The *reorganisation of the Normal School* which was suppressed some years ago, I believe, and only lately revived would tend still further to aid in the extension of Technical teaching in the various Schools of this land generally, as a training in a Technical School could be made an indispensable qualification for the masters of Vernacular Schools. Indeed the entire success of any scheme of Technical education which is to embrace the teaching element in the country generally must depend very much on the organization of the Normal School. It goes without saying that the teachers themselves will have first to be taught, and a *teaching staff* imported mainly from Europe to inaugurate technical training in the Normal School will have to be almost the first question to be considered in any complete scheme that may be formulated. But both the Agricultural School and the Normal School would have to depend for their regular supply of pupils on the *Public or Higher Elementary Schools*, and it is *there* that technical instruction should really *begin*. When the Revised Education Code comes into operation here, *Drawing* in all but infant schools will become *obligatory*, while *Manual Instruction* will, it is to be hoped, find its place in the curriculum of every public school, and perhaps also in the highest stage of every village school. How far it would be possible to teach *Elementary Science* by means of *object lessons* as is done in French and German Schools in the Elementary vernacular schools here I do not know, but I am glad to learn that the plan which was first adopted in India, I believe of introducing a primary instruction in Science—in Agricultural Science especially, on account of the immense preponderance of boys of the agricultural class in schools, by means of specially prepared text books which take the place of the ordinary reading books in the various classes—has been followed in our Vernacular Schools here with very good results.

* An Infant School in Paris teaches drawing to all the children—aged from 4 to 6 years only.

(To be continued.)

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

Having traced the life history of the tapeworms (*Teniada*) we may name some of the common species of tapeworm and consider their importance to the agricultural student. Before doing so it may be mentioned that the term "hydatid" is applied to the scolex or cystic form of the tapeworm. *Tenia Echinococcus* is a tape worm (hydatid) in the dog, its hydatid (*Echinococcus veterinorum*) being found in all animals and in man; *Tenia caninus* also occurs in the dog, and its hydatid (*Cœnurus cerebralis*) is found in the sheep and ox, and occasionally in man; the *Tenia marginata* occurs in the cystic or hydatid form as *Cysticercus tenuicollis* in the sheep, ox, and occasionally in other animals also; *Tenia serrata* of the dog gives rise to the hydatid *Cysticercus pisiformis* in the rabbit; the *Tenia solium* of man causes the hydatid *Cysticercus cellulosa* found in the pig; and the *Tenia mediocanellata* of man is produced by the hydatid *Cysticercus bovis* in the ox. These are only some individuals of the tapeworm family. Though the tapeworm *Tenia echinococcus* is itself the smallest and most insignificant of the species, its hydatid, *E. veterinorum* is the most universally distributed of all hydatids, and from a sanitary point of view at least, it is the most important. The hydatid is found mainly in the liver and in the lungs of cattle, more frequently in adults and in the aged than in young animals. Horses, sheep and pigs and other small animals suffer in a much smaller degree than do cattle. The hydatids may be in the form of simple cysts containing apparently a clean serum, they may assume the form of multiple cysts formed in the interior of a primary cyst, or there may be several cysts developed from the exterior of a primary one. In the earlier stages of their formation they contain a limpid fluid which if set at rest in a glass vessel sometimes deposits a fine sediment resembling grains of fine sand, each one of which will be found on microscopic examination to represent an embryonic tapeworm. In the advanced stages of their growth these cysts undergo degeneration and become of a yellow colour and opaque, a large portion of their contents becoming absorbed. In this state they may be mistaken for tuberculosis. The existence of these hydatids in any organ warrants its condemnation as an article of food, as though no direct harm can accrue from its consumption by man, the idea of eating such organs is repulsive, and a vast amount of indirect harm may be produced by allowing such organs to be used for feeding dogs, as the tapeworm is thereby perpetuated in the intestines of these animals and the segments of the worm passing out with the feces may contaminate food. The presence of these hydatids in large numbers in the structures of important organs may by pressure or by setting up chronic inflammation so far interfere with or even annihilate the functions of the organs as to bring about marked changes in the flesh; thus if the liver is largely invaded jaundice, emaciation and dropsy may be present; if the lungs' oxidation is interfered with and the flesh becomes dark; if the kidneys uraemia, dropsy &c. may result.

The *Cœnurus cerebralis* or many-headed hydatid is found mainly in the brain and the spinal canal of the ox and sheep (mostly in young animals.) It is occasionally found in the muscles of animals and has been discovered in those of man. Its progenitor is the *Tenia caninus* of the dog. In the early stages it does not produce any important effects, but if allowed to increase in size and to cause absorption of the brain structure, the host rapidly emaciates, becomes anæmic, exhibits symptoms of brain derangement, and in the end dies from inanition or exhaustion. Though no deleterious effects are directly produced on the flesh, indirect harm may result in advanced cases from the unwholesome quality of the flesh. As in the case of the *Echinococcus* much may be done to diminish the prevalence of this tapeworm by adopting the plan of destroying the bladder worm when it is removed from the host instead of throwing it, as is often done, to the dogs, or allowing it to lie about for these animals to pick up and devour, thus perpetuating the tapeworm in their own intestines.

CATTLE: AND THE NEED OF A PROPER SYSTEM FOR VETERINARY WORK.

Says the *Indian Agriculturist*:—In order to calm the anxiety of the public respecting the consumption of milk from diseased cows, the French authorities have passed a law requiring Paris dairymen henceforth, when stocking their sheds, to produce a certificate from the official veterinary surgeon in whose district the animal has been purchased, that the milch cow is free from organic disease. They must also advise the similar officials in the city of the arrival of the purchase. As a further protection all dairy cattle are to be inspected monthly by the Government veterinary surgeon, who is also empowered to report on the sanitary condition of the cow stables and surroundings. These measures are not untimely in presence of the heavy human mortality from tuberculous affections, of the increasing use of milk as a diet, and of the communication of tuberculosis from the milk from diseased cows—a fact now placed beyond controversy. More careful inspection of Indian dairies, especially in large cities, is very necessary.

Here is an excellent precedent for our own authorities to follow, now that we have a Colonial Veterinary Surgeon who is not overburdened with work, and no doubt is anxious to have some regular duties to perform, and at the same time have an opportunity of showing some good results of his labour. At present we believe it is the duty of the Sanitary Officer to inspect diseased cattle and visit cattle sheds within Municipal limits. Now apart from the fact that the time of that officer is sufficiently occupied with looking after the sanitation of the town and the health of the public, he will no doubt be the first to admit that the subject of cattle and their diseases is foreign to his province, and one to which he has had no opportunity of giving any special attention. The late Attapattu Mudaliyar was well known to be most zealous for the suppression of cattle disease and the proper

treatment and housing of cattles. No one was more ardent than he in ferretting out diseased stock and tracing sources of infection where such existed, and stating the results of his enquiries in full reports. Now if his successor—if there be one—has as much experience as the late Mr. Dassanayake Mudaliyar, and if he be instructed to furnish all reports concerning cattle direct to the Veterinary Surgeon and not through half a dozen officials (owing to which procedure the cattle, like the poor old King of Spain, are left in a dying condition, because the doctor cannot be summoned before the usual formalities are gone through), we might see some good results follow. Even in the case of an outbreak of cattle disease in the provinces we believe that the Veterinary Surgeon is summoned after much delay caused by official formality, and often after the outbreak has spent its force and worked its havoc. But to return to the subject of the inspection of cattle (especially dairy stock) in Colombo; we would strongly urge that this part of the Sanitary Officer's duties should be delegated to the Veterinary Surgeon with whom Municipal inspectors and policemen, both of whom have special facilities for detecting concealed cases of disease, should be directed to communicate. Moreover, if the Veterinary Surgeon could also find time to periodically inspect the cattle and carcasses at the slaughterhouses, the result would be a direct advantage to the public, and the slaughterhouse-keepers will before long be adepts in the art of inspecting cattle intended for the slaughter, and meat for food. These are matters that should have had attention before the arrival of the Veterinary Surgeon, but it is not too late to make the innovation even now.

Much has been said about the advertisement that appeared in the local papers announcing that the Veterinary Surgeon was prepared to treat sick cattle at the School of Agriculture. While there is no denying that the wording of the notice was not sufficiently explicit and not such as would have been adopted by one who knew the people of the country, it was of course perfectly evident that only cattle suffering from ailments other than contagious and infectious diseases were called for. So far, however, from cattle affected with the latter description of disease being (as we feared might be the case, through misunderstanding) brought to the school, no cattle owners with sick animals have yet come in answer to the invitation.

GENERAL ITEMS.

In a contribution to our columns some months ago, "W. A. D. S." brought to our notice the fact that while buffalo milk was held in high esteem in Bombay, it was looked down upon in Ceylon. Why this prejudice against buffalo milk should be so strong in Ceylon it is difficult to say; the antipathy is founded on no good grounds, and is probably hereditary, for buffalo milk by no means merits the gastronomic ostracism that has been meted out to it by Colombo householders. True, it contains a larger percentage of fat than cows milk does, and hence is less digestive than the latter, but being as it is of high

nutritive quality, there is no reason why it should be objected to as an ingredient of an adult's diet. As may be expected buffalo milk is well adapted for butter-making purposes, and an English dairy expert travelling in India, lately gave it as his opinion that there is no superior animal to the buffalo as a butter-producer not excepting the best dairy breeds in England. Not very many years ago buffalo butter was extensively used in Ceylon, but even the *butter* of the buffalo is now coming to be tabooed. It may have a flavour peculiar to itself, but considering that it costs under R1 a pound, it certainly deserves to be used more generally. How few people care to think what fat they are eating—certainly not the fat of milk—in the highly anatto-coloured preparations that they buy in tins?

Our last number contained a further contribution from our correspondent "B." on the subject of a substitute for cattle-manure. As for the gas liquor from our gas works, it is, we believe, allowed to run to waste for want of local enterprise among landowners in the suburbs of Colombo. The manufacture of the valuable sulphate of ammonia would seem to be impracticable from the fact that Sulphuric acid cannot be had at a price low enough to warrant its use in the process, and that sulphates are rare minerals in the Island. We do not believe that any Thomas-slag, sold in England for £2 or £2 5s. a ton has yet reached Ceylon. The suggestion we threw out that coconut fibre dust might be desiccated to drive off excess of moisture was made with the idea that a short heating in a roughly-constructed stove might be found a cheaper means than the employment of machinery for exerting pressure. It does not appear likely that slight pressure by means of the apparatus described "B." will drive out any appreciable amount of moisture, but the experiment is worth trying. The action of coir dust will certainly be advantageous on both sandy and stiff soils, as giving body to the former and improving the texture of the latter. We thank our correspondent for the compliment he pays us when suggesting that we, ourselves, should undertake the experiment to test the comparative merits of cattle-manure and coir dust-guano compost. If we had the facilities and the encouragement for so doing, we would before now have tried many experiments in addition to the one suggested. Our sphere of usefulness has been limited for us, at least so far as agricultural work is concerned. We shall, however, remember the hint thrown out and make an effort to carry it out whenever opportunity offers.

We are in receipt of a copy of the 2nd edition of Professor Walley's "Practical Guide to Meat-Inspection." The volume is handsomely got up and contains 42 illustrations which greatly enhance the value of the book. We hope to refer to the work at greater length in a future issue.

The Agricultural information leaflet published in Sinhalese, and issued from the School of Agriculture is now edited by Mr. J. Rodrigo, 2nd Assistant at the School. The publication is highly appreciated, as is evidenced by the fact

that over 5,000 copies are issued every month, and that the number of subscribers is increasing.

Abrus Precatorius, which attracted so much attention some time ago as "the weather plant" or vegetable barometer, has now been found to supply in its seeds the poison used by the natives of India for poisoning cattle for their hides. The *Indian Agriculturist* describes the preparation of this poison as follows:—The seed is first pounded and kneaded into paste, and is made to adhere to some tiny little pegs made of bamboo. With these little pins, so poisoned, they pierce the cow's hide in two or three places, and let her go. The cow dies in less than an hour. The Assistant Surgeon of Jamni, an intelligent officer who had some cases of cows so poisoned brought to him, states that the symptoms displayed by cows poisoned with these pins (sootarie) are just like those of snake-bite. The *kooch* poison, when taken internally, has however been found to be uninjurious, and another extraordinary fact said to be discovered is that a cow treated inwardly with certain preparations of the *kooch* poison becomes proof against being poisoned by subsequent pin punctures. How long the effect of a dose of this *kooch* decoction is likely to last has not yet been discovered. Should the experiment now being conducted by the Assistant Surgeon be found efficacious in cases of cattle-poisoning, it is argued that it may prove efficacious in the analogous case of snake-poisoning as well. The plant is known among the Sinhalese as *Olanda wel*, and the seed are familiar as "Kondamane," which owing to their pretty red and black colour are used as ornaments.

We have received from the Secretary for Agriculture, Brisbane, another bag of Australian salt-bush seed (*Atriplex nummularia*) (which did not succeed with us at the first trial), for further experiment.

It has been found by experience in India that the planting of the Rain-tree (*Pithecolobium Saman*) is a most effectual means of improving

the character of land rendered sterile owing to saline efflorescences.

Lathyrus Sylvestris has been proved to be a complete failure in the North-Western Provinces, India. The description of its weakly growth and final dying-out as given in the report of the Director of the Botanical Gardens there, reminds us of our own experience of this much-lauded plant. An advertisement sheet has just reached us from F. E. Clotton of High Holborn, London, in which he describes *L. Sylvestris* as growing any where (even on sandhills and desert places), lasting 50 years, standing the severest drought, and yielding a clear profit of £20 an acre. His price for a pound of seed is £2 2s. We can only say that either the seed sent to the East is not genuine, or the plant is not suited to this part of the tropical zone.

The students of the School of Agriculture paid two or three visits to the Dematagoda Slaughterhouse in company with Mr. Lye, who through the kindness of the Sanitary Officer has had special conveniences allowed him for carrying on his demonstrations to the students.

The Veterinary Surgeon was lately away in the Kurunegala and Anuradhapura Districts, where an outbreak of cattle disease required his presence.

The subjects of the Marsh lectures that have been delivered up to date are: Food and Food-Substances (Dr. Fernando), Electricity for Lighting Purposes (Dr. Pinto), Public Health and Personal Hygiene (Dr. Vanderstraaten), Bleaching and Bleaching Agents (Mr. C. Drieberg), and Printing (Mr. G. J. A. Skeen). H. E. the Governor and Lady Havelock were present at the lectures on Electricity and Printing.

Some "Jowari" seed sent to us by Major General la Touche has come up well and the plants are now in ear. We owe our best thanks to Messrs. Miller & Co. for another parcel of vegetable seeds.

TECHNICAL EDUCATION—ITS AIMS AND METHODS.

(Concluded from page 37.)

HAVE already shewn you how it is possible to combine Elementary with technical teaching, as in the Glen Allen School, even for boys of 6 or 7. I do not see why it should

not be done here. But I have no desire to encroach on the province of the Director of Public Instruction, and very many innovations which I should like to see introduced into our school system of education, *i.e.*, the bifurcation of classes as in Germany and Italy into a classical and scientific side, the establishment of Kindergarten schools all over the island, the institution of at least one Manual Training School in which the American system of combining instruction in Science and Literature with training in Drawing, Modelling, Wood-carving and Workshop Practice could receive a fair trial—these and other such matters I refrain from entering on here for much the same reason—not to speak of the lateness of the hour.

I cannot conclude this part of my subject without reference to two papers which I hold in my hand: one, a rather elaborate scheme for Technical Education drawn up by Mr. Marsh, the organiser of the present series of lectures, so far back as 1876; the other a provisional scheme for a Technical School by Mr. Wall, thoroughly practical, and built almost on the same lines as those followed in the American Manual Training schools, but wanting the combination of Scientific and Literary courses of instruction with Art Training and Workshop Practice which forms such an essential

feature of the latter. Mr. Marsh's paper, originally published by the local Education Department, has been reprinted in a recent number of the *Literary Register*, and as a thoughtful well-matured proposal for the introduction and encouragement of Technical Education in all the schools throughout the Island, showing besides a clear appreciation of the industrial needs of the country, and a wise provision of the growing importance of Technical Institution 16 years ago, when there was barely any public interest aroused on the subject even in England, I have no doubt it will receive due consideration from the Government in any scheme that may be organised for Technical Teaching in our public schools. I regret that the lateness of the hour as well as the limits of my lecture preclude me from reviewing either of these papers here: but as they are both accessible to the public, I would commend them to your attention as well deserving of careful perusal.

And now to come to a conclusion of the whole matter. The problem of Technical Education for the people of this country cannot, in my opinion, be solved by any slavish imitation of Western institutions, however successfully conducted elsewhere. The method of education adopted must suit the *genius loci*—the character and aptitudes of the people as well as the resources and needs of the country. Any complete scheme of Technical Education will have to begin by modifying the instruction given to the children in our Elementary and Higher schools. Our schools are in one sense already technical in that the majority of the children are prepared (if the present one-sided grammar school training can be said to be preparatory in any sense) for the so-called liberal professions. Let them become avowedly and distinctly technical, in the widest sense of the word, *i.e.*, preparatory for special callings in after school life.

Let us recognize the fact that the classical system of our public schools, however suited as a preparatory training for the Universities and for the learned professions, is a stupid and senseless method as regards the majority of our boys who will have to fight the battle of life, not in the ranks of the learned professions but in the overcrowded fields of productive toil and industry. Let us recognize the fact that this system has been denounced by the oldest

educationalists of the day—Huxley and Spencer and Playfair and a host of other authorities—as “bookish,” “unpractical,” “one-sided,” “aimless,” and altogether unsuited to the industrial needs of the present day. Could there be a more sweeping condemnation of the classical system of teaching that obtains in the public schools in England—of which our best schools are but a poor copy—than that pronounced by Canon Farrar? In a lecture delivered before the Royal Institution, Canon Farrar, once Headmaster of Harrow, and for 13 years a classical teacher, thus expresses his deliberate opinion, arrived at in the teeth of the strongest possible bias and prejudice in the opposite direction—arrived at with the fullest possible knowledge of every single argument which may be urged on the other side. “I must avow,” he says, “my distinct conviction that our present system of exclusively classical education as a whole, and carried on as we do carry it on, is a deplorable failure. I say it, knowing that the words are strong words, but not without having considered them well. I say it because that system has been weighed in the balance and found wanting. It is no epigram but a simple fact to say that classical education neglects all the powers of some minds and some of the powers of all minds.”

Far be it from me to disparage the education to which, perhaps more than any other circumstance, I owe my present position and even the honor of appearing before you today as a Marsh Lecturer. I am not so ungrateful to my Alma Mater as to desire to lower by a single atom the standard of classical teaching in the only Government High School we possess—the Royal College. But while retaining the present curriculum for the highest forms which comprise perhaps most of the boys who are preparing for the Universities or for a liberal profession, I see no reason why every boy should be passed through the same mill whatever his future destination. The old plea which was accepted hitherto as sufficient to justify the retention of an exclusively classical, or a combined classical and literary training—namely, its value as the only known means of intellectual discipline—does not hold any longer. Science, Art and even Manual Training has been found to answer equally well in a vast number of schools both in Europe and America, as a means of intellectual training, and even superior to the classical system in many respects, since they embrace a harmonious all round education fitted to cultivate all the powers of body and mind equally, while the latter stimulates and exercises but a few of the mental faculties only—memory and imagination and reason.

But a very small proportion of the boys of our schools can hope to enter the learned professions or proceed to complete their Collegiate education at a University, and already the cry is heard on every side that the professions are over-crowded. The same complaint is made with regard to the Clerical Service, in Mercantile Offices, in Banking Establishments. The supply is even greater than the demand, salaries are cut down almost to starvation point, and in the keen competition for the smallest vacant office the worst passions are aroused, while the man who is most to be pitied is the one whose lot is envied most by his unlucky competitors,

the respectable clerk or book-keeper who has to keep up a decent appearance and provide for his family on the salary of—a butler! I who have had more opportunities perhaps than any one else in this room to know what hardships and misery are being silently undergone by hundreds of families in our midst, with the bread-winner thrown out of employment in the struggle for existence, or striving desperately to keep body and soul together on a miserable pittance, thanks to the cast-iron system of education which sends him out into the world with no better preparation for the work of life than a knowledge of the three R's—the only working tools he possesses, or at most a smattering of “little Latin and less Greek,” I cannot find words strong enough to express my burning sense of indignation at the cruel wrong and injustice done to our children by the perpetuation of our unpractical, aimless, antiquated and altogether defective system of teaching.

When will our teachers and educational reformers recognize that the object of true education is not mental discipline only, but a preparation for the whole work of life, needing the cultivation of all the faculties and powers of body and mind—that the end to be attained is not culture merely but *practical power*—not dead knowledge crammed from books but living knowledge derived from life and experience?

All education is development it is true; but the mistake generally made is to limit it to mental development, and to ignore what should properly precede and follow, mental training—physical development. The unfolding of the organs of the senses and the powers of the body, and manual culture or skill in handling and dexterity in the use of tools when these powers and organs are sufficiently developed to act as fit instruments for the mind, leading to creative power and constructive activity; thirdly, æsthetic training or the development of the sense of the beautiful and a perception of the laws of Rhythm and Harmony comprised in Drawing and Painting and Music; fourthly, scientific training, to satisfy the craving to know to search into the causes of things, to inquire into the meaning of things, into the Nature and uses of the phenomena of the Universe, and from the world of Nature around us to the world of Nature within,—to the study of humanity and through various stages to the study of self-consciousness and the consciousness of the Divine.

It may be long before our present school system will be reorganized in accordance with the teachings of Science; but would it be too much to expect such a modification in our existing school curricula as to establish at least a relationship between school work and the occupations of after school life. Would it not be possible to introduce elementary technical instruction into every elementary school including Drawing, Physical Drill, Gardening and Singing Object lessons in elementary science and elementary woodwork, such as the Sloyd or Swedish system, so successfully introduced into English schools, and as I know even into very many girls' schools? The same or similar studies but in more advanced stages could be carried successively and continuously through each class and division of each school to the highest forms of the highest schools. While a Manual Training school in which chil-

dren leaving the Elementary or Public school at 13 or 14, could continue for 3 years to receive general instruction in Literature, Mathematics, or Science, and special instruction in commercial subjects in a Commercial Department, and Art Training (Drawing, Carving, Modelling) in an Art Class, with workshop practice for all would form an intermediate stage leading up to the Technical School or School of Technology whenever it be founded. With Science and Art and Technology entering into the teaching of all the schools, with the education of the hand and the eye supplementing the education of the mind, with special schools for furthering Scientific Instruction, Art Training, and Technological teaching I can conceive of no better provision for Technical Education for the people, no scheme which will specialise instruction and bring it within easier reach of the masses, no better means of interesting children in their school work and enabling them to lead such full and rich and harmonious lives that "Mind and soul according well may make one music fuller, richer, more harmonious than before."

OCCASIONAL NOTES.

It is our painful duty to record the unexpected death of Sir Samuel Grenier, and to offer our deepest sympathy with those who are bemoaning his loss. Apart from the interest he showed in Technical Education in general, Sir Samuel evinced his concern in agricultural education in particular by offering a prize to be competed for by the students of the School of Agriculture. The deceased Knight was more than once present at our public prize-givings, and also supported our Magazine. Among the last, if not the last of public functions in which Sir Samuel Grenier took part, was the occasion of the inauguration of the "Marsh Lectures" at the School of Agriculture, when he occupied the chair.

By the time this number reaches our subscribers, the New Year will be upon us. To all we wish a year of happiness, to agriculturists in particular a season of plenty and prosperity.

The virus of glanders is said to consist of a bacillus, and if dry may maintain its vitality for six weeks, but in damp surroundings it perishes more quickly. Infected horses coughing and sneezing scatter the bacillus over the mangers and amongst the food of healthy animals, and thus it becomes ingested. Buckets, sponges or even harness used for the sick convey the virus. The bacillus, it is pointed out, thrives best in close warm stables, and finds less resistance in overtaxed horses, or those pulled down by influenza or other reducing disease. In Great Britain glanders, whether in its acute stage of development, or in its chronic type in which the horse may be still fairly fit for work, or in the form of farcy more or less pronounced, must now not only be reported on pain of penalties, but any animal found to be diseased by the Inspector when called in must at once be slaughtered. Infected animals and those that have been in contact with them will in future be immediately slaughtered, and half their values,

not exceeding £20, allowed. Suspects will be isolated, and if slaughtered and found free of disease full compensation will be paid for them. The requisite funds for carrying out the order will be obtained from Imperial sources. This order firmly and uniformly applied through the country is expected to exterminate glanders in a little more than a year. It has been estimated on good authority that glanders and farcy annually kill in London alone about 2,000 horses.

I would only have you remember, says Dr. Sims Woodhead, in an address before the Royal Physical Society, that an enormous amount of work has been done to prove that bacteria belong to the animal kingdom; it may, however, be generally accepted that they are to be transferred to the domain of the botanist. We must remember, however, that they are of a low form of protoplasm, and that although in certain cases they may be considered as having special functions, the general powers of protoplasm are most strongly developed in them, and that their specific powers are more readily affected than where development is of a higher order.

In a paper on "The Utilisation of Waste Produce of Forests and Woodlands" in the last journal of the Highland and Agricultural Society, the writer asks the question:—"Do we utilise to the fullest extent the by-produce of the forest and woodland, and so diminish waste and at the same time add to the general revenue of the Forest Department? By waste products or by-products is meant anything other than wood, or of wood not in a condition in which it is generally used, and includes bark, charcoal, firewood, faggots for house use and for kilns, tar, woodspirit, turpentine, rosin, acetic acid, sawdust, wood-ashes, leaf-soil, &c. That much can be done both in the economy of production and utilisation of waste produce is well known to those in charge of woods and forests; and where the by-products cannot well be utilised in any of the abovementioned ways, better, perhaps, reduce them to ashes, for by so doing insect and fungus life are lessened, and a valuable manure, whether for grass or certain farm and garden crops, obtained in the ashes which are particularly rich in potash."

The annual home supply of bark in Great Britain is estimated at nearly 300,000 tons, but in addition to this some 30,000 tons are imported from the Continent. Tanning bark, though not at present a valuable product, will, it is stated, yield a good margin of profits even at the present low price of £5 10s. per ton for English bark (oak and to some extent larch) through careful and judicious management.

WEEDS.

A weed has been described as a plant out of place, and it is therefore true that what may be a weed in one situation may be a desirable plant in another. The question has lately been mooted as to whether certain plants that are wont to spring up continually in cacao, coffee and tea plantations are weeds or useful plants, useful in the sense that they check wash of soil, conserve and add to

the soil and its fertility, help the soil to retain rain water, and lastly when pulled up and applied to the land, in decaying, enrich it. The rapid growth of weeds, says Warrington, will greatly diminish the loss of nitrogen by drainage, and be of use in other ways as a green crop. When the weeds are ploughed in, the valuable matter stored up by them again becomes available as plant food. Here, however, Warrington refers to the growing of weeds on land not in crop, or rather on land between the intervals of cultivation. That it is desirable that some vegetation should grow on land in the absence of a regular crop, even though the clearing of such when it has taken a firm hold on the soil entails some trouble, no one will deny; but the question with us as regards such perennial growths as coconuts, coffee, tea, &c., is, whether it should be the object of the cultivator to keep his land always as clean as possible, or whether it would be to his advantage to allow a natural crop of weeds to spring up and flourish, and then, at some trouble and expense, clear his land and apply the weeds as manure. In this connection we may quote the words of Mr. Joseph Holloway who, writing to the *Ceylon Observer* on October 19th, says:—"I have the pleasure of stating that I have tested my system of using weeds for the saving of wash and also as a manure in the cultivation of coffee, cinchona, cacao and tea to my entire satisfaction, and am now carrying on the same system on this estate (Marakona estate) with marked success in the cultivation of cacao. The record of this experience of Mr. Holloway is most welcome and useful. Looking at the natural conditions under which weeds grow in a tropical country such as ours, it would seem that they were intended to serve some more useful purpose than is generally associated with them. In this country the natural agents would seem to favour the propagation and growth of weed to an inordinate degree,—wind, weather, and temperature assisting to the fullest extent in this work which is in a far less degree favoured by the same agents in temperate elimes. No one can appreciate this difference more than he who has seen the operation of weeding in the course of cultivation in a temperate country and its lasting effect there; and has subsequently witnessed the weeding process and the unsatisfactory sequence of the labourious operation on land in our tropical zone. There is another consideration worthy of the student of Agriculture, and that is that the decomposition of weeds when buried is a much quicker process with us than in temperate countries. Again, from the fact that we cultivate perennials in a large measure, we have better opportunities for making use of this process of green manuring while the crop is standing than they who almost solely cultivate annuals and biennials, and nearly always plants (seldom or never shrubs and trees).

These considerations, we think, would warrant our cultivators of strong perennial shrubs and trees, in inquiring more closely into the functions which our various weeds are intended to fulfil in agricultural economy, and thus endeavour to avail themselves of any advantage which the fostering of weeds would appear to secure for them.

We know of one of two agriculturists, besides Mr. Holloway, who believe in this system of leaving their estates in weeds till the season arrives, which in their opinion is the right time

for their extirpation and interment; but Mr. Holloway would seem to us not merely to have been satisfied with noting the effect of this treatment of weeds in general, but to have studied the process more closely and to have observed that some weeds which appear to act more beneficially on land than others, deserve proportionately to be treated with more respect and to receive greater encouragement.

We have no doubt but that Mr. Holloway well recognises the fact, in spite of his prejudice in favour of weeds, that some of them such as "Æluk" and "Atora" (our tropical couch grasses) which, owing to their strong and rapid growth by means of penetrating and destructive but nearly indestructible ramifying underground stems, are formidable rivals in the struggle for existence in the battle of plant-life and effectually succeed in arresting the free and healthy growth of the more useful plants.

One of the "weeds," which Mr. Holloway's experience has proved to him to be beneficial, is the *Desmodium*, known and valued as a medicinal agent among the Sinhalese as *undupiyali* and among the Tamils as *sivan-coddie*. This, Mr. Holloway says, is in my opinion the best of manurial weeds, as it requires no cutting whatever and makes a thick covering on the top of the soil, and has a thick network of roots under the surface. . . . It is the best (of three named) in manuring qualities.

Now Mr. Holloway, though as a practical man he will be quite content with the results of his experience, will have some satisfaction in knowing that the species *Desmodium* belongs to the order of leguminous plants, which the latest researches in agricultural science have proved to exert a most desirable fertilizing influence upon the soil, and that in encouraging its growth and in availing himself of its benefits as a fertilizing agent, he is proving himself a wise and economical husbandman.

SIDA FIBRE.

Of the family *Sida* belonging to the order *Malvaceæ*, we have six members indigenous to Ceylon viz., *S. Humilis* (Sin. Bevila), *S. Mysorensis* (Sin. Sirivedibevila), *S. Spinosa*, *S. Carpinifolia* *S. Rhombifolia* (Sin. Kotikan-bevila) with a variety *S. Rhomboidea*, and *S. Cordifolia* (Sin. Binbewila). The first, second, fifth, and sixth are well-known in native medical practice, the roots and leaves being used as curative agents; but all these can be made to yield a fine white fibre which experts have pronounced to be a fitting substitute for silk. Half-a-century ago Dr. Roxburgh is said to have described the various species of *Sida*, and speaking particularly *S. Rhombifolia* and *S. Rhomboidea*, said that the bark yields an abundance of white delicate flaxy fibre. A report on specimens of fibre from these species was pronounced to "much resemble our best dressed jute. It is very attractive in its appearance; its silvery bright and clear colour, its great cleanliness, and its excellent condition are well exhibited,—much better indeed than the great bulk of jute which is exported to Europe. . . . I think from the length of the staple, its similarity to silk, and its great strength, that it would fetch a high price in England." Unfortunately no proper trials have been since made with

the fibres though it has again and again been described as of excellent quality. Samples were sent from India to Dundee and Leeds for trial in jute machinery, but the result of such trial has not yet been made known.

The fibre-yielding plants of Ceylon are numerous, but no final opinions have been arrived at as to the value of the fibre of such plants from a commercial point of view; for their preparation in insignificant quantities in isolated places by rude methods, and as is generally the case only for the manufacture of rope, gives us little opportunity of judging of its merits for better purposes. In this connection the remarks of Prof. Goodale in his address on the "cultivated plants of the future," an abstract of which appears in the last Royal Agricultural Society's Journal, are very appropriate:—"Countless sorts of plants have been suggested as sources of good bast-fibres for spinning and for cordage, and many of these make capital substitutes for those already in the factories. But the questions of cheapness of production, and of subsequent preparation for use, have thus far militated against success. There may be much difference between the profits promised by a laboratory experiment, and those resulting from the same process conducted on a commercial scale. The existence of such differences has been the rock on which many enterprises seeking to introduce new fibres have been wrecked. In dismissing this portion of our subject, it may be said that a process for separating fine fibres from undesirable structural elements and from resin-like substances which accompany them is a great desideratum. If this were supplied, many new species would assume great prominence at once."

CEYLON PRODUCTS AT THE IMPERIAL INSTITUTE.

We are in receipt of a neatly got up booklet, being a Catalogue of Exhibits in the Imperial Institute from Ceylon. The catalogue was compiled by Dr. Trimen, whose services in connection with shows and exhibitions are known to be invaluable, and who must have been sorely missed while the collection for Chicago was being made. In the preface to the catalogue Dr. Trimen says:—"The following list contains such products of Ceylon as were sent in for the Imperial Institute by the Government Agents and their Assistants in the various provinces and districts of the colony, the Planters' Association, the Royal Botanic Gardens, and a few private persons.... During the process of arrangement many gaps and desiderata have become apparent; these it is hoped to supply in course of time." The booklet consists of 48 pages containing a list of 1,404 lots of specimens. Of those interesting from an agricultural point of view are first the items included under Class I, viz., raw food products consisting of 313 specimens of cereal grains (mainly varieties of paddy of course), 14 specimens of pulses, 16 of other edible fruits and seeds, 4 of edible roots, 31 of spices and condiments, and 10 of miscellaneous food products.

The Class II. comprises 5 specimens of exported drugs, 17 specimens of drugs from Jaffna, and 260 of medicinal plants from the Central Province.

In Class III., raw products not used for food or medicine, are included 11 species of oil seeds, 11

of gums and gum-resins, 14 of resins and lac, 3 of caoutchouc, 16 specimens of dyes, 20 of tanning materials, 57 of fibres and ropes, 98 of timbers and cabinet woods, and 6 of miscellaneous vegetable products.

The mineral products under the same class include specimens of laterite, granitic gneiss, magnesian limestone, limestone, sandstone, quartz, coral, coral-stone and lime, iron-stone, mica, plumbago and precious stones, besides kaolin and even "3 small pieces of gold"!

The coconut, areca and palmyra palms with their products take up each a section.

Among the prepared foods and estate products generally come tea, coffee, cocoa, pepper, cardamoms, cinnamon, cinchona, arrack, sugar and jaggery and flours and starches.

Under manufactured products other than foods are found the oils (20 specimens of fixed and 11 of essential oils), tobacco, &c.

The main object of the Imperial Institute being to further the commercial interests of the various Colonies and Dependencies of the United Kingdom, and to give those in the trade in England an opportunity of judging as far as possible of the merits of the various products by means of the specimens stored in the Institute, it would manifestly be an advantage to maintain the Colonial Courts in an efficient condition and to make the display of products in London as perfect as possible.

The "gaps and desiderata" mentioned by Dr. Trimen will no doubt be supplied before long.

SOME USEFUL SEEDS.

Tokmari is a plant found growing in the N.-W. Provinces of India, and is botanically named *Lolemantia Royleana*, its old name being *Draccephalum Royleanum*. The seeds of this plant when soaked in water swell up into a jelly, in which form they are used by the Mohamedans for mixing with their sherbets, to form a cooling drink in hot weather. A writer in the *Indian Agriculturist* mentions that the mucilaginous portion of the seeds is used internally as a sedative on the mucous membranes of the respiratory passages, intestines and bladders, and that it also acts as a diuretic. Native physicians of India prescribe it in cases of bronchitis and dysentery, as well as in many other forms of disease. In the form of a demulcent poultice, the use of the seeds is said to be rapidly extending in the treatment of hospital patients in North India, as well as in private practice there. For this purpose it is asserted that the seeds have no equal, and arrangements have been made for sending samples of the seeds to Europe for experimental trial. In Calcutta they are sold at R5 or R6 per maund.

Sweet Basil (*Ocimum Basilicum*) belongs to the same order as *Tokmari*, i.e., *Labiatae*. This plant which was known to Pliny and other ancient writers, and which enters extensively into the superstition and romance of Southern Europe, is now naturalized in Ceylon. The seeds of sweet Basil are very like those of *Tokmari*, and also swells when wetted and become coated with semi-transparent mucilage. *O. Basilicum* is closely allied to *O. Sanctum*, the Sinhalese Madurutala, a well-known medicinal plant. There are many members

of this family indigenous to Ceylon, e.g., *O. Canum* (Sin. Hintala), *O. Suave*, *O. Ascendens*, *O. Grati-simum* (Sin. Otala), nearly all of which are used in Sinhalese medicine. *Plantago Isphagula* belongs to a family of which there is one indigenous (*P. Asiatica*) and one naturalised member (*P. Lanceolata*). Seeds of *P. Isphagula* were given to us by Major-General La Touche who spoke highly of their curative properties in cases of dysentery in the treatment of which he had never known them to fail. Many doctors in India and one or two in Ceylon had tried the remedy at the request of the General and found it very effectual.

Salvia Plebia, another Labiate, belongs to the sage family and possesses medicinal properties in its seeds similar to those of the seeds already mentioned, and *Tokmari*, *Sweet Basil*, *Isphagula* and *Salvia Plebia* are generally combined in Mohamedan prescription.

In this connection it may be mentioned that the roots and leaves of *Plectranthus Zeylanicus* (Sin. Eeriweriya) a Labiate, is one of the well known Sinhalese remedies for dysentery,—another being *Ptycotis Agowan* (Sin. Asamadagan). The latest number of *Imports* has under the head of new remedies the following reference to the last-named plant:—

“Agowan contains much thymol, to which it probably owes its medical properties. Dr. Waring regards this, of all umbelliferous seeds, as the most efficient carminative, and bespeaks for it a trial in cholera, in which, it is alleged, even in empirical practice it has done wonders. It has also been strongly recommended as a remedy for dipsomania or alcoholism, and is worthy of further trial for this purpose. Applied externally, as a constituent of poultices, it relieves pain. The above refers to the well-known *Omum Seeds*. We prepare Omum water from these.”

Among the natives *Pimpinella Heyneana* (Sin. Wal-asamadagan), is used in place of the above. Allied to these two are *Pimpinella anicum* (aniseed), *Anethum graveolens* (dill), *Cuminum cyminum* (cumin) and *Carum carai* (caraway) all possessing carminative and aromatic properties.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

The *Cysticercus tennicollis*, slender or long-necked hydatid, is found in the abdominal or pelvic cavity of the sheep, the pig, the ox and the fowl. Its progenitor is the *Tenia marginata* of the dog. It is found suspended, sometimes in large numbers, in an adventitious (nutient) membrane to the outside of the abdominal organs, most largely to the omentum (or caul, a membrane covering the lower intestines) and mesentery, presenting the appearance of bladders varying in size from a bean to a hen's egg and containing a transparent fluid. These hydatids are of less importance than are others that are found in the bodies of animals, and being situated on the outside of organs, they do not interfere with them functionally or mechanically, but all such bladders, says Professor Wally, should be carefully removed and effectually destroyed. If preserved they will, of course, be the means of propagating the tapeworm in the dog.

The *Cysticercus pisiformis* is found mainly in

the abdominal cavity of the rabbit and the hare, and in an immature state, in the liver of these animals. Its progenitor is the *Tenia serrata* of the dog. It sometimes exists in such large numbers as to cause emaciation and death of its host. The abdominal contents of hares and rabbits should therefore be carefully removed and all discovered cysts destroyed. The tapeworm is however limited to the carnivora.

The *Cysticercus cellulosa* is found inhabiting the inter-muscular connective tissue of the pig, producing the condition known as measles. It exists in enormous numbers in the body of its host. Its progenitor is the *Tenia solium* or solitary tapeworm of man. In addition to its being found in the muscles, it is sometimes located in very large numbers in the liver and in the spleen, giving that organ on section, a peculiar mottled and pitted appearance, and rendering it of a more solid consistence than normal. A careful examination of the peculiar greyish spot reveals their cystic character, and when the cysts are removed by the aid of a pin or a needle, a space is left behind. While the hydatid is found mainly in the pig, it sometimes finds a host in other animals, and is known to co-exist with the tapeworm in man. If the mouth of an effected pig be examined a row of translucent bead-like tumours may be detected on the lower edges of the tongue or between it and the lower jaw. When the flesh of the pig is cut up, the section presents a pale flabby appearance, and imparts a shiny feel to the fingers, it is soft and apparently dropsical. The bladder can be readily distinguished on close inspection of the muscles. If the hydatids have been in existence for a considerable period, their coats will have undergone calcareous degeneration and in this case a grating sensation is imparted to the knife on cutting.

The chalky condition just referred to is, says Professor Wally, frequently met with in hams both of home and foreign production. While the devouring of mealy pork in a raw or semi-cooked condition by man would inevitably produce the tapeworm, such a result could be prevented by proper cooking, as a temperature of from 140° to 150° is sufficient to kill all forms of hydatids. That tapeworm infection of man from mealy pork is of tolerably frequent occurrence is proved by the fact that the *Tenia solium* is so often found infecting the human intestines; and this fact is sufficient to warrant the condemnation of all mealy flesh.

The *Cysticercus Bovis* (beef measles) has its habitat in the muscles of the ox (mostly in the calf) in the same situation as that occupied by the *C. cellulosa* in the pig. It is, however, found to the greatest extent in the muscles of the haunch, and the muscular parities of the heart. As in the pig, so in the calf the hydatids are numerously developed in the mouth. Its progenitor is *T. mediocanellata* of man and it is—owing to the dirty habits of some of the natives—met with much more frequently in India than elsewhere. The remarks already made in reference to *C. cellulosa* of the pig apply in a sanitary sense to beef measles also.

The history of *Cysticercus Ovis* (mutton measles) has not yet been satisfactorily traced, that is to say the tapeworm from which it originates has not been identified.

MORINDA.

In Handbook No. 6 of the Imperial Institute series, says the *Indian Agriculturist*, the article on Morinda in the Dictionary of Economic Products by Dr. Watt has been produced with the addition of an Appendix. *Al* (Morinda) root has been occasionally sent to Europe but no regular trade in the dye stuff appears to exist. Cloth dyed with *Al* is not attacked by white-ants, and on this account is used in India to wrap round the account books of bankers and shopkeepers, and it might with advantage be more generally used for book-binding and other purposes for which protection from insects is a desideratum.

Morinda is a genus of erect or climbing shrubs or trees which comprise about forty species, all tropical. Of these seven are natives of India, and three of Ceylon, viz., *Morinda Citrifolia* var. *Brachteata*, and *M. Tinctoria* (both known as *Ahu* among the Sinhalese) and *M. Umbellata* (Sin. Kiri-wel or Maha-kiri-wel).

Of *M. brachteata*, Thwaites says:—Not uncommon in the hotter parts of the island, in and near the gardens of the Sinhalese, who employ the root as a dye. The leaves are used medicinally by the natives. The stems of kiri-wel (*M. umbellata*) are used by Sinhalese villagers instead of rope for tying fences.

Dr. Watt, however, remarks that the variety *Brachteata* will probably be restored as a species by future writers, as the reduction of that plant to *Citrifolia* appears quite untenable.

M. Citrifolia is described by Watt as a small tree or bush, and as the most important economic species of Morinda, yielding by far the greater portion of *Al* dye of Indian commerce. The dye is yielded by this as well as other species of Morinda. *M. Citrifolia* proper supplies in its wood, root or root-bark the bulk of the material which is the chief source of the dye of commerce in India. The colours given by *Al* vary from a reddish yellow through a pink and various shades of red up to a dark brownish red. The dye contained in the root bark seems to be the best red, whereas that contained in the woody part of the root is more yellow than red, and consequently where the wood preponderates over the bark the resulting dye is reddish-yellow. In some parts the bark stripped from the stem of the plants, as also the twigs, are used for dyeing, but the dye yielded is inferior; while the juice of the leaves seem to be occasionally used as a dye for cotton, to which it imparts a reddish brown colour. The selling price depends on the fineness of the root, the thin roots being by far the most valuable. According to McCaun the price varies from R1 to R18 per maund.

GENERAL ITEMS.

The wood of the Pandauk (*Pterocarpus Indicus*) which vies with the best Spanish mahogany in richness of colour and hardness, has for some time been exported to England where well-seasoned wood fetches as much as £10 per ton.

Brushes and mats made of coir fibre are being manufactured by special machinery invented by Mr. John Earnshaw of Greenwich at the works of Messrs. Price and Wadleigh, East Greenwich.

In his Presidential address at Haward University Prof. Goodale discussed the question of the likelihood of new cereals, fruits, and vegetables, fishes, dyes, and perfumes, and remedial agents supplementing or taking the place of those now employed. An abstract of this interesting address appears in the last volume of the Royal Agricultural Societys' Journal.

Attention has been drawn to serious disorders in stock traceable to the presence of castor oil seed in the so-called oil cakes, due to either carelessness or deliberate admixture. It has been suggested that in the case of cotton cake the presence of castor seeds may be due to the fact that the castor plant grows as a weed among cotton, and the difficulty of distinguishing between the two kinds of seeds. Stock-owners are advised to be careful not to allow castor poonac to lie near their cattlefood.

The price of ground-nut oil in Pondicherry as reported last month is R86 and 8 annas per candy of 529 lb. The estimated total value of the ground-nut oil trade for the current year is R1,118,828. The price of gingelly oil is given as R78 per candy.

There are, says the *Indian Agriculturist*, at the present day over 480,000 acres more or less under coconut cultivation in various parts of the world, and the ever-increasing demand for the products of this tree makes its cultivation a profitable undertaking.

No bird, beast or creeping thing, says an American paper, will touch a castor oil plant; it seems to be a rank poison to all the animal world.

