon—"s'allier à un cadavre"—bind themselves to a corpse, and commit a fatal blunder. An Anglo-Dutch syndicate therefore, seems to be out of the question. If any combination is formed in Amsterdam it will consist on Java planters only.—*Chemist and Druggist*, April 9.

FOOD OF THE GODS.

How to make a perfect cup of chocolate, is an art not mastered in many households. A cup of chocolate as served by Menier or Maillard, is a very different thing from a cup prepared by Bridget, in the early hours of the morning and served to one who must hasten for the morning train. The Directeur of the American branch of Chocolat-Menier, of which over 30,000,000 pounds are consumed annually, gives the following directions for preparing Menier Chocolate as a beverage: "For each cup desired, break into small pieces one-half of the six divisions into which every half-pound package is divided. Place in a saucepan and add sufficient boiling water to reduce the chocolate to a smooth paste by stirring it constantly with a wooden spoon over a brisk fire. When thoroughly dissolved add a cup of unboiled milk, either cold or warm, and boil for about four minutes, stirring it frequently. Serve while hot and you will have a perfect cup of chocolate."—*American Grocer*.

CEYLON TEA PLANTATIONS COMPANY, (LIMITED)

Report of the Directors to be submitted at the fifth annual general meeting of Shareholders to be held at Winchester House, Old Broad Street, E.C., on Friday, 29th April, 1891, at 2.30 p.m.

The Directors have the pleasure to submit the General Balance Sheet and Profit and Loss Account for the year ending 31st December, 1891, duly audited.

The net amount at credit of Profit and Loss Account, including Balance brought forward at 31st December 1890, and after providing for General Expenses, Directors' Fees, Income Tax, &c., is	31,439	3	3
An interim dividend of 7 per cent. on the Ordinary Shares was paid 27th October, 1891	10,254	6	0
It is proposed to pay a final dividend of 8 per cent. on the Ordinary Shares (making 15 per cent. in all, free of Income Tax) which will absorb	11,727	4	0
A Dividend on the 7 per cent. Preference Shares was paid on 30th June, 1891	1,018	3	11
A Dividend on the 7 per cent. Preference Shares was paid on 31st December, 1891	1,732	13	2
It is proposed to add to Reserve Fund	5,493	8	0
And to carry forward to next year a balance of	1,213	8	2
	31,439	3	3

The Directors are pleased to be in a position for the fifth consecutive year to recommend a total dividend of Fifteen per cent. on the Ordinary Shares. It is proposed to place £5,193 8s 0d to the Reserve Account, making that Fund up to £20,000, and to carry forward £1,213 8s 2d to next year. The gross average price realized for the Company's Teas, sold in London, was 94d per lb., this being

13d per lb. under that of 1890, but the net cost of production was 3d per lb. less than that of previous year.

There were 5,090 acres from which leaf was plucked, and this area yield 414 lb. per acre, the crop being as under:—

Tea from Company's Estates.	Bought Leaf Tea.	Tea manufactured for others.	Total.
lb.	lb.	lb.	lb.
2,086,291	856,565	1,318,735	4,291,591

The Company's properties consist of the following:—

Descriptions.	Acreages.	
	At 31st Dec. 1891.	Purchased 1st Jan. 1892.
Tea in bearing ...	5,090	303
„ not in bearing ...	2,245	301
„ seed ...	27	—
„ to be planted 1892 ...	82	—
Coffee ...	60	—
Jungle and timber clearings ...	1,789	—
Patewa and waste land ...	363	34
Totals ...	9,656	638
		10,294

It is gratifying to the Directors to be able to assure the Shareholders that the Company's properties are in excellent condition. The Factory accommodation and machinery, which were scarcely equal to our requirements during the past year, are now being increased to meet the largely-expanded business of the Company.

The Directors have again to record their high appreciation of the services rendered by the various Officers of the Company in Ceylon and London.

Mr. G. A. Talbot, the Company's Manager in Ceylon, having been granted leave, it is proposed that he be appointed a Director during his stay in England in the place of Mr. Henry Tod, who has resigned his seat on the Board.

Mr. R. H. Miller, of Messrs. Harper Bros., Auditor, retires from office, but offers himself for re-election.

DAVID REID, Chairman.

London, 14th April 1892.

WHAT DR. LEMON WILL DO?

Do you want to know the name of one of the best all around household doctors, and certainly the cheapest that can be found in any country?

It is Dr. Lemon. Yes, an ordinary, sour, yellow lemon, which you can buy at any grocery for a few cents.

Here are some of the things Dr. Lemon will do for you if you give him a chance,

Squeeze him into a glass of water every morning and drink him with very little sugar. He will keep your stomach in the best of order and never let Mr. Dyspepsia, whom he hates cordially, get into it.

If you have dark hair and it seems to be falling out, cut off a slice of the doctor and rub him on your scalp. He will stop that little trouble promptly.

Squeeze him into a quart of milk and he will give you a mixture to rub on your face night and morning and get a complexion like a princess.

Pour him into an equal quantity of glycerine and rub your hands with the mixture before going to bed. If you don't mind sleeping with gloves on that is better still and helps the doctor considerably in his task of whitening your hands. In the morning wash your hands thoroughly in warm water and apply the doctor again pure, but only a few drops of him this time. You must not keep this up too long or your hands will show such a dazzling whiteness as to make all the other young ladies in the vicinity jealous.

If you have a bad headache cut Dr. Lemon into slices and rub these along your temples. The pain will not be long disappearing—or at least in growing easier to bear.

If a bee or an insect stings you clap a few drops of the doctor on to the spot and you will find yourself he better for it.

If you have a troublesome corn the doctor can be again put to good account by rubbing him on the toe after you have taken a hot bath, and cut away as much as possible of the troublesome intruder.

Besides all this the doctor is always ready to sacrifice himself in the cause of Russian tea—slice him in without sugar—or in the preparation of old-fashioned lemonade, than which no drink is more wholesome.

Altogether Dr. Lemon is an individual few people can afford to get along without.—*Exchange.*

PLANTING IN THE NEW HEBRIDES.

From a letter dated to a gentleman in Colombo, we quote as follows.—

"Santo, New Hebrides, Feb. 10th, 1892.

"Just a line to let you know that we are applying to Japan for coolies, and as far as we can see at present, any number can be had for the cost of transport and about sixpence per diem for their work.

"It may not have struck you that in these islands a man has advantages that cannot be formed elsewhere.

"No restrictions with regard to imported labour which he can get from China, Japan, Malay or anywhere at his own price and on his own terms.

"If a few planters came out we could send our own chartered vessels and bring as many labourers as we require, and as to the question of titles to the land, that would be perfectly secure as we could get the islands annexed without trouble if settlers were here, and you have time to make a fortune or lay the foundation of one before there are too many laws or restrictions. Sugar planters could send their labour vessels up to Japan and load up thousands and there is nothing to prevent going to work at once. This end of Santo, Malo and Mallicolla has good low land for sugar and the natives as you are aware are anxious to sell for what they can get.

"We have been pushing the authorities for annexation, and no doubt shall get it in time, but it is questionable whether we should not be acting more to our advantage if we sent a vessel up to Japan for 200 coolies.

"We are getting islanders now by the mail steamer under the same laws that enable the mission stations to obtain native cooks and teachers from other islands.

"We pay their passages by steamer and the expense is less than in any part of the world, £3 per head and no restrictions. I think we can get them from Japan under £5 per head. What more do the planters want? There is no drought here to burn up the cane fields, and no heavy timber to clear.

"Price of land about one penny per acre cash or 100 acres for a musket and you would never be troubled by seeing a native unless you encourage them and come to trade or work."

COCOA.

By JOSEPH HATTON.

(Illustrated by W. H. Margeson.)

"Cocoa-leaf, coco-nut, cocoa," remarks a technical authority, "it requires thought before one can rightly attribute the properties and uses of these vegetable products." Many persons think cocoa-nibs are made from a root, others associate them with the coco-nut palm. I could hardly realize the existence of so much ignorance or indifference about one of the most familiar of popular beverages and confections until I opened an established dictionary and found an engraving of the coco-nut palm illustrating the word "cocoa." The great Encyclopedias do not however leave one in doubt. Cocoa is the product of the seeds of the *Theobroma* (Food of the Gods) *cacao*. The tree flourishes in Mexico, Brazil, the West India Islands, Columbia, Ecuador. The finest qualities are grown in the island of Trinidad, and in Venezuela. Caracas has given its name to a popular brand. Of late years, Ceylon also has produced a bean of high character. A drawing made in a

leafy corner of that sunny island supplies us with our initial illustration. The *Theobroma cacao*, better known as the cocoa tree, rises with a bare stem to the height of six or seven feet, and then dividing into many branches climbs upwards some ten or fifteen feet higher. The branches spread out not unlike an oak, but with a dark green leaf something of the shape and character of a plum tree. The fruit is a large pod that hangs pendulous from the tree by a tough timber stalk. Its surface is grained and hard. At first the pods are green, but as they ripen they become yellow, the side next the sun red. The tree attains its full vigour in seven or eight years, and yields two principal crops in the year. There is not what may be called a harvest time, not in the sense of our cutting of corn or the vintage in France. The pods do not ripen all at the same time. One or two from a tree are cut as they appear to the eye of the expert as ready for stripping. These are gathered together in heaps, and by and by the plantation hands, men and women, burst open the pods, strip away the rind and extract the nuts, each pod containing a hundred or more packed in the closest compass. The nuts are then laid out upon mats to dry, after which they are packed for exportation in bags, each of which holds about 112 lb.

Recently, in company with a friend, I saw vast quantities of the luscious-looking bean turned out of its Oriental packing in "the cocoa metropolis" of the West of England, and watched its gradual conversion into that particular "food of the gods" which has become universal among men. Bags from Trinidad, Venezuela, Ceylon and other cocoa regions were being swung through the air into the storage and grinding room of Fry's factories at Bristol. Pausing in one of the galleries that unite the different factories to watch the busy scene below us, we find ourselves on a level with the vane of St. Bartholomew's Church steeple. The sacred edifice is literally embedded in the secular buildings that have grown up all round it. The children pouring out of the church-schools might be part of the working-folk of the factory going to dinner. They all look free and happy and well nurtured, the working children as well as the scholars with their books and slates. St. Bartholomew's is one of those out-of-the-way churches which you often find in old cities lost in the noisy thoroughfares of growing industries, their congregations dispersed among other houses of prayer. A new site will evidently have to be found for St. Bartholomew's. From the first it would seem as if trade and commerce had been struggling at Bristol for supremacy with ecclesiasticism. In the fifteenth century it was "a city of towers," eighty monasteries and churches crowning its embowered walls. Prior to the edicts of Henry VIII., it was indeed more or less an ecclesiastical city, crowded with devotional guilds, hospitals, hermitages, churches, chantries, the population picturesque with the typical costumes of Franciscan, Benedictine, Carmelite and Dominican monks, priests, and friars, the air (says one historian) "thick with clouds of incense." If the possible conversion of the site of St. Bartholomew's into business purposes should strike a note of regret in some minds we would hasten to offer the compensating fact of the annexation of the county gaol for the firm's stables and timber stores. Indeed the exigencies of cocoa manufacture seems to have compelled a general making free with the western city. Fry's brassplate meets the eye in the various business quarters of the city, setting up fresh landmarks for old ones, and filling the air with a perfume at some points hardly less noticeable than was the incense of Bristol's olden days.

We had paused at the open door of the roasting room, not only to witness the unloading of tropical cargoes but to take a glance over the red-tiled roofs and gabled houses of Bristol away to St. Paul's in Portland Square, busy streets right and left and at all points, suggestions of the historic character of the famous old city and its merchant venturers, its battles for king and parliament, its royal and civil banquetings, its reform riots, its literary coteries, and its varied enterprises maritime and otherwise.

A fine old city Bristol, full of ancient landmarks, rich in architectural treasures, a vein of romance and poetry running right through its history from the days when Cabot sailed out of its picturesque port to discover new worlds to the present time when ships from every sea float upon her lazy tides and moor themselves in the very heart of the city as they do to this day in Amsterdam and Yarmouth. But our courteous guide awaits us and we must postpone for the time being such wayside reflection as do not come within the immediate focus of our work. The bags already mentioned are upon this floor, emptied into several roasters, cylindrical pans slowly revolving over open coke fires. The bean is stirred now and then by experienced attendants who can tell by the flavour of the vapour that arises from them when the operation is complete. This first process is the most important of the series of treatments which the cocoa bean undergoes before it is ready for the breakfast or dessert table. A bad roast is fatal. The bean is destroyed. But a bad roast is a very exceptional incident. From the roasters the beans are conveyed to large hoppers connected with the floors beneath by shoots that convey the roasted bean to the winnowing room. Here a machine cracks the nut, removing its hard outer skin or shell, and both are together hauled to a point over the winnower where the blowers separate the husk from the nut, and the latter now being thoroughly cleaned from all *débris* of the shell becomes what we know as cocoa-nibs which are now ready for grinding.

As there are four main factories, each more or less reproductions of the other, the various departments are known in the works by numbers, but for the better understanding of the reader we prefer to give them proper names. Thus from the grinding room we come to the sugar-grinding room, which is incidental as it were to the next operation which belongs both to the manufacture of chocolate and the ordinary drinking cocoa. We might now be in one of the floors of a flour-mill, so white is the atmosphere, so ghost-like the workpeople. Tons of loaf-sugar are here ground and sifted until it is as fine as the finest flour, and as soft and silky to the touch. As the salt-sea waves leave their flavour upon the lips, so does the flying dust of the sugar-room leave behind its sweet if not cloying flavour; and one also leaves the room as to beard a trifle grayer than one entered it. This little world of "sweetness and white" gives upon the pan or pug-mill room, where the cocoa-nibs, in great revolving pans, are mixed with the fine-dressed sugar and pounded between granite rollers into paste. No water is used, but the material is kept warm. There is a large percentage of oil in cocoa-nibs, and encouraged by a gentle heat it is brought forth, and thus the nut or bean becomes liquefied. Sugar is added until the cocoa is of the consistency of dough. The beds of the revolving pans are of granite like the rollers. Iron would set up a chemical condition inimical to the delicate flavour of the product. When the nibs find their way into these heated mills they are hard and brittle, and one might expect to see them ground into powder. Not so; they become paste as we have seen, and in this form are made to perform all kinds of strange evolutions. It is whirled hither and thither in the great pans, making graceful curves, now ejected in liquid columns like miniature Severn "bores" or enormous snakes, rich brown tortuous never-ending boa constrictors; thence it goes into batteries of rollers where it is conducted over granite cylinders, flattened out and rolled by a series of ingenious machines invented and made in Paris, and comes out chocolate, except that it has to cool. This hardens the oil of the nib, called "cocoa butter," and the chocolate is then ready to be prepared for use.

Skipping the floor we have just described a certain proportion of the ground nibs come to the department to which we next descend, falling into hoppers that make the powder finer and finer. For storage purposes there is a curious little machine here, originally made for pressing patent fuel into blocks. Later the inventor applied it to cocoa in this way. The

material is placed in an automatic metal box, the lid is closed, then by pressure the bottom is forced upwards until the lid opens to let out the compressed brick of cocoa which is then stored. Passing this little machine we are in one of the most picturesque departments of the factory. There is no more artistic form than that of a wheel, nothing in continual motion that gives a greater idea of power. The avenging Jupiter could think of no punishment so persistent as that of the whirling wheel to which Mercury bound the banished Ixion. In every manufactory the wheel is familiar enough. It is the motor of the place, the guide and controller of miles of straps and bands; it is beginning and never-ending in almost every nook and corner; but we have rarely seen it in such striking evidence as in one particular department of these great cocoa factories. Here on this floor of hoppers into which the ground nibs are deposited to make concentrated cocoa the sense is bewildered, the mind fascinated, by the incessant repetition of wheels. They fill the ceilings in two or three vast circles, that have their revolving satellites like moons each on its own axis, and each governed by the master wheels. The curious part of the scene for a novice is literally a ceiling of moving wheels as well as a continuation of the same right, left, and centre. Watch them for any length of time and you might find yourself presently going round and round with them until you whirled yourself out of existence like the grating madden in the fairy-tale. To the turn of these many wheels the mills perform their eccentric motion until the chocolate is sufficiently ground. It is then collected in batches and placed in canvas bags, which are packed into the receivers of a long array of hydraulic presses that also constitute a very interesting scene. At first blush you might think you had strayed into the counting house of the firm of Gogs and Magog whose letter-copying presses stopped the way; but these double-handled machines are worked by a power greater than that of a thousand Gogs and Magogs with an army of Polyphemuses thrown in. The canvas bags subjected to hydraulic pressure give forth most of the oil which the cocoa contains. It runs off into tin pans and leaves behind the dry pure cocoa of commerce. The oil is of a dark brown colour, but as it cools it gradually becomes white and in solid blocks. Later we come upon it turned out of the tins "cocoa butter" in great solid pats. On this and other floors there are large artificial cooling rooms, for which there is on the ground floor extensive frost-generating machinery on the brine and ammonia system. The shafts go up through the various factories as do also the lifts or elevators. Even in summer days the artificial snow has to be collected and removed from the freezing closets.

Passing through the rooms devoted to the mixing of miscellaneous chocolates we now leave what may be called the manufacturing departments. We have not thought it necessary to mention the separate treatment of different varieties of bean, Trinidad, Caracas, Ceylon, and others. The process does not vary. In quitting the grinding, winnowing, milling, pressing and other operations we leave behind us the men's work. Not that the master hands do not appear in the lighter sections of the factories, but girls and women predominate in the later departments which belong to the production of chocolate creams and fancy confections. On our way to the ground floors we come upon one of the rooms set apart for the filling of cocoa tins and packets. Here crowds of girls are weighing and packing the brown powder. They are a healthy, well-dressed company of young women, and of a more than ordinary look of intelligence. The ground floor of the factory is devoted to many varied purposes. First, we come upon the busy scene of sugar boiling, long rows of boilers, long rows of men in white French caps and aprons. From the boilers the sugar is emptied upon great stone slabs where a little army of more white-capped labourers stir and beat up the cream-like compound with white wooden spades. Thus prepared it is transferred to the moulds; and this brings us to another department that repeats the atmosphere of the sugar mill. Moulds for iron castings, as you are aware, are made of sand.

The creamy sugar which we have seen boiled and manipulated for the next process is poured into moulds made of starch. We find ourselves in the midst of stacks upon stacks of these square moulds, flanked by bench after bench of men and boy moulders. Wherever labour is divided by machinery or hand, one operation dependent upon another, there is no time for idleness. The machine, human or otherwise, must be kept going. Here moulds are filled and emptied with a steady and effective monotony. On one side the sugar cream is poured into the moulds from handy funnels; on the other, when solidified, resultant creams are collected for ultimate coating with chocolate. Leaving the moulding rooms we seem to drift to and fro into various other departments where thousands of trained dainty fingers are giving the finishing touches to fancy forms of creams and plain chocolates that gradually develop into all kinds of boxes, from the cheap popular little *bonbon* boxes to the handsome and artistically arrayed and decorated cabinet of mixed sweets fit for the notice of a Princess.

And now once more in the fresh air we make the acquaintance of the engines and boilers all on the most perfect scale, even to the oldest mechanical servant of the firm, a great old beam engine of the melancholy mad-elephant kind described by Dickens. It has been in use over fifty years, and in its present site was erected the first engine that Boulton and Watt introduced to Bristol. The old-fashioned but powerful engine has been supplemented by many others. It takes eight powerful sets to drive the works in these days. They would be a surprise to the writer of a paragraph in the *Bury and Norwich Post*, of June 6, 1798, could he once more visit the glimpses of the moon. "Since the great improvement of the steam engine," he wrote on that particular date, "it is astonishing to what a variety of manufactures this useful machine has been applied; yet it does not a little excite our surprise that one is used for the trifling object of grinding chocolate; it is, however, a fact, or at least we are credibly informed, that Mr. Fry of Bristol, the maker of the famous Churchman's chocolate, has in his new manufactory one of these engines (improved by Mr. Jones, an ingenious millwright of that city) for the sole purpose of manufacturing chocolate and cocoa. Either the consumption of this little article must far exceed our ideas, or, which we think much more likely, a very large portion of what is drunk in this kingdom must be made by him." This is the very thought that occurs to us after walking for hours over only one of the four main factories that rise aloft tier upon tier, with their tall smokestack, giving employment to more than two thousand people. Fry's had been established some half a century when the *Norwich* paragraphist quipped about the "little article" of cocoa, and yet with four factories *en bloc* and several outsiders there is still room for competition in the supply of the United Kingdom, which in 1891 paid duty on 21,601,825 lb.

The water supply for the eight sets of engines is obtained from the river Frome which runs under the factories a prisoner beneath stone arches, the old story of the bright and cheery brook arrested on its way through pleasant meadows for various industrial purposes, dammed up to turn a mill, then released for a brief freedom to be the playmate of village children, to floating tiny boats and murmuring beneath ancient bridges, finally, to be caught and imprisoned under city roads and compelled to feed the boilers of hot and steaming-engine houses. If the Frome were sentient, the strong child of the Avon might be content to know that it was helping to produce the pretty boxes of chocolate creams that come to happy children at Christmas time, not to mention those canisters of cocoa extract that give wholesome drink to thousands of busy people. "We shall want a larger supply than the Frome can give us," remarks our guide, "when the new factory is finished," and he draws our attention *en passant* to a block of buildings in course of erection. Here we have an opportunity of noting the principle upon which all the factories are constructed. Each floor is supported by iron pillars, with girders and cross girders, the spaces between the girders being

filled with slate pavements; where stone is used it is Cornish granite. The completion of the new factory will increase the number of hands employed to between two and three thousand men, women and girls. It is a surprising story, the multifarious operations that belong to the production of a cup of cocoa or a chocolate cream.

Incidentally we ought to mention that traversing one of these factories and parts of the other four, making excursions over bridges from street to street, we have noted with pleasure evidences of the care both physical and moral which the firm takes of its work-people, more particularly of the younger members of their staff. More than once we have passed through meal-rooms and school-rooms. The firm provides the means of cooking in the factories, and the great majority of the young people only leave the works to buy their daily food or to supplement the tea and dinner baskets with some trifles from the adjacent markets. In one of the main factories we came upon a large and handsome lecture room which is also once a week used as a night school, once for boys and once for girls, the firm providing them with teachers. Every morning at a quarter to nine, one of the seniors of the firm attends in the lecture room and reads a chapter in the Bible; and a hymn is also read. The hall is occasionally lent to them for meetings of their own, the employers and employed are evidently on the best and most friendly terms with each other. There are also sick clubs and other organizations of great usefulness connected with the factories, and indeed the whole concern is conducted as if the persons engaged belong to a special community outside and apart from the busy city to which it has given the name of "the cocoa metropolis."

We have already seen how the growth of great industries has compelled manufacturers to extend their businesses in directions never contemplated at the outset. Fry's is a remarkable instance. Besides chocolate makers, they are engineers, boxmakers, carpenters, tinworkers, and are concerned in various other occupations. Beyond the factories we have described, we found ourselves driving in cabs and tramping through the ancient ways, visiting other concerns that belong to them and are an integral part of their main business. Our first visit was to Wapping, where they have a steam saw-mill with all kinds of implements, circular, whip and other saws, planers, nailers, and what not on the newest principles. The nailing-machines are ingenious contrivances; they work automatically, are fed with nails and supplied with boxes in sections which, passed from hand to hand, from machine to machine, are completed with remarkable rapidity. There is a new saw here, circular and pliable, which cuts two planks at one operation and does not need to be fed; one man gives it occasional attention. Fenced off in the mill are several printing machines for labelling the box lids. How many separate packets these boxes are made to hold it would be difficult to say, but the firm in its Wapping carpentry turn out some thousand dozens of them every week. After inspecting the mechanical work of the mill, we entered the store-rooms to find what almost seemed to be acres of boxes ready for use.

From Wapping we drove to the county gaol. It is many years since the present writer visited this once formidable house of detention, the occasion being the arrest of Sir William Don, while that "tall monumental warning" of reckless expenditure (as he called himself in one of his local speeches) was fulfilling an engagement at the Bristol Theatre in King Street. Those were the days before the abolition of arrest for debt, when the bailiff though shorn of much of his power was still a formidable officer. Sir William was a good deal put out when he was not allowed to finish the play in which he was acting; but great sympathy was shown for him, and he found exceptional accommodation at the castle, where the Governor, Mr. Gardener, gave up to him one of his own private rooms and made his brief incarceration as pleasant to him as possible. This included a very agreeable luncheon the next day, at which I was a guest. Sir William related to us some of his numerous adventures. One may be excused after all these years for feeling a curio

sensation at finding the little garden, in which one had walked and smoked after that breakfast with Sir William and the Governor, now occupied as stables for the large working team of Messrs. Fry, and part of the castle turned into a store for their box timber. But there are many other remarkable changes in Bristol, and it seems as if our guide had a curious facility for impressing them upon us. He takes us to Quay Street and introduces us to the card box factory of the firm. We had already in the stationery department of the main factory seen the cardboards cut into shape by various curious little machines and prepared for this outer shop. Here the boxes are made and decorated and the tops embellished in gold with the names of the firm. The atmosphere of one of the *ateliers* was full of gold leaf. Stray bits of it here and there looked like golden butterflies, their fanciful motion aided once in a way as to realistic effect by a ray of sunshine that came in through an open window. Throughout this building there were heard the cheerful voices of girls whose division of labour began with a plain bit of cut cardboard and ended in the perfected box.

Once more threading the traffic of the city, we come to premises where the firm has converted a comparatively new building into a store chiefly used for the Christmas fancy trade; here cases are being filled with chocolate dainties by scores of busy hands, while one floor is dedicated to the making of "orange flavoured," and a very attractive operation it would prove, we fancy, to most young people. Stacks of loaf sugar and baskets full of oranges are being used up. The oranges having been rubbed upon the sugar to extract the flavour of the rind, they are then returned to the baskets which are emptied into presses made on the principle of the cider-press. The juice is squeezed out with the impregnated sugar and the whole place is full of the aroma—"orange groves and music from sweet lutes" might be added by the imaginative writer.

From Quay Street we pass on to Nelson Street, and here, like the cuckoo, the firm occupies another nest built for other birds. This time it is the old Trade School that has been annexed for a tin industry. The shops are fitted with remarkable machines that deal with tin as easily as if it were paper, cutting it, twisting it, making it into canisters round and square with the greatest ease, but not without a certain amount of noise and clatter. For instance, there are machines that at one operation make the tops and bottoms of canisters, embossing them at the same time with everlasting labels.

There are other minor industries in which the firm is engaged—they make much of their own machinery with the exception of castings, for instance—but it would need a week's stay at Bristol and an entire magazine to follow the ins and outs of this cocoa and chocolate industry. We have said nothing about its offices, its carts, its shipping arrangements, little about its history; nor paused to mention the political and judicial honours that belong to the family; these things are part of the history of Bristol; but luxuriously ensconced in a Great Western railway carriage, with a rack full of literary souvenirs of the western country, and one of those bright boxes of sweets made from the beans which the dusky maidens are collecting in our first picture, it would have been impossible not to think of a few parting words about the literature of this "food for the gods" that takes so many people to prepare and provides so many with pleasant refreshment.

White's in St. James's is the direct successor of White's Chocolate House, which is represented with St. James's Palace in the fourth plate of Hogarth's *Rake's Progress*. Chocolate was the excuse, gaming the object of White's. Yet the beverage was much drunk and very fashionable in the days of *The Tatler* and *Spectator*. The Cocoa Tree was also in St. James's Street. It was a Tory house. De Foe mentions it to remark that "a Whig would no more go to the Cocoa Tree, than a Tory would be seen at the Coffee House of St. James's." Eventually the Cocoa Tree, like many of the taverns and coffee houses of the time, developed into a club. As an instance of

the familiar terms which many of the men of fashion permitted between themselves and the menials of these famous rendezvous, it is related that a favourite waiter named Samuel Spring, having occasion to write to George IV. when he was Prince of Wales, commenced his letter in these words: "Sam, the waiter at the Cocoa Tree, presents his compliments to the Prince of Wales, &c." Next day the Prince saw Sam, and after a quiet rebuke as to the freedom of the style of his note, remarked: "This may be all very well between you and me, Sam, but you will find it will not do with the Norfolks and the Arundels."

These passing thoughts with a few mental memoranda as to the literature of White's, and the Chocolate House, have scarcely been supplemented by a glance at the evening papers when we run smoothly in a Frith's Railway Station, having made the journey of a hundred and eighteen miles in the time that it would have taken the wits of St. James's to get from the Cocoa Tree to Richmond.

A PERAK COFFEE ESTATE.

The following notes by Sir Graeme Elphinstone are on the Waterloo Arabian Coffee Estate, Perak, and are from the *Perak Government Gazette* :—

ELEVATION.—The elevation of the average of the present opened area of Waterloo, and also of the surrounding forest, which I consider most suitable for the successful cultivation of Arabian coffee, is some 2,300 feet.

This elevation is similar to the elevation of what in Ceylon was termed the lower districts, but, although similar in that respect, there is a very marked difference in the temperature, and certainly the comparison is favourable to Waterloo. I presume that the comparative coolness of the Waterloo climate is mainly attributable to the fact of there being so large an adjacent area of high mountain ranges covered with virgin forest, and also to the close proximity of the sea.

Anyhow, there is no gainsaying the fact that at the elevation of the present bungalow, some 1,850 feet, the climate is both pleasant and salubrious.

QUALITY OF SOIL.—The present opened area of Waterloo is in extent some 270 acres. In the opened land there are four distinctly different qualities of soil, and all of them seem to be very suitable for the successful growth of coffee. Dr. Ridley, who visited Waterloo last month, was highly pleased with the nature of the soils he passed through, and agreed with my opinion as to their fertility; there is a very good average depth all over the estate of some 20 feet (this is a much greater average depth than in any district in Ceylon). I cannot speak with any certainty of what the soils may be deficient in, as I have not as yet been able to get samples analysed; but if, as both Dr. Ridley and I believe, there may be a deficiency in lime, this deficiency can easily be supplied from the adjacent lime-kilns. However, that is as yet merely a conjecture, and at no very distant date I hope to have more certain information to work upon.

ASPECT.—In Ceylon we always preferred an eastern aspect, and here I find, from careful observation, that it is of equal importance. Waterloo has an almost uniform eastern aspect, and this, I consider, reflects considerable credit on those who first selected the land. Whenever I select land for coffee, I shall most certainly be most careful to select forest land with as much of an eastern aspect as can be obtained, and I would certainly advise intending planters to be careful on this point.

RAINFALL AND CLIMATE.—The information I can gather from the estate books leads me to believe that the total annual rainfall is some 95 inches, and this, apparently, divided over the twelve months; but, for want of exact records, I cannot speak with certainty as to the amount. Now a careful record is kept, and will furnish correct data to go upon. From personal observation since the date of my arrival on the 11th December, 1891, I have noted the fact that on no single day has there been continuous rain, and on

no single day have we been without some sunshine. This is very different to the average of the Ceylon coffee districts: there it is a frequent experience in both monsoons to have incessant squalls and heavy rainfall with a complete absence of sunshine, sometimes for ten days to a fortnight. The effect in Ceylon of the heavy rains and absence of sun-heat is very marked, and has a most prejudicial effect both upon the yield and the vigour of coffee and tea. I have also noted that the sun-heat is of greater strength here than in Ceylon, and it is most beneficial, as it acts favourably on the strong soils, pulverising and drying the soil down to a depth of fully 15 feet. This, again is of benefit in the prevention of wash. In Ceylon, a heavy shower in the rainy season simply runs over the surface; here on the contrary, it passes down the sun-cracks and thus fertilises the soil.

CULTIVATION—WEEDING.—The great importance of keeping clearings clean and in hand, weeding from the commencement, has been the Waterloo experience. The sunshine and showers, which are almost daily, favour a growth of weeds almost incredible, and I am of opinion that it is a *sine qua non* for successful planting—clean weeding from the date of the burn.

PRUNING AND HANDLING.—From what I have observed, I believe that, with careful and judicious treatment of the bushes from the commencement, knife pruning would not be required. Handling is most important. Great care must be taken in keeping the centre of the tree for 6 inches entirely free of wood, and the outside branches must be carefully and systematically singled out so that the lower primaries may not be excluded from the light. The same effect experienced in the growth of weeds, caused by the sunshine and showers, is also to be found in the growth of young wood, and it is essential for the health of the bush, as well as for regular bearing, that the wood should be limited to what is actually required.

MANURING.—The opportunities for cultivation, on a liberal scale are all that can be desired. There is an abundant supply of lime, a similarly abundant supply of bat guano, and from the fact that both Guinea grass and the native grass grow with such luxuriance, cattle can easily and profitably be kept. This is a most important fact, for in Ceylon many a good estate dates its decline from the date that it could not obtain the necessary help from cattle manure.

LABOUR.—On the point of the labour supply there will, I expect, for several years yet be a difficulty. The Tamil labour will gradually increase, and once more estates are opened there will, I believe, be a supply quite equal to the demand; but it would be folly to consider planting at present impracticable because Tamil labour is not yet completely organised. I have, through necessity, been obliged to employ Malays, Chinese and Javanese. I have found them all most efficient workmen. I am exceedingly glad that I have had cause to employ others than Tamils, otherwise, I might have continued in ignorance of the valuable labour supply locally available. I cannot at present fully particularise on this subject, but I will do so at a later date, and will supply figures showing actual cost of work done by Chinese, Javanese and Malays, which will compare favourably with what is done by the Tamil in Ceylon.

SORGHUM.

Sorghum has been used as a forage for stock in this country for many years. As such it is adapted to a wide region, and its cultivation has extended over the entire extent of the United States. In other countries it has been used for the manufacture of spirits, glucose, beer and vinegar. Its seeds have been used as a food for men and beast, and in this country a large part of the profit of growing sorghum consists in the value of its seed as a stock food. For nearly thirty years syrup has been made from it, and during that time high hopes have been entertained of its power to produce profitably sugar. The attempt to make sugar from sorghum has

been made almost exclusively by Americans. In China, where the sorghum has probably been grown for thousands of years, we are told by Dr. S. Wells Williams, Professor of Chinese in Yale College, that there is no evidence that it has ever been used for either syrup or sugar making.

It is curious to read in the earlier publications on sorghum, the contradictory opinions and opposite views so positively asserted by the authors. As to the kind of sugar present; the best varieties; the period of growth; of maximum sugar content and the exact time to work after cutting, nothing was known definitely until the beginning of the scientific investigations by the National Department of Agriculture in 1878. Since that time this Department has assiduously continued its investigations in sorghum, and while we write the Fort Scott experiments in diffusion and carbonation are being brought to a conclusion by the eminent government chemists. The publications of this department upon sorghum since '78, have been numerous and instructive and to-day every farmer has within his reach valuable and definite information in regard to this plant, the result of patient investigation conducted by trained scientists at government expense.

BOTANICAL RELATIONS OF SORGHUM.

Sorghum is one of those plants, whose origin is utterly unknown. By long cultivation, its habits and characteristics have been so changed that no resemblance can now be found to any wild plant. Formerly the different cultivated varieties of sorghum were regarded as distinct species, but modern botanists have been gradually led to the conclusion that all our sorghums and juphees, including broom corn, chicken corn, durra, milo maize, etc., are but varieties of a single species—*Sorghum Vulgare*. These conclusions have already inspired many seedsmen, farmers and scientists with the belief, that ultimately by selection of seed, proper fertilization and cultivation, a true sugar bearing sorghum may be obtained, which can be profitably grown and worked, instead of the true sugar cane or beet. Differentiation in plants is accomplished by extending the area of cultivation, taking in differences of soil, climate, rainfall and manures; by careful selection of seed; by cross breeding, etc. In this way varieties are produced. Some plants have a greater capacity for variation than others, and sorghum is perhaps surpassed only by Indian corn, in its tendency to assume new varieties under changed conditions. Hence we find a large number of varieties of sorghum on our market, differing in every conceivable character, from content of sugar to color of seed. It is therefore of first importance in growing sorghum to select those varieties best adapted to our wants, remembering the modifying factors of soil, climate and manures.—From *Bulletin No. 5 of the Louisiana Sugar Experiment Station.*

NEW JOINT-STOCK COMPANIES.

The following tea company has just been registered:—Maybloom Tea Plantations, Limited, with a capital of £50,000 in 10 shares. Object, to acquire, either in India or any Colony or dependency of the United Kingdom or elsewhere, land suitable for the cultivation of tea, coffee, cinchona, &c. and to stock and manage the same, and generally to carry on business as tea, coffee, &c., planters and merchants, brokers, &c. The first subscribers, who take one share each, are:—E. G. Rook, 1, Great Winchester Street, E. C.; T. H. Trotman, 69, Highbury Quadrant, N.; O. H. Wellard, 10, Gray's Inn Square, W. C.; J. W. Aubrey, 55, Dallview Road, Stamford Hill; T. E. Munday, The Poplars, Buckhurst Hill; Gr. R. Davey, 4, Fasset Road, Dalston; C. T. Wale, Bourne Hill, Palmer's Green, N.

The business of the company is to be under the control of managing agents, the first being the Planters' Stores and Agency Company, Limited. No particulars given as to qualification or remuneration.—*H. and C. Mail.*

THE TEA ROLLER PATENT CASE.

DECISION AGAINST JACKSON.

In the District Court of Colombo today (May 2nd.)

Mr. Owen Morgan gave judgment in favour of the defendants in the action for infringement of tea-roller patent, Jackson v. Colombo Commercial Company and Brown. The following is the full text of the deliverance:—

This is an action for an injunction to restrain the two defendants from importing into the island and using and selling the tea-leaf rolling machine known as "Brown's triple action tea-roller," and from otherwise infringing an invention of the plaintiff's for the rolling of tea-leaf for which he had acquired certain patent rights. The plaintiff also prays for an account of all gains and profits derived by each of the defendants from the importing and using and selling in the island of tea-leaf rolling machines infringing as aforesaid.

The plaintiff alleges that he was the first and true inventor of a certain new and useful invention for improvements in machinery or apparatus for rolling tea-leaf as declared in his specification and called "The Excelsior."

The defendants deny that plaintiff was the first and true inventor of the invention by him alleged to have been new and useful, or that it is new and useful or that the specification filed by plaintiff describes the nature of the plaintiff's invention, or that the defendants infringed any exclusive right granted to the plaintiff and they allege that the first defendant (as the importer) is the inventor of the invention known as "Brown's triple-action roller," and that the same was an invention new in Ceylon and was not only useful within the requirements of the requirements of the Invention Ordinance, but possessed an utility as a tea-roller far superior to that realized by any machine designed or constructed by the plaintiff.

The specification filed by the plaintiff states that he is in possession of an invention for improvements in machinery or apparatus for rolling tea-leaf and he therein describes the nature of the invention and in what manner the same is proposed. In figure II of the drawing filed with the specification, A is the top-rolling surface usually composed of wood, B is a case or jacket loosely enclosing the rolling surface A so that it (A) can be weighted to give the required pressure to the leaf and can be raised or lowered within the jacket by means of the chain C for the purpose of feeding the machine from the hopper D; and E is a bar firmly attached to the case B and arranged to slide in the bearing F which together with the crank P in K carries the case B and prevents it bearing its weight on the under table at any time although the case B actually comes nearly in contact with it. Having described the nature of the invention and the manner in which it may be used, he asserts what he considers novel and original and therefore claims as his invention three arrangements or combinations, the first of which only the Court has to deal with in this case, for that is the infringement which plaintiff complains of. It is this: "The arrangement of transmitting motion to the top rolling surface through the case or jacket surrounding it whereby such rolling surface is left free as regards vertical movement from the mechanism operating it." That is the invention in the Excelsior which the plaintiff complains has been infringed by "Brown's triple-action roller."

The first machine for rolling tea leaf which the plaintiff also claims as his invention and which he calls the Standard, was a machine which plaintiff invented in India and which he patented there. This machine involved him in India in litigation with Kinmond who asserted that plaintiff had infringed his patent in respect of a machine which he had previously invented, and the plaintiff was obliged by arrangement with Kinmond to manufacture the Standard under a license from Kinmond. The Standard was never patented in Ceylon and only

one of the Standard was sold in London and imported into the island and worked on Loocondra estate. The jacket of the Standard rested on the lower surface, and its heavy weight made it stiff to drive. The driving mechanism of the Standard was connected with the upper plate or surface or cap, the jacket surrounding the cap being left free or loose. It was an expensive machine, and a good deal of time was wasted in getting the leaf through the centre of the cap. The jacket had to be made heavier to prevent jerking and jumping whilst in motion. This led the plaintiff to contrive a machine which was less costly and more easily driven and he hit on the Excelsior which he states is just the converse of the Standard. In the Excelsior he took the driving mechanism from the cap and attached it to jacket, and this machine proved to be a great improvement on the Standard.

There can hardly be any doubt that the plaintiff was the first and true inventor of the Excelsior and that it was a novel and useful machine. The only question remaining for consideration is whether the defendants' "triple action roller" has infringed the arrangement in the Excelsior of transmitting motion to the top rolling surface through the case or jacket surrounding it.

The case or jacket, the plaintiff asserts, consists of a wooden case attached to a metal frame and secured to it by bolts—all forming one piece and designated by him "the case or jacket."

The top or upper rolling surface moves vertically and can be raised or lowered into the case or jacket which loosely encloses it.

What is the case or jacket of the Excelsior? Is it the woodwork or wooden lining combined with the metal frame to which it is attached, or is it the woodwork or wooden lining alone? In appearance the whole upper part of the machine is one piece, and can be tilted up in its entirety; nevertheless it consists of two distinct parts—the metal frame and the woodwork or wooden lining. This metal frame, by whatever name it may be called or whatever shape it may assume, is still what engineers call "a connecting rod," for it has all the adjuncts or parts which constitute a connecting rod. It takes the form in the Excelsior of a metal frame or plate, and is so attached to the crank pin at one end and the guiding rod at the other, that it may be the means of converting circular into rectilinear motion. There has been a good deal of conflicting evidence on this point, but the weight of testimony is in favour of the defendants' contention, that the metal frame is a connecting rod, and that the case or jacket is the woodwork or wooden lining alone; that the metal frame is a part of the driving mechanism of the machine and gives motion to the woodwork or wooden lining, this woodwork or wooden lining being the case or jacket which drives the upper rolling surface.

Upon the evidence it is abundantly clear that the upper rolling surface receives its reciprocating and horizontal motion entirely through the woodwork or wooden lining, which is truly the case or jacket by impact with it, that is it receives its motion from the case or jacket immediately adjacent to it. If the case or jacket is removed the upper rolling surface would have no motion, except the vertical movement upward and downward which it has quite independent of the case or jacket, acting merely as a weight on the tea leaf and giving pressure to it.

In the triple action roller motion is not imparted to the upper rolling surface by or through the case or jacket. The upper rolling surface has no impact whatsoever with its case or jacket. The whole machine can be worked and motion imparted to the upper rolling surface without the case or jacket. The upper rolling surface has its horizontal as well as its rotatory motion complete, and quite independent of the case or jacket. The machine is complete without the case or jacket, for, it was removed from the machine and it worked perfectly.

Both machines—the Excelsior as well as the triple-action roller—have the same object in view; both

have a lower and upper rolling surface and a case or jacket; but in the Excelsior the case or jacket not only holds the tea leaf, but it also drives the upper rolling surface and transmits motion to it, whilst in the triple-action roller the only use to which the case or jacket is put is to hold the tea leaf and that appears to be its only office. As the Excelsior was an improvement on the Standard so the triple-action roller is an improvement on the Excelsior, and is decidedly a far more efficient and satisfactory machine.

On the whole I am of opinion that the defendants have not infringed the plaintiff's right by the arrangement of transmitting motion to the upper rolling surface though the case or jacket surrounding it, and that plaintiff's action must be dismissed with costs.

OWEN MORGAN, D. J.

PETITION OF APPEAL.

In the District Court of Colombo.

William Jackson of Aberdeen, Scotland, Plaintiff and Appellant, vs. 1. Alfred Brown of Colombo, 2. The Colombo Commercial Company, Limited, of Colombo, Defendants and Respondents.

On this 5th day of May 1892.

To the Hon'ble the Judges of the Supreme Court of the Island of Ceylon.

The petition of appeal of the abovenamed plaintiff appearing by his Proctor Mr. F. Liesching states as follows:—

Your petitioner feeling aggrieved by the judgment of the learned District Judge dated the 2nd day of May 1892 begs leave to appeal therefrom on the grounds

1. That the issue of infringement has alone of all the issues in this action been decided against your petitioner, and it is humbly submitted that the learned Judge's verdict on that issue is contrary to law and against the weight of evidence.

2. It is contrary to law because in determining this issue, and for that purpose enquiring into the nature of the invention alleged to have been infringed, the learned Judge has governed himself not as he should have done by a consideration of the language of the specification in which the invention is described of the circumstances under which this instrument was framed of the kind of machine to which it relates and the class of persons to which it is addressed but by the opinion of skilled witnesses as to the function and terminology of the various parts of a machine, treated rather as a model for the illustration of mechanical principles than as one designed for the manufacture of a useful commodity.

This is indicated by the learned Judge's remark that the triple action roller could work perfectly well without the case or jacket. So it might, perhaps as a piece of mechanism in a laboratory but it would not be an efficient machine in a factory.

3. The real question involved in the issue of infringement is what did your petitioner mean by the word "jacket" in the specification of his invention as illustrated by the accompanying drawings, and if they are examined as made and addressed by an inventor to workmen of competent skill and acquainted with this class of machinery there can be no room it is submitted for doubt that it must mean and could only have meant the case confining the tea leaf with its bow bracket and general bearings as a whole and the best available evidence is all on one side as to the correctness of this information.

To treat the pieces of wood which when fitted together compose the case in which the leaf is confined as an integral part of the machine disconnected from its other constituent parts and to confine the word jacket to that wooden case is to make it insensible for the purposes of the invention described in the specification and contradicts the very language of the specification with its drawings.

4. If the jacket as your petitioner contends comprise the case, it supports the bearings, bow, bracket, &c.

i. e., in fact all the parts above the lower rolling surface except the lid which controls the pressure of the leaf in operation it is self-evident from a comparison of the machines in work that the principle of the "Excelsior" invention "the arrangement" to wit of transmitting motion to the upper rolling surface through the case or jacket surrounding it has been taken over by the "Triple Action" machine of the defendants.

Wherefore the petitioner prays that the said judgment dated the 2nd day of May, 1892, may be set aside and judgment entered for the plaintiff as prayed in the plaint and for such further and other relief in the premises as to your Hon'ble Court shall seem meet.

(Signed) F. LIESCHING,
Proctor for Plaintiff and Appellant.

THE PLANTING DISTRICTS OF SOUTHERN INDIA.

As the first districts we propose to refer to are those in which coffee is cultivated, a brief *résumé* of the life of the coffee planter throughout the year will be of interest. It is one of the most popular fallacies of human nature to presume that everyone, whose method of work and whose work itself is not identical with his own, must therefore be enjoying an easy and a lazy life. The man across whose brow course perennial streams of sweat refuses to admit that he, who is able to keep cool with the thermometer over 80 and is not ever on the fidget and fret, can honestly earn his bread. So it is argued by him in tea that the planter who is not cursed with a factory rejoices in a life in which beer and skittles preponderate largely. No doubt the coffee planter is spared much anxiety by not having to be on the watch continually to see that his produce is not ruined in the preparation of it, but this anxiety is made up to him in various ways—by the many changes and chances of weather on which his whole crop depends, by the numerous enemies to the berry itself against which he has to guard, and by his having to entrust the preparation of the bean entirely to others, with whom he is often not on the best business terms.

The work of the coffee planter, who has an old estate and is making new clearings, may be generalized as follows in the majority of the planting districts in Southern India. In January he commences his felling in order for the timber and brushwood to be well dried to burn off before the first showers fall towards the end of February or beginning of March. So soon as this work is over, lying and pitting go on apace, for labour is scarce through the hot months of March, April and May; and though the planter may reckon on having the best part of three months in which to plant, yet the south-west monsoon is as fierce as the fair sex, and the wise man will prepare so as he can take advantage of every burst of the monsoon as though it were the last. In June comes the monsoon. Then the rule is that there is more work to be done than hands to do it—planting in the new clearings, weeding in the old, to be followed by pruning, digging and manuring; and while the sun is up the planter has but little time to cool his heels in his verandah until September, when work eases off a little, and advantage is taken to enjoy ten days' holiday either in assisting at week festivity or a stalk after bison and big game, or a visit to the hospitable homestead of some distant friend. Thus will the coffee planter fortify himself against the multitudinous worries and annoyances which are rife while "crop is on." In October he commences his preparation for the great event of the year, and before the middle of November small gangs of women and children will be put on for a "fly-pick." It may be the middle of December before the crop really begins to pour in, and the whirl of the palper is heard in the land and the watch-fires are lit by the barbecues and the time of the coffee thefts is at hand. These are days of intense anxiety, it is with a deep and sincere sigh of relief that the respect for the last handy load of parchment is received from

the Coast curers, and the cash for the tails and refuse counted out by the local native merchant. January will be often on the wane when this consumption is arrived at, and then there will be another two or three week's work, clearing up, pruning the old coffee, manuring the fields shaken by overbearing, &c., &c. So the year wears away. In the hot weather there is usually an exodus for six weeks or two months, for a good 'writer' is capable of superintending new clearings up to a certain point, more especially if a stay-at-home friend can be found who will ride over once or twice a week and see everything is going on all right. The Shevaroyis in the Salem District and the Pulaeys in Madura get but little of the south-west monsoon, the north-east being the one on which they depend, and so the foregoing hardly applies to them.

As regards the climate which the coffee planter of Southern India enjoys, it is varied but good, except that at some seasons and in some districts malarial fever is prevalent. As the elevation of coffee cultivation varies from 2,000 feet to 5,500 feet, the temperature is, of course, different: but Wynaad, where the estates are on an average at just under 3,000 feet may be taken as a fair average. The south-west monsoon usually begins in the first or second week of June. Then the flood-gates of heaven are opened, and the rain beats down in torrents, and the Zephyrs rage and bluster: but it is in July when the heaviest and longest burst takes place. This climate is not nice, for, equally with nature out of doors, your books, your boots and your bread assume a verdure, which is dispiriting. However, crackling wood fires and hot toddy can be indulged in in comfort, and there are many things more unpleasant than of evening to sit in front of the one and with the other beside you while outside the stormy winds do roar and the rain comes down in torrents. Presently there will come a break and a few days of the most glorious weather that ever gladdens this dear old "vale of tears:" days such as that one must have been at the dawn of which "the stars of the morning came together and all the sons of God shouted for joy." August is sometimes beautiful and fine, sometimes dem'd moist and unpleasant, and so September: in fact these months take it in turns to be one or the other. October is a month of lovely mornings and wet afternoons, the north-east monsoon being about to declare itself, wherefore thunderstorms are rife and heavy downpours frequent, in which an inch or more of rain will fall in less than an hour, much to the annoyance of the planter whose land is steep. The mornings in November grow crisp and cold, wisps of snipe are in the swamp, the bell of the sambhur is heard on the mountain side, and life is as full of sport as work allows and very much worth living. December and January are glorious months with a climate that would make the fortune of the district many times over if it could only be transposed to Europe or the States. Fires blaze in the hearth at nights and in the mornings the planter blazes in the swamps, which are frequent and hold many snipe, and while tramping through them an occasional shot at a jungle sheep or spotted deer may be got and no little excitement worked up over *khubber* of bear, panther or tiger in an adjacent *shola*. February is rendered unpleasant by a raging and tearing N.-E. land-wind, which dries up everything, curls up the backs of your *éditions de luxe*, and converts your cheroots into tinder. At night beacon fires flare on all the hills, a glorious sight to gaze on from afar, but not so pleasant should the fire come tearing down the hill above the stables, the flames leaping and rushing and frolicking through the tall jungle grass and scrub like a herd of wild horses at play. The whole country side becomes black and burnt up, and a heavy mist of smoke lies over the land. Before March comes in thunder is heard remote, and each night the lightnings blaze and flash and quiver along the distant horizon. The mornings are hot and sultry and every afternoon black masses of cloud, big with the rain that means fortune or disaster for the planter, roll heavily across the sky. At length the rain falls in blinding sheets, and from the grounds there goes up

that strange fragrance all know so well, like a song of thankfulness from a thirsty land. In a very few days everything is green again, save the fields of coffee which are covered with the sweet white petals of the blossom for which the planter has been waiting so anxiously. April is much the same as March—sultriness followed by heavy thunder-storms, then a few days of refreshing coolness. In May the weather continues broken, and the middle of the day very hot, but the mornings and evenings are deliciously cool and fresh; and so on till the monsoon again breaks. This is the climate of the Wynaad, and it is very similar in other districts. No little rain interspersed amongst days of the most glorious and perfect weather.

