During the drying and fermentation of the leaves a certain amount of ammonia is formed, which is less in the finer, and higher in the coarser kinds of tobacco thus, according to Nessler:—

Havanna smoking tobacco	contains	.2	per cent ammonia.
Cuba do do		.3	" "
Syrian do do		.6	" "
German as much as		.8	" "

On the other hand Schlossing found as much as .8 per cent of ammonia in Havanna tobacco.

The mineral ingredient which seems most to affect the quality of the tobacco is potash combined with an organic acid; but which in an analysis of the ash appears as carbonate of potash. As a general rule a tobacco, the ash of which is rich in carbonate of potash burns well. Nessler illustrates this by the following table:—

	Total amount of potash.	Carbonate of potash.	Total amount of ash.	Remarks.
	per ct.	per ct.	per ct.	
Havana	2.93	2.3	24.6	Small thin leaf, burning very well, and aromatic.
Syrian	2.753	3.42	20.685	Finely cut tobacco, burns well, and is very aromatic.
German	6.246	5.21	22.343	Large thin leaf, burns very well, and is aromatic.
German	1.913	.15	22.591	Burns very badly, goes out easily.
German	2.766	.07	24.219	Do do
German	3.666	1.06	25.533	Do do

The mineral ingredients of tobacco appear, according to analyses, to be greatly affected by the composition of the soil. The following analyses of tobacco ash from tobaccos, grown upon argillaceous and calcareous soils respectively, show this, which is specially remarkable in the cases of the potash and lime. The analyses are from "All about Tobacco" quoted from "Simmond's Commercial Products of the Vegetable Kingdom."

Analysis of Five Samples of Tobacco Leaf Ash.

	Grown on Argillaceous Soil.		Grown on Calcareous Soil.

The above are from Haldane's "Subtropical Cultivation Climates," the author of which says "the best artificial manures will be found to be

- (1) Carbonate of potash, or pearl ash.
- (2) Sulphate of potash costing from £12 to £20 per ton.
- (3) Nitrate of potash, or saltpetre. Applied at the rate of 2 cwt. per acre.

The kind of soil suitable for tobacco is evidently very varied, and practical planters are said to pay more regard to the mechanical condition than to the chemical composition of the soil. Thus there appears to be a consensus of opinion that heavy clay land is unsuitable, and that free well-drained soils are best. The conclusions that Schlossing drew from various experiments to ascertain the kind of soils best suited to produce fine tobacco were these. "He found that a bad burning tobacco was produced in a soil containing little potash, on unmanured soil, on soil manured with flesh, humus, with calcium chloride, magnesium chloride, and potassium chloride" a good burning tobacco was produced on a soil manured with potassium carbonate, with saltpetre, and with potassium sulphate."

The following is an analysis by Nessler of a soil on which he made some of his elaborate experiments in tobacco cultivation (from "All about Tobacco") :—

Soil,	100 parts of soil dried at 212° F. contained the following constituents soluble in hot hydrochloric acid.								
	Organic Matter.	Phosphoric Acid.	Potash.	Soda.	Magnesia.	Lime.	Oxide of Iron.	Alumina.	Silica.

	{ Superphosphate ..	400												
14	Feldspar ...	1,000	18	8½	3,530	—	—	—	—	—	—	—	—	

It will be seen from the preceding table that the heaviest crops were obtained from soils manured with potassium chloride and sodium chloride. Unfortunately, however, though chlorides produce quantity, the quality of the tobacco is inferior. Nessler made another series of experiments to test the combustibility of the tobaccos. Under this test tobacco from soil manured with potassium carbonate proved to be the best, and that from soil manured with potassium sulphate next in order. Nessler tried also nitrate of potassium as a manure for tobacco, and found that it increased both the growth and combustibility of the leaf.

The following is the table of combustibility :—

No.	Manured with	Kept fire in seconds.	Contained carbonate of potash in the ash.
1	Carbonate of potash ...	17	2.51
2	Sulphate of potash ...	15½	1.40
3	Gypsum ...	13½	1.6

13	Sulphate of magnesia ...	7½	1.03
14	Common salt ...	4½	.47

ARECANUT.

Arecanut is the fruit of the betelnut palm, *areca catechu*. It is largely used as a masticatory in the East Indies. The following, according to the *Chemist and Druggist*, are the chemical principles present, an inferior catechu, tannic and gallic acids, ammonium acetate, fats, oils, gum, nitrogenous substances and a dye (areca red). The charcoal of the nut is used as a dentifrice and the ground nut as an anthelmintic.

Bentley and Trimen say: "According to Morin, arecanuts contain tannic and gallic acids, gluten, red insoluble matter, fixed oil, gum, oxalate of lime and lignin. Plücker and Hanbury found them to contain 14 per cent of a crystalline fatty matter, tannic acid, nearly 15 per cent of an amorphous tannic matter, 2.26 per cent of a brown ash, containing peroxide of iron and phosphate of magnesium, and other substances. They also came to the conclusion that catechin is not a constituent of arecanuts, and that any extract made from them must be essentially different from the catechin of *Acacia*, or of *Nauclea*, and rather to be considered a kind of tannic matter of the nature of Ratanhia red or Cinchona red." Three alkaloids have been received obtained from arecanut, of which two have the names arecoline and arecaïne respectively.

It is from the fruit and wood of the areca catechu that the article known in commerce as Bombay catechu is prepared. The other important kinds of catechu met with in commerce are Bengal catechu prepared from the twigs and unripe pods of *mimosa catechu*; Gambier catechu, which is extracted from the leaves of the shrub *uncaria gambier* and kino or gum kino. Good catechu on ignition does not leave more than 5 per cent of ash, and should contain not less than 88 per cent of matter soluble in boiling alcohol.

ANNATTO.

Annatto, which is variously written Arnatto, Annotto and Annotto is the coloring matter derived from the seeds of the *Bixa orellana*, an evergreen plant common both to the East and West Indies. The two kinds best known in commerce are the Spanish, which come from Brazil, and the French, prepared in Cayenne. This substance is also exported from Ceylon. Each fruit capsule contains a large number of red seeds; from these the dye is removed in three ways. The seeds may be boiled with water till a thick paste is obtained, or the seeds may be rubbed with water and the coloring matter allowed to subside, excess of water is drawn off, and the remainder allowed to evaporate till the dye has attained a pasty consistency. A third method is to bruise the seeds, mix them with water and to allow the mixture to ferment till the coloring matter is removed from the seeds.

The coloring principle of Annatto is called bixin $C_{16}H_{26}O_2$, which may be separated as yellow crystals. The composition of commercial annattos varies to a great extent. In ten samples analysed by Lawson (*Pharm. Jour.*) that analyst found the coloring matter varied from 1 to 12 per cent. A good sample analysed by Dr. Wynter Blyth yielded

Coloring resin	per cent.
Extractive matter	28.8
Water	24.5
Ash	24.2
			22.5
			100.0

In a sample of Ceylon Annatto I found

Moisture	per cent.
Soluble in alcohol with aid of sodium carbonate	46.22
* Insoluble in alcohol	34.43
			19.35
			100.00
* Containing soluble ash	...	2.41	4.36
" insoluble ash	...	1.95	

The following is an analysis of and report upon a sample of Ceylon Annatto by Wigner and Harland, public analysts, Lombard Street, London. The sample had been a much drier one than the above:—

Moisture	27.58 per cent.
Ash	8.16 "

- "It yields a rich extract to alcohol."
- "It yields a rich extract to a weak solution of soda."
- "It gives a very deep blue colouration with concentrated sulphuric acid."
- "When opened, the sample had a strong smell of ammonia."
- "It is an excellent sample of annatto. The colour is very good."

ERYTHROXYLON COCA.

This plant is a native of South America. The dried leaves have long been used as a masticatory by the natives of Peru and of other parts of South America. The dried leaves are mixed with lime or wood ashes, which has the effect of liberating the alkaloidal principles contained in the leaf, the chief of which is the alkaloid cocaine. By chewing this mixture the Indians are enabled to endure abstinence from ordinary food for long intervals without experiencing the pangs of hunger or feeling of weakness. It is also said greatly to lessen the desire for sleep. The alkaloid cocaine is now largely used as a local anaesthetic, particularly for operations upon the eye.

The plant has been cultivated to a small extent in Ceylon.

A sample of Ceylon leaves sent to me was tested by the process of E. R. Squibb. One portion of the sun-dried leaves yielded .544 per cent of crude cocaine alkaloid, another smaller portion of the sample which I treated with fully one and a half times the proportion of solvent used in the first case yielded .648 per cent of crude alkaloid. The crude alkaloid obtained by this process is said to contain from 20 to 25 per cent of impurities.

The crude alkaloid which I obtained was a clear almost colourless substance, resembling varnish in appearance. After standing for some time, it crystallised, the crystals spreading out from star-shaped nuclei. The crystals, after long drying, remained viscons to the touch. A small portion when laid upon the tongue and pressed against the palate had a slightly bitter taste, and after a short interval produced a sensation of numbness. The effect, which was not very strong, but quite marked, passed completely away in a few minutes. A portion of the alkaloid obtained was dissolved in hydrochloric acid to a clear and neutral solution, and evaporated to the consistency of varnish. After standing for some time and being stirred it changed its physical condition to what looked

like a moist, nearly white amorphous powder; but under the microscope its structure was revealed to be a mass of clear, but very minute, prismatic crystals. This is the cocaine hydrochlorate, now used as a local anæsthetic.

Another sample of sun-dried leaves yielded no less than 90 per cent of crude alkaloids; but in this case the varnish-like substance obstinately refused to crystallise.

In order to ascertain the proportions of the mineral ingredients removed from the soil by a crop of coca leaves, I made an analysis of the ash left by incinerating a portion of the first sample of leaves received.

The sun-dried leaves gave off 10.8 per cent of moisture, when dried at 212° F., and when burned yielded fully 6 per cent of ash including carbon dioxide.

COTTON.

In Ceylon there are two conspicuous kinds of cotton-bearing trees, the *Bombax malabaricum*, or katu-ambul of the Sinhalese, distinguished by its bright red blossoms; and the *Eriodendron anfractuosum*, the Quibal, or kapagaha of the Sinhalese, which latter yields the silk cotton, or kapok of commerce. The chief useful application of this fibre is for the stuffing of mattresses, cushions, pillows, &c., the fibre being unfitted for spinning. Of late it has become an article of export to Australia.

A sample of the seeds of this tree was analysed by the author to test its value as a manure, with the following results:—

Composition of Kapok Seed.

	per cent.
Moisture	15.07
*Organic matter	75.88
Mineral matter	9.05
	100.00
*Containing nitrogen	3.38
Equal to ammonia	4.10
Valuable ash soluble in water	1.28
" " acid	3.9
Sand	3.87

In consequence of the establishment of a Cotton Spinning and Weaving Factory in Ceylon, the cultivation of different kinds of cotton suitable for spinning and weaving (various species of *gossypium*) has been undertaken on an experimental scale, but, so far as I am aware, with no very marked success. An interesting "Chemical Study of the Cotton Plant," has been published by J. Bolton McBryde, C.E., assistant chemist at the Agricultural Experiment Station of the University of Tennessee, State Agricultural and Mechanical College.

From this pamphlet I extract the following instructive analyses:—

Agricultural Analyses of the whole Cotton plant.

Per cent. (McBRYDE.)

Manures for the Cotton Plant.

Based on the foregoing analyses of the cotton plant and its parts, Mr. McBryde has calculated the proportions of a number of fertilizers which may be used as suitable mixtures for manuring the cotton plant.

Each mixture is calculated to give nitrogen twenty pounds, phosphoric acid fifty pounds, potash fifteen pounds for a crop expected to yield three hundred pounds of lint per acre.

The following are the fertilizers used to make up the mixtures with the percentages of nitrogen, phosphoric acid and potash which each is assumed to contain:—

Table of Commercial Fertilizers for the Preparation of Manures for the Cotton Plant.

Kainit „ ...	—	12.0	—
Muriate of potash „ ...	—	50.0	—

The foregoing percentages are perhaps slightly lower than the true average in each case, but are stated as above in order to ensure the application of the full amounts of nitrogen, phosphoric acid and potash.

The following are the six mixtures prescribed by Mr. McBryde, and are based on the preceding table:—

Acid phosphate	...	420 lbs.
Nitrate of soda	...	125 „
Kainit	...	125 „
Acid phosphate	...	370 „
Dried blood	...	165 „
Cotton seed hull ash	...	60 „
Stable manure	...	2 tons.
Acid phosphate	...	330 lbs.
Nitrate of soda	...	20 „
Acid phosphate	...	350 „
Cotton seed meal	...	280 „
Muriate of potash	...	20 „
Acid phosphate	...	350 „
Cotton seed...	...	809 „
Kainit	...	40 „
Stable manure	...	2 tons.
Acid phosphate	...	330 lbs.
Cotton seed meal	...	40 „

“An ammoniated acid phosphate containing ten per cent phosphoric acid (of which at least eight per cent should be available), four and two-thirds per cent ammonia, and three per cent potash applied at the rate of five hundred pounds per acre would supply these constituents in about the same proportion and amounts as the above mixtures.”

DATURA STRAMONIUM.

Datura stramonium is a plant which grows freely in Ceylon. It belongs to the natural order *solanacee*. Both the seeds and the leaves possess sedative and narcotic properties due to the presence of an alkaloid or alkaloids called daturine. The poisonous qualities of the plant are frequently used by the natives for criminal purposes. The plant is largely grown by the Sinhalese villagers in their gardens, and by the Tamil coolies on estates for its medicinal properties. A decoction of the fruit is prized as an outward application in cases of rheumatism. The plant is conspicuous by its very large, white, trumpet-shaped flowers. Daturine has been proved not to be a single alkaloid; but is composed of hyoscyamine $C_{17}H_{23}NO_3$ the alkaloid of henbane, and atropine $C_{17}H_{23}NO_3$ an alkaloid first obtained from belladonna. It is considered by Schmidt and others that the alkaloid as it

exists in both plants is hyoscyamine, and that the isomeride atropine is only developed in the process of extracting the alkaloid. The leaves, according to Alfred Senior, Ph.D., F.C.S., contain .02 per cent of alkaloid, and leave 17 per cent of ash when burned. The seeds contain .1 per cent of alkaloid, and about 25 per cent of a bland fixed oil.

(To be continued.)

PICKINGS WITH A LOCAL APPLICATION.

It is not an uncommon experience to find, after a belief in a certain principle or practice has been tolerably well established, that an attempt is made to doubt or upset that belief. The belief in the superiority of BUDDING and GRAFTING over propagation by seed, especially in fruit culture, has for some time past been pretty firm, and text books on agriculture and horticulture never fail to impress us with the advantages of the former over the latter process. They tell us that trees are rendered much harder by being put on strong stocks, that a larger return in fruit is obtained, and that the trees can be made to fruit much earlier, while seeds do not always preserve the characteristics of the parent plant, or “breed true.” These advantages it may be taken for granted, have been proved to exist by long experience, and, indeed, wherever fruit-farming is carried on, the processes of grafting and budding have always the precedence over propagation by seed. The superintendent of the GOVERNMENT BOTANICAL GARDENS at SAHARANPUR and MUSSOOREE does not seem however, to have much faith in BUDDING AND GRAFTING to judge from his notes on oranges and mangoes, in his last report. “I have no hesitation,” he says, “in recommending the method of raising oranges from seed to more general adoption,” and again, “the quality of the latter (*i.e.* seedling mangoes that took ten years to yield a profitable return) was quite equal to that of grafted plants;” while in the case of seedling oranges, “the fruit was even sweeter and of better flavour than that produced by grafted or budded plants.” Seedlings, it is admitted, will take a longer time than worked plants in attaining to a fruit-bearing condition; “but they are always more symmetrical in shape, healthier in appearance, and will probably live to a greater age than worked plants in the forcing climate of India.”

These remarks are undoubtedly valuable to the local FRUIT GROWERS of the North-West Provinces of India, and the author no doubt does not intend them to have a wider application, since his experience, so far as his Report indicates, is limited to the areas of the two Botanical Gardens he writes about; and he makes no reference to the experience of other experimenters in other parts of the Empire as corroborating his own. The only point of any certainty in the preference expressed for propagation by seed, is that certain seedling oranges were found to be sweeter and better flavoured than those produced by artificial propagation. In the case of the mangoes, we are told, the fruits were equally satisfactory under both methods. The further remarks as regards greater symmetry in shape and apparent healthiness of the seedling trees will probably fail to turn the belief of those who pin their faith to “budding and grafting”; and the probability of the plants living to a greater age is, after all, only a probability. But while the opinion of an expert practical botanist, such as the Superintendent of a Botanical Garden must be, is worthy of respect, it would still be very desirable to have the reports of other experimenters in this line, in the various parts of the great Indian Empire, to corroborate or contradict the above experience as to the unsuitability of grafting and budding for a “forcing climate” such as that of India. If corroborated, the fact that in fruit culture also man cannot improve on the methods of nature will have been established! But it may yet be discovered after scrutinizing the details involved in the culture of

fruits by different methods of propagation, as carried on in the above mentioned Gardens, than an explanation more favourable to artificial methods of propagation is possible, and that local causes and conditions are responsible for what is attributed to other forces.

From the success which has attended the introduction of the AMERICAN DEWBERRY (*Rubus trivialis*) into India, where it is reported to have borne most profusely, it should commend itself to the more enterprising fruit cultivators in Ceylon, through whose agency if, as is most likely, it finds a home here, it should spread through the island. Another desirable exotic would seem to be the Bismark Apple (*Pyrus malus*), described as a Tasmanian variety "which bears the name of one of the best kinds in the world for cultivation in districts which are too hot for satisfactorily fruiting the ordinary kinds of apples."

A correspondent of *Chemist and Druggist* contributes an interesting paper on the preparation, characteristics, and use of HAMBISH (Bhang), which he describes as an earthy brown substance in lumps, made by taking the small leaves and female flowers from the tops of *cannabis sativa*, rubbing them down to a powder, putting through a fine sieve, and heating the dark green powder thus obtained till it becomes adhesive, and then working it into lumps with the hand. Analysis shows it to contain 1 per cent of volatile oil, 6.7 per cent of substances soluble in water, 55.5 per cent of oily and 6.5 per cent of resinous matters, 18.1 per cent of insoluble organic matters, and 13.7 of mineral matters.

Drury, in his *Useful Plants of India*, mentions that the official part of the INDIAN HEMP consists of the dried flowering tops of the female plants, and that this is called *gungah*: the resin itself which exudes from the leaves, stem and flowers, is called *Churru*; and what is known as *Bhang* is the large leaves and capsules without the stalks.

There has been some correspondence in the local press regarding the phenomenon of LUMINOUSITY IN CERTAIN PLANTS. Chambers mentions the cases of Hepaticæ and Fungi which possess this property of emitting light, some to such an extent as is sufficient to admit of reading ordinary print. Reference is also made to the fibres of light matter by certain flowers, while the leaves and juices of some trees are known to possess luminosity. It is known that the roots of some of our common trees possess this property. Chambers is inclined to attribute luminosity to chemical action, while sparks and flames of light, he says, are probably due to electrical causes.

Sachs on his valuable work on Botany says:—In the few cases in which up to the present time the development of light or PHOSPHORESCENCE has been observed in living plants, this phenomenon is also dependent on the respiration of oxygen. The fungus *Agaricus Olearius* emits light only so long as it is alive, and ceases to do so at once when it is deprived of oxygen; the respiration is in this case also very copious. Besides this fungus, *Agaricus igneus*, *A. noctilucens*, *A. Gardneri*, and the Rhizomorphs are known to emit light spontaneously.

Apropos of the "KALAMADHEREA" (tree) of Ceylon, is the reference to the "luminescent tree" of Tussonia in your last column of Pickings which appeared on Monday morning's (the 16th inst.) issue. Moisture, we are there told, is essential to phosphorescence.

Further information on this subject of luminosity or phosphorescence is to be found in Hardwick's "Science Gossip" and Dr. Phipson's work "On Phosphorescence."

PLANTING IN BRITISH GUIANA IN THE OLDEN DAYS.

COFFEE AT 20CS PER CWT.

It is enough to make a modern planter's mouth water to read Mr. Rodway's statement (as copied into *Timber*) of the possibilities of planters' managing to jog along notwithstanding high freights,

high prices of necessaries, and all the risks and drawbacks of wertime, and the loss of one-eighth by drainage on the voyage. Sugar sold in 1797 at 63 shillings the hundredweight; in 1798 at 65 shillings, and in 1799 at 55. After this there was a drop in prices, which made the planters cry out terrible. Even those who cultivated coffee and cotton could find comfort, with the former at 200s the hundredweight, and the latter at 1s 10d the pound. In 1811 Demerara and Essequibo produced, together, about 18,000 hogsheads (of about 13 cts) but the average price had fallen to 34s 11d the hundredweight. The labour question was now making itself felt, owing to the abolition of the slave trade, and cotton estates were soon to be thrown out of cultivation and the slaves from them to be transferred to the sugar plantations which still were the more profitable properties. In 1720 Commander Tierens was ordered to begin the cultivation of Indigo in Berbice. In 1743 Ludigo fields were "still kept up" in Essequibo. The managers did not understand the manufacture and the slaves disliked the work at the vat, so the industry did not prosper. In 1747, all the Indigo fields were destroyed by caterpillars, and the cultivation was therefore given up. It was about 1746 that the cultivation of cotton was begun in Essequibo, to develop later on into a staple industry. In Berbice, directions had been given as far back as 1720, to begin the cultivation of cotton, and on the 12th of January 1791, 46 concessions for planting it were granted in Berbice. Each concession was of 500 acres of land, liable to a tax of one shilling per acre. The further liability to make a road was for the first time in Berbice, attached to these grants, all of which were on the coast. In 1800, a cotton estate of about £200 acres would clear about £2,000 a year for its owner. Only half the number of slaves per acre required for sugar were needed for the production of cotton or coffee. Demerara and Essequibo together exported about ten million pounds of cotton in 1811; but, in 1814, the quantity fell to just over six million pounds. The late Mr. Crosby, for many years Immigration Agent-General of British Guiana, has been heard to tell that he could remember seeing, when a boy, Berbice coffee, exposed for sale in London shops, as coffee of the choicest kind. But, that is all its fame, and British Guiana knows not Berbice coffee now-a-days. It was in 1729 that word was sent to Commander Tierens of Berbice to be particularly energetic in growing coffee, which had but two or three years before been introduced into Surinam. From Surinam a few plants had already been brought to Berbice. The authorities in Amsterdam, at the time they so instructed Tierens, also wrote to the Governor of Surinam, asking him to send a boat load of coffee beans, in the husk, to Berbice. Governor Coulier complied so thoroughly with the request that the Directors made him a present of a fine saddle horse. The coffee plants succeeded admirably, and Berbice became more prosperous. Mr. Rodway finds that coffee and cocoa never succeeded well in Essequibo. Governor Van Gravesande had even to send to Berbice, on one occasion, to buy coffee for the garrison in Essequibo. In 1800, a coffee estate of 200 acres would clear between £2,500 and £3,000 a year. Coffee was cropped two or three times a year. Every tree gave one to one and a half pound at each picking, or four to six hundred-weight per acre in the course of the year. About twelve million pounds of coffee were produced by Demerara and Essequibo jointly in 1811, but, in 1814 the quantity shipped from these two places fell to eight million three hundred thousand pounds. In 1821 there were still sixty plantations in coffee in Berbice. The cocoa grown in Berbice had a very fine flavour. In 1720 there were two plantations under this cultivation. An increase of the cultivation was urged upon Commander Tierens by the authorities in Holland. Demerara planters who visited Berbice in 1783 reported that they had never elsewhere seen cocoa trees looking so healthy. Preference should be given, they considered, to the cultivation of cocoa in that locality: it having a rich sub-soil, and being protected from the East and North winds,

COCOA IN ECUADOR.

The British Consul at Guayaquil makes the following report in the trade and cultivation of cocoa in Ecuador:—

The cocoa harvest, though still falling short about 10 per cent. of that for 1890, was 53 per cent. in excess of 1891, viz., 321,493 quintals (11,352 tons), as compared with 209,835 quintals (9,368 tons). Prices were well maintained throughout the year, and the Christmas crop of "Aftermath," was proportionately large.

There is no special feature of interest to record in respect to the cultivation of the cocoa tree, both the system of planting shoots and raising from seed having been continued with varying success. The extension of various plantations has added considerably to the acreage, and as such developments bid fair to continue, the production of the cocoa bean is likely to be largely increased in the near future.

It is worthy of remark that hitherto the increase in the crops has not been in proportion to the new fields laid under cultivation, but since seed-raising promises well, greater hopes are entertained of realizing a proportionate return.

The increase in 1892 proceeded principally from the Arriba (up-river) districts. Machala and Balao, though having yielded more than in 1891, nevertheless fell considerably short of the average, excessive moisture having affected the young shoots in the latter district, whilst the River Jubones, in Machala, overflowing, inundated and completely destroyed extensive plantations.

The export of cocoa direct to England is becoming smaller every year. This, to a certain extent, is doubtlessly due to competition of the colonial product, but probably more to the fact that the propaganda established in Germany, through direct sales to chocolate manufacturers in the small towns of the interior, has put a stop to the old system, under which such manufacturers drew their stocks from the large importing firms of London. The consequence is that the supplies for the Continent go now direct to their destination, and the imports of England represent only what is actually consumed there.—*Oil, Paint and Drug Reporter*.

SUGAR CANE DISEASE.

Dr. Cobb, of the Sydney Department of Agriculture, in speaking at Harwood on the sugarcane disease, which he has been lately investigating, said that he found in the field seven or eight different fungus pests which were attacking the cane, but they did not reduce the cane yield more than 2 per cent. From strict investigations he had discovered that the failure or disease in the cane was due to the presence of a gummy matter which blocked up the passages of the sap vessels in each fibre. In each stalk of cane there were upwards of 1,000 of these fibres, each containing two or more canals for the carriage of moisture up and down. He proposed to call the disorder in future "gumming." It was practically a new disease, and had never been thoroughly investigated before. In affected stalks it would be found that at the base of the arrow there existed a cavity filled with offensive matter called "pus," and the presence of which was often erroneously attributed to the borer. The gum was generally found more abundant in the plant cane and at the top of the two-year-old stalks than anywhere else. After he had fully satisfied himself that the disease was due to this gum, he then set to work to find out the cause of its existence. By putting it underneath his powerful microscope he found that it contained myriads of microbes. They were so minute that it would take 30,000 of them, laid one after the other, to make an inch in length, and one drop of gum contained upwards of 10,000,000 of them. He had no doubt that they were the cause of the disease. As a further experiment he had inoculated the healthy stalk of a cane with gum, to see if the disease would develop there. It would take time to learn the result. This gummy matter was in Queensland as well as

in New South Wales. The reason of the disease being more prevalent on the lower river, than up the river was the greater rainfall on the lower river and the less depth of soil, which prevented drainage. One remedy was better drainage. Like smut in wheat, the disease spread in the seed, because healthy stalks could be found in badly affected fields. It was possible, of course, for the disease to spread in other ways, but that mode of infection would be slow. Another remedial measure was to plant no sets, excepting those that were apparently free from gummy matter. If such a plan were followed up rigidly the disease would be gradually overcome. He also suggested the importation of new plants, and was glad to say that steps had been taken in this direction a few days since. Besides the arrival of American and Queensland plants last year, some had arrived from New Guinea. They could not pay too much attention to new kinds; this course had been found successful with wheat farmers in this colony. He also strongly recommended the rotation of crops, where at all practicable.—*Indian Agriculturist*.

CLOVES.

A recent issue of the *Kew Bulletin* publishes a most interesting letter from Sir Joseph Banks to the Earl of Liverpool, dated August, 1796. It contrasts the indifference of the British Government towards matters of practical or utilitarian botany with the wise vigour of the French. Before that date, it appears the authorities of the Isle de France had already begun to circulate a list of useful plants cultivated at the Royal Gardens which colonists might have on application. As the editor of the *Bulletin* observes, Sir Joseph suggested a hundred years ago that important function, which the establishment at Kew has but lately begun to fulfil—"the transference of useful plants from one part of the globe to another." We have not the Earl of Liverpool's reply; doubtless it was commonplace—not worth citing. But the great botanist was tempted to write by a brochure presented to him, which recounted the introduction of the clove tree to the island of Dominica, by Mr. William Urban Buee. This gentleman obtained some plants from Cayenne in 1789, and again from Martinique in 1791. They began to bear in 1795, yielding a great profit, and Mr. Buee, a true philanthropist, lost no time in publishing the facts for the instruction of his fellow-colonists. He also introduced the bread-fruit, cinnamon, black pepper, "and many sorts of fruit trees from different parts of the world." At the present time the clove and the cinnamon are wild in nearly all the West India Islands; but there are no plantations, and the export is comparatively trifling. It is sad to hear that this good man was ruined in the end, struggling vainly against a stupid Government, which imposed a higher duty on West Indian spices as soon as they began to enter the market, yielding to the jealousy of influential persons engaged in the eastern spice trade. One of the trees Mr. Buee planted is still alive and healthy.

Gold and silver alone, amongst all the products of the earth, have caused such misery as the clove with its allies, the cinnamon and nutmeg. They rank with the choicest and the rarest gifts of Heaven. The great Rumphius, who first examined the clove with the eyes of science in its native home, declares it "the most beautiful, the most elegant, and the most precious of all trees." Mankind in general are not worthy of such a blessing. "Hence the Almighty, allotting his gifts to the several regions of the world, placed cloves in the kingdom of the Moluccas, beyond which by no human industry can they be propagated"—an error. The spice trees have indeed "the fatal gifts of beauty." When a clove is decked with its clusters of scarlet buds, when the fruit of the nutmeg opens, showing its black polished seeds in their nest of vermilion mace, travellers dispute which is loveliest, but all agree that they have no rival. Both had a most limited habitat before man interfered with Nature's designs. The nutmeg is said to be indigenous in the small island of Lontar only; the clove occupied five little islands on the coast of Gilolo. It

is difficult to believe that in such crowded seas birds and waves could not have carried them all over the archipelago in a few years. But the statements are explicit, coming from various sources, all interested in the matter. More curious still it is to learn that neither the islanders nor their neighbours ever eat the fruit in any form. "The only purpose for which the Amboynese use cloves," says Mr. Bickmor, "is to prepare neat models of their praus and bamboo huts by running a small wire through the buds before they are dried." The native word shows that this indifference always prevailed. It is *chenki* which has no analogy in the neighbouring languages, but bears a resemblance unmistakable to the Chinese *theng-ki*, "sweet-smelling nails." From this fact it would appear that the pretty ceremony described by Mr. Fraser in his famous "Golden Bough" must have been introduced quite lately—perhaps transferred from another plant. Doubtless, the Chinaman was first of civilised mortals to discover the virtue of the clove. The earliest mention in Europe occurs in a law passed by Aurelian about 175 A.D., where the term used is *carofilum*—evidently a corruption of the Arabic *catophur*. This spice, above all, tempted the nations of the West to explore the Eastern seas. At the beginning of the sixteenth century the price of cloves in England was thirty shillings a pound, and the demand unlimited. No wonder that all the people of Europe coveted such a gold mine. The first discovery is claimed by the Italian Ludovico Barthez of Bologna, asserts that he reached Amboyna in 1506, but his descriptions are very vague for an eye-witness. D'Abreu, a Portuguese, arrived in 1511, and Magellan followed in 1521. The misfortunes of the Spice Islands had already begun. As the clove became better known in Europe all the peoples on the trade route grew more and more active. D'Abreu tells us that on his arrival Chinamen, Arabs, Malays, Javanese swarmed in the narrow seas. In 1512 the Sultan of Ternate observed this increasing bustle, and he sent a fleet to conquer the islanders—not only that but to convert them to Islam. Massacres and persecutions followed. Then came the Portuguese evangelising in their usual fashion, baptising people by the thousand. The Sultan himself went to Goa in 1535, and professed Christianity with grand ceremonial; but in the same year a Moslem fanatic, whom the Portuguese term "Cantalino," led his fellows to a grand massacre, which has been named "the Moluccan Vespers." Not a convert escaped, they say. In Ternate and elsewhere the slaughter was terrible. Meantime the Dutch had been creeping in, shipping, as the Portuguese declare, aboard their vessels until they had spied out all the Indies. Then Holland sent a fleet and after ten years' warfare the Spice Islands were seized. Forthwith zealous missionaries began to eradicate the errors of Popery, but not by it observed, in the papal manner. It is not surprising, however, that the poor Islanders declined to hear any more about religion. The number of Christians to this day is imperceptible.

Magellan's first cargo of cloves is said to have been 2,360,000 lbs. Think of it—at thirty shillings a pound! At this present time the whole yield averages only 350,000 lb. Such is the result of the monopoly. The English Government was persuaded in former days to suppress Irish industries by methods which seem incredible to us; but its cruelty and folly are not worth notice compared with the Dutch system in the Spice Islands. In the first place they despatched seven hundred soldiers and a great fleet to occupy the nutmeg islands. This war lasted eighteen years. One-fourth of the population perished, the remainder fled by sea, and the Dutch had to re-people the soil with slaves and convicts. The language and the type of the aborigines are matters of question now. Then the Dutch turned their attention to cloves. So soon as they felt themselves strong enough they forced a treaty on the Sultan of Ternate, which stipulated that all the clove trees in Buru should be destroyed. The people resisted, fighting desperately, and the Sultan had to ask help. An expedition was sent from Amboyna. After five years' war the Dutch triumphed, of course; all the natives surviving were settled in one spot, around Kayeli Bay, within reach of the garrison,

and the clove was actually exterminated all over that large island. It is not known to exist there to this day. But the Sultan had direct authority over the two islands of Tidore and Machian. After previous experience compulsory measures seemed inadvisable. So the Dutch East India Company offered to pay a yearly sum of 17,400 guilders for the privilege of destroying all the clove and nutmeg trees throughout his dominions which, we believe, is paid to this day. The operation was carried out ruthlessly with murders on one side and massacres on the other. Until the conquest of the islands by the English at the beginning of this century, expeditions were fitted out every year to search for trees. When the Dutch returned they gave up this practice. But the mischief was done. For many years past the revenue of the Spice Island has not covered the expenditure.—*Evening Standard*.

PLANTING IN THE NEW HEBRIDES.

Sir,—The settlers here expected great things from your leader on the 16th of August last year, and every mail has been looked forward to with interest, as the advent of one good settler with the means to pay his way is a matter of no small importance in the New Hebrides, where we seem to suffer from our connection with the Colony of New South Wales, which is said to be insolvent. An authority on affairs here recently stated that there was not a settler in the group who was safe to be trusted to the extent of one hundred pounds sterling; so you can form a fair idea of the extent and influence of the "planting" community. The only residents are copra makers, and, as a rule, these are not the class of men to develop a new country or to set a good example to the natives. Given a copra station and a small cutter or craft more money is made by sale and exchange of "black birds," and in picking up the remains of cash brought here from Queensland plantations, than actual profits on copra. What is given in exchange for that cash might surprise those framers of the law restricting the sale of arms, ammunition, and grog in the Islands. Generally speaking, a copra maker is a bird of passage leaving nothing to mark the spot where he carried on his trade. His house and smoke house is composed of leaves and bamboos, and he clears perhaps a quarter of an acre near the sea beach, living not exactly a hand-to-mouth existence, but from month to month as the stores arrive and his shipments are made.

As you have pointed out so admirably, in these times when men cannot find an opening for moderate capital, it is to be regretted that a country such as this should be left to the bats and wild pigs, as the natives are fast dying off and exterminating each other. All visitors agree that there must be a wonderful future for such a fair and fertile field, and all seem anxious to secure a few thousand acres for a nominal sum, just to have a finger in the pie, but although any Government would be bound to conserve all vested interests, it is hardly to be expected that such claims should be recognised. No doubt under annexation a man would be allowed a "fair thing" for the consideration which he paid, and (as was done in New Zealand) have the option of taking as much more as he could cultivate at a price of, say, five shillings per acre. Having no actual titles to land should not deter an enterprising man from laying out an estate here, as it would be to the interest of almost any power to keep a good settler in the group.

In the Northern Islands of Santo and Mallicolo this year we had a hurricane, which is not so much to be feared here as in the Southern Islands of the New Hebrides. The last hurricane on Santo occurred some fourteen or fifteen years ago; so we presume we shall be free now for some time. The French coffee plantations were very much knocked about; but a Ceylon man would not be surprised, as their trees run ten or twelve feet high, and are planted under the original forest, which being soft,

quick-growing timber, does not need more than a strong breeze to break it down.

As the French were looking forward to the crop this year to help them financially they will feel the loss, and the promoters of French settlements will be less likely than ever to interest their countrymen in the prospects here. But a planter who has had ever so small an insight into the working of similar affairs in Ceylon or elsewhere would only need to walk through the French properties in these Islands to see that hurricanes on the low elevations here are not to be placed in the same category with the monsoon winds in Ceylon.

Labour with the French here is plentiful at £8 per head recruiting money and £3 to £4 per annum; but it is reported that the labourers on their Santo plantation, who number about ninety, (90), have long ago worked their time out, and are dissatisfied, together with the management, which complains loudly of the neglect of the Directors and the want of money.

The superintendence has been changed several times in four years, each one adopting quite a different system from his predecessor, which alone would eventually end in financial ruin, to say nothing of the state of morality and conduct of the estate generally. But, of course, in the event of the French being forced to discontinue business in the Islands as a Coffee Planting Company, it would do harm to the future prospects of ever inducing the right sort of men to come out, as they would not know the reason of non-success by the French. The history of the French in Tonquin is being repeated here in a small way. There is no doubt about the rich mineral wealth of that country, which would have been developed by Englishmen whilst their army was fighting; but enthusiastic Frenchmen in Paris could not get their countrymen to leave the Cafes to prospect the hills at Tonquin, and the whole business is now merely a matter of history; but they have effectually prevented better men from opening the country.

There is a story told here of the French Administrator at Noumea having offered a high English authority every consideration short of bribery if he would "disclose" to him the "secret" of England's success in colonizing. If there is any ground for the truth of the story, it is probable it occurred about five years ago, at the time when three hundred women were about to be transported from France to populate the New Hebrides together with the Communists, who were to be freed from Noumea. The idea, of course, is that it was in this manner we secured our Australian colonies.

Japanese labourers can be had in any number at 10d. and one shilling per diem, their passage money being the principal expense; but, as their steamers are subsidised, no doubt an arrangement for a number could be made at an average price per head at a lower rate than the usual passage money. In Fiji the planters complain of the objectionable ways of the Indian coolies there, which is low the main topic of conversation. Nothing of this kind need be feared with Japanese, who have the reputation of being hardworking and peaceable; and there is little doubt but that these little people would make a paradise of the New Hebrides at once by annexing them if not checked by some "dog in the manger" policy of other nations; but French and English might take the map and see the benefit that must arise with a few million enlightened hardworking people placed here, with various lines of steamship communication and many Government works. Santo alone would take some 300,000 inhabitants, and the shipping, freights, and outlet for merchandize must benefit the Australian Colonies, Fiji, and even bring the whole chain of Islands together to New Guinea. But in these enlightened times we are all doomed to suffer, not so much from the microbes and influenza as from the working man and foreign alien farce "liberty and equality," and "the land for the people," etc.

No better place could be found than this group as a residence for the believers in Mr. Henry

George. Here is the land for the people, and every labourer who leaves for the Queensland plantations is the owner of one or more hundred acres of the finest soil in the world. Everything is equal with them, and a returning recruit divides all his wealth of money and goods immediately on landing. Nature provides all necessary food, and there is no inducement for men to work here. The Mission Societies declare that, unless the natives are obliged to work they must die out, and all the murders amongst them are family affairs summed up in the lines of Dr. Watts—"Satan finds some mischief still for idle hands to do." All that is wanted in this part of the globe to make nature smile and to bring peace and prosperity is the importation of those down-trodden and abused men who are *not required* elsewhere, either in Ireland or Australia, namely, the bloated capitalist, who can invest his capital with greater safety amongst the 42,000,000 of the Japanese empire than in the bricks and mortar of a country ruled by working men candidates.—Yours, &c.,

A. RUFUS POWELL.

Santo, New Hebrides (via Sydney, N. S. Wales).
May 30th, 1893.

P.S.—Coffee is now *double* the price given to the estimate by the late Alex. Brown of Kandy in the "Planters' Manual," and could be brought into bearing in the New Hebrides at little over than half the cost in Ceylon provided *quality* is more a consideration than aroma from the elevations.

NOTES ON ECONOMIC PLANTS IN TAHITI.

We gather from a recent report to the Foreign Office that some progress is being made in the cultivation of useful plants in the island of Tahiti. Amongst the most important of these plants Coffee appears to have attracted much attention, and it is considered likely that the natives may take up its cultivation. A beginning on a small scale has been made in the islands of Rurutu and Rimatara, and foreign enterprise also is at work in the island of Tahiti; it will be an important step if the people follow it up. This question has been agitated in Tahiti for the past three years, but with only one exception has anything beyond futile attempts been made to establish plantations. In these latter attempts the old Tahiti system was adopted, which consists of merely clearing away the undergrowth in the bush or forest and putting plants in the matted soil without trimming, due selection or care.

Coffee-culture on recognised principles has been adopted by an Englishman with promising success. The variety of Coffee known as Tahiti Coffee is a very luxuriant grower, becoming in its natural state a tree often upwards of 20 inches in circumference and fully 20 feet in height, but it is scraggy and overgrown, and on this account usually a poor produce. The plant was first introduced to the Society Islands as early, it is said, as 1823. Subsequently in 1860 the Mocha variety was brought to Tahiti by a Frenchman named Bonnefin, who established a plantation in the district of Paa, which proved a profitable business. For some unknown reason this plantation was afterwards abandoned and has now completely disappeared. The variety is still found, however, growing wild in the islands of Tahiti and Moorea.

Recognising that the uncared-for, uncultivated Coffee tree in Tahiti was capable of producing an excellent berry, though the crops obtained did not in quantity compare at all favourably with results in other countries, where modern methods for growing were adopted, it was decided by the gentleman above referred to, to attempt the culture of Coffee upon recognised principles.

Seven acres of level valley land were carefully cleaned of bush, weeds, roots, and stumps of trees, the soil was well prepared by means of the plough and horse. Young Coffee plants were then selected from those growing wild in the bush, and the roots and branches having been properly trimmed, they

were planted out in wholes 10 feet apart, the rainy season being selected for the latter operation.

It was soon ascertained that shade was necessary, and Banana, Apple, and Orange trees were at once planted between the rows. In addition, to ensure permanent shade the Candle-nut tree was planted 40 feet apart throughout the plantation, and has proved the most suitable for the purpose, being well branched and moderately open, admitting just sufficient light and circulation of air. The question of proper protection from the sun is an important point in the cultivation of Coffee in Tahiti; dense shade, though giving good growth, has been found to prevent the tree from bearing. In the 7 acres of land 3,500 plants were put out; the Tahitian distaste for cultivation was not indulged in, but a vigorous system of care and management was instituted. The result has more than surpassed the most sanguine expectations of the owner.

Two species of insect pests had to be contended with, the mealy-bug and a green scale, both being very injurious to young plants, but not giving serious cause for alarm in the older trees. The plantation at the date of the report, namely, March last, was commencing its third year of cultivation. The trees were most healthy in appearance, and were growing with symmetrical uniformity. The terminal buds are nipped off as the trees reach 6 feet, to prevent them growing beyond that height. By obtaining thus compact and comparatively low bushes, the picking of the crops is facilitated, and the additional shade thus given will in all probability in another two years prevent the growth of weeds, and thus reduce labour to an annual hoeing of the soil around the trees. Next season the owner intends to let the trees bear for a crop. The bushes blossomed well during the past season, but the berries were picked off at once, so as not to retard the growth. The owner fully expects to realise from the crops of the third, fourth, and fifth years sufficient to repay all the outlay he has been put to for the plantation from the beginning. During the sixth, seventh, and eighth years he anticipates that his crops will average 2 kilos (4 lb.) per tree each season, and after the eighth year, an average of 3 kilos (6.6 lb.) yearly. It is stated that the consumption of Coffee in Tahiti is far in excess of the production. It has been sufficiently proved that the lands and climate of Tahiti are well adapted to the production of excellent coffee, and it may now be assumed that a plantation under cultivation will bring back in five years, at the most, what it has cost. The prospects offered to those who may intend to embark on this enterprise in Tahiti are therefore certainly promising. But it should be remembered that, although for small plantations not exceeding 10 acres home or district labour may be depended on, it would require, before undertaking the cultivation of extensive plantations, a very careful study of the labour question, which is fully recognised to be an extremely difficult problem.

ORANGES.

The Orange tree was originally introduced into the Society Islands from Brazil by the navigator Cook, and subsequently by the early missionaries from the Australian colonies. These two varieties, though still giving a slight difference, have by acclimatisation and self-propagation become merged into one variety known in the markets as the Tahiti Orange. The fruit varies from oblong to oval in shape, being rather flattened at the top. It is a medium-sized fruit, very heavy, very juicy, sweet, and highly flavoured, thin-skinned, and the rind of a light lemon-yellow colour. The trees growing on lowlands produce an inferior fruit to those found at higher elevations, and generally supply the early portion of the produce exported on account of their easier accessibility.

The Orange tree in Tahiti is not cultivated, but grows in the wild state, propagation being carried on by raiders, such as rats, &c., scattering the seed which, owing to the moist warm climate, germinates with certainty and rapidly. With few exceptions, occasionally found on clearings made for dwellings, plantations, and roadways, the Orange tree in Tahiti

grows in the bush, straggling, moss-covered, enveloped by tendrils and creepers, and surrounded by weeds, and in this naturally weakened condition is becoming an easy prey to the many species of scale and insect pest now so prevalent, and so carelessly introduced during the last few years. The more vigorous trees found in the open are better able to resist the ravages of this evil, but the consequences in course of time to the so-called Orange groves of Tahiti must be evident to all; still the native, who so greatly depends on the Orange crop as a source of income does nothing whatever to save the trees. He makes no attempt to clear the chaos of jungle surrounding them, or to destroy the pest; he contents himself with living simply on the fruits of nature, so long as they are provided for him.

But this condition of inactivity, if continued, must bring disastrous results. To regain the markets of California, and to retain those of New Zealand, will necessitate attention being given to the cultivation of the Orange tree. As is seen now, the more attractive in appearance, though not superior or even equally good-flavoured fruit produced of late in California has driven the Tahiti Orange out of that market, and it may be that rival Orange growing islands of the Pacific, where attention is now being given to the culture of the fruit, will before long deprive Tahiti also of the market of New Zealand. It is perfectly possible and practicable to make the culture of the Orange in Tahiti a success, and this important matter should no longer be neglected.

VANILLA.

Owing to the fall in the price of Vanilla last year (1892), some of the native planters neglected their plantations to such an extent that even during the flowering season the fertilisation of the plant was not attended to. As, therefore, there are now fewer bearing plants at a time when the demand has again increased, the more thoughtful owners of plantations reap the benefit, and also gain the advantage of the rise in price that has recently taken place.—*Gardeners' Chronicle.*

INDIAN GUTTAPERCHA.

The natural sources of supply of guttapercha, and the possibility of their exhaustion were referred to in the Kew Reports 1876 (p. 23); 1887 (pp. 31, 31); and 1881 (pp. 38-45). A few trees, natives of the Indian peninsula, yield substances more or less similar to guttapercha. One of these is *Dichopsis elliptica*, Dalz. (= *Bassia elliptica* Isonandra acuminata).

The following note on this plant appeared in the *Report of the Royal Gardens, Kew*, 1881, p. 44:—

"This tree appears to be common on the Malabar coast, the forests of Coorg, the Wynnad, Travancore, &c. It grows to a height of 80 or 90 feet. A substance similar to the guttapercha of commerce is procured by tapping, but the tree requires an interval of rest of some hours, or even of days, after frequent incision. In five or six hours upwards of 1½ lb. was collected from four or five incisions. The gum is hard and brittle at the ordinary temperature, but becomes sticky and viscid on the increase of heat. It is not found applicable to all the purposes for which guttapercha is used, but 20 or 30 per cent of it may be mixed with guttapercha without destroying its qualities."

The same tree is referred to in *Watt's Dictionary of the Economic Products of India*, Vol. III., p. 102. In this, an extract taken from *Davy's Useful Plants of India*, suggests that the gum might be usefully utilised as a sub-aqueous cement or glue; or that on account of its perfume when heated, it might possibly be rendered of some value to the pastille and incense makers. More recently this gum has been analysed by Mr. David Hooper, F.C.S., F.I.C., Quinologist to the Government of Madras, and the results are given in the Annual Report of the Cinchona Plantations of Madras for 1891, p. 18:—

"*Indian Guttapercha.*—An abundance of guttapercha milk has been yielded during the past dry weather in the Wynaad by the Panchotee tree (*Dichopsis elliptica*), and some planters have been asking for information on the subject, and inquiring whether it could be made into a commercial article. The milk

has been known for some years to afford what was called Indian guttapercha or Pala-gum, and has been used as an adulterant of Singapore gutta. General Cullen brought it to notice 35 years ago, and Dr. Cleghorn published a memorandum on the subject at the time. It was reported upon by experts in London, who found that it was unfit for water-proofing purposes, as its solution in coal-tar and turpentine dry up to such a brittle consistence that the fabric is useless. It could be used as a hirdlime or cement, and keeps well under water, as a cable insulator, especially if mixed with some gomme gutta. By boiling the milk of the Panchotee tree, a white mass separates, which can be kneaded by the fingers, but which becomes hard and brittle when cold. The brittle character of this substance I find is due to a large porportion of a crystalline substance found also in true gutta, and called crystallan or alban. Crystallan, according to Payen, occurs to the extent of 14 to 19 per cent. in the best kinds of guttapercha, but I have extracted as much as 69.2 per cent. of crystallan from the dried secretion obtained from Wynaad. The presence of a large quantity of crystals in this gum, of course, would interfere with its utility, but crystallan is easily removed by boiling alcohol, and the residuc consists of a very good and pure guttapercha. I cannot see why this process could not be used to purify the Indian gum and so obtain an article similar to the Malayan article."

A note on a gum from a closely allied plant (*Dichopsis obovata*, C. B. Clarke) received at Kew from Burma appeared in the *Kew Bulletin*, 1892, p. 215.

GOLD COAST BOTANICAL STATION.

MR. CROWTHER to the COLONIAL SECRETARY.

Botanical Station, Aburi, 1st September 1892.

Sir,—I have the honour to submit, for the information of His Excellency the Governor, the report on the progress and condition of the Botanical Station at Aburi, for the period ending 30th June 1892, and also to report upon my visit to the coffee and cacao plantations of Messrs. Miller Brothers and others on my return from leave of absence in January last.

2. I regret that there has been so much delay in sending in my reports, but I have had so much work which required my personal attention and supervision that I have experienced a difficulty in sending them in earlier.

3. I arrived at Accra in the R.M.S. "Nubia" on the 8th of January, and immediately proceeded on board the steamship "Kinsemu" to return to Cape Coast, at which place I arrived at 10 p.m. on the 11th instant.

4. On my way to Cape Coast I noticed a small quantity of the Bass fibre being shipped from Appam. This valuable fibre is obtained from the palm which is so common and plentiful in this part of the colony, namely, *Raphia vinifera*. It is a very important product, being worth from 25l. to 60l. per ton according to quality. Great interest is at present shown in England in the discovery of similar fibres to this, and there is a good market for them, but the supply is very small, owing chiefly, I think, to the difficulty experienced in extracting and cleaning the fibre. It is chiefly used for brushmaking. I will make inquiries and endeavour to obtain information respecting suitable machinery for cleaning and preparing this fibre, which information, if I am able to procure it, shall be published in my next report. [See *Kew Bulletin*, 1891, p. 1.]

5. On my arrival at Cape Coast I went to see Mr. Batty, Messrs. Miller Brothers & Co.'s agent, who kindly gave me quarters for the night, and the next day I proceeded to Elmina to visit Mr. Hutchinson's coffee plantation.

6. Mr. Hutchinson calculates that he has about 150 acres planted with Liberian coffee, and that he has planted out 60,000 plants. The trees are in a very healthy and flourishing condition, and many, which have only been planted a year and a half, are already bearing a very fine crop of coffee. The trees on this plantation are in three stages, viz., 1st, there are a number of trees which were planted in May 1889. These

trees are about five and a half feet high, and are compact, bushy plants, bearing a splendid crop of coffee, some of which was ripening at the time of my visit. 2nd. A large area was planted in May 1890; these have grown well and almost all of them are bearing a first crop of coffee. This speaks very well for the suitability of the soil and situation for coffee planting as in Liberia and other places where this variety of coffee is grown, planters never expect the trees to bear until they are three years old. 3rd. The remainder of the trees, which comprise the greater part of the plantation were planted in May of last year, and on the whole are growing satisfactorily. Owing to the excessive dryness of the last season the mortality amongst the plants has been rather excessive, but that can be easily remedied by filling up the vacancies during the coming rainy season with good robust plants.

7. The plantation is in a very creditable and flourishing condition. The work is done by a gang of 70 Kroo-boys and the land is kept in good order and free from weeds. Mr. Hutchinson seems to thoroughly understand the work, and has every confidence in the ultimate success of the undertaking.

8. The next morning, on my way from Elmina to Messrs. Miller Brothers' plantation at Kuby Kul, I was asked to visit a coffee plantation belonging to Mr. Ter Meulen, who accompanied me himself.

9. This plantation is about 25 acres in extent and consists of about 5,000 plants, all of which look very healthy. Many of the trees, which are about three years of age, are bearing an immense crop of coffee and others of two years' growth are also bearing. Mr. Ter Meulen informed me that he had been unable to personally superintend his plantation as much as he would have liked, and consequently it had been rather neglected.

10. After spending an hour or two going over the plantation and directing Mr. Ter Meulen as to the best means of carrying on the work, I proceeded on my way to Messrs. Miller Brothers' plantation at Kuby Kul, where I arrived at 12-30 a.m.

11. Mr. Ter Meulen proposes to extend his coffee plantation very considerably, and is now raising a large quantity of young plants for that purpose. He is very energetic about the matter and very sanguine as to the results.

12. Mr. Batty met me at Kuby Kul, and after resting a short time, I commenced to go over this plantation along with him. I should calculate that the area of this plantation is between 130 and 150 acres in extent. The land is undulating and the soil a black mould and very rich, and I should say remarkably well adapted for the cultivation of coffee and cacao. The trees here are much more luxuriant in growth than those at the other plantations mentioned. This may be accounted for by the extra rainfall and humidity experienced here.

13. Mr. Batty has planted his coffee plants 14 feet apart, which, considering the growth they have already made, does not seem too much. The growth of some of the trees on this plantation is almost incredible. Many of them have grown as much as five feet in one year, and the foliage is of a great size and most luxuriant.

14. Besides coffee, Mr. Batty has also planted cacao on an extensive scale. This valuable product seems to thrive equally as well as coffee, the plants which I saw here in a healthy and flourishing condition, especially the ones supplied from the Botanical Station at Aburi during the previous year. The cacao is planted at distances of 13 feet apart and shaded with plantains and bananas, which answer the purpose admirably.

15. Tobacco was also being tried by Mr. Batty. He had about 2,500 plants each of the Havana and Sumatra varieties. They were well-grown plants, with enormous leaves of a good texture, and if the operation of curing has been successful should produce a good marketable article.

16. After my visit to the Cape Coast district I returned to Accra and proceeded to Aburi, where I arrived on the 22nd January.

17. On my arrival I commenced at once to clear

the land purchased by the Government from the Rev. A. W. Clerk, and succeeded in clearing the bush from the whole of the 16 acres during the months of February and March. The weather during this period was excessively dry and very suitable for this kind of work.

18. This land, which adjoins the land already possessed by the Government, was covered for the most part with dense bush and large trees, interspersed with a large number of palm trees (*Elais guineensis*). It is a valuable piece of land, consisting for the most part of a rich black vegetable mould, and free from stones and gravel, with the exception of a small tract of about an acre in extent near the Akropong road, which is rather stony.

19. I have used a part of it as a vegetable garden, and found that potatoes did splendidly, having had a good crop of excellent potatoes from seed which was got out from Messrs. Sutton & Sons, Reading. Corn, cassava, sweet potatoes, &c. have also been planted on this new land. They assist in keeping down the undergrowth and bringing the land under cultivation, and the produce comes in useful for feeding pigs, a good breed of which I brought out from England with me.

20. A small grove of palm trees has been allowed to remain. These I propose to thin out to reasonable distances apart, and clean and trim up the remainder, then run a fence round and allow the pigs to run about in. They will be well protected from the sun, and the palm nuts make very good food.

21. After I had completed the clearing of this land I made a 12 foot road round it, and planted a boundary of coconut palms at distances of 25 feet apart. These form an excellent and permanent boundary, and I am pleased to say are all growing well, not one having died through the dry season experienced since they were planted. This boundary of coconut palms has been continued around the whole estate, about 300 plants having been planted out in this way.

22. On the land formerly cleared and under cultivation a great amount of work has been done. On my return I noticed that cacao on the land extending from the west end of the house to the town of Aburi had not grown as well as it should have done, and could see that the cause was want of shade. Plants of castor oil (*Ricinus communis*) had been planted, but they had grown up spindly and did not afford sufficient protection, so I have planted bananas and plantains between the rows of cacao at distances of 12 feet. The whole of this patch, which is about 13 acres in extent, has been planted in this manner, and the plants are now growing satisfactorily.

23. The land in front of the house, and extending to the Akropong road, has been completely planted with Liberian coffee. Also a small plantation of Arabian coffee, consisting of 300 plants, has been laid down. This variety of coffee is grown rather extensively by the natives in this district and thrives extremely well. I obtained the plants from the Rev. A. W. Clerk, in exchange for cacao plants.

24. The avenue of oranges leading to Aburi and as far as the Akropong road has been completely planted with new varieties of oranges, raised from seeds obtained from the West Indies.

25. Besides the work above mentioned a large amount of road making, laying out, and planting has been done. In front of the house a small flower garden has been laid out, which improves the look of the place very much.

26. A path 4 feet wide has been cut from opposite the billiard room door at right angles to the house, and extending 600 feet to where it meets the Aburi road. A small border of flowering plants has been planted on each side. This affords a nearer approach to the house and looks very well.

27. An avenue of oranges and citron 20 feet wide has been made, which cuts the above-mentioned path near the centre, and extends from the Akropong road, below the police huts, to the road leading to Aburi. It is 700 feet long. The trees are growing well, and will form a splendid avenue in a few years.

28. An avenue of Royal Palms (*Oreodoxa regia*) has been planted at distances of 25 feet apart across

the land purchased from the Rev. A. W. Clerk. This avenue extends from the Akropong road near the new house in course of construction by M. Clerk, to the western boundary. It is 800 feet long, extending across a level portion of the land. The plants are growing well, and, in a short time, this will make a splendid avenue.

29. Many of these roads have been covered with rubble from the old walls surrounding the enclosure behind the house. This forms excellent material for road making, as it sets hard, and weeds, &c. will not grow in it.

30. The weather for the period under review has not been at all favourable for agricultural purposes. It has been exceptionally dry with a prevailing dry wind, which has been most injurious to plant life. The rainfall for the six months was 25.77 inches, which compared with the corresponding period for two previous years was very small.

31. The rainfall, besides being so much smaller than in previous years was not so well distributed over the period. The whole of the rainfall in June (3.34 inches) fell in a deluge on the 11th of that month, doing considerable more damage than good, and the whole period has been marked by occasional heavy rains and long intervals of hot and dry weather.

32. The benefit of the new tank which was completed in November last has been felt during the present season. I have no hesitation in saying that half the plants on the station would have succumbed had it not been for the water obtained from this source.

33. As an instance of the amount of water used I may mention that the tank is 80 feet long, 25 feet wide, and 14 feet deep. On the 12th of June, after the heavy rainfall above mentioned, the tank was at its highest, and had 8 feet 5 inches of water in it. On the 25th of the same month, it had been lowered to 7 feet 3 inches, and on the 5th of July to 6 feet 9 inches. This means a large volume of water, and also a large amount of extra labour for the staff employed.

34. The plants previously planted out have on the whole grown well.

35. VINES.—These have not done so well as I expected. On my return I took out the old soil around the roots for a distance of 3 feet and 2 feet deep, and filled in the space thus made with good soil and compost. I then shaded the plants and watered them well. They made a good growth, and went on well for a month or two, but have again fallen off. No doubt this can be partly accounted for by the extreme dry weather, but I think also that the site and soil is not suitable, and I propose to remove them to another part of the garden, where I trust they will do better.

36. COFFEE.—The plants previously planted have grown extremely well, and have a very vigorous and healthy appearance. About 2,500 plants which were planted out this spring are also growing satisfactorily, although they have had to be continually watered on account of the dry season.

37. CACAO.—As I before remarked, this has not done so well on account of lack of shade, and also the dry weather experienced. Now that the matter of shade has been attended to, they are growing better and I hope they will continue so.

38. ANNATTO (*Bixa Orellana*).—This valuable dye plant seems to have adapted itself well to the soil and situation. It is now producing an abundance of seeds, from which I propose to prepare a sample of "roll" or "flag" annatto, when ripe. The colouring matter washed from the seeds, and made into rolls or paste is called "flag" or "roll" annatto, and is the best mode of preparing it.

"There is a steady demand for good annatto made up into this form, and as the freight and other charges would be less on paste than on seeds there is a distinct inducement to adopt the preparation of paste. While the price of seeds varies from 1*d.* to 3*d.* per pound, the price of paste ranges from 6*d.* to 1*s.* 8*d.* per pound, according to quality."

39. FRUIT TREES.—The whole of the fruit trees planted are growing satisfactorily. Mangoes, shad,

dock oranges, sapodillas, avocado pears, star apples, &c., &c., are making fine trees, from which I hope in a short time to obtain fruits. A Loquat tree planted before my arrival has fruited during the present season, and some of the citrons and oranges are showing signs of blossom.

40. BEEFWOOD (*Casuarina equisetifolia*).—A large number of these plants are now raised at Aburi. This tree is stated to possess every property that is usually attributed to the Eucalypti family, and the extensive planting of it would undoubtedly be most beneficial to the colony.

The following plants have been sold from the Botanical Station, viz.:—

	£	s.	d.
Coffee, 12,000 at 1 <i>d.</i> each	50	0	0
Coffee, 110 at 1½ <i>d.</i> „	0	13	9
Oranges, 32 at 1½ <i>d.</i> „	0	4	0
Lemons, 3 at 3 <i>d.</i> „	0	0	9
Cocoa, 40 at 3 <i>d.</i> „	0	10	0
	51	8	6

42. Cacao plants were also exchanged for 300 plants of Arabian coffee, and several plants have also been distributed free.

43. The following plants and seeds have been received during the half year. [Here follows lists, not reproduced, of 40 plants and nine lots of seeds received from the Botanical Gardens, Trinidad; of vine cuttings and numerous seeds received from the Royal Gardens, Kew; and seeds received from his Excellency the Governor.]

46. VEGETABLES.—The growing of European vegetables has not been so successful during the present season as it was last year. The weather has not been suitable, and further I find that the seeds obtained this year were not so good as formerly, many of them not germinating at all. Potatoes, peas, and French beans have grown the best. Potatoes grown from sets obtained from Messrs. Sutton & Sons, Reading, did very well indeed. The varieties grown were Magnum Bonum, Beauty of Hebron and Sutton's Abundance. The latter variety produced the finest crop of potatoes. Many new vegetables are being tried, as for instance, Globe artichokes, Asparagus, Seakale, &c., &c., and so far they are growing satisfactorily.

I have, &c.
(Signed) W. CROWTHER, Curator.

The Hon. the Colonial Secretary, Victoriaborg.
—Kew Bulletin.

LIFE IN THE SOIL.

We now know three things at least about the soil we cultivate, viz., that it is of mineral origin, formed primarily of rock-dust, and so inorganic. Then it has added to it from time to time the organic matter afforded by the decomposition of plants and animals, such as dead and decaying vegetation, and the various animal manures. But thirdly, and in this case lastly, there is actually life in the soil, microscopic it is true, but vegetable life, active and potential, as all life is anywhere and everywhere, for where there is life there is no absolute rest, something is ever and always being done. In a word, vegetable life as we know it to-day is ever and always potential, and it is always operating on and altering the chemistry of other matter around it either living or dead. This much is especially true of the living vegetable organisms which are found more or less abundantly in all soils.

Those soil-organisms are really minute members of the fungus family, very low organisms it may be from a biological standpoint, even although it is part of a biologist's faith to call nothing, however low or minute, in the scale of life, "common or unclean;" and so even the low fungoid forms of life, now so familiar under the general name of bacteria, deserve the gardener's attention, seeing that they work for him unceasingly, even if, like the work of the good fairies of old, their operations be unseen.

Bacteria are then simply extremely minute representatives of the Mushroom and Toadstool family of plants, full of energetic potentialities for evil or for good, as the case may be, just as the higher fungi

may either feed us or poison us, according to natural laws, not as yet well "understande[d] of the people."

Someone once said to an American humorist, I think it was Mark Twain, "Yes! you see the botanists are very clever people, but they even can't say how we should distinguish Mushrooms from Toadstools." "Oh! that is easy enough," said the humorist, "you should eat the darned things right away; then if you live, it's a Mushroom, and if you die, it's a Toadstool!"

This is a strong appeal in favour of actual experience, as opposed to mere theory, and as a fact we know and learn much more of the bacteria by experience, *i.e.*, by the results of their labours than we at present can do of the organisms themselves, and so the working results of soil bacteria are evident, for it is their office to reduce the organic matter deposited in the soil to the elements of the rock dust, and of the atmospheric carbon and nitrogen whence it was originally derived.

Now, bacteria generally agree, so far, with the great fungus family of plants, that the activity of some is malignant, and that of others, is benevolent and life-giving. Bacteria, in a work, may be bacteria, but they are divisible into two distinct sections or groups. There is, in fact, a notable difference between the "bad fairies—the imps of darkness," that cause pathological disorders, such as anthrax, typhoid fever and small-pox, or hydrophobia and tetanus—and the "good little-people," that really act as the benevolent scavengers of Nature, and diffuse new life, and health, and beauty all around them, in garden and field; and to the latter group of division belong the soil-organisms, to which we desire to draw the especial attention of all interested in soil or earth-culture to-day. The bacteria of cultivated soils belong to the micrococci, rounded or egg-shaped bodies, not unlike frog-spawn when highly magnified, which carry on great chemical changes in the soil. There are presumably different species of bacteria that do this, some of which are spoken of as the "nitrous" and others as "nitric" organisms of the soil, and each organism has its own special work or function to fulfil.

The general work of both these organisms is to carry out or to cause what is called "nitrification" in the soil, a process of oxidation or decomposition by which organic and inorganic matter is rendered soluble or immediately available for growing crops. You can sow or plant a crop in the soil, but that does not mean that soil-food is at once fit to be taken up in watery solutions by the rootlets of the crop. Planting or sowing the land is, in fact, analogous to taking a horse to the water—you can "take him there, but you can't make him drink." So you can plant your fruit trees, or sow your vegetable seeds in the earth, but unless the soil organisms have rendered the plant-food soluble, *i.e.*, unless it has become "nitrified," the plants will not, because they cannot, take it up and send to their leaves for further development, and thence to be returned or attracted to flowers, fruits, or stems, for man's service and delight. We have said that there are two groups of bacteria that act in the nitrifying process continually going on in the soil, and from the latest evidence it appears that the function of the "nitrous" organism is to attack the ammonia in the soil, and form from it what are called nitrites, and after the ammonia (nitrogen) is thus changed, the "nitric" organism begins its work upon the nitrite, and reduces their composition into nitrates, *i.e.*, nitrogen in a soluble state available for the rootlets of living vegetation. Thus we here see a most beneficent kind of "symbiosis," a potent co-operation ever going on between the higher and the lower races in the vegetable world; and after this, need we wonder at the folk-lore which tells us of the "good fairies" that carried on the farmwork at night unseen and unheard? That bacteria did this in all the farmhouse operations of brewing and baking, and cheese-making, as well as on the farm itself, is a well-known fact to-day, and one with which we cannot become too familiar in the garden.

It may interest some readers to know that microscopic sides of the "nitrous" organism or bacterium, prepared by Prof. Winogradsky, can be obtained of

Messrs. Newton & Co., of 3, Fleet Street, E.C., and those who would like to dive deeper into his fascinating question of life in the soil may consult with advantage the followin papers &c.:—

Winogradsky, in the *Annales de l'Institut Pasteur*, 1890.

Munro, in the *Journal of the Royal Agricultural Society of England*, December, 1892.

Frankland (at Royal Institution) in *Nature*, June 9, 1892.

Warrington, R., letter in *Nature*, vol. xlv., p. 190, on "Nitrification in the Soil."

Those interested in economic bacteriology severally might with advantage refer to—

"Recent Contributions to the Chemistry and Bacteriology of the Fermentation Industries," *Cantor Lectures*, 1892, Society of Arts, London (price 1s); or, *Our Secret Friends and Foes*, S.P.O.K., 1893, price 2s. 6d.

In conclusion, I should like to say that the whole subject of soil-organism, as also of bacteria generally is well worthy of the gardener's closest attention, seeing that these organisms seem to lie at the very base of all growth-force, as well as at the root of most, even if not of all, kinds of decomposition as it occurs in the garden.

In a future paper, I shall like to draw further attention to the bacteria peculiar to Leguminose vegetables, and which are supposed to possess the unique power of "fixing" free atmospheric nitrogen. F. W. BURIDGE.—*Gardeners' Chronicle*.

SALE OF KANANGAMA ESTATE.

Mr. David Fairweather has, through Mr. W. D. Gibbon of the Central Land Registry Office, Kandy, sold Kanangama estate in the Kelani Valley to the Eila Tea Company, Limited, for £9,000 sterling. The estate is over 280 acres in extent, mostly under tea.

A NEW TEA BREAKER.

A Terai planter is loud in his praises of a new tea breaker, invented by Mr H. Sabow, than in those parts—well-known Kurseong Engineer. Since using this breaker the planter found that he had made 40 per cent less Faunings and Dust than with his former machine. Mr Sabow's breaker costs R250.—*South of India Observer*.

CHEMISTRY OF TEA.

We have already urged upon the Tea planters of Ceylon the great advantage they would almost certainly gain by the services of a qualified chemist, and we return to the subject, because of its paramount importance, now that competition is so keen and is increasing year by year. Planters who speak of the crop of the Island in millions of pounds may look complacently on such comparatively pigmy production as that of Johore, Natal, and other countries that are making their *debut* in the field; but, if they recall the rapid progress that Ceylon made from its first start, they would see reason to regard these small beginnings elsewhere as indicating great possibilities within a comparatively short space of time. Ceylon exports increased by leaps and bounds, and with that example before them, why should small beginnings elsewhere be despised? In short, the Ceylon planters have still to maintain the high position they have acquired, and that, too, with lands that are yielding up their fertility year by year, and with markets more and more abundantly supplied as time goes on.

Many of the planters, most of them indeed, admit, though with more or less mental reservation, that their lands become weaker with each crop they produce which means that a time is certainly coming when their fertility will be much more reduced. From that admission, which no one will deny, there is an inevitable conclusion forced upon the mind, that a period of exhaustion is assuredly coming, whether more or less distant may not be easily determin-

able. Ceylon tea planters are divided between those who are cultivating coffee lands, that had already been more or less exhausted before tea was planted in them, and others who are cultivating new lands that had not been so impoverished. In the former, the need of manurial aid is in many cases already pressing, and with regard to all such lands, no time should be lost in giving artificial help. Yet, where are the cultivators who are so situated who know, even approximately, what kind of aid their soils require? Even those planters who are cultivating virgin lands know not what artificial aid they require, nor how soon they may require it.—Ceylon "Independent."

VARIOUS AGRICULTURAL NOTES.

SEYCHELLES TURTLE OIL.—A gentleman has leased the Aldabra Islands, in the neighbourhood of the Seychelles, in the Indian Ocean, and proposes to promote a company for utilising the enormous supply of turtle which the islands provide. A large profit is, he thinks, to be made in preserving and canning the turtle oil for shipment to Europe, where its excellent medicinal properties, which are far in advance of cod-liver oil, would probably be much appreciated.—*Imports*.

MACE AND NUTMEG IN BANDA.—The spice-growers on the island of Banda (Dutch Indies) had a very prosperous year in 1891 owing to the rise in the market value of nutmegs and mace. There are thirty-four nutmeg-plantations in the island, and the recent sale of two of these showed that the value of this kind of property has increased very largely. The total output of nutmegs and mace in the islands of the Banda group in 1891 was about 14,580 piculs. The cultivation of nutmegs is extending to many of the neighbouring islands, but the trees there are not yet in bearing.—*Ibid*.

PERFUME-YIELDING FLOWERS AT GRASSE.—It is reported that the Violet crops in the south of France this spring, have given only a mediocre result, the output being not quite sufficient to satisfy the requirements of the local manufacturers. It seems that during the present, and in many previous years, the Violet plants have suffered from a blight, which has injured the flowering. The French and Algerian Geranium growers continue to complain of the competition to which they are being subjected by the distillers in Reunion, whose output is increasing very rapidly. Almost every steamer that arrives at Marseilles brings Reunion Geranium oil, sometimes by thirty cases or more in one consignment. The Orange trees at Grasse promise a good crop of flowers. Jonquils are now being gathered, but the prices realised for these flowers are so low, that they are gradually going out of use for perfumery purposes.—*Gardeners' Chronicle*.

NEW AND CURIOUS SUBSTANCES FROM PLANTS.—Amongst a number of obscure but chemically-interesting substances which have recently been obtained from plants, we notice the following:—From the root of *Corydalis cava*, M. Freund has isolated several alkaloids, namely, corydaline, bulbocapnine, and corycavine. G. Carrara has obtained conduranin from the bark of *Gonolobus condurango*; this substance is supposed to be identical with the zine-toxin from *Asclepias vincetoxicum*. Schimmel, the great German essence manufacturer, has found cineole in the oil of *Lavandula spica*. Gerard has shown that the cholutorol derived from phanerogamous plants is identical in physical and chemical properties with the phytosterin of Hesse; whilst that obtained from cryptogams is similar to the ergosterin of Tansit. From the *Belladonna*, E. Merck has obtained another alkaloid, namely, apoatropine. Altogether, this plant well deserves its other name of "Deadly Nightshade." Schmidt has found scopalamine in *Hyoscyamus niger*, *Atropa belladonna*, *Datura stramonium*, and *Duboisia myoporoides*. C. Seuger finds that *Artemisia absinthum* contains large quantities of absinthin. From *Licari kanali* P. Barbier has isolated licarol.—*Ibid*.

THE TEA PLANTING INDUSTRY IN CEYLON.

Just as we have pointed out the location of what is left to us of "Coffee," it may be well, briefly to bring under review the great divisions or centres of "tea" cultivation in the island. We may well be told that tea is everywhere, or asked where it is not, within the recognised planting country of the mountain zone and much of our South-Western lowcountry; but by grouping certain districts together and showing the total area in these covered by the tea plant, we may get a much better idea of the importance of the several divisions. In doing so we may first give an approximative estimate of the area under tea from an altitude of about five thousand feet above sea-level and upwards; secondly between five thousand down to about three-thousand-five-hundred feet altitude; thirdly from the latter limit to say two-thousand feet; fourthly between two and one thousand feet; and fifthly under a thousand feet altitude and in the low-country proper. Premising that the aggregate area planted for Ceylon is taken, according to the latest Directory returns, at 273,000 acres, our estimate of approximative areas at the different altitudes works out as follows:—

	Feet.	Feet.	Acres.
Tea above (or close on) 5,000	about	..	10,814
Do. do.	3,500 and under 5,000	..	125,851
Do. do.	2,000 do. 3,500	..	70,797
Do. do.	1,000 do. 2,000	..	81,050
Do. under	1,000	34,693
Total ..			273,205

Next we may attempt some grouping as respects districts. Taking first the great expanse of cultivation between Great Western and Adam's Peak and including Lower Dikoya, we get of tea planted, as follows:—

	Acres.
Dimbula—area under tea	.. 39,980
Dikoya do.	.. 25,855
Dikoya Lower do.	.. 7,150
Maskeliya do.	.. 17,760
Total ..	
90,745	

Or as near as possible, one-third of the total area planted in the country, and certainly by far the most valuable third. Let us by way of contrast place the Uva group of districts, going as far as Matura'a on the one side and Balangoda—though this may seem rather beyond the Uva climate—on the other. We then get a return as follows:—

	area under tea	Acres.
Haputale	..	9,050
" West	..	1,086
Balangoda	..	1,890
New Galway	..	545
Udapussellawa	..	5,957
Maturata	..	4,496
Badulla	..	5,989
Pasara	..	3,606
Madulsima and Nawara	..	
Eliya	..	5,620
Monaragala	..	245
Total ..		38,481

Here, we have about one-seventh of our total area under tea; but then it must be remembered that in this division there are over 20,000 acres of coffee and an appreciable area of cinchona against only 6,000 acres of coffee and very little cinchona in the Dimouta-Dikoya group.

It may be well next to show the area under tea in the districts North and South of Kandy respectively. In the Northern, North-Western and

North-Eastern divisions, we have:—

	Acres.
Matale East & Laggala—area under tea	6,638
Matale West	.. 2,881
" North	.. 828
Kelebokka	.. 4,227
Knuckles	.. 3,809
Nitre Cave	.. 329
Rangala	.. 4,397
Meda Mahanuwara	.. 767
Hnnasgiriya	.. 3,061
Panwila and Wategama	.. 1,716
Dumbara	.. 65
(And let us add) Knurnegala	.. 1,396
Total ..	
30,114	

Or less than one-ninth of the whole extent under tea and less than half the acreage included in the next group. South and West of Kandy, we place:—

	Acres.
Hantane—area under tea	4,349
Hewaheta Lower	3,065
" Upper	3,568
Nilambe	.. 4,402
Pussellawa	.. 11,358
Ramboda	.. 3,718
Pundalnoya	.. 3,010
Kotmale	.. 7,662
Ambagamuwa	.. 5,539
Yakdessa	.. 1,933
Dolosbage	.. 13,166
Kadgannawa	.. 2,626
Alagala	.. 1,887
Total ..	
66,273	

This takes the second place, the proportion being very nearly one-fourth of the whole.

Finally, we may give all that remain together as "Lowcountry," although the Rakwana, Kukululu and Morawak Korale districts are scarcely in that category:—

	Acres.
Kelani Valley—area under tea	18,679
Kegalla and Polgahawela	.. 1,153
Kalutara	.. 7,660
Udagama	.. 3,293
Other Lowcountry Districts	.. 5,843
Total ..	
36,628	
Kuruwita	.. 565
Rakwana	.. 3,135
Morawak Korale	.. 2,790
Kukululu Korale	.. 1,016
Total ...	
44,134	

In this total we have nearly one-sixth of the grand aggregate for the island; but as time rolls on, if only encouragement is offered through price keeping up, we may expect the lowcountry to show a further considerable development. (See next page.)

THE ORIENTAL BANK ESTATES COMPANY, LIMITED.

REPORT OF THE BOARD OF DIRECTORS.

The following is the report of the directors which was to be presented to the shareholders at the Seventh Annual Ordinary General Meeting, to be held at Winchester House, Old Board Street, London, E.C. ON THURSDAY, SEPT. 28TH, 1893, AT NOON.

The directors present as follows to Shareholders their report of proceedings together with the accompanying balance sheet for the seventh year of the working of the Company.

The great Mauritius hurricane of the 29th April in last year took place during the period under review and affected the crops which began to be reaped in September last, the loss of which has lately been completed.

The damage inflicted on the Company's buildings and plant proved to be about as anticipated by the Chairman in his speech of last year; but as he stated, it was impossible then to forecast with any accuracy the damage done to the canes, and the loss then likely to accrue from the injury to them and from the deterioration in the cane juice, and the difficulty of extracting the sugar. That loss proved in the course of the year's working to be extraordinarily heavy since not much more than half the usual crop of sugar (usually sold for over two million rupees) was secured from the Estates in which the Company is interested; the expenses on the other hand, notwithstanding every effort to economize, were increased by the necessary restoration of buildings and plant, the replacing of stook, the clearing and reshaping of watercourses, the rebuilding of bridges and other matters which also consumed much time and labour.

The tea and cocoa crop in Ceylon during the period under review was also generally found to be below the estimates made and this diminution affected to some extent the Company's estates in common with others, but exchange being favourable and the value of the company's tea proving the same as in the previous season, the profits were slightly increased: 1,363,714 lb. of made tea, from about 4,000 acres in bearing, were produced on the Company's Ceylon estates, in addition to which 156,797 lb. of tea were manufactured for the estates of other persons. The cost of cultivation and manufacture to f.o.b. Colombo varied with different estates from 5 pence to 7-36 pence per pound of made tea. The gross average price of the company's tea for the year was 9½d. per pound in London.

The cocoa crop amounted to 1,417 cwt. from about 500 acres in bearing, and realized gross 110s per cwt.

Under the above exceptional circumstances the Directors consider that the small balance which appears on the balance sheet after payment of interest on the debentures, and after making considerable provision for deterioration in Mauritius should not, however much it may be regretted, be a cause for apprehension, for they have good reason to expect that the results of the proceedings of the present year, as to which excellent reports have been received from the Company's Managers, will prove as satisfactory as the year under review was otherwise.

All damages to the Company's Mauritius Estates have been made good and occasion has been taken in rebuilding to improve the arrangement of the factories and the condition of the Company's Estates in both islands is reported excellent.

Mr. James Charles Shaw having retired from the Board, the Directors elected Mr. Henry K. Rutherford, Managing Director of the Ceylon Tea Plantations Company, Limited, to fill the vacant place.

In accordance with the Articles of Association, Mr. G. H. Tod-Healy retires from the Board, and as he does not offer himself for re-election, Mr. Norman W. Grieve, well-known as a Ceylon Planter, is, in accordance with the Company's Articles, recommended by the Directors, and has expressed his willingness to fill the vacant seat.

The Auditors, Messrs. Welton, Jones & Co., also retire from office, and offer themselves for re-election.

The Directors append the following particulars with regard to the estates in accordance with the wish of Shareholders:—

ESTATES IN CEYLON AND MAURITIUS THE PROPERTY OF THE COMPANY.

CEYLON.

Bellwood, Craigie Lea, Dangkande, Darrawella, Delmar, Dene, Dodangalla, Donoughmore, Forest Creek, Glen Devon, Havilland, Haddington, Henegahawelle, Hunnigalla, Kalugalla, Kondesulle, Kuda Oya, Lindupatina, Lonmay, Loolecondera, Mahaberiataune, Mahawatte, Naranghena, Newmarket, Nilloomally 3-4ths, Sinnapiya, Stellenberg, St. Coombs, Summerhill, Waloya, Wattewella.

Total acreage 13,091 acres.		
Under Tea	...	5,086 acres
" Coffee	...	658 "
" Cocoa	...	686 "
" Cinchona	...	525 "
" Cardamoms	...	113 "
" Fuels Reserves and Nurseries	...	690 "
Grass, Forest, &c.	...	5,393 "

MAURITIUS.

BRITANNIA | CENT GAULETTES.

Acreage 3,845 acres.

The Company is also interested in the following estates:—

Beau Sejour Sugar Estates Company, comprising:—
Beau Sejour estate, Mon Souze estate and the lands of Mont Piton, Australia, Mon Choix and La Paix, Bon Air estate.

Highlands Sugar Estates Company comprising:—
Highlands estate and Comto estate.

Acreage 9,572 acres.

By Order of the Board,

HENRY GREY, Secretary.

18th September, 1893:

THE CEYLON TEA PLANTING INDUSTRY :
ITS PRESENT STATUS WITH ESTIMATES
OF CROP ;

NATIVE CONSUMPTION AND CULTIVATION.

More important than the analyses we have already presented to our readers is that which has to do with the distribution of our planted tea area according to age. From the records made up for the Directory, at intervals since 1867 when the return was *ten acres* planted, we are able to arrive at a very close approximation of the extent throughout the country in full or partial bearing and of that still under age. The figures work out on the present occasion as follows:—

TEA PLANTED IN CEYLON.

	Acres.
6 years old and upwards	.. 183,000
5 to 6 years	.. 22,000
4 to 5 "	.. 15,000
3 to 4 "	.. 30,000
2 to 3 "	.. 12,000
Not in bearing	.. 11,000

Total 273,000

This will afford a basis for the Committee of the Planters' Association in framing their Estimate of Crop for 1894. For that year we may add 7,000 acres to the extent "not in bearing" for tea planted amongst coffee, of which no account has been taken in the above figures. Our own Estimate for the coming year, as given in the Handbook, is based on an average return of 371 lb. per acre for the old tea; 320 lb. for land between 5 and 6 years as an average; 270 lb. for the next stage; 200 lb. from 3 to 4 years and 100 lb. from tea 2 to 3 years of age. This works out to a total crop for 1894 of 86,183,000 lb. and deducting 700,000 lb. for home consumption, we get for export 85,483,000 lb. It is too early, however, to put forward such an Estimate with any authority. We must first have a better idea of how the present year's crop and export are to run, and we must also consider how much depends on the weather and the kind of encouragement offered to "fine," "medium" and "coarse" plucking. Taking these elements into consideration, the course adopted by the Planters' Committee of giving a range of figures in the estimate seems a wise one, and will no doubt be followed for the coming year. If the aggregate shipments for

the current year do not fall short of 78 million lb., we suppose 83 to 85 millions would be a safe reckoning for 1894. But we must not speculate further.