The Veterinary referee of the *North British Agriculturist*, writing on distemper in dogs, says:—

The disease, as stated, must run its course. Good nursing is almost more important than doctoring, and treatment can only be directed to mitigate untoward symptoms. The patient should be restricted to simple digestible food,—mainly milk. Undigested food, which may prove a source of irritation, is best got rid of in the earliest stage by an emetic or gentle laxative. The animal, promptly removed from its companions, should have quiet, comfortable, airy quarters, which must be kept scrupulously clean, and disinfected daily. Several times a day the discharges from eyes and nostrils should be removed with tepid water and a sponge or piece of lint, the parts carefully dried, and sprinkled with a little dusting powder, which may consist of one part of boric acid or sanitas powder, with twenty of kaolin. Before the cornea becomes opaque or ulcerated, or other serious symptoms occur, professional advice should, if possible, be obtained. Difficulty of breathing or cough are combated by steaming the head, hot compresses to the throat, and repeated doses of ammonia acetate solution and other stimulant expectorants. Gastro-intestinal catarrh is relieved by sodium hyposulphite, or by mineral acids and bitters. Diarrhoea is prevented from wasting the precious strength by a few drops of chlorodyne or of spirit of chloroform and laudanum. The irritable, eczematous skin is dusted with borax and starch, or moistened with glycerine and water, containing a few grains of boric acid. Anodynes

and antispasmodics are used to relieve the several nervous symptoms. From the outset, suitable food must be judiciously given to maintain failing strength. If the animal will not of its own accord take milk or other nourishment, he must be fed with spoon or bottle, receiving tea with milk, or beef tea, with which, after the third or fourth day, white of egg may be mixed. To maintain the action of the heart, a little wine or spirit may be required either with the food or

between meals. By early isolation of infected subjects and disinfection of premises, the spread of the complaint may be checked.

It is not improbable, says the *Indian Agriculturist*, that the service of the Swiss dairy expert, now in the employ of the North-Western Province Government, may later on be utilized by the military authorities for the establishment of dairy farms at selected military cantonments.

[No. 8.

MR. WALL'S LECTURE ON INVENTIONS.

(Being the last of the series of Marsh Lectures delivered at the Museum on the 28th Nov. 1892.)

WHEN I delivered the first lecture of this series, I had the honour of the patronage of the late Sir Samuel Grenier, who presided on the occasion, and I could not allow this occasion to pass, without paying a tribute of respect to his memory. By his untimely death the Colony lost a valuable and eminent public servant, and a most estimable man; but the cause of Technical Education lost its most powerful, and one of its most intelligent supporters. To him and the Honourable Mr. Mitchell is due the credit of whatever has been done towards establishing a Technical Institute on the foundation so well and practically laid by the late Director of Public Instruction, Mr. H. W. Green, and strengthened by his successor Mr. Cull. The present Government has given substantial support to the cause by its vote of R5,000, for the salary of a Technical Teacher; and while acknowledging our obligations, it would be unpardonable to omit honourable mention of Mr. Marsh, the originator of this course of lectures, for the service he thereby rendered to the cause of technical education and for the prize he connected with them.

In my introductory lecture, to which I have just referred, it was stated that the object of Technical Tuition is the application of the principles of science to useful purposes in the arts and manufactures; in other words, to promote inventions. For it stands to reason that men do not ransack the archives of science, and exercise their ingenuity merely for the purpose of perpetuating old methods and processes, but in order to improve

upon, or to supersede them by new ones; and that can only be done by means of inventions. Those who wish to pursue old methods for a living, will in future, as in the past, betake themselves to mills, factories and workshops, where they are pursued in the way of business; and if technical instruction be sought, it will only be the better to qualify them for those employments. Nevertheless, there are certain persons in the community, who, either from sheer opposition or from ignorance, persist in declaring that the proposed Technical Institute will be no more than a great big Industrial School. Argument would be wasted upon them.

It has been said that he who makes two blades of grass grow where only one grew before, is a public benefactor, and that is true, but he must also be an inventor. That extra blade of grass will not come by invocation, it must be extorted from the soil by the application of some adequate force, suggested by science, that is, by means of invention. In like manner, he who makes two bricks, two pairs of shoes, or two of any other commodity in place of one, or if he make the same things more economically or supersede them by something better, he is also a benefactor, who can only accomplish any of those useful purposes by the application of scientific principles, that is by invention. Seeing then that the ultimate object of all technical teaching is invention, it seems to me that invention would be an appropriate subject for this closing lecture of the series.

In order that we may all know precisely what we are talking about, it will be advisable, at the outset, to define what is meant by the term invention. In literature and in common parlance, it is usual to distinguish between discoveries and inventions, but in practice they are so mixed together, that it would be inconvenient for our present purpose to treat them separately. Moreover, the law

sanctions their being treated together, as it does not distinguish between them. And while speaking of the law, it may help to furnish a definition. For a patent is of the nature of a compact between an inventor and the Crown. The State desires to possess the inventor's secret, in order to prevent its being lost, as several important inventions have been, and also that the invention may not be worked only for the benefit of the inventor, but that the State may enjoy the advantage of its use, generally. On the other hand, the inventor is glad to be saved the risk and inconvenience of keeping his secret, and to have the advantage of keeping the arm of the law for the protection of his rights.

It follows from this view of the matter, by implication at least, that an invention must fulfil four conditions. It must be new. It must fulfil a useful purpose. It must be successful, and the secret of it must be so fully disclosed in the specification, that any expert in the business to which it refers, should be able to carry it out, without any other help than that of the description given in the patent. These conditions are all essential. Indeed, it stands to reason that the secret of an idea that is not new, or which fails to fulfil its purpose would not be worth buying or preserving. These conditions thus restrict the meaning of the term within narrow limits, and show that many ideas that are patented do not prove to be inventions. The patent office therefore becomes a sort of lottery, in which there are many blanks and only a comparatively few prizes. This fact gives the key to the curriculum of Technical education. For, seeing that invention is its ultimate object, it follows that the teaching should be such as to secure success and avoid failure. Technical students are, in short, to be instructed in the secret of success and armed as well as warned against the causes of failure.

It would be difficult for me to prescribe a curriculum suitable to answer that purpose on the present occasion, and it would put your patience to too severe a test. I purpose therefore to illustrate the sort of instruction that is required, by means of examples of familiar cases of success and failure. In doing this, however, it will not be possible within the compass of a lecture, to give more than the merest sketch of each invention adduced, so much only in fact as will serve to indicate the secret of success, or the cause of failure.

The first example I shall adduce is one of the greatest and most illustrious achievements of the human intellect, the invention by Sir Isaac Newton of the law of gravitation. You know it is said to have been suggested to his mind by the fall of an apple. And no doubt it was so, but the wonder is, that the fall of an object in a straight line to the earth, should have suggested the law that regulates the motions of the planets, in elliptical orbits, round the sun, and that of the satellites round their principles. We may perhaps take a step to help towards that grand conception by considering that when the apple was liberated, and fell perpendicularly to the earth, it had no motion of its own, and obeyed the single force of attraction to the earth. If, however, at the time of its liberation from the tree, it had possessed a motion of its own, at right angles to the straight line of its fall, and supposing that force was just equal to the force of attraction, then, instead of reaching the ground in a direct line it

would have obeyed both forces and would have reached the ground in a curve at a distance equal to the length of the fall. Similarly, if the rectilinear force it had when liberated was twice as great, the distance at which it would have reached the earth would have been correspondingly great. It is thus conceivable that the object might have possessed a force so great that it would not reach the earth at all, but would either go circling round it, in a more or less elongated ellipse, or escape from it in a parabolic curve into space. Such an fact must have been the mighty conception of the inventor of the law of gravitation. To test his theory, he resorted to various expedients, which confirmed its truth, and at length, being so far satisfied, he applied the theory to the motion of the moon, with which he was well acquainted, as it had been long known by observation. For the purpose of this test, however, it was necessary to ascertain the magnitude of the earth, and this he obtained from the French savants, who had computed it from a measurement they had made of an arc of a meridian. With this datum, Sir Isaac proceeded to ascertain if the moon, in her orbit round the earth, obeyed his new law. Alas! The test failed. The invention was laid aside, and for 16 years remained in abeyance. At the end of that time, the French philosophers, being distrustful of the accuracy of their first measurement, induced the Government to institute another and much more careful one. This gave the earth a magnitude considerably different from the first; and when Sir Isaac repeated his trial of the moon's motions with the new datum they were found conformable to his law, and he therefore disclosed to a wondering world the grandest invention science had ever suggested to the human mind.

This example shows the importance of employing reliable data. For Sir Isaac's first failure he was not himself responsible. Nevertheless, his experience affords a useful lesson on the employment of data in inventions. But this example is cited mainly for the wonderful power of logic; that is, of reasoning that it exhibits, and the still more remarkable resources of calculation that were brought into requisition. These, and the marvellous industry, perseverance and patience he devoted to his task, constituted the secret of Sir Isaac's success. Such are the lessons taught to technical students by that illustrious example.

The next example to which I will ask your attention is one which has probably affected the progress of mankind even more than the one just mentioned. The *steam engine* prior to WATT's time was comparatively of little use; but in his hands it was converted into a most powerful agent in the progress of the race. It is true that it has since been improved, in many ways, and has been the subject, probably of a hundred patents. Nevertheless, all those features of Watt's invention on which its efficiency depends are, at this day, exactly the same as he left them. The crank, that beautiful contrivance for regulating the movements of the piston in the cylinder, and preventing it from alternately butting against the ends serves its purpose so admirably that it must persist for all time. The parallel motion, which adapts the linear motion of the piston rod to work in harmony with the curved motion of the end of the oscillating beam, solved a great problem; and though the piston rod is not guided

in an absolutely straight line, its motion approximates to one so closely that it has never needed to be improved. Indeed, it is worthy of note, that a mathematically exact solution of the problem of drawing a straight line by mechanical means was not obtained till so lately as 1865, and then it required seven links, whereas Watt's has only four. Again, the eccentric and slide valve are used to-day as Watt used them, and the condensing process with its appliances is also in use in the form he gave them. In short, the Steam Engine, as Watt invented it, went at once into universal use, and will ever remain as one of the grandest and most successful efforts of human genius under the inspiration of science. The steam engine is especially an example of resource and technical knowledge, that is of the application to useful purpose of scientific principles; and therefore affords one of the most instructive illustrations of invention the technical learner who is desirous to learn the secret of success can study.

Before passing on to further illustrations, it will be useful to point out a common characteristic of the two inventions that have been briefly sketched. Few are the inventions which are brought forth at their birth, as were these two, in a state of maturity. By far the greater number pass through many successive stages, and owe their maturity to many authors. Of the few that were matured at the outset, or, as the surgeons would say, by the first intention nearly all are simple, as the vacuum pan for sugar boiling, or the hot blast for smelting. Instances like those of Newton and Watt, which involve vast research, and require boundless technical resource, are rare indeed and should be distinguished as the greatest triumphs of technics.

The next illustration is rather of an introductory nature, and, in fact, not so much to an invention as to the thoroughness of the preliminary measures that were taken for one in prospect. The gentleman who was induced to investigate the subject of small arms, with a view to ascertain the true principle of constructing them, commenced his work by indenting on the patent office for specifications of all the patent that had been taken out in connexion with gunnery for 150 years! He was determined to know all that his predecessors had done or tried to do. This vast pile was consigned to his assistant, to be analysed and condensed into a formal précis. This work, which occupied a quire or two of double elephant drawing paper, to make room for the numerous columns representing separate parts of a gun, was a formidable undertaking. In due time, the work disclosed many points of interest in the history of gunmaking, and it will be worth our while to consider two of these points, for their bearing on our subject.

James Puckle, it appears, obtained a patent in 1718 for an excellent design for a revolver. The principle was intended to apply to small arms as well as to pistols. Now, seeing that in 1854, when that précis was made, the modern revolver was of quite recent date, the question arises as to the cause of more than a century's delay in the production of the invention. The answer is simple. Mr. Puckle was before his time. His invention could not be carried out with accuracy with the appliances then in use.

He lacked the technical knowledge of existing means of construction. Here is a lesson to technical students, showing that a vital element of the success of an inventor is an intimate and practical knowledge of the constructive capabilities of the tools and appliances practically and thoroughly. For want of this knowledge Puckle failed.

The other point suggested by the précis is very curious. It refers to at least three or probably more patents that were obtained, at considerable intervals of time, for the same idea, which had evidently captivated in turn several minds independently one of another. The idea was to let air into the breach simultaneously with the ignition of the charge. Presumably, the idea was to strengthen the combustion. It does not appear to have occurred to the inventors that in letting air *in* they would let the explosion *out*. Even, however, if any one of them had contrived to introduce air, without opening the breach, the failure would have been equal. I cite this remarkable example to warn students against applying or attempting to apply scientific principles, without a thorough knowledge of them and therefore without perceiving their applicability or otherwise to a given purpose. The men who patented this strange invention must have been very much in earnest, for the cost of the great seal alone was £120, in those days, beside other fees. They were right in their idea that oxygen stimulates combustion, but they were utterly wanting in the technical knowledge of the conditions to which they proposed to apply that idea. Hence their utter failure.

Turning now to the particular invention for which that précis was wanted, the construction of small arms, the subject was then engaging much attention. The Minie rifle had caused much sensation. Notwithstanding the high standard that had been attained in the construction of guns, however, there were no means of ensuring their all shooting alike. In those of the best makers there were unaccountable irregularities. A number of the best gunmakers were examined by a committee of inquiry, but without arriving at any satisfactory result. Lord Hardinge therefore induced Mr. Whitworth to undertake an investigation, by means of his known appliances for accuracy of work. The précis, just mentioned, was his first preliminary, and while it was in progress he visited the Enfield gun factory, to learn all that it could teach. The Enfield gun was an excellent weapon, and it was made in great perfection, and with the utmost secrecy, at that Government factory. Mr. Whitworth was, of course, to be informed on every point he might inquire into. He and his assistant first visited the forge, where the barrels were made in the rough. Holding one of these rough pipes in his hand, Mr. Whitworth remarked aside to his assistant, that its imperfections could never be entirely eradicated, but would cling to it, in some degree, to the end, and he said: "To end right, one should begin right." A. "Then you would begin with a solid bar." W. "Yes." A. "And how would you insure truth in boring?" W. "What should hinder?" A. "Any irregularity in the texture of the metal." W. "True, but, I would employ homogeneous metal and anneal it perfectly." The walk through the factory suggested

nothing to men so familiar with all mechanical work as these visitors, and therefore nothing arrested their attention, till they came to the viewer, a highly skilled workman, whose business it was to view the barrels in order to test their straightness. This he did by looking through them at a pane of glass in a window opposite. The upper part of the pane was blackened down to a line of perfect straightness. By directing the barrel on this line it was reflected on the sides of the brightly polished bore of the barrel, the upper half of which was thrown into shade and divided from the lower and fully illumined half by the reflection of the line on the pane. Now, in looking through the barrel, its whole length was foreshortened into a space of about half an inch on each side, and therefore any crookedness, however slight, was magnified and made perceptible to the experienced eye of the viewer, who corrected such errors as he discovered by delivering one or more blows of a wooden mallet on the barrel, as it lay on a wooden anvil. Corrections so made for Mr. Whitworth's special information seemed to be very effective, but he remarked that those blows dislocated the molecular structure of the metal, and were, beside, but partially effective.

It would be beside my present purpose to describe all the exhaustive experiments that were carried on in the shed at Rusholme, 500 yards in length, with all appliances and apparatus, and it would take up too much time. Suffice it to say, that when twenty of the new Whitworth rifles were produced at the Wimbledon meeting, and when Her Majesty, on being asked to inaugurate the occasion by firing the first shot, electrified Lord Elcho by asking if she should be certain to hit the bull's eye. Mr. Whitworth's reply was well-known. "Tell her Majesty she shall hit the bull's eye!" He accordingly laid the gun and Her Majesty fired the shot and hit the bull's eye within half an inch of the centre. Here is one of the greatest triumphs of purely technical skill on record. Let the technical student mark the preliminary care observed in the précis—the exhaustive trials—the sound reasoning—the intimate knowledge of the behaviour and characteristics of the metals—and the perfect command of constructive resource which this inventor possessed, and he will then understand the secret of that remarkable success. Failure was barred out at every turn of the exhaustive research. There is a mine of lessons for the technical student in that pregnant example of mechanical skill and research.

The next illustration I take is one of those rare instances, to which allusion has already been made of an invention produced in maturity at its birth. It is beautiful in its simplicity and success. A certain dock gate, of ponderous dimensions, that had to be opened once a day, required the power of 300 horses engine to open it; but, as the work only required the service of the engine for a few minutes daily, Mr. (now Lord) Armstrong devised a better plan. He erected a tower with a cistern at the top, of a height to give the requisite head of water. He then employed a small engine to pump water into the cistern. It had all day for its work, and when the gate had to be opened the whole accumulated contents of the reservoir were brought to bear on the work.

Thus a 10 or 20 horse engine was made to do the work of one of 300. Similarly, when a number of cranes were all actuated by one engine it was often brought up to a stand, when two or more cranes were simultaneously, but the inconvenience was simply remedied by a hydraulic. Even if all the cranes happened to be at work simultaneously, there were no stoppage, but only a heavier drain, for the time, on the supply of water in the cistern.

Now this same inventor, so successful in the work just mentioned, and who has since been so distinguished by others of equal value, failed in his next invention. The first Armstrong gun had a multigrooved bore and a lead coated projectile. The lead was intended to be forced into the grooves by the explosion, and to give the projectile the necessary axial rotation, to insure the accuracy of its flight. For this purpose it proved to be too weak; and the angle of the rifling had to be reduced below the most effective one. Even then, the lead and the iron had no cohesion, and being of very different specific gravities, they often parted company in flight. If I am not mistaken, a battery of these guns was taken into the field and misbehaved. That form of gun was therefore abandoned, and it is now cited to show the importance to an inventor of a perfect knowledge of the character, strength, and behaviour of the materials he uses. A lesson is also contained in this example of a lack of technical knowledge, even in an eminent technist, and of the need there is for special examination of the materials that an inventor purposes employing for a new purpose.

Whilst on the subject of material I may adduce in illustration a most important invention, which turns entirely upon the special application of a new material. Many attempts had been made, unsuccessfully, to construct a cable for submarine telegraphy, until guttapercha was tried, and that material solved the problem successfully and permanently. The first account of guttapercha was in a French periodical, *La Technologiste*, about 1838. It was there described as somewhat resembling caoutchouc, but wanting in the elasticity that gave that substance its chief value. It was said to be suitable for moulding into picture frames and such like purposes! How little could the writer of that paragraph have imagined the incalculable importance it would come to possess and the revolution that would be wrought by its agency. Here is a lesson to the Technical student, of the importance of an intimate acquaintance with materials of every kind, and their properties. The success or failure of the greatest invention may, as we have seen, be determined by the use of a material suitable to a particular purpose.

It has already been stated that the great majority of inventions are of a progressive character: beginning with a comparatively crude idea, and improved upon by successive steps, and in many cases reaching maturity by contributions from many inventors. From the great mass of illustrations that might be adduced of inventions of this kind, I select a few only. First on the list are *printing* and *photography*, which will be treated together, because of the contrast they afford of the slow development of the former, owing to secrecy observed by its inventors, compared with the rapid progress of the latter, under the modern

regime of publicity. There may probably have been as many as a hundred patents in the maturing of photography, and a great number of different contributors. They followed each other at first slowly but in recent years the development of the invention has been indicated by rapid progress. The last achievement of the art that has come under my notice was a set of illustrations in the *Revue des Sciences* of photographed cannon shot in flight. They are the greatest triumphs of instantaneous photography yet accomplished. The *electric light* is another instance of progressive development, and it seems to be yet far from the maturity which may be hoped for it. The *aniline dyes* afford another and important illustration. Commencing when benzole, an essential ingredient was obtained from tar, its use as a dyeing material was taken up successively by chemists, and then by practical dyers, until the aniline dyes came into universal use. The last illustration of this kind to which I will invite your attention, is the very familiar *sewing machine*. Many attempts were made before success was attained. Embroidery was done mechanically long before proper sewing was done by machine. The problem was solved by Elias Howe in 1846. His machine was mechanically imperfect, but it contained the one essential feature, without which no true sewing machine is practicable, that is: a *needle with the eye in the point*. Fortunately, the inventor included this item in the claim under his patent, and though the mechanical arrangements of his machine were little esteemed and were speedily superseded, the sum he received and heartily merited was, over 2 million dollars. The problem once solved, a great many improvements were made, and accessories were added, until the invention reached its present perfection, and its application extended to all kinds of sewing, including every kind of fancy stitch.

This last example would serve equally to illustrate those inventions which have for their object to substitute mechanical contrivances for the use of the human hand. These constitute the great majority of all mechanical inventions. There are scarcely any manual operations of importance, for which machinery has not been adopted. Time would fail us to adduce adequate examples of this class. We may mention two however, which afford lessons to the technical student, not suggested by those already given. One is that of an invention to supersede corks for closing bottles by substituting a screwed stopper to be used with a washer of indiarubber or cork. The inventor, a wealthy old retired merchant, expatiated on the convenience his invention would afford, especially for champagne and effervescing drinks from which a glass could be taken and the bottle resealed. After having secured his patent, he took his invention to a bottle manufacturer, who showed him that his plan was impracticable by the usual method of making bottles, and would require a special apparatus. For this the patentee had to seek the help of a mechanical engineer, who supplied what was necessary. Otherwise, the invention would have died at its birth. The other example is one in which two inventors simultaneously invented the means whereby the driver of his Hansom Cab could open or shut the doors of his Cab without moving from his seat. The two inventors worked independently, and

neither knew of the other's proceeding. Eventually, the one who was senior, by a few days only filed his specification, and the other followed immediately after. Their inventions were substantially different, but had one feature in common. This feature the former, who was an amateur, claimed as part of his invention, not knowing that it was in common use. The other, who was an expert, avoided that mistake, in consequence of which the later patent was good and the former was invalid, by its having claimed as a novelty a well-known expedient, the universal joint. These two examples show the importance to inventors of a thorough acquaintance with the processes and designs they propose to improve upon, and also to be conversant with all the mechanical expedients in ordinary use, lest they should claim as a novelty one that is well known.

The foregoing examples and illustrations are adduced to give a general idea of the commonest causes of failure, and the general conditions necessary to success, and they are to be considered only in their bearing on these points. It was deemed necessary for this purpose to select such inventions as are either well known, or were easily understood, and would therefore convey clearer ideas than others less popular, that might have afforded more striking evidence. They show, in general terms, that there are three principal qualifications for successful invention, namely:—

First, a knowledge of *constructive powers, tools and appliances* for giving effect to the inventor's ideas. Puckle and the inventor of the bottle stopper failed for want of this qualification, and Whitworth succeeded mainly by virtue of his intimate knowledge of what could be accomplished by the means he could command.

Secondly. A knowledge of *metals and materials*, their capabilities, and special qualities, and adaptability to the purposes required. The submarine cable is a notable instance of success, and the lead-coated projectile of failure attributable to this cause.

Thirdly. An inventor must be thoroughly acquainted with all the available devices and expedients by which required *mechanical movements* may be produced. This knowledge is indispensable, and is called into requisition in almost every mechanical contrivance for superseding hand labour. Almost all the complex movements of the human hand may be simulated by suitable mechanical expedients, as may be seen well illustrated in the common sewing machine, and still more perfectly in some other machines well-known in the mother country which have not yet been introduced here.

In order that technical students in Ceylon should acquire these three essential qualifications for successful invention, it will be absolutely necessary that they should have access to a museum or gallery of illustration, furnished with working models of machines, tools, materials, and appliances, that will exhibit this essential information practically, not merely by seeing them, but by close investigation and dissection. It is as essential to the technical student that he should dissect machines, tools, and contrivances, as that the botanist should investigate the various parts of a plant, or that the medical student should study the anatomy of the human frame by operating on the human corpse. It is not enough that

he should see the performance of a machine, he must know how it is effected, and the means that are employed. The necessity for workshops, as accessories of a technical institution, needs no insistence, as they afford the *only* means of acquiring a practical knowledge of the uses of tools, and of some at least of the properties of materials. The workshop is as necessary to a practical knowledge of mechanics, as a laboratory is to the chemist. A technical institute must be, above all things, *practical*. The student who possesses only book knowledge would have no chance as an inventor in prosecuting his experiments and researches.

It is not necessary for me to emphasise the importance of a student's thorough knowledge of *drawing*, because that at least is fully acknowledged, and has already been introduced into most schools. It is in fact the *language of invention*. Nor is it necessary to point out the necessity of a thorough grounding in that kind of close reasoning that Euclid teaches, for, as drawing is the language of invention, *logic is its grammar*.

OCCASIONAL NOTES.

"An Essay on Farmyard Manure" is the title of a pamphlet sent to us by the author, Mr. E. T. Hoole, Agricultural Instructor. The subject is fully and intelligently dealt with, and is evidently treated of with the object of impressing upon the cultivators of Ceylon the importance of conserving and utilising to the fullest extent the droppings of all animals kept on the land. It is the complaint of the scientific agriculturist everywhere that there is great negligence on the part of the ordinary farmer in the treatment of farmyard manure, and to the wasteful system now in vogue among the natives of Ceylon must in a great measure be attributed the unsatisfactory results of their cultivation. We trust Mr. Hoole's pamphlet will have a wide circulation, and be the means of working the reform at which it aims.

We were glad to note that the Assistant Government Agent of Matara had taken steps to exterminate the insect pests that devastate the paddy crops in this district, and that his efforts have proved successful. We have not been informed what form of spraying apparatus Mr. Le Mesurier has been using, and whether it was imported or is of local manufacture. If the latter, it would redound to his credit to have contrived a machine which is reported to work so successfully. The School of Agriculture is in possession of a patent spraying apparatus known as the "Eclair" knapsack machine. It consists of a copper reservoir or vessel holding 26 pints made to fit on to the operator's back, being fastened there with straps like a knapsack. A rod traverses the lower part of the reservoir inside, being worked by a lever with the operator's hand. This does not move a piston as in ordinary pumps, but acts upon an india-rubber diaphragm, by whose sucking action

the liquid is forced through the delivery tube with great force. The liquid can be delivered in the finest spray in any direction. The machine, which has worked well on trial at the School, ought to do well for infested paddy-lands.

The School of Agriculture re-opened after the Christmas holidays' on Monday the 16th January. Fifteen new students have been admitted. There have been some changes in the teaching staff: Mr. Jayawardene, late Headmaster has resigned, and Mr. W. A. De Silva at present in Bombay prosecuting his veterinary studies has been appointed to succeed him. Mr. D. A. Perera of the Ratnapura Government School has been appointed 2nd assistant and acts for Mr. Silva, while Mr. Hoole, Agricultural Instructor comes to the School as permanent 3rd assistant. Mr. P. S. Rodrigo, who has been connected with the School for over 3 years, during which time he won the highest respect of the students and the confidence of his superiors, takes up the duties of Headmaster of the Kadugannawa primary English School.

There was no public prize distribution at the School last year. The following is a list of the prizemen:—Among the Seniors: Nallatamby and Abeysekera in Agriculture, Savarimuttu in Veterinary Science, Gunawardene in English and Mathematics, Abeysekera in Science, Romiel in Practical Chemistry. Among the Juniors: Cooray in English and Mathematics, Fernando for Agriculture and Science.

FARMYARD MANURES.

A pamphlet of 15 pages on this subject, written by Mr. E. T. Hoole, late of Happy Valley and at present Agricultural Instructor at Bandara-gama, has reached us. Mr. Hoole explains at the outset that farmyard manure is a general manure, because it supplies all the elements of plant food in convenient proportions. One of its many advantages he notes is that in the natural course it decomposes but slowly in the soil and gradually yields up its stores of plant food. This advantage is of special importance with us where heat and moisture favour the decomposition of organic substances, while our copious showers have a tendency to wash out of the soil the soluble ingredients of plant food. Again, we have no cheap substitutes for this manure as is the case in western countries where many refuse nitrogen-yielding substances are manipulated into products of manurial value, such as shoddy, hair, skin, horns, leather, blood, &c. Now it is beyond the means of the ordinary cultivator to import or locally purchase the so-called artificial "guanós," and while bones are used by them to some extent to supply phosphoric acid, and ashes or leaves are utilised for the other valuable ash constituents which they contain, without farmyard manure there is no convenient means of appreciably adding nitrogen-yielding material to the soil. For these and many others reasons which Mr. Hoole has not failed to notice, it is most important that our cultivators should exercise the greatest care in pre-

servicing and utilizing to their fullest extent all the droppings of the animals kept on the land. The manner in which cattle manure is allowed to lie exposed to the severity of the weather when, at a small cost, a covering can be provided which will be the means of preventing any loss of the valuable ingredients the manure supplies, cannot be too strongly condemned. Mr. Hoole gives special hints of an instructive nature as to storage, preservation, and application of farmyard manure. The pamphlet under review has the special merit of being a simple treatise, free from scientific details, and it is intended to have selections from the essay rendered into the Vernacular for the Sinhalese Agricultural Information Leaflet which is so widely circulated. We quote the following passages specially referring to our native cultivators:—"In conclusion let me point out the great ignorance and negligence that exists among most of our countrymen about farmyard manure. They are blind as regards its valuable qualities. True, some of them manure their fields and gardens with it; but this is more the exception than the rule, especially in the South and West of our Island. It is astonishing to see the reckless manner in which valuable manure is wasted by the majority of our goiyas. They care nothing for the large quantity of droppings that may be had on the roads and compounds and from the public cattle stalls. This indeed is bad enough, but it is shocking to find that they do not make cattle sheds for housing their own animals at night and collecting the manure. They are sometimes tied in the open; but very often they are left to wander about on the roads, jungles, meadows, &c. Many villagers seem to have a prejudice against the use of farmyard manures. . . . One reason why the Jaffna paddy-fields are more productive, notwithstanding the natural drawbacks in the soil and climate, is the extensive use of farmyard manure. The cultivators of the North avail themselves of every scrap of manure procurable and turn it to good account. But even there several improvements are necessary, especially in the making of manure and the preservation of the manure heaps.

"The village farmers all over our Island must be taught better about farmyard manure. They do not know its real virtues. They either neglect them through laziness, or lose them through ignorance. Some are still unaware of the fertilizing character of the liquid portions of farmyard manure. I have even seen people scrupulously thinning aside bits of straw soaked with urine, lest they should deteriorate the manure. They leave their manure heaps to the mercy of the elements; and many a time you may have seen cartloads after cartloads of dry, rain-washed, worthless stuff emptied into the fields as farmyard manure and applied to them with feelings of perfect satisfaction.

"All this is very deplorable and calls for the aid of enlightened scientific knowledge. It is therefore our duty to show our lazy and ignorant countrymen both by precept and practice—by example and instruction—the real nature and value of farmyard manure, and the proper method of preserving and utilizing it to the best advantage."

THE STUDY OF FORESTRY.

Professor McAlpine, of Edinburgh, in delivering the opening address of the Forestry class in the Glasgow Technical College, stated at the outset that there were three situations in which plants were grown—(1) in the field, (2) in the garden, and (3) in the forest. The man who produced plants in the field was the agriculturist; in the garden, the gardener; and in the forest, the forester. With plant production in the field and in the garden they had there nothing to do; their business in that class would be with the plants in the forest, and in the forest alone. In dealing with forest production, the skill possessed by the forester determined, to a very large extent, the profit realised. There were, however, two kinds of skill—the practical skill gained from long experience, and which had, he was bound to say, reached a high degree of perfection in Great Britain, and the skill to be derived from a genuine scientific knowledge of the principles underlying the growth and production of trees in the forest. Practical experience was, no doubt, valuable, but it only carried them up to a certain point; they were still without a thorough knowledge of, and the reasons for, the different changes that took place in the course of the growth of forest trees. It was quite evident that the best forester, and the one that could attain to the highest maximum profit in the production of timber, was the man who combined practical with scientific skill in his practice. In these days of keen competition, it was necessary in forestry, as everything else, that they should produce the best quality at the lowest possible cost, and this could not be done unless their knowledge was good and sound, and their methods of the most economical and satisfactory description. Scientific skill in forestry had often been regarded as of no practical merit, but without it the maximum profit could not be realised from the trees. In that class he proposed to tell them something of what science and scientific knowledge had to do with the subject of forestry, and he proposed to deal with it under two leading heads—(1) forest botany, and (2) the forest itself. The great object of the forester was to produce timber, and to him the plant was a lignin-making machine. This lignin, the characteristic constituent of wood, was easily identified by the red colour produced by the action of piloroglucin and hydrochloric acid. Wood, taken as a whole, was a combustible mixture, composed chiefly of the three elements—carbon, hydrogen, and oxygen. In introducing such a subject as the scientific study of forestry, it was important to know what timber was made from. It was very often stated, and very widely supposed, that the organic matter, or humus, in the soil was the substance used by the plant for timber production. Such a doctrine was quite untenable, since the amount of humus was not diminished by the production and growth of trees, but was, as they must all know, rather increased. The method of water culture also proved beyond a doubt that the constituents actually employed by the tree plant for the production of its woody substance were water from the soil and carbon dioxide from the air. He had himself seen in Germany, where, as they knew, great attention was devoted to the production of the best class of forest timber, a pair of alder trees

which had been grown from seed by the method of water culture. These trees when he saw them had attained a considerable height and girth, yet they had only received distilled water and certain mineral substances, the carbon dioxide they wanted being taken by themselves from the air. That was a very remarkable thing, and, seeing that these substances cost so little, they would naturally be inclined to think that there must be a large profit in timber-producing, and no doubt there was, if a suitable supply of plant food could be got readily, and the plant skilfully and carefully managed. Dealing next with the function of the wood in the tree, the lecturer said there were two main purposes to be accomplished, viz., the upward circulation of water, and the carrying of mineral matter. The duty of carrying the water and the mineral matter up the tree devolved on what might be called circulating pipes or wood vessels, and circulating cells or tracheids. Wood, in addition, played the part of a skeleton, and this duty devolved upon the woody fibres or tracheids, the most solid constituents of timber. Associated with the circulating and skeleton apparatus were the servant cells to feed the wood cells, and to aid in pumping up the water into the circulating apparatus. Different kinds of wood had (as the lecturer showed by means of large diagrams on the wall) these structural elements differently arranged. The ash, elm, oak, and chestnut were stated as being amongst the woods which had the larger sized pipes for circulation purposes; the beech, hornbeam, alder, and sycamore had medium sized pipes; while in the case of coniferous trees like firs, pipes were entirely absent, the work of circulation devolving upon the cells or tracheids. Alluding next to the formation of wood, the lecturer explained how the cambium, the part between the wood itself and the separable bark, added rings of wood year by year. On the activity displayed by this cambium depended the quality of wood produced per annum. Its proper feeding was accordingly of great importance, and the forester should see to it that an adequate supply of food material was not prevented from reaching it by the presence of too many branches. When too many branches were growing on a tree they carried off the food that ought to go to the cambium, the result being that it became very slow in its action, and wood was added to the main and important part of the tree at a much slower rate than it would otherwise be. As regards quality of wood, it was pointed out that this was to be secured, as a rule, by diminishing the amount of thin-walled wood in certain trees and by increasing the proportion of thick-walled wood. Thin-walled wood was mostly of spring growth, and the thick-walled of autumn growth; therefore it ought to be the business of the forester, if he wanted the best quality of wood, to encourage growth in the autumn rather than in the spring. The lecture was effectively illustrated by means of several large wall diagrams, also models and specimens, showing the construction of some of the most important timbers.

GENERAL ITEMS.

The Indian Agriculturist, speaking of the newly-appointed Agricultural Chemist for India, says:—Dr. Leather is, we believe, a young man with a reputation still to make as an agricultural chemist... Dr. Leather was, we believe, only an assistant in his (Dr. Voelcker's) laboratory prior to the short period during which he has practised as an analyst in Lancashire. In the selection of so inexperienced an officer the Secretary of State has shown great want of discrimination, for if any such officer was required at all, one was wanted who could speak with the weight of an acquired reputation.

In his reply to an enquiry from the Earl of Wemyss as to his views on the subject of Technical Education, Mr. A. J. Balfour, M.P., says:—In the case of industries which are constantly being modified by the advance of science and the progress of invention, where success between competing centres depends upon the discovery of new improvements and their rapid adoption, I think that technical education may be most valuable. So also in a country of small farmers, whose methods are antiquated, and who have little opportunity of making themselves acquainted with the recent developments of Agriculture, I think much may be done by judicious instructions... In this as in other departments of practical life, each case must be considered on its merits, not simply in the light of vague generalisations, but with a close scrutiny of the practical mode in which any proposed reform would work.

In a paragraph headed "How to Plant Bananas," in the *Sugar Journal and Tropical Cultivator*, we read:—Most people are under the impression that large plants are preferable for planting. This is an error, it is using large plants that causes the first bunches to be much smaller than the others that grow from the same plant. In a clump of bananas may be noticed young suckers that throw out leaves when not more than 9 in. or 1 ft. high, others that grow 2 ft. or 3 ft. before there is any sign of leaves. The latter are always good plants, the former should not be used as plants, neither should they be allowed to grow and can easily be removed by hand. It is a common sight to see stems 6 ft and 7 ft. high with a few leaves cut off stuck in the ground which for weeks afterwards with their withered leaves present a most wretched appearance, and if they survive the results are not at all satisfactory. If this same plant instead of being planted whole was cut down to about 2 ft. 6 in., and instead of being planted straight up was planted at an angle of 45 degrees, instead of the first crop being a poor solitary bunch (the result of the check caused by removal and transplanting) there would be at least three good stems with the fine bunches of fruit. A sucker if planted straight continues to grow from the stem, but if planted at an angle of 45 degrees, the old stem dies and the new plants grow from the eyes.

MARCH, 1893.

[No. 9.

FIBRES AND DYE-STUFFS.

FIBRE and dye-producing (not to mention tan-yielding) plants are among the chief natural resources of our Island, but they await the critical eye of a technologist who will be able after examining them, to give us the professional advice that he only can give, as to their economic value, and as to the best methods of utilizing the fibre and dye they contain. It was only in our last number, while writing of sida fibre, that we quoted the words of Prof. Goodale to the effect that there are countless sorts of plants which have been suggested as sources of good bast fibres for spinning and for cordage, many of which make capital substitutes for those already in the factories, but the question of cheapness of production and of subsequent preparation for use has thus far militated against success; that a process for separating fine fibres from undesirable structural elements and from resin-like substances which accompany them is a great desideratum, and if this were supplied many new species would assume great prominence at once. We now note that a factory has been established in High Street, London, for the treatment of various fibrous plants. Samples of these plants of every species, can, it is said, here be submitted for carefully-supervised trial, and if the present machines or processes prove unsuitable in some little detail or other, the defect will be discovered and remedied. In like manner advice will be given as to the best machines and methods for treating fibrous plants, and opportunity will be afforded of studying the various processes of production, and of acquiring a knowledge of the most scientific

methods of preparing fibres. In fact the present enterprise promises to develop into an important public technical school; for it is proposed to establish branches in textile, manufacturing, and cognate centres. From a still wider point of view the fibre factory may, as the *Indian Agriculturist* observes, be looked upon as an exhibition and a permanent institution for perfecting machinery and processes relating to the treatment of fibre-bearing plants of every description. The various processes to be carried on at the model fibre factory as set forth, comprise the rapid retting and ungumming of fibrous plants; automatic breaking, scutching, combing and hauling; spinning into simple and mixed yarns; cottonising and wollenising fibres to imitate fine cotton or wool suitable for the manufacture of various mixed and cheap fabrics as well as for fine and costly goods; bleaching and dyeing the same, and the rapid drying of fibres by means of cold air. The factory is described as consisting of a spacious warehouse and store-room for machines and samples, with offices annexed, and a large machinery and operating-room with a laboratory, and engine and boiler house. The chief feature in the operating room is new machinery for dealing more particularly with leaf plants, such as phormium, aloe, agave, palms and the like.

Here is the supplying of a desideratum, the existence of which has been so long deplored, and the result of which must be the opening of a new vista of enterprise for many in the cultivation of fibrous plants and the preparation of fibres for the market.

In the matter of dye stuffs, that is vegetable dye stuffs, too, there would seem to be good prospects, for says our Indian contemporary, there are premonitory indications that the days of aniline dyes—the products of coal-tar—are numbered; for though cheaper, and having the advantage of being capable of concentration into smaller bulk than those furnished by the vegetable kingdom, they are found to be impregnated with deleterious compounds that prove highly injurious to the material to which they are applied. This objection is trivial in the case of cheap cotton prints which wear but a short time, dyed or undyed, but when these chemical concoctions are used on silks and velvets they rot the cloth, which soon loses its hue. Assuming this to be

established, agriculturists are advised to closely watch the market for dye stuffs, as in these days of constant commercial revolutions the revival of the trade in lac-dye, safflower, orchilla, chaya, and other once popular dye-producing substances may possibly be looked for. There is of course the probability of aniline dyes being produced of such a quality as will ensure freedom from any prejudicial ingredient, but it remains to be seen whether this result is possible and how the means of obtaining it will affect the price of the dyes. At any rate, there would seem to be a fair prospect of the fibre and dye-producing industries being widened, and proving more remunerative.

We are now on the eve of possessing a technical school, and it is to be hoped that technical enquiry will be directed to the proper channels and will aim at desirable ends. The Right Hon. A. J. Balfour, writing lately on the subject of technical education, said:—I venture to lay down no general rule about the advantages or disadvantages of technical education. I believe it to be of vital importance in some places and some industries; I believe it to be nearly useless in any form in which it is likely to be applied in other places and other industries. Each case must be considered on its own merits, not simply in the light of vague generalizations, but with a close scrutiny of the practical mode in which any proposed reform would work. It is to be hoped that our technical instructor will possess the qualification of a technical chemist and botanist in addition to his intimate knowledge of machines, and will arrange his curriculum with a view to developing already existing industries and evoking new ones. Then one of the main objects of technical teaching in Ceylon will have been attained.

OCCASIONAL NOTES.

The *Indian Agriculturist* has begun what promises to be a most interesting series of articles on "The Agricultural Problem in India," in its issue of the 21st January. In the first article the "then" and the "now" of Agriculture in India are strikingly contrasted, and the apathy of the Government in the present situation deplored and censured. From the similarity of circumstances in India and Ceylon, the series of articles would be well worth perusal by the promoters of agricultural reform in our own Island. The first article at the outset draws attention to the fact that an almost complete change has taken place in the circumstances of the country during the last half-century. Before then husbandry was conducted on the self-sufficing system for villages or groups of villages: the possession of ample waste was the primary condition of prosperity, the villagers then being able to provide themselves with unexhausted land,—fresh fields and pastures new,—whenever they felt it necessary. Cultivation was kept up only on the best land. Each separate village, or group, was able to raise food enough for itself, and the domestic industries of the village provided for all the other wants of the community. The ryot's world was his village, and inherited experience sufficed to enable him to deal with circumstances as they arose. Now all this has changed.

Means of communication within and from without has to a great extent been established; trade is active, and this activity is felt everywhere in the country; in most cases more produce is being raised than is required merely for the support of the community; husbandry is becoming more and more a business. But the ryot has not changed his system with the times. Open field husbandry is still very general; careless and extensive tillage is still depended on to provide food; and poor land, from which a precarious produce can be obtained, is brought under the plough. With these changed conditions the population is increasing. Such facts as these are pressed upon the attention of those entrusted with the responsibility regarding the economic condition of the country. They must consider that the population of the country is increasing; that the population is dependant on the results of a precarious husbandry; that the people are tied and trammelled by inherited custom, and now find themselves in a rapidly altering environment to which they are practically unable to accommodate themselves and their practice; that the common system of husbandry, though suitable enough to self-sufficing village communities at a time when ample waste land of good quality was available, is now practised on land that has been severely cropped for long periods, and that has in most cases been reduced to its normal limit of production. These are grave dangers especially in a country where droughts are of frequent occurrence. "Have any among those who are entrusted with the duty of promoting agricultural reform and improvement," it is asked, "shown the slightest sign of having grasped the essential points of the question?"

We have to thank Mr. Hoole for samples of his work in the way of preserving botanical specimens according to the simple method described by him in our present issue. Botanical students would do well to try the method; as for its results we can vouch for their being very satisfactory, not merely in the case of simple and compound leaves but of delicate inflorescences as well. We also thank Mr. Alfred Drieberg for a specimen of a coconut, divided internally to the shell into two chambers. It is not generally known that the ovary of the coconut flower is formed of 3 carpels, and that the fruit should therefore if no suppression occurred be three-chambered instead of one-chambered as in the ordinary coconut which usually matures but one seed. The two-chambered coconut presented to us is an instance of reversion to the original type. We have heard of, but have never seen a typical three-chambered nut.

Herr Bolle, President of the Royal and Imperial Agricultural Society of Austro-Hungary, who has been deputed to India to study the agriculture of the country, spent a few days in Ceylon on his way to Calcutta, visiting some of the upcountry tea plantations.

The name of Mr. G. Rajapakse was inadvertently omitted from the list of prize winners given in our last issue. Mr. Rajapakse had a creditable career as a first year student, winning the Government prize for Agriculture.

We regret to have to record the death of Mr. V. Kumaravelu—the first Agricultural student we have lost by death—who succumbed to an attack of typhoid fever last month. Mr. Kumaravelu was a very promising young man of excellent character, and was prosecuting his Veterinary studies when he was seized with his fatal illness.

INDIAN JOTTINGS.

There are many varieties of pulses grown here, and, moreover, Bombay being the port of Western India, large quantities are brought over from the adjoining districts. The grain market is well worth visiting, and one with which nothing we have in Ceylon can compare. The large stores in the centre of the native business quarters which are devoted only to storing and selling the different kinds of grain, extend over several streets, and may be roughly estimated at over half a mile in length.

Among the heaps of pulses, dholl forms a very important part. There are two varieties of this seed, one the orange-coloured grain and the other a pale whitish one. The plants of both the varieties are almost alike in appearance, and in the methods of cultivation and cropping there is no difference whatever. It proved rather a difficult problem when dholl cultivation was started in Ceylon to find out a method to prepare the seed for the market, or in other words to turn it into *parippu*. From inquiries made here I find that it is no difficult matter, and large quantities are daily prepared for export by the help of hand stone mills. Two flat circular slabs of stone are made to slide on each other by a handle attached to the side of the top one, and kept in position by fixing the upper stone by means of a hole made in its centre, into a rod fixed to the centre of the lower one. The principle of this is in fact nothing more than the common *kurrakkan gala*, which is used in the villages to grind the fine-grain *Eleusine*, but the stones used in preparing dholl are much larger in size, and the hole in the centre of the top slab is also larger.

The dholl seed is first cleaned of dirt, &c., by winnowing and then dried in the sun. When it is thoroughly dry, it is poured between the stones above referred to. Finally the split seeds undergoes a second winnowing before being packed.