The present Government of Madras has at length realized that the planting industry of Southern India which brings into the country a crore or two of rupees per annum, and is a very present help in time of famine and distress to the ryots and labouring classes of Southern India, deserves encouragement, and the planter is beginning to feel that he has but to represent his case to receive consideration at the hands of Lord Wellock and his advisers. Slowly and by degrees that curious delineation of the brutal planter, is fading from the walls of the Council Chamber where it has figured for so many years, and he is ceasing to be looked on as that strange specimen of obsolete feudal barbarity, who when not wallowing in whiskey and wantonness was dancing a waltz on the spleens and the domestic virtues of his coolies. The weakness of the planting community of Southern India consists in its being under the rule of so many different Governments; for while Wynaad, the Nilgiris and the Shevaroyis are under the Madras Government, Coorg is under the Government of India, the Mysore and Travancore planting districts are within the boundaries of these native states, while the N. Iliamphies belong to Cochin. Here we will draw to a close and reserve our description of the districts themselves for another week.—*Indian Planters' Gazette.*

THE PIONEERS OF NORTH TRAVANCORE.

(From One of Them.)

From time to time you have admitted to your columns fugitive communications from the planters, or to speak more correctly, from the pioneers, who have for the last ten years been engaged in opening out the northern portion of the Travancore State to planting enterprise. It will be remembered that the main obstacle in the way of settling the extensive and salubrious range of mountains and valleys which are known by the name of the Kannan Devan Hills lies in the difficulty of access. While the estates were in a state of childhood, not yet having reached the productive stage, the absence of roads did not much affect the formation of estates. Forests have been felled, nurseries formed, plants have been set out and even bungalows built (though at great cost) while all the tools, rice, stores, roofs, and building materials necessary for the above objects have been carried up from the plains on pack cattle, ponies, donkeys and on men's heads. Time has meanwhile been rolling along, and the plant has developed into a bush, the cinchona seedling into a tree. The years have at length rewarded the settlers, and they pride themselves with thousands of pounds of bark, tons of coffee, and chests of tea. But now has come into play the question of cost of carriage, and the delay and expense of pack animals seriously handicap the exporters when competing for markets with produce from other planting Districts where carts take the crop from the planters, then to the railway station or port without break of bulk. However these planters are a self-reliant body. They

always have in the mind honest Sancho's solution that there is a remedy for everything but death, so by dint of importuning the Government of Travancore, harassing the Resident and petitioning the Governor in Council, and out of Council the planters have at last the satisfaction of knowing that a cart road has been sanctioned, funds provided by the Travancore Government, and that in a short space of time, carts may come rolling up with rice and tea box fixings and rolling down with wealth "beyond the dreams of avarice." This cart road, which will come out into the Coimbatore plains some 20 miles south of Udamlapeta, which again is 40 miles from the nearest railway station, will immensely improve the prospects of the planters and should lead to a very considerable increase in the number of properties opened out in these hills.

There is no other place in India or Ceylon where such facilities exist for the acquisition of planting land. The Directors of the North Travancore Land, Planting and Agricultural Society seem to have profited by all the dunning and dunning regarding easy purchase of land which have been in all the newspapers for ever so many years. I learn that a man on the look out for land can go up to Devacolum, select his block, have his application registered, pay down his money and take up possession within as short a time as suits his convenience. There is no bother about stamped application, or waiting till Collector Sahib has had the land inspected. The Agent has only to see that no one else claims the block, and our eager planter can become master of his acres, and put down his nurseries, and fell his forest and build his preliminary huts—all in the rub of Aladdin's lamp. If he ventures into cinchona—and a wonderfully cheap and profitable venture that same is, notwithstanding low prices—there are estates all round him where he can decide on the sort best suited to his bit of land, and purchase seed or plants as may please him. If he goes for coffee, he can have his pick of thousands of acres of virgin forest all at R15 to R25 an acre. Tea is in the same category. 'Tis extraordinary to see the output of tea at so high an elevation. Five hundred pounds of made tea to the acre off four or five years bunches, and at an elevation of 5,000 feet too! However, until the road is finished, the best way for the new man is to go to Ammanayakanore, on the South India Railway, thence by bullock transit to Bodinaiknore, whence a bridle path leads to the Land Agent's bungalow at Devacolum. There are, as I say, great quantities of forest land at an elevation of 5,000 feet available for tea and coffee, but I must guard your readers from supposing that there is very much forest suited for cinchona above 6,000 feet. No doubt a few thousand acres still remain, but it is being rapidly absorbed by planters, for, in point of fact there is low no place either in India or in Ceylon where such land is to be got. Pleasure and profit attend a settler in these altitudes, where the delicious climate, pure water and healthy life really make life worth living; where a man can rear his estate and rear his family and make unto himself a home to last for his life and for his son's lives; where he can grow cinchona and tea, and make 50 per cent. on his capital; where he can teach his boys to pull the ibex by the beard, and adorn the walls of his bungalow with tusks and horns, and where his girls lose not their roses, nor his wife pine away with fever and longing for the absent faces—for what shall it profit a man if he gain the whole world and lose his own health, and what can a man give in exchange for his health!—*N. Mail*, April 8th.

NAGAMALLY TEA COMPANY, LIMITED. (TRAVANCORE.)

In submitting the report and accounts for the second year of the Company's working, the Directors congratulate the shareholders on the results proving better than were anticipated.

When the last Annual Report was issued there were in all 367 acres under cultivation, of which 120 acres are now yielding tea, and a small field of some 7 acres in coffee and spices; since then about 220 acres of forest have been felled and are now being cleared for planting with tea, and the intention is to go steadily on extending the area under this cultivation.

The estimate of tea for past year was 60,000 lb. and the quantity despatched from the estate amounted to 62,030 lb.

The coffee crop for 1891 proved a very short one compared with previous year, being only 9 cwt. 3 qrs. 17 lb.

The spices harvested amounted to 649 lb against 137 lb in 1890.

The estimate of tea for 1892 is 80,000 lb and may probably be exceeded, and the time has now arrived for the Company to provide itself with a permanent Factory and with efficient Machinery. Plans and estimates for these are now being prepared and materials collected for an early commencement of the work.

It is hoped, in addition to improved manufacture of the Company's tea, that they will secure an extension of the manufacture of tea for neighbours, which it will be seen from a credit item in the crop account is not unprofitable.

The amount at credit of profit and loss account is	£494 12 6
----------------------------------------------------	-----------

Out of which the Directors propose to pay a Dividend for the year at the rate of 5 per cent. per annum, absorbing	442 2 4
-------------------------------------------------------------------------------------------------------------------	---------

Leaving a balance to be carried forward of	£52 10 2
--------------------------------------------	----------

Of the second issue of 1,000 shares, up to date 325 have been allotted, and the balance of 675 shares will be placed as opportunity offers.

The Board desire here to express their satisfaction with the conduct of the Company's affairs by their Local Manager, Mr. F. W. Bennett.

FERTILIZERS FOR PEACH TREES.—At one of the New York farmers' institutes, Mr. G. T. Powell, in reply to the question, what is the best fertilizers for peach trees? said: "A fertilizer high in the element of potash is preferable with me; phosphoric acid is also necessary to perfect the seed. I find wood ashes, if they are good, one of the best fertilizers for peaches, as they contain both of these elements of plant food. Do not feed them too much nitrogen, as it induces too large a growth of wood which if continued late in the season, will not ripen."—*Rural Californian.*

GOOD PLANTING.—Meehan's Monthly for February publishes the following: "It is not unusual to hear people say that they cannot understand why trees die on er transplanting, considering that they give the planting the very best of care. What is considered the best of care is often very bad care. It is amazing to see the careful planter without experience, occasionally on his knees pressing the earth in around the roots with his fingers, for fear of crushing the fibers. It is impossible to get the earth properly packed around roots in this way. In nurseries, where it is presumable planting is thoroughly understood, a man stands with a hammer while one is putting in the earth, and hammers the earth in as tightly as though he was hammering in a post. This packs the earth in more tightly than can be done by either feet or hands. Some are afraid of crushing the roots with this hammering process; but with the pressure all around, the force is directed towards the roots and not away from them. It is not necessary, however, to go into reasons, as the universal experience of the nursery is in favour of hammering in the earth as represented. This is the essence of good planting, and any other planting is decidedly bad. Trees properly planted need no staking. The fact that a tree needs staking is a proof that it was not properly planted."—*Rural Californian.*

IMPORTANCE OF MOISTURE.—The importance of moisture in fruit culture is strikingly illustrated in the writings of the late Charles Darwin. Respecting the district around Chiloe he says: "The town is situated on the low banks of the stream, and is so completely buried in a wood of apple trees that the streets are merely paths in an apple orchard. I have never seen any country where apple trees appeared to thrive so well as in this damp part of South America. On the borders of the road there were many young trees, evidently self sown. The inhabitants possess a marvellously short method of making an orchard. At the lower part of every branch small brown wrinkled points project. These are already to change into roots, as may be seen where any mud has been splashed against the tree"—*Rural Californian.*

TEA IN WYNAAD.—The *Madras Times* of 10th May says:—

Our South Wynaad correspondent in an interesting and amusing letter which appears in another column tells us of inability to send any news about tea in Wynaad. We are in a position to state that beyond 75 acres which are being opened by a large Company at Oherambadi, there will be no extension of tea cultivation in Wynaad this year. More's the pity! The enormous increasing exports from Ceylon have evidently made capitalists at home 'scary' of this product, and we are afraid it will only be when Wynaad has proved beyond a doubt that it can produce tea of a quality which is able to hold its own with consignments from that island, that money will be forthcoming to any extent for opening out land in tea. Ceylon, from a tea-grower's point of view, can only beat Southern India in two respects: the climate with its regular rainfall, and the assurance of labour all the year round. The latter is the most important of the two. The best jat teas there are undoubtedly behind those grown here, while on most of the estates the plants are of a very poor jat indeed. The soil of Ceylon, as well known, is behind that of Southern India, but this is compensated for by the climate. The quality of Ceylon tea is deteriorating each year, more especially on estates where manure is not used, and we believe that the outturn per acre is also less. Fortunately for Ceylon there is a cohesion among planters, which is unknown here, and next to the United States there is no country that has so thoroughly mastered the art of advertising. Planters in Southern India will have to wait yet awhile before money comes to this country to any extent, and the only thing to be done is to keep their districts well before the notice of the public at home.

THE MANUFACTURE OF TEA IN LONDON.—In a recent letter I told you that I had been making tea from leaf plucked from tea plants, grown from imported seed in Mr. Icceton's palm nurseries at Roehampton, Putney. It may not be without interest to some of your readers to know how I am getting on. I have not had much of a flush as yet, and have only had small quantities of leaf to work at a time, the plants flushing very irregularly; and the leaf has not been satisfactory. My last plucking was very small, but it is, I think, a curious instance of what may be done that though the leaf was so wet when plucked in the morning about 10 a.m. I had to toss the water off it, yet I was able to wither it, to roll it, to get it to ferment in some degree, and to fire it, and convert it into passable tea, before 6 p.m. the same day. The liquor proved fair, and after standing some time creamed well. It had a rather greenish and slightly cooling flavor, probably owing to the hasty way in which I had been compelled to make the tea, as I had to leave town next day, and to its not being well fermented. The plants are now in a better use, and I hope to have a more even flush soon, and more time to turn out a larger quantity and a better sample. As I said, I am curious to know if this is the first attempt which has been made to manufacture tea in this country from English-grown tea leaf. Be this as it may, I fancy no one else ever made tea, from green and wet tea leaf in London before in one working day of eight hours.—*Cor. in local "Times," May 12th,*

FROM THE METROPOLIS

LONDON, April 15.

CEYLON TEA IN AMERICA.

I had the pleasure this week of meeting Mr. Elwood May as well as Mr. Grinlinton and of learning a good deal about places and prospects connected with our staple product in the Far west. From what I knew of America, I was able to test with some degree of authority the utterances of Mr. May, and generally I was impressed very favourably with the good sense, the determination and straightforwardness of the head of the Ceylon American Company. What he has accomplished in respect of advertising Ceylon tea in a large proportion of the leading newspapers in the States is quite astonishing, the more so as in all his contracts extending generally for twelve months, no cash has passed, the remuneration being taken in stock of the company. This has been accomplished in the face of Mr. May's frank avowal in each case that the value of such "stock" is still problematical and altogether in the future. Still the evident belief of Mr. May himself and of a large number of influential friends whom he has converted and whose testimonials he holds, to the superiority of Ceylon tea, has told in the newspaper world, and the result is seen in the following extract from the letter of a well-known New York Press Manager (a personal friend of my own) whose words I have been allowed to copy:—

"I want to say, as a parting word, that the contracts for advertising, which you have made, surprise me, both in their amount and the character. You have done, I am sure, what no other man has ever accomplished in securing many of the very best papers in the country, and placing the stock where you will not only receive very valuable space for it, but will secure the good will of papers who have great influence with the public."

It is impossible not to anticipate good fruit from such extensive and continuous advertising as has thus been arranged for. But Mr. May himself is not oversanguine—indeed I was almost going to say, he is despondent. He has full faith in pure Ceylon tea as a good article worth "booming," and he knows how it can be made in demand all over the United States and that he is promoting in the right way; but he considers the campaign as only commencing and he is urgent that unless the "sinews of war" are forthcoming, the company must collapse and the effect of what has already been done, be in a great measure lost. In other words, Mr. Elwood May, though he has done wonders hitherto in advertising, does not see how his business is to be continued and extended without certain continuous expenditure, and he and his American friends, I gather, are not prepared to spend more, unless they are backed up by English friends and Ceylon planters. His mission to England this time seems to be to raise additional capital for the company, or to intimate plainly that otherwise it may have to disappear and the advertising contracts be closed. This is disappointing news, the more especially as we cannot consider the present a favourable time to appeal to English (albeit tea) capitalists for money, or to Ceylon planters just as they are doing their best for Chicago. So I intimated to Mr. May, adding the hope that a profitable trade must surely be already springing up and that the Exhibition should be a great help to the

success of the company. Mr. May's answer was that we had but a faint idea of the conservative character of the large distributors of established products in America—how that large tea benefactors in New York would not as yet consent even to hold Ceylon tea, as a thing unknown to their customers, and how only by convincing consumers and creating a demand could a stable foundation be laid for a steady, growing trade in Ceylon tea throughout the States. Even the Chicago Exhibition will not do permanent good, unless plans are promoted in a way which Mr. May is prepared to lay before Mr. Grinlinton. "It is a very easy matter," added Mr. May, "to create a temporary trade—to get obliging small tea dealers throughout the country to take off a large quantity of a new tea, once in a way,—each taking a few chests to oblige a commercial traveller it may be. But as such tea would lie on their shelves without demand, the large trade forced in any one year would merely act as a deterrent to any legitimate business extending afterwards, since dealers would never touch the article again." There is something in this argument, and in the strong liking of Yankees for what they are accustomed to, Japanese and Chinese green teas; but I ventured to point out that surely in the Western and Middle States with so large a proportion of "fresh blood,"—of English, Scotch and Irish accustomed to good tea at home—there should be no difficulty in getting them to try Ceylon tea. Nevertheless, Mr. May insists the process must be a slow one; only to be worked out on the lines he has laid down, and which he—still a comparatively young man occupying a position of influence and reputation in New York—is prepared to follow and develop, provided he is adequately supported. Otherwise, apparently, it is a matter of indifference to him personally, whether his past labours are to bring any return to him or not. I have tried to reflect the outcome of our interview; and I could not help regretting that Mr. May had not made his way some months ago to Ceylon, to meet the planting leaders themselves and to lay before them his ideas as what can, and cannot, be done for Ceylon tea in America.

Meantime he and Mr. Grinlinton have seen a good deal of each other, and though "the Commissioner" and Mr. Stretch, who were present, said little at the conversation referred to, I am aware that Mr. May's views as to the Exhibition and Ceylon tea have been adequately explained; but whether they can be accepted is another thing. Some of us interested in Ceylon rather thought that in nominating Mr. Grinlinton as their representative the Planters' Association were arranging for the "Ceylon-American Company" to take the lead at Chicago; but I can see that there may be points of difference of some importance. Of this, however, we may be certain that the Commissioner will allow nothing to interfere with his doing the very best in his judgment for the promotion of Ceylon teas. We shall know more shortly; for Mr. Grinlinton has asked Mr. Leake to call a meeting of the Tea Committee of the London Association to lay his plans, so far as formed, before them, and possibly Mr. Elwood May may have his "say" at the same time. Mr. Grinlinton has already been busy at the Society of Arts, the Colonial Office, &c. His health is improved; but he had evidently had a "shake" and is by no means the man he was when I saw him last in Ceylon, and I ventured to warn him to be specially careful in this treacherous climate against the risk of a relapse from cold of the influenza or its after-effects.—I was glad to learn from him that he does

not see why 80 or 85 million lb. tea should not be shipped this year from Ceylon—he should have said so in the Chamber of Commerce—a quantity which certainly would do as good in the end as all the sooner putting an effctual check on the China trade. However, the actual exports for the first quarter do not point to such large figures, though we may see a steady advance in the remaining quarters.—Mr. May is very strong on the point of keeping up the quality of Ceylon tea if the taste of Americans is to be captured. Here is a complimentary paragraph from a letter to me of a gentleman connected with the Society of Arts:—

“You Ceylon people are putting the Indian tea wallas to shame in respect to Chicago. Your Commissioner, Mr. Grinlinton, was at the Society of Arts the other day. I understand that he is going or has gone to the States as Secretary of the Indian Committee of the Exhibition. I am doing my best to stir up our Indian fellows and I hope we shall not be entirely left out in the cold.”

In another direction, very satisfactory progress is reported: Mr. Whittall, who lately referred to the fact that Ceylon tea was evidently becoming better known in America, tells me that RUSSIAN DEALERS are beginning to give special attention to our teas, and that large purchases have lately been made. The great drawback is the want of big breaks; but this is gradually being overcome, and it will no doubt become an object in the larger factories in our higher districts to prepare and send home large breaks of fine teas with the view of meeting the demand for RUSSIA. To get a hold of the Russian tea market would be almost a greater advantage to the Ceylon tea planters than to capture America, though it is best and wisest to fight for both, and for those of Austria, Germany, &c., as well. But have the Ceylon Tea Fund Committee or the Planters' Association done anything towards urging the Java tea planters to turn their attention to the conversion of their own countrymen in Holland as well as the Belgians and West Germans? Java teas are coming in increasing quantities to Mincing Lane. They ought properly *all* to go to Amsterdam. I must see Mr. Ernest Tye of the Indian Association on this point.

CEYLON TEA COMPANIES.

You have possibly received the report of the “Standard Tea Company of Ceylon” by last mail; but in case not, I send you the copy Mr. Brooke, of Messrs. James Hadden & Co., was good enough to send me:—

THE STANDARD TEA COMPANY OF CEYLON, (LIMITED).

Directors: Alex. Brooke, Esq., 25, Fenchurch Street, London; Peter Moir, Esq., East Grinstead, Sussex; Robt. Kay Shuttleworth, Esq., Wood End, Clitheroe, Lancashire.

Secretary: A. Trafford Brooke.
Agents in Ceylon: Messrs. George Steuart & Co., Colombo.

The Directors submit Statement of Accounts to 31st December, 1891.

The Profit and Loss Account shows a profit on the working of the St. Leonard's Estate (for the ten months from 1st March, from which date it was bought) £1,670 7s 9d.

The results compare favourably with the promises in the Prospectus.

On taking over the Estate there was due to the Vendor, and there has been paid as interest £345 17s 8d. It is proposed to pay a dividend for the 4½ months of 1891, at the rate of 10 per cent. per annum, free of Income Tax, absorbing £658 13s 11d.

The Eskdale and Liddesdale Estates, bought from Mr. Norman W. Grieve, are taken over as from 1st January, 1892, and promise to be valuable properties.

Another engagement prevented my being at the meeting which, with so satisfactory a report, was naturally a very pleasant one. Mr. C. H. Hadden, whom I had the pleasure of seeing a few days before, looking as hearty as he has done any time these twenty years back, and Mr. Peter Moir were present and could not help interchanging congratulations on their continued good health. Mr. T. S. Grigson of Messrs. Geo. Steuart & Co. was naturally gratified over the success of the company he had promoted. [Mr. Grigson is returning to Colombo early in May with Mrs. Grigson and children.] Mr. Norman Grieve was elected a Director, and a better one there could not be among Ceylon proprietors; and in this connection Mr. Brooke mentioned to me how “Kanāspolla” mark in spite of a falling market had got a higher average for its teas—a fact noteworthy in view of recent adverse criticism on the latest Ceylon Tea Company. This reminded me that the *Echo City* Editor had not dealt fairly with the few notes I left on his desk in correction of his criticism of the “Baring” Company. I referred to the high reputation of the Directors and to the fact that Wangie-oya is a plantation any company might be proud to have; but this part is ignored and only one item accepted and dealt with (!) as follows:—

CEYLON AND ORIENTAL ESTATES COMPANY.

With regard to our criticism of the Ceylon and Orient Estate Company, formed to purchase various tea properties belonging to Messrs. Baring Brothers and Mr. Thring in Ceylon, Mr. Ferguson calls attention to the fact that "the price of tea was abnormally high in March, 1891, and that the comparison made with the question of March, 1892, is therefore hardly a fair one." As we have not the least wish to be unfair in the matter, we are pleased to give prominence to this opinion.

Although we have no doubt as to the correctness of Mr. Ferguson's remark, the fact does not remove the great objection we take to the prospectus on behalf of the public. Why was not the price of tea given? If abnormally high in March, 1891, why could not this fact have been stated? In dealing with the price of tea, we naturally made a comparison between quotations now ruling and those of twelve months ago. The falling off in value is more than abnormal, it is startling.

In his excellent paper on Ceylon, read before the Royal Colonial Institute, Mr. Ferguson detailed how the annual export of tea had risen within 15 years from

1,000 LB. to 68,000,000 LB.

"while there is the probability of the Colony attaining to an export of 100,000,000 lb. in the course of the next few years." The author of the paper touched very lightly, indeed, upon the decline of the London market. "But on the other hand, the falling prices of recent years for tea generally, and the fear of over-production—of supply out-running a demand profitable to the planter—forbids me to say that there is scope in Ceylon for more tea-planters, unless they be young men with capital." To show what an important part the market price of a product plays in the finances of those who grow it we have only to recall the collapse of cinchona, or Peruvian bark, which at one time was being planted all over semi-abandoned coffee estates. "Over the hill country generally"—we again quote Mr. Ferguson's words—"this culture has had to be given up, since the price of quinine fell (mainly through large crops of bark from Ceylon) from

12s to 1s AN OUNCE—

and even to 9d an ounce—between the years 1877-79 and 1891." Against the tea enterprise, as a whole, we have not a word to say. No doubt means will always be found, by cheapening of labour and economy of management, to keep a fair margin of profit in all the best districts; but with regard to the company formed for the purchase of Messrs. Baring's estates, we cannot advise our readers to entrust any single one of their financial eggs to so doubtful a basket.

In connection with Tea Companies, I cannot help referring to the sudden death of Mr. DAVID REID, Chairman of the Ceylon Plantations Company, and whose name has been so fully in your columns of late, the contractor for the Nawalapitiya and Mtatale Railways, and the Unionist candidate for Cackmannan and Kinross shires. A career which seemed only to be opening at home, has been thus unexpectedly closed to the great regret of a wide circle of friends. Much sympathy will be felt for Mrs. Reid and family.

I was pleased to see Mr. GEO. HEDGES looking so well on meeting him in the City the other day, and to learn of his hopefulness about the steady development of the Ceylon tea trade with Australasia which he did so much to foster and develop, by his visits to Melbourne, in the early days.

As regards the future and improved preparation of Ceylon tea, I feel sure there is much yet to be heard. Several experiments in this direction have come under my notice of late; in one case the process of fermentation and drying is the subject of close, detailed and scientific observation under the direction of an experienced planter, who, however, does not wish names or operations mentioned further in the meantime. The respective merits of high and low temperature drying will also be

further tested. I have seen a report by a member of Messrs. W. J. & H. Thompson's firm, of a most favourable character on samples of Indian teas, dried at a low temperature. But more light and experience generally are required.

As to the MANURING OF TEA and an improved AGRICULTURE generally, you are likely to hear from Mr. John Hughes by this, if not indeed, by last mail; for Mr. Hughes has been good enough to write the following to me worthy of quotation even at the risk of repetition, especially what is said of tea:—

By last Friday's mail I forwarded to your office, Colombo, a copy of Dr. Voelcker's lecture on Thursday, April 7th, at the Indian section of the Society of Arts on the Agricultural Needs of India. I also enclosed some remarks of mine upon one of the points raised in reference to the present practice of burning cow-dung cakes or sun-dried *brathies* as they are called.

I pointed out that the practice was no doubt a waste of valuable manure, but being the result of necessity and not of choice the natives could not be blamed, and that the Government should rather endeavour to provide other fuel such as the supply of forest reserves. But after all that in as much as the whole of the mineral salts such as the potash, lime and phosphates remained in the ashes which under proper sanitary arrangements should be restored to the land; the actual loss was confined to the nitrogen compounds, which however being resolved on burning into gaseous products were either absorbed by the growing plant or crops or were brought down again in the rain and to a great extent retained by the soil for subsequent plant food.

As regards the absorption of nitrogen from the air it is important to remember that in round numbers 80 per cent of the atmosphere really consists of nitrogen in a free form. Further recent scientific research has proved that leguminous plants such as vetch, clover, peas, beans, lupines, &c. have the power in a very special degree of absorbing this nitrogen and yielding large crops of valuable food and also by virtue of increased root extension leaving the soil also richer in plant food for the future crop. What leguminous plants therefore can do in a special degree other plants may be able to do in a smaller degree so that we may find by and by that nitrogen especially in tropical climates is largely supplied to plants and trees by natural means and does not require to be supplied directly by artificial means as we find necessary in our temperate climes. How comes it that India has for centuries produced crops of corn, rice, gram, &c., without practically any nitrogenous manure being supplied, and yet the soil appears no more exhausted now than at the commencement?

It would be a most interesting experiment if a Ceylon planter would select a good average tea bush just ready for pruning and pick off all the leaves, weigh them at once and then dry them gradually in the sun like grass is made into hay, then again weigh the dried leaves and forward a sample here for analysis.

We should then know the actual weight of the green leaf per acre and with the weight of the dried leaf could make a calculation of the water lost. I believe we should find the quantity of nitrogen very large and much in excess of the supply of the soil itself.

THE KELANI VALLEY TEA ASSOCIATION, LIMITED.

REPORT OF THE BOARD OF DIRECTORS.

To be presented to the Shareholders at their Sixth Annual Ordinary Meeting, to be held at the Offices of the Company, on the 27th April, 1892, at 2-30 p.m. The Directors beg herewith to submit to the Shareholders the Report and Accounts of the Company for 1891.

The results of the year have been somewhat affected by the low prices of tea obtained, giving for the Company's produce a less average than for previous

year. Still, the Board consider the Profit and Loss Account a satisfactory one, especially in view of the acreage in full bearing being still so small, the production being over 462 lb. to the acre, the large quantity of tea made somewhat compensating for the low prices obtained.

During the past year the Directors have acquired two blocks of native land, referred to in former reports, amounting to 48 acs., 1-rd. 28-pa., of which 30 acres have been cleared and planted with tea.

The Company's acreage now consists of the following:—

	acres.
Under tea in full bearing	123
1887 Clearing	220
1888 "	217
1889 "	10
1890 "	34
1891 "	30½
Acreage under tea	634½
Grass	3
Jungle	306½
In all	943½

This acreage includes Dover.

The estimate of tea crop for 1891 was 216,700 lb., and the quantity despatched from estate 263,497 lb., showing an excess over estimate of 46,797 lb.

During the year 30½ acres have been cleared and planted with tea, and the prospects from this addition are very favourable.

It will be seen that a further substantial sum has been expended on our factory and machinery, and for dam, &c. Some further small additions will be required to the machinery in 1892, but practically, our capital expenditure under this head has ceased for the present.

The whole of the last issue of 397 shares, at £1 premium, has been allotted, and the Directors think it a suitable opportunity to commence a Reserve Fund, and propose to appropriate the premiums on these, and on a former allotment of shares to that purpose. The amount of £954 10s is already invested in Consols in the names of the Chairman and Secretary.

The net profits shown in the Company's Profit and Loss Account, including balance brought forward, are £1,688 6 9 which it is proposed to apportion as follows:—

An interim dividend at 2½ per cent paid in Oct. 1891, absorbed	£249 15 0
It is now proposed to pay a final dividend of 7½ per, free of	
In come Tax (making 10 per cent for the year) absorbing	755 11 0
And to place to Reserve Fund, as explained above	654 10 0
	1,659 16 0
Leaving a balance to carry forward of	£28 10 9

BALANCE SHEET AT 31ST DECEMBER 1891.

Fourth class	59
Total	127

The wood specially rated is ebony; the four placed in the first class at R1 per cubic foot are: hal-millilla, nedum, satinwood, and tamarind. Amongst the 31 in the second class at 50 cents per cubic foot, we find doon and hill-doon, hulanhik, jak and kina, na (iron-wood) and palu, sapu, suriya, suriyamara, wa and walburutu. This last is generally known as wild or jungle satinwood. We are somewhat surprised to find this wood and sapu ranked second class. Of the 32 third class timbers at 30 cents, the most notable are damba, del and waverana. There are also domba and dombakina. Amongst the fourth class tress valued at only 15 cents per cubic foot is the very tree which gave its name to the capital of Uva—badulla. In succession we get bombi, bomboo, bo! "Emberella" must, of course, be a corruption of the word "umbrella," itself connected with umbrageous? In this category there is a wal-kina, but who is responsible for spelling the nelli tree "Nelly"? Ravan-gedilla must convey a reminiscence of the mythical arch-demon of Ceylon, represented as a monster of wickedness, and yet for the slaying of whom a god of the Hindu pantheon was subjected to severe penance! Rikattana and Rukattana look as if some tree-namer has been amusing himself. In this list there is a wal-jambu, one of the *eugenias*, of course, but what its affinity to the cultivated jambu may be we do not know. But we do know that but a percentage of the 127 timbers enumerated in the Uva list are used by the native carpenters, who are, like all orientalis, very conservative. In the rates for sawn timber we notice that no "Upcountry woods" are in the first class, and a note to "Upcountry woods" states: "25 per cent extra charged for milla, jak and kumbuk." Our planting readers will be specially interested in the rates charged for shingles, round timber, fuel-wood, charcoal, bambus and mana grass. We quote as follows:—

SHINGLES.

R15 to R20; per 1,000 delivered at the Haputale Depôt.

ROUND TIMBER.

Description.	In the Forest.	
	Badulla.	Haputale.
	R c.	R c.

SCHEDULE OF RATES OF MINOR FOREST PRODUCE.
Charcoal.

	R c.
Delivered at Badulla Depot, per bushel	0 33
Do Haputale Depot, per bushel	0 30

If burnt by parties in the forest under supervision, royalty per bushel .. 0 10
Bamboos and Canes.

Royalty on canes per 1,000 6 feet in length	5 0
Do rattans per 1,000	4 0
Do bamboo creepers per 1,000 12 feet long	3 0

Illuk and Mana Grass, &c.
To estates for a permit to cut and remove for 6 months.. .. . 2 50

To public departments and private purchasers other than villagers, per 1,000 bundles, 2 feet in circumference 2 0

To villagers for their *bona fide* use .. Free
Permits to collect Binkohomba, per cwt. 2 0

Bricks and tiles made from materials obtained from Crown forests, at 50 cents per 1,000. All rights to collect gallnuts, birds' nests, &c., to be sold yearly, What is "Bin-kohomba"? The "birds' nests," for the right of collecting which payment is demanded, are, of course, the glutinous nests of the cave-haunting swiftlets, and which the Chinese prize highly for soup-making purposes, as they do the sea-slugs found along our coasts.

THE EASTERN PRODUCE AND ESTATES
COMPANY, LIMITED.

Report to be presented at the fifth Ordinary general meeting, to be held at Winchester House, Old Broad Street, at 12 o'clock noon on the 28th April 1892.

The directors herewith submit report and balance sheet for the year's working, ending December 31st 1891.

The profit for the year, including £4,572 4s 1d, brought forward from the last account, amounts to £26,608 13s 4d, and, after providing for payment of interest on debentures and dividend on the preference shares, there remains a sum of £15,177 15s 10d to be dealt with in terms of the company's articles of association. As the shareholders are aware, provision is there made for the appropriation of profits, after payment of debenture interest and dividend on preference shares:—first for the creation and maintenance of a reserve fund of £10,000 applicable if required for the payment of said interest and dividends; secondly, for the redemption of debentures to the value of £3,000 each year, and thereafter for the payment of a dividend on the ordinary shares, not to exceed the rate of three per cent per annum, until the debentures shall be reduced below £50,000. Any surplus profits after payment of dividend at that rate to be applied in further redemption of debentures.

Having set aside £3,000 as required for payment of debentures out of profits, it is proposed to declare a dividend at the rate of 1½ per cent per annum, free from Income Tax for the year 1891 on the ordinary share capital. There will then remain a balance of 7,690 15s 4d, to be carried forward to next year's accounts.

It will be noted that debenture debt was reduced by £10,010 drawn and paid off in 1891.

As shown in the schedule annexed there are 9,236 acres of the company's property under tea cultivation of which about 6,700 are over four years old. The yield of tea in 1891 amounted to 2,008,000 lb. the average gross price obtained being approximately 9³/₄ p. per lb. The crop for 1892 is estimated at 2,240,000 lb.

The directors have sold three estates during the past year, viz:—Belgode, Montefiore and Sinnegode-Belle Vue, proceeds of sales being carried to the credit of "estates reserve account, realizations and recoveries."

In accordance with the articles of association, two of the directors, viz:—Mr. Norman W. Grieve and Mr. David Reid, retire from office and, being eligible offer themselves for re-election. The retiring auditor, Messrs. Welton Jones & Co., also offer themselves for re-election.

SCHEDULE OF THE COMPANY'S ESTATES AT 31st DECEMBER, 1891.

Arapolakande	Koladenia		
Asgeria and Maddawella	Kolapatna and Gongalla

		Total ..	16,791

NOTES ON PRODUCE AND FINANCE.

THE BUDGET AND PRODUCE.—In his speech on the Budget, Mr. Goschen made the following reference to tea, coffee, and cocoa:—"Tea has been extremely satisfactory. The receipts from tea were £3,434,000, against an estimate of £3,400,000, and against the receipts last year of £3,412,000. I must say that the result is more satisfactory than it appears, because a considerable amount of duty was paid at the beginning of the last financial year, the tea having been held back in expectation of a reduction in duty. That amount can be pretty well calculated, and the real increase on tea is £150,000, representing an increase of $\frac{4}{3}$ per cent. Of that 2 per cent. will be due to the increase in population and the fact of there being extra days in the year; but the remaining $\frac{2}{3}$ per cent. is a *bond fide* increase in consumption. The Coffee Group produces £331,000, or £2,000 less than the estimates. But where coffee shows a slight decrease cocoa shows a slight increase."

MINING LANE AND ITS MERCHANTS.—In the *Daily Graphic* of Tuesday there is a sketch of the Indian tea sale room in Mincing Lane during the progress of a sale. Underneath the sketch which is referred to as "A Pulse of the Nation's Prosperity—The Headquarters of the Tea Trade of the London Commercial Sale Room, Mincing Lane," there is a quotation from Mr. Goschen's remarks about the increased consumption of tea in his Budget speech. Under the heading "The Cup That Cheers," our contemporary says:—"On June 1st, 1811, the narrow little thoroughfare known as Mincing Lane was in a state of considerable excitement, for the Lord Mayor was coming in state to lay the foundation of the London Commercial Sale Rooms, accompanied by the 'band of the Honourable East India Company.' The ceremony was duly performed, and as the official report states, the Lord Mayor, 'having received a bottle of rum as a British colonial production broke the same upon the stone, and afterwards a bottle of wine, the produce of Portugal, the brave and faithful ally of Great Britain, and pronounced

the name of the institution to be the 'London Commercial Sale Rooms.' Such exertions necessitated refreshments, and the party forthwith proceeded to an 'elegant cold collation,' where his lordship, in a burst of eloquence, said 'the tyrant of Europe cast unceasingly an envious eye upon this happy island, and longed, but would long in vain, for her ships, her colonies, and her commerce.' Launched under such august auspices it might have been hoped that a grateful Mincing Lane would desert its coffee-houses and other miscellaneous places of business, and crowd the 'subscription room,' the numerous sale rooms, and the reading room. But merchants and brokers of those, as of the present days, were conservative in their habits, and for many years the London Commercial Sale Rooms were called, after their chief promoter, 'Martin's Folly,' and the shares dwindled in price from par to £17 per cent. As trade developed, and new articles were included in the comprehensive lists of Mincing Lane, the advantages of the rooms were, however, gradually recognised, and today there are 1,500 subscribers to the institution, which is so much too small for their requirements that it is to be pulled down, and a more commodious building erected. Like many other great ideas, the Commercial Sale Rooms were started before their time; but time has amply justified the enterprise of Mr. Martin, who, by the way was one of the founders of the firm of Hollams, Son and Coward, the well-known commercial solicitors. Mincing Lane as a thoroughfare is certainly insignificant and uninteresting, but Mincing Lane, in regard to the commercial interests located within its dingy offices, or the vast 'warrens' which front upon it, is one of the most important centres of commercial London. Here are located, for instance, the great sugar merchants and brokers, and a trade of vast extent is transacted in this article alone—not as formerly in sugar mostly of colonial growth, but now principally in beetroot and the crystallised goods heavily subsidised by foreign governments for the benefit of British consumers. Even more important, perhaps, than the sugar is the tea trade, an essentially British, nay, an almost exclusively London industry. This business is divided into the Indian and Ceylon and the China trades, and these have each their separate dealers and sale rooms."

TEA-PLANTING AND PHILANTHROPY.—In the current number of *Scribner* there is an article on the "Social Awakening of London," in which reference is made to the work done in the East—and by P. R. Buchanan. The writer says:—"The University Club has the constant support of Mr. Buchanan, who lives in B thnal Green with his family for the sake of entering into an intimate, helpful relation with working people." Of the teetotal clubs founded by Mr. Buchanan the writer says:—"These unique institutions are the creation of Mr. Buchanan. They combine the features of a coffee-house supplying a variety of good food and non-alcoholic drinks with those of a club having numerous facilities for improvement and recreation. Mr. Buchanan illustrates" says the writer, "the new type of man now coming forward in England, who with intelligence, means, and energy shall devote himself and his possessions to working out plans for widening the circuit of life for the toiling majority of his fellow-countrymen."

CEYLON TEA IN AMERICA.—Mr. S. Elwood May, President of the Ceylon Planters' Tea Company of New York, arrived in London a few days since, and is now staying temporarily at the Hotel Victoria. The Ceylon Planters' Tea Company of New York was established for the purpose of introducing and promoting the sale, in the United States and Canada, of pure Ceylon tea; and Mr. Elwood May's visit to this country has been undertaken chiefly with the object of furthering the operations of the company by consultation in the first place with the members of the Ceylon Association in London.

LAST WEEK TEA MARKET.—Discussing last week's tea market, the *Produce Markets' Review* says:—"Indian tea has been more freely offered, including a fairly good assortment of medium and fine grades. These have been actively dealt in at firm

to advancing prices, the market again closing strong with a tendency to a further upward movement. The liberal supplies of Ceylon tea now coming forward, which were expected to check the advance in Indian growths, have so far had no effect, and it appears probable, with a further curtailment of good Indian grades, which is almost certain to take place later on, the rise established will be increased. For the common descriptions the demand has slightly improved, but the quantity placed on the market has been amply sufficient to meet the enquiry, and consequently prices have been barely maintained. The deliveries for the past month were unusually large, as will be seen by the figures below, but, owing to larger imports, the surplus stock has not been materially reduced, and is still about 6,000,000 lb. in excess of the preceding year, although only about 3,000,000 lb. larger than in 1890. The demand for Indian tea for other markets is steadily increasing, but the rate of progress is not sufficient to relieve this market of the additional supplies promised in the coming ensuing seasons. It is understood, however, that greater efforts will be made to produce tea that will more effectively meet the requirements of an export demand. There are two important things to be considered, especially for the development of the export demand from America and Canada, namely, the size of the leaf and of the packages. The former should correspond as nearly as possible with the leaf of China Congou, and a good proportion of the tea should be packed in half-chests, containing about sixty pounds. There is little change of any kind in the position of Ceylon teas. A fair quantity has been offered, but the indifference of the dealers to go further into stock has been about balanced by the apparent willingness of brokers to buy over, and consequently there is no quotable change on values. The quality of the teas has been fairly maintained, as the present standard now goes, but it is seldom, if ever, possible to match the thick juicy teas which were the rule rather than the exception two seasons ago. The imports for the month were only 710,026 lb. in excess of last year's, but the stock still stands at a rather high figure, namely, 16,686,854 lb., as against 11,779,720 lb. on March 31, 1891. The exports from Colombo, according to the latest advices, dated March 7, were 11,226,061 lb., or nearly 1,000,000 lb. in excess of last year."

ANOTHER COFFEE SUBSTITUTE.—According to a German paper the fruit of the wax palm (*Corypha cerifera, L.*) is being used in Brazil as a coffee substitute. The fruit of this tree is of a stony consistency, which, however, disappears during the roasting process to which it is subjected for the purpose of manufacturing it into "coffee." The following figures show the constitution of the Brazilian fruit before and after roasting:—

	Crude fruit.		Roasted fruit.
	per cent.		per cent.
Water	9.37	..	3.76
Albuminoids	5.82	..	6.14
Fat	10.57	..	14.06

Ash	2.06	..	2.24
Substances soluble in water	12.17	..	13.50

—*H. and C. Mail*, April 15.

INDIAN TEA AND THE CHICAGO EXHIBITION.—We learn that the subscriptions to the proposed Tea Fund in support of the above, and other opportunities for pushing Indian tea, are coming in satisfactorily, although somewhat slowly. It is hoped that the response to the circular we published last week will be general, as it is only in that way that the effort can be successful. The Government of India, we believe, are prepared to follow the example of the Ceylon Government, and subsidize the planters' efforts. The appointment of a special commissioner direct from Calcutta, approved of by the Government

of India, who would take charge of the arrangements, would be generally welcomed. The sooner this is done the better, as we understand that Mr. Grinton, the commissioner deputed by the Ceylon people and their Government, has already reached London en route to Chicago.

THE SILVER QUESTION.—It was very unlikely that Sir Frank Adam's views on the silver question, as expressed at the recent meeting of the East India Association, would meet with general approval in India. We notice that the *Bombay Gazette* invites those who believe that the finances and the export and import trade of India may with advantage be left dependent upon "the whims and intrigues of Washington politicians" to take into account the contingency of the United States suspending their purchases of silver, and remarks that the complacency with which Sir Frank Adam declares that the loss due to the decline in exchange is temporary, falls only on individuals, and is actually very small, is worthy rather of the doctrinaire than "practical man of business." The serious fall in the gold price of silver has gone too far to please even those who at one time believed that the low price of silver was a splendid stimulus to trade, although planters have very little fault to find with the position. From Bengal we learn that it is difficult to remember when the exchange question so considerably engrossed attention as it has done of late. Any rapid drop unrelieved by a partial recovery has always tended to disorganise trade in every direction, and this is the more marked now when each disappearing thirty-second means a larger percentage than when we were higher up in the scale. The effect of the fall in silver, and the constant and violent fluctuations in price upon the Eastern banks is shown very clearly in the statement made by the chairman of the Chartered Mercantile Bank of India, London, and China, at the meeting on Tuesday. The credit balance is only £18,279, or rather under $2\frac{1}{2}$ per cent. upon the capital. The directors have decided to carry this amount forward to the next half-year—a prudent course. As it is not put to reserve, it is still available for dividend at any future time. The shrinkage in the bank's business is shown by the fact that the cash and bullion amounts to £2,100,000, and securities freely convertible into cash are put at about another million. If, as the chairman said, trade were good, and credit generally established, the bulk of that money would be in circulation and making profit for the bank.

NO CAUSE FOR COMPLAINT.—But it is an ill wind that blows no one any good. Planters, as a rule, have no objection to the low price of silver. Speaking at the annual meeting of the Standard Tea Company of Ceylon, reported in another column, the chairman, Mr. Alex. Brooke, said:—"Exchange is favourable to planters, and seems likely to continue so for awhile—at least, if there be no Government tinkering with silver." Thus, what is a matter of general distress to many members of the Eastern communities is a boon to employers of labour, who pay in silver and realise in sterling on this side.

LAST WEEK'S TEA SALES.—Of last week's tea sales the *Grocer* says:—"The only public sales of Indian tea held this week were on Monday last, when, preparatory to the market closing for the Easter holidays, no less than 13,580 packages were offered, which met a reception similar to that accorded these descriptions of teas for many weeks past, that is to say, while the small proportion of what may be called fine qualities with strength were readily taken at firm rates, the remainder, consisting of poorer and commoner sorts found a dragging demand at cheap and here and there at $\frac{1}{2}$ d. to $\frac{3}{4}$ d. per lb. lower prices. Calcutta advices, dated March 23rd, inform us that "the tea season is now over, and the market closed." In London the only arrivals this week have been the "Pindari," with 24,900 lb., and the "Coromandel," with 65,340 lb. Nearly 14,000 packages of Ceylon tea have been offered, and the market still retains a quiet tone. There has been little disposition to carry stock over the holidays, which has tended to depress prices. Sales have been on a liberal scale since Christmas, and the trade will be heartily glad of a short interval of rest.—*H. and C. Mail*, April 22nd.

TEA GROWING IN ENGLAND.

"J. R." writes from London to a local contemporary:—

I have lately been selling tea plants raised in this country from imported seed. When I first saw those tea plants, I was much struck with their fine and healthy appearance. They have been so carefully reared by Mr. Seston and gradually hardened at his nurseries at Roehampton that I can quite believe what one man told me—that he had been trying experiments with the single specimen which he has, and had often put in outside his window in town on some of the coldest days last winter and it *would not kill*. It certainly looked very far from being killed, or of having anything the matter with it when he shewed it to me. The tops of three of the plants were cut off last August, and put into a pot and forced, and the result, which was shewn to me in February, was a splendid show of leaf, and a really beautiful lot of blossom. I heard of a tea bush some years old at Kew; so went down there. I was disappointed to find it had been allowed to grow almost wild, the result being a weeping-willow-sort of tree some six or seven feet high, giving an entirely erroneous impression of a tea bush in bearing, there being not a sign of flush on it. The British public naturally conclude, as indeed the man at Kew thought who showed it to me, that tea is made from the ordinary leaf with which the tree is covered. I wrote the directors of the Royal Gardens offering to go down and to prune this tree, and said that, if they would put it into a hotter house, I was certain I could make some tea from it very soon. I had a courteous reply from your old friend, Mr. Morris, the assistant director, but he said they were afraid to risk any experiments with their tea tree, as it was the only one they had.

Having once got the idea of making some tea in this country from English-grown leaf, I went out to Mr. Seston's nurseries at Roehampton again, and made a selection of some of the plants for special treatment. I have not had much of a flush yet, but from young "bany" leaf and some tips have produced an article which has been reported on not unfavourably by tea experts. It is not easy to manipulate such a very small quantity, and such leaf as I have yet been able to pluck will scarcely roll properly or ferment. My samples passed muster, however, amongst a lot of six or eight, and I hope very soon to produce a sample which I shall not be afraid to put along with anything you are sending home just now, and I am very sure your "tuppenny" will not be in it! I am curious to know if anyone else has ever tried tea-making in this country from tea grown here; perhaps some of your readers can give me information as to this. It would not, of course, pay to grow tea in this country, and it can never be produced here at 2d a pound. My first pound will have cost quite a fabulous sum, and I doubt if it would pay to sell it at even the fancy price put on the pound or two of tips which made such a noise last year; still, the first pound of tea made in this country from leaf grown in England, say in London, would not be without its own value, and would certainly be of interest to many.

As I pointed out in a letter to the *St. James's Gazette* lately, referring to an article on Indian and Ceylon vs. China teas which had appeared in that journal, it is a curious fact that, in 1880, when I opened a 100 acre clearing for tea in the Kelani Valley, and advertised for plants, I could not get any at any price, and had to put out seed at stake, while this year I am advertising tea plants for sale in London, and many grocers and tea-dealers have those plants now growing in their shop-windows all over the country. They make a popular and attractive advertisement in the window or on the counter, and there is evidently an increasing demand for them, as I have had applications for dozens, for hundreds, and even for a thousand of them at a time, and for seedlings and seed by the thousand. If this sort of thing goes on, I suppose, we shall soon be able

to buy Ceylon tea at a penny a pound as good as we pay a penny an ounce for now. Who would not with such prospects, be a tea planter! All the same I would say: make hay while the sun shines, and keep your name up for quality. Do not try to compete in cheapness or in low prices, and give up sending home "tuppenny teas."

STANDARD TEA COMPANY OF CEYLON LIMITED.

The first annual meeting of this company was held at the offices, 25, Fenchurch Street, on April 12. The directors present were:—Mr. Alex. Brooke in the chair, Mr. Peter Moir, and Mr. Robert Kay Shuttleworth. The shareholders present included the following names: well known in Ceylon:—Messrs. Thomas S. Grigson, Norman W. Grieve George Johnston, and J. L. Anstruther.

After the usual formalities; the Chairman said that the report was pretty well confined and had reference almost entirely to the working of the one estate—St. Leonard's, the company's first purchase; that the shareholders were aware that, in addition they now owned the Eskdale and Liddesdale estates of some 1,065 acres in the same district Uda-pusilawa, and within such a distance as to be workable together; but that these were only taken over as from January 1st, 1892; and the report and accounts dealt with the company's existence to December 31st 1891. The results to that date compared favourably with the promises in the prospectus. The quantities of coffee, cinchona and tea accounted for to the company, in each case well exceeded the estimates of the prospectus. The general result of the crop 1891 had been a net profit of £1,670 7s 9d. The company bought the St. Leonard's estate as from March 1st, 1891. It was one of the conditions of purchase that they had the benefit of the crop from that date; but, as they were not in a condition to pay for the place immediately, they had to pay interest, which, at 5 per cent., amounted to £345 17s 8d. Out of the balance the directors proposed that a dividend should be paid for the four and a-half months of 1891 at the rate of 10 per cent. per annum on the first issue of shares, absorbing £658 13s 11d., and that the balance, after paying some small sum to them, the directors, towards expenses and trouble in forming the company, should be carried forward—say something over £600; for it was early days for the company yet and the bulk of the income for 1891 was from coffee, now a somewhat speculative source of income, even in the most favoured districts. The company's tea is still young, and in these high districts it takes longer to come into maturity than in the low countries. The two new estates, Eskdale and Liddesdale, give great promise for tea, both in quantity and quality. At present the leaf is cured on neighbouring estates; but a good factory is being built on St. Leonard's, designed when completed to manufacture as much leaf as is likely to be required. Exchange is favourable for planters at present, and seems likely so to continue, for awhile, at all events, if there be no Government tinkering with silver. The Americans, by legislating to raise the price, so succeeded for a season as to stimulate production to an excess. The inevitable reaction and fall in price followed, until we now see silver lower than we have ever before seen it, viz.: bar silver, London standard, below 39½d per oz. Had they left the article to find its own level, its price ere now probably would have been almost satisfactory to those whose meddling brought about what they now so much deplore; but the rise in price would have been gradual, and much loss saved to many, including a large, hardworking, deserving body—the planters of Ceylon and India. Let us hope that silver will now be left to natural causes, for the planters have natural troubles enough of their own. For the moment, at all events, exchange or silver (for here they are almost synonymous) is in favour of the company, cheapening outlay on the estates, and reducing the cost of factory and coolie lines.