One thing is certain: that "local consumption" must henceforward be taken into account. There is no question that a rapidly increasing proportion of our population are taking to tea drinking. In Colombo and our other large towns, the consumption must be considerable, while in the boutiques along the main thoroughfares a bowl of tea can now be far more readily got than one of coffee, the supply of which has fallen to very low as to make it almost a luxury in the planting districts. Of course, it is chiefly the inferior kinds of tea that are used by the natives so far—the red-leaf, dust and broken teas sold off from several factories to travelling tamby-pedlars who are developing an extensive business in this line, and are beginning to carry their distributing trade far beyond the ordinary beaten tracks into remote districts and secluded villages. Nor do we know of any trade that more heartily deserves encouragement. The "temperance" party in our midst ought especially to rejoice in the spread of tea-drinking habits among the people as one of the best antidotes to the arrack-shop. Nor need the planter have any feeling but one of satisfaction; for unlike "coffee" and "cocoa," there is little or no chance of "tea-leaf" being stolen from the field, however much the demand for the prepared product may extend, and all he has to do is to guard his factory. Of course, it must be remembered that many of the Sinhalese themselves are becoming cultivators of tea, especially in the lowcountry and more particularly in the Southern Province. In his Administration Report for last year, Mr. Elliott remarks that "tea planting is becoming popular with the Sinhalese: their gardens are especially numerous in Wellaboda and Talpe pattus." We do not at all fear the result as regards our export trade: we consider rather that local consumption will extend *pari passu* with such native cultivation until among the 3 millions of people in Ceylon as many million lb. of tea are consumed—a very low rate of consumption as compared with that obtaining in the mother-country or the Australian colonies.

TEA SEED OIL.

We have lately referred more than once to samples of oil prepared from tea-seed, which were highly approved by Colombo authorities on oil.

We have referred one home for report; but meantime we learn from Mr. Walter Agar, Dikoya, that some years ago he secured a report and analysis by a competent English authority, the result of which was not favourable. Mr. Agar is good enough to give us the following information:—

"In May 1890, I sent a quantity home for report and analysis. Professor Atfield analyzed it and his report I cannot lay my hands on just now, hence delay in writing you. However, the valuation placed on it was too low to make a paying speculation, by exporting it to England. I have some of what I made then still here. It has become beautifully clear like Lucca oil in the keeping and for local use might pay. It takes a large quantity of seed, however, to produce a bottle of oil; this was done in my case by a hand or cooly chekko-mill. I may be able to get a copy of Professor Atfield's analysis report from my agents who sent the oil home and had it tested."

We shall be glad to have the Professor's Analysis and Report. It is just possible that there would be a better demand and price now available than in 1890.

DR. VOELCKER'S REPORT ON INDIAN AGRICULTURE.

This report, which after so long a period of incubation has at last seen the light, proves to be of a far more valuable character than could have been anticipated from the brief summaries of Dr. Voelcker's ideas and conclusions which have appeared from time to time since he left India two and a half years ago. On several of these we commented at the time they appeared, and we were constrained to remark that the learned Doctor had not, it seemed to us, appreciated all the aspects of the problem before him. The delay which has been allowed to occur in the preparation of his Report has, however, enabled him to set himself right in many ways in which at first he appeared to have gone astray, and he has now produced a work which—if the powers that be will read, mark, learn, and inwardly digest the advice he sets before them, and then proceed to act thereon consistently and strenuously—should lead to very considerable results as to the improvement of Indian agriculture. It is not that Dr. Voelcker tells us much that has not been said before one or other of the various authorities who have made a study of the problems of Indian agriculture on the spot, but rather that from his position as an outsider, brought in as a scientific authority on agricultural matters he has been enabled to bring such views into focus, and to put them forward with a weight and impressiveness that no one whose position has been that of a student on the spot can ever expect to exert. Thus the results of Dr. Voelcker's Report are likely to be much more far-reaching than any that could be expected from what might be said or urged by authorities on such matters whose reputation is Indian or merely provincial. Not that we would be understood to say that all the Doctor's *ex-cathedra* deliverances on such varied agricultural topics as judging at Horse-Shows to the management of fuel reserves, or from dealing with cattle disease to details of agricultural education, are to be accepted *en bloc*, but that on the greater number of the various matters that he has dealt with, and these are many and diverse, he has shown great shrewdness and discrimination in sifting the wheat from the chaff. Where he has failed, the failures are generally of minor importance and easily explained by the limitations of the qualifications of an Agricultural Chemist however able and distinguished, for dealing with a matter concerning so wide a field as agriculture in India, with only one year's experience in the country.

When, four years ago, it was announced that the Secretary of State had secured the services of Dr. Voelcker to come to India to report upon the possibility of improving Indian agriculture, and to settle once for all a long standing discussion which had been proceeding between him and Sir Edward Buck as to the advisability of furnishing the latter with a scientific adviser in agricultural matters in the form of an Agricultural Chemist, there was an uneasy feeling abroad that the Government of India understood that the mission had been entrusted to the distinguished father of the individual who was actually sent out. As we have already said, the son has fully justified the choice, and has added further to the honour in which the name of Voelcker is held in the agricultural world by the manner in which his work has been done. For the greater part of a year he travelled up and down the land, evidently making the most of his opportunities, which were great, for obtaining from everyone who had given thought to the matter information on the principal subject of his mission, and finding here, there, and everywhere items of evidence of the utility of having an Agricultural Chemist to study Indian problems. Dr. Voelcker also had placed at his disposal the mines of wealth in these respects to be found in the official literature of the Secretariat, and his Report bears repeated evidence of his industry in utilising these resources. All these sources, from which

he has drawn so beneficially, are gratefully acknowledged by Dr. Voelker, when he compares the opportunities he had with those whom he terms his "predecessors" in the field.

His main conclusion regarding the Indian cultivator and his practice is that sweeping generalisations deduced from experience of one part of India may be directly contradicted by reference to the practice of another part, but that, "taking everything together, and more especially considering the conditions under which Indian crops are grown, they (practices of the ryot) are wonderfully good." This is no doubt true, but fully so only in regard to cultivation, and that is it must be remembered, only one portion of agricultural practice, and, as the Doctor himself shows in his Report, the management of his cattle and of their manure, which are two other most important items in agricultural practice, are matters to which epithets entirely contravening the above would be most justly applied. Dr. Voelker, moreover, expressly limits his remarks to the ordinary acts of husbandry, *et c.*, keeping the land clean from weeds, ingenuity in device of water-raising appliances, knowledge of soils and their capabilities as well as of the exact time to sow and to reap; and this limitation must be remembered always when his remarks on the subject are being studied. It is to be regretted that Dr. Voelker did not see more of this Presidency than he did, to enable him to specify more definitely his opinions on local practices, but his remarks, that in the "garden cultivation" of Coimbatore there is little that can be bettered, and that in the general cultivation of Tanjore there is a field for improvement, are such as will commend themselves to all who have made much study of the matter, and enable them to estimate the value of his conclusions. What appears to have impressed Dr. Voelker most in Indian agriculture is the great variations in practice in different parts of the country in one place, the practice being so good, and in another so inferior. He rightly puts this down to one or other of three causes, or of several of these causes acting together. The causes are (1) differences inherent to the people themselves, such as prejudices which prevent people of certain castes from utilising night soil as a manure, and others from engaging in indigo cultivation; (2) differences due to external surroundings, such as rainfall, or facilities for water manure, grazing, wood, etc., the former being beyond human control, except perhaps to a very limited degree, but the latter calling for direct action; (3) differences arising from want of knowledge which may and do occur frequently either because the ryots of a tract simply do not know of any better practice than their own although such may be followed in an adjoining District, or because the ryot's capacity for appreciating improvements on his own practice has not been developed to enable him to grasp the manner in which he may beneficially modify it. Under the second head we should be inclined to include many matters of economic importance which lead to differences in practice; but although he notices the existence of such causes briefly, Dr. Voelker refrains from attempting to deal with them in his Report, and it is sufficient to allude to their importance in any consideration of the general question of improving Indian agriculture. Dr. Voelker's chief recommendation for the removal of the differences noted is the spread of General and Agricultural Education, a matter to which we only very recently referred, but besides this, his remarks and conclusions on many other points of great importance are of such value as to demand separate notice, which we must defer to another occasion.—*M. Mail.*

JAVA PETROLEUM.

The Dortsche Petroleum Company commenced operations about the middle of 1888 with a capital of 350,000 florins (about £92,000), and is reputed to have paid last year a dividend of 80 per cent. At Wonokromo, five miles and a half from Sourabaya, it has erected a large refinery, employing some 200

men. The oil is procured at present from wells in a village called Djabokkoto, four miles from Wonokromo, being conveyed to the refinery by pipes. At Djabokkoto there are twenty-seven wells varying in depth from 100 to 600 feet. The density of the oil is 23° to 42°. At another village (Gogor) there are six wells, the deepest being 1850 feet. There is also a gas well at Gogor with a pressure of 438 lb. The gas is utilized for stoking purposes. The area of the Dortsche Petroleum Company's concessions in different parts of Java is about 150,000 bahoes (a bahoe is an acre and three quarters.) At present there are about 90,000 tins of oil obtained every month, which will soon be increased to double that amount. The oil costs packed in tins and cases, 2-29 florins per case, and is sold in Sourabaya by agents of the company for 3 5/2 to 3 6/5 florins. The company buys up empty tins and cases, and utilizes them for its oil. There is another concession for petroleum. The Goenong Sarie—granted by the Government to a Chinese family, the Twan Lok, with a registered capital of 300,000 florins; but they are reputed to have formed a Chinese company with 4,000,000 florins capital.—*New York Drug Reporter.*

NOTES ON PRODUCE AND FINANCE.

TEA AND THE INLAND REVENUE.—According to the report of the Commissioners of Inland Revenue, the consumption of tea is still steadily increasing. The amount used per head last year was 5 4/33 lb., a larger average than in any previous year; but coffee seems to be going out of favour. We consumed last year 207,055,679 lb. of tea, and only 28,224,008 lb. of coffee. As a beverage, indeed, cocoa may soon be running coffee a close race, as so less than 20,795,271 lb. of it was consumed last year, though forty years ago we used ten times more coffee than cocoa.

INDIAN TEA COMPANIES.—The statistical table of Indian tea companies, compiled by Mr. Geo. Seton, which appears on another page, is additional testimony in favour of the growth and development of the tea industry. The table now includes particulars of forty companies, as against thirty-five last year; and, if we allow for the omission of two from the list, there are seven new names added to the list of Indian tea companies in London since last year. A study of the capital cost per acre, cost of production, margin of profit, the amount of reserve fund, out-turn per acre, and the proportion of immature plant given in this table, will enable the trade to judge of the merits of the respective companies from the investing point of view, and should satisfy him that tea companies should occupy a prominent place in every well-selected list of sound investments.

LAST WEEK'S TEA MARKET.—Of last week's tea sales the *Produce Market's Review* says:—"A considerable quantity of Indian tea has been placed on the market, including a somewhat better selection. The demand generally continues active, buyers evidently taking advantage of the exceptionally good values offering, especially in teas under 9d. Many of these grades probably show as good value now as they will at any time during the season, and retailers may, with confidence, hold a fair working stock of well-selected tea over 6d and up to the above price. As these kinds have now touched the lowest point at the most depressed period last season, and compare most favorably with other growths, it is not improbable that the demand will keep pace with the supply, although imports are expected to be materially in excess of last year; the effect, however, has already been discounted in the present low range of values. The good medium grades are not over plentiful, particularly whole leaf teas between 9d, and 1s, but later on the selection will no doubt improve, while broken leafs at these prices offer fair value. For the finest grades the market is more liberally supplied, and the distinctly easier tendency has been established, excepting for some of

the choicest Assam and Darjeeling growths which were keenly bid for and fetched extreme rates. The downward tendency noticed last week in Ceylon teas has received a check in the considerably smaller supplies brought forward, and most of the common grades ruled firm, while in many cases a rise was established. No public sales have been held since Tuesday, and the quantity at present advertised for next week again shows a falling off, so that lower prices are very improbable, even in the face of the cheap Indian teas now offering. The bulk of the sales has consisted of the medium and lower kinds, good Pekoes about 9d and upwards continuing very scarce, and all fine descriptions have met with a good demand."

THE TEA TRADE OF CHINA.—Mr. O'Connor, in a report to the Earl of Rosebery, on the foreign trade of China, makes the following references to tea:—"Tea has not been so profitable for the Chinese middleman. Money was made by him at Hankow on what he sold there, but the Russian demand was limited, and a later demand expected through London never came. The consequence was that some good teas brought from Hankow to Shanghai were sold at a reduction of 30 to 50 per cent of prices obtainable at Hankow early in the season, and upon these teas men suffered heavy losses. The foreign exporter of tea bore in mind the heavy losses of previous years, and displayed much caution in purchases which has borne good fruit. A shrinkage in the export of tea from India and Ceylon owing to drought helped him, as it imparted strength to the London market, and, on the whole the tea exporter to London has had the best season on record for some years. Teas to America have practically done fairly well, and exporters to that market are satisfied with their operations."

A SURPRISE INDEED.—Indulging in playful speculation as to the future of Indian coal, the *Globe* says:—"Although India does not yet figure among the great coal-producing countries of the world, her output of black diamonds is assuming quite respectable dimensions. What an unpleasant surprise for the British miner it would be if India were literally to "send coals to Newcastle." Yet half a century ago wheat growing was unknown in the peninsula; now India is one of its chief exporters. At the same date China monopolised the English market for tea; now both India and Ceylon are a long way ahead of her. Then, too, there are the Bombay cotton mills steadily eating into Lancashire's trade with the Far East. In presence of these quite recent conquests our pitmen should not make too sure that they would have the game in their hands against consumers even if Continental competition came to an end."

THE BANK RATE.—At a meeting of the directors of the Bank of England yesterday the Bank rate was reduced from 5 per cent. (at which it has stood since Aug. 24th) to 4 per cent.—*H. and C. Mail*, Sep. 15.

INDIAN TEA NOTES AND NEWS.

Our Moriani correspondent writes on 9th September:—Rainfall up to date 72.10, total for same period last year 77.67; most gardens now doing fairly well although very little ahead of last year. There are already signs of an early close to the season, viz., the usual fog in the morning and cold nights.

Our Hulmari correspondent writes on the 6th September:—The weather for the last week has been dry with a very high temperature. Rainfall to date 86" against 132" last year. There has been a good deal of sickness amongst the coolies, and a large percentage down with fever daily. Leaf is fairly plentiful and most gardens are ahead, but the prices realized for first invoices are not encouraging.

The weather in Chittagong during the past week has been somewhat more favourable for leaf and most of the gardens in the northern part of the district are doing well, while those in the southern—notably Chandpore and Tuogoo—still suffer from the effects of the late floods due to a large portion of the tea being in low-lying flats, the tap root being waterlogged.—*Indian Planters' Gazette*, Sept. 16.

CEYLON PRODUCE IN AUSTRALIA.

In a report of the Spring Show in connection with the Royal Agricultural and Horticultural Society which appears in the *South Australian Register*, of the 16th ult. it is stated:—

Among the many interesting exhibits at the Show is a fine collection of Ceylon and Indian produce, arrayed by Messrs. Drummond Brothers. On the stand are to be seen photographic views of tea and coffee plantations with the natives at work in the fields, and performing the various operations necessary before the tea is fit to be put in cases for export. It is interesting to see displayed the many varieties of tea, from the strong black pungent article to the exquisite-flavoured flowery orange Pekoe. A sample of "Golden Tips" at four guineas per pound provoked a farmer to say that if gentlemen indulged in high-priced wines the gentler sex must sometimes indulge in expensive teas.

MADAGASCAR RUBBER.

Some people who ought to know have come to the conclusion that Para rubber will find formidable rivals in some of the Madagascar grades as soon as rational and uniform methods of procuring and coagulating the milk are adopted. From recent French reports it appears that rubber vines abound in the forest, but the product (as in other rubber districts) becomes rarer, and consequently rises in price, in consequence of the wasteful methods of the native rubber gatherers. On the East Coast the article has gone up considerably in price, in the thinly populated West it is as plentiful as ever, and can be purchased at a very low figure. But the natives must be taught not to saw down the vines for the sake of drawing them, but to tap them annually instead. They also need instruction in the preparation of the rubber. They use warm water and citrom juice, or even tea salt, with very imperfect results. Only where Europeans are in authority is sulphuric acid used, and of course, pays well for the extra expense and trouble. The future of Madagascar, commercially and financially speaking, is declared by men who have carefully considered the subject to rest largely upon the proper management of its rubber product. The authorities who may hold the destinies of the island in their hands, whether native, or French, or English, or any other, will be guilty of inexcusable folly if they neglect to take proper measures for enforcing economical and efficient methods of tapping the vines and preparing the product for commercial purposes.—*India Rubber Journal*.

MORE ABOUT TEA IN CEYLON.

PROSPECT OF EXTENDED NATIVE CONSUMPTION: AND IS IT TO BE ENCOURAGED?

On page 306, we referred to the rapidly extending consumption of tea among the Sinhalese and Tamils. The cups

"that cheer but not inebriate"

are fast supplying the favourite beverage at every roadside bouvette, in native boarding-schools and even in the village dwellings of the people. Nor is Ceylon doing more than following the example of Northern India at least in this matter. It was not above the dignity of the Government of India some years ago to take an interest in the establishment of wayside tea-shops where the people could get this refreshing beverage supple and this led later on to the establishment of an Association in Calcutta in the interests of the tea planter, and having for its object, the promotion of a taste for tea among the 60 millions of natives in Bengal, as well as among the vast population in the North-West and Central Provinces, the Punjab and the borders generally. These

might well be expected in the course of years to consume a large proportion of the commoner teas produced in India, leaving the better kinds for export; and there is no reason why the same experience should not extend over the Bombay and Madras Provinces—though coffee is still available in the latter—and in Ceylon. We think every encouragement should be given by our tea planters and members of the public service, if not the Government, to promote the local distribution, and thereby foster a taste for tea among the native population. Official approval of the opening of tea shops can be indicated without much trouble and we know how far some notice in this way goes with natives of all degrees in our remoter districts. In this connection we cannot help repeating the passage in which the veteran Government Agent for the Northern Province relates his experience and evident approval of recent development in the habits of the people under his care. In his Administration Report for 1892, Mr. Twynam writes:—

"Tea shops have recently become quite a feature of the peninsula of Jaffna. I first noticed the hawking of tea at the pearl fishery of 1888, when two or three tea cans were carried about the camp. In 1889 the number increased, and in 1891, at Marichchukkatti, there were several tea boutiques, which were much frequented by the Muhammadan divers. There are now tea shops at Jaffna near the Kachcheri, the Courts, the Custom-house, and in almost all the bazaars of the peninsula. Tea is retailed at 1 cent the tumbler without milk, and 2 cents with milk."

So much for tea consumption among the natives of the lowcountry. We do not know how far planters would deem it wise to encourage a taste for tea drinking among their estate coolies, and to carry the same with them from time to time to Southern India. We fear they would consider the risk of appropriations from the factory too great. We remember how alarmed the late Messrs. Worms were at the thought of a taste for coffee spreading to the coolies or even in the wayside boutiques in the planting districts. According to one satirical visitor who wrote about the hill country twenty years ago, the way to horrify a planter and to create a sensation in a "resthouse," was to shout,—"Boy, bring a cup of coffee,"—the answer being "Coffee not allowed keep, Sar"! The story is a good one though apocryphal; but certainly no such prohibition or scarcity, even in resthouse, applies to tea; and while our Tea Fund Committee do well to give all possible attention to America, the Australian colonies and Russia, let them not despise tea-drinkers nearer home with "the day of small things," seeing it may develop into a consumption following after that of China and Japan where the people drink a weak decoction of tea morning, noon and night, and never touch unboiled water, thereby saving themselves to a great extent from the fevers, dysentery and other troubles so prevalent among the natives of many districts of India and Ceylon. "Nothing more dangerous to drink in India than brandy, *except water runs the old saw,*" and certainly if the people in the country districts could, as a rule, be got to substitute a weak decoction of tea for the water they often drink, there would be less expenditure in the distribution of fever medicines and less need for multiplying dispensaries. Is this view of the case above the notice of the Tea Fund Committee, the Civil Medical Department and of Government?

BRAZIL grows about four-fifths of all the coffee consumed in the world. Its exportation of coffee berries last year amounted to no less than 360,000 tons.—*Evening Standard.*

SAMPLES "OF FINE TEAS FROM THE LANE.

We have received a series of "samples" from the "Lane" authority whose letter about Ceylon teas in our columns, some time ago, attracted so much attention and was generally acknowledged to be the weightiest deliverance in respect of "quality" and alleged deterioration made in the whole course of the discussion. Our correspondent now writes:—

"By mail I am sending you specimens of the new crop Indian teas, which may perhaps interest planters who look in at your office to talk over 'tea,' and ask what like are the teas fetching high prices in London.

"The Darjeelings leave me with high *aroma* on dry leaf, which may probably be lost in transit: it counts much as a factor of value.

"Wishing you every success in your efforts on behalf of planting industry."

The particulars of the interesting selection of samples (which we may as well say come from 38, Mincing Lane) are as follows, with the remarks of the sender:—

15th Sept. 1893.

1. Goomtee, Darjeeling				
sold at	...	3s	3d	Best of the season.
2. Goomtee, Darjeeling				Above the average of crop valued for combination of high flavour with deep colour and fullness in cup: all in fair sized breaks.
sold at	..	2s	9d	
3. Margaret's Hope	sold at	2s	1d	Not the finest in liquor sent from Assam, but specially good in make and colour of tip.
4. Do	"	1s	6d	
5. Lebong, Co.	"	2s	0d	
7. Pandam	"	1s	9d	
6. Assam Company's	"	2s	2d	
8. Assam Frontier Company's	"	2s	1d	

(Such teas were worth 2s 9d to 3s in the time of high prices for fine Ceylons.)

9. Kangra Valley Tea sold at 1s 1d. A particularly good specimen in make and liquor: sent to show how value of tea has fallen: this used to be 2s or 2s 3d in days of high prices.

10. Sylhet Tea sold at 8d. A specimen of well made tea of *fairly good quality*, but quite wanting "strength" "pungency" or "flavour." This is from one of the best estates, hitherto noted for fine tea—and shows how "character" may change, without fault of the tea maker.

The selection can be seen at our office, and on Wednesday next, we shall hand them to Messrs. Somerville & Co. to show in the Colombo Tea Sales Room where they are sure to attract attention.

OUR CEYLON TEA INDUSTRY AGAIN: OUR BIGGER PLANTATIONS AND FACTORIES; SOME INDIAN AND CEYLON TEA COMPANIES.

With 273,000 acres planted with tea and considerable reserves in private hands, besides the amount of money sunk in factories and machinery, we cannot be above the mark in giving 6 to 7 million pounds sterling as the value represented by our tea industry at the present time. This may, indeed, be thought too moderate an estimate by many, seeing that tea plantations have sold as high as £55 an acre in the Kelani Valley and no less in the Kalutara district. Thirty pounds an acre would therefore seem a moderate average valuation, but we prefer to take £25 which when turned into rupees does not fall short of the old rate fixed for coffee of R400 per acre including stores and pulping machinery. Much more elaborate and costly, however, are Tea Factories and tea machinery than ever were Coffee Estate Stores with their few simple appliances for all the preparation of the beans done on the estates. It is of interest in this connection to name a few of

the largest Tea Factories in the country with estimates of the total quantity of tea prepared in twelvemonths. We adopted for our Handbook Review, 500,000 lb. as a limit, and the result of our inquiry gave us the following big Ceylon Tea Factories with approximate quantity of tea made in each per annum:—

Name.	District.	Proprietors.	Making about lb.
New Pera-deniya	Hantane	Ceylon Land & Prod. Co.	...800,000
Mariawatte	Kaduganawa	Ceylon Tea Plantations Co.	.. 750,000
Do.	do.	New Factory	...150,000
Wallaha	Dimbula	Ceylon Tea Plantations Co.	...700,000
Carolina	L. Dikoya	Carolina Tea Co.	...650,000
Diyagama	Dimbula	New Dimbula Co., Ltd.	...600,000
Galleha	Hantane	Chas. Strachan & Co.	...500,000

Of the larger plantations in Ceylon, the list as now compiled taking 750 acres as the minimum limit runs as follows, only that it must be remembered the area in some cases includes coffee and cinchona as well as tea:—

NAME.	PR-OPRIETORS.	CULTIVATED EXTENT.
Diagama ...	New Dimbula Co., Ltd.	.. 2,334

Meerlabedde ...	A. Gibson	753
Charley Valley ...	Lady De Soysa, executrix of C. H. De Soysa	750

[We include "groups" where worked through one factory.]

Finally we may repeat a list, representing "the business agency of plantations," which has appeared in connection with our Directory for many years and which has lately been corrected as far as was possible. This gives a list of all Estate Agents representing from about 1,000 acres upwards, although such representation in many cases may mean merely the shipping of the tea, while in others it means the financing and transaction of all business in connection with, if not the responsible management of, the plantations. In most cases again, "Colombo Agency" in this "tea" era is a very different and less important matter than was that of "coffee," the chief preparation of the latter being attended to at the stores of the Colombo Agents. With this explanatory introduction we give the following list:—

["P. p." stands for Partly Proprietary, "S. p." for Small Portion Proprietary; "C. p." for Chiefly Proprietary; "A. p." for All Proprietary; "C. S. A." Chiefly Shipping Agents.]

THE TASMANIAN EXHIBITION.

As we have already mentioned, the *Gazette* contains the prospectus of the International Exhibition of Industry Science and Art to be held at Hobart, Tasmania, in 1894-95 under Government patronage. In that document it is stated that the proposal has been taken up by the people of Tasmania and the adjacent colonies with such general approval that the necessary capital has been most readily subscribed.

The City of Hobart is most favourably situated. The Colony of Tasmania has a population of 150,000, and with the neighbouring colonies the total population numbers about 4,000,000 inhabitants. Launceston and other centres are within a few hours by rail. The Austrian Colonies are easy of access by steam, and tourists' routes to all places of interest radiate from Hobart. The objects of the Exhibition are:—To promote and foster Industry, Science, and Art, by inciting the inventive genius of our people to a farther improvement in Arts, and Manufactures as well as to stimulate commercial enterprise by inviting all nations to exhibit their products, both in the raw and finished state. Samples of the products for which this and the other Australasian Colonies have become famous will be exhibited with a view to increase the development of their natural resources. Similar and more varied exhibits may be expected from Great Britain, the Continent of Europe, America, India, Canada, the Cape, and other Colonies, to which the Government of Tasmania have forwarded an official invitation to grant their substantial support to the undertaking. A Fine Art Section will form an important and attractive department of the exhibition. For the accommodation of the Art Treasures and Historical Objects a special block of the building will be reserved, and the most ample precautions will be taken for the security of valuable property lent for the purposes of the Exhibition. Two sections, viz., the Women's Industrial and the Artisan Section, will be particular features. Special arrangements will be made for the management of these.

The site which has been granted by the Government for the Exhibition Buildings covers about eleven acres. It is one of exceptional beauty and convenience, being that portion of the Queen's Domain adjoining the Battery and the Central Railway Station.

The Exhibition will be opened on the 15th day of November, 1894, and will continue open during the day and evening for a period of about six months.

No goods will be received prior to the 1st of September, 1894, without the special permission of the Directors, nor after the 1st of November, but arrangements may be made for motors, heavy

machinery, boilers, or any Exhibit requiring under-building.

The following are the headings of the classification of exhibits:—I.—Fine Arts (including Photography, Engravings, etc.); II.—Music and Musical Instruments; III.—Education and Apparatus for Physical Training; IV.—Furniture, Decoration, Fancy Goods; V.—Pottery and Glass; VI.—Jewellery, Clocks, Watches, and other Time-keepers; VII.—Paper, Printing, Bookbinding, and Stationery; VIII.—Textile Fabrics, Leather, India-rubber Goods, Clothing; IX.—Food, including Drinks; X.—Chemistry, Apparatus and Processes, Philosophical Instruments; XI.—Electricity; XII.—Gas and Lighting, other than Electricity; XIII.—Heating and Cooking Apparatus; XIV.—Cutlery, Ironmongery, Firearms, Military Weapons; XV.—Road Carriages, Bicycles, Tricycles, Ambulance; XVI.—Machinery, Machine Tools, Hydraulic Machines, and Machines for raising heavy weights, Elements of Machines, Furnaces; XVII.—Prime Movers, and means of distributing their power, Railway plant; XVIII.—Naval Architecture and Engineering; XIX.—Civil Engineering, Construction, and Architecture, Sanitary Appliances, Aeronautics, etc.; XX.—Mining and Metallurgy, Minerals, Quarrying, and Fuel. XXI.—Agriculture, Horticulture, Arboriculture; XXII.—Fishes; XXIII.—Women's Industries; XXIV.—Artisan Section.

Group 9 includes coffee, chocolate, tea, and the apparatus used in the process of infusion.

RUBBER AND COFFEE PLANTING IN MEXICO.

From an American journal elsewhere we give some curious particulars of coffee planting in Mexico under the shade of rubber trees, the kind used being the Panama (*Castilloa*), which we believe Dr. Trimen does not consider so promising in Ceylon as *Hevea*, either as to growth or yield. In Mexico it is said however, that no better shade has been found for coffee than this rubber, and it looks as if cacao also was to be planted along with it. In Dumbura, we believe, the Ceara Rubber tree has not been a success as a shade tree for coffee or cacao. But what are we to say of the yield of coffee per bush in Mexico: 1 lb. a tree in Ceylon would mean 10 cwt. per acre, a maximum yield seldom reached save in the early days; but the Vera Cruz writer speaks of 2 lb. and even 3 lb. per tree—only his trees (he does not specify the kind of coffee planted) are placed 7½ to 9 feet apart instead of half that distance as is usually the case with Arabian coffee, so that after all the return per acre may not exceed the half-ton. We suppose the 100,000 coffee trees and 25,000 rubber trees cover about 250 acres, and this area is supposed to be fully planted and kept up for three years exclusive of Managers' salary for 12,200 dollars—say roughly £2,000, a good deal less perhaps if cheap silver in Mexican dollars is considered. At the rate we mention, the outlay would be £8 per acre (or let us put the dollars into rupees and reckon) £100 per acre which would certainly be very moderate. The buying of plants is included, but nothing is said about cost of land? We should like to have the opinion of our correspondent, Mr. W. J. Forsythe, who is now busy coffee-planting in Western Mexico, on this Vera Cruz "coffee-and-rubber" experiment. We have heard of an interesting rubber-growing experiment on a tea plantation in the Kalutara district; but although the price of rubber keeps up fairly well and the demand is a growing one, our latest information as to the enormous extent of the Amazonian country covered with indigenous rubber trees, and of the supplies which that region as well as Africa can send forth, is not specially encouraging to cultivators.

THE SUPPLY OF PALMYRA AND OTHER FIBRE.

A very material impetus to the welfare of the native inhabitants of our Northern and Eastern Provinces has of late been afforded by the demand for palmira fibre. Anyone acquainted with the districts which have specially benefited by this demand would have deemed that the supply must have proved almost more than adequate, but the teaching of experience seems to have demonstrated the insufficiency of it. For very many miles the Jaffna Peninsula presents an almost unbroken grove of these somewhat unsightly palms. Along the shores on both the east and west coasts southwards towards Manaar on the one side and Trincomalee on the other, there also exist long-stretching groves of the tree. In the neighbourhood of Batticaloa also, the palmira has long been cultivated, in large quantities, so that, as we have said, little apprehension could have been felt of the disparity which has been proved to exist between demand and supply. It becomes a question well worthy of consideration as to how the balance may be redressed. The palmira is an exceedingly slow-growing tree. It is stated, indeed, that it does not reach maturity under a hundred years. In that case there could be little prospect of any substantial addition to the number of fibre-yielding trees within the lifetime of the present generation. Anyone who might plant them must do so only in the hope of benefiting his grandchildren, and we fear this fact must tend to discourage the further extension of the cultivation. The coconut palm does not yield its full crop until 20 years have matured its growth, and we know that this has been largely the cause tending to restrict its further systematic cultivation. While tea renders its full return almost at the age of three years, the reluctance to give attention to the more slow-growing productions can be well understood. The counterbalance is, however, to be found in the fact that millions of acres exist in Ceylon unfitted for any growth except that of the palmira. It is, besides, a tree which requires little or no care or attention after the seedlings have been once planted out. It may, therefore, be hoped that many may feel inclined to plant such land with palmira or other fibre-yielding palms. If the fruits should not be gathered by them, at least land so planted must year by year become enhanced in value, and so afford a return for the slight first expense to be incurred. It seems to be a question as to whether the gathering of the fibre does not reduce the other yielding qualities of the tree. It may possibly be the case that this apprehended difficulty may be due more to the want of experience in obtaining the fibre than from any evil that must positively attend the collection. But we think it should be borne in mind that the world's demand for fibre extends with leaps and bounds, and manufacturers are every day experiencing increasing difficulty in obtaining the supplies they require. Palmira fibre has evidently been appreciated by them as a stop-gap, but as they cannot, apparently, rely upon getting all that they want of it, substitutes must be found. We should seriously recommend those who have benefited by the late run upon this special fibre to consider whether it would not be possible to cultivate other trees which yield a similar article and which come earlier to maturity than does the palmira. It has been shown to them how ample a market may be secured for fibres meeting the wants of home manufacturers, and they will prove themselves to be wanting in resource if they make no endeavour to meet it.

RUBBER AND COFFEE-PLANTING IN MEXICO.

Some interesting experiments have been in process for some time on the Isthmus of Tehuantepec, looking to the cultivation of coffee with the use of rubber-trees for shading, so that the two industries may go on together. This isthmus lies between the Gulf of Mexico and the Pacific Ocean, at the point where the two seas approach nearest each other. In the *India Rubber World* Mr. F. O. Harriman, C.E., Jaltilpan, Vera Cruz, says:

The rubber-tree (*Castilloa elastica*) was found to give as good if not better results than any of the woods formerly used, and all new plantations are substituting this shade-tree.

On account of the continued high price of both coffee and rubber for several years past, and of the great advantages of this district in fertility, excellence of its coffee, favorable means of communication both by river and the isthmus railroad, and nearness to the markets of the United States, a great stride has been made in their production. Without doubt this district will become a most important factor in the world's production of both rubber and coffee.

In the town of Jaltilpan, for instance, where ten years ago there were not more than 30,000 coffee-trees and no planted rubber, we find today hundreds of thousands of coffee-trees, with corresponding rubber shade-trees. There is a great boom in this interest all over the isthmus, natives and foreigners trying to outdo each other.

From actual experiments Mr. Harriman gives directions for the cultivation of coffee in connection with rubber, and to him we would refer all parties interested. He states that the coffee-tree will bear the third year after setting out, and the fourth year will produce an average yield of about two pounds per tree. He says:

One plantation in the district of Pena Blanca gives a yearly average of over three pounds, which is a great deal more than the average of the plantations in the high altitudes of Cordova, Orizaba, Oaxaca, and Guatemala, where one pound per tree is considered a good yield. The old theory that coffee should be planted at an elevation of over 3,000 feet is entirely without foundation. It arose from the simple fact that plantations were formerly mostly made in high localities on account of life being more pleasant there, the climate being cooler and more healthful, and disagreeable insects being less plentiful. Lands on the isthmus at an elevation of 400 to 1,500 feet have the advantages (1) of producing a greater quantity per tree of coffee (2) of being much better adapted to the growth of rubber, and (3) of being adapted to cacao culture, besides having more fertile soils. Our coffee-trees spread out very much, and even when planted 2½ and 3 yards apart, will interlace after four years when the ground below becomes so shaded that little or no work is needed in cleaning.

From actual experience in planting coffee with rubber shade I find that it can be done (including cleaning ground, buying plants, setting out, resetting those that die, and the three cleanings that are needed) for 9 cents per tree. This is for one rubber-tree to four coffee-trees. The second year there will be about 10 per cent of resetting on account of loss to weaker plants, or say nine-tenths of 1 cent per tree. The three cleanings in the second year will cost 37½ cents per hundred trees including twenty-five rubbers or \$112½ for the three cleanings,—that is 1½ cents per tree. The third year the cost will be the same, and the total cost by the time the coffee begins to produce will be 12½ cents. For 100,000 coffee-trees and the corresponding 25,000 rubber-trees we have a total cost of plantation for three years (not including salary of manager, etc.) of \$12,200. The third year the crop will be so small that it may only pay for picking, but the fourth year it will be profitable, and, as the ground is so well shaded by this time, very little work in cleaning will be necessary.

An extremely low average yield of coffee on the isthmus is two pounds per tree, which will give 200,000 pounds for our plantation. No coffee has been sold in the State of Vera Cruz in the past year at less than 20 cents (in Mexican silver) per pound which would give \$40,000. Allowing \$10,000 per year for maximum cost of picking and cleaning we have after the fourth year, \$30,000 profit, if coffee continues at the same price.

Coffee-trees increase in yield up to the tenth or twelfth year, remaining stationary to about the twentieth year, and then decline to about the thirtieth year when they should be removed, intervening ones having been set out to take their place.

In all old coffee plantations shade trees were used that were useless in other respects but we have substituted a shade that in seven years will in itself alone more than pay all expenses of the plantation of today—both coffee and rubber, cultivation and cost of land—and pay an interest on the capital invested.

Putting the value upon the coffee and rubber-trees that is customary on the isthmus—50 cents for coffee and \$1 for rubber—we have for the 100,000 coffee-trees \$50,000, and for the 25,000 rubber-trees \$100,000, or a total of \$150,000. This should give a net yearly income of \$50,540 gold, which may be seen, without further calculation, to be a handsome rate of profit.—*American Grocer*.

NOTES ON PRODUCE AND FINANCE.

LAST WEEK'S TEA MARKET.—The demand for Indian tea has not been quite so active as in the preceding week, which is no doubt mainly attributable to the advance in the lower grades, says the *Produce Markets' Review*. In these a rise of $\frac{1}{4}$ d has been established, and with smaller supplies and a stronger market for Ceylon growths, there does not appear to be any immediate probability of a return to the lower prices of last week. Teas between 6d and 9d, however, continue in full supply, and offer exceptionally good value, so that a large business has been transacted in them. At the current low rates for these descriptions a continuance of the present good demand may be expected, as prices have touched a level that cannot fail to bring them liberally into consumption for the retail medium and lower-priced blends. For Pekoes between 9d and 1s the market remains poorly supplied, and firm rates have been paid, while Broken of similar grades are more plentiful and relatively better value. The quantity of Ceylon tea brought forward has again been small, and the market continues very firm at the advanced rates.

COFFEE IN BURMAH.—Lower Burmah promises well for coffee growing. The Tavoy district is regarded by experts as being exceptionally rich in suitable soil for coffee growing.—*H. and C. Mail*, Sept. 22.

CULTIVATION OF ALFALFA.

The cultivation of Alfalfa, better known in Europe as lucerne, says the British Consul at Buenos Ayres, covers an enormous area in Argentina, and is every year becoming more important. In the opinion of many persons it will probably, as an export, be second only to wheat and maize in importance. It has already been exported to England as an experiment, and been pronounced a most satisfactory forage. Alfalfa is a kind of clover, and is particularly suited to a great part of Argentina, owing to its not requiring much surface damp or rain. It throws down its roots very deep, even to the depth of five yards, and is therefore more dependent on moisture deep down than on the weather for its nourishment. Even after long drought it remains green. Alfalfa enriches the ground. Its success depends largely on the substratum of soil; if that is satisfactory, alfalfa has been known to yield good crops for twenty years. One can get four or five crops regularly a year, sometimes more. If wheat lands after six to ten years only yield poor crops, and deep ploughing or rotation of crops is not made use of, alfalfa can be sown in between the

last crop, and the following year will yield a little and the next year good crops. This alfalfa is grown for forage purposes, and largely used for feeding animals and fattening them up for market—a business that is rapidly developing. Like wheat and maize, it is a large article of consumption. Considerable quantities are exported to Brazil for feeding cattle there. The province of Cordova is often called the alfalfa region; the lands round Rio Quarto are particularly suited to its growth, but it flourishes almost everywhere. One reason of its rapid increase of cultivation in late years is undoubtedly the facilities afforded by the railways for its transport to ports for exportation. In 1892, 39,200 tons were exported, though this is probably but a small beginning of a large branch of trade. Alfalfa, grown as a forage, adds the Consul, has a great feature, and, if properly managed, may become a most important and valuable export of the Argentine Republic. At present it is mostly consumed in the country, either fresh as pasture for cattle, or in a dried form as hay. The profits vary largely, according to the price of alfalfa, which has been sold for 50 dollars a ton (£3 6s), but the average is £2 upwards. The area of alfalfa in 1891 has been given as 1,495,000, and is now probably 3,000,000 acres.—*Commerce*, Sept. 13.

COFFEE IN MEXICO.

The facilities offered by this country for the growing of coffee, at present one of the most profitable of tropical crops, are attracting much attention in the United States. A short time ago we noticed the taking up by Americans for coffee culture large tracts of land on the isthmus of Tehuantepec, and since then the enterprise has taken definite shape under the name of the Mexico Land and Improvement company. Following the lead of this company several private individuals have made purchases of coffee lands in other parts of the state of Vera Cruz. Some of these investors have settled on their plantations in order personally to acquire a knowledge of the business of coffee-growing, while others have appointed agents to watch over their interests. As long as the price of coffee runs high, the investment of American capital in Mexican coffee lands is likely to continue. The unfavourable conditions of the labor market in Brazil and the unsettled state of affairs there generally, have furnished Mexico with her golden opportunity in the matter of coffee production.—*Mexican Financier*.

COFFEE NOTES.

The arrivals of coffee in the United States east of the rocky mountains during the year ended June 30th last aggregated 4,283,239 bags, against 4,617,019 bags in 1891-92.

The new export duty on coffee in Mexico went into effect on July 1st. It amounts to \$3.00 per 100 kilogrammes, and will unquestionably prove prejudicial to the development of coffee production in that country.

In an article on Jamaica, in *Scribner's* for July, the good qualities of the coffee produced in that island are referred to. "We are told, however," says the writer; "that the quintessence of all is the *rat coffee*, or the seeds from berries which have been gnawed by rats, for these animals are very fond of the aromatic pulp of the cherry-like fruit which incloses the seeds, and as their fastidious taste leads them to select the best, children are employed to gather among the bushes the berries which they have gnawed, and this coffee is set apart as the finest and most delicious of all."—*Rio News*.

RUBBER IN MEXICO.

A few years ago a Mexican company purchased from the Government half a million acres of choice lands in a certain district in western Oaxaca bordering on the Pacific, with numerous rivers, two harbors, good roads and the certainty of a railway now being rapidly extended from Mexico city into the district, together with a most valuable concession providing for the

planting of 15,000,000 rubber trees on these lands, the Government paying the owners of the land 3 cents cash for every tree planted, and admitting free of duty everything needed for the plantation. The subsidy amounts to \$450,000, and is payable whenever 100,000 trees have been planted. One million trees are already growing and forming the nucleus of a vast and steadily increasing fortune. This land is of easy access, two mail steamers touching twice a month at its two harbours. The title is absolute and cannot be forfeited by failure of carrying out the concession. The land can be subdivided and sold to colonists, who will enjoy all the privileges of the colonization law for fifteen years.—*Mexican Financier.*

THE DUTCH MARKET.

AMSTERDAM, Sept. 14.—The cinchona-auctions to be held here on October 5 will consist of 4,485 bales: and 278 cases, or about 391 tons, divided as follows: From Government plantations, 332 bales (about 38 tons); from private plantations, 4,153 bales and 273 cases (about 358 tons). This quantity contains; Of druggists' bark—*Succinubra* quills, 14 bales 160 cases; broken quills and chips, 80 bales 118 cases; root, 91 bales. Of manufacturing bark: *Ledgeriana* broken quills and chips, 3,186 bales; root, 973 bales. *Hybrid* broken quills and chips, 133 bales. *Officinalis* root, 8 bales.—*Chemist and Druggist.*

THE JAVA CINCHONA PLANTATIONS.

The official report of Java Government cinchona-plantations for the second quarter of 1893 contains interesting account of the alkaloidal development in young trees of the *C. calisaya* Schubkraft variety in the Lembang plantations, showing that the increase in the quinine percentage of the trees is largest between the ages of 12 and 18 months, whereas after four years of age the alkaloids increase but little. The following table demonstrates this:—

Age of Tree, year	Quinine	Cincho-nidine	Quini-cine	Cinch.+ Amorph. Alk.	Total per cent of Alk.
1	2.18	2.64	4.82
1½	4.49	1.92	6.41
1¾	5.15	0.04	..	2.21	7.40
2	6.90	0.07	..	1.82	8.79
3	9.60	0.21	..	1.40	11.21
4	10.43	0.30	..	1.10	11.83
5	10.60	0.30	..	1.15	12.05

Some trees showed a decline in alkaloidal content at the age of 15. In one of them the percentage of quinine fell from 10.33 to 6.06 per cent whilst that of cinchoidine increased. There are now in the open air on the Government plantations 2,874,000 cinchona trees, of which 2,177,000 are *Ledgers*, 1,900 *calisayas* and *Haskasianas*, 650,000 *succinubras* and *calopteras*, 43,900 *officinalis* and 2,000 *lanifolia*, the latter including 1,500 *C. pitayensis*. The nurseries contain 1,019,000 plants of which 892,000 are *succinubras* and the remainder *Ledgers*.—*Chemist and Druggist.*

COFFEE IN SELANGOR.

AN OLD CEYLON PLANTER TO THE FRONT.

Mr. J. R. O. Aldworth, the District Officer, Klang, in his August report, says:—On the 1st of August the grant to Mr. A. Forsyth, of Medan, Deli, of 500 acres of land near Klang for coffee planting was sanctioned. There are now about 800 acres of coffee in this district, 80 per cent. of which is owned by Asiatics; it is of all ages up to about 10 years, and the unanimous verdict of the Europeans to whom I have shewn it is that nothing like it is to be seen elsewhere in the State. Mr. Forsyth, who has been in Sumatra for 13 years and was previously well known in Ceylon, has made arrangements with Mr. C. M. Cumming (now looking after Weld's Hill Estate) to come to Klang and open up the land, as Mr. Forsyth intends to make the Province his head-quarters.—*Pinang Gazette.*

FROM THE HILLS IN CEYLON.

TIMBER TREES ON ESTATES IN DIMBULA.

Oct. 12th.

No one can now-a-days use the heading of our letter without recalling the hand and pen that made it so peculiarly their own in these columns and the flow of spirits which betokened his return to his beloved hillsides.

"When musing on companions gone,
We doubly feel ourselves alone"—

says the poet, and during the past few days in revisiting the mountain-home, the paths and dells, the vantage-points which "our senior" loved so well it is only natural that the feeling which Wordsworth so well touches in his "Yarrow Revisited" should predominate. How much has occurred in the planting district and neighbourhood in which he above most, would feel the keenest interest. Not the least the multiplication of first-class factories, thoroughly equipped, especially the one which he did not live to see finished on his own property—the marvellous success shown on plantations in his neighbourhood (Mr. Beck's Henfold and St. Regulus) in the production of first-class teas in quantity as well as quality. How keenly would he have shared the good hope that the time is fast approaching when a high average price should be attained and maintained for all tea over a certain limit, 4,500 or even 4,000 feet, as well as for the select portion of 10,000 acres above the 5,000 feet limited. Again, how enthusiastic would the writer of "From the Hills" have become over the wonderful change which every few months illustrates more delightfully in the landscape of the planting districts. Where not so long all was tea—tea—or a little earlier all coffee—coffee—without a break of forest for a thousand, aye over five or ten thousand acres, now there is scarcely an estate without its avenues or reserves of useful and ornamental timber trees. Dimbula and the sister districts are putting on a truly varied and interesting appearance. There is no more monotony for the vision; for as seen from the top of Abbotsford, we doubt if there is a more attractive tropical planting district in the world than a clear day brings under the ken of the visitor between Great Western and Elbedde, Pilot Hill and Rilligala. And no one did so much to promote this great and beneficial change, to lead the way in introducing attractive as well as valuable exotic trees, as the late owner of the estate on which we stand. We suppose that even now, save in the Peradeniya and Hakgala Gardens, no greater variety or larger number of different trees are to be found than on Abbotsford. We must not say greater extent planted, because even as we write we learn from a "V. A.", who travels far and wide, of how freely this example of interspersing and surrounding the staple with trees has been followed in the middle and lower districts. To hear of one flourishing tea plantation on classic coffee ground in Matale, having as many as

SIXTY ACRES COVERED WITH GREVILLEAS

gives one a new idea of the advance in re-afforesting the Kandyan planted districts which has set in with the tea era.

The contrasts between the foliage of the *Encalypti*, *Acacias*, *Grevilleas*, *Cedars* and *Pines* and elsewhere the "Toons" and *Firs* against the handsome indigenous *Kinas* and other forest trees, add a new interest of the most gratifying character to our planting districts. Henceforward, it will not simply be to see tea or coffee, or cinchona or cacao, that the visitor or traveller can be sent to "the hills;" but to inspect groves and avenues of trees which for variety and successful growth cannot be equalled by anything under the care of our Ceylon or Indian Foresters.

There is to be at least no scarcity of timber or firewood for tea estate proprietors who are thus taking time by the forelock, and as

THE TEA PLANT HAS COME TO STAY IN CEYLON,

it is well that all due provision for a long spell of tea-making, aye, into the generation to come, should be

made by all whose forest reserves melted away, when planting every acre with coffee and cinchona was the rage. That the tea plant has found a congenial home in at least these higher regions of Ceylon may be deduced from an experience in

HAKGALA GARDENS

—which the courteous and intelligent Superintendent, Mr. Nock, is fond of showing to those interested. The plot of China tea put in there in the early days—the Gardens were opened in the year of our arrival in the island (1861)—was some years ago condemned to be removed and superseded, and coolies with knife, axe and mamotie were set to work to clear it out—even the firestick was eventually got—^{but of no} avail; the roots could not all be got at, and from these new shrubs have sprung up; so that Mr. Nock's experience is of tea being in this respect as great a nuisance as the despised wattle—there is no getting rid of it when you want to do so!

In how many respects is a visit to these highland Gardens delightful to the jaded toiler from the seaside? We renew acquaintance with all the old and many new favourites. We note again with ever-new delight the graceful head of fronds of the most attractive of all tree-ferns, *Alsophila crinita*. It is something to be proud of that Ceylon should have indigenous to it—common enough in our upland glens and in gardens in and around Nuwara Eliya.—the tree-fern which Colonel Beddome, the great authority on Indian ferns, pronounced the finest of all the Asiatic tree-ferns; and no less interesting to learn from Mr. Nock that none of the West Indian varieties that he had seen in Jamaica, and none even of the Australasian tree-ferns, are to be compared to it in gracefulness and beauty. In Hakgala, there is a specimen not far short of 20 feet in height with a head of fronds wonderful to see. In contrast we have the New Zealand silver-tree fern, striking and attractive in its way. The Gardens had suffered from a rather prolonged drought before our visit, but this did not affect the splendid specimens of introduced trees:—in Japan cryptomerias, cypressus, the flame tree, *pinus longifolia* and a host besides. The giant for growth, at least in girth, is an *acacia dealbata*, condemned by planters for its troublesome spreading habit from the roots, but which in this case in the course of 12 years has developed a circumference not less than 8½ to 9 feet, say 3 feet diameter at the stoutest.

NEW VEGETABLES.

Mr. Nock's great service to the community in introducing useful vegetables from the West Indies is well-known. The tree tomato is now widespread in many of the higher districts and most productive and useful is it found to be. No less so are the cho-cho and some vegetables which are admirably adapted for native cultivation, but which it is found most difficult to get the Sinhalese to take in hand. They would fain go on as their fathers did before them; and yet that persistency has its reward is shown by the way in which the people of Uva cultivate potatoes at the present day and for many years back. Of course, we have here an introduced vegetable which at the beginning of the present century was quite unknown to the Sinhalese, but which now they quite appreciate, at least in Uva. So we encouraged Mr. Nock to persevere until he sees the villagers far and near growing his "chochos" and "arracachas" and realizing that they are more useful even than the tree-tomatoes and nearly as much so as potatoes. And then in reference to the last-named vegetable, how much has been done at Hakgala by introducing fresh seed (the value of which the natives most fully appreciate) and a great number of varieties. In this respect, as in the introduction and growth of new fruits, blackberries, strawberries, cherries, pears, figs, apples, Mr. Nock has done very valuable work of late years at Hakgala, and no one could be readier, or more interested, than he in helping any native or planter who may wish to profit by his experience in experimenting with any of these new introductions. We have alluded to a recent drought at Hakgala. Here are the figures for the expired nine months

of the year compared with the same period of 1892:—

1892.		1893.
Inches.		Inches.
8.10	... January	5.25
3.09	.. February	1.19
3.81	... March	11.55
7.61	... April	3.15
9.33	... May	5.49
7.11	.. June	11.46
6.42	... July	5.82
4.60	.. August	2.81
5.96	.. September	1.27
56.03	Total	47.99
47.99		

8.04 Deficiency.

The deficiency is thus over eight inches, and more particularly have August and September been short, notwithstanding very wet weather occasionally on the Dimbula side. But that is a common experience; for while Nuwara Eliya as well as the western districts have had for three or four days now abundance of rain (in this last Son'Wester), Hakgala with all Uva and indeed—as I learn as I write—Maturata, have had no rain whatever, but are bathed in sunshine.

There is no need to allude to the delightful view from Hakgala; for we had the more novel as well as interesting outlook over Uva afforded from

MR. LIPTON FOR INSTANCE.

In purchasing the Damhatenne-Laymas Group, it is understood the coffee was reckoned as very little worth—as likely to disappear before long, and yet last year this fortunate proprietor got no less than 8,000 bushels of this valuable product. He is now the owner of nearly 1,000 acres of tea and the Damhatenne portion is among the very finest in the island. Indeed the higher you go in Haputale (as in some other quarters) the finer the tea seems to be. It will be hard to beat in India or Ceylon the St. Catherine portion of the far-famed Nayabedde belonging to another and even more extensive proprietor, whose dealings in Ceylon (from the time he was known as the most capable and successful Bank Manager the East ever saw) have been almost uniformly successful. We refer to

MR. G. S. DUFF

who has never spared his capital in doing justice to his plantation properties in so many of our more notable districts. We have it on competent impartial authority—that of a Matale proprietor and Inspector of estates, (not the ex-Haputale resident who had to do with the planting!)—that there is no finer field of tea in the island than that which runs up to over 6,000 feet altitude on the St. Catherine's division of Nayabedde. We have frequently referred to the great success of

TEA ON PATANA LAND IN UVA

—and this opens up a vista for extended cultivation in the neighbourhood of Badulla, Passara and below Narangalla, which we scarcely like to dwell on at a time when Sir John Muir and his colleagues are threatening in another quarters to inaugurate the era of over-production. One thing is certain: that the Secretary of State must relax his law about

CROWN LAND OVER 5,000 FEET

so far as the country between Dimbula and Haputale is concerned. It will never do to have a Railway running some 12, 15 or even 20 miles with scarcely any contributory traffic *en route*. We are aware, of course—no one knows better—that the terminal traffic at The Pass which practically commands Uva, was the great object in view. But as owners of the railway and trustees for the public interests, the Government are sorely bound to, at least, afford the opportunity of developing industry and traffic alongside their own railway stations and sidings through one of the healthiest regions in the island. We do not so much think of the sale of forest-land for the purpose of tea planting, though there are select valleys between Nuwara Eliya and Haputale, where lots might well be cut out and sold at from £100 upwards per acre probably, with the condition that a certain

reserve of forest be maintained, or groves of exotic trees planted. But apart from this, there is the utilization of much of the country we speak of for live-stock and grazing purposes, under a system of leases, which could provide for none of the larger timber trees being interfered with.

As we close (on the 13th) the mist and rain of the past few days have given place to a cloudless, blue sky and delightful sunshine over the Plains, with a cool brisk breeze—

"A livelier emerald twinkles in the grass,"

A purer sapphire melts into the lake,—
the day broke in fact as if the "clerk of the weather" were determined to make it all right for the cricketer visitors and their planting opponents at Radella. So may it be.

The subjoined report from Hakga'a is dated the 12th and shows that yesterday's rain extended so far although today all from the "Jaw Mountain" to Naminacooly is doubtless "bathed in sunshine":—

"The wind is pretty strong here this morning and between 5-30 and 8 a.m. 26 parts of an inch of rain fell. Since then it has been dull and drizzling, but it appears to be still fine on the Uva side. It is quite likely that there will be a break of nice weather in Nuwara Eliya before the N.-E. sets in, but I am afraid it will not be a long spell this year." Our holiday is at an end; but we trust for others who follow and for hill residents generally that the intervening spell of fine weather may be an appreciable one.

TEA PLANTING IN INDIA AND CEYLON:

From time to time, Ceylon planters have been alarmed by accounts of the far-extending and rich reserves of land at the back of the Indian tea planters. "In the future development of tea planting, Ceylon is not in it" has been the assurance oft-times advanced and that not altogether by interested parties. We recall the fact that a well-known machinist and inventor, as much interested in the welfare of Ceylon as of Indian planters, after his last visit to the North, had a wonderful account to give of the thousands upon thousands of acres of rich, deep black soil in the Dooars waiting to be turned into tea-gardens, and which, from the results obtained in the area already open, must yield additions to the tea supply of the world far beyond any to be experienced in Ceylon. But year after year goes by, and so far there is no special sign of a great advance in cultivation or production; while there is the significant fact that somehow neither in the Dooars nor anywhere else can Indian Tea Planting Companies yield the dividends which appertain to not a few Ceylon Companies. It is no doubt this monetary result and the continued prosperity of the Ceylon tea industry, in spite of all the prophecies of our critical visitors for the past ten years, that have at length induced leading capitalists interested in North Indian tea concerns to turn their attention for investments to this colony. The mercantile houses and tea companies with which Sir John Muir and Mr. P. R. Buchanan—who are on their way to visit the island—are identified are among the most important of Anglo-Indian firms, and they control some of the largest tea plantations or gardens in Northern India. With unlimited reserves to fall back on in the Dooars and other districts, the question may well be asked why the chief capitalists in large Assam and Sylhet Companies should want to invest in forestland in comparatively poor Ceylon? The answer must no doubt be that whether it be climate, reader means of transport, better or more manageable labour, or more skilled and systematic management, tea plantations in Ceylon yield larger profits as a rule than those in India. Hence we have the prospecting on the Balangoda side for suitable land

among the few large forest reserves in private hands in this island and the news that some 5,000 acres have been as good as secured on behalf of the capitalists who are nearing our shores. No doubt Sir John Muir and Mr. Buchanan are wise in their generation in arranging for a considerable planting interest in this colony, before it is too late; and besides it will be specially interesting to them to visit some of our planting districts and leading gardens and factories and then to contrast their experience with that on their own North Indian properties whether they will doubtless proceed a little later on.

We have already fully analyzed by groups of districts, the Ceylon tea industry aggregating 273,000 acres, with a possible total crop for the current year of 80 million lb. Let us sum up the figures which, after collation from official and other sources, seem to us to represent the Indian Tea Industry at the present time. We have first the enterprise in Assam, including Cachar and Sylhet; next in Bengal (Darjiling, Chittagong, Chota-Nagpur, &c.); in the North-West Provinces (Kumaon, Dehra Dun, &c.); in the Punjab (Kangra Valley); and then in Southern India, the Nilgiris—where although a beginning was made so far as 1835, it is still the day of small things—in the Wynaad, Travancore, &c.; and finally in Burma and the Andamans. The result in area planted works out, approximately, as follows:—

Districts.	Properties.	Area acres.	Total planted acres.
Assam; Sylhet, &c.	918	1,050,665	241,586*
Darjiling, Chittagong, &c.	—	—	75,000
Kumaon, Dehra Dun, &c.	—	—	10,000
Kangra Valley, &c.	—	—	10,000
Nilgiris and Wynaad	—	—	19,000
Travancore	—	(52,000 reserve)	9,500
Burma & the Andamans	—	—	1,500

Total acres: 366,586

Or with extensions since the official returns were sent in, we may say 379,000 acres of tea, and making allowance for the local consumption of South India as well as Northern teas, the total crop for a year at this time may be given at 130,000,000 lb. Indeed as the Calcutta Tea Association make out a crop of nearly 127 millions for North Indian gardens alone, our total must be below the mark. In the Association's return (given below) the Nilgiris, Wynaad—tea chiefly young—and the Travancore districts, are ignored:—

ESTIMATE OF CROP OF 1893.

	Revised. lb.
Assam	53,298,839
Cachar	17,870,889
Sylhet	18,948,414
Darjeeling	7,328,314
Terai	3,587,009
Dooars	15,935,066
Chittagong... ..	879,389
Chota-Nagpore	431,862
Dehra Dun, Kumaon and Kangra	4,500,000
Private and Native Gardens ...	4,000,000
	<hr/> 126,779,773

The area represented for the above crop is about 336,000 acres or about 22 per cent more than we have planted in Ceylon, while the crop is more than 50 per cent. in excess of our Ceylon estimate

* Of this 247,249 acres all "maturo" tea and 4,237 acres "young" tea.

for 1893. Either therefore the returns of planted extent are below the actual figures—not improbable—or the average yield per acre is considerably greater in India and this is no doubt the case.

Still, as respects profitable tea concerns, Ceylon can undoubtedly hold her own, and this can best be seen by a comparison between a certain number of Indian and Ceylon Tea Companies as follows:—

DIVIDENDS DURING LAST 13 YEARS BY LEADING INDIAN AND CEYLON TEA COMPANIES.

In	1880	1881	1882	1883	1884	1885	1886	1887	1888	1889	1890	1891	1892	Average
Assam*	10	7	25	10	14	14	10	10	7	10	10	6	9	11
Jorhaut*	5	0	12½	8	12½	15	15	18	10	10	10	10	12½	10
Lebong*	8	6	7	6	9	9	8	8	6	6	6	6	6	7
Darjeeling*	6½	7	8	6	7½	7	7½	7	6	6	6	5	6	6
Brahmapootra	13	7	11	9	12½	15	16	15	8	18	20	17	18	13½
Borelli	10	4	10	8	6	6	5	6½	6½	10	7	6	5	7
Doom Dooma	2	4½	10½	5	2½	6½	13½	6½	8	14	13½	10½	13½	8
Scottish Assam	2½	0	5	2	5	5	5	5	5½	5½	5	4	5	4
Ceylon Tea Plantations*	—	—	—	—	—	—	—	—	15	15	15	15	15	15½
Yatiantota	—	—	—	—	—	—	—	—	22	25	25	40	30	28
Scottish Ceylon	—	—	—	—	—	—	—	—	—	—	—	8½	16	14
Kelani Valley	—	—	—	—	—	—	—	—	—	—	—	—	7½	12½

* These Companies are quoted on the Stock Exchange.

There are some other Ceylon Companies with dividends of from 10 to 12 per cent for a few years back which might be added; but, of course, it is open to our Indian critics to say that our local experience is but limited. However, the Ceylon Tea Plantations Company with plantations in low and medium as well as high districts, is about the best and oldest representative that can be offered for local profitable concerns; and although the profits must be a good deal less in the case of Ceylon tea grown on the older coffee lands, yet the comparison must always be for comparatively virgin soil on both sides.

MINOR PRODUCTS IN THE PLANTING DISTRICTS :
CASTILLOA RUBBER FOR LOWCOUNTRY DISTRICTS AND AS SHADE FOR COFFEE.

We thoroughly endorse the opinion expressed in the following interesting communication as to the importance of adding new, even if minor, products to the cultivation of our staples, and we are pleased to learn that Castilloa rubber is doing

better than we expected. We trust the example set by our correspondent will be widely followed. The sample he sends us seems to be a very satisfactory and merchantable one. We shall try and get an expert's opinion on it:—

"I read with much interest your remarks upon the Mexican experiment of growing *Castilloa elastica* as shade amongst coffee.

"The Castilloa rubber has not been thought much of in Ceylon, but I am disposed to think it may have been under-rated. I send you a sample which has been lying on my desk some months exposed, and which ought surely to have been spoiled if not good stuff, and you can see yourself how good the substance and elasticity are.

"My opinion is that we should not overlook such valuable auxiliary cultivations as rubber in the low-country estates, and though we are certainly improving in many respects, by the introduction of various minor products, there is still room for a vast deal more to be done. There are always patches of the low-lying places that would serve for such cultivations and on which the main enterprise may not be so successful and then there are roads and river-sides, and Castilloa may prove good shade for coffee where Liberian or Coorg is being newly grown. There is no question about the *Albizia Moleucana* which you once wrote about, being one of the finest possible shade trees for coffee and tea: but Castilloa would, if it is suited for shade, be more valuable, from its produce being an annual crop, whereas the *Albizia* to be utilized for timber, has to be altogether sacrificed.

"I found my Castilloa trees grew slowly, and it is a tree that does not branch out much—and is not suggestive of being a good shade tree in that respect, nor to afford the splendid fertilizing litter of the *Albizia*—but it would be a splendid help.

"Ceara is a failure for shade—and is injurious I think to both coffee and cocoa. I remember being taken in Dumbara to a magnificent cocoa tree close to an equally fine Ceara, as a proof that Ceara did not injure cocoa, but I never believed it and put my Ceara separate, and it has fallen into complete disrepute in Dumbara. It is, of course, discouraging to hear of the vast supplies that the American and African forests must contain of rubber, but nevertheless we have some advantages here in respect of labor and transport, and really the enterprise could be gone on with steadily and without great risk of loss.—J. M."

BARK AND DRUG REPORT.
(From the Chemist and Druggist.)

London, Sept. 21st.

CINCHONA.—As already foreshadowed by us last week, the cinchona-sales which took place here on Tuesday were the smallest in extent known for many years, while the quality of the bark offered was mostly very poor, not a single parcel of rich grey or yellow barks being shown. The seven catalogues embraced of:—

	Packages	Packages
Ceylon cinchona	278 of which	259 were sold
East Indian cinchona	302 "	224 "
West American "	66 "	66 "
	646	549

The total amount of bark placed on sale contained the equivalent of about 4,000 lb. sulphate of quinine, or say 2.56 per cent on the average. There was rather more animation in the competition than has been observed lately, principally because one of the German factories which abstained from buying on the last occasion now again entered the market, and also because the druggists bought a considerable quantity of bark; but no actual alteration in price can be reported, the unit remaining ½d per lb.

The following are quantities secured by the principal buyers:—

Agents for	Lb.
the Mannheim and Amsterdam works	40,364
Agents for Anerbach factory	22,746
Agents for the Frankfort-o/Main and Stuttgart works	18,896

Messrs. Howard & Sons	18,636
Agents for the Paris factory	6,000
Agents for the Brunswick factory	4,739
Sundry druggists	18,485

Total quantity of bark sold	129,867
Bought in or withdrawn	26,600

Total quantity of bark offered ... 156,467

The following prices were paid for sound bark:—

CEYLON CINCHONA.—Original—Red varieties:—Ordinary dusty to fair, partly quilly stem and branch chips 1d to 1½d; low dark, dusty chips ¾d to 1d; dull root 1½d per lb. Gray stem chips, poor and dull 1½d per lb. Yellow stem chips, mixed with root 3¼d to 3½d; small to fair stem and branch chips 1½d to 2½d per lb. Hybrid dull chips 1½d; root 1½d per lb. Renewed: dull to good bright red chips 1½d to 2½d per lb, Hybrid stem chips 2¼d to 2½d per lb.

WEST AFRICAN CINCHONA.—Sixty-six bales totalling about 6,500 lb. of Succiubra bark in fair medium to thin, partly irregular and slightly damaged quills, from St. Thomas, sold at from 2¼d to 3d per lb. to the export druggists.

At the Amsterdam auctions on October 5, 4431 packages bark contains 364 tons of cinchona, will be offered, exclusive of Government-grown bark. During the month of July the exports of cinchona from Java were heavy viz., 788,640 Amsterdam lb. against 2,9,094, 1,164,163, 385,512, and 305,397 Amsterdam lb. in the months of July of the our preceding years.

COCA.—The American market is reported to be glutted with best quality of bright green Truxillo leaves, which are offered in 100-lots at the rate of 7½d per lb. c.i.f., which is the lowest price on record for coca; bona Huancu leaves are firm at 1s 3d per lb. c.i.f. At the Amst. da a cinchona-sales, on October 5, a case of about 47 lb. "Bolivian coca," of direct import, belonging to the Cinchona-cultivating Company, "Cinchona," will be offered.

COCAINE.—There has been a sudden reduction in price in the grades of all makers tutone Hydrochlorate being low quoted by all of them at 10s 6d per c. for 100 c. contracts, and 15s 9d for quantities between 25 and 100 c. It is said that this move is due to the desire of the old manufacturer, to put a stop, if possible to the competition of the younger maker, who is believed to have been underselling them; that manufacturer reports that he has not followed the present reduction, and that his "official" price is still 15s per oz. It is also said that the more plentiful arrivals of crude cocaine are the cause of the reduction.

QUININE.—A very considerable amount of business was done on Saturday last and in the early part of the present week. It is said that nearly the whole of the purchases have been made by a large American firm. They amount to about 200,000 oz. for which from 9d to 9½d per oz. has been paid. Since then, the market has ceased off, and today is flat, at 9d per oz. for second-hand German bulk.

THE PLANTING INDUSTRY OF CEYLON.

[It may be of some interest to reproduce the letter which appeared in the London Times with our latest planting statistics.—ED. T.A.]

TO THE EDITOR OF THE TIMES.

Sir,—It may be of interest to your readers to see the latest statistics representing the position of the Ceylon planting enterprise. These have just been compiled with much labour and pains, and analyzed for the different products cultivated on the plantations chiefly owned by European colonists. The main results are as follows, and I offer a comparison with the return similarly compiled by me two years ago:—

CEYLON PLANTATIONS IN TEA, COFFEE, CASSAO, CINCHONA, CARDAMOMS, &c.

	Results in		Differ-
	July, 1891.	Aug. 1893.	
	Aores.	Aores.	Aores.
Total area of pro-			
perties...	687,832	724,805	Inc. 36,973
Do cultivated	333,953	333,235	Inc. 19,282
In tea	249,586	273,015	Inc. 23,430
Do coffee (Arabian)...	35,759	30,096	Dec. 8,663
Do do (Liberiau)...	1,633	2,438	Inc. 805
Do cacao	12,900	16,286	Inc. 3,386
Do minor products			
(various)...	18,000	22,000	Inc. 4,000
Do Cardamoms	4,955	4,73	Dec. 232
	Trees.	Trees.	Trees.
Do Cinchona trees	9,175,000	6,909,000	2,166,000

Of the plantation products more particularly cultivated by the Ceylonese, my estimates—the best available—are briefly as follows:—

	1891.	1893.	Difference.
	Acres.	Acres.	Acres.
Palms—			
Coconuts...	530,000	555,000	25,000
Palmyra, Kitul, and			
Areca...	135,000	15,000	15,000
Bark—			
Cinnamon	40,000	40,000	—

The coconut palms and tea-planting industries are the most flourishing at present. Coffee (Arabica) is being gradually superseded by tea; but it is hoped the Liberian variety and the chocolate plant (cacao or "cocoa") will be more widely planted now. Cinchona and cinnaom do not pay to plant at present low prices.—I am, sir, yours faithfully,

JOHN FERGUSON of the Ceylon Observer and Tropical Agriculturist.

Colombo, Aug. 31.

A number of the metropolitan and other home journals repeat the information, the Westminster Gazette and Manchester Examiner especially, taking over the full information.

TEA AND SCANDAL.

Under this heading I purpose sending you from time to time, if agreeable to you and your readers, a few pickings of tea gathered from various sources, accompanied by a piece or two of chit-chat to wash them down with.

A short time ago Mr. Arthur Sinclair mentioned having received a copy of "A Practical Treatise on the Analysis of Tea, Coffee and Cocoa," by J. A. Wanklyn, in which the author makes the astounding assertion that coffee is a bean which grows in a pod. The following criticism of the book appeared in the Brit. and For. Med. Chir. Review, October 1875, p. 408:—"The author acknowledges in his preface that he has done little more than collected the materials which had been accumulated by the numerous chemists who have examined tea, coffee and cocoa. His own additions to our knowledge are very small, and from perfect acquaintance with the chemical literature of food analysis, he too often claims as original, methods and facts long previously known."

Of another work, "Tea its Effects, Medicinal and Moral," by G. G. Sigmond, 1839, the following crushing remarks are made in the Brit. and For. Med. Review, January 1839. "Dr. Sigmond's book has entirely disappointed us. Its title is attractive, its contents the reverse. We eagerly sought for information, and, except in its extracts from other works, we found scarcely any. We were prepared for good souchong or pekoes, and all that was offered us was exceedingly weak Bohea. As in duty bound we drank the Bohea, but really cannot recommend to our readers a similar draught. There was scarcely a lump of sugar in the cup."

You are in good company in your way of spelling 'coconut'; for not only do I agree with you, but Charles Kingsley, in "At Last" says:—"These Coooca, be it understood, are probably not indigenous," and "about thirty to fifty feet is the average height of these, Coco-palms." (p. 327-8.) Grant Allen also in 'The Great Tahoo' p. 105. says:—"Bread-fruits and coconuts lay tossed in the wildest confusion on the ground."

Is 'cooly' a Chinese word? In Peter Osbeck's China, 1751, I find "The name we give to the Chinese servants is Kullier" (p. 213), and "As soon as some of the chests are packed by a number of Kuleers, or Chinese servants, they are pasted over with paper." (p. 253).

In 'A Naturalist's Wanderings in the Eastern Archipelago,' by H. O. Forbes, F.R.G.S., 1885, I find two items referring to Ceylon:—On p. 8, while at Buitenzorg, he observes: "In front of the barracks another fine park, the Waterloo plain, is ornamented by a tall column surmounted by a rampant lion with an

inscription to commemorate the prowess of the Netherlands in winning the battle of Waterloo." A remark, perhaps not quite fair of a Ceylon friend on viewing the pillar and its long inscription: "The lion at the top is not more conspicuous than the lion at the bottom." And on p. 17 about the Cocos Islands: "It is gratifying, however, to know that the islands are after all really British territory, for I myself carried down a copy of the proclamation in the Ceylon Gazette of Nov. 1878, by which the Cocos, Keeling islands, were annexed to the Government of Ceylon "to prevent any foreign power stepping in and taking possession of them for the purpose of settlement or for a coaling-station," as Russian agents it was rumored had been examining the locality with sinister views."

NOTES ON PRODUCE AND FINANCE.

THE AUSTRALIAN TEA MARKET.—The Australian tea market, which the Ceylon growers are so anxious to capture, is well worth the effort. The Australians are great tea-drinkers, and import annually some 30,000,000 lb. of the leaf the bulk of which was brought from China. This year Ceylon shipments are expected to reach 7,000,000 lb.

A NEW TEA COMPANY.—The Etah Tea Company, Limited, has been registered with a capital of £22,000 in 500 preference and 1,700 ordinary shares of £10 each, to acquire and take over from the respective proprietors the tea gardens, plantations, factories, lands and property situated in the district of Sylhet in British India known as the Eaton and Indessur Tea Estates; and to carry on the business of tea planters, &c. The subscribers, who take one share each, are:—*M. Fox, 2, Catherine Place, Bath, gentleman; *J. D. Boswell, 1, North Charlotte Street, Edinburgh, solicitor; C. D. Boswell, Sundgate, Ayr, widow; J. D. Boswell, Sandgate, Ayr, spinster; W. H. Dunlop, Doonside, Ayr, gentleman; C. A. Goodricke, 110, Cannon Street, E. C. Indian tea estate agent; H. A. Aokin, 46 Queen Victoria Street, E. C., solicitor. The first directors are those gentlemen whose names are marked by an asterisk; qualification, £500; remuneration not yet fixed. Registered office, 110, Cannon Street, E. C.

TEA AND COFFEE DRINKING.—The Customs returns are all in favour of the consumption of tea and the decline of coffee, but notwithstanding this there are those, with whom the wish is father to the thought, who profess to detect a rival of coffee drinking habits. A writer in the *Globe*, for instance, says:—"Are we becoming a nation of coffee drinkers? In spite of the Customs returns it looks rather like it. Already the City is undermined by luxurious cellars with Oriental names where coffee is almost the exclusive drink." In the desire to prejudice the consumer against tea this writer continues:—"Coffee is a giant drink, and has played the tyrant ere now. Brillat-Savarin tells us that he saw in London—'sur la place de Leicester'—a coffee drunkard who had nearly wrecked his constitution, but had so far disciplined himself as to indulge in not more than five or six cups a day. It would be easy to pile up evidence of the ravages on health of which this eminently 'temperance' beverage is capable. Already the question is being asked in high medical quarters whether we are developing into a nation of tea drunkards. The cup that cheers is roundly declared to inebriate after all, in the strong Indian form in which it is now universally drunk, or at least to work mischief not a whit less serious in the long run than is imputed to alcohol. This is bewildering, and yet a crusade against tea drinking, with its own pledge cards and banners, might be welcomed as a *reductio ad absurdum*. It would surely convince our mis-called 'temperance' friends that they are moving in a circle, and that the enemy is not the thing abused, but the tendency to abuse it. At least let us start fair with coffee. While as regards tea we are said to be now developing 'that indifference to quality which is the crowning mark of indulgence.' We are just beginning to appreciate quality in coffee. We are learning to take it pure

and strong." "Pure and strong coffee" is a very good drink for those who can take it, but the majority find it far more potent for evil than the of late much maligned Indian and Ceylon tea.

FORMOSAN TEA.—In a recent issue we referred to the popular report on this subject, and gave some particulars of the cultivation. Mr. Hosie in his report referring to the manufacture, says:—"The tea manufactured in Formosa is generally, but erroneously classed as a green tea: It is in reality a black tea, prepared without the usual fermentation, but it possesses a decided flavour of the green variety. The leaf is 'fried' when green, and this taken with the flavour, may account for the popular belief. But between the exposure in the open air and the firing the edges of the leaves are rendered quite soft by being thrown against bamboos in a revolving machine—a process unknown elsewhere in China. It is said that if the leaves, after being picked and exposed for a short time, were placed in the firing pans they would spit up—the tea leaf is thick and brittle and loses all semblance to the whole leaf which is so much desired." Mr. Hosie describes the important process of "firing" as follows:—"On entering a firing-room, one sees rows of circular holes two feet in diameter, two feet deep, and a foot apart, faced with brick, raised about 18 inches above the brick floor. These are the fireplaces wherein the live charcoal, which has been brought to a red heat outside, is placed. Before any firing can begin it is essential that all the combustible matter in the charcoal has been consumed and that no smoke remains. To attain this end men are constantly engaged in breaking up the live charcoal in the holes with long iron instruments. When it is uniformly red and smokeless a layer of the ashes of paddy husks is spread over the charcoal to temper the great heat which it emits, and the fires are ready to receive the tea. The firing basket is shaped like a dice-box with the bottom knocked out. It is woven of split bamboo, about 3 ft. high, a little over 2 ft. in diameter and narrowing from both ends towards the centre. Into one end a moveable bamboo sieve, which fits the centre, is pushed, and the other end is placed over the firing-hole. The leaves are poured in at the top and the firing begins, the firers constantly going the round of the baskets and shaking up the contents, so as to ensure uniformity in firing. When this firing is completed, the tea is spread out in flat bamboo baskets, and all pieces of twigs and leaf stalks removed by hand. This part of the work is performed by women and girls. The tea is again poured into the firing-baskets, and, after being fired until every particle of moisture has evaporated, it is removed and packed hot in lead lined baskets for exports."—*H. and C. Mail*, Sept. 29.

COFFEE NOTES.

The Mexican Coffee Company has been incorporated at Albuquerque, New Mexico, with a capital of \$3,000,000.

A concession has been granted by the Mexican Government to Dr. A. K. Caney and E. J. Monera of San Francisco, for the purpose of colonizing Americans in the states of Vera Cruz and Hidalgo on rich coffee and agricultural lands. Mr. D. C. Weymuth has been appointed colonization agent for the company.—*N. Y. Journal of Commerce*.

Our American exchanges publish the following telegram from the city of Mexico, dated July 22:—

"In view of the export tax on coffee, imposed July 1st, planters in the states of Vera Cruz, Oajaca, and other districts of Mexico made great efforts to ship all their surplus in June. During the latter half of that month prices ruled at \$25 to \$26 per quintal of second quality. One steamer, 'El Gran Antilla,' sailed during the last week in June with 10,470 sacks for New Orleans. Since June 30th complete calm has reigned in the Vera Cruz market, there being no stock on hand. However, when the new crop comes in, if the high price in exchange continues the difference, will more than cover the export tax now levied upon coffee.—*Rio News*,

THE ORIENTAL BANK ESTATES
CO. (LD.)

ANNUAL GENERAL MEETING.

The seventh annual ordinary general meeting of the above company was held at Winchester House, Old Broad-street, on 28th inst. to receive and consider the directors' report and statement of accounts, and to transact the ordinary business of the company. Mr. Alexander William Orichton presided. The secretary (Mr. Henry Greey) having read the notice convening the meeting, the Chairman said:—

Gentlemen: I have now to lay before this meeting our report, with the balance sheet and profit and loss account, for the seventh year of the working of the company, and, in doing so, I would observe that this is the first time since the beginning of our business in which a large balance of profit has not been shown on the account as the result of the year. The cause of the present state of things has been, of course, the great hurricane which swept over Mauritius, at an utterly unprecedented time, when the greatest possible amount of damage could be wrought. We suffered a very heavy loss there, but in estimating the value of our Mauritius estates and the benefit derived by the company from them, not one, but several years should be taken. In the preceding year the profits derived from other sources were not large compared with those from Mauritius, which, as I then told you, amounted to over three lakhs of rupees. In the next year—the year covered by this balance sheet—had it not been for the hurricane, the profits would undoubtedly have been near to five lakhs of rupees. That is the opinion of those best acquainted with the subject, and in the current year, that is, the year which will be before you at the next meeting, the profits are again estimated to be at least over three lakhs of rupees. Referring now to the year covered by this balance sheet, after all the losses we have sustained, there still remains a balance to our credit on the account. That balance, you will observe, is ascertained after the payment of all debenture interest, and after payment of all the expenses connected with the hurricane, and also after setting aside a very considerable sum to meet the loss of exchange in silver, as compared with gold, which corresponds to a certain depreciation of our assets. We have written off, for this purpose, £9,800. The report, after stating that the hurricane occurred in the year under consideration proceeds as follows:—"The damage inflicted on the Company's buildings and plant proved to be about as anticipated by the Chairman in his speech of last year; but as he stated, it was impossible then to forecast with any accuracy the damage done to the canes, and the loss then likely to accrue from the injury to them and from the deterioration in the cane juice, and the difficulty of extracting the sugar." The exact damage inflicted on the Company's buildings and plant, as measured by the cost of restoration, amounted to £6,500, but the principal loss that we sustained was not this, it arose from the destruction of our crop. After the storm the canes were laid over wide areas in all directions; many were twisted and broken, and many were otherwise spoilt. We obtained, of course, from our manager a very full report on the whole subject, but I could not go into his figures as regards all the estates unless I had much more time at my disposal than you could allow me at present. But the best proof of the diminution of the crop lies in the figures of the export of sugar from Mauritius, which was reduced from a normal crop of about 125,000 tons canes to 70,000 only. Besides that, this diminution appears in the figures of our balance sheet, for the crops unsold in hand on 31st March whereas in the previous balance sheet they were valued at £59,898 in this balance the entry is reduced to £23,971, a reduction of over £30,000, due almost entirely to the hurricane. You will see therefore that after the hurricane we were suddenly confronted with a most difficult and serious problem. Our crops were to be reduced perhaps by one-half, while the expenses, as we feared, were considerably

to be raised, not only for the repairs of the buildings and plant on our own estates but also partly on those other estates in which we were interested and which we were working. Besides this, there were the streams and watercourses, which were choked with debris and which had to be cleared; there was the drainage which had to be restored; and there were the roads, bridges, and communications, which had to be put in order. Everyone in Mauritius was clamouring for extra labourers for similar purposes at the same time. When the news of the disaster arrived in England, Lord Knutsford, who was then Secretary for the Colonies, himself at once perceived the gravity of the situation, and he took, I believe, a warm interest in it. Ultimately he assented to the Mauritius Government issuing a loan, the proceeds of which were to be applied partly to assist the planters. Those arrangements were made and published, with which you will more or less be familiar, and we, in common with others, received benefits from them. Indeed, the policy which dictated the making of the loan, was very beneficial, inasmuch as the property of Mauritius depends upon the prosperity of its planters, who by these means were enabled to tide over a great difficulty, and were put in a way to recover their former position. Circumstances, too, have turned in their favour, for sugar holds a good place in the markets of the world. Prices are accordingly expected to be more remunerative than usual, and the prospects of the crop are reported to be favourable, so at least we were on all hands. Having thus explained the circumstances which have affected our balance-sheet unfavourably I will, now proceed to comment on its most salient features. After the figures relating to the capital and the debentures comes the "Mauritius Government Mortgage" covering a loan which we contracted under the circumstances which I have fully detailed to you and which is charged on our estate of Britannia only, repayable by the action of the sinking fund spread over a period of twenty-five years, the interest being 5 per cent. The next item is that of "Sundry Creditors." That is the account of our floating indebtedness, and this I think will be found to be highly satisfactory, because the acceptances which in the preceding year stood at £20,000 have now been reduced to £11,000 and the accounts payable with them stood at £106,000 are now reduced to £56,000. Of course this great reduction in our indebtedness, or rather avoidance of indebtedness, was effected by means of the money which we obtained from the Government loan, and also by means of other moneys which we had previously invested on mortgage and which were called in. But I would strongly insist that this great reduction of floating liabilities is a most satisfactory feature in our present accounts. The "Cost of Estates" on the asset side shows a small increase, but that has nothing whatever to do with any expenses on account of the hurricane, or any of the repairs or supplies in that connection. All such repairs and supplies have been charged to the ordinary expenditure of the year, and the details will be found included in the £110,000 charged for the upkeep of the estates in profit and loss account. This increase of cost is for perfectly new plant and buildings, about equally divided between Ceylon and Mauritius, and which we were advised by our managers to be necessary for the conduct of our increasing business, and which therefore, after scrutiny, we had to assent to. The next item is "Sundry Accounts Receivable," which is about the same as the previous year. "Advances on Mortgage" have been reduced, owing to our having called in certain moneys in consequence of the stringency of the money market at a particular period. The "Shares in Companies" are about the same, and "Cash in Hand" amounts to £10,000. In profit and loss account you will see the "Cost of Upkeep of Estates" is raised from £104,000 in the previous year to £111,000. For that there are three reasons. In the first place, that cost includes all the hurricane expenses; in the second place, it includes the cost of a very large quantity of canes which were bought, worked into sugar,

and the produce of which appears on the credit side of the account; and in the third place, it includes that considerable sum I mentioned of £9,800, which we have written off owing to fall of exchange, and which is to harmonize the values in our balance sheet with the low rate of exchange now had in view. It may be said that as this low exchange is not detrimental to our business, but, on the contrary, that no provision need be made for it as yet. I am quite sure however, we are taking the most honest and prudent course. As to the division of expenses between Ceylon and Mauritius, as that is a question we have been asked, I will mention it generally now, although we are quite prepared to give any figures which are required. In ordinary years the expenses of Ceylon and Mauritius are about equally divided. In this year the expenses in Mauritius are about £12,000 beyond those in Ceylon, because there is added to them that allowance for the depreciation by the fall of exchange which I have alluded to, and also there is added the amount which represents the molasses, which were utterly destroyed by the hurricane. But I would point out to you, in justification of our manager in Mauritius, if these extraordinary charges, the hurricane expenses and the loss by exchange, were removed from the Mauritius expenses, it would be found to be greatly reduced and much below the Ceylon expenses. Generally as to the profit and loss account, the key of the small balance in our favour will be found to be the reduction in the value of the produce in hand on March 31st last as compared with the preceding March 31st, attributable to the hurricane, for on March 31st last the produce was only valued at £28,900, as against £59,800 on the preceding March 31st, a difference of no less than £30,000. The account closes with a balance of £1,454, which, however little advantageous from the point of view of dividend, is, I would submit, not so very unsatisfactory if you compare it with the reports of similar companies doing business in Mauritius during that year. You will see that the most respectable and influential companies made a loss of £40,000, or £50,000, and in one case there was a loss £100,090. This concludes the consideration of the balance sheet, but I must still detain you in order to give you the details asked for at the last meeting with regard to Ceylon. They are principally as follows:—From the tea estates, which now include about 4,000 acres in bearing, we made 1,363,714 lb. of tea, and, in addition to that, we manufactured for other persons 156,797 lb. of tea. The cost of cultivation and manufacture to f.o.b. Colombo varied with different estates from 5d to 7-36d per lb. of made tea. The cocoa crop amounted to 1,417 cwt. from about 500 acres in bearing, and realised gross, 110 shillings per cwt. The company's agents appear to be well satisfied with the general condition of the estates, although they recommend that the cultivation of the tea should be extended to those places which were left available by the decay of the coffee and cinchona, which is, I think, common to all estates in Ceylon. With regard to the direction of the company, Mr. Shaw, as I think you are aware, has resigned his seat at the board, and in consequence of this we elected Mr. Henry K. Rutherford, chairman of the Ceylon Tea Plantations Company. Few persons, I believe, have a better knowledge or judgment with regard to the management of tea estates in Ceylon than Mr. Rutherford, and I think the company is fortunate in obtaining the benefit of his advice and co-operation. In conclusion, we have every reason to believe, from the increase of our crops and from the good prices we are obtaining for part of it, at all events, that a prosperous year lies before us. Owing to the meeting being held later, we can speak on this point with greater confidence than usual: We sincerely trust that at our next meeting our hopes and calculations may be found to be realised and fulfilled. I have now to move that the directors' report and statement of accounts to March 31, 1893, now submitted, be and they are hereby adopted.