In order to facilitate the process of grinding the seed is often first soaked in water for twenty-four hours and then completely dried.

There is rather a novel (novel to us) way of preparing certain varieties of beans as a food. The seeds are closely planted in beds and watered till they come up; in about three to four days the cotyledenous leaves are seen above the ground, when they are pulled up and made into bundles and sold in the vegetable markets. For some time I was puzzled what these bundles which were exposed for sale in the markets could be, and I had no way of satisfying my curiosity, as the only information the sellers could give me was that they were "vegetable." However, I chanced a few days

ago to see the beans sprouting in a vegetable garden. When prepared this vegetable is of a very bitter taste, but the natives here seem to relish it very much.

Speaking of pulses I chanced to read that glowing advertisement of the *Lathyrus Sylvestris* (the plant that is alleged to grow everywhere) in one of the Bombay journals, and a few days ago Prof. Wagner's Agent in London wrote to the same journal offering the seed to Indian cultivators at reduced prices, further announcing his intention of opening a breeding farm in India and growing *Lathyrus* on a large scale. Perhaps the seed which was received at the Colombo School of Agriculture some time back was not the genuine *Lathyrus* of Wagner; in that case it would be worth while to write to Prof. Wagner's Agent in London, for some seeds for further trial, as from his letters the Professor appears to be ready to give every facility for demonstrating the value of the plant.

I have more than once written you on the cultivation of subsiding products in paddy-fields, and the more one sees of the system of cultivation round about Bombay, the more he is convinced of the necessity of adopting such a system in Ceylon. It is indeed a great waste to leave so many thousands of acres of land unused for more than half the year, and then only obtain a scanty crop of paddy after much toil and trouble and anxiety too. It has been stated by villagers, that the reason why some of them do not attempt to grow anything else but rice in their fields is that certain regulations connected with the now-abolished paddy-tax stood in the way of the conversion of a paddy-field into a dry-crop land. This might or might not have been a very valid excuse, though in all probability it was often a fact that if a villager tried to plant a coconut or two in an unused strip of land which once formed a field, and which either in course of time or by the work of a few hours had been raised above the level of the surrounding fields, he became a marked man. Now the tax is no more, and the cultivator has no such plea. But putting aside this or that idle excuse, the *goyiya* must now have more time at his disposal to devote to his land and more money for improving it. And this is just the time to try and get him to better his prospects. Indian Corn was mentioned as one of the products which could be profitably grown in a large acreage of fields. I have now observed a paddy-field here under lucerne: the crop which takes only a few weeks, has come up nicely, though I observed the same land under paddy to produce only a wretched crop.

In Ceylon, fields which are dry during more than half the year could be utilized for growing Indian Corn and such other crops, and when the time at the disposal of the cultivator is not sufficient for a subsidiary grain crop requiring so much labour, it could very well be put under lucerne or a quick-growing fodder. In this connection it is worth while trying to grow systematically some of the numerous Ceylon herbs which are eaten by people in times of scarcity, or which when gathered often form a part of the villagers' daily food.

Among these particular mention might be made of *Ipomea repens* (S. kankun) as a crop which would thrive even in wet lands. Other *Ipomea*, or the many varieties of amaranthus, particularly *A. speciosus* could be grown on dry lands. Besides, these and other crops would undoubtedly improve by culture.

Much has no doubt been written on the backward state of Indian agriculture, but I believe Ceylon is very very far below India as regards its native agriculture, with the exception of coconut. Of course it does not require any argument to prove that the "planting products" are far above anything in other countries. The Indian cultivator very often grows fodder crops and prepares hay out of the natural grasses, but these means are never heard of in the Island.

About twenty-five miles away from Bombay I have seen large tracts of paddy-fields, and one thing which struck me was that in many places they make use of the numerous ridges to grow fruit trees. Mangoes and Papaws were thriving well on these ridges.

HOW TO PRESERVE BOTANICAL SPECIMENS.

The specimen is carefully spread out and placed between two thick sheets of blotting paper and pressed by a clean, smooth, heated dhoby's iron. The pressure by the iron should be always downwards and not sideways. For instance, if a rather big leaf has to be pressed by a small iron, the iron should be lifted straight up from the part already pressed and laid on the unpressed part with a downward pressure. If the iron be even slightly dragged across from one part of the leaf to the other, the leaf might be squeezed or distorted by the sideward pressure thus exerted.

The pressing is done so as to remove the moisture from the leaf and to make it dry and smooth for keeping. If a specimen is very thick and fleshy, it will be better to press out the moisture gently and gradually rather than attempt to do it too quickly. If the blotting paper becomes saturated after some of the leaves have been pressed, fresh blotters should be used for pressing any more that remain to be done, as the paper which has become thoroughly wet will be useless for the purpose.

When the pressing is over, the leaf should be carefully removed from between the sheets of blotting paper and mounted on card or thick paper after gently applying some liquid gum to the back of the leaf. If the mounting cannot be done immediately after pressing the specimen, it may be temporarily placed between the leaves of a book and mounted afterwards when convenient. The mounted specimens must be kept, as far as possible, without being bent or squeezed.

I send along with this (for the Agricultural School Museum) a few specimens collected at Happy Valley and pressed in the above manner full eighteen months ago. Two large collections prepared by me in this way, at the same time as these have been taken by some ladies to England, and are keeping well I hear. There are, no doubt, other

good methods of preserving botanical specimens, such as by the application of salicylic acid for instance; but the one I have described here has the advantage of simplicity.

E. T. HOOLE.

Bandaragama, 19th Dec. 1892.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

In the division *Scolecida* are also included (besides the tapeworms), the "flukes" or suctional worms (*Trematoda*). With few exceptions the sexes are united in Trematodes, and the young may be developed directly into the adults, or may pass through a complicated metamorphosis, which varies in different cases, and does not admit of description here. In many cases the larvæ are tailed, and one of the early stages of their existence is often spent in the interior of freshwater molluscs, from which they are finally transferred to their definite hosts. The "flukes" inhabit, in their adult condition, the most varied situations. Most are internal parasites, living in the intestines or hepatic ducts of mammals, birds or baccrachians, the vitreous humour or lens of the eye, the blood vessels, &c. A few are external parasites, living in the skin and gills of fishes, crustaceans and other animals.

Practically there is only one trematode worm of any importance in a sanitary sense, viz., the *Distoma* or *Fasciola Hepaticum*, or liver fluke. This worm inhabits the bile ducts of the liver of the sheep and the ox, and occasionally the bile ducts of the horse, and gives rise in sheep to the disease known as "liver-rot," which is found to exist to a much greater extent in damp and swampy districts (except salt-marshes) than in any other. In wet seasons too the disease is more prevalent than at other times.

Rot is directly of no consequence to man, but indirectly the disease is of vast importance, not only on account of the great loss which it causes to sheep owners, but also from the immense diminution of the food supply which results from its ravages. The fluke produces extensive organic disease upon the liver of the sheep, annihilating the function of the organ and leading to emaciation and exhaustion of the host whose tissues become dropsical and innutritious. In all cases where important tissue changes such as wasting, discoloration or dropsy occur, the condemnation of the flesh is warranted; at any rate the liver and the contents of the intestines should be destroyed, not only on account of the structural alterations which may exist in the former, but in order that the ova of the worm may be destroyed. Prof. Leuckart in Germany and Mr. A. P. Thomas in England, traced, almost simultaneously, the life history of this parasite through all its stages, and published accounts of their investigations in 1882. They find that it lives for a time, and changes its form in the body of a minute shell snail (*Limnæus truncatulus*) which thrives in an excess of moisture.

The great means of checking the outbreak and spread of the disease are draining, keeping animals off flooded land, scattering about lumps of rock-salt, and not allowing the stock to go off condition,

The last order of scolecid worms of importance is the Nematoda or Nematodea. The individuals of this order are cylindrical vermiform scolecid, sometimes parasitic, sometimes free; integument not ciliated; a well-developed alimentary canal; sexes distinct or rarely united. The Nematoda comprise the so-called thread-worms and round worms, most of which inhabit the alimentary canal, the pulmonary tubes, or the areolar tissue in man and many other vertebrates. Among the more important members of the parasitic section of the Nematoda may be mentioned the ascaris lumbricoides, the oxyuris vermicularis, the trichocephalus dispar, the sclerostoma duodenale, the dracunculus medinensis and the trichina spiralis. The first-mentioned is the common round worm inhabiting the intestines of man and sometimes of other mammals, especially the pig, often attaining a length of several inches. The second, commonly known as the "small thread worm" is a gregarious worm. It is the smallest of the intestinal worms of man, and is most commonly found in children. The third and fourth also are parasitic on man. The fifth known as the guinea worm inhabits during one stage of its existence the cellular tissue of the human body, generally attacking the legs and often attaining a length of several feet. *Trichina spiralis* is by far the most important of this species of worms, though in large numbers any of the Nematoda may so far interfere with digestion and nutrition as to bring about emaciation and dropsy in the host, and thus render the flesh unfit for food. Since the vast majority of these worms inhabit the alimentary canal, in such cases where the intestines are used for the manufacture of sausages &c., care should be taken to subject the gut to processes which will ensure the destruction of the parasites, their ova or embryos, as specimens have at times been found adhering to the mucous membrane of the gut that has been used for sausages. The *trichina spiralis* (which has its habitat in the flesh of swine alone) is, notwithstanding its minute size, the entozoan that is most to be dreaded by sanitarians. We shall consider its life-history in our next issue.

A ROTATION OF CROPS.

It cannot be denied that the adoption of a rotation of crops where practicable is the most economical and intelligent system of husbandry. The reasons for so doing are well known, viz., because it is more economical of manure, as different crops require different ingredients in different quantities; because for the same reason it is more economical of food in the soil, different crops drawing upon such food in different proportions and not exhausting particular ingredients; because it allows of a better distribution of labour of men and animals; because it allows of the better cleansing of the land; because it allows deep-rooted and "air-feeding" crops to enrich the top soil for the benefit of the shallow-rooted varieties to follow; because some crops are a good preparation for others, as leguminous crops for cereals; because it checks the ravages of insects and fungi by shifting the locality of the crop which they affect; because a better supply of cattle fodder can be secured.

Granted even that crops are continuously grown upon the same soil by means of manure, still the system is a bad one, not only because it is a wasteful one, but because there is a tendency of certain ingredients to accumulate in the soil, and the balance of the various ingredients of plant food to be interfered with. The reasons as regards the economy of manure and plant food are obvious, while the fact that the tendency of crops grown in rotation is to mutually benefit each other should greatly weigh with our cultivators. Again, the check that such a system gives to insect and fungoid attacks is of the utmost importance to tropical agriculturists who have suffered so much from these misfortunes.

Our esteemed correspondent, W. A. D. S., writing from Bombay, deserves all credit for his effort to convince our Ceylon cultivators, who say that a rotation of crops cannot be practised under the conditions of paddy cultivation, that the thing can be done, and that he (W. A. D. S.) has seen it done in North-Western India. He has thrown out the hint that Indian Corn and lucerne should form part of the rotation with paddy. As far as our experience as founded on our own experiments at the School of Agriculture goes, we believe that both Indian Corn and lucerne can be successfully raised on paddy soils after a little special preparation of the land.

GENERAL ITEMS.

The substance known as *Ginseng* is so highly valued in China that it is sold at from 20 to 250 times its weight in silver, and sometimes for more than that price. It is not generally known that the drug is valued as a tonic and stimulant. *Ginseng* is the root of *Panax quinquefolia*. The collection and preparation of the root for the market were at one time extensively carried in Canada, and *Ginseng* gathering is again becoming an industry. The plant grows in China, Manchuria and Corea, but the natives are loth to part with any seed. The wonder is, says the *Medical Press and Circular*, that with a much used commodity at such a price, steps are not taken to cultivate it in sufficient quantity so as to adjust the balance between supply and demand. With silver in the one scale and the highly esteemed root in the other, it seems reasonable to conclude that the cultivation of *Panax quinquefolia* would be remunerative whatever the cost and trouble. *Panax fruticosum* is found in Ceylon, so that it is most probable that *P. quinquefolia* may thrive with us. We had an opportunity of inspecting a specimen of *Ginseng* for the first time a few days ago. From the section shown us the so-called root would seem to be a rhizome about an inch, more or less, in diameter, of a yellowish colour just beneath the epidermis, but the white central pithy portions of which the section mainly consisted was white in colour.

Improved ploughs are said to give better results than the native ploughs to such an extent, that the superiority of the former is now an axiom at the Cawnpore Experimental Farm; and the effect of deep ploughs, where effective supervision is possible, has confirmed this experience. At the same time the adoption of the improved plough makes

but slow progress. Cultivators in the neighbourhood of the farm occasionally hire them, and landlords buy them from time to time; but a stern and passive resistance is offered to their general introduction, by native ploughmen, who do not appreciate the value of economising labour. This account of the progress of the improved plough in India is similar to the experience of those who have endeavoured to bring improved ploughs before the attention of native cultivators in Ceylon. If agricultural improvements and reforms were taken up in a more whole-hearted manner, and the effective supervision above referred to was provided, better ploughing and a large variety of crops—such as they grow in India, either independently or in rotation—would help to greatly ameliorate the generally wretched lot of the Ceylon ryot.

The horse and cattle breeding and veterinary institution in the Bombay Presidency has organised the establishment of veterinary dispensaries in twelve districts, under subsidy by the Government, and the relations of the Superintendent, Horse Breeding Operations, to the Department of Land Records and Agriculture, have been defined. These veterinary dispensaries are to be in charge of graduates of the Bombay Veterinary College, employed as servants of the District Local Boards on salaries of R50 to R100. Their duties have been prescribed, and, in addition to ordinary hospital work, comprise (a) the superintendence of Government stallions, (b) castration, (c) attendance at shows, and (d) repression of epidemic disease in the district. Provision has only been made for the employment, wherever possible, of a travelling graduate, towards whose pay further contribution has been made by Government. This arrangement is of great importance, as it is impossible for officers in charge of dispensaries to attend to epidemics in the districts, or to visit the villages without detriment to hospital work. Through these officers much improvement in the treatment of stock should result; they will encourage owners to send difficult cases to the hospital, and they are to report the existence of epidemic disease for the information of the Imperial Bacteriologist.

The contents of *The Journal of the Royal Agricultural Society* of December 31st are as follows:—Cottage Sanitation; Field Experiments on the Fixation of Free Nitrogen; Wild Birds—Useful and Injurious; Utilization of Straw as Food for Stock; Few Poisoning; Feeding Experiments on Cattle and Sheep; History of the English Landed Interest: besides the official reports, and a number of interesting notes, communications and reviews.

One of the most recent inventions patented in America is that of a cotton reaper. The number of hands employed under the present

system of picking is said to be almost as great as that required on a tea plantation. The machine not only does the work of over a hundred people, according to size, but frees the bolls from the dead capsule in a more thorough manner than the smartest picker has heretofore been able to do. The invention is adapted, under present circumstances, only to flat or gently undulating lands; but no doubt the necessary alterations could be made to fit it for work on hillsides.

The Madras Government has shown its solicitude for the welfare of the agriculturist by issuing an order for the protection of 57 insectivorous birds therein named. The Ceylon Government rule for the protection of wild birds in our Island still remains a dead law.

Mr. B. R. Harrington, who has been successful in burning the refuse of Calcutta with his incinerator, is now prepared to supply similar apparatus to any towns or communities needing them. As he states in a memo. he has issued on the subject, his incinerator is the only furnace which has effectually destroyed the refuse of the city by fire. It is a perfect and reliable destructor, simple in construction and easy of management, and is especially adapted to towns where fuel is expensive. Incinerators of the same type, of from one to eight furnaces in a group, can be constructed to destroy twenty to thirty loads of refuse daily per furnace, together with night-soil from a population of 2,000. These incinerator furnaces are inexpensive in construction, the cost of each being R6,000.

Prof. Wallace, of the Edinburgh Agricultural Chair, writing to us, complains of the bad times for agriculture in Great Britain and how most farmers there are ruined. The Professor leaves for Chicago in March, returning to Edinburgh in May. A new and much enlarged and improved edition of his *Farm Livestock* has just been brought out by Crosby Lockwood & Son.

"The Scottish Farmer" is the name of a new Agricultural weekly started this year. The paper is issued from Glasgow, and counts many eminent authors on its staff of contributors. The annual subscription, postage inclusive, is only ten shillings.

Prof. Dewar has succeeded by pressure, freezing and a surrounding vacuum, to liquify not only oxygen but also atmospheric air and to retain them for hours in the liquid form, so that they can now be easily experimented on, and their most important properties demonstrated.

THE MAGAZINE

[No. 10.

DAIRYING IN CEYLON.

It is now pretty generally known that a Government dairy is about to be started in connection with the School of Agriculture, and the question has been asked in more than one quarter:—Is it right of the Government to monopolise the supplying of milk to all Government institutions and exclude private enterprise in this connection? The fact is there is no other alternative for the Government to choose, if its institutions are to have a supply of guaranteed pure milk. There are two objections against milk supplied by the ordinary native cow-keeper: one is the very insanitary surroundings and the unclean habits that are always associated with native cattle-sheds; and the other, the custom, which indeed almost amounts to a superstitious observance, of diluting the milk with water, and the temptation (too often given way to) there exists for otherwise adulterating the milk. All that the Sanitary Officer and his staff of inspectors can do in the way of warning and prosecuting has been of no avail in checking these evils. Under these circumstances it is but natural that the Government should bethink itself of making such provision as would prevent its supplies of milk coming forth from suspicious sources. Again, the native milkman, even if he supplies pure milk, cannot supply milk of such good quality as can be produced by the most approved system of dieting cattle, which he refuses to adopt because it is no advantage for him to do so. Another very cogent reason that may be brought forward for the establishment of a Government dairy is that no convenient and satisfactory method of proving the purity of individual samples of milk has as yet been discovered, and that the way

still lies open for milk suppliers who earn their livelihood by the sale of milk, to carry on their machinations (which are multifarious and clever) undetected by the eye of Science. We have still omitted to take note of the fact that the inmates of the Government institutions concerned, viz., the sick and the afflicted in mind and body, in the hospitals, asylums, and lazaretto, require food of guaranteed purity and uniform good quality, and that medical treatment of these patients assumes that such is the character of the food. It would be an idle excuse on the part of Government to allow our poor sick to be supplied with other than the best and most reliable food, and to say "it cannot be helped."

Indeed, it can be helped! The Government in starting a dairy farm under control of its own officers is shutting the door to chicanery, putting an end to adulteration and dilution of milk, and securing for its institutions a supply of guaranteed pure milk of good quality. The establishment of such a dairy is no innovation as a policy of Government, for throughout India and in other parts these Government dairy farms are looked upon as the only remedy against the supplying of bad milk to hospitals, asylums and military barracks. Those who cavil at the initial outlay in starting a Government dairy may rest satisfied that the establishment is moreover expected to yield a fair return. This should be the case with good management, which is of the utmost importance. The great thing to be dreaded in bringing together a large herd of cattle into one centre is devastation by "murrain" or other epizootic disease, but with veterinary advice at hand as regards means of prevention and cure, there should be no very great fear on that score.

OCCASIONAL NOTES.

Mr. P. S. Rodrigo, for over three years an Assistant Master at the School of Agriculture, severed his connection with the institution last month, to take up the duties of Headmaster of the Kadugannawa Boys' School. The School has lost in Mr. Rodrigo a teacher of the highest character, and one who commanded universal respect. He will be much missed by both masters and students.

Mr. Charles Basnayake of Urugala School has sent us a small parcel of onions raised in his School garden. They are of exceptionally good size and quality for Ceylon-grown bulbs.

The Government dairy buildings are now complete. They occupy a site on the new grant of land to the right of the present School buildings, and consist of a cattle shed providing accommodation for 70 cows, and a block of four rooms to be used as store room, milk room, office and manager's room.

A Veterinary School is about to be opened in Cawnpore, the object of which is to supply the districts of the North-West with practical men to aid in the suppression of cattle disease, perform simple operations upon cattle and horse stock, and help the agriculturist generally with his farm animals. It would be an excellent thing if the Government of Ceylon utilized some of the young men who have been trained by the Colonial Veterinary Surgeon at the School of Agriculture. These students might be deputed to perform the double duties of agricultural instructors and veterinary helps. Mr. Lye's work would undoubtedly be more effectual if he had a few men under him to aid him in carrying out his schemes.

The Easter holidays will include the whole of April, the School opening again on the 2nd of May.

Unexpected but very welcome showers fell pretty often in March, and vegetation generally has been greatly invigorated thereby. There are, however, complaints from some quarters that the rain was rather too heavy and caused some damage.

Mr. J. A. Kodippily, lately a student of the School of Agriculture, has been given a post in the Forest Department, and is at present stationed at Hambantota. Mr. Kodippily ought to prove a very useful officer.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

The *Trichina Spiralis* is a minute round worm of hair-like dimensions and is found lodged in the muscles in lemon-shaped cysts, lying coiled upon itself in a spiral manner. When fully developed its extreme length does not exceed one-eighth of an inch, and for its detection a very strong lens or a low power of the microscope is necessary. It is calculated by Dr. Sutton that one inch of swine's flesh may contain 100,000 parasites. The cyst wall is partly membranous and partly calcareous; the presence of the calcareous matter protecting the parasite against the effects of salt and to a limited extent against smoke, heat and cold. If a portion of trichinised flesh is ingested by man, the trichinæ, by the combined action of gastric juice and pepsin become liberated, and in the course of a few days they originate a new brood, the members of which pass through the walls of the intestines and find their way to the voluntary muscles, where they are found in the largest

numbers, penetrating as far as the tips of the fingers. The condition produced by the parasites is known technically as Trichinosis or Trichiniasis. Each female trichina gives birth to a brood varying in number from several hundred to a thousand or more, and it is calculated that the parasite may retain its vitality in the encysted state for fifteen or twenty years. Looking at the vast importance of the question it is most necessary that we should always be on the alert for such flesh. Trichinosis is a painful and not uncommonly fatal affection somewhat resembling rheumatic fever. If the patient—man or pig—has sufficient vitality to bear up under the severe symptoms which last during the migration of the parasites, and till they become encysted in the muscles, he is safe, since they cannot become sexually mature or develop further until again transferred to the alimentary canal of some other animal.

The following directions were given by Mr. George Morehouse in the *Veterinarian* of July, 1879, for examination for trichina:—Cut thin longitudinal sections from the extremities of muscles, and place the sections in a watch glass, covering them with acetic acid. In a few minutes the tissues will be apparent enough to enable one to see the letters through the specimen when the watch glass is placed on a printed page. Drain off the acid, add water and examine, or wash and transfer to a glass slip (pretty large with large covers for a number of sections at once) either in water or glycerine and cover. In examining with the microscope, a power of 25 diameters, obtained with a good 2 inch objective and 2 inch ocular, is amply sufficient.

In addition to the above-mentioned forms, it may be noted that minute parasitic worms are not uncommonly found, sometimes in large numbers in the blood of various animals, including the dog, man himself and various birds. Their origin, development, and the mode in which they are introduced into the blood have not yet been clearly understood. The most remarkable species is the *Filaria sanguinis-nomines*, which in its immature state inhabits the blood of man in intertropical regions, its presence being associated with chyluria, hæmaturia, and other morbid affections.

It has been mentioned that some of the nematodes are free and not parasitic in their habits. These free nematodes constitute the family anguillulidæ, among the more familiar of which are the vinegar eel (*Anguillula aceti*) and *Tylenchus tritici*, the latter producing a sort of excrecence or gall upon the ear of wheat, causing the disease commonly known as "Purples," "Ear-cockle," and "Peppercorn." Many varieties of *Tylenchus*, and especially *P. devastatrix*, attack the stems and roots of plants and trees which they tend to stunt and distort and often kill outright. These eel worms as described by Miss Ormerod, are minute, transparent white threadworms, scarcely more than $\frac{1}{25}$ of an inch when full grown, their greatest breadth being $\frac{1}{30}$ of their length. The subject of *Tylenchus* worms, which seem to give much trouble in Australia, was fully treated of in an exhaustive and able report issued by the Agricultural Department of New South Wales not long ago.

ROADSIDE ABORICULTURE.

The planting of trees on roadsides, where the width of the reservation admits of such procedure is greatly to be commended for various reasons. Among other advantages it provides shade for pedestrians, besides shading the centre of the road itself, and thus making it a cool drive, while it also keeps off the direct glare of the sun and the reflected glare from the road. Further, trees ornament roads by their foliage and blossoms. Who that has driven along Skinner's Road on a hot day has not felt thankful for the grateful shade provided by the avenue of *Inga dulcis*, or along Flower Road and the neighbourhood where *Cassias*, *Pithecolobium*, *Lawsonia*, *Erythrina*, *Pterocarpus* and *Poinciana* were in bloom, and not felt gladdened by the colour and fragrance of the blossoms that clothed the trees? The late Mr. William Ferguson's botanical instincts and his love for the beautiful in nature it was that helped to give Colombo the beauty that visitors to our shores attribute to it; but there has been no one to carry on the work of roadside aboriculture that he initiated, with the same enthusiasm.

We now read in the *Indian Agriculturist* that the Magistrate of Monghyr (Mr. C. F. Worsley) has issued a report on a system of planting trees which has been adopted successfully by him, and that the Government has directed the circulation of the report among all district officers and Local Boards. We believe that nurseries are kept up in the Victoria Park for supplying trees for roadside planting, but on the whole the system of tree planting as at present adopted in Ceylon would be the better for some reform, and it is for that reason that we take over Mr. Worsley's report as given in the *Indian Agriculturist* :—

When I first commenced the system of planting trees along the sides of roads in Mozufferpore district in the year 1877, I adopted the plan which, I believe, is usually followed by inexperienced amateur planters, of working through contractors, and allowing them to plant very young trees or to raise them from seed in the spots where the trees were intended to grow up. Each of these young trees or seedlings required to be protected by a gabion or bamboo fence, and it was soon discovered that the expenses of repairing or renewing the fences and of supplying water to the young trees in the hot season were more than the District Road Fund could conveniently bear. I accordingly tried the experiment of raising young trees in nurseries from seed sown either in pots or in the open ground, and of planting them out along the sides of roads when five or six feet high. It having been found in practice that the young trees so raised in pots succeeded best, this system was generally adopted in Mozufferpore from the year 1880.

In my report No. 99, dated 6th February 1880, for the Road Cess year 1878-79 (published in pages 1471-1479 of Part II. of the *Calcutta Gazette*, dated 29th September 1880,) I described at some length the operations of the Mozufferpore Road Committee in connection with the planting, and the subjoined extracts will explain the advantages of their system:—

"On all other roads the trees are fenced with strong bamboo gabions, six feet in height and

two feet six inches in diameter, made on one uniform plan, and built round the tree when planted in the following manner:—

"Five whole, not split, bamboo posts eight feet in length and not less than one and-a-half inch diameter, are sunk in the ground to a depth of two feet at equal distances from each other, and a radius of fifteen inches from the stem of the tree. Four pieces of split bamboos are then placed between the posts, and split bamboos are woven in basket fashion to a height of six feet, the last six inches being passed through loops in the bamboo posts to prevent travellers removing and untwisting the basket-work, which was a common and very mischievous practice, and one that caused continual labour and considerable expense in repairs. I may add that the system now adopted has been absolutely successful in preventing such mischief and injury; as, although easy to twist the split bamboos through the loops when green, it is most difficult to remove them when they have become dried and set.

"*Nursery Gardens*.—Two nursery gardens have been established during the last Road Cess year 1878-79—one at the dak bungalow in Mozufferpore, the other in the District Engineer's grounds. The formation of nursery gardens was rendered necessary for several reasons, amongst them the following:—

"(1) The difficulty experienced in obtaining young fruit trees of even inferior description.

"(2) The policy of planting none but good varieties and descriptions of fruit trees, so as to ensure eventually from the sale of the fruit a handsome return for the outlay and expenditure incurred in planting and maintaining them.

"(3) To prevent injury in transplanting trees with tap roots such as *artocarpus integrifolia*, *bassia latifolia*, and *dalbergia sissu* by raising them in pots, it having been found by practical experience most difficult to transplant such trees satisfactorily. Experience has impressed the necessity of using pots for all future nursery operations as being eventually a safer and more economical way of raising and transplanting young trees than in and from the open ground. After much care, time, and expense have been laid out and incurred on the young trees in the nurseries, it is very disappointing to find them dying a few days after being transplanted, in consequence of injury to tap roots, and here I would observe that it is very inadvisable to plant out any trees less than two years old. The cost of tending, watering, and maintaining them is much less in the nurseries than when they are scattered over many miles of roads, and as the existence of a bamboo fence such as is used in this district is three to four years, by the time it is worn out its need is no longer required, the trees being five to six years old, and strong enough to do without such protection. We have now in the nurseries 14,112 well-grown young trees, which will suffice for about 80 miles of road, which is about the annual average length of avenue planted in this district."

I may mention that the pots in which young trees are raised should be buried in shallow trenches, each trench being long and broad enough to hold 400 or 500 pots placed as close together as they will stand in parallel rows. The rims

of the pots should be slightly below the level of the surrounding ground, so that they may all be easily and cheaply flushed with water every two or three days during the hot season from an adjacent well. Between the trenches there should be narrow raised pathways by which the gardeners may obtain access to the trees. It will be necessary as the trees advance in height to turn the pots occasionally; otherwise the roots are apt to strike through the pots and to penetrate the ground. It is best to prepare the trench of the required length and breadth in the first place, next to arrange the pots in rows therein, and then to fill up the spaces between the rows with earth. Where flower-pots are as cheap as they are in Mozufferpore, viz., from Rs 3 to Rs 4 per 100, no hesitation should be felt about breaking each pot at the time of transplanting a young tree.

As regards the distance apart at which trees should be planted on roadside avenues, much depends on the kind of tree and on the locality. As a general rule, I would plant Pipul, Bar, and Raintrees 50 feet, and all the others in the list from 30 to 40 feet.

If trees are not planted out by the sides of the roads until they are 5 to 6 feet high, and if they are planted out at the commencement of the rainy season, they will not require, in a climate like that of North Belar, to be watered in the following hot season. By that time their roots will have reached such a depth as to be able to dispense with artificial supplies of water, and nothing beyond general supervision and attention to the state of the gabions will be required. This duty can easily be performed by members of Road Committees, and the officers of the engineering departments. In drier parts of the country, it may be necessary to give water during the succeeding cold and hot season. And it may be advisable in very dry localities to adopt the plan of sinking a pot (kushi) near the root of each plant, and keeping it filled with water at all times of drought during the first year or two after transplantation.

The holes in which the trees are to be planted by the roadside ought to be carefully prepared some months beforehand, and some old manure, where available, should be mixed with the earth. These holes should be at least 2½ feet wide and 2 feet deep, but if money be available larger holes, say 4 feet in diameter and 3 feet deep, are preferable. The height of the gabion* is of great importance. The two evils to be guarded against are (1) "the poisonous tooth," as Virgil calls it, "of the accursed goat" which is certainly more injurious to the young tree than winter cold and summer heat, and (2) the mischievous habit which travellers have of breaking off the young shoots of the mango and some other kinds of trees and using them as tooth brushes. In places where whiteants abound, it is a good plan to smear with tar the ends of the posts before fixing them in the ground, and a daub or two across other parts of the posts will deter villagers from extracting and appropriating them for their own use.

* If a bamboo gabion is too expensive or inconvenient a mound of earth topped with aloe leaves, or a ring of bricks placed alternately so as to admit light and air where bricks are cheap, may be substituted.

I would strongly recommend that avenues be planted with due regard to symmetry and convenience, and that large and small fruit-bearing and timber trees be not planted indiscriminately together. If it is intended eventually to sell the fruit of fruit-bearing trees year by year, it will be most convenient to plant a few miles of each road with each of the most valuable kinds of fruit trees, e.g., five miles with *mangifera indica*, five miles with *artocarpus integrifolia*, five miles with *bassia latifolia*, &c. This is the principle which I adopted in Mozufferpore town where I planted about 12 miles of avenues with 12 different kinds of trees, fruit-bearing and timber, allowing one mile or so for each kind of tree.

The trees, which should specially be planted where the soil is suitable for their growth, are the following:—

Fruit trees.	
Botanical name.	Native name.
Mangifera Indica	Am.
Eugenia Jambolana.	Jamun.
Aegle Marmelos.	Bel.
Bassia Latifolia.	Mohwa.
Artocarpus Integrifolia.	Jak (or Kantal.)
Timber trees.	
Botanical name.	Native name.
Swietenia } Mahogany.	Mahogany.
} Macrophylla.	Large-leaved mahogany.
Gmelina Arborea.	Kumbar or Ghambar.
Dalbergia Sissoo.	Sissu.
Cedrela Toona.	Toon.
Casuarina Equisetifolia.	Jhao.
Pongamia Glabra.	Karanj.
Albizia Lebbek.	Sirish.
Pithecolobium Saman.	Rain-tree.
Lagerstromia Regina.	Jarul.
Pterospermum Acerifolium	Kumik Champa.
Ficus } Religiosa.	Pipul.
} Beugaleusia.	Bur.

NOTE.—In the case of the two species of Ficus in the above list (Pipul and Bur) it is best not to plant seedlings, but branches of adult trees. The branches selected should be straight, from four to eight feet long and from three to five inches in diameter.

When I left Mozufferpore district in December 1882, the total length of avenues on the district roads was about 210 miles, most of which were in very fair condition; while along some 12 miles of roads in Mozufferpore town there were about 2,800 trees all of valuable kinds, which had been planted and maintained under my own immediate supervision at less than an average cost of Rs 8 per tree and most of which no longer required any special protection.

BLEACHING OF VEGETABLE OILS.

The colouring matters in vegetable oils consist of a mixture in varying proportions of the colouring matters known to exist in the leaves of plants, but which, in the case of oils are derived from the fruit or seeds from which the oils are expressed. There can be no doubt that these substances are closely allied in chemical constitution; they all possess an intensely powerful colouring property, that is, the colour of

some of them may not be dark, yet a very minute weight is capable of importing a tint to a very large quantity of material.

The names of these substances are xanthophyll (yellow), yellow chlorophyll (yellow), blue chlorophyll (blue), erythrophyll (red). According to the different proportions of these colouring matters the oil varies in colour; for instance a mixture of erythrophyll and yellow and blue chlorophyll gives a brown tint, while a mixture of yellow and blue chlorophyll imparts a greenish hue to the oil. These substances seem to be combined with the oils, or to be substances of a fatty nature. They are neither dissolved nor acted upon by water, nor by acids diluted with water, when naturally present in the oils. They are, however, freely soluble in alcohol, and an alcoholic solution is not only susceptible of being destroyed by the joint action of the air and water, but by very dilute aqueous solutions of mineral acids, and by acetic acid. In aqueous and alcoholic solutions, light speedily modifies the blue, and eventually destroys all these colours. A solution in turpentine of the isolated colouring matters is also easily destroyed. But, on the other hand, a solution of the colours in melted paraffin wax is completely stable.

Vegetable oils are decolourised either partially or completely by the application of one of the following agents or chemical processes: 1. By the action of light, or by the joint action of light and air. Prof. Hartley, treating of the subject of the bleaching of oils before the Society of Arts, says that it is in the highest degree probable that as oxygen is absorbed by the oil and acid substances produced thereby, these acids effect the destruction of the colouring matters. It is remarkable that no reference is made to the action of ozone and the actinic rays of the sun which are acknowledged to be active agents in sun and air bleaching. 2. By treating the oil with moderately strong sulphuric acid. As acid and oil are of different specific gravities, it is essential that they be very rapidly and thoroughly mixed by violent agitation. The impurities such as mucilage and albuminous matter are thus deprived of water and more or less charred, and along with them the colouring matters are destroyed by the acid. It is essential for the success of the process that the oil and the acid be not long in contact without undergoing dilution, otherwise the oil itself may become charred. It is possible to obtain oil by this process in a fairly colourless condition, after it has been thoroughly washed with water and allowed to settle. 3. Oils may be rendered of a pale yellow and even almost colourless by a process of partial saponification with caustic alkali of a suitable strength. The colouring matters are saponified and the resulting soap is of a dark yellow or brown colour from the colouring matter having combined with the alkali. 4. By the action of chlorine produced in contact with the oil when, for instance, an aqueous solution of bleaching powder is acidified with a cheap mineral acid, such as dilute sulphuric. In this case rapid mixing and violent agitation are essential to the success of the process, otherwise chlorinised products are retained in the oil, which not only confer upon it a distinct flavour,

and odour, but also cause the oil to solidify with a very moderate lowering of the temperature. It is very questionable whether the "dyeing oils" can be subjected to such treatment. A variety of methods may be merely mentioned, such as treatment with sulphurous acid, ferrous sulphate (green vitriol), and potassium dichromate and sulphuric acid.

Lastly, there is the method of Binks, specially adapted for decolouring dyeing oils, such as linseed oil, viz., by means of oxides of manganese. The colouring matter of the oil forms a compound with the manganese which, while it remains in solution, is very speedily oxidised in contact with air, especially when a current of air or oxygen is blown through. The oxidation destroys the colouring matter.

GENERAL ITEMS.

Referring to betel-leaf a Medical Correspondent to the *Indian Agriculturist* writes:—The juice is hot, pungent and stimulant, increases gastric juice, and helps digestion. It is in its way antiseptic, for it not only removes the fætor of the mouth, but increases saliva. It is useful in catarrhal affections especially in children. When smeared with mustard oil and applied to the chest it relieves cough and dyspepsia more by warmth and exclusion of air than by any rubefacient effect it produces. Thus applied it also relieves congestion of the liver, arrests the secretion of milk, and resolves glandular swellings. Abscesses are induced to burst when betel-leaf is applied with ghee on one side, and headache is relieved by the application of it to the temples. The writer has successfully used betel juice and lime externally in cases of troublesome cough resulting from sorethroat and phthisis. The relief is said to be instantaneous.

According to the *Madras Times*, the Government of India has indicated its disapproval of the policy of the Madras Government, by which the Agricultural and Veterinary department should be under the control of the Director of Public Instruction, and has hinted that these departments should each attend to its own proper work.

The Cotton tree, the native *kapok*, which is very common in Burmah, is now said to be receiving much attention as an article of cultivation, and to be ousting coffee from that province. The lack of suitable machinery to clean the fibre has hitherto stood in the way of its development as an industry, but that obstacle is said to have been recently removed. The cotton trees of Burmah are of three species, two of which are known among the natives as the male and female trees, and are very common, and grow to a height of from 80 to 100 feet. Though grand-looking trees the wood is soft and worthless, and the cotton fibre attached to the seeds has hitherto been used only for stuffing pillows and cushions. If, however, the machinery, which is a Dutch invention, about to be introduced, will enable it to be spun into yarn, Burmah will develop a very important industry.

The following note is taken from a recent communication from the Colonial Secretary,

Ceylon, to the Madras Government:—The Kittul tree is generally most prized for its sugar and toddy-yielding qualities in Ceylon. The collection of the fibre is, as a rule, delayed until the tree has flowered and begun to yield sugar and toddy. In places where the fibre is collected from young trees three or four years old, the fibre sometimes commands a higher price in the market, but the tree is ruined. The process of removing the fibre is as follows:—The fibre collector takes a sharp knife and climbs up the tree till he reaches the base of the "crown" and there selects a leaf that affords a sufficient hold or footing from which to commence operations. The fibre in itself forms a strong connecting tissue by which the base of the leaf stalk of the palm is held to the tree, and in order to support the leaf is closely folded upon the body of the plant long before the leaf itself is fully formed. The operator introduces the point of his knife under the fibre midway between the two edges of leaf stalk and severs the tissue, pulling the leaf as he does so outwardly and downwards till it detaches itself from the tree. After removing as many leaves as will yield mature fibre, the operator descends and proceeds to cut the fibre off the leaf stalk, and the whole is then picked over by hand and combed till it is free of any woody or other foreign matter, and finally put up into bundles, each about 2 feet long and 4 inches wide, tapering at both ends into a point. The quantity of fibre depends greatly on the age of the tree. In a young tree that has not flowered, the largest quantity appears to be present, and is said to be as much as 4 lb. when clean; but again, in very young trees, not more than 6 feet in height, a greater quantity can be obtained by taking all the fibre round each stalk-base till the heart or "cabbage" is reached, but the *quality* is inferior and the plant is killed. In this way the collectors of Kittul fibre (Kenddi) killed a large number of palms yearly, to the great loss of the "Wahampuriyo" (toddy and jaggery-makers) who depend on the Kittul to afford them a means of living. The price paid by traders in Kittul is said to be from R9 to R12 per cwt.

A Bacteriological Laboratory is about to be established in India, near Simla, where cattle disease, especially rinderpest, will be the main subject of research.

The following is a comparative estimate of the proportions of the most valuable ingredients in 1 ton of cow, pig, and fowl manure, in their natural state and free from litter:—

Con-stituents.	Cow manure.	Pig manure.	Fowl manure.
Potash ..	7 ..	2 ..	24
Phosphoric acid	5 ..	18 ..	41
Lime ..	6 ..	33 ..	47
Nitrogen ..	9 ..	13 ..	87

Here is the latest method of preserving potatoes in France: Plunge the tubers, before storing them away for ten hours, in a two per cent solution of sulphuric acid in water. The acid penetrates the eyes to the depth of about one-fortieth of an inch, which serves to destroy their sprouting power; it does not have any

appreciable effect on the skin of the potato. After remaining ten hours in the liquid, the tubers must be thoroughly dried before storing. The same liquid may be used any number of times with equally good results. A barrel or tank of any kind will do for the treatment. The acid is so diluted that it does not affect the wood. Chemical analysis shows that potatoes treated by this process are as nutritious and healthful after eighteen months as when freshly dug; they are, however, worthless for planting.

For deficiency and acidity in the taste of limes, oranges and pumeloes, a liberal incorporation of demolition mortar with the soil has been recommended. The experiment was tried at Lucknow with gratifying results. Ashes obtained from a brick kiln have also been tried, it is said, successfully.

The fibre of *Sansiviera Roxburghii* about 4 feet long is valued at from £16 to £20 per ton in London.

In a bulletin issued by the Louisiana Bureau of Agriculture, and dealing with the analyses of commercial fertilizers and other substances useful to Agriculture, the following note on blood appears:—A waste product of the slaughter-houses is found in the market in two forms, viz., dried blood and red blood. The difference in colour is due chiefly to the difference in the temperature employed in drying, the black blood having been subjected to a much higher temperature than the red. While dried blood contains small proportions of both phosphoric acid and potash, it is valued chiefly for the nitrogen it contains, the proportion of this element varying from 8 to 15 per cent. The red blood is the more finely divided of the two varieties, and has been found to be more prompt in its action. An analysis of a sample forwarded contained 1.24 of phosphoric acid, and 9.94 of nitrogen.

Says the *Indian Agriculturist*:—After prolonged research and experiments in Pasteur's laboratory, M. Chamberland is reported to have come to the conclusion that no living germ of disease can resist the antiseptic power of essence of cinnamon for more than a few hours. It destroys microbes as effectively, if not as rapidly, as corrosive sublimate. Even the scent of it is fatal, and M. Chamberland holds that a decoction of cinnamon ought to be taken freely by persons living in places affected by typhoid or cholera. There is nothing new in all this. In oldest known medical prescriptions for infectious diseases cinnamon was a prominent ingredient, and it was in great request during the plague of London. There is no reason for doubting that the physicians of those early days were as familiar with its medical properties as with its odour.

It is not generally known in India, says a Bombay paper, that the castor oil plant is avoided by mosquitoes. In Egypt it is planted about houses to drive them away. A still better plan for towns is to have the young plants in pot and bring them indoors for a day or two at a

time. They must not be kept too long in the shade, as the castor is a sun-loving plant. Its action on the mosquito is not very well understood: one writer says they are killed by a poison they find on the underside of the leaf. But if a dozen leaves are placed about a room that swarms with mosquitoes, the wretched insects will disappear without leaving any dead victims lying about.

Tea planters will be interested in the following applications for patents:—1. Samuel Sykes, Engineer of Calcutta, for improvements in the treatment of green tea leaf preparatory to the process of rolling. 2. By Augustine Cooke, tea planter of Chota Nagpore, for improvements in the apparatus for preparing green tea leaf for the process of rolling. 3. By William Carey Leechman, Merchant, for an improved preparation of tea and the process of making the same.

We have all heard and wondered over the man-eating tree and the cow tree, the thread and needle tree and the tree that provided candles ready for use, and other vegetable prodigies, but the latest discovery said to have been made by a Mr. Barber in the mountainous region of Kiating would seem to throw all these in the shade, to wit (1) the tea and sugar tree, (2) the tea of milk tree. The first is described as tasting, when brewed, "like coarse congou with a large addition of brown sugar," the second, "just like tea and milk, without sugar, or perhaps more like tea and butter." The occupations of the tea planter and broker, the dairyman, and the grocer as well as the sugar grower would now appear to be in jeopardy, and with the prospect of the cultivation of the tea and sugar plant and the milk and tea plant as a mixed crop, the very thought of the revolution that is imminent in trade circles is appalling!

MAY, 1893.

[No. 11:

HINTS TO POULTRY KEEPERS.

POULTRY should not be cooped up at night in ill-ventilated rooms. Nothing can be better it is said than to let fowls roost in the open air—the plan adopted by many poor native families more from necessity than choice, because, forsooth, they have not the means of building hovels, such as they build for themselves, for their poultry. The only objection against this plan being adopted with us, is the danger from wild-cats and such predatory beasts; but the fact is that those who have been bold enough to let their poultry find open air roosts for themselves, have discovered that in this natural method there is in the end really more safety both from wild animals and poultry thieves. The birds are, moreover, less subject to cold and seldom or never contract roup, when allowed to remain in the open air than when kept in a close shut-up roost all night. If necessary, the protection afforded by the roof of an open shed in the open might be provided, but under any circumstances if health and vigour are to be maintained refrain from shutting up your birds in a Black Hole of a poultry-house. See then first that fowls have plenty of fresh air at night, and that their houses are kept scrupulously clean. They ought to be thoroughly cleaned out once a week, indeed oftener if the time could be afforded, and a little paraffin diluted in water and sprinkled over the perches and floor will prove a capital preventative against vermin. Then with regard to water, never use zinc drinking vessels so commonly advertised for watering poultry; they are said to cause half the diseases to which poultry fall victims. Even stone fountains must be deprecated. The old-fashioned open saucers are the best watering vessels. These can be kept thoroughly sweet and clean, and though they do not hold sufficient water to last for a day or two, one can at all events see when the vessels are dirty. It has been pertinently remarked that if a man is too

lazy to fill the water vessels when they require replenishing he has no business to keep poultry. See then that the water vessels are kept thoroughly clean: a good plan is to empty them at night when the fowls have gone to roost and replenish them in the morning. It is very advisable to float a lump of camphor in the drinking dishes, as it is a great preventative against cold and scouring. Green food should always be accessible to fowls, and the refuse greens from the kitchen, such as cabbage leaves and the like, should always be thrown to them. A supply of nice sharp grit is most necessary to ensure proper digestion. Pieces of limestone, crushed oyster shells or broken-up china is also most essential in every poultry yard for supplying the material which goes to form the shells of the eggs. A warm feed in the morning is an excellent thing for poultry, and grain should be given at night. To feed too often is very inadvisable. Many people who start poultry-keeping think that the more they feed their birds the better it is for the birds themselves and also for the egg basket. Thousands of birds die annually by diseases brought on entirely by over-feeding. Moreover, fowls that are too fat will not lay. Be careful then in feeding your birds, only just to give them as much as they will eat with a relish. Directly they cease to run with eagerness for the food you throw down, stop, and you will find your birds in better health, no food wasted, and the egg basket better filled.