Coolies (our labourers) have to be considered. Good "lines" on Eskdale were nearly complete by last advices. The directors believe in treating coolies well, and that if there be a pressure for labour those estates situated, as the company's are, in a healthy district, and furnished with comfortable "lines," will be greatly advantaged through having the preference before others among coolies. Prices for fine teas, like those from the company's properties, keep up very well, and are about as high as they were a year ago, though the average price of Ceylon tea has fallen. Coffee on St. Leonard's promises to be again a fair crop. It has been estimated at 3,000 bushels for 1892 by Mr. Edward Grigson, who at that figure much under-estimated it last year. There were excessive rains that must have caused some loss in January and February. On Liddesdale, in January, the total fall was 45½ inches in 25 days, against an average of about 70 for the year. We have had no crop figures since; but if there was the same margin on the estimate this year as last year, some coffee may be lost and yet leave a fair crop. Tea from Eskdale also promises exceptionally well; and the general prospects for the year current seemed bright and promising.

Questions were asked about the accounts, and remarks made by Messrs. Johnston, Anstruther, Wilson, and others. When these were answered, the report was adopted. A dividend at the rate of 10 per cent per annum was voted for the four and a half months of 1891, and £50 for division among the directors for past work. Mr. Grieve and Mr. Brooke were respectively elected and re-elected directors, Mr. F. G. M. Grove, A. C. A., auditor.

Mr. Grieve, in returning thanks, said that he had the highest opinion of the estates, of their capabilities, and of their prospects, and that he had backed his opinions in the large amount of shares he held. He added that the chairman had remarked on fine teas keeping up in price, though the average price had fallen. He (Mr. Grieve, might add in confirmation that he had, since he entered the room, a memorandum of prices put into his hands showing that his Eskdale teas were selling that week at 1d per lb. advance in each grade over the prices of the corresponding date last year.

A vote of thanks to the chairman concluded the proceedings.—*H. and C. Mail*, April 22nd.

THE INFLUENCE OF FORESTS ON WATER-SUPPLY.

Does cultivation and protection of forests cause an increase in rainfall? The reply of Mr. Henry Gannett, as published in *Science*, does not tend to confirm the generally admitted opinion on this question; whilst the statistics collected by this scientist have the more value, in that they refer to extended tracts in which the conditions of the country and the climate, both before and after changes in cultural treatment, are perfectly well known.

His observations extend over—

I.—An area of prairie lands in the State of Iowa in the north of Missouri, in the South of Minnesota, Illinois, and partly in Indiana. This area, measuring about 163,000 square miles, was formerly entirely covered with grass, but during the last 30 years large portions of it have been afforested.

II.—The State of Ohio, with an area of about 58,000 square miles, formerly entirely covered with forests of which at the present not one-tenth exists.

III.—An area of about 18,400 square miles situated in Massachusetts, Rhode Island, and Connecticut, which was densely wooded before its colonisation by Europeans. After the almost total destruction of these forests, about one-half of the area has, since 1860, been re-afforested.

If the removal of forests produces a decrease, and afforestation an increase, in the rainfall, the result of observations extending over a long series of years should show in the first instance an increase in the rainfall, in the second a decrease, and in the third a decrease up to 1860, and an increase after that date.

But the statistics collected by Mr. Gannett show that in these prairie lands an increase in the area under forest has not only not been followed by an increase in rainfall, but by an appreciable decrease. In the second instance, that of Ohio, a decrease in rainfall has indeed been proved, but this decrease is so insignificant that it cannot be seriously advanced as a conclusive proof of the unfavorable effect of disafforestation. The results of statistics collected in the third instance, that of Massachusetts, also do not tend to confirm in any way the generally accepted theory, for up to 1860 it is shown that there was an evident increase in the rainfall over this area, reaching a maximum of 28 inches annually.

Mr. Gannett also investigated the question as whether the cultivation of land denuded of forest growth resulted in influencing the rainfall; but the result of these investigations proved that no increase or decrease had occurred.

In writing generally on the causes of atmospheric phenomena, we have replied to the often put question which forms the title of this article long before Mr. Gannett wrote on the subject. In this periodical some six years ago we said "that forests do not produce rain, but that they play the important part of storing it up."

As far as concerns Algeria, we have arranged the observations registered at various meteorological stations in the provinces of Oran and Constantine, and these observations, extending over a period of 25 years, refer to large areas covered with forest adjacent to others, which are entirely free from forest growth; and whilst the areas are not to be compared with those reported on by Mr. Gannett, yet the results of the observations are very conclusive.

The region where the rainfall observations have most interest for the forester is bounded on the north, between Bulgaria and Lalalle, by the Mediterranean, on the east and west by the valleys of Summam and Sez-bouse, and on the south by the high plateaux forming the water-shed between the sea and the desert of Sahara. This tract is in area about 47,000 square miles; and though no regular re-afforestation works are being carried out, yet the closure of large extents of forest and pasture land against the destructive action of the natives may almost be regarded as having a similar effect.

In spite, however, of these protective measures, many thousands of acres have from 1850 to 1875 been burnt over, and it is especially in these burnt areas, when compared with others successfully protected, that the rainfall statistics have the greatest significance.

These statistics show the following results:—

I.—That nearly the same amount of rain fell annually before and after removal of forest growth, and before and after re-afforestation.

II.—That totally different effects are produced by the annual rainfall before and after removal of forest growth, and before and after re-afforestation.

During the summer following the removal of forest growth, the spring level begins to fall, and the following year most of the springs dry up.

In consequence of the water-courses cease to be permanent and become intermittent, being transformed, during actual rainfall, into impetuous torrents, which cease to flow during dry weather.

The valley of Oned-Guebli to the north of the province of Constantine furnishes a remarkable instance of this.

This immense valley is divided into two portions by the river of the same name, and the western side includes the densest forests of this region, whilst the eastern is almost entirely denuded.

During eight years of topographical research in these mountains, we have invariably remarked that during the winter, when heavy rain falls persistently, often for weeks at a time, the floods in the water courses from the Western or wooded side rise slowly, and rarely overflow the banks, and even after tropical rain storms, which are frequent, the water remains clear.

On the eastern or denuded side, however, this is not the case. Scarcely has the rain commenced when each small ravine becomes a torrent, which rolls

down gravel, boulders, and rocks, and overwhelms the neighbouring fields: whilst the muddy water passes rapidly on, arrested by no vegetation, conferring no benefit on the country it traverses,—to leave behind, on the cessation of rain, nothing but dry and rocky ravines.

There is, however, no need to expatiate on the disastrous action of rain in mountains and unwooded countries, it being too well-known.

At the same time, well-informed people have frequently an exaggerated idea of the value of mountain forests, attributing to them other virtues than those which they possess. The virtues they do possess are the power of storing up the rainfall, and thereby regulating the flow of water-courses and springs, and they are entitled to respect.

Our rainfall observations are extremely interesting in reference to forests which have been destroyed by fire: in such forests the annual rainfall remaining unchanged the springs dry up and the water-courses become dry ravines.

We need not be content with contemporaneous evidence; we can also bring valuable witness from the past to the truth of our assertions. About 10 miles to the west of the road from Constantine to Batna there is a horse-shoe shaped mountain range, with its convex towards the east. This range is named Djebel Anouda by the natives of the country. The inner slopes of this horseshoe were formerly thickly wooded, a fact proved by the presence of stumps of oak trees. These stumps, deeply charred and rooted in soil thoroughly baked by the fire which destroyed the trees themselves have hitherto resisted the decomposing effects of time. An enumeration of the stumps shows a former growth of about 60 large trees per acre, and in the centre of this magnificent forest there are the remains, in hewn stone, of a gigantic tank, and issuing therefrom a broad aqueduct, traceable in its ruins for several miles. Today the soil of Djebel Anouda is one of the most arid in Algeria; in former days a strong spring existed, its water-supply stored and protected by a sturdy forest growth.

In concluding this short paper, we would like to add that, though the extent of the areas under our notice cannot compare with those observed by Mr. Gannett, on the other hand our rainfall stations are much closer to each other than those under Mr. Gannett's registration. Of 44 such stations erected by the Government of Algeria, the four which enclose the tract of Oned-Guebli have been most useful to us. It is this tract of country that the observations above recorded refer to, and these observations lead us to the conclusion that "the salutary influence of forests in storing atmospheric humidity is irrefutable; but to enable them to store this humidity, the atmosphere must first contain it."—L. PARQUET in *Revue des Eaux Forêts*.

DUNG V. ARTIFICIAL MANURE.

High-fed manure is more nutritious to the soil than the produce of plain-feeding, but it is questionable whether its extra richness could not be supplied more economically in the form of commercial fertilisers. This is where and how the merits of home-made and artificial manures have come so closely into competition, and what has in many instances led to an extensive substitution of the one for the other. It has to some extent been found that the three main elements—nitrogen, potash, and phosphoric acid—extracted by crops, and at recent market value, be returned to the soil more profitably in the shape of special than general manures. That may be, from such a cause as we have just referred to, but is not the advantage of applying artificial fertilisers, instead of well-rotted dung, more apparent than real?

We repeat that rather more than three times as much nitrogen as phosphoric acid is removed from the soil by crops. Farmyard dung returns these elements in similar proportions, but, of course, it would be a mistake to suppose that dung supplies nitrogen to any crop at the rate of 12 lb. per ton, or anything approaching that quantity. Its duration as a

manure extends over four or five crops, but the close resemblance which its chemical composition bears to that of ordinary crops as regards manurial ingredients points it out as a peculiarly suitable manure for the purpose of maintaining the fertility of regularly cropped soil, while it furnishes much of the material necessary for the promotion of nitrification.

In duration, farmyard manure is excelled only by lime and borax, and this we regard as a very decided point in our favour. We accept the theory that fertility is due to organic residue of previous generations of plants mixed with certain mineral substances of which phosphoric acid and potash are the principal. Organic residue of previous generations of plants is simply another name for farmyard dung. The excrement of cattle, horses, and sheep is nothing more or less than the indirect residue of plants grown on the farm; and if it is properly managed during the period of fermentation, farmyard manure germinates what for want of a better term, may be called the very essence of fertility.—*Farmer and Stock-Breeder*.

MR. L. WRAY reports on "gutta rambong" that it is the rubber from the *Ficus Elasticus*. It is a large, many stemmed-tree, like the bavian tree. It is extensively cultivated in Assam. It may be grown from seeds or cuttings. The plants are planted on mounds 3 or 4 feet high, in 40 feet wide cleared lines, through the jungle: the lines being 100 feet apart (the jungle being left standing between them), and the trees placed 25 feet apart along the lines. Beyond once or twice a year clearing the undergrowth round the young trees nothing more requires to be done till the trees are old enough to tap. I do not know how long it is before they begin to yield rubber. There are a few trees near Ipoh, which I think ought to be preserved, as from them seed could be obtained. There are also a few trees in Upper Perak and the Plus. The rubber fetches about \$100 per pikul. From information which has been communicated to the Superintendent of Lower Perak, it appears that both in Langkat and Deli, Sumatra, the natives are successfully opening rambong plantations. The price of young plants is said to be \$1 for a seedling one foot high, and \$2 if two feet or more in height.—*Singapore Free Press*.

MALTESE BLOOD ORANGE.—H. E. Van Deman, pomologist of the department of agriculture at Washington, expresses the following opinion of this orange in the *Horticultural Art Journal*: "This is one of this choicest and most highly flavored of all the varieties of the orange. It is true that the flavor is not so mild and sweet as some, but in delicate aroma and sprightliness it is scarcely excelled or equalled by any. In size, it is about medium, and in shape it is slightly oval. The peel is not thin as that of some varieties, but the core is unusually small and seeds are quite rare. The name 'Blood' is attached because of the unusual characteristic red color of the pulp. This, however, varies greatly in different climates; as for instance, in California it is much more inclined to show the red than Florida and the Gulf coast where, in fact, it sometimes occurs that well developed specimens have no red color at all, or but the slightest trace. The skin is also thicker in California, and the flavor is more acid than the same variety grown east of the Mississippi river. In the Mediterranean regions, the flesh is almost as red as that of the beet, the skin is quite thick and the flavor tart. As its name indicates, this orange is a native, so far back as history goes, of the Island of Malta, in the Mediterranean sea. It has been known there for many centuries, but not before the Christian era, as the Roman writers make no mention of this or any other variety of the orange at that time."—*Rural Californian*.

NOTES FROM OUR LONDON LETTER.

LONDON, April 22.

THE CEYLON TEA PLANTATIONS COMPANY,

we hear that its report has this week been circulated among its shareholders, but no details have yet been allowed to transpire as to the amount of the dividend it recommends. All that has reached me as yet with respect to it is that it contains a suggestion that the Company's chief manager in Ceylon, Mr. G. A. Talbot, who is now in England on leave, shall, during the continuance of that leave, act as director of the undertaking in place of Mr. Henry Tod. Mr. Reid's death is of course too recent to have enabled arrangements for filling up his place on the same board of directors to have been discussed. Just as my writing had thus far proceeded it became possible for me to learn some of the leading particulars of the report just referred to. It states that the net amount of credit of profit and loss account, including balance brought forward at 31st December 1890, and after providing for general expenses, directors' fees, income tax, &c., was £31,439 3s. 9d. The interim dividend of 7 per cent on the ordinary shares paid 27th October 1891 absorbed £10,254 6s. 0d. It is now proposed to pay a final dividend of 8 per cent on the ordinary shares (making 15 per cent in all, free of income tax) which will absorb a further sum of £11,727 4s. 0d. A dividend on the 7 per cent preference shares was paid on the 30th June 1891, requiring £1 018 3s. 11d. and another similar one paid on the 31st December 1891 took £1,732 13s. 2d. The directors propose to add to the reserve fund out of last year's profits £5,493 8s. 0d. and to carry forward to next year the balance remaining of those amounting to £1,213 8s. 2d. The gross average price realized for the company's tea sold in London during last year was 9½d per lb. this being 1½d per lb. less than was obtained during the year previous. The report states, however, that the cost of production was one farthing per lb. less than in 1890, so reducing the net difference to 1½d per lb. This is, however, heavy enough to show how seriously the selling price of tea has been reduced upon the London market, for we believe few groups of estates in Ceylon have sent home teas of more level or better quality than that marked by the Ceylon Plantations Company. Certainly it is a feather in the cap of this large undertaking that in spite of the reduction in price obtained it has yet been able to maintain so satisfactory a dividend as 15 per cent during the past year. All the shareholders are greatly to be congratulated on this result, one which the publication of cannot, but influence opinion as to the remunerativeness of your leading industry. We also strongly feel that, taking that view alone, it must be most satisfactory to the general public in Ceylon that there is now no chance of the Company's continued success being endangered by the undertaking of any enterprise outside of the colony, such as it was proposed to enter in the Straits Settlements. There may as well be added to the particulars above given of this report that the tea received was plucked from 5,090 acres, and that the average yield per acre over this area was 414 lb. per acre. It announces also that all the Company's properties are in excellent condition, and that the factory accommodation and machinery, which were scarcely equal to the requirements of the past year, are now being increased to meet the largely-expanded business of the Company. It is regrettable to observe that this report is signed by the Chairman, the late

Mr. David Reid. Enclosed with it was a circular intimating the death of that gentleman at his residence, Thomanean, Kinross-shire, on the 13th inst. I have been obliged to deal with this report in a somewhat unconnected fashion, no copy of it having reached me, and having had to obtain my information respecting it from several different sources, time not having permitted of my amalgamating their intelligence into a more connected form.

GOVERNMENT QUININE.

Under this heading the *Rangoon Times* publishes some interesting remarks on the Government of India declining to sell sulphate of its own manufacture to anyone beside Government officers. It assumes, among other reasons, that this may be due to Government not wishing to interfere with private trade, in which assumption it is undoubtedly right. Our contemporary proceeds:—"Private vendors of quinine sell it at very high rates, far beyond the reach of very many, and often their article is of inferior quality and greatly adulterated. In the East, where quinine in most places is an absolute necessity to guard against the insidious attacks of the deadly fevers peculiar to the tropics, everyone should be able to get it, and in as pure a state as possible, and no one can for a moment maintain that the Government is competing with private enterprise if it offers an article in the interests of the health and the lives of its subjects, of a purer quality than the article obtainable in the market, and at a rate far below that charged by private vendors. In fact, such a proceeding on the part of Government will have the effect of making private vendors more careful of what they offer the public, and will really give a stimulus to private trade." We concur in the suggestion conveyed in this remark, and would add that there is no reason apparent why Government should not supply local traders with its own manufacture and thus give an impetus to an important industry both in Northern and Southern India.

Dealing with this subject so far as it affects Burma, the *Rangoon Times* continues:—"In Burma, which is preeminently a feverish province, it would be a boon to many engaged in private enterprise in the country to be able to purchase quinine from Government. There are many Europeans, and thousands of Burmans and others, working in the forests for private individuals and firms; large numbers are also employed in exploiting minerals and oil, and many are engaged by private contractors on railway construction and road-making for the Government. The majority of these undertakings is in the most sickly parts of the province, and much inconvenience, and loss is often experienced from the Europeans and the labourers engaged in them falling sick and having to go away from ill health. At the high rate at which private vendors sell their quinine, it would be ruinous to supply everyone who required it with the article and in many cases even it is procurable only in very small quantities. If those engaged in private enterprise were allowed to purchase the Government quinine at the rates at which it is sold to Government officers, a great deal of the sickness which prevails among those engaged on works of public utility and private enterprise in Burma would be avoided, and the province itself would be greatly benefited. It is possible that private individuals can obtain Government quinine by getting it through Government officers, if they are able to show just and sufficient cause why they should be supplied, but such a course is undesirable, on account of the circumlocution which has to be observed, and for several other reasons. We assure the Government of India, that it will be conferring a boon on the people who are intrusted to its care, by making the sale of Government quinine free to everyone, official and non-official alike, at the rates at which it is now sold to Government officers." These arguments are forcible, and will, we trust, receive attention from the Government of India, whose present arrangements for supplying quinine might

easily be improved. We believe we are correct when we state that in Madras planters and private individuals are at liberty to purchase quinine in certain quantities from the Neddiwattum Factory.—*Madras Times*, May 4th.

QUININE AND JAVA CINCHONA.

We publish on page 922 full statistics of the estimated crop of Java cinchona for 1892. The figures have been collected by the Soekaboemi Agricultural Association, that energetic organisation of Java planters to whose efforts on behalf of the cinchona industry we have often had occasion to refer. This is the fourth year of publication of the Association's estimates, which have fairly stood the test of accuracy, although the actual output has always been rather in excess of the forecast. On this occasion, we are told, special pains have been taken to render the figures as correct as possible, and the Association's efforts have been more generally seconded by individual planters than in any previous season. The statistics show that of the 115 plantations known to exist in the island two have been abandoned since last year, while on three others all the trees have been uprooted. These three plantations only produced an aggregate of 1 0,000 lb. of bark, or less than 3 per cent of the total production—a fact which disposes of the assertion that there has been a general uprooting of trees in consequence of the low prices which have ruled. Moreover, nearly all the uprooted cinchona averaged only 3 to 3½ per cent of quinine sulphate, a yield admittedly too low to hold out any prospect of successful competition in the future. On the other hand, twenty-six plantations have either not yet come into bearing at all or only yield insignificant quantities, while six others, though still in existence and ready to ship bark under more favourable circumstances, did not harvest any last season. These figures indicate that there is plenty of reserve stock in the island to fall back upon when the market improves. Another important feature of the return is that the quinine value of the bark on almost all the large estates is increasing. The manufacturing bark from Java, which averaged about 3½ cent not long ago, will next season represent an average value of nearly 5 per cent in sulphate of quinine, and that proportion is likely to be still further increased later on. The main interest of the Soekaboemi returns, however, lies in the fact that, for the first time in the history of the Java cinchona industry, they presage a falling-off, positive as well as relative, in the shipments from the island. If the unit remains where it is now, the compilers expect the quinine output of the island to be fully 10 per cent. less than last season, and even if the unit should improve to 1½d or 1¾d per lb., it is likely to fall below that of 1891 by 1 per cent. or thereabouts. Private advices which have reached us simultaneously with the returns state that the actual shipments will almost certainly fall below the minimum mentioned in the returns, unless, indeed, in the unlikely event of a considerable improvement in prices. What the planters aim in the first place, however, is not so much a considerable advance in the unit value as an assured steadiness in the market, and they will, therefore, endeavour to regulate their shipments in such a manner that the quantities to be offered at the Amsterdam auctions shall be as nearly equal as possible, "experience having proved that the Amsterdam market is an unusually sensitive one, and easily affected by irregularity in the supply."

The position of the Java planters today resembles that of their Ceylon colleagues in 1886 in this respect—that the excessive feeding of the European bark-market is beginning to produce the inevitable reaction—but the situation is different from that in Ceylon six years ago, first, inasmuch as there is in Java a heavy supply of rich bark to fall back upon; secondly, because the Java growers have taken to heart the lesson that the indiscriminate production of low-grade, quickly-growing barks does not pay; and, finally, because they have not, as the

Ceylon growers had at the time, looming before them the spectre of a new and rapidly growing source of production the advent of which they are bound to forestall at all hazards. There is no important source of supply behind the Java planters. They have taken the lead of the market, and can keep it if they like. That is a fact about which there cannot be two opinions.

The threatened falling-off in the production of Java cinchona-bark would, no doubt, under ordinary circumstances make itself felt in the quinine market. But that market has been unhinged to such a degree by speculative sales, that the effect of the laws which usually govern the fluctuations of manufactured products may be retarded for a considerable time. There is certainly no indication yet of any upward movement in quinine, though the signs which would warrant such a tendency are slowly accumulating at the horizon.—*Chemist and Druggist*, April 23rd.

THE CINCHONA ADMINISTRATION REPORT.

The Government of India, in acknowledging receipt of the Annual Report of the Government Cinchona Plantations on the Nilgiris for the year 1890-91, remarked that the quantity of bark in stock at the close of the year amounted to 510,695 lb., which the Director of Plantations (Mr. Lawson) hoped to utilise for the manufacture of quinine during the next few years. The Government of India trusted that these anticipations might be realised, and added:—"It has not been altogether satisfactory that manufacture has failed to keep pace with the increased demand, and the Government of India is glad to observe that the Madras Government is calling for a special Report regarding the alleged inadequacy of the machinery received from England." It also pointed out that one reason for the difficulty experienced in the sale of the quinine powders was probably the high price charged for them, namely, 3 pies each, or at the rate of R21 per lb., giving a profit of 50 per cent on the cost of production. It was unable to believe that reluctance existed anywhere in India to take quinine. There was a well-founded repugnance, no doubt, to the cinchona febrifuge on account of its nauseating properties, but no such objection was found to the use of quinine with the effects and potency of which the people were generally familiar. With a view, therefore, to render the retail distribution of quinine successful, the Government of India thought the price should be considerably reduced.

Mr. Lawson, in commenting on the Supreme Government's letter, said that the large amount of bark in stock consisted chiefly of red bark, which, when compared with crown bark, is poor in quinine; so that to obtain a large amount of quinine it would be necessary to use a much larger quantity than would be the case if it were crown bark. In other words, the amount of bark in stock would not go so far as the number of pounds given in the Report might lead Government to suppose. Of the crown bark remaining, there was ground up a sufficient quantity to last till the end of July next, and of unground bark enough to last till the end of this year. During the next monsoon it is proposed to take a large harvest of crown and crown hybrid bark from the Dodabetta and Naduvattam estates; but although 150,000 lb. have been put down in the Budget Estimate as the probable outturn, Mr. Lawson will be guided by what is found necessary for the factory, and then after that, by what he thinks desirable to take from the trees. With reference to the remark that the manufacture had failed to keep pace with the increased demand through inadequate machinery, Mr. Lawson said this was not quite the case, as after supplying all requirements there remained at the close of the year 1572 lb. in stock, all of which, and more, had been since intended for by the various Indian Medical Departments, besides 1,200 lb. of febrifuge. Up to the 31st December, 1891, indents were received which amounted to R77,000 or R1,000

over the estimated year's expenditure; and after these indents had all been complied with, there would be still left in stock on the 31st December, 1891, 1,150 lb. of finished quinine and about 100 lb. of unpowdered febrifuge. The machinery at present erected was, he said, adequate to turn out the quinine and febrifuge likely to be indented for; but the machinery in duplicate. Mr. Dawson hoped the Government of India was right in thinking that the native population had no reluctance to taking the quinine; and that the small sale of the powders hitherto was due solely to their high price, which he agreed might be reduced to 2 pies each.

The Surgeon-General with the Government of Madras, to whom the correspondence was forwarded for remarks, said he did not see that any appreciable saving would be effected by sending quinine and jalap in bulk as proposed by the Government of India. On the other hand, it would throw additional work on the subordinates at Municipal hospitals, who had already as much work as they could attend to. Moreover, uniformity in appearance, &c., could only be obtained by adhering to the present system. He did not approve of the suggestion to wrap the powders in old papers, which would increase the possibilities of one powder being mistaken for the other, "moreover, the outer covering of a drug even among more civilised people, has a decided effect on its sale. A recognised feature of the success of proprietary drugs is the neat and attractive way they are made up." To prevent any mistake the wrappers might have printed on them in Tamil "Purgative powder," and "Fever powder," respectively and the outer wrapper enclosing both powders might contain simple directions, such as "the purgative to be taken first and when it has acted, the fever powder." Surgeon General de Fabeck's own opinion regarding the sale of these drugs was that it would be in direct ratio to the interest taken in the sale and distribution by Revenue officials. The price of the 5-grain quinine powder has accordingly been fixed by the Madras Government at 2 pies and that of the 100 powder packet at 11, the jalap being issued free of charge as hitherto. This arrangement will give the seller a commission of 3 pies in the rupee or about 4 per cent. as at present. The Madras Government is of opinion that it would be better to continue the existing method of distribution, and it has ordered that the names of the drugs and directions for their use are to be printed on the wrappers in the vernacular of the district to which the packets are sent for distribution.—*M. Mail*, May 5th.

SOURCES OF FERTILITY.

Among the substances produced in the course of the fermentation of dung, organic acids are formed similar, to those found in what is anciently known as humus. These organic acids have a strong affinity for ammonia which they retain firmly in combination. But for this fact, there would doubtless be a much greater loss of ammonia from the manure heap during fermentation than there is, though there is actually more waste every day than should be, by allowing the manurial fluid—the very essence of dung—to drain away from the mass.

It is too often forgotten that farmyard dung has something more to command than its completeness as a manure. Farmers are very apt to look on one side of its usefulness only. Its mechanical virtues are not sufficiently appreciated. It is well known that manuring is not all that the soil requires; its physical condition must be looked after. While dung replenishes the soil with chemical constituents, it also adds bulk and porosity, and thus accelerates drainage. It has, therefore, much to do with the temperature of land. Besides assisting in the removal of superfluous moisture, it renders the soil more absorptive, enabling it to make better use of the heat of the sun than it would otherwise do. This is an extremely important matter.

The temperature of the soil is affected by other causes than the sun's rays. Decaying vegetable matter

is a source of heat, as evidenced by the high temperature germinated by the process of fermentation of dung. Farmyard manure thus supplies heat to the soil from two different sources, while it helps it to retain much valuable manurial ingredients, which, in a colder or more purely mineral soil, would be washed away. It also opens up dense, stiff soils to the influences of the air and gives freer course to the roots of plants. It is not to be commended for application alone, but in conjunction with phosphatic manures we believe that farm-yard dung is indispensable in maintaining the necessary temperature and fertility of the soil.—*Farmer and Stock-Breeder*, April 4th.

CINCHONA-SAMPLING IN AMSTERDAM.

We gave particulars some time ago of a meeting held under the auspices of the Cinchona Warehousing Association in Amsterdam at which it was decided to adopt a new plan of drawing samples of bark. We now understand that the necessary machinery for grinding the bark has been put down, and that the samples for the auction of May 5th, next will be treated upon the new system.—*Chemist and Druggist*.

AGRICULTURAL PRODUCTS OF THE PHILIPPINES.

The United States Consul at Manilla says that the principal products of the Philippines are hemp, coffee, rice, tobacco, corn, and fruits. The cultivation of hemp is a very simple operation, and as it yields a large revenue it is not surprising that it is a popular occupation among the people. This staple is the product of a species of planting which grows wild on the Pacific slopes of the volcanic elevations of the Philippine islands, particularly the southern ones. Under cultivation the tree attains a height of 15 or 20 feet, with a trunk from 8 to 12 inches in diameter. In its green state it is crisp and juicy, and can be readily cut down with an ordinary carving knife. The preparation of the hemp for market is very simple. When the tree has properly matured, it is cut down and divided into long strips, which are shredded under a large knife kept in the proper position by a rude lever. This separates the juice and spongy matter from the fibre, and the latter is spread out in the sun to dry, after which it is packed in bales of about 240 lb. for shipment. There are a large number of plantations owned by natives, as well as by Spaniards and mestizos, where the trees are set out in regular rows, and well cared for. The cultivation of the coffee tree has been followed to some extent for the past thirty years, but interest in this branch of cultivation has been renewed during the past four or five years, and it is expected that its export will increase annually. There is no way of ascertaining the area of land occupied by coffee trees nor the amount of coffee annually produced, as the trees are scattered in various parts of the archipelago. The largest plantations are in the province of Batangas, in the island of Luzon, but many of the natives have a few trees in their front yards, under the shade of the plantations, that may yield four or five bushels of coffee berries. The increase in production has been marked within the past few years. In 1887, a little over 5,387 tons were exported; in 1888, about 7,501 tons. Although rice is the native's principal article of food, there is not enough of it produced in the archipelago for local consumption, and more than 70,000 tons are imported annually. The tobacco industry in the Philippines employs a large amount of capital and a vast number of hands. The best tobacco comes from the provinces of Cogayan and Isabella on the island of Luzon, the average annual yield from these being from 60,000 tons to 100,000. Tobacco is also grown in the provinces of North and South Ilocos, Abra, Lepanto, Nueva Ecija, and Union, all on the island of Luzon, and on the islands of Cebu, and Panay. The tobacco produced in the former provinces is called *Igorrotes*, while that from Cebu and Panay is designated *Visayas*. In cultivat-

ing, the earth is well ploughed and harrowed and the seed sown in September. About six weeks later the young plants are transplanted about two feet apart, and the field is kept free from weeds, and otherwise carefully attended to until February, when the plants are almost ripe. The crop is gathered in March and April. It is then made up into "hands" of one hundred leaves each, the leaves of each hand being fastened together at the stem ends with strips of bamboo fibre. These hands are then hung up in rows upon bamboo poles under long sheds, which are open on all sides, and when they are almost dry they are piled up on the ground and allowed to ferment. The leaves are then dried again and packed into bales for shipment to Manila, where they are repacked and pressed into bales for export, or sent to the factories to be converted into cigars and cigarettes. It is not sold by weight at the plantation but by the *fardo*, which contains forty hands. All the tobacco manufactured in the Philippines is made into cigars and cigarettes. The tobacco is classified at the plantation into first, second, third, fourth, fifth, and sixth grades, according to the size and quality of the leaves. In Manila there are twelve large tobacco factories, one of which, La Flor de Isabela, the factory of the Compania General, manufactures seventy-five brands of cigars, ten brands of cheroots, six grades of cut tobacco, and eight brands of cigarettes. These twelve factories give employment to about 11,000 persons. Besides these there are numerous small factories owned by natives and Chinese. Corn holds a very unimportant place among the agricultural products of the Philippines, although it is cultivated to some extent. All the corn produced is that known as maize or Indian corn. The method of cultivation is similar to that followed in more advanced countries, but the implements used are of a very primitive character. As a rule the land is ploughed with a sharpened stick drawn by a buffalo, after which a heavy wooden frame, about four feet square with long wooden teeth on the under side, is drawn over the ground to break the lumps. The corn is then hoed by hand, and all that is necessary thereafter is to keep the weeds down. No manure nor fertiliser of any kind is used. No attention is given to fruit culture, and mangoes, bananas, apples, guavas and numerous other native fruits grow without cultivation, and are gathered by the natives in the hills and even within the limits of the cities and towns, who bring them to Manila and sell them in the streets and markets. Consul Webb says that no attempt has ever been made to export any of these fruits except a few mangoes, which are sent every year to Hong-Kong and other neighbouring ports, although it is quite probable that under a proper system of cultivation, grafting, &c., some remarkably good fruit might be developed that could be preserved or canned, and sold at a great profit in Europe and the United States.—*Journal of the Society of Arts.*

CALIFORNIAN FRUIT PRODUCTION.

A correspondent, writing to the *Economiste Français* says that at the present time California is one of the principal fruit-producing centres of the world. It is more particularly in the southern part of the State that this industry is the most developed, and Sacramento is the centre of it. It produces all kinds of fruits—pears, peaches, figs, grapes, &c. The pear which is one of the choicest and most easily transportable of fruits, was the first to attract the attention of the grower, and was cultivated on a very considerable scale. The pear tree in California bears at the end of three years, but it is only in full bearing at the end of six or seven. An acre of ground, well planted and carefully attended to, should yield at the expiration of this period about 35,000 lb. weight of fruit, worth £200. Grapes are of three descriptions—those for the table, for wine making, and for drying. Each description has its own special centre of production. Grapes for drying are grown in the valley of San Joaquin, those for wine making, further to the north, and the table fruit is cultivated in the

neighbourhood of Stockton and Sacramento. Southern California is distinguished by very varied climates, which admit of all descriptions of fruit culture. The choicest kind of table grapes are those known as Tokay. A San Francisco paper—the *California*—states that over an area of fifteen acres planted with Tokay grapes, the vines being fourteen years old and well tended, the gross yield was valued at nearly £4,000. Deduction being made of the expense of cultivation, irrigation, transport, and commissions, the net product is estimated at £1,738, that is at the rate of £124 per acre. This, however, is stated to be an exceptional case. After grapes come the figs. These latter are cultivated in very large quantities in California, and there are many different descriptions. An attempt has been made to acclimatise the true Smyrna fig, but it has not hitherto been a success, although fruits have been grown very nearly resembling it but inferior in perfume. The choicest variety and the one most easily obtained is the fig called the "white Adriatic." At Ventura, where it is most successfully cultivated, one grower alone has planted a very large extent of ground, and estimates, judging from past results, that in ten years' time his annual yield will amount to about 1,250 cart loads of fruit, which at the rate of one cent a pound will produce an amount of £50,000. The fruit growers of California having a supply of fruits greater than is necessary for home consumption, are naturally desirous of finding outlets for their supplies, and for some years they have been endeavouring to establish markets on the Atlantic coasts. In the fruit season an exhibition of choice fruits is sent over the principal lines of the Union in a specially constructed wagon, which is called "California on wheels." The cost of this travelling exhibition is borne by the Board of Trade of the State of California and the Southern Pacific Company. At the same time the Board of Trade supports, not without considerable expense, at San Francisco, a permanent exhibition of fresh fruits. The Eastern States, the large cities such as New York, Boston, Philadelphia, and more in the west Chicago, and in the South St. Louis, equally receive regular supplies of fruits. Railways have been constructed to unite the principal producing centres of California with the great transcontinental lines, and to carry the fruits rapidly from one end of the country to the other. But no matter how abundant the yield may be, and the cheapness of transport, fresh fruits are still a luxury, and their sale cannot exhaust the production of California, so for some years now attention has been paid to developing the sale of preserved fruits. At first, these were prepared on the evaporation system, and the fruit was then packed in boxes. This industry has had an enormous development, and the manufacturers of tin boxes in California are considered among the most skilful and the richest in the world. Since 1885 the yield of fruit has been so abundant that the special apparatus for artificial evaporation have been insufficient, and recourse has therefore been had to natural evaporation by solar heat, but the latter system has not given, everywhere, satisfactory results. In the greater part, however, of California, the air is extremely dry, and the desiccation of fruits under the influence of the sun is, says the *Economiste*, absolutely perfect.—*Journal of the Society of Arts.*

THE PEPPERMINT INDUSTRY OF ST. JOSEPH COUNTY, MICHIGAN.*

Next to Wayne country, New York, St Joseph country in Michigan is the largest peppermint producing locality in the United States. As early as 1846 farmers began to cultivate the plant in this locality and the industry has continued to grow ever since. Most every farmer thereabout now raises some peppermint, but usually in connection with other crops, while a few devote their whole time to its cultivation. By far the principal grower is Mr. Henry

* From the *Pharmaceutical Era*, April 1.

Hall, of Three Rivers, and "Halls Big Marsh of Florence" is the largest piece of land in America devoted to raising peppermint. The farm is eight miles southeast of Three Rivers, and contains some 900 acres, of which 400 acres are put into mint each year and alternated with clover to keep up the strength of the soil. Mr. Hall has four large distilleries with total capacity of some five hundred pounds of oil daily. The largest still house is situated in the centre of a 600 acre field; it contains four stills, and is surrounded with mint fields as far as the eye can see.

The cultivation of the plant is accompanied with more than ordinary care and the success of the crop depends largely upon the attention it receives, as well as the season. The ground is ploughed in August, September, or October, then thoroughly harrowed, and the following spring it must be harrowed again, then marked and planted. Old roots from "first" crop are removed from the ground in spring, and planted in rows three feet apart; a man carries the roots in a sack on his back, throws them into the rows, and they are then "kicked in."

Two or three crops are gathered from each planting, the first and second crops are the best, and twenty rounds of oil to the acre is a good yield; the third crop is very apt to be "weedy" and the yield only about ten pounds to the acre.

From the time the mint appears above the ground until it is gathered, it should be constantly cultivated and hoed to keep it free from weeds, which are the bane of the peppermint grower's existence. The plants mature from the middle of August to the first of September, soon as the blossom is out; the "second" crop mint comes first, then the "first" crop, and lastly the "third." It is cut with a mower and by hand with a scythe, and if weedy the weeds must be stored out by hand. The plant stools out and spreads, but "first" crop is in quite distinct rows; the second year it grows from the runners which fill in the rows making it a more solid mass, and in the "third crop" this is still more apparent.

After cutting, the mint is allowed to partly dry or "cure," and is then raked into cots like hay and drawn to the still house, where it is immediately distilled.

The process of distillation is not complicated but interesting. The still is a large wooden tub with tight hinged top, a steam supply connection at the bottom and outlet to the condenser at the top of one side. The condenser used by Mr. Hall is a very effective and unique piece of apparatus, the worm instead of being in a coil is in longitudinal sections about 14 feet long, which lap under each other, the top about 6 inches in diameter and tapering to some 2 inches at the bottom or outlet, and is made of tin. The cooler consists of a tin trough about 8 inches in diameter with perforated bottom, the length of the condenser, over which it sets, and through the perforations a constant stream of water is kept flowing over the tin condensers.

The mint is drawn to the still house in waggon, pitched into the still, the packer "packs the tub," the top is fastened down and the steam turned on for about an hour or until exhausted; this is told by pulling out a plug in the top of the still. Across the inside bottom of the still is a frame with chain connections that run to the top; by means of a heavy crane, which is connected to these chains, the exhausted mint or "charge" is lifted out of the still and carried away on a waggon. The "mint straw," as it is called, is dried in the sun and used as fodder for sheep and cattle.

The quality of the oil produced depends entirely on the mint used, and the freedom from admixtures of "weeds" or other foreign substances.

Careless and lazy farmers raise poor mints as well as poor wheat, and whether it be "first," "second," or "third" crop mint, thorough cultivation is an important consideration in producing good oil of peppermint. Everything that comes from a still is by no means pure oil, and experience is a most important factor in judging of its quality.

Enough has been written about tests for oil of peppermint to fill a large volume, but one of ex-

perience in the business will judge of the quality of a can of oil almost as soon as he places his nose to the opening. It may be necessary to examine it for water or castor oil and alcohol and possible other adulterants, or to see that none of the menthol has been removed, but the natural flavour of pure oil of peppermint is what the man of experience first seeks.—*Pharmaceutical Journal*.

ANOTHER SUBSTITUTE FOR JUTE.

Wonderful are the uses of the cotton plant! Formerly it was grown for the cotton alone, and the seed was looked upon as a nuisance, to be got rid of in the cheapest way possible, not even being thought worthy of use as a manure, and both it and the hulls were regarded as dangerous food for stock. Now the value of the seed is almost as great as the cotton itself. As an oil producer, a food for stock, and a fertilizer, it is in constant and growing demand, and it has even been suggested that it would pay to develop seed-growth at the expense of the cotton, making that merely a secondary product. Up to this time the stalks have retained their old-time valueless character, but this also appears now to be nearing its end; for it is proposed to utilize the fibre contained in them for making bagging. The difficulty in the way has hitherto been the absence of a machine to break them and draw out the fibre. This appears now to be overcome, and another source of profit opened to the cotton-planter, as we learn from the following paragraph, taken from the *Progressive Farmer*:—

"The following from Augusta will be read with interest by all our readers:

"William E. Jackson, a well-known lawyer of this city, has solved the Jute-bagging problem that has agitated cotton circles for so long. Jackson has perfected mechanical appliances for making bagging from cotton stalks, and he has just returned from New York with a roll of bagging.

"Expert cotton men say that it is in every respect equal to jute bagging. He will buy the bare stalks from the farms, and can afford to pay about \$2 a ton laid down. An annual stalk yield will bale three years' cotton crop. The machinery comprises heavy corrugated rollers, with vasts of running water, carding machines, and bagging looms. It is estimated that in making bagging from cotton stalks two million dollars annually will be put into the pockets of farmers for what is now cleared from the fields at an expense.

"Augusta will be headquarters for the company's mill and office, the demand for the products of which will extend from Virginia to Texas. Jackson had the roll of bagging which is exhibited woven by the jute-bagging looms of J. C. Todd, at Paterson, N. J., and he says that experts pronounce it equal to its jute rival. Cotton-stalk bagging is less inflammable, and is only a shade darker than jute. Cotton circles here are jubilant."—*Southern Planter*.

SUGAR IN INDIA.

Papers respecting the sugar production of India have been received from the Secretary of State for India, from which the following particulars have been extracted:—

On the 8th May, 1889, Messrs. J. Travers and Sons, Limited, wrote to the Under Secretary of State for India:—

"The average production of India is given as a ton of sugar per acre, and the produce (with the exception of the three modern mills in Madras) is of the most wretched character.

"In the West Indies (which are also backward) sugar growers obtain two tons of sugar per acre, or double the Indian average, and, with modern machinery, properly crystallised sugar can be made direct from the cane juice at a cost on the spot (that is, without carriage) of 8s. to 10s. per cwt.

"It is no doubt the competition of such direct cane sugar from Mauritius which is leading to the closing of refineries in Bengal, if, as we imagine,

those refineries work, not from the sugarcane, but from coarse native sugar.

"In all the statistics sent us, Mauritius and similar sugars are described as refined, but this is altogether misleading. There are no refineries in Mauritius, where sugar is remelted, and the produce of the island is simply raw sugar properly made by modern processes.

"It is such sugar that India ought to make, and the Empire, with sufficiently improved cultivation and machinery, might readily supply the world with sugar. Refining is a secondary process, likely to altogether die out, by slow degrees, as cane and beet manufacture becomes more perfect. The disappearance of refining in Bengal, though hard upon individuals, is really a sign that there is progress elsewhere, and progress which no country is better adapted than Bengal to share in.

"That modern sugar can be well made in India is shown by Messrs. Minchin at Aska, Madras, and it is simply absurd that India should have first to export the labour to Mauritius, and then to re-import sugar from that distant island, which could be as well made, and certainly more cheaply, at home. India is generally regarded as the home of the sugarcane, and with its teeming population, its climate, and (in some districts) its plentiful water and coal supply, it should be a large exporter of fine sugar instead of an importer.

"The manufacture of modern (or, as it is called vacuum pan) sugar, to be profitable, must be on a large scale, because it involves costly machinery and chemical and mechanical supervision impossible for ryots, who probably do not extract one-third of the sugar that might be extracted from their crops, and make that third in a shape that looks more like manure than sugar, and which appears to fetch in many parts of India as little as 6s. per cwt. on the spot, whereas Mauritius sugar in India must net double that to pay the grower.

"Vacuum pan sugar making is, probably, only possible on a large scale in India through the central factory system, where the raw canes are bought by the mill from the growers. A system similar to this already prevails in indigo and silk mills in Bengal.

"We do not know whether the Government of India would be able to start a few model factories in suitable districts, or whether they must confine their attempts to develop sugar manufacture to the collection of information and figures like those in the returns forwarded to us. In any case, the efforts of the Government in this direction for some years past cannot fail to be of great value."

This letter was sent by the Secretary of State to the Government of India, and in reply to the points there raised, a series of letters were obtained from authorities of India. The Director of the Department of Land Records and Agriculture, North-West Provinces and Oudh, wrote:—

"The suggestions made by Messrs. Travers and Sons is that the Government of India might start a few model factories for the preparation of sugar by modern processes in suitable districts. This appears to be the only point of practical import nec in the memorandum. In my opinion the Government would be ill-advised were it to act on the suggestion. I base my opinion on the general ground that private enterprise in India is now sufficiently alter and well organised to undertake the business of sugar-refining on a large scale, and with ample capital if there were a reasonable prospect of success. That sugar-refining companies working on scientific principles, such as the Rosa Company and the Aska Factory, show no signs of multiplying in India is to my mind a clear proof that, under existing commercial conditions, the prospects of successful trade are small. Nor is the explanation why prospects are not encouraging far to seek. European sugar refineries in India have two markets, and two only, open to them. They can manufacture for export to Europe, in which case they have to contend with the bounty-aided sugars of the Continent, and are no more able than the Mauritius factors to make a reasonable profit on their capital in such a market. Or they can manufacture for

local consumption in India, endeavouring to supplant sugars refined by native or crude European processes, and sugars imported from the Mauritius. Here they are met with the great difficulty that the mass of the native population regards with dogged suspicion all machine-made sugar, holding it to be impure and contaminated with bones and blood. The market is thus a very small one, and the prices ruling in it are by no means improved by the quantities of similar sugar thrown in despair upon it by Mauritius planters. Assuming that the cost of producing a given amount of crystallised sugar by modern processes is about the same in India and in the Mauritius (and from such information as I have at hand, I do not think a sugar refinery in India could manufacture cheaper than the Mauritius planter), what are probabilities of commercial success? They are bounded, it seems to me, by the actual success attained by the Mauritius planters, and as we are constantly told that sugar in Mauritius does not pay, scientific sugar-refining in India is not a hopeful industry. The Rosa Factory in these provinces depends more on its rum than on its sugar, and I believe this is the case with the few other similar concerns existing in other provinces.

"The memorandum refers in contemptuous terms to the quality of the common sugars consumed by the Indian public. But they have an almost unlimited and active market, which is at present closed to machine-made sugar; and even if superstitious prejudices could be overcome, there would still remain the question of national taste. The compost known as *gur* has a peculiar flavour which is absent from machine-made sugars, and the tastes of a most conservative people will require to be changed before the local markets of India really open to the European sugar manufacturer.

"I admit all that the memorandum says as to the smallness of the yield of sugar per acre in India, as to the inferiority of the processes employed to extract the juice and make it into sugar, and as to the low quality of the so-called 'refined sugars' of India. But it is conceivable that these rude processes and this small outturn may yield a profit, while scientific processes and high cultivation result in a loss. Not only does the Mauritius system require a large initial capital expenditure, and a large annual outlay, but it also requires a highly paid supervising and controlling agency. I do not defend the imperfections of the Indian system, but I think it is economically explicable.

"There would be some difficulty in introducing the Mauritius system bodily into India, since a prominent feature of that system is that planting and manufacturing are concentrated in the same hands. But as the memorandum points out, a sugar refinery might easily work in an Indian sugar-growing district on the line familiar to indigo planters. It would buy cane at the proper season from cultivators of the neighbourhood, and would restrict its interest in the actual production of the crop advance to growers. A large sugar refinery, I may point out, would have to face two problems which are not easy to solve. The first is the question of carriage. Cane soon dries when cut, and cannot be carried long distances. A sugar refinery has thus to depend for its raw material on a small area devoted almost exclusively to the production of sugar, and this is opposed to the habits and traditions of the Indian agriculturist. The second difficulty is that the machinery of the factory would stand idle for a great part of the year, and occupation would not be forthcoming for the hands, unless a subsidiary business, such as the manufacture of rum, is added to that of sugar refining. The market for rum in India is not large, and is probably sufficiently supplied by existing concerns."

Mr. M. Finucane, Director, Department of Land Records and Agriculture, Bengal, wrote:—

"As regards the question of improvements in manufacture suggested by Messrs. Travers and Sons, I would remark that it seems not unreasonable to suppose that such improvement is possible and it is not improbable that the establishment of model

factories in suitable districts, whether by Government or by private individuals, encouraged or subsidised by Government, would yield beneficial results. Messrs. Mylne and Thomson, in their letter dated 28th February 1880, to the address of the Collector of Shahabad, reported that they had for years been trying whether cane could be profitably purchased and worked off at a central factory, and the conclusion to which they came was, that the price demanded for cane by the growers, which price the growers realised by making it into *goor*, was so high, that the experiment was not deemed to be profitable and was discontinued. Messrs. Mylne and Thomson added that the Rosa Sugar Works at Shahjehanpore had not found it advisable to make arrangements for crushing cane and making refined sugar from the juice direct, and the inference would seem to be that central factories, such as are suggested by Messrs. Travers and Sons, will not pay. The reason given for this is, that the factory could not work at a profit, if it paid as high prices for the cane as the cultivators realise by making it into *goor*. But this is only stating the fact in another shape, and is no explanation of the problem—why is it that with cheap labour, cheap raw material, refined sugar cannot be manufactured in India at a lower price than that for which it can be imported from the Mauritius or England? A similar question may be asked as regards other products, for example iron—why is it that with cheap labor and cheap iron ore at Ranigunge, it is found profitable to import manufactured iron articles from England? I am not at present in a position to furnish an answer."

The letter from the Government of India to the Secretary of State, covering the correspondence is dated "Calcutta, 24th December, 1889," and is as follows:—

"The improvement of sugar production and manufacture in this country has been the subject of attention both of the authorities and of capitalists since the beginning of the century, and various attempts have been made to establish factories, none of which appear to have been attended with any permanent success unless supplemented by the sale of rum and liquors. Sugar refining alone has not proved sufficiently profitable to maintain a factory. If this had been the case, there appears to be no reason why the industry should not have been largely taken up by private capitalists.

"Some of the main difficulties against which the industry has to contend are believed to be these:—

"(a) The cultivation of sugarcane is limited by the supply not only of water for irrigation, but also of manure.

"(b) As cultivation in India is confined to small farms or holdings, each cultivator who is able to grow the crop at all can only find manure enough for a small area, generally less than half an acre, of sugarcane. The plots of sugarcane are therefore greatly scattered, even in a canal-irrigated tract.

"(c) A central factory has accordingly to bring in its supplies of cane in small quantities over varying distances, in many cases the distance being great.

"(d) The carriage of canes over a long distance, even in a climate like that of the Mauritius, is detrimental to the juice for purposes of sugar making. It is much more so in India, where the canes ripen at the season when the atmosphere is driest and suffer, therefore, the maximum of injury.

"(e) The Mauritius system of growing large canes at intervals is not adopted to the greater part of India where, in order to prevent the ingress of dry air into the fields, small canes have to be grown in close contact.

"(f) The amount of cane which can be grown, limited as it is by the supply of water and manure, barely suffices for the wants of the Indian population. It seems to be at present as profitable to produce coarse sugar for their use, as highly refined sugar for export. There is, therefore, no sufficient inducement to capital to embark on the more difficult and expensive system.

"A further obstacle to sugar refining in India

exists in the high differential rate which the conditions of our excise system require to be placed upon spirits made on the European method, as compared with that levied on spirits manufactured by the indigenous process. The sugar refiner in India is thus placed at a disadvantage in respect to the utilisation of his molasses in the form of spirits.