Mr. W. O. Rohde seconded.

Mr. Hewitt complained of the way in which the

accounts had been presented; alleging that they were characterized by a policy of non-disclosure. He thought that separate figures should be given for the charges in Ceylon, Mauritius, and London, and that they should not be lumped together as in the present profit and loss account. Unless the directors would undertake to give the information he would move the appointment of a committee of shareholders to investigate the affairs of the company.

General Masey said he would second that. He quite agreed with the previous speaker as to the lack of information contained in the accounts.

Mr. Welton, the auditor, said there would be no inconvenience in separating the upkeep of Ceylon and Mauritius and in giving more details, and he hoped the directors would adopt that course.

Mr. Laurence asked the chairman whether he would give the separate figures for Ceylon and Mauritius, so that they might know exactly where the loss occurred.

In the course of further discussion, Major Speed criticised the management of the directors in Ceylon.

The Chairman, in a general reply, said the only reason why the accounts had not been rendered in the way suggested was that the directors felt that it might be prejudicial to their business to do so. There was no desire whatever to keep any information from the shareholders. With regard to the London expenses they only amounted to £2,800 which was a comparatively small amount for such an extensive business. The produce from Ceylon was valued at £63,906 8s, and the expenditure £48,541. The value of the produce in Mauritius was reduced, owing to the hurricane, to £38,639 19s 4d, and the expenditure £48,303 9s 4d, including the hurricane expense, leaving a deficit of £9,663 10s. The directors would circulate a printed paper amongst the shareholders, giving all the details asked for.

Mr. Hewitt expressed himself satisfied with the chairman's statement, and withdrew his amendment with regard to the appointment of a committee of shareholders.

The resolution for the adoption of the report and accounts was then put, and carried unanimously.

Mr. Norman W. Grieve was unanimously elected a director in the place of G. H. Todd-Healy, who retired, and did not offer himself for re-election.

Mr. Hewitt proposed the re-election of the auditors, Messrs. Welton, Jones & Co. General Masey seconded, and it was carried unanimously.

A vote of thanks to the chairman terminated the proceedings.—*L. and C. Express*, Sept. 29.

CACAO PLANTING NOTES.

Matale, Oct. 14.

Although we had rain since Saturday last, sufficient to put away all further apprehensions concerning the drought, it is not exactly what may be called planting weather as yet. Two or three days of bright hot sunshine waited on us during last week, enough to have scorched out any tender plant brought up of a nursery where it had been used to regular watering. However, the steady rains are not far off and let us hope to have a good planting season, now that we have seen the last of one of the severest droughts we have had for some years past.

If it was impossible to make a certain estimate while the drought was on, then the certainty that is left us now is that the best part of the young crop has been burnt off, as may be gathered from the innumerable little pods a week or two old, withered and black, hanging on to the branches. This year's crop depends therefore chiefly on the already matured pods which when the drought came on were hardy enough to have withstood it. One might venture to guess that by the end of the year most estates will see the bulk of their present crop out.

The drought was so intense that on some estates acres upon acres of cacao had, at great cost, to be actually watered, to save them from the fire. They were not nurslings either, but venerable crop-bearers

The crop this year will therefore so far from showing an increase on the last year more likely approximate the returns of the previous year. The compensating advantages of a rise in the market, is all the consolation that is left now, with, of course the prospect of a bumper crop to come, which let us hope we shall all realize next year.

CROPS IN CEYLON:

ABSTRACT OF OFFICIAL SEASON REPORTS FOR SEPT. 1893.

In the Western Province good yala harvest has been reaped, particularly in the Rayigam korale, Kalutara District, where it is said to have exceeded any harvest during the past ten years. Maha suffered from drought. In the Kandy District of the Central Province far crops are reported and it is said that rain is much wanted in every division. In the Matale district there is severe drought everywhere in the district. Ratamahatmaya reports scarcity of food in Kandapalla and Wagapanaha Pallosiya pattu. Coming now to the Northern Province the report from the Jaffna District is that there was no rain during the month except slight showers on the 29th and 30th in some parts. Paddy sowing for kalapokam of 1893 commenced. Payaru reaped crop reported fair. Palmira fruit gathered; crop indifferent. In the Mannar District there is no land under crop. People are still clearing jungle and preparing lands for dry grain cultivation. No rain. Great distress. In Galle District the report is—yala over; good. In Matara the crop prospects are good all over the district. In Hambantota District the yala returns were generally excellent. Owing to irrigation works the district was not much affected by the long drought. In Batticaloa the threshing of later pinnari on 5,500 acres was nearly over; yield good. Eltota harvest on 400 acres is ripe; 1,500 acres sown a second time; crop now in ear on 1,400 acres is very good. Ploughing for munmari harvest of 1894 is retarded for want of rain. In Trincomalee the Pinnari harvest throughout the district reaped and stacked; threshing not over, weather being unsettled. More rain wanted to moisten munmari lands for ploughing and sowing; on this account progress in cultivation slow. In Kurunegala the country has suffered seriously from want of water during September; cultivation was consequently retarded. Cattle everywhere suffer from want of grass and water; beyond the Deduruoya drought most pronounced; tanks empty. Cultivation for maha wet and dry very restricted, and food supply at low ebb. Relief works in Wannu draw increasing numbers—five hundred persons now at work; drinking water very short, especially beyond Deduru-oya. In the North-Central Province paddy crops, where irrigation available, matured well, and are harvested. A few tanks contain water, but most are still dry. Scarcity of food reported in some villages. The prices of all grain are high, though not prohibitory. Sore eyes, measles, and fever reported prevalent. In province of Uva the report is—harvesting of late maha sowing; crop damaged by flies; yield consequently below the average. Yala cultivation in progress. From Ratnapura it is reported that in all the korales a good yala crop has been harvested, weather having been splendid for harvesting operations. Prospects of maha cultivation throughout the district both in dry and mud lands are unfavourable, owing to the continued drought. In Nawadun korale some of the maha plants in the fields have suffered from the growth of a weed known as "madametta" or "kirihevan."—*Gazette.*

INDIAN TEA NOTES AND NEWS.

A South Wyuad correspondent writes:—"I am very glad indeed to learn that the Perindotty Factory was fully insured. The energetic manager has done wonders and has run up sheds with the expedition of a burst-out American citizen, and hand rolling is in full swing until machinery is available. There are splendid flushes on the tea bushes now, which it would have been a thousand pities to lose."

There is a decline, says an American paper, for the demand of Formosa green tea, which is such a favourite with Americans. The Japanese seem to be making the running for green tea, though, as an English traveller says, there is no accounting for its popularity except that it is due to the big commercial intercourse between Japan and the States.

The Japanese green tea may be preferable to that from Formosa; but it is not free from adulteration. The colouring or painting is still effected by means of a spoonful of indigo and powdered soapstone put into each basin, and thus disseminated through its contents. But in Japan tea is not grown for export only, but is the chief article of home consumption, and these domestic teas as procured in the country are probably the only samples of unadulterated green tea which Europeans are likely to meet with. They produce a beverage which is refreshing, quite harmless, and which, notwithstanding the way in which it is prepared, can, after only a short residence in the country, be readily distinguished from hot water.

"W." writes:—"It is not generally known that years ago the Government issued a circular on the subject of the preparation of brick tea, and attempts to make it were started in Dehra-Dun; but unsuccessfully. The planters had not the trick of supplying the abominations which the Chinese use in fabricating this stuff, and I think they were too honest."

China brick tea, at its best, is but a confection prepared out of the refuse of tea and the decayed leaves and twigs, which is pressed into moulds, and with a little sheep or ox blood added to stiffen the mass and perhaps make it palatable. Bullocks' urine is used to give certain sorts of it a flavour acceptable to the Thibetan, and there are other vile mixtures which I would rather not mention.

Up to the half-year ending 31st August, the Dehra Dun Tea Company manufactured 500,000lb of tea, being about 10,000lb in excess of the corresponding period of last year. The estimates have been already exceeded and reports are most favourable.

A letter from Jorehaut (Upper Assam) states that the leaf is fairly plentiful, but is getting short in the shoot. It appears that on the 14th September the flats at Gusein Goun went down to the month of the Sutee, owing to a fall of the Brahmapootra, and this occasioned some inconvenience, as the Godown at Gusein Goun had been washed away and there were no boats to take the tea chests.—*Indian Planters' Gazette.*

LONDON REPORTS ON TRAVANCORE CEYLON PRODUCE. TRAVANCORE TEA.

(From Patry & Pasteur, Limited, Report of the Colonial Markets for the Week ending September 27th, 1893.)

The undermentioned teas have been sold this week, prices for which show no alteration,

	Pek.	Pekoe.	Sou.	Sonchong.	Bro Tea Dust.	Quantity.	Av. about.
Aneimudi	9½d	7½d	6½d	...	6½d	48 ½-chs.	7½d

					4½d		

Total 155 packages, averaging 6½d per lb.

THE ISLAND OF FORMOSA: ITS AGRICULTURE, BOTANY, &c.

A report by Mr. Hosie on the Island of Formosa, with special reference to its resources and trade, has been issued as a Parliamentary paper by the Foreign office. It differs from the ordinary annual Trade Report in that it deals with the resources and trade of the whole island.

SOME PHYSICAL FEATURES.

With regard to vegetation, it is much more tropical than on the opposite mainland, and leads one to attribute to it a much more southern origin. But what evidence is there to support this conjecture? It may be said that the greater humidity of the island and a richer soil would account for the great tropical luxuriance; but these, powerful factors as they are, will not account for the presence of plants and trees not to be found on the mainland. Either, then, such plants and trees are indigenous, or they have found their way to Formosa from other lands. The rattan is a case in point. It grows to great perfection in the jungled eastern half of the island, and is exported in considerable quantity from Tamsui. Now the home of the rattan (*Calamus rotang*, L.) is the Malay Archipelago, and the Chinese word *ʻeng*, meaning rattan, is supposed to be an imitation of the Malay *rotang*. Is the rattan found elsewhere in China? In the Island of Hainan and on the adjacent mainland it grows, but Hainan lies between its Malayan home and Formosa, and this valuable creeper is probably a stranger in both islands. The Black Stream from the south, with its average velocity of thirty to forty miles a day, runs along the east coast, and throws on the island part of the floating vegetation which storms have detached further south. The betel-nut palm, too, a native of more southern climes, grows in Formosa and Hainan, but is unknown on the mainland between these islands.

In addition to these I might mention a variety of the banana (*Musa textilis*, Nees), which produces a large fruit unrivalled elsewhere in China, and only to be had in the same perfection in the Malay Archipelago and the Philippines. In Formosa it has found that volcanic soil which it loves. Many of the minor plants, too, which grow with wonderful profusion, are undoubtedly non-indigenous. While larger plants and trees would be able to bear the transit by sea, seeds would probably succumb to the action of salt water and insects would perish, so that the Black Stream will not account for the presence of the latter. But Formosa is in the direct line of typhoons from the south, and seeds and weak flyers like beetles and butterflies could easily be caught up, carried along by these aerial currents, and dropped on the island.

AGRICULTURE.

As the level part of Formosa is peopled by immigrants from the Fuhkien and Kwangtung provinces, agriculture is conducted on much the same principles as on the adjacent mainland, the only difference being that, whereas the opposite seaboard is stony, and in many places scarcely repays the labour spent upon it, the soil of Formosa is bursting with fatness, and yields with unparalleled profusion. As an example of this, I may mention that the tea shrubs which now dot the hillsides of the north of the island were originally introduced from An-ch'i, one of the poorest districts of the Fuhkien Province; that nowhere can a purer leaf than of Formosan tea be now obtained; and that the once considerable tea trade of Amoy, the port through which these very tea plants were imported, has, within recent years, been almost superseded by the fine teas now produced in the island. Some thirty years ago the island was known as the "Granary of China," and from it rice was largely exported to the mainland; but the great influx of labourers since that time has necessitated a shrinkage in the export, the supply nowadays being little more than sufficient to meet home requirements, except when the harvests prove exceptionally bounteous.

Mr. Hosie then goes on to tell us that after rice the sweet potato, which yields two crops a year, is most grown, whilst wheat, millet, maize, several species of taro, yams, bamboo shoots, lotus, ginger, and various vegetables are grown. "The foreign or introduced cabbage thrives wonderfully, the heads frequently weighing as much as twenty pounds a piece." Of fruits, there are arbutus, banana, guava, jack-fruit, lung-ngan, mango, orange, peach, pines, plums, pomelo, quince, and a few inferior lichees.

ECONOMIC BOTANY.

China is the home of a large number of economic plants of great commercial value, and of these Formosa, small though it is, possesses a very considerable proportion. In this respect the island is indeed wealthy; but up to the present, neither the native nor the foreigner has taken full advantage of that wealth. These plants I propose to discuss under the following heads:—(A.) Textile plants. (B.) Oil-producing plants. (C.) Other commercial plants.

(A.)—TEXTILE PLANTS.—This class includes not only such plants as yield fine fibres, like rhea, but all plants from which articles of any description can be woven, whether by loom or by hand. I do not contend that the list is complete; but, having studied the textile plants of China whenever and wherever I have had the opportunity, for the last three years, I do not think that the omissions, if any, can be of any great importance. And I may say at once that three of the most valuable textile plants cultivated in China are not grown in Formosa: They are *Gossypium herbaceum*, L., or the cotton plant, *Cannabis sativa*, L., or the true hemp plant, and *Abutilon avicennae*, Gaertn., a plant which yields Abutilon hemp.

1.—*Boehmeria nivea*, Hook., and Arn., known as the grasscloth, rhea, or ramie plant. In Formosa, the soil and temperature are exactly suited to its wants; but the heavy rainfall of the island is somewhat injurious to its growth. It is propagated by rhizome cuttings, and is extensively cultivated both by Chinese and savages.

Some years ago, a foreign firm at Tamsui imported a Death machine for decorticating the stems and extracting the fibre. The firm was, however, too ambitious: it wanted to produce an article like floss-silk, and after the fibre was extracted by the machine it was boiled and otherwise chemically treated. A silk-like fibre was ultimately produced, but it was found impossible to reduce it to the necessary softness.

2. *Corchorus capsularis*, L., is the annual plant which yields true Indian jute, and should not be confounded with *Abutilon avicennae*, Gaertn.

3. *Ananas sativus*, Baker: Grown in the south and gives a valuable fibre.

4. *Musa textilis*, Nees.—The extraction of fibres from the banana and the manufacture of a yellowish cloth therefrom are entirely confined to the savages.

5. *Chamærops excelsa*, Thunb., a palm from which cloth is manufactured; used by the peasantry and fishermen of China as rain clothes.

6. *Cyperus tegetiformis*, Roxb.: A rush, grows abundantly in salt, marshy ground on the west coast, is used for mat making.

7. *Broussonetia papyrifera*, Vent.—The paper mulberry grows into a tree in Formosa. The inner fibrous bark of the tree made into paper and when oiled used for umbrellas.

8. *Alpinia mutica*, Roxb., grows wild in North Formosa. Its principal use is for making the uppers and soles of "straw" shoes.

9. *Pandanus odoratissimus*, L.—The screw pine grows profusely in North Formosa, and is largely used for fencing the fields. Its fibre makes the uppers of "straw" shoes.

10. *Oryza sativa*, L.—The straw of the rice plant is much used for making sleeping mattresses.

11. *Triticum vulgare*, L.—A like use is made of wheat straw.

12. *Bambusaceae*.—To catalogue the uses to which the bamboo is put in China would be no easy task but it would be just as difficult to point to any

industry, and say that in it there is no place for the bamboo.

13. *Calamus rotang*, L., grows in savage territory, and the savage spear has often pierced from behind the unwary rattan collector. Like the bamboo, its uses are endless.

14. *Pueraria thunbergiana*, Benth., a trailing vine not treated for the fibres.

15. *Agave Itzli*, or *Henequen*.—In Formosa a very prominent plant. It is not treated, but there is every probability of a suitable machine being imported for extracting and cleaning the fibre.

16. *Sterculia platanifolia*, L., might, with advantage, be put to uses.

(B).—OIL PRODUCING PLANTS.—Since the introduction of kerosene oil into China the demand for native lightning-oils has been on the decline, but for cooking purposes some of these oils are produced in large quantities. Of the seventeen oil-producing plants cultivated in China, eight grow in Formosa.

1. *Dolichos soja*, L. (?).—More oil is extracted from the bean than from any one of the other oil-yielding plants of China. The beans yield about 10 per cent. weight of oil, and the cakes, when removed from the press, weigh some 64lb., and are worth about 2s. 9d. each. They constitute a very valuable manure.

2. *Brassica Chinensis*, L.—Rape is usually a winter crop in China.

3. *Sesamum Indicum et Orientale*, D. C.—Is a summer crop. Sesame is essentially a food oil. Refuse seed-cake is much used in Formosa for adulterating opium.

4. *Arachis hypogaea*, L.—Is extensively cultivated in China, not only for food which the nuts supply, but also for the oil which they contain.

5. *Stillingia sebifera*, S. and N.—From the seeds of the vegetable tallow tree, both tallow and oil are produced. They are used for lighting purposes only.

6. *Camellia thea*, Link.—The seeds of the tea-plant not required for raising new bushes are collected and treated for oil, which is employed for both food and lighting.

7. *Cinnamomum camphora*, N. and E.—Although the camphor laurel is found in many of the provinces of China, where it is highly valued on account of its wood, yet Formosa is the only province in which camphor and oil are manufactured.

8. *Ricinus sp.*—The castor-oil plant grows wild throughout Formosa.

I have not included *Diospyros kaki*, L. f., which grows in Formosa as well as on the mainland, among oil-producing plants, for the juice of its fruits should be classed as varnish and not as oil.

(C).—OTHER COMMERCIAL PLANTS.—In addition to textile and oil-producing plants, there are others, cultivated as well as wild, which are of considerable commercial value.

1. *Nicotiana tabacum* L.—Tobacco is grown in Formosa both by Chinese and savages.

2. *Fatsia papyrifera*, B. and H. f., in Formosa attains to the dignity of a tree, and is frequently seen over six feet in height.

3. *Polygonum Chinense et Orientale*, L.—These two varieties of the indigo plant are cultivated in Formosa for the valuable dye which their leaves yield.

4. *Circuma longa*, L.—The rhizomes of turmeric are made into a yellow dye, and are used in medicine.

5. *Dye Yam*.—I was unable to procure specimens of this wild plant. The yams are macerated in water, and the liquor is used for dyeing fishing lines and nets, a dull red colour.

SPECIAL INDUSTRIES.

The chief industries carried on in Formosa are the cultivation and manufacture of tea in the north and of sugar in the south. To these may be added coal-mining, sulphur making, camphor distilling, and gold washing.

TEA.

The cultivation of tea is not in Formosa a very old industry. The tea-plant was imported from the

Fuhkien Province and proved a great success. Since its introduction the cultivation has spread rapidly, advancing *pari passu*, with the clearing of the hill-sides in Northern Formosa. In this virgin soil no manure is required, and all the cultivator has to do is to keep the ground clear of weeds and undergrowth. In three years the shrubs have obtained their maximum height of two to three feet, and the time has arrived for picking the leaves. This operation, which is carried out by women and girls for the most part, takes place in the end of April or beginning of May, in July, and in September, three crops during the season. The leaves, when picked, are placed in bamboo baskets, and afterwards spread out in the open air—usually on the threshing floor—for a short time.

The tea manufactured in Formosa is generally, but erroneously, classed by the public as a green tea. It is in reality a black tea, prepared without the usual fermentation, but possessing a decided flavour of the green variety. The leaf is fired when green, and this, taken with the flavour, may account for the popular belief. But between the exposure in the open air and the firing, the leaf has to undergo a somewhat peculiar treatment, a process which I discovered accidentally, and which was unknown to the foreign tea merchants to whom I mentioned the matter. One day I suddenly found myself close to a farmhouse, and saw a man sitting on a high stool on the threshing floor turning rapidly with his feet what appeared to be a long cylindrical drum. On nearer inspection, I found that the machine was about 8 feet long and 2 feet to 2½ feet in diameter, six-sided, each side made of brown, coarse cloth let into a wooden framework, that the axle ran right through the cylinder and rested on two wooden supports, one at each end. Between the support and the cylinder at one end were four treadles fixed in the axle. Working these with his feet the man caused the cylinder to revolve rapidly, each revolution being accompanied by a swishing noise inside the cylinder. On my expressing my desire for some enlightenment the man willingly unfastened one of the sides, which was the door of the cylinder, and laid it back on its hinges. Exposed to view were six bamboos, corresponding in number to the sides of the machine, fixed at equal intervals into the ends of the cylinder midway between the axle, to which they ran parallel, and the periphery of the "ch'a-nung," or tea preparer, as the machine is called. At the bottom of the cylinder there was a heap of green tea leaves, which had been placed there after the necessary exposure on the threshing floor. As the machine revolves, these leaves are dashed against the bamboos, whereby their edges are rendered quite soft; they are then removed and put into the iron firing pans. It will be asked, "Why are the edges of the leaves softened?" The answer is easy. Were the leaves, after being picked and exposed for a short time, placed in the firing-pans; they would split up—the tea leaf is thick and brittle—and lose all semblance to the whole leaf which is so much desired. Such, at least, was the explanation given to me, and it appears to be very reasonable and natural.

Some of the leaf which has brought into Twatutia, tea market of the island, is ready for packing and shipment, but most of it is brought in after the first firing, and is finished—that is to say, again fired in bamboo basket,—in Twatutia itself, where, foreigners and Chinese alike possess firing rooms.

When firing is completed, the tea is spread out in flat bamboo baskets, and all pieces of twigs and leaf-stalks removed by hand. This part of the work is performed by women and girls. The tea is again poured into the firing-baskets, and after being fired until every particle of moisture has evaporated, it is removed and packed hot in lead-lined boxes for export.

SUGAR.

Two varieties of sugar-cane are grown in North Formosa—*Saccharum sinense*, Roxb., and *Saccharum violaceum*; but in South Formosa, which is the great sugar-producing region of the island, the former is

the principal variety cultivated. When ripe, the canes are carried to the sugar-mill, which consists of two stone rollers, about 3 feet by 2 feet usually of granite, set up vertically side by side. The principle is the same as in the Chica Ballapura engine, except that the rollers are not themselves grooved to form screws. The canes are passed three times between the rollers, and from 100 lb. weight of the raw material an average of 50 lb. of juice is expressed. Clay or mud of the consistency of cream, and without any regard of cleanliness, is poured to the depth of an inch or two on the top of the brown drained sugar. The moisture from the clay, which soon hardens and does not contaminate the sugar, descends through the crystals, carrying with it the dirty coloured treacle enveloping the crystals, which are not affected or diminished, but simply washed white. It has been proved, by experiments conducted in the presence of the sugar growers of South Formosa, that there is a great waste of juice as at present extracted by the native mill. Two small mills from England were set to work, and from 100 lb. weight of cane each produced not 50 lb. but 68 lb. of juice, and, to prove that, there was no mistake as to the amount, the refuse of 100 lb. of cane, which had passed three times through the native was passed once through the foreign mill, and yielded 18 lb. of juice, that is, a gain of 18 per cent.

CAMPHOR.

The manufacture of camphor itself is a most important industry in Formosa, and the difficulties connected with it are by no means light. In the first place, the camphor laurel grows in savage territory only, and the hillmen of Hakkas, who border on that territory, have to make monetary or other arrangements with the savage Chiefs to protect, or refrain from destroying, the stoves or stills which the former set up in their country. These arrangements are, as a rule, very unsatisfactory, for, as soon as trouble arises, no matter what may have been the cause, they proceed without delay to vent their resentment on the stills, which are promptly destroyed. Several foreign firms are engaged in the trade, and their method of conducting the business is worthy of notice. Advances are made to the hillmen on condition that they set up a certain number of stoves, supply monthly a fixed amount of camphor at a price agreed upon, and repay the advances by instalments at certain stated periods. Bonds are entered into, and securities are given by the hillmen for the due performance of their contracts; but there is an agreement between the Chinese and foreign Consular authorities that Consular assistance cannot be invoked for the recovery of advances made in the camphor business. In spite, therefore, of the securities given, foreign merchants make advances at their own risk.

As soon as the hillmen have settled all their preliminaries with the savage Chiefs, and a suitable spot has been fixed among the camphor trees for the erection of a still, the former proceed to run up a shed or rough building, the size of which depends on the number of stoves it is intended to contain. If ten are to be erected, the building would be about 20 feet long by 13 feet broad. In the centre of the floor an oblong structure some 4 feet high, 10 feet long, and 6 feet broad, is built of sun-dried mud bricks, having five fire-places or holes at each side raised a foot or so above the floor of the room. The two ends of the structure are solid, and without fire-places. The latter are so built that an earthenware pot can easily be inserted above the fire in each hole. An earthenware cylinder connects the mouth of each pot with the service of the structure, or still, as it may more conveniently be called. Between the pot and the lower end of the cylinder there is a round thin piece of wood fitting both the mouth of the pot and the lower end of the cylinder, and perforated so as to allow the steam from the water in the pot to pass into the cylinder during distillation. The top of each cylinder is usually about a foot in diameter, and is level with the surface of the still.

The camphor laurel attains an enormous height and girth in Formosa. I have seen a horizontal section of a stem which was at least 6 feet in diameter, and which at one time formed the entrance to the house of a savage chief. The doorway is cut out of the section. It is now a trophy belonging to a missionary, and has to be accommodated on the verandah of his house. Much difficulty is experienced by the hillmen in felling their forest giants, and recourse is frequently had to firing so as to expedite their work. Quantities of valuable timber are thus consumed, and, as no trouble is taken to plant young trees, the day will come when such waste will be regretted. The tree once felled, the branches are removed, and the trunk sawn into planks. Branches and planks are then set upon by a number of men, each armed with a small scoop-shaped adze, every stroke of which removes a chip about an inch long. The extract remains a greyish white powder, which unlike the camphor produced in Japan, does not solidify under pressure. A ready market is found for Formosan camphor, which is an important ingredient in smokeless powder.—*London and China Express.*

MORE POTASH NEEDED.

1. Fodder crops, pasture grasses, corn stover and hay all remove large amounts of potash from the soil, and these crops occupy a large proportion of our improved lands.
2. The urine of our domestic animals contains about four-fifths of the total potash of their excrements.
3. When urine is allowed to waste, the manure is poor in potash.
4. When manures are exposed to rains, much of the potash being soluble, is washed away.
5. Nearly all the special fertilizers are especially rich in phosphoric acid, and do not contain enough potash.
6. Superphosphates were the first fertilizers to come into general use among our farmers.
7. When the farmer buys a fertilizer, he still, nine times out of ten, calls for a phosphate.
8. As a result of the above conditions our soils seem to be quite generally in need of more liberal applications of potash.
9. In the case of corn the need of potash appears to be particularly prominent.
10. For a good crop of corn the fertilizer used should supply 100 to 125 lb. of actual potash per acre; 200 to 250 lb. of muriate of potash or one ton (50 bu) of good wood ashes will do this.
11. With ordinary farm and stable manure it will generally pay to use some potash for corn; 125 to 150 lb. of muriate of potash has given profitable results.
12. The liberal use of the potash means more clover in our fields, more nitrogen taken from the air, more milk in the pail, a richer manure heap, and store-houses and barns full to overflowing. It means also a sod which when turned will help every other crop.
13. For the potato crop the sulphate appears to be much superior to the muriate of potash, promoting both yield and quality in much higher degree; 300 to 400 lb. of high grade sulphate of potash furnishes enough of this element.
14. For oats, rye and grass, nitrate of soda applied just as the growth begins in spring has proved very beneficial; 300 to 400 lb. per acre should be applied. Prof. W. P. Brooks, Massachusetts Agricultural College.—*Indian Agriculturist.*

INOCULATING FOREST-PESTS.—The Society of Friends of Natural Science in Danzig offers, says *Chemist and Druggist*, a prize of 50*l.* for the most practical method of destroying the insects which ravage the forests of Western Prussia, by means of the introduction among them of an epidemical disease. Treatises on the subject must be written in German or French, and reach the Secretary of the Society in the course of the present year.

Correspondence.

To the Editor.

MANGOSTEENS IN THE PLANTING DISTRICTS: PRACTICAL HINTS.

September 18.

DEAR SIR,—You were good enough to take notice of my mangosteens and therefore I am taking it upon me to send you the following notes:—

The mangosteen (*Garcinia mangostana*) is a native of the Moluccas Islands and is a very slow growing tree, but most certainly worth the small trouble of patiently watching its gradual development, and he is selfish indeed who thinks thus: 'oh what's the use, I won't get the benefit, I plant, and another reaps the fruit thereof.' Rather be the benefactor to your species in even making one mangosteen tree grow where none grew before! The plants I got from the Peradeniya Gardens in 1872, so that they are now twenty-one years old. The first crop was in 1883, so that one has to wait some ten years before they can enjoy this fruit,—a delicious blend of sweet and acid—of their own planting. Don't be discouraged, keep in mind the Auld Laird's advice to his son: "Aye be sticking in a tree Jock, it will be growing while ye are sleeping." They are growing on very fair soil at an elevation of 1,700 feet and have received no special care or treatment. Rainfall is about 180 inches. They look very healthy with their large leathery leaves, and are free from insect pests. Height of tree which has a tapering stem and regular form is 25½ feet, and the diameter of foliage the same. The stem has a girth of 28 inches at a foot from the ground. Crop is once a year, August-September.

—Yours truly, JOHN DRUMMOND.

THE BANDARAPOLA CEYLON COMPANY, LIMITED.

London, E.C., Sept. 27th.

SIR,—We beg to inform you that the Board of Directors of this Company have declared an interim dividend at the rate of 6 per cent. per annum (free of income tax) for the half-year ending 30th June last.—Your obedient Servants,

ANDERSON BROS., Agents and Secretaries.

THE QUALITY OF TEA IN THE LOCAL MARKET.

Sept. 30.

THE ENCOURAGEMENT GIVEN BY BUYERS.

DEAR EDITOR,—In your issue (*Observer*) of 25th, there is a letter from Mr. Street, in which he complains that there is a lack of good teas in the Colombo market. This may be so; but do planters get encouragement from the Colombo buyers to send really good teas to their market? I for one think that good teas don't get that attention in Colombo they ought to get.

I will give you an instance that came under my notice, which will bear out what I have stated.

A parcel of tea was sent to Colombo for last Wednesday's sale, but previous to despatch samples were sent to one who is deservedly thought to be the best taster and valuer in Colombo. He valued the Broken Pekoe at 88 cents. The teas were sent away to another broker for sale and he at once sent his valuation: Broken Pekoe 78 cents (seventy three cents),

I may here mention that in the interim there was a rise in the market. When this valuation was received by the parties interested, you may be sure they were put out. They at once wired "B. P. not to be sold below 90 cents." Well, the teas were put up and 76 cents was bid at the sale; but would you believe it—the tea was sold the following day at 90 cents.

Now, Mr. Editor, what do you think of the fore going. Here was tea valued by one broker at 88 cts. per lb. Do. by the selling broker at .. 73 do. And afterwards bought by a well-known Colombo man for 90 do.

You will see we planters are really at the mercy of Colombo buyers and usually we have to take whatever is offered. In the case mentioned above some of the parties interested have an idea what good tea is; otherwise this fine sample of tea would have been thrown away.—I am, H. H.

COFFEE IN DOLOSBAGE: LIBERIAN AND COORG-ARABIAN PROMISING WELL: A CORRECTION.

DEAR SIR,—In a recent leading article you remarked that no coffee was grown in this district.

If you will refer to one of the returns furnished for your Directory, you will find that there are 20 acres of Liberian and 35 acres Arabian (Naalkanad-Coorg variety) growing on one estate.

The Arabian is now 18 months old and promises to be a great success. DOLOSBAGE.

TALAGSWELA TEA COMPANY LIMITED.

Colombo, Oct. 16.

DEAR SIR,—We have been asked to invite your attention to the Brokers' Circulars, which are usually issued with your paper, in which the estimate of Talagaswela Tea Crop, for 1893 most persistently appears at 180,000 lb. made tea.

The estimate for 1893 was revised in June last to 140,000 lb., and information to this effect was made public, but evidently not availed of by the brokers for the benefit of the shareholders.

The following have been the crops since the manufacture of tea was commenced on the Company's property.

Year ending 31st Dec. 1891, 80,000lb. made Tea.
do do do 1892, 118,000lb. do do
Present estimate for 1893, 135,000lb. do do
The Crop for 1893 which so far has averaged 45 c. per lb., will shew a yield of about 200 lb. per acre, and a substantial dividend will be declared in February next.—Yours faithfully,

BAKER & HALL, Secretaries.

DIETETIC PRODUCTS.—Of the popular beverages for the breakfast table, the home consumption of cocoa keeps pretty steady at 21,000,000 lb. yearly. Coffee is stationary at about 255,000 cwt., chicory coming in largely to replace it with 93,000 cwt. Tea makes giant progress, at the advanced rate of 5,000,000 or 6,000,000 lb. yearly, Indian and Ceylon teas forming the bulk; for out of 207,000,000 lb. taken last year, only 33,000,000 lb. of Chinese tea were consumed. The average is now about 15½ lb. per head of the population. The import of refined sugar were about 700,000 cwt. less than in 1891, but those of unrefined sugar show a slight increase over the previous year. The quantity of raw sugar consumed per head of the population is now about 47½ lb., and of refined 33 lb.—*Journal of the Society of Arts*

REPORT FROM THE CENTRAL PROVINCE.

(Notes from Wanderer.)

October 12.

TEA PRICES are certainly more encouraging. We are now only $\frac{1}{2}$ d below last year's average at same date and exactly the same average as India. Last year we were $\frac{2}{3}$ d under India. Our Indian brethren are now being treated to the same style of gentle chiding from the London brokers, meted out to Ceylon planters last year. Gow, Wilson Stanton thus discourse in their circular of the 22nd Sept:—"Quality from some of the Assam gardens is better, though not equal to last year. Darjeeling continues to send some fine tea, but in other districts the crop shows no new feature." India has therefore to take a back seat in the Lane this season. Neigherry 589 packages averaging 7d, and Travancore, 1,204 packages, 6 $\frac{3}{4}$ d, are not startling. Java, 1,711 packages averaging 6 $\frac{1}{2}$ d does not say much for the Dutchman's manufacture of the cheering leaf.

WEATHER.—Matale and Dumbara men begin to hold up their heads, for rain has at last fallen. Rain was wanted even in the Kelani Valley. Some estates there have had no rain for 20 days.

HELOPELTIS is now becoming scarce in the Kelani Valley, thanks to the catching of these troublesome pests. If they reappear, vigorous steps should at once be taken to destroy them. I fancy "mosquito blight," as they call it in India, will never be so troublesome or so destructive in Ceylon as in India, for we only lose a month's flush which can be made up later on. On the Indian Continent they have virtually only three months of heavy plucking, and if anything interferes with the flush in these months the whole season's yield is affected.

COAST ADVANCES.—Some planters are inclined to insinuate that the joint Committees of the P. A. and Chamber of Commerce have not done much to improve matters. They have on called they could and if their suggestions are loyally carried out, we shall see a more healthy state of matters in 1894.

FRUIT PRESERVING AT SINGAPORE:

The Netherland Consular report on Singapore for last year, just published in the *Java Government Gazette*, gives the following particulars regarding the preserved pineapple trade:—

"The preparation of preserved tropical fruits, chiefly pineapples, increased again during the year under report, the export being estimated at 1,670,000 pineapples against 1,500,000 in 1891. This increase of 70,000 units is, almost exclusively, to be ascribed to the augmented export of 30,000 units to Great Britain and 40,000 units to the Continent of Europe, mostly to France. The steady extension of this branch of industry is in consequence of the article becoming better known abroad, and of the considerable increase of pineapple cultivation in Singapore, Johore and adjacent places, as also on neighbouring islets in the Rho Archipelago. The pineapple crop was, moreover, very satisfactory during the past year, so that the supply was considerably greater than in 1891. The price realised, on the average, fell hence to 2 dollar cents for each pineapple against 6 cents in 1891, and this, too, in spite of an increase in preserving factories. During the year under report, at Singapore, five Europeans and five Chinese carried on the preserving business against four Europeans and three Chinese in 1891. From the above mentioned increase in the export, it need not, however, be made out that the consumption abroad has grown in proportion. A lot inconsiderable portion of the export, indeed, mostly to England, had to remain there unsold owing to a glut in the market, as also in consequence of inferior quality and less careful preparation of the product. These last mentioned consignments were largely from Chinese factories, of which during the past year, several stopped business while others were set up."

SALES OF ESTATE PROPERTY.

We heard some weeks ago from a Fort businessman that a nice little cacao property was in the market at what seemed a very low price—the explanation being that it was so surrounded by native thieves that the crops could never be secured! We do not know if this is the reason; but now learn that Kandewatte plantation of 182 acres (115 in cacao) in the Dumbara district, has been sold to a native by Messrs. Chas. Strachan & Co. for R12,500 which seems a bargain if the trees are in good condition.

Another sale is that of Nugawella tea estate in the Pussellawa district—191 acres, 180 in tea—by Mr. A. O. White to Mr. M. B. Evans for £4,000 or £4,500.

It is reported that the Ceylon and Oriental Estates Company are buying a group of Badulla estates.

A contemporary has the following:—

Mr. E. H. Stewart, of Wattegama, has purchased the property known as the Narandanda lands from the Ceylon Tobacco Company, Limited, at present in liquidation, and they will, I hear, together with the surrounding lands, also purchased by the same gentleman, be known in future as "Gillbury Estate." The property in question is situated between Katugastota and Wattegamme.—Kandy Cor.

PLANTING REPORT FROM UVA.

Badulla, Oct. 16th.

THE WEATHER during the latter part of September was showery and we all thought the North-East monsoon had made an early burst. Some few were adventurous enough to plant. It is now hard and dry. Wind at night from the South-West and, though clouds bank up in the East in the afternoons, no immediate prospect of rain. The weather now is particularly bright and the mornings are very charming.

TEA is still flushing well, though not quite so heavily as it was three weeks ago. The pruned fields have recovered wonderfully well, and those fields pruned in July and August are flushing very well. Clearings are being busily proceeded with and a very considerable acreage will go into tea in this district this year. With the older tea yielding as it is, proprietors have every encouragement to increase their acreages. I understand that a very large Central Factory is being built in Badulla by the Uva Company to serve the estates in that vicinity.

COFFEE is looking well, and bug, though present, does not seem spreading or doing any particular harm. The dry weather we are now having means a good deal to coffee proprietors, for higher estates will give another blossom yet, if it last a little longer. There is a good blossom in spike. There was a very nice sprinkle of blossom out last week, and every little helps at present prices. Autumn crops are coming in well, and as far as my experience goes will everywhere exceed estimates. The quality is, moreover, excellent, and there is practically no light coffee.

Your remarks re patana land for tea in Uva interested me much. I do not myself, however, think that there are the large acreages available generally supposed. There is patana land and patana land and I think a very large proportion is unsuited for tea. The patana that does grow tea grows it magnificently, but I very much doubt immense acreages of it being available. The finest patana probably lies on the spurs of the hill country. But here the rainfall is very generally doubtful, and the climate is not very desirable. Most of the Uva patanas proper are more suited to cattle grazing than tea growing, and I wonder no one has attempted an experiment of this sort on a large scale. Has manuring of grass land with lime ever been tried? [We think not in Ceylon.—Ed. T. A.]

I believe the RAILWAY is taking almost the whole of the Badulla traffic, and I fancy—and hope—few carts are working on the Ratnapura road. It would be interesting to know what produce does reach Colombo from Uva by that route. The Police registering stations would supply the information,

PROSPECTS OF THE CEYLON TEA ENTERPRISE IN AMERICA.

Our London Correspondent has been endeavouring to learn the feeling existent among Ceylon men at home, with reference to Mr. Grinlinton's demand that we should do something to render lasting the appreciation of Ceylon tea that he states will be the outcome of his endeavours at Chicago. Up to the date of his last letter, our correspondent had only succeeded in obtaining two such opinions—those of Mr. J. L. Shand and Mr. Martin Leake. As an instalment, the views of those two well-known men of business must be valuable. The first-named is sure that, viewed from the stand-point of British trade, any attempt made directly by our Planters' Association would be unjustifiable in principle. But he does not feel certain that the same view would be taken of such a course in the United States. The customs and rules that so conservatively govern the conditions of trade in the United Kingdom are, according to Mr. Shand, of very rare application among our American cousins. He holds it to be possible, therefore, that things might be done in America that in the mother country would be regarded as wholly unjustifiable, and which would be certain to produce combined and determined mercantile opposition.

We find, however, that Mr. Shand has, on other grounds, objections to Mr. Grinlinton's proposals being followed up. These objections are based entirely upon pecuniary considerations, not involving condemnation of the principle advocated by Mr. Grinlinton. In his (Mr. Shand's) opinion, nothing should be attempted with a less capital than £100,000. He fixes this sum, it would seem, upon the results of his own experience in the endeavours made by his firm to introduce Ceylon tea into America. He fears that our tea will never be largely consumed in that country until it can be acquired at very low prices from the surplus which may overflow from the supply of European and Australian markets. He admits that the American consumers will pay high prices; but the wholesale dealers will never introduce a tea for which they have to pay correspondingly. And, as his conclusion, Mr. Shand asks:—"Where is the £100,000 going to come from?" We fear echo must answer "Where indeed?"

Mr. Leake, in reply on the case stated to him, at once said:—"Well, the golden goose has been killed. Had the American Ceylon Tea Company been maintained, Mr. Grinlinton would have found the agencies he now demands ready to his hands." This statement, of course, cannot be gainsaid. But it is little use looking back now that the steed has been stolen. Whether it would have been possible, had good relations been maintained between Mr. May and Mr. Grinlinton, to have pulled the American Ceylon Tea Company through its difficulties, it is useless at present to inquire. But, even according to Mr. Grinlinton's own showing, the work accomplished by Mr. May has, if we are to reap continued benefit from the exertions made at Chicago, to be done over again. But threads once dropped are not easily to be recovered, and perhaps Mr. Shand's estimate of £100,000 is not so extravagant as some might deem it at first sight to be. We shall be anxious to receive further home opinions upon Mr. Grinlinton's proposals. We must reserve judgment as to whether the sudden increase of London exports of Ceylon tea to America assigned by the home brokers as the cause of the late very favourable turn in price,

may be due to a demand consequent upon our representation at Chicago. It may be that it is only a "flash in the pan," consequent upon Mr. Grinlinton's own purchases for the supply of tea in the Ceylon Courts in the Great Exposition. If, however, the increase indicate a really growing appreciation of our teas by the American people, it is certainly an argument urging us to make some effort to further Mr. Grinlinton's suggestion. And there is this important fact that coffee is bound to be both scarce and dear—in view of the news from Brazil and Java—for some time to come; and it is not unlikely therefore that many of the American consumers should turn their attention to tea during the next twelve months.

THE RAGALLA TEA ESTATE CO., LD.

A Company has been formed in London called the Ragalla Tea Estates Ltd. Capital 5,000 shares of £10 each and £20,000 in 6 per cent debentures. 3,100 shares only are to be issued at first and they as well as the debentures have all been subscribed. The Company have so far bought (from Mr. Chas. E. Strachan) the Ragalla and Halgranoya estates—covering 1,493 acres of which 513 are in teas, 420 in coffee, 11 cinchona and 3 cardamoms.

CACAO AND RUBBER.

A Djolosbage planter writes:—"I was thinking of trying a small clearing of cocoa and 'Para' rubber, but your information has rather damped my ardour with regard to the Para or Hevea when cogitating over the vast acreage of natural rubber in S. America, &c. The Hevea would be put in as a shade tree. It loses its leaves for a time in the dry season, but I think that would not much matter."

We think our friend should go ahead—transport and labour are difficulties not readily to be overcome in South America as was shown in the case of cinchona bark.

CHINA VERSUS CEYLON TEA.

Having exhausted this special topic Ceylon Tea in America* I inquired of Mr. J. H. Roberts (of Messrs. S. Roaker & Co.,) if he thought that, supposing a further depreciation of the rupee—say as low as one shilling.—China teas would be enabled to supplement Ceylon and Indian in the home market. "Certainly not," he answered; "Ceylon teas have by far too firm a grip on the public taste here to ever become deposed in favour of China. It might be different, perhaps, if the old qualities of China could be obtained, but the day has passed for this. China will always send a tea far inferior to that of former days, and Ceylon, if she will only maintain her standard, need fear her rivalry under no circumstances of silver exchange rates." You will find consolation in this opinion no doubt; but your planters should bear in mind Mr. Roberts' qualification as to the maintenance of a high standard by them.

HINTS TO PLANTERS.

Although much space in this letter has already been devoted to tea, the fact must not make me abstain from still further reference to it. It had been asked of me why there was so much variance between the quotation of averages by individual brokers as well as by Reuters' agency. A leading broker offered me the following ex-

*See Further on,—ED. T.A.

planation:—"Undoubtedly the variance exists. I could quote one firm whose valuations are almost invariably a farthing below those of others, taken all round. The fact arises from a differing system of computation. If the calculation made yields 8-18d or so, we always quote it as 8½d, or, in other terms, 8-25d. Other brokers perhaps may take it at 8½d. But you see we cannot refer to the weight notes. The Broker's Association fixes an average weight for packages, so much for the chest, so much for the half-chest, and so on. But as a fact the weight of the contents of the packages varies so greatly as to defy accurate estimating. And this leads me to mention a subject which is one of great importance, and to it is constantly due the necessity for rebulking in this country. Constantly the quality of chests in the same break is very unequal. When that is the case rebulking here must follow, and the lead lining is so spoilt in the turning out and repacking that the tea is not fit for re-export. Very lately we had a large break from Ceylon of high quality that sold for 1s 2½d. We were driven to rebulk it, and resold it at fully 2d a lb. loss. An endeavour had been made to save a few chests in the break by overnight packing. The result was an amount of dust in some chests that deteriorated general value. I can fancy that some estates of large yield might lose from £1,500 to £2,000 annually from this cause. Tea should never be stamped down in packing. The chest should be gently shaken from side to side while the tea is slowly poured in. Coolies often get into the chests and stamp the tea down with their feet. The consequence is that much of it is broken to powder. It is a foolish economy to try and save a few chests in a break by such a method. Hundreds of pounds of loss result from it, besides a great inequality in the several chests of a break. Buyers complain of this and return the tea on our hands, and we then have to rebulk it all, such a course having two results as above mentioned, reduction in price obtained and complete unfitness for export." This piece of advice seems to me to be valuable, and worthy of the serious consideration of your planters.—*London Cor.*

LIBERIAN COFFEE IN JAVA.

The *Indische Mercur* states that:—"In many parts of Java, where the plantations of coffee Arabica seem to become less profitable, there will be a better future by planting Liberian coffee, because this species does not want such a rich soil and climate and does not suffer so much from the blight. Till at present, the Government has not done much in planting Liberian for their own account; but seeing the good results private planters were getting with Liberian coffee, it proposes now to give a great extension to that culture. Up to the present time only 2,800 acres are planted by the Government and the Javanese are extending for their own account also greatly that species."

BRITISH NORTH BORNEO.

SANDAKAN, Aug. 22.—In the country I am, as I have said, a believer. That in the ten years of its existence much solid and good work has been done no one can deny; that the shareholders have good value for their money they need only to consult anyone who has practical knowledge of the country to satisfy themselves; that many who, like myself, are loyal supporters of the company, would like to see some advance made in the directions I have pointed out I will not deny. Let the directors open the strings of the purse in which they keep the money realised from land sales, and give the Governor a free hand in the manner of its expenditure, and I

feel sure they will not have to crumble at the return they will get on their investments.

With regard to present prospects from the Kinabatangan I hear excellent accounts of this year's crop of tobacco, both as to quality and quantity. I believe it will be the best that has yet been grown. Coffee, from all the estates is reported as all that can be desired. From the gold districts I hear that the number of Chinese engaged in the search is steadily increasing and their earnings, I now hear, average over \$2 per head per day. Tin has been reported as having been found on the Kinabatangan River, and coal I have heard of in several places. Time is all that the country wants; I never yet heard of a country which, in ten years, had earned sufficient surplus revenue to pay dividends to its proprietors.—*L. and C. Express.*

SELF-BREEDING PEARLS.

A good many startling stories have been told regarding the origin and formation of various gems; but none has aroused more acute discussion, in certain circles; than that told about the self-breeding pearls of the Malay Archipelago. The late Frank Buckland devoted considerable space to the matter in the pages of *Land and Water*, and Dr. Darwin was sufficiently interested in the statements put forth to make them the subject of a letter to the present writer. The following details possess at least one merit—that they were collected on the spot and that the evidence of their truthfulness comes from so many quarters and is of so strong a nature that it would be considered overwhelming circumstantial evidence in a court of law.

The popular Malay belief in the existence of breeding pearls has been noticed by various writers on Eastern matters, but rather as a matter of curiosity than as one demanding assent or contradiction. No serious attempt was made to prove or disprove the allegations made until 1878, when a paper was read before the Straits Asiatic Society on the subject. A good deal of ridicule was cast upon it in certain quarters, but those responsible for the statements embodied in the paper reiterated their assurances of their truthfulness. Some of them being now in England, those curious in the matter might, without difficulty, satisfy themselves both as to the *bona fides* of the narrators and see for themselves the pearls produced under strange if not incomprehensible conditions.

Most people know that pearls are obtainable from other sources than the pearl oyster. There are, moreover, fresh-water and salt-water pearls. Apart from the fanciful legend which declares them to be found in the heads of elephants, serpents, boars and fish, in bamboos and other plants, several varieties of shell-fish undoubtedly produce them. In addition to the oyster, whether "pearl," "edible," or "hammer-head," both conch shells and clams furnish them in fair abundance. Mr. E. W. Streeter, the well-known jeweller, of Bond-street in his interesting work on "Pearls and Pearl-Life" (1886) describes them as chiefly produced by the *lamellibranchiata*, which—we omit further scientific phraseology—included the "winged," "hammer," "wedge-shaped," "window shell," "edible," and other varieties of the oyster tribe. The giant clam, or *tridacna gigas*, the shells of which measuring from 2 to 3 feet across, are to be seen in many fish-mongers' shops, and are frequently used as fonts in the churches of the far East, is, next to the oyster, the most prolific source of production; and it is from such shells that the breeding-pearls under notice are principally obtained. For our present purpose it is unnecessary to notice the fresh-water shells whence the lustrous gem is also now and then procured.

The hunt for pearls in the shells of the giant clam is not devoid of danger. Should the would-be captor get his foot or hand within the margin of the shells while the animal is still alive a horrible fate awaits him. The clams being found only under water caves have occurred of natives searching a low tide who have accidentally placed a limb in the submerged trap. The victim's foot or hand is not merely

crushed into a shapeless mass, but he is held in a vice that knows no slackening until the rising tide puts an end to his sufferings; or, if in the less dreadful contingency he may manage, if assisted by companions to free himself, he remains a cripple for life. Such cases are naturally very rare, but the writer was told a dramatic story of such an occurrence by a Malay who had witnessed it. Assuming, however, that no such mischance occurs, and the enormous shell has been safely got to beach, the clam, like the oyster, will in a few days die from lack of water. Perhaps a single shell in six or seven may yield one or two of the much-prized pearls. As a rule, they are of nearly spherical shape. Fine specimens are from a quarter to three-eighths of an inch in length, and three-sixteenths in width, or of still more irregular outline. The fortunate finder, however, is sure of a good price for his treasure. The pearls, when present, are usually situated close to the valves of the shell, although in some cases embedded in the fish.

In order to make the mother pearls thus procured produce others, various means are adopted. They may be placed in a closed bottle of sea or fresh water, but the more common proceeding is to enclose them in a box with several grains of *Pulot* rice. And then, according to the information of breeders, curious change happens. The circular or nearly circular mother-pearls alter their form and become pear or hour-glass shaped, or mere formless lumps of pearly matter. Those seen by the writer were at least 3/8ths of an inch to 1/2 inch in length. After being left in darkness for a period varying from one to three, four, or even eight years, the bottle or box on being examined is found to contain a number of other pearls, varying in size from the merest pinhead to that used in the best class of jewellery. In one case a lady well known at Singapore possessed a box in which, as averred, had been put about twenty years previously some four or five "breeders." When examined by the writer it contained about 120 of various sizes. The social position of the owner forbade, in a general way, the supposition of fraud. But as no class is exempt from a desire to mystify other people, an isolated case like this would have done but little to strengthen scientific belief in the real existence of the "breeding pearl." Corroboration, however, came from so many independent quarters that the statement above mentioned could not be dismissed as imaginative. The head mistress of the local girls' school, a Eurasian chemist and his partner, both of reputable standing, a Chinese clerk, a lady who had disposed of a number of pearls thus bred, and who, in fact, was chiefly supported by such sales, and the wife of a Government official of high standing, whose account was corroborated by three friends, besides her husband and family, were among the numerous witnesses who declared most positively that they had actually bred pearls in the way described. In the last-mentioned case the pearls were seen and examined by the writer, nine having been produced by the three originally placed in the boxes. All were unanimous in asserting that after a certain period the mother-pearls lose their lustre and "die," the outer surface changing to a dirty flake white, and peeling off in scales. When about to "breed" a small black speck makes its appearance on some portion of the pearl, and this speck continues visible as long as the breeding process continues. It is noteworthy that although, as above mentioned, the giant clam furnishes the principal supply of breeding pearls, they are also obtained from the pearl oyster. The pearls thus bred have been submitted to eminent scientists in England who pronounce them to be indistinguishable from the ordinary gem.

On the other hand, a good many trials to obtain pearls in this way have failed. A medical friend of good standing and a solicitor resident in the Straits both met with non-success. Another curious fact must be mentioned. In the cases above cited the 15 or 20 grains of rice placed with the breeders appeared, after a lapse of a few months, to have had no end bitten into, as if by an insect, and the

writer can confirm the truth of this statement. But, oddly enough, a report appeared in the press some years ago that the Rani of Sarawak having submitted some pearls and rice (as supposed) to Professor Tyndall, the latter was found to be a small shell common in the Malayan Archipelago; and the whole story was pronounced to be a pure invention. But in addition to the fact that the grains examined by the writer were undoubtedly rice, the alleged fact that pearls will breed as described in water alone introduces a fresh consideration. The result at which the members of the Straits Asiatic Society arrived appears to have been an open one. It was held that either the allegations made were true, or that a most singular agreement to assert an absolute falsehood had been come to by people personally unknown to each other and who had held no inter-communication on the subject. The believers and disbelievers were about equal in numbers, but those who represented the latter in the debate on the paper admitted that if on a jury, they would have convicted a prisoner upon testimony as strong, and apparently independent and uninterested, as that given in support of the existence of breeding pearls. So here this curious question rests. One great reason which prevents experiment is the high price now asked for the mother-pearls. But the matter is quite worth further trouble, and if the local society were requested by any scientific body in England to make an exhaustive inquiry, a mass of curious evidence would probably be forthcoming. It may be added, in conclusion, that a lady, married within the last two months, was presented by her mother with a handsome pearl ring, the pearls of which she had herself bred. The bride's mother is the wife of a well-known resident in the Straits Settlements, and the story will bear strict examination.

There is one other form of pearl, so called, of vegetable origin—a calcareous formation, sometimes nearly as large as a marble or tit's egg, now and then found in the interior of the coconut. Mr. Streeter records their existence, but offers no opinion as to their formation. Of their being found there can be no doubt, as they are frequently offered for sale at enormous prices by the Malays, who regard them as most valuable charms. The secretion of a mineral substance by another plant is exemplified in *Tabasheer* the siliceous matter found in the interior of the stem of the large bamboo. The coconut pearl appears to resemble it in hardness, and though somewhat yellower than the ordinary pearl, it bears a curious resemblance to the latter, both as regards lustre and appearance. The "coconut" and "breeding" pearl are about equally common—or uncommon—in Malayan countries.—*Pall Mall Gazette*.

TEA NOTES AND NEWS.

Our Rajgur correspondent writes on 3rd October 1893:—Rainfall to 30th ultimo 69.60 against 108.55 inches to the same date last year. September closed with a large increase on all gardens near here, last year that month having been a particularly small one for yield. The prospect for October appears to be good and the season generally seems likely to be a good one for quantity, but the reports of price lately to hand are not very encouraging.

Dhan planting is now finished and very well the crops are looking, showing every promise of a good yield.

Our Darjeeling correspondent writes on 11th October 1893:—The past ten days or so have been bright and warm, especially in the valleys, rather foggy in the mornings on the higher elevations. Rain has been promising the last two or three days and now and then fitful showers have fallen. Leaf is fairly good for time of year, although blight has made sad havoc on some estates. A nice autumn flavour is now showing in the teas, so invoices shortly going forward should show some very good averages.—*I. P. Gazette*.

THE AMSTERDAM BARK-SALES.

Amsterdam, October 5.

At today's auctions 3,350 bales of Java cinchona bark, representing about two-thirds of the quantity offered, sold with fair competition at an advance of 5 per cent, the unit averaging now 2-70c (or 3d per lb.) which makes the Amsterdam quotations equal to the London ones. The figures realised were:—For manufacturers' bark in chips and broken quills 4½c to 28¾c (equal to 2d to 4½d per lb.); ditto in root 7½c to 19½c (equal to 1½d to 3½d per lb.) For druggists' barks the prices were: 5½c to 112c (equal to ½d to 1s 8d per lb.) for quills and chips, and 5½c to 6½c (equal to 1d to 1½d per lb.) for root. The chief buyers were Mr. Gustav Briegleb, the Auerbach Works, the Frankfurt Works and the Brunswick Factory.—*Chemist and Druggist.*

THE PACKING OF DUSTY TEA.

In consequence of the complaints of country tea dealers about loss of weight in dusty tea, owing to insecure packing, the London Wholesale Tea Dealers' Association urged the planters about a year ago to use metal packages for dusty teas. Experience now seems to have led them to change their opinion, as the following correspondence shows. In this they suggest as we did in our issue of July 28, the use of a canvas wrapper in addition to the ordinary package:

To the Editor HOME AND COLONIAL MAIL.

DEAR SIR,—Kindly give insertion to the following letter from the London Wholesale Tea Dealers' Association on the subject of packing dusty teas so as to avoid loss of weight and subsequent claims, and oblige,—Yours truly,

ERNEST TYE.

Secretary Indian Tea Districts Association.

Ernest Tye, Esq.,

Secretary, Indian Tea Districts Association.

DEAR SIR.—My Committee were pleased to note by your favour that notice has been called to the subject of more securely packing dusty teas, and they suggest the desirability of using a canvas wrapper in preference to metal cases, which do not appear to be acceptable to buyers in the country, and therefore might prejudice the sale of the tea to a certain extent.—Yours faithfully,

(Signed) R. SEDGWICK, Hon. Sec.

London Wholesale Tea Dealers' Association,
4, Fenchurch Street, E.C., Oct. 2, 1893.

TEA SAMPLES FROM INDIA.

The following is a continuation of the correspondence which we published last week:—

General Post Office, London,

Sept. 28, 1893.

GENTLEMEN,—With reference to your further letter of yesterday's date, I beg leave to inform you that the Department has already telegraphed to the Post Office of India, directing attention to the fact that tea is not prohibited from importation into the United Kingdom by sample post.—I am, gentlemen, your obedient servant.

(Signed) W. ROCHE, for the Secretary.

Messrs. D. M. Stewart and Co.—*H. and C. Mail.*

SANDISON'S FAMOUS TEA SEED.

We are requested from Maskeliya to make a correction in our recent reference to Mr. W. G. Sandison and his tea seed. Mr. Sandison, we are reminded, had three seed gardens, Arcady, Asoka and Sans, distant three to six miles from each other, from which he gathered his seed. Although calling it all "Sana" seed, his famous "Sandison's Crossed Indigenous" (see numerous references in the *T. A. and Observer*) is grown on Arcady, and his "Single Hybrid" on Asoka and Sans. It was on Arcady, and not on Sana, that he planted the Manipuri Indigenous ("wild tea") seed obtained

by himself from the villagers on the spot in India, and gathered from seed-bearers growing wild in the jungle.

TOPICAL DITTIES.

THE TEA BROKER.

In this spicy charming Isle
I am sure 'twould you beguile,
If I sang a little while
Of the tea brokers.

All about the Fort they swarm
They are not at all forlorn,
They're as common as the worm,
Are the tea brokers.

Do a palate they possess
For your pekoes when they're less
Than they ought to be? O yes,
Do those tea brokers.

But if samples you send round,
Not two of them I'm bound
Will agree, this has been found
Of the tea brokers.

"Oh! is blackish greyish brown,
Liquors weak, and O my son
Too much red leaf!" So says one
Of the tea brokers.

Another vouches him your friend,
So your pekoes him you send,
But he swears it is a blend
Of Indo-China!

Then you try another man,
Who as taster has a fame,
Who is second unto none
Of the tea brokers.

Here's the burden of his song,
For he would not do you wrong,
He can stretch his conscience long
Like elastic.

"Oh its brownish blackish grey,
Liquors prime, 'tis truth I say,
Never tasted better tea."
Writes this tea broker.

And as he thinks it's nice
Just to say 'twill fetch a price,
He then values it at twice
What the others did.

But after auction sale,
When you bitterly bewail
That the "bids" were such a fail—
—ure for those pekoes,

He'll condole, but cannot tell
How your teas he could not sell
At his valuations—well
But—that's the tea broker.

Had the "liquor" been too strong
That his valuation's wrong?
Well, perhaps your coarse souchong
May have done it!

"Still they're such a flavoury lot,
Tho' this market's gone to pot,
You can ship 'em, yes, why not?"
Says that tea broker.

But withal you must agree
Tho' they often slang your tea,
They're as jolly as can be
All those tea brokers.

Yes they're right as right can be,
Tho' they never do agree
On the merits of a tea—
Good old tea brokers!

L. G.

PUSHING CEYLON TEA IN AMERICA.

Our London Correspondent has now obtained and forwarded to us the opinions of some of the most prominent members of our home colony on the subject of Mr. Grinlinton's proposals. Messrs. J. L. Shand, W. M. Leake, H. K. Rutherford, and Mr. Whittall, besides Mr. J. H. Roberts—comparatively speaking, an outsider,—have all expressed their views upon the topic, and doubtless the experience of all these gentlemen has well fitted them to form a judgment on a matter which must be of as great importance to their own as it is to our island interests. In addition to the contributions made severally by them to the discussion of this question, we are further informed that the Tea Committee of the Ceylon Association in London had sat to consider it. But we find that there is no inconsiderable divergence of opinion expressed. Mr. Rutherford, seems to stand pretty well alone as an advocate for measures to be taken here. But even he deems the matter of too wide a scope to be dealt with by enterprise founded only on private capital of local subscription. Evidently, although he has not so explicitly expressed himself, he regards such a venture as being financially risky. Therefore, as the endeavour suggested is to be in the interest of the whole of our tea-planting community, he holds that every member of it should share in the risk. This end, he believes, can only be attained by the continuance of the present export cess, and the administration of the funds realized from it by our Tea Fund. He suggests that with the means to be so obtained the management of that Fund should seek the co-operation of one of the foremost of the London firms interested in the Ceylon tea trade, and that this should undertake communication with the leading retail houses of the States and make all required arrangements with them, receiving from our Tea Fund such an amount of annual subsidy as should minimize their possible losses until the trade to be done with America should develop to the self-supporting stage. Mr. Rutherford's suggestion contains much to recommend it, for he holds, as do all the other gentlemen consulted, that heavy financial failure must attend any private endeavour unsupported by public contributions. But while all the other old friends who have expressed their opinion share this latter view, they are opposed to any course whatever being taken in furtherance of Mr. Grinlinton's scheme. Mr. Whittall is especially strong in his denunciation of such a movement. He holds that unless effort previously made prove to be sufficient to secure the appreciation of our teas throughout the States, unless they may now safely be permitted to force themselves into consumption upon their own merits, nothing that we may further undertake will induce the American people to abandon their long-established proclivities in their choice of teas. "We are not philanthropists," Mr. Whittall remarked, "and who is going to find capital for an endeavour which is certain to fail in the object for which it is proposed to expend it?" He further stated that he was himself devoting attention to the manufacture of green teas for the purpose of trying to introduce the "thin end of the wedge." Mr. Shand is, perhaps, more strongly opposed to further public effort than any other of the gentlemen consulted. He holds that it would be

wholly wasted unless a very large capital—which he puts at £100,000—was available. He further thinks that if trade is to be done with America, private enterprise of the character of that pursued by Mr. Lipton will find the way to establish it. Mr. Shand, however, expresses a view with regard to restricting sales to pure Ceylon tea which we fancy will not receive general endorsement. We have hitherto relied upon *purity* as the surest basis for securing success. We should not feel disposed to counsel any departure in the case of America from that basis, and to place our interests for the future in Mr. Lipton's hands would, we fear, ensure the abandonment of that principle and the landing of ourselves we know not whither. Mr. Leake seems to share Mr. Shand's view as to the hopelessness of any endeavour to regain the ground lost by the cessation of Mr. Elwood May's enterprise, and the Tea Committee, in the absence of any directly propounded proposals, has been able to come to no resolution on the subject. Mr. John Roberts, of Messrs. S. Rucker & Co., states that he would be glad, in the interests of Ceylon tea, to see further efforts made, but at the same time he holds to his previously expressed opinion that America is a hopeless field for our teas, for reasons to which our correspondent gives currency. Any investments made for the object proposed would, he feels sure, be wholly lost, and he would counsel no friend of his to put money into any scheme having it in view. To sum up these opinions impartially is a difficult matter. We must leave final judgment upon them to those who have taken the matter in hand here, and can only express regret that the failure of the American Ceylon Tea Planters' Company should have occurred at such an inopportune juncture as it did. Meantime, we must just wait to see what result will follow on the establishment of Tea Agencies by Commissioner Grinlinton, and how far these can be extended to other large American towns besides Chicago.

CEYLON TEA IN AMERICA: FURTHER OPINIONS.

LONDON, Oct. 5.

During the week it has been possible for me to obtain further opinions from Ceylon men in London with reference to the practicability of carrying out Mr. Grinlinton's views in respect of Ceylon tea in America. Conversation has been had by me on this topic with Mr. H. K. Rutherford, Mr. J. Whittall, and Mr. J. Roberts. Before proceeding to report what those said, it may be as well to interpolate that the Tea Committee of the Ceylon Association met on Tuesday last to talk over this subject, but no real proposal was submitted to it, and the members deemed it to be fruitless to discuss the mere principle advocated by your Commissioner at Chicago. The Committee therefore separated without arriving at any resolution, or venturing on the expression of combined opinion.

Mr. RUTHERFORD was the first among the above-mentioned who was seen by me relative to this matter. He told me that the first intimation he received relative to it was by a letter from Mr. Wright of Maskeliya. This gentleman had just returned from a visit to Chicago, where he had been greatly pleased with what Mr. Grinlinton had accomplished on behalf of Ceylon. His letter reached Mr. Rutherford while in Scotland, who replied to it by another in which he stated his view that, as any effort to be made must be in the interest of all your planters equally, all

should be compelled to contribute towards it. He considered the enterprise to be

ENTIRELY BEYOND THE FINANCIAL POWER OF THE
CEYLON PLANTERS

as private individuals. He believed there must be a heavy first loss, and that to meet it a very large capital would be required. Neither was it the sort of business that could be conducted by the planters themselves. Men of experience in the tea-trade would be required for this throughout. His suggestion to Mr. Wright was that the export cess levied on tea to meet Mr. Grinlinton's expenditure should be continued after that had been fully met, for the purpose of making the effort desired. The money so obtained should be handed over to, and be administered by, your local Tea Fund Committee. This body should seek the co-operation of some prominent London firm connected with the tea trade to which a subsidy of annual amount should be paid as a guarantee for first expense. The amount of this subsidy would, in Mr. Rutherford's opinion, probably be £1,200 or £1,500 a year. It should be the duty of that firm to open up and establish relations with the most influential retail traders throughout America, and to offer them every reasonable inducement to give Ceylon teas a foremost place in their dealings. Those proprietors of newspapers who had advertised Ceylon teas under Mr. Elwood May's regime, and who doubtless were embittered by the fruitlessness to themselves of the efforts made by them, might be conciliated so as to withdraw opposition by further advertising to be placed with them. Mr. Rutherford was informed by Mr. Wright that the plan formed in his own mind had been identical with that formulated by him and detailed above. Mr. Wright could, he said, see no other way in which the sustained help desired by Mr. Grinlinton could be given. In further conversation with Mr. Rutherford he told me that, not knowing Mr. Lipton, he could not say how far he might be relied upon to introduce Ceylon tea into America. When it was mentioned to him that Mr. Shand had said that we need not insist upon only pure Ceylon tea being sold, Mr. Rutherford remarked that he took a different view entirely. "We have always," he said, "worked in the past upon the intrinsic qualities of our teas, and have insisted upon their being sold pure and unblended. I should think it would be a great mistake to depart from this practice and to place our teas unreservedly at the discretion of a trader like Mr. Lipton, whose system of advertising it cannot be said I quite approve." Mr. Rutherford concluded by saying that he certainly thought some effort should be made to continue Mr. Grinlinton's work when the Exhibition closes, but that it would be hopeless to make it on the limited basis proposed by Mr. Kelly with his £1 shares.

The next gentleman seen by me was Mr. JAMES WHITTALL. I found him to be wholly opposed to the spending of any more money, public or private, in the endeavour to force Ceylon tea into consumption in America. "If, after all that has been done," he remarked, "the intrinsic merits of Ceylon teas will not recommend them to the Americans, it is hopeless to expect that any further exertions by Ceylon will compel it. Mr. Shand's estimate of £100,000 does not seem to me to be at all an exaggerated one, and I should say it would be all lost. Where on earth is it to come from? We are not philanthropists! We don't want to throw away our money with an illusory object! And the planters of Ceylon

want to see a certain return before them, and won't go throwing good money after bad on the advice of anybody. Besides, suppose we could stimulate an American demand up to 18 million or 20 millions lb., how could Ceylon possibly supply it? I am trying to introduce the thin end of the wedge myself by manufacturing green teas on one of my estates with which I purpose trying the American market. That may possibly suit the national taste. It is far more likely to do so than the more delicately flavoured Ceylon teas."

My next call was upon Mr. John Roberts of Messrs. S. Rucker & Co. That gentleman at first showed some indisposition to reply to my question on the subject dealt with above. On my pressing him he said:—"The fact is I do not wish to appear as in any way inclined to discourage an endeavour such as you mention. It would undoubtedly advertise Ceylon teas, and in a public sense would probably be useful. But I cannot close my eyes to what I hold to be past doubt. There is no chance, in my opinion, of those who may invest in the scheme ever seeing their money back again. For I still hold strongly to the opinion before expressed to you that

THE AMERICANS WILL NEVER TAKE TO CEYLON TEA.

Of course, I do not say that many individuals among them will not do so, but that the great mass of the people will ever care for it I am more than doubtful, Ceylon tea is utterly opposed in its character to the palate of the people, formed as that has been by climatic influences. Very recently I had a Ceylon gentleman in here to see me who discussed this very matter of further pushing of Ceylon teas in America with me. He told me he was quite prepared to invest £500 in it. I told him that if he did he would lose every penny of it. "Never mind if I do," was his reply, "the endeavour will benefit Ceylon, and by so doing will benefit myself." As he was prepared to view the matter in that light I had of course, nothing more to say, and could only admire his speculative disinterestedness. Still I should certainly not for myself care to follow his proposed lead. I adhere to my text in this matter most completely, but perhaps Mr. Whittall's green tea may take the public taste in America."

RECENT INCREASE IN EXPORTS TO AMERICA.

On my referring to the recent increase in exports to America, Mr. Roberts said:—"Yes, there has undoubtedly been a spurt, but not sufficient to affect the market to the extent shown by the late rise in price of Ceylon tea. That has been due to several conditions. Better qualities have come forward; the season is that at which more purchases are made; and hundreds who have been hanging back are now buying freely. It is very probable that Mr. Grinlinton's own demands for his tea rooms at the Exposition are responsible for the extra demand for America, but it is not likely, in my opinion, that this will be maintained."

CEYLON'S CAPACITY.

On my referring to Mr. Whittall's doubt if Ceylon could supply another 20 millions of pounds if wanted for America, Mr. Roberts replied:—"I should think that it might do so. I was terribly laughed at when I prophesied that one day the Ceylon export would reach 80 millions. Of course the area for tea growing in Ceylon may be somewhat circumscribed, but tea growing in the lowcountry is advancing, and low-grown teas from Ceylon have greatly improved in quality of late. I still expect to see that her export will one day reach the round 100 million."

COCONUT PLANTING IN OUR EAST COAST.

WHAT COCONUTS CAN DO IN SANDY SOIL IN THE
BATTICALOA DISTRICT.

We are indebted to a correspondent for a splendid specimen of coconut (brought to us through the good offices of Capt. Whitley of the "Lady Gordon") grown upon a young estate belonging to Mr. E. N. Atherton. It is certainly a big nut, weighing $6\frac{1}{2}$ lb., and shews what Batticaloa can grow on sandy soil and from a ten-year old tree! This is one from several hundred picked of the same size. "There were larger ones"—writes our correspondent—"but this was a better shaped one, and I thought you would like to see it. It measures 31 inches round. The larger ones measuring 36! The natives have gone in very largely for coconuts, and every acre has been readily purchased for its cultivation and they seem more keen on it than ever. When Mr. E. N. Atherton opened this estate on the Trincomalee Road (12th mile), Governor Longden inquired from Mr. Worthington, Acting G. A., what fool intends growing coconuts on such soil?! The result as you perceive is the 'fool's' nut!!"

IN THE HEART OF THE RUBBER LAND.

A Special correspondent of the *Washington Evening Star*, Fannie B. Ward, has been traversing the regions where the rubber tree flourishes, and we gladly reproduce in our columns her interesting narrative, which is as follows:—

Being in any of these Amazonian towns, where everything reeks of India-rubber—where it is the one engrossing industry of the people, the one topic of conversation, the one thing constantly seen, smelled and tasted—you are sure to be seized by the spirit of discovery sooner or later and a burning desire to turn hunter yourself and become a *habitant*, if for ever so brief a period, of a genuine rubber camp in the wilderness. And nothing is easier than to gratify that laudable ambition especially if you are "taken" with it at Mauaos, a thousand miles up the mighty river, in the heart of the greatest rubber-producing section of the globe.

OFF FOR A RUBBER CAMP.

In our case it was particularly easy, for our host is a rubber merchant (as are most of the substantial citizens of the place), who keeps from 50 to 100 Indians constantly employed as collectors, under the leadership of a "captain" or head collector of their own choosing. It happens that their present main camp may be reached without difficulty by a two days' journey up the Rio Negro on one of the regular steamers, and then, disembarking at a certain point in the wilderness, near the mouth of an unnamed affluent, by a slower canoe cruise of several hours, between jungle-covered banks, where apparently human beings never came before.

At the first indication of our desire, which had evidently been expected and partially prepared for, a party was made up, headed by mine host and his family, servants were sent ahead with tents and provisions, and Indian boatmen summoned from the distant camp to meet us at the junction of the rivers. To our kind entertainers it was merely a pleasant little picnic excursion, such as New Yorkers are wont to make up the Hudson; but to us it was an event of magnitude, fraught with perils and adventures enough to keep the average Yankee of either sex in yarning material for a lifetime. Think of it; the Amazon river measures more miles straight across its mouth than the whole navigable length of the "lordly Hudson."

IN THE FOREST.

And then suppose those Indian boatmen should fail to be on hand at the appointed time and place and we be left, like the babes in the Woods, among boas and tigers and goodness knows what

other terrors? And later—when being paddled up the nameless igarape, which is hundreds of miles from anywhere, and so narrow a stream that the dense wall of vegetation towering upon both sides keeps it in perpetual twilight, and the absolute silence of the primeval solitude is mournfully oppressive—suppose the half-savage guides, who certainly look capable of any atrocity, should conclude it were better paying business to rob and murder their charges, what in the world was there to prevent them? We thought of the harrowing experiences of Madame Godin des Odonais in these same wilds (of which I must tell you anon), and of the thousands of explorers, whose hearts were fired with missionary zeal, or love of nature, or search for the fabled El Dorado, or greed of gold and conquest, who have perished miserably here—and there is none to tell their story. We remembered Capt. Mayne Reid's tree-dwelling savages who delight to puncture Amazonian travellers with poisoned arrows shot from blow guns; and the monster serpents of the same author, which lie in wait upon overhanging branches and swallow them, boats and all. But in our expedition it turned out that there was on almost disappointing dearth of perilous adventure and not a single "hairbreadth 'scape" to chronicle. The Indians we encountered despite their unprepossessing appearance, proved to be the most docile, gentle, and tractable of creatures, and probably the aerial savages and man-swallowing snakes, disgusted with the increasing frequency of human invasion, have retired farther into the wilderness.

THE RUBBER TRADE.

The following facts, stated briefly as possible, are a summary of the information we have picked up in Brazil from diverse sources relative to the rubber trade. Like other industries in various parts of the world, it appears to be controlled by capital on the Scriptural plan of "to him that hath shall be given," while the actual toilers are very poorly paid for their labour. Hereabouts it is customary for a wealthy man to obtain a grant of land, of greater or less extent according to his political influence and financial powers of persuasion, with the exclusive right of gathering rubber thereon for a stated number of years. The entire river trade of the Amazon is run on the credit system.

THE RUBBER HUNTERS,

who are mostly Indians, are fitted out by their employers much as American miners used to be supplied with "grub stake" in their search for precious metals. Each hunter, before he sets forth on a fresh journey, is provided with a gun, a quantity of ammunition, blanket, hammock, and enough provisions to sustain him from two to six months, all of which is charged to his account at the highest market price, and in return he stipulates to sell to this same accommodating dealer, at some fixed sum per pound, all the rubber he may collect during his trip, after paying what he owes for the outfit. But he seldom gets the debt paid up, and, according to the laws of Brazil, as long as he owes a penny, the man to whom he is indebted can claim him for work, holidays and all, in a bondage akin to slavery. They are engaged, in the first place, for a term of years, and the majority of hunters, in consequence of their debts and propensity to drink up all available cash in the form of chicha, are practically never released from the contract.

THE EXCHANGE.

The employers, in their turn, are bound to be in debt to the small traders in the river towns, to whom they sell the rubber. They pay absurdly high prices for inferior goods and get little for the product of the enterprise as compared to the price of rubber when it gets out of the clutches of the "middlemen," while those who do all the actual work and endure the risks and hardships get next to nothing. The small trader, likewise, is in debt to the wholesale dealer at Para, and the wholesaler

is even more deeply indebted to the New York, Baltimore, or London firm which furnishes him with supplies and finally secures the rubber. Somebody makes heavy profits out of every transaction; but it is not the poor Indian, upon whose courage and powers of endurance all depends, nor yet the smaller traders.

THE ANNUAL EXPORTATION OF INDIA-RUBBER

from Para is said to be upward of 20,000,000 pounds, worth from 6,000,000 to 9,000,000 dollars. The rubber tree of Brazil (*siphonia elastica*, a near relative of the *ficus elastica* of the East Indies, and the *urucola elastica* of Asia) is really a giant species of milk weed. It begins to yield when about fifteen years old, and the Government has repeatedly suggested plans for cultivating it by planting large areas with trees and conducting the business like that of coffee and sugar plantations. But Brazilians seem to be peculiarly devoid of the power to take "a long look ahead," and, so far, nobody has been found willing to wait fifteen years for the first returns on an investment.

ON THE HUNT.

Hereabouts the rubber hunters are called stringerios, as in Central America they are known as yularoes. They usually go out in small parties, having chosen one of their own number as "captain," and as soon as the rubber swamps are reached they select a suitable spot for the base of operations and proceed to construct a rude camp, which serves as a general rendezvous. They then wander off, singly and in couples, searching all day for the new trees, and returning to headquarters at nightfall. The "camp" consists of a central hut, built upon still-like supports to elevate it above the malaria-haunted morass, in which rubber trees most abound, with palm-thatched roof projecting all around like that of a Swiss chalet. There are neither windows nor door to this rude home, nor any interior furnishings except hooks upon which hammocks may be suspended when rains drive their owners inside. Ordinarily "all out doors" serves well for a kitchen, and the men prefer to suspend their sleeping paraphernalia from the trees around the central fire, built for the triple purpose of frightening away prowling beasts, counteracting the effects of deadly dews and miasmas and keeping off those troublesome pests, mosquitoes, gnats, xinxins and garripotás. All around the little camp is boundless forest, so dense that it is impossible to penetrate it the distance of a rod beyond the hut, except in those paths which the hunters have partially cleared with infinite toil. But I can assure you that a visitor feels no "call" to walk abroad in the spongy marshes, where every step sinks him in above the shoe tops, and poisonous water snakes are known to lurk and jaguars prowl in search of prey.

A DANGEROUS LIFE.

As may be imagined, the hunter's life is little above that of the wild beasts whose prowlings make night hideous around him, and he is constantly exposed to a thousand dangers, seen and unseen. Not only do hungry pumas, wild boars and other powerful animals abound, but deadly reptiles no longer than your finger and tiny insects whose sting is fatal. There are wee lizards, the exact colour of the leaves under which they hide, and innumerable creeping and crawling things more dangerous than the dreaded rattler of our northern wilds, which at least gives some warning of his intention to strike; while even more to be feared than the monstrous crocodiles of the lagoons and serpents of hugging proclivities, are the fevers that float upon the noxious vapours of the tierra caliente.

MARKING THE TREES.

The hunter, as he goes his daily rounds, makes a number of fresh cuts around the trunk of each tree which he has previously marked as his own special property, *pro tem*, and sets his little clay cups to catch the valuable sap that will ooze from the incision. Later in the day he repeats the round, carrying a queer sort of bucket made from a big gourd which has a cover and handle of braided palm fibre

and into it he empties the collected contents of all the little cups. When he gets back to camp he pours the juice from the calabash pail into the mammoth shell of a torturuga or Amazon turtle. In that stage the yellowish white fluid resembles good rich Jersey cream more nearly than anything else to which I can compare it. Different ways of coagulating it into the article known to commerce, are practised in various parts of the world. Here it is held on a wooden paddle over a fire of palm nuts which has been built under a clay pot shaped like a huge lamp chimney. The dense white smoke issuing from the top of the pot hardens it into a heathery substance, and at the same time changes its colour from pale yellow to black. As fast as it hardens more sap is poured on, until the mass of rubber on the paddle is as heavy as a man can handle, when it is sliced off with a huge knife.

IN CENTRAL AMERICA

the fluid is coagulated with the sap of a wild vine, somewhat resembling the grape, which overgrows all those tangled forests and acts the part of rennet to cheese curd or "mother"-pulture to crude maguey juice, for after its addition the milk soon hardens into hard cakes of India-rubber, all ready for transportation. In other places it is solidified by evaporation of the liquid part in the sun, and is then completely dried in kettles suspended over a wood fire. In the great warehouses of Manaos and Para, you may see enormous masses of dried caoutchouc sap, resembling cheeses, awaiting shipment. By the way the native word for India-rubber (caoutchouc) sounds much like a sneeze, and is pronounced as if spelled keechook, with the accent strong on the first syllable. The milky juice which now plays so important a part among the world's productions was first made use by the Indians of Costa Rica, and by them made known to their conquerors. Early as 1,513 the Spaniards in Mexico had learned to make it into shoes, and also to use it for waxing their cloaks in order to render them waterproof; and no doubt that was the origin of the idea of its manufacture into waterproof cloth and the modern mackintosh.—*India-rubber and Guttapercha Journal*.