During the hot months an occasional tonic is very useful in keeping fowls in active, healthy condition. A simple and cheap one is sulphate of iron or green-vitriol. To one gallon of water add 60 drops of sulphuric acid, and then half a pound of sulphate of iron. When this is thoroughly dissolved bottle off, if possible in a spirit jar, and cork tightly. About one ounce of the tonic should be added daily to each gallon of the drinking water. The drinking water for fowls should be kept where the ducks cannot get at it, and may be placed on a box 18 in. to 2 ft. off the ground. It is of great assistance in fattening ducks to give them their grain in water. It is the natural way for water-fowl to take their food. Every poultry-keeper should grow sunflowers. A few of the seed fed occasionally to the laying hens will have a most beneficial effect on their egg production. All table scraps and kitchen waste should be

collected and kept for a sloppy morning meal. Advantage may be taken of this meal to give any medicine that may be required. Thus, during the moulting, a small quantity of powdered sulphur may be given with advantage two or three times a week, and some of the sulphate of iron tonic about once a week. Except in the warm weather the morning meal should be warmed up by means of warm water. A small proportion of curry is greatly relished by poultry and seems to do them good.

One of the results of excessive wet will probably be an increase of elephantiasis or "scaly legs." This is caused by a parasitic insect, and should be promptly attended to. When the legs become rough and seem to thicken, the bird should be caught, its legs thoroughly washed with soap and warm water, and then a mixture of sulphur and lard (sulphur ointment) well rubbed in. If taken in time one rubbing is usually sufficient. Although the bird affected does not appear to droop, it may be taken for granted that a fowl suffering from elephantiasis is not fit for the table, and this is a point which should be carefully attended to when buying poultry.

In order to preserve eggs, the following results of a prize competition at the last Birmingham Exhibition are worthy of note: The first prize was given to eggs which had been stored in a solution of 4 lb. of lime in 2 gallons of water in an earthenware jar. The solution should be stirred occasionally for 2 days, and the eggs put to within 3 inches of the surface. The next most satisfactory method was simply placing the fresh eggs in common salt, and keeping them in a dry place. Other samples were rubbed over with melted suet, beeswax, and oil or lard, and although they were good, none were so successful as the two methods first described.

ADHATODA VASICA.

This plant, also known as *Justicia Adhatoda*, is called among the Sinhalese *Atatoda*, *Agaladara*, and *Paawetta*, and is used medicinally by them. It is the subject of No. 10 of the Imperial Institute series of Handbooks issued in connection with the Indian collection. The object of the Handbook is to draw attention in Europe to a product which is used in India for the treatment of pulmonary affections &c., and for killing low forms of life injurious to rice crops. It has been suggested that a decoction might be found useful in destroying animal pests of such crops as sugarcane, tea and coffee. An aqueous solution of an alcoholic extract of the leaves was tried upon flies, fleas, mosquitoes, centipedes, &c., and, in every case, the application was followed with the usual results of poisoning.

A yellow dye obtained from the leaves by boiling, is used for dyeing coarse cloth in parts of India. As a medicinal agent the plant would appear to be of great value, to judge from the many high opinions given by both Indian and European medical men as to its efficacy in case of cough, bronchitis, asthma, rheumatism, malarial fever, and many other affections.

The plant is said to be avoided by stock, only the goat being occasionally seen to browse on it. The wood of the thicker stems is used for preparing charcoal for making gunpowder. The

leaves are held to possess high qualities as a manure, and are scattered over fields just before the rains; it is then ploughed in and left to decay. The smaller and pliant branches are worked round and round in a sort of plait to support the interior surface of mud-wells. The leaves and twigs when applied to rice-fields as described not only act as a green manure, but have also the property of destroying aquatic plants, keeping the fields free from the green scum caused by floating lemnae and submerged chara. The habit of using substances for green manuring which have powerful active principles seems to obtain in many parts of India, where *calatropis gigantea* (madder, the Sinhalese wara), *melia azadirachta* (nim, the Sinhalese margosa or kohomba), and *cedrela toona* (toon). The *calatropis* (wara) as is known contains a corrosive milky juice which is used by the natives in Ceylon as a blistering fluid, while *azadirachta* (margosa) leaves are hung about sick rooms to keep off flies and other insects.

We quote as follows from the Handbook:—"The antiseptic property of the plant in killing minute organisms, while being harmless to higher forms of life, thus established by native opinion, has been abundantly shown in a recent paper by Mr. Hooper in the *Pharmaceutical Journal and Transactions* (April 7th, 1888). Mr. Hooper writes of the chemistry of the leaves: 'A well-defined alkaloid appears to be the most important constituent; it constitutes the bitter principle, and, to all intents and purposes, is the active principle. It occurs in white transparent crystals belonging to the square prismatic system, without any odour, but with a decidedly bitter taste. It is soluble in water with an alkaline reaction and in ether, but more so in alcohol.' It would be beside the present purpose to give here the whole of Mr. Hooper's analysis of the substance. The above passage shows that simple maceration in water suffices to extract the active principle, and Mr. Hooper's practical experiments with it may therefore be preferentially cited here. 'A sample of pond water,' he writes, 'containing *Spirogyra* and numerous animalcules was mixed with a few drops of a strong infusion of *Adhatoda* leaves. The chlorophyll gradually disappeared from the weeds, and the cells became broken up. The oxygen was given off with less frequency and at length ceased; some insect pupae rose to the surface of the water and there died. Numerous *Paramæcia* remained active for some time, but eventually succumbed to the action of the poison. In 24 hours the beaker containing the water that had been thus treated showed only a brown mass lying at the bottom; while some water in a beaker by its side, without this treatment, contained the green aquatic weeds evolving oxygen, and the animalcules alive.'

'An aqueous solution of the alcoholic extract of the leaves was tried upon flies, fleas, mosquitoes, centipedes, and other insects, and in every case the application met with poisonous results. The solution appeared to kill them without previous intoxication. On the higher animals the leaves do not seem to have such an effect. A quantity of the alcoholic extract representing 15 grains of the leaf was given to a small dog, and the administration was not attended with any inconvenient symptoms. These experiments show that the reputed use of the

leaves in destroying injurious weeds in submerged fields is founded upon very scientific principles. The poisonous properties of the *Adhatoda* on the lower orders of the animal life will, perhaps, find for it a use in destroying insect pests, and make it an important addition to the *Materia Agricoliarum* in India."

Dr. Watt gives it as his opinion that the utility of *Adhatoda* has been placed beyond a doubt, and its extended use should, therefore, not only be strongly urged on the attention of rice cultivators of India wherever aquatic weeds prove troublesome, but also to tea, coffee and indigo planters. It is probable, he says, that in *Adhatoda* we have an antiseptic at the door of every native peasant, which, if not useful in the treatment of sores on his own person, could at all events be extensively used in the cure of the troublesome maggot-infested wounds of his cattle.

OCCASIONAL NOTES.

When coffee failed and valuable estates in out-of-the-way places had to be abandoned, the buildings on them of wood, stone, brick and mortar constructed at enormous expense had to be abandoned also. How many proprietors regretted the latitude they had given their superintendents and visiting agents to raise such palatial bungalows and stupendous stores, all to be lost in a few years! Had these buildings been of iron, which would not have cost half as much as the other materials absorbed, the iron might have been removed to civilized centres and sold. This ought to serve as a warning to proprietors of tea estates of the present day, whose young managers put them to the expense of building bungalows with bay-windows, and stores with blocks of granite which cost 40 cents per cubic foot.

Fresh pepper usually take a week to dry sufficiently in the sun when a bushel weighs 42 lb. If scalded in boiling water it takes about three days to dry and weighs 34 lb. The latter process has to be resorted to in wet weather, though the loss in weight is seriously felt. It struck me therefore to try drying it over a fire, and this is how I did it this last season. Place a wire sieve over a tea chuloo, or a barrel with both ends open, with a slow charcoal fire inside, and put the pepper with the catkins on, till the sieve is full; then keep on turning it with the hands by raising the pepper in handfuls and letting it fall into the sieve again for half an hour, when the berries will get separated from the catkins which should at one be removed, and the berries allowed to dry for half an hour more, and then taken off from the fire and spread on the floor to cool. After this another half hour's drying will make it fit for the market—weight of a bushel is 40 lb. by this process. To make pepper black dry in the sun for a few hours, and wrap it in a woolen cloth or blanket to sweat—the same as is done with vanilla.

Even supposing that the grape vine was not known in Ceylon before the Portuguese brought it from their country in the sixteenth century and planted it in Jaffna, it is a mistake to

suppose that the excellent wine with which the early travellers to the East were treated to in the "Courts of the Emperors" of Ceylon was anything other than the sap (toddy) from the coconut, palmira and kitul palms. Even in the absence of any literature on the subject, there is ample reason to suppose that the Sinhalese knew the art of making spirituous liquors from the juice of the kaju fruit, and may be that they also knew how to make good wine from the fruits of the *bilimbi*, *kamaranga*, *ratta-billin* and *embul-palla*. All these, except the last mentioned, belong to the *averrhoea* family, and all to the order *geraniaceae*. It is well-known that much of the champagne of the present day is made from gooseberries. The native fruits I have mentioned above being as good, if not better, may also produce the best of "fizz." The experiment is certainly worth trying.

The large variety of papaw recently introduced into the island by some Parsee gentlemen from Bombay is being widely scattered in the Central Province. One planted at the Matale Hospital premises by the Superintendent of Crystal Hill estate, lately produced a fruit weighing 6 lb. If any of your readers are aware of this weight being exceeded, he would oblige the writer by communicating the same to your Magazine.

ALL PRODUCTS.

TRAINING AND AFTER-TREATMENT OF THE GRAPE VINE.

1. *Training*.—When the young plants have made a fair start at growing, every encouragement should be given them to push on the growth. Watering and weeding should be carefully attended to, and the growing shoots or "canes" supported and protected against injury by winds and other external causes. Liquid manure may be applied now and then with advantage. Besides the shoot which is intended to form the future stem, a number of small ones are sent out from the bottom and ought to be nipped off with the socket. If there is a tendency to throw out too many branches close to each other, it should be checked by thinning out the weaker ones with a sharp knife, while they are yet very young. But at this stage of the growing plant care should be taken not to lay the knife at all heavily on it, as the leaves are very essential to its healthy growth and development.

When the vine has grown for about six months, it should be trained in a suitable and systematic manner. Mr. J. Allen thus describes two ways in which it is trained in Germany:—"I was very much interested in the different modes in which they grow vines in the wine country which fringes the Rhine for so long a distance. I found two modes of culture pursued. In the first, the vines were trained up a 6-ft. pole and stopped at that height. Six or seven stems were trained up the pole from the same root encouraging sidgrowths for the fruiting wood. In the other method one leading stem was grown up and bent down and tied to the foot-stalk so as to form a loop round which the growth was made and the fruit borne." Besides

these two described by Mr. Allen, there are several other methods for training the vine. For instance, some make it trail along the ground like cucumber creepers, while others, by a series of nippings and prunings, make it grow like a dwarf bush without any stake or support of any kind. There are also other ways, such as the coiling system, the spur system and the long or succession method. But the one with which we in Ceylon are most familiar is to grow it on trellises or 'pandals.' Of course when the vine is trained in this way there is the extra expense for putting up the 'pandal'; but this method seems so peculiarly suited to this country, so highly favourable to the healthy growth of grapes, and so well adapted to keep out injury from external causes as far as practicable, that the expense for the pandal can be well incurred. But at the same time it would be advisable to try other methods as well on a small scale, so that we might have some definite basis for comparing the relative merits of the various systems of training.

2. *Pruning and Wintering.*—The vine may be first pruned for bearing when it is about 15 or 18 months old. All the dry branches and useless runners must be cut off as close as possible to the joint without hurting it, and all the leaves must be stripped. The old shoots which bear this year will not bear again. The leading shoots should be shortened back to firm wood, and the lateral branches to one or two buds. If you find too many branches at the end of a main shoot, cut them off with a part of the parent limb. Use a very sharp knife and always cut in a sloping direction an inch or so beyond the terminal bud.

The mere pruning of the leaves and twigs in this manner has been found in several instances to make the vine bear fruit in some parts of the island. But it is generally considered better to lay open the roots for a few days simultaneously with the pruning. The following is the method adopted by the best grape-growers in Jaffna:—Dig round the root carefully, make it bare and cut off also a few of the fine rootlets. Keep it open for ten days or so. If you find the blossoms coming out with the leaves, the vine may be watered after covering the roots with about 4 or 5 baskets of well-rotted cattle manure mixed with the earth. If, however, the blossoms have not appeared by that time, the root must be left still open for about a week longer, then covered, manured and watered.

3. *Manuring and Watering.*—I have mentioned only cowdung, because it is the kind most commonly applied; but a good sprinkling of broken bones along with it is to be highly recommended. The vine is a gross feeder and a great drinker, and should, therefore, be liberally watered and manured. Sewage and slaughter-house refuse and the carcasses of animals are also applied; but care should be taken that rank manures be not applied to excess or too near the roots. In fact, the proper way would be to prepare them beforehand in the form of a compost by mixing them with carth, leaves, weeds and clearings of roads, ditches, ponds, &c., and frequently turning them over till they are duly ameliorated by time and are rendered fit for use. Liquid manure may be applied now

and then while the fruit is swelling. The watering must be copious the first day after manuring and returning the soil; afterwards it is done moderately every second day, until you see that the vine has blossomed well, then every day until the fruit begins to get a little larger than peppercorns, then twice a day. The more water it gets afterwards, the grapes will be all the sweeter and sooner ripe. But if too much water is given before the blossoms come out well, the plant will run too much to leaf at the expense of the fruit. Watering should be stopped when the grapes begin to ripen.

4. *Discussion about Exposing the Roots.*—The roots of the vine are laid bare in order to give it an artificial wintering by checking the continual flow of sap, and thus prepare it for a fresh fruit-bearing start. Some gardeners object to it as it is rather a rough and risky method of treating the vine, and perhaps interferes with its longevity. But in Jaffna, Calpentyn, and many other parts of Ceylon, it is considered indispensable to profitable grape culture. Of course in the temperate regions of Europe, Australia and America, there is no need for an artificial hibernation, as it is amply provided for in the natural way by the climate. But in Ceylon with its perennial spring, the upward flow of sap goes on with an unceasing activity in most parts of the country; hence the necessity for exposing the roots. Nevertheless, there are some districts where this process might be dispensed with, and pruning only will suffice to make it bear well. For example, in Kandy and some other parts of the hill country, it is found that as soon as the vine has given a crop, the leaves turn yellow and remain so until again pruned, when new life seems put into it, and in two or three weeks from pruning it is again decked in green and blossom. Where, however, it becomes necessary to lay the roots bare, the risk consequent upon the process can be minimized by digging and exposing only one-half of the roots for one season and the other half the next, as is done by some Jaffna gardeners.

5. *The Season for Pruning and Wintering.*—This must be determined chiefly by the climate of the place. If any rain happens to fall while the roots lie exposed, the vine will throw out any amount of wood and leaves but little or no blossom. It is therefore very important that we should make sure of at least three weeks of dry weather for the wintering. It is at the same time desirable to do it five months before the next dry season, so as to secure dry weather for the ripening of the fruit too.

The vine in Jaffna has two seasons. The first season begins early in March, and the second in August, and it is pruned and wintered at these two parts of the year. Most of the Jaffna gardeners, however, prune only once in April or May and are satisfied with one crop. This is the case at Calpentyn too. In Kandy it is pruned in the latter part of April and October.

Father Assauw, in a letter he has been kind enough to write me from Wahakota, says:—"I prune my vines in February and October. But that is not a general rule, as I have found it does not answer in all places. The vines I had when at Negombo were pruned only once a year, as is also done, I believe, in Chilaw and Jaffna.

I prune twice here, because I observed that in February and October the leaves begin to wither and the vine is ready to put forth young shoots, and this, I believe, indicates the time for pruning."

If any other particular is required under this head, it might be added that about three weeks before other fruit trees are usually in full blossom will, as a rule, be the proper time for pruning; and this is considered to be a safe guide in all districts.

E. T. HOOLE.

INDIAN JOTTINGS.

I have lately seen a farinaceous seed sold in the bazaars here called "Shengoda." The seeds are round and a little larger in size than an ordinary gallnut, and are invested with a hard covering of a dirty black colour; when the covering is removed the whole mass inside is a hard lump of starch which, when boiled, tastes well and much like a yam. Its scientific name, so far as I have succeeded in discovering it, is *Trapa bispinosa*. If this is so, it must be pretty common in Ceylon. For Dr. Trimen's list gives *Trapa bispinosa* as the Sinhalese 'Ikilya.' It grows commonly in marshy places, and the roots are used medicinally in Ceylon, though I am not aware that the seed is made use of at all. But as it appears to be considered tolerably good food-product here, it would be advisable to encourage its collection for use in Ceylon.

I had recently occasion to notice a method of husking paddy which is very speedy and at the same time done with very little waste. The methods now in vogue in the villages of Ceylon are rather tedious, viz., that of pounding in a mortar or on a mud floor. Not only do such methods necessitate a loss of time, but there is much waste in the form of broken grains, while the quantity of dirt and stones which get in, is such that the grain requires careful winnowing before use. The method I have referred to consists in grinding the grain by means of an ordinary stone hand grinder, which I had occasion to describe in my last, in connection with the preparation of dhal seed. The paddy is thrown in the middle through the hole of the upper slab with one hand, while the other is used in giving the slab a rotatory motion. The first thought which struck me was that a large quantity of grain would be crushed in the process, but I could not find a single crushed grain in one or two handfuls which I examined. The husks separate quickly, and the quantity which one woman cleans in a given time may be roughly said to be about five or six times that obtained by crushing in a mortar.

It is very desirable that some attempt to bring about simple improvements to save labour on the part of the goiyias in preparing their staple food should be made in Ceylon.

If improvements are gradually introduced which do not entail much expense, the cultivators would no doubt adapt them gladly.

Husking the grain by means of a grindstone is only an example of a possible improvement. Another improvement which is greatly needed is the simplification of the thrashing process. The number of weary nights and days passed by the goiyia and the patience exhibited by him in getting a few stacks of corn thrashed (which could probably yield not more than a score of

bushels of paddy) is worthy of notice. Perhaps the technical knowledge which would be brought before the youths of Ceylon by the new technical scheme would help in devising some inexpensive hand machine to do the work at less cost of time and labour. Let us hope the goiyias' claim would not altogether be overlooked.

The hand-thrashing machine which you once referred to as being in use in Italy, and an account of which you gave in the pages of the Magazine, should have had a trial in Ceylon. Japan is a large rice-growing country, but curiously enough possesses very few cattle; and the cultivators are said to be as conservative as those in Ceylon. But the Japanese seem to have a very simple instrument that does thrashing work with comparatively little labour and waste of time. The appliance is described as an iron-spiked comb of about a yard in length, with teeth set close together so as to just admit the passage of a rice stalk. These combs are fixed on a raised stand, and the workmen separate the grain from the straw by drawing handfuls of the reaped corn through the teeth by a dextrous stroke of the hand.

Unseasonable rain and consequent floods are often a source of danger to growing paddy crops, and in some districts of the island large areas of paddy land are not cultivated if the season is at all likely to be rainy for fear of the crop being lost. I have been informed that there is a variety of rice grown in Bengal in the Ganges valley well adapted for cultivation in such lands. These plants are said to grow up from eight to twelve feet in height, and hence the floods which come a few weeks after sowing, or when the crop is ripe do not affect the plants, as they are usually above the water level. Sir William Hunter also mentions this variety of rice in his recent work on the Indian Empire, and there cannot be any doubt about its existence. It would be advisable to procure some seed paddy for experiment in Ceylon, if possible, through the Agricultural Department of Bengal.

TRAPA.

The *Trapa* mentioned by our correspondent "W. A. D. S." belongs to the small aquatic order Haloragææ. *T. bispinosa* and *T. bicornis*, known as "water-chesnuds" are important food plants in Thibet, N.-W. India and China. Hooker mentions that *T. natans*, which he also calls the water-chesnut or caltrop inhabits stagnant water in Central and Southern Europe, and that its seeds afford a farinaceous food as do those of the two above-mentioned species. *T. bicornis* is known among the natives of China as ling or ki-chi. Trimen gives the Sinhalese name of *Trapa bispinosa* as Ikiliya, and Thwaites mentions that it is found in tanks in the hotter parts of the island. The small order Haloragææ is sometimes included in Onagraceæ, to which the well-known Fuchsia of our gardens belongs. *T. bicornis* is also known as the "singhara nuts," and is now being cultivated experimentally in N. S. Wales. The *Indian Agriculturist* referring to "singhara" says:—"The plant furnishing this important article of food appears to have been extirpated from the tanks of Southern India, but it has been preserved in the Mahratta country and the Nizam's Dominions, though we have not heard of it occurring in the Nerbudda Valley to any

appreciable extent. In Upper India, in the well-watered provinces of the Punjab and the Gangetic plain, 'singhara' is a well-known cry in the vegetable markets. There are more than one species which produce the spinous fruit. The large seeds of the *Trapa bicornis*, a native of China, so called because of its two recurved and obtuse horns, and of the *Trapa bispinosa* and *Trapa natans*, species indigenous to India, are sweet and eatable. Dr. Royle writes that the 'singhara' forms a considerable portion of the food of the inhabitants of Kashmere, and we learn from Mr. Forester that they yielded the Government £12,000 a year of revenue. Moorcroft mentions nearly the same sum as Maharaja Runjeet Singh's share, from 96,000 to 128,000 ass-loads of this nut being yielded by the Wulur Lake alone. In the Punjab the variety known as singhara purbeya, or eastern or down country water caltrop, such as that found in the pools about Jullunder cantonment, is deemed of superior quality. The nut abounds in fecula, and in China the kernel is popularly used as an article of food, being roasted or boiled like the potato.

"Even as an ornamental plant the two-horned *Trapa* is not without its merits. The long stalks of the plants reach up to the surface of the water, upon which their green leaves gracefully float, whilst their pure white flowers expand beautifully among them in the sheen of an Indian afternoon in the monsoon. The nut itself grows under water after the flower decays: it is of triangular shape and covered with a tough brown integument adhering strongly to the kernel, which is white and esculent and of a fine cartilaginous texture. It ripens in the latter end of the rainy weather, and, in the N.-W. P. at least, is eatable till November. In these Provinces the cultivation of the two-spined water caltrop is extensively carried on by the Dhimar castes who are everywhere fishermen and *palki*-bearers, keeping boats for planting, weeding, and tending his water crop. The holdings of each cultivator are marked out in the tank by bamboos, and they pay so much an acre for the portion they tend. The rent paid for an ordinary tank is about R100 a year, but R200 or R300 are ordinarily paid for a large tank. The plants, however, are said to cause such an increase of mud that a tank is quickly spoiled by them, and the cultivation is not allowed where the tank is required for a water reservoir."

This last statement would seem to prove that the *Trapas* are not so suitable for growth as checks to evaporation. The *Agricultural Gazette* of N. S. Wales referring to checking of water evaporation by means of aquatic plants distinguishes *T. bicornis*, *T. bispinosa*, and *T. natans* as ling nut, singhara nut, and water-chesnut respectively, and notes that their fruits are of considerable size, abound in farinaceous matter, and are of considerable economic value, and goes on to observe that "they are admirably adapted for growing in Australian waters which are not impregnated with any mineral constituent deleterious to plant growth. . . ." The absorption by their roots, which are as fine as hair, from $\frac{1}{4}$ to 3 inches long, and the transpiration of their leaves, which are spread over the surface of the water very quickly, are exceedingly small in connection with the beneficial check: these plants have on the evaporation of water.

GRAFTING MANGOES AND ORANGES.

"W. A. D. S." writes from Bombay:—"Since last I wrote to you about the grafting of mangoes, I have observed more of the processes. Besides grafting young plants on to trees, what is known as "side-grafting" is practised. Two or three incisions are made in the trunk of a tree, and small twigs, about $\frac{1}{2}$ an inch in thickness, from a good variety, are grafted on to the trunk by cutting their ends wedge-shaped. These wedges are fitted to the incisions made in the stem, and are set with a little bees-wax, any space left between the wedge and the tree being padded with cotton. The whole is then rubbed over with clay and cowdung, and after covering with a piece of plantain stalk is tightly bound round with a single string of coir-yarn wound over the whole surface. The process is considered easy and generally produces the desired result."

It will be remembered that the first process of grafting described by "W. A. D. S." was that known as "inarching," or grafting by approach, which two other correspondents referred to as being practised in the Northern Province.

In his Primer of Agriculture, Mr. H. W. Green describes the methods of cleft-grafting, saddle-grafting, side-grafting and splice-grafting.

Dr. Nicholls, in his book on "Tropical Agriculture," thus refers to the method known as "crown-grafting" which he says is very useful in orange culture, especially when it is desired to graft sweet oranges on to a large and old sour orange stock. The trunk of the tree is cut right through with a saw, and then smoothed off with a knife. Two or three scions are then inserted between the bark and the wood. It will be found much easier to insert the scions if a piece of hard wood cut the exact size and shape of their ends be used to force a passage between the bark and the wood of the stock. Grafting by approach or inarching is also extensively employed in the West Indies for the multiplication of the plants of the better kinds of mangoes.

The following are the advantages of budding and grafting:—Many delicate plants, and more especially fruit trees are rendered much hardier by their branches being made to grow on strong stocks, and when they become hardier they naturally give a larger return in fruit. Besides, some plants which are very difficult to propagate by cuttings are easily multiplied by budding and grafting, and seedling fruit trees, which take a very long time to bear can be made to fruit much earlier by these processes. In the case, too, of oranges and other fruit trees, the seeds do not always produce plants that bear fruit of the same character as that of the parents—in fact they do not "breed true." That is to say, if the seed of a very fine orange be planted, the fruit obtained from the seedling, when it has grown to a tree, may after all be of a worthless character; so that after the trouble of nursing the tree from the seed, and after weary waiting for years for the produce, nothing but disappointment may be the result. But by adopting the system of budding or grafting, the fruit could be harvested in a much shorter time, with the certainty that all the characteristics of the original plant would be preserved.

GENERAL ITEMS.

Mr. Falconer King, City Analyst, Edinburgh, lecturing on the work of bacteria in the soil, said that bacteria were of advantage to the farmer in the manipulation of his soil, as well as in the manipulation of his dairy produce. In all fertile soils, bacteria was present doing useful work. They had also a good deal to do with the nourishing of plant life. In the atmosphere there existed practically an inexhaustive supply of nitrogen (the most costly manurial substance that farmers had to buy), but it was not in a form in which plants by themselves could make substantial use of it. Bacteria, however, came to the assistance of the plants, and enabled them to assimilate atmospheric nitrogen, and to use it in building up their structures. In the soil also bacteria changed such substances as urine, which was of no use to the plant itself, into a most valuable ammonia salt. Another change, the importance of which to the farmer it was impossible to over-estimate, was the reduction of the nitrogenous compounds in the soil to the condition of soluble nitrates. In the case of other forms of plant food, the germs also performed most useful work. Such substances as phosphates and potassium salts were broken up by them, and in all probability handed over to the plant in a form fitted for assimilation. One of these bacteria fed on sulphur and another on iron compounds, and it was possible that the plant supply of sulphur and iron necessary for its existence was obtained from these bacteria. Seeing that these organisms were extremely minute, and that they did a vast amount of work, it followed that in all soil they must be very plentiful. It had been calculated that every fertile soil would contain in as much as would lie on a sixpence no less than two millions of them. To do their work properly these bacteria must be under certain conditions. Some of them, for example, required fresh supplies of nitrogen. They all required nourishing materials containing certain chemical elements. They all required water, and they all required a certain temperature, many of them being killed by frost. In conclusion, Mr. King pointed to the great advantage it would be if farmers knew and were able to control the working of these different kinds of bacteria. They talked of different treatment of soils, of different kinds of soils, and of manures suitable for different crops. What if this difference of treatment of soil, and difference of manuring was but an assisting or helping of the proper organisms to do the work required of them in feeding their crops? He could not help thinking that in a great measure it was, and he hoped the day was not far distant when a greatly extended knowledge of bacteria would enable them to farm in a much more scientific, and, he hoped, a more profitable manner than they did at present.

The New South Wales *Agricultural Gazette* refers to *Crinum asiaticum* (*S. telaboo*) as follows:—“Another plant, *Crinum tovicarium*, Roxb., is cultivated in Indian gardens, and has been admitted into the Pharmacopœia of India as an emetic. It has handsome white flowers and fine foliage, growing wild in some parts of India and Ceylon.” *C. asiaticum* is not commonly found in a wild

condition, though it is often used as a hedge plant. The juice of the leaves is used by the Sinhalese in ear-ache, while the bulb is externally used for boils and internally as an emetic.

What is known as “Blady grass” in Australia is the Sinhalese “iluk” (*Imperata arundinea*), one of the greatest enemies of the cultivator in some parts of the island. It is looked upon as a good stand-by in droughty weather in Australia, and if old stems and leaves are burnt off, it produces a fine growth of succulent herbage which cattle are said to relish.

Tomato leaves have proved to be of value in an unexpected direction. It has been found that water in which a quantity of fresh tomato leaves have been steeped, when sprinkled over peach, roses and orange trees had the effect of totally routing the numerous insects of all kinds which infested the trees, and in two days' time not one of these pests was to be found.

In the last quarterly issue of the Royal Agricultural Journal, to which we referred in our last number, Mr. James Mason contributes an article on “Field Experiments on the Fixation of Free Nitrogen.” Mr. Mason does not bring out any new points as throwing fresh light on this subject, but gives the results of careful experiments, among which are that in three crops—beans, clover, clover,—he collected a quantity of nitrogen equal to 376 lb. per acre, or more than 1 ton of nitrate of soda per acre, over a period of three years, equal to about 750 lb. of nitrate of soda per acre per annum. He concludes that these crops are capable of accumulating nitrogen in the soil itself, and by their roots afterwards able to support so voracious a nitrogen consuming crop as potatoes.

In the same Journal Mr. Archibald discourses on “Wild Birds: Useful and Injurious,” a subject he began to treat of in the previous quarterly issue. He is eloquent in his defence of the owl, and speaks glowingly of the services this bird renders to agriculture. He recalls the fact that those of an older generation knew the value of the owl, and left entrances in their barns for its special convenience. He characterises this bird of darkness as zealous for the extermination of mice and other plagues, and remarks that while the habits of the owl will bear the strictest investigation, this much-maligned bird bears the highest character for honesty and industry. Mr. Archibald finds himself unable to make out a good case for the black-bird, which, though a sweet warbler and of excellent attainments, is of very doubtful morality.

The utilisation of straw as food for cattle is the subject of another contribution by Mr. Joseph Darby. The writer quotes Dr. Voeleker to the effect, that it is undoubtedly a fact that some practical feeders are in possession of the secret of converting considerable quantities of straw into beef, and Mr. John Coleman who has stated that by the proper admixture of chopped straw with other foods, from $\frac{1}{3}$ to $\frac{1}{4}$ more cattle can be kept on a given area of land.

Jalap (*Evozonium purga*) gets its name from Xalapa or Jalapa in Mexico, the principal market for the drug. Dill (*Anethum graveolens*) is derived from an old Norse word dilla, to dull, in allusion to the carminative properties of the seeds.

Can the addition of water to milk be detected? The chemists have been saying positively that it can; but Professor Primrose McConnell, who is described as one of the most practical exponents of dairy science in Great Britain today, laughs the pretensions of the chemists to scorn. He argues that a dozen samples of unadulterated

milk, drawn from as many cows, may all differ from each other in regard to the proportion of water that they contain naturally, and that therefore it is impossible for the chemist, who is ignorant of their origin, to pronounce a certain opinion as to whether they contain added water. "I deliberately say, therefore," he concludes, "that the chemist who goes into the witness-box and swears that a farmer has put 5 or 10 per cent of water into his milk, or extracted 2 or 3 per cent of the cream therefrom, is going beyond what he knows, and is committing a great error—let me be charitable, and say unintentionally."

[No. 12.

AGRICULTURAL LOANS.

THE indebtedness of the Indian ryot and his dependence on the *sowcar* or the money-lender has now been shown to exist nearly all throughout India; in fact, the small land-

holders are at the present day in a more or less ruined state, and before long it is feared many of them will completely break down.

Legislative Acts were passed in 1883 and 1884—Agricultural Loans Acts—to enable the Government to advance money to the ryots for agricultural improvements. Perhaps, if these regulations came into operation a score of years before, they would have been of material help to the cultivator, but now the ryot is hardly able to reap the full benefit of their provisions.

Under the Agricultural Loans Acts, landowners are allowed to receive loans from Government for the purpose of directly improving their lands; and they may borrow for the purpose of buying cattle, or implements for drainage and clearing of lands, for the purchase of seed paddy, construction of irrigation works, &c., the amounts thus received having to be returned in yearly instalments. At one time it was feared the ryot would not take advantage of the offers of Government through ignorance or fear, or that he might in many instances attempt to obtain money under false pretences, for other than agricultural purposes. Some people went so far as to say that the ryot would sooner get their money from the *sowcar*, in spite of the ruinous rates of interest than from Government, as the *sowcar* would allow them to have their own way for a long time before putting on pressure, whereas Government demands will have to be met then and there.

From the Report for the last year on the working of the Loans Act, it is amply demonstrated that the ryot is not blind to the advantages offered by Government loans, that he has taken full advantage of the liberality of the Government, and that there is a greater demand for loans than the administration was prepared to advance; further, the dues have been regularly returned within the

prescribed dates, and not a single instance has been met with where the ryot even attempted to evade the authorities and use the advances obtained for other purposes, though it is almost proverbial that the Indian peasant whenever he is able to get the money is fond of spending it lavishly on jewellery and gold. The amount of money advanced under this Act during the last year in India has been forty-eight lacs of rupees.

The goiyias of Ceylon in many instances are indebted to usurious money-lenders, but their indebtedness is not a fraction of what it is in India, nor is it so widespread. The goiyias are involved to such an extent, however, as to make it impossible for them to be rid of their debts of themselves. There may no doubt be rare instances where this is not so, but these cannot be taken into consideration in a general view of the subject. It would be interesting if a proper estimate could be made of the extent of indebtedness of the goiyias in different districts. Such an estimate, correct for all practical purposes, could no doubt be made by referring to the lists of Notarial deeds executed in the districts within a given period.

No one could deny that the goiyias are a poor lot. They are, moreover, indebted in another way and in a way which is more serious than the ordinary form of indebtedness. They sell their labour before the season of cultivation for the very purpose of carrying it on. They borrow seed-paddy, cattle, and sometimes a score of measures of grain to last during the working season; and for all these the interest they have to pay is enormous. A rich neighbour who at times may talk very sympathizingly of the goiyias to his equals or those in office, will probably not lend a measure of seed-paddy unless he is promised the delivery of two measures at the end of four months. This means an interest of hundred per cent for four months, or calculating compound interest 800 per cent for one year. When these and other dues are paid, the labourer hardly finds anything left him for his trouble. This state of things goes on from season to season, and year by year the "cutest" man cannot for a moment see his way to extricating himself from such a mess. This is one of the main reasons why paddy cultivation is not paying, and why a goiyia cannot adopt any improvement in his method of cultivation or go in for any new departure, even if it promises to be of immense benefit to him. The disastrous results of the now defunct grain commutation tax may solely be attributed to the same source as the above.

The grain tax is no more, but the cause still exists which retarded and which would prevent any improvement being effected in the methods of cultivation, or any amelioration of the condition of these unfortunate people who work, but the fruits of whose labours are reaped by others.

The conditions in Ceylon are more favourable for introducing an agricultural loan system, and would result in greater benefit than it has already done in India, for our goyiya borrows practically for agricultural purposes, with the result that he has often to give up almost the whole crop. Any system of agricultural loans, if introduced, would obtain seed-paddy or seed-grain for the cultivator, it would enable him to have his own plough and cattle, or hire animals for work at a reasonable price; it would enable him to purchase manure for his land, without paying double its worth, and above all, when the day comes for reckoning, it will bring him his proper reward for his work, and will, best of all, engender energy instead of the apathy and laziness of which he is so often accused. Moreover, it would be the only means of bringing about improvements in his methods of culture and the undertaking of new enterprises.

The advancing of money for this purpose will not in the least prove to be a burden to the revenue, and a charge of three to four per cent interest would amply cover the expenses of distribution and recovery, as officers for that purpose are more than available now, after the abolition of the grain tax.

There might no doubt be initial difficulties. The persons who are more or less benefited as things stand today would work heart and soul to prevent the successful issue of such a scheme. Unscrupulous men entrusted with the work might abuse their powers, and even a few of the goiyias themselves might try to obtain money under false pretences. These are minor difficulties which could be overcome by proper administration, and should not overshadow the actual merits of such a system.

W. A. D. S.

OCCASIONAL NOTES.

A Javal "Baby" cream separator, kindly lent by the Eastern Produce and Estates Co., the Agents for the Dairy Supply Co., of London, has been worked with success at the School of Agriculture. By means of a separator it is possible to remove the butter fat from milk in a very short time, and the necessity of "setting" for cream is thereby done away with. The new milk is allowed to run into a bowl which is made to rotate on its own axis several thousand times per minute. The heavier particles of the watery part of the milk fly to the outer circumference of the bowl, the lighter particles of butter fat being forced to travel in an inner zone. By a simple arrangement, the separated or skim-milk is forced out at one tube, and the cream passes out at another.

The following are given as the advantages of this system; the skim-milk and the cream are obtained

perfectly sweet, and the separation is much more rapid than that which takes place naturally. While by shallow setting about 80 % of the butter fat is secured, by means of the separator from 92 to 98 % is removed.

Separators are made of all sizes, from small machines dealing with 12 to 15 gallons per hour, and worked by hand, to large machines, separating 350 gallons per hour, and worked by steam or horse power. In all the machines, however, the principle is the same. The separation is found to be most effective at high temperatures, and these range from 80° F. to 98° F. in different machines.

The Refrigerator is a simple apparatus for cooling milk by causing it to trickle in close proximity to a current of cold water. The milk can thus be safely transported to a distance without turning sour or otherwise deteriorating.

As has been noted before, the Government dairy building are now quite complete, and all minor arrangements are being made for the reception of the cattle, which will have arrived before our present issue is circulated.

Mr. R. Atherton, the well-known agricultural correspondent, sends us the following note on the "Tumbancai":—On every plot of newly-cleared or deserted land, on every newly-cleared coconut estate and chena in the Eastern Province, there grows on a small vine, a pod full of seed called the "Tumbum" or "Tumbancai," which is a great favorite with all classes of people and fetches a ready sale in every market it is taken to. The root of the vine is a large tuber differing in shape in nearly every vine, and resembles a root of short thick cassava. The fruit or pod resembles exactly that of the plant commonly known as "Indian Shot," with flowers both yellow and scarlet, and the seed within the prickly husk is held in much the same manner. The whole pod curried or fried is indeed a great delicacy and makes a pickle equal in flavour to that made from "Nastartium" seed, and some people think it superior. There is one peculiarity about the root or tuber. Under the impression that it would bear transplanting to village or town gardens, and improve in condition if put into better or richer soil and well watered, many people have had it dug up and planted afresh, but strange to say, it always deteriorates and either dies away, rots or bears much smaller pods! This I have observed with jungle flowers as well as jungle fruit. For instance, you may transplant a "gloriosa superba" from the jungle into your own garden, and notwithstanding all the care and attention you bestow upon it, it will inevitably dwindle away. Its own peculiar "habitat" is the best situation for every tree and shrub that grows on the face of the wide earth. The marvellous clumps of giant bamboo which develop themselves into vegetable marvels of height and girth on the Islands of the Eastern seas, invariably suffer from a change of residence. It may after being transplanted and acclimatised grow, and grow well, but it never comes up to its ancestor of the vegetable world. It would seem that a wise and

beneficent Creator has apportioned to each clime those things most necessary for its well-being, and that the puny efforts of man, however based on scientific skill, can never come up to His work. But that thought should never deter the benefactor of the human species,—agricultural or horticultural—from attaining what perfection is possible, from bringing to one clime the flowers and fruits of another.

The same writer delivers himself thus on the subject of Sugarcane Cultivation:—It has been put forward at various times, that the cultivation of the Sugarcane is unprofitable. The reason adduced for it is, that cane grown in Ceylon is wanting in the "saccharine constituent," which distinguishes it in other lands, and that the greater portion of the product is mere fibre and watery matter: to which assertion I have many things to say *per contra*. The two kinds of cane known and seen and grown in Ceylon are the white or pale yellow, sometime green streaked, and the dark purple, and I allow that it is very noticeable that some of the white species are often devoid of saccharine matter, and are, so to say, watery or contain more water than sugar in their cells. And the wild Sugarcane seen growing in profusion in all our mountain valleys by the side of streams and watercourses, and often in the lowcountry, have scarcely any sugar in it at all, say not two parts of sugar in one hundred of fluid matter, and therefore useless for sugar boiling, however excellent for fuel, when dry. I am certain of one thing, that if Sugarcane has been cultivated for sugar boiling in Ceylon, it has been inefficiently and carelessly done, and those who attempted it have either done it on too large or careless a system, or have not had the patience to persist in it in preference to other or more seemingly certain industries! We all know—have seen and have tasted Sugarcane of both the above species in our own Island. I have for one, and have seen splendid specimens grown in all our Eastern Province estates, gardens and chenas, and every bundle brought for sale is devoured with avidity, being almost "sickly sweet," thick with sugary matter, and capable not only of excellent but marvellous results if skillfully handled. We see in every direction the juices of the Ceylon palms made or boiled into splendid jaggeries or sugary substances, and I'll stake my reputation that the toddy is not half so sweet as sugarcane juice, which is fifty times as sweet and viscid. With the millions of acres available for Sugarcane cultivation in Ceylon, in the shape of marshes and morasses, rice banks, and alluvial soil in every direction, why is not the experiment fairly tried, if not by private individuals by Government? who would foster a grand industry and add to the wealth of the country! Why indeed!

The Superintendent of the School of Agriculture spent part of the Easter vacation in travelling across the Deccan, enquiring into the progress of dairying.

Mr. H. D. Juanis, an old boy, is at present employed at the Asylum, superintending the garden cultivation.

Mr. W. A. de Silva, at present in Bombay headed the list at the second professional examination of the Veterinary College, besides winning a valuable special prize.

THE KADAMBA TREE.

This tree (the subject of an article in a late number of the *Indian Agriculturist*), is indigenous to Ceylon, and is known among botanists as *Anthrocephalus Cadamba*, (the Kadamba of the Tamils). It has an erect stem with many branches; the flowers, which have a peculiar sweet smell, forming a small globe. The fruit is about the size of an orange: this is eaten by the poor natives in India, while the leaves are given to cattle as fodder. The bark is considered to be of great value as a febrifuge and tonic; its taste is bitter and astringent. The fresh juice of the bark is applied to the fontanelles of children when that soft portion of the head sinks; at the same time a small quantity mixed with cumin and sugar is given internally. The juice of the bark mixed with an equal quantity of lime juice, opium and alm has been applied with great benefit round the orbit of the eye to subdue inflammation. The tender leaves, when applied in the form of a paste, resolve glandular swellings, and the large leaves prove an efficacious remedy for eczema. A decoction of the leaves is used as a gargle in cases of apthæ and stomatitis. The fruit is considered to be cooling, a destroyer of phlegm and impurities of the blood. The wood of the Kadamba tree is of great economic importance, is soft, yellow-coloured and even-grained, weighing about 40 lb. per cubic foot. It is used for building purposes in Assam, and may be used as material for beams and rafters, being also good for joiner's work. In Calcutta it is one-third as cheap as mango wood. Kadamba trees grow wild throughout India, and are principally used for fuel. The closely-allied *Manjal-Kadamba*, the *kolon* of the Sinhalese (*Adina Cordifolia*) and Nir-Kadamba or Chelembe, the Helamba of the Sinhalese, (*Stephegyne parvifolia*) are sometimes used by carpenters in Ceylon. The wood of the former is extremely fine and like that of the box tree, being light and durable, though it does not stand damp well; it is used in Bombay for planking for the floors of houses. The former, which is of a light chesnut colour, fine and close-grained, has also been used for flooring-planks, packing boxes, and similar purposes.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

SUB-KINGDOM IV. *Annulosa*.

Division 2. *Anarthropoda*. This division includes the Spoon worms (*Gephyrea*), the ringed worms (*Annelida*), and the arrow-worms (*Chaetognatha*). The members are characterised by an elongated worm-like body composed of similar or nearly similar segments. Passing over the spoon worms, which at present are of no importance, we find that the *Annelida* include the leeches (*hirudinea*) characterised by the possession

of an adhesive and locomotive sucker at one or both extremities. The leeches are mostly aquatic, chiefly inhabiting freshwater. The body is ringed, as many as a hundred annulations being present in the common leech. The two species used in medicine are the *Sanguisuga medicinalis*, chiefly imported from Germany, Bohemia, and Russia, and the *S. officinalis*, the Hungarian leech. The second order of *Annelida* is *Oligocheta* which includes the earth-worms (*lumbricidae*). Of the animals which dwell in the soil, none approach the earth-worm (*lumbricus*) in the magnitude of their effects. Earth-worms feed upon the organic matter of the soil; and in order to get sufficient food, they have to pass large quantities of earth through their bodies. This earth is ejected in the form of castings, which may often be seen as little mounds on the surface near the entrance to the burrow. Through these burrows air and water penetrate more freely into the soil, and the work of decomposition progresses more rapidly.