"In view of the circumstances above noted, we are unable to advocate any attempt being made at the cost of the State to establish model factories. We are inclined to attach much confidence to the views and conclusions formed by Messrs. Thomson and Mylne, who have paid, for many years, practical attention to the subject of sugar cultivation and manufacture by ryots, and were the first to introduce the portable sugar-mills which have now spread over India. They advocate the gradual improvement of the ryots' method of manufacture rather than the introduction of more expensive and centralising systems. The Provincial Departments of Agriculture have of recent years, directed attention to this question, and may usefully be desired to continue to do so.

"We are also willing to advocate the establishment of agricultural experiments in those comparatively limited tracts of the country (such as Eastern Bengal, where there is a moist climate and a more or less abundant supply of manure) in which the Mauritius methods of cultivation have *prima facie* prospects of success, and we are prepared to advise our Local Governments and Administrations to give every reasonable support to sugar factories and refineries which may be established by private enterprise."

Messrs. Travers's reply to the correspondence is dated 21st February, 1890:—

"We observe that while all the officials who have reported fully confirm our information as to the great, and indeed excessive, waste in Indian sugar manufacture, yet that they are able in some degree to explain the causes of the existing state of things, while the opinion is general that it would not be wise for the Government to establish experimental central sugar factories.

"It would be presumptuous on our part to offer any comments on a question so fully taken up by the local authorities on the initiative of the Secretary of State.

"It only remains for us, in concluding the correspondence, to acknowledge the very great courtesy with which our necessarily imperfectly informed remarks have been received, and the promptitude with which action has been taken owing to the recognition by the India-office and the local authorities of the great importance of sugar manufacture to India, and the possibility of a great development in it.—We are, &c.,

"Pro. J. Travers and Son, Limited.

"(Signed) J. W. Rogers.

"P.S.—We may mention that 'German granulated,' a small white dry crystal sugar made direct from the beetroot, is now being shipped from Hamburg to India; so that the ryots will not have Mauritius only to compete with at home. We believe this sugar costs about 16s. per cwt. laid down in Bombay, and that the bounty on its export does not exceed 6d. to 9d. per cwt."—*Journal of the Society of Arts.*

LIME AS A PREVENTIVE OF MILDEW AMONGST CUCUMBERS AND MELONS AND FOR POTATO DISEASE.

In cases of mildew among cucumbers and melons and disease among potatoes, lime is an invaluable article. If applied wherever the disease has manifested itself, it will prove an effectual remedy, but if any part of the plants affected is not touched with the lime, the disease will not be effectually stopped. The best way to apply it to cucumber vines affected by mildew is to sprinkle the powdered lime under as well as over the leaves by means of a small sieve. This should be done early in the morning when the leaves are damp from the night's dew. Plants that have been nearly dried up by the dis-

ease, will frequently take on a new growth in a few weeks with a steady application of lime.

Applied in the same way to potato stalks that have been dried and eaten up by disease, the lime has similar good results. When the disease has eaten so far down into the heart of the stems that the roots of the potatoes are affected, the application of powdered lime will not have much effect. Unless the disease has, however, made such rapid headway, it will pay to give the whole field a treatment with lime. The greatest care should be taken to sprinkle them carefully, sifting the lime on all parts of the leaves and stems that are affected in the slightest degree. Very many potato fields could be saved from partial or complete destruction in this way.—*Southern Planter*.

NOTES ON ESSENTIAL OILS.*

Sandal-wood Oil.—At the Government auctions of sandal-wood held at Mysore in November and December last the following quantities were brought forward:—

	Tons.
From the Shimoga district.....	770
From the Kador district.....	200
From the Hassan district.....	300
From the Mysore (Seringsapatam and Hunsur) district.....	1,000
From the Bangalore district.....	150

while the auctions in previous years show the following quantities:

Year	1883	1884	1885	1886	1887	1888
Tons	2,600	2,775	2,650	2,025	2,450	2,500

The assortment usually consists of 15 per cent. of root, 20 per cent. of best-quality logs and the remainder of second-quality logs and chips. Unexpectedly high prices were paid for all qualities, for whereas the values had been, superior 46s. 6d., roots 44s. 9d., ordinary 40s. c.i.f., the whole of the quantity brought forward sold rapidly at 54s. 6d. for superior, 52s. 9d. for roots, and 46s. 6d. for ordinary, an increase of 20 per cent. It is believed that for a long time to come the article will be maintained at high prices, as the government of Mysore has again taken energetic steps to obtain the full benefit of this monopoly. In future only so much good is to be cut down as required for the consumption, and it seems to be the object of the Government gradually to increase the price of the wood, and then to keep it at a definite point. Of the whole of the wood, which is sold, about two-thirds is used in India, partly for carving, and partly as an incense in religious ceremonies, and only about one-third is consumed in Europe. If, in spite of this advance in the price of the raw material, the cheap oil from East Indian wood is frequently offered, cause may be found in the use of Macassar sandal-wood oil, which very nearly approaches the Indian oil in quality, although for perfumery purposes the Indian oil deserves decidedly the preference.—*Oil, Paint and Drug Reporter*.

NOTES ON POPULAR SCIENCE.

By DR. J. E. TAYLOR, F.L.S., F.G.S., &c.,
EDITOR OF "SCIENCE Gossip."

The artificial manufacture of rubies is still going on, and a trade demand for them has arisen for use as pivots in watches. They are stated to be not inferior to the natural stones in hardness. The two French chemists who have been long experimenting on the subject have been able to produce much larger stones than formerly by a modification and improvement of their original method. As much as six pounds of rubies can be produced at each operation. These experiments show that the colours both of natural rubies and sapphires are due to chromium in different states of oxidation.

Indigo can now be artificially produced by two different methods, worked out independently by two or three different experimenters, all German chemists.

* From Messrs. Schimmel & Co.'s report.

One is produced with phenylglycocine and the other from anilidoacetic acid.

Dr. Alfred Carpenter, of Croydon, the well-known sanitarian authority, in an address recently delivered before the Association of Sanitary Inspectors at Liverpool, estimates the loss to England from the non-utilisation of sewage, during the last 800 years, at 16,000 millions sterling. He declared that if our present wasted sewage could be put upon the land, meat and milk would be produced over that yielded now, and five times the amount of labour would be employed thereon. He contended there should be from 5,000 to 6,000 tons of sewage placed on every 35 acres of land, from which 40 to 50 tons of produce per acre would be obtained. Moreover, he argued that, if properly treated, the land would be freed from excess of nitrogenous matter, and there would be a complete purification of the water supply. He did not say, however, how the latter could be effected. I imagine you would find it difficult in Australia to put 50 tons of sewage on every 35 acres of cultivated land. Even in our densely-populated country we cannot do so. Consequently our British bill for artificial manures is a little over five millions a year.

The official report issued by the U. S. A. Department of Agriculture at Washington shows a falling off in the wheat cultivation of America during the last decade. In the year 1880 the total production was 498,549,868 bushels; in 1890 it was reduced to 399,262,000 bushels, nearly one-fifth less. Maize yielded in 1880 1,717,434,543 bushels; in 1890 only 1,489,970,000 bushels, although this is a characteristic American crop. On the other hand, the yield of oats had gone up, perhaps owing to the large increase in the number of horses employed. In 1880 417,858,380 bushels of oats were produced; in 1890 the yield had increased to 523,621,000 bushels.

From some important experiments by Professor Henry, the principal of the Wisconsin Agricultural Station, as to the relative fattening properties of barley meal and maize meal, it appears that it required 36lb. more barley meal than maize meal to produce 1,000lb. of meat. The experiments were on ten hogs, 14 months old, extending over a period of eight weeks. Both feeds were soaked with water, and it was found it required about three pounds weight of water properly to soak one pound of barley meal, and only two pounds of water to soak the same quantity of maize meal. The hogs fed on barley meal consumed 30lb. of water daily with their food, while the hogs on maize meal only required 22lb. Even with this large amount of water in the feed, the barley-fed hogs drank two pounds a day extra, from a separate trough, whilst the maize meal fed hogs only required three-quarters of a pound extra daily.—*Australasian*.

THE PROJECTED JAVA QUININE-FACTORY.

We mentioned recently that the Java planters intended to send a chemist well acquainted with the cinchona industry to British India to report upon the quinine-works existing there, with a view to the establishment of a factory in Java. The mission, however, is not likely to take place, as the necessary funds have not been forthcoming. A correspondent of the *Indische Mercur*, states that two years ago he inspected the works at Nadivatam and Mungpo, in India, but found the process used there quite unsuitable for the proper manufacture of quinine, although since then Messrs. Lawson & Hooper have improved the process in several particulars. He happened to meet in India one of the largest European quinine manufacturers, who had also visited the two factories, and spoke of the process followed there with contempt, saying that, if the freight were not too heavy, he should be glad to buy the already extracted barks from these factories, because the alkaloids are very imperfectly taken out.—*Chemist and Druggist*. [We doubt the *bona fides* of this critic, considering the cheapness of the bark in its original state.—Ed. T. A.]

Correspondence.

To the Editor.

THE PUSHING OF CEYLON TEA.

Nuwara Eliya, April 24th.

SIR,—Why do we neglect the opportunity placed at our doors of advertising our tea at a nominal cost, and with more far-reaching results than perhaps any other scheme; and why do we permit rubbish not fit to be called tea to be sold as such to the passengers in our harbour and the visitors to our shores, thus seriously injuring the name of Ceylon? Perhaps we neglect it because it is so easy of attainment in the same way that few of us residents have climbed Adam's Peak, although we have lived close to it for years, while thousands come from all parts of the world to ascend it. But, whatever the reasons may be, should not the Planters' Association (more especially in view of recent revelations) take the matter in hand at once?

I would suggest the following as a very simple scheme, which would be an immense advertisement for Ceylon and lead to a lot of future orders from abroad, reaching every country and nation on the globe, and at the same time choking off all the inferior rubbish at present sold in the harbour, which is ruining the name of Ceylon tea. Perhaps you, Mr. Editor, could add a foot-note stating the number of passengers last year and their destination, which would better enable us to estimate the possible results.

(1st.) I would have the Planters' Association arrange with all steamer agents to give them (the Planters' Association) the exclusive right to sell tea on board ship in Colombo harbour. This is necessary, and the Planters' Association should in return promise to sell the tea as an advertisement at cost price (including packing and selling charges).

(2nd.) At every port nearest to Ceylon on the principal routes to it a stock of pamphlets should be held by an agent. These pamphlets should contain a concise history of Ceylon, some interesting information about Ceylon tea, and an advertisement of the Planters' Association announcing that tea at cost price would be sent on board that ship as an advertisement when she reached Colombo harbour. The agents of all steamers visiting Singapore, King George's Sound, Calcutta, Aden, etc., would be glad to have these pamphlets distributed on board ship to their passengers, and the passengers would be equally glad to read them, as a description of the country they were coming to, with the result of a sale of tea in a great many cases.

(3rd.) To make the scheme a complete success, the Tea Kiosk should be taken over and worked together with it by the Planters' Association. Some Rs15,000 have already been spent on the Kiosk, and there is very little to be seen for the money; but I believe good returns could be got from it in connection with this scheme. I would propose to do away with the high-sounding title of "The Kiosk," which half the passengers don't understand, and in large-letters on a signboard put something like "Ceylon Planters' Tea Room;" "Tea sold by cup and packet at cost price," etc., and show its position on a map of Colombo in the pamphlet.

(4th.) The tea sold should be a blend—or blends—and made by a committee of local experts, and should be *uniform in quality always*; those gentlemen would, I have no doubt, give their services free.

(5th.) A considerable stock should be held to execute further orders from abroad that would be sure to follow from private individuals and tradesmen who found the tea suitable to their requirements. This feature of selling further supplies is objectionable, inasmuch as it is introducing an element of trading into what is really an advertisement, but better do a little trading than leave a loophole for the failure of the scheme.

In conclusion two instances that have recently come under my notice go to prove the desirability of carrying out some scheme such as I suggest.

A.—I saw a cart load of 10 lb. boxes neatly got up by a European firm (who did not know their destination I may say) in charge of the owner—a native—on the way to the wharf for sale on board-ship. I got one and opened it, and it contained the most ghastly rubbish I ever saw, not worth 8 cents a lb. The price was Rs8 or Rs10 per box, I forget which! Is anything calculated to damn Ceylon tea more than this?!

B.—A friend of mine who sells part of his tea through one of the Fort shops, Cargill's I think, has had orders for the last three years from an Australian grocer, who got his first lb. in the Colombo shops, increasing yearly till this year (1892) he has an order for 30,000 lb. of pekoe at highly profitable rates.

One can easily imagine the disgust of the passengers when they are swindled in CEYLON over our staple product; and I consider it the duty of the Chairman of the Planters' Association to be up and doing in this matter before further damage is done to the planters when the remedy is of such easy application.—Yours, &c., L. D.

[We are unable at the moment to say what was the number of European passengers in 1891. Our correspondent fixes no limit to the quantity of tea which is to be sold at cost price, and does not take into account the interference with private enterprise.—ED. T. A.]

ON THE BURNING OF CATTLE MANURE AS FUEL.

Analytical Laboratory, 79, Mark Lane,
London E. C., April, 8th, 1892.

GENTLEMEN,—I have much pleasure in sending you a copy of Dr. Voelcker's long expected lecture^o on the Agricultural Needs of India which was given last night at the Society of Arts and a which the late Sir James Caird was to have taken the chair. As you will notice and indeed as might reasonably be expected Dr. Voelcker was not able to suggest any new improvements but only an extension of those already largely in force. A judicious construction of canals, and of well sinking under careful supervision and consideration of the local agents of the Government, also the increased establishment of forest reserves with a view of improving the climate and also of furnishing wood as fuel. Speaking of the subject of manure being used as fuel in certain districts Dr. Voelcker strongly condemned the practice, though he was unable to point out how under existing circumstances and in the absence of wood suitable for fuel, the present custom could be materially altered or imposed. It is in fact a matter of necessity and not of choice, and until new forest reserves are established the poor natives are likely to continue to burn the cow-dung cakes or bratties for many years to come.

Indeed as pointed out by myself in a note published in the *Journal of the Society of Arts* for March 21st, 1890, this practice of burning bratties is after all not so wasteful as might at first sight be supposed;

According to my new analyses of sun-dried cow-dung cakes every ton of these bratties contained in round numbers the following quantities of the important plant food constituents.

Lime	43 lb.
Nitrogen	33 "
Potash	14 "
Phosphoric acid	12 "
		102 "

When such a manure is burned as fuel the nitrogen which originally in the manure existed as organic matter becomes converted into gaseous products which are either directly absorbed by the growing plants or crops in the neighbourhood or are carried down by the rain into the soil and retained for subsequent use as plant food.

The loss, therefore, of nitrogen by the use of cattle manure for fuel purposes is by no means as complete as is generally supposed to be the case.

While the *whole* of the mineral salts including the valuable lime potash and phosphoric acid are retained in the ashes which under proper sanitary arrangements ought to be carted out on to the land together with the usual house refuse and vegetable rubbish always associated with domestic dwellings. It should be remembered that about 80 per cent of the atmosphere consists of free nitrogen, and that according to the most recent scientific research leguminous plants such as clover, peas, beans, &c., have the property of absorbing nitrogen from the air and so yield large crops of valuable food, as well as by virtue of increased root development increasing the nitrogen in the soil, so that not only a good crop has been obtained but the soil is actually enriched and better able to produce other crops of a different character. In a smaller degree, most crops may be expected to absorb nitrogen from the air, so that in tropical climates it may be found that nitrogen is of all the important plant foods the one which can be most easily obtained by natural means, and if so its artificial supply in the form of manure may be dispensed with the least loss.

Certainly the custom so general in India of burning the stubbles after harvest and so destroying the straw left on the fields would tend to confirm the view that nitrogen in the form of organic matter is not so much required by the soil of the country as might have been supposed, bearing in mind too the well-known mechanical advantages of farmyard manure; also its moisture holding properties which in a hot country would strike most observers as of special value.

Again the fact that some 40 to 50 thousand tons of bones and bonemeal are being now annually exported to Europe, still further proves that there cannot be any great demand of really first-class fertilizers in India. Indeed a country which has produced year by year crops of corn, rice and gram for centuries without suffering any appreciable loss of fertility in the soil can probably afford to go on for centuries in the same manner. At the same time there should be judicious improvements of existing customs and practices, as it would be most unreasonable to maintain that no improvements were necessary in order to provide for the vast and rapidly increasing population.

In the past periodical famines prevented any undue increase of population, but with the extension of railways and improved transit, the starving people can be readily reached with supplies of rice, so that aided by thoughtful and energetic administration famines will not prove the terrible scourge they did in former times when thousands died in certain parts of that vast continent, while in other parts there was an abundant plenty.

In the discussion which followed the reading of the paper Professor Wallace supported the present practice of burning cattle manure chiefly on the ground of the necessity of the case, pointing out that until wood or coal was provided by the authorities the poor natives were not to blame. For myself I am always inclined to believe that local customs are usually the result of sound and long established experience, and in the foregoing remarks I have ventured to put forth my views in support of the present custom by way of explanation rather than of any new principle or theory.

JOHN HUGHES.

[There is this qualification. The practice of burning cow manure as fuel is defensible because there is no wood. But why is there no wood? Because the people keep the all-devouring animals, goats. These beasts are amongst the most formidable enemies of forestry in India.—Ed. T. A.]

THE MADRAS AGRI-HORTICULTURAL SOCIETY: —The Madras Mail of 14th May 1892.—

The Committee of the Agri-Horticultural Society of Madras recently brought to the notice of the Madras Government that for a period of 35 years, or from 1854 to 1889, seeds to the value of R4,000 annually were, by order of Government, purchased from the Society by regiments serving in this Presidency, but that since 1889, in accordance with an order of Government all indents have been made on the Government Botanical Gardens at Ootacamund. The result of this has been a serious loss to the Society, which was established in 1835 for the promotion of agriculture and the encouragement of improvements in agriculture generally. The Society claims to be the only body in the Presidency which the Government can consult and seek assistance from in introducing new plants or improving those indigenous to the country. Such advice was, it is urged, often asked and always cordially given. The Society has also for many years supplied seeds to and prizes for the products of soldiers' gardens, and aided the Government in the introduction of Mauritius sugarcane, which now grows in all the sugar-growing Districts in this Presidency; and it established a nursery for raising and distributing species of timber trees, foreign or peculiar to other parts of India. During the American War the Society tested every procurable species of cotton, and furnished much valuable information to Government as to the commercial value of the fibre of each and its suitability for the climate of Southern India. The Society has also been of great service in the teaching of botany in the Government Medical College, the Presidency College and the Agricultural College at Saidapet. Specimens of plants are supplied gratuitously for the Lecture Rooms of the Professors, and the pupils regularly visit the Society's Gardens to receive practical lectures on the plants growing there. The Society was the first body in India to institute a scientific inquiry into the natural history of coffee borer and to seek to obtain some remedy for its terrible ravages which have caused such loss to the planter. Further Dr. Bidie, the then Honorary Secretary of the Society, was selected by the Madras Government to carry out the enquiry into the ravages committed by the insect and suggest a remedy therefor. His report was published by the Madras Government and Dr. Bidie was thanked for the manner in which he had conducted the enquiry. Considering, therefore, the great and valuable services rendered by the Society to the Presidency generally, and the fact that without the Government subsidy, according to the Committee, the Society cannot exist, the Committee requested the Madras Government to order that the privilege of providing seeds for soldiers' gardens should be again restored to the Society. We hear now that Government has declined to sanction any alteration in the existing procedure under which seeds for soldiers' gardens are now supplied, as the present arrangement was sanctioned by the Government of India after mature consideration, and in view to assimilate the practice with that obtaining in Bengal and Bombay.

FROM THE METROPOLIS.

22nd April 1892.

TRADE AND INDUSTRIES OF EAST AFRICA.

Two Consular Reports recently issued contain matter of considerable interest to Ceylon readers—planters and merchants. ZANZIBAR, under new auspices and as a free port, probably may become the great entrepôt of trade for East Africa and this is the end arrived at by Mr. Portal, who reports to Lord Salisbury for 1891, as follows:—

The total declared value of imports from all parts of the world during the whole of last year amounts to 158,79,691 rs., or 1,205,691/ 10s, whereas the estimate made in November, based on the return of the previous ten months, gave 1,300,000/ as the probable figures for the whole year. No stronger argument could have been found in support of the contention that if Zanzibar is to maintain its pre-eminence it should, without loss of time, be declared a free port. That principle has now been accepted by Her Majesty's Government, and the formal declaration will be made on February 1.

To turn to the exports from Zanzibar. A complete tabular statement is now enclosed showing the quantities and value of each class of goods exported, and the ports to which they were consigned. The gross value of the exports during the year amounts to 1,384,233/., or about 30,000/ above the average shown by the ten months reviewed on November 17. The relative values of the different classes of goods exported is about the same as it was in November. Nothing need, therefore, be added to the remarks made under this head at that time.

Finally, although these returns and statistics still leave much to be desired as regards both completeness and accuracy, yet it should be borne in mind that this is the first yearly commercial statement that has ever been compiled in Zanzibar. The initiatory difficulties in the way of establishing an orderly system at the custom-house were great: an efficient staff had first to be formed and then trained to their work; exporters and consignees had to be requested and even pressed to make a declaration of the nature and value of their goods—a request which was for many months strongly opposed by several firms; and the dhow trade, hitherto quite unlicensed, unwatched, and unrestricted, had to be brought under at least a partial supervision, though this, I may add, is as yet very far from sufficient.

The subordinate official class and the trading public in this country are undergoing a process of education which was begun only a few months ago; until that education is completed, statistics and returns may be an approximate estimate, but they cannot be a thoroughly correct index of the trade and prosperity of the Sultan's dominions.

The peculiarity of the statistical tables given is that very much the same products (and quantities) are entered as Imports (from Africa) and Exports (from Zanzibar to Europe). It is only necessary to notice some of the chief exports. Of Cloves, the total weight in 1891 is given at 13,233,400 lb. in 94,560 packages of 140 lb. each. London got 16,294 packages, New York 22,041, Hamburg 10,669, Marseilles 8,910 and so on. The total value is put down at \$1,134,722. The next biggest export is of "Coffra" to a value of \$302,065 for 10,572,275 lb. over three fourths of which went to Marseilles. 1 10th to Bombay and 50 packages or 8,750 b. to Colombo. Next was "Rubber" exported to a value of \$224,768, total weight 491,680 lb., nearly all sent to London. Then we have "Hides," value \$185,963; Gum Copal, value \$156,600; Tortoise-shells \$89,600; Chillies (to London, New York and the European Continent) \$53,454; Gum Arabia \$12,180; Cowries \$9,708; Coconuts \$2,300; Tobacco \$2,340; Rhinoceros Horns \$19,104; Shark-fins \$5,904; Wax \$8,208; Orchella \$12,730; besides some Betel-nuts, Opium, Colombo-wood, Gum-myrrh and Tiger-skins; be-

sides, above all, Ivory Tusks exported last year to a nominal value of \$3,584,900.

On the trade of MOZAMBIQUE, the figures are not nearly so detailed. All we are told is that the total exports of seven districts equalled £288,222, against imports £709,190. But there are interesting remarks in Mr. Churchill's Report, more especially in reference to the Pearl Oyster reefs south of the Zambesi road. I quote as follows:—

The number of deaths registered during the year has been 743, or about 200 to the 1,000 of the whole population. The death are entered in the lists as having resulted from the diseases predominating in most tropical and malarial districts, though the percentage of 200 to the 1,000 is excessive for even unhealthy regions.

The fever prevalent amongst the Europeans here is rarely in itself pernicious, although, with prolonged attacks of fever, the system is so prostrated that some other disease usually sets in and causes death. There are many reasons given for the great unhealthiness of the climate. The principal ones are: bad and insufficient food; houses inadequate to resist the sudden atmospheric changes; the total absence of any social enjoyment or entertainment; and the impossibility, on account of the sandy nature of the soil, of taking any legitimate exercise. One depends mainly upon tinned provisions for food, and tinned food is not invigorating.

The majority of houses are built of corrugated iron and wood, and although such houses can be built cheaply and quickly they are too hot in summer and too cold in winter, and tend to increase unnaturally the climatic pressures one has to bear.

There have been 600 emigrants sent from Portugal to Lourenço Marques this year. A few of these emigrants obtain employment such as has been formerly given to the natives, a large number die, and the remainder are without work or the desire to obtain any; and are consequently a source of expense to the authorities.

The rates of wages in this district are as follows:—

Description	Amount.	
	£ s. d.	£ s. d.
Native and emigrant labourers ... Per day	0 1 6	to 0 4 0
Native masons ... do	0 6 0	0 12 0
Indian do ... do	0 12 0	1 8 0
Chinese Carpenters ... do	0 15 0	1 10 0
European do ... do	1 0 0	1 10 0
Indian painters and colourmen ... do	0 10 0	1 5 0
Native servants ... Per month	1 0 0	5 0 0
... cooks ... do	2 10 0	10 0 0

There are no industries in this district. The natives in the interior plant small patches of ground around their kraals and produce small quantities of cereals for their own consumption. The natives who live near the towns on the coast, although having ground that would produce heavy crops, find it more profitable to work for Europeans, and buy from them such food as they require. With the high rates of wages obtained they are both able to live better in this way than they could by cultivating the ground, and to have a surplus with which to drink or to buy such luxuries as they may desire.

Among the Europeans such energy as has been expended has been rather in the direction of expeditions to the interior, and in discussing political questions of boundaries, &c., than in paying attention to the nature of the soil, its cultivation, or its possibilities.

There exists on the east coast, south of the Zambesi River, reefs of pearl oysters, of which the most important is situated to the south of Chiloane, in the Bazaruto Archipelago. The greater portion of the reef is within enclosed waters, and, as it has never been regularly worked, the pearls which could be found there must be considerable dimensions. The natives in the locality of the pearl reefs occasionally find black pearls of great beauty, but their value is

absolutely destroyed in consequence of the method employed in extracting them from the shell. This method consists in placing the oyster in the fire.

A syndicate is being formed in Lisbon at the present time for the development of these fisheries.

In the month of August of this year the first fully granted Mining concession for mining of any description in this district was given to a Portuguese syndicate for the development of diamond mines situated about 37 miles from this city, near the railroad.

Other mining concessions for the development of coal, gold and precious stones have been applied for, but have not yet been granted.

Valuable coal deposits are said to exist in this district in large quantities. As, however, according to law a mining shaft cannot be sunk more than 6 feet before a concession is fully granted to work the mine, the samples of coal produced have been taken from the surface, and the real quality of the coal in the mines themselves has not yet been ascertained.

The same public works which were in hand last year are in hand this year. Those that were in contemplation have not yet been begun. All public works came to a standstill over six months ago, when such funds as were available were used for expeditious purposes.

The Netherlands Railway Company, which is connecting this port with the trade centres of the Transvaal, is completing its line to within a few miles of Barberton.

A survey is being made with the idea of constructing a railway from Komati Poort, at the frontier of this district, to the Salati River goldfields, and thence to Mashonaland. The proposed route would be three times the distance to Mashonaland that the proposed Beira route would be, but it is held that the advantages obtained in opening up the Salati goldfields on the way would more than equal the disadvantages of the more lengthened route. A large tract of valuable farming and grazing country would also be reached by a Salati River railway and homes could be established for thousands in a country practically, healthy and capable of producing payable crops of all South African produce. The proposed route, however, also runs through a country full of rivers, and is so hilly in places as to be almost impassable. The cost of building a railway in such a country leads one to imagine that it will not be attempted.

A company is about to be formed in this city for running trams for passengers and freight from the principal thoroughfares in town to the residential quarters on the hills surrounding the bay. The trams are to be propelled by steam. The company is to have the monopoly of all public delivering, and the financial success of the enterprise is in this way partly secured.

During this year a chamber of commerce has been formed by the merchants, with the idea of obtaining certain privileges in trade which do not at present exist. The chamber, however, seems to be a political as well as a commercial association, and it is a question whether any material advantages will be obtained by the department.

It has been decided by the Portuguese Government to open up the country south of the Zambesi River by means of chartered companies. One of these companies, the Portuguese East Africa Company, has a block of territory bounded on the north by the river. On the south the influence will extend to the Limpopo River, and on the east to the ocean, the islands near the shore coming within its jurisdiction. The company is compelled to construct a railway, connecting either the Transvaal Railway or the Matabele country with the Limpopo River at the point where it ceases to be navigable (a distance of about 70 miles from its mouth); or with the port of Inhambane; or with any railway system north of the Sabi River, according to a future agreement to be made between the Government and the company. It is also authorised to grant sub-concessions, with the approval of the Government, for pearl, coral, and amber fishing.

Other companies are to be formed for the development of the remaining territory south of the Zambesi, and it is hoped in this way to open up the country

both rapidly and thoroughly by introducing industries which, without doubt, could be followed to advantage in most of the luxuriant valleys that extend along the coast a few miles inland.

CEYLON TEA IN AMERICA.

Further information respecting Mr. ELWOOD MAY'S mission to England on the present occasion does not prove very encouraging in respect of the prospects of the Ceylon-American Tea Company. No one can say in view of all that Mr. May has done in securing attention to Ceylon teas on the part of public men and the press—and specially by large advertising contracts—that he has not worked well, and entirely without fee or reward, for Ceylon tea. He has done so, as he says, because he has believed and still believes in the product as a thoroughly good article which his countrymen do well to consume in place of the inferior, and in many cases adulterated, trashy China and Japan teas. But to change the taste of a people like the Americans so completely won over for many years to a liking for the green "faced" teas is not an easy matter, as Mr. May has found to his cost; and yet he is quite certain that the lines on which he has proceeded are the right ones—that he has been laying a good foundation on which to build; and that if the process can only be persevered in, the building slowly, but surely proceeded with,—success is certain in the end. But meantime, as I have already stated, the "sinews of war" seem wellnigh exhausted. The trade of the Company so far has not been self-supporting—far from it. Messrs. Watson & Farr—to whom the greatest credit is due and the special thanks of every Ceylon tea planter—are out of pocket, if report speak true, to the tune of £3,000 to £4,000 sterling, and naturally, they do not care as men of business, rather than of speculation, to advance further unless simultaneous support can be got from those more immediately interested. So with Mr. May himself, any further effort beyond the Atlantic for this Company depends on co-operation in England or Ceylon or both. Already the rumour is that the store of the Company in New York which Mr. Penco managed, and for which a heavy rent was paid, may have to be, or has already been, closed; and Mr. May makes no secret that unless his mission is crowned with some degree of success he will as an honourable man have to throw up the advertising contracts and generally to suspend operations—in other words the Company must collapse. This would be an especially unfortunate circumstance on the eve of the Chicago Exposition; and no one seems to recognize that fact more clearly than the Commissioner, Mr. Grinlinton. He has also personally not the least pecuniary interest in the Company of the Ceylon shareholders. One question may be whether the Company should not be in some way identified with the Ceylon Tea Court in the Exhibition. Probably as regards this point, as well as in respect of the financial requirements, the counsel of Sir Arthur Birch may be sought; and no one has manifested a greater interest in the future expansion of the consumption of Ceylon tea in America, than our former Lieut.-Governor and Colonial Secretary.

Mr. GRINLINTON, who continues very busy, is likely to make his passage by the S. S. "City of New York," the last boat in which he returned from America in 1890. Leaving Liverpool by it on 4th May he should be at Chicago by the 17th—in good time for the purpose in view. He has been seeing the American Minister, and leading American citizens in London and getting introductions to leaders in the tea import trade in New York, &c.

GERMAN v. ENGLISH MANUFACTURING CHEMISTS AND
THE OPENING IN INDIA.

My attention has been called by Mr. T. Christy to an article which has appeared in a German Pharmaceutical Journal written in a depreciatory and unfair tone towards English chemists. I send you the translation which has been supplied to me for publication, and apart from the replies and criticism which will no doubt be provoked in India as well as Ceylon. I would only mention the case of Messrs. Kemp & Co. of Bombay, who manufacture a large number of Indian preparations on the spot, and who even supply home wholesale drug houses with preparations made from the fresh products of India. Altogether Mr. Hellinz deserves a good rap over the knuckles, and it may be a question whether he has ever been in the East at all. The paper is as follows:—

A CHAT ABOUT INDIA.

By H. HELLING, LONDON.

Which appeared in the *Pharmaceutischer Zeitung* of Berlin, 4th Nov. 1892.

(Translated by a London Friend for the "Ceylon Observer.")

A great deal has been written about India; and as far back as its history can be followed, new and wonderful things are heard of from time to time.

To a chemist and druggist, India is a land of especial interest, not only because products of the country have been used as medicines since the oldest times, but because the drug export even up to the present day continually offers something new and brings its influence to bear upon the whole commerce of drugs; take for example the influence exerted by East India cinchona bark. But the country is of far greater interest to the German apothecary, for in British India German influence has recently made itself conspicuous in a considerable manner. A few words therefore with regard to the conditions of commerce and the position especially of the drug commerce, may be not without interest, all the more so, as I have obtained the information (as far as the conditions of commerce are concerned) from authentic sources; and I cannot do otherwise than express my thanks to Messrs. Collingwood and Schlesinger. Mr. Collingwood only lately returned from lengthy travels in India and is well up in the drug trade, whereas Mr. Schlesinger has had an experience of many years in the drug trade, and both occupy themselves with the introduction of rare and new drugs. Starting from the fact that British India has a population of between 200 to 300 millions; this sufficiently proves of what importance such a country must be to commerce.

Until a few years back its trade lay in the hands of Englishmen and natives. Englishmen imported and exported, whereas the native has exported and found a sale for their produce in India. These conditions have gone through a mighty change of late and it is chiefly German firms that have the import trade to a great extent in their hands, competition driving English goods more and more out of the field.

The reasons for this are plain. The English are used to high profits in India since ages back, and they had hardly any occasion to deviate from this, as the wants of India were completely monopolised by England directly or indirectly, for there is no doubt that since a considerable time many Continental goods were brought to India through English houses. The ever-increasing competition together with the interest for colonial trade, has caused the German houses to take foreign commerce more and more into consideration, and what formerly seldom occurred and was hardly noticed by Englishmen has now become an unalterable fact viz, the successful appearance of German houses of commerce in India. The chief reason for this success of German industry is to be found in cheap prices, which of course outweigh everything else from a native's point of view. To a native the chief condition is cheapness, once more cheapness and again cheapness. Quality does not come into

consideration at all, they will buy small quantities of cheap things today and when used up will buy again without considering whether a dearer article might not have lasted longer. Moreover a German adapts himself more to the demand of the public and supplies to the native traders things made according to their wishes. He is not like the English who manufacture their goods as they think best, without attending to any of the wishes of the buyers. This is also especially the case with pharmaceutical and medicinal utensils such as surgical instruments, thermometers, glassware, etc., which are often supplied by Germans at a quarter of the price at which English houses offer them. A large field is open in British India for Germans, all the more so if they can settle down in the country with capital. Chemical industry in India and the manufacture of pharmaceutical preparations do not exist. Everything is imported into the country instead of being produced in the country itself.

The alcohol industry is as good as non-existing. The only thing made by everybody is artificial mineral water, and as this represents about the highest step of chemical industry there, it indicates how very backward manufacturing is in India. There is an opportunity for many a German chemist and druggist or manufacturer to work out new enterprises in the country and draw out the profits. When we consider that the native medical man and apothecary having only the crude products is obliged to take his supplies of all other preparations such as tinctures, extracts, chemicals, etc. from Europe, there remains no doubt that a golden future is beckoning many as hardly anything in the way of galenic preparations is made by the wholesale or European druggists of India themselves. It is a fact that many an Indian drug must travel first to Europe to be made into a tincture and as such be taken back to India again. This "keeping back" of industry is in strong contrast with the rising of other countries, for instance Japan which makes an Iodide of Potassium superior in purity to the English and equal to the best German brands. As regards the buyers of imported goods it is astonishing that for the greater part they consist of native agents who sell their goods in poor looking booths in the bazaars and buy and sell in wholesale or retail quantities. Many of these people are rich and have enormous businesses; most of the goods are transmitted to their clients direct.

Among the native merchants in Bombay and its neighbourhood the Parsee or emigrant followers of Zoroaster take the first place as far as mercantile efficiency is concerned and are on a par with the Europeans. It is said that three Chinese are necessary to equal one Parsee, and the Chinese are known as thorough merchants. In the bazaars everything is classified according to the different guilds; that is, we find the different branches of business together and the poison shops form a street for themselves. The business with every stranger is to a great extent simplified by the obliging manner in which he is received in the bazaars by the Parsees who with the other merchants for the most part speak English. A few more words about the Parsees with whom the Europeans have chiefly to do; they are merchants on a large scale and have a liking for home life; contrary to Europeans they acquire landed property, fine country houses of European style, and fine horses.

These are habits which hardly agree with many of their customs, as for instance the giving up of their dead to the vultures for food. In Calcutta and the surrounding districts the chief merchants are the Baboos who are said to be inferior to the Parsees. With regard to the quality of the chemicals introduced in almost all cases the requirements of the British Pharmacopœia are sufficient, although I know of cases where the Indian authorities put even higher requirements for instance that cocaine should stand McLagin's test. An Indian Pharmacopœia is in existence, but chiefly for the sake of Indian drugs used by the native doctors.

Native gentlemen continue to come in large numbers to England to study medicine where they pass the examinations and then of course prescribe quite in the English style. On looking at Dymock's "Vege.

table *Materia Medica* of Western India" and the "Pharmacographica Indica" now appearing, one notices that a large mass of drugs playing an important part in India medicine have not been examined, even as to their chemical and physiological action and it almost seems as if of late years in England the general interest is turned more to the examinations of synthetic chemical products quite neglecting the vegetable drugs.

This is all the more to be regretted as one can at least get authentic plants from India as the number of botanical gardens and agricultural institutes do everything to find use and demand for the raw products of the country for the benefit of it.

It would be a great pleasure to me if these lines were to excite the German chemical industry and drug commerce, on to further enterprises in India and in the English colonies in general. There is no doubt, but that in these countries a wide future lies open to Germans of this profession.

SOUTH WYNAAD NOTES.

4th May 1892.

During the last month we have had a rainfall measuring 8 inches 55 cents, which for April is somewhat unusual. This was ushered in by sharp cyclonic storms, which drifted off into an excellent imitation of the monsoon—dull grey skies and a continual dripping of soft rain. The storms were sufficiently strong to bring down no end of trees, which blocked our roads in a most inconvenient manner. The worst of it was, that in some cases the heavy rain fell upon the open blossom. This is a sensation which no one but a coffee planter can duly appreciate. To saunter round in the evening and gaze hopefully at the sheets of snowy blossom, to speak encouragingly to the bees which hum merrily round, intoxicated by the wealth of sweetness spread out for them, to eat your dinner in happy consciousness that the crop would pay for it, to lay your head down peacefully on your pillow rejoicing in the thought that "the blossom is safe, and then," . . . crash, down comes the rain—bang, down go the charco trees upon the finest bushes! The thunder rolls, the lightning flashes, and you lie on your back doggedly staring at the ceiling and saying to yourself, "What a glorious, happy, innocent Arcadian sort of life is that of the free and independent planter!" However, we may hope that it was only here and there that the blossom was thus caught. But here, you see, comes in one of the advantages of Liberian. The flower opens, sets, and falls within a few hours, and storms affect it not. Oh! how I longed for some of the detractors of my favourite product, to take a walk round my special plot, the morning it was "out." It was simply a magnificent sight and every passing wayfarer paused to admire and exclaim at the glorious show of big waxen blossoms. As for the bees, they became absolutely delirious over it, such a buzzing and fusing, such a turning up of their noses at the Arabica, which looked so insignificant besides its towering brethren. I think the most rabid abuser of Liberian, after a sight of that field, however much he may have come to scoff, would have returned to plant Liberian.

I have not yet met anyone in this neighbourhood who seems especially jubilant on the subject of crop. Of course, we have different ways of expressing ourselves. Our optimists say—"Everything is splendid, though of course, we cannot expect such a magnificent crop as last year, two seasons running!" Our pessimists sigh heavily and murmur *Ichabod*, and point at estates abandoned now, and more to be abandoned; moderate folks like myself steer a happy medium, or to try to, mindful of the stone-throwing provicilities of some other people. I don't think there is any immediate prospect of Wynaad turning out many millionaires in this year of grace, 1892. But possibly if the rupee keeps to its present deplorable depreciated state, we may be able to cover expenses. On several estates the crop has promised very fairly well, whilst on others,—rumour

says,—but there, let us talk of "sealing-wax and kings," rather than dwell upon uncheerful subjects.

The long drought has been a splendid check upon leaf disease, but we rather dread the subsequent effect of all these late rains. I hear groanings over borer, but as far as I can gather, this plague is not general, its fancy being apparently for especially situated estates. You know the impenetrable silence of everything before a big storm? How at last you almost strain your ears to catch the rustle of a leaf, or the twitter of a bird? Well that is exactly how it is with your South Wynaad "special" as regards news of "tea." A month or two ago I dreamed of long telling paragraphs for the *Madras Times*. The air was full of rumours, and I had no end of enchanting "strictly confidential" whispers into my delighted ears. When my neighbours talked of this and that possibility, I chuckled to myself, and thought about certain estates, and what I knew was going to be done with them and so on. I even mentally planned an "interview," with the manager of our "Central Factory," and how I would describe him as such a splendid genial fellow, and all that, and tell you all about the machinery and the penetrating, intoxicating odour of the hot tea and so on. Now, I feel run down to the lowest depths of humiliation, for here is May, and oh! Mr Editor, be merciful for like the rustic lover "I hain't got nuthin' to say." Absolutely nothing further is heard at present on the tea subject, and certainly nothing practical in the way of planting is likely to occur this year. It is a terrible pity that so much splendid possibilities should be thus ruthlessly wasted. However, to revert to my former simile, perhaps it may be only the silence before the storm, and I may yet gladly record jubilee days for poor old Wynaad.

The Woodlands Estate, I note, has passed hands since I last wrote and become the property of a "perfect stranger." The management, however, remains the same.—*Madras Times*, May 10th.

THE INDIAN COTTON CROP OF 1891-92.

The final Memorandum on the Indian cotton crop of 1891-92, which we have just received, shows that throughout the reporting Provinces the season was exceptionally unfavourable to the crop and that both area and outturn have in consequence fallen off largely. The Punjab crop is estimated at 41 per cent. less in area and 36 per cent. less in outturn than in 1890-91, itself an unfavourable year, and is stated to be the lowest crop on record. In the North-Western Provinces and Oudh the deficiency is 23 per cent. in area and 42 per cent. in outturn, and in Madras it is 21 and 30 per cent., respectively. In the remaining Provinces the influence of the adverse season on the area returns is less marked. The falling off in production due to the diminished area is aggravated by the lower yield per acre, which is disclosed in the estimates of outturn, which in Bombay is put at 36, in the Central Provinces at 35, and in Berar at 15 per cent. less than last year's. The general result for the seven reporting Provinces is that the area stands at a little over 11 million acres against 13 million acres in the previous year and an average acreage of over 12 millions. The forecast of production is 1,380,000 bales of 400 lb. each against 2,031,000 in 1890-91, and an average of 2,185,000. Taking the average value of a bale at Rs100, the money equivalent of the deficiency on the crop of 1891-92, as compared with the normal, is, roughly, 112 millions of rupees, or about 74 per cent of the average annual exports of cotton to foreign countries, and over 33 per cent of its estimated average production.

Sir Edward Buck remarks that the export trade in Indian cotton is not progressive and fluctuates largely; so also does the outturn, the cotton plant being very susceptible to the influence of unfavourable seasons and the attacks of insects. But al-

though complaints of adulteration have been some what loud and frequent of late years, the trade returns afford no evidence of any marked decline in either demand or supply. Indeed, taking into consideration the annually increasing consumption of Indian mills, there is, he says, good reason to conclude that the total production of raw cotton has, on the whole, increased rather than diminished. What has taken place is a diversion of the Indian exports from the markets of the United Kingdom to those of other European countries, among which Italy, Belgium, Germany, Austria, and France are the principal customers. As the year for which trade returns are compiled ends on the 31st March, the full effect of the present unfavourable harvest will not, Sir Edward Buck writes, be apparent till 1892-93, the traffic returns of which may be expected to show a large falling-off. The exports by sea to foreign countries during 1891-92 will also in all probability be much less satisfactory than those of the preceding year, as the harvest of 1890-91 was unfavourable, though not nearly to the same extent as the present one. The total foreign exports registered during the first ten months of 1891-92 (ending 31st January 1892) amounted to 931,280 bales, against 1,207,360 and 1,238,160 in the corresponding periods of 1889-90 and 1890-91.—*Madras Mail.*

TEA IN CHINA.—The reports from China regarding tea continue to be more and more gloomy. The *Foochow Echo* of 3rd April has the following:—

From a native source we learn that four Chinese millionaires (?) of Hinghua have conceived the idea of substituting cotton for tea in several districts, and their agents are now busy sounding the country-people as to whether they will co-operate with them. Our informant states that the scheme is well thought of generally, if only the Government will assist the project (as before) instead of obstructing it of which there seems to be some dread. News of the great falling off in advances to the teamen this season seems to have reached the tea districts apace, since we are already assured that growers, instead of allowing all their first pickings to lie at the mercy of the few who may be in a position to buy it on the spot, intend sending large quantities of it down to the Foochow dealers to sell to the local packers. As it is generally understood that the sooner tea is cured and packed after picking the better, foreign tea buyers will not learn of this new departure with much satisfaction. Nor will the up-country buyers be best pleased if this move is carried out to the extent talked of; they had planned to corner the growers, but, if we may use a sporting expression, the growers are going to hedge. Between the two factions, foreigners may be the gainers in the end as far as price is concerned. Yet another large Chinese Bank has now been started over the bridge, making four new ones since the commencement of the new year. Considering the admitted unsoundness of business all round, we learn of this with some surprise. The capital of this new bank is said to be considerable, and they will have to use it though in what way is not very clear. That they will have applications for loans from disappointed teamen is certain, but they must have more faith in the future of tea if they accept such men as customers, when the older banks, well acquainted with the business, decline to loan money to them. Of course there are several other articles of merchandise dealt in at the port on a very large scale, but the trade is in an unsound state, and as the bankers have been sufferers with the traders themselves, it is astonishing to hear of so many new banks starting.

We also read:—

A correspondent at Hankow, writing to the *N. C. Daily News* on the 26th ult., says:—'Torrential rains here had lock out for the tea, as this is just the picking time. Rain at the picking season means "bar" and too old leaf, while if this season's crop should turn out a bad one, it will put the finish on China tea.' According to reports in the native papers, this year's tea crop is going to be both bad and small, a fact which

is attributed to the bad weather, and in consequence of this the price of the first leaf has risen already. The *Shenpoo's* Wenchow correspondent describes the yield of tea this year, in the Pingyung district, as being very bad. Owing to the unusual cold and incessant rain the tea-plants have been much stunted and the crop this season is estimated to be only half of what was produced last year. Tea merchants who have gone into the mountains to purchase tea are paying high prices. For the best quality they are giving 50 dollars per picul and for an inferior kind 30 dollars per picul is charged.

COFFEE IN JAMAICA.—Sir Nicholas Laws, it is said, was the first person who planted coffee in Jamaica, but dying three years afterwards he did not see the cultivation make any considerable progress. In 1732 several planters and merchants subscribed £220,103 as a fund for defraying the charges of soliciting an act of Parliament for lowering the inland duty upon the importation of coffee from Jamaica into Great Britain, which at that time was £10 per cwt. That year the duty was reduced from 2s to 18d per pound producing a revenue of £10,000 per annum. In 1752 the export from Jamaica was 500 cwt, in 1755 it was, 4,000 cwt. in 1891 it was over 75,000 cwt. *Madras Times.*

THE MAGAZINE

OF

THE SCHOOL OF AGRICULTURE,

COLOMBO.

Added as a Supplement monthly to the "TROPICAL AGRICULTURIST."

The following pages include the contents of the *Magazine of the School of Agriculture* for June:—

INSECTICIDES AND FUNGICIDES, AND THE APPARATUS FOR DISTRIBUTING THEM.

ANY insects and fungi, destructive to cereals, from the nature and time of their attack, cannot be directly dealt with, and must be left to their destructive works

though there are indirect means of preventing their appearance. In the case of the fungi known as smut (*Ustilago Segetum*) and rust (*Uredo-graminis*), nothing has yet been found of avail after they have appeared, though sulphate of copper, applied to the plants when young, will most probably keep them off.

Wireworms, the grubs of the click beetle, (*Elatér lineatus*) can be hindered in their destructive work by dressings of gas-lime, at the rate of 10 cwt. per acre ploughed into the land. Top-dressings put on the crops at an early stage, consisting of soot, from 20 to 40 bushels per acre, or guano, from $1\frac{1}{2}$ to 3 cwt. per acre, or nitrate of soda, 1 to 2 cwt. per acre, have been found valuable, acting as plant stimulants, as well as by keeping the insects off the plants. Salt put on at the rate of from 4 to 6 cwt. per acre is also useful as tending to make the neighbourhood of the plants unpleasant. After all these applications the land should be well rolled.

In some seasons the plant louse (*Aphis granaria*) causes much harm, first by exhausting the juices of cereals, and later by getting into the ear and doing much mischief. When it is seen that these aphides are on the plants in large numbers, it is well to apply a wash of soft soap and quassia, in the proportion of 7 lbs. of soap to an

infusion made from 6 or 7 lbs. of quassia chips to 100 gallons of water. This should be sprayed on with an efficient spraying machine before the plants get too high. Again, paraffin solution might be used, made of 3 quarts of paraffin to 100 gallons of water, with 4 or 5 lbs. of soft soap, or paraffin pure and simple distributed at the rate of from 2 to 3 gallons per acre. Aphides multiply with incredible rapidity; early dressings may therefore effectually prevent a bad attack.

For the eel-worm (*Tylenchus devastatrix*) which makes the bases of the stems of cereals swell, and plants unhealthy and unproductive, applications of sulphate of potash, at from 1 to $2\frac{1}{2}$ cwt. per acre, have been found most useful, and a mixture of 2 cwt. superphosphate, and 1 cwt. each of sulphate of potash and sulphate of ammonia per acre have been found of benefit.

Almost similar remedies to those employed against wire-worms may be used for the grubs of the daddy-long legs (*Tipula oleracea*) and its congeners (*Tipula maculosa* &c.) when they infect cereals. All these dressings of manure and preventive substances may be put in by the hand, or with ordinary broadcasting machines, or with the Strawsonizer, whose powers of distribution are generally acknowledged. One great advantage of this distributor is that as little as half a bushel of powdered substance can be put on per acre, and as small a quantity of liquid as a gallon per acre if desired. In many cases of insect and fungoid attacks upon plants, the great object in spraying is to spread the obnoxious substance all over the leaves in the form of a mist or dense fog. A very small quantity suffices to make the plants objectionable to insects and fungi.

For the mustard beetle or black jack (*Phædon betule*) the following is serviceable: 5 lbs. soft soap well dissolved in water, extract of 5 lbs. of quassia boiled, 100 gallons water. Paraffin and

soft soap compositions, and quassia and soft soap washes have been tried with advantage to prevent and check the onion fly (*Anthomyia ceparum*), the celery fly (*Tephritis onopordinis*), the carrot fly (*Psila rosæ*), all of which work great destruction in vegetable gardens. These remedies may be put on with garden engines fitted with nozzles like the Rily, the helmet spray, the Climax, and Stott nozzles, or with the "knapsack" machine, of which there are several patterns in use. The best of these seems to be the Eclair which is about 2 feet high, and consists of a copper reservoir, or vessel, holding 26 pints, made to fit on to the operator's back, being fastened there with straps like a knapsack. A rod traverses the lower part of the reservoir inside, being worked by a lever with the operator's hand. This does not move a piston as in ordinary pumps, but acts upon an Indianrubber diaphragm, by whose sucking action the liquid is forced through the delivery tube with great force. With the Vermorrel or Rily nozzle the liquid can be delivered in the finest spray, or almost in single jets, and in any direction. For high trees the delivery hose can be lengthened by being attached to a light wooden or cane pole and directed by a boy. The machine will throw a spray from 20 to 25 feet and a jet 30 feet high. It weighs about 40 lbs. when full and costs 35 shillings. The Eclair is sold in London by Messrs. Clark & Co., Windsor Chambers, 20, Great St., Helens, E. C.