CINCHONA BARK AND QUININE IN THE UNITED STATES.—The *American Grocer* has the following:—

Bearing on the general question of the present supply and position of bark we give the following imports into the United States for several fiscal years ending June 30th from which it will be perceived that the receipts, as a rule, are slowly diminishing year after year: 1887, 4,787,311 pounds; 1888, 2,801,457 pounds; 1889, 2,878,184 pounds; 1890, 2,938,306 pounds; 1891, 2,672,361 pounds; 1892, 3,434,375 pounds, and 1893, 2,379,395 pounds. During the same period was imported quinine to the following extent: 1887, 2,180,157 ounces; 1888, 1,603,936 ounces; 1889, 2,825,008 ounces; 1890, 2,931,233 ounces; 1891, 3,079,000 ounces; and 1892, 2,636,677 ounces. For the last fiscal year, the separate figures for quinine are not yet available, but the report on that article includes all alkaloids or salts of cinchona bark and amount to 3,443,907 ounces.

A RIVAL TO OAK—The representative of a well-known firm of builders informs me (says the London correspondent of the *Manchester Courier*) that he believes himself to have hit upon a discovery in a Borneo wood called "bilian." It has a very close grain, and in appearance is not unlike ebony, more especially after exposure to the air. Its main virtue, however, consist in its breaking strain, which is greater even than that of English oak. Moreover, "bilian" is not a particularly heavy wood, since it only weighs 60 lb per cubic foot against the 80 lb. of box-wood. Further, it seems remarkably free from the propensity to swell in water, and so would be extremely useful for subaqueous piles, besides being most suitable for beams and uprights in domestic architecture.—*Public Opinion*.

Correspondence.

To the Editor.

A CEYLON PLANTER IN VICTORIA.

Geelong, Victoria, Oct. 7.

SIR,—In view of my expected return to the "Spicy Isle" shortly, I have not been using my pen to record my observations so much lately, intending rather to defer them till I should find myself back again in Ceylon. It is a wonderfully attractive place is that same island,—there is no quitting it, and whether it be some enormous loadstone of world-wide influence, or the spell of its dusky Syreas, that accounts for it, it is quite evident that all who once come under its sway find it very hard, if not altogether impossible, to sever their connection with it. And yet its attractions for the home-sick colonists are but few, and equally so are the individuals who care to spend more than a few years of their existence, in what they deem to be at best an exile. Ask the most successful planter or merchant you may meet and you will find his prospects all time towards going home. Where are the successful "K. C. B's, who for love of occupation settle down on their family estates and spend their declining years in curbing the scamping propensities of Ramasamy and Nagalingen, and filling in their leisure by the study of Coast Advances, etc.?" Oh! no. They are off home and Mr. Freshman, fresh from the scene where the battle of Waterloo was won, according to an eminent authority, takes over charge of Teatotum Wattie, and so it goes on. But this is not the end. After a few years when *Henileia* and *Helopeltis* have had their turn out comes our veteran again—couldn't stand the winter at home, estate matters requiring attention, etc.: any way out he comes. So it is with the disappointed man who goes off to Canada, Australia, Africa or Fiji, all come back like the bad shilling. What is it, Mr. Editor?

I have long come to the conclusion that Ceylon was made for Sportsmen and Missionaries, a queer assortment perhaps, but I believe about the best solution of the problem. There is a grand field for both, and it will result in the survival of the fittest.

So "Aberdonensis" is back again! Well, he will have some experience to give you, and he has got the right notion about Ceylon tea. What is going to be done? I see you are discussing what is to be done to secure the advantage gained by the Chicago Exhibition, and it is certain that unless it is followed up, the money already spent might as well have been dropped into the sea. A nine-days' wonder at the best and Ceylon and its Court forgotten altogether. I think it is a mercantile matter, but our merchants' horizon is confined to Mincing Lane, and they are great believers in ordinary trade channels, which is a mistake in this instance. Every encouragement should be given to the

CEYLON MEN ALREADY AT WORK IN THE STATES,

and if some of our Colombo houses would start agencies both in America and in these colonies they would soon do an exceedingly profitable business, and greatly benefit Ceylon. It must be pushed in these new markets by men thoroughly loyal to Ceylon; otherwise you will find the name of Ceylon getting injured by rubbishy blends being sold. Personally I have declined to handle any blended teas, although offered commissions to do so; but in sticking to pure Ceylon, I felt I knew what I was doing and could safely guarantee quality.

There is no very stirring news here. The weather is getting warmer and we shall soon be glad to get back to Ceylon to avoid the heat! I astonish people here when I tell them we used to have fires every night of the year at Nuwara-Eliya. The changes of season here are very abrupt, and already a few hot days have given us a taste of what

summer weather means, while only a week or so ago we were experiencing bitterly cold weather.

The winter has been a severe one according to all accounts, but the abundant rains are a great boon to the country, and the crops are likely to turn out very well; and provided the market keeps up for all country produce, the farmers should have little to complain of.

THE WANT OF EMPLOYMENT

is still the pressing question of the day, and there is a great deal of distress in all the large towns. Beyond effecting considerable retrenchment in the public expenditure, the Government has done very little to better the condition of matters, the several labour colonies started being too illiberal in their scope to relieve the congested condition of the labour market, brought about by the protection system and the inflation of the land-boom.

One result of the depression has been the turning of attention to the development of the mining industry and the prospecting of new fields. There has been a revival of mining in some of the older fields, and deeper sinking and improved machinery are proving these to be far from worked out and capable of yielding profitable returns although it may be far below the rich revenues obtained in times gone by.

The main hope for the country is however, in my opinion, the settlement of a large rural population and the fostering of

AGRICULTURAL ENTERPRISE,

and the sooner the people recognize the fact, and one and all set to work to carry it out instead of playing at it and waiting for each other to begin, the better. The report of Mr. Wilson, the expert on dairy produce, who has been on a mission to England in connection with the trade in frozen meat and dairy produce, has been published, and is on the whole encouraging. There is evidently room for a large development of trade in these articles and public attention is more likely to be directed to it now that the brick and mortar craze has come to such a disastrous termination. I hear of over 300 houses in one suburb of Melbourne being empty and of an instance where a rent-free tenant threatened to leave unless the landlord added another room to the premises. CAPRICORN.

INDIAN AND CEYLON TEA COMPANIES.

DEAR SIR,—In your interesting article on "Tea Planting in India and Ceylon" (see page 317) you have quoted a comparative table of the profits paid by some Indian and Ceylon Tea Companies, but unfortunately you have overlooked the question of *capital account per acre* which makes your statistics utterly misleading.

The capital of the Indian gardens quoted is somewhat over £50 per acre, while the capital of the Ceylon gardens quoted is, I fancy, considerably under half this sum (will you be good enough to give the capital per acre of the Ceylon gardens quoted?). The real test of the tea enterprise is the profit it gives per acre; and I fancy if you compare those same Indian gardens against the Ceylon ones on this basis they (the Indian gardens) will come out very much more favourably than your tables indicate; or if you write up the Ceylon Companies' capital to the same amount of the Indian Companies you will find the dividends are much more favourable to India.

Another thing is that the four Ceylon Companies you have quoted are about the most successful Companies in the island and as such do

* Not got it; but surely it is all the more to the credit of the Ceylon gardens if their capital expenditure is so low?—ED, T.A.

not indicate a fair average, while the Indian Companies are about a fair average of all the Indian Tea Companies. What about the Castle-reagh Co., Hapuala Co., Oriental Bank Estates Co., Madulsima Co., Lanka Co., Spring Valley Co., Asiatic Produce Co. and others which might be quoted as well as those Companies we hear rumours about planting with large capital, £50 to £60 an acre? What about them I ask?—Yours faithfully,
TEA PLANTER.

INDIAN AND CEYLON TEA COMPANIES: CRITICISM THEREON.

Colombo, Oct. 23, 1893.

DEAR SIR,—Mr. George Seton's "Comparative table of Indian Tea Companies" is interesting to all in the tea swim.

The first thing that strikes one is if in 1892 the Companies, whose working is analysed, paid a dividend of 7½ per cent, made a profit of 2½d per lb. on the made tea; how much are they likely to pay in 1893 when Indian teas have averaged about 2½d per lb. less than they did in 1892?

The second thing that strikes one—that is the Companies with large yield, paid better than the Companies whose yield was smaller and prices higher. Thus three Companies whose yield was 628—527 and 710 lb. per acre respectively, although they only realized 8'31d—8'11d and 8'30d, or an average of 620 lb. at 8'40d, per lb. made an average profit of £8 8s 3d an acre, against an average of £4 13s 4d for all the Companies reviewed. This indicates either that 1892 was a year of extra profit for estates producing low priced tea; or, that a larger yield pays infinitely better than a low yield and fancy prices and that 620 lb. an acre at 8'40d is much more profitable than 440 lb. at 11d a lb.; and I take the latter as being the correct deduction. Then take capital accounts, there are 15 Companies; whose capital is £50 and upwards per acre and they paid a dividend of 5 per cent on an average against an average of 7½ per cent for all the Companies, so high capital is a great disadvantage.

The Indian Companies which yielded under 325 lb. an acre coasting 9'04d to place in London market and selling at fully 11d had an average of £45 per acre capital, and on it yielded 5 per cent, and if we compare this with the proposed Gallaha Company, which is estimated to yield 10 per cent, I confess I am a little confused. Perhaps—if it is still intended to float it as a public Company—its valuator Mr. Gibbon will give the public the benefit of his researches, and for comparison they might be put in tabular form thus:—

	Capital per acre.	Lb. per acre yield about.	Per lb. cost of production to London.	Per lb. selling price.	Dividend.
Indian Companies whose yield is 325 lb an acre and under average..	£45	300 av.	9'04	d.	5%
Gallaha Company estimated (Total capital £130,000)...	?	?	?	?	10%?

If the actual yield for Gallaha for 12 months from July 1892 price per lb. it realized is added is would be better. The selling price of the Indian teas 11d per lb. is so very much above what any Ceylons of medium elevation are likely to fetch that it seems difficult to see where a 10 per cent dividend is likely to be got, as the yields

are approximately the same so far as I understand but (if the Company is to be floated publicly) Mr. Gibbon will no doubt afford the information for the benefit of intending shareholders, and make the matter quite plain. Please observe that the profit of these estates was £2 10s an acre only although their teas fetched 11d per lb!

Altogether the outlook of the tea enterprise is not of the brightest and for estates giving about 300 lb. an acre especially (as will be seen when we compare the first group of estates with the last group) the outlook is gloomy:—

	Yield	Selling at	Profit per acre
1st group	620 lb.	8'40	£8 8s 3d
2nd group	300 about	11	£2 10s

Which goes to prove that high prices are of very little avail unless they have a large yield with them and that with a large yield a moderate price leaves a fine margin for profit. The reason of this is that whether we get a yield of 200 lb. per acre or 800 lb. all standing charges have to be paid, such as weeding, pruning, upkeep of building, superintendence, Agency, &c. The strength of Ceylon today lies in the fact that a far larger proportion of the capital invested in the enterprise belongs to the proprietors than in the days of coffee when many a man borrowed half to two-thirds of the value of his estate on mortgage bonds with the result that when coffee began to fail the men had nothing to fall back on but with tea it is different. The banks have constantly refused to advance on block loans, with the result that although our acreage is smaller than it would otherwise have been, the amount borrowed on it is much less per acre and so we will be better able to stand the coming crisis in our tea enterprise.

So far as 1893 is concerned prices for the first 6 months have been at a level that would have ruined many, had they remained at it much longer; and fortunately for us owing to short yield (we are not likely to get over 78,500,000 lb. at the outside) prices are likely to keep up till December anyhow.
TEA PLANTER.

HOPE FOR THE WEST INDIES.—In concluding a very readable little new book Mr. H. J. Bell—says the *St. James's Budget*—combats the idea that the West Indies are "played out." Writing of Grenada, Mr. Froude declares that the settlers, had once been a thriving and wealthy community, but have melted away. Those that are left he says, are clearing out, having sold their estates for anything they could get. But Mr. Bell points out that:—

So far from this being the case, the truth is that ten to twenty years ago, the sugar-cane having become an unprofitable cultivation, a good many proprietors of sugar estates sold them for less than their value and left the colony. To every one of these individuals, ten, instead of giving up in despair, stirred up their energies and set to replacing the worn-out sugar industry by raising cocoa plantations on their rich cane lands. Last year Grenada exported over 80,000 cwt. of cocoa, worth about £300,000. As cocoa at present pays about 20 per cent. on the outlay, every one who can is planting up every acre he can get of suitable land, and so far from the white planters selling their estates for whatever they can get for them, it is the rarest thing for a cocoa estate to be sold willingly, and for every such estate there would be twenty buyers. A great many Englishmen have, in the last two or three years, come to Grenada with the intention of investing in cocoa plantations, but so far from obtaining estates for a song, were nearly all obliged to return home, not finding a single cocoa estate for sale. Cocoa lands sold by the Provost Marshal realize sums which would have bought five times as many acres in days gone by, and only the other day £210 were paid for two acres of land in cocoa.

AN INDUSTRY which has caught on—say the *Pioneer*—with remarkable rapidity in India during the last few years is paper-making. Ten years ago the total outturn from all the Indian paper-mills was only 7½ million pounds a year. Last year the nine mills now in existence had an output of 26½ million pounds.

TEA IN SERBIA.—In Serbia, tea which, for Customs purposes, used to be classed under the head of groceries, is according to the *L. and C. Express*, placed in the Serbian statistics for 1891 under that of drugs and chemicals, owing, perhaps, to the extremely high price of the commodity, and to the fact that the bulk of the people look upon it as a beverage to be used only in times of illness. The value of the total amount imported did not exceed £625.

TEA CUTTING MACHINERY.—*W. Parnall, Bristol*—The cutting rollers are provided with a groove at one end, into which is dropped a plate or other suitable stop to retain the rollers in position. In connection with these rollers is or are arranged one or more knives, constructed to move backwards, and kept against a shoulder by means of a lever weighted at the end. Working against the knives is a special form of ratchet or wheel, arranged so that the teeth are not provided with a continuous flange.—No. 16,271. 12th September, 1892.—*Industries and Iron.*

“LABOUR used to rob the soil is worse than labour thrown away,” said Mr. Henry C. Carey, the American economist. The saying is quoted by Dr. Bruno Terne in connection with the fact that the sewage of a town is so much chemical wealth originally taken from the fields and not returned to it. The Chinese, he remarks, are wiser than us in carefully restoring to the soil what can be restored, and thus keeping up its fertility. Hence it is that so dense a population can be supported by it. The refuse of a city of a million inhabitants amounts, as Liebig showed, to no less than 45,000,000 lb. of fertilising matter in a year. Instead of imitating the Chinese and following the advice of Liebig, we neglect this source of supply at our doors, and import phosphates and nitrates at great expense from distant countries.

CACAO CULTIVATION IN CEYLON.—Mr. Joseph Holloway, the Wategama pioneer of new and old products, will have to prepare to meet a rush of inquiries after “cacao investments” from the city of London! For, his letter to us showing forth the extreme profitableness of his 15-acre field has been copied into the London *City Leader* in large type and the rate of profit—£22 per acre!—is sure to have such an effect on City men with spare cash, in this time of distrust, that cacao more than tea, is likely to become the subject of inquiry with would-be investors. At any rate, Mr. Holloway has made an impression in “the city” with his £22 per acre clear profit!

DESICCATED COCONUTS.—I notice by the Chamber of Commerce circular dated the 23rd inst., that the quantity of this stuff exported from 1st January to 23rd October this year was 5,305,077 lb. against same time last year of 2,562,320 lb.—or an increase of 2,742,757 lb. As three nuts on an average go to a pound the quantity of extra nuts used in this manufacture is 8,228,271. There are still two months for the year to run out, and if we take another 100,000 lb. as the average quantity that will be sent away during November and December, we shall get a grand total of 8,528,271 nuts used in the manufacture of Desiccated Coconuts this year, as compared with last year. Who will say after this that

the price of coconuts has not been affected—*Com. Cor., local “Examiner.”*

TEA STATISTICS.—The London correspondent of the morning paper brings us to task over tea statistics and inferences advanced before the completion of our “Handbook and Directory.” He ought to have waited for the book itself. In it he will find the figures in detail of the estimate we ventured on for next year—figures which generally followed, so far as crops are concerned, those adopted by Mr. Rutherford some years ago. There is very little practical use in forecasting for 1896, although our critic seems to have named 90 million lb. for that year from 280,000 acres because 250,000 acres are this year producing about 80 million lb. Well, if our annual outturn only increases by 5 million lb.—a very moderate estimate surely—we ought to have 95 million lb. at least in 1896! It must be remembered by friends who are inclined to insist on low estimates, that quite as much harm may be done by minimising as by exaggerating estimates. Nothing will encourage the Indian tea planters to extend culture more than to tell them that Ceylon has nearly reached her maximum—not more than 10 million lb. additional to her crops being expected in the next three years!

THE SURREY LAVENDER FIELDS.—A correspondent of the *Daily Chronicle*, who has recently paid a visit to Miss Sprules, whose family for over a century has been engaged in the industry of lavender distillation at Mitcham, writes:—The process of distillation is a very interesting and somewhat primitive affair. The lavender is deftly cut by men with small saw-like scythes, then made up into sheaves, and finally rolled into “mats,” into which they are secured by skewers. These mats or sacks of lavender are then brought along to the distillery, which consists of a lower floor, in which are the receiving cans for the oil and the furnaces for heating the stills above, and an upper floor, which is a raised platform of wood with a thatched roof supported by beams, in which are the stills and vats. The big iron coppers or stills are filled with the pretty, delicate-looking bloom by men naked to their waists, who press it down and stamp upon it till the still is tightly packed. Water is then added, the head of the still is firmly fixed on by means of a crane, and the whole made airtight (to prevent the escape of any steam) by layers of whitening. The men then light the fires below, and the vapour passing through a pipe technically known as the “worm,” is caught in a huge vat nearly full of cold water, where it gets condensed, and flows into a receiving-cen below as oil and water. The essential oil is thus retained whilst the water, which is useless, trickles away. In the distillation of peppermint the water is collected, as it is regarded by the poorer people of the district as a potent remedy against certain minor ailments. A large portion of the lavender oil is sent up by Miss Sprules to the druggist for medicinal purposes, the remainder being retained for the preparation of her famous lavender water the details of which are her own secret. During the autumn and winter the bottling of the lavender water, lavender essence, and the aromatic lavender salts, is carried on in the farm parlour. The stranger should not leave this attractive place without a stroll through the fields where the lavender and mint grow. A huge field of lavender lies a little to the east of the town, skirted on one side by a plain of yellow waving oats and on the other by a field of mauve-tinted mint. Near by is a field camomile the white blossoms of which is dried and used in the composition of various drugs.—*Public Opinion.*

A NEW CEYLON TEA COMPANY: THE HORN-BY ESTATE, COY., LTD.—The mail just in brings us news of the starting of this Company, which is formed to take over the Horsey, Abercainry, and Ulapane estates in Dikoya, and the Gandanawa property near Nawalapitiya, in which Messrs. W. and H. Saunders, E. C. Bredin and E. G. Harding are severally interested. The vendors will retain a large proportion of the shares in their own hands, and there is very little likelihood of the scheme falling through. We shall doubtless have further particulars in a short time:

RE-AFFORESTING IN THE SOUTH OF FRANCE is certainly found to be profitable to the State, and beneficial to public wealth in a high degree. We quote as follows:—

In the report for the Department of the Landes, published towards the close of '90, particulars were given of the reclamation work carried on for thirty years on the waste land between Bordeaux and Bayonne. The 730,000 acres, distributed over 162 parishes, and worth only 4 fr. an acre, or under £120,000, had been replanted and drained, and are now worth £3,200,000. Private owners have also reclaimed and reafforested 875,000 acres. The vine has flourished on a sandy soil, where the phylloxera will not thrive, and the exports of pine timber and of turpentine have rapidly developed. The Department, from being the most unhealthy in France, is now one of the most salubrious, and the last statistical report showed that the births exceeded the deaths by 1,412.

"**INDIAN FORESTER**," for Oct. 1893, has for its contents:—I.—Original Articles and Translations. A tour in Jaunsar, No. 4; Located Fellings, a first step towards regular Working Plans, by "Vagrant"; Wood paving from India; The Prize day at Coopers Hill; Obituary, J. Kelly. II.—Correspondence. "Tea boxes," a letter from "Viper"; Growth of Eucalyptus in Hoshiarpur, letter from W. Coldstream, G. S. III.—Official Papers and Intelligence. Allowance to Working Plan Officers; Budget Estimates of the Forest Department for 1893-94. IV.—Reviews. OPIMUM AND HONEY.—It would be interesting, says a writer in the *St. James's*, if the Commissioners now examining into the Opium Question would inquire whether honey made from the flowers of the poppy is in any way injurious to health. The cultivation of the plant in England for ornamental purposes has increased enormously of late years. Scarcely a villa or cottage but has its broad patches of the gaily coloured annual, while in gardens of any extent it may almost be said to be sown by the acre: From the tiny Iceland variety, through French, Norwegian, Danish, up to the beautiful and stately white "sleep-poppy," all the papavers are intensely beloved of bees; and if, as is alleged the honey so made is injurious, the increasing cultivation of the poppy is likely to become a serious question for bee-keepers. The anti-opiumists ought really to see to this. There is little doubt that the properties of honey are much influenced by the flowers from which the bees gather it. Xenophon's account of the effect of the Tribizened honey on the soldiers who ate of it will be remembered. It is said that the drunkenness to which he alludes was caused owing to the bees extracting the honey from the *Azalea pontica*, which abounds in that region. Again, the excellence and harmlessness of that made from wild thyme, such as the Hybla honey from Sicily, or that Hymettus,

in Attica, also drawn from fragrant herbs; the Narbonne, the Swiss mountain honey, and the heather honey of our own moorlands, each having its own separate scent and flavour—all go to prove how much depends upon the sources from which it is derived.—*Pioneer*.

UDAPUSSELLAWA, Oct. 22nd.—This favourite district is coming to the fore with a vengeance and promises to hold its own against the island, not only as regards tea but that glorious old staple coffee. The recent prices realized for the "St. Leonard's" tea speak, for themselves, and as regards coffee one has only to visit the district just now during the blossom, to be struck by the magnificent and unusual show. "Delmar" in particular is a perfect picture, some fields of which near the road look like a sheet of snow so white and even with blossom and reminds me forcibly of the good old days when crops were too heavy to be all picked. If the favourable weather they are now having continues, eight cwt. per acre should be an easy yield for that estate; this probably sounds "tall" in these days of tea, but no doubt the old Indian system of *shade and renovation pitting*, which that estate has recently adopted accounts for a lot! Those who were fortunate in getting their tea pruning done early are now deriving the benefit; the old tea, though not probably flushing as "heavy as one could wish" is in splendid heart and promises well for the future clearings, of which there is a large acreage being energetically pushed forward and some places are only waiting for the monsoon to burst to commence planting. The Association met the other day and discussed that bitter subject of coast advances; nothing definite seems to have been arrived at further than that the heavy advance system little or in no way affects this district.

ISLANDS OF CHILOE.—At the meeting of the British Association, Mrs. Lilly Grove, F.R.C.S., gave an interesting description of her visit to the islands of Chiloe as follows:—

These islands lie between 41 deg. and 43 deg. S. Lat., and are only 25 miles distant from the mainland at its nearest point. The principal island, Chiloe, can be reached by steamer or by one of the native sailing vessels, which are well managed by the hardy and dexterous Chilotes. These vessels form the chief means of communication, as the postal service is irregular. The island is peaceful and prosperous, and crime is rare among its gentle and hospitable inhabitants. Education is improving, and agriculture and wood-cutting are the chief employments both of the men and women, and the ownership of land is very widely diffused. They have few wants, fish and the potato forming the staple articles of their food. Wages are generally paid in kind, often, unfortunately, in alcohol. It is interesting to know that the potato (called *patata* or *papa*) is of Chilian origin, and grows in the wildest districts, even at the top of the highest mountains. A whole region is called after it, and it is sometimes the sole food of the people. Other interesting native plants are the *latuá* (similar to belladonna), an infusion of which produces temporary madness; the *panque*, valuable as an astringent; the *pinon*, rising to a majestic height, with a white resin, also useful medicinally; the *canelo*, whose branches are recognized as a flag of truce; and the *alerce*, large forests of which are found near Castro and Ancud, and whose wood is most valuable for building purposes; but better means of transport are needed in order to work these forests economically. Fishing is a very important industry, both in Chiloe and the Guaitecas. Telegraphic communication between the last-named islands and the mainland would be of great service, and the Government of Chili should make fishing and shooting regulations to prevent the extermination of the seals, whose skins are prepared near Dalcahue. The chief ports are Ancud and Castro, the latter of which is very picturesque.

CROP PROSPECTS COORG : VERY FAIR.—Mr Lambert, Honorary Secretary of the Coorg Planters' Association writes:—With regard to the crop prospects and season in Coorg, the crop in N. Coorg promises to be a good one generally, the crop in S. Coorg is average, but is better on the Sidapur side than on the Polli Betta side. The season has been a good one, and coffee is looking very well all over Coorg. A little leaf disease is showing here and there, but nothing of a serious nature. Borer has been bad this year, unusually so.—*S. I. Observer.*

"AN ACCOUNT OF TEA CULTIVATION AND MANUFACTURE IN CEYLON by J. A. & W. E. Henderson,"—a copy of which has reached us is a neat little brochure of 38 pages which is introduced by the following:—

Prefatory Note.—It was at the instigation of a number of friends, who, on various grounds, are interested in the tea enterprise of Ceylon, that the following pages were written. Their contents are largely matter of compilation, and there is no pretence to originality in them. A full list of the sources from which we are conscious of having drawn will be found at the end; but we would mention here that the writings of Mr. J. Ferguson, Mr. J. Paton, Colonel Money, and Mr. H. K. Rutherford are those from which the borrowing has been largest. In general, quotation marks have been purposely omitted, it being thought that their frequent appearance would have constituted an interruption of comfort in reading.

The chapters are:—Introduction (a brief historical account of tea); Part I.—Field-work on a tea estate; part II tea manufacture; and a short concluding chapter besides two or three illustrations and useful tabular statements as appendices. Altogether for the purpose of giving our Australian fellow-colonists or American cousins a proper notion of Ceylon tea, this little pamphlet is admirably adapted.

CINCHONA IN JAVA.—The *Chemist and Druggist* sums up the case of the Java Bark exports as follows:—

According to Mr. Van Gorkom's statements there are at present in Java no fewer than 149 companies or private proprietors who grow cinchona bark, and who, together, possess about 283 plantations. These figures are much in excess of those given by the Java Planters' Association, and even if they should turn out to be somewhat in excess of the actuality, they show that the exhaustion of Java in consequence of unremunerative prices will be but a slow process. Another factor which renders many Java planters able to bear up against low prices for a prolonged period is that on a large number of the plantations cinchona is only a culture of secondary importance, and where that is the case the planter can refrain from harvesting his bark until happier times are in prospect. Unfortunately, the conditions upon which the land of other plantations has been leased by the Government preclude the lessors from planting coffee, the alternative crop for which the soil is suited, and Mr. Van Gorkom urges that under the present distressed conditions of the cinchona industry the Government should abolish that disability. He also suggests the restriction of the output of the Government plantations, which is now sold in Amsterdam in competition with private firms. This is a suggestion that has also been made by the Amsterdam Chamber of Commerce, but to which the Government does not appear inclined to listen. The Government plantations are the richest in the island, and their produce represented in 1892 about 10 per cent in weight and about 13 per cent of the quinine sold at the Amsterdam auctions. It should not be lost sight of, however, that the main object of the Government in establishing plantations in Java was not to assist private planters in making a profit, but to insure the constant supply of cheap quinine—an object which has certainly been fully attained. Up to the present time, it appears, the Java bark at the Amsterdam sales has been much below the quinine richness that may be expected from it when the market conditions

are once more such that only mature trees will be harvested. In their hurry to grow cinchona many growers have planted their trees too closely together, thus preventing the alkaloids from attaining their natural proportions. The immature trees are now being uprooted in large numbers and their bark keeps down the general level. Altogether the prospects do not seem very favourable for the planters, and during the present year, at any rate, the continuation of a cheap quinine and bark supply seems well assured.

ORIENTAL BANK ESTATES COMPANY.—We call attention to the full report of the Chairman's address at the annual meeting given on page 321 as affording an interesting account of the position of the Company. We are averse to the conjunction of sugar estates in Mauritius and tea coffee or cacao plantations in Ceylon under one Company. The case of the Ceylon Company, Limited, was a warning that ought not to be forgotten, and we think it would be far better if two Companies divided the properties and interests now held by the above institution. No doubt there would be shareholders ready to back up both Companies freely; for the Mauritius properties appear to be valuable and to have been got as good bargains; but then shareholders who know about Ceylon interests—as General Massey and Mr. Lawrence—are apt to be suspicious of Mauritius, and no doubt, *vice versa*. It seems to us that a division should result in better and more economical management; but of course, this is a matter for the shareholders and Directors themselves. Our London Correspondent made a rather dubious reference to one of the Chairman's utterances which we may as well correct—it was not as regards the "management," but the details of "expenditure" that the Chairman objected to give in public full particulars and for obvious reasons. Meantime, the Company has undoubtedly to be congratulated on the accession to their Directorate of two such well known, reliable men as Messrs. H. K. Rutherford and Norman Grievé. The Chairman (Mr. Crichton) alluded to the former as follows:—

Few persons, I believe, have a better knowledge or judgment with regard to the management of tea estates in Ceylon than Mr. Rutherford, and I think the Company is fortunate in obtaining the benefit of his advice and co-operation. Both Messrs. Rutherford and Grievé are about to visit the island, and there will no doubt be a careful inspection of the Ceylon properties with advantageous results to the shareholders.

SULPHATE OF QUININE AND ELECTRICITY.—Quinine has many uses, and it would be a very good thing if these could be even more extended. We see in the *Engineer* of last week that the sulphate of your production is being used to illustrate electrical action, but it may well be doubted if this use would prove one likely to raise the price of your product in the market. The fact, however, is not without its scientific interest. The object of the use of sulphate of quinine after this new fashion is to make visible lines of electric force. The sulphate is introduced into a chemical mixture which need not be here specified and on passing the electric current through this the crystal of the sulphate form beautiful curves, showing the directions in which the current is passing with more or less intensity. The *Scientific American* says that on sending a series of discharges through a mixture of quinine and oil of turpentine, "a clearance is produced at the positive pole, and the particles cluster round the negative pole, arranging themselves in streamers directed along the lines of force." We presume it is the extreme lightness of the sulphate of quinine which has led to its selection for use in these interesting experiments.

TEA CULTURE IN ASSAM.

Since writing a recent article on Tea in India and Ceylon, we have come on the official Report on Tea Culture in Assam for 1892 by the local Government. It does not cover all the territory we had included in Assam and subsidiary districts; but it is interesting to see the details so far, although the figures are far from complete and trustworthy:—

As regards sub-divisions, Cachar sudder maintains its position at the head of the list with the largest number of gardens, and Lukhipore sudder comes next. The former also has the largest area under tea, whereas Lukhipore shows the largest outturn. Tezpur sudder, in the Brahmaputra Valley claims the highest average yield, viz., 598 pounds per acre; while in the Surma Valley, Habiganj, as in the previous year, heads the list with an average of 551 pounds per acre.

The total number of gardens on the district registers at the end of the year under report was 807, against 828 in 1891, showing a decrease of twenty-one gardens.

Only four gardens were newly opened during the year against twenty-one in the previous year, and thirteen were closed, against twenty-four in 1891, twelve gardens were amalgamated with other gardens; against seven in 1891.

The explanation of the apparently large increase in the area of land held by tea-planters in the Lukhipore district is that the total area taken by planters under different kinds of tenure, whether cultivated or not, has been shown in the returns of the year under report, whereas in the previous year only the total area under tea was shown. The increases in Sylhet, and Sibsagar have not been explained by the Deputy Commissioners; the decreases in area in Goalpara, Kamrup, and Nowgong are owing to the closing of gardens. The cause of the decrease in Darrung has not been explained by the Deputy Commissioners.

The Chief Commissioner regrets to find that considerable difficulty is still experienced in obtaining information from the agents and managers of gardens. During the year under report, statistics were received in respect of 671 gardens only against 752 in the previous year, and it was found necessary to frame estimates for as many as 136 gardens compared with seventy-six in 1891. The gardens for which estimates have been framed on the returns furnished during the preceding year are distributed as follows:—Silchar 34, Hailakandi 19, South Sylhet 8, Karim-jang 3, Gowhaty 3, Tezpur 33, Mangaldai 7, Sibsagar 7, Jorhat 5, Golaghat 8, Dibrugarh 8, and North Lukhipore 1, Nowgong has the credit of being the only district which has sent in returns for all gardens. The Chief Commissioner's thanks are due to those planters and agents who have furnished the statistics which are incorporated in this report.

The increase under mature plants was 5,118 acres, and occurred mainly in the districts of Sylhet (1,856 acres), Lukhipore (1,121 acres), Darrung 1,137 acres, and Sibsagar (1,101 acres). This would have caused a corresponding decrease in the area under immature plants, but it was more than made up by extensions as the area under immature plants increased from 33,416 acres in 1891 to 33,667 acres in 1892.

Thus, there were increases in the total area under tea in the districts of Cachar, Sylhet, Darrung, Nowgong, and Lukhipore, the largest increases having occurred in Sylhet, Darrung, and Lukhipore.

The total outturn of tea during the year under review is reported as 84,221,133 lb. against 90,399,362 lb., in the previous year, showing a decrease of 6,178,229 lb.

The average yield per acre for the whole province is 394, against 434, lb. in the previous year the decrease during the year under report being considerable. The decrease occurs in both valleys but that in the Surma Valley is more marked.

During the year under report tea-seed was imported from Manipore into Cachar and Kamrup, but it is old at an extremely low rate. The Deputy Commissioner of Cachar reports that planters are

inclined to buy it, as it has heretofore been adulterated with China seed. The reports from other districts do not supply any information on this point.

BARK AND DRUG REPORT.

(From the *Chemist and Druggist*.)

London, Oct. 5th.

CINNAMON.—A considerable business has been acted recently for arrival at 6 9-16ths d. to 6½ per lb. c. i. f. terms, usual assortment. Sales are also reported of 20 tons of cinnamon chips at 2½ per lb., c. i. f. terms, October-December shipment.

CINCHONA.—At Tuesday's fortnightly auctions an even more emaciated selection of bark was offered than at the preceding sales. Both from India and from Ceylon the arrivals have been very small lately, and barring the working-off of the old stock, which may occupy a considerable time, and the selling of the few consignments that still keep dribbling in, it really looks as if the London cinchona-market were already in the throes of expiration. The full descriptive memoir of the career of the deceased, when it comes to be written, will be an interesting document.

The five catalogues at yesterday's auctions (there was to have been a sixth of 49 bales of Ceylon bark, but the broker explained that he had forgotten to make his sale known in the usual way, and no one appeared to deplore the withdrawal of the parcels) included of:—

	Packages	Packages
Ceylon cinchona	37 of which	307 were sold
East Indian cinchona	387 "	315 "
	604	622

Neither South American, Javan, or African barks were offered.

The auctions being seemingly too unimportant to warrant the expectation that buyers would be willing to climb four flights of stairs, they were held in the historic back-room on the ground floor 6 Minclug Lane, which ten or twelve years ago resounded with the excited bids of buyers competing for Pitaya and Colombian barks at from 3s to 6s per lb., and thinking nothing of buying £10,000 worth of them at a single sale. The same buyers were there now, or many of them, but in the prices, "Oh Hamlet, what a falling-off was there!" This week the unit scarcely exceeded ½d per lb. on any lot, and although competition was occasionally a little less inanimate than before, we appear to be as far removed from an improvement as ever. Some of the druggists, however, bought freely, apparently in the confident expectation that the long-looked-for turn in the market is in sight, and a speculator also laid in ten or eleven tons of good Ledger bark.

The following were the quantities secured by the principal buyers:—

	Lb.
Messrs. Howards & Sons	19,292
Agents for the Mannheim and Amsterdam works	16,602
Agents for the Brunswick works	14,487
Agents for Auerbach works	13,633
Agents for the French works	2,450
Sundry druggists and speculators	75,064
Total quantity of bark sold	141,497
Bought in or withdrawn	17,229

Total quantity of bark offered ... 158,726

It will be noticed that more than half of all the bark sold was bought in by non-manufacturers, an occurrence probably unmatched in the history of the London bark sales. The following prices were paid for sound bark:—

CYPRON CINCHONA.—Original—Red varieties:—Ordinary woody to good bright stem shavings 1d to 1½d; bright chips and shavings mixed 1½d; bold bright chips 1½d; fair to good root 1d to 1½d per lb. Grey varieties:—Ordinary dull to fair stem chips ½d to 1d; stem shavings ½d to 1d; dusty but quilly mixed chips 1½d per lb. Yellow stem chips, fair quilly mixed 1½d to 1¾d per lb. Hybrid chips 1½d; shavings 1d to 1½d per lb. Renewed. Red varieties, small and dull stem and branch chips 1½d to 1¾d; stem shavings 1½d; good bright chips 3½d; per lb. Grey stem chips 1½d to 1¾d per lb. Hybrid shavings 1½d to 1¾d per lb.

COCOA BUTTER.—At auction on Tuesday 400 2-cwt. cases of Cadbury's cocoa butter sold at 1s 2½d to 1s 2¾d per lb., an average decline of about ½d per lb.

THE EARLY EUROPEAN COCONUT INDUSTRY IN THE BATICOLOA DISTRICT.

BATICOLOA NORTH.—An old resident in Batticaloa has sent us the following interesting notes in connection with this subject :—

The coconut planting enterprise in Batticaloa North was commenced fifty years ago by the late Dr. Sortain, a worthy Britisher who, after distinguishing himself in physical science and metaphysics at Edinburgh and Germany, came out to the East as a naval doctor, and then joined the Civil Medical Department. He eventually devoted himself exclusively and successfully in 1846 to the coconut industry at Tannamunai estate, five miles from the town of Batticaloa, at the head of the northern arm of the lagoon. Simultaneously Mr. Robert Atherton, senior, then Assistant Government Agent at Batticaloa, opened Kalmunai estate, 1½ miles to the north of the bar, and perhaps owing to the Governor's minute as to Civil Servants holding landed property, he sold it to his cousin, Capt. (afterwards Colonel Meadows Taylor, the well-known historian and novelist of Central India.) His brothers, Messrs. Selby and Glanville Taylor, came over here, the latter to look after his brother's Hyderabad estate, and the other to open out Linsogoor for Captain (afterwards General) Baldwin Availing themselves of a series of water holes or "cobbs they made an artificial canal up to the mouth of the river for cheap and easy transport of materials and produce to and from the group of estates. But pioneer work of this kind was too much for the young men, and they both succumbed to dysentery one after another. The large herd of black cattle they had acquired were brought down to the town and sold with their other effects. But some of them seem to have broken away into the jungle and their progeny—a herd of wild black cattle known as "Taylor Durai's cattle"—are still roaming about the jungles; the young ones being occasionally trapped and trained by the wily natives. More than one of those estates now belong to Mr. Edward Atherton, retired District Judge.

Mr. Charles Dixon was the son and heir of Colonel Dixon, who introduced civilization among the Aborigines of Central India near Ajmere, and induced the Indian ruler of the place to found a new city "Nya Nugger," and for whom a permanent memorial has been lately raised there. Young Charles Dixon set to work vigorously, and opened out the Ajmere and Nya Nugger estates, founded a town residence and a country residence, became connected with the *Athertons* by marriage with a relative of their, and was getting on splendidly for a time. But in an evil hour he became enchanted with the dazzling prospects of coffee, sold out his estates, one to a Tamil broker and the other to a Moorish trader, while his tiny garden was donated to his god-daughter, the child of the Rev. S. Nicholas, then of Batticaloa and who died as the Colonial Chaplain of St. Paul's, Colombo. The property was eventually bought by the late Dr. Covington, and now forms a part of that bone of contention, the new market of the Local Board. Mr. C. Dixon proceeded to the Central Province and invested his savings in coffee. He failed with the failure of coffee, sickened, and died there. His eldest daughter married young Forbes (son of the late Government Agent), who died at Matar lately. His only son, C. Dixon, junior, went out to America, but is now, we believe, in the Straits Settlements. Besides the Tannamunai estate, opened by Dr. Sortain, the pioneer planter, there was also another modico, Dr. Jal'and, who opened Mylampaveli estate, but disappeared from the scene without making his mark.

Mylampaveli estate belongs to Mrs. Atherton, senior. The Haven belongs to the heirs of Mr. Treahy—a thrifty non-commissioned officer who took to coconut planting, and owned estates at Trincomalee and Batticaloa. He was a good man, and was successful for a long time and when Kottaimunai (Port point) became the northern suburb of the town after the construction of the bridge, he built good houses in the most desirable nooks of jungle lands that he had had the forethought to buy, and rented them out to European residents.

Rockwood estate was opened in 1850 by Mr. Kidd; but the natural advantages possessed by lands in that quarter were not discovered until more recent times, when the all classes and creeds, nor is it devoid of several queer differences of opinion and romantic tales. Rumour has it that once upon a time a public servant, who also had a hereditary penchant for planting entertained a friend of his at his town residence. While conduced through the rooms to his accustomed morning bath the friend espied on the walls the plans of all the estates in which the public servant and the members of his family were interested. Ampler details no doubt must have been freely given during the post-prandial small talk. Several inaccurate impressions were received and formed. Time passed by, months elapsed, the friendship cooled, and causes of difference arose. Matters were brought to a head, and then followed in quick succession a commission of enquiry and its train of attendant circumstance. In the meantime the coconut plants rose up, as no earthly commission could arrest their natural growth. A few changes, a mere fleahite, the coast cleared, and the quondam public servant reigned supreme. Land-grabbing is thought by some to be a vice peculiar to the members of the Anglo-Saxon race, but when accompanied by a benign patriarchal disposition and a kindly and philanthropic disposition, it is of immense and lasting benefit to the natives around, which though real is honestly acknowledged by a few only.

Chantiveli (upper and lower), in the Northern division of the Batticaloa district was opened in 1847 by the Messrs. Munro. The place was then (and to some extent is even now) the haunt of the bear, the cheetah, and the elephant. Being keen sportsmen they were in their turn spotted by the wild beasts. They had monthly encounters during full moon time and contended for the mastery of the primeval forest that had hitherto remained untouched by civilized man. One of the brothers was hugged and severely bitten by a bear, which disabled him from active work for a long time. The other brother fell ill and eventually died. An Assistant Superintendent, a gigantic Highlander, escaped malaria and the wild beasts for a time. An elephant at last trampled him almost to death, and returning to Europe, he died there. Strange to say the "bear-bitten Durai" (Mr. Stuart Canada Munro) has returned to his first love. Half of the estate belongs to the heirs of Colonel Spencer, viz:—

(1.)—Charlotte Frances Bona, widow of George Fitzroy, Esquire; (2.)—Frances Isabella Catherine, widow of Lord Vere Chelmondeley; (3.)—Caroline Louisa Elizabeth, widow of the Hon. Charles Murra; Hay Forbes; (4.)—Georgia Melicent Julia Spencer, and (5.)—John Winston Thomas Spencer, Major, R. A.

But the "Laird of Chantiveli," an old bachelor still, loved and honoured alike by all classes, remains the sole representative of the pioneer planters of the Eastern Province, a model of justice, equity, and liberty. A list of the estates and the present owners is as follows:—

Name of Estate.	Properties.	Extent, in acres.	Remarks.
			Acres.
Kumburumulai	S. A. Crowther	135	125 cultivated
Chantiveli, Upper and Lower	S. C. Munro & heirs of Colonel Spence	500	Estate, grass Land & Jungle
Rockwood	E. N. Atherton	277	160 cultivated
Hyderabad	E. N. Atherton	500	100 do.
Linsogoor	E. N. Atherton	40	20 do.
Newnham	E. N. Atherton	189	150 do.
Kumbilymadu	E. N. Atherton	80	54 do.
Mylampaveli	Mrs. E. T. Atherton	400	150 do.
Tannmunai	Mrs. Sortain	638	208 do.
Haven	Heirs of Treahy	80	4 do.
Ajmere	Vannithamp	105	
Nya Nugger	M. Ahamatulevai & Brothers	400	
Navalkoni	Dr. Orr	200	
Kulmunai	R. Kadramar and Mrs. J. B. A. Swaminader	370	300 cultivated

—“Local Times.”

ORCHID TEA

One would not look to the *Kew Bulletin* for a hint upon French customs. But some who have been thinking themselves familiar with the ways of Gaul may be surprised to learn from that recondite periodical that a tea of orchid leaves has long been popular across the Channel. There is record of it fifty years ago as a beverage fairly well established and of late consumption has increased. The sagacious and enterprising people of this country are always glad to hear of something new for the tea-table and acquaintance with this boon should not be confined to the readers of the *Kew Bulletin*—a peculiarly estimable class, but limited. The mere name of orchid tea has something lordly and impressive in its sound. We fancy a millionaire consigning plants worth their weight in gold to the housekeeper's room, there to be stewed and served up for royal guests. It seems a revival of the luxury of old Rome. Vitellius should have drunk orchid tea at his feasts. Cleopatra should have dissolved her pearl therein. It is a theme for the invective of those guileless moralists who denounce the unparalleled extravagance of the Upper Classes.

Looking more closely, however, we fail to see anything really wicked in the fashion of orchid tea. The article is genuine enough. It is not compounded of some homely weed which botanists alone identify as akin to the gorgeous Cattleias and the stately Dendrobies of the tropics. The orchid from which this tea is made is a member of one of the handsomest and most expensive families—the *Angræcum*—and a very pretty member too. It grows in the forests of Bourbon and Mauritius, and the scientists know it as *Angræcum fragrans*. Probably the natives have been using it for ages. Incidentally we may remark that those who fear the extermination of the nobler orchids may find solace here. If a small species occupying a very narrow area, of which flowers and leaves alike are eagerly stripped, can hold its own for generations, there is not much cause to dread that the most ruthless of collectors can do worse than retard for a little while the increase of more showy species which are quite as prolific.

The commercial virtue of *angræcum fragrans* lies in the strong perfume of its leaves. The genus is allied to vanilla—also an orchid, of course—and in this instance kinship displays itself. It is enough, we read, "to touch the fresh leaves for the fingers to remain impregnated with the aroma," which remains when the leaves are dried. This process is simple as could be, apparently. No heat is applied; no colouring matter. Describing samples at Kew, the *Bulletin* observes that they are unshrivelled and as "flat as we should find them in any herbarium. And the decoction is equally simple. You just lay the leaves and stalks in cold water, about one gramme to a teacup—more or less according to taste—close the vessel tight and boil for ten minutes. It may be sweetened; milk and rum bring out the flavour of the vanilla more strongly. It is as good cold as hot, and may be warmed up without deterioration. Finally, we are told that material enough for fifty cups is sold in Paris for 2 fr. 50 c., 105 onps 5 fr. It is called Faham, as in Mauritius.—*Hongkong Daily Press*.

GALAHA TEA FACTORY.

Going on the best information at our command, we entered Galaha among the big tea factories of the island as manufacturing about 500,000 lb. in a year; but we learn in correction from Mr. W. M. Hall, the Manager, that for 1893, his manufacture will not aggregate less than 1,200,000 lb. making the biggest return for any single factory in the island, we suppose. Mr. Hall writes:—"We are at present very busy fixing a new steam engine and when complete, the engine and turbine will together represent 120 H.P. At present I am taking in daily 20,000 lb. green leaf and the busy season has barely started yet.

THE GREAT WESTERN TEA COMPANY
OF CEYLON, LIMITED.

Report of the Directors for Presentation to the first Ordinary General Meeting of Shareholders, to be held on Tuesday, 7th November, 1893, at noon

In order that no disappointment may be felt through the non-payment of an interim dividend, the Directors have decided to present this short report to the Shareholders on the working of the estates during the first six months of the Company's financial year. The yield of tea in this period, viz., 145,600 lb., has been satisfactory, being 31,677 lb. in excess of that in the same months of 1891-92; so that there is every prospect of the estimate for the season, viz., 330,000 lb. tea being fully secured. The prices too realised, viz., about 56 cts. per lb. net by the Company's teas, have been satisfactory, seeing that the bulk of them came to a depressed market.

The cost of production per lb. of tea during the six months under review has necessarily been heavy since four out of the six months are those in which the smallest yields are always secured on these estates. The expenditure, moreover, has been increased by having to bear some R4,000 more than its share of such items as buildings, pruning, manuring, &c. The crop of 145,600 lb. tea has been put on board ship in Colombo at a little under 39 cts. per lb.; but the Directors estimate that the 185,000 lb. tea expected from 1st October to 31st March next will not cost more than 30 cts. per lb. About 144 acres of tea have been matured since 1st April with bulk, compost, and artificial. Notwithstanding the short yield and comparatively high expenditure, the result of the half-year's working should leave a profit equal to at least 4½ per cent. on the Company's capital, a result that the Directors consider augurs very favourably for the future of the Company, having regard to the time of year it has been realised and to the considerable storage of tea, which, being still young, is contributing as yet but little to revenue.

In not recommending the payment of an interim dividend the Directors are solely influenced by the fact that they would have to borrow money to do this, for the full share capital of the Company was paid over to the vendors of the estates, and a considerable portion of the six months' profit is therefore unavailable immediately for distribution. Cost advances taken over and preliminary expenses absorb a large sum, though the former are all considered good and are recoverable. Some 38,700 lb. of tea moreover are still unsold. Two of the Directors have recently visited the estates, and were much pleased with the general appearance and condition of the whole property.

A PROFIT ON TEA.

Our esteemed Canadian contemporary, *Hardware*, is in line in advocacy of working for good profits. It says:—"In spite of small profits there are here and there lines out of which the grocer can make a little profit. Tea is one of them; and it is strange that some do not make a greater effort to cultivate it. Practically the same sugars, fruits, canned goods, etc., are sold by all dealers alike, but with tea the case is different, and the very fact of this difference prevents cutting and gives each grocer an opportunity of making money out of it. The same class of tea will not suit every locality, but a good tea will take anywhere. The peculiarities of customers in the matter of taste require a good deal of careful study. But the taste once gauged, as it were, the next thing is to push the sale of the tea for all you are worth. It would be inadvisable to do so before you know whether or not you have got a tea that suits the majority of your customers."—*American Grocer*.

CROPS AND PROSPECTS IN THE PHILIPPINES.

HEMP—COFFEE—TEA—TOBACCO—SUGAR, &C.

Consul William Stigard, in forwarding the Commercial Report on Manila for 1892, states in his covering letter:—The difficulty of procuring statistics here is very considerable. He proceeds to give some account of the general characteristics of the Islands, remarking they are an extremely fertile group of islands, over 500 in number, rich both in soil and in minerals, which, together with the Carolinas, Peleus, and the Marianues, form an area of 116,256 square miles. Luzon is the largest island of the group, and has about 40,024 square miles of land area. Mindanao, the next largest island, lies quite to the south, and has something like the form of a crab, with one very long claw. It is very mountainous, and contains the highest volcano on the islands, Apo, which is still active.

The permanency of tropical temperature in the islands, however favourable for the production of sugar, hemp, tobacco, and vegetation generally, tells much even on the physique of the native inhabitants, who are mostly under sized and not too well favoured specimens of the Malay type. They are, however, when young, very docile, and make as "muchachos," or boys, very fair household servants. The natives are all called "Indios" by the Spaniards, and are, as a rule, unenterprising and indolent, unless well looked after. They are much in the hands of the priests, and are very superstitious. Their chief sports are cock-fighting and gambling, and most of the Malay men and boys have a pet "coq de bataille," whom they carry about like a baby on their arms, and whose comfort they look to before that of wife or children. Women, children and priests smoke everywhere, and especially in the streets. The people are, however, clean in their habits externally.

There are tribes in the interior in a savage or half-savage state—the Igorrotes of the mountains in the west of Luzon are one tribe of these, the Negritos of the island, of evident negro origin, are another, and the Moros of Mindanao, who appear to be descended from the Mussulman Dyaks of Borneo.

FLORA—The flora of the islands would require a long chapter for proper treatment. There is a great absence of flowering plants, and those which do flower have, as a rule, very small flowers, and the absence of odorous blossoms is as remarkable as the absence of singing birds. Vegetables—beans and peas, for example—are grown here by covering them up from the sun with trelliswork, covered with banana and other leaves, but most of the vegetables are brought from Hongkong. There is hardly any eatable fruit but mangoes and pine-apples. The sugar-cane, coffee plant, "abaca" or hemp, tobacco, maize and rice are the plants chiefly cultivated. As for the woods of the country their nomenclature forms an immense list, and the better kind of woods are too little known. Some of these woods are excellently suited for furniture, especially the "narra" wood, which has the look of mahogany, but is not so close in grain, while having a lighter colour.

TEA SEED OIL.

A London merchant, to whom we sent an Uva correspondent's sample of tea seed oil, reports as follows:—

"I duly received the small sample, and have had it carefully and exhaustively tested and valued. The sample was too small to enable us to ascertain accurately its commercial value, but there is little doubt: it would find a ready sale in quantity, say at £20 to £22 per ton as a safe quotation.

"You might induce 'Wallace' or some other of your enterprising correspondents upcountry to crush 5 to 10 tons of the seed, and send us the oil for sale in packages not exceeding 10 cwt. each, and let them put a brand on the packages, but avoid indicating that it is tea seed oil. With an appreciable quantity like this we could better

gauge the market, but I have no doubt, if it can be produced like the sample, that it has a commercial value, and that the price I have named is safe.

"I should like to learn whether the oil is produced by crushing or boiling? Any information as to this, and generally regarding the article would be acceptable.

"Tea seed oil is not a new product. It has been for long in use in China for cooking and lighting, but for some reason unknown to me it has never found a market here." We suspect it is too early in the history of our tea enterprise as yet to expect attention to be given to the extraction of oil from the seed on any considerable scale. But this may come a little later; and even now an experiment, such as is suggested in the above letter, might be made?

NOTES FROM OUR LONDON LETTER.

LONDON, Oct 13.

TEA OIL.

After more than one attempt, and after a long period of patient waiting in his office, I this week succeeded in getting hold of that much-engaged man Mr. Christie, the well-known dealer in tropical and other drugs. My object in endeavouring to obtain a few minutes of conversation with him was to try and learn from him something respecting the tea-oil to which you have lately referred on several occasions in your Overland issue. Mr. Christie could only give me on the occasion of our meeting a few very hurried words, but he has kindly promised me a fixed and more lengthy interview on some more favourable occasion. In reply to the few hurried questions I have as yet been able to put to him, he told me that this tea-oil is well-known in the market here as China oil, and has been a commercial product for a long time past. At the same time he does not think it to be possessed of much value, and it is—so far as I could judge from his rapidly made remarks—of but limited use or application. I shall hope to tell you more about this oil before long, but you may conclude from what has above been written that tea oil is not a thing likely to be in much demand, or worth the while of your planters to give much consideration to, nevertheless it occurs to me that it may be useful to follow up my inquiries into the subject, because we can imagine that there may be instances in which the leaf may become spoiled for manufacture into tea, which it might yet be available for the oil-press.

RAGALLA ESTATES COMPANY.

It was a surprise to me, after what had been told to me by Messrs. Dunn and Evans recently as to the dropping of the scheme for a Ceylon Estate Company with which their names had been prominently connected, to see that a Company had just been registered to the deed of which their names were appended. The following extract from last Saturday's *Investors' Guardian* furnished the first information had by me with respect to this new Ceylon venture:—

RAGALLA TEA ESTATES, LIM (39,657).

The co. was registered on the 25th ult. with a capital of £50,000, in £10 shares, to purchase or acquire in any other manner lands and buildings in Ceylon or elsewhere and in particular the estates known as "Ragalla" and "Halgran Oya," situated in the district of Udapusselawa, Ceylon; and, among other things, to carry on the business of farmers planters, graziers, cultivators and growers of tea, coffee, and other crops, miners, and shipbrokers. The subscribers are:—

M.P. Evans, 1 & 2, Fenchurch St. E. C., merchant	Shares	1
W. Dunn, 1 & 2, Fenchurch St. E.C., merchant		1
W. Harwood, 31, Lombard St. E.C., solo		1
J.P. Evans, 1 & 2, Fenchurch St. E.C., merchant		1
S.J. Wilson, 41, Mincing Lane, E.C., colonial broker		1
W. Schmidt, 10, Cornhill, E.C., underwriter		1
T. Mercer, 21, Mincing Lane, E.C., merchant		1
C.E. Strachan, 35a, South St. Mayfair, tea-planter		1

The first directors are:—C.E. Strachan, M. P. Evans, C. Hannen; qualn, £1,000; remun, £100 per ann each. Registered office, 1 & 2, Fenchurch St. E.C.

On reading this paragraph inquiry was made by me at the registered office for a copy of the prospectus, but I was told that it could not be permitted to be given to me as also that no information of any kind respecting the company would be made public, the association having a strictly private character. We have become too much accustomed to such refusals to think them either discourteous or singular. There are doubtless good and sufficient reasons for them, but is it not somewhat strange that as regards Tea Companies enterprise in Ceylon there is often shown so much disinclination to take the public into full confidence? This disinclination is not confined to the initiatory start of Companies connected with Ceylon tea cultivation. It is constantly exhibited with regard to their published reports. Some time back, desiring to systematize my method of obtaining such reports for forwarding to you, I took much trouble in preparing a list of Ceylon Tea Companies in London and in writing to each individually requesting the favour of information as to the date of publication of their reports. It was singular how few of the replies obtained exhibited a desire that these documents should receive publicity. The excuses were many and various, and although in some instances every information, and copies of reports when published, was promised, it has unfortunately proved to be the case that with but few exceptions the promises made have not been kept. Newspaper correspondents are therefore subjected to use enormous amount of trouble to obtain these annual documents, and we cannot conceive why the Companies connected with Ceylon should shew the publicity that others of a more general character directly court. Certainly as the rule, the reports made are usually very deficient in information as to details. Very recently, as you will recollect, complaint was made as to this deficiency at the meeting of one of the most important of the Ceylon tea companies that representing the Oriental Bank Estates. The only reply given by the chairman was that it was inexpedient to give the information sought for unless in privacy and confidence. What does this mean? There may be secrets in the growth and preparation of tea, but these can hardly exist in respect to some of the information desired. There is an air of mystery about Tea Companies working in Ceylon which does not attend the proceedings of any other Companies that are known to us here in London.

A NEW DEPARTURE.

Passing through Westbourne Grove of Whiteley farm, the other day, I saw it announced in the window of a newly completed shop that it was to be opened by the Kanagalla (?) Tea Company of Ceylon as a first class floral depôt, and that mild refreshments would also be served therein. This is a new departure in the history of home enterprise in Ceylon tea; but it seems to me to be one that will not improbably be a successful one. The swarms of ladies who are attracted by

Whiteley's emporium, as are flies round a sugar cask, will very possibly avail themselves in large numbers of the opportunity for drinking their afternoon cup of Ceylon tea in the midst of sweet-scented flowers.

PEPPER.

There is said to be probably no country in the Far East where better pepper is grown than in Cochinchina. Experts have given the palm to Cochinchina as a pepper-producing country, and yet nearly all of that condiment consumed in France is obtained from the London market, despite the fact that pepper from Cochinchina is asked to pay only half the fixed duty. The output of pepper for this year in Siam is looked upon as very encouraging, no less than 20,000 piculs having been reported to have been exported from Chantaboon.—*Straits Times*, Oct. 24.

INDIAN TEA EXPORTS.

The following paragraphs from the proceedings of the Committee of the Indian Tea Association, dated 29th Sept. last, only now published, are of interest to Ceylon planters:—

Read letter from Messrs. Finlay, Muir & Co, suggesting an alteration in the system on which the Association's Monthly Returns of shipments of tea from Calcutta are made up. The suggestion was to the effect that the figures should be taken daily from the Custom House list of Exports and an allowance made for all relands, instead of making up the returns from the actual clearances, as under the present system, in the case of a vessel clearing on the 1st or 2nd of the month, the cargo, although virtually shipped in the previous month, would not be included in the Returns for that month.

After a full discussion of the matter the committee were of opinion that the Association's system of making up the Returns, which was also followed by Messrs. W. Moran & Co., Messrs. J. Thomas & Co., and Messrs. Carritt & Co., was the most reliable, and it was resolved to address a letter to Messrs. Watson, Sibthorp & Co., asking them if they could not adopt the same system so as to bring all the circulars into line.

Read letter of 12th instant, from Mr. J. C. Stalkart, stating that he understood a World's Fair was about to be held at San Francisco, and suggesting that, if this was the case, Mr. Blechynden's operations should be continued another year on America, and that he should push Indian tea in that quarter. Mr. Blechynden was to be written asking if he had heard anything about an Exhibition at San Francisco, as no information of the kind had reached the Committee.

Considered also letters of the 9th and 19th September, from Mr. H. E. Grant, Allahabad, stating that he was going to Hobart town, Tasmania, for the Exhibition which was to open early next year, and offering his services as an Agent for the Association to push Indian tea. The Committee, however, were not disposed to entertain the application, and Mr. Grant was to be informed in accordance.

"LIPTON" TO MAKE COLOMBO THE HEADQUARTERS OF HIS EASTERN TEA TRADE.

Mr. Lipton's Agent here has just taken a new departure in establishing a separate office and stores in view of the growth of business and not because of any withdrawal from Messrs. Buchanan, Frazer & Co., of whose management of Mr. Lipton's interests, Mr. Duplock speaks in the highest terms. The offices taken are those formerly held by Messrs. Baker & Hall in Upper Chatham Street and a portion of the Fairfield Store

in Union Road, Slave Island. Now that Mr. Lipton is established in India, and his business in the East generally and Australia is growing so rapidly, it has become a matter of great importance that he should have a recognised headquarters in this part of the world. Mr. Lipton's interests in Ceylon are so large and Colombo is so centrally situated, that very naturally it has been selected as the best centre from which to work both in India and Australia. The possibilities of building up a big business here and there sometimes, are very great and we understand Mr. Lipton means to do it. But our extraordinary Customs Tariff is a big drawback: the duty on imported tea (25 cents per lb) for instance is the only hindrance in the way of Mr. Lipton doing all his Australian business from here, instead of doing it partly from London and partly from Calcutta. Is it not absurd that the big tea dealer and distributor should be sending tea to Calcutta, in order that it should be blended with Indians and sent thence to Australia?! A very considerable amount of occupation which might be given to the native population in Colombo is in consequence given to the Bangalis and much valuable time, and opportunities of steady shipments are lost. Freight from Calcutta to Australia is very irregular, while from here it is constant even though difficult at times to get. If Colombo is to attain to its true position as the great central trading Port between India and Australia, as well as Europe, it is quite evident that absurd and illiberal Customs restrictions will have to be abolished and the sooner the better.—Mr. Duplock expects by next Orient steamer a trained tea Assistent, Mr. Davis from London, to remain in Colombo, while Mr. Pohl, who was here for a short time last spring, takes charge under his direction in Calcutta.

In respect of the American tea market again, Mr. Lipton is determined to go ahead, and no doubt large shipments could be made direct from Colombo if antiquated restrictions were removed. The news from London is that Mr. Lipton was endeavouring to secure wholesale places at Montreal, Quebec, and New Orleans, as well as at New York and Chicago. From the last-named town the business in America will in the first place be started, and already the special blends of tea required for this new development of the business are decided on.

DRUG REPORT.

(From the *Chemist and Druggist*.)
London, Oct. 12.

CROTON SEED.—At today's auctions 45 bags from Ceylon sold at 10s to 21s for fair medium small seeds; from 13s to 17s; for apparently damaged dark seeds; and 7s per cwt. for common quality.

CUBBS.—The report that several parcels have been withdrawn from the market is confirmed. On the other hand, a new arrival of about 50 bags of fair commercial quality has just been landed and is held for 75s per cwt. At auction today 16 bags were shown, told brown berries being quoted at 80s per cwt.

CUSCUS GRASS.—Fifty bundles of this drug, of fair bright colour, but somewhat sandy, were bought in at 30s per cwt. There was no bid at 25s per cwt.

KOLA is in moderate supply, with which the demand more than keeps pace. Thirteen packages shown today were mostly sold at pretty full prices: good bright West Indian, 8s; mouldy ditto 6d per lb.; and African, rather dark and partly mouldy (without reserve), 3½d per lb.

QUININE.—At the close of last week, when the result of the Amsterdam cinchona-sales had become known, the quinine market began to show a further considerable improvement. About 25,000 oz. German bulk quinine (in second-hands) sold at 9½d to 9½d per oz.; and after these transactions the agents for the Mannheim works rejected an offer of 9½d per oz. which was made to them. This week, however, the article has been altogether quiet, and today it would be possible to buy at 9½d per oz. second-hand. It is said that there

is a large American order in the market waiting to be executed.

VANILLA.—At today's auctions only a moderate quantity of about 160 lbs was offered, and chiefly sold at steady prices; good to fine bright crystallised at from 8s to 14s; medium chocolate 3½ to 6 inches, at 7s 3d to 8s 9d per lb.

THE PERFUME-CROPS IN SOUTHERN FRANCE.

London, Oct. 12.

In the South of France the collection of jasmine is nearly finished. It will be one of the heaviest on record. The tuberose-crop which has been gathered earlier than usual, has only yielded a moderate result. Nevertheless, even the tuberose-output has been greater than the probable consumption, and the price remains low for both articles. The second week of October will witness the beginning of the cassie-manufacture. With regard to this flower, it is a noteworthy fact that the commoner quality the so-called *cassie romaine*, is scarcely saleable any more. Perfumers prefer to pay double or treble the price of this kind for other cassie varieties and the planters are therefore gradually exterminating the flowers of the "Roman" variety.—*Chemist and Druggist.*

LONDON REPORTS ON TRAVANCORE CEYLON PRODUCE. TRAVANCORE TEA.

(From *Patry & Pasteur, Limited*, Report of the Colonial Markets for the Week ending October 18th, 1893.)

These are only in moderate supply and of medium quality, which, in sympathy with similar classes of Indian and Ceylon, barely maintained previous prices.

Merchison	Bro. Pek.	Pekoc.	Pek. Sou.	Sonchong.	Bro Tea Dust.	Quantity.	Av. about.
10d, 7½d	7½d	6½d	30½ chs.	7½d

Total 261 packages, averaging 6½d per lb., against 9½d for the corresponding week last year.

THE GREAT WESTERN TEA COMPANY.

The first ordinary general meeting of the shareholders of the Great Western Tea Company of Ceylon was held today (Nov. 7th) at noon in the registered office of the Company No. 6 Princes Street, Colombo, Mr. J. C. Dunbar presided and the others present were Messrs. W. B. Baring, V. A. Julius, D. Nolle, Eric Anderson and H. G. Boie. The Chairman and Mr. Baring held proxies representing 467 shares.

The following Report by the Directors was submitted:—

In order that no disappointment may be felt through the non-payment of an interim dividend, the Directors have decided to present this short report to the Shareholders on the working of the estates during the first six months of the Company's financial year.

The yield of tea in this period, viz., 145,600 lb., has been satisfactory, being 31,677 lb. in excess of

that in the same months of 1891-92; so that there is every prospect of the estimate for the season, viz., 330,000 lb. tea, being fully secured.

The prices too realised, viz., about 56 c's. per lb. net by the Company's teas, have been satisfactory, seeing that the bulk of them came to a depressed market.

The cost of production per lb. of tea during the six months under review has necessarily been heavy, since four out of the six months are those in which the smallest yields are always secured on these estates. The expenditure, moreover, has been increased by having to bear some R4,000 more than its share of such items as buildings, pruning, manuring, &c. The crop of 145,600 lb. tea has been put on board ship in Colombo at a little under 89 cts. per lb.; but the Directors estimate that the 185,000 lb. tea expected from 1st October to 31st March next will not cost more than 30 cts. per lb.

Two of the Directors have recently visited the estates, and were much pleased with the general appearance and condition of the whole property.

The CHAIRMAN in moving the adoption of the report said they continued to receive most satisfactory accounts of the estate where everything was in the finest order and condition. Since this report was furnished the figures showed that the yield of tea to the end of last month was 180,500 lbs., which is 7,500 lbs. more than the official estimate up to that date. The tea was coming in very rapidly indeed. The prices realised for the half-year had been satisfactory, and if they could only maintain these prices and secure the yield originally estimated, when they met again at the end of the financial year, the statement that would be placed before them would be a very satisfactory one. In fact it did not require much calculation to see what the earnings for the season would be. Remark had been made as to the cost of production. Well, he thought it had now come to be generally recognised that tea ought to be manured. He was a very strong advocate of the use of manure, and he did not think they could spend too much money on cultivation. The estimated cost of production was 32 or 33 cents and of that 4 cts. was for the upkeep of the very large cattle establishment they had and for the purchase of artificial manure. If they deducted the cost of manure they would find that the cost of production was 29 cents per lb. for the year. For the first half year it was rather high, because, as the report showed, several things went into that which would not come into the second half year. The cost of production for September was only R26 97 cents per lb. and he thought that at the end of the year they would find that they had worked down to a fair figure while at the same time doing justice to the estate. The estate was well supplied with labour in every way and the coast advances stood at a reasonable figure about R7 or R8 per head. He did not think there was anything else he need say at present. This was only an *ad interim* meeting and he hoped that when next they met when the accounts for the year would be closed, there would be a larger number of shareholders present to hear the satisfactory report which he was sure would be submitted then.

Mr. NOBLE seconded and the report was unanimously adopted.

This was all the business and the meeting separated after according a vote of thanks to the Chairman on the motion of Mr. Julius seconded by Mr. Anderson;

LIPTON'S FIRE: COFFEE V. TEA.

The London correspondents of our evening contemporary and our own have made a curious blunder over the great Shoreditch fire, in suppos-

ing that the Store and Depot burnt contained a large quantity of tea. Our correspondent speculates on the effect on Mixing Lane, while our contemporary's cut-throat Herod by describing the sight of the tea burning! The Shoreditch store we need scarcely say was one of coffee only and of our old staple some hundreds of tons probably were burnt, besides a large quantity in packages of coffee essence, &c. To show the extent of the business done there, we need only mention that there was a steam engine of 60 horse-power, and a gas engine of 10 to 12 to drive the essence-making and other machinery. Originally, this depot was Mr. Lipton's headquarters and then he had tea as well as coffee there; but the headquarters and tea store are now in Bath Street; and certainly not more than 50 to 60 chests of tea in the street retail shop can have perished in the fire. It is the price therefore of coffee—a scarce article everywhere this season—that is likely to be benefitted. It is not expected that a man of Mr. Lipton's resources and energy will lose many days in being able to continue his preparations and supply of coffee—from temporary premises and arrangements.

BUFFALO BILL AND BARLEY COFFEE.

The handsome hero of the plains and proprietor of the Wild West Show has gone into a new enterprise, viz.: the manufacture of an imitation coffee from barley and wheat, to which mixture a coffee flavour, the discovery of a Dr. Powell, is added. Col. Cody calls the new article "pan malt," and claims it to be a satisfying and economical substitute for coffee. None has been placed on the market to date. —*American Grocer.*

INDIAN PATENTS.

Calcutta, Oct. 18.

Specifications of the undermentioned inventions have been filed, under the provisions of Act V of 1888, in the Office of the Secretary appointed under the Inventions and Designs Act, 1888.

No. 319 of 1892 —Angustine Cooke, Tea Planter, of Ranbi, Chota Nagpore, for improvements in appliance for the treatment of and pressing green tea leaf prior to the process known as firing. (Filed 4th September 1893.)—*Indian Engineer.*

SALE OF TEA IN AMERICA.

The first paragraph of the following London communication to our evening contemporary is reassuring, after the fears expressed that Mr. Grinlinton's use of "fine teas" might do harm. There is much truth in the following view of the case:—

Your Commissioner knows well what he is about. Get the thin end of the wedge in, interest people in your article, get them to talk about it, praise it, enlodge it as the most delicious tea grown by giving them the very best and the notoriety which leads to enquiry will be secured, and the retailers will soon push on to people your cheaper teas in their endeavour to secure a larger profit. When I commenced at the Health Exhibition in 1884 to introduce your tea to the British public, do you think my Ceylon tea-house would have become the rage it was if I had sold a common Ceylon. I chose the finest Rockwood teas I could procure, and for the first week I served everybody with cream. This set people talking and success was secured. Before a week was over all the officials were coming for their afternoon tea and their after-dinner, and they never forsook the house. When trying an article they are unaccustomed to, the Yankees must taste the best we have.

I have heard that a rent of £2,500 a year is being contemplated in connexion with the continuance, after the Exhibition is closed, of the sale of Ceylon tea. I should be sorry to be connected with any Company saddled with such an enormous expenditure. In these days the profit upon tea is "cut" very considerably, and it would take a very handsome sale of tea to secure the rent alone. Whatever is done, take the place only for one year. I should venture to predict that the second year would see the lessees less anxious to renew that tenancy than when they entered into possession. Whereas Henry S. King & Co.'s shop in Gracechurch Street, today, which was started on a precisely similar connexion, and for a precisely similar reason, except that they had the advantage of selling Indian as well as Ceylon tea? The idea of shops at Chicago, New York, Montreal, and other places that Mr. Grinlinton mentions as the way to continue the sale of your tea reads very well on paper. But when you get it into actual practice who is going to manage these shops. Employés are all very well when they are looked after. But they want looking after daily. So do the expenses. So does the cash. You cannot compete against shopkeepers unless you have the same advantages. I should like to know what Yankee grocer would like to have the enormous distances, as contemplated by your Commissioner, between his branches. It is this sketched idea of Mr. Grinlinton that convinces me that, however good he may be at doing the talker-talker perfectly necessary at such an Exhibition, and however good an organiser he may be (with £30,000 to spend), he knows nothing whatever about the conditions necessary to successfully run a shop, and that he will lose his money and that of subscribers to such a scheme if he carries it out. So will the Ceylon Tea Company Limited. That Company will soon find a branch at Chicago is a veritable "white elephant," and the shareholders will rue the day when they decided, if they do decide, to launch out so far away from their base.

TEA PLANTING IN INDIA AND CEYLON.

AN ASSAM PLANTING VISITOR.

We have had a very experienced Assam planter in our midst in Mr. John Stewart whose experience of tea in India goes back thirty years and to the days when averages were 4s to 5s the lb.—an experience, alas! not likely to return. Mr. Stewart has had a wide and varied experience during some 27 years of almost continued work as manager and managing proprietor of large concerns in several divisions of Assam. He has been at home for the past four years and is now on his way out (with Mrs. Stewart) to inspect properties in which he is interested, and he has taken Ceylon, where he has relatives and friends among the planters, on the way. Mr. Stewart has spent some days in Dikoya, Bogawantalawa, Dimkula and on to Haputale where he has been with Mr. Morison of Dambetenne, whose large clearings of young tea at 6,000 feet altitude and over were of special interest to him. He was also pleased with the tea on Norwood and parts of Bogawantalawa: the best cover of tea he has seen was Mr. Hill's Harrington. Several things astonished Mr. Stewart after his Assam experience: among the rest to see tea growing among stones and rocks, to note the close planting even on old coffee land—(the poorer the land he would say, the wider apart!)—the style of transplanting from nursery to field without any large ball of earth round each plant such as they are careful to have in Assam notwithstanding their rich soil, the cheapness of the labour (though he takes a serious view of the "advances" liabilities) and finally the long time given to rolling the tea—1½ to 2 hours against less than an hour in Assam. The large area of young tea—some thousands of acres—he passed

through has strongly impressed Mr. Stewart and he wonders what is to become of the increased production both here and in India where planting is also extending every year. Mr. Stewart would be a strong advocate for India raising a Tea Fund—by a Customs cess after the fashion of Ceylon if possible—and the two bodies of planters (India and Ceylon) working shoulder to shoulder to drive out China tea from Russia as well as America and Australia, while exploiting fresh fields for consumption elsewhere.—Of all the enemies of tea, Mr. Stewart thinks "mosquito blight" most troublesome, the insects, very similar to mosquitoes, multiply so rapidly and are too small and numerous and too quick in their mischief to be dealt with effectively. In his experience, badly planted, weak poor jāt fields have always been the first to suffer; and he thinks there is room for improved jāt in Ceylon and for an improved style of planting. As for the country and life in the hills of Ceylon—in climate, scenery, means of transport, &c.—Mr. Stewart was charmed, and thinks tea planters at over 4,000 feet here ought to be thankful for their lot, so long as tea continues to pay!

A CEYLON PLANTER IN BRAZIL.

[We have received a long communication from Mr. A. S. Blacklaw on the siege, which will appear in our next Monday morning's issue. Meantime we give the following.—Ed. T.A.]

Rio, 23rd Sept. 1893.

DEAR OBSERVER,—As I mentioned in my last communication, public curiosity was centred in Santos, which one may call the second city of the Republic as regards the value of Imports and Exports, being the port of export of the greater part of the coffee which leaves Brazil for Europe and the United States.

The news is confirmed that the "Republica" and one of the prizes taken in Rio harbour—these are two of the five which had forced the bar of Rio on the morning of Monday the 18th—had appeared at Santos. Their appearance there has created a panic. Telegraphic communication being stopped, the Santos newspapers (come by private means) give details. The most important to note is that the two vessels do not show any damage from the firing of the three forts as they passed out of Rio harbour.

Shots were exchanged between the "Republica"—the armed vessel—and the fort at Santos, but no damage was done, unless knocking in some old walls and wounding some two soldiers out of the 140 defending it. It seemed—on the part of the two ships—to be a look-in to let the people of Santos know that they had passed the strongly fortified harbour of Rio without damage.

A regular exodus commenced from Santos in two days. 2,700 passengers left by the English railway for the interior and others who could not get by rail fled to the outskirts of the town. This is foolish, for the insurgents do not show a disposition to attack innocent people, or places that are undefended in Rio. Yesterday afternoon one of the vessels, taking a position right under the nose of one of the fortified places, tempted the land batteries to fire which was responded to. The result as usual was killing innocent people—a poor woman who was leaving the town from fear of the firing, and an advocate who was proceeding to his home on the outskirts. The latter it is supposed—had missed the castle hill battery, and landing far beyond it happened to land in the part of the town where these people happened to be.

The two papers, the *Paiz* and the *Troupe*, are, of course, very sentimental over the affair, and it is no doubt lamentable that innocent people have to suffer for the sake of these insignificant political squabbles—for one can call the whole "negocio" nothing else.

Place-hunting and military despotism are at the bottom of it all. Until they can get rid of the latter, these outbursts of revolutions will always happen. The people have themselves to blame, for they will

not use the voting power their Constitution gives them; and they are led by the nose by professional politicians who take to politics for the money they can make by it.

In Rio, yesterday up till night, even with all the firing in the bay, loading and unloading of ships continued, but launches and lighters had to be under a foreign flag.

The quays are lined with *Govardus National*; but even then, the steam launches of the Rebel ships succeed in occasionally taking some valuable prizes, right under their noses. Three fine Brazilian steamers were taken only yesterday from a wharf where they were unloading, during broad daylight.

Parliament has only two more days to sit, the President having given his veto against the bill preventing him from being re-elected. The house which prevented it has the right to over-ride his veto by a vote of three-fourths. It has been proposed again and requires to be voted only—the discussion on it being closed—but there cannot be members enough found to attend to vote (it requires a house of 110 before a vote can be taken.) These fellows do not want to vote this measure, as this would probably cost them their seats at next election, and, of course, all the emoluments and patronage which it gives them would go to others.

The most of them have already gone home, the steamer which takes this will bear away from Rio all those for north of Bahia, so this President will have it all his own way for a year longer that is to say the elections can only take place in March 1895, and as from the time of their independence some seventy years ago the party who happens to be in power always wins the election, the state of Brazil may continue the same for some years. For Floriano Peixoto is determined at all hazards to keep in power with the support the military give him. Coffee planters have all along held aloof from politics being content to gather in the extra cash which their coffee gives them by the low exchange, for the gold value of coffee has always kept up, while the cost of production has not increased. 27d is the gold value of the milreis and the forced circulation of paper money has made them currency only on an average of 12d, and when the banks begin to do business it will be about 10d or even less after this row. So the wealthy people in the interior will not offer opposition to the present Government in Rio. As might have been expected, when firing began yesterday afternoon the people made a stampede for the outside of the town; again every place where they could find shelter would be occupied—even the virgin forests in the hills round the town would be occupied.

It seems to me a storm in a teapot. I was on the top of a hill right behind where the foreign fleet are anchored yesterday, while the firing was going on; and it was ridiculous to see such child's play, the fort firing at the ships at least three miles off and *vice versa*. I could notice no hits on either side. The ships did not fire in the direction of the town. The stray ball which killed two people although said to be from the ships, could much more readily be from the Santo Cruz Fort, passing wide of the mark. Commercial interests suffer a great deal and people of nervous temperaments seem to get almost distracted during these stupid displays.

We receive European telegrams now, if written in plain language without reference to Brazilian matters; but local telegrams are entirely blocked and all channels of information, either ingoing or outgoing are entirely under police censorship. A. S. B.

HOW TO TEST SEEDS.

The following interesting details on the subject of testing seeds, copied from an exchange, are worthy of perusal by farmers, gardeners and settlers generally:—It is of the utmost importance to everyone to know how to buy seeds. When you want new seed peas put one from the stock into your mouth and bite it. If it is very hard it is more than one year old. If the teeth enter it with moderate ease, it is new seed.

New carrot seed always has a green shade on it. Old seed loses this, and is of a dead pale brown, and less fragrant. New parsnip seed has a shade of green, which it loses if more than one year old. Onion seed is more difficult to prove than most other seeds, but if you take a single seed at a time and carefully bite it you will find that the old seed has a tough, dry skin, with a very white and harsh kernel, while new seed has a more tender moist skin, and the kernel possesses a greater degree of moisture, and is somewhat oily. The seed may be cut with a penknife instead of bitten. Onion seed that has no vitality at all has no kernel, or one perfectly dry. Test this by pressing the seed on a piece of white writing paper. If it leaves no moisture on the paper it is of no use, and has been tampered with, and has lost its vitality by age. New cabbage and broccoli seed possess a pale green shade in the kernel when pressed out or cut, and a tinge of green in the brown skin also. But old seed loses this in proportion to its age, becoming of a dull dark brown. Cabbage, brocoli, wales, etc., will retain their vitality longer than any other seed, and will grow when three years old, or even six years when well kept. Beet seed has a faint tinge of pale green if new, but is a dull brown if old, and its vitality is very doubtful if old. New celery seed has a faint tinge of green, and is very aromatic, but it loses the green and becomes less fragrant if more than one year old, and is doubtful. Lettuce seed is of a bright silvery grey if new, and the kernel has a green tinge with it, both of which it partially loses with age. Lettuce seed will grow very well two years old, but above that age it is doubtful. The black-seeded varieties can only be tested by the colour of the kernel, which is the same as in the white-seeded.

CACAO-GROWING IN THE WEST INDIES AND CEYLON.

(Communicated.)

The Report on the failure of the cacao crop in Dominica* (1892-3) made by Mr. Barber to Government cannot fail to be of special interest to Ceylon cacao growers as the causes that led to the failure of crops in the West Indies may at any time overtake the growth of the same product in our island. And to be forewarned is to be forearmed. Yet there is one dreaded physical agency in operation in the West Indies, of which, we in Ceylon should be thankful to say, we are entirely free; and that is the prevalence of hurricanes, which do disastrously affect the plantations in those islands. Passing over the consideration, therefore, of this one external destructive agency, against which the planter is practically powerless, it will be of profit to the Ceylon grower to look upon the others as common causes that may lead at any time to failure either here or there, just in the same manner, under similar conditions.

Foremost among the enemies and pests affecting the cacao tree in Dominica, Mr. Barber places the root disease. In describing this it may be of importance to use his very words:—"A tree in apparently good soil and of considerable health and vigour suddenly dies off from the root. The neighbouring trees are seen shortly to be similarly affected and frequently the patch of infected trees attains considerable dimensions." He describes it further on as affecting also Liberian coffee. Yet it is possible that his examination was superficial. All the same he sold out. It is, however, quite clear now, from the light thrown on the investigation by so eminent an authority as Mr. Barber, that there is a pest or root disease which has disclosed itself among the West Indian plantations. It is noticed by the destruction of patches of trees in a plantation, and is readily traced to the mycelium of a fungus. "In all cases" he says, "I have succeeded in discovering a white fan-like net-

* Report of the failure of the Dominica Cacao Crop (1892-93.) by C. A. Barber, M.A., F.L.S.—Supplement to the *Leeward Island Gazette*.

work of hyphae between the bark and wood of the roots, (i.e. the cambium) and by this fan-like network the root-fungus may be known."

Whether this disease has nowhere manifested itself in Ceylon or if it has whether it has escaped our comparative superficial observation hitherto, remains to be seen. With the berries still clinging to the withered branches, it gives to the tree the appearance of having undergone the process of petrification.

Now this, it may be here noted, is not altogether unknown to Ceylon; as Mr. Vanderpoorten when he was here a couple of years ago complained to the writer more than once that patches of his cacao died out in a mysterious fashion. It was asked whether he manured the trees sufficiently, or whether he overdid it; if he forked up the soil; if there was slab rook at bottom in these patches; or too much moisture judging from the situation of the particular field. In short he was plied with one and all the questions that would suggest themselves to an old cacao planter. His characteristic answer came in the shape of a query—"Do you think that a proprietor enjoying good profits and years of experience, as I had, would have neglected anything even the most distant suggestion?"

But one thing is certain that one is naturally in a hurry to invite the public to go and see his plantation "petrified" in patches; or so ready to run down cacao in the island as the one proprietor who insisted that cacao was doomed in Ceylon, because he lost some trees in patches in spite of all his experience and care in its cultivation and treatment.