It has been calculated that an acre of ordinary agricultural land contains about 50,000 earth-worms. The effect of their combined labours in reducing the soil to a finer condition is great, whilst they also enrich the surface soil in nitrogen. In old grass land the production of a close compact green sward is largely due to the fine earth which is brought up by earth-worms, to be afterwards crumbled down and levelled by the action of wind and rain. The action of earthworms has been fully studied by Darwin. He shows that their burrows penetrate 5 or 6 feet or even more, and that the worms are continually bringing up finely-levegated soil to the surface which is removed to lower levels by rain, so that a kind of constant circulation of soil is going on—the loss at the surface being made good by material brought up from below. Humus acid is generated in the bodies of the worms, and thus is enabled to act upon the rocks and rock fragments at some distance from the surface, while the small particles of stones are triturated in the powerful gizzards which the worms possess. "In many parts of England," says Darwin, "a weight of more than 10 tons of dry earth passes through their bodies, and is brought to the surface on each acre of land; so that the whole superficial bed of vegetable mould passes through their bodies in the course of every few years."

PALMYRA.

Bulletin No. 25, issued by the Agricultural Department of Madras, deals with the "Palmyra Palm and its uses." The age at which the palm begins to yield sap or fruit is variously stated at from 15 to 30 years. From 6 to 20 fruits will grow on a single spadix, and a palm will bear from 4 to 12 spadices, thus producing from 40 to 200 fruits in one season.

The average contract on which palmyras are let in Tinnevely is 2 annas per tree; of this sum, which represents the gross profits, the climber gets half. The average number of trees tended by each climber is 40, the average height of the

trees is at least 40 feet, and each tree has to be ascended and descended twice a day, morning and evening, during eight months (the hottest) of the year. The palm sometimes reaches 90 feet, but 40 or 50 feet is the average height. Its girth is about $5\frac{1}{2}$ feet flat at the bottom, and $2\frac{1}{2}$ feet at the top.

The British Government at present take an average rate of 5 pies per tree. Palmyras are divided into four classes: (1) female palmyras not allowed to bear fruit, but tapped for juice; (2) male trees tapped for juice; (3) fruit-bearing females; (4) leaf-yielding trees. Each palm has from 25 to 40 fresh green leaves at a time, of which 12 or 15 are cut. In times of drought, the green leaf is used extensively as fodder for cattle. The refuse of the leaves and stalks forms fuel and manure. The ripe fruit is also given to cattle. In a recent report the Head Assistant Collector, Madura, says regarding the fibre exported from Pambán to Ceylon:—

"The fibre appears to be used in Ceylon for making brushes for rough use and for rough hats, mats and baskets. Pambán, however, is the only place in this division in which the trade is carried on at all. Its existence there seems to be largely due to the efforts of an agent of a firm in Colombo, who has been actually engaged in encouraging the natives of the island to prepare and sell to him the fibre. He tells me, however, that it is with great difficulty he can induce the people to undertake an industry that is new to them and was not practised by their forefathers, and, in many instances, instruction in the method of preparing the fibre and even advances of money to be repaid in fibre were not productive of much extension of the trade. Were it not for this difficulty, the quantity available in this division would be very large, as palmyra trees grow in great numbers in every part of it. This might, however, be surmounted if instruction, as to the method of preparation of the fibre and information as to the high price it fetches, were sufficiently disseminated. The present price in Pamban island is R10 a cwt. The method of preparation simply consists in detaching from the trunk of the palmyra tree the lower part of the stalk of the leaf which remains clinging to the tree after the leaf has been cut off or had died, beating this with a wooden hammer, and pulling out the fibre which is so detached. The best trees for the purpose are young ones from 12 to 15 feet high, as in these there are usually more of these leaf stalks attached to the trunk. They fall off as the tree gets older. The stalks require to be of a certain and particular state of decay, in which the fibre in them, when hammered out, will be of a black colour. The white fibre, which is obtained from immature stalks, is less pliable and more brittle, and fetches an inferior price in the market.

"As explained above, the quantity which would be available in this division depends less upon the number of palmyra trees here than upon the extent to which the people could be induced to undertake the industry. Palmyras abound everywhere along the coast, and, were sufficient hands available, the supply would be very considerable, but, at present, and for these reasons, I can give no more definite information than that 158 cwts. have been exported from Pamban

alone since April in this year, and that the industry there is still a new one capable of improvement."

The author of the Bulletin (W. A. Symonds) particularly refers to the extraordinary depth to which the roots penetrate. Their length, he says, is commonly supposed to exactly equal the height of the stem. "Not till they reach the water under the earth do they stop in their downward search for moisture, and it is thus that the palmyra is enabled to withstand the drought of the driest months in a tropical clime. Hence it follows that although a palmyra will grow in a stiff clayey soil, and even in stony tracts of country, a deep loose soil is of all soils the best adapted for the growth of this tree."

A VISIT TO THE POONA DAIRY FARM.

The Poona dairy is situated at Kirkee, about 3 miles from Poona town. It is as all dairy farms in the Bombay Presidency are, under the supervision of Mr. J. W. Mollison, M.R.A.C. and s., who is also lecturer on agriculture at the Poona College of Science. To the dairy is attached a farm on which the superintendent raises fodder crops for the dairy stock. *Panicum maximum* or Guinea grass (our rata-tana)—which is not one of the crops commonly cultivated in the district—is being successfully raised by means of irrigation. The grass is planted out on ridges, and the irrigation water is led along the furrows. By this method of cultivation the land is able to be kept clean without difficulty. I observed that the bushes were not permitted to grow to anything like the proportions they attain to with us,—the grass being mowed when comparatively tender. Guinea grass is sold at the rate of 150 to 200 lbs. for the rupee, and 40 lbs. is the ordinary allowance for a milch cow per day. Another crop raised on the farm is *Medicago sativa*, the English lucerne or South American "alfalfa." This too is cultivated in a similar manner, and is sold at the rate of from 120 to 150 lbs. for the rupee, and it is not thought advisable to allow a milch cow more than 10 lbs. per day. [My experience of lucerne cultivation in Ceylon is very similar to that of Mr. Nock, whose report I saw on my return from Poona. I first tried to raise the crop from seed received from Sutton, but the growth which stood out a whole year was unsatisfactory. Next I obtained seed from the Bombay Presidency, and the result of my experimental cultivation of a small plot was eminently satisfactory. I have seen lucerne grown around Bombay and at Poona, and I think that the growth at the School of Agriculture is equal to that in the Bombay Presidency, while if anything our plants have a greater inclination to stool. The soil here is the notoriously barren cinnamon sand, and a special bed had to be prepared with a due admixture of mould and lime, but I am looking forward to raising lucerne with less trouble on parts of the old Model Farm grounds. Unfortunately, lucerne is liable to the attack of a fly (which, however, so far has done hardly any damage), while it has been found in Poona that excessive wet causes the roots to become diseased.]

Teosinte (*Reana luxurians*) is also grown in Poona. Its cultivation was fairly successful, but the young shoots were found to spring slowly from the root stumps and appear less vigorous each time a "cut" was made.

Dolichos Biflorus (kollu, horsegram or Madras gram) has been grown on the farm as a fodder crop. It is known there as kulthi. This Mr. Mollison values at rather a lower rate than the other fodders, because liberally rationed dairy cattle reject the coarser stems, and thus some waste is caused.

Sorghum Vulgare (Jowari) is much cultivated in India for cattle fodder; one variety (Sundhia Jowari) being grown in the cold seasons, and another (Kadwal Jowari) raised in the hot weather. The cultivation of the latter is comparatively expensive as a water rate of R9 per acre besides cost of watering has to be included. I am of opinion that Jowari could also be introduced as a fodder crop here, as experimental plots raised from seed kindly presented by Major-General La Touche, late of Ceylon, showed a healthy and vigorous growth. At Kirkee I saw the real *Lathyrus Sylvestris* which Mr. Mollison pronounced a failure in his district. The plants were totally different from those we raised from seed imported from Italy. Some R20 were paid by the Poona farm for their seed, while we got ours at R5 per lb. I may mention that I was convinced before I left for Poona that we had been supplied with the wrong seed, and Dr. Trimen, to whom I submitted some of our plants, declared the growth to be that of a *Pisum*.

In the hot weather all cultivation has to be carried on by irrigation. Where the water supply is drawn from the canals a rate has to be paid, otherwise well irrigation has to be resorted to. The water is drawn up from the wells in leather bags by bullocks walking forward down an incline and back again up it. The arrangement of ropes attached to the water bag is such that the man in attendance on the bullocks is able by manipulation of the strings to empty the bag when it reaches the surface,

(To be continued.)

SOME WILD PLANTS OF OUR CINNAMON GARDENS.

1. *Wrightea Zeylanica*.—(Sin. *Idda*; Tamil, *Vedpalai*.) This is a small milky shrub belonging to the natural order Apocynaceæ and is very common in the Cinnamon Gardens. It looks somewhat like the tea plant at a distance. The leaves are oblong, acuminate, smooth and bright green on each side. The white flowers which have a kind of silky tuft are largely collected for offering at the Hindu and Buddhist temples. The pods contain a silky wool which is useful for stuffing cushions. The bark is astringent and bitter and also deemed a febrifuge. An infusion of the bark is given by the *vedalatas* in cases of chronic dysentery.

2. *Evacum Zeylanicum*.—(Sin. *Ginuhiriya*.) This is a species of gentian. It rises to a foot or two in height, and looks very beautiful with its bright, blue-purple flowers. The stem is square and erect, and the upper leaves enclose the flowers

in pairs. The whole plant, and especially the root is very bitter and is devoid of astringency. It is a powerful tonic and febrifuge. In short, it may be remarked that this herb has probably the same virtues as the yellow European gentian (*gentiana lutea*), and it may be that we seek at a distance what lies at the very threshold of our doors.

3. *Cuscuta reflexa* (Sin. *Agamula-netiwela*.) This is a parasitic leafless creeper which preys on the Cinnamon bush and belongs to the same family as the "dodder." The Sinhalese name means "a creeper that has no beginning or end." The Tamils call it *Muda-kottan*, and consider it a specific for cuts, fractures and dislocations. Wonderful stories which try one's credulity are told of the power of this plant to make flesh adhere and cure wounds, and the remarkable success of some native doctors in surgical treatment is attributed to the secret use of this plant. One thing, however, can be said with certainty about its virtues, the mucilaginous juice has a very soothing effect when it is applied in the form of a poultice.

4. *Acalypha Indica*.—This is a common annual herb with greenish flowers belonging to the natural order Euphorbiaceæ. It is called *Kup-pemenia* by the Sinhalese and Tamils. It is reported to have a peculiar effect on the cat which has sometimes been noticed to play about with great fondness round the plant. A decoction of the leaves has laxative properties and the root is a cathartic.

5. *Hemidesmus Indicus*.—This plant is known as *iramusu* in Sinhalese and *namdari* in Tamil. It belongs to the order Asclepiadæ, and is a perennial with a thin woody creeping stem and small lanceolate, smooth and shining leaves streaked with white along the midrib. Its root is long and slender, with few ramifications, covered with rust-coloured fragrant bark which keeps its odour even after drying. The root is popularly employed all over the Island as a substitute for sarsaparilla (smilax) and is very highly spoken of. Its diuretic property is very remarkable. It also acts as a diaphoretic and tonic and increases the appetite while it purifies the blood. The taste and smell of the infusion of the root are balmy and sweet. It has been used with the most decided benefit in numerous cases of the description in which sarsaparilla is generally given, and indeed it is said that the activity of this medicine is much more decided than that of sarsaparilla itself.

E. T. HOOLE.

INDIAN JOTTINGS.

I was on the lookout for some time to see whether the papaw which was some time back introduced to the Island and mentioned in your last by "All Products" is grown in Bombay. So far as I have seen it does not seem to be cultivated here, and papaw trees do not thrive so well in these parts as they do in Ceylon. It is rather surprising to see that papaine, the new product from the papaw, has not given any stimulus to the growth of the tree in Ceylon. From the prices which were offered for the article, papaw cultivation would have seemed to be a paying investment. No doubt the prepar-

ation of the juice required a little knowledge and practice, but then some technical knowledge and practice are required in the preparation of all planting products—tea, cocoa, cardamoms, cinnañon, &c. However, the only reason I could see for its not becoming popular, is that the attention of the agriculturist in Ceylon is centred in the products which are "booming" just now, and there is no time for cultivators to look about.

The betel leaf, *Chavica betel* is now recognized as one of the most important antiseptics and you had a full notice of it in the last number of the Magazine. It is remarkable that the betel or *Pan* leaf as they call it here, is of a very inferior quality in Bombay. The pale crushed thin leaves exposed in the markets would be despised even by the poorest in Ceylon. However, its consumption is great here as it is in Ceylon. Perhaps if the leaves could be properly packed and shipped, the Ceylon betel cultivator would find a profitable market out here. If arrangements are made with the Peninsular and Oriental Steam Navigation Company, a cargo would take only three days from Colombo.

Bombay is famous for its mangoes; there are now and again very superior fruits offered for sale, but the general run of the fruit on sale here at rather exorbitant prices never reaches in quality our Colombo "Jaffna" mangoes. Some one should try to ship mangoes to Bombay from Colombo, even at the risk of "carrying coals to Newcastle." If coal is dear at Newcastle, there is no reason why it shouldn't pay to send it there from some other places!

By-the-bye, anyone visiting Bombay would have observed that the tea which is retailed here is mostly rubbish. Sometimes one cannot actually make out whether a sample of cheap tea is tea or some other powdered dry leaf. Such stuff sells largely here, and the retail dealers no doubt are making immense profit, their lowest price being about fifty cents a pound, and that too for what I am inclined to call dry "leaf mould." A pound of tea sold from seventy-five cents to a rupee in Colombo cannot be had here for less than, I believe, two rupees. This is all the work of the retail dealers, and the poor workman and those who cannot afford to pay high prices for good ordinary teas must be satisfied with the rubbish they get. While writing of tea, I do not know whether you remarked how a paragraph in a number of your Magazine of last year has gone round the papers of the world, of course with modifications to suit the different readers. The paragraph I refer to was one contributed by "All Products" about croton plants being grown on tea estates, and the purgative effects produced by drinking certain teas. I read the same paragraph in more than one of the Indian papers, months after its appearance, and last though not least, under a separate heading in the *Scientific American* of New York.

More than once I was told by ignorant natives that the tea plant was to be found growing in the vicinity of this city, and some innocently inquired how the leaf was so nicely prepared in Ceylon. The description of the plant which they gave me was very unlike that of the true bush. At last I

had an opportunity of inspecting the so-called tea, and found it to be no other than the common lemon grass *Andropogon martinii*. This is called by many of the ignorant people here the tea plant, and its leaves are infused and drunk with milk and sugar. Sometimes it is said that these leaves are cut into small bits and dried and mixed with half the quantity of real tea. I expe-

rienced the taste of this lemon grass tea, and my curiosity was satisfied once and for ever.

In this connection I annex a list of plants which are used in different countries as substitutes for tea, which I had occasion to jot down, from "Johnston's Chemistry of Common Life," edited by Professor Church:—

Name.	Natural Order.	Common Name.	Where used.
1. Catha Edulis ..	Celastraceae	.. Arabian tea	.. Arabia.
2. C. Spinosa ..	"	.. Kat	.. Abyssinia.
3. Sageretia Thozans ..	Rhamnaceae	.. (?)	.. China.
4. Ceonothus Americanus ..	"	.. New Jersey tea	.. N. America.
5. Psoralea glandulosa ..	Leguminosae	.. (?)	.. Chile.
6. Cyclopia Vogeli ..	"	.. Berteia	.. Cape.
7. Prunus Spinosa ..	Drupaceae	.. Sloe	.. Northern Europe
8. Fragaria Collina ..	Rosaceae	.. Strawberry	.. "
9. Gephyllia Nitida (Flower)	Myrtaceae	.. Long life tea	.. Bencoolan.
10. Laptospermum Scoparium	"	.. "	.. Tasmania.
11. Melalica Genistifolia	"	.. "	.. "
12. M. Scorparia ..	"	.. "	.. "
13. Myrtus Ugni ..	"	.. (?)	.. Chile.
14. Helichrysum Seraphylifolium	Compositae	.. Colony tea	.. Cape.
15. Gaultheria Procumbens ..	Ericaceae	.. Mountain tea	.. N. America.
16. Ledum Palustre ..	"	.. Labrador tea	.. "
17. L. Latifolium ..	"	.. James' tea	.. "
18. Ocymum Album ..	Labiatae	.. Toolsie tea	.. India.
19. Monarda Didyma ..	"	.. Oswego	.. N. America,
20. M. Purpurea ..	"	.. "	.. "
21. Micromeria Theasinensis ..	"	.. "	.. France.
22. Salvia Officinalis ..	"	.. Sage	.. N. Europe.
23. Hydrangea Thunbergia ..	Lythriaceae	.. Amatsja	.. Japan.
24. Acaena Sanguisorba ..	"	.. Burr tea	.. New Holland.
25. Styraax Alstonia ..	Styraceae	.. Santafe tea	.. N. Grenada.
26. Capraria Biflora ..	Scrophulariaceae	.. —	.. Cent. America
27. Correa Alba ..	Rutaceae	.. Cape Barra tea	.. New Holland.
28. Lantana Pseudothea ..	Verbenaceae	.. Capita de Mátto	.. Brazil.
29. Stachytarpha Jenseisensis ..	"	.. Brazilian tea	.. Austria.
30. Chenopodium Ambrosioides	Mexican tea	.. Mexican tea	.. Columbia.
31. Viburnum Cassinoides ..	Caprifoliaceae	.. Applachian tea	.. N. America.
32. Prinos Glaber ..	Aquifoliaceae	.. "	.. "
33. Angraecum Fragrans ..	Orchidæ	.. Bourbon	.. Mauritius.
34. Coffea Arabica ..	Rubiaceae	.. Coffee tea	.. Sumatra.
To this list may be added some of those plants of which the leaves are used in India and Ceylon:—			
35. Hemedesmus Indicus ..	Asclepiadeaceae	.. Iramusu.	
36. Cassia Auriculata ..	Leguminosae	.. Ranawara.	
37. Bidens Pilosa ..	Compositae	.. Wal te.	
38. Andropogon Martini ..	Graminae	.. Pengiri.	

"Rose" tea and "gardenia" tea are not unknown in Ceylon, and many substances are used in different countries to give a fragrance to tea, among others being *Olea fragrans* (sweet-scented olive), *Chloranthus inconspicuus*, *Aglaia odorata*, *Majorium sambac*, *Vitex spicata*, *Camellia odorifera*, *Illicium anisetum*, *Magnolia gracilis* (sapu) and *Murrya exotica* (*S. etteryia*).
12th May, 1893. W. A. D. S.

GENERAL ITEMS.

Rice is being raised at Louisiana at a cost of 4s. 2d. per barrel or sack and is selling for 10s. to 12s. 6d. No other class of farmers, it is said, are making such profits. Wheat, oats and corn rarely pay 4s. 2d. per acre over cost of labour. Rice often pays £5, £6 and £10 per acre over cost of production.

Milk (or skim milk) is one of the best articles that can be used in connection with poultry either young or old, whether used to wet their

food or for drink or both. Animal food and green food are as important for chickens, fairly grown, as for fowls.

Charcoal is a very valuable assistant in raising chickens, although seldom mentioned in poultry publications. It assists digestion, and hence corrects or prevents a multitude of evils. It need not be completely pulverised, but should be well broken up and placed in shallow pans or on bits of board, either near the coops, or in various places about the premises where it will

be readily discovered by the chickens. This simple suggestion should not be forgotten.

The following table shows the normal number of respirations and beats of the pulse per minute in adult healthy animals:—

	Respiration.	Pulsations per minute.
Horse ..	9 or 10	.. 36 to 40
Ox ..	15 to 18	.. 45 to 50
Sheep, Goat	12 to 15	.. 70 to 80
Dog ..	16 to 18	.. 90 to 100

These numbers vary of course with age. A young horse, for example, makes 14 or 15 respiratory movements per minute, whereas in an old horse the number may fall to 9 or 10. In a young ox the number is from 18 to 21, in an old ox it varies from 12 to 15.

Wrapping lemons in tissue-paper and storing away in a cool place has been found to be the best method of preserving the fruit.

Prof. Wallace's work on the live-stock of Great Britain has passed into a third edition. The latest has extended to 350 pages, containing 75

photographic plates, over 20 electrotypes, and four maps.

We have received the following publications, through the kindness of the Secretary for Agriculture, New South Wales:—Practical Results of the Treatment of Plant Diseases, Plant Diseases and how to Prevent them, Insect and Fungus Pests with a few well-known and tested remedies; Directions for Collecting, Forwarding and Packing Specimens of Insects, Plants, Fungi and Soil; and Canning and Preserving Fruits.

In a lately published work on the Natural History of the animals of the farm by Dr. Georges Pennetier, Director of the Museum of Natural History in Rouen, the author touches upon a subject which, at various times has aroused considerable discussion. Dr. Pennetier revives M. Thurey's theory according to which the sex of the offspring is determined by the exact period at which the service takes place; although, however, he quotes the testimony of a breeder of cattle who certifies that in the course of twenty-nine experiments there was not one failure in securing the desired end, it is evident that the author still regards the problem as unsolved.

COLOMBO SALES OF TEA.

Messrs. FORBES & WALKER put up for sale at the Chamber of Commerce Sale-room on the 20th July the undermentioned lots of Tea (179,382 lb.), which sold as under :—

Lot No.	Mark	Box No.	Pkgs.	Description.	Weight lb.	c.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

June 10th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	11,569 packages.	39,960 packages.	2,192 packages.
1892-1893.	631 "	3,115 "	

During the week

631 packages INDIAN
 115 " CEYLON
 — " JAVA
 Total 3,746 packages have been offered in public auction.

The season year just closed has been marked by increased Home Consumption. Coming after the great expansion of the previous season, this is encouraging. The re-export of Indian and Ceylon Tea is steadily progressing.

Exports of Indian and Ceylon Tea from Great Britain during May were Indian, lbs. 280,746, Ceylon, lbs. 325,501; against Indian, lbs. 193,147, Ceylon, lbs. 131,932 in May last year.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to 31st May.

	1888-1889.	per centages.	1889-1890.	per centages.	1890-1891.	per centages.	1891-1892.	per centages.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

June 17th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	17,376 packages.	60,730 packages.	4,403 packages.
1892-1893.	10,687 "	26,937 "	1,989 "

During the week

10,056 packages	INDIAN
23,822 "	CEYLON
1,989 "	JAVA

Total 35,867 packages have been offered in public auction.

The *Times* in a recent article upon "Indian Affairs," remarks:—

"The Indian Tea Planters are at last taking active steps to have their industry properly represented at the Chicago Exhibition." "The experience of the past few years has convinced them that the production of Indian Tea is increasing at a rate which imperatively requires that new markets shall be opened for its consumption."

The article appeared on the 2nd June, and contains matter of considerable interest to the Tea planting community.

It is satisfactory to note that re-exports of Indian and Ceylon Tea, both to the United States and to Canada, show encouraging progress.

Export of Indian & Ceylon Tea from the United Kingdom to United States and Canada, from 1st Jan. to 30th April.

	INDIAN.			CEYLON.

INDIAN. The quantity of New Season's Tea brought to auction, 2,052 pkgs. comprised invoices from Darjeeling, Terai, Dooars and Assam. The quality on the whole was decidedly satisfactory and from some estates excellent; a few invoices however, were disappointing in liquor. Competition for both New and Old Season's Teas, except the few choicest lines, was languid, and the market must be quoted easier for all descriptions. The following averages are worthy of note:—"Mim T Co.," 1/10; "Assam Frontier T Co.," 1/3; "Margaret's Hope" and "Tukvar," 1/2½.

Weekly average of New Season's Tea sold on Garden Account, 1892, 2052 pkgs. av. 11¼. 1891, 259 chests av. 9½d.

PEKOE.	(Blackish, greyish, some tip, inferior liquor)	" 7¼d.	" 9d.	" 9¼d.	" 6½d.

CEYLON. Tuesday's auction of 21411 packages overtaxed the market, resulting in lower prices for all grades to the extent of about ½d. per lb. Quality continues about the same, being rather above the average for this time of year. The following averages may be mentioned:—"Norwood" EP&E Co., 1/1¾; "Waverley" CTP Co., "Labukelle" EP&E Co., and "Portmore," 1/1. Average, 9d.

Comparative prices of Ceylon Tea in London:—

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Broker

13, ROOD LANE, LONDON, E.C.

June 24th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	25,469 packages.	79,545 packages.	6,506 packages.
1892-1893.	23,003 ..	48,427 ..	2,644 ..

During the week

316 packages	INDIAN
490 ..	CEYLON
55 ..	JAVA
18 ..	NATAL

Total 34,579 packages have been offered in public auction.

The action taken by the Tea Planting community in India increases the probability that an exhibition of Indian Tea will eventually be made at the World's Fair in Chicago.

The importance of making the most of this opportunity to foster a taste for British Grown Tea North America cannot be overrated—especially now that the industry appears to have taken a firm root in that country, and only to require to be carefully tended to insure ultimate success.

The development which has recently taken place in the export of Indian and Ceylon Tea from Great Britain, is perhaps not fully appreciated, and it may be well to draw attention to the fact that during the past five months, 3,220,710 lbs. were re-exported against only 1,514,413 lbs. in the corresponding period of 1891.

This outlet may eventually afford considerable relief to a market likely to be heavily supplied in the near future.

INDIAN. There is a general disinclination on the part of buyers to operate, and the market has consequently been on the decline except for "stand out" Teas. 2,627 packages of New Season's Tea were brought forward and sold at rates nearly a penny below last week. Poorer quality was noticeable in many invoices. The following averages are worthy of note:—"Mim Co.," 1/5½; "Assam Tea Co.," 1/2; "Balasun Co.," 1/1¼; "Turzum," 1/1¼; "Dilaram," 1/0½.

Weekly average of New Season's Tea sold on Garden Account, 1892, 2627 pkgs. av. 10. 1891, 1261 pkgs. av. 10½d.

								TRAVANCORE	252 p 7¾

Comparative prices of Indian Tea in London:—

ST.	(Fair ordinary, dark liquor)	1892,	1891,	1890,	1889,
ANNINGS.	(Red to brown, strong rough liquor)	3½d.	6d.	6¼d.	4¼d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	4½d.	7d.	6¾d.	4½d.
K. SOUG.	(Blackish greyish, useful liquor)	6d.	8½d.	8d.	5½d.
KOE.	(Blackish greyish, inferior liquor)	6¾d.	8¾d.	9d.	8d.
K. SOUG.	(Greyish to blackish some tip, useful liquor)	9¼d.	10¼d.	10½d.	9d.
KOE.	(Blackish greyish, inferior liquor)	5d.	7¾d.	8¼d.	5¾d.
K. SOUG.	(Blackish, greyish, some tip, inferior liquor)	6¾d.	8¾d.	9¼d.	6¾d.

CEYLON. Buyers could only be induced to purchase at a general reduction of a halfpenny to a penny per lb., and bidding flagged throughout the auctions. Medium Pekoes and Broken Pekoes were the most. In Thursday's small sale, slightly more disposition to operate was noticeable. The following averages may be mentioned:—"Ormidale," 1/2½; "Labukelle" and "Norwood" of the R&E Co., 1/0¼; and "New Dimbula D," 1/-. Average for week, 8½d.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	1890,	1889,
KOE SOUG. (Ordinary leaf; fair liquor)	5¾d.	8d.	9d.	6¼d.
KOE (Ordinary leaf, little twist; fair liquor)	8d.	9d.	10½d.	7½d.
KOE SOUG. (Rather bold leaf; indifferent liquor)	4¾d.	7¾d.	8½d.	5½d.
KOE (Somewhat bold leaf; indifferent liquor)	5½d.	8¼d.	9½d.	6¼d.

JAVA. Auctions were small and comprised selections from only two estates. Lower grade Teas were the most, and averages in consequence appear low.

NATAL. A small catalogue was brought forward comprising 118 packages.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3½. Colombo 1/3½.

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

July 1st, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	31,000 packages.	89,541 packages.	9,433 packages.
1892-1893.	28,165 "	63,300 "	4,901 "

During the week

5,162 packages	INDIAN
14,873 "	CEYLON
2,257 "	JAVA

Total 22,292 packages have been offered in public auction.

During the past few weeks the Tea market generally has been in a quiescent condition.

With the General Election so close upon us, and at a time like the end of the half year, it is natural that buyers should be inclined to minimise their stock of Tea. It is therefore not surprising that bidding during the last week or two should have been slack, and that the disposition generally manifested should have been towards extreme caution. It is, however, worthy of note that the value to be obtained in many kinds of tea at present prices is exceptional, and when the attention of the trade can be brought to bear upon the subject, there is little doubt that this fact will be fully recognised, and that more extensive buying will be the natural outcome.

At present low prices, the export trade continues fairly active, and the favourable opportunity afforded for the development of external markets has not been lost. There is little doubt but that the result of recent operations will be to encourage the use of Indian and Ceylon Tea in partially developed markets, in the not far distant future.

INDIANS. There is not much to notice except the continuance of last week's depressed prices. Wherever special quality could be discerned, bidding became more spirited and good quotations were obtained, but for poor liquoring Teas buyers were still inclined to bid with little or no animation.

Weekly average of New Season's Tea sold on Garden Account, 1892, 3747 pkgs. av. 9. 1891, 392 pkgs. av. 10½d.

Comparative prices of Indian Tea in London:—

	1892.	1891.	1890.	1889.
DUST. (Fair ordinary, dark liquor)	3½d.	6d.	6¼d.	4¼d.
FANNINGS. (Red to brown, strong rough liquor)	4½d.	7d.	6¾d.	4½d.
BROKEN TEA. (Brownish to blackish, strong liquor)	6d.	8½d.	8d.	5¼d.
PEK. SOUG. (Blackish greyish, useful liquor)	6¾d.	8¾d.	9d.	8d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	10¼d.	10½d.	9d.
PEK. SOUG. (Blackish greyish, inferior liquor)	5d.	7¾d.	8¼d.	5¾d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	6¾d.	8¾d.	9¼d.	6½d.

CEYLONS. Auctions this week were smaller than last, only 14,873 packages being brought forward, against 21,490 last week. The result was a fairly steady market with slightly more disposition to take advantage of current low rates. The lowest grades appeared to be wanted for price, and all really good liquoring descriptions with special flavour and quality met with marked attention. Average for week, 8¼d.

Comparative prices of Ceylon Tea in London:—

	1892.	1891.	1890.	1889.
PEKOE SOUG. (Ordinary leaf; fair liquor)	5½d.	8d.	9d.	6½d.
PEKOE (Ordinary leaf, little twist; fair liquor)	7¾d.	9d.	10½d.	7¾d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	4¾d.	7½d.	8½d.	5¾d.
PEKOE (Somewhat bold leaf; indifferent liquor)	5½d.	8½d.	9¼d.	6½d.

JAVA. These were well represented, 2257 packages being brought forward, against 655 last week. Competition was good, more especially from the export demand, and the Teas were mostly sold at rates about on a par with those ruling last week. A few parcels of re-purchases in Holland were also included in the Catalogue. 1351 packages are advertised for next week.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3½. Colombo 1/3½

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE. LONDON, E.C.

July 8th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
During the week 1891-1892.	45,338 packages.	103,309 packages.	9,433 packages.
1892-1893.	33,725 "	78,560 "	6,252 "
4,959 packages INDIAN	Total 21,468 packages have been offered in public auction.		
5,158 " CEYLON			
1,351 " JAVA			

This week has been devoted to the General Election, throughout the Kingdom as well as in the Metropolis itself. Business has therefore been restricted, and the Tea trade has participated in the predominant slackness.

The arrival of the first steamer with New Season's China Tea failed to enliven the market, and contracts were only effected with difficulty. The quality of Teas so far arrived may be judged by the low prices obtained, ranging from under 6d. to about 1/3 per lb., although in an exceptional case about 2/- is reported to have been paid. It seems unlikely that the New China Crop will prove a formidable rival to British Grown Tea.

Figures for the month of June again show a marked reduction in deliveries of China Tea. **INDIAN.** The small auctions passed without material change in quotations, the tendency being towards rather lower rates except for specially attractive parcels. A small lot of Orange Pekoe from the Assam Frontier Tea Co. sold at 2/6 $\frac{1}{4}$ per lb.

Weekly average of New Season's Tea sold on Garden Account, 1892, 2658 pkgs. av. 10. 1891, 7660 pkgs. av. 9 $\frac{1}{4}$ d.

Comparative prices of Indian Tea in London:—

	1892.	1891,	6d.	1890,	1889,
ST. (Fair ordinary, dark liquor)	3 $\frac{1}{2}$ d.	7d.	8d.	6 $\frac{1}{4}$ d.	4 $\frac{1}{2}$ d.
ANNINGS. (Red to brown, strong rough liquor)	4 $\frac{1}{4}$ d.	7d.	8d.	6 $\frac{3}{4}$ d.	4 $\frac{3}{4}$ d.
BROKEN TEA. (Brownish to blackish, strong liquor)	5 $\frac{3}{4}$ d.	8d.	9d.	8d.	5 $\frac{1}{2}$ d.
PEK. SOUG. (Blackish greyish, useful liquor)	6 $\frac{1}{2}$ d.	8 $\frac{1}{2}$ d.	9d.	9d.	8 $\frac{1}{2}$ d.
PEKOE. (Greyish to blackish some tip, useful liquor)	8 $\frac{3}{4}$ d.	9 $\frac{3}{4}$ d.	10 $\frac{1}{2}$ d.	10 $\frac{1}{2}$ d.	9 $\frac{1}{2}$ d.
PEK. SOUG. (Blackish greyish, inferior liquor)	4 $\frac{3}{4}$ d.	7 $\frac{1}{2}$ d.	8 $\frac{1}{4}$ d.	8 $\frac{1}{4}$ d.	6d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	6 $\frac{1}{2}$ d.	8 $\frac{1}{4}$ d.	9 $\frac{1}{4}$ d.	9 $\frac{1}{4}$ d.	6 $\frac{3}{4}$ d.

CEYLON. Now that the New China Teas have been tasted and found so far to be of only different quality, buyers who waited to examine these before increasing stock may be more inclined to operate in Ceylons. Auctions about equalled in quantity those of last week. Prices remain about the same with some slackness in the bidding. Quality is not quite up to that of arrivals some weeks back. Average for week, 8 $\frac{1}{4}$ d.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	8d.	1890,	1889,
PEKOE SOUG. (Ordinary leaf; fair liquor)	5 $\frac{1}{2}$ d.	8d.	8 $\frac{3}{4}$ d.	8 $\frac{3}{4}$ d.	6 $\frac{3}{4}$ d.
PEKOE (Ordinary leaf, little twist; fair liquor)	7 $\frac{3}{4}$ d.	9d.	10d.	10d.	8 $\frac{1}{2}$ d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	4 $\frac{3}{4}$ d.	7 $\frac{1}{2}$ d.	8 $\frac{1}{4}$ d.	8 $\frac{1}{4}$ d.	6d.
PEKOE (Somewhat bold leaf; indifferent liquor)	5 $\frac{1}{2}$ d.	8 $\frac{1}{4}$ d.	9d.	9d.	6 $\frac{3}{4}$ d.

JAVA. The 1351 packages offered met with fair attention and sold generally with good competition at steady prices. A parcel of White Tipped Pekoe from the "Jasinga Estate" sold at 1/3 per lb.

The progress of the General Election has continued to engross the attention of the trade and Country at large. The demand has been of a hand-to-mouth description, the trade only buying immediate or urgent requirements; hence the small supplies brought forward proved ample.

The remarkable displacement of China Tea by Indian and Ceylon growths indicated in the following figures shows the continued popularity of British grown Tea in this country. It must be remembered that the price of China Tea during the periods named declined proportionately to that of Indian and Ceylon Tea.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st Jan. to 30th June.		1889.	per centages.	1890.	per centages.	1891.	per centages.	1892.	per centages.

INDIAN. The feature of the week has been the increased attention given to good and useful liquoring parcels of all grades. On the other hand poor liquoring parcels have failed to attract attention notwithstanding that prices have shown a cheapening tendency. The quality generally is disappointing, as the first few invoices of the season placed on the market gave promise of better teas to come; telegraphic advices received this week from Calcutta, however, intimate an improvement in the quality of the Teas arriving there from the gardens.

Weekly average of New Season's Tea sold on Garden Account, 1892, 2112 pkgs. av. 8½. 1891, 8021 pkgs. av. 8¾d.

TEA	(Description)	1892,	1891,	1890,	1889,
DUST.	(Fair ordinary, dark liquor)	3½d.	6d.	6¼d.	4½d.
ANNINGS.	(Red to brown, strong rough liquor)	4¼d.	7d.	6¾d.	4¾d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	5¾d.	8d.	8d.	5½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	6¾d.	8½d.	9d.	8½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	9¼d.	9¾d.	10½d.	9¾d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	4¾d.	7¼d.	8¼d.	6d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	6½d.	8½d.	9¼d.	6¾d.

CEYLON. Importers have wisely refrained from pressing supplies forward at a time when buyers have not been operating with freedom. Prices current last week have consequently been maintained, and the slackness in the bidding then noticeable has to a large extent disappeared. The quality of the Teas, though not good, is quite up to that usually received at this time of the year; it is certainly better than it was at this period three years ago, when it will be remembered quotations ruled nearly as low as at present, the average then being about 8¾d., against the present average of 8¼d. Latest mail news from Ceylon notifies that rain was much wanted in many parts. The "total crop" estimate is reduced to 72 millions for this country, of which about 34 had been shipped up to 20th June. The June shipments to this country are stated by wire to have been about 7 millions, and are estimated as but little over 6 millions for this month.

TEA	(Description)	1892,	1891,	1890,	1889,
PEKOE SOUG.	(Ordinary leaf; fair liquor)	5¾d.	7¾d.	8¾d.	7¼d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	7¾d.	9d.	10d.	9¼d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	4¾d.	7¼d.	8¼d.	6¾d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	5½d.	8d.	9d.	7¼d.

JAVA. The offerings were mostly from the "Bagalen" Estate. The "Perbawattee," "Tjogreg" and "Tjiboengoer" gardens were represented by strong useful liquoring Teas. These met with good competition.

INDIAN. Average 8½d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices may thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE. LONDON, E.C.

July 22nd, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
During the week 1891-1892.	69,349 packages.	138,150 packages.	11,282 packages.
1892-1893.	48,725 "	111,349 "	8,328 "
9,429 packages INDIAN	Total 31,755 packages have been offered in public auction.		
21,561 " CEYLON			
765 " JAVA			

On the whole, considering the larger quantities (than a week previously) that have been placed on the market, prices have remained fairly steady. The general feature which it is desirable to keep in view at the present time is the satisfactory development of American and Continental demand.

For the six months to June 30th, 1892, the quantities of India, Ceylon and China Teas, exported from Great Britain, have increased at the following percentage rates:—

Indian	63½ per cent.
Ceylon	105 " "
China	12 " "

This indicates that the expansion in foreign consumption of British Grown Teas continues at a most remarkable rate, as shown by the following figures:—

Exports of Indian and Ceylon Tea from Great Britain during June were Indian, lbs. 184,553, Ceylon, lbs. 303,885; against Indian, lbs. 221,132, Ceylon, lbs. 316,682 in June last year.

Quantity of Tea exported from Great Britain, from 1st January to 30th June, and comparison with former years have been as under.

	1889.	1890.	1891.	1892.
Indian	Included with China.	1,443,994	1,203,088	1,967,742

INDIAN. Thin and poor liquoring parcels, which this week have been in large supply, met with a slow demand and prices show in some cases a further shrinkage though not to a quotable extent; strong and fine Teas have been wanted but are scarce. On the day the largest business of the week was transacted, some four or five parcels sold from 2/6 to 3/- per lb.

Weekly average of New Season's Tea sold on Garden Account, 1892, 4931 pkgs. av. 10. 1891, 7341 pkgs. av. 9½d.

PEKOE.	(Blackish, greyish, some tip, inferior liquor)	" 6½d.	" 8d.	" 9d.	" 7d.

CEYLON. The larger sale on Tuesday attracted attention and bidding was brisker than for the two or three weeks back, prices though showing no actual advance, ruled with firmness. A quantity of the finer lines, however, realized advanced rates. The business of the week has been 21,561 packages against 11,228 for the previous week. Towards the end of the week the better tone again disappeared and the market closes weak—the average price being but little more than 8d. per lb., a fractional decline on last week.

PEKOE SOUG.	(Ordinary leaf; fair liquor)	1892, 5½d.	1891, 7½d.	1890, 8¾d.	1889, 7½d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	" 7½d.	" 8½d.	" 10d.	" 9½d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	" 4¾d.	" 7d.	" 8¼d.	" 6¾d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	" 5½d.	" 7¾d.	" 9d.	" 7½d.

JAVA. The smaller quantity offered this week was disposed of at rates lately current, values being maintained by the shipping demand. Amongst the "Ardja Sarie" Teas was a parcel of White Tipped Pekoe which sold at 1/1.

our circular of 8th inst., please correct the stock figures as follows:—Indian, 1890, 19,316,934; 1891, 21,462,453. Ceylon, 1890, 9,669,810; 1891, 15,974,504. Java, 1890, 1,058,960; 1891, 1,018,080. China, etc., 1890, 34,396,167; 1891, 22,912,938. Total, 1890, 64,441,871; 1891, 61,367,075.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3⁵/₁₀. Colombo 1/3⁵/₁₀.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Broker

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

July 29th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	1891-1892.	Indian.	Ceylon.	Java.
During the week	1892-1893.	77,090 packages.	153,377 packages.	13,185 packages.
12,040 packages	INDIAN	60,765	138,621	9,576
27,272	CEYLON	Total 40,560 packages have been offered in public auction.		
1,248	JAVA			

Supplies of New Season's Indian Tea are now coming in more freely, but sales from 1st June to date are still considerably behind last year. This feature is also noticeable in the supplies of Ceylon Tea. There has been a fair demand for all descriptions, fine Teas being especially in request. The late drooping tendency in the prices of lower class Teas has continued.

INDIAN. Demand this week has run principally on dark liquoring Teas and Fine parcels, and for these prices show a further improvement. On the other hand, thin weak liquoring Teas are neglected, and a further concession in price has had occasionally to be made to induce business. Many second and third invoices of Assam and Dooars Teas show a considerable improvement in quality. Thursday's auctions commence again in August.

Weekly average of New Season's Tea sold on Garden Account, 1892, 7675 pkgs. av. 9½. 1891, 5175 pkgs. av. 9¼d.

Comparative prices of Indian Tea in London:—

	(Fair ordinary, dark liquor)	1892.	1891.	1890.	1889.
PEKOE.	(Red to brown, strong rough liquor)	3½d.	5¼d.	6¼d.	4½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	5¼d.	7½d.	8d.	6d.
PEKOE SOUG.	(Blackish greyish, useful liquor)	6½d.	8¼d.	9d.	8½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	9d.	9½d.	10¼d.	10d.
PEKOE SOUG.	(Blackish greyish, inferior liquor)	4½d.	7d.	8d.	6½d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	6¼d.	8d.	9d.	7½d.

CEYLON. At the exceptionally low range of rates current buyers have been tempted to operate pretty freely in the larger quantity placed before them, and last week's quotations have been maintained for all but Pekoe Teas from 6d. to 9d. These show a quotable fall of from ½d. to 1d. per lb., which is doubtless attributable to an even more pronounced fall in the price of China Teas at about the same figure. Ceylon medium Teas are now offering such extraordinary value that they cannot fail to open up more new outlets in quarters where China Tea has now the monopoly. A demand would thus be created which in turn should beneficially affect prices. As regards quality,—an improvement is apparent in many instances, noticeably in Teas from the Kelani Valley; as an instance we may mention an invoice sold this week from the "Degalessa" Estate, the Broken Pekoe of which realised as much as 1/10 against 1/0½ for the same grade in the preceding invoice, and an average of 9d. was obtained against 7¼d. The Ceylon Teas sold during the week averaged 8d. per lb.

Comparative prices of Ceylon Tea in London:—

	(Ordinary leaf; fair liquor)	1892.	1891.	1890.	1889.
PEKOE SOUG.	(Ordinary leaf, little twist; fair liquor)	5¼d.	7½d.	8¾d.	7¾d.
PEKOE	(Rather bold leaf; indifferent liquor)	7d.	8¾d.	9¾d.	9¾d.
PEKOE SOUG.	(Somewhat bold leaf; indifferent liquor)	4½d.	6¾d.	8¼d.	7d.
PEKOE		5¼d.	7½d.	9d.	7¾d.

JAVA. The Java Teas were for the most part of a very useful description and attracted attention from the trade; the prices obtained in some cases showed an improvement on those lately current.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3½. Colombo 1/3½.

LOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

August 5th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
During the week 1891-1892.	83,766 packages.	157,500 packages.	13,185 packages.
1892-1893.	66,617 "	140,100 "	10,320 "
352 packages INDIAN	Total 8,075 packages have been offered in public auction.		
479 " CEYLON			
744 " JAVA			

Owing to the Bank Holiday, sales have been unimportant and on too small a scale to accurately gauge the course of the market.

The statistical position at the close of last month exhibits many interesting features. Taking "supply" figures;—Indian Imports for the first two months of the season show only half a million increase over those of last year, whilst the exports from Calcutta for the season to date, as raised by wire, show an actual decrease, the exact figures being 18,080,000 lbs., against 18,830,000 lbs.

The Ceylon Imports last month were practically the same as in July, 1891, and the shipments from Colombo are advised as only a trifle over six millions, being half a million less than in July last year. Since the 1st January, the increase in the imports of Ceylon Tea is about 4½ millions compared with the first seven months of last year. As the supplies for the United Kingdom for the current year were estimated to show an increase of 14 millions over those of 1891, some normally large imports will have to be received during the remaining five months of the year if this is to be reached. There is, however, but little probability of the estimated figures being attained, and buyers may in consequence gain confidence.

China Imports show a decrease which is warranted by the further contracted use of this article. As regards consumption, Indian figures show satisfactory increases, while the deliveries of Ceylon Tea during July were the largest on record.

Referring to stocks, it is a curious fact that the total amount of Tea lying at the bonded warehouses is now smaller than it has been at the end of July for seven years.