The onion crop—a source of much profit—also suffers greatly from the onion mildew (*Peronospora Schleideniana*). Sulphate of copper solutions will prevent this attack if put on just as the bulbs begin to swell. In preparing, dissolve the sulphate of copper (5 lbs.) in a wooden vessel in 3 gallons of boiling water; in another vessel the lime (2½ lbs. of quicklime) is put with 4 or 5 pints of water, and when slaked 4 gallons of water are added and the whole well stirred. This is then poured into the tub containing the sulphate of copper, being passed through a sieve to keep back the particles of lime. The whole is well stirred and water to make up 22 gallons is added.

Another and a weaker preparation is as follows:—The sulphate of copper (3 lbs.) is dissolved in cold water by hanging it in a coarse bag or basket in a tub. In a separate tank the quicklime (1 lb.) is slaked and passed through a sieve and put into the tub with the sulphate of copper, and the whole well-stirred. Water to make up 20 gallons is added. The Tomato is much affected in some seasons by a fungus of the family *Peronosporæ*, and sulphate of copper preparations have been proved to be efficacious against this. The solutions may be put on with the Eclair machine. Sulphate of copper may be used in the form of a powder for mildews (fungi) of various kinds. A good preparation of this consists of sulphur 50 parts, quicklime 3, sulphate of copper 10, coal dust very finely crushed 37 parts.

Another powder (the Skawinski, obtainable of the manufacturer of that name, at Lesparre, Medoc, France, for about 10 shillings per cwt.) active against fungoid attack, and used for vine mildew, is composed of 40 lbs. sulphate of copper, 6 lbs. quicklime, 15 lbs. coal dust finely ground. This may be put on with a soufflet or

bellows which is a very useful means of distributing powders on a small scale for insect and fungoid attacks. A handy pail engine for small areas is Snow's patent universal garden engine, which may be fixed in any ordinary pail. The pump is very strong, forcing a powerful jet either in a single stream or in a thick fog. It is most easily worked.

The helmet spray before referred to, envelopes plants in the densest mist; the delivery can be regulated by turning a screw.

OCCASIONAL NOTES.

The stud bull at the School of Agriculture is available for service; charge R250 per head; arrangements as to date &c. should be made by letter.

We have received from the Lawes' Chemical Manure Company one bag each of their special manures for cotton, paddy and cereals, and for grass and leguminous crops, with the request that we will experiment with them on our grounds. We have also received from Messrs. Sutton & Sons, the well-known seedsmen of Reading, a box containing samples of the following seed: Lucerne, Common Sainfoin, Kidney Vetch, Hungarian Forage grass, Bromus Schrederi, Giant Caragua Maize, Sorghum Vulgare, and Sorghum Saccharatum, Permanent pasture grasses and clovers, and strong-growing grasses and clovers for 3 or 4 years lay.

Mr. W. A. de Silva, Assistant Master at the School of Agriculture, left for Bombay on the 12th of May, with a view to studying Veterinary Science at the Bombay Veterinary College. Mr. Silva, who holds a Government Scholarship, expects to be away for 3 years, at the end of which time he will return to the School.

Mr. Mendis, an old boy of this school, who has been in the employ of Mr. Clovis de Silva of Moratuwa, on a coconut property in Kegalle district, has just been transferred to a tea estate belonging to the same proprietor in Alutgama.

Mr. Lye, the Veterinary Surgeon, will commence his course of lectures to the Agricultural Students in July, after the vacation. Since his arrival, Mr. Lye has been enquiring into the epizootic disease commonly known as "Murrain," and for this purpose spent a few days in the Matale district, and has advised a course of medical treatment which, we believe, is being adopted at present in the district named.

Some months ago a writer in the *Ceylon Observer* discussed the question of the protection of birds, and urged that singing birds and those useful to the agriculturist should be protected, while those which damage crops should among others be permitted to be destroyed. In the Indian Museum Notes an attempt has been made to classify Indian birds according to the diets which they affect. Under purely insectivorous birds fall the Cuckoos, Trogons, Rollers, Bee-eaters, Hoopoes, Woodpeckers, Gatsuckers, Swifts, Ground Thrushes, Wagtails, Swallows, Hedge-sparrows, Pipits, Redstarts, Robbins, Chats, Fly-catchers, Shrikes, Minirets, Warblers,

Creepers, Drongos or King Crows, Ioras, Green Bulbuls, Ground Bblers, Solitary Bblers, Babbling Thrushes, Crowtits. The following are the birds of mixed diet, partly insectivorous and partly fruit and grain-eaters: Tits, Sibias, White Eyes, Bulbuls, Nuthatches, Orioles, Starlings, Mynas, Thrushes, Finches, Larks, Sunbirds, Flowerpickers, Pheasants, Partridges, Button Quails, Rails, Cranes, Bastards, Waders. The next list comprises birds which live in or near water, their food consisting of fish, frogs and tadpoles, aquatic larvæ of insects, and small animals such as freshwater Crustaceans, Ouzels, Kingfishers, Cormorants, Pelicans, Herons, Egrets, Ibis, Ducks, Gulls and Terns. The carnivorous birds are Owls, Vultures and Hawks; Omnivorous:—Crows and Storks; Frugivorous:—Hill Mynas, Weaver birds, Hornbills, Barbets, Parrots, Pigeons, Sandgrouse.

Very few of the purely insectivorous birds are said to be among those destroyed for plumage or food. It has been observed that in Upper India most small birds breed between April and July, and the four months April, May, June, July practically cover the breeding time of nearly all the birds which require protection. The breeding time of course varies in different climes. If the Director of the Museum would draw up a list of Ceylon birds similar to the above, and note the close seasons of birds, say in the various Provinces, it would greatly aid the Agents of these Provinces in putting into effect what is practically a dead law for the protection of birds in Ceylon.

For human beings the minimum air space consistent with health is 400 cubic feet; horses it is said require double the area, but no less than 1,200 cubic feet have been advised. In England the cubic space of cattle byres varies from 350 to 800 cubic feet. In London 600 cubic feet are required. Dr. Russell, the well-known Sanitarian of Glasgow, has lately been enquiring into this matter, as regards cattle, and after collecting a deal of information on the subject, and discovering probably that the regulations concerning the cubic contents of cattle byres had been framed with imperfect knowledge of the subject, in view of amending the regulations referring to Glasgow, recommends:—1. "That the registration, regulation, and control of byres should be placed in the hands of the sanitary authorities. 2. That in all existing byres the cubic space should be raised to 600 cubic feet. That in all new byres it should be 800 cubic feet, and that the regulations generally, as to lighting, ventilation, cleaning, drainage, and water supply, should be carefully revised, so as to give full effect to the mind of the sanitary authority, and thereby enable them to discharge themselves of the responsibility imposed upon them by the Legislature." If some such system for the inspection and regulation of cattle pens in Ceylon be adopted, it will go a great way towards preventing outbreaks of disease and arresting their progress; for, want of proper ventilation is the chief cause of lowered vitality, of colds and most diseases of the air passages, and of other descriptions of sickness.

KITUL PALM.

THE MODE OF EXTRACTING TODDY.

The processes adopted for the extraction of toddy are to begin with tedious, and a man should go through a complete course of training before he undertakes to practice the art.

When the flower is on the verge of bursting, which often happens before maturity, preparations are made by the toddy drawers to tap the palm. Having tied on a bamboo to the tree, he climbs up with a table knife and a chisel, and commences work by removing the sheaths (hannasus). An oblong-shaped cavity is then cut about a span from the axil of the inflorescence, and "a medicine" compounded of various ingredients is deposited in this cavity. Salt, pepper, ginger, white onion, the roots of rataatui (*Plumbago rosea*) and the bark of the murunga (*Moringa pterygosperma*) are taken in certain quantities and pounded well in a mortar, first applying a sprinkling of leema or caffer lime juice. After depositing the "medicine" a thick coating of ashes is placed over the mouth of the cavity, and a piece of gunny bag is wrapped round it in several folds and tied with a rope. The flower is then washed with the juice of caffer lime. This done, the apex of the inflorescence is sliced with a knife.

The terms *Kanu Mala* and *Akmala* are used for the flower at different stages of its development. On the second day the man similarly cuts the flower once, and on the third day he cuts it twice (morning and evening), and suspends a vessel from the wounded inflorescence.

If the flower is shaded by leaves so as to prevent the free access of sun, such leaves are cut away. As a preventative against the flower breaking, it is tied to an upper leaf, and in order to keep it motionless, a few stones are suspended.

It is important to observe that there are two kinds of flowers called the Kohu Mala and the Ala Mala respectively.

The same "medicines" are used for both the flowers, but the most striking difference is, that the *Kohu Mala* always require a dry season, but if there is excessive rain, the flower becomes so hard that the sharpest knife would fail to cut it. There is also every probability of this flower rotting. Any prevailing weather generally suits the *Ala Mala*. Of course there are exceptional instances where this flower also rots, but such cases are very rare. Another difference is that the *Kohu Mala* is not liable to be broken easily, while the *Ala Mala* is very easily broken.

The first yield of sweet toddy is generally rejected. To make sweet toddy ferment and become sour, the roots of eramaniya (*Zizyphus jujuba*), and Sevendera (*Andropogon zeylanicus*) are first sliced into fine pieces, put into the vessel and hung from the flower. Similarly to prevent fermentation, the barks of the *Hal tree* (*Vateria acuminata*) and the leaves of Ankenda (*Acronychia laurifolia*) are put into the vessels.

I have observed in the case of an extremely fertile tree an uninterrupted flow of the juice, while in trees of ordinary vigour the flow goes on at intervals. A profit of R300 to R400 could safely be calculated (deducting expenses for

medicine which is generally a trifling item) from the sale of produce and preparations. At least 15 flowers arrive at maturity on each tree.*

If a bottle of sweet toddy is left for a few hours, it becomes sour without any application of leaves or barks of trees. But such toddy is said to be not fit for drinking purposes. It is in order to ensure fermentation that the barks of trees &c. are put. During the Kandyan Government, measures were passed to prosecute sellers as well as drinkers of toddy. From a dozen bottles of sweet toddy which fetch at the rate of 2½ cents each, 8 of sour toddy could be prepared, which fetches 5 cents each.† Toddy is said to be efficacious in cases of sore mouth, biliousness, and cutaneous diseases.

Mr. Lee, in his History of Ceylon, says:—"There is another disease called the Beri-beri, to which Europeans are very subject; it is a sort of cramp so very violent that it prostrates those who are attacked by it, and the diseased part might be cut with a knife without causing any pain. The best remedy is to eat pork and biscuit, to drink palm-wine or toddy, and to smoke; three or four months living in this manner cures the patient entirely; on this account the Captain-General Antonio de Mascarenhas, by the physicians' advice, issued an order for every one to smoke in the camp, and to give a good example, he adopted the practice himself first, and after that time the disease was far less prevalent."

T. B. P. KEHELPAHALA.

(To be continued.)

NOTES FROM A TRAVELLER'S DIARY.

I have just had a run over a large area of the Province of Uva. By far the most interesting place I visited in the province was the Happy Valley Industrial and Reformatory Schools. I alluded to this Institution in some of my previous notes, but I was then able to say very little. After the return of its founder, the Rev. S. Langdon, from England, the Institution has put on fresh vigour, and the way in which the work is now carried on is all that could be desired, and is sure to elicit popular applause.

The most interesting part of the Institution is the Reformatory School where about 40 juvenile offenders are at present undergoing sentence of detention. Agricultural labour, dairy farming, poultry-keeping, tailoring, &c. are the principal industries. The dairy farm is the best that I have as yet seen in the island. A fine lot of selected poultry is kept, and the eggs are hatched by the artificial mode of incubation. Curiously, the head juvenile offender at the Reformatory (*Marsal* by name) who is about 11 years of age, is a boy who was once charged before the Police Magistrate of Colombo with stealing arrowroot from an experimental plot at the Colombo School of Agriculture. He was,

* The racemes are attacked by beetles, while the toddy is drunk by bats. Great damage is done in this way to trees.

† In some parts of the Kandyan Districts vinegar is also prepared from toddy.

however, let off with a warning, but has subsequently been sent to the Reformatory for stealing some clothes in Colombo. This boy is now the favourite of the place, has forgotten all his thieving propensities, and I am assured that he has thoroughly reformed. He learns dairy farming and gardening, and seemed to be an expert in making butter and cream, and I would not be surprised if he be some day called to the Colombo School of Agriculture as a dairy expert.

A large area of land at the Happy Valley has been put under tea experiments in the cultivation of fruit, paddy, tobacco and various other crops are also being carried on. It would be well if experiments in the cultivation of barley are also started on a somewhat large scale.

I am surprised that the cultivation of ginger does not attract the attention it deserves of the goiyas of Uva. A large quantity of the ginger consumed in the Province, I think, is brought from the Western Province. During the late epidemic of cholera, in some parts of the Province, a pound of ginger was sold for from R1 to R2. The lowest price of a pound of ginger at Badulla on any day is 12½ cents.

The patanas of Uva may in some respects be compared to some of the owita lands we often meet with in the Western Province, covered with rank grass. Bracken fern is commonly met with on the patanas, the presence of which is supposed to indicate fertility of the soil; the daffodil orchid is also common, and it is easily recognised by the yellow colour of its flowers which appear in the months of February and March, peeping through the grass on their long slender stalks from among the patana grass.

The country around Happy Valley seems to have once been thickly populated, and was probably the site of Portuguese encampments during the struggles they had with the Sinhalese kings. The names of places such as Halatutenne (rice store plain), Haldummulle, (the corner at which rice was distributed) and Bathgangoda (the villages in which the rice was cooked and served) bear out these facts.

CROTON TIGLIUM.

Some time ago a writer in the *Times of Ceylon* called attention to the danger in planting croton-oil trees among tea bushes, as was then the case on many places in the Matale district, since it was feared that while plucking the leaves from the latter, some leaves of the former might accidentally fall into the baskets and be manufactured into tea. Natives have a dread of the croton tree, as its poisonous properties are so well known to them, that they fear even to pass under its shadow. Even native medical practitioners, in prescribing the oil obtained from the seed as a purgative, use only a very small quantity, the dose for an adult being about half a grain or only a drop which is rubbed on a betel leaf and given to the patient to be chewed and swallowed. Some Sinhalese cartmen at

Wattagama came to grief by eating rice that had been cooked over a fire ignited with croton sticks. But the tea planters of Matale took no need of this warning, till at last people in England began to make enquiries regarding the laxative quality of certain brands of tea sent from Ceylon, by the use of which several persons would seem to have taken ill. Shortly after this almost all the croton trees on tea estates disappeared. Planters who did not go in for tea were more fortunate and allowed their croton trees to remain, and at the present day are making some profit, as since of late there has been a demand for this product. The writer being one of these fortunates might be congratulated for his wisdom, but if the reader wishes for an instance where it was folly to be wise, he need only be told that not long ago he (the writer) had the misfortune to lose a good serviceable horse which died after three days' violent purging, supposed to have been caused by its having eaten some croton leaves from trees growing by the roadside. Sometimes this tree is infected with a kind of caterpillar which drops to the ground in large numbers when the tree is shaken; and fowls have been seen to gorge themselves with the grub. What seems strange is that these birds were never known to have suffered any bad effects afterwards; nor is it known that any people have been inconvenienced by eating the fowls in question. But those who possess poultry ought to prevent them eating the croton oil seed, as they do eat it when they can get at it, and then become stupefied, *pirouette*, and gyrate like a spinning top till they drop dead. This potency of the seed does not however appear to affect the ground-doves, very common birds in the island, which feed on it quite freely. No other animals are known to eat either the leaves or the seed. Where domestic troubles arise among those more intelligent animals, the Tamil coolies employed on estates where croton trees still exist, and Ramasamy gives his wife a beating, the latter not infrequently revenges herself by taking a mouthful of the poisonous seed and causes much consternation among her kith and kin, till the usual remedy of bathing the patient in cold water, to counteract the poison, is resorted to. Sometimes purging and vomiting continue for several hours, but ultimately stop after the bath, leaving the mouth much inflamed by the irritating poison, and the throat quite sore. These effects necessitate the patient being kept on milk, butter and sweets for several days, and thus the husband of the victim has to pay rather dearly for his indiscretion!

ALL PRODUCTS.

NITRIFYING FERMENTS OF THE SOIL.

This forms the subject of an instructive article by Mr. J. M. M. Munro, in the *Royal Agricultural Society's Journal*. In 1877, the experiments of Schloesing and Muntz threw an entirely new light on the matter of nitrification, the existence of which was well known to Boussingault as early as 1856, though the process by which nitrification went on was not then understood. The

experiments of 1877 were taken up on the suggestion of Pasteur in 1862, that the oxidation in this case (like that in the conversion of wine into vinegar) might be due to the action of a living ferment and not to simple action of the air. "Fifteen years after this suggestion" says Mr. Munro, "the first experiments confirming it were published, and not until the present year, that is after the lapse of nearly fifteen years more, has the prediction been fully and completely verified by the isolation and separate examination of, at any rate, two of the species of organisms concerned in the process." So slow, in certain cases, is the onward progress of what we are accustomed to regard as the rapid advancing strides of science. A considerable portion of the paper is taken up with the history of what Mr. Munro terms "the hunt after these organisms." Those who worked industriously and followed up the scent were Warrington, Winogradsky, Dr. and Mrs. Frankland, and apparently Mr. Munro himself.

Warrington, summing up the results of his experiments, tells us that all samples of soil taken down to 2 feet in depth provoked nitrification, but that over this depth failures to nitrify increase in number, and at a depth of 6 feet and over, the soil has lost this power. From this and other experiments it would appear to be certain that the first few inches of surface soil contain the ferments in vastly greater proportions than the subsoil. From the soil these ferments get into water, and the power which rivers and wells have of ultimately converting the ammonia of sewage into nitrate of lime (or other base) depends on their presence.

One after another discoveries were made, the last and one of the most important being that of Winogradsky, that the nitrifying ferments have an antagonism to organic matter. Mr. Munro says that the importance of this discovery is very great; it reveals an entirely new property of living things, that of building up from the carbon of mineral carbonates and the nitrogen of ammonia, the complicated albuminoid and other organic constituents of living cells. It appears that about 35 parts of nitrogen in the form of ammonia have to be oxidised to a nitrate for one part of carbon taken in as food by the ferment: and it is the heat evolved by this large oxidation that furnishes the force necessary to effect the decomposition of the carbonate.

Mr. Munro concludes his paper with the following important reflection:—The practical point should not be lost sight of, that nitrates are destroyed much more easily and much faster than they can be formed. A free supply of air above all things favours their preservation, whilst the presence of organic matter in the absence of air is certain under natural conditions to result in their destruction. This destructive work, we are told, is also brought about by microbes, and is a property common to a great number of different species. Some of these are capable of destroying in a few days as much nitrate as is formed in months or years. Fortunately, the activity of these baneful species can always be kept in abeyance by the aëration of the soil brought about by drainage and good tillage.

SUBSTANCES OF MANURIAL VALUE.

It has often been asked how the ammoniacal liquor from gas works, a byproduct in the process of purifying coal gas, may be used for agricultural purposes. Griffiths, in his treatise on manures, says that gas liquor is essentially an impure solution of carbonate and acetate of ammonia. As gas liquor is of various degrees of strength, the amount of water to be added to it before applying to the land varies also. As a rule, ammoniacal liquor should be diluted with 4 or 5 times its bulk of water. For grass land the manure can be applied by means of a water cart. In very dry weather gas liquor burns up grass, but on the first appearance of the rains, the herbage will again spring up with increased luxuriance. Ammoniacal liquor has also proved a valuable fertilizer for cereal crops growing on clayey soils.

Another way suggested by Dr. Griffiths for utilizing gas liquor is to absorb it by means of saw dust, peat or charcoal (and we might add coir dust), and then to add bone dust to the mixture.

Gas liquor is said to keep off flies and slugs, and it also promotes the fermentation of saw dust, peat, and similar vegetable substances. It is thus used for preparing composts. The addition of dilute sulphuric acid to ammoniacal liquor till it shows no alkaline reaction with red litmus paper, fixes the ammonia as a sulphate.

In an article on the agricultural value of shoddy or woolen waste, Mr. John Hughes says: "Quite recently, in Ceylon, shoddy (manufactured into a very fine powder by treatment with sulphuric acid) has been tried as a manure for the tea plantations; and for these, bearing in mind its richness in organic nitrogen, it promises to be an excellent fertiliser, if only it be properly applied and of good quality." This is a very important qualification, for shoddy is generally of very variable composition, containing cotton and other substances of little or no value, which, moreover, sometimes deter the action of the manures. When very greasy, shoddy is of little value; if consisting of pure wool, it contains a large proportion of nitrogen, and should dissolve under the action of caustic soda. Shoddy as got from woolen mills contains from 2 to 8 % of nitrogen and is generally very greasy; acted upon by sulphuric acid and dried it falls as a powder. Of leather and shoddy Dr. Aitkin says: "Of no value unless they are dissolved." The latter is used by manure manufacturers as a source of ammonia in dissolved manures, and it is capable of yielding from 5 to 10 % of ammonia, but is said to be unsuitable for direct application. The following points should therefore be considered in comparing the merits of shoddy and farmyard manure:—Whether the shoddy consists of pure wool, containing from 7 to 8 % of ammonia and not more than 20 % of water, whether the ingredients are in a suitable condition, and what would be the value of shoddy sold at £3 per ton after being brought into a state convenient for application, and after allowance is made for freight &c. at the present rate of exchange. It will also have to be considered when the calculation according to Mr. Hughes' method is made, whether the saving of

£3 in England by the use of shoddy in place of cattle manure could be effected here under the circumstances just mentioned, and with the fact in view that 1 ton of cattle manure does not cost anything like 7s. 6d. or its equivalent in Rupees in Ceylon.

The value of dried blood in England is about £8 per ton. The nitrogen is in the form of albumen, and is capable of yielding from 12 to 16 per cent of ammonia. "Dried blood," says Warrington, "is an excellent manure, containing 10 to 13 per cent of nitrogen."

Horn dust or keronikon sells in England for about £7 7s. It is capable of yielding from 16 to 18 per cent of ammonia. When in the form of fine dust it decomposes easily and is a good nitrogenous manure even for cereals. When in the form of chips or coarse shavings horn decomposes but slowly.

GENERAL ITEMS.

A simple process for preparing bees-wax is to reduce the comb to the smallest compass, tying the same in a piece of muslin or similar fine material, and placing in a vessel of boiling water, attaching a weight to the bag to keep it some distance below the surface. After boiling for half an hour or so, allow to cool, when the wax will be found as a solid cake on the surface, the impurities being left in the strainer. Or the rough comb may be placed in a vessel of water, and after boiling a short time the whole may be poured through some straining medium placed over another receptacle, where the wax may be left to cool as above. As the wax lightest in colour will be the most valuable, the combs should be sorted before boiling.

Drury mentions the fact that *Valisneria spiralis* and *Hydrilla verticillata* are used in India in the process of sugar refining. It is said that sugar refined in the ordinary way is rendered still purer and whiter by covering it with the moist leaves of these succulent aquatic plants, the moisture from which drains slowly through the sugar and carries with it the dark-coloured molasses. After several days the leaves are removed and the upper part of the sugar, which has been most purified, is taken away and dried in the sun. Fresh leaves are then added, by which another layer of sugar is whitened in like manner, and the operation is repeated until the whole mass is refined.

Wight, writing in 1839, of Cocoa says:—This is a native of America, and has been introduced into India. Hitherto our attempts at culture have not been very successful, but I saw very thriving trees at Courtallum, and there is one at Palamcottah which annually bears a crop of fruit, and gives promise that it might be increased. I attempted to take grafts from that tree, and also to propagate by slips and gooties, but failed in both attempts. . . . I presume the most probable tracts of country in India for commencing its cultivation on a considerable scale, would be the high and cool tableland of Mysore, in plantations well sheltered, and

still further kept cool and damp by being made in only partially cleared forests. Wherever such localities are to be found the cocoa may be expected to thrive, and might be introduced with effect and at little charge. On the Malabar Coast, too, where forest lands abound, the humid and insular-like climate would as in the West Indies, where it is very extensively cultivated, counteract the injurious effect of excessive heat and render the chances of success fully equal to those of Mysore. The only drawback to its extended cultivation is the slowness of its growth in the first instance, which, however, is well compensated for by its after duration and productiveness. The fresh virgin soil, the shade, the humid atmosphere of forests recently cleared of their brushwood are all dwelt upon by Humbolt as peculiarly favourable for cocoa plantations, and in such of course they ought to be tried in the first instance until we get the tree acclimatised.

The foundation stone of the Bengal Veterinary Institute was laid last month in a suburb of Calcutta. The *Indian Agriculturist* hopes that this institution will not fall into the same errors as those of the Bombay Veterinary College, of turning a hospital for animals into an infirmary for horses, almost to the exclusion of oxen which are the beasts of burden and of agricultural work in the East. It is also hoped that one of the chief objects of the institute will be to bring Veterinary aid to the cultivator, and that the recommendation of the Cattle Plague Commission of 1871 should be adopted, and "a native agency by which epizootic and other diseases might be properly investigated and treated," formed.

The Chinese and Malays make four kinds of Gambier, viz., Gambier papan, bulat, paku, and dudur. The first two of these are used for chewing, the others for dyeing. Besides these, two uses to which Gambier is put, it is also used for tanning, and is said to give a peculiar gloss to leather not produced by other tanning substances. Next to oak-bark it is the most important tanning material. Again, it is used for strengthening canvas and making it water-proof, as a masticatory, and an astringent in medicine. It has been recommended as a preservative of timber in sea water.

A writer in the *Agricultural Journal* of Cape Colony says that Euphorbia or *Naboom* milk is a sure cure for warts on horses and cattle. Three applications removed a very large wart from the belly of a mare. The same result followed in the case of two heifers with warts,—one with so large a wart that it was thought the animal would have to be killed: three applications effected a cure. Young trees should be tapped for the milk, which, if left standing for a few days becomes hard. It should then be cut fine mixed with a little turpentine or paraffin, and stirred till it gets to a fluid again, ready to rub on. The writer states that some years ago, he saw in a paper that a lady in the Queenstown district, who had a cancer on her breast, got cured by the same remedy. It is unfortunately not stated which

of the Euphorbias is the *Naboom* which is evidently a local name. Most of the plants belonging to this family yield a milk which is more or less corrosive in character. The milk from *E. Antiquorum* (Dalookgass), *E. Tortilis* (Senook gass) and *E. Tirucalli* (Nawahandi) is used as corrosive fluids for blistering and other purposes by the natives of Ceylon.

Sir Charles Elliott, the Lieutenant-Governor of Bengal, in his last report, referring to the food supply of the Provinces recommends the bulb of *Kesoor* (*Cyperus bulbosus*), the Chilanthi arisi of North Ceylon, as an article of diet in case of famine. He states that it is palatable and nutritious, and that a seer of it could be dug in a day, but the *Indian Agriculturist* remarks the whole stock of *kesoor*, which moreover is by no means common in all localities, will thus be exhausted in a few hours. In North Ceylon Chilanthi arisi is used as an article of diet, especially in seasons of scarcity. The *Indian Agriculturist* suggest that *Motha* (*C. Rotundus*) the Sinhalese Kalandooroo might also be pressed into use in famine times.

According to American experiments, phosphatic manures alone or in combination with nitrogenous fertilisers gave the best results with cotton. Nitrogen and potash separately were of little value, but combined with phosphoric acid doubled the yield.

Mr. Edward Brown in his well-known book on Poultry-keeping, says that the true secret of feeding young chickens is to give a little plain food, and often. Amateurs like to give chickens dainty bits, to be constantly feeding them on rich morsels, with the result that they are often killed by kindness. The plainer the diet they get the better, and anything in the shape of forcing is sure to cause harm. Where death does not result at once, the seeds of disease are sown, and sooner or later these seeds are developed, and trouble is the result. Unless chickens are also fed often, they are very apt to suffer and be stunted through hunger, and also to gorge themselves when the food is placed before them, the latter a state of things very likely to induce disease. They should get a warm feed as soon after daylight as possible, and till a month old should have a meal the last thing at night.

Fish guano, which is manufactured from fish offal brought into a very fine mechanical condition, is said to be the cheapest and best form of guanos. Though the values of ammonia in Peruvian and fish guanos are given in the Highland and Agricultural Societies' scale of charges as 15/ and 10/6 per unit respectively, it is there stated that although such are the commercial values, the agricultural values are probably the same. It would thus appear that fish guano is commercially and agriculturally the cheapest guano, and the fact that superior prices paid for Peruvian and Icaboe guanos are to be referred to the antiquity and reputation of the former. The manure is said to have given excellent results when applied to sugarcane, tea, coffee and tobacco, and is suitable for all kinds of crops.

TEA, COFFEE, CINCHONA, COCOA, AND CARDAMOM SALES.

No. 15.]

COLOMBO, JUNE 10, 1891.

{ PRICE :—12½ cents each; 3 copies
30 cents; 6 copies ½ rupee.

COLOMBO SALES OF TEA.

Messrs. SOMERVILLE & Co. put up for sale at the Chamber of Commerce Sale-room on the 20th May, the undermentioned lots of Tea (48,464 lb.), which sold as under:—

ROYAL BOTANIC GARDENS.

REPORT OF THE DIRECTOR FOR 1891.

I.—MOVEMENTS OF THE STAFF.

THE Director, by permission of His Excellency the Governor, visited in the early part of the year the Botanic Gardens at Singapore and at Buitenzorg (Java), being absent on that duty from February 27 to April 5. I had long desired to have an opportunity of examining the two principal botanical establishments in Malaya, and especially the great scientific institution kept up by the Government of the Dutch Indies. During this short visit I acquired much new information, and made many useful additions to our collections, as will be seen in this report; and I may add here a few notes as to the character of the two Gardens in general.

There is little to be said about that at Singapore, which is situated close to the town, and has to fulfil somewhat of the part of a public park as well as of a scientific garden. Both aspects are well carried out: there is more ornamental gardening than we are accustomed to see in Ceylon, the turf is well kept, and the flower-beds very neat for a tropical climate, whilst there is a large and valuable collection of rare Malayan plants. The ground for the experimental culture of economic plants is separated by some distance from the Garden itself, which is a very good arrangement. The Director has under him a European Head Gardener and two or three good native assistants; and has also charge of branch gardens, each under a trained English gardener, at Penang and Malacca. The Herbarium and Library are being rapidly extended and improved.

The Dutch botanical establishment at Buitenzorg is of a different character from this or any English one, not even excepting Kew, and is maintained entirely on a scientific basis. The Director has the control of all the six departments into which the institution is divided, as follows:—1, the Herbarium, Library, and Museum; 2, the Botanical Laboratory; 3, the Experimental Garden and Laboratory for Agricultural Chemistry; 4, the Pharmacological Laboratory; 5, the Botanic Gardens; 6, the Photographic Institution. Each of these departments is under the immediate management of a highly trained scientific or technical chief from Holland, and most of these have also an assistant. There is thus a very large staff of Europeans. The Laboratories, Library, &c., are completely stocked, and kept fully up to the time, and everything is provided for close investigation and original research in all branches of botanical study. Many students are thus attracted from Europe, and the Laboratories afford accommodation for a considerable number of workers. A valuable serial publication, the "Annales du Jard. Buitenzorg," is issued at intervals, devoted to scientific botany, and another one, "Teijsmannia," occupied with economic and garden subjects.

The Botanic Gardens themselves at Buitenzorg occupy between 60 and 70 acres, at an elevation of about 800 ft., with a fine soil and abundant water, and are well protected by a high iron railing and a barbed wire fence. Nearly the whole is occupied by a classified arboretum, each Natural Order being isolated by a road or path. The collection is extremely rich, and every species is elaborately labelled with upright labels made of the very hard wood of *Eusideroxylon*, which is never attacked by termites. The whole is now much too crowded, and cannot be said to be of much beauty, but is of course extremely convenient for scientific study. Connected with Buitenzorg is a small Hill-garden at Tijbodas, 4,700 ft., also under a European superintendent, where is also a house for the Director and a laboratory and accommodation for four students.

The Experimental Garden (Cultuur-tuin) is about two miles from the main Garden, and is 200 acres in extent, but is not all at present occupied. It is laid out in square plots, each devoted to one product; large labels at each corner give the name, date of sowing or planting, and other information. Here are very many plants of great interest. Though a large distribution of seeds and plants is made to planters and others, no charge is made for anything.

On the whole, I was filled with surprise and admiration at the completeness of Buitenzorg as a centre for botanical work ; the only weak side seemed to be the Herbarium, which is by no means kept up on a par with the rest of the means of study.

The Head Gardener, Mr. Clark, went on leave to England on February 11, and had not returned at the end of the year.* For the greater part of this time he has been travelling, for the Peruvian Corporation, in the Andes, whence he has sent (through Kew) a few seeds of useful and ornamental plants for cultivation here.

Mr. H. M. Alwis, the Clerk and Foreman at Hakgala Garden, left the Department in July, after a very satisfactory service of nine years, to take charge of the Victoria Park Gardens in Colombo under the Municipality. His place has been filled by the appointment of Mr. M. G. Perera, from the Forest Department, who had previously served under Mr. Nock at Hakgala, and given satisfaction.

2.—PÉRÁDENIYA GARDEN.

Roads and Paths.—The almost constant rain throughout the year has rendered necessary a continuous attention to all the drives and footpaths, so that no extensive repairs have been anywhere undertaken. The road round the Palm Crescent in the South Garden was however partly remade, and a portion of the Central Drive, during the dry time at the commencement of the year.

Buildings.—I regret that my efforts to obtain a suitable dwelling for the Head Gardener have been again unsuccessful, and that he will be compelled to still continue to live in the incommodious old store, the demolition of which I have so often urged. I trust it is deferred only. Some repairs to the roof and flooring of the building have been made by the Public Works Department during the year, which have rendered it a little more suitable for a dwelling-house.

The much-needed repairs and alterations to the Director's bungalow are to be taken in hand in 1892 ; the other buildings that now require attention, after the long wet weather, are the Museum, which needs new pipes and guttering, and the houses occupied by the Garden Arachchi and the Draftsman, which both much require repairs to the roofing, &c.

During the year a small dwelling for the second gate-peon was put up in the Garden, and the plant-collector's new house finished. These have both been erected at the cost of the Gardens ; and I may here remark that it is my practice to effect all small repairs in the same way, the Public Works Department being required only to estimate for the larger works beyond our means.

Improvements.—A balance remaining on the vote granted by Government to supplement the sum given by the British Association for conveying water to the Laboratory (see last year's Report), I asked permission to be allowed to employ it in the formation of a small tank and fountain. This was granted, and the work was carried out in June and July. The tank occupies a little open space under the shadow of the largest trees of *Ficus elastica* ; it is circular, with a diameter of 24 ft., and a continuous stream of water flows through it. Its depth, 2 ft. 3 in., allows the growth of water-plants in sunk pots, which we have hitherto had no opportunity of cultivating. The fountain in the centre is supplied by a small pipe, and can only be played to its full height of 18 or 20 ft. when the water-supply to the rest of the Garden is cut off ; otherwise it rises to only about 6 or 8 ft. This change has much improved the appearance of that part of the Garden affected, formerly a damp patch of rank grass where nothing else would grow.

I have introduced the use of the scythe to Pérádeniya during the year. I observed that in Java and the Straits the Malay and Javanese gardeners mowed fairly well, and I now find that after a little practice several of our Tamil and Sinhalese men can handle the scythe after a fashion, and produce a better result than with the old grass-knives hitherto used in places where the large and small machines cannot be employed.

Cultivation.—Many of the palms in the grove by the entrance having become with age very tall and lanky, some of the commoner ones have been cut out, and specimens of rarer kinds planted to supply their places.

The young palmyra palms (sown in 1889), intended to form an avenue, have greatly suffered from the prolonged wet ; an endeavour to save them has been made by cutting deep drains on either side.

The collection of ferns in pots kept in one of the old plant-sheds has been improved in appearance by widening the brick stages on which they are placed, and so giving more room for their proper development.

Two or three of the fine clumps of Giant bamboo have died during the year without apparent cause. I think that this species is unable to bear excessive and prolonged wet weather.

The male Coco-de-mer palm (*Lodoicea*) again put out a flower-spike, which came into blossom in September, and continues at the end of the year to open a few flowers at a time successively.

* Returned to duty on February 10, 1892.

Among the plants which flowered during the year for the first time may be noted :—*Saraca declinata*, *Leca sanguinea*, *Passiflora Watsoniana*, *Tristillateia australasica*, *Euadenia eminens*, *Eranthemum velutinum*, *Chlorocodon Whitei*, *Pavetta madagascariensis*, *Iponœa Briggsii*, *Asystasia flava*, *Gynura sarmentosa*, *Ruellia affinis*, *Araucaria Cookii*, *Euphorbia heterophylla*, *Lagetta lintearia*, *Carludovica ensiformis*, *Smilax officinalis*, *Xiphidium floribundum*, *Æchmea calyculata*; and of Orchids :—*Galeandra Devoniana*, *Epidendrum aloefolium*, *E. Stamfordianum*, *Calanthe Regnierii* and *C. Sanderiana*, *Vanda teres*, *V. Hookeriana*, *Cœlogyne cristata*, *Dendrobium Lowii*, *D. lituiflorum*, *D. Cassiope*, *Lælia grandis*, *Cattleya eldorado*, *C. Mendelii*, *Bifrenaria atropurpurea* (?), *Arundina densiflora*, *Dendrochilum filiforme*, *Miltonia Weltoni*, *Cycnoches chlorochilum*, *Rodriguezia fragrans*, *R. candida*, *Oncidium splendidum*, *Phalaenopsis Esmeralda*, *Plocoglottis* sp., *Cypripedium Haynaldianum*, *C. Sedenii*.

Labelling.—This has been steadily persevered with, a writer being employed throughout the whole year. Most of his work has been writing labels for the plants in pots (several thousands), orchids, aroids, ferns, &c. Nearly all the wooden tallies formerly used have now been supplanted by neat tin labels, black, with the names in white paint.

Race-course Ground.—The forest of weeds covering this was cleared off and burnt early in the year, but by May it had largely grown up again, and a second clearance had to be made. This nearly exhausted the small sum of money at my disposal, and I was unable to make a much-needed third clearance before the end of the year, though the rains caused a heavy growth to again spring up. I regret that my original request was not complied with and a smaller piece reserved, which could have then had more attention given to it, and be constantly kept in order.

Visitors.—The number of foreign visitors and tourists who entered their names in the book kept at the Lodge during the year was 1,792, a considerably large number than hitherto. Most of our visitors come in the early part of the year, especially in February.

On February 13, H. I. H. the Czarewitch of Russia visited the Gardens in company with his Excellency the Governor, and planted a tree as a memorial of his visit. I selected a ná tree (*Mesua ferrea*), and a spot opposite to the bó tree (*Ficus religiosa*) planted by H. R. H. the Prince of Wales in 1875.

Weather.—A very exceptionally wet year has to be recorded, the rainfall having exceeded our average by nearly 34 in., and fallen on 63 days more than the average number. This remarkable period of wet weather set in on March 7, the season up to that date having been of the ordinary dry character of the north-east monsoon season. From March 7 to 17 it rained continuously, and from that date to the end of the year more or less wet weather has been experienced. From April 15 to June 6 only six days passed without rain, the fall in May being 21·30 in., against an average of 7·67. The south-west monsoon wind set in about May 17 here, and blew vigorously for over three months. From June 12 to July 4 there was but a single rainless day, but after that a period rather drier than usual was experienced—that is, with less rain, though with more rainy days—until early in October, when the rain set in with increased persistence. From October 3 to November 16 only three days passed without rain, and the total fall for October reached the unprecedented figure of 27·73, or about 2½ times the average amount. We had a fortnight of dry weather at the end of November, after which heavy rain again set in and continued till the end of the year.

These facts are shown in the subjoined table, where the averages for the past 7–8 years are also given :—

Rainfall at Pérádeniya.

	1891.			Average.		
	Rainfall.	Rainy Days.		Rainfall.	Rainy Days.	
January ...	2·66	7	...	1·86	4	} 1884–90
February ...	1·57	5	...	1·43	4

Year ...	117·71	212		84·99	149	1884–90

The heaviest fall in any recorded twenty-four hours was 4·85 in. on October 19–20.

3.—HAKGALA GARDEN.

Such improvements as our votes will allow have been effected during the year, and the Garden continues gradually to advance under the assiduous care of the Superintendent, Mr. Nock. I am gratified to know that an increased vote for upkeep is to be granted for the coming year, which will render progress somewhat more rapid.

Another portion of the old drive has been taken in hand and finished off. This was the worst remaining piece, 130 yards in length, very uneven and irregular, and with a gradient in one part of as much as 1 in 9. By altering the curves and adopting a new trace a uniform gradient of 1 in 15 has been obtained, and the banks being cut back and sloped the road has been greatly improved in appearance and utility.

A second propagating pit has been constructed during the year. It forms a sunk span-roofed house, 36 ft. long by 12 ft. wide, the details of which are given below. This is a great aid to garden work and the maintenance of a stock of plants.

I regret to have to report that much less progress has been made by the Public Works Department with the reservoir than might have been expected. The work of excavation was not even commenced till May 8, and it was not till July that the foundations of the walls were laid. Then, at the end of September, it was discovered that the sum voted for the whole work was exhausted, though little more than half of it was done. Work was not commenced again till December 16 (with a supplementary vote), and as little could be done during the wet weather at the close of that month, the end of the year sees us still without any provision against the probable droughts of March and April.

I have made a commencement towards labelling the more prominent trees and other plants on a similar plan to that in use at Pérádeniya, and about 300 brick labels have been painted and put in position. I hope to continue this work during the coming year.

A permanent shelter for carriages and horses, in place of the shabby and dilapidated structure at present used, is one of the most pressing requirements at this Garden.

The following details are extracted from the Superintendent's Report for the year :—

One of the principal pieces of work during the year has been the construction of a span-roofed pit for the propagation and growth of young plants. It is 36 ft. long and 12 ft. wide. From the ridge to the floor it is 7 ft. 6 in. The walls up to 12 in. above surface-level are made of split stones. The uprights for the side lights, which are 18 in. deep, are fitted on to this, and the wall plates on top of this support the roof. Three iron tie-rods, three quarters of an inch in diameter, screwed to the ridge and wall plates, strengthen the roof and keep it in place. Four side lights on each side are made to open with small hand levers to admit air, and three small lights on each side of the roof for top air. The pit is entered by a flight of four steps on each side. These steps are 4 ft. 6 in. wide, the tread 12 in., and the rise of each step 10 in. The path, which is 3 ft. below the surface of the ground, runs along the centre, and is 3 ft. wide. The stages which are made of 2-in. planks are supported by brick pillars, 9 in. square, and are 3 ft. 6 in. wide. This, with the 8-in. margin of wall all round, gives us about 250 superficial feet of stage-room for plants. The roof is glazed with ordinary glass. The stages were put in, the woodwork well painted, and all made ready to receive plants by the end of September. All that remains now to complete it is a small coping for the ridge and guttering round the eaves.

Fernery.—Beyond cutting down the undergrowth for a space of twenty-four yards wide on the upper side, fixing orchids on to the stems of the large trees, and thinning out and pruning the jungle trees, nothing but the ordinary weeding, cleaning, and replanting was done in the fernery. During the high winds in June a tree, which afforded shade to the large clump of *Adiantum cuneatum*, was blown down, and the plants here suffered a good deal from exposure. With the exception of about six weeks during the drought the plants generally here have done well, and continued to be attractive to visitors. A quantity of cowslips and oxlips flowered very well among the ferns in February.

Plant Sheds and Nurseries.—The usual stock of plants, trees, and shrubs has been kept up, both for distribution and for the upkeep of the Garden. I regret, however, to report that, owing to the severe drought at one time and continued heavy falls of rain at other times, several batches of cuttings have failed to strike, and many succulent plants were killed completely.

A large number of the grafts which were worked on to stocks of the common plum in November, 1890, united well, and a considerable quantity of them have been distributed. In consequence of the fine bright weather in November the grafting this year was delayed till December, when 190 scions of various kinds of plums were grafted on to common stocks.

Some of the conifers in the Garden are now beginning to produce good seeds. These have been collected, and a part sown in the nursery, and some have been sold.

There were 1,024 pans of seeds sown and 46,550 seeding plants pricked out or transplanted, 60,050 cuttings of various sorts were put in the nursery or propagating house, and 4,844 plants were potted.

Borders, Shrubberies, &c.—Our manure supply is so limited that we were unable to give so liberal a dressing as the soil required.

39,130 plants of ornamental trees and shrubs and general garden plants and annuals were set out during the year in the borders, beds, and shrubberies.

A new border, 66 ft. long, was formed near the carriage shed and planted with herbaceous plants—ribbon-border fashion. A stone drain of the same length, to carry off the water, and one side to support this border, was made here on the side next the drive. Another new border, 111 ft. long, was made near the large

Cupressus tree at the top corner of the herbaceous garden. Stone edging was laid along the side next the path, and over this was planted *Sedum stoloniferum*, and the border was planted with mixed plants.

Considerable improvement was made round the summer arbour. The floor of this was raised 3 in. and a layer of gravel spread on the surface. In front and around the building the land was made even and turfed. The little shrubbery at the back was overrun with roots of *Acacia decurrens*, which had choked out nearly all other plants, and a number of *Leptospermum scoparioides* plants have now been planted this year, in the hope that they will hold out against the *Acacia* roots, as they are very hardy and usually grow fairly well in poor soil.

Two retaining walls have been built to support the new borders running along the lower side of the portion of drive reconstructed this year. The larger measures 168 ft. long with an average height of 4 ft., and the other is 36 ft. long with an average depth of 2½ ft. A large amount of filling in was required to make these borders. The borders have been planted with a large variety of roses, small shrubs, herbaceous plants, and showy annuals.

In the space of ground between the nursery and the rubbish yard, large holes were got out 20 ft. apart, and prepared for growing specimens of trees and large shrubs. Eighty-two assorted plants were planted out in them.

A large flight of steps made of dressed stones were laid down the long bank below the flower garden. This makes a very convenient and short way to reach the new pits, the anemometer and nurseries, and saves much time. The steps are 23 in number, and 4 ft. wide.

In August the old pond was cleared of growing weeds and of leaves and stalks, and the silt from the two inlets was removed.

Plants of *Cupressus macrocarpa* were planted on the bank near entrance gates at equal distances of 12 ft. apart, and 12 ft. from the edge of the drive. Those planted last year on the opposite side are making good growth.

170 English oak plants and 54 plants of various *Acacias* were set out on the patana near the cooly lines, and 105 plants of several varieties of *Eucalyptus* on either side of the bridle-path leading down to Gorindakela.

New turf verges, measuring 373 running yards, 12 in. wide, were laid down along the sides of the drive and paths, and 220 square yards of turf on banks by new flight of steps, and around the summer arbour.

It is with much regret that I have to report the loss, by fire, of nearly all the young trees of *Junipers*, *Cupressus*, *Frenela*, *Pinus*, &c., which were growing so nicely on the patana above the entrance gates. The fire occurred on April 2 during my absence on a visit to Péradeniya. The fire originated near the public road, and was evidently lighted by some one passing by, but all efforts to find out who did it failed. This loss is most annoying, as the plants were doing well, and some of them were fully 9 ft. high. We had been unable, for want of labour, to do more than clean occasionally round the collar of each plant, and the patana grass had grown so thick between them, that the fire, when once alight, spread rapidly, and it was not discovered until it was too late to put it out.

During the high winds in June a considerable number of trees were blown down and destroyed. The cold damp weather in the following month, assisted by the strong gusts of wind twisting and shaking about soft and tender plants, killed out more plants than is usual for these months.

Flower Garden.—No alteration of any importance was made in the flower garden. The beds and borders were kept supplied with the usual showy garden plants, and were maintained in good order all through the year. I may mention one bed which was very attractive. It was planted with mixed varieties of *Phlox Drummondii* (of Messrs. Sutton & Sons' strain) and edged with *Antennaria margaritacea*. None of the *Phlox* plants grew higher than 9 in., and formed one compact mass of thirteen distinct colours, and they remained in full bloom for several months.

Rose Garden.—A few new varieties were added during the year, and the plants on the whole have done well. There were some very fine blooms out during the month of March. I was able to stage forty varieties at the Nuwara Eliya Show at the end of that month. The plants were all pruned well back in the middle of January, in order to get them to come in for the Show. Experience has proved that from nine to ten weeks is about the time to allow, in this locality, from the time of pruning till they are in full bloom. The treatment the plants received was the same as last year, with the addition that they were supplied liberally with liquid manure after the flower buds began to show. Great difficulty was experienced this year in getting rose cuttings to strike, and two fine batches were complete failures, owing in a great measure to the severe drought.

Herbaceous Garden.—In March, 232 supplies and additions were planted out in the beds. As a quantity of plants had grown too large for the beds, and a considerable number of the weaker and tender sorts were killed out by the drought, it became necessary to re-arrange the whole garden. This was done in November. All the beds were dug up for a depth of 18 in., and roots and rough stones removed. The beds were heavily manured and filled up with old potting soil and decayed matter from the rubbish yard. Fifty-two cart loads of manure and twenty-nine cart loads of the above-named soil, besides a large quantity of burnt earth and ashes, were used in this work. The plants were all replanted in their Natural Orders as before. Many plants of interest flowered during the year. A fine plant of the "tree daisy" flowered profusely, and continued in bloom for many months.

Manure Supply.—Manure is a great necessity in a Garden like this where the soil is naturally poor. The want of a good supply is more and more felt, and without which it is impossible to do justice to the plants. We have received sixty-five cartloads from the coach shed at the foot of the Garden, the coach proprietor kindly allowing us to have all the manure made there, for the use of the shed which was built by the garden coolies. The only other manure we get is what is made by the five bullocks belonging to the Garden and that made by my own cattle and pigs. Considering the importance of this matter, and the fact that there is a large acreage of Government patana land pasturage in the vicinity of the Garden, I would respectfully suggest the advisability of the purchase of, say, at least half a dozen breeding cows. These could be kept at little cost, and with the young ones they would produce would always be worth the money spent on them. The Garden would thus receive an increasing supply of valuable manure. Manure is readily sold here for two rupees per load, and considering the first cost of half a dozen cows would not be more than one hundred and twenty rupees. They would more than pay this off in the first year.

Cattle Disease.—At the beginning of the year foot-and-mouth disease was very bad in this locality. The garden bulls and most of the other cattle here suffered with it. They were dressed with Jey's disinfectant, and all recovered in about ten days. There were no cases this year of the murrain, which was so prevalent in this district last year.

Two of the most promising young bulls in my herd have been killed by a large leopard, one in April and the other in October. The animal had caused great destruction among the cattle in this neighbourhood for some time previously. We have not yet succeeded in trapping the leopard, though he has been seen in and about the Garden several times since.

Lime Kiln.—A permanent lime kiln was built in February on a site near the lime-stone rock, a few hundred yards below the cooly lines. This was built at the expense of the Public Works Department on the understanding that lime be supplied them for the restoration of the reservoir at the price it costs us to burn. This was of course agreed to, and we can now burn lime for the Garden use at any time.

Water Supply.—We have this year again been very short of water, and during the long drought in July, August, and September, a good deal of labour was spent in carrying it, especially for three weeks in September, when from 3,000 to 6,000 gallons were used daily, and the greater part of this had to be carried from the pond in the lower part of the Garden, all the little streams above the Garden having completely dried up.

Visitors.—The number of visitors during the year was 1,519, being an increase of exactly 200 over that of last year. The greatest number in any one month was 206 in December, against 154 in the same month last year. The lowest in any month was 42 in July, against 46 in June the year before.

Weather.—The weather was remarkable for general low temperature, for the severe drought during July, August, and September, and for the heavy rainfall in May, October, and December. In the three last-named months no less a quantity than 64·26 in. of rain fell, considerably more than half the total for the whole year.