At the present moment there are tea plantations in the lowcountry where, if you take the evidence of competent visiting agents, *Helopeltis* is doing considerable mischief, and is increasing rapidly; but you hear little discussion about it in the papers.

Yet some say the time may come, though we hope sincerely never, that a Government Commission or one from the P. A. may be appointed to sit on the prolific bug and investigate matters; as it came about in the days of the decline and fall of coffee when Morris went out on his campaign and the coffee planters resorted to this expensive treatment he suggested with sulphur. But it was too late and "The sulphur blowers an a'an a'" found the crop did not pay the hundred pipers an a'an a' to "blow" the sulphur over the leaves of Valambrosa, and so they diverted their attention to the discussion of the cool wages bills that followed in the wake of the disaster.

But now before we proceed further into the subject of cacao let me throw out a suggestion to the afflicted tea planters from the visitation of *Helopeltis*.

Most insects swarm into bungalows in the night attracted by the lights in the bungalow. If it be ascertained that the *Helopeltis theovora* is partial to light and is drawn by it, how would it do to clear up portions of the plantation at certain distances at the sacrifice of a few trees and to have regular bonfires lighted in these places by night. It will be well to begin the experiment at once and so check the spread of the pest, if it can be done. There is the sacrifice but it must be faced. But to turn to the cacao root fungus and its life history as detailed in the Report:—

"The fructification is, I believe, a lateral outgrowth of mushroom-like character which is usually seen on old trunks of dead trees a few feet from the ground. But it is the insidious mycelium which creeps from tree to tree beneath the surface that we have to fear and one feels helpless against it."

UDUGAMA TEA AND TIMBER COMPANY, LIMITED,

The first ordinary meeting of this Company was held at Messrs. Mackwood & Co. Offices at 3 p.m. today (Nov. 10th).

Present.—Messrs. J. N. Campbell, W. H. Figg, A. P. Green, E. Beuham, T. B. Campbell, R. D. Kershaw (representing T. S. Dobree), H. W. Unwin, (representing Rev. W. E. Rowlands) and Mr. A. F. Conio (Superintendent.)

DIRECTORS.

The Provisional Directors having announced their retirement. Mr. J. N. Campbell was elected to the chair and Mr. A. P. Green moved and Mr. W. H. Unwin seconded. That the following be appointed Directors:—Messrs. J. N. Campbell, W. H. Figg, T. S. Dobree, H. Creasy and C. P. Hayley. This was carried unanimously.

ALTERATIONS IN PROSPECTUS.

The Chairman then stated that as the whole capital had not been taken up it had been arranged that the vendors should take a larger proportion of the purchase money in fully paid up shares and on these terms the Directors propose that the Company should go on with the lesser capital subscribed. The arrangements having been fully explained the resolution that the Company should go on the new conditions was carried unanimously and all the shareholders present signed a memorandum accepting the alterations. After one or two questions had been asked and answered, the meeting closed with a vote of thanks to the chair.

INDIA TEA CAMPAIGN.—We call the attention of our tea planters to an article from the *Indian Planters' Gazette* in our *Tropical Agriculturist*; it shows that at last they are fairly waking up in India to the necessity of following the advertising and exploiting example of the Ceylon Tea Industry a little more freely. We wish our Indian brethren all success

THE MAGAZINE
OF
THE SCHOOL OF AGRICULTURE,
COLOMBO.

Added as a Supplement monthly to the "TROPICAL AGRICULTURIST",

The following pages include the contents of the *Magazine of the School of Agriculture* for November :—

Vol. V.]

NOVEMBER, 1893.

[No. 5.]

GOVERNMENT DAIRY FARMING
IN INDIA.

THE subject of dairy-farming has now a special interest for us since the establishment of a government dairy at Colombo. The policy of government in founding this institution, in order to secure a reliable source of milk for the medical institutions in the capital, has been much discussed, and though there are still a few who stubbornly assert that the policy is a bad one, and that there is no more virtue in a Government dairy than in a native cowshead, the opinion of those whose opinion is worth something, is that the establishment has supplied a long-felt want. It is interesting to read from time to time of the progress of the Government dairies that have been established in the neighbouring Continent. We have already referred to the Poona dairy farm, and would here make reference to an account of the Allahabad dairy, which appeared in the *Pioneer* some time ago. Says the writer of the account :—

"It may be noted as a curious fact that although the military authorities have done many things for the comfort and health of the British soldier in India, they have most unaccountably never seriously considered one of the

most fruitful sources of disease among the troops, viz., the milk and butter supply. As with grass and other supplies, the contract system has been accepted in the case of milk, and in all probability enteric fever frequently owes its origin to the milk supplied for the use of troops, resulting in many cases in the death of hundreds of young soldiers who cost the Government large sums of money to import. The outbreaks of enteric fever at Rawul Pindee, Lucknow, and some other cantonments recently have been traced by some to the milk supply, and there is a strong belief that if similar outbreaks are to be guarded against in the future, some radical changes must be made in the system of milk supply. This conclusion has been forced upon the attention of the military authorities by recent events, and one result of it is the establishment of cantonment dairy farms. The reason why such a step was not taken earlier was, I believe, that there was some fear of its interfering with private enterprise. But if private enterprise will not rise to the occasion, it cannot reasonably expect the Government to sit quietly and see hundreds of British soldiers carried off by preventable diseases without taking measures to find a remedy for the growing evil. Cantonment dairy farms have been established at a few centres, notably Allahabad, Cherat, and Aligarh, where they have been worked with such marked success, that during the short time they have been in existence a gratifying decrease in the sickness and mortality of the troops has been observed. That the Government have done well in starting the Allahabad dairy may be gathered from the fact that the working of it during six months has resulted in a profit of Rs. 1,300. But apart from this, the immense benefit the troops have derived from a pure and wholesome supply of milk and butter should outweigh other considera-

tions. The general public will, I have no doubt, hail with delight the extension of this pure milk and butter supply to them; and this is a point that I would strongly urge for the consideration of the responsible authorities.'

The *Indian Agriculturist* thus refers to the subject of dairy farming, and makes mention of the success at Allahabad as an inducement for the establishment of dairies in Calcutta:—"In view of the results that have attended the experiments in dairy farming recently made under Government auspices at Allahabad and elsewhere in the North-West Provinces, the want of enterprise which has hitherto left the large European and Eurasian population of Calcutta at the mercy of the *goala* (milkman) for its supply of two such important articles of food as milk and butter becomes more inexplicable than ever. Hitherto the theory has been that, even with high prices prevailing in the metropolis, the industry on a large scale, or in the hands of any but natives of the country, will not pay."

* * *

"The cost of keeping cattle would, no doubt, be higher in Calcutta than it is at Allahabad; but, on the other hand, the market prices of the produce are at least 75 per cent higher in Calcutta, even for the highly adulterated compounds commonly sold as milk and butter. Unless there is anything in the climate or soil which would render it impossible to keep cattle of the same quality, or to obtain the same quantity and quality of milk from them, in Calcutta, or its neighbourhood, as at Allahabad, which we do not believe, the inference is that, with the necessary care and honesty a very handsome profit might be realised from a properly conducted farm." Reference is then made to the Allahabad farm where, with a small herd, the nett profits for 6 months amounted to Rs. 1,300 (the capital invested having been less than Rs. 4,000) which is said to represent an annual percentage that "throws the result of the most flourishing of our industrial enterprises into the shade." In conclusion the *Indian Agriculturist* makes the following remarks:—

"The whole secret of success appears, in short, to lie in a proper choice of animals, combined with judicious feeding and cleanliness. Of the sanitary results of the substitution of a supply of pure milk and butter for the troops for the wretched stuff on which they previously depended, no actual statistics are given; but we are told that there has been a gratifying diminution of sickness and mortality. An attempt was, we see, made at Allahabad to introduce the Danish system of having the cattle brought in from the adjacent villages to be milked at the farm; but it was found that the *goalas*, however carefully supervised, could not be prevented from feeding their cows with unsuitable materials and watering them from impure sources."

In Ceylon, too, we have the complaint, to make that the cost of upkeep of the animals is high, and the price of good milkers is about double their value in India, but again dairy produce fetches rather more here than there. Let us hope that the Ceylon Government dairy will have as good an account to give of itself as its sister institution at Allahabad.

TO THE CREDIT OF WEEDS.

This is the title of a thoughtful article by Mr. G. C. Hill in the *American Agriculturist*. It is doubtful, says the writer, if any thing brought more grey hairs to our forefathers' heads than their perennial worry over weeds. The plants that nature so freely sows and favors with such tenacious qualities, could not fail to be a sore trial to farmers who had little more than a hoe and their fingers to work with. No wonder that the sight of a weed, even in autumn, sent a chill to the spine; and no wonder that a feeling of hatred for such offenders became a part of the common legacy bequeathed to the present generation. The result was that we dropped almost unquestioningly into the old way of regarding a "weed" as a thing of unmitigated evil, a "robber of the soil;" and it became almost heresy to think otherwise. Even to-day a progressive thinker and investigator who discovers a useful quality in the condemned plants, hardly dares to mention it, lest the popular verdict place him as an advocate of slackness in farming.

A student of the weed problem must impartially consider: 1. The good weeds do. 2. The harm they do. He must also give due recognition to the fact of their existence, and cost of getting rid of them. In other words, the debtor side must show a balance equal to the cost of extirpation before such work can economically be undertaken. In the practical dealings with weeds, they may be separated into two classes; and every farmer draws the dividing line for himself, for there is a wide difference of opinion as to where it belongs. The first class includes those that can be, and should be, entirely eradicated from the farm. To it belong plants that have a strong tendency to monopolize the soil, regardless of its present occupancy, and whose hardness and tenacity render it difficult to control them when they get a foothold. This class seldom has more than a very few kinds on any one farm. For these plants there is nothing to offer but extermination. Under the other division is included the numberless common weeds, mostly annuals, which spring up so readily on vacant spots or along the intervening spaces of crops planted in rows. The harm they do depends greatly on the treatment they receive. The cultivator is however apt to forget that the stirring the soil receives in the eradication of these weeds is no more than is needed for the good of the crop, and which would be needed just the same if there were no weeds in existence. In regard to being a "robber of the soil," no plant can impoverish the soil if it decays on the spot where it grew.

Among the benefits the soil may derive from a crop of weeds are those accruing from these facts: 1. Weeds shade the soil. 2. They furnish a mulch. 3. They supply vegetation to be ploughed under. The influence of a burning sun on a naked soil is not fully understood. It is generally conceded, however, that it has a harmful effect in some way. "In not one, out of several experiments," says Mr. Hill, "have I been able to raise more than three-fourths of a crop on soil kept naked and frequently stirred during the

previous July and August." The value of a dead mulch is unquestioned by any. In some way both live and dead mulches favor nitrification in the soil, and the earth is made richer apart from the decay of the covering. Even a cover of boards, or stones is known to bring about enrichment of the soil. Concerning the value of a crop for ploughing under, the common verdict stands in high approval. Any crop is considered valuable for the purpose. That a crop of ordinary weeds is as valuable as one of clover, I do not claim. Yet it is not improbable that some among the miscellaneous growth may be nearly, or quite, as good a collector of nitrogen as the clover.

To place an estimate on the aggregate benefit of weeds would be a difficult task. That it is sufficient to be worthy of consideration, is a fact that can hardly be questioned. On the great Western American farms they furnish about all the fertility that is ever received. It is not improbable that they do much more in keeping up the continued richness of soil than is ever credited to them. The fall crop of weeds costs nothing. If a system of agriculture shall make profitable use of them, it saves the hard work of keeping them down. There is also a great saving of worry over conditions that are often unavoidable.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

In the last instalment of these notes reference was made to the various orders of Insecta, and especially those which were most harmful to agriculture. We do not purpose taking up individual insects and referring to their physiological characteristics and habits of life in detail, for we shall then be encroaching upon the domains of the science of entomology. We would, however (to show the importance of an acquaintance with this sub-kingdom of zoology), point out that all insects may be roughly classified as biting insects (*Mandibulata*) and sucking insects (*Hausellata*): to the former class belong the Coleoptera, Hymenoptera, Orthoptera and Neuroptera; to the latter, Lepidoptera, Homoptera, Heteroptera and Diptera. The biting insects (the beetles for instance) are furnished with two pairs of jaws, the mandibles for biting, the maxillæ for chewing. In the sucking insect (such as the butterfly) the maxillæ are transformed into two long slender tubes so as to form a canal through which liquids can be sucked; this canal, which can be coiled up when not in use, is called the proboscis. From what has been said, students will to some extent be able to classify insects as biting or sucking insects, as well as, in some measure, to place them in the different orders in which they have been grouped principally according to the structure of their wings. But it is often not so easy to state the natural order to which a mature insect belongs. Beetles, moths and dipterous insects are sufficiently distinct; but as many insects (all those that pass through a complete metamorphosis) are specially destructive to vegetation in the larval stage, it is of practical importance,—especially with a view to adopt remedies—to be able to determine of what order a larva is a member.

Dr. Fream gives the following as a guide to this process of identification:—"A legless fleshy grub, with a soft, fleshy, retractile head (a "maggot") is usually one of the diptera. An active six-legged grub, with a horny head and strong jaws, is usually that of a beetle (coleoptera). The so-called caterpillars, long, soft (sometimes hairy), with prominent head and jaws, and furnished with sixteen legs, belong to the lepidoptera. When several of the intermediate legs are absent, a "looper" caterpillar results. Active leaf-eating larvæ, with from 18 to 22 feet, usually belong to the hymenoptera, and are termed "false caterpillars." It will be seen from the foregoing notes that a knowledge of the zoology of insects is most important, in that it helps us, in a great measure, to find the means of dealing with them when they appear as agricultural pests. The biting insects which destroy vegetation by gnawing, can be reached by some poison (e.g., arsenical compound) thrown on the leaf itself, so that when they consume the leaf, they also take in the poison and are killed. In the case of the sucking insects, something (e.g., kerosine) must be forcibly thrown on them, which in itself is fatal by contact. It should also be borne in mind that insects breathe by means of air-tubes (tracheæ) which open at the surface of the body, so that by clogging up these pores with powders or other materials, an insect may be suffocated, and many methods of destroying insect pests are based on this fact also.

N.B.—In the August number, in enumerating the characteristics of the individuals belonging to Insecta, they were said to "breathe by means of trachea," (wind-pipe). This last word should have been *tracheæ* (air-tubes).

THE DAIRY.

Never allow your cows to be hurried to and from the pasture, and never allow a dog to worry them. In fact a dog is a useless thing around cows. He invariably barks or in other ways annoys them. Cows should be kept as quiet as possible, that the milk may be normally secreted.

It is a disappointing time when one sees the calf that has been growing thriftily while fed by its mother, begin to look rough in the hair and thin in flesh, as it comes to the changed condition of feed when once it has been weaned. It is just here that much of the trouble comes in attempting to raise calves. It is the suddenly changed condition of food that damages the small animal's digestive organs, and for a while appears to stop its growth entirely. The remedy is the making of the change from the mother's milk to the new food as little of a change as possible at first, and to make this change very gradually. The great point is to make the change so gradually as not to disturb the digestive functions, and no small part of the care required to do this is having the prepared food always of the warmth of new milk. After it has grown strong and lusty on its new diet, the calf may have some grass or hay, but not too much, as by overtaking both the capacity and digestive

powers of the stomach, it will tend to become "pot-bellied" and unthrifty. If scour occurs, even when all care is taken, a drink of milk freshly drawn from the cow will prove a corrective, while constipation may be corrected by the addition of laxative food, such as boiled bran. If such a system is followed, and the little animal is kept warm and given a dry pen, the change from their dams to the pail can be made with little difficulty.

Stock of all kinds are not unlike mankind in some respects, and seek shade whenever possible during extreme heat. To gratify this desire, shade should be provided wherever practicable by means of trees; otherwise, and while trees are growing, it would be only humane to provide a temporary shelter of some kind, such as setting up a few posts and covering with poles upon which are thrown branches of evergreens or even limbs of trees in full leaf. This will afford a useful shelter.

An American paper recommends that a handful, or more, of salt thrown into the churn when the cream begins to granulate, assists in the separation of the butter, while the butter milk will draw off much more freely. We have tried this, and found it true.

A case of great interest and importance as bearing upon the adding of water to milk came before the London Police Courts. A respectable farmer was charged with sending milk to the metropolis, which in one instance was alleged to contain six and in another seven per cent of added water. It turned out, however, on Mr. Lloyd, the well-known analytical chemist, examining samples of the mixed milk of 17 cows belonging to the defendant who had the animals milked in the presence of the chemist, that they contained eight per cent more water than what is regarded as the normal standard. The explanation offered is that the water over the usual proportion was due to the exceptionally poor quality of the milk; in other words, to the very small percentage of solids, and that was to be attributed to the miserable quality of the herbage caused by the character of the season.

The *Scottish Farmer* writes as follows on the above case:—It shows that in exceptional circumstances milk may contain a large percentage of water without any being added from "the cow with the iron tail"—in other words, without any water being literally mixed with it. It is of the utmost importance that the public should be protected against paying for water when they should have milk. It is so from an ordinary commercial point of view, and it is so also from the further consideration that the people should get nourishing food when they believe they are purchasing it. But it may be asked, Is a man to be liable to be punished for adding water to milk when in reality he vends it in its strictly natural condition? Of course there is a way of feeding cows with sloppy food for the express purpose of making them produce a large quantity of poor, thin milk which, when sold by bulk or

per gallon, will yield a large return. While that should be provided against, it may be hard on a farmer, such as in this case, whose milk is watery although his cows are feeding on the natural pastures in the fields.

Mr. Francis Watt of the Government Laboratory Antigua, has wisely exposed the defects in the use of the lactometer:—The lactometer merely indicates the density of a fluid and gives no indication of its character; and if plunged into any solution having a density of about 1.030 will indicate it as "pure milk," hence any addition to the adulterated milk which will raise its density to the required point will render the lactometer inefficient to detect the addition of water.

Another and more serious defect arises in the following way:—The cream or fat of milk has a lower density or is lighter than water, (the reason why it floats on the surface) hence if the cream be removed the remaining skim milk will have a higher density than normal milk, and the density in this way may be brought up to 1.036 or 1.037 (that is 36 or 37 on the lactometer). If now water is added in proper quantity, the density may be reduced to 1.030. Here then we have the lactometer indicating as "pure milk," milk doubtly sophisticated, firstly by abstraction of cream, and then by addition of water. The lactometers commonly made are adjusted at a temperature of 60° F., being intended for use in temperate climates. Should it be necessary to use a lactometer graduated at 60°, at a temperature of 82° or 84° F., then 3° should be added to the reading. Thus a sample of milk tested with a lactometer graduated at 60° and showing a density of 27, should have 3 added, thus bringing the true density up to 30. The lactometer may be tested by floating it in pure rain water when it should float to the 0 mark, since the specific gravity of water is 1.000; if it is graduated at 60° and is floated in water at say 84° F., it will sink about 3 degrees below the 0 mark, and in this way the amount to be added to the readings to correct them for temperature may be found. It is very desirable that every instrument should be so tested before use in order that any error may be detected and allowed for in the manner described.

The lactometer is a useful instrument to the dairyman who superintends the milking of his cows, and enables him to ascertain the quality of milk of different animals so far as the percentage of water in milk is concerned; but it is of little or no value to the purchasers of milk. The evil in the use of the lactometer, however, is that few know its exact character and capabilities or how to use it correctly. Most people make no allowance for the temperature of the milk when tested, not knowing that the specific gravity of a fluid varies with its temperature. Fortunately for the dairy industry, as well as for buyers of milk, there is now more than one means of rapidly and conveniently testing milk.

Dr. Voelcker, the well-known chemist of the Royal Agricultural Society of England, regards the popular idea that morning's milk is of a better quality than that drawn in the evening as a fallacy. As far as his experience goes, he says, the result

depends on the quality and quantity of the food which is given to the cows four or five hours before milking. "If the supply of food given in the day time be good and plentiful, and that furnished in the evening be unnutritious and scanty, the evening's milk is of the better quality. On the other hand, when the cows get a good supply of rich food in the evening, and are stinted or fed upon very watery food during the daytime, the evening milk is the poorer."

MAN AND BEAST.

Tuberculosis is another disease of cattle which is communicable to man. It is a matter of great difficulty to diagnose a case of tuberculosis in its early stages, though the characteristic manifestations in the later stages of the affection can never be mistaken. On *postmortem* examination tubercular growths varying from the size of a pin's head to a pigeon's egg are invariably found in various parts of the body, and commonly in the lungs. These nodules contain the germs of the disease, and the meat, but especially the milk, of affected animals are capable of communicating the disease to those who consume it as food, developing in the human race the common-enough-disease known as consumption.

Actinomyces is a new disease only in the sense that it was formerly confounded with other perfectly distinct affections, chiefly cancer and tuberculosis. The disease is now admitted to be caused by a vegetable parasite called from its mode of growth the actinomyces or ray fungus, and by the presence of this fungus in the diseased parts we can easily distinguish between this affection and tuberculosis.

Rinderpest is the most common disease among cattle in India and Ceylon. It is the so-called murrain or cattle-plague of Ceylon (*Vasangata*). The suddenness of attack, the prevalence of the disease in epizootic form, the inflammation of the digestive canal followed up by constipation or diarrhoea are all well-known symptoms, while the *postmortem* appearances especially in the tissues of the mouth and stomach are well marked. By introduction of the septic matter of this disease into man, serious affections of the stomach, and even typhoid fever are apt to supervene.

Pleuropneumonia is not so common occurrence in India and Ceylon as in other countries. In the case of this disease, too, mistakes are apt to occur in diagnosing during the early stages, when an affected animal is often liable to appear in more than ordinary thriving condition, before the well-marked symptoms of general debility, fever and cough are developed. The appearance of the lungs which become more or less solidified, and the flabby glazed meat, on *postmortem* examination, are unmistakable signs of the disease.

In addition to the above-mentioned affections skin diseases, such as ringworm, are also liable to be contracted by man; while we should even guard against consuming the meat of animals suffering from rheumatic affections, the meat or milk of cows attacked by parturient diseases, or of animals dying suddenly from suffocation or poison.

W. A. DE S.

TUBERCULOSIS IN CATTLE.

Tuberculosis is one of the few diseases which, it has been demonstrated time and again, cannot be accurately diagnosed in its early stages in the cow by a physical examination, even by the most expert men. Veterinary Surgeon Niles of the Experimental Station, Blacksburg, has contributed a paper on this subject, with the object of directing attention to the possibility of the detection of the disease in its early stages, so as to save the human family from a source of great danger.

"When we stop to consider," says the writer, "that one out of every seven persons dies of tuberculosis, and that perhaps the greatest source of infection is the flesh and milk of tuberculous cattle, the importance of an early diagnosis impresses itself upon us. It is also stated by various authorities that a majority of the deaths of infants in the cities are caused by tuberculosis as a result of being fed on tuberculous milk. There is probably no disease of the lower animals and human being so treacherous as tuberculosis. It may infect the individual or animal for an indefinite length of time without causing suspicion. Yet, at the same time, such individuals or animals are a constant source of danger to others."

The practically important part of the paper, however, is to follow, namely a description of the method of detecting the disease in its earliest stages; we quote the writer's own words:—"In 1890, Dr. Koch announced the fact of his discovery of a substance with which he believed he would be able to successfully treat the disease. This substance is known as Koch's lymph, or tuberculin, and consists of the taxy-albumins produced by the growth of the germ in artificial culture-media. It has a specific action on tubercular processes, and, when properly administered, causes a hyperæmia, or congestion, around the tubercle, and an elevation of the body temperature. This action is not observed when the substance is injected into healthy animals, or those suffering from other diseases than tuberculosis. As a cure for the disease, the substance is at present a failure, but as an aid to the diagnosis or detection of tuberculosis, in all its forms and stages, it is invaluable. No matter what organ or organs of the animal economy are affected, or how slight the lesions, a re-action is sure to follow the injection of tuberculin if the animal has tuberculosis. Since 1891, numerous investigators have experimented with tuberculin on the lower animals very extensively, and reports are unanimous as to its value as a diagnostic agent. When animals do not re-act after the injection of tuberculin, it can be said, with almost absolute certainty, that they are free from tuberculosis, since not a single case has been unquestionably established in which animals affected with tuberculosis did not re-act. On the other hand, if a re-action takes place, it may be said, with almost absolute certainty, that the animal has tuberculosis. The method of using tuberculin is as follows:—A 10 per cent. solution is made in a 1 per cent. solution of carbolic acid. Of this dilution, 2.5 cc.

to 5 cc., according to size of animal, are injected beneath the disinfected skin of the scapular region by means of a hypodermic syringe. Animals to be injected should be tied in the barn two or three hours beforehand, and the injection made at about 6 p.m., at which time the temperature should be normal. The temperature of the animal is taken at the time of injection, and at intervals of three hours, for fifteen hours. The amount of re-action varies from two to six degrees, and lasts from twelve to twenty-four hours, and in some cases longer. The entire herd of cattle, on the Experiment Station Farm, has been subjected to the test of tuberculin with the result of discovering that one animal gave the characteristic re-action. This animal was apparently healthy, and showed no physical symptoms of the disease. Upon a *postmortem* examination, however, the lungs, liver, and intestines contained a number of tubercles, from the size of a pea to that of a walnut. The amount of tuberculin used varied from .25 of a grain to .5 of a grain, according to size and age of animal."

Since writing the above, the writer made, by request, another test on 38 head of cattle. Only one out of the thirty-eight tested gave the characteristic reaction. But for the use of tuberculin, the disease could not have been positively diagnosed. A *postmortem* examination confirmed the presence of the disease in that animal. Mr. Niles anticipates if the Koch test be regularly applied, and all diseased animals be destroyed, that "the continuous spread of tuberculosis or consumption would be checked, and it would be a comparatively short time before the disease would be almost unknown in the bovine species, while the number of cases would also be decreased in the human family at least 50 per cent in a short time." He further urges the necessity for legislation to compel all parties keeping cattle, especially for supplying milk and meat, to furnish a certificate to the effect that the animals have been tested and found free from the disease.

THE MURUNGA TREE.

In the latest Journal of the Agri-Horticultural Society of India the cultivation of murunga (*Moringa Pterygosperma*) and the expressing of oil from the seed, are advised as a desirable and remunerative occupation. Dr. Watt, referring to the murunga, says:—"The seeds yield a clear, limpid, almost colourless oil (according to Cloez 36 per cent), rather thick at ordinary temperatures and easily extracted by simple pressure . . . It is composed of oleine, margarine and stearine . . . and is highly esteemed by perfumers, owing to its great power of absorbing and retaining the most fugitive odours." In the West Indies murunga oil is used as a salad oil. The Director of the Jamaica Botanical Gardens mentioned some time ago in a report that great interest was being shown in the extraction of the oil from the seed of the horse-radish tree, as the murunga is sometimes called. The oil has a specific gravity of .912 to .915 at 60° F., is fluid at 77° F., thick at 79° and solid at lower temperatures. It has neither colour nor smell, saponifies slowly, and does not turn rancid. It is from

this tree as well as the closely-allied *Moringa aptera* that the lubricant so much valued by watchmakers is obtained. The oil is also known as oil of Ben. The following appears in the *Chemist and Druggist* of the 20th May last:—"OIL OF BEN.—Those who think that this is the original macassar oil may be interested to know that the Kew authorities are endeavouring to encourage the propagation of the plant that yields it—*Moringa Pterygosperma*." The murunga grows almost wild in native gardens in Ceylon, and one often sees the trees forming live fences. The fruits—sometimes called "drumsticks"—are a favourite vegetable, the natives looking up on them as particularly wholesome articles of food. Parts of the tree are used in native medicine in Ceylon. For instance: "The bark of the tree and of the root is acrid and pungent; internally it is used for promoting the appetite and to help digestion, and externally as a rubefacient in case of collapse; the leaves for wounds from dog bites." We have often heard of the root bark being taken internally as a carminative, and the boiled leaves are used for fomenting, in all cases where fomentations are advised. The tree can hardly be said to be cultivated here, but where it is at all cared for, it is for the sake of the fruits which are commonly found in the market; the leaves also being eaten after cooking. If, however, the tree is to be cultivated for its seed, the fruits will have to be allowed to mature on the tree, and this would unfit them for eating purposes, as they become very hard and fibrous when mature, and are always collected when tender for eating. The oil, it is said, can be expressed in the ordinary native mill, the only difficulty being the clearing process. This, however, we are told, would soon be overcome, once a supply of the crude oil is obtained in large quantities, and it is expected that a demand for even the crude oil will spring up. The murunga, it may not be generally known, produces a beautiful gum, resembling tragacanth. In Jamaica the wood is used for dyeing a blue colour.

GENERAL ITEMS.

In an account of the bread-fruit tree as found in the South Sea Islands, the writer says that the fibre of the inner bark makes good cloth but coarser than the "tapa" made from the paper mulberry tree. The wood is soft and light, of a rich yellow turning to mahogany by use, and suitable for dug-out canoes. Then the milky juice obtained by puncturing the stem is used as gum and for bird-lime, a preparation being also used for tattooing. The Polynesians, when they do not care for the baked fruit, make silo pits into which they fill about a couple of tons of the fruit so as to change them from sweet to sour, in which state it will keep for months. These Islanders bake their fruits after a curious fashion. The fruit is cut up, the core removed, and, hot stones having been placed in a hollow in the earth and covered with leaves, the fruit is laid on the top and again covered with leaves and hot stones, on which more bread-fruit is laid, and so on; a layer of earth about six inches deep covering the whole. The baking lasts

about thirty minutes, and the result is a brown piece of natural bread, white or perhaps yellow inside, and very nutritious.

The important influence which the physical or mechanical properties of the soil exert upon its fertility are pretty generally though vaguely recognised by practical farmers. These properties were among the first to be investigated, and such investigators as Sir Humphrey Davy and others did much to throw light on this department of *agronomy*, as the French call the science of the soil.

The physical properties of a soil may affect plant growth in several different ways. For one thing, a soil may be so compact or tenacious as to prevent the plant roots from freely developing. Most important, too, is the influence of the physical condition of the soil on those biological processes whereby plant food is prepared for the plants' needs. The process of nitrification, for example, is entirely controlled in its development by the mechanical properties of a soil. No matter what the composition of the soil is, unless its physical condition is favourable, it is incapable of producing large crops. These properties, which were early recognised as having an important bearing on soil fertility, have been of recent years too much neglected by agricultural scientists.

Says an Australian paper:—The reckless and wanton wood-cutting operations which have been going on in Australia without intermission for upwards of forty years, are unparalleled in any other part of the world. The proportion of trees felled, but left unused, to those made use of has been astounding. This death-like disregard of Nature's teachings through her forests has so disarranged the seasons in the north and north-west districts of Victoria as to render profitable farming almost a matter of impossibility. The wonderful climatic changes that have come over the Wimmera and other districts are painfully apparent to farmers and all observant residents. The heat of the summer has become more intense, and the cold of the winter more severe, and there is a greater liability to drought. The late Mr. Clement Hodgkinson, Assistant Commissioner of Crown Lands in Victoria, wrote on this subject:—"The destruction of forests on any tract of land lessens the rainfall thereon, arrests the springs at the sources of the water-courses, besides rendering the flow of water thereon irregular and intermittent. On the other hand, the renewal of extensive planting operations of the forest on such tract again increases the rainfall thereon, causes the springs to re-appear, and the discharge of the watercourses to be again satisfactory, as incontestably proved by the multitude of well-authenticated cases recorded by French, German and Italian scientists, in which cases the reduction and irregularity of the flow of water and the disappearance of springs on tracts of lands on which forests have been suddenly felled, have been completely overcome, and the water supply restored to its pristine state, by planting such tracts with trees."

An Australian nurseryman referring to the three common pests on fruits and flowers, viz., scale, aphid, and mildew, gives some practical hints from his own experience. In the case of the coccus or scale insect and the aphid or plant louse, he recommends kerosine emulsion as the most simple, effective and the easiest applied. The following is the recipe: Boil soft soap in just sufficient water to dissolve it (1 lb. soap to 1½ pint water), then add one pint of kerosine. When thoroughly mixed one quart will be sufficient for three gallons of water, and the mixture should be applied with a fine nozzled syringe. In the case of the plant louse one good dressing is generally effectual, but when applied to the scale the greatest care should be exercised, so that every part of the tree gets thoroughly saturated, more especially underneath the leaves, for if this is neglected all the insects so secured will remain untouched and form a new stock for further destruction. The oidium or mildew, different from the two preceding pests, is due to a fungus, and in its early stages consists of a white coating over all parts of the infested plant. The superficial position of the fungus renders direct treatment comparatively easy, and a thorough application to the diseased part of flowers of sulphur or sulphide of potassium in weak solution (which is also recommended for green fly and red spider) will be found sufficient to put an end to the fungus without injuring the plants. But it has also been found that the same remedy as has been recommended for scale and plant louse with the addition of a little flowers of sulphur, applied during the period of rest, has been found a good preventative; loose bark and the soil immediately round the plant should at the same time be removed and burnt, and every part of the plant thoroughly washed. If this treatment is adopted once a year, as a rule, it will destroy all traces of mildew.

The following is recommended in cases of roup among fowls. Preventive treatment: keep poultry houses scrupulously clean, sprinkling unslaked lime over the floor and thoroughly limewashing walls, perches and boxes. On the appearance of the first symptoms remove the affected bird, give a small quantity of epsom salts; next morning follow with a piece of camphor about the size of a French bean, and give only soft food. Where the breathing is very heavy, syringe through the roof of the nose with a weak solution of Condy's fluid.

A writer to an Australian paper is advocating the establishment of "Advisory Boards" of agriculture consisting of agricultural authorities and scientific experts in various districts. Here in Ceylon, with no proper agricultural department, we have not yet succeeded in establishing even a Central Agricultural Board for the Colony. If there is any subject which nearly every man thinks he knows something about, it is Agriculture; and it is often folly for those who really know something about the subject to be wise.

"Evenden's butter extractor" is the name of a new patent churn. The following, in the words of the advertisers, are "a few of its many suc-

passing qualities." It will produce butter in less than five minutes, and it will do so whether the temperature is 32° or 81°, whether the atmosphere is clear or muggy. It removes the butter-milk automatically, and the butter can be washed for a week without injuring the grain. The butter can never be overworked. It will be admitted that if all these claims can be justified, the Evenden butter worker is bound to supersede every other churn, at any rate in the tropics.

The *Scottish Farmer* refers to a glowing account, in *Le Petit Journal*, of the new forage plant, *Polygonum Sachalinense*, which comes from a Russian Island between Siberia and Japan. "The planting," we are told, "is, so to speak, for perpetuity. All that remains to be done is to restrain its encroachments."

Among exotic fruits recently introduced into India, one of the most promising seems to be the American dewberry, which is bearing profusely in the Shaharānpur Botanic Gardens.

The Japanese finger orange tree produces fruits made up of a number of long segments joined together at the lower end, but separating towards the apex into a number of finger-like bodies. The fruit taken on the whole is said to be so unlike an ordinary orange, that it can scarcely be recognised as the fruit of a member of that family.

Professor Wally, in a paper read before the British Institute of Public Health, advocated radical forms in the method of inspecting dead meat. In regard to the first source of supply—that of meat specially fed for the butcher and finding its way to the consumer through the ordinary recognised channels—there was not much to be said, but the case was different with meat that had not been specially prepared—meat thrown on the market suddenly from a variety of causes, and reaching the consumer in unrecog-

nised and sometimes illegitimate ways. It is not difficult to follow the former, but with the latter it is otherwise. His point was that all animals should be inspected before slaughter, but in order to do this there must be, as in Berlin, one receiving house for all cattle to be slaughtered—one common slaughter-house—and an effective system of both live and dead meat examination by qualified professional men having some trained acquaintance with diagnosis of disease. The head and the chief internal organs—the heart, lungs, kidneys, and liver—should be hung up beside each carcass until the dead meat inspection was completed, and provided the animals slaughtered could be marked when examined alive, important statistics would thus be collected regarding diseases in cattle and means provided for comparing the results of live and dead meat inspection. Should such reforms be carried out, it is obvious that there would be a great accession to departments of life open to veterinary surgeons, and it is well, in view of the probability of an extension of their functions and responsibilities, that veterinary students henceforth require to be as well equipped before entering on their studies as members of the medical profession.

Professor Sachs, of Wurzburg, asserted, and the Royal Institute for fruit and vine culture at Giesedheim has tried experiments and is apparently satisfied, that sulphate of iron is a valuable stimulant to plants that are suffering from chlorosis, or absence of the proper green colour. They gave small trees 2 1-5th lb. of copperas, and large trees 4 and 2-5th lb. The results, it is said, were most gratifying. Strange to say in some cases where the trees were suffering from the attack of aphides as well as deficiency of colour in the leaves, the aphides disappeared, and frequently the leaves became healthy within a few days after the treatment. The sulphate of iron was dissolved in water, and applied near the roots. Early spring is the best time to try the experiment. Some soils do not require the addition of sulphate of iron.

No. 6.

"PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON."

CHRISTOPHER ELLIOTT, M.D.,

WHO DIED AS "PRINCIPAL CIVIL MEDICAL OFFICER" OF CEYLON;

RESIDENT IN THE ISLAND 1834-1859;

PHYSICIAN, PHILANTHROPIST, PIONEER PLANTER, AND AN ALL-ROUND PUBLIC MAN.

CHRISTOPHER ELLIOTT was born at Clonmore, County Kilkenny in Ireland, on the 7th July 1810, and was the youngest of a family of six brothers, all of whom took to professions, Christopher studying medicine in Dublin. He arrived in Colombo on the 30th July 1834 by the ship "Henry Wellesley." Dr. Elliott came out in the Government service as one of three "Colonial Assistant Surgeons," another being Dr. Kelly, father of the present Planting Member in the Legislative Council, who arrived in the "Louisa Campbell" on 31st July 1834. The third was Dr. Grant. The medical arrangements of the island were at the time and for many years after under the control of the Military doctors, and this was an experiment to supplement the staff.* Dr. Elliott was first stationed at Badulla, having as his neighbour at Aliput the late Sir C. P. Layard, at that time (1834) returned from England and just married. Dr. Elliott proceeded to his station by riding via Pussellawa and Nuwara Eliya, and in after years he used to recall the dense jungle covering the former district, which was afterwards well named "Black Forest," when opened as a coffee plantation. He did not long remain in Government service; severing his connection in 1835, and

coming to Colombo to practise his profession, he early became connected as a contributor with the *Observer*, then a small weekly broadsheet. This he soon after purchased for £120 from the Syndicate of Merchants who had established it in opposition to another print, the *Colombo Chronicle*, largely conducted by Government servants, and to which the then Governor, Sir Robert Wilmot Horton, was a regular contributor.*

Dr. Elliott was married on 18th January 1836 to Miss Jessie Selina Clark, sister of Mr. W. Clark, a well-known Scotch Colombo merchant, and who had come to the Colony very much about the

* The period of Sir Robert Horton's rule was the era of newspapers. The Governor was fond of writing, and he had as Private Secretary his son-in-law Mr. Tuffnell, afterwards a Lord of the Admiralty, who, it is understood, wrote a good deal. Then there were Mr. George Lee, Mr. E. R. Power and others, while Turnour, Forbes, Fagan, &c., contributed notices of antiquities. The first paper ever printed in Ceylon was the *Colombo Journal*, of which two volumes were issued from the Government Press; but then the Home Authorities ordered the local Government to confine itself to publishing the *Government Gazette*, leaving newspapers to private enterprise. Accordingly the *Observer* was started by the merchants, the late Mr. E. J. Darley being for a time the Editor. Mr. George Winter also edited the paper. The title was subsequently changed to the *Colombo Observer*, and Dr. Elliott left the Colonial Medical Service to become Editor and Proprietor. The subsequent history of the *Colombo Observer*, now the *Ceylon Observer*, we need not write. Dr. Elliott and the merchants of that day going into strong opposition to the Government of Sir R. W. Horton, "a committee of gentlemen" started the *Chronicle* of which Mr. George Lee was understood to be Editor, Sir Robert Horton contributing largely to its columns. Soon after Mr. Stewart Mackenzie became Governor the *Chronicle* had its name changed to the *Herald*.

* The three gentlemen named were appointed Assistants in the "Vaccine Department," and so appear in the "Government Almanac" of 1835 and 1836.

same time as her future husband. Mr. W. Clark was the first merchant to introduce Manchester wools to Ceylon.

From 1836 to 1859 Dr. Elliott's career was widely identified with the social and material progress of the Colony. He achieved great popularity and esteem as a very capable physician and a bold as well as skilful surgeon. He was the first to cut down to the liver for abscess on that organ, and he did so in spite of serious remonstrances from other medical men of the day in Ceylon, at a time when the anaesthetics and antiseptics, now so largely used, were unknown aids in surgery. Army Surgeon Cameron was one of the remonstrants, but he confessed afterwards in the *Lancet* how he had watched and profited by the success of Dr. Elliott's operations. Dr. Elliott acquired immense influence medically with the natives at a time when European medical aid was, as a rule, scorned by them. He was trusted and beloved by the European and Native community of Colombo beyond any other European who ever lived in Ceylon, and it was through his influence that the Ceylon Government in 1858 created a Civil Medical Department, of which he was appropriately named the first Chief, although he survived at the post for less than a year.

The compiler of the present notice arrived in Ceylon two years after his death, but he found then, and for many years after, that Dr. Elliott's name was familiar as a household word in Colombo. The doctor was the kindest and most sympathetic of friends and physicians, and yet withal very practical and shrewd. One characteristic story was connected with his choice of the "Captain's Garder" peninsula as the site of his chief hospital. Asked why he fixed on that spot, the Dr. replied: "You see they are going to place the Railway terminal station close by; now they are sure to have accidents, on the Kadugannawa incline especially, and as we can have a siding from the station to the hospital, what so convenient as to be able to run the train with the wounded, right to the door of our wards, where we can speedily get the broken bones put right?" and one of the softest-hearted men living rubbed his hands at the thought of the good he and his staff might do on the occurrence of the inevitable accident! Eventually, Borella became the site of the Civil Hospital; but fortunately no such accident as Dr. Elliott feared has ever occurred on our Colombo-Kandy line since its opening, very much owing to the steadiness of the broad-gauge, and the careful way in which traffic is worked under the block system. To tell the story of Dr. Elliott's work among the poor of Colombo as Christian philanthropist, as well as physician, ever ready to help without

fee or reward, would require a volume in itself. Few better men have ever lived in the island or have done better work for their adopted land.

As Editor, Dr. Elliott was upright and outspoken and a rapid, good writer. As an Irishman born, he had a ready wit and was prompt to act, as the following anecdote shews. In the very early days of the *Observer*, on one occasion a contribution intended for the *Chronicle* was left at the *Observer* office containing, it was believed, an article by the Governor. A notice appeared in that day's issue of the *Observer*:—"A parcel said to be from King's House and addressed to the *Chronicle* office, left by mistake at this office by a mounted orderly, can be had on application!" Following the strong opposition to Government in Sir R. W. Horton's term came a spell of more general accord with official action in the time of that very high-minded statesman, the Right Hon. Stewart Mackenzie; but the days of Sir Emerson Tennent and especially Lord Torrington found the *Observer* again in strong opposition to the Government, and their rash, new-fangled notions of taxation and harassing legislation. The disturbance which took place in the interior—notably in the Matale and Kurungala Districts—and which was magnified into a "Rebellion," although not a British soldier received a scratch, was very much occasioned by the fears of the people as to the new taxes. So high did the excitement reach in Colombo, and so enraged were the Governor and the Colonial Secretary with the *Observer's* writings, that it was reported on good authority, that warrants were agreed on at one time in the Executive Council for the arrest of both Editors (Mr. A. M. Ferguson had joined Dr. Elliott as Co-Editor in 1846), and were it not for the wiser counsels and sturdy resistance of both the Chief Justice (Sir Anthony Oliphant) and the Queen's Advocate (Mr. Selby), it was believed Lord Torrington would have been foolish enough to have forestalled Mr. Eyre's action in Jamaica by casting his two political foes into jail." His Lordship, however, paid off his score against the Doctor on one occasion when the latter headed a deputation of residents in the Pettah (then occupied by a large number of Dutch descendants) on the "Verandah Question." His Excellency received the deputation very coldly, with a bow, listened to their written and spoken statements, and then merely bowed, advanced a step and bowed, and so on, until he bowed them out of the room without uttering a word! The fiery as well as warm-hearted Irish leader was furious

* Dr. Elliott too was warned by friends not to visit Kandy after "Martial law" was proclaimed (very unnecessarily) there.

—he rushed over to Baillie Street where friends were waiting to learn the result, and the first thing he got was a bucket of water in the backyard to dip his head and face in, to cool his passion! He then came in to his friends exclaiming:—"Were it not for my religious principles I could have — him!"

An illustration of his great influence over the natives occurred soon after, and shewed how he stood in their opinion quite as high as the "one-armed Rajah" (Mr. Anstruther), of whom it was said that had he been in Kandy or Matale during the so-called Rebellion, he would only have had to shout, "To your tents, oh! Israel" to get every Kandyan to go home at once. The news of a series of new taxes led to public meetings of protest in Kandy on 8th July, 1848, and the news of these taxes alarming the natives of the Colombo, Hanwella and Panadure districts, they assembled in many thousands one day at Cotta to march into Colombo and lay their grievances before the supreme Raj, according to usual oriental practice. The Government got intimation, and chose to regard this movement as a beginning of "Rebellion" in the lowcountry: the Fort guns were ordered to be loaded, double sentries posted at the gates, and the mass of natives were to be fired on if they dared to try and pass into the Fort! Indeed the military were ordered to march towards Borella, and they got as far as Slave Island, ready to stop the Natives' advance. (This was on 26th July 1848). Dr. Elliott got news of all this only after the crowd of people had started from Cotta in the full belief that their great number would induce the Government to abolish the new taxes. He drove off to meet them—did so at the "Mango Tree," Darley Road, close to where the Baptist Church now stands. He called a halt, only just in time to prevent a collision, got a table from an adjacent house, mounted it and addressed the people by interpretation, explaining to them the risk they ran of giving offence and getting into trouble,—he explained the English custom of "petitioning" against grievances, and having brought paper, pen and ink with him, he caused a short Petition to be drafted in Sinhalese on the spot, read it to the crowd, got their ready approval, and then called for signatures, selecting three or four representatives to present it. All this was done, and the people at the worthy doctor's request, at once returned home, quite satisfied.

Had they gone by thousands to Slave Island and tried to force their way on, they would probably have been shot down!

Dr. Elliott was next actively engaged as an unofficial representative for the Natives and Burglers in their grievances against the Torrington

Government. He succeeded in getting a Parliamentary Inquiry by Committee into Ceylon affairs, both Messrs. Gladstone and Disraeli voting in the majority against Lord John Russell's Government, and afterwards sitting together on the Committee. A Commission of Anglo-Indian officers came to Ceylon and Dr. Elliott was examined before it. The Inquiry resulted in the recall of Lord Torrington and Sir Emerson Tennent. [Some years afterwards, Dr. Elliott, and later on Mr. A. M. Ferguson, met both Lord Torrington and Sir Emerson Tennent on friendly terms in England.]

Dr. Elliott and the *Observer* very cordially welcomed Sir Henry Ward to the Government of Ceylon, and most heartily supported his progressive administration; but when the great Governor in his ardent desire to see a railway made to Kandy in his day, entered into a rash, one-sided, and as it turned out, most unfortunate compact with a Railway Company, Dr. Elliott was one of the first to take alarm and to resist the Governor with all his influence and strength by pen and voice, although his doing so imperilled his being appointed Principal Civil Medical Officer by the Governor. His boldness and ready wit appeared in a public meeting in Kandy where admiration of the Governor personally, divided opinion with great distrust of the Railway compact. Mr. John Selby, who then edited the *Examiner*, was sent up to Kandy to support the Governor's policy and to offer certain concessions which much modified the objectionable features—and it was then that with reference to Mr. Selby and those who acted with him, that Dr. Elliott hit off the prevalent feeling exactly by an apt classical quotation:—"Timeo Danaos et dona ferentes"—"I fear the Greeks even when bringing gifts."

After the death of his wife,—on 7th March 1855 (aged 48 years)—Dr. Elliott visited England in 1856, and while there he was consulted by the Secretary of State regarding the Railway, and also about the arrangements for freeing the State of any connection with Buddhism. On the 24th March, 1857, Dr. Elliott was married a second time to an Irish lady, Miss Bessie Scott, who still survives him, living with some members of her family in Texas.

Our review now draws to a close; but before winding up, we must refer to Dr. Elliott's connection with Pioneer Planting operations in different directions. He took a warm interest in the development of the great coffee planting enterprise, and at one date was a part proprietor of a coffee estate until the bad times of 1845 arrived. Still earlier he was interested in experiments in sugar cultivation; but his last love proved his best, namely the coconut palm, a large plantation of which he formed with

his savings in the Negombo district, leased for many years after his death to the late Mr. David Wilson, and eventually sold to Mr. De Soysa. Dr. Elliott wrote very freely during the "forties" and "fifties" on planting and agricultural topics generally, and he was keenly alive to all improvements that could be introduced into local industries.

To shew what Sir Henry Ward thought of him—notwithstanding the opposition to his Railway Company—we need only repeat that it was he who chose Dr. Elliott to be the first holder of the office of "Principal Civil Medical Officer" for the Colony, for which also Sir Charles MacCarthy and his father-in-law Sir Benjamin Hawes (Permanent Under-Secretary) strongly recommended him. This was in 1858, and, alas! within a twelvemonth, he in whom so many hopes and so much affection (public as well as private) were centered, was no more. Dr. Elliott was struck down by dysentery and died on the 22nd May, 1859. We need say nothing of his final illness and the closing scene, nor of his activity and warm interest in another phase—that of Christian teacher as well as philanthropist—because all are so fully and well dealt with in the extracts we now append from the file of the *Observer* and from the *Examiner*, to which the late Mr. C. A. Lorenz contributed his testimony in verse. We quote as follows:—

TO THE EDITOR OF THE "COLOMBO OBSERVER."

Kandy, Saturday Evening, May 14, 1859.

All who know of Dr. Elliott will feel how real and genuine is the regret shared by all classes of men at his serious indisposition. Last Sunday Evening he preached in the Baptist Chapel from Hebrews 9, 27th and 28th verses. In his opening he alluded to his journey to Matale on the previous day—his having met with a poor Tamil woman on the roadside lying down ill—with two of her children one of whom was dying—and his urgent recommendation to the mother to seek shelter in the Hospital and of her refusal—and when she was told that her child was dying and will surely die—of her wild grief and agony—that when the Doctor returned from Matale how the two letters he opened brought the afflicting intelligence of the death of William Ferguson's child and of young MacGregor. He said that after the experience of the day he was at no loss for a subject. Most who heard him that night never for a moment imagined that the preacher himself would be soon stricken with the insidious disease, dysentery. I who had heard him before, felt that there was a change in his delivery—that he looked exhausted—and gasped for breath—and had not sufficient strength to continue his address. One would have naturally ascribed it to the excitement of the occasion, but it never entered into

the minds of his hearers that he was then subjected to the fearful attack of so fatal a malady.

(From the "*Observer*.")

"At Colombo, on the morning of Sunday, May 22nd, C. ELLIOTT, Esq., M.D., Principal Civil Medical Officer of Ceylon, aged 49 years and 10 months."

DEATH OF DR. ELLIOTT.

(By A. M. Ferguson in 1859.)

We, in common with Dr. Elliott's family and friends, have to deplore an event which although it places him beyond the reach of suffering, and in possession of "joy unspeakable and full of glory", is to us, personally, one of the greatest of earthly calamities. The warm-hearted steadfast friend—the wise and cheerful adviser of more than twenty years' standing, has been taken from our side, and while the wound is so recent, we feel it impossible to do more than briefly notice a loss which to us, to his family, and we may safely add to a large portion of the public of Ceylon, is irremediable. Latterly Dr. Elliott has been best known and most prized as a skilful and successful Medical man, with sympathy for all who suffered and advice and comfort for the many who sought his guidance in time of sickness, trouble and perplexity. As a Christian he had been for years back becoming increasingly affectionate, earnest and laborious, and his last public act was to stand up in the pulpit and warn sinners to prepare for death and eternity. We who knew much of his inmost life, can testify that when he bore testimony to the grand verities and the comforting assurances of the Gospel, he spoke of what he sincerely believed felt and enjoyed. The turmoil of political life does not, perhaps, present the most favourable elements for maturing Christian character—is certainly not the best calculated to secure for him who takes part in it the credit of good intentions. Dr. Elliott was for about 24 years—(almost the whole period of his residence in Ceylon) connected with the *Colombo Observer*, as Editor and Proprietor. It cannot be hoped that the course he pursued—the sentiments he put forth—should always and with all command approval. But we believe there are few now in Ceylon who will not admit that his intentions were ever good and his aim to advance what he believed to be the true interests of the country of his adoption. Dr. Elliott had been always in the habit of affording gratuitous aid to the sick poor (having gained in an eminent degree the confidence of the Natives) and latterly his appointment to the post of Principal Civil Medical Officer of Ceylon, gave him increased opportunities of doing good which, we are confident, he valued as much at least as the emoluments and honors of office. It seems a

most mysterious providence that he should have been cut down at the very period when he had the immediate prospect of carrying out several wise and benevolent plans which were calculated to alleviate suffering and extend the benefits of medical knowledge over the Colony, and on the accomplishment of which he had set his heart. But HE "who doeth all things well," knew what was best, and death found our friend fully prepared for the last conflict and the great change:—prepared not by reference to the useful life he had led, but to the foundation on which, as he averred, he had rested for 30 years and which was the mainspring of his every holy thought and good action through life—the *atonement* of the SON OF GOD. "It is all right" was his repeated declaration as to spiritual things; and in the midst of physical suffering, which was occasionally severe, such was the composure of his mind that throughout his illness he continued to watch his own symptoms, which from the first he pronounced to be fatal. It was affecting to notice him feeling his own pulse and drawing inferences from its character almost to the moment when pulsation ceased—and when one of the warmest, noblest and most generous hearts that beat in human breast, gave its last leave and was for ever still.

All that was mortal of Dr. Elliott died at $\frac{1}{4}$ past 9 yesterday, Sunday, 22nd May.

(From the "Ceylon Examiner.")

CHRISTOPHER ELLIOTT.

One bright career was over,
Another scarce begun:—
Death crossed his path of usefulness,
And left us all one friend the less—
The tried and valued ONE.

And though amongst the living,
They may be others such,
As true, as noble-hearted,
As the good man departed:—
Yet who hath done so much.

In striving for our welfare,
In battling for the right;
In works of love, in acts of faith,
In turning hearts from Sin and Death
To realms of Life and Light?

Careless of those who wished him ill,
(The paltry few above him),
He left no work of good undone,
Outlived the slanders, one by one,
And forced his foes to love him.

And those who scorned or envied him
For deeds which shamed their own,
Forgot at last the Partizan,
In the generous, frank and honest man,
And wept that he was gone.

Such was the man we've lost—
The good, the noble-hearted:
Each tear that told our heart's regret
Was a joy in heaven, when angels met
To welcome the Departed.

C, A. L.

(From the "Ceylon Overland Observer.")

Colombo, 26th May, 1859.

We shall be pardoned if on this occasion we refer, at the outset, to the loss the Colony has sustained in the death of Dr. C. Elliott, a gentleman who for nearly a quarter of a century took an active and useful part in the discussion of every question connected with the interests of Ceylon and its people. He arrived in 1834 in the capacity of Colonial Surgeon, and was for some six months stationed at Badulla. He then resigned the service, and settled in Colombo, where for well nigh twenty-four years he was before the public as Editor and Proprietor of the *Colombo Observer*. In June last year he obtained the appointment of Principal Civil Medical Officer of Ceylon, an office for which he was well qualified by skill and experience in his profession, while the confidence with which all classes of the Native inhabitants regarded him, opened up to him a special and extensive prospect of usefulness. But just as he had got settled in his office and was about to carry out his plans of usefulness, he was attacked by rapid and fatal dysentery, under which he sunk at Colombo, on Sunday the 22nd instant. He was not quite 50 when he died, but he was eminently a man who "lived while he lived." Naturally buoyant and conscientiously active, he crowded the exertions and the events of many ordinary life-times into his own. In the strife of politics, of course he must have sometimes erred, and often failed to command credit for the good intentions by which he was always actuated. But no earthly consideration could induce him to swerve from the avowal of his sincere convictions in politics or religion; and as years passed away and prejudices softened down, his really excellent qualities of head and heart became generally appreciated, and he was admitted to be a good as well as an able man. The immense attendance at his funeral shewed the respect in which his memory was held. A notice of his dying hours—which were cheered by unshaken Christian faith—will be found elsewhere.

(From the "Examiner," Saturday, June 4, 1859.)

MEMORIAL OF DR. ELLIOTT'S SERVICES.

TO THE EDITOR OF THE "EXAMINER."

DEAR SIR,—I have read with cordial feelings the excellent verses published in one of your late periodicals, on the death of Dr. Elliott. In him, indeed Ceylon lost one of her most beloved benefactors. Now, sir, shall we pass by such a lamentable event without doing something to perpetuate amongst us the memory of that great and beloved man? *Surely not; the unspeakable value of Dr. Elliott as a good man, and what he*

did and suffered for the promotion of the interests of all classes of people in this Island are enough to rouse our feelings of gratitude, if we are susceptible to those feelings which, I think, are radical to all rational beings; and I say, those considerations demand most strongly, that something should be done by us, as a token that Ceylonese do appreciate the value of a man, and that they have sense enough to recognize the services done for them by any one, whoever he is.

If I be asked, what shall we do, I would say, let us make a special subscription in the land and get out a statue of Dr. Elliott from England, and set it up in a suitable place either in Colombo or Kandy. Dear Editor, permit me to call upon you or some other good and noble-hearted man, to propose and cause some such a thing to be done, whereby we may best represent our regard and respect to the name of Dr. Elliott.

I remain, dear Sir,

Your obedient servant,

Gampola, 31st May, 1859.

C. P. R.

TESTIMONIAL TO THE LATE DR. ELLIOTT.

(From the "Colombo Observer," 8th July, 1859.)

Morandahn, June 15, 1859.

DEAR SIR,

The services which Dr. Elliott rendered to the people of Ceylon during his long residence amongst us, have already been prominently alluded to in the public papers; and expression has been given to the very general feeling entertained by the public that there should be some appropriate Memorial of their regard for him. He was not known and esteemed for political services alone. The many good works with which he was connected, as a Physician, and a Christian, have secured for him a place in the hearts of the multitude; and it will be many years before his virtues and kindnesses will be forgotten. And though there were many who differed from him in his views on particular subjects; there are, I believe, NONE who did not admire and esteem him for his sincerity and his devotion to the cause of Religion and Humanity.

Under these circumstances I applied to a few Gentlemen, who I thought would be willing to act as a Committee for the purpose of receiving subscriptions towards securing some token of our regard for the Memoir of Dr. Elliott. And I trust to be able shortly to publish the names of those who have agreed to form the Committee.

Among the several suggestions which have been made on this subject, there may be some difficulty in adopting the one most likely to find favour with intending subscribers. The selection will probably be between the erection of a Tablet or Monument and the formation of a fund to provide for the education of a limited number of pupils, male or female, at some of the Schools in Colombo. This

difficulty may however be solved by taking the opinion of the majority of the subscribers, or by leaving the question to the decision of the Committee.

The Committee when formed will at once proceed to receive subscriptions through the Secretary in Colombo, and through Agents at Outstations, whose names will shortly be submitted to the public through the papers. In the meantime I have thought it expedient to address this letter to you, with the view of informing the public at once of the measures which are about to be taken.

Your obedient servant,

C. A. LORENZ.

Strange to say, notwithstanding all the talk and writing on the subject, nothing ever resulted in the shape of a Public Memorial to one who had proved so great a benefactor and friend of the Ceylonese community, and especially of the Burghers and Natives of Colombo. Over Dr. Elliott's remains in Wolvendal Church, a plain stone was placed by his representatives on which the inscription runs:—

SACRED

to the memory of

CHRISTOPHER ELLIOTT Esq.,

M.D.

Principal Civil Medical Officer
of this Island.

Who died 22nd May 1859
aged 49.

And Jessie his wife
who died 7th March 1855
aged 47

Heb. ix, 27-28.

Those who were joined with him in fellowship in the Pettah Baptist Church placed a memorial tablet in the wall of the Chapel, Prince Street, on which is engraved:—

"IN MEMORY OF

CHRISTOPHER ELLIOTT M.D.

Principal Civil Medical Officer
a deacon of this Church
and a Preacher

of the Gospel of our Lord Jesus Christ
to the congregation assembling in this place.

As a servant of Christ,
an enlightened Citizen,
a discerning Philanthropist,
and a skilful Physician,

having served his day and generation well,

He died in the Lord at Colombo,
on May 22nd 1859,
aged 49 years.

This tablet is erected by the members of the church and congregation with whom he was wont to worship."

Dr. Elliott left altogether a family of five sons and three daughters: two of the sons have been closely connected with Ceylon; but the second Mr. John Clark Elliott, after good work done as planter and in the Public Works Department, settled down to farming in Ireland, and has since gone out to Texas to reside with his family. The eldest of the family entered the Ceylon Civil Service, and after a long and varied administrative and judicial career in nearly every province of the island, is now as the Hon. Edward Elliott, Acting Government Agent, Western Province, and Member of the Legislative Council.

CLEARING JUNGLE.

The letter relating to the extermination of jungle quoted by our London correspondent on page 368, deals with a subject that has considerable interest for all engaged in planting operations in tropical or eub-tropical countries. We are not aware if the special compound to which that letter makes reference is known to any member of our own planting community. If it be so, and if any trial has been made with it in Ceylon, the results, if communicated to us, would certainly be possessed of considerable interest. Both on patana and chena lands, the growth of noxious grasses or of those of a character unfitted for use creates a difficulty that, could it be removed, would probably enable many acres that now are perforce left sterile to be brought under profitable cultivation. It is commonly to be observed on the occasions when publication is made as to the number of acres composed within certain estates, that no considerable proportion of their areas is described as uncultivated. It would be a distinct gain if this proportion could by any method be reduced. Of course we know that much of this uncultivated acreage is not without its useful purpose. Belts of timber are left as wind-screens, while other areas of the same description of growth remain unfelled as a reserve for firewood or for the promotion of rainfall. Similarly, there is a distinct object in leaving portions of an estate untilled for the sake of the growth of such grasses as are useful for cattle fodder, litter, &c., for the numerous cattle that are kept either for manuring or transport purposes. But even when allowance has been made for these voluntary reserves, there yet remain on many of our estates a considerable amount of land of which it seems to be impossible to use. We believe that much of this is abandoned because of the noxious growths which it alone seems fitted to produce. The letter to which we have above referred seems to indicate the possibility of dealing with such land. It would be well worth the while, we should think, of some of our planters to experimentalize with this compound. We are not informed as to the name by which it is known in India, the correspondent writing the letter to the *West Indian and Commercial Advertiser* not having given it. But there is little doubt that this could readily be obtained from some of the agencies in India. If this mixture can accomplish what is professed for it, a great step in the direction of our requirements would be gained. Anyone who has endeavoured to reclaim lands producing only useless growths has experienced the first difficulty of completely eradicating the latter. So long as there remains the tendency to reproduce

noxious growths, efforts to cultivate must prove fruitless. If they could be thoroughly cleared off, steps might then be taken to introduce some more profitable cultivation. We hold that the constant reproduction of particular forms of useless scrub or grasses does not necessarily mean that the land is not possessed of qualities fitting it for higher forms of plant life. It is simply that the lower form has acquired such a hold upon it that its prevalence kills off any natural endeavour made by seeds of more valuable products. Therefore the steps of primary importance must be to destroy this hold. If after doing this the land to be dealt with was thoroughly ploughed over and left for a season to aerate, it might, we think, probably be found possible by the aid of enrichment by manure to grow upon it either tea or coffee, or failing that, some useful fodder grasses. At all events it strikes us that experimenting in this direction might be useful. It is asked if our Forest Department has ever made any endeavour to rescue from their condition of inutility any of the clearings so abundant throughout our forest areas that have been devoted to chena cultivation. If this has been done, it would be useful to know what results have followed. It seems to be opposed to the beneficent laws of nature that land of the kind should be for ever rendered unproductive. In the earlier stages following after their abandonment we can understand this relative sterility rendering them incapable of the higher productions. They yield, therefore, during such stages only such weak growths as they may be fitted for. But if these could be thoroughly eradicated by the use of some such compound as the letter under reference indicates, there does not seem any reason why, by careful after-treatment, they might not be restored to their pristine vigour and productiveness. We can only suggest that some such process might be usefully tried, and were it successful, a very considerable acreage now valueless might be added to the productive area of our estates.

PLANTAIN GROWING.

[TO THE EDITOR "SOUTH OF INDIA OBSERVER."]

SIR,—In compliance with the suggestion in your issue of the 26th ultimo that I should let you know the result of plantain growing at Kotah Hall I send the following notes.

My experiment was on a small scale, and did not last long enough to give a reliable estimate of yield per acre. Of course the experiment was interesting on account of the elevation, 6,200 feet. At Kotah Hall fruit was obtained in from 18 months to two years after a planting out of suckers; a few months after the parent stem had borne and been cut down, the largest sucker came into bearing, followed a few months later by the next in size; and so on, until the soil was exhausted or kept on by manuring. Exhaustion was shown by the fruit becoming puny and the bunches small. This kind of yield was also noticeable wherever too many stems were allowed to grow together. A space of ten feet square for each plant in the first instance was found advisable not to allow more than five stems at a time from suckers in each space. The extra suckers were either planted elsewhere or destroyed. The more numerous the suckers were allowed to grow the smaller the fruit became and also the bunches. Very good fruit was obtained, and the flavour was considered more delicate than the same *jat* grown at a low elevation. In poor soil, where manure had not been used, and where insufficiently used, the usual signs of weakness (puny fruit and small bunches) were noticeable. On the other hand, where manure had been liberally applied the yield was most satisfactory, and signs of exhaustion

were not apparent. The experiment was commenced with two plants, which in about five years had increased to several hundred, when the estate passed out of my hands. The cultivation consisted in manuring where needed; in good forking round the plants; and in weeding and piling the weeds around the stems to turn into mould. Though plainain growing, even at this elevation, is remunerative. I would not recommend it as a speculation on a large scale, because it is still more remunerative, at low elevations. Here the cultivation is more expensive; rich soil being scarce, manure would have to make up for the deficiency. I found it necessary to fence in plainain trees to protect them from wild pigs, &c.

These reasons do not apply so strictly to the growing of Pears, Walnuts, Apricots, &c., and I believe that some of the exposed parts of these hills which are much injured by Samy cultivation could be covered by dwarf* cherries. The injury done on these hills by Samy cultivation and what in my opinion should take its place would make this letter longer, probably, than you desire. W. D. REDMOND.

[At the distance noted in the above there would be about 440 stools per acre, which would mean the same number of bunches. Allowing the wholesale price to be three annas per bunch, the gross returns would only be Rs2-odd per acres, that is to say if each stool gave only one bunch per year. We would ask Mr. Redmond to correct us if we are wrong.—Ed.]—South of India Observer.

THE COFFEE PLANTATIONS IN MONTSERRAT,

conducted as they are by a coffee planter of considerable experience in Ceylon (Mr. Hamilton) are of great importance to the Leeward Islands: and I regard their success or failure as a matter of vital interest in connection with the re-establishment of coffee in Dominica. I have carefully examined the plantations from time to time with Mr. Hamilton. On the last occasion I observed a destructive scale insect of familiar appearance which had attacked most of the trees. Mr. Hamilton however pointed out a small red ant which he credited with destroying the scale insects. And certainly most of the trees appeared well able to throw off the parasite, for after a season the scale insects became flat, surrounded by a small film, and finally died off. Unfortunately it is too well known that the ants usually live in a kind of symbiosis with scale insects. They have been observed in the case of *Lecanium hemisphericum* to carry the eggs from one tree to another, and thus literally to plant the scale insects upon the trees, afterwards feeding upon the sweet waxy secretion exuded by these insects. Knowing these facts I collected specimens and examined into the matter. My conclusions were that some other cause was at work, probably the abundant rainfall as much as much as anything—and I noted and carefully collected specimens of the scale which appeared to have died and become mouldy from this excess of moisture. These I sent to Professor Reilly the celebrated Entomologist of the United States Agricultural Department, with whom I had commenced a fairly constant correspondence, stating my views concerning the fungus, the ant, and the scale insect. I have received the following confirmatory letter from him. "The Montserrat coffee scale is, as you suppose, *Lecanium hemisphericum* and the small red ant is *Tetramorium auro-punctatum*, Rog. Many of the scale had evidently been killed by fungus disease. This was particularly true among those 'said to be cleared by the red ant.' The mouldy appearance is mycelium and not wax." The scale insect *Leca-*

*These are grown in England in unfavourable situations without manure. The average yield per stool was a bunch of about 60 plainains. The retail price of the same size but inferior flavour was about eight annas per bunch. The wholesale prices were about three annas per bunch.

nium hemisphericum is unfortunately too well known to me as a most destructive pest in Antigua and other islands, and the discovery of its destroyer I regard of great importance. As far as my observations at present extend this scale, as well as many others of a like nature, cannot stand much rain: and after the setting in of the autumn rains in Antigua, the trees are quickly, although only temporarily, freed from it. I shall take particular notice whether the fungus is already in Antigua, and if not, shall attempt to introduce it at the first opportunity, as it will undoubtedly be a great assistance to the sprays I have hitherto advised. I have not at present met with the scale on coffee in Dominica although I hear that it is met with in Martinique. Unless, however, we can succeed in fighting it by means of this fungus, I fear that the expensive spraying operations will do much to injure the industry which I regard as one of the most likely to bring prosperity back to that once famous coffee growing island.—I have the honour to remain, your obedient servant,

C. A. BARBER,
Hon. Col. Secy. Supt. of Agriculture.
—Agri-Horticultural Society of India.

THE EXTERMINATION OF JUNGLE.

In the *West Indian and Commercial Advertiser* of last week the following letter attracted my attention:—

"EXTERMINATION OF JUNGLE.

TO THE EDITOR OF THE 'WEST INDIAN AND COMMERCIAL ADVERTISER'

"SIR,—Permit me to bring to your notice the following invention of an Australian gentleman for the eradication of jungle by chemical means, which has been placed upon the Indian market. It is stated that by sprinkling or spraying the compound at the rate of half an ounce to every gallon of water it will kill all kinds of scrub and noxious grasses in one to at most four applications. I obtained a hundredweight of the compound from the firm introducing it, and made careful trials with it. I found it was capable of doing all that was represented if it was applied to the scrub or noxious grasses while these were in active growth, but it was almost innoxious if applied in the winter while growth was inactive. The compound is, in my opinion, worthy of a fair trial, but as it is said to be very poisonous, great care has to be exercised in its use.

London, October 24, 1893.

INDIAN."

It occurred to me that possibly a good use of the mixture referred to might be made in many localities in Ceylon. Often during my journeys through the forests of the Northern Province it has occurred to me to come across, surrounded by magnificent growths of timber trees, several acres of dwarfed and stunted vegetation, and even in such cases wherein to all outward seeming the trees were as fine and perfect as all others in their neighbourhood, it has been observable that they were partially hollow, and therefore worthless to the timber feller. It was known to me that such areas had in days gone by been subjected to the process of cheuing. I have always held the theory that, if the weakened vegetation could be thoroughly rooted out and the soil in some way reinvigorated, such patches might become as fertile as is the original forestland. It occurs to me that the employment of some such agent as that mentioned in the letter given above might be able to effect this complete eradication and pave the way for subsequent treatment. Possibly this compound, or something analogous, may be already known in Ceylon, and may have received trial there; but should it not have done so, it seems that experiments with it might result usefully in the direction pointed out.

A NEW TEA COMPANY.

The Morawakorale Tea Co., Ltd., with a capital of £50,000, takes over Ensalwatta, Craven, Silvakanda and Naragalla estates.

CEYLON MANUAL OF CHEMICAL ANALYSES.

A HANDBOOK OF ANALYSES CONNECTED WITH THE INDUSTRIES AND PUBLIC HEALTH OF CEYLON FOR PLANTERS, COMMERCIAL MEN, AGRICULTURAL STUDENTS, AND MEMBERS OF LOCAL BOARDS.

(Continued from page 295.)

CHAPTER VIII. OILS.

ESSENTIAL OILS—CINNAMON OIL—CITRONELLA OIL—CITRONELLA GRASS—LEMON GRASS OIL—INDIAN GRASS OILS—OIL OF PATCHOULI—TABLE OF ESSENTIAL OILS—BURNING OILS—KEROSENE OIL—LUBRICATING OILS—FIXED VEGETABLE OILS—COCONUT OIL—KING COCONUT OIL—MARGOSA OIL—CASTOR OIL—GINGELLY OIL—SOME FIXED OILS FROM PLANTS THAT ARE COMMON IN CEYLON—STANDARD ANALYSES OF OIL SEEDS AND OIL CAKES.

Essential Oils.

Many odour-bearing plants are found in Ceylon from the roots, bark, wood, leaves, or fruits, of which essences are extracted and exported to Europe for use in pharmacy or perfumery. Amongst the best known essential oils exported from Ceylon may be enumerated Cinnamon oil, Citronella oil, Lemon grass oil, Patchouli oil

Cinnamon Oil.

This very fragrant oil extracted from different parts of the cinnamon shrub—*Cinnamomum Zeylanicum*—is chiefly composed of cinnamic aldehyde and a hydrocarbon. By exposure to the air a portion of the cinnamic aldehyde C_9H_8O is converted into cinnamic acid $C_9H_8O_2$ and a portion of the hydrocarbon into a resinoid body, the oil becoming darker in color. When freshly prepared, the best quality is of a golden yellow color; but by age the color deepens to a reddish orange.

The specific gravity of cinnamon oils varies from 1.019 to 1.053. The finest quality is distilled from quill bark only, and has a specific gravity of from 1.019 to 1.021. The quality that is more commonly met with in commerce as bark oil is distilled from cinnamon chips, root bark and broken quill. Its specific gravity may reach 1.035. A third quality is distilled from the leaves, and this has the highest specific gravity of all. It varies from 1.040 to 1.053. This oil is much darker in color and its perfume much inferior to the bark oil. Mutter gives the boiling point of cinnamon oil at 428° to 446°F. Cinnamon oil ranks high as an antiseptic substance.

Citronella Oil.

This is one of the essential oils known as the Indian-grass oils. It is distilled from the grass *Andropogon nardus* of Linnaeus, and is extensively used in perfumery, the well-known scent of honey soap being due to this essence. The grass from which the oil is distilled attains the height of 6 to 8 feet and contains much silica. The color of the oil may be pale yellow, orange yellow or light green, and the same oil may pass through these changes of color in a short time. The specific gravity of the oil varies between wide limits. As the result of testing some hundreds of samples I have found the specific gravity of genuine oils vary from .870 to .902. A show sample exhibited at the Agri-Horticultural Show in Colombo in 1891 had a much higher specific gravity than .902, but I had no opportunity of examining

it as to its purity.* The low specific gravity oil when genuine is considered the best. The great difference in the specific gravities is no doubt due to oils from different varieties of grass being called by the same name. Conditions of age of the grass, climate, and of soil, are also said to affect the specific gravity of the oil. Formerly this oil was adulterated with coconut oil, more recently with kerosene oil. This last reduces the specific gravity of the oil; but the range of specific gravity of the genuine article being so great, this test left a large margin for adulteration. Owing, however, to the discovery of a better test, the amount of adulteration practised has been greatly lessened.

Besides its chief use of scenting fine soaps, citronella oil is also used as a preserving agent for books and natural history specimens, especially in tropical climates where these are subject to the ravages of insects. Like most of the essential oils it produces, when applied to the skin, a burning sensation; hence it is used as an external application, with rubbing, in rheumatic affections.

The grass from which the oil has been extracted is used as a feeding material; for although cattle refuse to eat the grass in its natural state, even calves will eat it after it has been mollified by the thorough steaming or boiling it gets in the process of oil extraction. It would therefore be interesting to analyse it as a feeding material. I analysed a sample of the steamed and decayed grass to ascertain for constituent its value as manure. The following were the results obtained:—

	per cent.
Moisture expelled at 212° F.	82.68
Dry matter	17.32
	100.00

The dry matter had the following composition :

	per cent.
*Organic matter	84.09
Ash consisting of	
Silica	12.39
Oxide of iron and alumina ..	.97
†Phosphoric acid30
Lime61
Potash09
Other constituents74
	15.01
	100.00
Containing nitrogen	2.24
Equal to Ammonia	2.71
†Equal to tribasic phosphate of lime	.65

It is evident that the manurial value of this substance is small. The nitrogen is the chief element of value present, of which the dry matter contains somewhat less than three-fourths of the amount in coconut manure; whereas the manure in its wet state contains only about two-thirds as much nitrogen as farmyard manure. Of the mineral ingredients, by far the most abundant is silica, which constitutes 82 per cent of the ash or 12.39 per cent of the dry matter. It is possible that as a manure for sugar cane this silica may have a distinct value as being no doubt more easily assimilated than the sand or mineral silicate of the soil.

* Citronella oil apparently genuine, of specific gravity as high as .922 is now (Nov. 1893) finding its way into the market. It does not pass Messrs. Schimmel & Co's. modification of the alcohol test; nevertheless the sample submitted to me was not adulterated with kerosene or other mineral oil nor with coconut or other fatty oil. It behaved like the heavier portion of citronella oil that has been fractionally distilled,

Lemon Grass Oil.

This oil is distilled from the grass *Andropogon citratus* of De Candolle, which is cultivated on an extensive scale in Ceylon and Singapore. The oil is also known as oil of verbena from its odour resembling that of the sweet-scented verbena. Another name by which it is known is Indian melissa oil. Gladstone gives the specific gravity of this oil as '8932 at 15° C., that of the oil from Penang being '8766 for the same temperature. Bentley says: "It is spoken highly of in India as an external application in rheumatism and for internal use in cholera. It possesses stimulant, earminative, antispasmodic, and diaphoretic properties. The fresh leaves are sometimes used as a substitute for tea and the centre of the stems for flavoring carries."

Other Indian Grass Oils.

An oil is derived from *Andropogon pachuodes* known under various names, such as oil of geranium, oil of ginger grass, grass oil of Namur. In India it is known as Rnsakatel or Rusa oil. It is said to be used to adulterate the true geranium oil and otto of rose. If this is the same as Dr. Gladstone refers to in the table as Indian geranium oil its specific gravity is '9043.

An oil is derived from *Andropogon muricatus*, which has also many names, such as khuskhus, cuscens or vetiver or vetiver. It is from the roots of this tall tufted perennial grass that the oil is obtained. The leaves of the grass are without perfume; but the roots are very fragrant. When dried the odour is less perceptible; but on moistening the dried roots the perfume is again given out. Hence it is used in India woven into screens, which, when moistened, both cool and perfume the atmosphere. The yield of oil from the roots has been variously stated at from 2 oz. per 100 lbs. to 10 oz. per ewt. I have also seen it given as from '8 to 1 per cent of the root. The oil is said to possess stimulant and diaphoretic properties. The specific gravity of this oil according to Gladstone is 1.007.

Oil of Patchouli.

This oil which is much used in perfumery

is distilled from the leaves of *Pogostemon patchouli*. The leaves of this plant are exported from Singapore to Europe. I am not aware that the leaves are exported to any extent from Ceylon; but a small parcel sent to England in 1887 was valued in Mincing Lane at 9d per lb., the leaves arriving in a slightly mouldy condition. Good Singapore leaves at that time were worth from one shilling to one shilling and a penny per lb.

The leaves are said to yield 1½ per cent of essence. The following table giving a numerical expression to certain of the physical characteristics of essential oils is extracted from the article perfumery in "Chemistry theoretical and practical." The author of the article remarks: "Essential oils possess great refractive and dispersive power and exhibit peculiar effects when submitted to the action of a ray of polarized light—some being dextro, others laevo rotatory in various degrees, while a few are inactive. The rotatory power is given for a tube 10 inches long; this length of a solution consisting of equal parts of cane sugar and water giving a rotation of 105°. It should be remarked that the product obtained by any one of the ordinary methods of preparation rarely consists of a simple volatile oil, but generally is a mixture of two or more oils. One of these, a hydrocarbon, is lighter and more volatile than the other which is either an oil containing oxygen or a camphor. Hence various samples of crude oils may show slight differences in the properties here given. The history of the specimens used in the determinations was generally well known, and the examination of them gave no reason to doubt their genuineness, the only sign of impurity being a little alcohol in one or two." From information furnished by Dr. Trimen I have marked with a dagger the plants cultivated in Ceylon, principally in the Botanic Gardens, which yield essential oils. The only one in the list that is from a plant native to Ceylon is vetiver from cuscens grass (*Andropogon muricatus*.)

* † While none of the plants yielding the oils in this supplementary list is native to Ceylon, those that I have marked with an asterisk (*) are according to Dr. Trimen cultivated in Ceylon gardens, those that I have marked with a dagger † cultivated in the Hakgala Botanical Gardens.

Dr. Trimen mentions one other plant which grows in Ceylon, the flowers of which are used for the preparation of an essential oil for local sale, viz., the Aegle marmelos, which furnishes the Beli-flower oil, a favourite perfume among the Burgher community; but, Dr. Trimen adds, "There are numerous neglected flowers which "would be well worth using for the purpose as :-

- Sapu (*Michelia champaca*)
- Wana-sapu (*Cananga odorata*—ylang ylang)
- Petika-wel (*Artabotrys odoratissimus*)
- Netan and Dat-ketiya (*Xyloia parvifolia* and *X. Championii*)
- Nâ (*Mesna ferrea*),

and many others, such as all the species of citrus and the jasmies.

"I have often wondered that no one has taken up this industry."

Burning Oils.

The oils that are used for illuminating or heating purposes in Ceylon are chiefly two, viz., kerosene and coconut.

Kerosene Oil.

Kerosene is a mineral oil, being derived from petroleum, of which it forms 50 to 70 per cent. A burning oil similar in properties to kerosene is also obtained from bitumen and shale. Crude American petroleum has a specific gravity varying usually from .790 to .800, though it is found from .74 to .92 in specific gravity. The specific gravity of crude Scotch shale oil is from .860 to .890.

In his work entitled "Commercial Organic Analysis," Mr. A. H. Allen, F.I.C., F.C.S., gives the following table, which shows the character and quantities of the products obtainable from average Pennsylvanian petroleum of S.G. .807, and crude Scotch shale oil.

Lubricating or paraffin oil	..
Paraffin wax	..
Coke gas and loss.	..

The same author states that the density of the first 90 fractions obtained by distilling the average petroleum of the New York market, has been determined by Bourgonnon; and the following table shews the density of every 10th fraction obtained, the original oil having a specific gravity of .7982 at 15° C.

Fraction	S.G.	Fraction	S.G.
1st	.679	50th	.777
10th	.705	60th	.790
20th	.728	70th	.815
30th	.750	80th	.829
40th	.765	90th	.825

The composition of the crude oil furnished by the distillation was naphtha at .700 17%; benzine at .730 9%; burning oil at .783, 64%; residue and loss 10%; and the residue contained about 1/16 lb. of its weight of solid paraffin.

The specific gravity of kerosene varies between the limits .78 and .82.

The commercial tests for the quality of petroleum are its specific gravity, its color, odor, the sensation it produces when rubbed between the fingers, and the amount of naphtha of .700 specific gravity, which it yields on distillation. Seeing that petroleum gives off inflammable vapor at a comparatively low temperature, the storing and transport of this substance is attended with some danger. Hence in civilized countries stringent regulations are in force to prevent accident to life and property from the careless treatment of this substance. The Ordinance No. 6 of 1887 entitled "An ordinance to regulate the importation, possession, transport, and hawking of petroleum and other fluids of a like nature" is that which is at present in force in Ceylon. According to this ordinance the term petroleum includes also the liquids commonly known by the name of Rock oil, Rangoon oil, Burma oil, Kerosene, Paraffin oil, Mineral oil, Petroleum, Gasolene, Benzol, Benzoline, Benzine, and any inflammable liquid that is made from petroleum, coal, schist, shale, peat, or any other bituminous substance, or from any products of petroleum; but it does not include any oil ordinarily used for lubricating purposes, and having its flashing point at or above 2% degrees of Fahrenheit's thermometer.

The ordinance further distinguishes petroleum as dangerous petroleum when the flashing point by Abel's test is below 76° F. "If, however, the petroleum on board a ship or in the possession of a dealer, is declared by the master of the ship or the consignee of the cargo, or by the dealers, as the case may be, to be one uniform quality, the petroleum shall not be deemed to be dangerous if the samples selected from the petroleum have their flashing points, on an average at not less than 76 degrees of Fahrenheit's thermometer, and if no one sample has its flashing point below 73 degrees of that thermometer."

Much of the ordinary kerosene oil consumed in Ceylon has a flashing point only a very little higher than is required to remove it from the class of dangerous petroleum. Thus 14 samples of kerosene drawn from a cargo of 35,000 cases of Russian petroleum were tested by the author, and the average flashing point was found to be 77.9° F., while in no single sample was the flashing point below 70° F.

The flashing point of the special product known as water-white oil, is said to be considerably higher than that of ordinary kerosene. The flashing point by the open test is usually higher than 118° F, and deducting from this 27° which is the mean difference found to exist between the open the close test, this would give at least 91° as the flashing point of this oil.

As an example of mineral burning oil with a very high flashing point, I might cite an oil imported into Ceylon for use in the light-houses. This oil is known as "mineral colza." I found the flashing point of this oil to be beyond the range

of the thermometer accompanying Abel's test apparatus, so that the flashing point had to be determined by the open test and was found to be 266° F. The firing point or the temperature at which the oil became permanently ignited was 311° F. The specific gravity of this oil at 82° F was .82, and its viscosity, compared with American kerosene was as 30 to 20.

The following is a comparison of the gravities and flash points of the four principal mineral oils used as illuminants in Europe:—

	Specific gravity.	Flash point.
Ordinary American petroleum	.790	73° F.
American "Royal daylight"	.810	76°
Russian	.25	82°
Scotch extra refined	.809	104°

Lubricating Oils.