INDIAN. A small sale was held yesterday and comprised many useful liquoring and fine parcels; the quality generally shows signs of improvement. Demand was fairly strong and late prices were maintained all through the sale. Two parcels from the Assam Frontier Co.'s Estates sold at 2/1¼ and 2/6¼ respectively, whilst for a small parcel from the "Budla Beta" Estate as high as 3/3½ was offered.

Weekly average of New Season's Tea sold on Garden Account, 1892, 4485 pkgs. av. 11. 1891, 4830 pkgs. av. 9¼d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; 1/2 c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

August 10th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
During the week 1891-1892.	121,205 packages.	204,698 packages.	14,751 packages.
1892-1893.	116,636 "	190,924 "	11,080 "

629 packages INDIAN }
 612 " CEYLON } Total 55,241 packages have been offered in public auction.
 " JAVA }

The better demand noticed last week has continued, resulting in active bidding throughout the week and consequent hardening of prices generally.

Quantity of Tea exported from Great Britain, from 1st January to 31st July.

	1889.	1890.	1891.	1892.
Indian ...	Included with China.	1,540,739	1,405,522	2,136,877

China, etc.	20,338,366	18,173,396	14,447,087	15,772,409

INDIAN. Auctions were about equal in quantity to those of last week. Prices were fully maintained, medium grades with desirable liquor being if anything slightly dearer. Assam and Darjeeling continue to be represented by invoices of good quality, and high prices have occasionally been obtained. Amongst the Darjeelings the following averages may be mentioned:—"Ting Ling," 2/2³/₄; "Balasun Co.," 2/2³/₄; and "Tukvar Tea Co.," 1/6¹/₄. The best prices from Assam were obtained by the following marks:—"Hukanpukri" and "Jamira" of the "Jokai Co.," 1/10¹/₄; "Dorella T Co.," 1/6³/₄; "Bamgaon," 1/5; and "Samdang" of "Doom Dooma T Co.," 1/4¹/₄.

AVANCORE. Offerings comprised only a small selection, the highest average being made by the Wallardie Estate, which brought 10¹/₄d. for 25 packages; the Bon Ami Estate with 273, realized 10¹/₄d. A fair quantity is catalogued from this district for next week.

Weekly average of New Season's Tea sold on Garden Account, 1892, 15,386 pkgs. av. 10³/₄. 1891, 11,650 pkgs. av. 10¹/₄d.

Comparative prices of Indian Tea in London:—

	(Fair ordinary, dark liquor)	1892.	1891.	1890.	1889.
ASSAM.	(Red to brown, strong rough liquor)	3 ¹ / ₂ d.	5 ¹ / ₂ d.	6 ¹ / ₄ d.	4 ¹ / ₂ d.
DARJEELING.	(Brownish to blackish, strong liquor)	3 ¹ / ₂ d.	6 ³ / ₄ d.	8d.	5 ³ / ₄ d.
CHOTA NAGPORE.	(Blackish greyish, useful liquor)	6 ¹ / ₂ d.	8 ¹ / ₂ d.	8 ³ / ₄ d.	8 ¹ / ₂ d.
DARJEELING.	(Greyish to blackish some tip, useful liquor)	9d.	10d.	10 ¹ / ₄ d.	10 ¹ / ₂ d.
CHOTA NAGPORE.	(Blackish greyish, inferior liquor)	4 ³ / ₄ d.	6 ³ / ₄ d.	7d.	5 ³ / ₄ d.
DARJEELING.	(Blackish, greyish, some tip, inferior liquor)	6 ¹ / ₂ d.	7 ³ / ₄ d.	7 ³ / ₄ d.	6 ³ / ₄ d.

CEYLON. The week's auctions aggregated 29,612 packages, a total which has never previously been reached. Tuesday's sale of 24,966 packages was the largest ever held in one day, and comprised 895 breaks, lasting for six hours. Notwithstanding the heavy supply, the market was not over-weighed and bidding was animated and general. All grades must be quoted very firm, poorer descriptions alone showing little or no disposition to improve in price. Useful liquoring Teas show an advance of a farthing to a halfpenny, and in some cases where special character is noticeable the advance has been greater. The following averages may be mentioned:—"OBEC Glendevon," 1/2; "Edinburgh" and "PDM," 1/0³/₄; "Waverley" of "CTP Co." and "Katookella," 1/0¹/₂.

Average for week, 8¹/₂d.

CHOTA NAGPORE.	(Ordinary leaf; fair liquor)	1892, 6d.	1891, 7 ¹ / ₄ d.	1890, 8 ³ / ₄ d.	1889, 8 ³ / ₄ d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

August 26th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	146,476 packages.	223,207 packages.	17,014 packages.
1892-1893.	143,431 ..	213,787 ..	13,658 ..

During the week

6,795 packages	INDIAN
4,863 ..	CEYLON
578 ..	JAVA

Total 52,236 packages have been offered in public auction.

It is satisfactory to be able to report that the Indian Tea industry seems at length in a fair way to be adequately represented at the World's Fair in Chicago. The Special Commissioner appointed by the Government of India and the Tea Planters, left England this week for America.

The figures below show the exports of Indian and Ceylon Tea from Great Britain to the United States of America during the first six months of 1890, 1891 and 1892. Although the high prices ruling in the first six months of 1891 somewhat checked exports from Great Britain, the low rates of the present year have acted as a stimulus to the trade.

	1890.	1891.	1892.
Indian ..	lbs. 426,191	lbs. 142,802	lbs. 357,159
Ceylon 189,639	.. 155,999	.. 465,704

INDIAN. 26,795 packages were brought forward this week against 25,629 last week. Competition ran mainly upon the better grades of Tea, especially those where the liquors stood out from amongst the rest on account of strength or flavour. Medium and poor liquoring kinds were not in quite so much demand, and prices ruled with some slight irregularity, undesirable kinds being so somewhat neglected, and fractionally easier. Several invoices from Assam and Darjeeling have sold at good rates and the quality from these districts continues satisfactory.

Weekly average of New Season's Tea sold on Garden Account, 1892, 19,000 pkgs. av. 11. 1891, 14,885 pkgs. av. 10½d.

MANNINGS. (Red to brown, strong rough liquor)	..	5d.	..	8¼d.	..	8d.	..	5¾d.
BROKEN TEA. (Brownish to blackish, strong liquor)	..	6½d.	..	8½d.	..	8¾d.	..	8½d.
PEK. SOUG. (Blackish greyish, useful liquor)	..	9d.	..	10d.	..	10¼d.	..	10½d.
PEKOE. (Greyish to blackish some tip, useful liquor)	..	4¾d.	..	6¾d.	..	7¼d.	..	5¾d.
PEK. SOUG. (Blackish greyish, inferior liquor)	..	6¼d.	..	7¾d.	..	8d.	..	6¾d.

CEYLON. Auctions this week were considerably lighter, aggregating 22863 packages against 4612 last week. The quality continues very fair taken as a whole, although there are not many voices which stand out from the remainder on account of special point and labour. The market is not materially changed; good Teas are however in most demand and slightly dearer, while poor liquoring descriptions are less enquired for, and have sold occasionally with some little irregularity. Amongst low grown Teas a specially fine invoice from the "Degalessa" Estate of the Kelani Valley Tea Association deserves notice. Exports to the United Kingdom for August are estimated at 1½ million pounds.

Average for week, 8½d.

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892,	6d.	1891,	7d.	1890,	8¾d.	1889,	9d.
PEKOE (Ordinary leaf, little twist; fair liquor)	..	7¾d.	..	8½d.	..	9¾d.	..	11¾d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	..	5d.	..	6½d.	..	8¼d.	..	8d.
PEKOE (Somewhat bold leaf; indifferent liquor)	..	6d.	..	7¼d.	..	9d.	..	9½d.

JAVA. 2578 packages were brought forward and met with fair competition mainly for the export trade, prices being about on a par with those recently ruling.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/27. Colombo 1/27.

In our Circular, week ending 12th inst., "Tondoo" Pekoe should have read 11¼d., and the average 11¼d.

INDIAN. Average 11d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Broker

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE. LONDON, E.C.

September 2nd, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	181,144 packages.	243,483 packages.	17,913 packages.
1892-1893.	170,770 "	235,301 "	13,698 "

During the week

339 packages	INDIAN
514 "	CEYLON
40 "	JAVA

Total 48,893 packages have been offered in public auction.

The increase in the season's crop of Indian and Ceylon Tea is likely to be less than was at one time expected, and the anticipated danger of over-supply appears to have been averted.

The great displacement of China by British-Grown Tea—so conspicuous this year, is not likely to necessitate a still more general use of the latter growths, a probability emphasized by the satisfactory deliveries during August.

INDIAN. The week's selection again included a good proportion of fine Teas from Assam and Darjeeling. These continue to attract attention and realize high prices. Generally speaking, the market remains unchanged with good competition. The following averages are worthy of note:—"Jamira" of the Jokai T Co., 1/9; "Darjeeling Co.," 1/8½; and "Poobong," 1/7½.

Weekly average of New Season's Tea sold on Garden Account, 1892, 17,964 pkgs. av. 11¼. 1891, 20,867 pkgs. av. 11d.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

September 9th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	211,814 packages.	258,381 packages.	18,561 packages.
1892-1893.	202,542 "	256,348 "	13,698 "

During the week

772 packages INDIAN
 2047 " CEYLON
 " JAVA
 Total 52,819 packages have been offered in public auction.

Deliveries of Indian and Ceylon Tea since the 1st June show $4\frac{1}{2}$ million pounds increase over same period last season, and China Teas a decrease of about $5\frac{3}{4}$ million pounds.

INDIAN. Auctions have been rather heavier and have passed generally with fair spirit at last week's rates, the chief alteration being a slight hardening in quotations of the lower grades of useful liquoring Teas and some weakness in tippy Teas over 1/- where the liquors were not specially attractive. Quality from Assam and Darjeeling continues excellent and some good Teas have also been offered from "Cachar" and "Sylhet."

Weekly average of New Season's Tea sold on Garden Account, 1892, 22,948 pkgs. av. 11 $\frac{1}{4}$. 1891, 21,663 pkgs. av. 10d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests, p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Broker

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

September 16th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	244,416 packages.	271,013 packages.	20,757 packages.
1892-1893.	231,129 "	272,315 "	13,698 "

During the week

2713 packages INDIAN
 18967 " CEYLON
 " JAVA

Total 44,680 packages have been offered in public auction.

Since the 1st January, a remarkable expansion has taken place in the use of Indian and Ceylon tea, both at home and abroad, while the home trade in China Tea has fallen to only *seventeen per cent.* of the total consumption. It will be seen by the following figures that the entire Home consumption has increased nearly four million pounds; hence, as it now appears very unlikely that supplies from India and Ceylon will exceed requirements, it is not surprising that the market should be improved for those grades which supply the bulk of the home demand.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st Jan. to 31st Aug.

	1889.	per centages.	1890.	per centages.	1891.	per centages.	1892.	per centages.

China, etc.	23,420,824	20,822,005	17,504,103	18,993,884

318,356 lbs. of Indian and 257,494 lbs. of Ceylon Tea were exported from Great Britain during August.

INDIAN. The hardening in price of the lower grades, noted last week, has now developed into positive advance, ranging frequently up to a halfpenny per lb., and in some instances even more. Cheap Teas over 1/-, without point in liquor, are less enquired for.

Weekly average of New Season's Tea sold on Garden Account, 1892, 19,465 pkgs. av. 11. 1891, 23,435 pkgs. av. 9½d.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

September 23rd, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	282,310 packages.	285,652 packages.	21,800 packages.
1892-1893.	259,648 "	287,344 "	14,749 "

During the week

519 packages	INDIAN
29 "	CEYLON
51 "	JAVA

Total 44,599 packages have been offered in public auction.

The sharp advance which has been in progress during the last ten days commenced with the demand usual in the autumn, and which this year has come before the arrival of heavy supplies in India.

The belief that the Indian Tea crop is not now likely to exceed last year's, and that Ceylon only show a moderate increase, has allayed fears caused by over sanguine estimates made earlier in the season.

These circumstances, taken in conjunction with the more general use of Indian and Ceylon tea, both at home and abroad,—so marked during the present year—have influenced buyers, and later confidence has naturally followed, resulting in the higher scale of prices now current. It must not however be forgotten that arrivals from India in October and November are always heavy, and there is no apparent reason why they should not be so this season.

INDIAN. The advance in price of the lower grades referred to last week has been intensified, and prices for Teas under 9d. per lb. must now be quoted fully 1d. to 1½d. above the lowest point. For other descriptions bidding continues firm and competition good. Latest advices from Calcutta estimate that the season's crop will be only about 108 million pounds. The following averages are worthy of note:—"Jamira," of the Jokai T Co., 1/11½; "Margaret's Hope," 1/6¼; "Gabroo Arabot," of the Assam Co., 1/5; and "Tiok," 1/4½.

Weekly average of New Season's Tea sold on Garden Account, 1892, 17,505 pkgs. av. 11. 1891, 28,151 pkgs. av. 9½d.

Comparative prices of Indian Tea in London:—

	1892,	1891,	1890,	1889,
DUST. (Fair ordinary, dark liquor)	3½d.	5½d.	6¼d.	4¾d.
FANNINGS. (Red to brown, strong rough liquor)	4½d.	6½d.	7d.	5½d.
BROKEN TEA. (Brownish to blackish, strong liquor)	6d.	8½d.	8½d.	6½d.
PEK. SOUG. (Blackish greyish, useful liquor)	7½d.	8½d.	8¾d.	9½d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9½d.	10d.	9¾d.	10¾d.
PEK. SOUG. (Blackish greyish, inferior liquor)	5¾d.	7d.	7¾d.	5½d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7¼d.	7¾d.	8½d.	7½d.

CEYLON. Competition for all grades has been very keen, and an almost general advance has taken place, Teas under 9d. per lb. being most affected and showing a rise of about ½d. to 1d. upon last week's rates. The following averages may be mentioned:—"Ormidale," 1/8½; "Waverley" of the CTP Co., 1/1¾; "Kandapolla," 1/1½; and "Mooloya," 1/1¼. The average for the week is 9¾d., being the same as for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	1890,	1889,
PEKOE SOUG. (Ordinary leaf; fair liquor)	7d.	7¼d.	10d.	10¼d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8½d.	9¼d.	11d.	1/0¾
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	5¾d.	6¾d.	9½d.	9¼d.
PEKOE (Somewhat bold leaf; indifferent liquor)	7d.	7¾d.	10½d.	11½d.

JAVA. This grade was well supported and showed some advance, in sympathy with Indians and Ceylons, competition being good and prices somewhat dearer.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2½. Colombo 1/2½

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices may thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Broken

3, ROOD LANE, LONDON, E.C. September 30th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON
 FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	310,897 packages.	301,035 packages.	21,800 packages.
1892-1893.	296,120 "	306,053 "	16,484 "

During the week

472 packages	INDIAN	} Total 56,916 packages have been offered in public auction.
709 "	CEYLON	
735 "	JAVA	

Supplies from India are now commencing to arrive in quantity. The landing of several cargoes during the last few days has induced importers to catalogue freely, 46,176 packages already being offered for next week. Buyers are in consequence taking a calmer view of the future, and, anticipating a more ample selection, are acting with caution.

INDIAN. Last week's prices were fully maintained in Monday's auction, but the large catalogues which were issued during the week induced operators to bid less eagerly on Wednesday and Thursday, when a portion of the late advance in price was consequently lost, some parcels selling regularly and occasionally at a fractional decline. Quality from Assam and Darjeeling continues satisfactory. Cachar and Sylhet are showing further signs of improvement, Dooars continuing to send a very useful selection. The heaviest auction yet held, viz., 23,931 packages, is advertised for next Monday. The following averages are worthy of note:—"Samdang," of the Doom Dooma Co., 1/11; "Turzum," 1/6; "Eastern Assam Co.," 1/4³/₄; "Jamira," of the Jokai T Co., 1/4³/₄; and "Noahbarrie," 1/3¹/₄.

Weekly average of New Season's Tea sold on Garden Account, 1892, 21,816 pkgs. av. 11. 1891, 20,786 pkgs. av. 9¹/₄d.

CEYLON. Very strong competition was maintained for all grades throughout Tuesday's auction and here and there a slight advance was recorded. Thursday's sale met with good attention at about similar prices, bidding continuing animated and general. With reduced supplies, quality in shows improvement. Exports to Great Britain during September are telegraphed as 3,700,000, against lbs. 4,011,000 the same month last year. The following averages may be mentioned:—"Norwood," of the E.P.&E.Co., 1/3; "Waverley," of the C.T.P.Co., 1/2¹/₄; "Mooloya," 1/1¹/₂; "Gartmore," 1/1¹/₄; "New Dimbula, D.," 1/1. The average for the week is 10d., being the same as for the corresponding week last year.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

October 7th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	349,240 packages.	317,708 packages.	22,015 packages.
1892-1893.	348,475 "	318,658 "	17,208 "

During the week

355 packages	INDIAN
605 "	CEYLON
724 "	JAVA

Total 65,684 packages have been offered in public auction.

September figures show heavier deliveries of Indian and Ceylon Tea, the latter being in excess of previously recorded. Since the first of June deliveries of both growths exceeded the imports. While only *nineteen million lbs.* of China Tea were delivered, against *thirty-one-million lbs.* imported.

INDIAN. This week's Indian sale was larger than any previously held. The market was somewhat irregular, and a decline of a halfpenny to a penny per lb. from the highest point must now be quoted.

Weekly average of New Season's Tea sold on Garden Account, 1892, 32,163 pkgs. av. 11. 1891, 27,079 pkgs. av. 9½d.

Comparative prices of Indian Tea in London:—

	1892,	1891,	1890,	1889,
DUST. (Fair ordinary, dark liquor)	3¾d.	5d.	6d.	4¾d.
FANNINGS. (Red to brown, strong rough liquor)	4¾d.	6d.	6½d.	5¾d.
BROKEN TEA. (Brownish to blackish, strong liquor)	6d.	7¾d.	8d.	7¼d.
PEK. SOUG. (Blackish greyish, useful liquor)	7¼d.	8d.	8½d.	9½d.
PEKOE. (Greyish to blackish some tip, useful liquor)	8¾d.	9½d.	9½d.	10½d.
PEK. SOUG. (Blackish greyish, inferior liquor)	5½d.	6¼d.	7½d.	6¾d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7¼d.	7d.	8½d.	8½d.

CEYLON. With small visible supplies in the near future, and present deliveries considerably exceeding imports, it was natural that competition should have been very keen. Prices were very strong and many Teas showed a further advance upon last week's rates, more especially the lower grades of useful liquoring Teas. Average for week 10½d., against over 10d. for same week last year.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	1890,	1889,
PEKOE SOUG. (Ordinary leaf; fair liquor)	7½d.	7½d.	10d.	11½d.
PEKOE (Ordinary leaf, little twist; fair liquor)	9d.	9½d.	10½d.	1/1½
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	5¾d.	6½d.	9½d.	10¾d.
PEKOE (Somewhat bold leaf; indifferent liquor)	7¼d.	7½d.	10¼d.	1/-

JAVA. Only 724 packages were brought forward, the auction passing generally at firm prices.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

LOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

October 14th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	382,819 packages.	330,309 packages.	24,430 packages.
1892-1893.	377,629 ,,	330,043 ,,	18,261 ,,

During the week

154 packages	INDIAN
385 ,,	CEYLON
53 ,,	JAVA

Total 41,592 packages have been offered in public auction.

Since the commencement of the season, home consumption and re-export of Indian and Ceylon Teas have both progressed satisfactorily.

In September, 288,396 pounds of Indian and 324,069 pounds of Ceylon Tea were re-exported.

Efforts are now being made to regulate the supply of Indian Tea to be offered upon the market, and at a meeting held on Friday, it was generally considered that about 35,000 packages was sufficient for one week's auction.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to 30th Sept.

	1889.	per centages.	1890.	per centages.	1891.	per centages.	1892.	per centages.
Indian	28,000,000	48	31,197,739	48	29,411,887	44	32,363,291	48

CEYLON. Auctions were very small and below those of last week, thus promoting competition and leading to stiffer rates, advances having taken place in all grades, medium Teas being fully $\frac{1}{4}$ d. dearer and the higher grades $\frac{1}{2}$ d. to 1d., and in some instances even more. The following averages may be mentioned:—"Holmwood," 1/4; "Portswood," 1/3 $\frac{3}{4}$; "Richarton" of the CL & P Co., and "Spring Valley," 1/2. Average for week 10 $\frac{1}{2}$ d., against 9 $\frac{3}{4}$ d. for corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1892,	7 $\frac{3}{4}$ d.	1891,	7 $\frac{1}{4}$ d.	1890,	9 $\frac{3}{4}$ d.	1889,	11 $\frac{3}{4}$ d.
PEKOE SOUG.	(Ordinary leaf; fair liquor)	"	9 $\frac{1}{2}$ d.	"	9 $\frac{1}{2}$ d.	"	10 $\frac{3}{4}$ d.	"
PEKOE	(Ordinary leaf, little twist; fair liquor)	"	6d.	"	6 $\frac{1}{4}$ d.	"	9 $\frac{1}{4}$ d.	"
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	"	7 $\frac{1}{2}$ d.	"	7 $\frac{1}{2}$ d.	"	10d.	"
PEKOE	(Somewhat bold leaf; indifferent liquor)	"		"		"		1/-

JAVA. Only one auction was held, comprising 1053 packages from the Bagelen Estate; these sold at firm prices. 1661 packages are advertised for next week.

BANK RATE. 2 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2 $\frac{3}{4}$. Colombo 1/2 $\frac{3}{4}$.

Bagelen ...	1053	$5\frac{3}{4}$	—	—	533	$5\frac{1}{2}$	46	$4\frac{1}{2}$	474	$4\frac{3}{4}$	—	—	—	—	—	—

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

October 21st, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	427,432 packages.	345,850 packages.	25,038 packages.
1892-1893.	412,791 "	340,128 "	19,922 "

During the week

62 packages	INDIAN	} Total 46,908 packages have been offered in public auction.
85 "	CEYLON	
61 "	JAVA	

It will be seen by the above figures that the quantity of tea catalogued since the commencement of the season from India, Ceylon and Java, is smaller than was the case at the same period last season.

With the statistical position as strong as it is at present, and with a good business doing in the country generally, it is not surprising that recent prices should have been fully maintained for all descriptions, and that rather better rates should have been paid for those grades which make up the bulk of the home consumption;—the market having shown considerable eagerness to purchase such teas during the past week.

Supplies continue moderate; it is however well to remember that although the crop from India will probably be far less than was at first believed, considerable quantities may be expected to arrive during the next few weeks.

A small invoice of Tea from Borneo is advertised for sale next week.

INDIAN. Auctions have again been comparatively light, although some 5,000 packages above last week. Competition for all grades was keen, and prices continue very firm at last week's quotations, Teas under 8d. showing a further advance on recent rates. Quality from Assam continues good; Teas from Cachar and Sylhet are also showing some improvement, while the Boars are sending home a very useful selection. Darjeeling also continues to send very good Tea. **Weekly average of New Season's Tea sold on Garden Account, 1892, 23,520 pkgs. av. 11½. 1891, 34,008 pkgs. av. 9¾d.**

Comparative prices of Indian Tea in London:—

	1892,	4d.	1891,	4½d.	1890,	6d.	1889,	5¼d.
JUST. (Fair ordinary, dark liquor)								
ANNINGS. (Red to brown, strong rough liquor)		5d.		5½d.		6¾d.		6d.
BROKEN TEA. (Brownish to blackish, strong liquor)		7¼d.		7¾d.		8¼d.		8d.
PEK. SOUG. (Blackish greyish, useful liquor)		8d.		8d.		8¾d.		9¾d.
PEKOE. (Greyish to blackish some tip, useful liquor)		9¼d.		9d.		9¾d.		10½d.
PEK. SOUG. (Blackish greyish, inferior liquor)		6¼d.		6d.		7¾d.		7¼d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)		8d.		7d.		8½d.		8¾d.

CEYLON. Auctions were very small and about 1000 packages below those of last week; bidding was keen throughout the sales, and prices were if anything stiffer, especially for Teas below 10d. which are slightly dearer. With the smaller quantity coming forward, quality continues to improve, and many estates are now sending excellent Tea, possessing distinctive Ceylon flavour. The want of variety in Ceylon Teas, so noticeable during the summer months, has now given place to the most useful and varied selection, buyers now being able to supply themselves with the flavoured teas for which they had so long been looking.

Average for the week is 10¾d., against 9¾d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1892,	8d.	1891,	7d.	1890,	9½d.	1889,	1/-
PEKOE SOUG. (Ordinary leaf; fair liquor)								
PEKOE (Ordinary leaf, little twist; fair liquor)		10d.		9¾d.		10¾d.		1/1¼
PEKOE SOUG. (Rather bold leaf; indifferent liquor)		6¾d.		6¼d.		9¼d.		1/1½d.
PEKOE (Somewhat bold leaf; indifferent liquor)		8d.		7¾d.		10d.		1/0½

JAVA. Auctions were somewhat larger, but with the improved demand for Indian and Ceylon Teas, the sales passed with good spirit at rates which show some advance for the better descriptions. Some of the Teas grown from Assam seed possessed good quality which was fully appreciated by the trade, an invoice from "Perbawatee" being specially noticeable.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3³/₁₆. Colombo 1/3³/₁₆.

WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

October 28th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	473,394 packages.	359,173 packages.	25,038 packages.
1892-1893.	453,893 "	355,496 "	21,639 "

during the week

102 packages	INDIAN
5,568 "	CEYLON
1717 "	JAVA

Total 58,387 packages have been offered in public auction.

Quantities brought to public auction since the beginning of the season continue below last year. With a good general business in the country, supplies continue to be quickly absorbed, the market for all grades being strong with a further advance in the price of Teas under 10d.

It is satisfactory to record that, in spite of the advance in rates, some high priced Teas have recently been taken for export. The low figures at which suitable Teas for foreign trade were obtainable a few months ago, appear to have stimulated demand for Indians and Ceylons, and produced a firm foothold in outside markets, thus necessitating the continuance of purchases even at enhanced rates.

CHICAGO EXHIBITION. Satisfactory progress appears to have been made, both as regards Indian and Ceylon arrangements, and there is little reason to doubt that both these branches of the Tea industry will now be adequately represented.

A duty has been levied by the Ceylon Government to meet the expenditure of the World's Columbian Exposition, at the rate of 10 cents. per 100 lbs. weight of Tea, to come into force on the 1st January, 1893.

INDIAN. Auctions comprised 41,102 packages, against 35,162 packages last week. Bidding was animated, and a further rise took place in Teas under 10d.; other grades sold at firm prices, although occasionally Teas over 1/3 were less competed for.

Weekly average of New Season's Tea sold on Garden Account, 1892, 22,662 pkgs. av. 11½. 1891, 30,260 pkgs. av. 9½d.

PEKOE.	(Greyish to blackish some tip, useful liquor)	" 9½d.	" 8¾d.	" 9¾d.	" 10½d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	" 6¾d.	" 6d.	" 7¾d.	" 7d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	" 8½d.	" 6¾d.	" 8½d.	" 8¼d.

CEYLON. The week's auctions were somewhat heavier, comprising 15,568 packages, against 1885 last week, but bidding was exceedingly animated and the competition caused an advance of a halfpenny to a penny per lb., specially noticeable in Teas under 10d. Very little whole leaf Tea is now obtainable under 7½d. per lb. Pekoes sold well and were evidently much wanted. Broken pekoes are now selling at a much higher scale of prices than a few weeks back, the average for this grade of Tea being considerably higher than a short time since. Quality continues very satisfactory, as was to be expected with a smaller output; but the high prices now obtainable have been caused mainly by the actual rise in the market. Average for the week is 11¼d., against 9¾d. for corresponding week last year. An average of 11¼d. has not been reached since March, 1891.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG.	(Ordinary leaf; fair liquor)	1892, 8½d.	1891, 7d.	1890, 9¾d.	1889, 1/-
PEKOE	(Ordinary leaf, little twist; fair liquor)	" 10½d.	" 9¼d.	" 11d.	" 1/1½
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	" 7d.	" 6d.	" 9½d.	" 11¼d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	" 8¼d.	" 7½d.	" 10¼d.	" 1/0¼

JAVA. The 1717 packages brought forward met with good competition, and were mostly disposed of at full prices, in sympathy with other grades. Invoices from "Tjiboengoer" and "Panoembangan" were noticeable on account of quality.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3¼. Colombo 1/3¼

In these tables all packages are chests unless otherwise stated. b stands for boxes; 1/2 c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

November 4th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	1891-1892.	Indian.	Ceylon.	Java.
During the week	1891-1892. 516,395 packages.	373,182 packages.	25,038 packages.	
638 packages	1892-1893. 499,531	362,418	21,639	
922	INDIAN			
—	CEYLON			
—	JAVA			

Total 52,560 packages have been offered in public auction.

Deliveries in October were satisfactory and appear to have suffered only a slight check through high prices which have ruled throughout the month. From the commencement of the season Indian imports are slightly in excess of last year, Ceylons being a little below.

INDIAN. Auctions have been heavy, totalling 45,638 packages. Prices were fairly well maintained for Teas under 10d., but above this figure much irregularity was noticeable, some whole leaf teas showing as much as a penny per lb. decline.

Weekly average of New Season's Tea sold on Garden Account, 1892, 32,279 pkgs. av. 11½. 1891, 34,399 pkgs. av. 8¾d.

CEYLON. This week's auction was the smallest which has been held since the week ending November 14th, 1890., and comprised only 6,922 packages. Bidding was naturally very animated, and the small quantity was readily absorbed at rates which show some hardening upon last week's prices. Hardly anything in whole leaf can now be obtained under 8½d., and Teas for price continue very firm. Exports to Great Britain from Ceylon during October were slightly over lbs. 4,000,000, those for November being estimated at about lbs. 4,500,000.

The average for the week is over 11½d., against 9¾d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1892,	8¾d.	1891,	7d.	1890,	9¾d.	1889,	11¾d.	
PEKOE SOUG.	(Ordinary leaf; fair liquor)	..	10¾d.	..	9d.	..	11d.	..	1/1¼
PEKOE	(Ordinary leaf, little twist; fair liquor)	..	7½d.	..	5¾d.	..	9½d.	..	11d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	..	8½d.	..	6¾d.	..	10¼d.	..	1/-
PEKOE	(Somewhat bold leaf; indifferent liquor)	

JAVA was not represented, but catalogues are issued for 1724 packages to be offered next week.

INDIAN. The heaviest auction ever held took place on Monday last, when 25,846 packages were catalogued. The total quantity printed for the week amounted to 46,523 packages. These supplies were too great for immediate requirements and thus occasioned some irregularity in the bidding, resulting in easier rates for all Teas, especially those over 9d. per lb. The drop in the higher grades now amounts to fully 3d. to 4d. from the best prices. Latest telegraphic advices from Calcutta give the seasons probable export to London as 109 millions.

Weekly average of New Season's Tea sold on Garden Account, 1892, 25,157 pkgs. av. 10 $\frac{3}{4}$. 1891, 28,298 pkgs. av. 8 $\frac{1}{2}$ d.

Comparative prices of Indian Tea in London:—

	1892.	1891.	1890.	1889.
DUST. (Fair ordinary, dark liquor)	4 $\frac{1}{2}$ d.	4 $\frac{1}{2}$ d.	6d.	5 $\frac{1}{2}$ d.
ANNINGS. (Red to brown, strong rough liquor)	5 $\frac{1}{2}$ d.	4 $\frac{3}{4}$ d.	6 $\frac{1}{2}$ d.	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7 $\frac{3}{4}$ d.	7d.	8 $\frac{1}{4}$ d.	7 $\frac{1}{2}$ d.
PEK. SOUG. (Blackish greyish, useful liquor)	8 $\frac{1}{2}$ d.	7 $\frac{1}{4}$ d.	8 $\frac{1}{2}$ i.	8 $\frac{1}{4}$ d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	8 $\frac{1}{4}$ d.	9 $\frac{1}{2}$ d.	9 $\frac{1}{4}$ d.
PEK. SOUG. (Blackish greyish, inferior liquor)	6 $\frac{3}{4}$ d.	5 $\frac{1}{2}$ d.	7 $\frac{3}{4}$ d.	6 $\frac{1}{2}$ d.
PEKOE. (Blackish, greyish, some tip. inferior liquor)	7 $\frac{3}{4}$ d.	6 $\frac{3}{4}$ d.	8 $\frac{1}{4}$ d.	8d.

CEYLON. Although sales were heavier than last week the quantity was comparatively small, arrivals having recently been extremely limited. Competition was strong, and prices all round were fully up to last week's quotations, although a somewhat quieter tone was noticeable.

The average for the week is 11 $\frac{3}{4}$ d., against 9d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1892.	1891.	1890.	1889.
PEKOE SOUG. (Ordinary leaf; fair liquor)	8 $\frac{3}{4}$ d.	6 $\frac{1}{2}$ d.	9 $\frac{1}{2}$ d.	11d.
PEKOE (Ordinary leaf, little twist; fair liquor)	10 $\frac{1}{2}$ d.	8 $\frac{3}{4}$ d.	10 $\frac{3}{4}$ d.	1/-
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7 $\frac{3}{4}$ d.	5 $\frac{1}{4}$ d.	9 $\frac{1}{4}$ d.	10d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8 $\frac{3}{4}$ d.	6 $\frac{1}{4}$ d.	10d.	10 $\frac{3}{4}$ d.

JAVA. The 1724 packages brought forward, comprised selections from 9 Estates, and the sales passed firmly at fair prices, although several lots were withdrawn for higher offers.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3 $\frac{1}{8}$. Colombo 1/3 $\frac{1}{8}$

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

November 18th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	596,603 packages.	402,369 packages.	26,604 packages.
1892-1893.	582,085 "	385,923 "	25,377 "

During the week

3031 packages INDIAN

876 " CEYLON

2014 " JAVA

Total 48,921 packages have been offered in public auction.

There has been generally less disposition to operate this week at late rates, and the natural consequence has been apparent in a drooping tendency in the auctions.

The large quantities of Indian Tea which have been brought forward, during the last few weeks, appear to have amply sufficed for immediate trade requirements, and dealers are probably inclined to go heavily into stock at prices which mark a sharp rise upon rates which were current some few months back.

A certain degree of caution is not at all surprising under the circumstances, especially considering that we are approaching the season of the year when Grocers are too busy with other articles to pay more attention than necessary to Tea, and that trade has frequently a tendency to become somewhat slack as Christmas draws near.

INDIAN. Although auctions have been considerably lighter, totalling only 36,031 packages against 46,523 last week, bidding showed less animation and prices dropped for nearly all descriptions, especially those where the liquors were at all indifferent. Whole leaf grades are cheaper, even Teas for price being less generally competed for, a general fall of ½d. per lb. being noticeable, although considerable irregularity in prices must be recorded.

The quality of recent arrivals has not been up to those of some weeks back, and fewer fine purging Broken Pekoes and Pekoes are on the market. Although this circumstance is answerable to some extent for lower quotations, the depression in the market is responsible for a good deal.

Weekly average of New Season's Tea sold on Garden Account, 1892, 23,157 pkgs. av. 10¼. 1891, 28,386 pkgs. av. 9d.

Comparative prices of Indian Tea in London:—

	1892,	1891,	1890,	1889,
DUST. (Fair ordinary, dark liquor)	4½d.	4¼d.	6d.	5½d.
PANNINGS. (Red to brown, strong rough liquor)	5½d.	4¾d.	6½d.	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7¾d.	7d.	8d.	7½d.
PEK. SOUG. (Blackish greyish, useful liquor)	8d.	7d.	8¼d.	8½d.
PEKOE. (Greyish to blackish some tip, useful liquor)	8¾d.	8¼d.	9½d.	9½d.
PEK. SOUG. (Blackish greyish, inferior liquor)	6¾d.	5½d.	7½d.	6½d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7½d.	6¾d.	8¼d.	8d.

CEYLON. The quantity brought forward was slightly below that of last week, viz.: 10,876 pkgs., against 12,629 pkgs. Bidding was rather less animated, Teas over 10d. showing decided weakness; lower grades did not meet with quite the attention lately bestowed upon them. Prices for all grades have eased a little, many Teas selling ¼d. to ½d. below recent quotations.

The average for the week is 11½d., against under 9d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	1890,	1889,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8½d.	6½d.	9¼d.	10½d.
PEKOE (Ordinary leaf, little twist; fair liquor)	10¼d.	8¾d.	10½d.	11½d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7½d.	5½d.	9d.	9¾d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8½d.	6½d.	9¾d.	10½d.

JAVAS were fairly represented, 2,014 packages being brought forward. In sympathy with other descriptions bidding was less keen, and prices in consequence somewhat drooped. The export demand has not been strong, and although the Home trade has been taking Javas to some extent, the lower prices current for other Teas appear to have made buyers somewhat hesitate before going more generally into stock of Javas.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3¼. Colombo 1/3¼

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

November 25th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	634,069 packages.	413,302 packages.	26,604 packages.
1892-1893.	622,970 "	398,066 "	25,725 "

During the week

1885 packages	INDIAN
143 "	CEYLON
348 "	JAVA

Total 53,376 packages have been offered in public auction.

The caution of buyers, alluded to last week, has since become more pronounced and prices for all descriptions have in consequence still further receded.

The lower rates now current for Indian Teas will probably result in an increased export business, many grades having of late been too high for extensive purchase by foreign markets. There are already signs of attention abroad being attracted by the more moderate values now ruling.

The American market appears to have at last taken a firm hold of Indian and Ceylon Teas. It is interesting to note that the Ceylon Planters Tea Co. have in the United States nearly a hundred and fifty retail grocers keeping a supply of their Teas.

In Australia, Indian and Ceylon growths continue in public favour. It is stated that increasing attention is being bestowed upon Teas with good liquor;—higher values being sometimes obtained for Pekoe Souchongs with special point in liquor than for tippy Pekoes.

INDIAN. We have to chronicle a still further drop in the market for nearly all descriptions. Whole leaf Teas between 9d. and 1/- have fallen to a comparatively low level; Teas for price are also cheaper, while the higher grades of all but finest liquoring Teas have shared in the present depression.

TRAVANCORE is becoming a more important district, and constant supplies are being brought to auction. Some Estates have recently been represented by Teas of improved quality. This district is materially benefited by the high range of values lately ruling for medium Teas, the average price of Travancore Teas having in consequence shown a considerable advance.

Weekly average of New Season's Tea sold on Garden Account, 1892, 25,965 pkgs. av. 10½. 1891, 35,675 pkgs. av. 8½d.

Comparative prices of Indian Tea in London:—

JUST.	(Fair ordinary, dark liquor)	1892,	4½d.	1891,	4½d.	1890,	6d.	1889,	5½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5½d.	"	4¾d.	"	6½d.	"	6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	7d.	"	8d.	"	7½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7¾d.	"	7d.	"	8½d.	"	8d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	8½d.	"	8½d.	"	9½d.	"	9d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6½d.	"	5½d.	"	7½d.	"	6¾d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¼d.	"	6¾d.	"	8½d.	"	7¾d.

CEYLON. Less animation was again noticeable, and all grades now show a decided fall from the highest point. Broken Pekoes sold with considerable irregularity and the lower grades are also easier, the market all round being fully a penny per lb. below the highest point reached.

The average for the week is rather over 10¾d., against 9½d. for corresponding week last year.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG.	(Ordinary leaf; fair liquor)	1892,	8d.	1891,	6¾d.	1890,	9d.	1889,	10½d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	"	9½d.	"	9d.	"	10½d.	"	11½d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	"	7d.	"	5½d.	"	8¾d.	"	9½d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	"	7¾d.	"	6¾d.	"	9½d.	"	10½d.

JAVAS are difficult to dispose of privately, owing to the lower prices of Indian and Ceylon Teas, and the market shows a weak tendency. Very few packages were brought forward this week, the auction being composed of Teas imported from Holland.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/3½. Colombo 1/3½.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

December 2nd, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

Indian. Ceylon. Java.

during the week 1891-1892. 678,826 packages. 426,583 packages. 27,286 packages.
 1892-1893. 656,466 ,, 405,956 ,, 26,403 ,,

496 packages INDIAN }
 1890 ,, CEYLON } Total 42,064 packages have been offered in public auction.
 678 ,, JAVA }

Deliveries during November were good, especially those of Indian, which are above any previously recorded, except those immediately following the reduction of the duty in May, 1890.

INDIAN. The Market has steadied, and all Auctions throughout the week have ruled with considerable firmness. No doubt last week's drop has induced operators to take advantage of the somewhat lower prices. Competition has in consequence been general and animated, and although positive advance can be quoted, the tone of the market has become much stronger.

Recent arrivals have not shown the satisfactory quality of several weeks back, although, taken as a whole, the crop has so far proved better than last season, and somewhat above the average. This is especially the case with Assam, where the crop has been noticeable for unusual strength and quality. Doars, Cachar and Sylhet compare very favourably with Teas from these districts last season, when the quality was exceptionally poor.

Weekly average of New Season's Tea sold on Garden Account, 1892, 20,751 pkgs. av. 9 $\frac{3}{4}$. 1891, 34,242 pkgs. av. 8d.

CEYLON. Another week of unusually small supplies maintained prices at about last week's level. The tone of the market was firm, but no improvement can be quoted. Exports from Ceylon to the United Kingdom in November are telegraphed as about lbs. 5,250,000, and are estimated for December at lbs. 6,000,000., to lbs. 6,500,000. Average for week 10 $\frac{3}{4}$ d., against 9 $\frac{1}{2}$ d. for same week last year.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG. (Ordinary leaf; fair liquor)	1892, 8d.	1891, 6 $\frac{3}{4}$ d.	1890, 9d.	1889, 10 $\frac{1}{4}$ d.
PEKOE (Ordinary leaf, little twist; fair liquor)	,, 9 $\frac{1}{2}$ d.	,, 9d.	,, 10 $\frac{1}{4}$ d.	,, 11 $\frac{1}{4}$ d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	,, 7d.	,, 5 $\frac{3}{4}$ d.	,, 8 $\frac{3}{4}$ d.	,, 9 $\frac{1}{2}$ d.
PEKOE (Somewhat bold leaf; indifferent liquor)	,, 7 $\frac{3}{4}$ d.	,, 7d.	,, 9 $\frac{1}{2}$ d.	,, 10d.

JAVA was represented by 678 packages, comprising 551 pkgs. of "direct import," and 127 pkgs. from Holland. Bids not reaching Merchants' ideas, the Teas were mostly withdrawn.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

December 9th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	712,998 packages.	438,540 packages.	27,470 packages.
1892-1893.	680,897 "	418,998 "	27,105 "

During the week

2,431 packages	INDIAN
1,042 "	CEYLON
702 "	JAVA

Total 38,175 packages have been offered in public auction.

Statistics in the table at foot comprise six months of the season-year. Compared with the same period of last season, imports are smaller from both India and Ceylon, while deliveries are larger in each case.

293,718 lbs. of Indian Tea, and 268,389 lbs. of Ceylon Tea were re-exported in November. **INDIAN.** The steadiness of last week has hardened into occasionally dearer prices, all grades being distinctly firmer. Auctions were unusually light.

Weekly average of New Season's Tea sold on Garden Account, 1892, 15,896 pkgs. av. 10¼. 1891, 28,773 pkgs. av. 8¼d.

Comparative prices of Indian Tea in London:—

	1892,	1891,	1890,	1889,
DUST. (Fair ordinary, dark liquor)	4½d.	4¼d.	6d.	5½d.
FANNINGS. (Red to brown, strong rough liquor)	5½d.	4¾d.	6½d.	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7½d.	6½d.	8d.	7½d.
PEK. SOUG. (Blackish greyish, useful liquor)	8½d.	7d.	8½d.	8½d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	8½d.	9½d.	9d.
PEK. SOUG. (Blackish greyish, inferior liquor)	6¾d.	5½d.	7½d.	7d.
PEKOE. (Blackish, grevish, some tip, inferior liquor)	7½d.	6¾d.	8½d.	8d.

CEYLON. Firmness throughout the sales, with well distributed competition, has been the main feature. Prices have decidedly hardened in spite of the larger quantity brought forward, and some slight advance has taken place in all grades, the improvement being also reflected in the week's average, which stood at 11d., as against 10¾d. last week, and 9½d. for the same week last year.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	1890,	1889,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8½d.	7d.	8¾d.	10¼d.
PEKOE (Ordinary leaf, little twist; fair liquor)	9¾d.	9¼d.	10d.	11¼d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7¼d.	5¾d.	8½d.	9½d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8d.	7¼d.	9½d.	10¼d.

JAVA. The few Javas offering met with better attention, and were mostly disposed of at firm to rather better prices. For next week, 1,947 packages are advertised for sale—comprising invoices from some of the favorite gardens.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

December 16th, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	745,084 packages.	446,538 packages.	27,470 packages.
1892-1893.	720,877 ..	438,453 ..	29,052 ..

During the week

3,980 packages INDIAN)
 1,455 ,, CEYLON)
 1,947 ,, JAVA)

Total 61,382 packages have been offered in public auction.

The six months between the 1st June and the end of November, comprise exactly one half of the season year. During that period the total quantity of Tea upon which duty was paid in the United Kingdom has been practically the same as the corresponding period last season, but the proportions of the various growths used have changed.

The Table below shows the difference to be largely in favor of Indian and Ceylon. These kinds have contributed about *nine* million pounds more, and China, etc., about *nine* million pounds less than last year, the proportions now standing thus:—India and Ceylon, 84%; China, 16%; against India and Ceylon, 76%; China, 24% last year.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to 30th Nov.

	1889.	per centages.	1890.	per centages.	1891.	per centages.	1892.	per centages.
Indian	47,500,000	51	50,258,435	50	48,547,047	47	52,476,875	51

China, etc.	29,705,000	31	29,415,119	29	25,443,178	24	16,627,263	16
Total lbs.	93,805,000		100,183,556		103,925,479		103,899,229	

Quantity of Tea exported from Great Britain, from 1st June to 30th November.

	1889.	1890.	1891.	1892.
Indian	Included with China.	1,096,507	1,947,104	1,638,451
Ceylon	789,626	1,381,095	1,818,154
China, etc.	17,830,798	18,062,333	15,974,104	16,370,138

INDIAN. The near approach of Christmas no doubt induced importers to push forward supplies this week, resulting in comparatively heavy auctions. General firmness was the predominant feature in the market, Teas under 10d. showing here and there a slight advance.