The following table shows the monthly rainfall and averages from July, 1883, to the end of 1891, and the number of days on which rain fell during the ten years 1882-91 :—

	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1891 ... { Rainfall ...	8·54	4·20	8·50	6·22	18·53	7·14	3·76	2·70	5·87	22·85	7·46	22·88	118·65

The greatest pressure of the wind registered was 1·620 lb. per square ft. on 4th and 5th of June, this being equal to only 18 miles an hour, against 27·60 miles on 19th June last year. But, as stated in the general remarks, the wind was often strongest during the evenings and nights in June, our windiest month, after the afternoon readings were taken.

The mean daily horizontal movement of the air for the year was 97·31 miles, against 145·41 miles last year, which shows that the movement of the air was very much less this year than last. The windiest month was again June, with a mean daily horizontal movement of 239·74 miles, against 384·37 miles last year. The calmest month was January, with a mean of 31 miles, against 33·51 miles in December the year before.

The barometric pressure and temperature of the air for the year are given in the following table :—

* Of half a year.

† Average of ten years.

‡ Average of eight years, January to June, and nine years July to December.

Barometric Pressure (5,581 ft. elevation).

1891.	Mean.	Range.
January	24-571	187
February	24-567	230
March	24-570	166
April	24-570	168
May	24-511	311
June	24-510	220
July	24-506	202
August	24-519	175
September	24-554	190
October	24-528	252
November	24-550	208
December	24-563	218
The twelve months	24-543	364
Highest reading	24-694 on Feb. 14	
Lowest reading	24-330 on May 21	

Temperature of the Air.

1891.	Mean.	Range.
January	57.5	23.5
February	59.8	21.5
March	62.2	25.7
April	63.8	23.5
May	63.3	17.5
June	61.6	15.2
July	62.1	16.5
August	62.5	20.0
September	63.3	20.0
October	62.2	15.5
November	60.9	18.0
December	60.6	16.5
The twelve months	61.6	31.5
Maximum temperature	73.0 on April 16 and May 5.	
Minimum temperature of air	41.5 on January 14.	

The highest temperature in the sun's rays during the year was 148.8 on March 22, against 149.0 on May 10 last year.

The lowest on grass was 33.8 on March 1, against 36.5 on February 18 of the year before.

The mean amount of cloud was 6.3, against 6.6 last year. The cloudiest months this year were October and December, with a mean of 8.5 each, against April of last year with a mean of 7.5. The brightest month was August, with a mean amount of cloud of 5.0, against February last year with a mean of 6.0.

4.—HENARATGODA GARDEN.

The condition of this branch remains excellent, and the various newly-introduced economic plants are progressing most satisfactorily.

Rainfall returns were kept here during the year for the first time, with the following result :—

Rainfall at Henaratgoda, 1891.

	Fall.	Days.		Fall.	Days.
January	1.93	4	July	4.82	13
February	3.32	7	August	5.43	9
March	8.29	11	September	7.01	21
April	11.19	13	October	22.51	28
May	14.44	19	November	16.91	11
June	14.30	17	December	10.58	19

Total for year, 120.17 in. on 172 days.

Comparing this with Pérádeniya, it is to be noticed that though the fall is slightly (2.46 in.) greater, it fell on much fewer (40 less) days. Even the very much heavier falls in November and June occurred in both months on less days.

This heavy rain did a good deal of damage to the paths, but most have been remade and stamped. Some old Liberian coffee has been removed to allow one path to be widened, and a good many old trees, too much crowded, have been cut out.

The Conductor's little house has been roofed with tiles in place of the old thatch.

It remains a subject for regret to me that this pretty and interesting little Garden has so few visitors. Besides a party of the boys of the Royal College (40 in number), only 34 persons came during the year. Probably the wet weather had something to do with this diminution of the number of the previous year: but it is chiefly the want of a place to stay at during the necessary waiting for the trains that makes a visit to the Garden a matter of discomfort. I have been in communication with the Government Agent as to the desirability of the establishment of a small rest-house somewhere between the Garden and the Railway station, and I believe that he has selected a site, and that a building will be erected very soon.

5.—ANURÁDHAPURA GARDEN.

The season of 1891 has been on the whole a favourable one. This part of Ceylon shared in the generally heavy rainfall, as much as 75.04 falling. On the whole it was well distributed, though there was the usual dry period from June to September, during which four months there was a rainfall of only 1.68 in., August being absolutely rainless. An unusually heavy fall of 19.42 in. occurred in May, and the last three months of the year were very wet, 36.54 in. falling, of which 11.87 were recorded in December.

As a result the trees, shrubs, and other plants in the Garden are looking very well at the end of the year, and much growth is apparent in most of them. The mastic and divi-divi trees are in fruit, and the sandalwood in flower. Teak has done remarkably well: young trees, six years old

from seed, are over 22 ft. high ; and seedling trees of *Eucalyptus alba* are making fine growth. In favourable years like this, it is interesting to find plants succeeding which are not generally adapted for the climate : thus, a cacao this year ripened eleven good pods, the seeds of which have been sown. Breadfruit and pineapples seem to ripen in most years.

In spite of these interesting results, I confess to feeling some disappointment as regards this branch garden. It has now been nine years in existence, and it must be acknowledged that its influence on the inhabitants of the North-Central Province has been very slight. In the little town itself some improvement in the gardens is observable : many now have flowers in the front, and there are beginning to appear a very few cocoanuts, jaks, mangoes, oranges, limes, breadfruits, plantains, and pineapples. These have been obtained from the Garden, but how small is the desire for such things is evidenced by the fact that the average annual sales have been less than Rs. 50. The purchasers, too, are almost always Tamils from Jaffna.

The Arachchi in charge is a very intelligent, industrious, and capable man, but he is discouraged by the little result of his nine years' work and the little support he receives. Our very small vote—deducting his pay, only Rs. 600 per annum—also renders it impossible to carry out even the most trifling improvements, the whole being required to pay a few coolies, whose main work is watering ; yet I scarcely feel justified in asking for a larger sum for the support of a Garden in which no one of those intended to be benefited by it appears to take the slightest interest.

We have usually had the use of a small provincial vote for "Botanic Gardens" annually placed in the hands of the Government Agent, and this has enabled me to send up cartloads of plants from Pérádeniya ; but the vote this year has not been available for us, being otherwise employed.

I hope to be able to properly roof the Conductor's bungalow, and to build brick or stone supports for the plant-house during the coming year.

6.—BADULLA GARDEN.

Our little vote just suffices to keep up routine work here, and does not allow of much progress by any additional undertakings. The principal improvement during the year has been the levelling of the main driving road, which formerly ran over a hill now cut through. The flowerbeds on either side now appear raised above the road, but this has by no means a bad effect.

The young trees and shrubs have made much progress, this being largely due to a good supply of manure regularly obtained from the town till the end of July. Some new arrangement for its disposal having been then made, we have lost this benefit for the remainder of the year ; but it is hoped that the deprivation will be only temporary. Many trees have made striking growth here, especially conifers ; a durian is 16 ft. high, and the rambutans have flowered. Brick pillars in place of wooden ones have been set up in the plant-shed, but I have not been able to finish this house or to build new cooly lines as I hoped to do.

Nor has as yet anything been done to give a better cottage to the Conductor. This is urgently needed, and I trust will be effected during the coming year.

As usual the Garden suffered somewhat from drought in the very dry weather of August and September ; but the year generally was, here as elsewhere, a wet one. In all 142·48 in. of rain fell, of which no less than 87·74 fell during the last quarter of the year, October having the extraordinary record of 41·67 in.

7.—INTERCHANGE OF PLANTS AND SEEDS.

Our mutual relations with other Botanical establishments are shown by the following lists :—

Plants.—Wardian cases and boxes of living plants were received from the following : Kew (2), Calcutta (2), Singapore (3), Buitenzorg (2), Natal (1), Trinidad (2), and from Messrs. Sander (2), Messrs. Bull (1), and Messrs. Veitch (1).

Cases and boxes in exchange were sent to the following :—Kew (3), Cambridge (1), Calcutta (2), Singapore (1), Hongkong (1), Buitenzorg (1), Brisbane (1), and to Messrs. Sander (4), Messrs. Bull (1), and Messrs. Veitch (1).

Seeds.—Packets of seeds have been received from the Botanic Gardens at Kew, Edinburgh, Dublin, St. Petersburg, Paris, Calcutta, Saharunpore, Madras, Hongkong, Singapore, Buitenzorg, Natal, Mauritius, Jamaica, Trinidad, British Guiana ; also from Baron F. von Mueller, Melbourne ; J. S. Gamble, Dehra Dun ; W. Bull, London ; J. H. Maiden, Sydney ; and L. Yates, California.

In exchange, seeds have been sent to Kew, Cambridge, St. Petersburg, Calcutta, Saharunpore, Madras, Singapore, Penang, Hongkong, Natal, Buitenzorg, Mauritius, Brisbane, Jamaica, Grenada, Trinidad, and British Guiana ; to the Agri-Horticultural Society at Calcutta, to Baron von Mueller, and to Messrs. Bull and Veitch.

My thanks are also due to the following residents in the Colony to whom the Department is indebted for plants, cuttings, or seeds, by gift or in exchange :—Lady Havelock, Mrs. Baker, Mrs.

Ballardie, Mrs. Grinlinton, Miss McLaren, and Miss Layard, and Messrs. C. H. Bagot, F. Bayley, D. F. Browne, N. G. Campbell, J. Cotton, G. de Saram, J. Ferguson, E. Hamlin, T. C. Huxley, A. J. Kellow, R. M. Knight, A. C. Lawrie, G. E. Miller, E. Mortimer, J. Regan, H. B. Roberts, J. H. Starey, F. H. Stephens, E. J. Thwaites, R. Wardrop, J. Wickwar, E. P. Willisford, and J. P. William Bros.

We have, as usual, distributed from the Gardens, free of charge, large quantities of plants and seeds to public departments, places, and persons throughout the Colony, viz.:—The Queen's House at Colombo, the Pavilion at Kandy, and Queen's Cottage at Nuwara Eliya; the Municipalities of Colombo and Kandy; the Government Agents of Batticaloa and Ratnapura; the Assistant Agents of Mátalé and Kégalla; the Director of Public Works and the Public Works Officers at Kandy, Batticaloa, Jaffna, Trincomalee, Katugastota, Mihintalé, Haldummulla, Dikoya, and Haputalé; the Principal Civil Medical Officer, Colombo, and the Hospital and Dispensaries at Kandy, Nuwara Eliya, Hanguranketa, Kalmunai, and Maturata; the Assistant Conservators of Forests at Ratnapura and Kurunégala; the Postmaster, Maskeliya; the Railway Stations at Nánu-oya, Gampola, Mátalé, Veyangoda, Henaratgoda, Hunupitiya, and Katukurunda; the "Happy Valley" Mission, Haputalé; the Agricultural Instructor, Nildandahinna; and the Churchyards at Nuwara Eliya and Wattagama. I have, under the head of Receipts, given a statement of the estimated value (at our ordinary rates) of these gratuitously distributed plants, &c., which ought to be taken into consideration in estimating the amount of saleable produce sent out from the Gardens.

8.—ADDITIONS TO THE COLLECTIONS.

As is seen by the following lists, my visit further East resulted in the acquisition of several interesting plants, which have been for too long *desiderata* in Ceylon. Some of these I brought back here with me, and others have been since received.

For the large additions to our collection of orchids we are again mainly indebted to Messrs. Sander, of St. Albans.

The sum at my disposal for the purchase of plants has been expended on a large collection of plants (including many roses) from Messrs. Cannell; a large collection of seeds from Messrs. Haage and Schmidt, of Erfurt; and a further selection of plants and seeds from Japan from Mr. Boehmer, of Yokohama. Most of these purchases were for Hakgala Garden. (In the following list for that Garden the large collection of temperate ferns was purchased from Messrs. Veitch in 1890, but the consignment sent in that year having nearly all died *en route*, Messrs. Veitch kindly sent a duplicate series during the past year.)

[Then follows the list of plants acquired.]

9.—NOTES ON ECONOMIC PLANTS.

Tea.—An enormous increase of more than 21½ million lb. over last year's export—much exceeding all expectations—has been witnessed during 1891, the total export being no less than 68,274,420 lb. This greatly increased yield has doubtless been largely due to the continuous rainfall of the year. It cannot be regarded as altogether an unmixed benefit, as there seems to be no doubt that the quality has often suffered from the great difficulty experienced in properly withering the leaf. Prices ranged considerably lower than in 1890 for the greater part of the year, the average for the whole being estimated at a little less than 10*d.* per lb.

The hitherto extraordinarily rapid progress of the exports from Ceylon may now be expected to be considerably less marked; we have also now reached the point when an extension of existing markets has become essential to the industry. It is satisfactory to note that the Australian ports took 3,210,598 lb. during the year, an increase of nearly three-quarter million lb.: and that to German and Austrian ports a direct export of 237,299 lb. has taken place, showing a commencing taste for Ceylon tea on the European continent. It is noted that in England for the first time the year showed a larger consumption of Ceylon than of China tea, the figures being roughly 51 against 49 million lb.

As a whole, the condition of the plantations remains excellent. In a few places, where planting was done on shallow soil in worn-out coffee estates, the bushes have shown a tendency to die back when the roots have reached an impervious bed of rock; but considering the rapidity with which whole districts were planted up with this product, it is rather a subject for astonishment that so generally high a standard of healthy trees has resulted. I regret to notice that *Helopeltis* has been doing a little damage in some low-country estates, but nowhere has this pest assumed any serious proportions.

Coffee.—There is no change to report in the position of this cultivation in Ceylon. The export, 82,324 cwt., is much the same as in 1890, and the crop, so far as estate coffee is concerned, is mostly derived from the east of the Island.

I am however, since my visit to Java, more than ever of opinion that the cultivation of Liberian coffee in Ceylon was too hastily abandoned, and would be still a profitable one.

Cinchona.—A great drop of over 3 million lb. in our exports for 1891—to 5,679,339 lb.—shows how rapidly our trees are now being used up. Our poor barks are, however, now scarcely worth harvesting. The history of cinchona culture in Ceylon—a most interesting and instructive one—is drawing to its close ; the future of the industry belongs to Java, which has followed wiser counsels and has known how to wait.

Cacao.—It is gratifying to see a substantial increase in our export of this product, the amount for 1891 (20,532 cwt.) being considerably the largest yet recorded. Prices, too, have continued very high for Ceylon cacao, which now occupies a commanding position in the home market.

Many inquiries have been addressed to me by persons interested in the West Indies as to the causes of the much higher prices reached by the Ceylon product. So far as I am able to judge, I believe it to be almost wholly due to the greater care and skill employed in the processes of manufacture, and especially to the copious washing and thorough drying of the beans. I do not think it possible to attribute it to any general superiority in the cacao here grown, for, as remarked in my last report, it holds good both as to the “ Old Red ” and “ Forastero ” varieties, though no doubt it is the fact that it is the former sort alone which exhibits the peculiar light colour of the interior so appreciated by the chocolate maker.

The distribution of seed to villagers has been continued, and about 1,000 pods have been sent from Pérádeniya, and nearly the same number from Henaratgoda, to the Government Agents of Ratnapura, Kégalla, and Mátalé, for direct distribution. I followed up the remarks made on this subject in my last report by an inquiry into two applications received through the Government Agent of the Central Province, and found, as I had suspected, that the persons who were asking for seed *gratis* were not of a class who had any right to be so supplied, or indeed likely to be cultivators at all ; and I of course refused to entertain the applications. In Sabaragamuwa, on the contrary, the distribution has been carried out in a proper manner, and its results are beginning to appear. At the Agri-Horticultural Show held at Kégalla in August, there were no less than eighteen exhibits of cacao.

India-Rubber Trees.—Para Rubber. I was able to supply the Forest Department with 20,000 seeds and 2,000 stumps for the plantations near Nambapána, in Sabaragamuwa, alluded to in my last report ; and it is hoped there will be at least as large a quantity of seed to spare in 1892. A case of 40 stumps was also sent to British North Borneo, and 500 seeds to the German East African Company. Our largest tree, now sixteen years old, girths 6 ft. 1 in. at a yard from the ground.

Panama Rubber (*Castilloa elastica*). The Conductor of Henaratgoda Gardens prepared a sample of rubber from this for the Colombo Exhibition. It was obtained by making small V-shaped incisions in the bark (after carefully washing it) and allowing the milk to trickle down on the tree and into cocoonut shells and to dry *in situ*, afterwards pulling it off and finally finishing the drying by exposure to the sun. The sample appears to be of first-rate quality, very clean and solid, and is very dark, almost black in colour. Our best tree of this is only 3 ft. 7 in. in circumference.

Gambier (Uncaria Gambier).—The five plants at Henaratgoda are very healthy and have grown rapidly. Two flowered freely in April, and produced a few seed-pods. There will apparently be no difficulty in propagating this plant in the Colony.

I took the opportunity whilst at Singapore of witnessing the manufacture of this curious product, and though it has more than once been partially described,* I think the precise mode of procedure as I saw it is worth recording. Accompanied by Mr. Ridley, the Director of the Botanic Gardens, I visited on 11th March a Chinese plantation at Chung-chu-kong, a few miles out of Singapore, where the cultivation and manufacture is carried on. The whole industry is in the hands of the Chinese, who grow the plant—it can scarcely be said to be cultivated—on the exposed slopes amid a tangled mass of weeds, lantana, and alang-grass ; the last is occasionally cut away, but no other help is given. The bushes on this plantation were five years old, and the plant lives from thirteen to fifteen years, flowering all the year round. The manufacture is carried on only when the pepper, a more valuable product, is not ready for picking. Only one sort is grown in Singapore, and whether the *U. acida*, said to afford Gambier in Penang, is really different, is very doubtful. *U. Gambier* does not seem to be known in a wild state, but Mr. Ridley tells me that the wild *U. ovalifolia* is very close, and may possibly be the same.

The Gambier plant forms a straggling semi-scandent shrub with long arching branches, and the crop consists of the short leafy twigs which branch off from them laterally. These are rapidly stripped off by hand and carried in baskets to a low thatched shed. Here are fixed large circular iron vats filled with water, which is kept in complete ebullition by large fires beneath ; a constant supply of brushwood or other fuel is thus necessary for this industry. The leaves and twigs are immersed in the boiling water, and constantly stirred about and bruised for six hours by two men armed with long-handled five-pronged forks made of the very hard “ Tampines ” wood (*Sloetia*

* There is a good account in Begbie's “ Malayan Peninsula, 1834.”

Sideroxylon). This is very tiring work. The flaccid masses are then taken out and placed on a sloping wooden trough and allowed to drain into the vat so as to obtain all the extract possible.

The boiling ley is next poured into shallow wooden tubs to cool. It is now of a yellowish olive-green colour, with the consistence and appearance of thin pea-soup. When quite cool it still remains fluid, and the process of solidification is effected in the following curious manner. The operator thrusts into each of two of the wooden buckets placed before him a short, thick, smooth cylinder made of the very soft wood of "Mahang" (*Macaranga hypoleuca*), and then proceeds to agitate the mass by rubbing his fingers up and down on the surface of the cylinders. During this process the fluid gradually becomes thicker, and some solid matter coagulates on the fingers, but is wiped off. The process is continued for about a quarter of an hour, when the whole mass rather suddenly becomes somewhat contracted and of a paler colour. A few minutes after the whole "sets" into a mass of the consistence of soapy cheese, the effect probably of the crystallisation of the catechuic acid of which it chiefly consists. The whole art of the manufacture is said to lie in knowing precisely when to cease the agitation: if not done sufficiently, or if carried on too long, it is said that solidification will not occur. Nothing whatever was added to the fluid at any time so far as I could observe. After a few hours the mass can be turned out as from a mould, and is cut into small cubes and finally dried in the shade; but these final processes I did not see.

Cubeb.—As one result of my expedition to Buitenzorg, I have at last succeeded in obtaining the true *Piper Cubeba*, which for so many years I have been vainly trying to get. Thirty-one rooted cuttings were obtained from the Java Garden, and 20 reached Ceylon in apparently good health. Most of these have however since died, and at the end of the year only 8 were living. I have, however, little doubt that these will succeed at Henaratgoda, if not at Pérádeniya.

At Buitenzorg I found the plant grown on white cotton trees (*Eriodendron*) closely planted; they were fruiting freely. The difference in the form of the upper and lower leaves on the same plant was striking; they would never be supposed to belong to the same species. I am not however, sure that there are not two plants cultivated together as *P. Cubeba* at Buitenzorg.*

I had no opportunity of seeing the cultivation of this product on a commercial scale, and it does not seem to be carried on in W. Java. The plant, however, is apparently a wild one there, to judge from the labels of plants I examined in the Buitenzorg herbarium. All the specimens of the true plant have the leaves (however much differing in form according to age) thick, with an unequal base, alike on both surfaces, and drying of a pale colour with a pinkish tinge; the younger ones are more veiny beneath. I may refer to my reports for 1887, 1888, and 1889 for further remarks on this pepper.

Cola-nut.—A small plantation of 36 seedlings, raised from Jamaica seed, was made at Pérádeniya in April; a smaller one was also made at Henaratgoda. We have not as yet found this tree to do well with us, and it is equally unsatisfactory in Java. Our trees at Henaratgoda, eight years old, have as yet made no attempt to flower.

Calumba Root (Jateorhiza Calumba).—This valuable tonic medicine is known as "Columbo" in the trade, and was formerly supposed to be obtained from Ceylon. Its name is, however, derived from the word "Kalumb," which is its appellation in E. Trop. Africa, of which country it is a native, and whence all supplies are obtained. I have been for some time desirous to add this to our rich collection of medicinal plants, but have never been able to obtain it from any of the Gardens with which we have relations, though it is reported to be growing in more than one of them. So long back as 1866 or 1867 we received a plant from Mauritius, and I find a record here to the effect that it lived for a few years only. With much surprise, therefore, this year I have discovered a plant of it in Pérádeniya. The great tuberous root is sending up a vigorous stem, and unless this be the plant above referred to, which has lain dormant for so many years, I am at a loss to know how it came here.

Erythroxylon Coca.—The plant cultivated at Buitenzorg (originally obtained in 1876 from Linden, the Nurseryman of Ghent) has been distinguished by Dr. Burck from that usually cultivated (which he names *E. bolivianum*) as var. *Spruceanum*. He states that it affords four times as much alkaloid as the common kind; but there seems to be some doubt as to this. I examined the Buitenzorg plant, and find it identical with plants familiar to me in Pérádeniya, where I have been accustomed to call it the "small-leaved form." We may have probably obtained it from Buitenzorg in one of our frequent exchanges. The flowers are quite white (not yellow), and the leaves very like those of var. *granatense* of Morris, but not so pale and less rounded at the ends.

* I saw nothing at Buitenzorg quite corresponding with the plant we received as Cubeb from Soerabaya in 1889 (see my report for that year) though some specimens approached it nearly. I suspect that this will prove to be *Piper (Cubeba) sumatranum* (figured in Miquel's Comm. Phyt. t. 5) which is perhaps really a variety of *P. Cubeba*. But till it flowers and fruits this must remain doubtful.

Chinese Ginger.—In my last report I ventured to express a doubt as to the correctness of the roots sent from Kew under this name, which proved to be *Alpinia Galanga*; and my remarks have received confirmation from the observations of Mr. Ford of the Hongkong Botanic Gardens. In his report for 1890 he states that he saw cultivated extensively in the rich alluvial delta south of Canton (whence the “preserved ginger” of commerce is chiefly derived) the ordinary true ginger (*Zingiber officinale*), and believes this to be after all the source of the product. He points out that the confusion may have arisen from both the plants coming under the same general name of “Keung” in Chinese.*

Fruit Trees at Hakgala.—Mr. Nock reports:—

A good many of the European fruit trees started into growth in May, but none have made satisfactory progress. The Morella cherries flowered well and produced some fruit. The raspberries, too, bore some fruit, but they tiller out so much in their growth that I am afraid they can never be profitably cultivated here. Some very fine fruit was produced on the blackberry plants, raised from English seeds—one panicle bearing 72 berries. The American sorts have made remarkably good growth, and are now sparsely showing flower buds. I have hopes that they will fruit next year. Three varieties of plums received from Japan in February have grown very well indeed, and at the end of the year showed numbers of fruit buds. I have every reason to believe that these varieties will suit this locality.

Ullucus.—On this vegetable Mr. Nock further remarks:—

The crop of *Ullucus* which was taken up in February weighed 16 pounds. This was the produce of a bed 46 ft. long and 4 ft. wide. Another small patch was taken up in March, which gave 21 lb. more. These were the produce of 2½ lb. weight of tubers planted. The 25 largest weighed 2 lb. We have had very few applicants for tubers of this plant, and unless some one should take up its cultivation for feeding pigs and require a stock of it, I see no reason to continue its propagation here. The natives, though they like the tubers very much, have not taken to growing it, and its flavour is scarcely such as to lead to its cultivation by Europeans as a table vegetable.

Palmyra Fibre.—The sheathing leaf-stalks of the palmyra, as of many other palms, contains a stiff thick fibre, and a new industry in the collection of this has sprung up, under the auspices of a Colombo firm, in the north of the Island. These fibres or bristles are much like the “Piassaba,” so largely exported from Brazil (the produce of the palms *Attalea funifera* and *Leopoldinia Piassaba*) for brush-making, and are doubtless exported hence for the same purpose. Immense numbers of the palmyra exist in the Jaffna peninsula and the islands near, and it is in the latter especially that the business of collecting the leaf-stalks for sale has been carried on by the inhabitants. In Elavaitivu the value thus collected in six months was about Rs. 3,000, a great addition to the means of the people. Unfortunately, in their eagerness for this easy method of money-getting, they have treated the trees so badly that it is reported that in that island alone 1,000 young palmyras have been destroyed. As this palm is the principal permanent source of food in the country, and is besides of immense utility for timber, fences, &c., it became obviously necessary to put a stop to this reckless destruction, and I understand that steps have been taken to regulate the fibre industry, which, properly conducted, should become a valuable addition to the means of living for the inhabitants.

Mahogany Trees.—In my report for 1888 (page 7) I recorded the receipt from the Calcutta Botanic Gardens of the seed of *Swietenia macrophylla*, a new kind of mahogany. Young trees from this seed are now very flourishing at Pérádeniya, Anurádhapura, and Henaratgoda, those at Pérádeniya being about 13 ft. high. This shows a much more rapid growth than the old kind, *S. Mahogani*; experience in Java is the same, and I saw at Buitenzorg trees sown in December, 1888, which were 12 ft. high.

I obtained more seed of this promising tree from Calcutta this year, and have sent 160 of the resulting seedlings to the Forest Department to form a small plantation in the North-Western Province.

The Calcutta Gardens originally received the seed in 1872 as mahogany seed, said to be from Honduras, through the India Office; and Dr. King, on its flowering, named and described it in Hooker’s “*Icones Plant.*” for November, 1886 (t. 500). Its great advantage over ordinary mahogany is that it seeds freely in the East, whilst the latter very rarely does so.

I had occasion to fell a large tree of ordinary mahogany in Pérádeniya during the year, and found it very sound and free from all defects. The trunk measured, at 6 ft. from ground, 9 ft. 1 in. in girth; another tree growing in the Garden is 11 ft. 2 in. in circumference at the same level; both these trees are, I believe, just fifty years old from seed.†

* Since writing the above I have received the Kew “Bulletin” for January, 1892, in which it is now acknowledged that “in some way a mistake was made in the selection of the plant” in China, and that “it is probable that none of the preserved ginger is derived from” *Alpinia Galanga*.

† These measurements may be compared with those of trees at Jaffna given at p. 8 of the Report for 1890 of the Conservator of Forests.

10.—HERBARIUM AND LIBRARY.

Ceylon Herbarium.—All the additions up to the end of 1890 have been mounted and intercalated in their places. Four new cabinets were set up, and the whole of the additional duplicate specimens, accumulated during the last few years, have been named and sorted away into their places. The Ceylon duplicates are now all properly named and arranged, and occupy 14 cabinets.

Owing to Mr. Clark's absence on leave, my own visit to Java, and the prolonged wet weather, I have made no extended tour in Ceylon for collecting during 1891. The Garden collectors have, however, been out as usual.

The herbarium of Ceylon plants formed by the late W. Ferguson, F.L.S., which he bequeathed to the Ceylon Medical College, was during the year transferred to my Department. I have been carefully through the whole, and regret to have to say that owing to the ravages of damp and insects nearly the whole of the specimens were perfectly useless and had to be destroyed. This is less to be regretted, as Mr. Ferguson had been careful to supply the Garden herbarium with duplicates of all plants of interest which he collected.

The whole of the specimens and drawings of Ceylon *Anonaceæ* have been lent to Dr. G. King, F.R.S., of Calcutta, to assist him in preparing his monograph on this Family for the "Annals" of the Calcutta Gardens.

Dr. G. Radde, the well-known traveller in the Caucasus and Director of the Tiflis Museum, accompanied the Czarevitch of Russia to Ceylon, and made a botanical expedition in the Hambantota District. He formed there a considerable collection of plants, which I had the pleasure of naming for him.

General Herbarium.—A very large collection of plants sent in exchange (I believe in 1878) from the Imperial Museum at St. Petersburg, which had remained ever since tied up in bundles, has been taken in hand, and all have been sorted away into the General Herbarium. It proved a valuable addition, consisting of numerous specimens from the following collectors:—Skofitz, Armenia and Persia; Karelin, Turcomania; Radde, Baikal; Schrenk, Songaria; Maximowicz, Japan; Riedel and Langsdorff, Brazil; and F. von Mueller, Australia.

From Dr. King, F.R.S., we have received from the Herbarium of the Calcutta Gardens about 300 named and mounted specimens illustrating his memoirs on *Myristica*, the flora of the Malay Peninsula, &c.

The draughtsman made 31 finished drawings of Ceylon plants and 29 of garden plants during the year.

Library.—The Garden Library has received the following books and pamphlets during the year either by gift or by purchase, and my thanks are due to the various donors:—

- Pfeiffer, Nomenclator Botanicus, 2 vols. (in 4). 1873-4.
 De Candolle, A. P., Mémoire sur Anonacées. 1832.
 De Candolle, A., Monographiæ Phanerogamarum, vol. VII. 1891.
 Hegelmaier, Die Lemnaceen. 1868.
 La Billardiere. Nouveau Genre de Palmier. 1869.
 Palisot de Beauvois, Essai d'une Nouv. Agrostographie, 2 vols. 1812.
 Seemann, Revision of Hederaceæ. 1868.
 Teijsmann, Lodoicea Seychellarum. 1868.
 Veitch, Manual of Orchidaceous Plants, Pt. 7. 1891.
 Hooker, J. D., Flora of Brit. India, Pt. 17. 1890. (*Presented by India Office.*)
 King, Two new Ilex from E. Himalaya 1886. (*Presented by Author.*)
 Id., Three new Himalayan Primula. 1886. (*Presented by Author.*)
 Blume, Flora Javæ, Orchideæ. 1858.
 Boerlage, Handleiding d. Flora v. Nederlansh Indie, vol. I. 1890. (*Presented by Dr. Treub.*)
 King, Materials for Flora of Malay Peninsula, pts. 1-3. 1889-91. (*Presented by Author.*)
 Vander Sande-Lacoste, Synopsis Hepatic. Javan. 1856.
 Elliot, Farinaceous Grains of S. India. 1862.
 Greshoff, Onderzoek n. d. Plantenstoffen v. Ned. Indie, pt. 1. 1890. (*Presented by Author.*)
 Watt, Dictionary of Economic Products of India, vols. IV. & V. 1890. 1891. (*Presented by Government of India.*)
 Ferguson, The Palmyrah Palm. (*Reprint.*) 1888.
 Annales du Jard. Bot. de Buitenzorg, vol. IX., pt. 2; vol. X. pt. 1. 1891. (*Presented by Dr. Treub.*)
 Hooker's Icones Plantarum, vol. X., pts. 3 & 4., vol. XI., pts. 1-3. 1891. (*Presented by Bentham Trustees.*)
 Bailey, Catalogue of Plants in Botanic Gardens, Brisbane. 1885. (*Presented by Author.*)
 The Missouri Botanic Gardens, Report for 1890. (*Presented.*)
 Woodrow, Gardening for India. 1889.
 Commelinus, Plantæ Rariores Exoticæ. 1706.
 Murray, Avifauna of Ceylon. 1891. (*Presented by Ceylon Government.*)

As in previous years, we have added the annual volume of the following periodical publications to our series of each :—

Botanical Magazine.	Journal of Botany. (<i>Presented.</i>)
Gardeners' Chronicle. (<i>Presented.</i>)	Kew Bulletin. (<i>Presented.</i>)
Chemist and Druggist. (<i>Presented.</i>)	Nature.
Illustration Horticole. (<i>Presented.</i>)	Pharmaceutical Journal. (<i>Presented.</i>)
Indian Forester.	Tropical Agriculturist.

Acknowledgment has also to be made of the receipt of numerous Reports, Bulletins, &c., from various Colonial and Indian Botanic Gardens and other public departments.

11.—MUSEUM AND LABORATORY.

Museum.—The purchase of three more wall-cases, six table cases, and twenty-five dozen more stoppered glass jars has enabled me to exhibit a fair collection of the vegetable products of the Colony in one of the rooms. Many valuable specimens have been obtained from the fine series sent from the Northern Province and the Province of Uva to the exhibition held at Colombo in December. When completely arranged the four rooms of the Museum will be thus occupied: rooms 1 and 2, native timbers and wood specimens; room 3, native foods, drugs, and other raw and manufactured products; room 4, foreign products and botanical specimens too bulky to go into the Herbarium.

Laboratory.—Mr. J. B. Farmer, M.A., Fellow of Magdalen College, Oxford, spent nearly six months here, during most of which period he was engaged on researches on the Ceylon *Hepaticæ*. He left on July 8. No student has availed himself of the Laboratory for the present season.

12.—RECEIPTS FROM SALES.

The sales at Pérádeniya were somewhat higher than usual, but the total amount remains pretty steady year by year. As many as sixteen Wardian cases and twenty-nine boxes of orchids were sold to the public during 1891, mostly for export :—

			Sales.		Number of
			Rs.	c.	Purchasers.
Pérádeniya	2,210	6	368
Hakgala	593	61	100
Henaratgođa	163	72	31
Anurádhapura	71	92	46
Badulla	50	60	25
Total	3,089	91	570

In estimating the actual distribution of seeds and plants from the Gardens, there should be added to this the value of those supplied *gratis* to the Government officers, &c., enumerated on page 8. These have been for the year 1891 :—

	Rs.	c.
From Pérádeniya (about 2,000 plants, and very large quantities of seeds) value	700	76
From Hakgala (over 8,000 plants, 500 cuttings, and 16 packets of seeds) value	1,030	0
Total	1,730	76

In all Rs. 4,810·67.

13.—EXPENDITURE.

The whole actual cost of this Department for 1891 has been as follows :—

	Rs.	c.	Rs.	c.	Rs.	c.
Salaries and Personal Allowances	—	—	20,188	58		
Gardeners' and Labourers' wages :—						
Pérádeniya	...	8,330	0			
Hakgala	...	3,499	98			
Henaratgođa	...	2,199	99			
Anurádhapura	...	1,200	0			
Badulla	...	1,500	0			
			16,729	97		
Stationery	...				98	37
Postage and telegrams...	...				100	0
Pots, tools, books, freight, &c.	...	3,499	6			
Purchases of plants and seeds	...	443	63			
Museum	...	497	65			
Upkeep of racecourse ground	...	119	76			
Travelling and collecting	...	1,848	41			
					6,606	88
Total	...				43,525	43

Pérádeniya, February 23, 1892.

HENRY TRIMEN, F.R.S.,
Director.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

June 26th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	41,782 packages.	70,309 packages.	6,905 packages.
1891-1892.	25,469 "	79,545 "	6,506 "

During the week

8,093 packages	INDIAN
18,815 "	CEYLON
2,103 "	JAVA

Total 29,011 packages have been offered in public auction.

For the time of year the market continues steady and bidding generally is animated, although we are approaching so closely the end of the present month, when dealers frequently endeavour to carry a minimum of stock.

The first cargo of new season tea from China is expected to reach London this day week; but very little interest centres on New Season's China Tea when compared with the excitement of a few years back. Now that barely 30% of China Tea is taken for home consumption it is natural that Indian and Ceylon Tea absorb the greatest share of the attention of the trade, and that even the quality of the new China crop should excite comparatively little interest.

INDIAN. Auctions have been slightly heavier and comprised a fair number of New Season's Teas. The quality of these still continues about as previously noticed. The market shows little alteration, and bidding has been fairly brisk up to last week's rates. The following averages are worthy of note:—"Mim T Co.," 1/1 $\frac{3}{4}$; "Jetookiah," "Jetookiah, M.," and "Singtom," 11 $\frac{1}{4}$ d.

Average price of New Season's Teas sold on Garden Account. Total 1261 pkgs. average 10 $\frac{1}{2}$ d.

ASSAM	PKGS.	PRICE.	CHOTA NAGPORE ..	PKGS.	PRICE.	KANGRA VALLEY ..	PKGS.	PRICE.
CACHAR AND SYLHET..	434 p	10d	DARJEELING & TERAI	617 p	11d	NEILGHERRY ..		
CHITTAGONG	107 p	7 $\frac{3}{4}$ d	DOOARS	103 c	10 $\frac{1}{4}$ d	TRAVANCORE ..		

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST. (Fair ordinary, dark liquor)	1891,	6d.	1890,	6 $\frac{1}{4}$ d.	1889,	4 $\frac{1}{4}$ d.	1888,	4 $\frac{1}{2}$ d.
FANNINGS. (Red to brown, strong rough liquor)	"	7d.	"	6 $\frac{3}{4}$ d.	"	4 $\frac{1}{2}$ d.	"	5 $\frac{1}{4}$ d.
BROKEN TEA. (Brownish to blackish, strong liquor)	"	8 $\frac{1}{4}$ d.	"	8d.	"	5 $\frac{1}{4}$ d.	"	7d.
PEK. SOUG. (Blackish greyish, useful liquor)	"	8 $\frac{3}{4}$ d.	"	9d.	"	8d.	"	9d.
PEKOE. (Greyish to blackish some tip, useful liquor)	"	10 $\frac{1}{4}$ d.	"	10 $\frac{1}{2}$ d.	"	9d.	"	9 $\frac{3}{4}$ d.
PEK. SOUG. (Blackish greyish, inferior liquor)	"	7 $\frac{3}{4}$ d.	"	8 $\frac{1}{4}$ d.	"	5 $\frac{3}{4}$ d.	"	7 $\frac{1}{2}$ d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	"	8 $\frac{3}{4}$ d.	"	9 $\frac{1}{4}$ d.	"	6 $\frac{1}{2}$ d.	"	8 $\frac{1}{2}$ d.

CEYLON. With rather lighter auctions, competition became animated in Tuesday's sale; all grades, except the very commonest kinds, sold well. Pekoe Souchongs were firm, Medium Broken slightly dearer, and the few Teas where distinctive flavour could be noticed, again showed an advance. Thursday's auction passed at Tuesday's rates with good competition. Speaking generally, the quality continues poor, liquors in many instances being very weak, and dry leaf brownish, ragged and uneven. The following averages may be mentioned:—"Ouvahkellie," 1/2 $\frac{3}{4}$; "Frotoft," 1/2 $\frac{1}{2}$; "Mooloya" and "Portswood," 1/0 $\frac{1}{4}$.

Average for week, 9 $\frac{1}{4}$ d.

AVAS were offered in considerable quantity and sold chiefly at firm prices. The lowest grades attracted least attention but sold without material change, while better descriptions, especially Pekoes, were keenly competed for, principally for export markets. An invoice from the "Bagelen" estate, comprising 1,165 packages, realised an average of 7 $\frac{1}{2}$ d.

Average for week, 7 $\frac{3}{4}$ d.

MOVEMENTS OF TEA IN LONDON (in lbs.) FROM 1st JUNE, 1890, TO 31st MAY, 1891.

	IMPORTS.			DELIVERIES.			STOCK

In these tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

July 3rd, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	46,894 packages.	78,693 packages.	6,905 packages.
1891-1892.	31,000 "	89,541 "	9,433 "

During the week

8,093 packages	INDIAN
8,815 "	CEYLON
2,103 "	JAVA

Total 29,011 packages have been offered in public auction.

The first cargo of New Season's China Tea ex S.S. "Moyune," is expected to be on the market during the course of to-day. It is too early yet to speak positively as to the character of the Teas, or their reception by the trade.

The deliveries of all Teas during the month of June have been exceptionally heavy for the time of year and it is evident that the lower prices recently current for Indian and Ceylon Teas have had a marked effect upon consumption whether in this Country or in foreign markets.

INDIAN. The very small auctions which consisted both of new and old season's Teas passed without material change in valuations. Wherever good quality could be discerned in the new arrivals bidding was brisk and fair prices were obtainable, but amongst old seasons Teas bidding lacked animation wherever the Teas were wanting in point or character.

TRAVANCORES have been in larger supply this week but there were no invoices which obtained specially high average. The following however being amongst the best:—"Vembenard," 10½d.; "Poonmudi," 9¾d.; "Kuduwa Karnum," 9¼d.

Average price of New Season's Teas sold on Garden Account.

Total 392 pkgs. average 10½d.

ASSAM	PKGS.	PRICE.	CHOTA NAGPORE ..	PKGS.	PRICE.	KANGRA VALLEY ..	PKGS.	PRICE.

CHITTAGONG			DOOARS			TRAVANCORE		

As an idea of the comparative prices of Indian Tea in London we quote:—

JUST.	(Fair ordinary, dark liquor)	1891,	6d.	1890,	6¼d.	1889,	4¼d.	1888,	4½d.
ANNINGS.	(Red to brown, strong rough liquor)	"	7d.	"	6¾d.	"	4½d.	"	5¼d.
ROKEN TEA.	(Brownish to blackish, strong liquor)	"	8¼d.	"	8d.	"	5¼d.	"	7d.
EK. SOUG.	(Blackish greyish, useful liquor)	"	8¾d.	"	9d.	"	8d.	"	9d.
EKOE.	(Greyish to blackish some tip, useful liquor)	"	10¼d.	"	10½d.	"	9d.	"	9¾d.
EK. SOUG.	(Blackish greyish, inferior liquor)	"	7¾d.	"	8¼d.	"	5¾d.	"	7½d.
EKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8¾d.	"	9¼d.	"	6½d.	"	8½d.

CEYLON. Auctions comprised only about half the quantity brought forward last week. Consequently a rather firmer market was natural, but no advance has taken place in quotations of any descriptions except those Teas where special point can be discerned in liquor. Only small auctions are so far advertised for next week. Quotations for commonest kinds are weak, but for all other descriptions competition was very strong at last week's rates. The following averages may be mentioned:—"Chapelton" and "Kotiyagalla," 11½d.; "Columbia," "Glassaugh" and "Sheen," 1¼d. Average for week, 9¼d.

JAVA. The chief demand still continues to run upon Medium Pekoes for export, other kinds attract less attention and poorest liquoring descriptions are difficult to sell, several parcels have in consequence been withdrawn from sale for higher prices.

Average for week, 7¾d.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

July 10th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	51,325 packages.	93,111 packages.	7,751 packages.
1891-1892.	45,338 "	103,309 "	9,433 "

During the week

4,527 packages	INDIAN	Total 28,295 packages have been offered in public auction.
3,768 "	CEYLON	
— "	JAVA	

During the last six months there has again been a large increase in the Home Consumption of Tea; duty was paid on about 8,000,000 lbs. more than the corresponding period two years ago. This is the more remarkable considering the high prices ruling throughout many months of 1891.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st January to 30th June.

	1889.	per centages.	1890.	per centages.	1891.	per centages.
Indian	46,500,000	51	51,430,411	54	48,309,455	49
Ceylon	13,066,893	14	14,583,450	16	22,205,172	23
China, etc.	31,418,794	35	28,686,554	30	28,102,441	28
Total lbs.	90,985,687		94,700,415		98,617,068	

The first New Season's China Teas were offered last Friday. They are generally considered to be of fair quality and flavor, but lacking in strength. Some high bids ranging up to 3/- per lb., have been registered, mostly for export. The market has quieted since then and business now slow, and sales difficult to effect.

INDIAN. This is the first week in which New arrivals were sufficiently extensive to afford a rest of the market. Prices have been weak and irregular, dealers preferring to await the arrival of better liquoring Teas. Quality generally has so far been very similar to early arrivals last season.

Average price of New Season's Teas sold on Garden Account. Total 7,660 pkgs. average 9½d.

PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8¾d.	"	9½d.	"	6¾d.	"	8¾d.

CEYLONS met with good competition and sold at last week's rates. All teas with fine quality, and especially those where delicate flavour could be detected, were eagerly bid for, and sold at advanced rates. Really fine Broken Pekoes commanded full prices. The following averages are worthy of note:—"Goatfell," 1/0¼; "Calsay," 1/-; "Templestowe," 11½d. Average for week, 9½d.

JAVA. No auctions were held and no catalogues are issued.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

July 17th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	57,573 packages.	101,045 packages.	8,556 packages.
1891-1892.	58,705 "	121,463 "	9,433 "

During the week

3,367 packages INDIAN)

8,154 " CEYLON Total 31,521 packages have been offered in public auction.

— " JAVA)

With increasing supplies from India and Ceylon the importance of fostering new markets becomes greater than ever. Re-exports of British Grown Tea from this country during the past six months compare favourably with the corresponding period of 1890, considering the high rates lately ruling. At the lower prices now current these Teas should find a readier sale in foreign and colonial markets.

Exports of Indian and Ceylon Tea from Great Britain during the six months ending 30th June.

INDIAN. A good supply of New Season's Tea was offered on the market, all but the lowest qualities being well competed for. Prices have remained at about last week's rates except for poorest liquoring kinds which are weaker. Quality continues much the same as previously noted. Shipments to date are telegraphed as 9,740,000 lbs., against 8,600,000 lbs. same time last year.

Average price of New Season's Teas sold on Garden Account. Total 8,021 pkgs. average 8½d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.

As an idea of the comparative prices of Indian Tea in London we quote:—

	1891,	6d.	1890,	6¼d.	1889,	4½d.	1888,	4½d.
JUST. (Fair ordinary, dark liquor)	"	7d.	"	6¾d.	"	4¾d.	"	5¼d.
MANNINGS. (Red to brown, strong rough liquor)	"	8d.	"	8d.	"	5½d.	"	7d.
BROKEN TEA. (Brownish to blackish, strong liquor)	"	8½d.	"	9d.	"	8½d.	"	9d.
PEK. SOUG. (Blackish greyish, useful liquor)	"	9¾d.	"	10½d.	"	9¾d.	"	9¾d.
PEKOE. (Greyish to blackish some tip, useful liquor)	"	7½d.	"	8¼d.	"	6d.	"	7½d.
PEK. SOUG. (Blackish greyish, inferior liquor)	"	8½d.	"	9½d.	"	6¾d.	"	8¾d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	"		"		"		"	

CEYLON. Auctions have been heavier but not excessive. The condition noted last week continues to prevail, all good liquoring Teas being sought after and when found rather more keenly competed for. Anything that can be classed as above good medium is distinctly dearer, the best liquoring Broken Pekoes showing a decided advance. Undesirable liquoring Teas are slow of sale and the lowest grades of Pekoe and Pekoe Souchong are rather cheaper. July exports to date are telegraphed as 2¼ millions, the revised estimate for the entire month of July being 4,500,000 lbs. average for week, 9½d.

JAVAS have not been offered this week, but sales are advertised for next and the following week.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

July 24th, 1891

**QUANTITY BROUGHT TO AUCTION IN LONDON
 FROM 1ST JUNE TO DATE.**

	Indian.	Ceylon.	Java.
1890-1891.	63,881 packages.	115,595 packages.	9,795 packages.
1891-1892.	69,349 "	138,150 "	11,282 "

During the week

5,644 packages INDIAN }
 5,687 " CEYLON } Total 29,180 packages have been offered in public auction.
 1,849 " JAVA }

With an unusually large quantity of unattractive Tea upon the market, quotations naturally became depressed.

New arrivals from India do not yet show much strength or flavor, and imports from Ceylon will continue poor in cup. Telegraphic advices state that better quality is coming forward from Ceylon, and that an improvement is taking place in some of the Indian districts.

INDIAN. A larger quantity has been brought forward, but there is not much alteration to record as regards general quality. Competition for poor Teas was dull, and the market for these depressed. Better liquoring Teas continue to be sought for. The following averages are worthy of note:—"Putharjhora," 1/-; "Doom Dooma B," 11 $\frac{3}{4}$ d.; "Joyhing of the Jokai T. Co.," 11 $\frac{1}{2}$ d.

Average price of New Season's Teas sold on Garden Account. Total 7,341 pkgs. average 9 $\frac{1}{4}$ d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.

CHITTAGONG			DOOARS	563 p	9 $\frac{3}{4}$ d	TRAVANCORE ..	34	6 $\frac{1}{2}$ d

As an idea of the comparative prices of Indian Tea in London we quote:—

	(Fair ordinary, dark liquor)	1891,	5 $\frac{3}{4}$ d.	1890,	6 $\frac{1}{4}$ d.	1889,	4 $\frac{1}{2}$ d.	1888,	4 $\frac{1}{2}$ d.
JUST.									
FANNINGS.	(Red to brown, strong rough liquor)	"	6 $\frac{3}{4}$ d.	"	6 $\frac{3}{4}$ d.	"	5d.	"	5 $\frac{1}{2}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 $\frac{1}{2}$ d.	"	8d.	"	6d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8 $\frac{1}{4}$ d.	"	9d.	"	8 $\frac{1}{2}$ d.	"	9d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 $\frac{1}{2}$ d.	"	10 $\frac{1}{4}$ d.	"	10d.	"	10d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	8d.	"	6d.	"	7 $\frac{1}{2}$ d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8d.	"	9d.	"	7d.	"	8 $\frac{1}{2}$ d.

CEYLON. Auctions passed without much change except for undesirable Teas which are again weaker. Anything with good character or point in liquor meets with marked attention and sells at higher rates. Quality continues disappointing and many Teas of indifferent liquor are brought forward, but advice of better quality is cabled from Ceylon. We are now approaching the time of year when an improvement generally commences.

The following averages may be mentioned:—"Portswood," 1/3; "Mooloya," 1/1 $\frac{1}{2}$; "Goatfell" and "Henfold," 1/0 $\frac{3}{4}$.

Average for week, 9d.

JAVAS. Sales passed with fair competition, but prices for poorest Teas are weaker.

Average for week, 6 $\frac{3}{4}$ d.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes, c for chest, p for packages. Prices marked thus represent the highest offer in the room. In calculating these averages two half chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

July 31st, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	73,623 packages.	131,023 packages.	11,935 packages.
1891-1892.	77,090 "	153,377 "	13,185 "

During the week

7,741 packages	INDIAN
5,227 "	CEYLON
1,903 "	JAVA

Total 24,871 packages have been offered in public auction.

A little more enquiry from the country, combined with moderate auctions, has tended to steady the market, and the sales have passed off with fair spirit at fully last week's rates.

Home Consumption is going on satisfactorily, being a little ahead of last year to date, for the month, and the low range of prices current appears also to have caused some demand for export.

INDIAN. Less Tea has been catalogued, but the quality shows no improvement. Competition has been fairly active, but no advance can be quoted. Amongst the most desirable Teas offered, were invoices from the "Bamandanga" Estate of the Dooars T. Co., and from "Hukanpukri" garden of the Jokai T. Co., $1/7\frac{3}{4}$; also "Chalouni," $1/2$; and "Budla Beta," $1/1\frac{1}{2}$.

TRAVANCORE. The offerings from this district were important, some fifteen gardens being represented. The quality without exception was very poor, and but low prices were consequently realized.

Average price of New Season's Teas sold on Garden Account. Total 5,175 pkgs. average $9\frac{1}{4}$ d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.