Mineral oils of high flashing point are used in Ceylon, as elsewhere, as lubricating oils. Such oils sometimes have fanciful names, but they are prepared from petroleum or shale. According to Allen "mineral lubricating oils have densities ranging from .850 to .915, the most usual gravities falling between .880 and .905. Mineral lubricating oils boil at a very high temperature. The flashing point of the pale Scotch oils from shale range from 130° to 180° C. (266° to 356° F.), and of the darker oils and greases from 180° to 235° C. (356° to 446° F.). The viscosity at 15° C. (59° F.) is from 2 to 7 times that of water."

Most of the mineral oils exhibit the character of fluorescence, and they are not saponifiable; characteristics which are useful in enabling us to distinguish them from fat oils.

The following series of propositions give in a condensed form a description of the properties of lubricating oils. They are from Spurr's "Encyclopedia of the Industrial Oils" with some verbal alterations by Allen.

(a) "A mineral oil flashing below 150° C. is unsafe.

(b) A mineral oil losing more than 5 per cent in ten hours at 15° to 20° C. is inadmissible, as the evaporation creates a viscous residue, or leaves the bearing dry.

(c) The most fluid oil that will remain in its place fulfilling other conditions is the best for all light bearings at high speeds.

(d) The best oil is that which has the greatest adhesion to metallic surfaces, and the least cohesion in its own particles; in this respect the fine mineral oils stand 1st; sperm oil, 2nd; Neat's foot oil 3rd; and lard oil, 4th; consequently, the finest mineral oils are best for light bearings and high velocities, the best animal oil to give body to fine mineral oils is sperm oil (?); lard and Neat's foot oils may replace sperm oil when greater tenacity is required.

(e) The best mineral oil for cylinders is one having a density of .893 and a flashing point of 360° C.

(f) The best mineral oil for heavy machinery has a density of .880 and a flashing point of 269° C.

(g) The best mineral oil for light bearings and high velocities has a density of .871, and a flashing point of 262° C.

(h) Mineral oils alone are not suited for heavy machinery, on account of their want of body; but well purified animal oils are applicable to the heaviest machinery.

(i) Olive oil stands first among vegetable oils, as it can be purified without the aid of mineral acids. The other vegetable oils which, though far inferior to olive oil, are admirable as lubricants, are, in their order of merit, sesame, earthenut, rape and colza, and cotton seed oils.

(j) No oil is admissible which has been purified by means of mineral acids."

The property of lubricating oils called viscosity, which is determined by noting the number of seconds a given measure of oil takes to run through a small orifice of definite size, is one which varies much according to temperature, but does not vary in any definite manner according to the specific gravity of the oil. In England the viscosity of the commoner animal and vegetable lubricating oils varies though a very wide range; in Ceylon the range is much less, while above 80° C. there is very little difference in this respect between them. The following table quoted by Allen from a pamphlet by Messrs. J. Veitch, Wilson & Co. gives the viscosity for the commoner animal and vegetable lubricating oils for three temperatures.

Kind of Oil.	No. of Seconds.		
	at 60° F. = 15.5° C.	at 120° F. = 49° C.	at 180° F. = 82° C.
Sperm oil	47	30½	25¾
Olive oil	92	37	28¼
Lard oil	96	38	28½
Rape oil	108	41¼	39
Neat's foot oil	112	40¼	29¼
Tallow oil	143	37	25
Engine Tallow	Solid	41	26½

The author has not had occasion to test lubricating oils as used in Ceylon. The following, however, are notes of a few observations made:—

Lubricating Oils used in Ceylon.

The following are some of the lubricating oil used for machinery in Ceylon:—

Crane's Machinery oil for machinery generally. This oil has a greenish yellow color when seen by transmitted light, with a blueish green fluorescence or bloom when seen by reflected light. Its specific gravity at the ordinary temperature of Colombo, compared with water at the same temperature is .933. *Crane's Patent Oil* for engine cylinders is red by transmitted light with blueish green fluorescence and specific gravity .915. *Rangoon oil* used for machinery, gearing &c. is dark red by transmitted light with dark fluorescence specific gravity .934. *Engelbert's oil*, a dark-colored oil, used for engine cylinders, valves &c. *Castor oil* of lemon yellow color, specific gravity .965; and also *Coconut oil* are used as lubricants, though they are less in favour than formerly. Coconut oil contains free acids which is a disadvantage in a lubricating oil. The mineral lubricating oils of Messrs. Thompson and Bedford Company, Limited, of New York, are also used to a considerable extent in Ceylon. In specific gravity they range from .880 to .930 at standard temperature.

Fixed Vegetable Oils.

As examples of Ceylon fixed vegetable oils might be mentioned Coconut oil, Gingelly oil, and Margosa oil.

Coconut Oil.

The oil is obtained from the dried kernel of the *cocos-nucifera*, technically known as copra, either by the process of boiling in water, and skimming off the oil, which rises to the surface, or, more commonly, by pressure. Its uses are very varied. It is used for burning, either in its crude state as in warm countries, or after being converted into candles as in cold countries. It is largely used in Eastern cookery; also as a cosmetic. The manufacture of soaps also absorbs a large quantity of

coconut oil. The soap made from it is soluble to a larger extent in saline and alkaline water than most other kinds of soap; hence it is used for the manufacture of marine soaps. It does not make a good lubricant, as it contains free acids. In addition to the other uses enumerated, it has been used in considerable quantities of recent years for the manufacture of a butter substitute, known in commerce as coconut butter.

Coconut oil has a very complex constitution. The following fatty acids have been found in it, Lauric acid $C_{12}H_{24}O_2$; myristic acid $C_{14}H_{28}O_2$; acids having the composition $C_{11}H_{22}O_2$ and $C_{12}H_{24}O_2$; also palmitic acid $C_{16}H_{32}O_2$; and stearic acid $C_{18}H_{36}O_2$.

When coconut oil has solidified, which it does at the comparatively high temperature of 78° F. it can be readily separated by pressure into a solid body, stearine, and a liquid called elaine. The former substance is used in the manufacture of candles, the latter, after being purified with sulphuric acid, is used as a burning oil.

A sample of ordinary coconut oil from the bazaar had a specific gravity .9207 at 85° F. (29.4° C.).

A sample of Hultsdorf pure king-coconut oil at the same temperature had a specific gravity of .9186.

The specific gravity of coconut oil given by European writers is for the temperature 212° F. (100° C) .868.

Margosa Oil.

This is a bitter oil obtained by pressure from the seeds of the Margosa tree, *Melia Azadirachta*, also known as the nim or neem tree. The bark of this tree has long been known to possess tonic and astringent properties, and is now also used as a febrifuge. The leaves are used as an external application for ulcers, &c. The oil is highly prized for its anthelmintic properties, and is used more especially to protect the sores on horses and cattle from blow flies. It is used also as a lubricant for steel, iron, &c., but its price is too high to admit of its extended use in this direction. It is dark in color, and has a strong smell. A sample of the oil purchased in the bazaar had a specific gravity of .9223 at 80° F. (26° C.).

Castor Oil.

This oil is extracted from the seeds of *Ricinus communis*, a plant which is common in Ceylon. The chief applications of castor oil are in medicine, in the making of toilet soaps, and as a lubricant for heavy machinery. It is a colorless or pale yellow, viscid oil, of specific gravity .960 to .964, at 59° to 60° F. It is an oil which is subjected to a good deal of adulteration, such substances as olive oil, poppy seed oil, lard oils, coconut oil and refined rosin oil being amongst the known sophistications.

Gingelly Oil.

This oil is expressed from the seeds of *Sesamum indicum*, and *Sesamum orientale*. It is known by different names such as Benne, Sesame, Til, Teel, Gingili. For many purposes it forms a good substitute for olive oil. In Ceylon and Egypt it is used as a cosmetic, in addition to its other applications, such as for cooking and burning.

It is used to some extent for soap making, and for adulterating olive oil. This adulteration can be detected by the shape of the cohesion figure formed when a drop is placed on the surface of water.

The color of gingelly oil is pale yellow, it has very little odour, and its taste is mild and rather agreeable.

A sample of bazaar oil had a specific gravity of .9163 at 80° F. Its specific gravity at 59 to 60° F. (15° to 15.5° C.) is .923 to .924. It becomes solid at from + 8 to + 5° C. (Allen).

Table I.—Particulars of some Fixed Oils and Fats from Plants Common in Ceylon.

Name of Oil.	Source of Oil.	Sp. Gravity at 15 to 15.5° C. (= 59 to 60° F.)	Solidifying Point. °C.	Fluidity at 15° C. (59° F.)		Color and other Characters.	Chief Application.
				100	73.7		
Tobacco seed oil	Nicotiana tabacum	.923	-25	100	73.7	A drying oil of greenish-yellow color; inodorous; mild taste.	Soap making; lubricating; frequently used to adulterate rape and olive oil.
Cotton seed oil	Gossypium barbadense and other species	.922 to .930	+ 2 to -3	—	—	Yellow or brownish to colorless; mild taste sometimes strong and disagreeable.	Cooking; soap making; burning; adulterating olive oil.
Sesame or Teel oil	Sesamum orientale and indicum	.923 to .924	+ 8 to -5	—	—	Pale yellow; taste mild and agreeable; almost odourless.	—
Seed of	Butea frondosa	.917	+ 10°	—	—	Colorless or pale yellow; viscid, taste mild, then acid.	Medicine; making toilet soaps; lubricating.
Seed of	Calophyllum inophyllum	.942	+ 5°	—	—	—	—
Castor oil.	Ricinus communis	.960 to .964	- 18°	4.9	2.3	Colorless, chocolate like taste and smell not liable to become rancid.	Pharmacy; manufacture of soap and candles.
Mesua seed oil	Mesua ferrea	.954	+ 5°	—	—	—	—
Cacao butter	Theobroma cacao	.945 to .952	20° to 30°	—	—	—	—

Comparatively few of the vegetable fixed oils of commerce, besides those already mentioned, are obtained from plants which grow in Ceylon. Many oils, however, that are not produced in Ceylon are used in Ceylon either in medicine or the arts, so that a pretty full list of the vegetable and animal oils of commerce might not be out of place in this work. Those specially interested in oils not produced in the island, however, would doubtless require more detailed information than falls within the scope of this work to furnish. The reader desirous of such information is therefore referred to such works as Watt's or Thorpe's Dictionaries of Chemistry, Allen's Commercial Organic Analysis, &c. From Allens tables I select particulars of a few oils which are obtained from plants that are common in Ceylon.—(See table 1.)

The following are some standard analyses of Oil-seeds:—

	(T. Anderson.)		(C. A. Cameron.)	(T. Anderson.)	
	Lin-seed.	Rape seed.	Rape seed.	Hemp seed.	Cotton seed.

(To be continued.)

THE EILA TEA COMPANY OF CEYLON LIMITED.

At an extraordinary General Meeting of Shareholders held today in the Company's registered office, No. 6 Prince Street, the following resolutions passed at the Extraordinary General Meeting held on 4th ultimo were confirmed, viz:—

1st. That the Kanangama Estate be purchased by the Company.

2nd. That the Capital of the Company be increased to Rs300,000.

3rd. That the Directors be authorized to issue Debenture Bonds to the extent of Rs100,000—as required for the purposes of the Company, bearing interest at 7 per cent.

J. M. ROBERTSON & CO.
Agents and Secretaries.

"RESIN-OPAL."—We owe an apology to a planting friend who sent us a short time ago a specimen of a striking-looking stone, of which he has a good deal on his property, for not informing him before now about its nature. Mr. Geo. Armitage pronounces it to be "resinous-opal," a very pleasing coloured and marked form of Quartz-resinita about which "Dana" informs us in the following paragraph:—

Common Opal.—In part translucent; (a) milk-opal, milk-white to greenish, yellowish, bluish; (b) Resin-opal (Wacht opal. Pechopal. Germ.), wax-honey, to ochre-yellow, with a resinous luster; (c) dull olive-green and mountain-green; (d) brick-red. Includes Semiopal, Halbopal Germ.

Nicely polished paper-weights or other useful articles of resin-opal would look well.

VARIOUS AGRICULTURAL NOTES.

TEA PLANTING IN INDIA AND CEYLON.—Says the *H. and C. Mail*:—If the tea industry of Ceylon should decline, a contingency so remote that we will regard it as well-nigh impossible, it will certainly not be for lack of enthusiasm on the part of those engaged in upholding it. The newspapers published in the island have made Ceylon tea their rallying cry, and have vied with each other in singing its praises. They never tire of the operation, and if their spirits ever flag, or there is the slightest suggestion of monotony in the chant in praise of tea, a new chord is touched, and the poems are renewed with fresh vigour. The *Ceylon Observer*, we notice is for the moment especially jubilant over the idea that some Anglo-Indian firms are turning their attention to Ceylon. Then follows our note about the Docars and about Sir John Muir and Mr. Buchanan coming to Ceylon. The *Mail* winds up:—

"The *Observer* gives figures in support of the claims it puts forward that Ceylon can hold its own as a tea-growing country, and it infers that not only are the Anglo-Indians, who are opening their eyes to the advantage of Ceylon, wise in their generation, but that in doing this "before it is too late" they are to be congratulated. Here is the material for another boom in Ceylon tea gardens and the produce thereof. Truly the zeal and push of the friends of Ceylon tea resemble the soil and resources of the island, in that they are well-nigh inexhaustible."

A BREAKFAST WEATHER GAUGE.—From an article in *Chambers' Journal* on "Natural Barometers" we learn that the forecasting of the weather by the bubbles in a cup of coffee has been lately attracting attention in the columns of the daily papers. A writer says:—"With my breakfast I drink coffee mixed with milk. When poured into the cup I gently drop in the lumps of loaf sugar, and shortly after the fixed air in the sugar rises to the top in small detached bubbles. Now watch these: I call them my little people, who will tell me if it is going to rain or not; and although the coffee is perfectly still, these little bubbles will be on the move, almost like life. It will be noticed that if it is going to rain very hard, they will almost rush over to the side of the cup—as much as to say, I shall get under shelter, as quickly as possible. If the rain is only to be a gentle downfall, then the bubbles all meet together, evidently to deliberate on the matter, and then quietly move over to the side; but if it is not going to rain, every bubble that comes up remains stationary in the middle of the cup." The writer adds "that during the past four or five years these little people have not deceived him a dozen times." The main condition seems to be that the observations be made in the morning, when atmospheric influences will have every chance of fair play, and if the window being open so much the better.

COFFEE.—Messrs. I. A. Rucker & Benckraft's weekly report for Nov. 9th, is as usual pitiful and interesting:—

A comparison of the figures is interesting. World's Visible Supply 1st Sept. 193,626 tons, last year 163,417 tons. World's Visible Supply 1st Nov. 147,679 tons, last year 162,065 tons. In two months a surplus of 30,000 tons has changed into a deficiency of 15,000 tons, a marvellous transformation. Admit to Europe from Brazil and the East 8,526 tons against 28,370 tons last year. Comment is hardly necessary, and it is not difficult to look for the real reason of present high prices. Bull speculation or manipulation has played no part in this upward movement, and the only factor has been scarcity. To prognosticate the immediate future would be dangerous, as price is a great leveller, but the Trade must bear in mind that scarcity still faces us for some time to come. That trade continues slow is perhaps explained by the fact that in some leading consuming countries, at present retail prices, there is no margin for profit to the dealer. Retail prices will, we are led to believe, be raised shortly, and this would give the small dealer again some margin and the effect would be immediately felt at the Coffee centres,

where prices for mild Coffees are absurdly low in comparison with Brazil. It may be reasonably argued that raising retail prices will affect consumption, this is probable and must be so, as only decreased consumption can establish a proper balance between supply and demand. Messrs. Nossbeck cable from Santos:—"Reduce present crop estimate to two millions, next uncertain." Messrs. Gutz, Hayn & Co., Santos:—"Prospects less favourable, four millions."

THE NEW "FODDER PLANT"—referred to by our London correspondent—(see page 400) is in reality an old garden plant (*Polygonum sachalinense*) remarkable for its size, beauty rapid growth and, according to several gentlemen who have experimented with it, for forage and even human food! From notes published by Mr. J. Wood of Kirkstall, we quote as follows:—

It is a native of the Isle of Sakhalin, in the Sea of Okhotsk, between Japan and Siberia. It was discovered by a Russian explorer, and introduced into English gardens about 26 years ago. Another name than *Polygonum sachalinense* by which it is known is *Persicaria sachalinense*. Its botanical relationship may be described as near to our common dock. Of course it has a very different aspect, and few would suspect its relationship to one of our commonest weeds. The plant grows to a stature of ten feet. This is all the more wonderful when it is considered that it is merely an herbaceous plant—that is, that it dies down every year and makes this length of stem a fresh annually. The main stems have an oblique and semi-arching habit. They have lateral branches or twigs, all furnished with bold heart-shaped leaves, 8 in. to 10 in. across, and from the base of each leaf there springs a tuft or compound cluster of spikelets of white flowers. It may therefore be imagined how noble and beautiful the plant is arching, full-folaged, and touched off with such blossom. Its rate of growth has been measured in late spring or early summer to be 3½ inches per shoot per day, and as one friend said, "You may almost stand and watch it grow." The vigour and diffuse habit of the root is remarkable as its rapid development. It goes without saying that such a plant has been taken advantage of by gardeners, and especially by gentlemen who seek for tropical effects in their grounds. In the vicinity of water it grows with even increased luxuriance, and is a truly stately plant. It has of late, however, been brought into more prominent notice in the National Society of Agriculture of France by experimenters. They especially commend it as a forage plant, and although it loves the vicinity of water, it proves to be a good grower in a droughty season like the present. This is a most commendable property. Experiments are said to have given results highly satisfactory. The green yield is said to have been 44lb. to 83lb. per square yard, or 95 tons to 190 tons per acre. Bees are fond of the flowers, and cattle extremely fond of its foliage. Doubtless more will be heard of this plant ere long. It does not yield seed, and therefore has to be planted by pieces of root, every short piece of which will make a plant, and grow strongly the first year. The new shoots or sprouts in spring are stouter than the thickest asparagus, and much resemble that vegetable. Indeed, the shoots have been used in a similar way to asparagus. It is similar to *Polygonum cuspidatum* in all its parts, but much less. *Cuspidatum*, I know to be cultivated in many of the thickly populated parts of Leeds, and, indeed, is one of those things that may be said to be capable of growing anywhere. This is a useful feature in a way; but in well-kept gardens it should be planted judiciously, or owners may have to speak bitterly of it, as Mr. Joshua Buckton does, who aptly describes it as "original sin." Notwithstanding the tropical appearance of the plant, it is capable of enduring our worst and coldest winters, and once it gets possession of good light soil, it grows amazingly, and, indeed, in the worst soil in which vegetation can live at all, it thrives in a degree beyond comparison with most vegetation.

Has anything been done in Ceylon with this plant?

TEA VERSUS ALCOHOL.

To the Editor HOME AND COLONIAL MAIL.

SIR,—The following quotation from the report of Sir Evelyn Wood on the recent Aldershot manoeuvres may not be altogether without interest to tea planters:

"The experiment of giving the men cold tea, flavoured with lemon, was tried, and some beer, given by a landowner, was issued during one march. . . . The medical officers advised me, and I am satisfied that although the stimulus of the beer produced an apparent beneficial effect for about an hour, it was manifest later on that the men would have marched better without it."

Your readers will observe that the General refrains from making any actual comparison between the effect of tea and of beer respectively, but, inferentially, we may conclude that his opinion was in favour of the tea. Certainly, in my own experience, a mild infusion of tea—not too strong—with a slice of lemon and some sugar, is both a refreshing and stimulating drink, and the pity is that the efficacy of tea, drunk in this way, is not more widely appreciated in this country.—Yours faithfully, GEO. SEYON.

126, Bishopsgate Street, E.C.

Oct. 11, 1893.—H. and C. Mail, Oct. 13.

INDIAN TEA.

A CAMPAIGN IN AMERICA AND AUSTRALIA ADVOCATED;
WANTED MORE PUSH, PLUCK AND PERFECTION.

According to an old planting "wheez," when coffee failed in Ceylon a sturdy and, we fear, irreverent, old planter throw his last rupees into tea with the profane alteration of the motto—*In te (thea) Domine, speravi*, which he interpreted as "In tea, O Lord, have I put my trust." He afterwards altered this to "*In te (thea) Domine, spes nostra*," as he thought the change more appropriate to the prospects of Ceylon. Now, though tea is not the mainstay of India, as it is of Ceylon, yet it is nevertheless one of the many hopes of this country, which might be labelled with the parodied motto of the disrespectful Ceylon planter. According to Dr. Watt, little short of 20 millions of British capital are invested in tea planting in India, while it affords employment for half a million people, including some of the finest and best specimens of British manhood. It has been the means of introducing a large amount of foreign capital into provinces, which otherwise would have been waste places, and giving lucrative employment to numbers of the native population, that erstwhile led a savage, half-starved existence. If it has not infilled the glowing anticipations of the early writers on Indian tea, who fondly imagined that in time the Indian people might, like the Chinese, take to this "simple healthy beverage," it has at any rate supplied the British public with a wholesome article, of British growth and manufacture, in place of a doubtful article from an alien source. It has made a wonderful progress and it would have achieved greater victories were it not for the rivalry of Ceylon. Having reached this point of prosperity, it would seem that Indian tea planters think that they can rest on their oars and pleasantly glide whither the current takes them. We say *seem*, as the lack of outward and visible signs of enterprise, such as are seen in Ceylon, denotes, at least to the casual observer, this conclusion though it may not necessarily be the correct one, or even approximately so. As we shewed in our last issue, the Ceylon planters are straining every nerve to push their teas, the most trivial devices being employed to effect this purpose. They are as alive and smart as Americans in advertising their wares, and their enterprise is really phenomenal compared with the quietness and apparent sluggishness of tea folk in India.

There is a capital field in the United States and Australia; but require hard working, for we have not only to fight against China, which is still supreme but against Ceylon, which is pertinaciously push-

ing her teas in these parts. The *Pioneer* is not given to extremes of opinion, and in a recent article it showed that the Indian leaf has lost ground in the United States, for whereas 83,415 lb. were imported therein in 1891-92, only 59,000 lb. were imported in 1892-93, while the importations of Chinese growth have tremendously increased. Then in regard to Australia, we are told, that though there was a greater demand for Indian teas in 1891-92, there was a marked falling-off in the following year. "It will be seen," says the *Pioneer*, "that except as regards Great Britain, China and Japan still more than hold their own against India, while last year's official trade returns shew that the footing we had acquired in Persia is being lost again." America offers a fine future for Indian teas, but to take advantage of it, we must be prepared to compete with Ceylon in the matter of advertising and generally pushing the leaf. The United States consume from 80 to 100 million pounds of tea per annum, and according to latest reports a distinct favour has been shown for Indian tea, wherever it has been introduced. It is not possible to enlarge the area of its consumption, by some enterprising methods of advertisement and then by making tea adapted to the American taste?

Our representative at the Chicago Exhibition has done good work in making known Indian teas to the American tea drinker; he has laboured quietly and, we believe, very effectively. But more is required with a busy, quick, alert people like the Americans, who take to nothing unless it is well advertised and consider that an article whose merits are not described in flaming characters and well pushed, is not worth having. The same remark applies, though perhaps with less force, to Australia. It might be worth while to prepare a systematic campaign for America as well as Australia, on the following lines. Let each garden producing 5,000 maunds of tea give five maunds, and each garden of 1,500 maunds 1½ maunds to the Tea Association or some Agency, so that it can be banded and shipped to our representative in America and distributed by him in such a way as to have the merits of Indian tea impressed on circles whence it is likely to be spread. Distasteful though it be, we think that we should follow the example of Ceylon in this matter, and "go one better" than the planters and their agents in that island, while there must be more attention given to the quality of the tea so that it may be adapted to the taste of intending customers. The *laissez faire* system must be thrown aside altogether.

Indian tea must improve in quality if it is to continue a profitable investment, and we think there is something to be said on the point of scientific knowledge in the manufacture and a quickness in meeting popular tastes, diverse though they be. The London market is now flooded with inferior tea which some letters described in terms that we should not care to repeat and to quote one authority, this is likely to be so with the foolish competition among planters for quantity not quality results. "The practice seems to be hardening," says one correspondent, "that if B. has estimated for 5000 maunds, C., his neighbour says to himself I'll go for 5200 maunds, forgetting that it is better to make 3000 lb. of eight auna stuff than 5000 of very inferior." The deterioration in the quality of Indian teas, encouraged by this inadvisable competition, is being strongly commented on at home, the usual ending of a letter on the subject being "reform, or you will be beaten by Ceylon." Last year the home sales shewed that there was 50 per cent. medium disposed of, but this year the proportion is, following the figures of our authority, 15 per cent. good and 85 per cent. inferior medium, of which a large quantity was very inferior calling forth some of the expressions once applied to China tea of the commoner sorts. It is not well to take so pessimist a view of the situation as some dealers; but we cannot slight their opinions nor fail to see that there must be an improvement in quality, if Indian tea is to hold its place in the

London market; and, beyond this, some notice should be taken of the warning given by Dr. Watt, that the manufacture should be pursued on scientific principles, especially in view of the probability of the superior strength of Indian teas passing through changes in the soil, when it will be necessary to invoke for future the aid of science.—*Indian Planter's Gazette.*

NEWS FROM GERMAN EAST AFRICA.

We are glad to have a good report from Mr. W. H. Cowley of his health and the progress of the works under his care. He writes:—

"Latterly I have been away living some ten miles from this close to a large tract of jungle which I hope to begin felling soon to form another coffee estate; and this week I go off again to the lowcountry to finally pick out a piece for cocoa and lowcountry products. I hear my assistant will turn up soon. What a blessing it will be. I shall probably meet him, if anywhere near Jaugant at the time."

COFFEE-GROWING

is evidently going to take hold in Queensland, and there is no lack of information offered to intending planters. The latest is a pamphlet issued by the Agricultural Department entitled:—"Coffee-growing and its preparation for market by R. W. McCulloch."—From his paper we quote:—

"That the Coffee plant has found a congenial home in Queensland has been amply demonstrated in almost all the Northern coast districts, and recently in the Bunderim Mountain district, where the crops promise to be phenomenal. In the North the driest season seemed to affect the plant but little, judging by the luxuriance of its dark green foliage when that of most other plants was yellow, and by the unusually heavy crop of berries produced. The demand for seed and plants, as well as information, pointing to a growing interest in an industry which promises to be remunerative, and to, in the near future, assume large proportions, is sufficient inducement for the Department of Agriculture to issue this Bulletin on "Coffee-growing and its Preparation for Market," with a hope that the information contained herein, being the outcome of practical knowledge on the subject by the writer, and written to suit Queensland conditions, will be of interest to intending Coffee-growers.

The list of contents may be given:—

Historical, Botanical, Climates and Soils, Seed, Nursery, Transplanting, Cultural Operations, Pruning, Harvesting, Preparation for Market, Roasting, Yield per Acre, Will it Pay?, Diseases, Statistical. And finally we quote the two paras of most practical interest:—

WILL IT PAY?—The only serious consideration in connection with coffee-growing is the necessary labour for picking the crop when ready, and this will have to be got over somehow. The operation is no different from the picking of hops or any other fruit. Contract work having overcome this difficulty in other places will doubtless do the same here. The following calculation may elucidate this point a little:—One acre of coffee will yield 25 cwt. of ripe "cherries." An average European labourer ought easily to pick 200 lb. of ripe cherry per day; at this rate it will require fourteen men to pick one acre; wages, say, at 3s 4d per day, equal to £2 6s 8d. The 25 cwt. of "cherry" will yield 5 cwt. of marketable coffee, valued at £2 10s per cwt. at the very lowest, which is equal to £12 10s per acre. Surely such a return would warrant higher wages than £1 a week being paid for coffee-picking, and so attract labour. Coffee-picking is essentially suitable work for women and children, and opens out remunerative employment for them. Payment may well be made by results, at so much per bushel. The question of suitable labour during the picking season will settle itself. Like the shearers in this colony and the hop-pickers in England, a class of coffee-pickers will spring into existence and travel

about earning good wages. Coffee-growing in big areas, like our sugar plantations, is not advocated under present labour conditions, these pages being written for small growers only. Areas of from 5 to 10 acres are quite sufficient for any one grower, and, were six or twelve such growers to co-operate and procure a good pulper, would prove highly remunerative.

The intending coffee planter will naturally ask where the market for his produce lies. The following table of imports during 1890 will clearly show the demand there is for the article. These figures do not limit the demand, for so surely as it is ascertained that genuine unadulterated coffee is procurable, so surely will the demand for this most popular beverage arise:—

	Coffee lb.	Value £
Victoria ..	1,288,906	58,31
New South Wales ..	659,241	32,294
Queensland ..	223,193	9,917
South Australia ..	397,476	19,912
Total...	2,568,903	120,407

The above figures represent imports of both raw and roasted coffee. Can anyone doubt the chances of success of coffee-growing?

PICKINGS WITH A LOCAL APPLICATION.

The *Rural Californian* has the following paragraph referring to Coconut cultivation in our Island:—"The coconut has made such good progress in Ceylon, that the difficulty now is to obtain first-class suitable land. Wherever there is any, Government should have no hesitation in hurrying it in to the market, for whatever may be said about tea, the planting with palms is, in every sense, better, for the Island and its people than the maintenance of the forest." Good advice in a way, but it may be pointed out at the same time that our forests do not, as things go in Ceylon, consist of tea.

Mr. Forsyth, of the School of Mines, Adelaide, ably deals with the subject of the education of Colonial boys in a lecture which the *Adelaide Observer* epitomises. The question is one of universal interest and the following quotation is worthy the consideration of parents in this country:—

The question of questions among educationists now is whether the usual studies of the ordinary lad are to be curtailed in order to make room for manual training? One class of instructors reply in the negative, and contend that every boy should have his intellect trained while his time is free for such training; busy times, occupied with other things, will come soon enough, but the intelligent boy, who has made good use of his intellectual school training is the one who has reasoning powers to give him a good start in life, and who will ultimately succeed. Hazlitt once remarked very forcibly that "a very large proportion of people confound a knowledge of useful things with useful knowledge." The most valuable training which any boy can get is not that which consists in the actual handling of useful things, but that which will in later years enable him to understand and appreciate these things when he comes to use them. If together with this sort of knowledge we can succeed in instilling into the rising generation not only a taste for useful manual work, but also a clear idea of the dignity of labour and its importance in the world's progress, we shall have done all that is usually possible, so far as schooldays are concerned. The great want is a more decided recognition by parents of the necessity of determining what line of life their children shall follow out. If there were decision on this point the work of the teacher would be greatly simplified. Those intended for professional life could then aim at passing the University standards; those meant to take up commercial pursuits could study bookkeeping, modern languages, shorthand, and so forth; while those with

a bent for instrumental work would do a good course of manual training and the study of machinery. It would be a huge mistake to allow even manual training to oust from their present positions any of the really elementary subjects of education. But as soon as boys are able to pass a fair test in these they should be free to specialize for the rest of their schooldays.

In the present day there is a tendency on the part of medical men to forget the older remedies and to be carried away by an enthusiasm for new drugs. Frequently those who constantly employ the newer remedies find that they fail to produce the desired results, and are surprised, when the older medicines are resorted to, that results are got which, if produced by the newer drug, would lead to enthusiastic praise. An instance of a drug which is in danger of passing into obscurity is camphor, on the value of which the *Therapeutics Gazette* has a long dissertation, noting the various cases in which it has been found most efficacious and almost invaluable. "We believe," says the *Gazette*, "that camphor is not sufficiently used" and the object of the paper is admitted to be "to increase its general employment." Indeed the article referred to can be read with benefit by our new-drug doctors, and will delight the heart of the so-called old-fashioned physician.

The *Indian Agriculturist* has been treating exhaustively on the subject of "Hemp drugs and their uses." The narcotic products of the hemp plant are briefly stated as follows:—

1. *Churrus* the resin (named cannabin) which is either collected off the leaves from which it is found exuding, or extracted by infusion or decoction in spirits of wine or either from the flowers and twigs.

2. *Ganja* properly a preparation of the flowers, but the ganja of commerce consists of three varieties:—(1) the flat ganja said to be full of leaves; (2) round ganja, named from the form it takes in being rolled, and credited with stronger narcotic powers; (3) rora or choor, broken flowers and leaves, undoubtedly the strongest in narcotic properties.

3. The leaves, which form a most important article of trade are known under the different names of "Bhang, siddhi, patti, and subj." The commonest preparation is as follows:—

The dried leaves are repeatedly washed to remove the green coloring matter, then pounded into a fine paste with a few grains of aniseed, diluted with water and drunk as a refreshing draught. Pounded dry rose leaves, black pepper, rose water and sugar may be added according to taste. Another favorite form is an extract of the resin from the leaves which are boiled in water with ghee. The jelly so obtained is cooked with desiccated milk and sugar into a paste which on hardening is cut into small tablets. The preparation is known as *majun* or *majum*.

Churrus is sold in brownish black grains or masses. It is only used for smoking mixed with tobacco and molasses, and is frequently taken to whip up the effects of ganja, which is also used only for intoxication in the form of a smoke.

The useful products of the hemp plant are its excellent fibre, and the seed. The latter produces a bland fixed oil, employed sometimes in the adulteration of mustard oil, but also for burning in lamps, in wax-making and in paints and varnishes; while the seeds themselves may be eaten, and are given to birds.

Q.

THE NATURAL AND INDUSTRIAL RESOURCES OF INDIA.

Sir Juland Danvers' paper on this subject should be carefully studied by all those interested in the progress of this country. Its agriculture and its manufactures have, only since the assumption of the Government by the Crown, exhibited development, but he did not wish to depreciate, in saying so, what had been done for both, by the late East India

Company, who laboured for thirty years previously in the same direction. That more success did not attend their pioneer efforts was not due to the absence of sagacious energy or activity on their part, but rather because modern improvements in steam navigation, and cheap and speedy intercourse with Europe were wanting. These have since placed Indian natural products, her grains, her seeds, her cotton, her jute, her tea, her coffee, tobacco, silk and other things before capitalists at home, and have brought about the advancement of the last twenty-five years. The Suez Canal has played no insignificant part in this result. With that powerful factor of civilisation, he brackets the moral and intellectual progress of India and the greater security it enjoys in good government and the policy inaugurated by the East India Company. Steam, electricity, machinery, capital, science, skill, energy and wise administration have all contributed to the result, and it would not be possible to differentiate the part each of these forces has exerted in the common cause where all were so intimately associated and worked together. Speaking of the alarm which the great increase of the Indian population occasions in some quarters, he adopted the sentiments, and quoted the words of the late Census Commissioner who arrived at the following conclusions after mature deliberation and with a large and recent experience, "that relatively to its means of subsistence India is not over-peopled, that even in the favorable circumstances of the last ten years, the population has not increased in an undue proportion to those means, whilst the rates of increase in its process of production and purchase indicate a general rise in the wellbeing of the community at large."

In recent years more land has come under cultivation and irrigation has been extended over vast areas. Agriculture has been decidedly improved though there is room for greater improvement. It is the preponderating industry of the country, as no less than 83 per cent of the population are sustained by it. Compared with this enormous percentage, the 9 per cent that live on handicrafts and manufactures are an insignificant factor and equally so is the amount of exports credited to them, averaging 14,300,000 rupees compared with a total aggregating 103,500,000 rupees.

It is not desirable that a great country should depend on one source of wealth. Agriculture will, no doubt, hold its own, and continue to be the main industry, but if besides exporting her raw materials, India could turn them to account in supplying her own and foreign markets with manufactured goods an important step will be taken in promoting the prosperity of the country.

Among her agricultural products, Sir Juland Danvers noticed tea, coffee, cinchona, tobacco, fibres, hambo, timber, opium and indigo. Tea he said is now cultivated and manufactured on the slopes of the Himalayas, and on the hill tracts of Southern India, occupying an area of no less than 1,000,000 acres and exporting as much as 120,149,467 pounds of made tea in 1891, of which 111,169,000 went to Great Britain and considerable consignments to Persia and Australia. He could remember the time when Indian tea was a curiosity at home, China, enjoying the monopoly of that product and supplying 1,668,870 pounds in 1871. In twenty years, this quantity dwindled to 67,256,263 pounds with a tendency to fall lower still year by year since. This shows what can be done by energy, intelligence, and the outlay of British capital properly directed.

Quinine is another product, he said, which had been successfully introduced and established in India. Mr. Markham in 1858 was deputed to South America to collect cinchona seeds and plants from the forests of the Andes. The attempts were unsuccessful at first, the plants were injured by travel and arrived in a dying state, but subsequently seed were gathered, and with perseverance were got to germinate on the Nilgiris, where several flourishing Government plantations now exist where the drug is produced in great purity and abundance.

Another industry which has not made the same strides but is steadily increasing in bulk and value is tobacco. The climate of Southern India is admirably adapted for this cultivation, which needs careful choice of seed and better treatment to expand indefinitely. Both in the time of the Honorable the East India Company and since, efforts have been made in this direction, but no very marked degree of success attended them, perhaps because English capital has not been devoted more largely to the production of tobacco and the manufacture of cigars. According to latest statistical information 31 tobacco farms and factories exist in India, of which 29 are situated in the Madras Presidency. Exports, however, are small and show little increase. In 1881-82, these amounted in value to rupees 115,000, and ten years later to no more than 145,000 rupees, or an increase of 30,000 rupees only.

In fibres, again, there is an opening for greater commercial and industrial activity. Many grow in India, such as the rhea, jute, jalse, mallows, barks of sorts and grasses and reeds in endless variety. All grow luxuriously and are worked up for domestic use into ropes, bags, clothing, mats, paper, canvas, and other things too numerous to mention. For greater development of this industry India requires suitable machinery for cleaning and preparing its different fibres. The production of that excellent material Rhea, languishes from this cause. "British manufacturers would pay a profitable price, for the fibre, if it could be placed in the market, in reliable quantity and quality, for their purposes. They have asked for it during many years but cannot have the demand met, from the want of an efficient decortecating machine.

Jute, which is a coarser material, shows a better history. It had its first start in the European market at the time of the Crimean War when Russian hemp was excluded from export and Scottish and Irish firms were compelled, with a short notice to find a substitute and a source of supply. Bengal in 1857, exported rupees 32,90,760 worth in 1891-92, this export rose to rupees 68,48,493 or more than double. Locally by handlooms Jute is used for manufacturing gunny cloth. There are 26 factories which have sprung up, but one only in the Madras Presidency. Statistics of the Jute industry show its importance at present. In 1890 according to Mr. O'Connor there were 8100 looms, 161,815 spindles and 61,915 operatives engaged in making gunny bags and clothes, and in 1891-92, rupees 25,13,1000 worth of these articles were exported.

The lecturer did not dwell in sufficient detail on the timbers and bamboos of India. Teak he said found its way in considerable quantities to England for shipbuilding and the manufacture of furniture, he thought however that with the facilities enjoyed in the way of cheap labor, much valuable trade might be done in sending it out ready cut up instead of in logs as is done with pine from Norway and Sweden. Bamboos so abundantly grown in warm localities, have recently found their way to Europe and America. The canes vary in size from a walking stick to a thick pole. In India bamboos are used for the frame work of buildings, for bridges of light construction, for primitive articles of furniture and for musical instruments. Art has been brought to bear in working up this raw materials in America where it is made into chairs, screens, fretwork, flower stands, baskets, fancy boxes, parasols, chairs, tables, footstools, flower pots, settees, hat racks, cabinets, buckets, bottles, easels, whatnots, and a multitude of other articles for which they are expensive and less easily manipulated woods are now used.—*Nitgiri News.*

COFFEE AND BANANAS IN GUATEMALA.

A former Uva resident writes to a Ceylon friend, from Guatemala, Central America, as follows:—

"I came down here from the States last July with a Chicago man for the purpose of opening up an estate for coffee and bananas, the latter is a very

profitable crop here, easily raised and you gather your first crop in 10 months and monthly after that. This is a beautiful country but not like Ceylon; I have often wished myself back in the spicy island. During July and a part of August I was planting bananas and then took sick with fever I am now better but very weak as I lost 30 lb. weight." The writer further speaks of planting tea; but we strongly advise him for his own benefit to give the preference to coffee as in better demand and for which there is at present no fear of over-production.

STANDARD TEA COMPANY.

The directors of the Standard Tea Company of Ceylon paid Oct. 29th an interim dividend at the rate of 5 per cent per annum for the half-year ending June 30th last. Last year the interim dividend was at the same rate, though the dividends for the whole year 1892 amounted to 10 per cent.—*O. Mail.*

A NEGLECTED INDUSTRY FOR EUROPEANS.

The *Asian* of the 3d ult. devotes a column to an article by "Creighton" on coconut planting as a neglected industry for Europeans. The article begins:—

I am sure that this branch of planting does not receive half the attention it deserves from Europeans in India. Yet in Ceylon it is a very favourite form of investment, and coconut topes in bearing are eagerly sought after by both Europeans and Natives. As an investment coconut planting is considered far safer than banks and yields moreover a much greater interest. The profits are not very high compared with tea and coffee, but the initial outlay and subsequent cultivation required are of the smallest. The returns per acre are not—I am talking of Ceylon—much over R150 per acre on the average, but well-cared-for estates yield more like R200 annually. A yield of only fifty nuts per tree will in a good year—like 1892-93—bring in as much as R130 per acre, while on well-cultivated land the yield is sometimes as high as 150 nuts per tree, which in a good year mean almost R400 per acre. Of course the one great disadvantage is the length of time required before they begin to yield—from six to seven years—but this again is no longer than in the case of cacao. From time to time the *Tropical Agriculturist* has published many scattered notes on the subject, and the following notes contain the gist of papers contributed to that journal from time to time.

The notes quoted are chiefly from "W. H. W." contribution to our columns.

HYBRID COFFEE.

I read somewhere recently that the authorities at the Government Botanical gardens at Peradeniya, Ceylon, had succeeded in obtaining hybrid plants by cross-fertilisation between the flowers of Arabian and Liberian Coffee. This was probably accomplished artificially, as in a state of nature they can but occur very fortuitously, seeing that they hardly ever blossom simultaneously, at any rate this is the case up here. I suppose it will be an easy matter to obtain hybrid seed from the above mentioned gardens. If this be the case, it would be cheaper and would save a lot of trouble and disappointment if planters who are desirous of trying the hybrid plants, obtained the seed from there. Some months ago you had an extract from the *Ceylon Observer* in which Messrs. Middleton and Brooke-Mockett of Mysore were reported to have said in an interview with a representative of that paper that some hybrid trees bearing profusely had been discovered in a Liberian field on the estate of the latter gentleman, and that he intended planting up a large area with what he believed to be hybrid seed. Now I believe hybrids planted by themselves are bound to be disappointing, as the following from

Hooker's Botany will make clear. He says:—"Hybrids are the result of the ovules of one species having been fertilised by the pollen of another. They are called mules, and are rare in nature but easily produced by art. Many grow rapidly and flower copiously, but do not fertilise their ovules, owing to the imperfection of these or of their pollen; hence they rarely ripen seed. On the other hand, they often produce seed abundantly when fertilised by the pollen of one of their parents." The italics in the above are mine, and I think planters would do well to take note of it. It is clear from the above that hybrids to be a success must be intermingled with either Arabian or Liberian Coffee—i. e., one of their parents—so as to facilitate their flowers being fertilised by the pollen of the latter. Furthermore their success will also be conditional on their flowering at the same time as at least one of the latter.—*Nigiri News.*

MOTHER-OF-PEARL AND SHELLS.

The *Moniteur Officiel du Commerce* publishes the following account of the Java trade in mother-of-pearl and shells taken from a recent report of the French Consul at Batavia:—Macassar appears to be the point where the products of the region intended for export are centred. The following is the result of the market of this place for the year 1892, as regards mother-of-pearl and shells:—The Aroe mother-of-pearl fishery was very satisfactory; the product placed on the Macassar market in 1892 was about 2,000 piculs (picul=about 133 1/3 lb.). The first arrivals were rapidly sold, and about 1,200 piculs were cleared at prices varying between 109 and 125 florins per picul. These prices are considered on the market as very high. Towards the end of the season the prices fell and the late mother-of-pearl shells from Aroe arriving on the market, about 800 piculs, realised an average price of 102 florins per picul. During the final months of 1892 the Aroe islands were characterised by disturbances on the part of native and Chinese coolies, and the increase in price of the mother-of-pearl shells is partly attributed to this event. There is still some agitation in the Aroe islands; the fishermen only venturing with caution into these parts, and it is anticipated in consequence that the Aroe mother-of-pearl will be scarce on the Macassar market this season; prices are therefore expected to rule still higher. The Brgos shells have arrived on the Macassar market in sufficient quantity to satisfy all demands. Shells from this region of large or average dimensions are sold at from 21fl. to 25/50fl. per picul. For those of small dimensions the price has varied between 19fl. and 22ad per picule. The Bangai and Ceran shells have realised an average price of 75fl. per picul. The other shells which are sold at Macassar are those which come from Floresso Banda; they are in less demand; and their value has consequently decreased from 30fl. to 19fl. per picul. The principal markets for the mother-of-pearl and the various shells employed in European industry are found in the large commercial towns of the Netherlands and Belgium. It is there that the European prices are at present fixed, but an attempt has already been made by the Americans to take this market into certain towns in the United States. The exports from Macassar go direct from that port to the port of destination, when the exporter has enough to entirely fill up a vessel, if not the goods are generally sent to Singapore so as to be re-consigned, after transshipment to the port of final destination.

NOTES ON PRODUCE AND FINANCE.

TEA AND THE WATER SUPPLIES.—The question of the water supply and the part it plays in the development of the flavour of tea is not lost sight of by the large tea dealers. The right sort of tea to suit the water in any particular district is carefully studied by many dealers, who have experimented with much patience in this direction. Just at present Dublin is in a very bad state as regards in water supply, and brewers, distillers, and tea dealers are

rather exercised about the threatened water famine.

CACHAR PLANTERS DINE TOGETHER.—Another gathering in London of tea planters is likely to become an annual affair. From particulars which have been communicated to us, and which appear in another column, it will be seen that a number of Cachar planters dined together on October 12th, and it is proposed to make this an annual dinner. We shall then have an Assam, a Ceylon, and a Cachar Annual Dinner taking place in London, which says something for the importance of the tea industry as well as for the festive disposition of those engaged in it.

THE COFFEE MARKET.—This market continues extremely firm, with appreciating values for nearly all varieties. Colony kinds are now scarce and in considerable request and command a high figure. The better trade demand which usually sets in at this time of the year is now showing itself, and as supplies just at present are very moderate, there is keen competition for all desirable lots. There has also been a considerable speculative business in the Term markets, the continual unsettled position in Brazil, which prevents the distribution of arrivals from the interior and the moderate daily receipts, inducing large operations for a rise. Quotations at the close show an advance of fully 2s per cwt. for all positions.—*H. and C. Mail*, Oct. 27.

THE PROSPECTS OF CINCHONA BARK.

We call attention to the letter of Chevalier Schmidt on page 385. We can only refer him and the Java planters generally, to the review of the present position of our cinchona industry and the prospects of bark generally given in our "Handbook and Directory" just published. Against an export last year of 6 1/2 million lb., we do not expect to see more than 4 million shipped for 1893—if so much. Up to the 6th inst. the total is only 3,131,982 lb., and unless prices improve, there may be no additions for some weeks. For next year, we ventured to say that the total export would not exceed 3 million lb., but even that may be too high if the market keep as depressed as it is at present. Should prices on the other hand improve, 3 or even 4 million lb. of bark might be collected and shipped from Ceylon. The acreage now under cinchona in this island is quite insignificant, and South America—rather than India or Ceylon—should be considered by Java as the only rival source of supply of special importance.

NEWS FROM THE CENTRAL PROVINCE PLANTING AND OTHERWISE.

(Notes by Wanderer.)

9th Nov.

WEATHER exactly what is wanted, and the rains have done good to tea and cacao. We don't worry much about weather for coffee on the Kandy side of the Nuwara Eliya range.

CACAO.—It is quite wonderful to note the growth of wood. If the rains of the N.-E. monsoon don't continue too long we will have good cacao blossoms for Spring. Still the general opinion is that the Autumn crop of 1894 will pull up the crop returns for next season. 25,338 cwt. to 6th November against 15,237 cwt. to same date in 1892, means a large addition to stocks of Ceylon cocoa, and there is little doubt we shall send away 28,000 cwt. by the end of 1893. The stock of cocoa at home is 5,000 packages more than it was at same date last year. That abominable Gnayaquil received 12,000 quintals in the first fortnight in October as against 8,400 in the corresponding fortnight of last year. However, a rise of a few shillings took place lately and the market was acquainted with all the foregoing facts.

TEA.—We have shipped 69,189,601 lb. to 6th November. So if we have sufficient shipping we shall

export two or three millions over the maximum P. A. Estimate by end of December. Tea is reported to be flushing splendidly everywhere, and planters are grudging the holidays the coolies like to keep at this time.

CACAO STRALING.—We are anxiously looking forward to the action which will be taken by our Planting Representative in Council to lessen this evil. The Native Representatives, more especially Mr. Panabokka, will no doubt back up Mr. Kelly, for the industrious Native Agriculturist is terribly handicapped by the cacao thief who tries his hand on other products when the cacao season is over. The receiver ought to be got at.

RAINFALL DAILY RETURNS are sometimes very funny reading. For instance Jaffna on the 4th November had 1'38 inches of rain in the 24 hours, but the numeral sign for weather in the 24 hours is 2 which means threatening. I once met a Brother Scot in the Kotmale Pass in the midst of a thunderstorm, and he ventured the remark that it was "like to be showery." Of course, he and the Jaffna weather man both hail from the North. However, the Matale observer of weather on the 7th, takes a leaf out of the book of his Brother in Jaffna, and records the figure "2" when the rainfall of the last 24 hours was 1'37. I suppose the Recording Angels in Dikoya and Nawalapitiya have broken their rain gauges, for they don't give any record of rain in inches on the 4th, and report the weather as "1" or *fine and clear*. The Nawalapitiya Angel in fact goes the length of recording the weather as fine or "1" on the 4th, 6th, 7th, and 8th instant. Every one who lives in that damp village knows that to be absurd.

PLANTING IN THE RATNAPURA DISTRICT.

RATNAPURA, 23rd Oct. 1893.—I have now been nearly four months in this obscure corner of the earth between five and six miles to the north-west of the city of gems. Our climate is nearly all that can be desired for tea. I wish I could say as much for our soil. This estate is situated in a valley with high steep ridges on either side with a stream in the bottom running nearly due north. The whole valley is closely studded with boulders and the banks of the stream is broken up with old gem pits at every few yards. Such is the spot on which I have lighted on for a home till I am called to my long one. The tea field has been leased for some years and the lease is not yet lapsed. In the meantime we are endeavouring to get it equipped with necessary buildings, &c., before taking it over. Our chance of success will lie rather in the cheapness of our working than in the bulk of our crops or the fineness of quality, if we may judge by the prices obtained by the lessee.

Rainfall:—August 7.09 inches, September 7.88 inches, October to date 14.85—eleven inches of which fell in five days 8th to 12th.

The North-east opened on the 22nd with a shower of 50 cents.

BAMBOO.

The Orient is wreathed with bamboo. A considerable proportion of the houses in the East are built of bamboo, and at one season of the year many thousands of natives are fed on bamboo. There is nothing else I should find so impossible to wipe from my memorized picture of the East as bamboo. It is the one characteristic common to all the East. Indigo, rice, opium, tea, coffee, cochinal, gems, spices—they all mean the East, but no one of them means the entire East. Bamboo is symbolic of all the East. It lifts its graceful feathery heads among the coconut trees and cinnamon groves of Ceylon, it touches with rare beauty every few yards of the Chinese landscape. It breaks up into lovely bits the fields of India. It grows at the base of the Himalayas. It softens again the soft, fair face of Japan. It thrives in

Singapore, it runs riot in Penang. And wonderfully dolt are the various natives in their use of the bamboo. The Chinamen excel in its manipulation. I have come home, after a sojourn in the East of some years, with an idea that the Chinamen excel in almost everything mechanical in which they have an entirely fair chance. There are few things a Chinaman cannot make out of bamboo: houses, boxes and baskets, furniture, palanquins, rickshaws, hats, shields, carriages, scaffolding, fences, mats, portiers; those are a few of the simplest uses to which Chiu-Yang puts bamboo.

There is nothing else in the vegetable kingdom at once so pliable and so strong as bamboo. The fingers of Chinese children weave it. The hands of Indian women pluck it. Yet from it is made scaffolding, upon which stand a multitude of Chinese workmen. Once in Hongkong I saw the Chinese prepare for their "Soul Festival." The "Soul Festival" is a unique expression of the artistic yearnings of this peculiar people. It occurs once in every four years. A temporary house is built of bamboo. It is lined with shelves of bamboo; on these shelves are placed pictures, vases of flowers—in brief, anything and everything that marks Chinese progress in the fine arts. The "Soul Festival" is the Chinese World's Fair. But a World's Fair from which all the world is rigorously excluded except China. There was a great deal about the "Soul Festival," I saw that was incomprehensible to me. And a Chinese mystery is apt to remain a Chinese mystery, to the most inquiring European. They are not prone to explain themselves to us. One thing, however, was clear to me at the "Soul Festival." That one thing was the preponderance of bamboo. Not only was bamboo an important ingredient of the building, and of half the semi-useful articles displayed, but it was in evidence on the majority of the pottery, and in many of the pictures. It was the saving grace of the most hideous carvings. It gave the utmost touch of beauty to the finest ivory.

Bamboo is as light as it is strong. That makes it invaluable for receptacles that must be carried. I used often to stop in the streets of Shanghai to buy Chinese sweetmeats from a "chow-chow seller" who had a portable booth or cabinet. I wondered at the ease with which he carried it, until one day I lifted it myself. It was inexpressibly light. It was made of bamboo. The minor Chinese bridges are made of bamboo. Very quaint and effective they are.

I went to a Chinese court of justice. The judges sat upon bamboo chairs, about a bamboo table. The doors of a Chinese prison are barred with bamboo lattice-work. The shields of the Chinese soldiers are made of bamboo. Of bamboo are made the flutes of the Chinese musicians. The Chinese poulterer carries across his shoulder a straight bamboo rod, and on it are hung his feathery wares. The captive song-birds of China chirp their sad music behind the bars of bamboo cages. The Chinese woman who toddles from her window to see your strange pale European face leans over a bamboo balcony. I had some boxes made in Singapore (Singapore is full of Chinese), and in Hongkong, I used to spend hours watching their manufacture from the almost green bamboo. The Chinese are unrivalled in thoroughness and in exactness. I drew a plan of a rather intricate box for a Chinaman in Singapore. I got a tape measure and showed him the dimensions I wished. We bargained, as to the price, on our fingers. The day on which it should be completed was determined in the same way. On the day agreed upon, John arrived with my box. He had padded and lined it with silk, as I had shown him, the compartment for my wigs; he had lined the little place for "make-up" with tin; my armour fitted into its place to a nicety. In brief, he had done everything exactly as I had indicated. Not from one of my many instructions had he deviated by a hair's breadth. And yet I had only shown him on a piece of paper. I had told him nothing. We were equally ignorant each of the other's language. I paid him the exact sum agreed upon, and he said "Oid-ohin," and went away very contentedly. That is a characteristic of

the Chinese, the quality of fidelity to a bargain. In that they differ from the Japanese. If a Chinaman agrees to make you a pair of boots for three *yen*, and to deliver them on Monday, why then, as sure as Monday comes, come the boots, made as they were ordered. The bootmaker takes his three *yen*, and says "Thank you." Make an identical arrangement with a Japanese. On Monday you never see him. On Tuesday he calls to say that he will bring the boots on Wednesday. On Thursday he actually brings them. He is very polite, far politer than the Chinese cobbler. He demands four *yen*, because they have taken twice the leather he thought they would. Nine to one the boots are not just what you ordered. But there will be about them that indefinable something that will stamp them works of art; and the boots the Chinaman made you, though just as you ordered, will be, at the utmost, masterpieces of mechanical workmanship.

In Bengal I have seen women carrying bundles of bamboo three times their own height and quite their own circumference. They cut it, the women of the coolie class (hard-working class) and carry it for miles on their heads. They have a little pad of rags between their skulls and their tremendous burdens. They bring the bamboo to the nearest village and sell it to some bamboo shop. The "Mohurrum" is the thriving time for one branch of the bamboo trade, for at the celebration of the Mohurrum festival thousands of *tazias* are carried about the streets before they are thrown, as sacrifices to the native gods, into the Ganges or its nearest substitute. The *tazias* are marvellous concoctions of paper and tincl, more or less typical of Indian religious history or myth. They are carried upon carts, or upon the shoulders of religious enthusiasts. But whether the *tazias* are carried on carts, or by men, they rest upon bamboo scaffoldings. And most of them are built upon bamboo framework. The Mohurrum is one of the two great Mahomedan festivals. It is often provocative of riot and bloodshed and it is at such times, when native fanaticism rides its high hobby-horse, that European interests are most endangered.

Bamboo is a delightful vegetable. Only the young tender shoots can be eaten; but they are very palatable. They are dressed with a cream sauce, such as Americans serve asparagus points with. The natives use them in an iscipid broth. They are a toothsome accompaniment to any game curry. They are often used in all the nicest curries. I claim to have invented bamboo salad, and I assure you it is very nice. You boil the young tender tips, but not too thoroughly. Then put them in the ice-chest. When they are thoroughly cold, serve them with a French dressing, or with a rich mayonnaise. You can serve them with or without lettuce, cucumber, &c. But serve a little celery with them, if possible; and whether you use the French dressing or the mayonnaise, season it with cayenne until it is quite piquant. The bamboo tips are also very nice served as a *confiture* with preserved ginger and candied mangoes. I was looking the other day over the price list of an Eastern condiment house here in London. But no Eastern *delectasse* was there. The fruits, the queer combinations that give the Eastern flavour to your food and make every mouthful more delicious and pungent than the last, they are not to be had here. But it is happiness to remember them.

But it is the picturesque aspect of the growing bamboo that I would emphasize. Except in Japan, almost all the beauties of the East are positive—aggressive in colour and in line. Bamboo is soft of hue, graceful, indefinite of outline. It softens and modifies many a mile of Indian scenery which without it would be crude. I remember with genuine gratitude one glorious clump of bamboo in Jubbalpore. It was so delicate in tint and shape that it toned to tender half-colours the rough dyes of the garments of the natives who clustered about it. I always made a point of including it in my afternoon drive, and many a starlit night I have walked some considerable distance to see it outlined, like wonderful grey-green lace, against the opalescent sky, from which the sunset had not quite gone.—*Pall Mall Budget*.

THE FUTURE OF CINCHONA BARK AND QUININE.

We call the attention of Java (and for that matter of Ceylon and Indian) cinchona planters to the letter from Messrs. Bohringer which appears on page 386. We learn from this leading bark-buying house that their principals in Mannheim consider the Statistics and Review in our latest "Handbook and Directory" as, on the whole, fairly correct. But there is one important correction to be noted which we could not possibly discover from the authority from which we quoted. The exports of "Quinine and Quinine Salts" from Germany which were returned at the large figures of 7,966,000 ounces last year really include the weight of the packages! "Tare" has to be deducted and in some cases this will make a very large difference. Then we are also informed that of late years, the manufacture of quinine in both France and Italy has fallen off even to a greater extent than we ventured to show. But the important point is that although the consumption of quinine—notwithstanding the number of substitutes introduced of late—is steadily growing every year, still the total has scarcely reached to our estimated quantity. Nevertheless it now bears a most encouraging proportion to the supply of bark, and if the Java planters—as Messrs. Bohringer recommend—will only restrict and regulate their exports henceforward, they can very speedily secure a considerable difference in the bark market. Our Java neighbours undoubtedly hold the key of the position: they can easily raise the prices by checking their output; for Ceylon and India are no longer to be counted as of importance. What has hitherto kept the prices of bark unduly down, is speculation in quinine to hold for future use, based on the extremely low quotations for the latter article. Quinine is so easily stored, that there will be always a temptation to buy to hold. But the manufacturers rather checkmated the speculators by fixing among themselves a minimum rate below which they would not sell, and so for some time, the market has been supplied a good deal from the stock held by the speculators, and the demand for bark has correspondingly fallen off. But this will soon right itself, and if the Java planters only refrain from sending out too much of their five-per-cent bark during 1894, a considerable improvement in the market may be anticipated.

LOWER AMBAGAMUWA.

Nov. 10th.

THE WEATHER.—Quite an inch of rain a day for nine days in November is a record you would be quite proud of. Presumably we are in for another spell of the wet cycle. Decile Menatehie and dodgy Ramasamy with their time-honoured "Tavallie" have had a most damping time of it. In spite of the spirits imbibed the cooling spirit has had the ascendancy all throughout; thus Ramasamy off the balsuce has been a peculiarly rare feature this festive season. For such little mercy at least let us be truly thankful.

QUEEN TEA is behaving herself very encouragingly. Spring-tide, as these months are generally termed, naturally turns the scale in favour of the long suffering Ceylon planter, and with the celebrated Dr. Clark gathered unto his fathers, Ceylon and Indian tea planters are at least one short of their numerous *Hilopeltis*, and crape manufacturers, I am afraid, need not turn their attention to Ceylon and Indian tea planters for a fortune in crape trade, I don't think they would sell $\frac{1}{2}$ a yard in the Tea districts of Ceylon! *De mortuis nil nisi bonum.*

POSTAL.—What a saving of time and money it would be if our good P. M. G. would only kindly extend the privilege to even the doctor and other officials in planting districts who live within reach of the delivery pions, and permit them to be served in the usual course of town service with district letters—3c. saved is not so small with tea down to 7d. Take the number of letters directed in a day to the doctor. These might all be posted and take the tappal coolly returning after dark. May we hope the P. M. G. will see his way to grant us this favor.

VARIOUS AGRICULTURAL NOTES.

TEA SEED OIL.—We have some further inquiries respecting this product. It is a curious fact that in Balfour's "Cyclopaedia of India" where a very full list of all oils known in India and China are given, "tea seed oil" does not occur, although we have mentioned such seed oils as "cacao whole seeds," "croton seeds" &c. In a long list of "Chinese oils" also tea seed oil does not occur.

TRAVANCORE TEA AND CINCHONA BARK.—Mr. H. M. Knight, Chairman of the Travancore Planters' Association, has been taking some interest while passing through Colombo, in the question of getting the produce of Travancore into Colombo market free of Customs duty. We think there is much to be said for the Government making such an exception and legislating if necessary. Travancore has ever been regarded as an outlying district of Ceylon and already exceptional negotiations about tobacco have taken place between the two States.

FINE TEAS FOR AUSTRALIA.—With reference to the recent complaint published about more fine teas being required in the Colombo market to meet a demand for Australia, a tea authority calls our attention to the following extract from the *Melbourne Journal of Commerce*, Oct. 21:—

Colombo is sending reduced shipments, the shortage of space and the unsatisfactory result of sales having its effect upon shippers. Several auction sales have been held here, but the result has not been good, the proportion of withdrawals being heavy. Fine tea is very difficult to sell at covering rates, the trade evidently not being able to sell high price tea.

COFFEE NEAR KANDY.—A visitor from Java, without much time to spare, was anxious to see coffee growing in Ceylon, but his Colombo agents were puzzled above all things to know where, within a day's journey of Colombo, our old staple could be seen! At length, inquiry brought to light the fact of a young field on Anniewatte near Kandy, grown from Coorg seed, and here the Java planter was able to satisfy his curiosity. The field in question only covers a few acres and was a piece of land often chenaed; but the coffee on it is looking very well, notwithstanding that the plants were covered with leaf disease in the nursery. The field is, however, carefully manured.

A REMEDY FOR PHYLLOXERA.—A paper presented to the Paris Academy of Sciences by M. F. de Mely would lead to the conclusion that the treatment of vines with peat-moss mixed with schist is, at least to some extent, a remedy against the phylloxera. At all events, some experiments have proved so successful that the Government has taken the matter in hand, and a systematic trial on a large scale is to be made. The phylloxera is as serious an enemy to the French vineyards as the hop aphid in Kent and Sussex, or the potato disease in Ireland to the respective crops which they attack, and any suggested remedy which has appeared to be tentatively successful is worthy of extensive trial.—*English Mechanic*.

THE IMPORT DUTY ON TEA IN HOLLAND.—We are indebted to Mr. Schwarz of Messrs. Volkart Bros., Consul for the Netherlands, for the information conveyed in his letter given on page 386. It shows that the duty in Holland is equal to about 2 1/5thd per lb., a very moderate rate when compared with the duty in Germany (5 3/4d) or Belgium 3 1/2, England 4s. France 9d to 11 1/2d! Holland ought to become a great tea-drinking country were it not for the prevalent taste in favour of coffee, —which Java, of course, supplies—in all the provinces save one or two on the borders of Germany.

PROPOSED CULTIVATION OF TEA IN RUSSIA.—It is stated, according to the *Overland China Mail*, that the Russians are exporting from China large quantities of tea plants and appliances with the intention of starting plantations in the mountains of South-east Russia, which is said to be very favourable for the growth of the plant. Chinese labourers are being taken over. The Chinese trading classes do not favour the project as they consider it will become another serious rival to the native industry. Reports of famine in some of the Provinces of China come in periodically, but there are reports from other Provinces of first-rate crops.—*Pioneer*.

ANOTHER PLANTING COMPANY: THE CEYLON-SELANGOR PLANTING COMPANY, LIMITED.—We understand that a Company is about to be formed under the above title with a capital of £200,000 for the purpose of acquiring from Mr. H. W. Bailey a block of some 2,000 acres extent in Selangor. The land has a railway—that from Klang to Kwala Lumpur—running through it, and the Petalin station is on the land about 4 miles from Kwala Lumpur. It is believed to be the best land in the State, and the Company is to be formed to acquire the land and to open up 600 acres in Liberian coffee. We are glad to learn that a large number of the shares have already been subscribed for, and we hope the project will be successfully put through.

A LESSON TO FRUITGROWERS.—An American agriculturist raised the question a short time ago as to the necessity of insect visits to the flowers of pears and other fruits affected by blight. It was shown that the organism causing blight was disseminated by insects during their visits to the blossoms, and it was thought that if by some practical means insects could be excluded from the flowers without interfering with the fruitfulness of the trees, one form of blight at least might be prevented. A series of experiments were made at Brockport, New York, to obtain some information in regard to the effect on fruitfulness of excluding insects. These experiments were made under the direction of the United States Department of Agriculture, and the results which are certainly startling, have been published. The results seem to indicate a fact hitherto overlooked by scientific and practical men—v. z. that many well-known varieties of pears will not set fruit unless their flowers receive pollen from other varieties—that is to say, the visits of insects, by means of which cross-fertilisation is effected, necessary to ensure proper sitting of the fruit. Further information on the subject being required, some extended experiments were made, the work being carried on in Virginia, New York, and New Jersey. The results in every case confirmed those previously obtained. Thus it would seem that most of the common varieties of pears and apples are unable to fertilise themselves. Of course, this has been touched upon by Darwin, Knight, and others; but it would appear that no one has advanced any theories as to the common fruits. The lesson for the fruit grower is to select his varieties and plant them in such a way as to ensure cross-fertilisation.—*Pall Mall Gazette*.

Correspondence.

To the Editor.

COFFEE AND TEA IN GUATEMALA.

Guatemala, Central America, Sept. 19.
Colombo, Ceylon.

DEAR SIR,—I venture to ask you for the kind information whether frost hurts the tea plant. In addition to a coffee estate, I have recently purchased a beautiful piece of land 4,800 feet high, the only disadvantage of which is that in certain seasons slight frosts occur, which fact prohibits me from planting coffee. But as the soil is very fine and over a hundred Indian families are living on the land, I should not like to leave it uncultivated, and I am convinced that tea would grow very well, if the rare and slight frosts would not interfere. I should be glad to receive your reply to the question asked and hope you will with equal frankness ask for my services when required.—Yours very truly,

E. F. DISSELDORFF.

[The tea plant as well as coffee is affected by frost though perhaps not to the same extent. Opening in small clearings with belts of forest sheltering them all round might protect both plants from frost, and if tea is to be tried the hardy China variety, though not so prolific as the Assam, might suit better. But as there is much danger of tea being overproduced, while the supply of coffee is greatly falling off, we would strongly advise Mr. Disseldorf to try coffee even at 4800 feet, in his latitude, by opening in small clearings in the way we suggest.—Ed. T.A.]

CEYLON TEAS IN MONTREAL,
CANADA.

Montreal, 3rd Oct. 1893.

DEAR SIR,—I send you particulars of our last tea sale amounting to about R150,000 to R200,000 which may be interesting as showing the increased esteem in which Ceylon tea is being held in the Dominion: and I have no doubt that our market here for Ceylon teas can be increased by judicious shipments of high middle class teas and fine grades:—

Japans	realized from	13	to	39	cents.
Young Hysons	"	12½	to	31	"
Gunpowder	"	11	to	35	"
Congou	"	17½	to	24	"
Ceylons	"	24½	to	37	"

It will be noticed that while Ceylon's did not fetch the very highest price (by 1d), yet the lowest price Ceylons brought double and over double the prices of the lower grades of other teas (with the exception of congous).

The prices equal say 1s ½d to 1s 6½d. All the teas were sold at our periodic auction sales.

I shall be happy to give any information regarding through rates of freight or other particulars at any time.—Yours truly, WILLIAM BENTHAM.

CINCHONA BARK IN JAVA.

Socrabaiia, Java, Oct. 28th.

SIR,—You know the most deplorable condition of the planters of Peruvian bark and it is superfluous to expatiate upon it.

The manufacturers impute the overproduction resulting from the colossal harvests of Ceylon some years ago, and they say that, with a little increase of prices, Ceylon will be able to furnish 5 or 6 millions of pounds a year for some years.

For us Javanese planters it is of the greatest importance to know, at a rough guess, how much bark Ceylon will be able to furnish during the next years, and it is therefore that I take the liberty to ask from you as expert and editor of the *Tropical Agriculturist*, the favour, to give us some information on it, if you can do so. Your informations are destined for the Soekaboemische Landbouwvereniging.

With my sincerest thanks I remain, your obedient servant,
J. H. SCHMIDT,
Chevalier of the Dutch Lion.

CEYLON TEAS IN THE AUSTRALIAN
MARKET.

Colombo, 28th Oct. 1893.

DEAR SIR,—We publish the following extract from the letter of a large tea firm in the Australian Colonies in the hopes that it may lead to better teas being offered on this market. We are distinctly of opinion that the large proportion or more or less spoilt teas seen on this market, is due to faults in plucking and manufacture.—Yours faithfully,
per pro. BATHGATE, PIM & CO.,
F. F. STREET.

Extract from Australian letter.

"There is every appearance at present of this market being overdone by imports and even now we are buying better than we could import in some kinds.

"There is also much tea here more or less out of condition, that looks as if mixed with old spoilt leaf and tastes sour. It will take very little of this sort of thing to drive three-fifths of the present Ceylon business on to Indians, which are showing better value at the present time.

"There seems to be a prevalent notion both in Colombo and Calcutta that quality will not sell at a profit here, that in fact anything is good enough for the Colonies. The sooner this notion is got rid of the better for all concerned; its operation is simply to hinder the more rapid growth in consumption of both Indian and Ceylon sorts. The consumption of fine to finest teas is now as large per head as anywhere else and would rapidly grow with very little encouragement and opportunity."

THE VALUE OF MANURE FOR TEA:
HOW TO SECURE 100 MILLION LB. OF
TEA IN CEYLON "NEXT YEAR."

Upcountry, Oct. 30th.

DEAR SIR,—If you wish to see your estimate of tea for 1896 secured next year, advocate manuring one-fourth of the acreage in full (?) bearing. Lipton will then have his work cut out to dispose of the tea from the acreage not yet in full bearing. Manure and medium plucking has doubled the yield in fields in this neighbourhood.—Yours truly,

AN OLD COFFEE STUMP.

[Good for individual proprietors; but in the interests of the entire tea planting community, we stand in doubt as to whether we should wish to see an outturn of 85 million lb. tea exceeded in 1894? !—Ed. T.A.]

PRACTICAL CULTIVATION OF CACAO
AND RESULTS.

Marakona, Nov. 7.

DEAR SIR,—In my letter of 17th August last I have shown the results of practical cultivation of cacao on a land which many thought not fit

for cacao. You will no doubt remember I have proved the same on Maria estate with coffee when in November 1883 I challenged all to come and see the result. His Excellency the then Lieut.-Governor Sir John Douglas was good enough to pay us a visit; full description was given in the your paper of 20th November 1883 by a correspondent, from which I take the following extract:—"In the dining-room there was 'King Coffee' in letters made with ripe cherry and wire, 'Queen Cacao' with a fine sample cacao pod underneath, next (the pretender) 'Cinchona' covering his head for a time with cacao leaves; at the other end of the room was 'Prince Tea' who desires to become emperor (if care is used in planting and prices keep up he may be)." Now how true this prophesy made ten years ago has turned out. Planters should take a lesson from experience in Coffee which I maintain was abused not used, in many ways; bad planting, overbearing, no cultivation; in some instances too much forcing manure used, bad pruning; and now I have shown confidence in coffee when nearly every one has given it up by planting some on Nikatenna estate in Panwila and will show good results before long. You know I like to take in hand what others are frightened to touch and prove what practical cultivation can and will do. You must learn to understand by the appearance of the leaf and bark and soil what is required to be done with or added to the soil to make the plants healthy. I cannot bear to see the treatment many of our products receive; sometimes allowed to struggle on for mere existence where a little money spent in the proper time and with practical knowledge of what to do would make them good plants and profitable; remember the old saying—a stitch in time saves nine—even plants have a language, they show their wants through leaves and bark; when they get what is wanted their gratitude is shown by the new healthy leaf and sappy bark. I much enjoy the letter of Doctor Dale and agreed with it in many arguments he has used. "Theory is doubtful, practice is safe." The writer advising cocoa pods for planting should only be plucked from the stem is entirely in error; I have tested pods from stem and branches in planting as well as curing and found good and bad from stem as well as branch. I noticed a remark in the Agricultural School Magazine, referring to my letter about weeds; surely I did not put Illook among useful weeds. I must say it all depends, in some soil I look—as long as you do not let it get too thick—will actually do good by keeping soil moist, and open; the roots taken out and washed clean and given to cattle raw or boiled is much relished and cows fed on same will give much milk.—Yours truly, HOLLOWAY.

THE DUTY ON TEA IMPORTED INTO HOLLAND,

Netherlands Consulate, Colombo, Nov. 9th.

DEAR SIR,—With regard to your enquiry *re* duty on tea imported into Holland, I am informed by the Department for Foreign Affairs at the Hague that the duty levied is 25 florins per 100 Kilogrammes. I may mention that 12 florins = £1 and 50-75 Kilos. = 1 cwt. The communication from the Hague further states that the tare of packages is fixed in the following manner. Packages of 58 Kilos, or more 18 per cent; packages below 58 Kilos. weight 25 per cent. I remain, yours faithfully

A. SCHWARZ,

Consul for the Netherlands.

THE FUTURE OF CINCHONA BARK AND QUININE—JAVA AND CEYLON BARK.

Colombo, Nov. 14th.

DEAR SIR,—With reference to an article published in your paper *re* cinchona bark, we quite agree with you as regards the future output of bark in Ceylon. There is no doubt about it that Java holds the key of the situation and it only depends on the policy of the Java cinchona planters whether prices will have to suffer a further reduction or not. The consumption of quinine has always been over-estimated and the consequence was that the cinchona bark produced and shipped during the last years has been far beyond the requirement of the demand for quinine. With the increasing production of bark and quinine, the speculation in the latter article has attained great proportions and if the manufacturers are afraid of the increasing output of bark it is quite natural because the overproduction of bark and quinine will only encourage the speculators and interfere with the consumptive demand of quinine. There is no danger of Ceylon overflowing the market as there are only small quantities left. The Java planters not only increased their shipments as regards quantity, but their shipments show an increase in the percentage as well. If they don't put a stop to the increasing export, prices are sure to go even below the present limit. The average analyses of Ceylon bark compare with that of Java like 2 to 1 or in other words 5 million pounds Java bark are equal to about 10 million pounds Ceylon bark. If Java limits its output to 5 million pounds at 5 per cent average, the situation is bound to improve as Ceylon and India are quite out of the question. The great question is to regulate the supply according to the demand for quinine, a problem which remains with the Java bark producers to be solved.—Yours faithfully,
CH. & A. BÖHRINGER.

DAMMER AND SEALING WAX—AN INQUIRY.

Chilivers, Nagercoil, Travancore, Friday, Nov. 10.

DEAR SIR,—Could you kindly let me know how black dammer can be converted into good sealing wax?

I have melted some with coconut oil but the sticks do not dry sufficiently and are not brittle like those one buys in the shops.—Yours sincerely,

A CONSTANT READER.

SPLENDID COCOA PODS FROM WATTEGAMA.

Wattegama, Nov. 16.

DEAR SIR,—I have sent you by this morning's train eight cocoa pods gathered yesterday from Frankland Estate. There are 4 varieties, two of each:—Forestero, Condamara, Criolo and Caracas Hybrid. This will show you what this estate can do—last year's crop was 1,555 pods to the cwt.

Glad to say my son plucked fully one cwt. per acre in one plucking the last round. Crop it is true is somewhat late this year, but we have secured up to 10th inst., 30 cwt. 1 quarter 14—not bad for the little Watte. Marakona Estate Cocoa is now coming on finely—a leaf plucked measured 25 inches by 10½ inches and some pods weigh 3 lb.—Yours truly,
HOLLOWAY.

[This is certainly the finest collection of Cocoa pods we have ever seen; the eight weigh 19 lb., and the heaviest one of all is 2½ lb. and measures 11 inches in length and 13½ in largest girth. We shall try that all interested in the Port see them.—Ed. T.A.]

VARIOUS AGRICULTURAL NOTES.

THE COFFEE CROP in Haputale, which at one time was expected to be short, is now reported as likely to be quite up to that of last year—and therefore a fairly good one. The prospect of prices up to 17 and 18 rупes a bushel makes everyone with a coffee crop extra cheerful.

COFFEE PROSPECTS.—Messrs. James Cook & Co.'s on the 23rd Oct. report:—So far as accounts of the growing crops have been received, the prospects of that of Rio do not point to a large yield; as regards Santos little news is as yet to hand. The Central American crops promise to be of an average, with the exception of the Cucho district (Guatemala). The new Java crop is estimated to produce 1½ million piculs, of which fully 500,000 for private account, but the present Government crop has now been reduced to 71,000 piculs, against last month's estimate of 92,000.

THE INFLUENCE OF THE MOON ON THE RAINFALL.—Two American meteorologists have collected statistics of rainfall over a large number of years to test the popular belief that rain is influenced by the moon. The results, which are published in *Science*, show that during 1881-90 the rainfall was liable to increase about the time of the new moon; that the new moon was generally followed by a diminution in the quantity of rain that fell; and that the wettest period of the lunar month was that just preceding the new moon, while the driest was that just preceding the first quarter.

THE GERMAN EAST AFRICAN COMPANY'S new departure in the introduction of coolies has as read in the *C. M. Intelligencer* for Nov. apparently met with satisfactory results. Four hundred and sixty-two were brought to Tanga; of these, 277 Chinese and Javanese are employed at Derema and Ngouelo on the extensive coffee-plantations. The Company however, does not confine itself to the growth of coffee only; tea, cocoa, cardamom, comes within its scope. Its two stations of Bagsmoyo and Quiloa have proved profitable, but the depreciation of silver has been prejudicial to its progress.

COFFEE IN THE FAR EAST.—They seem to have a "coffee plantation" at Hongkong or in the neighbourhood, to judge by the following paragraph from the Hongkong Press:—

For stabbing another Chinaman at the Coffee Plantation on June 27th last, a gardener was on Saturday sentenced to six months' imprisonment. The wounded man was very dangerously wounded in the abdomen, and remained a patient in the Hospital for a long period.

The latest news from North Borneo, under date Sandakau, 12th October, includes the following:—

Coffee everywhere is doing well, and there is a prospect of two or three more estates being opened in the near future.

The tobacco crop on all the estates in the British North Borneo, has, at the same date, reported to be safe.

THE CHINA TEA TRADE.—We have had the opportunity of discussing "the situation" and prospects in respect of China tea with a gentleman of considerable experience in the trade. He has just come from Foochow and says the season has, on the whole, been an encouraging one for the buyers, that shipments are not quite closed yet for the season and that he and others anticipate more trade and a better class of teas "next year." In fact the China tea trade is not dead yet in his estimation, even in its competition with India's and Ceylon's in the old country and Australia, while for Russia and America it will hold its own, he thinks, for a long time. There

can be no question that the difference in exchange may next season give a serious advantage to China and the gravity of the position will have to be fully considered by Ceylon men.—As respects the present season, the latest figures show that half-a-million lb. has been added to the exports to Britain, making the total 3½ million ahead of last year; and no less than 2,360,000 lb. from China and 800,000 lb. from Japan, additional, have gone to America, which thus has got nearly 71 million lb. from China and Japan against 75 million lb. last year.

TEA PRICES AND PRUNING.—A Dimbula planter writes as follows:—"It is really wonderful to note how short a space of time a given crack estate maintains its high prices, Agarsland no longer tops the market, and where is Hoolankande? Portswood and Pedro seem to be well in the front at present, though I have not heard so much about Portswood of late. Why is this? Is it not because they cannot maintain these prices long without wearing out the trees?" The above subject is of great interest to all planters, but we do not think the explanation of an undoubted fact is very difficult to account for, though some may not agree with us. Is it not a fact that very high and exceptional prices are not to be obtained without a great loss in yield even in the case of high grown tea, and that that reduction in production more than counterbalances the increased price obtained? The great aim of every planter should be to hit the happy mean and secure the largest yield compatible with the smallest sacrifice in quality. And this must necessarily differ in different districts and even with different estates. That too heavy pruning results in a loss of quality, sometimes spread over a long period seems open to little doubt, and planters are right in using the knife more sparingly than they used to do. It is worthy of note that high estates, noted for the fine flavor of their teas seldom prune so heavily as others at a lower altitude. Of course they do not require to do so, but the fact remains and must not be lost sight of.

CEYLON TEA IN AMERICA.—The Tea Fund should advertise in America in the interests of the sellers. No one cares to give something for nothing. When a grocer in the cream of the packet days was approached to take up an agency for Ceylon tea he often stipulated that a certain amount should be expended in his local paper to create the demand. His people were very well satisfied with what they were getting, and he did not see why he should push another man's goods, helping to establish his business without that other man spending something at first to help the sale. How do you suppose such firms as Henri Nestle, of Condensed Milk fame, Van Houten, and others, got their footing in this country. They went to the wholesale men and got them to include their goods in their lists, they advertised them and referred all enquirers to them. Tea may be a little different from a branded article, but the same thing applies. Doubtless many and many a wholesale firm in America issues the same sort of price list that Lazenby, Crosse and Blackwell, Moir, Travers, Hanson and hundreds of others send out weekly to their constituents. To advertise in the o lists would awaken their interest in your article and impress the wholesalers of America with your business grasp of the position that would surely bear fruit, following such a true wholesalers' method of creating a sale as the spending of £30,000 at the Exhibition. But to start a retail store in Chicago to follow this most telling and grand introduction of your article!! Take my advice and leave it severely alone. Better, far better, put *one advertisement* in the best Yankee daily, with "Planters' Association of Ceylon, Kandy, Ceylon," at the foot, giving a good description of Ceylon tea and the names of the firms who have already taken up the sale of Ceylon tea, and offering to add others, naming the most popular firm of wholesalers for retailers to apply to, stick to wholesaling.—London Cor.

THE PRAIRIES OF THE CONGO.—The King of the Belgians, as Sovereign of the Independent State of the Congo, has sent a professor from one of the Ecoles d'Agriculture, of Belgium, to the Congo, to choose the site for the prairies destined for grazing cattle in large quantities to meet the requirements of the new country.—*Gardeners' Chronicle.*

SISAL HEMP.—Referring to the culture of Sisal Hemp in Havana, it is stated in a recent report that limited attempts have been made to introduce this branch of industry, but up to date no profits have been derived from it for want of special attention. In and about the port of Nuevitas more than 1,800 acres have been planted close to the seashore, of the very best appearance and quality. Now that the plants have attained full growth, there seems to be no doubt but that the industry could be made a thriving one if some capital were invested in proper machinery to obtain the fibre, which is of remarkable strength, length and whiteness.—*Ibid.*

STORY OF AN ENGLISH FARM.—Mr. S. Skinner, a farmer, of Mount Pleasant Farm, Hornchurch, told a painful story yesterday at the Romford Petty Sessions to explain the non payment of certain rates. He said he had lost £1,100 during the past three years, and owing to the drought his early crops this year entirely failed. The landlord's agent came in for rent and sold him up, property worth about £500 bringing in only £60. His rent again became due on September 29, and on the very next day the landlord's agent came in. He declined to allow him a few days' grace to get up his potatoes, and another forced sale resulted in a serious loss on the potato crop. If time was given him he should be able to pay the rates. An order was made for payment of the rates, but it is to stand over for six weeks.—*Globe.*

MR. DUPLOCK, Mr. Lipton's Ceylon agent, who was recently in Calcutta, has not a good word for the tea industry in this part of the world. He must evidently have been "crabbed" while here or he could never have spoken so unfavourably of what he saw while in Calcutta. "He has," says a Colombo paper, "a few interesting items to give us in reference to the Calcutta tea market which he says, has 'gone to the dogs.' Asked why this was so, he said that the quality of the tea coming down from the gardens this year would not bear comparison with the crop last year. Some of the estates in the Dooras and in Cachar have been inundated with floods of a most disastrous character and the weather has been altogether against manufacturing good teas. The result is that fine teas are very scarce, and the tea gardens are having a bad time. This ought to be good news for Ceylon estates; but the number turning out fine teas now is not large."—*Indian Planters' Gazette.*

PALMYRA FIBRE.—I was asked a little time back for information as to the varied uses to which Palmyra fibre is applicable, but was unable to afford the information desired. What it was possible for me to say as to the nature of the fibre itself made my questioner very doubtful as to the possibilities of its application, and it occurs to me to suggest that full information on this point would be very acceptable. Would it not be possible to find some use for the fibres of the trunk itself? They are very coarse, too much so it would seem for any textile application, but they are possessed of immense individual strength. Many years ago a series of experiments upon Palmyra wood was entrusted to me, and comparing the results obtained with those deduced from comparative experiments with other woods, it was found that the Palmyra was prominent among all the specimens for strength. The peculiarity of the trials made with this was that it did not yield to strain in the same way that all the other woods did. Teak, satin, halmilla, nadoon, and the other woods, all broke at the first shown symptom of yielding. The Palmyra gave repeated warnings before doing so, the weaker among its fibre giving way first with

loud reports at marked intervals, showing that the wood would indicate a dangerous strain being put upon it before completely giving way to it. This peculiarity might in many cases of application prove to be a most useful one, giving time to remove any undue strain to which the wood might be subjected.—*Indian Cor.*

COFFEE PROSPECTS.—Messrs. Rucker & Ben-craft thus deliver themselves on future of coffee, writing on 12th Oct. :—

History repeats itself. We are again in the midst of small crops, with a tendency here and there to look for smaller supplies than the estimates pointed to three months ago, at the commencement of the current season; whilst at the same time many seem overpowered by the idea that next season the supplies may be over bountiful. The latter idea cannot at present be treated as a matter of practical politics, firstly, because it is still purely conjectural, and secondly, because the shortness of current crops, which is not conjectural, has not yet been really felt. There are houses of the first class who estimate the present Rio and Santos crops as low as 4,500,000 bags. Brazil stocks in Rio and Santos at the commencement of the season were as small as 167,000 bags, so they cannot be much drawn on. Again, when we recollect that the Cape, other countries, &c., &c, take at least 2,000,000 bags per annum, probably nearer 250,000 bags, and that last season nearly 6,000,000 bags were exported to Europe and the States, it is evident that this season we may be anything from 1,250,000 to 1,750,000 bags short as compared with a year ago. The exports from the Dutch East Indies are estimated at about 400,000 bags against 1,081,100 bags last year. The course of deliveries is generally conceded to be unusually uncertain, and few would care to commit themselves to a figure, but, on the other hand, we hear nothing about bounteous stocks upcountry, and consumers will have to draw their requirements from the entrepôts. Under these circumstances we find it impossible to treat values such as are now current as anything but normal.