Weekly average of New Season's Tea sold on Garden Account, 1892, 26,921 pkgs. av. 10¼. 1891, 25,580 pkgs. av. 9d.

	1892.	1891.		1892.	1891.		1892.	1891.
ASSAM	PKGS. PRICE. 12319 p 10¾	PKGS. PRICE. 11204 p 9¾	CHOTA	PKGS. PRICE. 71 7½	PKGS. PRICE. 94 5½	KANGRA VAL	PKGS. PRICE. 175 p 8¼	PKGS. PRICE. 158 6

Comparative prices of Indian Tea in London:—

	1892.	1891.	1890.	1889.
DUST. (Fair ordinary, dark liquor)	4½d.	4¼d.	6d.	5¼d.
ANNINGS. (Red to brown, strong rough liquor)	5½d.	5d.	6½d.	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7¾d.	6½d.	8d.	7½d.
PEK. SOUG. (Blackish greyish, useful liquor)	8¾d.	7¾d.	8¼d.	8¼d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	8¾d.	9½d.	9d.
PEK. SOUG. (Blackish greyish, inferior liquor)	6¾d.	5¾d.	7½d.	7d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7½d.	6¾d.	8¼d.	8d.

CEYLON was somewhat heavily represented. Competition was strong for all grades up to about 10d., prices for these remaining at about last week's rates. Medium Broken Pekoes sold with irregularity and were occasionally somewhat easier.

Average for week 10¾d., against 10d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1892.	1891.	1890.	1889.
PEKOE SOUG. (Ordinary leaf; fair liquor)	8½d.	7¼d.	8¾d.	10¼d.
PEKOE (Ordinary leaf, little twist; fair liquor)	9¾d.	9½d.	10¼d.	11d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7¼d.	5¾d.	8½d.	9¾d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8d.	7¼d.	9d.	10¼d.

JAVA. Amongst the offerings were many good Teas, two invoices from Perbawattee standing out from amongst the rest, as did also some Tjiboengoer, Panoembangan, and a few Tjiomas. Prices show an advance on last week's rates, with good home trade competition.

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Broker

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

December 22nd, 1892.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	774,730 packages.	462,810 packages.	27,643 packages.
1892-1893.	743,115 "	447,394 "	31,015 "

During the week

2,238 packages INDIAN
941 ,, CEYLON
963 ,, JAVA } Total 33,142 packages have been offered in public auction.

Auctions were held only on Monday, Tuesday and Wednesday this week, when the Market closed for Christmas and will probably not reopen until early in January.

Considering the near approach of the holidays business has been brisk, and all Teas brought forward appeared to be wanted. This points to small stocks being held by buyers generally and to active demand in the early part of 1893.

INDIAN. The small Auctions met with general support, and with active competition prices were well maintained at last weeks rates.

The average price of all the Indian Tea sold in London on Garden Account in 1892, was 10d., against about 10½d. in 1891.

Weekly average of New Season's Tea sold on Garden Account, 1892, 10,218 pkgs. av. 10½. 1891, 13,312 pkgs. av. 8¾d.

Comparative prices of Indian Tea in London:—

	1892,	1891,	1890,	1889,
JUST. (Fair ordinary, dark liquor)	4½d.	4¼d.	6d.	5½d.
MANNINGS. (Red to brown, strong rough liquor)	5½d.	5d.	6½d.	6d.
ROKEN TEA. (Brownish to blackish, strong liquor)	7¾d.	6¾d.	8d.	7½d.
BEK. SOUG. (Blackish greyish, useful liquor)	8¼d.	7¼d.	8½d.	8¼d.
BEKOE. (Greyish to blackish some tip, useful liquor)	9d.	8¾d.	9½d.	9d.
BEK. SOUG. (Blackish greyish, inferior liquor)	6¾d.	5¾d.	7¾d.	7d.
BEKOE. (Blackish, greivish, some tip, inferior liquor)	7½d.	7d.	8½d.	8d.

CEYLON. Offerings although small, were not bid for with quite the keenness lately so noticeable, and prices for all grades were rather inclined to droop. Competition was strongest for Teas "for price," there being a good general demand for this class.

Average for week 10½d., against 9¾d. for the corresponding week last year.

The average price of all the Ceylon Tea sold in London on Garden Account in 1892, was 9½d., against 10d. in 1891.

Comparative prices of Ceylon Tea in London:—

	1892,	1891,	1890,	1889,
BEKOE SOUG. (Ordinary leaf; fair liquor)	8¼d.	7¼d.	8¾d.	10¼d.
BEKOE (Ordinary leaf, little twist; fair liquor)	9½d.	9½d.	10d.	11d.
BEKOE SOUG. (Rather bold leaf; indifferent liquor)	7¼d.	5¾d.	8½d.	9¾d.
BEKOE (Somewhat bold leaf; indifferent liquor)	8d.	7¼d.	9½d.	10¼d.

JAVA. The 1963 packages brought forward, met with good attention, and were well competed for. This growth is now being more freely taken for Home trade use, owing to the high price of the lower grades of Indian and Ceylon Teas. Of the 1963 packages in Auction, only 1071 packages were of direct import, the remaining 892 being mostly Teas of indirect import, brought over from Holland.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2¹³/₁₆. Colombo 1/2¹³/₁₆

GOW, WILSON & STANTON,

BROKERS, 13, ROOD LANE, LONDON, E.C.

The history of the Tea trade forcibly illustrates the triumph of science and education over barbarism and ignorance.

Originally learning the use of tea from China and drawing supplies from the vast fields in the Celestial Empire, we have domiciled the shrub in India and Ceylon, cultivated the plant and prepared the leaf on scientific principles, and thus brought the produce grown in our own Possessions to such perfection that China has at length been nearly beaten out of the Market.

This result has not been attained without a struggle of many years duration, and great sacrifice of actual money;—the price having gradually been forced down lower and lower, until a point was reached in the early part of this year almost level with cost of production.

The chief cause of this abnormally low value was the rapid annual increase in the output from both India and Ceylon, which by last year had grown to such a point that it threatened to outstrip consumption.

HOME CONSUMPTION. The extremely low price no doubt materially assisted in bringing up the total Home Consumption of all Tea for 1892 to the high point at which it now stands, viz. 207,000,000 lbs.;—exceeding that of any other year; and this too in a year when the process of substituting the strong Teas of India and Ceylon for the weak Tea of China was perhaps never more actively in force, its use falling from 52,000,000 lbs. in 1891 to 34,000,000 lbs. in 1892, while the use of Indian Tea increased from 99,000,000 lbs. to 109,000,000 lbs. and Ceylon from 51,000,000 lbs. to 64,000,000 lbs. in the same period.

The Home Consumption of Tea in its liquid state must therefore have been enormously augmented in 1892, and the public have at last the happy satisfaction of knowing that almost every cup of Tea they drink tends to increase the prosperity of our own kinsfolk in India and Ceylon, besides assisting to support the vast native population in these portions of the British Empire; for out of every 100 lbs. of Tea used, 53 lbs. were grown in India, 31 lbs. in Ceylon, and only 16 lbs. in China.

CROP RESULTS. Although prospects opened gloomily for the Tea Producer this season, events have nevertheless proved auspicious, for the excessive crop estimates indulged in both from India and Ceylon, which hung like a pall over the market, have proved fallacious, and the actual out-turn has barely come up to that of last season. The result has been a reaction in price to a more remunerative figure. The coincident fall in the value of silver has also lessened cost of production, and the planting community expect to reap a fairly profitable harvest, while the increased use of the article—both at home and abroad—resulting from recent low values, has materially raised the proportion in which consumption stood towards production, and thus lessened the danger of over supply in the near future.

QUALITY OF CROP from India has so far been above the average, that from Assam especially being noticeable for strength and richness. Ceylon Teas have been up to average, and towards the close of the year were particularly good, those grown at high elevations being noticeable for very fine delicate flavour.

Average price of all Indian Tea sold on garden account in 1892, was 10d., against about 10½d. in 1891; and of all Ceylon Tea sold on garden account 9½d. in 1892, against 10d. in 1891.

THE CHICAGO EXHIBITION. Much time and attention have been given to the adequate representation of Indian and Ceylon Tea at the coming World's Fair, in the hope that the market in North America may become an important consumer of British-Grown Tea.

FOREIGN MARKETS have been somewhat extensively developed, the low rates prevailing in the earlier months having offered a favourable opportunity for fostering this important branch of the industry. Flavoury kinds of Ceylon Tea are also finding a market in Russia at remunerative prices.

JAVA. The trade this year has been principally with Export Markets. America has taken a fair quantity, and the consumption of this growth appears to be increasing in that quarter. Recently the advanced prices of Indian and Ceylon Teas have induced home buyers to operate more freely in Javas. 46,434 packages were catalogued against 55,814 in 1891.

GOW, WILSON & STANTON,
BROKERS, 13, Rood Lane, London, E.C.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

January 6th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	814,159 packages.	475,060 packages.	28,269 packages.
1892-1893.	769,573 "	461,490 "	31,901 "

during the week

458 packages INDIAN
 1,096 " CEYLON
 886 " JAVA

Total 41,440 packages have been offered in public auction.

The most noticeable feature in the opening sales after the holidays was the strong competition for Teas up to about 10d. per lb., establishing an advance of ½d. per lb. over closing rates of last year.

Thursdays Sale, comprising 11,226 packages Indian, 4,638 packages Ceylon, and 589 packages Java, was postponed until to-day; prices will in consequence be given next week.

INDIAN. The first auction was held on the 4th inst., and passed with good competition for all Teas under 10d., at a general rise of ½d. per lb.; Teas over 1/- on the other hand being ½d. to 1d. per lb. cheaper.

Weekly average of New Season's Tea sold on Garden Account, 1893, 10,528 pkgs. av. 10¼. 1892, 35,858 pkgs. av. 9d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ¹/₂c for half-chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

January 20th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	909,589 packages.	517,519 packages.	29,458 packages.
1892-1893.	860,377 "	500,839 "	34,559 "

During the week

17,779 packages	INDIAN
19,980 "	CEYLON
1,613 "	JAVA

Total 69,372 packages have been offered in public auction.

The probable supply of Tea in the near future appears none too large. From India the most recent estimates for the season, point to a crop rather smaller than that of last season, while the dry weather lately reported from Ceylon is likely somewhat to curtail Tea flushing in that quarter.

INDIAN. Another week of heavy auctions has rather strained the market and produced some slackness in the bidding. Prices for the lower grades have occasionally drooped, in addition to which the offering of some Teas of poor quality has further lowered quotations. The following averages are worthy of note:—LMB "Moondakotee," 1/8³/₄; "Mim," 1/5³/₄; "Moabund," 1/2¹/₂; "Behora" and "Salonah" Co. K, 1/2; "Kyel," 1/1³/₄; "Dooria," 1/1¹/₂.

TRAVANCORE. This district continues to grow in importance. 956 packages, comprising 10 invoices from thirteen estates were represented in the auctions, the averages realized varying from 8¹/₄d. up to 10¹/₂d. per lb.

Weekly average of New Season's Tea sold on Garden Account, 1893, 29,459 pkgs. av. 10¹/₂. 1892, 24,687 pkgs. av. 8³/₄d.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
DUST. (Fair ordinary, dark liquor)	4 ¹ / ₄ d.	4d.	6 ¹ / ₂ d.	5 ¹ / ₂ d.
FANNINGS. (Red to brown, strong rough liquor)	6d.	4 ³ / ₄ d.	7d.	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7 ³ / ₄ d.	6d.	8 ³ / ₄ d.	7 ¹ / ₂ d.
PEK. SOUG. (Blackish greyish, useful liquor)	8 ¹ / ₂ d.	6 ³ / ₄ d.	9 ¹ / ₂ d.	8d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	8 ¹ / ₂ d.	10 ³ / ₄ d.	9 ¹ / ₄ d.
PEK. SOUG. (Blackish greyish, inferior liquor)	7 ¹ / ₄ d.	5 ¹ / ₂ d.	8 ¹ / ₂ d.	6 ³ / ₄ d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	8d.	6 ¹ / ₄ d.	9 ¹ / ₂ d.	8d.

CEYLON. The quantity brought forward was again comparatively large and prices in consequence were easier, a decline of a farthing to a halfpenny per lb. being registered in most descriptions. Exports from Ceylon to the United Kingdom during January are estimated at 5,500,000 lbs. The weather has lately been unfavourable for heavy flushing. The following averages may be mentioned:—"Wallaha" CTP Co., 1/1; "Norwood" EP&E Co., 1/0³/₄; "Waverley" CTP Co., "Hethersett," "Mooloya," and "New Dimbula" D, 1/0¹/₂. The average for the week is 10¹/₄d., against 9¹/₄d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8 ¹ / ₄ d.	6 ¹ / ₂ d.	9 ³ / ₄ d.	10d.
PEKOE (Ordinary leaf, little twist; fair liquor)	9 ¹ / ₄ d.	9d.	11d.	10 ³ / ₄ d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7 ³ / ₄ d.	5d.	9 ¹ / ₄ d.	9 ³ / ₄ d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8 ¹ / ₄ d.	6 ¹ / ₄ d.	10d.	10d.

JAVA. Auctions comprised a varied selection and included some invoices of very useful quality. The highest average was made by "Perbawattee," 207 packages from which Estate realized 11d. per lb. A Flowery Pekoe with white tips from "Sindang Sarie," was sold for 1/3 per lb. Bidding was brisk and prices ruled decidedly firm, this growth being now in considerable demand for home use, owing to the high prices ruling for certain grades of Indian and Ceylon Teas.

BANK RATE. 3 per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2¹⁵/₁₆. Colombo 1/2¹⁵/₁₆

Supplement to "CEYLON OBSERVER."
GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C. January 27th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	938,445 packages.	530,656 packages.	29,824 packages.
During the week 1892-1893.	893,594	513,905	35,102
33,217 packages INDIAN	} Total 46,826 packages have been offered in public auction.		
13,066 ,, CEYLON			
543 ,, JAVA			

The following table shows the progress of the Export trade in Indian and Ceylon Tea from Great Britain during the past three years. Canada and the United States are now important consumers of both kinds, while Turkey takes a considerable quantity of Indian Tea. One of the most noticeable features is the large quantity of Ceylon Tea sent to Germany in 1892 amounting to very nearly one million pounds, the bulk of which was most likely destined for the Russian Market. Fine flavoured Ceylon Teas grown at high altitudes, have for some time past been used in Russia, and it is very encouraging to find that prospects are good in this quarter, although it may be necessary to make concession to the Russian authorities in the way of paper lining to the tea chests, in order to remove any possible barrier against the rapid increase to the use of Ceylon Tea in this very important market.

Exports of Indian and Ceylon Tea from Great Britain during 1890, 1891, and 1892.

* Probably much of the Tea exported to Germany was for Russia

INDIAN. The first closing invoice of the season was sold on the 16th instant, and since then one or two more have been catalogued. The market as a whole is firm at fully last week's rates, the quantity brought forward having been materially less.

Weekly average of New Season's Tea sold on Garden Account, 1893, 25,460 pkgs. av. 10½. 1892, 21,878 pkgs. av. 9d.

	1893.	1892.	1893.	1892.	1893.	1892.

Comparative prices of Indian Tea in London:—

	1893.	1892.	1891.	1890.
DUST. (Fair ordinary, dark liquor)	4½d	4d	6¾d.	5½d.
FANNINGS. (Red to brown, strong rough liquor)	6d.	4½d.	7½d.	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7¾d.	6d.	9d.	7½d.
PEK. SOUG. (Blackish greyish, useful liquor)	8½d.	6¾d.	10d.	8d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	8½d.	11d.	9¼d.
PEK. SOUG. (Blackish greyish, inferior liquor)	7½d.	5½d.	9d.	6¾d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	8d.	6½d.	10d.	7¾d.

CEYLON. No actual change has taken place in the market, but prices for the lower grades are a trifle harder, and competition in the auctions has been maintained. The following averages may be mentioned:—"Ormidale," 1/6½; "Devonford," 1/1¼; "Norwood" of EP & ECo., and "Elbedde," 1/1. The average for week is 10½d., against 9d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1893.	1892.	1891.	1890.
PEKOE SOUG. (Ordinary leaf; fair liquor)	8½d.	6½d.	10d.	9¾d.
PEKOE (Ordinary leaf, little twist; fair liquor)	9½d.	9d.	11d.	10½d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7¾d.	5d.	9¾d.	9¼d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8½d.	6¼d.	10½d.	9¾d.

JAVA. The week's auctions have been confined to Teas of indirect import. These consisted of the lower grades, and in sympathy with similar descriptions from India and Ceylon sold readily

BANK RATE. 2½ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/23½. Colombo 1/2

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.
 13, ROOD LANE, LONDON, E.C. February 3rd, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	965,969 packages.	547,190 packages.	29,824 packages.
During the week 1892-1893.	927,291	526,854	35,357
13,486 packages	INDIAN	Total 46,690 packages have been offered in public auction.	
12,949	CEYLON		
255	JAVA		

INDIAN. Many Invoices now coming forward have an autumnal flavor. Less disposition to support late rates has resulted in a weaker market. Broken Pekoes at about 11d. were somewhat neglected, and sold at easier rates. Demand for the lower grades was decidedly less keen, and quotations for these must in consequence be reduced by fully a farthing.

Weekly average of New Season's Tea sold on Garden Account, 1893, 23,743 pkgs. av. 9 $\frac{3}{4}$ d. 1892, 22,308 pkgs. av. 9 $\frac{1}{2}$ d.

Comparative prices of Indian Tea in London:—

	(Description)	1893,	1892,	1891,	1890,
DUST.	(Fair ordinary, dark liquor)	4 $\frac{1}{4}$ d	4d.	6 $\frac{3}{4}$ d.	5 $\frac{1}{2}$ d.
FANNINGS.	(Red to brown, strong rough liquor)	6d.	4 $\frac{3}{4}$ d.	7 $\frac{1}{2}$ d.	6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	7 $\frac{1}{2}$ d.	6d.	9 $\frac{1}{4}$ d.	7 $\frac{1}{2}$ d.
PEK. SOUG.	(Blackish greyish, useful liquor)	8 $\frac{1}{4}$ d.	6 $\frac{3}{4}$ d.	10 $\frac{1}{4}$ d.	8d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	8 $\frac{3}{4}$ d.	8 $\frac{1}{2}$ d.	11d.	9 $\frac{1}{4}$ d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	7 $\frac{1}{4}$ d.	5 $\frac{1}{2}$ d.	9 $\frac{1}{2}$ d.	6 $\frac{3}{4}$ d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	7 $\frac{3}{4}$ d.	6 $\frac{3}{4}$ d.	10d.	7 $\frac{1}{2}$ d.

CEYLON. The total Export of Tea from Ceylon was 69,626,31 lbs. in 1892, against 682,744,20 lbs. in 1891; to the United Kingdom 63,505,065 lbs. in 1892, against 63,744,897 in 1891.

Less animation was noticeable in the bidding, resulting in rather lower quotations for all grades. Medium Broken Pekoes are neglected, in spite of the good value obtainable. Teas for price are $\frac{1}{4}$ d. to $\frac{1}{2}$ d. cheaper. Exports to the United Kingdom in January, were 5,800,000 lbs., and the estimate for February is 6,500,000 lbs. The following averages may be mentioned:—"Portswood," 1/3 $\frac{3}{4}$; "Wallaha" of the CTP Co., 1/0 $\frac{3}{4}$. Average for week, 10 $\frac{1}{4}$ d., against 9 $\frac{1}{4}$ d. for same week last year.

Comparative prices of Ceylon Tea in London:—

	(Description)	1893,	1892,	1891,	1890,
PEKOE SOUG.	(Ordinary leaf; fair liquor)	8 $\frac{1}{4}$ d.	6 $\frac{1}{2}$ d.	10 $\frac{1}{2}$ d.	9 $\frac{3}{4}$ d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	9d.	9d.	11 $\frac{3}{4}$ d.	10 $\frac{1}{4}$ d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	7 $\frac{3}{4}$ d.	5d.	10d.	9d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	8d.	6 $\frac{1}{4}$ d.	10 $\frac{3}{4}$ d.	9 $\frac{3}{4}$ d.

JAVA. Of the 255 packages brought to auction, only 105 were of direct import; these were from the "Perbawatee" Estate. The remainder comprised Teas brought over from Holland. Java Teas appear to have been freely used for home trade purposes lately.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

February 10th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

Indian.

Ceylon.

Java.

1891-1892. 998,832 packages. 564,296 packages. 30,921 packages.

ring the week 1892-1893. 953,902 ,, 542,024 ,, 37,278 ,,

415 packages INDIAN

470 ,, CEYLON

921 ,, JAVA

Total 41,806 packages have been offered in public auction.

The quantity of Tea used for Home Consumption since this season commenced has very greatly exceeded that in the corresponding period of last season. But the difference in the proportioned indicates that the *liquid consumption* has considerably increased, for a displacement of some *nine million* pounds of dry leaf has taken place in China Tea, and a corresponding increase in Indian and Ceylon Tea.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to 31st Jan.

	1889-1890.	per centages.	1890-1891.	per centages.	1891-1892.	per centages.	1892-1893.	per centages.

China, etc.	22,325,992	20,905,452	19,035,679	19,919,665

INDIAN. Somewhat lower rates were established early in the week both for Medium Pekoes and Broken Pekoes, and for lower grade Teas above 8d. per lb. Later sales were noticeable for longer demand and a disposition to support the lower range of prices which had been established. The following averages are worthy of note:—LMB "Moondakotee," 1/9½; "Kalej," 1/7¾; "Margaret's Hope," 1/6¼; LMB "Nagri," 1/4¾.

Weekly average of New Season's Tea sold on Garden Account, 1893, 17,535 pkgs. av. 10. 1892, 24,234 pkgs. av. 8¾d.

Comparative prices of Indian Tea in London:—

	(Fair ordinary, dark liquor)	1893,	4¼d	1892,	4d.	1891,	7d.	1890,	5½d.
JUST.									
ANNINGS.	(Red to brown, strong rough liquor)	..	6d.	..	4¾d.	..	7¾d.	..	6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	..	7¾d.	..	6d.	..	9¾d.	..	7½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	..	8¼d.	..	6¾d.	..	10¾d.	..	8d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	..	8¾d.	..	8¾d.	..	11d.	..	9¼d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	..	7¼d.	..	5½d.	..	9½d.	..	6¾d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	..	7¾d.	..	6¾d.	..	10¼d.	..	7½d.

CEYLON. Prices were again allowed to droop a little, but although quotations generally are slightly lower, buying at present rates appears more general. Medium Broken Pekoes are now relatively very cheap, and fully a halfpenny per lb. below prices current last week. The following averages may be mentioned:—EP & E Co. "Norwood," 1/0¾; CTP Co. "Wallaha," 1/0½; "Abbotsleigh," 1/0¼; "New Dimbula D," 1/-.

The average for the week is rather under 9¾d., against 9¼d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	(Ordinary leaf; fair liquor)	1893,	8¼d.	1892,	6¼d.	1891,	10½d.	1890,	9¾d.
PEKOE SOUG.									
PEKOE	(Ordinary leaf, little twist; fair liquor)	..	8¾d.	..	8¾d.	..	11½d.	..	10¼d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	..	7¼d.	..	5d.	..	9¾d.	..	9d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	..	8d.	..	6d.	..	10½d.	..	9½d.

JAVA. Competition has somewhat flagged, in sympathy with Indian and Ceylon markets, and many parcels were in consequence withdrawn. 101 chests from "Perbawattee" brought an average of 10½d. Fair prices were also made by an invoice from "Sindang Sarie" grown from Assam seed.

BANK RATE. 2½ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2½. Colombo 1/2½

The price bid for the "Gartmore" Broken Pekoe in our last week's circular should have been 10¼d., instead of 1/2.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

February 17th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	1,033,529 packages.	582,764 packages.	31,165 packages.
1892-1893.	976,442 "	556,850 "	37,670 "

during the week

22,540 packages	INDIAN	} Total 37,758 packages have been offered in public auction.
14,826 "	CEYLON	
392 "	JAVA	

The direct export of Tea from Ceylon to Foreign Countries was more important in 1892 than in 1891, aggregating lbs. 6,221,766 against lbs. 4,529,433 in 1891. The chief increase was in Australia which has become a most promising outlet for Ceylon Tea. Most of the other large markets received the bulk of their supply from London.

Owing to the increase in this branch of trade the quantity available for shipment to London in 1892 was rather below that of 1891.

Distribution of Tea Exports from Ceylon during the years 1891 and 1892.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
DUST. (Fair ordinary, dark liquor)	4¼d	4d	7d	5½d.
FANNINGS. (Red to brown, strong rough liquor)	6d	4¼d	7¾d	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7½d	5¾d	9½d	7½d.
PEK. SOUG. (Blackish greyish, useful liquor)	8¼d	6¾d	10½d	8d.
PEKOE. (Greyish to blackish some tip, useful liquor)	8¾d	8½d	11d	9¼d.
PEK. SOUG. (Blackish greyish, inferior liquor)	7¼d	5½d	9½d	6¾d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7¾d	6½d	10¼d	7½d.

CEYLON. The market showed further weakness for Teas over 9d., Medium Pekoes and Broken Pekoes being about a halfpenny cheaper. Teas for price continue in demand and remain without material change in quotations. The following averages may be mentioned:—"Ouvahkellie," 1/0¾; "CTP Co. Wallaha," 1/0½; "Henfold" and "Valamaly," 1/0¼.

The average for the week is 9¾d., against 9d. for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8¼d	6d	10¼d	9½d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8¾d	8½d	11¼d	10¼d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7¼d	5d	9¾d	8¾d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8d	5¾d	10½d	9½d.

JAVA. Only one auction was held, comprising an invoice from "Bagelen," which mostly sold with good competition at late rates. Catalogues are advertised for 1,980 packages.

BANK RATE. 2½ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2¾. Colombo 1/2¾

	JAVA		

Arrangements for the representation of Indian and Ceylon Tea at the Chicago Exhibition are now approaching completion. The Commissioners from both countries are busy with their preparations for the opening, which is to take place in little more than two months.

Direct exports from India to places outside Great Britain for the last three complete seasons, were most encouraging, viz.: in 1889/90, lbs. 5,388,560; in 1890/91, lbs. 6,286,416; in 1891/92, lbs. 9,275,473; the principal trade has been with Australasia and the Persian Gulf. Nearly all other important markets are supplied from London.

Exports of Indian Tea (in lbs.) from Calcutta from 1st May to 30th April.

INDIAN. Another week of moderate supply, coupled with somewhat better demand from the country, has imparted rather more strength to the market. Buyers appear more willing to support current rates in view of the certainty of a short crop. Teas for price continue in strong demand, while the low values ruling for Medium Broken Pekoes have at length induced rather more attention to this grade. Several estates have already printed their closing invoices. The following averages are worthy of note:—"Tong Song," 1/7½; "Tukvar," 1/1¼, and "Barnesbeg," 1/1½, both of the "Lebong T Co.;" "Upper Assam Co.," 1/0¾.

Weekly average of New Season's Tea sold on Garden Account, 1893, 17,178 pkgs. av. 9¾. 1892, 18,816 pkgs. av. 8¾d.

PEK. SOUG. (Blackish greyish, inferior liquor)	7¾d.	5d.	9½d.	6¾d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7¾d.	6¼d.	10¼d.	7½d.

CEYLON. With light auctions, competition somewhat improved; rates for the lower grades hardened a trifle. Broken Pekoes continue remarkably cheap, but show a little more life. Telegraphic advices from Ceylon give the estimated shipments to the United Kingdom for February as 5,500,000 lbs., and state that rain is still much wanted. The following averages may be mentioned:—"Ormidale," 1/5½; "Norwood of the EP & ECo.," 1/0¾; "Ouvahkellie," 1/0¼; and "Nayabedde," 1/-. Average for week is 9¾d., against just over 9d. for same week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8¼d.	5¾d.	10d.	9¼d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8¾d.	8½d.	11¼d.	10¼d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7¼d.	4¾d.	9¾d.	8½d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8d.	5½d.	10¼d.	9d.

JAVA. At the Java Sales, 1,125 packages were brought forward. The Teas of direct import comprised selections from eight estates. A few Teas from Holland were also included in the auctions. With good competition nearly everything was disposed of at about late quotations. 4584 packages are to be offered for sale in Amsterdam on the 1st March.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

March 3rd, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
During the week 1891-1892.	1,083,442 packages.	617,694 packages.	33,034 packages.
1892-1893.	1,026,493	580,970	41,311
813 packages INDIAN	Total 37,955 packages have been offered in public auction.		
626 ,, CEYLON			
516 ,, JAVA			

Deliveries of Indian and Ceylon Tea, as shown below, are at first sight disappointing. No doubt purchasers have operated as little as possible in the lower grades, owing to comparatively high prices ruling; and these Teas supply the bulk of the home consumption.

But another cause has been powerfully influencing deliveries of Indian and Ceylon Tea. A displacement of nearly 18 million pounds occurred in the use of China Tea in 1892. Consequently the natural increase in the use of liquid Tea could be maintained with a comparatively *small* addition to deliveries of the stronger Teas of India and Ceylon. Whenever the displacement of China Tea becomes slower, there must of necessity be a *large* addition to the weight of Indian and Ceylon Tea used, in order to supply this increasing liquid consumption of Tea.

INDIAN. The market has been rather stronger for Teas for price, and buyers are beginning to display more confidence in operating.

Weekly average of New Season's Tea sold on Garden Account, 1893, 15,160 pkgs. av. 9 $\frac{1}{2}$ d. 1892, 14,974 pkgs. av. 8 $\frac{3}{4}$ d.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
JUST. (Fair ordinary, dark liquor)	4 $\frac{1}{2}$ d	3 $\frac{3}{4}$ d	7d	5 $\frac{1}{2}$ d
ANNINGS. (Red to brown, strong rough liquor)	6d	4 $\frac{1}{2}$ d	7 $\frac{3}{4}$ d	5 $\frac{3}{4}$ d
BROKEN TEA. (Brownish to blackish, strong liquor)	7 $\frac{1}{2}$ d	5 $\frac{3}{4}$ d	9 $\frac{1}{2}$ d	7 $\frac{1}{2}$ d
BLACK SOUG. (Blackish greyish, useful liquor)	8 $\frac{1}{2}$ d	6 $\frac{1}{2}$ d	10 $\frac{1}{2}$ d	7 $\frac{3}{4}$ d
BLACK SOUG. (Greyish to blackish some tip, useful liquor)	8 $\frac{3}{4}$ d	8 $\frac{1}{2}$ d	11d	9d
BLACK SOUG. (Blackish greyish, inferior liquor)	7 $\frac{1}{2}$ d	5d	9 $\frac{1}{2}$ d	6 $\frac{1}{2}$ d
BLACK SOUG. (Blackish, greyish, some tip, inferior liquor)	7 $\frac{3}{4}$ d	6 $\frac{1}{2}$ d	10 $\frac{1}{2}$ d	7 $\frac{1}{2}$ d

CEYLON. Competition for the lower grades was decidedly strong, but other descriptions continue somewhat neglected. Exports to the United Kingdom for February are cabled as 6,200,000 lbs. Average for the week is rather over 9 $\frac{1}{2}$ d., against 9d. for corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
BLACK SOUG. (Ordinary leaf; fair liquor)	8 $\frac{1}{2}$ d	5 $\frac{3}{4}$ d	9 $\frac{3}{4}$ d	8 $\frac{3}{4}$ d
BLACK SOUG. (Ordinary leaf, little twist; fair liquor)	8 $\frac{3}{4}$ d	8 $\frac{1}{2}$ d	10 $\frac{3}{4}$ d	10 $\frac{1}{2}$ d
BLACK SOUG. (Rather bold leaf; indifferent liquor)	7 $\frac{1}{2}$ d	4 $\frac{3}{4}$ d	9 $\frac{1}{2}$ d	8d
BLACK SOUG. (Somewhat bold leaf; indifferent liquor)	8d	5 $\frac{1}{2}$ d	10d	8 $\frac{3}{4}$ d

JAVA. Auctions were comparatively heavy, but bidding was animated and prices very firm, the home trade finding it to their advantage to use these Teas in the present state of the market.

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

March 10th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

Indian. Ceylon. Java.

1891-1892. 1,105,599 packages. 630,858 packages. 33,034 packages.

During the week 1892-1893. 1,057,652 ,, 602,619 ,, 42,342 ,,

1,159 packages INDIAN

1,649 ,, CEYLON

1,031 ,, JAVA

Total 53,839 packages have been offered in public auction.

The slight disappointment which may have been occasioned by the poor deliveries of Indian and Ceylon Tea during February, should be more than counterbalanced by the duty payments, shown below, of the past nine months;—in which Indian and Ceylon have made considerable strides, in spite of the reduced quantity of China Tea used.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to end of Feb.

	1889-1890.	per centages.	1890-1891.	per centages.	1891-1892.	per centages.	1892-1893.	per centages.

INDIAN. General firmness has characterised the market for Teas below 9d., the weakness in other kinds still continuing. Closing invoices are being freely catalogued. The following averages are worthy of note:—"Budla Beta," 1/8; "Luckimpore," 1/3¼; "Hattiali," 1/2¼; "Beheading," 1/1¼; "Rungmook," 1/1½; "Tukvar," 1/0¼.

Weekly average of New Season's Tea sold on Garden Account, 1893, 21,873 pkgs. av. 10. 1892, 16,173 pkgs. av. 8¾d.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
MUST. (Fair ordinary, dark liquor)	4¼d	3¾d.	7d.	5½d.
FANNINGS. (Red to brown, strong rough liquor)	6d.	4½d.	7¾d.	5¾d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7¾d.	5¾d.	9½d.	7¾d.
PEK. SOUG. (Blackish greyish, useful liquor)	8¼d.	6¼d.	10¼d.	8d.
PEKOE. (Greyish to blackish some tip, useful liquor)	8¾d.	8¾d.	11d.	9¾d.
PEK. SOUG. (Blackish greyish, inferior liquor)	7¼d.	5d.	9½d.	6¾d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7¾d.	6¼d.	10¼d.	7½d.

CEYLON. Teas under 8d. continue in strong demand at very firm rates, dusts and fannings marking an advance. Grades above 9d., in spite of the good value shown, have not yet attracted the attention they should command, and quotations are in consequence about a half-penny below last week's rates;—hence the fall of a farthing in the average price. It is estimated that about 7,000,000 lbs. will be exported from Ceylon to all places during 1893 as against 69,600,000 lbs. in 1892. The following averages may be mentioned:—"Dessford" and "New Dimbula D," 11¾d.; "Henfold" and "Valamaly," 11¼d. Average for week is rather over 9¼d., against 8¾d. for same week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8¼d.	5¾d.	9½d.	9d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8¾d.	8½d.	10¾d.	10½d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7¼d.	4¾d.	9¼d.	8d.
PEKOE (Somewhat bold leaf; indifferent liquor)	8d.	5¾d.	10d.	8¾d.

JAVA. Sales passed off with good competition at very firm rates, an invoice from "Perbawattee" being conspicuous for good quality and realizing an average price of 10½d. Some good Teas were also sold from "Djatinangor" and "Tjiomas." 484 packages are catalogued for next week.

BANK RATE. 2½ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2¼, Colombo 1/2¼.

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

March 17th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	1,126,299 packages.	641,718 packages.	33,034 packages.
During the week 1892-1893.	1,083,086	625,649	42,826

6,524 packages INDIAN }
3,030 ,, CEYLON } Total 50,038 packages have been offered in public auction.
484 ,, JAVA }

Home Trade still continues slack and buyers appear unwilling to increase stocks. Export markets have recently paid some attention to medium grades of Indian and Ceylon Tea. The extremely low values now current for this class should conduce to more notice than has as yet been bestowed upon them.

The total re-export of Indian and Ceylon Tea from Great Britain during the last three years was as follows, viz.: 1890, 4,056,510 lbs., 1891, 5,432,857 lbs., 1892, 7,209,709 lbs., thus showing a steady and encouraging advance.

We annex, on the last page, a table showing the quantities of Indian and Ceylon Tea exported from the United Kingdom during each month of the last three years, commencing January 1890.

INDIAN. Demand has been somewhat slack and prices are a trifle lower than those of last week, although a reduced quantity was brought forward.

TRAVANCORE has been a considerable item in the auctions during the past few weeks and some fair averages have been made. The following averages are worthy of note:—"Doom Dooma Co. Pandang," 1/3¼; "Barjang T Co.," 1/1½; "Romai," 1/1¼; "LMB Nagri," 1/1.

Weekly average of New Season's Tea sold on Garden Account, 1893, 16,702 pkgs. av. 9½. 1892, 14,411 pkgs. av. 8¾d.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
JUST. (Fair ordinary, dark liquor)	4¼d	3¾d	7d	5¼d.
ANNINGS. (Red to brown, strong rough liquor)	6d.	4½d.	7¾d.	5½d.
ROKEN TEA. (Brownish to blackish, strong liquor)	7¾d.	5¾d.	9½d.	7d.
EK. SOUG. (Blackish greyish, useful liquor)	8d.	6¼d.	10¼d.	8d.
EKOE. (Greyish to blackish some tip, useful liquor)	8¾d.	8¾d.	11d.	9¾d.
EK. SOUG. (Blackish greyish, inferior liquor)	7¾d.	5d.	9½d.	6½d.
EKOE. (Blackish, greyish, some tip, inferior liquor)	7¾d.	6½d.	10¼d.	7½d.

CEYLON. The heavy supplies catalogued for this and last week, together 44,679 packages, have further strained the market and caused a depression of nearly a half-penny in quotations. Medium Broken Pekoes and Pekoes continue most neglected, but Teas for price have now slightly participated in the decline. Really fine flavoured high class Teas are much wanted, but are in very small supply. A small lot of "Pedro" Broken Pekoe, brought the high price of 2/3¼ per lb.

Were Thursday's auctions more generally supported at times when large quantities of Tea are arriving, so great a number of breaks need not be printed for one day, and the buying powers of the trade would thus be less severely taxed. The following averages may be mentioned:—"EP & ECo. Norwood," 1/1½; "Dessford," 1/0¼; "EP & ECo. Labukelle," 11¼d.; "Kandapolla" and "Portmore," 11½d. Average for week is rather over 9d., against 9¼d. for same week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8d.	5¾d.	9½d.	9d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8½d.	8½d.	10½d.	10½d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7¾d.	4¾d.	9½d.	8¾d.
PEKOE (Somewhat bold leaf: indifferent liquor)	8d.	5½d.	9¾d.	9d.

JAVA. Auctions comprised selections from three Estates only, and passed off with fair spirit, the small quantity finding ready purchasers. Perbawattee was represented by 148 packages, for which an average price of 10d. per lb. was obtained. 200 packages Djatinangor brought an average 7½d. per lb.

BANK RATE. 2½ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2¾. Colombo 1/2¾

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

March 24th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	1,149,274 packages.	656,477 packages.	33,071 packages.
1892-1893.	1,107,267 "	646,527 "	44,073 "

during the week

1,181 packages	INDIAN	} Total 46,306 packages have been offered in public auction.
1,878 "	CEYLON	
1,247 "	JAVA	

At a time like the present, when dulness pervades the tea trade in the United Kingdom, it is a relief to be able to turn to foreign markets for some response to the excellent values now offering. It is therefore a satisfaction to discern that the efforts made, during the past few years, to encourage new outlets for Indian and Ceylon Teas, have been attended with such marked success.

The Continent of North America, to which the attention of the civilised world is now being diverted, is naturally looked to, in the hope that the kindred interests of India and Ceylon will benefit by the forthcoming Chicago Exhibition. Preparations have been made by both these countries, not only for a thorough exhibit of their respective Teas, but also with a view to sustaining their endeavours to foster the taste for Indian and Ceylon Tea after the close of the World's Fair.

Information from the Ceylon Planters Tea Company of America states, that there are over 100 stores in New York City and Brooklyn alone, where its Teas are sold.

INDIAN. The market has not changed much during the week but a rather better demand has been noticeable for Teas under 1/- per lb. and the lower grades have ruled a trifle firmer. A few choice parcels from Darjeeling met with good support and realized high prices. The following averages are worthy of note:—"Seeyok," 1/1³/₄; "Sealkotee," 1/0³/₄; "Jaipur," 1/0¹/₂; "Dibroo," "Poobong" and "Rungmook," 1/0¹/₄.

Weekly average of New Season's Tea sold on Garden Account, 1893, 18,417 pkgs. av. 9¹/₂. 1892, 16,090 pkgs. av. 9¹/₂d.

BEKOE.	(Blackish. greyish. some tip. inferior liquor)	"	7 ³ / ₄ d.	"	6 ³ / ₄ d.	"	10 ¹ / ₄ d.	"	7 ³ / ₄ d.

CEYLON. The week's auctions have again been on a fairly heavy scale, the bulk of the sales taking place on Tuesday, and thus somewhat straining the buying capacity of the trade. The market was fairly strong at the lower rates established last week; and at these prices demand appears to be rather more pronounced, although irregularity was noticeable here and there in Medium Broken Pekoes and Pekoes. The following averages are worthy of note:—"EP & ECo. Norwood," 1/0³/₄; "Henfold," "Holmwood" and "Valamaly," 11¹/₂d.

Average for week is 9d., being the same for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

PEKOE SOUG.	(Ordinary leaf; fair liquor)	1893,	8d.	1892,	6d.	1891,	9 ¹ / ₂ d.	1890,	9d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	"	8 ¹ / ₂ d.	"	8 ³ / ₄ d.	"	10 ¹ / ₂ d.	"	10 ¹ / ₂ d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	"	7d.	"	5d.	"	9 ¹ / ₄ d.	"	8 ¹ / ₄ d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	"	7 ³ / ₄ d.	"	5 ³ / ₄ d.	"	10d.	"	9 ¹ / ₄ d.

JAVA. 1247 packages were brought forward and met with good support, fair prices being generally realized. Some Teas from the Sinagar Estate grown from Assam seed were noticeable. Only three other estates were represented, in addition to a few Teas brought over from Amsterdam.

BANK RATE. 2¹/₂ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2³/₄. Colombo 1/2³/₄

In these tables all packages are chests unless otherwise stated. b stands for boxes; ½c for half-chests; p for packages † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

March 30th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
during the week 1891-1892.	1,161,796 packages.	673,013 packages.	33,535 packages.
1892-1893.	1,114,465 "	658,168 "	45,443 "
1,198 packages	INDIAN	Total 21,209 packages have been offered in public auction.	
1,641 "	CEYLON		
1,370 "	JAVA		

The figures above show that 1,114,465 packages of Indian Tea have been brought to auction since the commencement of the season, as against 1,161,796 packages during the same period of last season. 101 gardens have now sold their closing invoices, as against 99 to the same date last year.

Printing since Christmas has not been carried on quite as freely as last year, doubtless owing in great measure to the comparative slackness of trade during the earlier months of this year.

Of Ceylon Tea, 658,168 packages have been brought to auction to date this season, against 673,013 during the same period of last season, the arrivals to the end of February having been rather smaller.

INDIAN. The only auctions held were on Monday, after which the Market closed for the holidays. Bidding was animated and prices were generally firm—the lower grades occasionally showing a hardening tendency. The following averages are worthy of note:—"Doom Dooma Co., Pandang," 1/1, and "Beesakopi," of same Co., 1/-

Weekly average of New Season's Tea sold on Garden Account, 1893, 6,515 pks. av. 9¼. 1892, 15,251 pks. av. 9½d.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
JUST. (Fair ordinary, dark liquor)	4¼d	3¾d.	7d.	5d.
ANNINGS. (Red to brown, strong rough liquor)	6d.	4½d.	7¾d.	5½d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7¾d.	5¾d.	9½d.	7d.
PEK. SOUG. (Blackish greyish, useful liquor)	8d.	6½d.	10¼d.	8¼d.
PEKOE. (Greyish to blackish some tip, useful liquor)	8¾d.	9d.	11d.	9¼d.
PEK. SOUG. (Blackish greyish, inferior liquor)	7¼d.	5¼d.	9½d.	6½d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7¾d.	6¾d.	10¼d.	7½c.

CEYLON. Tuesday's auction passed with good competition at a slight recovery from late depressed rates, more demand being noticeable for both the lower grades and good liquoring Broken Pekoes. No further auctions will be held till after Easter. The following averages may be mentioned:—"Ormidale," 1/3; "Wallaha, of the CTPCo.," "Kandapolla," and "Elgin," 11½d. Average for week is 9d., being the same for the corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8d.	6d.	9½d.	9d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8½d.	8¾d.	10½d.	10¾d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7d.	5d.	9¼d.	8¼d.
PEKOE (Somewhat bold leaf; indifferent liquor)	7¾d.	5¾d.	10d.	9¼d.

JAVA. The sales consisted entirely of Teas of direct import. Competition was good and prices were firm—the lower grades being slightly dearer. A small lot of Flowery Pekoe from "Perbakti" realized 1/9 per lb., and from "Tendjo Aijoe," 1/7½ per lb. Auctions are advertised for 3,599 packages to be sold after Easter.

BANK RATE. 2½ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2²⁵/₃₂. Colombo 1/2²⁵/₃₂

INDIAN. Average 9¼d.

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest

GOW, WILSON & STANTON, Brokers.

Supplement to CEYLON OBSERVER.
GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

April 7th, 1893.

The Market has remained closed, so far as Public Sales are concerned, during the whole of this week. It re-opens for Indians on Monday, and Ceylons on Tuesday next.

Deliveries of all Tea during March are disappointing, being a natural reflection of the extremely dull condition lately prevailing in the Tea trade generally throughout the Kingdom.

Exports to the end of March from Calcutta to the United Kingdom are telegraphed as 106 million pounds as against nearly 110 million pounds for the same period of last season.

The export from Ceylon to the United Kingdom during March is telegraphed as about 6,000,000 lbs., and the estimate for April is 7,000,000 lbs.

We print with this circular a table, which shows the Home Consumption of Tea in Great Britain during each year since 1866. The consumption of Indian Tea is specified from that date and of Ceylon Tea from the year 1885. The average consumption of all Tea per head of population each year is also shown.

Comparative prices of Indian Tea in London:—

JUST.	(Fair ordinary, dark liquor)	1893,	4 $\frac{1}{4}$ d	1892,	3 $\frac{3}{4}$ d.	1891,	7d.	1890,	5d.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

April 14th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.	
During the week 1891-1892.	1,211,623 packages.	704,658 packages.	37,668 packages.	
1892-1893.	1,138,469 "	679,789 "	49,217 "	
2,004 packages	INDIAN			Total 49,399 packages have been offered in public auction.
2,621 "	CEYLON			
774 "	JAVA			

The slackness of trade in the country, and the reluctance displayed by some to pay duty on anything not absolutely necessary, before the publication of the Budget, have recently told rather severely upon figures;—hence the duty payments shown below appear to compare unfavorably with that season, unless sufficient allowance be made for this temporary derangement of clearances.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to 31st of March.