As an idea of the comparative prices of Indian Tea in London we quote:—

JUST.	(Fair ordinary, dark liquor)	1891,	5 $\frac{3}{4}$ d.	1890,	6 $\frac{1}{4}$ d.	1889,	4 $\frac{1}{2}$ d	1888,	4 $\frac{1}{2}$ d.
MANNINGS.	(Red to brown, strong rough liquor)	"	6 $\frac{3}{4}$ d.	"	6 $\frac{1}{4}$ d.	"	5 $\frac{1}{4}$ d.	"	5 $\frac{3}{4}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 $\frac{1}{2}$ d.	"	8d.	"	6d.	"	7 $\frac{1}{4}$ d.
BEK. SOUG.	(Blackish greyish, useful liquor)	"	8 $\frac{1}{4}$ d.	"	9d.	"	8 $\frac{1}{2}$ d.	"	9d.
BEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 $\frac{1}{2}$ d.	"	10 $\frac{1}{4}$ d.	"	10d.	"	10d.
BEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	8d.	"	6 $\frac{1}{4}$ d.	"	8d.
BEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8d.	"	9d.	"	7 $\frac{1}{4}$ d.	"	8 $\frac{3}{4}$ d.

CEYLON. Though the demand has improved and all good liquoring Teas have realized better prices, the average for the week is the lowest which has been reached for a considerable period. This is owing to the large proportion of Teas with inferior leaf and liquor which have been brought to auction. No general advance in price can be anticipated until the quality improves, though fine favoury Teas are badly wanted and the few offering realize extreme rates. The following averages may be mentioned:—"Pita Ratmalie," $1/2$; "Goatfell," $1/1$; "Chapelton," $1/0\frac{1}{4}$.

Average for week, $8\frac{3}{4}$ d.

JAVAS of fair quality were pretty well competed for, and sold with no change in prices, but commoner kinds were cheaper, and in little demand. There being a large proportion of the latter class of Tea, averages in general were somewhat low.

Average for week, $6\frac{3}{4}$ d.

These tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

August 7th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	79,494 packages.	133,970 packages.	11,935 packages.
1891-1892.	83,766 "	157,500 "	13,185 "

During the week

6,676 packages INDIAN

4,123 " CEYLON

— " JAVA

Total 10,799 packages have been offered in public auction.

The market opened yesterday with a small sale; the tone remains very similar to last week, the demand being principally concentrated on the better liquoring sorts. Larger sales are antologued for next week.

The figures for July, of British Grown Tea, may be considered satisfactory, the deliveries of these growths being 12,565,564 lbs., as against 6,849,182 lbs. from China and other sources.

Shipments for the season to the 31st July from Calcutta were wired as 18,830,000 lbs., against 4,540,000 lbs. for the same period last season.

The exports from Ceylon to the United Kingdom for July were 5,600,000 lbs.

INDIAN. Competition was active for all the better liquoring invoices, and for these satisfactory rates were obtained, dealers however would only take the poorer liquoring descriptions at old rates, and some low quotations resulted.

Average price of New Season's Teas sold on Garden Account. Total 4,830 pkgs. average 9½d.

As an idea of the comparative prices of Indian Tea in London we quote:—

	(Fair ordinary, dark liquor)	1891,	5½d.	1890,	6¼d.	1889,	4½d.	1888,	4½d.
ANNINGS.	(Red to brown, strong rough liquor)	"	6½d.	"	6¾d.	"	5d.	"	5¾d.
ROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	8d.	"	6d.	"	7½d.
EK. SOUG.	(Blackish greyish, useful liquor)	"	8¼d.	"	9d.	"	8½d.	"	9d.
EKOE.	(Greyish to blackish some tip, useful liquor)	"	9½d.	"	10¼d.	"	10d.	"	10d.
EK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	8d.	"	6d.	"	8d.
EKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8d.	"	9d.	"	7d.	"	8¾d.

CEYLON. There is no appreciable change to record in the tone of this market, buyers showing little inclination to increase their stocks with the undesirable kinds on offer. For the few Teas possessing quality and flavour bidding was keen, and good prices were realized. The following averages may be quoted:—"Mooloya," 1/1½; "Bogawantalawa," 1/0½. Average for week 9d.

CORRECTION.—In our last circular the average price obtained for the "Frotoft" Teas was incorrectly stated—it should have read 1/2½ per lb., which was the highest record of the week.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

August 14th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	99,919 packages.	153,439 packages.	12,513 packages.
1891-1892.	101,827 "	178,702 "	13,199 "

During the week

18,187 packages INDIAN

21,202 " CEYLON

14 " JAVA

Total 39,403 packages have been offered in public auction.

The total quantity brought to auction was considerably in excess of last week. The general tone of the market is towards firmness and many improved quotations have resulted excepting for the poorer liquoring kinds.

The figures given below showing the exports of Tea from Great Britain illustrate a satisfactory increase in the use of British grown Tea in foreign markets. In view of anticipated increased supplies from India and Ceylon during this and subsequent seasons such figures cannot but be of great and pleasing interest to those concerned in these industries.

It will be observed that not only is there an increase in the total amount of Tea re-exported, but that this increase is made up entirely of Indian and Ceylon growths.

Export of Tea from Great Britain for the two months ending 31st July, 1891, compared with same period, 1890.

	1890.	per centages.	1891.	per centages.

As an idea of the comparative prices of Indian Tea in London we quote:—

	1891,	1890,	1889,	1888,
JUST. (Fair ordinary, dark liquor)	5 ¹ / ₂ d.	6 ¹ / ₄ d.	4 ¹ / ₄ d.	4 ¹ / ₂ d.
ANNINGS. (Red to brown, strong rough liquor)	6 ³ / ₄ d.	6 ³ / ₄ d.	4 ³ / ₄ d.	5 ³ / ₄ d.
ROKEN TEA. (Brownish to blackish, strong liquor)	7 ³ / ₄ d.	8d.	5 ³ / ₄ d.	7 ¹ / ₂ d.
EK. SOUG. (Blackish greyish, useful liquor)	8 ¹ / ₄ d.	9d.	8 ¹ / ₂ d.	9d.
EKOE. (Greyish to blackish some tip, useful liquor)	9 ¹ / ₂ d.	10 ¹ / ₄ d.	10d.	9 ³ / ₄ d.
EK. SOUG. (Blackish greyish, inferior liquor)	7d.	8d.	5 ³ / ₄ d.	7 ³ / ₄ d.
EKOE. (Blackish, greyish, some tip, inferior liquor)	8d.	9d.	6 ³ / ₄ d.	8 ¹ / ₂ d.

INDIAN. The tone has been decidedly firmer, and an inclination was displayed to bid higher prices for all grades of good and fair liquoring teas. There is a marked improvement in many of the offerings from the Assam and Darjeeling districts—the latter especially. The Darjeeling Co. obtained over 2/- per lb. for their invoice; the Land Mortgage Bank of India sold an invoice from their Moondakottee Division at 1/5¹/₄, whilst as much as 2/1³/₄ per lb. was paid for the Teas from the Goomtee Estate.

CEYLON. The market continues much in the position as quoted last week, though there was slightly more animation in the bidding for all desirable kinds. The following averages may be mentioned:—"Mooloya," 1/4¹/₂; "Portswood," 1/3¹/₂; "Goatfell," 1/2; "Henfold and Melfort," 1/1; "Norwood" the E.P.&E.C., and "Ouvahkellie," 1/0¹/₂. The average for the week remains the same, being 9d.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

August 21st, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	120,724 packages.	170,861 packages.	12,513 packages.
1891-1892.	121,205 "	204,698 "	14,751 "

During the week

9,378 packages INDIAN }
 5,996 " CEYLON } Total 46,926 packages have been offered in public auction.
 1,552 " JAVA }

The late depression in prices has doubtless to a large extent been caused by the very inferior class of Tea received from the producing Countries during the last two or three months.

There is now a large demand for useful liquoring Teas of all grades to be satisfied and the arrival of a few ships bringing improved quality has had a salutary effect on the Indian Tea market.

INDIAN. For all the better liquoring descriptions competition continues strong, and good New Season's Teas are in active demand at advancing rates. Amongst the most desirable invoices offering those from the Jokai Co., Ltd., commanded the best attention, the Teas from their "Hukanpukri" Division realising exceptionally high prices, and as much as 4/8 per lb. was paid for a fair sized parcel; the average for this invoice was 2/4½. Other averages such as 1/6¾ for Tukvar Co.; 1/4½ for "Kalej"; and 1/3 for "Putharjhora" are worthy of note.

This weeks average price of New Season's Teas sold on Garden Account. Total 11,650 pkgs. average 10½d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	4324 p	11¾d	DARJEELING & TERAI	1627 p	11¾d	KANGRA VALLEY ..	69 p	7¾d

CHITTAGONG	184 p	8¾d	DOOARS	2007 p	10d	TRAVANCORE	472 p	8½d

For an idea of the comparative prices of Indian Tea in London we quote:—

1ST.	(Fair ordinary, dark liquor)	1891,	5½d.	1890,	6¼d.	1889,	4¼d.	1888,	4½d.
2ND.	(Red to brown, strong rough liquor)	"	6½d.	"	6¾d.	"	4¾d.	"	5¾d.
3RD.	(Brownish to blackish, strong liquor)	"	8d.	"	8d.	"	5¾d.	"	7½d.
4TH.	(Blackish greyish, useful liquor).	"	8½d.	"	8½d.	"	8½d.	"	9d.
5TH.	(Greyish to blackish some tip, useful liquor)	"	10d.	"	10¼d.	"	10½d.	"	9¾d.
6TH.	(Blackish greyish, inferior liquor)	"	6¾d.	"	7d.	"	5¾d.	"	7¾d.
7TH.	(Blackish, greyish, some tip, inferior liquor)	"	7¾d.	"	7¾d.	"	6¾d.	"	8½d.

CEYLON. The late scarcity of fine and good medium Teas has had a decided effect on prices, and the few lots possessing flavor and quality sold at an advance of from 1d. to 2d. per lb. On the other hand common liquoring descriptions could only be disposed of at a further concession in price. The following averages may be mentioned:—"Goatfell," 1/3½; "Bogawantalawa," 1/2¾; "Kotiyagalla," 1/1¾; "Glendevon" of the OBEC 1/1½; "Calsay" 1/1; and "Invery" of the SCTCo., 1/1. The Ceylon average remains the same as last week, namely 9d.

MOVEMENTS OF TEA IN LONDON (in lbs.) FROM 1st JUNE TO 31st JULY.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

August 28th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	137,131 packages.	180,684 packages.	13,462 packages.
1891-1892.	146,476 "	223,207 "	17,014 "

During the week

25,271 packages	INDIAN	} Total 46,043 packages have been offered in public auction.
8,509 "	CEYLON	
2,263 "	JAVA	

The demand for useful liquoring teas has become even more pronounced during the past week. As the supplies of Indian tea have contained a fair quantity of these kinds, a busier tone has pervaded the market and a larger volume of business has been transacted than for some time past. From latest advices both by letter and wire from Ceylon, we are led to expect better liquoring teas and decreased quantity from that quarter in the near future.

INDIAN. Arrivals continue to show improving quality especially from Darjeeling and Assam. The teas now coming to hand from the former district are distinctly preferable to those offering at the same period last year, and many excellent parcels have been sold. The Assam Teas are fully up to last season as regards quality. Dooars Teas have not shown any improvement, whilst from Cachar & Sylhet no fine invoices have as yet been placed on the market. The following averages are worthy of note:—"Darjeeling Co.," 1/10 $\frac{1}{4}$; "Moondakotee" of the LMBCo., 1/8 $\frac{1}{4}$; and "Margaret's Hope," 1/8 $\frac{1}{4}$.

This weeks average price of New Season's Teas sold on Garden Account. Total 14,885 pkgs. average 10 $\frac{3}{4}$ d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	4467 p	11 $\frac{1}{4}$ d	DARJEELING & TERAI	2955 p	1/1	KANGRA VALLEY ..	280 p	8 $\frac{1}{4}$ d

CEYLON. The paucity of fine or even good medium invoices and the consequent surfeit of lower grade Teas has had a still more pronounced effect on prices during the current week; useful liquoring Teas are so much wanted that they have sold at a further distinct advance in price, whilst the bulk of the Teas have continued to decline, and the average for the week has fallen to under 9d. The following averages may be mentioned:—"Norwood" of the EP & ECo., 1/5 $\frac{1}{2}$; "Mooloya," 1/5; "Froft," 1/3 $\frac{1}{4}$; "Kew," 1/2 $\frac{3}{4}$. A small quantity of Golden Tips marked "Mahakettiya," was knocked down in sale at 35 guineas per lb.

JAVA. Considering the heavy fall in quotations that have been recorded in Teas from other countries during the last few months, prices for Java descriptions have remained fairly steady. Average for week, 7 $\frac{1}{4}$ d.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

September 4th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	155,900 packages.	200,057 packages.	14,223 packages.
1891-1892.	181,144 "	243,483 "	17,913 "

During the week

4,668 packages INDIAN }
 2,276 " CEYLON } Total 55,843 packages have been offered in public auction.
 899 " JAVA }

As will be seen from the figures given below the deliveries of all Teas during last month show satisfactory increase over those of the corresponding period last year.

By wire we learn that the export from Calcutta during August was about 14 million lbs., and that from Ceylon a little over 4½ million lbs. against 6½ millions for June and a little over 5½ millions for July.

INDIAN. The improved quality in the bulk of the offerings noticed last week has been maintained; many excellent invoices have been offered and some high quotations recorded. During the last day or so some irregularity has been noticeable in the bidding for Teas over 1/- per lb., and in many instances the best prices of last week have scarcely been realised. Teas with useful flavors under rod. per lb. have well maintained their prices. The following averages are worthy of note:—"Hukanpukri," of the Jokai T Co., 2/4½; "Dooteriah," 2/0½; and "Moabund T Co.," 1/6½. This weeks average price of New Season's Teas sold on Garden Account. Total 20,867 pkgs. average 11d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	10375 p	1/-	CHOTA NAGPORE ..	97 c	6½d	KANGRA VALLEY ..	367 p	9½d

CHITTAGONG	457 p	8¾d	DOOARS	3545 p	9½d	TRAVANCORE ..	179 p	7¾d

For an idea of the comparative prices of Indian Tea in London we quote:—

	1891,	1890,	1889,	1888,
JUST. (Fair ordinary, dark liquor)	5½d.	6¼d.	4¼d.	4½d.
ANNINGS. (Red to brown, strong rough liquor)	6½d.	6¾d.	4¾d.	6d.
ROKEN TEA. (Brownish to blackish, strong liquor)	8¼d.	8½d.	5¾d.	7½d.
EK. SOUG. (Blackish greyish, useful liquor)	8½d.	9d.	8½d.	8½d.
EKOE. (Greyish to blackish some tip, useful liquor)	10d.	10¼d.	10½d.	9¼d.
EK. SOUG. (Blackish greyish, inferior liquor)	6¾d.	7¾d.	6d.	7¼d.
EKOE. (Blackish, greyish, some tip, inferior liquor)	7¾d.	8½d.	7¼d.	8¼d.

CEYLON. The market just now is in a very sensitive position and it is principally a matter of quality that will rule prices in the immediate future; unless the Teas very shortly improve another fall will doubtless take place as buyers are fully stocked with the class of Tea that has been offering for some two or three months past. The demand for good medium and fine descriptions is now very strong, dealers having little or none of these classes in hand. The 17,782 packages brought to auction on Tuesday last were offered in 722 lots. At the risk of repetition we must again impress upon producers the fact that it is impossible for buyers to value so many breaks in the day. The following averages may be mentioned:—"Bogawantalawa," "Glendevon," of the BEC., and "Portswood," 1/3½. Average for the week under 9½d.

JAVA. There were only 899 packages offered, these were from the "Parakan Salak," "Tjiomas," and "Tjikembang" estates, the latter being grown from Assam seed. Some of the Teas from the "Tjiomas" estate, realized high prices, as much as 3/4 being paid for a little lot of Flowery Pekoe.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

September 11th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	178,018 packages.	209,514 packages.	14,223 packages.
1891-1892.	211,814	258,381	18,561

During the week

30,670 packages	INDIAN
4,898	CEYLON
648	JAVA

Total 46,216 packages have been offered in public auction.

Referring to the table given below showing re-exports of Tea from this country for the last three months, it is satisfactory to note that not only has the total amount shipped materially increased compared with the same period last year, but that the increase has been almost entirely made up of Indian and Ceylon growths.

Export of Tea from Great Britain for the three months ending 31st August, 1891, compared with same period, 1890.

	1890.	per centages.	1891.	per centages.
INDIAN	394,356	5	635,137	7
CEYLON	380,092	4	723,974	8

Total lbs. .. .	8,387,571		9,198,471	

INDIAN. Great uncertainty exists amongst buyers as to the probable course of the market during the next few months and prices during the week have been irregular except where the liquors have possessed any special point and character. This uneasy feeling has doubtless been caused by the greatly increased estimate of crop as given by the Indian Tea Association in Calcutta at the outset of the season, and by the exceptionally early arrival of the crop in quantity. Judging from figures which we have obtained, giving actual production to the 31st ultimo as wired by many of the representative estates in each of the producing districts, the yield to that date—say for two thirds of the manufacturing season—shows an increase of only 7% to 8% as against an estimated increase of about 13% all round.

This weeks average price of New Season's Teas sold on Garden Account. Total 21,663 pkgs. average 10d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	8051 p	11½d	CHOTA NAGPORE ..	—	—	KANGRA VALLEY ..	103 p	10d

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST. (Fair ordinary, dark liquor)	1891,	5½d.	1890,	6½d.	1889,	4¾d	1888,	4½d.
FANNINGS. (Red to brown, strong rough liquor)	„	6¾d.	„	6¾d.	„	5d.	„	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	„	8¼d.	„	8¼d.	„	6¼d.	„	7½d.
PEK. SOUG. (Blackish greyish, useful liquor)	„	8½d.	„	9d.	„	9d.	„	8½d.
PEKOE. (Greyish to blackish some tip, useful liquor)	„	10d.	„	10¼d.	„	10¾d.	„	9¼d.
PEK. SOUG. (Blackish greyish, inferior liquor)	„	7d.	„	7½d.	„	5½d.	„	7¼d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	„	7¾d.	„	8¾d.	„	7¼d.	„	8¼d.

CEYLON. Supplies this week have shown a material decrease and the attention of buyers has as a consequence been more concentrated; hence a steadier tone has prevailed in the auctions and there is more regularity in prices. The presence of many improved invoices has also helped to stimulate the demand, and many of the higher quotations recorded are attributable entirely to this cause. Average for the week 9¼d.

JAVA. All the Teas brought to auction were from the "Bagelen" Estate. They possessed useful characteristics and were well competed for both by the home and foreign trades.

MOVEMENTS OF TEA IN LONDON (in lbs). FROM 1st JUNE TO 31st AUGUST.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

October 23rd, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	380,407 packages.	270,580 packages.	22,982 packages.
1891-1892.	427,432 "	345,850 "	25,038 "

During the week

4,613 packages INDIAN }
 5,541 " CEYLON } Total 60,762 packages have been offered in public auction.
 608 " JAVA }

With Tea production continuing to increase in India and Ceylon, the expanding Home consumption in this country, upon which we commented last week, is satisfactory. But the importance of discovering fresh outlets is by no means lessened on that account. The work of opening new markets was to some extent curtailed in the early part of this year, owing to the high range of prices then ruling; but the lower rates which gradually became established, first for Ceylon, and then for Indian Teas, have induced demand from foreign markets. Exports have thus been upon a larger scale, and for the last of the three quarters noted in the following table, they show most encouraging increase over last year's figures.

With prices of Indian and Ceylon Teas at their present low level, reason exists for hoping to see a further recognition of the merits of these Teas, both in countries where they are now beginning to gain popularity, and in other markets where as yet their qualities are comparatively unknown.

Exports of Indian and Ceylon Tea from Great Britain.

INDIAN.

CEYLON.

	1st Jan. to 31st March.	1st Apr. to 30th June.	1st July to 30th Sept.		1st Jan. to 31st March.	1st Apr. to 30th June.	1st July to 30th Sept.

1890 lbs. 1,877,093 1891 lbs. 1,895,841 | 1890 lbs. 1,078,881 1891 lbs. 1,414,123

INDIAN. Auctions comprised 44,613 packages, against 33,579 last week, the majority being brought to auction on Monday, when 23,262 packages were catalogued—this auction slightly exceeded any previous sale. The market bore the weeks pressure without strain, prices remaining unchanged for all except poorest liquoring Teas which are a trifle easier. The following averages worthy of note:—"Balijan," 1/5; "Panitola" of the Jokai T Co., 1/4; "Moondakotee" of Land Mortgage Bank, and "Hapjan," 1/2½.

This weeks average price of New Season's Teas sold on Garden Account. Total 34,008 pkgs. average 9¾d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	19707 p	11d	CHOTA NAGPORE .. .	40 p	5¾d	KANGRA VALLEY .. .	126 p	8½d
CACHAR AND SYLHET..	7379 p	7¾d	DARJEELING & TERAI	2464 p	10¾d	NEILGHERRY.. .. .	235 p	6½d
CHITTAGONG	456 p	8¾d	DOOARS	3610 p	8½d	TRAVANCORE		

An idea of the comparative prices of Indian Tea in London we quote:—

	(Fair ordinary, dark liquor)	1891,	4½d.	1890,	6d.	1889,	5¼d.	1888,	4¾d.
JUST.									
MANNINGS.	(Red to brown, strong rough liquor)		5½d.		6¾d.		6d.		6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)		7¾d.		8¼d.		8d.		7½d.
PEK. SOUG.	(Blackish greyish, useful liquor)		8d.		8¾d.		9¾d.		8½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)		9d.		9¾d.		10½d.		9¾d.
PEK. SOUG.	(Blackish greyish, inferior liquor)		6d.		7¾d.		7d.		7¼d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)		7d.		8½d.		8¾d.		8¼d.

CEYLON. Auctions were some 3,000 packages in excess of last week and passed with good bid for all desirable kinds. Commonest liquoring Teas alone have given way about a halfpenny per lb. The demand for high quality is stronger, and all parcels that approach this description are only competed for at harder rates. Quality generally continues unaltered, arrivals from many estates being very good. The following averages may be mentioned:—"Rahatungoda," 1/4½; "Leathersett," 1/3¾; "Frotoft," 1/2¾; "Moray" and "Warwick," 1/2. Average for week 9¾d.

JAVAS were represented by only 608 packages, and of these not more than 499 were of direct export. The market remains much as noted last week.

BANK RATE. 3 per cent. **EXCHANGE.** Calcutta on London three months sight is. 5¾d.

During the week

5,962 packages INDIAN }
 3,323 " CEYLON } Total 59,285 packages have been offered in public auction.
 — " JAVA }

INDIAN. During the last fortnight 90,000 packages of Indian Tea have been offered in public sale. Heavy auctions are again advertised for next week. Figures of such magnitude are unusual for this period of the season, and this unaccustomed pressure might have seriously affected prices, were it not that a brisk business was in progress at the time, thus permitting London buyers to operate with considerable freedom. How long the market can sustain a similar pressure is problematical, but it has borne the recent test without any but poorest liquoring Teas feeling the strain—and even these have only yielded in price to a fractional extent.

Heavy arrivals of Tea this season no doubt increase the difficulty always felt in attempting a regulation of supplies, and with a crop estimated at 112 million pounds, available for London, the difficulty does not seem likely to decrease. Natural causes have recently facilitated large arrivals, the brisk demand for home trade, during the past few weeks, aided by some export buying, having enabled Importers to dispose of a far greater quantity of Tea than was practicable during the corresponding period of last season. The following averages are worthy of note:—"Hukanpukri" of the Jokai T Co., 1/6½; "Samdang" division of the Doom Dooma T Co., 1/3¼; "Selimbong" 1/2¾.

This week's average price of New Season's Teas sold on Garden Account. Total 30,260 pkgs. average 9½d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.

EKOE.	(Blackish, greyish, some tip, inferior liquor)	"	6¾d.	"	8½d.	"	8¾d.	"	8½d.

CEYLON. One of the most noticeable features in the Ceylon Tea market during the past few months has been the gradually increasing divergence between values of good and bad liquoring teas. While Teas with quality and flavor have steadily improved in value, undesirable liquoring sorts have as steadily declined—the margin between the prices widening every week.

This week's auctions were only 13,323 packages, comprising a fair selection as regards quality. Demand ran chiefly on good liquoring Teas, especially Pekoes and Broken Pekoes; an occasional advance of a halfpenny to a penny being paid. Inferior liquoring grades were neglected at another decline of fully a farthing per lb. Export orders appear to be more plentiful, and the growing demand to run considerably upon fine flavoured kinds as well as Medium Teas. The following averages are worthy of note:—"Waverley" of the CTPCo., 1/3½; "Bogawantalawa," 1/2¾; "Goatfell" and "Kotiyagalla," 1/2¼. Average for week 9½d.

TEAS were not represented and so far no catalogues are issued.

MOVEMENTS OF TEA IN LONDON (in lbs.) FROM 1st JUNE TO 30th SEPTEMBER.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

November 6th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	455,645 packages.	283,057 packages.	25,515 packages.
1891-1892.	516,395 "	373,182 "	25,038 "

During the week

3,001 packages INDIAN }
4,009 " CEYLON } Total 57,010 packages have been offered in public auction.
— " JAVA }

Except that low prices appear to be forcing Indian and Ceylon Teas into consumption both at home and abroad, statistics for the past month call for no special comment.

Deliveries of British Grown Tea exceed any previous record, except during Budget excitement. China deliveries are poor in spite of reduced prices.

INDIAN. With another week of heavy auctions the prolonged strain has somewhat depressed the market, causing irregular quotations and a further drop in price for poorer grades. Calcutta telegrams report an early closing of the season owing to want of rain, and give a reduced estimate of £8 to £10 million pounds for the season, available for London. The following averages are worthy of note:—"Margaret's Hope," 1/8 $\frac{3}{4}$; "Hapjan," 1/3 $\frac{3}{4}$; "Moabund" T Co., 1/1 $\frac{3}{4}$; and "Kalej," 1/1 $\frac{1}{2}$.

This weeks average price of New Season's Teas sold on Garden Account. Total 34,399 pkgs. average 8 $\frac{3}{4}$ d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	16139 p	9 $\frac{3}{4}$ d	CHOTA NAGPORE ..			KANGRA VALLEY ..

CHITTAGONG	158 p	8 $\frac{3}{4}$ d	DOOARS	3951 p	8d	TRAVANCORE..	980 p	7 $\frac{1}{4}$ d

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST. (Fair ordinary, dark liquor)	1891,	4 $\frac{1}{2}$ d.	1890,	6d.	1889,	5 $\frac{1}{2}$ d.	1888,	5d.
FANNINGS. (Red to brown, strong rough liquor)	"	5d.	"	6 $\frac{3}{4}$ d.	"	6d.	"	6 $\frac{1}{4}$ d.
BROKEN TEA. (Brownish to blackish, strong liquor)	"	7 $\frac{1}{2}$ d.	"	8 $\frac{3}{4}$ d.	"	7 $\frac{3}{4}$ d.	"	7 $\frac{1}{2}$ d.
PEK. SOUG. (Blackish greyish, useful liquor)	"	7 $\frac{1}{2}$ d.	"	8 $\frac{3}{4}$ d.	"	9 $\frac{1}{4}$ d.	"	8 $\frac{1}{2}$ d.
PEKOE. (Greyish to blackish some tip, useful liquor)	"	8 $\frac{1}{2}$ d.	"	9 $\frac{3}{4}$ d.	"	10d.	"	9 $\frac{1}{4}$ d.
PEK. SOUG. (Blackish greyish, inferior liquor)	"	5 $\frac{3}{4}$ d.	"	8d.	"	6 $\frac{3}{4}$ d.	"	7 $\frac{1}{4}$ d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	"	6 $\frac{3}{4}$ d.	"	8 $\frac{1}{2}$ d.	"	8 $\frac{3}{4}$ d.	"	8 $\frac{1}{4}$ d.

CEYLON. Fine flavoured Teas and all good liquoring descriptions continue firm. Teas with poor quality, or anything approaching to common, have dropped a farthing to a halfpenny per pound, during the week. Exports from Ceylon during October are cabled as four and a quarter million pounds. The following averages may be mentioned:—"Alnwick," 1/3 $\frac{3}{4}$; "Glendevon" of the BEC, 1/3 $\frac{1}{2}$; "Mooloya," 1/3; "Glen Alpin," 1/2 $\frac{1}{2}$. Average for week, 9 $\frac{3}{4}$ d.

AVAS have not been represented. 1,566 packages are printed for next and the following week.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

November 13th, 1891.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	492,549 packages.	288,778 packages.	26,407 packages.
1891-1892.	556,351 ,,	393,895 ,,	25,696 ,,

During the week

9,956 packages	INDIAN
0,713 ,,	CEYLON
658 ,,	JAVA

Total 61,327 packages have been offered in public auction.

Auctions of Indian and Ceylon Tea together have this week exceeded any previous record.

The mass of Indian Tea lately brought forward has occasioned frequent comments upon regulation of supplies, but little practical result has followed as yet.

The present rule of devoting Mondays and Wednesdays to auctioning Indian Teas, Tuesdays to Ceylon Tea, and Thursdays to both kinds, has now been in force more than three years. Since its institution the output from both countries has so vastly increased, that an alteration in the arrangement of public auctions is now generally recognized as likely to be beneficial to both industries.

Not only have Monday's auctions of Indian Tea of late been occasionally very heavy, but last Tuesday's Ceylon sale of 18,716 packages comprised so large a number of breaks (798) that it was impossible for buyers to give careful attention to the entire sale—the result proving most unfortunate for importers.

The obvious course to pursue, now that Ceylon has grown so enormously since the present plan was adopted, seems to be to devote more days to the sale of Ceylon Tea. This would enable dealers to distribute their purchases over a longer time, instead of operating practically only once a week, as they are now compelled to do, owing to the objection of Ceylon importers to sell late on Thursdays.

To facilitate this operation it may become necessary to hold auctions of Ceylon Tea in a separate room from Indians—a result which might ultimately be advantageous to both industries, though perhaps at first attended with some slight inconveniences.

INDIAN. Last weeks rates have been fully maintained, except for poorest descriptions, which are slightly easier. Pekoes and Broken Pekoes of high character are dearer. Assam Teas continue best in quality.

This weeks average price of New Season's Teas sold on Garden Account. Total 28,298 pkgs. average 8½d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	12875 p	9½d	CHOTA NAGPORE ..	2211 p	10d	KANGRA VALLEY ..	213 p	6½d
CACHAR AND SYLHET..	7012 p	7½d	DARJEELING & TERAI	5778 p	7½d	NEILGHERRY..	58 c	8½d
CHITTAGONG	151 p	8d	DOOARS			TRAVANCORE ..		

As an idea of the comparative prices of Indian Tea in London we quote:—

	1891.	1890.	1889.	1888.
DUST. (Fair ordinary, dark liquor)	4¼d.	6d.	5½d	5d.
FANNINGS. (Red to brown, strong rough liquor)	4¾d.	6½d.	6d.	6½d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7d.	8½d.	7½d.	7½d.
PEK. SOUG. (Blackish greyish, useful liquor)	7¼d.	8½d.	8½d.	8½d.
PEKOE. (Greyish to blackish some tip, useful liquor)	8¼d.	9½d.	9½d.	9½d.
PEK. SOUG. (Blackish greyish, inferior liquor)	5½d.	7¼d.	6½d.	7¼d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	6¾d.	8¼d.	8d.	8¼d.

CEYLON. Tuesday's heavy auction of 18,716 packages represented by 798 breaks, altogether overtaxed the market, and a general decline took place;—thus showing the necessity of some change in the arrangement of the auctions. Medium and common Pekoes and Pekoe Souchongs show a fall of fully a halfpenny, and higher grades a halfpenny to a penny per pound. Average for week, 9d.

AVAS. Only 670 packages were brought forward; and met with good competition.

In these tables all packages are half-chest unless otherwise stated. b stands for boxes, c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

13, ROOD LANE, LONDON, E.C. January 1st, 1892.

When our supply of Tea was drawn from China, the Public may well have regarded the Tea trade with indifference. At the present time so much British Capital is invested in Tea property in India and Ceylon that the welfare of the industry is a matter of National importance.

HOME CONSUMPTION. Our own possessions now contribute some 75 % of the tea we drink, only 25 % being supplied by China. Under these circumstances it is matter for general congratulation that the Home Consumption for 1891 has exceeded any previous record. In 1889 we only consumed 185 million lbs. of Tea; in 1891 we have used about 202 million lbs.

So long as the weaker Teas of China were being rapidly displaced by the stronger Teas of India and Ceylon, the increase in consumption of dry leaf was hardly appreciable, although a larger quantity of liquid tea was gradually being used. The displacement of China Tea during the last two years has not been very marked; hence the greater weight of Tea required to supply the gradually expanding liquid consumption. This, with the reduction of duty last year to 4d. is doubtless answerable for the heavy increase in the use of dry Tea.

There is another feature which is remarkable in the Home Consumption during the past year. It is the first time in which Ceylon Tea has been more largely drunk than China Tea (estimating figures for December). If we go back to 1887 we find only ten million lbs. of Ceylon Tea were drunk to 90 million lbs. of China. Only four years afterwards the use of Ceylon Tea has increased to about 50 million lbs., while the quantity of China Tea has been reduced by about 40 million lbs., Indian Tea supplying the bulk of the Home Consumption.

The year 1891 will also be remembered for the extraordinarily low range of prices current during the last few months for the lower grades of Indian and Ceylon Tea. These grades constitute the main portion of Tea drunk in this country, and have recently been obtainable at a lower price than was ever previously known.

FOREIGN MARKETS. The export trade in China Tea shows a considerable falling off, but Indian and Ceylon Teas both show substantial increase. The importance of this branch of the trade is now so great, that it is necessary to bring all possible influence to bear upon such foreign governments as impose duties which are almost prohibitive.

INDIAN. The year opened with very high prices for low grade Teas; short supplies being anticipated both from India and China. Prices gradually fell off till towards the close of the year when this grade reached its recent unprecedentedly low level. Fine flavoured Teas and Teas of exceptional quality have been somewhat scarce and commanded full rates. The general quality of the crop has not been equal to that of last year.

CEYLON. The early months of 1891 were marked by high prices for the low grades. The abnormally wet weather which prevailed in Ceylon occasioned so rapid a growth of the Tea leaf that production fairly outran any previous record. The London market in consequence became somewhat flooded with unexpected supplies. The result of this was a gradual shrinkage in values to the recent low level. Perhaps the only consolation to be drawn from the late depression is the stimulus which it has given to the consumption of Ceylon Tea both at home and abroad. It is remarkable that about 50 % more Ceylon Tea was used in Great Britain in 1891 than in 1890.

JAVA. The supply of Java has not been much, and the course of the market has mainly followed that of Indian and Ceylon Teas. Owing to the recent low prices of these, Java Tea has not been in so much demand for Home Consumption, and has in consequence been taken freely for export markets.

Supplement to "CEYLON OBSERVER."

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

January 8th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	707,966 packages.	353,969 packages.	29,168 packages.
1891-1892.	823,303 "	477,556 "	28,269 "

During the week

5,573 packages	INDIAN
746 "	CEYLON
626 "	JAVA

Total 63,945 packages have been offered in public auction.

December's statistics call for very little comment. Deliveries of Indian and Ceylon Tea are good. After about a fortnight's intermission, sales recommenced this week, the aggregate amount of Indian and Ceylon Tea catalogued being heavier than in any previous week. The auctions opened with fairly spirited bidding, but prices gave way slightly towards the close of the week.

INDIAN. Monday's auction of 24,796 packages was heavier than any previously held in one day; but a still larger sale is advertised for the 11th inst., catalogues for 25,852 packages being already issued. The market opened at about the closing rates of last year, buyers however not evincing great keenness. Prices, later on in the week, showed irregularity, and poor liquoring Teas must be quoted fully 1/4d. below closing rates of last year.

This week's average price of New Season's Teas sold on Garden Account. Total 35,858 pkgs. average 9d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.

Comparative prices of Indian Tea in London:—

JUST.	(Fair ordinary, dark liquor)	1892, 4 1/4d.	1891, 6 1/2d.	1890, 5 1/2d.	1889, 6d.
ANNINGS.	(Red to brown, strong rough liquor)	" 5d.	" 7d.	" 6d.	" 6d.
ROKEN TEA.	(Brownish to blackish, strong liquor)	" 6 1/2d.	" 8 1/2d.	" 7 1/2d.	" 7 1/2d.
EK. SOUG.	(Blackish greyish, useful liquor)	" 7d.	" 9 1/2d.	" 8 1/2d.	" 8 1/2d.
EKOE.	(Greyish to blackish some tip, useful liquor)	" 8 3/4d.	" 10 1/2d.	" 9 1/2d.	" 9 1/2d.
EK. SOUG.	(Blackish greyish, inferior liquor)	" 5 1/2d.	" 8 1/4d.	" 7d.	" 7 1/4d.
EKOE.	(Blackish, greyish, some tip, inferior liquor)	" 6 3/4d.	" 9 1/4d.	" 8d.	" 7 3/4d.

CEYLON. The average price of all the Ceylon Tea sold on Garden Account during 1891 was 11d. per lb. against 11d. in 1890, 11 1/2d. in 1889, and 11 1/2d. in 1888.

At the opening auction on Tuesday, last year's prices were rather more than maintained; open competition caused an occasional advance of 1/4d. to 1/2d. on Medium Grades. Average 10d.

Comparative prices of Ceylon Tea in London:—

EKOE SOUG.	(Ordinary leaf; fair liquor)	1892 7	1891 9 1/4	1890 10 1/4	1889 9 1/4
EKOE	(Ordinary leaf; little twist; fair liquor)	" 9 1/2	" 10 3/4	" 11	" 10 1/4
EKOE SOUG.	(Rather bold leaf; indifferent liquor)	" 5 1/2	" 8 3/4	" 9 3/4	" 8 1/2
EKOE	(Somewhat bold leaf; indifferent liquor)	" 6 3/4	" 9 3/4	" 10 1/4	" 9 1/4

JAVA. Only one sale was held, at which the bidding was good and prices were firm. Average 6 1/2d.

China, etc.	37,956,842	35,661,901	32,910,627	27,550,477

THE CHICAGO EXHIBITION is likely to exercise important influence upon the future of the Indian and Ceylon Tea Industries—It is therefore satisfactory to note that steps have been taken for their adequate representation. The necessity for utilising this powerful agency for fostering a taste for Indian and Ceylon Teas in the United States cannot be overrated.

INDIAN. The heaviest quantity ever brought to Public Auction in one week did not materially restrain the market. At Monday's unprecedentedly large sale, the closing rates of last week were fully supported with good all round bidding—at later sales commoner kinds suffered to a slight extent and were here and there a farthing cheaper. Quality of recent imports is better, especially in "Darjeeling," "Dooars," "Terai," and "Assam."

This weeks average price of New Season's Teas sold on Garden Account. Total 35,201 pkgs. average 8 $\frac{3}{4}$ d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.

CEYLON. Tuesday's sale of 20,047 packages lasted from 12 o'clock, until almost 6 p.m. In spite of this, bidding continued good throughout, the market remaining unaltered for all but poor inferior Teas. At Thursday's sale, Medium and poor Teas were again easier, these being now nearly a halfpenny below last week's rates. Quality has continued fair, with a good proportion of ordinary Teas. 51,227,602 lbs. of Ceylon Tea were used for Home Consumption in 1891, against 61,100,000 lbs. of China Tea. Exports from Ceylon to the United Kingdom in 1891 were nearly 200,000 lbs. Average for week, 9 $\frac{1}{2}$ d.

Comparative prices of Ceylon Tea in London:—

	(Ordinary leaf; fair liquor)	1892,	6 $\frac{1}{2}$ d.	1891,	9 $\frac{1}{2}$ d.	1890,	10 $\frac{1}{2}$ d.	1889,	9d.
BLACK COE	(Ordinary leaf; little twist; fair liquor)	"	9d.	"	11d.	"	11d.	"	10 $\frac{1}{2}$ d.
BLACK SOUG.	(Rather bold leaf; indifferent liquor)	"	5 $\frac{1}{2}$ d.	"	9d.	"	9 $\frac{3}{4}$ d.	"	8 $\frac{1}{2}$ d.
BLACK COE	(Somewhat bold leaf; indifferent liquor)	"	6 $\frac{1}{2}$ d.	"	10d.	"	10 $\frac{1}{2}$ d.	"	9 $\frac{1}{2}$ d.

INDIA. Competition has been animated and late rates were freely paid, the tendency being to counter hardness. Average, 7 $\frac{3}{4}$ d.

BANK RATE. 3 $\frac{1}{2}$ per cent. **EXCHANGE.** Calcutta on London three months sight is. 4 $\frac{1}{2}$ d.

INDIAN. Average 8³/₄d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

January 22nd, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891:	801,337 packages.	376,385 packages.	31,478 packages.
1891-1892.	909,589 "	517,519 "	29,458 "

During the week

6,986 packages	INDIAN	} Total 52,184 packages have been offered in public auction.
5,153 "	CEYLON	
45 "	JAVA	

Some relief has this week been afforded the trade through the comparatively light auctions.

The smaller quantity brought forward proved ample for requirements, the bidding being characterized by a lack of animation. The postponement of Wednesday's auction, on account of the Funeral of the Duke of Clarence, raised Thursday's catalogues to a heavy total, the valuing of which was considerably interfered with, owing to thick fog, prices in consequence showing considerable irregularity.

INDIAN. The quantity of Indian Tea brought to auction during the fortnight ending 15th inst. aggregated 97,873 packages.

Only 36,986 packages were catalogued against 49,300 last week. Fine and flavory kinds have not maintained values, but poor liquoring Teas are again easier. The following averages are worthy of note:—"Margaret's Hope," 2/1 $\frac{3}{4}$; "Mim T Co.," 1/7 $\frac{1}{2}$; "Dooteriah," 1/7 $\frac{1}{4}$; "Turzum," 1/7. Average for week, 8 $\frac{3}{4}$ d.

TRAVANCORE. This district is gradually increasing its output and some Estates are now showing improved quality.

This weeks average price of New Season's Teas sold on Garden Account. Total 24,687 pkgs. average 8 $\frac{3}{4}$ d.

EKOE. (Greyish to blackish some tip, useful liquor)	" 8 $\frac{1}{2}$ d.	" 10 $\frac{3}{4}$ d.	" 9 $\frac{1}{4}$ d.	" 9d.
EK. SOUG. (Blackish greyish, inferior liquor)	" 5 $\frac{1}{2}$ d.	" 8 $\frac{1}{2}$ d.	" 6 $\frac{3}{4}$ d.	" 6 $\frac{3}{4}$ d.
EKOE. (Blackish, greyish, some tip, inferior liquor)	" 6 $\frac{1}{4}$ d.	" 9 $\frac{1}{2}$ d.	" 8d.	" 7 $\frac{1}{2}$ d.

CEYLON. The lighter offerings were mostly sold at last week's rates, competition centring mostly upon good liquoring Pekoes and Broken Pekoes. Common Pekoes and Pekoe Souchongs are somewhat neglected and sold slowly. Telegrams from Colombo state that exports for January are not likely to exceed 5,000,000 lbs., which is 1,000,000 lbs. less than the general estimate. The following averages may be mentioned:—"Denegama," 1/2 $\frac{1}{2}$; "Kandapolla," 1/2 $\frac{1}{4}$; "Waverley" of the CTP Co., 1/2; "Dammeria," 1/1 $\frac{1}{4}$. Average for week, 9 $\frac{1}{4}$ d.

Comparative prices of Ceylon Tea in London:—

EKOE SOUG. (Ordinary leaf; fair liquor)	1892, 6 $\frac{1}{2}$ d.	1891, 9 $\frac{1}{4}$ d.	1890, 10d.	1889, 9d.
EKOE (Ordinary leaf, little twist; fair liquor)	" 9d.	" 11d.	" 10 $\frac{3}{4}$ d.	" 10 $\frac{1}{4}$ d.
EKOE SOUG. (Rather bold leaf; indifferent liquor)	" 5d.	" 9 $\frac{1}{4}$ d.	" 9 $\frac{1}{2}$ d.	" 8 $\frac{1}{2}$ d.
EKOE (Somewhat bold leaf; indifferent liquor)	" 6 $\frac{1}{4}$ d.	" 10d.	" 10d.	" 9 $\frac{1}{4}$ d.

JAVA was only represented by 45 packages of direct import. Arrivals have of late been very limited—the season's crop being considerably reduced through the prevalence of unfavourable weather in the island.

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests, p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

January 29th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	837,093 packages.	388,169 packages.	31,484 packages.
1891-1892.	943,158 "	532,493 "	29,824 "

During the week

3,569 packages INDIAN }
 4,974 " CEYLON } Total 48,909 packages have been offered in public auction.
 366 " JAVA }

The increasing favour with which Indian and Ceylon Teas are being regarded in Foreign Markets is shown by the progress made in the export trade of 1891 over that of 1890. Much encouragement may be derived from the fact that a larger quantity of both Indian and Ceylon Tea was exported during 1891, in spite of the high prices ruling during a considerable part of the year.

Exports of Indian and Ceylon Tea from Great Britain during 1890 and 1891.

	INDIAN.		CEYLON.	
	1890.	1891.	1890.	1891.
United States of America	635,077	659,831	322,539	417,982
Canada	567,268	621,490	201,979	410,958
Holland	309,150	393,394	129,872	153,995
*Germany	148,566	162,878	398,134	511,699
Russia	23,267	2,240	26,316	55,361
France	41,449	34,372	23,993	43,381
Other Places	899,802	1,465,623	329,098	499,653
	lbs. 2,624,579	lbs. 3,339,828	lbs. 1,431,931	lbs. 2,093,029

* Probably part of the Tea exported to Germany was for Russia.

INDIAN. Offerings were again light, and below last week's small total; thus contributing to strengthen the tone of the market. Prices have somewhat hardened, especially for better liquoring kinds—common Teas also being less neglected. A few more "Closing Invoices" were offered, the first having been sold last week. The following averages are worthy of note:—"Poobong," 1/11½; "Jokai Co., Hukanpukri," 1/7½; "L.M.B., Moondakotte," 1/6¾; "Shakamoto," 1/4¾.

This weeks average price of New Season's Teas sold on Garden Account. Total 21,878 pkgs. average 9d.

PEKOE. (Blackish, greyish, some tip, inferior liquor)	" 6¾d.	" 10d.	" 7¾d.	" 7½d.

CEYLON. With moderate offerings, bidding was more animated and prices have been generally very steady at last week's rates.

After this week, Thursday's Ceylon Auction will be held at 12 o'clock, in a separate room from Indian, instead of after the Indian Sales as at present. The following averages may be mentioned:—"Portswood," 1/4¾; "New Dimbula D," 1/1½; "St. George RA," 1/1½; "Kandapolla," "Melfort" and "Mooloya," 1/1. Average for week, 9d.

Total exports from Ceylon were 68,274,420 lbs., in 1891 against 45,943,469 lbs. in 1890.	
To the United Kingdom	63,744,987 1891 " 42,828,743 1890.
To Australia	3,210,598 1891 " 2,552,861 1890.
To the United States	163,137 1891 " 201,098 1890.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892, 6¾d.	1891, 10d.	1890, 9¾d.	1889, 9d.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT

13, ROOD LANE, LONDON, E.C.

February 5th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	871,778 packages.	397,038 packages.	34,908 packages.
1891-1892.	971,817 "	550,340 "	30,212 "

During the week

3,659 packages	INDIAN
7,847 "	CEYLON
388 "	JAVA

Total 46,894 packages have been offered in public auction.

The New French Tariff, which has just come into operation, happily imposes no additional duty upon the importation of Tea, notwithstanding its generally protective character.

Commercial Treaties with Portugal and Spain will shortly expire. An opportunity may therefore occur to negotiate for a reduction of the Tea duty, which in the former country is about 1/10½ per cent., and 10d. to 1/1½ in the latter.

Movements of Tea in London during January are shown below.

INDIAN. Comparatively light auctions,—28,659 packages against 33,569 last week,—imparted further steadiness to the market. Low Pekoes are a farthing dearer, and good liquoring Teas are strongly competed for at occasionally better prices.

This weeks average price of New Season's Teas sold on Garden Account. Total 22,308 pkgs. average 9½d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	14512 p	9½d	CHOTA NAGPORE ..			KANGRA VALLEY ..	226 p	6¾d
CACHAR AND SYLHET ..	4149 p	8¾d	DARJEELING & TERAI	1554 p	11½d	NEILGHERRY ..		
CHITTAGONG	89 p	9d	DOOARS	1136 p	8¾d	TRAVANCORE ..	642 p	7¼d

Comparative prices of Indian Tea in London:—

	1892,	4d.	1891,	6¾d.	1890,	5½d.	1889,	6¼d.
DUST. (Fair ordinary, dark liquor)								
FANNINGS. (Red to brown, strong rough liquor)		4¾d.		7½d.		6d.		5¾d.
BROKEN TEA. (Brownish to blackish, strong liquor)		6d.		9¼d.		7½d.		7d.
PEK. SOUG. (Blackish greyish, useful liquor)		6¾d.		10¼d.		8d.		8d.
PEKOE. (Greyish to blackish some tip, useful liquor)		8½d.		11d.		9¼d.		9¼d.
PEK. SOUG. (Blackish greyish, inferior liquor)		5½d.		9½d.		6¾d.		6¾d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)		6¾d.		10d.		7½d.		7½d.

CEYLON. No actual change can be noted in the market, but prices are fully maintained and competition has been general and animated. Thursday's sale, which was held concurrently with Indian Tea at 12 o'clock, in a separate room, was well attended; and was characterised by brisk bidding. Average for week, 9¼d.

Comparative prices of Ceylon Tea in London:—

	1892,	6½d.	1891,	10¾d.	1890,	9¾d.	1889,	8½d.
PEKOE SOUG. (Ordinary leaf; fair liquor)								
PEKOE (Ordinary leaf, little twist; fair liquor)		9d.		11¾d.		10¼d.		10¼d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)		5d.		10d.		9d.		8¼d.
PEKOE (Somewhat bold leaf; indifferent liquor)		6¼d.		10¾d.		9½d.		9d.

JAVA. Only 388 packages were brought forward; these met with attention at about previous rates. Average, 6¼d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

Supplement to THE OBSERVER.
GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.
 13, ROOD LANE, LONDON, E.C. February 12th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	904,788 packages.	409,914 packages.	35,445 packages.
1891-1892.	1,004,730 "	570,078 "	30,921 "

during the week

9,913 packages	INDIAN
7,738 "	CEYLON
709 "	JAVA

Total 53,360 packages have been offered in public auction.

A marked stimulus appears to have been given to Tea consumption in foreign countries, through recent low quotations. Exports of both Indian and Ceylon Tea from Great Britain, during the last six months of 1891, were greatly in excess of those between January and June, when prices were much higher.

Exports of Indian and Ceylon Tea from Great Britain during the first and last half-years of 1891.

weekly in our circular.				

* Probably part of the Tea exported to Germany was for Russia.

INDIAN. Very little change can be recorded in the market. Auctions have been characterized by general firmness, all grades selling steadily at prices fully up to last week's rates. The quality of some of the "Darjeeling" Teas recently arrived shows improvement, and high prices have been occasionally paid in consequence. At Thursday's sale good liquoring Teas were in very strong demand. The following averages are worthy of note:—"Majuli T Co. M," 1/4³/₄; "Darjeeling T Co. G," 1/4; "Balasun" and "Goomtee," 1/3³/₄.

This weeks average price of New Season's Teas sold on Garden Account. Total 24,234 pkgs. average 8³/₄d.

Comparative prices of Indian Tea in London:—

DUST. (Fair ordinary, dark liquor)	1892, 4d.	1891, 7d.	1890, 5 ¹ / ₂ d.	1889, 6 ¹ / ₄ d
FANNINGS. (Red to brown, strong rough liquor)	" 4 ³ / ₄ d.	" 7 ³ / ₄ d.	" 6d.	" 5 ³ / ₄ d.
BROKEN TEA. (Brownish to blackish, strong liquor)	" 6d.	" 9 ¹ / ₂ d.	" 7 ¹ / ₂ d.	" 6 ³ / ₄ d.
PEK. SOUG. (Blackish greyish, useful liquor)	" 6 ³ / ₄ d.	" 10 ¹ / ₂ d.	" 8d.	" 8 ¹ / ₄ d.
PEKOE. (Greyish to blackish some tip, useful liquor)	" 8 ³ / ₄ d.	" 11d.	" 9 ¹ / ₄ d.	" 9 ³ / ₄ d.
PEK. SOUG. (Blackish greyish, inferior liquor)	" 5 ¹ / ₂ d.	" 9 ¹ / ₂ d.	" 6 ³ / ₄ d.	" 7d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	" 6 ³ / ₄ d.	" 10 ¹ / ₄ d.	" 7 ¹ / ₂ d.	" 7 ³ / ₄ d.