COOLY IMMIGRATION TO THE WEST INDIES.—The editor of *Truth* has been airing his opinions on Indian immigration to the West Indian Islands, and, as so often happens, has made a sad muddle of the whole affair. This week's *Truth* contains a letter from a Jamaica coffee planter—whom, I suspect, is none other than our old friend W. Sabonadiere. It is worth quoting as showing the difficulties under which the planter labors in the Carribean seas. He says:—"On my coffee plantation the natives commence work at 9 a.m. (!) and leave off at 4 p.m., taking one hour for breakfast in the middle of the day. If, from rain or any other cause, they do not turn out on Monday morning, they take a holiday for the entire week. None work continuously, and nine months of this kind of labor during the year is probably the utmost they ever give. They are employed by contract, and can earn from 12s to 15s in four days. Considering that the climate does not compel them to buy clothes or fuel, that their grounds give them all they require to eat, that illegitimacy is 72 per cent, and that they do not drink and have no ambition, you will see that they are infinitely better paid than the 'gentlemen of Billingsgate.' With such insufficient labor—for it is only a few who will work even as above described, the greater portion do nothing—it is impossible to cultivate any estate. In Jamaica all coffee planters are resident proprietors. No new industries can possibly be opened up without coolie immigration. Coolies in no way injure the natives who will not work, or reduce the earning power of those who occasionally do; but by their constant labor enable produce to be raised, which is the only source of prosperity. To stop coolie immigration would be to reduce the natives to the state of the savage, for all capital must in that case leave." Labby's moralising on this plain statement of facts is a study, and I commend it to your notice. You will find it at page 746 of *Truth*, illustrating the teachings of that Cobden school whose motto is "Perish India."—I might add "and the Colonies!"—*London Cor., Local "Times."*

GREVILLEA ROBUSTA.

This well-known tree—the “Silky Oak” of Australia—is now so freely grown on Ceylon plantations that the following notes upon it by Mr. J. H. Maiden, Consulting Botanist, Sydney, cannot fail to be of interest to our planters. He writes in the latest *Agricultural Gazette* of New South Wales:—

The Silky Oak is an excellent plant for bees. Like most of its congeners, it abounds in nectar. When in full bloom it is a gorgeous sight, the masses of orange-coloured blossoms being well set off by the beautiful fern-like foliage. The fruit is technically known as a “follicle,” and is about three quarters of an inch long. It contains two winged seeds. The Silky Oak being in such steady demand, ripe seeds are always valuable, and they should be collected and preserved wherever practicable. Their retail price ascends to as much as 5s. per once and more, and in some seasons they can hardly be bought, so rare do they become. Besides the local demand, a quantity is exported to other colonies and foreign countries every year.

EXUDATION.—Like a number of other plants, the Silky Oak produces, at different times, or under different circumstances, two kinds of exudations, the one a true gum, and the other a gum-resin, *i.e.*, an admixture of gum and resin. As regards the gum-resin, it was first exhibited in the New South Wales Court at the Paris Exhibition, 1867, but no notice appears to have been taken of the substance until, in the year 1885, Mons. Fleury published a chemical analysis of a sample which he had obtained from trees growing in Algeria, in which country it has been thoroughly acclimatised. His results are too technical for reproduction here but they show the gum resin to be a very interesting substance. Since then I have obtained a quantity from the Richmond River. When quite fresh and soft it is of a peculiar yellow colour, but on hardening it assumes something of a flesh or wine colour. It has an extremely disagreeable smell. The local opinion is that there is more “gum” during rainy weather than during drier seasons. The country people look upon it as a nuisance, as it sticks to the horses’ manes when they rub themselves against the tree. As regards Silky Oak gum, it has only been recorded, so far as I know, by one observer. In some notes on the Shevaroy Hills, India, for 1881, by Deputy Surgeon-General Shortt, the following passage occurs:—“Of the plants introduced in these hills, I have to notice a peculiarity as regards *Grevillea robusta*, one tree, which is now 11 years old, has during the rains produced spontaneously each year about 10 ounces of a translucent gum, which has no smell or particular taste, is of a pale yellow colour, and mixes readily with water, when it forms a whitish-brown coloured mucilage, and as a paste answers all the purposes of the so-called gum arabic for adhesive purposes.” A true gum is here evidently referred to.

TIMBER.—Pale-coloured, from creamy to flesh-coloured, but darkening with age. It has the pretty mottled grain which is characteristic of most of the timbers of the Natural Order (the Proteaceæ), to which it belongs, and which includes the honysuckles, geebungs, nut-trees, waratahs, Hakeas and many others. It splits readily, and is hence used largely for staves in the Northern Districts. It is elastic and durable. In some experiments on our native timbers, conducted at the Sydney Mint in the year 1860, the specific gravity of Silky Oak timber was given at ‘564, equivalent to a weight of 35 lb. 4 oz. per cubic foot. Another specimen, whose specific gravity was determined by the writer, gave 36 lb. 2 oz. per cubic foot, while a third corresponded to 38 lb. 14 oz. per cubic foot. Its use, besides the local ones of cabinet-work, shingles for roofs and lining boards, has hitherto been for tallow-casks. Its pale colour and absence of taste have also suggested its use for wine-casks. Following is an interesting letter from Mr. Thomas Bawden, of Grafton, well known as an authority on such subjects:—“From 1840 in this district down to the advent of galvanised iron-ware, Silky Oak timber was always the only wood used for milk-buckets and dairy

utensils generally, for which purpose it was found admirably suited. Silky Oak has been proved here to be a durable timber. I know a house erected in 1852 floored with Silky Oak, whose floor is still perfectly sound unless where it was exposed to the weather, such as near the edge of the verandah, showing for durability and suitability for flooring its superiority to hardwood, and that it is equal to some of the imported timbers used for that purpose. During the boiling-down era this district was almost swept of Silky Oak, so that there is now very little to be found of any size. I know a selector who appears to be more wise than his fellows, who has a very fine plantation of Silky Oak trees which will in a few years be of great value. From my knowledge of the timber it is only second for many purposes to the Red Cedar so far as commercial value is concerned, and is in some respects superior to that valuable timber.

The Silky Oak shows considerable adaptability to climate. Its natural home is on the Northern Rivers, yet it flourishes in the dry western country, showing, as Baron von Mueller has pointed out, that it resists drought in a remarkable degree. It does well in the tropics, as experience in India, Ceylon, Jamaica, &c. has amply proved. It is also tolerant to cold. The Secretary to the Park Trustees at Adelong Crossing reports that Silky Oak trees planted three years since are now 15 feet high, and 15 inches in circumference of trunk at 6 inches from the ground. They are growing rapidly, are not in a sheltered place, and were only 3 feet high when planted. The Silky Oaks do well at Echuca in Victoria, farther south still, and they flower even in Melbourne. *Grevillea robusta* finds a place in the list of hardy trees and shrubs of a Tasmanian nurseryman, so that brings the geographical limit of outdoor culture as far south as Tasmania.

SIZE.—Up to 70 or 80 feet in height, with a trunk diameter of 2 or 3 feet.

PROPAGATION.—From seed. It prefers deep, rich, moist soil, and the protection of other trees, but it is very accommodating, making fine growth under what would be called uncongenial surroundings. It is hardly possible to name an Australian tree which promises a more profitable return than does the Silky Oak. It is being used for street planting, and the worst that can be said of it is that, being semi-deciduous, it is apt to make a little litter in winter.

The “Silky Oak” ought to become the popular name in our hill country as it is in the Southern Colonies and, as we have said once before, it is likely to prove the most useful arboreal gift ever bestowed on Ceylon by Australia.

DRUG REPORT:

(From the *Chemist and Druggist*.)

London, Oct. 28.

ANNATTO.—Fully ½d per lb. higher. Of 26 bags shown today 18 sold with good competition at 3½d per lb. for fine bright seed from Ceylon and Madras, and 2d per lb. for dull.

CINNAMON remains in active request for arrival, further sales being reported at 6½d per lb. c.i.f. terms for usual assortment, November-January shipment.

COCA-LEAVES are in large supply, but the market is quite neglected. For fair to good strong brownish Huano leaves; 18 4t to 1s 6d per lb is asked, and for broken green Truxillo 1s 2d to 1s 3d per lb. Eleven cases fair hard grey leaves from Colombo were bought in at 10 per lb.

CUBEBS.—Whatever scarcity may have existed a short time ago (when it was said that, in spite of the fairly considerable stocks in existence, holders were unwillingly to sell except at an advance) has been removed by the arrival of a consignment of 124 bags of cubebs from Singapore. Another lot of 14 bags fair bright genuine Berries, not stalky, imported via Amsterdam sold cheaply at 6s 6d per cwt.

KOLA.—Of 21 cases shown to-day only 5 sold at 6½d to 7½d per lb. for good, bright, partly mouldy. West Indian kolas, and at 2d per lb. for common dark quality.

QUININE.—The market keeps very firm, but quiet. The only business reported this week is a sale of 5,000 oz. second-hand German bark at 9½d per oz. Two parcels were offered at today’s sales, one of these consisting of 7,000 oz. of Whiffin’s brand, in 100-oz. tins, was bought in at 10½d

an offer of 10d. being rejected; for the other lot of 4,500 of the Brunswick quinae also in 100-oz. tins, a bid of 9½d was rejected.

VANILLA.—About 700 packages were offered today, and of these two-thirds sold at steady rates for the better qualities, at a decline of 61 to 1s on short beans. At first, competition was very good, but towards the end it became less lively. Good fresh chocolate sold at 8s to 10s; medium to good slightly crystallised, 3½ to 7 inches, at 3s to 3s; common foxy and rough at from 1s 3d to 4s per lb.

THE AMSTERDAM MARKET.

Amsterdam, Oct. 19.

The cinchona auctions to be held in Amsterdam on November 9th will consist of 4,610 bales and 292 cases or about 420 tons weight of bark, divided as follows:—From Government plantations 34 bales and 17 cases, about 33 tons; from private plantations 4,266 bales and 275 cases, about 337 tons. This quantity contains: Of druggists' bark—Succirabra, quills 194 cases; br ken quills and chips 166 bales and 98 cases; root 107 bales. Of manufacturing bark—Ledgriana, broken quills and chips 2,859 bales; root 847 bales. Hybrids, broken quills and chips 580 bales; root 33 bales. Officialia, broken quills and chips 15 bales, root 3 bales.—*Chemist and Druggist.*

THE CUBEB MARKET.

The *O. P. & D. Reporter*, in reviewing the position of cubebes, observes:—Cubebes are now approaching the level which prevailed previous to 1880. In October '77, minimum price of cubebes in the New York market reached the unprecedentedly low figure of 8c per lb.; but from this time forward, with a few retrogressive steps, values appreciated until high-water mark was attained in '89, when sales were made as high at \$1.75 per lb. The causes of the high prices relate principally to speculative manipulation. It has been estimated that the average annual consumption of cubebes is about 150,000 lb., and if this is reasonably accurate, the proportion of the production brought to the United States is very considerable as will be perceived by reference to the Government reports for the past ten years. These are the figure: '83, 120,618 lb.; '84, 89,745 lb.; '85, 82,526 lb.; '86, 110,065 lb.; '87, 61,481 lb.; '88, 68,031 lb.; '89, 51,021 lb.; '90, 84,729 lb.; '91, 65,404 lb.; and '92, 115,974 lb. The year of the largest importation was 1879, when 277,422 lb. arrived in this country. It is easy to understand that such immense quantities were not needed except to meet a fictitious, speculative inquiry which developed strongly about that time.—*Chemist and Druggist.*

ESTATE MANAGEMENT (IN CEYLON.)

A very important and commendable step was taken by the directors of the Oriental Bank Estates Company, at their recent general meeting. It was no other than the appointment of two gentlemen possessed of Ceylon experience to act with them on the Board. This was a tacit admission, that the element of local experience was absent from their council of management, and that in order to command success in the working of their valuable and extensive estate property, such experts were absolutely necessary. The Board of Directors had not previously contained any shareholder who had the slightest acquaintance with Ceylon or Ceylon industries, nor had any office bearer of the company ever been in the island. It is true the London manager, Mr. Rhoda, has had some experience of coffee planting in the Neilgherries, but so far as we are informed he had never seen a tea plant, unless, perhaps, in a nursery. With the best possible intentions, therefore, and with the most earnest desire to duly discharge their duty, the Board and the staff of their company could not possibly carry on the management of the numerous estates in their charge in a manner conducive to the best interests of the shareholders.

When we allude to "management" we refer especially to that one element in all such undertakings which is so essential to success

above all other considerations. We mean a cordial understanding between the governing body in London and the Company's superintendents and visiting agents in the island; if this be absent there can be no good feeling between them, and consequently no success in the working of the properties. On this subject we do not profess to have any personal knowledge, but reports coming from many sources, and of long continuance, assure us of a lamentable absence of any approach to *entente cordiale* where there should have been perfect understanding and mutual confidence.

These unfortunate facts were a common talk in the room during the meeting, and anyone having acquaintance with shareholders present could not well be ignorant of these things. If the directors of this company desire information as to what constitutes good management let them ascertain how matters stand between the Directors and the Superintendents of the Ceylon Tea Plantation Company, and they will at once learn what it is which has had so much to do with earning continuous dividends of 15 per cent. during the last 6 or 7 years. The liberal, even generous treatment accorded the working staff of the latter company, the entire confidence placed in everyone of them and the business-like tone of the correspondence passing between the London office and the Company's representatives in the island, all go to constitute the secret of their success.

The long, almost wearisome address of the chairman at the late meeting, failed to restore confidence in the minds of the shareholders present, a result that was only attained by the appointment on the Board of such experts as Messrs. Rutherford and Norman Grieve. *Men not words* can alone restore the Company to its proper condition of security and prosperity, and now that changes have been made in the Board of Directors, no doubt others will follow in due time.—*Ceylon Advertiser.*

NOTES AND COMMENTS FROM LONDON: TEA-COFFEE-CHOCOLATE.

It is passing strange that whilst a decided improvement has taken place of late years in the quality of tea and chocolate dispensed at city buffets, the coffee vended is still execrable in flavour, and often undrinkable, and it is no doubt to this fact that we must ascribe the decline in the consumption of the berry which is dwindling year by year. The truth is, we believe, that the high price of coffee since the devastation of leaf disease has been such a great inducement to adulterate ground coffee which admits of easy manipulation, that coffee shop-keepers are unable to resist the strong temptation to make money in this way.

A month or so ago the demand in Mincing-lane ran very much on teas for price, now, however, there seems to be a decided rush for full flavoured broken pekoes and any of these possessing full flavour and point command great attention from buyers, for not only this market but for the Continent, where as we understand there is a strong enquiry for grades of various degrees. Purchases for those quarters have been considerable, though the declared exports do not as yet show any large advance. Travelling on the Continent by English tourists no doubt goes far to account for this growing increase in the demand for full flavoured Ceylon teas.

Surely the planters and merchants of Ceylon will not allow their admirable show at Chicago to be closed without some practical outcome in the form of agencies throughout some of the leading centres of American population, where the tea, which was so admired in the Ceylon Court, may be purchased at reasonable prices. This is the task which the colony has now to take in hand, and though it is true that the Government will not join in any financial support to speculative business transactions, there can be no good reason why they may not consent to allow a portion of the official Tea Fund to be devoted for a certain time to the advertising of Ceylon tea in American cities, involving no sort of risk.

Half a kola nut will, says Mr. O. F. Scott Elliott' in his report on the botany of Sierra Leone, enable a man to go without food and support great fatigue for 24 hours or more. It is an excellent nerve tonic, and especially good for keeping the brain clear and active at night. It prevents sleep, however, almost too thoroughly, and should not be taken less than four hours before bed. It is said to remove immediately and thoroughly the unsteadiness and stupidity due to drunkenness.—*Ibid.*

NOTES ON PRODUCE AND FINANCE.

TASTE IN TEA.—Discussing the question of taste in tea and coffee, the *American Grocer* says: "The rank and coarser sorts of coffee and tea are in most favour in the newer portions of the country, while in the older established sections, especially those where wealth and culture are most marked, tea and coffee of the most delicate flavour are in highest favour. Boston, New York, and Philadelphia are the best markets for the finest Formosa and Foochow Oolongs. In the leading cities of the south great attention is given to flavour. In New Orleans the best grocers use the very finest grades to be had in the American market, taking the finest Congou, English Breakfast, Foochow, Formosa, Oolong, Moyuue, Gonpowder, and a little India and young Hyson and a very little Japan. In the country districts of the south, price rather than quality is the first consideration. Country jobbers will buy black teas ranging from 12½ to 30 cts. and are indifferent as to whether Amoy, Foochow or Formosa Oolong. In purchasing low-grade greens attention is given to well-made leaf, so that Purisueys are in favour. It is said that in and about New Orleans country dealers take about two packages of green to one of black, while in the city dealers take two of black to one of green. A correspondent in Philadelphia states that Formosa Oolong has for many years been the favourite with old Philadelphia families; the custom prevailing with them tends to affect the demand of the entire community. The newer element in Philadelphia are quite partial to Formosa Oolong, which at first was mixed with Foochow Oolong until the demand gradually and steadily inclined toward straight Formosa.

THE MAGNITUDE OF THE TEA TRADE.—Messrs. Brooke, Bond & Co., Limited, in a letter to a Manchester paper, call attention to one or two points in connection with tea which are worth noting. They say: "It is gratifying to our national vanity that the tea produced in the British possessions in India and Ceylon are more and more taking the place of the China growths. Indeed, the time seems to be fast approaching when practically all the tea consumed in Great Britain will be the produce of British soil. This change is startling when it is remembered that only a generation ago all our teas were imported from the Celestial Empire. The causes are easy to discover, and may be summarised mainly as the underhand practices of the Chinese, their primitive methods of manufacture, their short-sighted system of taxing and hampering trade, and the steadily increasing demand in England, and especially the North, for a stronger tea than the somewhat weak and delicately-flavoured growths of the Flowery Land. It may be mentioned, as showing the far-reaching effects of economic changes, that the recent action of our own Government in sustaining the exchange value of the Indian rupee has partially checked the long and continued decline in our imports of China tea. Perhaps the most interesting characteristic of the international trade in tea during the last twelve months has been the creation of a demand in North America for Ceylon and Indian growths. Americans unlike the English, but like the French, drink far more coffee than tea, and they have long preferred the weak and comparatively colourless liquor prepared from the Japan or Formosan leaf. Owing, however, to the extraordinary efforts of the Indian Government and of the Indian and Sinhalase planters, by means of imposing and attractive dis-

plays and free samples at the Chicago Exhibition, a taste seems already to have been created across the Atlantic for the darker and stronger British-grown teas. The mischievous M'Kinley tariff, moreover, has done much to divert the trade of Canada from the United States to British possessions, with the economic result that our North American Dominion is now developing a taste for Ceylon tea, and is taking less from Japan. The Canadians pay more attention to the liquor than to the appearance of the dry leaf, and prefer Ceylon, whilst their neighbours in the States notice the leaf rather than the infusion, and seem to be more interested in Darjeeling and other Indian teas. Coming back to our home trade, we may add that the trying season has necessitated the highest art and skill on the part of that 'borngenius' the expert tea blender' in maintaining the exceptionally high standard of quality set by last year's growths. It is a satisfactory fact from a national point of view that the millions in our manufacturing districts show year by year a steadily increasing preference for tea and other temperate drinks. Indeed, the quantity of tea consumed by the masses in the northern cities and towns is enormous and almost incredible. It is brought to them literally in tons every hour by rail and sea from the London market, which absolutely controls the tea trade of the British Empire.

A LARGE COFFEE PLANTATION.—A Liverpool syndicate, at the head of which is Mr. Alfred L. Jones and Mr. John Holt, of Liverpool, has pronounced what will probably be one of the largest, if not actually the largest coffee plantation in existence. The place is situated about 75 miles from the town of Lagos, on the West African Coast, and is about 50 square miles in extent. In order to grasp the enormous size of this plantation it is necessary to realize that it would cover quarter the distance from Liverpool to London one mile in width. The land, which is under British protection, was acquired about two years ago for the cultivation chiefly of African coffee, and already there are about 10,000 trees planted. It is intended to put at least 120,000 plants down within the next five years, and as the ground is said to be adapted for rubber growing, it is likely that this product may also be cultivated. A town is being erected close by called Joustown, and a second one is to be named Holttown.—*H. and C. Mail*, Nov. 3.

TECHNICAL EDUCATION: GARDENING, &c.

The following letter expresses the views of many of our readers, and deserves attentive consideration. It may be pointed out that the Royal Horticultural Society has recognised the requirements of the case, and by instituting scholarships, contingent not only on the results of didactic teaching and subsequent examination, but also on actual practice in the garden, has set an excellent example. At the Horticultural College at Swanley, the instruction is very largely practical; whilst at Kew, a practical training in various departments is always given. The lectures and examinations will serve as valuable preliminaries to such practical training. An adequate knowledge of the significance of "principles" is the great want among young gardeners:—

"The technical education movement is gradually spreading to all parts of the country. Many able men are engaged in the work, and here and there much interest is being shown, not only on the part of the lecturers, but also on that of their audiences. On the other hand, there are many capable men who think very little practical good is likely to result from this new departure. It may be of some service to look carefully into the matter, and ascertain, if possible, on which side the truth lies; and in doing so, we shall deal only with the subject of horticulture, which, in passing, we may say, seems to be one of the most popular among rural audiences, even more so than agriculture, which, *a priori*, one would have thought, would have been

interesting to larger numbers. Possibly the explanation is, that those concerned in gardening are, speaking generally, a more enlightened body of men; any way, the fact is incontestable, that the interest in gardening is greater than that in farming.

"The point on which we desire to lay the largest stress is, how far mere teaching without practical experience will be of real benefit to those who attend these technical lectures. We are very much afraid that what goes in at one ear will go out at the other; and if this be so, a vast amount of the good teaching now being given will be wasted. Gardening operations must, to be permanently effective, be actually done by the students. The very best teaching may be available, but if it is not supplemented by practice, so that the teaching may be congealed in the minds of the students, we cannot believe that its effect will be permanent and enduring. If this is not so, it will be of little real value. Doubtless there is a great future for gardening in this country, and its chief hope is dependent on the proper education of the rising generation, who will be taught to do their work not by rule of thumb, but on the basis of well-ascertained principles. If we can by means of the popular technical education lectures, or in any other way within our reach train the gardeners of the future in the days of their youth, when they are most susceptible to teaching influences, so that when they come in contact with actual practice they can apply their theoretical knowledge, and bring to bear an awakened intelligence in dealing with their routine duties, very important results may be anticipated. So far as we can judge, the great want in the existing state of affairs is the absence of practical training. Country lads, however intelligent, may listen time after time to the most practical lectures about horticultural methods, but unless they have the chance of putting the instruction to the test of actual practice, much that they here will pass away from their remembrance and leave no trace behind. But if after a lecture on, say, pruning fruit trees, they are set to do the work they have been told is advisable, and especially if this work is done under the inspection of a competent instructor, there is no doubt but that some definite ideas will be fixed in their minds, and some real good will have been done; and so with all other operations which the competent lecturer will commend to their attention.

"The practical conclusion from these remarks is, that in every centre where technical instruction is given in horticulture, there should be an opportunity afforded for the students to gain practical experience, and thereby to apply and consolidate the theoretical teaching they have received. It seems to us that there should be a garden provided at every centre of technical instruction in horticulture, where the students could put in practice what the lecturer has told them they should do."—*Gardeners' Chronicle*.

A NEW PLANTING GENERATION.

It is interesting to note how in many cases son is succeeding father in the planting districts of Ceylon, and how the names of pioneers are carried on in a new generation. If we ran over our planting districts, we could now make out quite a considerable list of those who represent a younger generation, in possession or management or in training for the management of the property originally opened by paternal relatives. The latest addition to the list is one whom we heartily welcome to Ceylon in Mr. Forbes, younger of Kadienlena, Kotmale, son of Capt. J. Arthur Forbes, R.N.; and nephew of Mr. C. W. Forbes, the original proprietor, whose name goes back to the very early days of planting out here. We wish Mr. A. G. Forbes, who has just come to the colony, every success in his training as a planter under such good guidance as that of Mr. Elder and Mr. Gray on Kadienlena.

VARIOUS AGRICULTURAL NOTES.

A NEW CHEMICAL TREATMENT FOR STABLE MANURE.—Two Italian horticulturists have recently proposed to prevent the loss of ammonia from stable-dung, &c., by means of sulphuric acid, which is employed in the form of a composition termed "arotol." This composition is obtained from organic substances, containing hydrogen and oxygen in the same proportion in which they are contained in water, such as dry straw, sawdust, &c.; 25 to 50 per cent. of such matters are mixed with 50 to 75 per cent. of sulphuric acid, allowed to stand till cold, and then reduced to powder. The charred powder contains up to 75 per cent. of free sulphuric acid, and in this state may be advantageously scattered about on dung-hills, or left exposed in stalls.—*Gardeners' Chronicle*.

KEW BULLETIN.—The numbers for February and March are issued under one cover, and contain an exhaustive article on the Palm-weevil in British Honduras, by Mr. Blandford. The principal, but not the only culprit, is a beetle known as *Rhynchophorus palmarum*. Of this insect, the history and mode of life are given, and the available remedial measures discussed. Mr. Rolfe contributes a fifth decade of new Orchids. In this list, whenever a personal name is used adjectively, the word is spelt without an initial capital: thus *Epidendrum lancheanum*; but whenever the word is used as a substantive, then the initial letter is written as a capital, thus *Stanhopea Lowii*. This plan, though open to some objections, has the advantage of accentuating the fact that the termination "anum" or "ana" is used merely as a complimentary epithet, and does not imply that the person whose name is used has had any thing whatever to do with the plant. Where the capital letter is used, and the genitive from i or ii employed, the inference is that the person whose name has been used is in some way or another directly concerned with the plant.—*Ibid*

THE SIAM TEAK TRADE.—The British Consul at Bangkok, reporting on trade of that port for 1892 says that rice and teak are the two chief industries of Siam. Concerning teak, the continued depression of the London markets offered little inducement to shippers in Bangkok to charter tonnage for direct shipment to Europe. It was found more profitable to supply the local demand which was sufficiently keen on account of extensive building in Bangkok to keep three European steam saw-mills fully employed during the season. There was also a fair market in Hongkong, to which most of the secondary wood is shipped. The quality of the teak which has been shipped to London from Bangkok, has much improved of late. Shipments are now confined to these British firms, and great care is exercised in selecting the choicest wood. Burmah wood has still the best reputation in home markets, but there is now nothing to choose between the two. The preference is certainly to be given to Siam as regards cube average and length, the former of which occasionally reaches 50 feet, and the average length is seldom below 28 feet. The shorter lengths of 15 to 20 ft. seem to be plentiful in Burmah cargoes, which is due to the fact that the forests of the Burmah side are probably more exhausted than those of Siam. When the improved quality of Bangkok shipments become more generally known to buyers in London and on the Clyde, Siam teak will doubtless be more in demand than that of Burmah. Of the British firms engaged in the teak trade, in which a large amount of capital has been invested, two have leases of forests in the north, and have been obliged to advance large sums of money to foresters for the purpose of working out the wood. With prices at 9l. 10s. per ton, and stocks in London going off rather slowly, the prospects of the teak merchants are not particularly encouraging.—*Gardeners' Chronicle*.

THE VANNI DISTRICT :—PADDY (RICE) CULTIVATION THEREIN.

Rice being the chief article of food of the people of the District, it is not surprising to find that the cultivation of paddy is their chief occupation. Out of 10,315 acres under cultivation in 1883 it was estimated that 6,610 acres were cultivated with paddy. (a)

There are three harvests, of which the only considerable one is the "*Kalapokam*" "or regular crop" sown in September or October when the rains of the North-East Monsoon begin, and reaped in February or March. The other two are "*Idaippokam*" "middle crop" sown in February or March and "*Chirupokam*" "little crop" sown in April. The three crops are only possible where there are tanks to irrigate the fields. Where the cultivation depends entirely upon rain as in most parts of the maritime pattus there is as a rule only one crop, *Kalapokam*. (b)

Idaippokam and *Chirupokam* are of very uncertain occurrence depending entirely on the quantity of water available at the time in the particular tanks under which the fields lie.

As regards the means of irrigation as has already been hinted there are three different kinds of lands:—

1. Tank lands.
2. *Manavari* (c) lands, which depend entirely upon rain; and

3. Lands irrigated by spring, (*Chinnattarai*).

Most of the fields in the maritime pattus are *Manavari* lands, but there are two villages, where lands of the third description are to be found, *viz.*, Mullizavalai and Tanniyuttu. In the inland pattus where the soil is clayey it becomes too hard after some months' exposure to the burning sun to allow of the showers softening it sufficiently for ploughing which is the main reason why *manavari* cultivation is not practised in these divisions.

Paddy cultivation in the Vanni is of two kinds. (1) "*Puluti*" or pulverized soil, and (2) "*Chettu*" or mud cultivation.

There are two methods of *puluti* cultivation, according as the seed is sown before or after the rains of the North-East Monsoon.

The former or *Kachchuppuluti vitaiippu* (dry *puluti* sowing) is chiefly carried on in *manavari* lands.

The lands are ploughed as soon after harvest as there is a shower of rain which is generally in July and the soil is then kept soft by the snows until it is sown in August and the early part of September. Later than August this mode of cultivation is not customary. One advantage resulting from it is that the heat of the soil keeps the seeds dry for a time, and they consequently germinate well, and when this is followed by abundance of rain the plants root well and grow luxuriantly.

The latter or *irupputti vitaiippu* ("wet *puluti* sowing") requires sandy soil and therefore is usually practised in *manavari* lands though occasionally also in tank lands if the soil is light and sandy. The fields are sown after the rains of the North-East Monsoon. When the soil has been sufficiently softened by the rain or by water from the tank it is ploughed (d) and then sown, and again on the 3rd or 5th day reploughed. The sowing takes place in October and November. This is an inefficient and lazy method

a The primary object of the people in cultivating is to obtain food by the shortest road and as the direct result of their labours, and not to make a profit in money by trading with the produce. No amount of arguing therefore that they ought to cultivate other and more paying products can have any effect in altering the existing conditions which lead to the results stated above.

b In some villages such as Mulliyavalai and Tanniyuttu where there are natural springs there is also *Chirupokam* cultivation.

c *Manavari* is said to be a corruption of *vana ri* ("sky water"). It is not given by Winslow.

d It is not always sown before ploughing. All paddy will not grow; and it is necessary that it should be allowed to dry after reaping and be properly secured from rain, &c.

of cultivation and is much favoured by farmers who have extensive lands to cultivate. It fosters the growth of weeds, while the soil eventually is not sufficiently pulverized when the seed is sown to allow of the paddy plants rooting properly. If there is constant rain germinated seeds are sown.

(2) *Chettu vitaiippu* is the mode of cultivation adopted in all land where the soil is other than sandy.

The land is ploughed twice—after the first ploughing it is left alone for from 3 to 7 days until the mud and water become "sour" (*pulippu*) and the weeds and grass are decayed, when it is reploughed. After this it is smoothed with a board (*palakai*) about 8 feet long drawn by a pair of buffaloes. The man who drives the buffaloes stands on the plank and holds on by a rope. This smoothing is called *palakai adippu*. Germinated seed is then sown. It has been previously kept for 5 days to germinate, being immersed for one night in water.

When sown the seeds sink into the mud and water and 12 hours afterwards the water is let out. This mode of cultivation is much superior to the other two, but requires more water, and if there is insufficient water the plants die sooner than in the other methods.

The sowing takes place at any time from October to January whenever the rain is enough water in the tanks.

As to the soil I take the following classification from Mr. Dyke's Diary of 2nd November 1818.

There are four kinds of soil in the Vanni, *viz.*—

1. *Kalittarai* "clay soil." If cultivated yearly the produce will continue to be same for 50 years, the rate of produce being about 20 fold, and after the above period it would begin to decrease at the rate of $\frac{1}{4}$ less for a space of 20 years, and of $\frac{1}{2}$ less for 10 years and $\frac{3}{4}$ less for another 10 years. The last rate will continue without any variation. To remedy this the ground is usually left uncultivated for 3 or 4 years and when the cultivation is resumed the produce would rise to 10 fold and not more.

2. *Irupadduttarai*, *i.e.*, "Soil of two qualities" (*padu*). This is a mixture of clay and sand. The produce continues the same for the space of 30 years, the rate of produce, 15 fold; in other respects the same as No. 1.

3. *Manattarai* (sandy soil), produce the same for 20 years, rate 10 fold.

4. *Uvattarai* (soil containing salt) the produce continues the same for 10 years, the rate 5 fold.

In the Vanni Pattus very often ploughing is not commenced until the tank is full and it is thus sometimes begun too late. An udayar in 1864 (a) gave it as his opinion that "if preparations for paddy cultivation were commenced at the same time as the people begin to clear chenas, and in substitution of that business there would never be a failure of paddy crops. Such failures usually result from paddy cultivation not being commenced until after completion of the clearing of chenas."

Transplanting is not practised. The pupils at the Agricultural School were taught it in 1883, and I find that one of them has since practised it with advantage.

At the same time experiments were made with the "Indian Ryot" plough and those belonging to the two Kachcheris have occasionally been used since, being lent to applicants desirous of trying them. In Vavuniya, the Mudaliyar, by using the Kachcheri plough in 1884 got a return nearly double the rate of that of the rest of the field. Compatriot, however, was that the buffaloes who worked it could do no more work for the rest of the season, and that it can only be used in sandy soil. It seems that buffaloes require training for its use. It would be too heavy for the bullocks generally used in ploughing sandy soil.

The ploughing moreover is often done in a perfunctory way. "In many cases they do not plough before sowing, but simply cut away the thorny weeds with which the fields are generally overgrown, burn the rubbish, sow the paddy and plough it in afterwards. The roots themselves are not removed and they grow up with the young paddy which consequently

choke the paddy and take all the nourishment from the soil, so that the crop is $\frac{1}{10}$ th what it ought to have been." (a) Nothing is done in the way of manuring or weeding (b) and the Mudaliyars periodically send in reports to the Kachcheri that "the crop is being much damaged by weeds," but it never occurs to the cultivator that they and their families might weed the fields. The spectacle of a number of women weeding a paddy field, which is so common a sight in the Kandyau districts, is never seen in the Vanni. (c)

Buffaloes are used for ploughing, generally in pairs, but sometimes as many as 3, 4, or 5 are used. At Chundikulam where the soil is sandy, bullocks are used as in Jaffna instead of buffaloes. The Vanni plough is of the Jaffna pattern but larger.

The hire for a pair of buffaloes for the sowing season, i.e., from the beginning of the month of August to the middle or end of September in the case of *manavari* lands, and later in the case of tank lands, is 15 *marakkals*. (d) It is understood that the pair are to plough for this hire not more than 30 *marakkals* sowing extent of *manavari* land, if tank land, rather less. An owner can hire out his pair twice in the season—once pair of buffaloes can plough about 3 *marakkals* sowing extent a day.

The paddy sown for *Kalapokam* is one of the kinds that ripen in 5 months; for *idaippokam* 5 or 4 months paddy is used, and for *Chirupokam* paddy that ripens in 3 months.

The different kinds of paddy sown are as follows:—

Kalapokam paddy.

1. *Kullavalai*—5 months—more productive—requires much water.
2. *Vellanelu*—5 months.
3. *Kavattaylankalayan*
4. *Vellaiyilankalayan* } —4 months, sandy soil.

These are the kinds usually sown. There are besides varieties of *Champa* ripening in 4 months

5. *Kanukampu Champa*—"arekanut flower *Champa*." This "gives a very fine kind of rice, the grain of rice being in size nearly that of Bengal table-rice although not quite so white. This kind is not generally sown."

6. *Chempavata Champa.*
 7. *Ikku Champa*
- Chirupokam paddy.*
8. *Pachchappirumal*—3 months, small and reddish.
 9. *Chinaddi*—3 months, small and black.
 10. *Vellaichinaddi.*

"There is a larger kind of paddy called *Perunellu* taking six months to ripen, which is sown in the beds of tanks. It is considered inferior to the smaller paddy taking from 3 to 5 months, the best paddy being that which comes to maturity in 3 months." (e)

Experiments were made by Government in 1869-70 with foreign varieties of paddy. Carolina paddy was tried as *Marai-adittahulam* and *Kumarapuram*, the red variety at *Maraotodai* in *Odduchehuddan*, *Otiyamalai* and *Karaippadd-murippu*, China paddy white and black at these places and at *Marutodai*, *Paliyanhulam*, *Melpattu* south and *Putukkudiyiruppu*.

a Diary of Mr. Pr'ce,

b Except in *Kumilamunai* where people from *Jaffna* have introduced *Jaffna* methods.

c I have however seen women using the mamoty at *Otiyamalai*, but that was unusual.

d The hire of buffaloes in 1807 was 10 *marakkals* for a season. For some time previous to 1842 the hire of a pair was said to have been 24 *marakkals*. In 1845 it had risen to 30 *marakkals*. See Diary of 27th October 1849.

e Other kinds of paddy are:—

<i>Oddaivalan</i>	<i>Vaduppittan</i>
<i>Charali</i>	<i>Chori Kurampi</i>
<i>Kadaikkaluttan</i>	<i>Morunkan</i>
<i>Alakiyavanan</i>	<i>Manalvari</i>
<i>Panankaliyan</i>	<i>Malaiyalakan</i>
<i>Chiruvellai</i>	<i>Kar Nellu</i>
<i>Muppankan</i>	<i>Mulli Ne'lu</i>
<i>Chavarakkuran</i>	<i>Adukku Vellai</i>
<i>Karunkuruvai</i>	

See Diary of 15th May 1848;

In some places transplanting which was directed was not carried out "because it is not the custom." Complaints were made that the red Carolina paddy was difficult to thrash, while the other variety was easy to thrash but gave a great deal of chaff. The China paddy, even where transplanting was carried out, was not nearly so prolific as the country paddy, of the China black paddy sown at *Odduchehuddan*, the ears being hard were entirely destroyed by flies before they ripened.

The practice to be followed by the cultivators with respect to extent to be cultivated in a given season, kind of paddy to be sown, rights and duties of shareholders, erections of watch huts and fencing, care of cattle, &c., is embodied in the Irrigation Rules, there being a separate set of rules for tank and *manavari* lands (a) respectively though many of the provisions in each set are identical. As these rules represent the customs of the country (b) with regard to paddy cultivation, no account of this subject could be complete which omitted them, and I therefore give such of the rules for Tank lands as are more particularly concerned with paddy cultivation, at the same time indicating where the rules as to *manavari* lands differ from them. The first 7 of these rules regarding tank lands provide for the upkeep of the tanks.

EXTENT TO BE CULTIVATED.

Rule 10.—Before the commencement of the sowing season, the proprietors of each tract of field intending to cultivate for the season shall decide on the description of paddy that shall be sown for that season, and any proprietor sowing any other description of paddy than that agreed on by the majority shall do so on his own responsibility and risk, and shall continue to watch, fence and perform all the duties as hereinafter mentioned until all the paddy in the field is reaped. For instance, if it be decided to sow five months' paddy, and a proprietor chooses to sow three months' paddy, he shall nevertheless continue to watch the fields till the whole of the five months' paddy is reaped. But whereas in some fields it is not possible to sow the same description of paddy over the whole extent, in consequence of the varieties of the soil, a majority of the proprietors intending to cultivate for the season shall decide on the description of paddy that shall be sown, and all the proprietors shall watch, keep up the fence, &c., until all the paddy is reaped.

This is identical with Rule 9 *manavari*, but instead of tract of field, paddy fields of each *Veli* is substituted, and there is a special rule (No. 1) explaining what is intended by a *Veli*, and providing for the separate enclosure of each *Veli*. This rule is as follows:—

No. 1.—"For the purpose of effectively carrying out the following rules, each tract of paddy field (*Veli*) in a village shall be separately enclosed by itself with the customary fence of stakes or thorns. In cases where a *Veli* is not easily definable, the majority of proprietors and headmen shall decide what extent of tract is to be called a *Veli* for these purposes."

COURSE TO BE FOLLOWED WHERE THERE IS INSUFFICIENCY OF WATER.

Rule 11.—"Whereas in these districts the sowing season for the *Kalapokam* commences long before the tanks are full, and it cannot possibly be known until after the heavy rains how much water will be available, and whether there will be sufficient for the full extent of the fields sown, if, after the rains, it be found that the supply of water is insufficient for all the fields sown, a majority of the proprietors of the fields sown for the season shall decide on what fields shall be abandoned. In the event of the proprietors not coming to a decision, it shall be open

a Lands irrigated by springs are classed as *manavari* lands.

b There is no reason to suppose that the customs of the Vanni as regards paddy cultivation have changed in any material respect within the memory of man.

to the Government Agent or the Assistant Government Agent to decide what fields shall be abandoned; and in the event of a proprietor being aggrieved by the decision of the majority, it shall be open to him to appeal to the Government Agent or the Assistant Government Agent, whose decision shall be final."

This rule of course can only refer to Tank lands.

SHAREHOLDER NEGLECTING TO CULTIVATE.

Rule 12.—"If a proprietor absents himself at the sowing season, or neglects to cultivate his share, it may be cultivated by the other proprietors or by one of them, as the majority may decide, free of rent for that season, all the duties required of the owner being performed by the person cultivating for that season. It must be understood that such duties do not include services required of the proprietors by 2nd and 3rd clauses. In the event of the share of an absentee not being cultivated by the other shareholders, the proprietor himself shall perform all the duties required of a proprietor, whether he cultivates the land or not. The cases of proprietors unable to cultivate their shares for any year from ill-health or some unavoidable cause, will be specially considered by the Government Agent, who may, if he thinks fit so to do, remit the commutation for service due for that year under the 2nd and 3rd clauses."

A proprietor of *manavari* lands has to give due notice of his intention not to sow, to the adjacent shareholder or shareholders in the presence of the irrigation headman on or before the 1st of June. In other respects the rule is practically the same for both descriptions of land, but the adjacent shareholder has the first option of cultivating the absentee's share.

SUBSTITUTE FOR PROPRIETOR.

Rule 13.—"A proprietor if unable to attend personally, may provide for the cultivation of his share by substitute or 'Varakkudi' in the performance of the duties required. No proprietor shall employ any substitute or 'Varakkudi' who is in the service of another proprietor as 'Varakkudi' without the consent of such other proprietor."

The same for *Manavari* lands (Rule 11).

WATCHING.

Rule 14.—"Each proprietor shall erect a proper watch-hut in his share and shall watch his share until all the paddy in the field is reaped, whether his own paddy has been reaped or not."

In the case of *manavari* lands the proprietor has to continue watching for 14 days after the whole of his crop has been reaped, and he has to give information of the completion of reaping of his crop without delay to the irrigation headmen.

FENCING.

Rule 15.—"Each proprietor shall assist in fencing the field in proportion to his share in the field; the fence shall be made sufficiently strong to keep out cattle, and all cultivators shall put up their fences before commencing to cultivate; and each proprietor shall see that his portion of the fence is kept in proper order throughout the Kalapokam season, until the crop is finally reaped, whether he cultivates his share or not, unless his share be cultivated by some other proprietor."^(a)

For *manavari* lands, which consist of a large tract of fields in one enclosure, it is provided that "each proprietor whose share lies on the outside shall put up his usual share of fence in a Veli (Rule 13). Proprietors of inside shares therefore are not bound to do any fencing except that of enclosing the Veli under (Rule 1). For *manavari* lands also a date is fixed on or before which the fencing is to be completed, viz., 15th August. Non-cultivating proprietors are not bound to assist in keeping up the fence.

THRASHING FLOOR.

Rule 16.—"Each proprietor shall be allowed a share in one of the thrashing floors, in which to

stack his paddy till it is thrashed; and all the shareholders of each thrashing floor shall put up a strong stake fence round it, and keep up the fence till all the paddy is thrashed. Each proprietor shall watch the thrashing floor, though his own paddy shall have been thrashed, for at least fourteen days after his paddy has been thrashed."

In the case of *manavari* lands, it is a common practice for each proprietor to have a separate thrashing floor and the fencing of each separate thrashing floor, if there are such, is therefore also required by the Rule 14. The common thrashing floor has only to be watched for 7 days instead of 14 by each proprietor after threshing of his share.

IDAIPPOKAM AND CHIRUPOKAM.

Rule 17.—"Whereas in these districts there is in general very little water available for idaippokam and chirupokam cultivation, when the sowing season for these crops arrives, a majority of the proprietors of each field shall decide on the extent and portion of the field to be cultivated, and all such proprietors as are desirous of sowing for the idaippokam or chirupokam, shall have a share in such extent in proportion to their shares in the field. But no shareholder shall be bound to cultivate for the idaippokam or chirupokam, and all the duties regarding the watching and fencing the *idaippokam* and *chirupokam* shall be performed by those proprietors alone who have undertaken to cultivate for these harvests; and any shareholder sowing for the idaippokam or chirupokam shall perform all such duties until the whole of the idaippokam or chirupokam is reaped, whether his own share succeed or not.

There is no corresponding rule as regards *manavari* lands. The only *manavari* lands in which there is *chirupokam* are those watered by springs as well as rain. What people cultivating under tanks call *idaippokam* would be called by *manavari* cultivators *chirupokam*. There is no rule respecting *chirupokam* in *manavari* lands.

Much damage to the growing crops is also done by cattle.^(a)

The crops are also damaged by pests that no irrigation rules can control. The principal of these are:

1. A kind of fly called in Tamil by the terse but comprehensive name of *i*; *i* is a general name for fly.

2. *Koddiyan*—a sort of green and black caterpillar. This may have been the "kind of green insect resembling a worm and about an inch long" which cuts the young plants as if with a knife and almost destroyed the crop of many fields after the storm of November 25th 1884.

3. *Nveli*, a kind of beetle.

4. *Kappuppulu*, a large green caterpillar or worm.^(b)

In January 1883 a sort of yellowish fungus or nest began to make its appearance on the leaves of the paddy plants near Mullaattivu. This was washed away by the heavy rain that occurred in that month.

At the other end of the scale we have elephants which occasionally help themselves to the growing or the stacked paddy. Bird and beasts of all sorts do their share of pilfering and keep the occupants of the watch huts fully employed.

CULTIVATION OF TANK.

When there is not sufficient rain in any season to supply the tanks or when the fields require to lie fallow for a time, it is the practice to cultivate the bed of the tank. This is called *pulavu* cultivation. The ancient customs of the country give the people a kind of prescriptive right to this mode of cultivation, and these are embodied in one of the irrigation rules relating to tank lands which is as follows:—

Rule 9.—"At the commencement of the sowing season it shall be decided by a majority of the proprietors of any tank and fields, whether or not

^a This rule is not adhered to in Melpattu North where it is doubtful whether it is in accordance with ancient custom. Only the proprietors of the shares on the outside of the field there put up the fence.

^a See under "cattle."

^b To which may be added "a species of green bug about the size of a large ant (with) a most disagreeable smell.—Diary of Mr. Price, 8th May 1863.

the tank or any portion of it shall be cultivated and if it be decided to cultivate any portion of it each proprietor shall be entitled to a share of the extent it is proposed to cultivate, in proportion to his share of the fields; and no proprietor shall be allowed to cultivate any portion of the tank, if it be decided by a majority of the proprietors not to carry on any cultivation in the bed of the tank. An appeal from a decision in this case may be made to the Government Agent or Assistant Agent of the district, whose decision shall be final."

In the Vanni the thrashing of the crop is usually delayed for months, and a cultivator thrashes a small quantity only at the time of harvest; thus "out of 50 bushels sowing extent he thrashes about 2." This portion is equally divided between himself and his *Varrak'udis*, and is what is called *putir*. They have a superstitious fear that unless they make a *ponkal* with *putir* (or "first fruits" of their labour) before they finally stack their paddy crops, the devils will destroy, or to use their own words, run away with all the paddy. "This custom is religiously observed by the Wannians."^(a)

Mr. Dyke remarks with respect to the custom in the Vanni of deferring the thrashing of the crops for months:—"I have been familiar with the fact ever since I knew this country, but I have never been able to understand the real reason for the great delay in thrashing the crops."

In numerous villages that we have been in they have not yet thrashed even the *Kalappokam*—and now they must expect rain to interrupt them and perhaps injure the paddy; besides there is all the enormous additional labour of watching the heaps for all this time. The explanation given by one of the Mudaliyars when he was consulted on the subject was that it was due to two principal reasons which, however, the people were disinclined to divulge.^(b)

1. By keeping the crops unthrashed the share of the *Varakkudi* is detained with it, and as long as the share thus remains undecided the *Varakkudi* could not well quit his master's service or engage himself to another employer, or make any engagement with another employer. Consequently, the thrashing is generally done and the share of the *Varakkudi* is allotted to him after he has done a considerable share of the work of the next cultivation.

2. It is a prevailing custom among natives when they wish to secure their grain, money, or other articles, from being carelessly spent, to invent some means to keep these articles under some restriction, *i.e.*, in such a way that access cannot readily be had to them. For instance, in the case of money, they would not keep it in loose coin but change it into notes or gold, and perhaps hide it under ground to prevent it from being spent without sufficient necessity. So in the case of a paddy crop, it is probable that the thrashing is deferred from similar consideration. When paddy is actually required a certain quantity is drawn out from the stack and thrashed by the cultivators themselves, treading out the corn.

Obstacles in the way of cultivation, besides the periodical droughts, are occasionally want of seed paddy, want of command of labour, and, after one of the periodical epidemics of murrain, scarcity of

^a (Diary of Mr. Atherton, 16th April 1854.) It gives the renters a hold upon the cultivators, as he informs them that for partially thrashing in this way they are liable to a penalty under the ordinance to the extent of double the tithe. If his tithe is 10 parras he tells them that if they will give him 15 parras he will not prosecute them; knowing that they had no right to act as they did, they pay him the 15 parras in money or kind.

^b Diary of 2nd November 1848. The reasons alleged by the people themselves were want of cattle, want of time, and carelessness but these the Mudaliyar did not believe.

buffaloes.^(a) As regards labour the *Varakkudi* system followed in Jaffna generally prevails. This system is fully explained elsewhere.^(b)

I take the following from Mr. Dyke's diary of 26th August 1842. "The rent of paddy land is usually 1 marakkal of paddy for each marakkal of sowing extent. The average rate of produce may be taken at 10 for 1.

The person holding the land in rent pays tithe. For 10 *marakkals* sowing extent of ground therefore he probably pays 10 *marakkals* for rent and 10 for tax—in all 20."

Except perhaps in one or two villages such as Putukkudiyiruppu it is probable that the extent of paddy land available is quite as much as the present population is able to cultivate.^(c) Such being the case it is not to be expected that the extent of land cultivated with paddy will show any tendency to increase. The following tables shew the extent sown at different periods:—

Divisions.	PADDY.				
	Quantity sown in acres. ^(d)

1889	3620

^a These obstacles have been subjects of complaint since the beginning of the century. In February 1863 the cultivators were paying 1 day to coolies. It is customary for a proprietor of paddy land if he has no seed paddy to allow another man who has to sow his field. In that case he gets a quantity equal to the seed paddy for rent.

^b See chapter on "Labour-wages."

^c See Mr. Ellis' Adm. Report for 1880.

^d I have reduced the figures given in Turnour's diary from marakkals of 12 and 15 seers to acres, taking $3\frac{1}{2}$ marakkals of 15 seers as sowing one acre's extent. In all the figures, fractions are neglected. The figures in the first two columns are of course nearly conjectural, and in their original form are given in round numbers. Hence the appearance of identical numbers in the two columns, from which extreme accuracy and a series of curious coincidences must not be inferred.

This shows an average of about 3,500 acres sown annually in Vanniya and 4,250 in Mullaitivu. The extent sown in the Mullaitivu district proper in 1858 was 3,830 acres.

As has already appeared there is a great difference in the fertility of lands cultivated under tanks and of *manavari* lands. The former yield from 5 to 30 fold, the latter generally not more than 5 to 10 fold.

According to the estimate given to Mr. Turnour in 1807 the following were the rates of yield in the different divisions of the

VAVUNIYA DISTRICT.

Kilakkumulai South	}	Tank land
do North		15 to 20 fold.
		Average 15
Naduecheddikulam	}	25 to 30.
Simnecheddikulam		8 to 30
		Average 20.
Merkumulai	6 to 20
Panankamam	8 to 12
Udaiyaar	10 to 30
Melpattu South	...	15 to 25
do East	}	Average 20
		5 to 20

MULLAITIVU DISTRICT.

Karikkaddumulai North	}	Tank land
do South		Manavari land
		5 to 8 fold
		5 to 20
		Average 12
Mulliyavalai	do 6
Putukkudiyiruppu	10 to fold 6 to 10
Karunavapattu North	15-10
do South	30
Tunukkay	5 to 15
Melpattu North	}	10 to 20
		Average 15

Kilakkumulai North, the Cheddikulams, Udaiyaar and Melpattu South in the Vavuniya District and Karunavapattu South in the Mullaitivu District would therefore seem to be the most fertile parts, and there can be no doubt as to the great fertility of the soil of the inland pattus generally. Mr. Price observes it is impossible to find superior land for any cultivation than there is in the district especially at Ariyamadu."

But according to the estimate of the headmen the average rate of yield is not more than 6 $\frac{1}{5}$ fold in the Vavuniya District and 4 $\frac{1}{2}$ fold in Mullaitivu.

This is shewn by the following tables.—

VAVUNIYA.

Year	Extent sown Bushels	Produce Bushels	Rate
1881 ..	6727 ..	43470 ..	6 $\frac{2}{5}$
1882 ..	6777 ..	35629 ..	5 $\frac{1}{2}$
1883 ..	10206 ..	55902 ..	5 $\frac{2}{5}$
1884 ..	7878 ..	47241 ..	5 $\frac{2}{10}$
1885 ..	9420 ..	73196 ..	7 $\frac{7}{10}$
1886 ..	9040 ..	66853 ..	7 $\frac{3}{10}$
1887 ..	7089 ..	21715 ..	3
1888 ..	6779 ..	43293 ..	6 $\frac{3}{10}$
1889 ..	6730 ..	50144 ..	7 $\frac{2}{5}$
Total	70646	437643	6 $\frac{1}{10}$

MULLAITIVU.

Year	Extent sown Bushels	Produce Bushels	Rate
1879 ...	7996 ...	24744 ...	3
1880 ...	8250 ...	40263 ...	4 $\frac{1}{2}$
1881 ...	8658 ...	56537 ...	6 $\frac{1}{2}$
1882 ...	10179 ...	47865 ...	4 $\frac{7}{10}$
1883 ...	11943 ...	57150 ...	4 $\frac{7}{10}$
1884 ...	10777 ...	41254 ...	3 $\frac{9}{10}$
1885 ...	10779 ...	43786 ...	4
1886 ...	10206 ...	49510 ...	4 $\frac{1}{2}$

1887 ...	10080 ...	36543 ...	3 $\frac{3}{5}$
1888 ...	8075 ...	13299 ...	1 $\frac{3}{5}$
1889 ...	8145 ...	35833 ...	4 $\frac{1}{2}$
Total	105088	466784	4 $\frac{1}{2}$

There is no doubt however that the headmen systematically under-estimate the crop. Mr. Fowler calculated this under-estimation to be at the rate of $\frac{1}{2}$, i.e., a crop of 60,000 bushels would be estimated by the headmen at 40,000 bushels(g). And if the estimated produce is compared with the produce as calculated from the amounts for which the rents sell, the substantial accuracy of this view will be confirmed.

With regard to the question whether the paddy produced in the district is sufficient for the want of the inhabitants, Mr. Fowler calculated and I see no reason for not accepting his calculation, that it required not less than 60,000 bushels to meet the wants of the district for a year. This would be represented in the headmen's estimate by 40,000 bushels.

Referring to the figures given above we find that there were only 4 years in the period 1879, 1889, when the crop fell short of this quantity, viz.—in 1879, 1887, 1888 (when the failure was disastrous) and 1889.

THE DROPPING OF THE BUDS OF PEACHES, &c.

This is a calamity to which the Peach tree, as raised and grown in gardens in this country, is particularly liable, and as to which the best gardeners are at variance in regard to the cause and the remedy. It will occur in trees in a forcing-house, in pots in the orchard-house, and on open walls. The mechanical conditions of the soil, apart from its special nature, may, and do seem to offer a probable cause, in so far as at one time the soil may become exhausted of its humus by the previous heavy draughts on its store of food supplies by a tree in luxuriant growth, or from an inadequate amount of water present in it, especially when the buds are nearing their full development in the autumn.

To go into the woods and forests for an illustration, we see something of this kind of effect in the sickening of, say, Oaks in a plantation that has been greatly thinned out, where previously the trees have grown healthily and well. The excessive thinning has let in the sun; there is no dense canopy of foliage to prevent rapid evaporation of moisture from the soil, and the exposure hastens the decay of the covering of leaves and leaf-mould, and other soluble plant-food on and in the soil, with the effect of hastening growth at the top. After a few years the vigorous growth of the crown and stem-growths has exhausted the stores of plant-food in the soil, the upper layer being without sufficient protecting covering, dries out quickly in the summer season; and then follows a course of starvation, with the subsequent result, if there is no undergrowth coming on to supply the shade that has been lost, that the trees die back at the top, and sometimes a whole plantation will die out.

Is there not in the case of our Peach trees something that in its initial stage resembles the unfortunate results of inordinate tree thinning? In the case of trees on a wall, or those exposed to the full blaze of the sun in a Peach-house, we have something that is analogous to the over-thinned trees with an uncovered soil, exposed to the fierce rays of the sun, evaporating its moisture, and causing a rapid decrease of the manurial portions of the same, at the same time that a large amount of growth of shoot and stem is encouraged, and an exhausting crop of fruits taken.

The gardener who considers all these points, can, and does try to mitigate the evils that are likely to arise from his special, and we may say unnatural, or at least artificial, proceedings; for he copiously waters the soil, not only during the season of growth, but afterwards, when the trees are about to enter

their winter's rest; and if it be a light soil, and therefore readily parts with its moisture, he mulches it with stable manure in sufficient quantity to prevent undue loss by evaporation, but not to seal it against the entrance of air.

Loss of buds may arise from a crowded state of the shoots, in which case only those shoots which are least crowded, such as those at the extremities of the longer branches, would develop good fruit and wood buds. The crowded shoots would produce buds small in size, deficient in vigour, and certain to be ill-matured at the end of the season, and this would be equally true of trees in houses and on walls. It will be obvious to anyone that crowding the shoots cannot pay, and the best growers have for many years past advocated a judicious thinning of the shoots, and an early commencement of the operation, together with its gradual performance. This year the lessening of the number of shoots on a Peach tree was begun, owing to the extreme earliness of growth, so early as the second week of April in southern parts of the country, and a finish will be made of the heavier portion of the work before the end of the present month. Of course, there is some thinning and cutting back of over-strong shoots to be performed even so late as the beginning of August.

Another cause we may advert to as affording a reason for bud-dropping, is a soil with inefficient drainage, or none at all. There, the excessive moisture present prevents the ingress of air, consequently keeps the soil cool, tends to prolong growth to a late period, and prevents its attaining to full maturity. In such soils the Peach seldom pays to grow, for unfruitfulness is sure to intervene when the roots have penetrated to any depth; and in such cases, nothing short of thoroughly draining the border and replanting the trees, perhaps renewing some of the staple, is of any use.

There is one aspect of the case which we may here say a few words about, and that is the stock on which the Peach and Nectarine should be budded when the tree is to occupy a place on a south wall on warm dry land, or in the peachery. The Peach and Nectarine differ from most other kinds of fruit in being "worked" on a plant which in many points differs greatly from themselves. In the case of the Apple, we make use of the crab, the progenitor of all Apples, or of the Doucin, the Burr Knot and seedling Apples taken from all sorts of sources, without regard to suitability, because, perhaps with the exception of the Doucin, a "dwarfing stock," it does not much matter, they being all of them Apples trees, and, therefore, nearly related. It is the same with the Plum, only Plum stocks are employed; and the Pear, with the exception of some score or two of varieties which grow on the Quince, is not happy if not united to another Pear. With the Peach this is different, for in this country it has become the mode, because found the best adapted to our climate in general culture, to work it on the Plum stock, a near relation probably some long ages since, but now widely dissimilar in fruit, foliage, root-formation, and many other points.

The usual stocks for the out-of-doors culture of Peaches, &c., are the Muscle, which comes pretty true from seed, but is best raised from stools, the St. Julien and the Damson, this last the worst. As is well known, the Plum stock tends to fruitfulness in the Peach or Nectarine, and in our moist climate is preferred to the Almond of the wild Peach stock. It is, however, not so certain that in our Peach-houses, where artificial conditions necessarily prevail, that the Plum stock is as well suited as those stocks that are found to suit the plants in countries with climatic conditions, closely resembling those we maintain in our forcing-houses. And may not this, under certain conditions of soil and treatment, account for the untimely fall of wood and fruit-buds?

In the Plum we have a plant that possesses abundance of small roots, but these naturally lie in the greater number near to the surface, and good fruit-growers endeavour to have them there, and transplant or lift the trees at intervals of three or four years with that intent. So far so good, but the bringing

up of the roots of the Plum near to the surface of the ground where any drought prolonged for only a few weeks might act injuriously on the roots, and, consequently, on the stepchild drawing its nourishment from them, seems to be a practice that is not without some element of danger. It is a question whether the Peach or Almond would not, at least for trees in forcing-houses, and very warm porous soils in the open air, be the more suitable stocks to make use of. Both of them are found to succeed better as stocks for the Peach in France, where the hard-shelled sweet Almond, *Amandier doux à coque dure*, is preferred; the warmer parts of the Peach-belt in the United States of North America, Austria, Hungary, and south-eastern Europe generally, all of them countries in which the Peach is grown as an orchard tree.

The roots of the Peach and Almond are few in comparison with the Plum, and have a natural tendency to stretch downwards in search of moisture, hence their greater adaptability for countries with warm dry summer climates. In all of these the trees are cropped to their utmost capacity whilst they are young and vigorous, and last but a few years, say, ten to twelve; in the United States of America, not so long, on account of that much-dreaded disease, the yellows. At about that age the fruit crop becomes smaller, and the trees are cleared out, young plantations taking their place. Here, there are often qualms about destroying old trees, and in spite of the obvious incurability of the weakness of old age, trees are kept alive along after they should have found a place on the rubbish-heap. In fact, the retention of old and worthless fruit trees amounts, in some gardens, to a superstition, and if any one who reads this note has doubts of its correctness, let him visit the old gardens in his neighbourhood, and judge for himself.

The roots of the Peach and Almond must not have their natural downward tendency curtailed by cutting off tap roots, as is practised with the Plum stock, or its capacity to support a tree in the comparatively dry soil and dry air of the Peach-house would be reduced below that of the surface-rooting Plum, and ill-health follows; nor should it be done when these stocks are used in dry soil and sites out-of-doors, for the same reason. At the most, the tap roots whilst at a pliable age, may be bent as much in a horizontal direction as may be without breaking them; but this will not effect much, and the points of these roots—of which there are always several on a tree, will again soon take a downward direction. This fact will determine the depth of the Peach border. It should not be less than 3 feet where the trees stand; although there is no reason that it should be so deep over the whole area, and it may slope off to 18 inches at the sides or front, or the top may be nearly level, and the bottom of the border slope downwards towards the wall, or that parts where the trees stand, and be provided with a drain at that side to carry off the water. In fact, in making borders for Peaches and Vines, there are good reasons for elevating the artificially made border-bottom at the point farthest from the plants, and placing the drains where the soil is the deepest, not where it is, in most cases, shallowest. By so doing, the extending roots, instead of ever tending downwards away from warmth and air would be kept at a short distance from the top of the border, a part in which gardeners mostly like to find them.—*Gardeners' Chronicle*.

FIBRES: RAMIE MACHINE TRIALS AT NEW ORLEANS.

The latest information connected with the extraction of fibre from Ramie (*Boehmeria nivea*, Hk. and *Boehmeria nivea*, var. *tenacissima*, Gaud.) is contained in a Report on the recent trials of Ramie decorticating machines held under the authority of the U.S. Department of Agriculture at New Orleans. The trials took place on the 30th September last, and

the Report of the Board of Experts, acting as jury, has just been published.*

The results of the New Orleans trials do not appear to carry us any nearer to the solution of the problem that has been so long under consideration in regard to the extraction of Ramie fibre. The machines presented do not appear to possess any advantages over those tried at Paris in 1888 and 1889, and fully discussed in the *Kew Bulletin*, 1888, p. 273, and 1889, p. 268,—while they are apparently inferior to the machines tried also at Paris under the auspices of the *Société des Agriculteurs de France* in September 1891.

The following extracts are taken from the United States Report:—

MACHINES ENTERED.

"The official trials of Ramie machines, under the auspices of the office of fibre investigations of the U.S. Department of Agriculture, set for the last week in September at Audubon Park, New Orleans, came off on the 30th of September, and included trials upon jute stalks as well as upon stalks of Ramie.

"Three machines were entered for trial as follows:—The Kauffman machine, by the Kauffman Fibre Company of New Orleans, La.; the Felix Fremerey Decorticator, by the Felix Fremerey Decorticator Company, of Galveston, Texas; the Fibre Designating machine (known as the J. J. Green machine) of the United States Fibre Company of Versailles, Ky.

"The *Kauffman machine*.—According to the entry of this machine it requires 15-horse power; it works upon green stalks stripped of leaves and upon dried stalks. Four attendants are required to run it; floor space occupied 6 by 14 feet. The machine is termed a decorticator for ramie, jute and hemp.

"The *Fremerey machine*.—In the entry of this machine about 5 horse power is stated. The machine is arranged to work upon green stalks, either stripped or with the leaves and upon dry stalks. It occupies a floor space of about 5 by 18 feet. The machine requires five attendants, three of whom may be boys.

"The *J. J. Green machine*.—Ten-horse power is named as the power required to drive this machine. The entry states that it works upon dried stalks (but it is also expected to work green stalks with or without leaves.) Five attendants are required for full capacity, three of whom may be boys; it occupies a floor space of 8 by 12 feet."

TRIALS OF GREEN STRIPPED RAMIE.

"The first trial was with the Kauffman machine, 500 pounds of green stripped stalks having been weighed out for the test. Of this amount 332 pounds of stalks were run through the machine in 42 minutes, when the machine clogged. The result in wet ribbons was 88 pounds, and 168 pounds of stalks remained unworked, owing to the inability of the machine to proceed further.

"Mr. Fremerey declined to enter this trial after 500 pounds of green stripped ramie stalks had been weighed out, claiming that the stalks were too uneven in size, the construction of his machine requiring medium stalks."

CONCLUSIONS.

In a review of the results of these trials, Mr. Charles Richard Dodge, special agent in charge of fibre investigations, report as follows:—

"While the figures for a day's work, based on the results of short running, are wholly misleading, it is interesting to note that the output of the Kauffman machine, during the 42 minutes of continuous work before it clogged, represents 4,743 pounds of green stalks in 10 hours of continuous action, or a little over 2 tons, with an output of 1,257 pounds of wet ribbons, equal to about 420 pounds of dry ribbons, which weight would be con-

siderable reduced after the loose hurds and woody matter remaining in the ribbons produced by this machine had been eliminated.

"In like manner, were the J. J. Green machine to run continuously for 10 hours, turning out ribbons at the rate of speed shown when in actual operation (that is, deducting the 67 minutes spent in cleaning and re-adjustment) the output would have shown a capacity of 4,821 pounds of stalks and 1,232 pounds of wet ribbons, equal to about 410 pounds of dry ribbons. But, as shewn, both machines were unable to finish the 500 pounds of stalks weighed out to each for the trial.

"The results of the new Orleans trials are satisfactory as far as they have demonstrated the status of the machines entered, and established an American record that gives a starting point for future comparison, as the results of other trials are made known. It is to be regretted, however, that a larger number of machines was not represented. In this report comparisons cannot be made with the best foreign machines, though I shall endeavour to cover the whole ground in a special report, Bulletin No. 5, Fibre investigations, to be issued at an early date."

The trials with Jute stems were very similar in their results to those noted in the case of Ramie stems. There was no conclusive evidence either way. The best results with Jute stalks as far as they went, were given by the Kauffman machine. This cleaned 100 pounds of stalks in 20 minutes, yielding 32 pounds of wet ribbons. The ribbons were described "as well designated with a very small percentage of woody waste. The fibre occasionally was somewhat broken."—*Kew Bulletin*.

CINCHONA.

LONDON, NOV. 3.

NOTES FROM OUR LONDON LETTER.

Meeting Mr. John Hamilton this week, and knowing him to be well-up in all that relates to cinchona, it occurred to me to question him as to the improved prospects reported for the bark. His reply was in substance:—"Really we seem here to have lost touch with the future of cinchona. I can really tell you nothing but what it may be believed Mr. John Ferguson is as well or better acquainted with than I can be. You could not have a better authority than that gentleman on all matters connected with planting products. Yes, it is true that a better demand has of late been developed in America for quinine. The reason for this is not known to me, but it is a fact that whereas we were exporting to that country a year or two back only three million lb. the amount now is up to about four million or so. The result of this has been to make prices here rise somewhat, and they seem to be firm and to promise a chance of expansion. You ask if quinine is locally manufactured in America. Yes, it is. There are, I think, two or three well-known manufacturing factories in the States and they derive their bark supply through the European markets. But London is no longer the chief centre of the trade. We have to watch the sales at Amsterdam and one or two other German centres. The quotations there now wholly rule prices here. You see the larger proportion of the bark supply now comes from Java. How is it, you ask, that that island has maintained the cultivation in opposition to India and Ceylon? The answer is very ready. It is simply a case of quality. Java sends us far richer bark than the average of Ceylon and Indian growth yield. I suppose this to be due to the soil of the island, for the rich Ledger tree flourishes there, and all the bark Java sends us almost is of that valuable kind. Do I think there is a chance of Ceylon being able to compete successfully with Java in the future? Well, I hardly like to give an opinion, but as Ceylon fails, except in certain localities and under

* The United States Department of Agriculture, Division of Statistics, New Series: Report No. 99, September, and October 1892, Washington Government Printing Office, pp. 347-354.

certain conditions to grow the Ledger tree, I fear she has but little chance of competing successfully. Still, if in the course of time the demand should extend beyond the capacities of Java to supply—and the available area there is now very short—or should inferior sorts obtain a freer market, the trees now standing in Ceylon might be made profitable, but I don't suppose its planters will ever care to plant fresh trees extensively, or that it would pay them if they did. No, I think Ceylon must be content with having made a good thing of the bark in the past. It undoubtedly helped its planters well over the bridge between coffee and tea. I think the soil of Java to be throughout far better than that of Ceylon. It always seems to me that it was a mistake of the British Government to give up Java and retain Ceylon. The former is very rapidly coming to the front with many cultivations, and its Government is doing all it can to foster these. I know several young men who are now going out to Java to plant coffee on the Ceylon plan, and there seems every reason to expect success for them." It is to be feared these views of Mr. Hamilton are somewhat opposed to the anticipations recently expressed by yourselves. He told me he had read your remarks, but that he could not fully endorse them for the reasons he gave me as stated above. It occurs to myself, in addition to Mr. Hamilton's reasons, that Java must have a great advantage in any competition with Ceylon owing to the absence of fluctuation in her currency value. With her guilders always maintained at 1s 8d, while your rupee intrinsically worth 20 per cent more, chopping and changing about from 1s 3d or so, she cannot fail to come to the front.

TEA SEED OIL.

Another expert that afforded me an interview this week was Mr. Christy. We resumed our former conversation on the subject of tea oil, but Mr. Christy was able to give me but little additional information to this matter. He remarked however:—"I do not see that, even if the oil could be used for any special application, its manufacture could be economically or beneficially carried out in Ceylon. In the first place it does not seem to me that the cake after the oil has been expressed could be made available. It certainly would not be suited as a cattle food. The only thing that could be done with it would be to return it to the soil as manure. Now in the expressing of most other oils, such as that obtained from cotton seed, copra, &c., the residual is almost as valuable as the oil. At all events it is in no case known to me a wasted product, but I cannot suggest any purpose to which tea-cake could be applied save that of manuring, and I doubt if it would be well suited even to that purpose. If tea seed oil were to command a high price this might not be a matter of such economic consequence. But, as I before told you, it does not secure this. It could never, in my opinion, compete with cotton seed oil, which can be and is applied to such a diversity of purposes. It can be so cheaply produced, too, that no comparison could be made between the price of it and that of oil expressed from tea. In short, no oil can compete with it either for wide application or for cheapness of production, and I should not counsel your planters to trouble themselves about trying experiments with tea oil."

A NEW FODDER PLANT.

On my asking Mr. Christy whether he had of late come across any new products facts as to which might interest Ceylon readers, he replied:—"There is one that I believe might well recommend itself to the consideration of all dwellers in Ceylon. This is the

Poligonum." (Query, if my spelling be quite correct.) "This is a most wonderful fodder plant, and I some time back promised Mr. Ferguson I would write him fully with reference to it, but time has not permitted of my fulfilling that promise. This plant is found in a natural state only in the island of Sagholian. Some nine years back I managed to obtain a few slices of the root, from which alone the plant can be propagated. These I planted in my Gardens at Sydenham, and now I have quite a fine bank of it. Every effort has been made by me to secure further plants. I sent agents throughout Germany with this object, but they could not find a single plant anywhere except solitary specimens in the different Botanic Gardens of that country and its special value seems to have been unrecognized there. The *Gardeners' Chronicle* has published several notices of this plant, and Mr. Ferguson will find full descriptions in his copies of that journal. I took an Indian tea planter down to my garden to see what I have grown of it, and he was so struck by its capabilities that he immediately ordered a Wardian case and has sent out in it a quantity of root pieces with which I supplied him from my own growth to plant along the sides of the water courses on his estate. It grows fast and freely, and seems to do well in this climate, having withstood all the severe frost we have had since it was first planted by me. It is, perhaps, one of the most valuable fodder plants known to us, and I should recommend your planters to follow the example of their brother-planters of India and grow it extensively on their estates." Perhaps you will be able to publish a full description of this plant from your numbers of the *Gardeners' Chronicle*. I do not feel sure if you have not already quoted them in the *Tropical Agriculturist*, but have had no time as yet to refer to the back numbers. You have, however, so often written as to the desirability of finding and growing new fodder plants, that we suspect this item among them has not altogether escaped your notice.

TEA-SEED OIL.

It appears that some of the Ceylon tea-planters are making an organized attempt to obtain a sale for their tea-seed in the London market. A parcel of seven bags of that article was offered at the drug-sales recently, but no one seemed to know what to do with it, and although the broker declared his belief that the drug was "a favourite medicine in China," the audience remained unmoved. Nevertheless, the tea-seed might have been worth purchasing for the sake of the bland oil which it contains to the extent of about 35 per cent. by weight, and which resembles olive oil in colour, and somewhat in taste. The seeds are about the size of a cherry-stone, sub-globular in shape, and of a deep-brown colour. The oil would be useful for burning or lubricating.—*Chemist and Druggist.*

SODIUM AS A PLANT FOOD.—In pure chemistry the properties of sodium and potassium are very closely related, but in the practical application of compounds containing these elements great differences are observed. However, some recent researches by A. Atterberg (*Egypt. Stat. Rec.*, iii., p. 534) show that in regard to the food of plants, sodium and potassium, though not capable of mutual substitution with equal advantage, possess some properties in common. In short, sodium compounds may be of considerable advantage where potassium is deficient. This observation has an important commercial consequence, since the large amount of sodium present in many of the standard manurial salts can now no longer be considered as useless.—*Gardeners' Chronicle.*

PROSPECTS OF CINCHONA CULTIVATION IN CEYLON.

Reference was recently made by us to the improved demand noticeable for quinine in America. Although the cause for this is not entirely demonstrable, there is no doubt that the increase exists, and there is reason to believe that it may yet extend. Under these circumstances it seemed reasonable to hope that prices in the European markets would rise to a point at which the export of cinchona bark from Ceylon might again become profitable. To judge from what Mr. John Hamilton of Messrs. S. Rucker & Co. recently mentioned in conversation with our London correspondent, it would, however, appear to be the case that some time yet must pass before it will be possible to state whether that expectation may be well founded or not. Mr. Hamilton agrees with us that Java now holds the key of the position and everything must depend upon the future course of cinchona cultivation in that island. The soil there appears to possess qualifications for the cultivation that are absent in the cases both of Ceylon and India. The bark Java sends home is almost entirely that of the *Ledgeriana* variety, and it contains a very materially greater proportion of quinine than does the cultivated product of Ceylon and India.

Still, it is admitted that the position of cinchona bark in the London market has sensibly strengthened. But with the increase of its export from Java, the controlling power of the London trade has become largely transferred to the great auction marts of Amsterdam and other leading continental centres. Hence home dealers look more to quotations at those places than to such as are derived from the auctions in Mincing Lane. Under all these conditions, Mr. Hamilton cannot express himself hopefully with regard to the future of cinchona cultivation in Ceylon. It is true he believes it to be the case that there remains but a narrow area in the great Dutch island upon which the extension of planting can proceed: but he is strongly of opinion that it must be a long time yet before the demand can rise to a point at which it will outstrip the capacity of Java to supply it. Nor does he seem to think that any proposal that our planters might again endeavor to extend their cultivation of the tree should be favourably received by them. Tea, in Mr. Hamilton's judgment, would suffer if cinchona trees encroached too much upon it, and he regards that cultivation as being too valuable to permit of any risk of injury being done to it by a revival of former efforts. And besides, while acknowledging that there is a promise of improved prices for the bark, he fears that neither Ceylon nor India are likely to reap much benefit unless their production of it can be raised to the high level of that of Java. The soil generally throughout that island is superior in most respects to that of Ceylon, and as regards the growth of cinchona it possesses very undoubted and very material advantage.

With these opinions before us, it becomes increasingly difficult to offer advice to our own planters with respect to their future dealings with the tree. Already, as we know, there has been a wide up-rooting of it over areas on which it was at one time dominant. There remain, however, a considerable number of trees scattered about our tea estates. The question now, as it appears to us, is not altogether whether the number of these should receive extension, but as to whether it may be worth

while to maintain it at its existing level. For years to come, probably, the key of the position which Mr. Hamilton asserts Java to hold must remain with it. Demand must outstrip her capacity for production before that of either India or Ceylon is likely to be largely called upon. Individual planters must decide on their future course for themselves. In certain localities it is possible cinchona may be cultivated in Ceylon of a quality that may rival in richness of extract the yield of the Javanese bark, and in such cases we should say it would be wise to plant judiciously when circumstances may admit of this being beneficially and economically done. But the future offers no prospect for this island such as was experienced when it first entered upon the cultivation. Cinchona is never again likely, we should say, to call for the attention of our planters as a possibly leading item of their business. Java has beaten us, and is likely from natural causes to always maintain the superiority now established for her.

THE DECLINE OF SULPHATE OF CINCHONIDINE

The *Oil Paint and Drug Reporter* calls attention to the decline in the use of sulphate of cinchonidine which only about ten years ago still figured extensively in every miscellaneous order for goods was accorded a favoured place among the staple articles and of which the commercial fluctuations were eagerly watched by the trade. Since 1882, when sulphate of cinchonidine of American manufacture was worth from 90c. to \$1 per oz. in New York, the value of the drug has declined to 3½c. per oz. Concurrently with this decline in value, the consumption of cinchonidine has diminished particularly within the last five years. Apart from the domestic article, of which the production and distribution are not definitely known, the supplies drawn from Europe have fallen off to the following extent:—'84, 381,885 oz.; '85, 478,747 oz.; '86, 449,414 oz.; '87, 570,162 oz.; '88, 609,576 oz.; '89, 171,251 oz.; '90, 106,829 oz.; '91, 156,229 oz.; and '92, 11,483 oz. —*Chemist and Druggist.*

INCREASE IN THE WEST-INDIAN ARROW-ROOT PRODUCTION.

The production of arrowroot in the West Indian Island of St. Vincent has lately increased at tremendous rate, the quantities exported from the island having been 15,458 barrels in '88, 16,732 in '89, 20,846 in '90, 17,540 in '91, and 23,433 barrels in '92. Of the '92 exports 17,008 barrels were shipped to the United Kingdom and 6,224 barrels to the United States. The advantage to the island of this extension of cultivation is shown by the fact that, whereas the average value of the arrowroot exports for the last three years was 29,152c., the shipments in 1892 alone were valued at 61,313c. The increase in the quantity produced was caused by a great advance in the price of the starch which had previously brought such low figures that its cultivation had almost become unprofitable. In his Official Report for 1892 Administrator Gouldsbury, with more enthusiasm than grammar, states that: "Arrowroot and cocoa are now the main chances of the colony. As the product of arrowroot is almost wholly limited to St. Vincent and Natal, and the product of Natal had almost disappeared nearly the very moment when the Jamaica Exhibition produced its effects on the exhibits of the colony of St. Vincent, it may be assumed that the St. Vincent arrowroot finds itself, all of a sudden in a position of commercial good luck, with the knowledge that arrowroot-production cannot be increased on the smallest scale inside of at least six months, and on a scale (for want of plants) likely to affect prices for a much longer time; so that there is a good early future for those who have arrowroot estates." —*Chemist and Druggist.*

THE COFFEE SITUATION.

The world requires an annual supply of 650,000 to 660,000 tons (11,050,000 to 11,220,000 bags) of coffee, under normal conditions. Brazil furnishes nearly 55 per cent. of the total exports. Central America, the United States of Colombia and Mexico are pushing coffee cultivation and more than offsetting the decreased yield in the East Indies.

From the above statements it will be seen that the situation is more perplexing than usual. There is no immediate danger of a lack of coffee with stocks in Europe large. The war in Brazil must be of short duration, so that exports of coffee are likely to be resumed soon. Consumption is threatened by financial troubles and unemployed labor. The prospective increase of supply from Central America and Mexico is an indefinite quantity. The safe course is conservative huying and light stocks. It is seldom that credits are as much of a factor as crops, but such is the present situation.—*American Grocer.*

PERAK AND PLANTERS.

The "Times of Ceylon" discussing an alleged discouragement of Ceylon planters in Perak, seeks to contend that Perak is much in the rear in regard to agriculture, and that its land is not open to planters in a spirit that encourages enterprise. Further, relating what is alleged to be an account of a personal application for land, the Ceylon newspaper contends that Perak should be religiously left alone. Putting aside the question of allowing the personalities of a disappointed planter to creep in what was intended to be a just criticism of the State of Perak, we regret that the Ceylon paper should have been led to believe what has been told. The article contains the allegation that Perak in agriculture is far behindhand as compared with Selangor. That is wholly inaccurate. There is more agriculture in Perak than in Selangor. In the Kamnung Estate, Perak possesses the finest and largest Liberian coffee estate in the Peninsula. Its control is under Mr. Hill, a planter of considerable experience, most of that experience being gained in Ceylon. In the Waterloo Estate, Perak possesses the only Arabian coffee estate in the Peninsula, owned by Sir G. Elphinstone, one of Ceylon's planters. There are very many sugar estates in Perak, notably the estate owned and operated by the Shanghai Compsny. What is Perak doing in tea, the staple product of the "spicy isle"? Here in Singapore the tea from Perak is found on the market and is readily saleable, and has the reputation of flavour equalling that grown in Ceylon. Of padi, one district of Perak alone exported last year no less than two and a half millions of gantangs. Especially for Malay cultivation, Perak is unquestionably ahead of every other Native State. The road facilities in Perak are greater also than in any other State,—a fact, no doubt due to greater resources derived from tin. It is news to learn that "the Selangor Railway is being extended to meet the wants of planters"; and also "that Selangor is putting on extra steamers to meet the requirements of planters." Perak is extending her railway, and also her road construction; but, for years, Perak has been building roads. A cart road was specially constructed to give access to the planting hill country, but it was only used by one estate. The hills there were not taken up for planting. It is absurd in the Ceylon critic to think, much more to commit to black and white, that the lessee of the Waterloo Estate can exclude any from selecting on the eastern face of the Hijau range.