	1889-1890.	per centages.	1890-1891.	per centages.	1891-1892.	per centages.	1892-1893.	per centages.

INDIAN. The market reopened on Monday with brisk competition for the lower grades, using a very firm tone for these with an occasional advance of a farthing per lb. Medium kinds all steadily at rates current before Easter. The following averages are worthy of note:—"Assam Co., Towkok," 1/0³/₄; "Seeyok," 1/0³/₄; "Assam Co., Gabroo Purbot," 1/0¹/₄; "Dahingepar," 1/-
Weekly average of New Season's Tea sold on Garden Account, 1893, 16,790 pkgs. av. 9¹/₄. 1892, 9,587 pkgs. av. 8³/₄d.

Comparative prices of Indian Tea in London:—

		1893,	1892,	1891,	1890,
JUST. (Fair ordinary, dark liquor)		4 ³ / ₄ d	3 ¹ / ₂ d.	7d.	5d.
ANNINGS. (Red to brown, strong rough liquor)		6 ¹ / ₂ d.	4 ¹ / ₂ d.	8d.	5 ³ / ₄ d.
BROKEN TEA. (Brownish to blackish, strong liquor)		7 ³ / ₄ d.	5 ¹ / ₂ d.	9 ³ / ₄ d.	7 ¹ / ₄ d.
PEK. SOUG. (Blackish greyish, useful liquor)		8 ¹ / ₂ d	6 ¹ / ₂ d.	10 ¹ / ₄ d.	8 ¹ / ₂ d.
PEKOE. (Greyish to blackish some tip, useful liquor)		9d.	9d.	11 ¹ / ₄ d.	9 ¹ / ₄ d.
PEK. SOUG. (Blackish greyish, inferior liquor)		7 ¹ / ₄ d.	5d.	9 ³ / ₄ d.	7d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)		7 ³ / ₄ d.	6 ¹ / ₂ d	10 ³ / ₄ d.	7 ³ / ₄ d.

CEYLON. Tuesday's large sale did not prove excessive after the fortnight's cessation of auctions. Bidding was animated, and prices ruled firm for all descriptions, the lower grades being keenly competed for at an occasional slight advance in rates. The following averages may be mentioned:—"Dessford," 1/0³/₄, "Labukelle, EP&ECo," 1/0³/₄, "Norwood, EP&ECo," 1/2¹/₂, "Wallaha, CTPCo," 11³/₄d. Average for week 9d., against 8³/₄d. for corresponding week last year.

Comparative prices of Ceylon Tea in London:—

		1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)		8d.	5 ³ / ₄ d.	9 ¹ / ₂ d.	8 ³ / ₄ d.
PEKOE (Ordinary leaf, little twist; fair liquor)		8 ³ / ₄ d.	8 ¹ / ₂ d.	10 ¹ / ₄ d.	10 ³ / ₄ d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)		7 ¹ / ₄ d.	4 ³ / ₄ d.	9 ¹ / ₄ d.	8 ¹ / ₄ d.
PEKOE (Somewhat bold leaf; indifferent liquor)		7 ³ / ₄ d.	5 ¹ / ₂ d.	10d.	9d.

JAVA was represented by a large selection, comprising a varied assortment. A strong market for all grades was the predominant feature in the auctions. Some good Teas were offered from the "Sinagar" Estate. About 600 packages of Tea brought over from Holland were included in the catalogues.

BANK RATE. 2¹/₂ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2³/₄. Colombo 1/2³/₄

GEO. WHITE & CO'S ANNUAL INDIA, CEYLON AND JAVA TEA REPORT.

TEA REPORT FOR 1892.

London, 31, Fenchurch Street, R.C.
21st March, 1893.

Owing to unfavourable climatic influences in some quarters, and also to a considerable extent to more moderate plucking, the over-production from all countries, which was at one time feared respecting this season's cut-ten of Tea, happily did not take place, although supplies will apparently be sufficient for trade requirements.

INDIA.—The excellent quality of the 1892 India crop, which was recognized from the first, gave a much needed fillip to business, and was of great help to the market for good in finest descriptions up to November, by which time buyers had accumulated full stocks of these grades, and commenced to turn their attention to the low-priced Tea. Common Pekoe Soucheongs therefore, which, at the beginning of the season were selling at 4d. per lb., are worth at the present time 7d. per lb., the quotation for "Type," i.e., Pekoe Souching with fair leaf and liquor, being 8-10d. per lb., whereas last year it was 6-10d. per lb., and 10-7-16d. per lb. in 1891. Since December this has been more marked, as dealers found that the good quality of the Pekoe Soucheongs enabled them to use this class more freely, to the detriment of medium to fine Pekoes and Broken Pekoes, which have accordingly remained depressed. The comparative scarcity of finest and choice parcels, however, tended to keep up their value, and high rates were obtained for some of the closing invoices from Darjeeling and Assam.

Notwithstanding a shorter crop than was originally estimated, the result financially, taking into consideration lower freights and exchange, will, in many instances, be better for owners of Estates owing to the higher average realized, which, for 608,000 packages, sold on garden account from 1st July to end of February last, was 10d. per lb., against 9d. per lb. for 707,000 packages last season. Calcutta purchases also, to the close of the year, generally met a rising market here, and resulted favourably.

Deliveries for the twelve months ending 31st December, 1892, showed an increase of 10 million lb. over those of the previous year, being 11,245,000 lb. against 10,100,000 lb. Although from 1st July to 25th February, the increase is less than half a million lb., the enhanced prices realized for common to fair having most likely checked buying for common to fair having trade and a clearing clearance, together with dull weather, are feeling amongst some buyers that the duty may be further reduced.

To 31st December last, 63 million lb. of the year's crop had been disposed of, against 63 million lb. in 1891, and up to now nearly 94 million lb., against 96 million lb., leaving the available supply, on the receipt of the new crop, rather less than in 1891, say about 14 million lb., (compared with 15 million lb. sold after 21st March, 1892), to make up 109 million lb., which will be the probable supply to the market from all the ports of India, after allowing for losses in the s.s. "Anglia," sunk in the Hooghly, and in a river flat on the way from Calcutta to Calcutta, in all, about 1 million lb.

CEYLON.—For the same reasons which prevailed in India, as given above, shipments from Colombo proved considerably under the estimates, receipts here from 1st July to the end of February being 39,875,000 lb., against 40,150,000 lb. in the previous year. In the early part of this period quality was not very attractive, but during October and November there was a marked improvement which, with increased clearances and moderate supplies, caused the average to rise from 8d. per lb. in July until it nearly reached 10d. per lb. in the middle of November. The low price current in the first half of 1892 stimulated consumption, so that during the second half deliveries were 35,217,000 lb., against imports of only 29,575,000 lb., thus reducing the stock from 18,381,000 lb. on 30th June to 12,738,000 lb. on 31st December. For the twelve months ending at this date, the home consumption of Ceylon Tea amounted to 62,870,000 lb., while that of China and Japan was only 39,000,000 lb. After the turn of the year, however, business slackened owing partly to bad trade in the country and to many of the Teas lacking strength and fulness, principally due to unfavourable weather, and also to their being first pluckings after pruning.

For the eight months from July 1st to the end of February, the average obtained for 503,700 packages sold in Public Sale was 9d. per lb., against 9d. per lb. for 498,350 packages last season.

JAVA.—Until October common kinds of Java did not meet with much attention, but after that month, through the demand for price, they were more sought after by the Home Trade, who found them valuable for blending on account of their useful quality, which has caused them to be freely taken up to the present. Fine and finest have been in request throughout, chiefly for the Continent. In contradistinction to the previous season the yield was rather large, and over 1 million lb. more has found its way to this market since 1st July.

EXPORTS.—As compared with the two previous years, the total amount exported from here during the past eight months is as follows:—

	India.	Ceylon.	Java.	China.
From 1st July 1892 to end of February 1893	2,199,000	2,172,000	1,421,000	18,265,000
From 1st July 1891 to end of February 1892	2,874,000	1,658,000	1,616,000	17,170,000

For the 12 months ending 31st December 1892	2,199,000	2,172,000	1,421,000	18,265,000
1891	2,874,000	1,658,000	1,616,000	17,170,000
1890	1,604,000	941,000	785,000	20,191,000

An idea of the countries to which shipments were chiefly made from Calcutta and Colombo, outside of Great Britain, from 1st May to the first week in February, for the past three years, can be gathered from the following figures:—

	India.	Ceylon.	Java.	China.
1892-3	3,125,000	757,000	93,000	180,000
1891-2	4,288,000	3,058,000	180,000	118,000
1890-1	4,545,000	742,000	118,000	118,000

The principal features in these are the decreased export from India to Australasia and Bombay, compared with last season, when very low quotations were ruling for Pekoes and Pekoe Soucheongs, and the marked increase in the quantity shipped from Colombo to the Australian Colonies, where it is evident that Teas are displacing those from China.

MANUFACTURE.—Looking at the 1892 crop in a satisfactory way, it is a case for congratulation. With every prospect of larger supplies in the coming season, it is to be hoped that planters will not be induced by the present high range established for pekoe soucheongs to broken teas under the name of "factory" or "broken" tea, which are not wanted here. This is a case for congratulation. With every prospect of larger supplies in the coming season, it is to be hoped that planters will not be induced by the present high range established for pekoe soucheongs to broken teas under the name of "factory" or "broken" tea, which are not wanted here.

SIZE OF BREAKS.—There is a growing feeling among the Trade in favor of larger breaks, as they economize so much time in weighing, packing, and unloading. It is gratifying to notice that further progress has been made in this direction, though in the case of many gardens, especially in the larger ones, the tea is not so well packed as it should be. Most of the large buyers refuse to take lots below 20 chests (except finest), although only parcels under 12 chests, 12 half-chests and 20 boxes are denominated as breaks, and as to assortment, the following has been in favour:—

Break	1892-3	1891-2	1890-1
1892-3	17,000	12,000	10,000
1891-2	12,000	8,000	6,000
1890-1	8,000	6,000	4,000

WAREHOUSE CHARGES.—Appended is a table showing the scale of warehouse charges in London, by which the higher rates obtained for Pekoe Soucheongs and Broken Pekoes are clearly shown. It is to be noted that in this table the charges are regulated in accordance with the weight of the packages as well as the nature of the goods.

Warehouse	1892-3	1891-2	1890-1
1892-3	17,000	12,000	10,000
1891-2	12,000	8,000	6,000
1890-1	8,000	6,000	4,000

ANALYSIS OF CROP.—In contradistinction to the previous season Assams have been unusually good, the average realized, as will be seen overleaf, being 14d per lb. more than in 1891-92. Most of them possessed the rich full flavoured liquor, so much appreciated in teas from this district.

DOORS.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

April 21st, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1891-1892.	1,211,623 packages.	704,658 packages.	38,387 packages.
1892-1893.	1,162,937 "	697,619 "	49,946 "

During the week

24,468 packages	INDIAN
17,830 "	CEYLON
729 "	JAVA

Total 43,027 packages have been offered in public auction.

Some slight revival appears to have taken place in the provincial demand; this has been chiefly noticeable in Teas for price, and has occasioned additional competition for such descriptions, resulting in an advance of about a farthing per lb.

It is expected that the Budget Statement will be made on Monday next.

A small parcel of Fiji Tea from the "Alpha" Estate was included in the auctions, the highest price offered being 8 $\frac{3}{4}$ d.

Telegraphic advice from Calcutta gives the estimate for the coming season's Indian Tea crop as 125,500,000 lbs. of which 116,500,000 lbs. is expected to be available for export.

INDIAN. The Market was again amply supplied, but the number of closing invoices has of late been so large that sales of Tea on garden account must soon show considerable diminution in quantity. Competition was good throughout the auctions. While medium grades showed no quotable change in price, the lower descriptions advanced a farthing per lb., and finest kinds were also in strong demand. A small lot of Jaipur Broken Pekoe brought 2/0 $\frac{1}{2}$ per lb., the Pekoe selling for 1/8 $\frac{1}{2}$, the invoice averaging 1/5 $\frac{1}{4}$ per lb. The following averages are worthy of note:—"Poobong," 1/3 $\frac{1}{4}$; "Rungli Rungliot," 1/1 $\frac{1}{2}$; Upper Assam Co, "Boroah," 1/1 $\frac{1}{4}$.

Weekly average of New Season's Tea sold on Garden Account, 1893, 16,019 pkgs. av. 9 $\frac{1}{4}$.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
DUST. (Fair ordinary, dark liquor)	5d	3 $\frac{1}{2}$ d.	7d.	5d.
FANNINGS. (Red to brown, strong rough liquor)	6 $\frac{1}{2}$ d.	4 $\frac{1}{4}$ d.	8d.	5 $\frac{3}{4}$ d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7 $\frac{3}{4}$ d.	5 $\frac{1}{2}$ d.	9 $\frac{3}{4}$ d.	7 $\frac{1}{2}$ d.
PEK. SOUG. (Blackish greyish, useful liquor)	8 $\frac{1}{2}$ d.	6 $\frac{1}{2}$ d.	10 $\frac{1}{4}$ d.	8 $\frac{1}{2}$ d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	9d.	11 $\frac{1}{4}$ d.	9 $\frac{1}{2}$ d.
PEK. SOUG. (Blackish greyish, inferior liquor)	7 $\frac{1}{4}$ d.	5d.	10d.	7d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7 $\frac{3}{4}$ d.	6 $\frac{1}{2}$ d.	10 $\frac{1}{2}$ d.	8d.

CEYLON. Auctions comprised a somewhat smaller quantity than last week, when it will be remembered, some accumulation from the previous fortnight was brought forward. With a good general demand, prices were fully maintained for all descriptions, except perhaps Medium Broken Pekoes, which sold with some slight irregularity. The few fine Teas attracted attention and sold readily at full rates. Teas for price showed a general advance of about a farthing, with keener competition. Some high prices were obtained for a small invoice of Aberdeen Tea in boxes, the Broken Pekoe realizing 2/0 $\frac{3}{4}$, the Pekoe 1/6 $\frac{3}{4}$, and the Pekoe Souchong 1/4 per lb., the average of the invoice being 1/8 $\frac{1}{4}$. The following averages may be mentioned:—"Labukellè," 1/0 $\frac{1}{2}$; "Dessford," 1/-; "Henfold," 11 $\frac{1}{2}$ d.; "Tangakelly," CTPCo., 11 $\frac{1}{2}$ d. Avge. for week rather over 9d. per lb.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8 $\frac{1}{4}$ d.	5 $\frac{3}{4}$ d.	9 $\frac{3}{4}$ d.	8 $\frac{3}{4}$ d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8 $\frac{3}{4}$ d.	8 $\frac{1}{2}$ d.	10 $\frac{1}{2}$ d.	10 $\frac{1}{4}$ d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7 $\frac{1}{2}$ d.	4 $\frac{3}{4}$ d.	9 $\frac{1}{2}$ d.	8 $\frac{1}{4}$ d.
PEKOE (Somewhat bold leaf; indifferent liquor)	7 $\frac{3}{4}$ d.	5 $\frac{1}{2}$ d.	10d.	9d.

JAVA. Only one auction was held, comprising selections from five Estates. Bidding was animated, and, in sympathy with similar grades of Indian and Ceylon Tea, some improvement was noticeable in the rates paid for the lower grades. "Perbawattee" was represented by two invoices which averaged together 10 $\frac{1}{4}$ d. per lb.

BANK RATE. 2 $\frac{1}{2}$ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2 $\frac{25}{32}$. Colombo 1/2 $\frac{25}{32}$

INDIAN. Average 9 1/4.

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages † Prices marked thus represent the highest order in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest

GOW, WILSON & STANTON, Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

April 28th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
During the week 1891-1892.	1,232,887 packages.	728,860 packages.	40,645 packages.
1892-1893.	1,185,499 "	715,379 "	51,899 "
2,562 packages INDIAN	Total 42,275 packages have been offered in public auction.		
7,760 " CEYLON			
1,953 " JAVA			

The reviving demand alluded to last week has further developed, but is chiefly noticeable in Teas of the lower grades, which are now strongly competed for, more especially those below 8d. per lb., where a slight advance has been established upon last week's rates.

It is probable that the publication of the Budget statement will tend towards a more settled feeling in the trade generally. Duty payments since Monday, when the Budget was read, have been exceedingly heavy.

INDIAN. The shortness of the present crop is shown by the smaller quantity which has so far been brought to auction, as will be seen by the above figures; and it is remarkable that 202 gardens have already sold their closing invoices against only 174 to the end of April last year, and 166 the previous season. Owing to the small quantity of Indian Tea now remaining in first hands, auctions were held only on Monday and Wednesday this week, and a similar arrangement will probably be continued until early in August. The market continued very strong throughout the week;—Teas under 9d. being keenly competed for at an advance of $\frac{1}{4}$ d. per lb. Bidding for other grades was also more animated, especially Teas possessing quality or thickness in cup. The following averages are worthy of note:—"Digloy Co. Pohukatta," $1\frac{1}{4}$; "Hattialli," $1\frac{1}{2}\frac{1}{2}$; "Nahor Kutia," $1\frac{1}{2}\frac{1}{4}$; "Behora," $1\frac{1}{0}\frac{3}{4}$.

TRAVANCORE has not been of late represented by very large quantities—probably owing to want of rain in this district; but quality has in some instances shown improvement, and better average prices were in consequence recorded.

Weekly average of New Season's Tea sold on Garden Account, 1893, 15,546 pkgs. av. 9 $\frac{1}{2}$. 1892, 15,954 pkgs. av. 8 $\frac{1}{2}$ d.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
JUST. (Fair ordinary, dark liquor)	5 $\frac{1}{4}$ d.	3 $\frac{1}{2}$ d.	7d.	5d.
ANNINGS. (Red to brown, strong rough liquor)	6 $\frac{1}{2}$ d.	4 $\frac{1}{2}$ d.	8d.	5 $\frac{3}{4}$ d.
ROKEN TEA. (Brownish to blackish, strong liquor)	8d.	5 $\frac{3}{4}$ d.	9 $\frac{3}{4}$ d.	7 $\frac{1}{2}$ d.
EK. SOUG. (Blackish greyish, useful liquor)	8 $\frac{1}{2}$ d.	6 $\frac{1}{2}$ d.	10 $\frac{1}{4}$ d.	8 $\frac{1}{2}$ d.
EKOE. (Greyish to blackish some tip, useful liquor)	9d.	9 $\frac{1}{2}$ d.	11 $\frac{1}{4}$ d.	9 $\frac{1}{4}$ d.
EK. SOUG. (Blackish greyish, inferior liquor)	7 $\frac{1}{2}$ d.	5 $\frac{1}{4}$ d.	9 $\frac{3}{4}$ d.	7d.
EKOE. (Blackish, greyish, some tip, inferior liquor)	7 $\frac{3}{4}$ d.	6 $\frac{3}{4}$ d.	10 $\frac{1}{4}$ d.	8d.

CEYLON was again well represented, the quantity being only 'slightly below that of last week. Bidding was animated and all grades were well supported, Teas for price showing an advance of a trthing per lb. Medium Broken Pekoes, however, sold somewhat slowly, with a little irregularity. The following averages may be mentioned:—"Ormidale," $1\frac{1}{2}\frac{1}{2}$; EP&E Co., "Norwood," 1/-; Ouhahkellie," "Valamaly," and CTPCo., "Wallaha," 11 $\frac{1}{2}$ d. Average for week 9 $\frac{1}{4}$ d. per lb., against 9 $\frac{1}{4}$ d. for corresponding week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	8 $\frac{1}{4}$ d.	6d.	9 $\frac{3}{4}$ d.	8 $\frac{1}{2}$ d.
PEKOE (Ordinary leaf, little twist; fair liquor)	8 $\frac{3}{4}$ d.	8 $\frac{3}{4}$ d.	10 $\frac{3}{4}$ d.	10d.
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7 $\frac{1}{4}$ d.	4 $\frac{3}{4}$ d.	9 $\frac{1}{4}$ d.	8d.
PEKOE (Somewhat bold leaf; indifferent liquor)	7 $\frac{3}{4}$ d.	5 $\frac{3}{4}$ d.	9 $\frac{3}{4}$ d.	8 $\frac{3}{4}$ d.

JAVA. A strong Market at slightly dearer prices has been the feature of the week. A good voice from "Tjiboengoer," sold at an average of 9d. per lb., "Panoembangan" and "Sindang Sarie" were also represented by some good useful liquoring Teas. $1\frac{1}{3}\frac{1}{2}$ was bid for a small lot of White Tipped Pekoe from "Tendjo Aijoe." 1,776 packages are catalogued for sale next week.

BANK RATE. 2 $\frac{1}{2}$ per cent. **EXCHANGE** on London three months sight.—Calcutta $1\frac{1}{2}\frac{7}{8}$. Colombo $1\frac{1}{2}\frac{7}{8}$

In these tables all packages are chests unless otherwise stated. b stands for boxes; $\frac{1}{2}$ c for half-chests; p for packages † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest

May 12th, 1893.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
During the week	1891-1892. 1,263,817 packages.	769,776 packages.	41,425 packages.
16,040 packages	1892-1893. 1,226,262	752,916	53,789
17,308	INDIAN	Total 33,468 packages have been offered in public auction.	
114	CEYLON		
	JAVA		

Duty payments are shown below from the commencement of the season to 30th April. Exceptionally heavy clearances having taken place since the Budget, the figures for May require to be added before the position again becomes normal.

This week has witnessed a quiet and somewhat inactive market, buyers complaining of great slackness in provincial demand.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st June to 30th of April.

	1889-1890. per centages.	1890-1891. per centages.	1891-1892. per centages.	1892-1893. per centages.
Indian	81,117,248 53	93,584,697 51	95,349,797 50	96,400,937 52
Ceylon	24,186,728 16	36,313,139 20	52,530,284 28	56,380,644 30
China, etc.	47,725,964 31	52,626,764 29	40,787,664 22	33,084,677 18
Total lbs.	153,029,940	182,524,600	188,673,745	185,866,258

Quantity of Tea exported from Great Britain, from 1st June to 30th of April.

	1889-1890.	1890-1891.	1891-1892.	1892-1893.
Indian	Included with China. 2,134,262	3,860,315	2,946,646	
Ceylon	" 1,294,162	2,672,592	3,217,620	
China, etc.	32,649,646	27,521,659	26,745,800	25,942,316

INDIAN. The quantity brought forward has shown marked reduction, but demand was slack and prices in consequence generally easier. Teas over 9d. per lb. must be quoted a farthing to a halfpenny cheaper, while the lower priced kinds sold with less competition in the bidding at slightly easier rates. A small lot of Orange Pekoe from the "Hukanpukri" Division of the 'Jokai Tea Co.' sold at 2/2½ per lb.

Weekly average of New Season's Tea sold on Garden Account, 1893, 5,912 pkgs. av. 9½. 1892, 6,228 pkgs. av. 8½d.

	1893.		1892.		1893.		1892.

Comparative prices of Indian Tea in London:—

	1893,	1892,	1891,	1890,
DUST. (Fair ordinary, dark liquor)	5½d	3½d	6½d	5½d
FANNINGS. (Red to brown, strong rough liquor)	6½d	4½d	7d	6d
BROKEN TEA. (Brownish to blackish, strong liquor)	7½d	6d	8½d	7½d
PEK. SOUG. (Blackish greyish, useful liquor)	8½d	6½d	9½d	8½d
PEKOE. (Greyish to blackish some tip, useful liquor)	8½d	10d	10½d	9½d
PEK. SOUG. (Blackish greyish, inferior liquor)	7½d	5½d	9d	7½d
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7½d	7d	9½d	8½d

CEYLON. The market showed less eagerness to purchase, and prices drooped to the extent of about a farthing per lb. on common Teas and a halfpenny on medium kinds. The few finest were in strong demand and sold freely at an occasional improvement in prices. The following averages may be mentioned:—"Wallaha," 11½d., and "Waverley," 11½d., both of the CTP Co.; and "Glentaffe," 11½d. Average for the week is 8½d., against 9½d. for same week last year.

Comparative prices of Ceylon Tea in London:—

	1893,	1892,	1891,	1890,
PEKOE SOUG. (Ordinary leaf; fair liquor)	7½d	6½d	8½d	8½d
PEKOE (Ordinary leaf, little twist; fair liquor)	8½d	9d	9½d	9½d
PEKOE SOUG. (Rather bold leaf; indifferent liquor)	7½d	5d	8½d	8d
PEKOE (Somewhat bold leaf; indifferent liquor)	7½d	6d	8½d	8½d

JAVA. The only Javas brought to public auction this week consisted of 114 packages which were brought over from Holland, no Teas of direct import being represented.

BANK RATE. 3½ per cent. **EXCHANGE** on London three months sight.—Calcutta 1/2½. Colombo 1/2½

NEW MARKETS FOR BRITISH GROWN TEA.

DEAR SIRS,

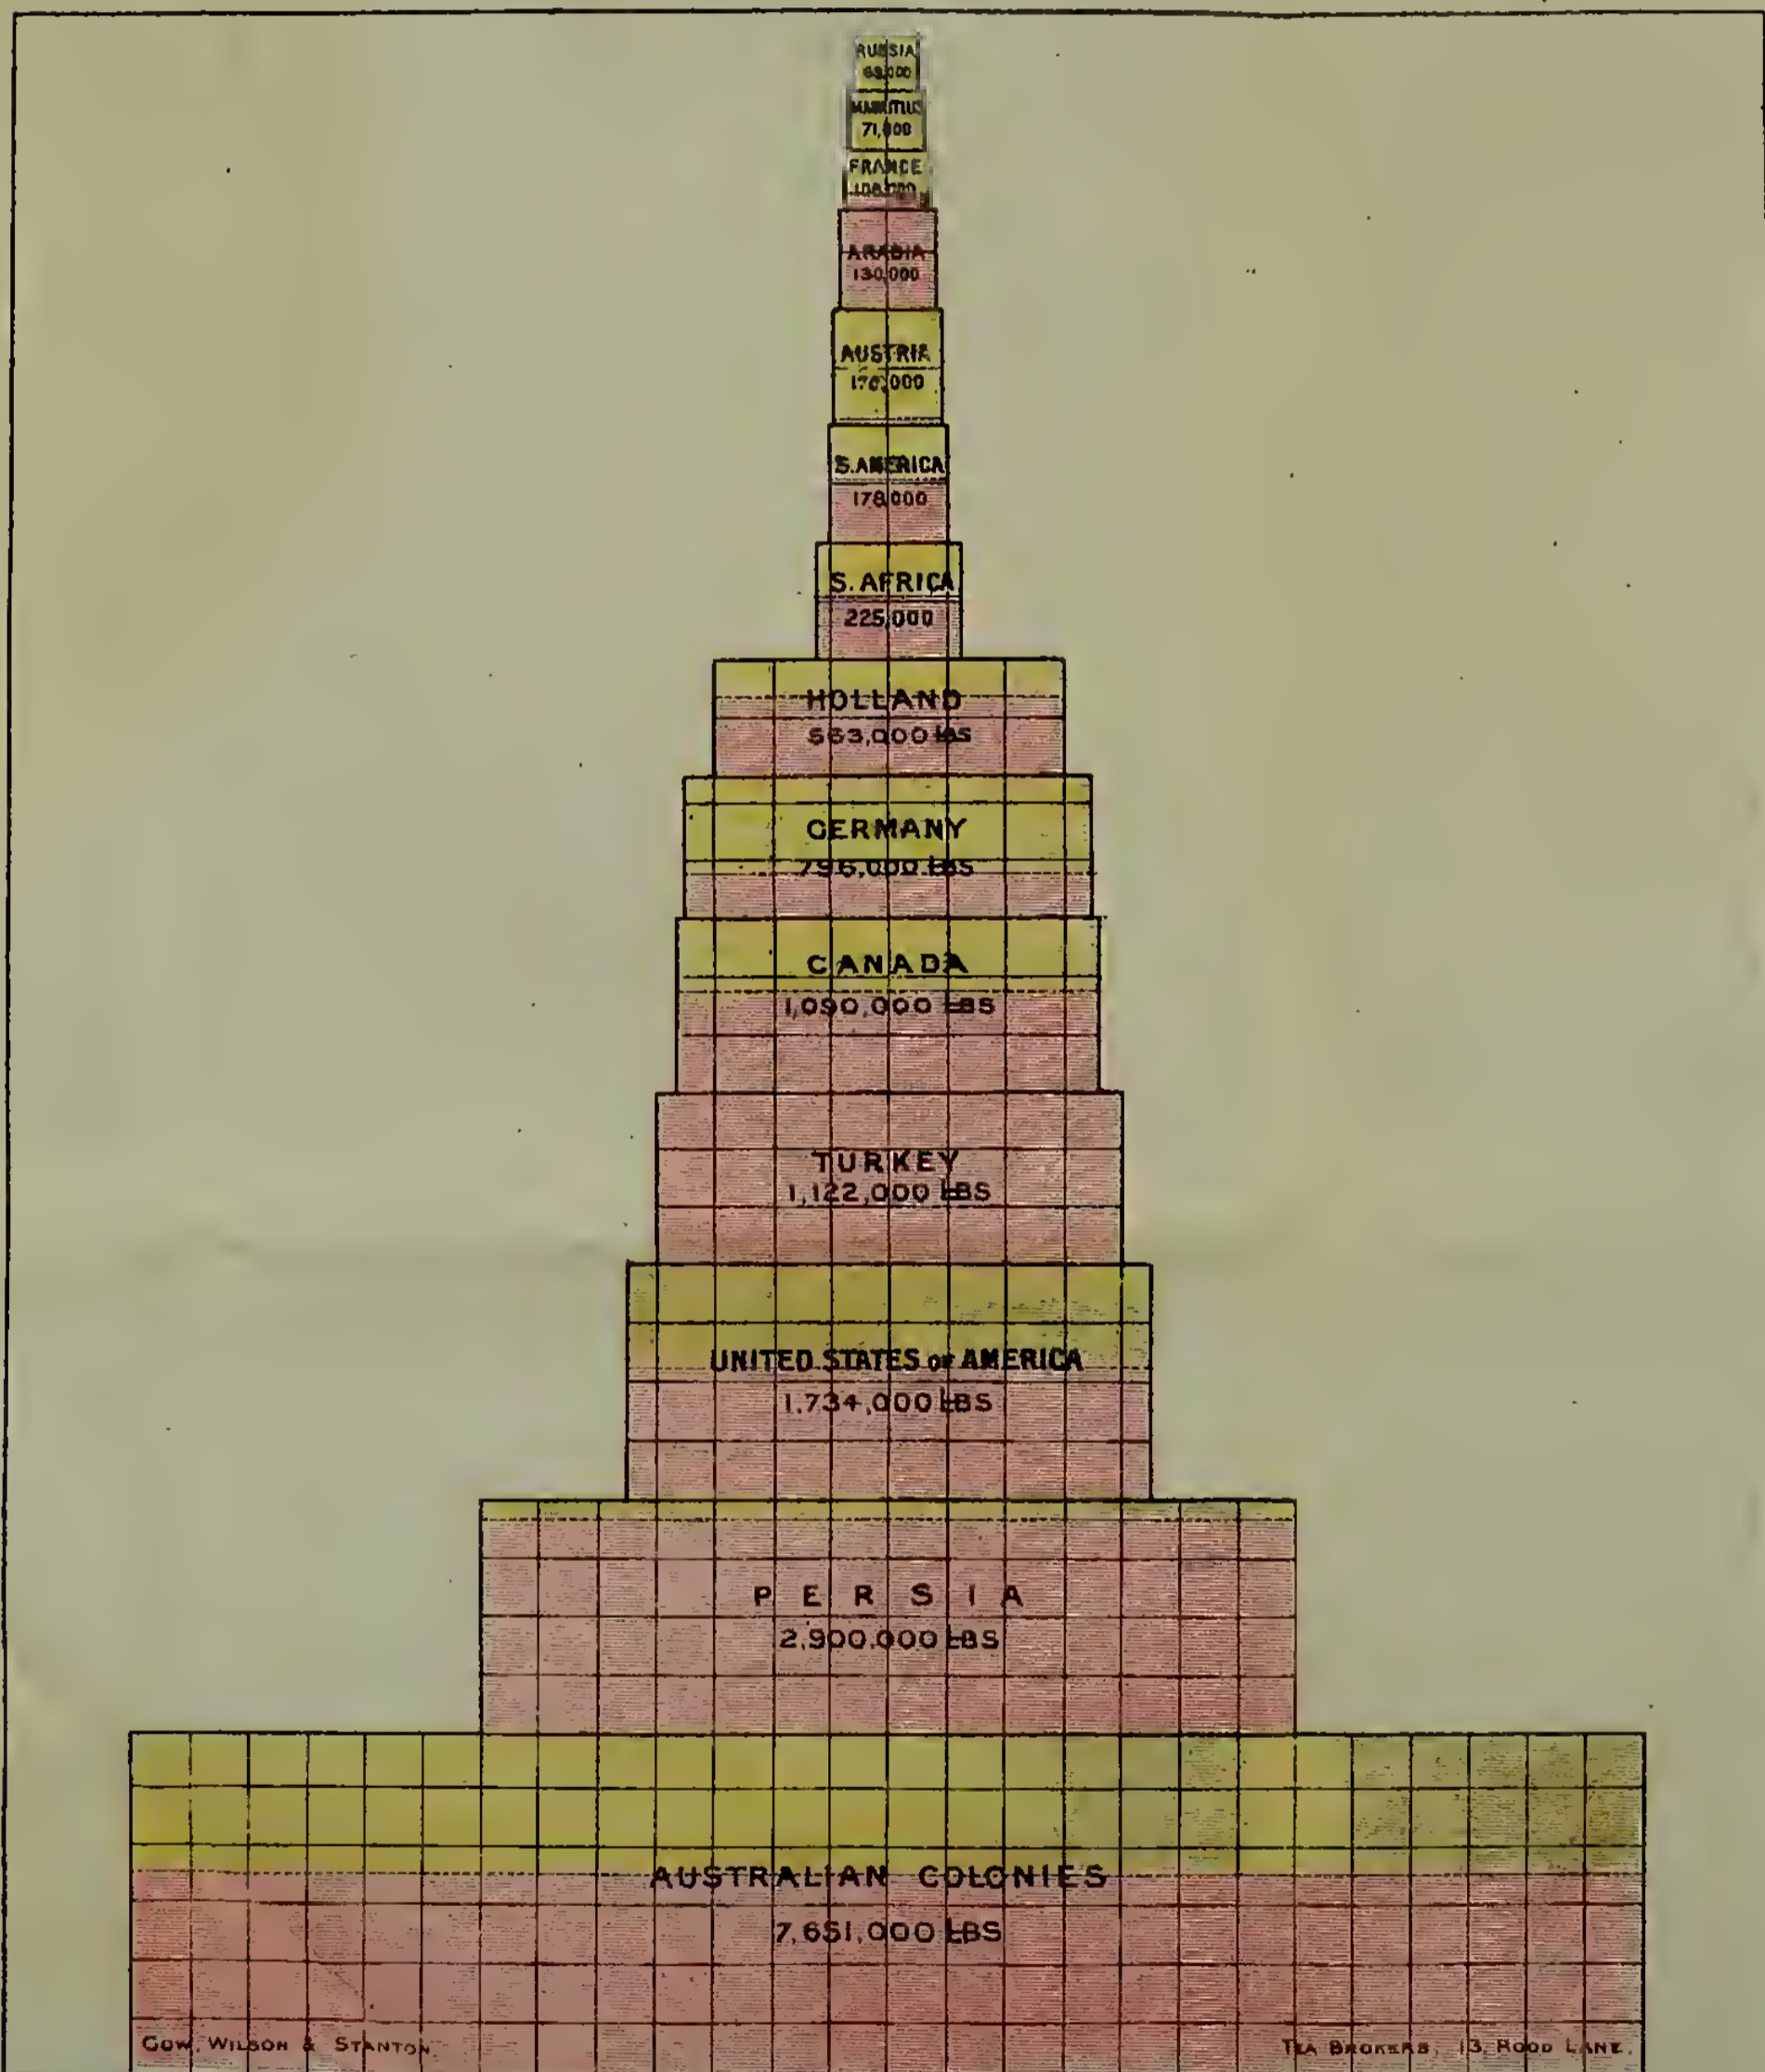

The crop of Indian and Ceylon Tea for the coming season may be estimated in round numbers at about 210 million lbs. Of this quantity it is a sanguine forecast to suppose Great Britain will consume more than 170 million lbs.

The object of this circular is to draw attention to foreign markets, in the hope that a great portion of the remaining 40 million lbs. may be absorbed by them, and that by this means a further shrinkage in prices may be avoided.

We are, DEAR SIRS,
Yours faithfully,
GOW, WILSON & STANTON,
Tea Brokers.

13, Rood Lane, London, E.C., May, 1892.

Indian and Ceylon Tea taken in principal Markets outside Great Britain during 1891.

Each square represents 50,000 lbs. Tea, Indian being shown in *red*, and Ceylon in *yellow*.

During last year about twenty million pounds of Indian and Ceylon Tea were taken by countries outside Great Britain. India contributed about thirteen million of this amount and Ceylon about seven.

The quantity taken in 1890 was only about fourteen million pounds, being nine million of Indian, and five of Ceylon.

The annual consumption of all Tea in Great Britain amounts to 200,000,000 lbs., and in outside markets (excluding Tea-producing countries) reaches some 250,000,000 lbs.

Why should not the bulk of this demand be supplied by British Grown Tea? If in two years its use in foreign markets can be raised from 14 to 20 million pounds—and that at a time when prices were as inflated as during fully one half of last year—what is to prevent the chief supply of these markets being drawn from the dependencies of the United Kingdom?

Aided by present low prices, British Grown Tea is working its way more rapidly than in the past. It has now taken sufficient root in many countries to warrant the belief that its use must become permanent and that similar results will follow to those attained at home, viz., the gradual displacing of the poorer China Teas by the richer and more economical Teas of our own dependencies.

Should this eventually prove to be the case, the time may not be far distant when Planters will look back to the exceptionally low prices of the past six months as little short of a blessing in disguise; for—with so large a quantity of Tea taken outside Great Britain—the natural result would be a larger demand for Indian and Ceylon Teas, if once a permanent foothold were obtained in foreign markets.

Much thought, time, and money have already been expended in efforts to open new outlets for our produce. Results have been sufficiently encouraging to justify us in still further prosecuting, with renewed vigour, our campaign in foreign countries; but time, money, and energy will be to a large extent wasted unless due regard be paid to the special requirements of the various markets. To flood them with unsuitable produce, as has on one or two occasions been done, is worse than useless. Growth can only be gradual, and may at first be extremely slow.

Instances can be recorded where beginning with *pounds*, the trade has rapidly grown to hundreds of packages; but very great care and attention are required in the earliest stage; the after development is then an easier matter.

Former experiences will doubtless be of great assistance in the prosecution of future enterprises. We are confident that with persistent and intelligent efforts, progress, though it may be gradual, will be sure.

CHICAGO EXHIBITION.—One of the most important agencies in the immediate future for extending the development of foreign markets is to be found in the coming Chicago Exhibition, which will, doubtless, be attended by visitors from all parts of the globe. With the aid of a grant from government, Ceylon has already subscribed a considerable sum of money towards a suitable representation at this exhibition. There is every reason to believe that her Teas will be prominently brought before visitors, and that strenuous exertions will be made to force the consumption of her Teas in America.

India has as yet decided upon no definite course of action. Without financial support nothing can be done, and an earnest appeal to planters has been made for funds. Money is not merely required, but required *without delay*, if one of the best opportunities ever offered is not to be thrown away, to the permanent loss and discredit of this important industry. Even now the time remaining for preparation is perilously short, and not a moment is to be lost, if the best means for opening to Indian Tea the American market—one of the largest and most promising outside Great Britain—is not to be utterly thrown away.

The Diagram on the front page shows that some of the chief consumers of British Grown Tea are to be found in unexpected quarters. One thing is evident, climate is no barrier to its free use. When we find Australia, Persia, and Turkey contributing so largely to its consumption it is absurd to say that its use is debarred in semi-tropical regions, while the fact of its adaptability to colder latitudes is too widely recognised to need advocating. The following statistics show, as nearly as can be ascertained, the quantities of Indian and Ceylon Tea taken in the undernoted Countries during 1891, compared with their approximate *total* annual consumption.

	INDIAN.	CEYLON.	TOTAL ANNUAL CONSUMPTION.		INDIAN.	CEYLON.	TOTAL ANNUAL CONSUMPTION.
Australian Colonies	lbs. 3,410,000	3,211,000	30,000,000	South Africa	.. lbs. 114,000	111,000	2,000,000
Persia 2,400,000	500,000		South America 04,000	84,000	
United States 090,000	744,000	80,000,000	*Austria 14,000	150,000	1,200,000
Turkey 1,104,000	18,000		Arabia 130,000		
Canada 080,000	110,000	20,000,000	France 13,000	05,000	1,200,000
*Germany 102,000	604,000	1,000,000	Mauritius 2,000	00,000	
Holland 407,000	150,000	5,000,000	Russia 2,000	00,000	70,000,000

* Probably most of the Tea sent to Germany and Austria was for Russia

AUSTRALIAN COLONIES.—It is not surprising that Australasia should be so large a consumer. Not only are its people our own kinsfolk and countrymen, and have thus inherited similar tastes, but it was here that India made her earliest efforts at establishing a new market; and she can now look back with grateful pride upon the work of those early days in the history of her Tea industry. Here, too, Ceylon was eager, in later years, to find not only a near but an important market—for the Australians consume annually nearly 30,000,000 lbs. of Tea—and her efforts have also reaped a rich reward. These colonies have now become the largest of all markets for British Grown Tea outside the United Kingdom, although the demand appears still to be only in infancy.

PERSIA.—This market is a source of surprise to many. It has grown and developed until it has attained its present dimensions. Its nearness to India may be one of the chief causes, but the favour in which Indian Tea is there regarded is attributed by some to a preference in the locality towards the use of an article supplied by co-religionists;—and there may be some truth in the suggestion.

UNITED STATES OF AMERICA.—This is so vast a territory, and the quantity of Tea consumed is so large, amounting annually to some 80,000,000 lbs., that it is curious so small a percentage of our Teas should be used. Decided headway has been recently made, and prolonged low rates of the past few months have done much to popularize Indian and Ceylon Teas. A very large amount of advertising has of late been done by the Ceylon Planters' Tea Company, who continue steadily pushing the sale of Ceylon Tea;—and the present demand may be partially due to their perseverance.

The kinds of Tea used in different parts of the States—separated by so many thousands of miles—are so varied that it is folly to argue that the produce of India and Ceylon is unsuited to the American taste, because Japans, Oolongs, and Greens, as well as Black China Teas, are so largely consumed. If the Americans knew where to buy *good* Tea, there is little doubt but that they would soon buy it,—although, to commence with, as a rule, they prefer light, flavoured kinds to strong, heavy Teas. Happily, both India and Ceylon can supply them with abundance of Tea, both light and flavoured, and of really good quality.

TURKEY has become an important consumer of Indian Tea, and it is possible that the religion of her people may induce her to take the Teas of a country which contains perhaps the largest Mahomedan population in the world. Ceylon Tea is being gradually introduced and appears to be received with some favour.

CANADA is perhaps one of the most promising outlets. The consumption of all Tea is nearly 4 lbs. per head of population and the percentage of British Grown Tea is already considerable—even though little systematic attempt has been made to open up this market. Recent low rates have perhaps given the greatest impetus to the trade.

RUSSIA, although a market of considerable magnitude, and taking some 70,000,000 lbs. of China Tea annually, takes but little Indian Tea, and until recently Ceylons were almost unknown. During the last two or three years a distinct enquiry for Ceylon Tea has sprung up, and considerable quantities are now disposed of in this country. Figures showing actual consumption of Ceylon Tea are impossible to obtain, but probably the bulk of that which goes to Germany has its final destination in Russia. The work of Ceylon in pioneering this market appears to have created some demand for the finest and most flavoured descriptions of her Tea. Russia should prove most valuable as an outlet for high-class Teas, and of much eventual assistance in maintaining, if not increasing, the value of Teas with flavour and quality combined.

Of other European markets Holland appears the most active, but there are reasons why Holland should be a Tea drinking country. She has herself fostered Tea culture in her own colony of Java, and having thus acquired a taste for Tea, is now one of the chief Tea consumers in Europe.

GERMANY also is likely to prove by degrees a useful outlet.

OTHER MARKETS.—Amongst those countries which as yet take but little of our Tea, perhaps that of South Africa, with its rapidly increasing British population, offers the greatest encouragement for prospecting. In time this locality should naturally consume British Grown Tea.

SOUTH AMERICA is a consumer of British Grown Tea, but the unsettled state of this continent is adverse to immediate development of the trade.

The Diagram on the last page shows the progress made in various countries during the two years 1890 and 1891. Australia is not included, being too large for representation. The quantity of Indian Tea taken there in 1891 did not quite equal that of 1890—but considerable progress has been made there during 1892. The Ceylon Tea taken in Australia in 1891 was twenty-five per cent. over that of 1890, and figures for the few months of 1892 show still further development.

To the countries represented it is unnecessary to draw further attention, except to observe that, having regard to the exceptionally high rates during so many months of 1891, the progress has been remarkable, and that exports in 1892 show most encouraging increases. To the United States and Canada, British Grown Tea has been freely exported during the past four months, and statistics of other large markets, particularly Australia, Persia and Turkey are also most encouraging.

Prolonged depression in values has at length produced its natural effect in promoting the use of Indian and Ceylon Tea in foreign markets.

Taken as a whole the export trade is in a more promising condition than ever before, and strong ground exists for anticipating a future which will go far to raise the Indian and Ceylon Tea industries from the depression to which they have recently been subjected, and if only the golden opportunity afforded by the coming Exhibition in Chicago be effectually taken, one of the greatest markets in the world may shortly be won over to the side of British Grown Tea.

Quantities of Indian and Ceylon Tea taken in some Export Markets during 1890, compared with 1891.

GOW, WILSON & STANTON,
TEA BROKERS
13, ROOD LANE.

The quantities of Indian Tea taken in 1890 and 1891, are represented by red lines.

The quantities of Ceylon Tea taken in 1890 and 1891, are represented by yellow lines.