CEYLON. Offerings although higher above last week's total and comparatively heavy, were readily taken by the trade with good competition. Rates have not materially altered, but finest descriptions attracted most attention. In Thursday's auction common kinds were somewhat less inquired for. The following averages may be mentioned:—"Tommagong," 1/3¹/₂; "Norwood" of the EP & E Co., 1/3; "New Dimbula D," 1/2³/₄. Average for week, 9¹/₄d.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892, 6 ¹ / ₄ d.	1891, 10 ³ / ₄ d.	1890, 9 ³ / ₄ d.	1889, 8 ³ / ₄ d.
PEKOE (Ordinary leaf, little twist; fair liquor)	" 8 ³ / ₄ d.	" 11 ¹ / ₂ d.	" 10 ¹ / ₄ d.	" 10d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	" 5d.	" 9 ³ / ₄ d.	" 9d.	" 8 ¹ / ₄ d.
PEKOE (Somewhat bold leaf; indifferent liquor)	" 6d.	" 10 ³ / ₄ d.	" 9 ¹ / ₂ d.	" 8 ³ / ₄ d.

AVAS. Only one auction was held; this was well attended and competition good. Rates were fully maintained; some parcels were however withdrawn for higher offers. A parcel of white tipped pekoe from the "Jasinga" estate, realized 1/6¹/₄ per lb. Average, 7d.

BANK RATE. 3 per cent. **EXCHANGE.** Calcutta on London three months sight is. 4¹/₂d.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

February 19th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	930,102 packages.	428,710 packages.	37,145 packages.
1891-1892.	1,039,713 "	585,784 "	31,165 "

during the week

4,983 packages	INDIAN
5,706 "	CEYLON
244 "	JAVA

Total 50,933 packages have been offered in public auction.

The volume of Tea brought to auction since Christmas has been comparatively heavy, and appears to have fully equalled immediate trade requirements, in addition to its absorption of considerable capital.

These reasons probably account for the somewhat quieter tone lately noticeable in the auctions, and the disposition of buyers to allow the market to droop.

The offering of a parcel of 303 packages of Tea from Natal is a noticeable feature amongst catalogues issued. No Tea from this quarter has been on the market for some years, and the present shipment is a comparatively large quantity.

INDIAN. Bidding was less animated for all but really desirable Teas. Poor liquoring kinds have generally sold with an easier tendency, and towards the close of the week were fully a farthing below last week's rates. Quality from most districts has shown some improvement during several weeks past, and many "autumnal" invoices have attracted attention owing to their fine flavour. The following averages are worthy of note:—"Pusumbing," 1/10½; "Tong Song," 1/10; "Darjeeling T Co. A," 1/6½; "Balasun," 1/4¾; "Dilaram," 1/3¼.

TRAVANCORE continues to be represented by increasing quantities, while it is satisfactory to note an occasional improvement in quality.

This weeks average price of New Season's Teas sold on Garden Account. Total 25,063 pkgs. average 8½d.

Comparative prices of Indian Tea in London:—

DUST. (Fair ordinary, dark liquor)	1892,	4d.	1891,	7d.	1890,	5½d.	1889,	6¼d.
FANNINGS. (Red to brown, strong rough liquor)	..	4¾d.	..	7¾d.	..	6d.	..	5¾d.
BROKEN TEA. (Brownish to blackish, strong liquor)	..	5¾d.	..	9½d.	..	7½d.	..	6¾d.
PEK. SOUG. (Blackish greyish, useful liquor)	..	6½d.	..	10½d.	..	8d.	..	8¼d.
PEKOE. (Greyish to blackish some tip, useful liquor)	..	8½d.	..	11d.	..	9½d.	..	9¾d.
PEK. SOUG. (Blackish greyish, inferior liquor)	..	5¼d.	..	9½d.	..	6¾d.	..	7d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	..	6½d.	..	10½d.	..	7½d.	..	8d.

CEYLON. The market has been supported wherever distinct point or character was discernible in liquor—but other kinds have sold with irregularity, and thin or poor Teas have been depressed, selling in some cases fully a farthing to a halfpenny below rates current a week ago. Many invoices are now showing a welcome change for the better in quality and flavour. The following averages may be mentioned:—"Bloomfield, F.," 1/5¼ & U.F., 1/4¼; "C.T.P. Co. Waverley, 1/2½; Kotiyagalla, 1/2½; "Mooloya," 1/1¾; "Hauteville," 1/1½. Average for week, 9d.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892,	6d.	1891,	10½d.	1890,	9½d.	1889,	8½d.
PEKOE (Ordinary leaf, little twist; fair liquor)	..	8½d.	..	11¼d.	..	10¼d.	..	10d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	..	5d.	..	9¾d.	..	8¾d.	..	8¼d.
PEKOE (Somewhat bold leaf; indifferent liquor)	..	5¾d.	..	10½d.	..	9½d.	..	8¾d.

JAVA was only represented by 244 packages of which 192 were of direct import. A small parcel of White Tipped Pekoe from the "Semplak" Estate, realized the high price of 2/- per lb. Arrivals of this leaf have recently been slightly heavier—hence catalogues for larger quantities may shortly be expected.

BANK RATE. 3 per cent. **EXCHANGE.** Calcutta on London three months sight is. 4¾d.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	1,107,237 packages.	550,554 packages.	50,348 packages.
1891-1892.	1,211,320 ,,	704,158 ,,	38,387 ,,

during the week

— packages INDIAN	} Total 719 packages have been offered in public auction.
— ,, CEYLON	
719 ,, JAVA	

The annexed table shows the quantities of Indian and Ceylon Tea exported from Great Britain during each month since January, 1890. At this date, separate figures for these exports were first obtainable.

The use of both Indian and Ceylon Tea in foreign markets has been gradually increasing, and when the high prices which ruled during the greater part of 1890 are taken into consideration, the progress is decidedly encouraging.

Recent low quotations have increased foreign demand generally, and imparted a stimulus to the trade which is very noticeable in the statistics of the last few months.

There is strong ground for believing that the approaching Chicago Exhibition will further popularize British Grown Tea in North America. Efforts are being made both by India and Ceylon to utilize this exhibition as a means for increasing the demand in the United States.

INDIAN. In the absence of public sales there is nothing to report, the market practically remaining closed till Monday next.

Comparative prices of Indian Tea in London:—

DUST. (Fair ordinary, dark liquor)	1892, 3½d.	1891, 7d.	1890, 5d.	1889, 5½d.
FANNINGS. (Red to brown, strong rough liquor)	,, 4¼d.	,, 8d.	,, 5¾d.	,, 5d.
BROKEN TEA. (Brownish to blackish, strong liquor)	,, 5½d.	,, 9¾d.	,, 7½d.	,, 6½d.
PEK. SOUG. (Blackish greyish, useful liquor)	,, 6½d.	,, 10¼d.	,, 8½d.	,, 7¾d.
PEKOE. (Greyish to blackish some tip, useful liquor)	,, 9d.	,, 11¼d.	,, 9¼d.	,, 9d.
PEK. SOUG. (Blackish greyish, inferior liquor)	,, 5d.	,, 10d.	,, 7d.	,, 6½d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	,, 6½d.	,, 10½d.	,, 8d.	,, 7¼d.

CEYLON. No auctions have been held this week, the next public sale being advertised for Tuesday the 26th inst., for which date 17,515 packages are catalogued.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892, 5¾d.	1891, 9¾d.	1890, 8¾d.	1889, 8d.
PEKOE (Ordinary leaf, little twist; fair liquor)	,, 8½d.	,, 10½d.	,, 10¼d.	,, 9d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	,, 4¾d.	,, 9½d.	,, 8¼d.	,, 7¼d.
PEKOE (Somewhat bold leaf; indifferent liquor)	,, 5½d.	,, 10d.	,, 9d.	,, 8d.

JAVA. Only one sale was held. This consisted of 719 packages from the "Bagelen" estate. Competition was good at slightly improving rates. 399 chests of Pekoe sold at from 5½d. to 9¾d., and 320 chests of Pekoe Souchong at from 4¾d. to 5½d. Total average, 6½d. per lb.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
during the week 1890-1891.	1,080,525 packages.	536,341 packages.	50,348 packages.
1891-1892.	1,211,320 "	704,158 "	37,668 "
3,584 packages	INDIAN		
3,811 "	CEYLON		
1,391 "	JAVA		
	Total 28,786 packages have been offered in public auction.		

Tea consumption continues to progress. An increased quantity was necessary to supply the expanding demand of the country, in spite of the serious falling off in the use of China Tea. The figures given below show that an additional 7½ million lbs. were taken during the past ten months, the consumption of liquid Tea must therefore have shown its usual satisfactory expansion.

The low rates so long ruling for Indian Teas have at length brought up the home consumption of this leaf a million pounds above figures this time last season. The use of Ceylon Tea also becomes more and more general.

It is worthy of note that the quantity of Indian and Ceylon Tea exported from Great Britain almost double what it was at the same period last season;—still further illustrating the effect of prolonged low prices.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to 31st March.

	1888-1889.	per centages.	1889-1890.	per centages.	1890-1891.	per centages.	1891-1892.	per centages.

China, etc.	32,898,797	29,572,801	25,295,929	24,121,756

INDIAN. Sales were only held on Monday, when competition was strong for all Teas with desirable liquor, but those of indifferent quality were neglected and must be quoted in many instances ¼d. to ½d. cheaper.

This weeks average price of New Season's Teas sold on Garden Account. Total 9,587 pkgs. average 8¾d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.

CACHAR AND SYLHET	5442 p	8¾d	DARJEELING	21 c	11¼d	NEILGHERRY		
CHITTAGONG			DOOARS	984 p	8d	TRAVANCORE	192 p	5¾d

Comparative prices of Indian Tea in London:—

	1892.	1891,	1890,	1889,
DUST. (Fair ordinary, dark liquor)	3½d.	7d.	5d.	5½d.
FANNINGS. (Red to brown, strong rough liquor)	4¼d.	8d.	5¾d.	5d.
BROKEN TEA. (Brownish to blackish, strong liquor)	5½d.	9¾d.	7¼d.	6½d.
PEK. SOUG. (Blackish greyish, useful liquor)	6½d.	10½d.	8½d.	7¾d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	11¼d.	9¼d.	9d.
PEK. SOUG. (Blackish greyish, inferior liquor)	5d.	9¾d.	7d.	6½d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	6½d.	10½d.	7¾d.	7¼d.

CEYLON. The only auction held this week was on Tuesday, when bidding was lacking in animation, except for such parcels as possessed greatest attraction in liquor. Speaking generally the market was weak, and poorer liquoring Teas must be quoted fully a farthing to a halfpenny cheaper. Undesirable kinds were somewhat neglected. Average 8¾d.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	1890,	1889,
PEKOE SOUG. (Ordinary leaf; fair liquor)	5¾d.	9½d.	8¾d.	8d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8½d.	10¾d.	10½d.	9d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	4¾d.	9¼d.	8¼d.	7¼d.
PEKOE (Somewhat bold leaf; indifferent liquor)	5½d.	10d.	9d.	8d.

JAVA. Sales passed at about rates current last week showing a lower market than that of a fortnight since, for all kinds except really good liquoring Teas or tippy Pekoes. The export demand continues to assist materially in giving support to the market.

BANK RATE. 2½ per cent. EXCHANGE on London three months sight.—Calcutta 1/31. Colombo 1/31

In considering the deliveries for March it must be borne in mind that Easter fell in that month last year, also that the value of such Teas as constitute the bulk of the Home Consumption was then very much higher than at present. Even taking these circumstances into account, deliveries have proved exceptional, and clearly illustrate the effect of prolonged low rates in forcing Indian and Ceylon Tea into consumption. The monthly deliveries of Indian Tea have on only three occasions exceeded those for March. Deliveries of Ceylon Tea during the past nine months almost equal the usually heavy imports.

INDIAN. The market has remained very firm for all descriptions, Teas with quality especially selling with strong competition. High averages were made by "Hukanpukri," $1/8\frac{3}{4}$; "Gotoonga," $1/5\frac{3}{4}$. This weeks average price of New Season's Teas sold on Garden Account. Total 16,314 pkgs. average 9d.

CEYLON. Auctions comprised 13,913 packages against 20,457 last week. All Teas with point liquor met with attention and sold at full prices. Commonest descriptions alone showed less animation and occasionally passed at slightly easier rates. Exports from Ceylon during March were 5,500,000 lbs., and the estimated export for April is a trifle over this figure. Average for week, 9d.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892, 6d.	1891, 9 $\frac{1}{2}$ d.	1890, 9d.	1889, 8d.
PEKOE (Ordinary leaf, little twist; fair liquor)	" 8 $\frac{1}{4}$ d.	" 10 $\frac{1}{2}$ d.	" 10 $\frac{3}{4}$ d.	" 9d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	" 5d.	" 9 $\frac{1}{4}$ d.	" 8 $\frac{1}{4}$ d.	" 7 $\frac{1}{4}$ d.
PEKOE (Somewhat bold leaf; indifferent liquor)	" 5 $\frac{3}{4}$ d.	" 10d.	" 9d.	" 8d.

AVAS. Bidding was languid, except for the higher grades, and a considerable proportion of the poorer descriptions was withdrawn. A few export orders somewhat assisted the market.

In these tables all packages are chests unless otherwise stated b stands for boxes, ½ for half-chests, p for packages † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

April 1st, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	1,028,998 packages.	496,630 packages.	44,871 packages.
1891-1892.	1,171,239 "	676,434 "	34,426 "

During the week

2,268 packages INDIAN

0,457 " CEYLON

1,355 " JAVA

Total 44,080 packages have been offered in public auction.

The quantity brought forward between 1st January and 31st March, shows considerable excess over that of the same time last year. Even taking into account the few working days which were lost in March last year, through the fact that Easter fell at the end of that month, greater freedom has been shown in bringing arrivals to sale.

INDIAN. About the same quantity was brought forward as last week. Up to the 31st March, 9 "last of the season" invoices have been disposed of, against only 40 for the same time last year. The market has been very steady for all descriptions, while anything above common must be quoted rather dearer, good liquoring Teas marking a still further advance. Autumn flavoured invoices continue to come in of good quality and occasional high averages have been obtained. The following averages are worthy of note:—"Moabund," 1/10 $\frac{3}{4}$; "Luckimpore," 1/6 $\frac{1}{2}$; "Panitola" of the Jokai Tea Co., "Majuli T Co.," and "Oaklands," 1/2 $\frac{3}{4}$.

Amongst the Travancore Teas, an invoice from the "Nagamally" Tea Co.'s Estate, realized an average of 9 $\frac{3}{4}$ d.

This weeks average price of New Season's Teas sold on Garden Account. Total 15,251 pks. average 9 $\frac{1}{2}$ d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.

CHITTAGONG			KANGRA VALLEY, ETC.	91 $\frac{1}{2}$	c 5 $\frac{1}{2}$ d	TRAVANCORE	194	p 7 $\frac{1}{2}$ d

Comparative prices of Indian Tea in London:—

	1892.	1891.	1890.	1889.
DUST. (Fair ordinary, dark liquor)	3 $\frac{3}{4}$ d.	7d.	5d.	5 $\frac{1}{2}$ d.
FANNINGS. (Red to brown, strong rough liquor)	4 $\frac{1}{2}$ d.	7 $\frac{3}{4}$ d.	5 $\frac{1}{2}$ d.	5d.
BROKEN TEA. (Brownish to blackish, strong liquor)	5 $\frac{1}{2}$ d.	9 $\frac{1}{2}$ d.	7d.	6 $\frac{1}{2}$ d.
PEK. SOUG. (Blackish greyish, useful liquor)	6 $\frac{1}{2}$ d.	10 $\frac{1}{2}$ d.	8 $\frac{1}{2}$ d.	7 $\frac{3}{4}$ d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	11d.	9 $\frac{1}{4}$ d.	9d.
PEK. SOUG. (Blackish greyish, inferior liquor)	5 $\frac{1}{4}$ d.	9 $\frac{1}{2}$ d.	6 $\frac{1}{2}$ d.	6 $\frac{1}{2}$ d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	6 $\frac{3}{4}$ d.	10 $\frac{1}{4}$ d.	7 $\frac{1}{2}$ d.	7 $\frac{1}{2}$ d.

CEYLON. 20,457 packages were brought forward against 14,759 last week. In spite of the comparatively large auction, competition was strong throughout the sale, and good liquoring and avoury kinds sold at very firm rates. Poor liquoring Teas of the lower grades were not bid for with much animation, and in Thursday's auction showed a slight decline in rates. The following averages may be mentioned:—"Norwood," of E.P.&E.C. 1/3 $\frac{1}{2}$; "Portswood," 1/2 $\frac{3}{4}$; "Edinburgh" and "Kotiyagalla," 1/2 $\frac{1}{2}$. Average for week, 9d.

Comparative prices of Ceylon Tea in London:—

	1892.	1891.	1890.	1889.
PEKOE SOUG. (Ordinary leaf; fair liquor)	6d.	9 $\frac{1}{2}$ d.	9d.	8d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8 $\frac{3}{4}$ d.	10 $\frac{1}{2}$ d.	10 $\frac{1}{2}$ d.	9d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	5d.	9 $\frac{1}{4}$ d.	8 $\frac{1}{4}$ d.	7 $\frac{1}{2}$ d.
PEKOE (Somewhat bold leaf; indifferent liquor)	5 $\frac{3}{4}$ d.	10d.	9 $\frac{1}{4}$ d.	8d.

JAVA. Auctions were on a somewhat larger scale, and the Teas met with considerable attention, being principally bought for the export trade. An invoice from the "Bagelen" Estate, comprised the bulk of the offerings; tippy Pekoes sold well, the average for the invoice being 6 $\frac{1}{4}$ d.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3 $\frac{5}{16}$. Colombo 1/3 $\frac{5}{16}$

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

March 25th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	1,028,361 packages.	496,630 packages.	44,871 packages.
1891-1892.	1,148,971 "	655,977 "	33,071 "

During the week

2,975 packages	INDIAN	} Total 37,771 packages have been offered in public auction.
4,759 "	CEYLON	
37 "	JAVA	

The firmer tone noticed last week has been even more pronounced, and the impression appears to be gaining ground that the lowest prices have been passed for the present, and that with diminishing supplies from India and moderate offerings from Ceylon, the outlook has a more hopeful appearance.

The very low range of prices so long ruling for such Teas as make up the bulk of the Home Consumption, compares in a marked manner with rates for similar Teas at this time last year, when they were several pence per lb. dearer. To the present low rates of Indian and Ceylon Teas of this class may probably be attributed the great falling off which is again so noticeable in the Home Consumption of China Tea.

Clearances of all Tea from the 1st inst., are considerably in excess of the same time last year. **INDIAN.** Closing invoices have been sold from several Gardens. The market for Teas with quality is, if anything, dearer, while medium Teas also, in some cases, show an advance upon last week's rates, the commonest grades being also better competed for. The quality of many of the autumn flavoured invoices was good and some high averages have in consequence been obtained.

The following averages are worthy of note:—"Jetookiah," 1/3½; "Shakamoto," 1/3¼; "Upper Assam," 1/2½; "Sealkotee," 1/2¼.

TRAVANCORE was represented by a considerable quantity. The general quality from this district still needs improvement, although it is satisfactory to note a change for the better in recent arrivals.

This weeks average price of New Season's Teas sold on Garden Account. Total 16,090 pkgs. average 9½d.

Comparative prices of Indian Tea in London:—

DUST. (Fair ordinary, dark liquor)	1892, 3¾d.	1891, 7d.	1890, 5d.	1889, 5½d
FANNINGS. (Red to brown, strong rough liquor)	" 4½d.	" 7¾d.	" 5½d.	" 5d.
BROKEN TEA. (Brownish to blackish, strong liquor)	" 5½d.	" 9½d.	" 7d.	" 6½d.
PEK. SOUG. (Blackish greyish, useful liquor)	" 6½d.	" 10¼d.	" 8¼d.	" 7¾d.
PEKOE. (Greyish to blackish some tip, useful liquor)	" 9d.	" 11d.	" 9¼d.	" 9d.
PEK. SOUG. (Blackish greyish, inferior liquor)	" 5¼d.	" 9½d.	" 6½d.	" 6½d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	" 6¾d.	" 10¼d.	" 7½d.	" 7¼d.

CEYLON. Auctions comprised 14,759 packages and were well received by the trade, competition running mainly upon Teas with point and character in liquor, finest descriptions selling at dearer rates. All Teas with quality were strongly competed for at steady prices. Poor liquoring Teas have sold with a rather hardening tendency. Quality of offerings continues to show improvement, and reports from Ceylon state that better Teas are likely to arrive in the near future. The following averages may be mentioned:—"Ormidale," 1/5½; CTPCo., "Waverley," 1/2½; "Portmore," 1/2; "Hauteville" and "St. George," 1/1¼. Average for week, 9d.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892, 6d.	1891, 9½d.	1890, 9d.	1889, 8d.
PEKOE (Ordinary leaf, little twist; fair liquor)	" 8¾d.	" 10½d.	" 10½d.	" 9d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	" 5d.	" 9¼d.	" 8¼d.	" 7½d.
PEKOE (Somewhat bold leaf; indifferent liquor)	" 5¾d.	" 10d.	" 9¼d.	" 8d.

JAVA. No auctions of direct import have taken place, but arrivals during the past few weeks have been heavier, and catalogues are advertised for several sales in the near future.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3²¹/₃₂. Colombo 1/3²⁴/₃₂

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

April 29th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	1,126,973 packages.	575,067 packages.	50,348 packages.
1891-1892.	1,232,584 "	728,360 "	40,645 "

During the week

1,264 packages	INDIAN	} Total 47,724 packages have been offered in public auction.
4,202 "	CEYLON	
2,258 "	JAVA	

The market opened after the holidays with a good demand for all grades. Competition was sufficiently active to carry prices in some instances slightly over those ruling a fortnight ago.

Export markets are now becoming of such importance to British Grown Tea, that it will be interesting to proprietors of Estates to know that during the past *three* months, the quantity of both Indian and Ceylon Tea exported from Great Britain, was almost equal to that shipped during the first *six* months of last year. The effect of low prices thus becomes very apparent, and is decidedly creating demand in foreign markets.

INDIAN. 174 closing invoices have been disposed of, against 166 to the end of April last year. The market was steady throughout the week, prices being slightly above those ruling before the holidays. Next season's Indian Tea crop is estimated at 129,000,000 lbs., of which 119,000,000 lbs. are expected to be available for the United Kingdom. The following averages are worthy of note:—"Hukanpukri" of the Jokai T Co., 1/8½; "Doom Dooma, B.," 1/2¼; "Tudor Hall," and "Panitola of the Jokai T Co.," 1/2.

TRAVANCORE was represented by a rather large assortment. The highest averages were obtained by the following estates:—"Fairfield," 10½d.; "Arnakel," 9½d.; and "Vembenard," 9d.

This weeks average price of New Season's Teas sold on Garden Account. Total 15,954 pkgs. average 8½d.

PEK. SOUG.	(Blackish greyish, inferior liquor)	5¼d.	9¾d.	9¾d.	7d.	7d.	6¾d.	6¾d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	6¾d.	10¼d.	10¼d.	8d.	8d.	7¼d.	7¼d.

CEYLON. Public sales were unusually heavy— the weeks quantity ranking amongst the highest totals on record. There was no difficulty in dealing with this large supply, after a fortnights cessation of auctions; consequently with a brisk demand, quotations were fully up to prices ruling before the holidays. Better liquoring kinds showed an occasional advance. Quality continues to show signs of improving and many Teas now arriving are of good quality and flavour. The following averages may be mentioned: "Norwood" of the EP & FCo., and "Portswood," 1/3¼; "Kew," 1/2½. Average, 9¼d.

Comparative prices of Ceylon Tea in London:—

	(Description)	1892,	6d.	1891,	9¾d.	1890,	8½d.	1889,	8d.
PEKOE SOUG.	(Ordinary leaf; fair liquor)	8d.	8d.	10½d.	10d.	10d.	9¼d.	9¼d.	
PEKOE	(Ordinary leaf, little twist; fair liquor)	4¾d.	4¾d.	9¼d.	8d.	8d.	7¼d.	7¼d.	
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	5¾d.	5¾d.	9¾d.	8¾d.	8d.	8d.	8d.	

JAVA. The auctions which comprised 2,258 packages, passed well, the Teas being mostly sold at prices about equal to those ruling just before the holidays— the late fall in values not as yet having been recovered.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3½. Colombo 1/3½

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

May 6th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	1,142,183 packages.	596,715 packages.	53,255 packages.
1891-1892.	1,255,027 "	748,828 "	40,645 "

During the week

2,443 packages INDIAN
 3,468 " CEYLON } Total 42,911 packages have been offered in public auction.
 — " JAVA }

The increase in the deliveries of Indian and Ceylon Tea last month, compared with April 1891, is satisfactory and illustrates the effect of prolonged low prices. Considering that Easter fell in April this year but in March in 1891, the comparison is even more favorable.

INDIAN. The market has continued very firm for all descriptions, and good liquoring kinds are if anything dearer. The following averages are worthy of note:—"Jhanzie T Association," 1/2, and "Panitola" of the Jokai T Co., 1/1 3/4.

This weeks average price of New Season's Teas sold on Garden Account. Total 10,380 pkgs. average 8d.

PEKOE.	(Greyish to blackish some tip, useful liquor)	9 1/2 d.	10 3/4 d.	9 1/2 d.	9d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	5 1/4 d.	9 1/4 d.	7 1/4 d.	6 1/2 d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	6 3/4 d.	9 3/4 d.	8d.	7d.

CEYLON. The quantity brought forward was again heavy although below last week's total. Little change can be recorded in prices; competition has been fairly brisk and values are about maintained. Tuesday's sale of 19,183 packages contained 873 breaks, a number extremely difficult for buyers to value carefully in the limited time available. Exports from Ceylon to the United Kingdom during April were 6,000,000 lbs. Average, 8 3/4 d.

Comparative prices of Ceylon Tea in London:—

	(Description)	1892,	1891,	1890,	1889,
PEKOE SOUG.	(Ordinary leaf; fair liquor)	6d.	9 1/4 d.	8 1/4 d.	7 1/4 d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	8 3/4 d.	10d.	10d.	9d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	4 1/4 d.	8 3/4 d.	8d.	6 3/4 d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	5 3/4 d.	9 1/4 d.	8 3/4 d.	7 1/4 d.

JAVA was not represented. Catalogues are issued for 930 packages.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

May 13th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	1,151,218 packages.	614,265 packages.	55,780 packages.
1891-1892.	1,268,514 "	769,276 "	41,425 "

During the week

3,487 packages INDIAN }
 0,448 " CEYLON } Total 34,715 packages have been offered in public auction.
 780 " JAVA }

The increase in Home Consumption during the past eleven months is satisfactory.

Exports of Indian and Ceylon Teas from Great Britain during April were Indian, 349,152, Ceylon, 340,123; against Indian, 169,104, Ceylon, 151,536 in April last year.

Figures below show a remarkable expansion in the re-export of Indian and Ceylon Teas during eleven months.

It has been arranged that until August, Indian Sales shall be held only on Mondays and Wednesdays, and Ceylons on Tuesdays and Thursdays. This plan may promote the more even distribution of the Ceylon auctions on the two days mentioned, and thus relieve the pressure of sales on Tuesdays.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to 30th April.

	1888-1889.	per centages.	1889-1890.	per centages.	1890-1891.	per centages.	1891-1892.	per centages.
Indian	82,582,401	49	81,117,248	53	93,584,697	51	95,349,797	50
Ceylon	20,937,366	12	24,186,728	16	36,313,139	20	52,536,284	28

Total lbs.	169,092,638		153,029,940		182,524,600		188,673,745	

Quantity of Tea exported from Great Britain, from 1st June to 30th April.

	1888-89.	1889-90.	1890-91.	1891-92.
Indian	Included with China.	Included with China.	2,134,262	3,860,315
Ceylon	"	"	1,294,162	2,672,592
China, etc.	36,231,595	32,649,646	27,521,659	26,745,800

INDIAN. The market continues very steady. Invoices of new Tea just to hand from Darjeeling and Terai show excellent quality and flavor, combined with useful strength.

This weeks average price of New Season's Teas sold on Garden Account. Total 6,228 pkgs. average 8½d.

	PKGS.	PRICE.		PKGS.	PRICE.		PKGS.	PRICE.
ASSAM	1328 p	9½d	CHOTA NAGPORE ..			KANGRA VALLEY, ETC.	52 p	5½d
CACHAR AND SYLHET..	4276 p	8d	DARJEELING			NEILGHERRY	25 b	9d
CHITTAGONG			DOOARS	486 p	9d	TRAVANCORE	61 c	6½d

Comparative prices of Indian Tea in London:—

	1892,	1891,	1890,	1889,
DUST. (Fair ordinary, dark liquor)	3½d.	6½d.	5¾d.	4¾d.
ANNINGS. (Red to brown, strong rough liquor)	4½d.	7d.	6d.	4¼d.
BROKEN TEA. (Brownish to blackish, strong liquor)	6d.	8½d.	7¾d.	5½d.
BEK. SOUG. (Blackish greyish, useful liquor)	6½d.	9½d.	8¾d.	7½d.
EKOE. (Greyish to blackish some tip, useful liquor)	10d.	10½d.	9¾d.	9d.
BEK. SOUG. (Blackish greyish, inferior liquor)	5¼d.	9d.	7½d.	6d.
EKOE. (Blackish, greyish, some tip, inferior liquor)	7d.	9¼d.	8¼d.	6½d.

CEYLON. The presence of several invoices of improved quality conduced to the distinctly better tone noticeable in the bidding. Prices are dearer to the extent of a halfpenny to a penny per lb., only a few poor liquoring lots not participating in the general advance. Average, 9½d.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	1890,	1889,
EKOE SOUG. (Ordinary leaf; fair liquor)	6¼d.	8½d.	8¼d.	6¾d.
EKOE (Ordinary leaf, little twist; fair liquor)	9d.	9½d.	9¾d.	7¾d.
EKOE SOUG. (Rather bold leaf; indifferent liquor)	5d.	8¼d.	8d.	6½d.
EKOE (Somewhat bold leaf; indifferent liquor)	6d.	8¾d.	8¾d.	7d.

JAVA. The small sale passed at rather better rates—export demand being strong and the quantity arriving very small.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/30. Colombo 1/30.

INDIAN. Average 8½d.

In these tables all packages are chests unless otherwise stated. b stands for boxes, pc for half-chests, p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

May 20th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	1,151,260 packages.	614,898 packages.	57,216 packages.
1891-1892.	1,283,636 "	683,807 "	41,765 "

During the week

5,122 packages	INDIAN
4,531 "	CEYLON
340 "	JAVA

Total 29,993 packages have been offered in public auction.

It is hoped that the Indian Tea Industry will be adequately represented at the Chicago Exhibition.

The Indian Tea Districts Association have sent out a circular to Tea Planters, inviting a subscription towards a Fund for developing New Markets; the immediate object being the representation of Indian Tea at the coming Chicago Exhibition.

At present 60,000 acres have subscribed from London, Calcutta not yet having had time to reply. It is earnestly hoped that Planters intending to subscribe will lose no time in sending in their names, as unless 200,000 acres are represented out of the 300,000 or so, under Tea in India, no action will be taken. The sum asked for is only 2 annas per acre of cultivation, plus ½ anna per maund of Tea made.

Ceylon has already raised a considerable sum of money, with the aid of a grant from Government;—and sent a Commissioner to Chicago.

INDIAN. The firmness noted last week has now hardened into an advance, all grades being slightly dearer, with keen competition. The first sale of the season was held in Calcutta yesterday the 19th inst., when about 5,000 packages were brought to auction. The following averages are worthy of note:—"Panitola" of the Jokai Co., 1/2; "Jaipur," 1/1½; "Singlo," 1/0¾.

This weeks average price of New Season's Teas sold on Garden Account. Total 9,597 pkgs. average 8¼d.

Comparative prices of Indian Tea in London:—

DUST.	(Fair ordinary, dark liquor)	1892.	3¾d.	1891.	6½d.	1890.	5¾d.	1889.	4¼d.
FANNINGS.	(Red to brown, strong rough liquor)	"	4¾d.	"	7d.	"	6½d.	"	4l.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6½d.	"	8½d.	"	8d.	"	5l.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7d.	"	9½d.	"	9l.	"	7¾d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	10¼d.	"	10½d.	"	10l.	"	8½l.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	5¼d.	"	9d.	"	7¾d.	"	5½l.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¼d.	"	9¼d.	"	8¾l.	"	6¼l.

CEYLON. Supplies brought forward were small, the quantity being only 14,531 against 20,448 last week. The advance noted a week since has further developed, and all descriptions must again be quoted fractionally dearer. Poor Teas and Teas "for price," which were not affected last week, have now participated in the better prices generally ruling. The improvement recently noticed in quality is fully maintained. The following averages may be mentioned:—"Norwood" of the EP & ECo., 1/1½; "New Dimbula," 1/1½; "Bambrakelly and Dell," 1/1½. Average for week, 9½d.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG.	(Ordinary leaf; fair liquor)	1892.	6¾d.	1891.	8¾d.	1890.	8¼d.	1889.	6¾d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	"	9½d.	"	9¾d.	"	9¾d.	"	8¼d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	"	5¼d.	"	8d.	"	8d.	"	6d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	"	6d.	"	8¾d.	"	8½d.	"	6½d.

JAVA. The auctions were very small, representing only 340 packages. Competition for these was good, this grade of Tea sharing in the better demand for Indian and Ceylon noted above. A small parcel of white tipped Pekoe from the "Tjisalak" Estate realised 1/11 per lb.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/30. Colombo 1/30.

INDIAN. Average 8½d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

May 27th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1890-1891.	1,159,343 packages.	633,503 packages.	57,339 packages.
1891-1892.	1,293,266 "	708,750 "	42,746 "

During the week

9,660 packages	INDIAN	} Total 35,584 packages have been offered in public auction.
4,943 "	CEYLON	
981 "	JAVA	

Promises of support towards the fund for representing Indian Tea at the Chicago Exhibition appear to be coming in rather more rapidly.

The appropriation of Thursday to Ceylon Tea auctions exclusively until August—Indians being held on Wednesday instead—is having a beneficial effect in promoting a more equal division of the Ceylon Sales, now that the whole attention of buyers can be concentrated upon them on that day as on Tuesday.

Yesterday's Ceylon Sale was the largest yet held on a Thursday, and comprised 7,902 packages. With a full room bidding was animated and competition was general and well maintained.

INDIAN. With strong competition for all grades, last week's rates were now and again exceeded. There was no Public Sale in Calcutta this week. The following averages are worthy of note:— "Gabroo Purbot" of the Assam Co., 1/0³/₄; "Gelakey" of the same Compy., and "Kelly Den," 1/-

This weeks average price of Indian Tea sold on Garden Account. Total 4,605 pkgs. average 10d.

FANNINGS. (Red to brown, strong rough liquor)	"	5d.	"	7d.	"	6 ¹ / ₂ d.	"	4d.
BROKEN TEA. (Brownish to blackish, strong liquor)	"	6 ¹ / ₂ d.	"	8 ¹ / ₂ d.	"	8d.	"	5d.
PEK. SOUG. (Blackish greyish, useful liquor)	"	7 ¹ / ₄ d.	"	9 ¹ / ₂ d.	"	9d.	"	7 ³ / ₄ d.
PEKOE. (Greyish to blackish some tip, useful liquor)	"	10 ¹ / ₄ d.	"	10 ¹ / ₂ d.	"	10d.	"	8 ³ / ₄ d.
PEK. SOUG. (Blackish greyish, inferior liquor)	"	5 ¹ / ₄ d.	"	9d.	"	7 ³ / ₄ d.	"	5 ³ / ₄ d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	"	7 ¹ / ₄ d.	"	9 ¹ / ₄ d.	"	8 ³ / ₄ d.	"	6 ¹ / ₂ d.

CEYLON. The market continues very firm and prices are fully maintained for all grades except broken Pekoes over 1/2, which are less eagerly bid for and have occasionally sold at rather easier prices. The following averages may be mentioned:—"New Dimbula, D.," 1/1³/₄; "Bambrakelly Dell, and "Ouvahkellie, B.," 1/1¹/₂; "Hauteville," "Portmore," and "Waverley" of the TPCo. 1/1; "Ferham & St. Andrews," "Kotiyagalla and "Mooloya," 1/0³/₄. Average for week, 9³/₄d.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892.	6 ³ / ₄ d.	1891.	8 ¹ / ₂ d.	1890.	8 ¹ / ₄ d.	1889.	6 ³ / ₄ d.
PEKOE (Ordinary leaf, little twist; fair liquor)	"	9 ¹ / ₂ d.	"	9 ¹ / ₂ d.	"	9 ¹ / ₂ d.	"	8 ³ / ₄ d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	"	5 ¹ / ₄ d.	"	8 ¹ / ₄ d.	"	8d.	"	6 ¹ / ₄ d.
PEKOE (Somewhat bold leaf; indifferent liquor)	"	6d.	"	8 ³ / ₄ d.	"	8 ³ / ₄ d.	"	6 ³ / ₄ d.

JAVA was fairly represented. Catalogues included some good useful Teas from the "Tjiomas" state, which were grown from Assam seed, and sold at full prices. A Flowery Pekoe from "Perbakti" brought 1/2³/₄ per lb., and a White Tipped Pekoe from "Jasinga," 1/5 per lb. Competition was good and prices continue firm.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3¹/₂. Colombo 1/3¹/₂

DAVIDSON'S PATENT SIROCCO TEA DRIERS.

OVER 2,500 NOW IN USE.

THE NEW DOWN-DRAFT SIROCCO.

The Down-Draft Sirocco (as per illustration) is the *most rapid* drier of Tea Leaf extant.

It works with a hurricane of pure hot air through the Tea, at any desired temperature from 160° to 240° F.

The lower temperatures, *in conjunction with the hurricane speed of air blast employed*, give higher quality, but less quantity of dried Tea per hour.

Any fuel may be used and about 3/4 lb. of wood dries 1 lb. of Tea.

The air is heated by the New Patent Sirocco Stove, with cast-iron flues, the construction of which is so strong and durable, that for many years, practically the only wearing parts are the furnace-bars and side-tiles.

The apparatus is easily erected the principal working parts being sent out in made-up sections ready for bolting together.

The large Down-Draft Sirocco is 7 feet high and occupies a floor space of only 6 ft. by 14 ft.,

These Machines are in two sizes as follows:—
Large size, Down-Draft Sirocco { Dries about 200 lbs. Tea per hour at 240° F. } **£185**
 do do 120 do do at 160° F. }
Small size, Down-Draft Sirocco { Dries about 150 lbs. Tea per hour at 240° F. } **£150**
 do do 100 do do at 160° F. }

At intermediate temperatures the drying is in relative proportions
 Packed and Delivered F. O. B., the outward Steamer at Birkenhead or Glasgow, and complete, with trays, thermometer, smoke chimney, fire-irons, countershaf hangers and pulleys. Terms—Cash against documents.

NEW IMPROVED UP-DRAFT SIROCCOS.

The New Improved Up-draft Siroccos, with cast-iron flue stoves of same make as in the Down-Draft and with top ventilating air-due and air chimney for producing self-acting draft of the hot air through the trays are now made to the following standard sizes:—

DESCRIPTION AND SIZE OF "SIROCCO."	APPROXIMATE OUT-TURN OF TEA PER HOUR		PRICE.
	With Self-acting Air-Chimney	With Exhaust Fan.	
Original make of No. 1 "Sirocco," with Compound Air and Smoke Chimney.	40 lbs.	40 "	£ 85
End Slide "Sirocco," 8 Tray size, with Exhaust Fan or large Air-Chimney for self-acting draft.	60 "	80 lbs.	£ 90
ditto	80 "	100 "	£ 110
End Slide "Sirocco," 12-Tray size, ditto	100 "	140 "	£ 130
Special Make, <i>Slide Drainer</i> "Sirocco," 16-Tray size, with exhaust Fan or large Air-Chimney for self-acting draft.	100 "	140 "	£ 140
			£ 145

NEW CIRCULAR
TO THOSE INTENDING TO ADOPT
THE BLACKMAN SYSTEM OF WITHERING.

AS each Application of our System requires considerable thought before we can supply the Working Drawings, which vary in every case, Enquiries should be sent in as early as possible now for the Installation for next season, to forestall the Rush of Enquiries which we usually receive later on when that full attention, which it is desirable that each Enquiry should receive, can only be given at the cost of delay.

N. B.—When sending in Enquiries please be sure that *every one* of our seven questions (see our pamphlet) is fully answered.

We are receiving splendid testimonials by almost every mail both from Indian and Ceylon planters who have adopted, or have seen adopted, our System as erected upon plans supplied by ourselves. These testimonials are now too voluminous to allow of our publishing them in advertisements, but they can be seen at our head office.

**Failure is not uncommon where we have not been consulted
previous to designing the application.**

Sixty-five Breaks, or "Lines," comprising over 1,700 packages, have been sold at the London Auctions, between *August 11th to November 19th, this Season*, from gardens possessing Blackman Fans, which Breaks have *all* realised 2s. per lb. or *upwards!* in one case, 6s. lb.!

VERTICAL TURBINE.

HORIZONTAL ENGINE.

Steam Engines,
Boilers,
Turbines,
Water-Wheels,
Gearing.

WE are prepared to give Plans of Factories and Estimates for supplying the above, and all kinds of Tea Machinery, including the Erection of the same on Estates. We also undertake the ERECTION OF MACHINERY imported by planters and others.

WE beg to call attention to the great success of MORTON'S PONCELET TURBINES, STEAM ENGINES and BOILERS imported and erected by us, and to intimate that we are AGENTS IN CEYLON for supplying them.

ENGINES have large bearing surfaces and are built on self-contained Massive Cast-Iron Seats requiring very little masonry foundations.

BOILERS are tested to double their working pressure and have large bearing surfaces.

TURBINES are of simple construction, of maximum efficiency and not liable to go out of order.

HORIZONTAL TURBINE.

WALKER & COY.

A Health-giving, Refreshing, Cooling, Sparkling, and Invigorating Summer Beverage. or for any Season. and a Gentle Laxative and Tonic in the various forms of Indigestion.

ENO'S "FRUIT SALT"

Invaluable to Residents in
HOT COUNTRIES.

Is the best Preventive and Cure for

Biliousness.	Sick Headache.
Mental Depression.	Want of Appetite.
Skin Eruptions.	Pimples on the Face.
Constipation.	Vomiting.
Giddiness.	Feverishness.
Thirst, &c.	Unnatural Excitement.
Impure Blood.	Errors in Diet.

Instead of being lowering to the system, ENO'S "FRUIT SALT" is in the highest degree Invigorating, and does not cake or get hard in warm and humid Climates. Its effect in relieving thirst, giving tone to the system, and aiding digestion, is MOST STRIKING.

TO AVOID INJURIOUS EFFECTS OF STIMULANTS.

—Experience shows that porter, mild ales, port wine, sweet champagne, dark brandies, and brandies are all very apt to disagree; while light wines and gin or whisky, largely diluted with soda-water will be found the least objectionable. ENO'S "FRUIT SALT" is particularly adapted for any constitutional weakness of the liver; it possesses the power of reparation when digestion has been disturbed or lost.

PRESERVING AND RESTORING HEALTH.—ENO'S "FRUIT SALT" has a natural action on the organs of digestion, absorption, circulation, respiration, secretion, and excretion, and removes all impurities, thus preserving and restoring health.

CAUTION.—*Legal Rights are protected in every civilised country. Examine each bottle and see that the Capsule is marked ENO'S "FRUIT SALT."* Without it you have been imposed on by a **WORTHLESS IMITATION.** Sold by all Chemists, &c. Prepared only at

ENO'S "FRUIT SALT" WORKS, Pomeroy St., London, S.E., by J. C. ENO'S Patent

CURE FOR SLUGGISH ACTION OF LIVER

ENO'S "VEGETABLE MOTO" is mild, effective, and agreeable, and lasting without force or strain in indigestion, biliousness, sick headache, gout, rheumatism, female ailments, suppressed secretions, head affections, nervousness, sleeplessness from liver derangement, flatulence, wind on the stomach. As a laxative, stomachic, blood, brain, nerve, bile, or liver tonic pill it will be found invaluable for creating and sustaining a natural action of the stomach and biliary secretions.

ENO'S "VEGETABLE MOTO" (or Moto Pill). Sold by all Chemists. Prepared only at

ENO'S "FRUIT SALT" WORKS, Pomeroy Street, New Cross Road, London, S.E.

FAGGED, WEARY & WORN OUT!!

Anyone whose duties require them to undergo mental or unnatural excitement or strain should use

ENO'S "FRUIT SALT."

It allays nervous excitement, depression, and restores the nervous system to its proper condition (by natural means). It is the best preventive and cure for biliousness, sick headache, skin eruptions, impure blood, pimples on the face, giddiness, feverishness, mental depression, want of appetite, sourness of the stomach, heartburn, accidental indigestion, constipation, vomiting, thirst, &c., and to remove the effects of errors of eating and drinking.

STIMULANTS and insufficient amount of exercise frequently derange the liver. ENO'S "FRUIT SALT" is peculiarly adapted for any constitutional weakness of the liver. A world of woe is avoided by those who keep and use ENO'S "FRUIT SALT."

"THOUSANDS OF MILES IN INDIA."—ENO'S "FRUIT SALT" I have found for many years of the utmost value in the hot and dry seasons, also in the monsoons. I have travelled some thousands of miles in India during the last thirteen years, and in all the various changes of climate I have always found ENO'S "FRUIT SALT" the most refreshing beverage I could get, especially after long heavy marches and other fatiguing duties to which the British soldier of late has been exposed to. I am yours, &c., A Warder, at Central Military Prison, Poonah. Bombay, Jan. 30, 1884. To Mr. J. C. Eno.

CAUTION.—*Legal Rights are protected in every civilised country. Examine each bottle and see that the Capsule is marked ENO'S "FRUIT SALT."* Without it you have been imposed on by a **WORTHLESS IMITATION.** Sold by all Chemists, &c. Prepared only at ENO'S "FRUIT SALT" WORKS, Pomeroy St., London, S.E., by J. C. ENO'S Patent.

BLOOD, BRAIN, NERVE ^{OR} LIVER TONIC

ENO'S "VEGETABLE MOTO" in indigestion, biliousness, sick headache, giddiness, gout, rheumatism, female ailments, suppressed secretions, &c., head affections, nervousness, sleeplessness from liver derangement, flatulence, wind on the stomach, coughs and colds, will be found everything you could wish for, creating and sustaining a natural action of the stomach, bowels, and biliary secretions, &c., and (when necessary) in conjunction with ENO'S "FRUIT SALT" is invaluable.

ENO'S "VEGETABLE MOTO" (or Moto Pill). Sold by all Chemists, etc. Prepared only at ENO'S "FRUIT SALT" WORKS, Pomeroy Street, New Cross Road, London, S.E.

IMPORTANT TO OWNERS OF HORSES & DOGS.

Copy of letter from Captain G. TODD, Kingston Vale, London, S.W.—"I had a horse with a very bad and infectious skin disease treated in ordinary manner without success, and I was at last advised to kill it, but a friend suggested trial of CALVERT'S CARBOLIC SOFT SOAP, with which, in warm water, I washed all over its body twice; when dry I rubbed in CALVERT'S CARBOLIC OIL. This entirely cured the horse, and the coat came on in a short time soft and glossy as ever."

SORES ON DOGS.—"Seeing a question by "COLLISON" in your valuable paper, asking after a remedy for sores under his terrier's legs, I strongly recommend his trying CALVERT'S CARBOLIC OIL and CARBOLIC SOFT SOAP. I have a spaniel which was covered with sores, more particularly under his legs and behind his ears. I tried many things without effect to cure him, till one day I received a card from Messrs. F. C. CALVERT & Co., Manchester, about their Oil and Soap. I at once procured some of each, and applied them in the following manner:—I oiled the dog thoroughly all over, letting it stay on two days, when I gave him a good washing with the soap. The following morning I oiled him again, letting it stay on two more days, when I again washed him with the soap, and the dog in a short time had a coat as bright as a star. I have recommended the remedy to others, who have spoken highly of it."—"CAPTAIN," (Plympton, Devon)—Letter to *The Field*, Mar. 20/86.

two more days, when I again washed him with the soap. The sores very quickly disappeared, and the dog in a short time had a coat as bright as a star. I have recommended the remedy to others, who have spoken highly of it."—"CAPTAIN," (Plympton, Devon)—Letter to *The Field*, Mar. 20/86.

Mr. W. L. RUMBALL, Birmingham (Dog Exhibitor) writes with reference to Calvert's Carbolic Soft Soap:—"I have had hundreds of Dogs, and used very many "recipes" which have all failed. I consider it the best thing for all Skin Diseases, and that no kennel should be without it. I shall use nothing else, and shall strongly recommend it to my friends. It is worth a sovereign a pot."

A correspondent of *The Field* states that he dissolves Calvert's Carbolic Soft Soap in hot water, making the mixture fairly strong, and sponges his cattle twice a week with it, and they are never molested with Gadflies.

PRIVATE REPORT.—"I had a lot of young cattle which got full of vermin during the Winter, and a single washing with your Carbolic Soft Soap effectually cleared them."

The Soft Soap is also useful against Greasy Heel, and Mud Fever, Mange, or Insects on Animals, and it is used in Her Majesty's Kennels. Applied lightly outside the Ears of Horses, &c., it protects them from Fly attacks.

CALVERT'S CARBOLIC OIL is sold in 1/- and 2/- Bottles, also 1, 1, & 1 Gallon Tins (delivered) 3/6, 6/6, and 10/6 each. CALVERT'S CARBOLIC SOFT SOAP is sold in 1/- 1 lb. Jars, 5 & 7 lb. Tins, at 3/- and 5/- each; also in 1/2 cwt. Kegs, at special rates, quoted in response to enquiries.

F. C. CALVERT & Co.,
MANCHESTER.
 Awarded 57 Prize Medals & Diplomas.

[By paying down £5, an Ayah can usually be handed over to this home, the owner undertaking to get her sent back with some lady and keepin meanwhile.]

Westland's Ceylon Tea Agency.

THE first established and oldest Ceylon Tea Agency in Britain. In 1879 W. WESTLAND (brother of two Ceylon Planters) received a present of the new Ceylon Tea, and recognising its extraordinary strength and fine quality, resolved to open an Agency for it alone. Since then the popularity of Ceylon Tea has increased immensely till it is now recognised as the Leading Tea of the Day. All should use it. Prices—2s, 2s 4d, 2s 6d, 2s 8d, 3s, and 3s 4d per lb. ¼ lb. Sample by Post 2d extra. 4 lb. Carriage Paid.

NEW ENGLISH PERFUME.

Crab Apple Blossoms. Regd.

"It would not be possible to conceive of a more delicate and delightful perfume than the 'Crab Apple Blossoms,' which is put up by the Crown Perfumery Company, of London. It has the aroma of spring in it, and one could use it for a lifetime and never tire of it."—New York Observer.

"It is the daintiest and most delicious of perfumes, and in a few months has superseded all others in the boudoirs of the grandest dames of London, Paris, and New York.—The Argonaut.

Put up in 1, 2, 3, & 4 ounce Bottles.

INVIGORATING LAVENDER SALTS.

"Our readers who are in the habit of purchasing that delicious perfume, 'Crab-Apple Blossoms,' of the Crown Perfumery Company, should procure also a bottle of their 'Invigorating Lavender Salts,' by leaving the stopper out for a few moments a delightful perfume escapes, which freshens and purifies the air most enjoyably." Le Follet.