The Resident of Perak has amply shown in his articles "about Perak" that he has always given and does now give his support, and all proper encouragement, to those who intended to embark upon legitimate planting enterprise. The Ceylon critic talks of delay of survey. There is an answer to that point. It is only necessary to select the land, and demarcate it, to at once proceed with the work of planting. It is not true to say that a selector must wait for the survey; and, we believe, we are correct

when we say that scarcely any planter either in Perak or Selangor has waited for survey before proceeding with the work of planting.

Before concluding it may be useful to note a little incident that goes to show what some "planters" expect. One party—and it is significant that the party came from Ceylon—openly admitted conversationally that they desired a very large block of jungle country with valuable timber which they would fell and sell. They would commit themselves to nothing more. They were informed that Perak did not urgently need woodcutters and sawyers, but that bona-fide planting the Government would do anything in reason to encourage. The land was not taken up. Perak, the foremost of the Malayan Native States, affords truly a field for agricultural development. Undoubtedly, Perak is at the present time, essentially a tin-producing country; tin has made Perak what it is. Tin-mining has paved the way for Agriculture. Tin has built the roads and railways. Planting has been rendered possible by mining. Perak possesses a wealth of land admirably suited to agriculture; and planters who are not concession-mongers will find every help in Perak.—*Straits Times.*

NILGIRI TEA REPORT.

Our Coonoor District correspondent writes:—

Out-turn is above average, quality of all tea made after September is likely to be very satisfactory.

Flush is coming out strong and healthy with fine bud. Very tippy and flavory.

Weather.—Very heavy rain lately, nicely distributed on some parts, too heavy on most.

Labour supply very indifferent. Trouble with defaulting contractors on the increase.

Remarks.—Everywhere increased interest in tea is shown. Openings are now carefully made with good jate. Drainage needs closer and better attention.—*South of India Observer*, Nov. 18.

INDIAN PATENTS.

CALCUTTA, 8TH NOVEMBER, 1893.

Applications in respect of the undermentioned inventions have been filed:—

No. 313 of 1893.—William Bull, Civil Engineer, at present residing in Calcutta, for an improved method of working continuous kilns for burning bricks and tiles by means of a single moveable chimney.

No. 314 of 1893.—James Alexander Crawford, Certificated Engineer, First Class, residing at Kalighat, South Sylhet, for pressing tea into boxes, and to be called "Crawford's Patent Tea Press."

No. 197 of 1893.—James Cockle Coxe, a Sub-Engineer in the Public Works Department, at present on furlough, residing at No. 6, Comedian Bagan Lane, Kidderpore, in the suburbs of Calcutta, Bengal, for an improved self-levelling "waterstone" and mixture to keep away ants of all kinds from almirahs, tables, boxes, &c., to be called "J. C. Coxe's patent antifer." (Filed 27th October 1893.)—*Indian Engineer.*

TEA-PLANTING EXTENSION IN CEYLON.

We learn that Mr. E. M. Leaf of the Dikoya district (Ceylon) has taken up some 800 acres of land for tea in the Balangoda district. Part of it was under coffee in the very early days, but has for a long time now been chena. Two other planting gentlemen—Messrs. Bailey and Worship—are going to open a tea plantation, in the same district; and all this is apart from what the Muir-Buchanan Syndicate is expected to do.

HIGH-CLASS NILGIRI TEA, a Southern contemporary says that the estate of Nonsuch owned by Mr. F. Gage, and situated on the Droog some nine miles from Coonoor, has yielded some splendid specimens of first class tea. A break of 99 packages fetched the fine average of 1s 3½d in the London market.—*Indian Planters' Gazette.*

CACAO ROOT DISEASE IN THE WEST INDIES.

(Continued from page 351.)

Nor does this root fungus confine itself to any one species or order of plants; but affects alike the mango, the orange, the coffee or the cacao in short almost anything from a sugarcane to a breadfruit, no diversity being apparently wide enough in the structure of the plant or root to deny to it a congenial nursery and home. "It is found," says the Report "in all its glory at the 'Latent' Estate. It has strayed into the 'Malgretout' Estate where the Liberian Coffee seems to be specially selected."

"At Currey's Rest, cacao trees have been killed, besides coffee, bananas and two fine orange trees."

Thus far we have tangible facts resting on the evidence of one's observation. But now we come to a study of the approximate causes; and in doing so, we are naturally obliged to step outside the limits of observation and patent facts; into the domain of speculation. How far the conclusions arrived at are justifiable, remains to be proved later on, that is to say, when a sufficient length of time shall have elapsed after the removal of the suspected causes, to be able to say with certainty that the disease has disappeared with the removal of these alleged causes. In the cases that came under his observation, Mr. Barber has been led to conclude that the disease is primarily and principally traceable to the presence of decaying stumps left on the ground, combined with the "slovenly planting of more trees than the ground can contain;" and the remedy he has prescribed in the cases under consideration is to "burn every stump and as much of the affected roots as possible."

In Jamaica Mr. Barber noticed a similar fungus called locally "Saltpetre" in the cacao and coffee. Mr. Fawcett, the Director of the Botanic Department, forwarded the following prescription:—

"Try Ferrous Sulphate (green vitriol) for your root mycelium. It is an excellent manure used at the rate of $\frac{1}{2}$ cwt. to the acre and kills fungi. In wet weather it is sufficient to sprinkle it on the ground, and the rain will dissolve it and carry it down to the root."

Mr. Lockhart, who communicated with Mr. Barber, and appears to have given him valuable information, describes another fungus as attacking not fields or patches but isolated cacao trees at Mitcham. It is said to be troublesome but not fatal in all cases. It is a fungus found not in the soil or root but above ground, and so this for distinction is called a "brauch fungus."

The following is a full and detailed description of the same:—

"It is peculiar and well marked; and appears to travel up the branches, making its way principally in the thick bast layers. On examining a diseased branch the following regions may be looked for, working downwards:—

(1) Healthy stem-surface, outer bark normal, thin and delicate.

(2) A delicate film of external, closely adpressed glistening hyphae resembling the track of a snail.

(3) Flesh-coloured bodies (spore bodies) principally at the angles of the lenticels; gum is frequently found exuding among these bodies from rents in the bark—also at (1) and (2).

(4) The surface becomes covered with a velvety, flesh-coloured layer with small dark letter-like erosions.

(5) The bark becomes brown, decayed: bast rotten—the bast is largely cracked and the decay frequently extends some way into the wood.

(6) In many cases branches seem to recover. A callus is formed by the cambium and grows around as if attempting to cover up the injured parts. A long cleft in healed branches frequently indicates the junction of the two callus-masses over a dead place; and a section of the stem at such parts shows a large dead tract underneath the callus, buried by subsequent growth."

It is recommended in this disease—which is not so fatal as the root fungus inasmuch as the trees

often recover from the attack—to paint the infected branches with some fungus-destroying compound; such as weak carbolic acid or carbolic tar, carboic sublimate, and green vitriol. This disease has not yet been traced to any known cause, as even isolated trees have succumbed to it.

To turn our attention to the more fatal root disease whose presence has been traced to decaying stumps and close planting: All we in Ceylon can say is that we have both causes present in our cacao plantations. In the new forest or jungle-clearings there is always the stump left in the ground after the burn—and in the older plantations, where a superabundance of the shade growth is cut down, trunk and branch and not merely thinned out, then the stump is in many instances left in the soil especially when too large for convenient eradication, so that there is one of the factors or external agents present; and the other of the two mentioned is said to be close planting: by which we should understand that there is a crowding of roots within a limited area of soil.

It need not for a moment be supposed that the special root of the cacao is the only one likely to contribute towards the outbreak of the root disease; for it has appeared in every sort of root from the lowly sugarcane and banana to the higher orders of bread-fruit and mango. It is therefore not the slovenly planting of cacao alone that contributes to the mischief. The general crowding of roots has to be equally guarded against.

Our Ceylon planters, therefore, who are adventuring on this product so largely at present, whether they be men of limited experience or of great experience in general matters of planting, will no doubt be careful not to rest contented in the security of having put their plants out twelve or fourteen feet apart: for in every plantation in the island the tendency is, under the assurance that shade and shelter are absolutely necessary for the cacao, to plant all manner of choice shade trees as quickly as possible. And it may thus come about some day that in some admirable damp situation for the cacao where the soil is rich, the land as flat as a tennis court, with too much shade and insufficient drainage from the nature of the land, and an overcrowding of roots in general, a root fungus may be started as a pest in Ceylon. It will, therefore, be none too soon to warn the public of the danger that may be run by the cacao planter in any part of the tropics.

And the failure of the crops in Dominica in 1892 and 1893, which called for the Report under consideration may well be offered as an illustration and a warning to all.

TEA DRINKING AND MORALS IN WALES.

The *Daily Chronicle* in reviewing "Glimpses of Welsh Life and Character" by Marie Trevelyan, has the following:—

Again, as in other lands, so also in Wales, there was no great gulf fixed between the upper and lower classes a hundred years ago. There was a much freer social commingling in those good old times than in these degenerate modern days. "It was nothing unusual to see the wealthy landlord and poor tenant riding abreast to market, and sitting down at the same market ordinary." "Money makes the mare to go," said a poor Welshman to a rich neighbour. "Aye, aye, boy! but its manners make the man," was the reply. No longer do servants remain a life-time with their employers, leaving only to be buried, or, it may be, to be married; and it is only in the smaller farmhouses that they sit at the same table with the master and mistress. The analytical spirit of the newer age has established discriminations. The great cause of this notable alteration in social life Miss Trevelyan has discovered from an old diarist. It is the "exorbitant practice of tea-drinking which has corrupted the morals of people of every rank." Lamentable declension from the days of the potency of metheglin! Especially among the hill women, among the most intensely Welsh of Welshmen, the colliers and miners, is this ruinous devotion to immoderate

tea-drinking established. Hence is it that "their complexions fade early, and leave a sallow and muddy colour upon the skin. Tea is drunk for breakfast, for dinner, at tea-time, for supper, and again before going to bed. That alone would be five times a day; but, as the tea-pot is always on the hob, there is no end to the potatoes." Let the theory of the diarist stand for whatever it may be worth. The tea-drinking has not deteriorated the patriotism, industry, and pluck that the hill-men received as a heritage from their forebears. Nor is the new altogether bad.

CITRONELLA OIL ADULTERATION.

From the Semi-Annual (Drug) Report of Messrs. Schimmel & Co. we quote as follows:—No alteration has taken place in the value of this important article since our last Report. On the other hand adulteration is being pushed to such extremities in Ceylon that it has become impossible for the middleman to guarantee the supply of pure oil. In order to strike at the root of this evil we have thought it expedient to place ourselves in direct understanding with the producers and shippers of citronella oil in Ceylon, and have forwarded to them a circular of which the following is a re-print:—"The sophistication of citronella oil has extended in Ceylon during recent years in such a remarkable manner, that we feel compelled to call the attention of the firms engaged in the export and sale of this oil to this grave deterioration and to indicate the means of confronting this mischief which threatens to entirely spoil the reputation of the article. By long experience we have stated that the adulteration is effected by admixture of either a fatty oil (probably coconut oil) or petroleum (kerosene oil). In both cases it can easily be detected by the following test, which, by its extreme simplicity, is practicable in buying the oil from the native distillers and therefore, strongly recommended by us. One part of citronella oil should yield a clear solution when well shaken with ten parts of spirit of 80 per cent. In applying the test a graduated measure is used, which we think may be obtained from any Ceylon chemist. A certain quantity of the oil to be examined is put into the measure and 10 times as much spirit of 80 per cent (sp. gr. 0.8645 at 15°C.), also procurable from any chemist, is added. Pure oil of citronella yields a clear or feebly opalescent solution not separating out after standing. If the oil should be adulterated by the addition of fatty oil or kerosene oil, the mixture is quite turbid when shaken and drops of the adulterant will separate out from the spirit after standing for about 12 hours. Fatty oils will of course sink on the bottom of the vessel, while kerosene oil will float on the surface of the solution. All oils not standing the above test are decidedly sophisticated and should be rejected as not being marketable. Our method of examination is so absolutely reliable and proved by our practical experience, that it will be unnecessary to require a certain specific gravity, the determination of which, on the spot, is often attended with difficulties. We are convinced that those Ceylon firms who will abandon the objectionable system of selling the oil in their contracts under the meaningless term: "Fair average quality of the season"; but apply in their reports, offers and contracts the words: "standing Schimmel & Co.'s test" will increase their sales and profits in the same way, as the Hongkong firms have done, since our well-known re-organisation of the trade in cassia oil, a product now entirely saved from adulteration by our energetic interference and examined all over China by the test published as the result of our investigations. We, therefore, request all firms interested in the citronella oil trade to adopt our system of examination and shall be glad to publish their names in our next semi-annual Report. Moreover we shall be pleased to supply them with the described graduated measures, in case they should not be obtainable in Ceylon." We have no doubt that the favourable effect of this step will soon begin to show itself in a practical manner. With regard to the original packages we have experienced fresh disappointments. The small drums lately introduced,

and containing about 97 lb. of oil, have proved altogether unfit for use. In the first place the oil, upon arrival, is mostly of a deep-brown colour owing to oxidation, and, secondly, the exterior coating red oil-colour often comes into contact with the contents of the drum on account of the existence of leaking places, the citronella oil being thereby contaminated. After having tried all imaginable modes of packing with negative results, we have come to the decision to give up our transit-stocks and ship citronella oil only, re-packed either in demijohns or in tins, according to the wish of the buyer and the distance of the place of consignment. Citronella oil is exhibited at Chicago by the firms of Clark, Spence & Co. and Delmege, Reid & Co., both of Galle, Ceylon.

TEA AND SCANDAL.

I have just come across at the British Museum a manuscript entitled "The Qualities and the Operations of the Herb called Tea or choo," by Robt. Hooke, which I thought worthy to head my letter to you this week. It has, according to the description, (being translated out of the China language) these following virtues:—1. It purifies the blood that which is grosse & heavy. 2. It vanquisheth heavy dreams. 3. It easeth the brain of heavy damps. 4. Easeth & cureth giddiness & paines in the heade. 5. Prevents the dropsie. 6. Drieth moist humours in the head. 7. Consumes rawnesse. 8. Opens obstructions. 9. Clears the sight. 10. Cleanseth & purifieth a dust humours & a hot liver. 11. Purifieth defects of the bladder & kidneys. 12. Vanquisheth superfluous sleep. 13. Drives a way dizziness makes one nimble & valient. 14. Encourageth the heart & drives away feare. 15. Drives away all paines of the collick which proceed from wind. 16. Strengthneth the inward parts & prevents consumptions. 17. Strengthens the memory. 18. Sharpens the witt and quickens the understanding. 19. Purgeth safely the gaul. 20. Strengthens the use of due due benevolence.

(Transcribed from a paper of Thos. Pouey, Esq. October 20, 1656.)

Here are some more Tea Names & Items to add to the list:—Domvora, Matagsla, Venoya, Lindoo Valley, Oopack, Packoo, & Oopong. "Pure Ceylon Tea, Ceylonia, imported direct from the plantations" (which). "Tea 1/10. This is not the finest tea the world produces, but it cannot be beaten at the price."

The following proverbial sayings concerning tea contain good advice:—"Another pot" try the teapot. 'Less in the pewter pot, & more in the iron pot.' 'spend your evening at the sign of "the tea kettle."

From tea we naturally pass to taste, so I copy this from Everybody's Scrap-book of Curious Facts:—"From some experiments made at the University of Kansas, it appears that the average person can taste the better of quinine when one part is dissolved in 152,000 parts of water. Salt was detected in water when one part to 640 of the liquid was used. Sugar could be tasted in 225 parts of water, & common soda in 48. In nearly all cases women could detect a smaller quantity than men." A. M. FERGUSON.

JAFFA ORANGES.

The British Consul at Jerusalem has recently sent to the Foreign Office a translation of a report by an engineer of the Turkish Government on a scheme for irrigating the plains and orange gardens of Jaffa, in which, incidentally, some interesting information is given in regard to the famous Jaffa oranges. The town, it is said, owes its importance to its climate, which is extremely favourable for orange growing. In consequence, the port is surrounded on the side by orange groves, covering an area of about 1,780 acres. Jaffa oranges, on account of their excellent flavour, have of late years acquired a world-wide reputation, and while some 18 years ago they were known only at Beyrout, Alexandria and Constantinople, enormous quantities are now exported to Europe, America, and even to India, and

the cultivation has constantly increased to a very considerable extent. A special feature of Jaffa oranges is that they will keep from 30 to 40 days, and, if properly packed, for two and even three months. New orange groves are continually being laid out, and the total number is now about 400, against 200, 15 years ago. This, again, has affected the population of Jaffa, which now contains 42,000 inhabitants, against 15,000 inhabitants 12 years ago. The exports for the last few years have averaged 36,000 boxes per annum, and owing chiefly to this trade Jaffa ranks next to Beyrout in importance among Syrian coast towns. Orange growing in Syria is conducted exclusively by natives. Each orange garden contains about 2,000 square feet of planted area, equal to about 1,300 trees to 2½ acres. The trees begin to bear the fourth year after planting, but it is estimated that it takes seven and sometimes eight years before an orange orchard yields a remunerative crop. During all this time, and even afterwards, the orchards have to be watered continually, and this irrigation is the most difficult and laborious part of the work, inasmuch as the water has to be drawn by means of primitive water-wheels from wells dug in the gardens 90ft. and even 100ft. deep. Pumping by horse-power has been tried and in some rare cases steam, but both have failed to give satisfaction. On the Jewish Alliance farm an artesian well has been tried, but had to be abandoned after three years spent in fruitless endeavours to strike water, although a depth of 700ft. had been reached and £2,400 had been spent in the attempt. The wells are circular, 20ft. to 26ft in diameter, and have to be sunk in the sandy soil down to the rocky stratum before water can be found. That part of the wells which goes through the sand has to be faced with masonry during the process of sinking. This watering begins on May 1 and is carried on until November 1. The cost of irrigation alone represents from 45 to 47 per cent of the first year's outlay, and during the second year it forms from 40 to 42 per cent of the working expenses. An improved and cheaper system of irrigation is therefore of paramount importance, and the need of it has been much felt for more than 10 years past, as it would tend to the extensive and fertile plains round Jaffa becoming in a short space of time extensive orange groves, would cheapen the production, and would enable the growers and exporters to compete with the oranges of other countries in the European markets. A scheme for utilizing the waters of the river Audja, which flows into the sea a few miles to the north of Jaffa and for which a concession has been granted by the Porte, is then described in detail.—*London Times*.

BRITISH NORTH BORNEO: LATEST NEWS.

PLANTING AND OTHERWISE.

GOLD MINING.—It speaks well for the prospects that with an unsatisfactory rate of labour, the men make dollars 1½, 2½, 3 and in some cases 4 per diem. The unsatisfactory rate arises from the fact that the men at work digging are tobacco estate labourers who have completed their contracts, and have been hired in small parties by various Chinese Tawkeys in Silam and Labadan who find them in food, tobacco and opium, and in return take over the gold they manage to secure. What is wanted to properly develop and follow up the recent gold discoveries is an influx of Chinese skilled miners to the country.

MASONRY is taking root in Borneo, for we read of a successful "At Homes", &c., given by the Sandakan Lodge.

SARAWAK AND BRITISH NORTH BORNEO.—There is no truth, says the *Borneo Herald*, in the rumour that the authorities of the latter territory have been in negotiation with Rajah Brooke. If the territory ever changes hands we feel convinced that the Imperial Government and none other will be established in North Borneo.

GROUND NUTS.—The ground nut is little known in England, but in all other parts of the world it has in one farm or another an immense sale: in the United States there are some thirty thousand acres under cultivation with it, in Senegal 100,000, while in China it is chiefly used for cooking purposes, and the production is immense: Marseilles imports about 100,000 tons a year half of which without doubt makes its appearance as olive oil, and the residue is pressed into cake of which some 60,000 tons were made in Marseilles alone in 1886. The Peanut sale farm in the Chicago exhibition is an item of no inconsiderable importance. Ground nuts are a four months crop, so that it would in good ground, or with manure be nearly possible to get three crops a year. The price of the oil has risen in China, and as there will also be a good market in San Francisco when freights across the Pacific are cheap the cultivation promises to become of importance to North Borneo in the future. The latest quotation in Marseilles shows a return of about 3½ dollars per picul to the cultivator. The amount of land suitable for ground nuts in North Borneo is indefinite.

SAGO.—The cultivation of the SAGO PALM on the river of the West Coast has always been an important industry, while on the East Coast the valleys of the rivers Kinibatangan, Labuk, Segat, Segama, and others offer the greatest facilities for its growth, if only there were a sufficient population, while conversely its cultivation and manufacture hold out the promise of remunerative occupation to a numerous population. The demand for sago has steadily increased. Last year's exports from Singapore bulked over 100,000 tons. In 1887 they were under 60,000, while the price of sago flour which for the years 1884 to 1888 averaged somewhere about 2 dollars per picul, is now nearly 2.50 and as the demand for it for adulterating, starch making and other purposes increases, the price gives every promise of remaining unchanged, if not rising for years to come.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, Nov. 2.

CINCHONA.—The fortnightly auctions, which fell on Tuesday last, were again very limited in extent, only five brokers offering barks, their catalogues totalling up to—

	226	638	53
	1,047	917	
Ceylon cinchona	252 of which	226 were sold	
East Indian cinchona	662	638	
American bark	133	53	

There was a fairly steady demand throughout the auctions, one or two parcels of bark which were bought in at sale finding buyers immediately afterwards. The unit remains unaltered at 3½ per lb.

The following were the chief buyers:—

	Lb.
Agents for the Mannheim and Amsterdam works	59,378
Messrs. Howards & Sons	39,450
Agents for the Auerbach works	21,319
Agents for the Frankfort o/M and Stuttgart works	20,220
Agents for the Paris factory	9,145
Agents for the Brunswick works	8,257
Mr. Thos. Whiffen	7,120
Sundry druggists	47,954

Total quantity of bark sold	212,933
Bought in or withdrawn	29,520

Total quantity of bark offered ... 242,453

The following are the prices paid for sound bark:—

CYLON CINCHONA.—Original—Red varieties: Ordinary dull to good bright quilly chips, 1d to 2½d per lb.; dull shavings 1½d; ordinary dull root 1½d to 1¾d per lb. Grey varieties: Dull shavings 2½d per lb.; dusty yellow chips 3½d per lb. Fair hybrid chips 1d to 1½d per lb.

CINNAMON continues to sell well; business being reported in Ceylon quill, usual assortment, October-November shipment at 6½d per lb. c.i.f. terms.

VANILLA.—It is pointed out that more than three-fourths (73½ per cent of the 656 ties of new crop beans offered at last Thursday's public sales consisted of "short lengths"—i.e., pods under 6 inches in length—

while 15 per cent measured from 6 to 7, and only 2½ per cent from 7 to 7½ inches. As a rule, the percentage proportion of short pods in a large sale such as that under notice is much smaller, and it is argued that, if last Thursday's assortment is fairly representative of the season's crop of Seychelles vanilla, long pods are likely to advance in price, while short ones may decline still further than they did on October 26th, when they fell from 6d to 1s 6d per lb. in value.

THE NEW DIMBULA COMPANY, LIMITED.

The following is the report which was laid before the meeting of the shareholders of this Company on the 25th ultimo.

In presenting their eighth annual report, the directors are glad to be in a position to recommend a further reduction of the amount due on account of the cumulative dividends on the "B" shares. The estate suffered somewhat from the exceptionally cold weather of the past season, with the result that the yield of tea was less than the estimate. Some considerable profit has, however, been secured from the coffee still remaining, but the directors cannot hope for much further yield from this product. The accounts now presented show a surplus of £10,752 6s 11d after crediting Tea Extension Fund with £1,500 and writing off a portion of the "Factory and Machinery Account." The directors propose a dividend at the usual rate of 8 per cent per annum on the "A" Shares for the year ended 30th June last, one-half of which was paid in March last; the directors also propose a further payment in reduction of the cumulative dividend on the "B" Shares of 14 per cent. Very satisfactory reports have been received of the property, and of the state of the Factory and Machinery. The general management in Ceylon continues to give every satisfaction, and has been ably supplemented by the local staff, to whom the directors recognise the justice of awarding a bonus on their salaries.—By order of the Board, A. CRABBE, Secy., 52, Graecchurch Street, London, E. C.

THE NEW DIMBULA COMPANY.—London, Oct. 27.—

The eighth annual meeting of the shareholders of the New Dimbula Company, Limited, was held at their offices in Graecchurch Street on the 25th inst., when the Director's report, which I enclose, was taken into consideration. So brief is this document that some may have considered it afforded but little opportunity for criticism; two of the shareholders, however, both formerly Ceylon men, viz., J. Anderson, once of the Oriental Bank, and J. K. Morrison, a former inspector of the same institution, did not hold this opinion and "wanted to know" on several points. They regarded the report as far too meagre and pressed for information which, in their opinion, should have been found in it.

Amongst the shareholders connected with your Island in addition to the above-mentioned were Sir A. Birch, and Messrs. H. Bois and A. Y. Adams, known for his daring night ride to Trincomalee through the Matalle rables in 1848, whither he went with orders for troops to be pushed up by forced marches.

The Secretary, Mr. A. CRABBE, having read the notice convening the meeting, and the previous minutes, the CHAIRMAN proceeded to offer some remarks on the statement of accounts and balance sheet, which he presumed would be taken as read. The season in the past year had been unfavourable for crops, hence the lessened returns shown on the credit side of the accounts; there was, however, every reason to look for better results in the current season. Sums would no longer appear against the tea extension account, as it was not deemed advisable to plant up any further extent of land of which they had still a considerable acreage. He would move that the accounts and report as laid on the table be adopted.—Sir ARTHUR BIRCH having seconded the resolution, the Chairman said that before putting it to the vote he would wish to know if any shareholders desired information on any matter connected with the Company's operations.

Mr. J. ANDERSON thought the Directors might have offered the shareholders a good deal more information than was to be found in their Report.

It was usual in such documents to enter into some little detail as to the acreage of tea in bearing, the ages of the different portions of the Company's property, estimates of tea and coffee crops for the past and present season, the cost of the tea, &c., but none of these details were forthcoming.

Mr. J. K. MORRISON wished in the first place to remark on what he regarded as unusual in reference to the Companies' balance sheets; the document submitted bore no signature whatever. It would have been satisfactory had the report stated the cost of their tea on the spot, which had not been done; it was a question also whether the local charges were not rather heavy.

The CHAIRMAN remarked in reply that they had not thought it necessary to cumber their report with more details than were absolutely necessary; at the same time he had much pleasure in affording all the information in his power on the points indicated. With regard to estimates and output of crop; the yield had been adversely affected by unfavourable weather, as to cost of their tea it had stood them in 4'98d. i.e., not quite 5d, whilst exchange had ruled at 15½d. In the previous year their tea had cost them 4'88d with an exchange of 16½d; the price realised for their last crop had been 4d per lb. less than in the previous year. It was not an easy matter to state the precise acreage now under tea seeing that the coffee which grew amongst it was gradually dying out, and before long would have disappeared altogether. Making a rough statement, it might be assured that they had about 1,640 acres of tea in bearing, and 290 acres containing tea and coffee. As for cinchona that was a product which was rapidly becoming a thing of the past. The directors now proposed to declare a dividend of 8 per cent. on the "A" shares, and 14 per cent. on the "B" shares, made up as follows:—4 per cent. on the balance of 1890 accounts, 8 per cent. on the balance of 1890 accounts, and 2 per cent. on the 1891 accounts.

The report was then declared adopted, the officers re-appointed, and a vote of thanks carried to the Ceylon staff, and the Directors, who, as a shareholder remarked, have had a very low scale of fees, whatever may be thought of the Ceylon charges.

INSECTS ON FRUIT TREES.

For the benefit of those of our readers who may be unacquainted with the means of destroying insects on fruit trees at the present season, we publish the following excerpt from a recent leaflet issued by the Board of Agriculture:—

Upon examination of fruit trees, and especially Apple and Damson trees, it will be seen that many caterpillars are at work eating the forming fruit and the leaves.

The caterpillars at first are greyish, and so small as to escape notice unless attention is specially directed to them, but they can be found in alarming numbers in many orchards and fruit plantations, and it is most important that steps should be taken at once to check their progress.

In their later stages the caterpillars are light-green, and nearly three-quarters of an inch long.

First.—It should be noted that syringing the trees infested with caterpillars has proved advantageous in many places in previous seasons; it has been more particularly useful in respect of Plum, Damson, and small Apple trees. The large old Apple trees are beyond the reach of ordinary garden engines used for this purpose, and it is only in hop-growing districts where hop-washing machines are generally used that the systematic syringing of large standard trees has been adopted. These machines can be moved about easily enough in orchards. In plantations, with fruit bushes under the standards, it is more difficult to move them about, and to get the supplies of liquid brought through the thick undergrowth.

The mixtures to be employed for syringing fruit trees are:—

1st. The extract of 10 lb. of Quassia, obtained by boiling Quassia in water, to 100 gallons of water and 7 lb. of soft-soap.

2nd. The extract of 5 lb. of Quassia, to 100 gallons of water, with 6 lb. of soft-soap and 4 pints of paraffin, well stirred.

3rd. The extract of 5 lb. of Quassia, to 100 gallons of water, with 6 lb. of soft-soap and 4 pints of Calvert's carbolic acid, No. 5.

4th. 8 lb. of soft-soap and 2 lb. of finely-ground Hellebore, and a quart of paraffin, boiled and well stirred together. This is sufficient for 100 gallons of water.

The soft-soap is dissolved in a tub with hot water; the Quassia chips are boiled in water, and put into another tub. Where paraffin is used, it should be well stirred up with boiling soap and water before it is mixed with the cold water. Water-carts, ordinary barrels, or wine casks set upon frames with wheels, should be brought full of water to where the materials are being prepared, either at the farm buildings, or in an extemporised shed with a copper in it, and the requisite amount of dissolved soap and other ingredients added. The Eclair, and other similar hand machines, can be used for small Apple trees, Plum and Damson trees, and for Filbert and Cobnut trees, which are also badly infested.

It is important that syringing should be done at once, as, to be effective, it must be commenced early. Directly there are signs of infestation, the process should be begun. As the hatching out of caterpillars is not simultaneous, but is extended over some days, the syringings must be renewed.

Secondly.—Some fruit growers in several parts of the country have tried the arsenical insecticides used extensively in the United States and Canada. These have not been generally adopted in this country on account of their poisonous properties. The time has now arrived when they should be fully tried.

There are two special substances of this nature. The one, "Paris Green," or "Emerald Green," is strongly recommended by several American and Canadian entomologists.

The latest advice from experienced practical entomologists is to put 1 lb. of Paris Green, in the form of paste, which is far better than powder, into from 165 to 200 gallons of water. The mixture must be kept well stirred, in order that the solution may be maintained at an uniform strength.

The object is not to dislodge the caterpillars, but to poison their food with arsenical solutions, which should fall, like gentle rain, upon the leaves and blossoms. For this purpose fine "rose" jets should be used. Riley's "cyclone nozzle" is used in America. The Vermorel nozzle is also a good distributor.

The other arsenical compound is "London Purple," obtained in the manufacture of aniline dyes, and composed of lime and arsenious acid.

One pound of London Purple should be mixed with from 160 to 180 gallons of water and kept well stirred, being applied in the same manner as the Paris Green, sprayed on in the form of a heavy dew or mist, and not squirted violently upon the leaves and blossoms.

London Purple can be obtained as a powder, and in a fluid form ready for mixing with water. It is as poisonous as Paris Green.

Stock must not be put on grass in orchards where these arsenical solutions have been used on the fruit trees until a considerable period has elapsed and rains have fallen; nor must they be used where bush fruits for early picking, and vegetables are grown under the trees.

Three or four days will elapse before the effect of these solutions is apparent, and, as a rule, it will be found necessary to repeat the applications.

These solutions can be put on with hop-washing engines, ordinary garden engines, the Eclair, hydro-nettes, and other pail engines. Syringing with Paris Green, London Purple, and other solutions recommended above, will be equally detrimental to the Apple Blossom Weevil (*Anthonomus pomorum*) now present in large numbers, and to the Apple Sucker (*Psylla mali*), which is causing unprecedented harm in many localities.—*Gardeners' Chronicle*.

CACAO IN NICARAGUA AND CENTRAL AMERICA GENERALLY.

We have received from Mr. Hart of Trinidad a copy of an interesting Report drawn up by him on "Cacao in Nicaragua," and making references to cultivation in other Central, and in a few Southern American States. He also gives some information respecting coffee and nutmegs. We had no idea before reading this Report that the growth of cacao was of so much importance in Nicaragua. For the whole of Central America our estimate of production as given in our lecture before the London Chamber of Commerce, was 65,000 cwt. or rather more than one-third the crop of Trinidad. But it is evident that these figures are considerably below the mark, although the difference does not affect the markets of the rest of the world. This is accounted for by the fact, that as Mr. Hart mentions, all the cocoa produced in Nicaragua is consumed within that State, not a single pound being exported. Cocoa is in fact the great drink of the people, chocolate in various forms being used several times a day by all classes, so that even Monsieur Menier, the great French Chocolate Manufacturer, who owns a large cacao property there, finds it to his advantage to dispose of all his product on the spot! Mr. Hart's mission was to convey a selection of the best varieties of Trinidad cacao, and although owing to "revolutions" and blockades, he could not land at one port after another and was altogether 47 days on the journey, 98 per cent of the seeds planted in Wardian cases gave good healthy plants, while plants 6 and 12 months old taken, did not fare so well. In some cases artificial irrigation is applied to Nicaraguan plantations; but the rich deep soil and great care taken in planting are sufficient to ensure success. Mr. Hart writes:—

The land of the district I visited was of a dark colour, and appeared to be composed principally of fine volcanic dust, mixed with a large proportion of organic matter. The depth of the tillable soil varied from (3) three to six (6) feet, to which depth not a single stone or rock of any kind was to be found. In the general run, the class of cacao grown in Nicaragua, when seen in the pods, differs little from that seen on a Trinidad estate, and pods can be selected to fairly represent most of the Trinidad varieties, such as Forastero, Amelonado, Calabacillo, Creolo, &c. When the pod is opened, however, it is at once seen that the bean is considerably larger and fuller than any Trinidad variety. Again, on cutting the bean it is found as a rule to be white in the inside, or in some cases slightly tinged with the purplish colour so well known in Trinidad. Again, it is found that it requires a very much shorter period for fermentation as will be described later. The plantations are laid out in squares of considerable area, and completely surrounded with hedges of mango trees planted closely together to form wind breaks in every direction. These trees grow to a height of sixty feet and are kept well trimmed so as to form a thick screen without gaps. The seeds are sown thickly together in straight lines to produce these hedges. The land is well drained by open surface channels similar to the Trinidad system. The "*bois immortel*" or *Erythrina* is known, but little used for shade. The trees in general use for this purpose is a species of *Lonchocarpus* or "*Savonette*"—there called "*Madera*." The plantation is formed and the "*Madera*" or permanent shade is first planted from seed in straight lines about five "*varas*" apart, which would be equal to about 13 English feet. After allowing the shade to grow from 18 months to 2 years, the cacao trees are planted in the same lines as the shade trees and alternating with them in the rows at about 12 or 13 feet apart or less. The "*Madera*" becomes the permanent shade of the plantation, but primary and secondary shade is also used at the same time. The primary shade is formed by a shrub be-

longing to the Compositæ known as "*Carriso*," probably a *Clibadium*. The secondary shade tree is known as the "*Quelita*," and is a *Jatropha* near to *Jatropha multifida*. Plantains are also used as intermediate shade, but are generally removed early. They are, however, largely used for shading nurseries, and are thickly planted along roadsides. The fruit is sold at the rate of 15 plantains for 5 cents Nicaraguan money, about equal to 3 cents—"gold." The planting of the cacao and shade trees is extremely well done, the lines are kept beautifully straight, and the trees are not an inch out of line in any direction.

We are rather puzzled to understand how mango trees which are allowed to grow to a height of "sixty" feet can be kept trimmed so as to form a thick screen without gaps? It looks as if this were a misprint for "six feet," more especially when it is added, that the seeds are sown thickly together to produce these hedges.

Harvesting or picking and breaking (not cutting) the pods are carried on after a primitive fashion in Nicaragua; but of the result Mr. Hart reports as follows:—

On 48 hours' fermentation the white-coloured bean changes into the beautiful cinnamon-brown so much prized by the chocolate manufacturers, and presents an appearance and "break" identical with the best strains of Ceylon cacao, but with beans more than double the size of the Ceylon growth. If more time for fermentation is afforded, it results in giving a darker colour to the interior, and the outside of the bean is rendered almost black and the substance of the bean itself loses flavour and aroma. Nicaraguan cacao does not contain nearly as much fat as the Trinidad samples, but from personal observation it is at the same time possessed of an aroma and flavour which is at least equal to, if not superior to the best Trinidad marks. The Nicaraguan uses a large quantity of cacao for the preparation of "taste." This is a drink made of ground roast corn or "Mays," mixed with the chocolate into a kind of gruel or pap, which is very nourishing and wholesome food. This is a universal drink for the early morning, but it is also taken at other times during the day. A description is given of several new varieties, and more especially of the Alligator cacao of Nicaragua, a taller and more vigorous tree and better cropper than the ordinary kinds. Attributing great importance to the interchange of seed between one country and another, Mr. Hart brought back a good supply of four different varieties to Trinidad. He shows how even in Nicaragua the yield per tree has fallen off in 30 years, and how it improved again when new seed was utilised. To this fact the Trinidad, as well as South American planters seem now fully alive, for we read further:—

Baron Eggers, the Danish Botanist is now on a mission to South American Republics, in which the cacao interest plays a most important part, and Robert Thompson, Esq., formerly of the Botanical Department Jamaica, has recently procured seed in quantity from Trinidad for the Columbian interior, personally assuring me that Trinidad cacao succeeds better there than the native varieties; which he reported as being weak, liable to disease, and gradually dying out; and Trinidad herself must not be behind if she desires to maintain her proud position in the world's markets. These statements show that the natural result to be obtained from imported seed is that as a rule plants obtained from it are decidedly more vigorous and healthy; and when the selection of the varieties is good, it is quite probable that the quality of the produce will also be improved. The cacao of Nicaragua is of a high class, rich in colour and aroma, a magnificent bean and altogether of a class likely to improve under Trinidad culture, and if it can be shown that under culture the colour and size of the bean can be maintained, there is little doubt that it will materially improve the quality of our cacao export in future years.

It is perhaps too soon in the experience of cacao planting in Ceylon to speak of a change of seed. Dr. Trimen has very clearly defined the varieties of "cacao" in his annual Reports from time to time, and we know from him that our "Old Red" scarcely varies at all; while any number of varieties of the "Forastero" can be made to fancy. These came to us indeed from Trinidad under half-a-dozen names obviously applied in a quite haphazard way and this is very much the experience in Trinidad itself. As a guide scientifically or even to the Agriculturist, these names are wellnigh worthless. It might be well, however, for intending planters of cacao to endeavour to get specimens of what Mr. Hart calls the "best Nicaraguan variety white seeded," and of the "Alligator" variety.

COFFEE, NUTMEGS, RUBBER AND SHADE PLANTING IN NICARAGUA.

In the course of his Report on Cacao, Mr. Hart incidentally refers to other products and we quote the more interesting paragraphs. The coffee industry in Nicaragua, so far as we can learn, is represented by a planted area of from 80,000 to 100,000 acres, the annual shipments being between 400,000 cwt. and 500,000 cwt. :—

Splendid coffee is grown in Nicaragua, especially in the district of Diriamba, one property alone shipping as much as 4,000 quintals of 100 lb. each per annum. This coffee is all shipped in the parchment and cleaned in London. The prices obtained for it are nearly on a par with those obtained for the celebrated Blue Mountain coffee or Jamaica.

A small consignment of nutmeg plants was carried to Nicaragua with the cacao, and stood the voyage without the loss of a single plant, although crowded together in the original seed box to save freight. These appear to be the first nutmegs imported into the country, as little was known of the tree or its cultivation. A considerable order for seeds has since been received.

Castilloa elastica, Cav., is a common wayside plant in Nicaragua, but it is always found under shade of other trees. It is being planted somewhat largely for rubber-producing purposes, but always with the protecting shade of large trees, and in areas proved to be unsuited to the growth of cacao by actual experiment.

I observed that a trial was being made of planting cacao under the shade of the original forest, thinned out to a suitable density; but on enquiry I found the proprietor had not much faith in the experiment, and the look of the young plants fully justified his doubts. I was told; however, by a large and successful coffee planter that having tried the system of felling and clearing and burning all materials and also that of planting under natural shade, with simply the lesser number of trees removed; he was bound to concede the advantage to the latter, although his own inclinations led him somewhat to regret the conclusion, as he considered felling and clearing to be a much mearer and cleaner method of planting, both for coffee or any other crop.

CEYLON PLANTING.—We learn that Mr. James Hill, one of the Proprietors of the well-known Kodanaad Tea Estate, has just returned from his Ceylon trip. He is staying just now with some friends at Nandu wattum, but will return to Ooty in a day or two. We hear that he is very full of what he has seen and heard of the Ceylon methods and means to try some of them up here.—*South of India Observer*, Nov. 18.

Correspondence.

To the Editor.

INDIAN AND CEYLON TEA COMPANIES :
A WOULD-BE CRITIC DISPOSED OF.

[In reply to letters appearing on pages 337 and 338.—Ed. T.A.]

Colombo, Oct. 25.

DEAR SIR,—With reference to the communication in your last night's edition headed "Indian and Ceylon Tea Companies: Criticism Thereon" we are not aware that there is any Galaha Co. in existence for your correspondent "Tea Planter" to criticize.

Negotiations were entered into for the purchase of certain properties from the proprietor of Galaha from which he withdrew when it appeared that he would not receive what he considered their value.

Should a Galaha Co. be brought out, "Tea Planter" may rest assured that all statements made in the Prospectus will be based on figures which will be verified by a competent accountant, and in the meanwhile the business of your anonymous correspondent would presumably appear to be tea planting.—Yours faithfully,

per pro. CHARLES STRACHAN & Co.,
J. H. STRACHAN.

EUROPEAN CUSTOMS TARIFFS ON TEA.

Colombo, Nov. 17.

DEAR SIR,—Enclosed information may be of use to you, and I think you are collecting the particulars of the European Customs Tariffs.

E. B. C.

TARIFF—Genoa, October 23, 1893.

- TEA—Lire 250 pr. 100 Kilos.
- TOBACCO (prohibited).
- CIGARS as Manila, Avana au Cigarets Lire 35 pr. Kilo.
- COFFEE (natural) Lire 150 pr. 100 Kilos.
- PRECIOUS STONES (raw) free from Custom.
- PRECIOUS STONES (laborated) Lire 10 pr. 1 Kilo.

TARIFF, Marseilles, October 28, 1893.

- COFFEE .. francs 156 per 100 Kilos
- TEA .. 208 " " "
- TOBACCO: (a) Cigars and Cigarettes .. 3,600 " " "
- (b) Wrought for smoking, snuffing, masticating 1,500 " " "
- N.B.—Tobacco can only be imported for private use, exclusive of whatsoever commercial purposes and the yearly quantity granted for one person, even paying above duties, cannot exceed 10 Kilogr.

- for GEMS or precious stones, cut or uncut no duty
- AGATE or do do do .. do
- uncut do
- the same, cut .. francs 18 per 100 Kos.

N.B.—PRECIOUS STONES is a qualification insufficient; they must be described as GEM or AGATE precious stones.

MILK TREES AND DYSENTERY.

Gonavy, Nov. 21.

DEAR SIR,—I send you copy of an extract from *Chambers's Journal* of September last. Should the properties of the *Clusia Galactodendron* be what they are described, the tree if possible should be

introduced into Ceylon where dysentery is so prevalent and fatal a disease.—Yours faithfully,

W. H. WALTERS.

MILK TREES.

(Extract from *Chambers's Journal* Sept. 9th, 1893.)

Besides the general usefulness of the juice as milk, it possesses another property, which though far more valuable, is oftentimes overlooked. Our readers will have noticed that the milk is always viscid, and contains a little caoutchouc; this renders it a most important remedy for dysentery. Its utility in this respect has been confirmed by an English gentleman who some years back resided on the Pacific Coast. He says: "I was attacked by diarrhoea, which in two days passed into very severe dysentery. In the space of 12 hours I was reduced to a state of utter prostration, suffering the most excruciating pains. The bloody discharge was so terrible, that it seemed possible to predict death in a few hours. At daybreak the wife of one of our inspectors was called in, as a nurse, and by 9 o'clock "leche de saca" (the Spanish name for this milk,) was procured. Up to this time, I was getting rapidly worse, and was then hardly conscious. The milk was given to me, a tablespoonful in a glass of water, every half hour, till 9 o'clock, and at this hour I was perfectly free from dysentery or the slightest symptom of it. Broth and light food was given me for a few days, and I was restored to perfect health, without taking any other medicine."

The tree from which this milk was obtained was the *Clusia Galactodendron*, a native of Venezuela. It is said to contain a resinous and an astringent principle, and an aromatic and tonic substance. . . . The resin no doubt coats the intestines with a film, and allays irritation. No other medicine is used in Choco, or on the coast of New Grenada, for dysentery, where this disease is thought little or nothing of, as it is so easily cured.

MR. A. E. WRIGHT ON THE CHICAGO

CEYLON TEA STORE.

Bedford, Nov. 9th.

DEAR SIR,—Mr. J. Capper of the "Ceylon Times" has written to ask me if it is the case that I had arranged with the Ceylon Commissioner at Chicago to join in a Syndicate for running a Tea Store in that city after the close of the World's Fair, and in reply I have sent him a copy of my letter embodying my proposal to Mr. Grinlinton and think it only fair to put your readers in possession of the same information. When in Chicago in June last I was so much impressed with the necessity of something of this sort (especially after the collapse of the Ceylon Planters' American Tea Company) to back up the benefit the Exposition has been doing our tea enterprise, that on my return to London I called upon the Secretary of our London Association and several of the leading merchants, who have interests in Ceylon, to try and interest them in the formation of a Big Company to push Ceylon tea in America. The matter was afterwards discussed by the Committee of the London Association who thought that the matter had better be left over for the present, as the subject was being taken up in Ceylon.

Fearing that nothing might be done, as the Tea Fund could only grant Mr. Grinlinton £1,000, out of the £2,500 asked for, I wrote him the enclosed letter, and if he accepts my proposal; I trust that this Company may be the nucleus of a large concern later on. The importance of the subject is my excuse for asking you to publish these letters in your valuable paper.—Yours faithfully,

A. E. WRIGHT,

Bedford, Oct. 18th.

J. J. Grinlinton Esq., Chicago. DEAR SIR,—I see by the *Ceylon Observer* (cutting enclosed) that the Tea Fund have only been able to grant you £1,000 out of the £2,500 which you require to start the store in Chicago. If you will subscribe £500, I will give a like sum, and I feel sure that _____ will make up the balance of the £2,500. What I propose is that we form ourselves into a Limited Company and start work at once, as there is no time to be lost, and I think we may fairly claim an annual grant from the Tea Fund, should we have a loss on our venture; but the interests of Ceylon generally are so much at stake that we must risk something, and it is of vital importance that you should put matters in training before you leave. The Tea Planters' Company, or some other Company with a large capital could take over our Company afterwards.—Yours faithfully,

A. E. WRIGHT.

Since writing this letter I have met Mr. Edmund Walker, of Messrs. Walker & Sons, Colombo, and read him this letter and he is willing to take £100 in shares in our Company and allow you to use his name; also information of same, if necessary on the terms of this letter.

A. E. W.

VARIOUS AGRICULTURAL NOTES.

TO CLEAN WATER-BOTTLES.—Half fill the bottles with tea leaves and a little water, and then add a spoonful of common vinegar; shake all thoroughly, then empty, and rinse well with cold water.

A TEA PLANTER writes from the Nilgiris that something should be done to encourage settlement there as there is no better or healthier spot in India. Not a few mothers will tell you that they have had no occasion to call in a doctor once in the whole season for anyone of their 3 or 4 "dots"; while as to the chemist's bill, that has amounted to the price of a bottle of castor-oil and a dose or two of pargoric. Another enthusiast says—"Tea is king."—*Indian Planters' Gazette*.

COFFEE IN BRAZIL.—Here is a characteristic and significant advertisement from the *Rio News*:—

COFFEE CULTURE

in Brazil pays better than any other agricultural work. Small farms of twenty to one hundred acres each are offered in exchange for manual labor.

NINETY THOUSAND ACRES

of the first quality *terra rosa* coffee lands in the county of Araraquara, on the Jacaré river, are to be had for the cultivation of them in coffee, a half interest in each farm given to the farmers who will work them. Address:

THE FARMERS' COFFEE LAND AGENCY

Rua Direita No. 2 São Paulo, Brazil.

THE "INDIAN FORESTER," No. 11—for November, has the following contents:—

I. Original Articles and Translations.—A Tour in Janssar, No. 5, Fuel Supply Works in Naini Tal, Forest Administration in Oudh by O. C. Fire Protection in the Landes Gascony, Tour of the Coopers Hill Students in Germany by E. P. S.; II. Correspondence.—A 'Burea de Recherches', Letter from 'Border', Inspection Note on Coimbatore Forests, Letter from H. B. Bryant, Eucalyptus in Hoshiarpur, Letter from 'T', Forest Fires in America and India, Letter from R. M., Compounding Offences in the C. P. Letter from B. Ribbentrop; III. Official Papers and Intelligence.—The new Dehra Dun Forest School Rules. IV. Reviews.—The Madras Forest Report for 1891-92, Report on Forest Administration in Jepore State for 1892; V. Shikar and Travel.—Forest School Sports at Dehra Dun. VI. Extracts, Notes and Queries.—The Resin of Conifers, Pice Packets of Quinine; VII. Timber and Produce Trade.—Statement of average selling rates in the North-Western Provinces for 30th September 1893, Churchill and Sim's Circular October 5th 1893, Market Rates of Produce, Calcutta Price Current.

THE LANKA PLANTATIONS Co., LTD.—although it has had to pass through the fire of affliction like all old Coffee Plantation Companies—is rapidly recovering ground as the report on page 414 shows and promises well for the future with its cacao and coffee as well as large extent of young tea.

PLANTERS who combine tea and coffee must now be having their work cut out, for with crops in full swing and the heavy flushes after the late rain and present sun, will have as much on their hands as they can attend to. The weather of the last few days must be a boon to coffee planters, whose barbacues and tables must be fairly full after the rainy weather of the last few days.—*Nilgiri News*.

TO TELL THE AGE OF EGGS.—Dissolve two ounces of salt in a pint of water. When a fresh laid egg is placed in the solution, it will descend to the bottom of the vessel, while one that has been laid on the day previous will not quite reach the bottom. If the egg be three days old, it will swim in the liquid, and if it is more than three days old it will float on the surface and project above the latter more and more in proportion as it is older.

COORG, Nov. 17.—We have had some heavy rain here recently which has done considerable damage especially in the bamboo by way of knocking crop off the trees and raneing the bursting of pulping tanks, bunds &c, which must have been very inconvenient as they are in the full swing of the crop down there. Up here the rain was not quite so heavy and besides that there was not much ripe crop, except in 3 or 4 cases, for damage to result from the dropping of crop; but I noticed that trees which had lost a considerable portion of their leaves, had dropped a lot of green berries. These are being gathered up. Most of us this side have begun fl-picking, but in the 3 or 4 cases referred to above contract picking at 3 annas per cherry box will be begun on Monday next here.

"THE PLANTER: OLD STYLE AND NEW" is the heading of an amusing sketch descriptive of the latter which we reproduce on page 414 from the *Nilgiri News*. The old conditions of planting life have disappeared from Southern India, it seems, quite as much as from Ceylon. An old planter writing to us by this mail asks that the younger knights of the tea-bush with all the conveniences of roads, railways, churches, hospitals, &c., &c., should just think now and then of the pioneers who had none of these comforts and of those who had the building of them as time rolled on. How even Sir Hercules Robinson would open his eyes were he now to see the "Wilderness of the Peak," which Major Skinner induced him to open with the first road, ever sent through it!

THE CHICAGO-CEYLON-TEA-STORE.—We call attention to the letter of our old friend, Mr. A. E. Wright, on page 409. It showed public spirit as well as enterprise in Mr. Wright to come forward as he did. We have yet to learn on what basis exactly Mr. Grinlinton has gone to work; for as Mr. Wright writes to us in a separate letter,—

"I was very much impressed with our Commissioner's work at Chicago, and do not think that our Company is at all likely to be a financial failure especially with the Tea Fund grant to help us start, but of course the capital is far too small, and if you could induce others to augment it all the better."

"It is of course possible that Mr. Grinlinton may think some other *modus operandi* will be more to the interests of Ceylon, in which case it, of course falls to the ground, but he at all events now has something to work upon."

Mr. and Mrs. Wright both enjoyed their American visit very greatly; they have now settled at Bedford which is fast representing quite a little colony of Ceylon residents,

JAPAN TEA.—There has been a spurt in the Tea trade, as buyers have been willing to pay the prices for which leaf is held, and the higher grades are now scarce and dear.—*Japan Mail*, Nov. 4.

ENGLISH VEGETABLES IN NUWARA ELIYA.—We were astonished by the receipt of a cumbersome and weighty parcel by rail yesterday, which on being opened proved to be an immense cabbage, the like of which we had never seen before. A letter received during the day explained matters. The cabbage had been sent us by Mr. W. H. Hawkes, P.W.D., and grown in his garden in Nuwara Eliya. It was as well grown a specimen of the genus cabbage as we remember to have seen anywhere, weighing 2½ lb., and having a splendid heart, and a stalk like the stem of a tree. No one can say after this that cabbages cannot be grown to perfection in Nuwara Eliya, given such care and attention as Mr. Hawkes bestows upon his garden. We omitted to state that the cabbage was 49 inches in circumference!—*Local "Times."*

HOW PLANTS ADAPT THEMSELVES TO CIRCUMSTANCES.—The forms of vegetable life are capable, just as animals are, of adapting themselves to a greater or less extent to altered circumstances or conditions. A curious experiment illustrative of this fact has recently been made by J. Bokorny (vide *Chemiker Centralblatt*, 1892, ii., p. 80), who has shewn that plants which have been deprived of starch, and placed in an atmosphere that contains no trace of carbonic acid gas, are capable of forming considerable quantities of starch if they are fed with the sodium hydrogen sulphite compound of formaldehyde. In order, however, that this experiment may succeed, the plants must be placed in strong light; in the dark no formation of starch takes place. A detailed account of this work is given in the *Landw. Jahrbuch*, xxi., pp. 445—465.—*Gardeners' Chronicle*.

THE LIME JUICE INDUSTRY OF MONTSERRAT.—It is stated that there are at the present time in the island of Montserrat about 1200 acres of land under cultivation of the Lime tree (*Citrus*), the juice from the fruits of which has become such an important article of commerce of late in this country. Three-fourths of the trees are said to be bearing fruit, the average yield of juice from an orchard in full bearing being about 500 gallons per acre. The average shipments from Montserrat during the past five years have been, of raw lime juice, 800 casks of 120 gallons each; of concentrated juice, 200 casks of 54 gallons each; and of essential oil of Limes 2500 pounds, besides large quantities of green and pickled Limes. Dominica also supplies a good deal of Lime juice, and it is anticipated that, if the roads that have been projected in Dominica should be carried out, the Lime tree cultivation will be greatly extended, the culture being one of considerable profit.—*Ibid.*

CEYLON TEA ABROAD.—A very pretty and effective form of advertising Ceylon Tea has been adopted by the proprietor of the Kintyre and Ruanwella Tea estates. The particular copy we have seen was headed "With the Season's Greetings" from which we infer that it is intended as a kind of Christmas card, that is being sent with every Chest of Tea shipped. The cards will thus be widely distributed. We understand that it is the intention of the proprietor to continue sending copies of the card with all future shipments sent abroad. The card is of cabinet size, and has on one side descriptive letter press of seven views on the obverse side of special features of the properties and the scenery around them. The views resemble photographs, but are produced by a new process, that renders them in an attractive style and of highly finished and excellent work. The subjects are: (1) the Kintyre factory—(2) Women plucking tea—(3) Portrait of a native girl—(4) a river landscape in the low country with an elephant in the foreground crossing it. This forms the central vignette of the group. (5) A group of Sinhalese girls—(6) The Ruanwella Tea factory in a picturesque scene, and (7) another river scene with pada boats on the Kelani. These views form a well-arranged group covering one side of the card, and are well adapted to give a correct idea of the country and the Tea plantations.

TO BRIGHTEN GILT FRAMES.—Take sufficient flour of sulphur to give a golden tinge to about a pint and a half of water and boil in this four or five bruised onions. Strain off the liquor, and with it, when cold, wash with a soft brush any gilding which requires resting. When dry it will come out bright as new.

CEMENT FOR BROKEN GLASS, PORCELAIN CROCKERY &c.—Ourdle one-third of a pint of milk by adding vinegar. The whey is taken and the white of an egg stirred into it. Finely divided quicklime is added and thoroughly mixed with a knife and applied to the surface. The mended article after drying in the air is heated in a stove.

MAZAWATTE "TEA AND MAZA" WINE.—The rumour has reached me that litigation is impending over the proprietors of "Mazawatte" Tea who, during the last few years, have driven so brisk a trade throughout the country. The story goes that certain parties, who have for some time past been selling a beverage under the name of "Maza" wine, on applying to register their title as a Trade Mark, were met by the most determined opposition on the part of the "Mazawatte" owners who held it to be an infringement of their own brand. The upshot of this is that the validity of "Mazawatte" itself as a Trade Mark is likely to be contested on several grounds. It has always, I believe, been held by the Ceylon Tea Plantation Company, Ltd., that the name "Mazawatte" was intended to be mistaken for "Mariawatte": and that forms one ground of objection. Another is that there is no such estate as "Mazawatte" which word, it is stated, is only a substitution for "Maza Estate," the original brand under which the Tea was sold. There are also other general grounds under the provisions of the act which it is argued vitiate the validity of the mark. It will be a serious thing for "Mazawatte" Tea and its owners if its career be brought to an untimely end. Whether any benefit would accrue to Ceylon may well be doubted.—*London Cor., "Independent."*

THE ZAMBESI INDUSTRIAL MISSIONS call attention (says the *C. M. Intelligencer*) to the unlimited possibilities which Africa suggests for Missions on a self-supporting basis. The Moravian lead is followed by other German Missions in this respect, and with great success, at least in its industrial departments, by the Mission of the Benedictine Order of Romanists. The magnificent waterways, the elevated and healthy plateaulands, the resources of coffee, cinchona (quinine), cocaine, cotton, Indian rubber, wheat, cattle,—all these favourable conditions invite the plantation and expansion on a large scale of Industrial Missions. It must not be forgotten that the early planting of the American Colonies was due to the Industrial Companies of England. While not within the direct sphere of this Society, they indicate openings and opportunities for combined Christian and commercial enterprise which should appeal to the locked-up capital of health and wealth, which lies in such abundance at home. Evangelization on such self-supporting lines is more than a possibility on the Niger and the Congo and the Zambesi, as well as the great lakes, Victoria Nyanza, Nyassa, Tanganyika. The oppression of the Natives under the Prazo system in the Zambesi valley and Kilimani district renders them willing to accept with rejoicing a Christian administration. With the willingness of their hearts combines the readiness of the soil for the coconut, the banana and the orange, and rice, the stay of life. Nor have the weeds of Romanism entangled the soil. While the climate in this part is very trying, that of the Shire highlands is eminently favourable, and the natives are highly tractable and intelligent. There are abundant carriers available here to Maima and Mashonaland and lying thus advantageously upon the route to those countries secures much commercial advantage.

CEYLON TEA IN LONDON.

Our advices by last mail show the market for the previous two weeks had been very disappointing. It was fully expected that the rise which set in so strongly about the middle of September would have been increasingly maintained until early in December when the attention of grocers is generally diverted from tea to special Christmas requirements; but the very heavy arrivals from India and the very large quantities said to be coming forward, checked any advance in price. Generally, the quantity of Indian tea available for the United Kingdom is estimated at the maximum figure, from which it gradually recedes 10 or 12 millions pounds; but this year it has remained steady at 118,000,000 lb. and as many of the gardens are now nearly closing and there seems no abatement of estimate, it looks as if the home market must be prepared for that quantity. The strikes in the manufacturing districts depress the market and tend to keep prices down, but so far have not checked deliveries. Hard times too may mean,—less beer and gin and more tea.

"We talk of the benefactors of the Ceylon tea enterprise, but no man"—writes a well-known London Tea-Dealer,—"has ever succeeded in getting so much work done for so little money as Elwood May; that he should never have been allowed to do so much was plain from the first and that he deceived himself or had been deceived was clear; but that all he has done should be undone and worse than undone, because disappointed friendship often becomes bitter hostility, is very lamentable. The London as well as Ceylon Association ought to have long ago recognized the fact that Ceylon could not afford to play at being one of the 'great nations of the earth' and that for the expenditure of £8,000 or at the very most £10,000, a thoroughly practical and sufficient Exhibition advertisement could have been obtained.

"The Indian Tea Districts Association have spent less than this, and before the opening of the Exhibition got in touch with a very large firm with travellers all over the States. If the result of your expenditure of £30,000 or so in Chicago, is a further subscription to establish a tea store in Chicago,—which is an investment of a dangerously doubtful character—not much has been achieved.

"Again have tea-growers realized that they are paying the refreshment contractor at the Imperial Institute a bonus of more than a shilling on every pound of tea he sells in the Institute, simply for the honour and glory of being able to say that Ceylon tea only is sold there?

"A few years ago the million or two pounds of Ceylon tea which goes into consumption from sentiment and the million or two which goes into consumption by personal push, formed so large a proportion of the whole crop, that a fictitious value was given to Ceylon tea; but that has long ago ceased and the 70,000,000 lb. sold in the Lane is sold entirely on its comparative merits with Indian tea. The two rise and fall in exact harmony, and the traders over the country no more care whether their teas are Indian or Ceylon than the bakers do whether their flour comes from Europe, Asia or America; all they want is the best value for money.

"We have all lived long enough to know that all Ceylon tea is not good tea, and that all good tea does not come from Ceylon. It matters very little whether Indian or Ceylon tea is used in the Imperial Institute. The Kandapolla planter has more in common with the Darjeeling planter than with the Kelani Valley planter; and the last more in common with Assam than with Dimbula or Dikoya. What is of great importance is that the

taste for good tea should be stimulated and encouraged.

"Why did not the Planters' Association avail itself of the experience of its London representatives in the management of Chicago affairs? The first thing the London body would have done would have been to recognise the absolute necessity for blending the energy of an Elwood-May with the genius of the Grinlinton and for establishing a *modus vivendi* between them."

We leave these reflections with our readers, merely reminding them that Mr. Grinlinton's bill may not be more than £12,000 or £13,000 after all; and that the waste of money over tea sold in the Imperial Institute, is now closed.

NEWS FROM THE CENTRAL PROVINCE:
PLANTING AND OTHERWISE.

Nov. 23rd.

MR. WHITTALL'S VISIT TO THE ISLAND, though short has been a busy one. An onlooker often sees more of the game, than the players themselves; and planters do wisely in noting his shrewd observations. He notes how well tea grows everywhere in Ceylon; also that planters in all districts are planting up reserves; and he is optimistic in his ideas of the output of Ceylon tea. The *Observer* is not in it in that respect, with Mr. Whittall. He also states that there is too much English capital invested in Indian estates to allow of slowing off the exports of Indian tea. China he believes not to be in the running now, and he also believes *silver has touched its lowest point*, so cheap silver will not enable China to send cheaper teas than it does at present. He therefore believes that a continuance of paying prices rests on our getting new markets in Australia, America and Russia for Indian and Ceylon tea.

COCOA.—In Matale planting notes, which appear in the *Tropical Agriculturist* for November, the writer makes a great mistake when he states that this year, so far from showing an increase on the last year, will more likely approximate the returns of the past year. The exports up to the 13th November are 10,000 cwt. more than they were at same date last year, and 8,000 cwt. more than the total Ceylon crop 1892, and 5,000 cwt. more than the total crop 1891. The cocoa area is rapidly increasing in Ceylon, and the editor of the *Tropical Agriculturist* could not do better by his readers, than get from his Java correspondent the area of cocoa now planted in Java.

TEA PLUCKING IN INDIA—A PRACTICAL
TALK—FINE Vs. COARSE.

The question just now exercising many minds is that of fine or coarse plucking, and it is a very vexed one. Perhaps the greatest preventive to either course being strictly adhered to, is the suspiciousness of one planter of another, in case he scores an anna off him.

At the present moment the prices given for common teas are anything but paying. *Four example*, a garden giving 5 maunds per acre, of 6 anna tea, yields precisely the same financial result as a garden giving 6 maunds of 5 anna tea; or a garden giving 7 maunds of 6 anna tea, the same as a garden giving 5 maunds of 8 anna tea. It will be said by some, that 6 anna tea is much more easily made in these times than 8 anna; but consider the difference in yield per acre, and we think the comparison does not come out so unevenly, and, over and above, in the case of 6 anna tea the extra wear and tear upon machinery has to be taken into consideration, in addition to the extra tea lead, boxes, etc. It is difficult to say how much the wear and tear would represent, but we think we may safely say a 5 per cent. deduction all round. Under ordinary circumstances, 5 per cent. is written off for deterioration of machinery, and adding the 5 per cent. mentioned above, we have an annual deterioration of 10 per cent. in machinery account; to

this adding 20 per cent. for extra tea lead, boxes etc., we have a considerable item, and, to meet all this we have only an advantage of R10 extra per maund, in net results of rupees, annas and pie. In the above calculation we are not taking into account at all the advantage to be reaped by the industry, should such a millenium ever occur in tea as to get planters all to agree to pluck one quality of leaf. This year we are told that common teas have declined so much on account of the quantity of poor teas being sent forward by Ceylon, and from all we can learn there is little doubt that coarse plucking has been the rule in the spicy Isle this year. In this competition for the race of premier, there is, we think, no doubt that Assam can at any time take the proverbial cake—and by Assam we mean "Assam proper," and not the Indian tea industry. Assam proper has its drawbacks as well as other places, and were it not for these the other districts would long ere now have had to take a back seat. The soil and climate of Assam are admirably suited for tea, and were the distance from seaports not so great, and the difficulty of supplying labor removed, investments in tea in Assam would have realised more than even the most sanguine could have expected. Sylhet, Cachar, and the Dooars, exist only by being more favorably situated, less isolated, and enjoying, with the exception of the last mentioned, a more salubrious climate, enabling the North-West coolie not only to live but to flourish. To climatic influences far more is due in the quality of the season's crop than is generally credited, and this year it has been amply demonstrated at Sylhet, Cachar, and especially the Dooars, stand out for the poverty of quality in the liquors of their teas, due, doubtless, to the want of sunshine necessary for the promotion of rapid growth, so essential to good results in cup. The growth this year has been slow, and the leaf, instead of being soft as a kid glove, has shown fibrous tendencies, except on one or two occasions when the leaf came with such a burst, that it was impossible for planters, even with good margins of withering space, to do full justice to its manipulation. Many planters are opposed to very fine plucking, on the ground that China would look in again, but we do not think that this need ever be feared, as China seems to be finding outlets for its teas, in other markets, and is not likely to return to its old love again; and besides, the planter with Ceylon at his back has only to change his system of plucking, to put a stopper on that, and very quickly too. The greatest block in the way of fine plucking is the dread of what Ceylon would do, but we contend if it were possible to manage it at all, that a system of fine plucking would be to the best interests of all in tea, as the prices would remain longer at present rates, and paying a return to the investors; whereas, if the present mania for quantity at the expense of quality goes on India tea will be even a greater drug in the market than Chinese ever was, and nothing but bankruptcy can stare in the face some of the older concerns now struggling for existence.—*Indian Planters' Gazette.*

THE SCOTTISH TRUST AND LOAN COMPANY OF CEYLON, LIMITED.

The following is the Report by the Directors of the Scottish Trust and Loan Company of Ceylon, Limited, which was to have been laid before the Sixteenth Ordinary General Meeting of Shareholders, to be held at the Company's Office, No. 122, George Edinburgh, on Tuesday, October 31st.

The Directors present their Sixteenth Report, being for the year to 31st August, 1893. Estates in Company's Possession.—The net return from the Company's Estates and Factories is £5,722 6s 10d for 1892-93, as compared with £3,954 7s 1d for 1891-92 affording evidence that the working of the six estates has been managed in an efficient manner by the Local Superintendents, in conjunction with the Company's Advisers in Colombo, Messrs. Cumberbatch & Co. During the year under review prices have fluctuated, but the average has been not satisfactory. The

sales of produce have been carefully supervised by the Resident Director in London. The produce on hand at 31st August, 1893, has all been realised since that date, with the exception of a small parcel of cinchona, estimated at £12 value, and is entered in the Balance Sheet at the amount actually realised. The outlay on Buildings and Machinery, amounting to £855 15s 4d, has, as in former years, been debited to capital; but against this £1,595 10s 7d, one-fifth of the total of such outlay since 1888 has again been written off. The Visiting Agents of the Company report the Factories and Machinery to be in good condition. A new factory is being erected at Bookside, which the Directors are advised will enhance the value of that estate. *Mortgages held in Ceylon by the Company*.—The Loans made in Ceylon have been reduced during the year by the sum of £6,000, and the Securities for those remaining are reported by the Visiting Agents as ample. The interest has been well met, and the arrear of £186 0s 6d shewn in the Accounts appended has been received since the close of the financial year. *Debt due*.—The Balance outstanding has during the year been reduced by £2,050. Of this sum £1,550 was due for repayment at maturity, and the Directors redeemed a further sum of £500, which did not mature until Martinmas, 1894. *Accounts*.—The Balance at the credit of profit and loss

Account is	£	s.	d.
			7,579 8 1
and the Directors propose—			
To pay a Dividend of 5 per cent. per annum free of Income Tax	2,250	0	0*
To pay a Bonus of 5 per cent.,	2,250	0	0
	4,500	0	0
To write down "Real Estate Account" by	1,250	0	0
			5,00 0 0

Thus leaving 1,829 8 1 to be carried forward to next account.

The Dividend and Bonus will be payable on 11th November next. Under the rotation fixed by the Directors, Mr. James Haldane retires from office at this Meeting; but he is eligible for re-election in terms of Section 14 of the Articles of Association. The Auditor for the current year falls to be appointed,—By Order of the Board, FRANCIS A. BRINGLOE, Secretary.

NOTES ON PRODUCE AND FINANCE.

TEA SALES AND TEA SAMPLES.—The question of heavy supplies of tea and the difficulty of testing the numerous samples on which we have commented so often is referred to in the last issue of the *Produce Market Review*. With the large quantity of 47,000 packages of Indian tea, necessitating the testing and valuing of something like 1,400 samples, says the authority we have mentioned, it is not surprising that prices were irregular. To add to the difficulty of grappling satisfactorily with such a number of samples it often occurs that the teas are not ready on application at the warehouses which is either due to the want of consideration shown to the trade by the importers or inability on the part of the warehouse-keepers to deal with such a weight of tea. However the remedy rests with the owners, and this can only be met by not issuing the catalogues until the teas are absolutely ready for sampling, and by giving instructions that samples must be ready on the first application, which would save a considerable amount of time and expense. The largely increasing imports no doubt severely tax the ability of the warehouses in the matter of bulking, as the room at their disposal for this purpose, which in the past, when supplies were small, was sufficient to ensure prompt execution in this

* Note.—Two and a half per cent. of this was paid as an interim Dividend at Whitsunday, 1893.

respect, is probably now quite inadequate. At any rate, these are matters that mostly concern the owners of the tea, and by them the remedy should be promptly attended to; otherwise the difficulties will increase, and their interests further suffer.

BOARD OF TRADE RETURNS.—The Board of Trade Returns for October show an increase in the imports; while the decrease in the Exports is, as was to be expected, somewhat large. The imports for the month are 31,356,469 lb., an increase over the same month last year of 629,611 lb. This is chiefly produced by the large increase in the import of wheat, of which we have received 1,321,704 cwt., more than in the previous October. There has been an increase in the importation of rice of 312,077 cwt. and £88,810 in value. Under the head of sugar the increase in refined is 340,096 cwt., valued at £376,116 and of unrefined and molasses of 207,283 cwt. and in value £215,835. Of dutiable articles there is an increase of 3,175,537 lb. and £73,291 in value in tea. China is now sending more tea to this market, the receipts thence being nearly 2,000,000 lb. more than in October, 1892.—*H. and C. Mail.*

THE PLANTER: OLD STYLE AND NEW.

THE NEW.

We approach them with awe. "By Jove what will Mrs.—say. I have left my cards behind, and I say old chap those breeches of yours are hardly up to calling style." This is the conversation between the two old ones as they find themselves within reasonable distance of Mrs.—(with a big *M.*) bungalow. However after a certain amount of chaff between ourselves in which the absence of a razor from my chin does not lose the critical glance of my companion, we gird ourselves, and at the garden (I am not alluding to tea or coffee,) hut an admirably kept, Madras malee kind of compound with beds and borders and stiffness adorning every available point, meet Ramaswamy with an electro plated card tray and deposit our past board. My companion and I are a little disconcerted and he says "sotto voce," "I hope they are in I'm awful thirsty," and this immaculate Ramaswamy, (so different to the old style) tells us to walk in.

We feel ourselves out of it. Such a cosy little house, we are eventually met, by a lovely thing in diaphanous material, who fairly takes our breath away.

He cannot speak for some time and then vaguely remarks on the weather, and how the seasons have changed, and somehow, though the surroundings are against him is eventually drawn out. She thaws, and he entertains her with an account of the olden times which is only interrupted by the entrance of the New Style immaculate in gaiters, hoots, coat and creaseless shirt; we wonder how garden work is carried on, or is it for our edification that the delay has occurred, and he is only just out of his dressing room?

Somehow the conventionalities subdue us, the old hospitality is there, the true old planting spirit, hut it is newly fashioned.

The old "peg" is varied into "Would you care to have any refreshment." Instead of the old method of going to the sideboard, and satisfy one's craving, the crest-het-raised butler hands round the whisky in a silver salver, with peg measure, and silver mounted cut glass bottle.

It's the same thing hut the way is different.

After accepting an invitation to lunch, we take a stroll round the "tote" and are learnedly instructed on the advantages of different chemical manures, the exact analysis of the constituents absorbed by coffee and tea bushes respectively from the soil, and the necessary amount of nitrogen, potash and phosphorus that mother nature requires for the due recuperation of the land.

My old friend squirms visibly and says little. In former years he thought little and cared less about "humus," and other combinations and constituents of manure, cattle or chemical, and at last merely asks a few pertinent remarks as to acreage and crop.

The reply evidently makes him chuckle, and he talks of the old days, when with his cattle shed only he considered anything under 5 cwt. as acre a had crop. Poor fellow! He forgets Borer, bug, and leaf disease.—He is far behind the times—but he won't admit it.

He hates these new fangled ideas and for the moment forgets that just now he is bordering on pauperism for the simple reason, that he cannot move out of the old groove.—No he will go back to his quarters and smoke his pipe—regret the past, but unable to reconcile himself to the present. Returning towards the bungalow a set of chimes wafts its melodious sound over the atmosphere which our host informs us in the half hour bell.

An excellent tiffin admirably cooked and served, so different from the old "coli" "spatch cook," curry and rice and week-old bread—a most pleasant afternoon with music, which puts the old man in a slightly better humour and we wend our way home to the old bungalow which on entering, though homely comfortable and hospitable, we at once realize from the contrast, has not been "progressive."

That evening we discuss our visit, discuss ourselves and them and we cannot help thinking (we may be wrong) we were happier in the olden days. We know little about Act. XIII. and kutcherrie, in fact a case in court was a matter for serious thought and reflection. Bangalore conferences were unthought of, unnecessary, and a Coffee Stealing Act was undreamt of.—We sometimes hut rarely lost our advances, I darsay we did looe coffee, but without being encyclopedias of law, our "totes" paid, our coolies remained with us for years and though perhaps we were a trifle rough and ready we enjoyed life, and were willing to jog along its path without the many innovations and excrecences of civilization so necessary to the planter of the new style.

But he had to come. Assistant Collectors, globe trotters, the improvement of communications were bound to kill the old style. Nature with her lap full of diseases that coffee life is heir to, completed the extinction of the old school who was able to take things easily, pick his crop, bank his profit and eventually look forward to passing the evening of his life comfortably in the "auld countrie."

Whatever the cause, he has nearly become extinct, hut we are sorry to lose him and should we live, hope to accommodate ourselves to the ways of his recessor.—*Nilgiri News.*

"MILK TREE AND DYSENTERY."

With reference to an extract from *Chambers's Journal*, on page 409, Dr. Trimen writes:—"I never heard of any plant named '*Clusia Galactodendron*' and do not believe it exists. There is of course *Brosimum Galactodendron* the well-known 'Cow-tree' of Venezuela; of this, young plants may be seen at Peradeniya and Heneratgoda. It is allied to the jack and breadfruit."

THE LANKA PLANTATIONS COMPANY, LTD.

DIRECTORS:

Sir R. P. Harding. | Edward Pettit, Esq.
George Allen, Esq. | Henry Bois, Esq.

AGENTS IN COLOMBO—Messrs. J. M. Robertson & Co.
SECRETARY—Mr. Charles M. Robertson.

REPORT

To be presented at the Thirteenth Ordinary General Meeting of the Lanka Plantations Company, Limited, to be held at the office of the Company, on Wednesday, the 15th November 1893, at 12 o'clock noon.

1. The Directors submit their report for the twelve months ending 30th June last, together with the balance sheet and Accounts of the Company made up to that date, and duly audited.

2. The coffee crop shipped to London was 837 cwt., against 914 cwt. 3 qr. 4 lb. last year, and realised £1,170 16s 3d net. The acreage under coffee alone was 347 acres on the 30th June last, all on the Ouvah side of Ceylon. Every effort will be made, consistent with economy, to preserve as much coffee as possible, but the old causes of decay are still in operation and some of the coffee above referred to is already being replaced by tea.

3. The total crop of Cocoa gathered on Yattawatte, from the 341 acres in bearing, amounted to 1,457 cwt. 1 qr. 4 lb., of which 1,399 cwt. 3 qr. 26 lb. were sold in London, against 707 cwt. 0 qr. 26 lb. sold here last year, and realised £6,451 16s 7d net. The autumn crop was of very fine quality, and, arriving to a strong market, sold at extreme prices. The spring crop was gathered in less favourable weather and, owing to the market being depressed by the heavy arrivals (shipments from Ceylon being 10,000 cwt. in excess of the previous year), and to the cessation of the American demand, had to be parted with at much reduced rates. The Superintendent reports that the trees carried their crop extremely well, and that they are in good heart and condition. The Directors desire to extend the cultivation of Cocoa to the full extent of the suitable land; 85 acres have been planted during the late financial year, and arrangements are in progress for increasing the acreage to 600 acres by the end of 1894.

4. The Tea received from the Company's estates amounted to 415,833 lb., being at the rate of about 300 lb. per acre from fields in full and partial bearing, and has been sold at an average of 8½d per lb., realising £14,048 10s, against 377, 327 lb., averaging 8¼d, and realising £13,028 0s 3d last year. Flushes were much checked and the recovery of the pruned bushes retarded by the unfavourable weather which prevailed in the early part of the season. The total acreage under Tea now stands at 2,009 acres, against 1,899 acres last year. The leaf from the Rappahannock and Rillamulle estates was manufactured in adjacent factories, and that from Totulagalla sold to a neighbouring estate. As the acreage and yield of Tea on these properties increase, it may be necessary to erect our own factories.

5. The following Statement shows the acreage and state of cultivation of the Company's Estates on the 30th June last:—

Estate.	Coffee.	Tea.	Cocoa.	Grass.	Pattina.	Forest and timber trees.	Total.
Am pittiakande	110	178	..	5	..	39	332
Arnhall	30	141	182	373
Fruit Hill	..	225	12	237
Fordyce, Garbawn, Gonagalla and Paramatta	..	762*	..	39	..	135	936
Rappahannock	35	290*	..	25	43½	80	473½
Rillamulle	..	230	..	2	6	20	258
Totulagalla	172	183*	..	7	114	79	555
Yattawatte	497	95	145	210	947
	347	2009	497	173	502½	583	4111½

* Partly in coffee.

6. The Directors who retire on this occasion are Mr. George Allen and Mr. Pettit, who being eligible, offer themselves for re-election.

7. Mr. John Smith, the Auditor, also retires, and being a shareholder, offers himself for re-election.

8. The profits for the past year amounted to £8,401 2s 8d, out of which the customary 10 per cent. has been written off the suspense account, viz., £1,669, and £500 has been written off the tools and machinery account, reducing the same to £832 12s 10d. Having already paid a half-year's interim dividend on the 6 per cent. Preference shares to the 31st Dec. 1892, the Directors recommend the payment of a smaller dividend on those Shares to the 30th June last, and a dividend of 6/- per Share, free of Income Tax

(being 3 per cent per annum), on the Ordinary Shares, carrying forward a balance of £968 4s 7s to the next account. It will be remembered that the dividend for the year ending the 30th June, 1892, was at 1½ per cent.—By order, C. M. ROBERTSON, Secy.
12, Fenchurch Street, London, E.C., 4th Nov. 1893.

A COMPARISON OF TEAS.

TO THE EDITORS OF THE LEEDS MERCURY.

Gentlemen,—The letter of your correspondent, J. Latchmore, in yesterday's "Mercury" should be widely read and considered by householders from a domestic point of view. The statements therein contained I substantially endorse, having been a professional tea-taster in Mincing-lane, London, for more than thirty years. Therefore I do not write theoretically or from a sentimental standpoint. I have uniformly upheld and advocated the greater purity of China tea, compared with the astringent Indian teas. For invalids and weakly persons I consider such teas (Indian) prejudicial to health, and should be avoided or taken in a modified quantity. To those who may desire to draw a contrast between the two classes I would suggest, in passing, that a cup of each kind (Indian and China), without cream or sugar, should be allowed to stand until quite cold: when it would be found that the infusion of the Indian tea would resemble yellow clay-water, while the China tea would retain its bright and transparent liquor—thus demonstrating its greater purity.

I append a verbatim extract from a lecture delivered to the students of the London Hospital by Sir Andrew Clark, Physician to the Queen.—Yours, &c., Harrogate, Oct. 26th, JOSHUA WHITWORTH.

SIR ANDREW OLARK ON TEA DRINKING.

Let the patient at the close of his meal sip a cup of milk and water, or a cup of tea. Tea to be useful should be, first of all, China black tea. The Indian tea which is being cultivated has become so powerful in its effect upon the nervous system that a cup of tea taken early in the morning, as many people do, so disorders the nervous system, that those who take it actually get into a state of tea intoxication, and produce a nerve disturbance which is painful to witness. If you want to have, either for yourselves or for your patients, tea which will not injure and which will refresh, get China black tea."

Gentlemen,—The interesting letter from Mr. Latchmore in your issue of today reopens the debate which filled so many columns of the daily and weekly Press throughout the kingdom some two years ago. We will refrain, therefore, from wearying your lay readers with the highly technical facts and figures which would be necessary to enable scientists to arrive at a conclusion. Let it suffice to say that Mr. Latchmore will find, even by referring to his own figures, that Indian tea possesses also more theine than China tea, as well as more tannin. Now theine is not only "the refreshing quality," as he rightly calls it, but it is indeed the essential characteristic of the tea-leaf, and mainly constitutes the dietetic value of the infusion. He and we therefore agree that Indian tea has the larger percentages of theine and tannin. But boiling water extracts the theine very much more quickly and readily than it extracts the tannin, and in a knowledge of this generally ignored but simple little fact lies most of the art and mystery of "making tea." If tea were always made for the good people of the North by analytical chemists intent on extracting the utmost decimal of everything out of tea, or if it were made and kindly kept warm for them from ten a.m. to ten p.m. by the accommodating young lady of the refreshment (!) bar at Slowburn-on-le-Moor railway station, we should strongly advise the good northerners to use only China tea, for they would then have less tannin to digest. But luckily every northern lady-of-the-house—whether in the Bishop's palace or the pitman's cottages—prefers to make her own tea, and curiously enough she knows which suits her best—better

even than all the male scientists in the world can tell her. Now, the vast majority of these very wide-awake housewives prefer Indian tea. We supply tea for more than a million every day, so we ought to know which they like best, and we know, too. In short, the drinker of China tea is like the farmer who tried claret, he "gets no forrarder on't!" The shrewd Yorkshire dame "wants to get there," as the New Yorkers say. She loves a good, strong, mouth-filling, tasty, tickling, thirst-quenching, rich, really refreshing, fragrant, body-satisfying, brain-contenting tea! And she gets it. And any observant, unprejudiced doctor would say her tongue was healthier and stronger than that of the most learned China tea-fed professor! You should leave out the old-fashioned "spoonful for the pot" with Indian tea, for one ounce of it will make as much good, strong liquor as an ounce and a half of China tea will make. Never let tea stew, for that's what doctors disagree with. Make the tea only six minutes before it is drunk, and give away that tannin-producing "tea-cosy" to the nearest and naughtiest little tyke, as a foolscap, or in the hope that you may thereby be giving him the tannin, he so richly deserves! Yours, &c.,

BROOKE, BOND, AND CO., LIMITED.

11, Boar-lane, Leeds, October 25th.

TEA CULTIVATION ON THE SLOPES OF THE CAUCASUS.

An interesting experiment is about to be made in Russia with regard to the cultivation of the tea plant. His Imperial Majesty the Czar, acting upon the advice of experts, has consented to the proposed cultivation of the shrub on the western slopes of the Caucasus, which are warm and approximate closely to the temperature in which the plant flourishes in China. At the present movement six hundred thriving shrubs are in Port Said awaiting suitable transport to some port in the Black Sea, from whence they will be conveyed to some convenient building where they will be able to withstand the rigorous winter. A staff of about a dozen Chinese is engaged—men thoroughly conversant with the peculiarities of the plant—and they are at present lodged in the Hotel Continental at Port Said under the direction of a Russian officer who has been deputed to carry out the initial steps of the experiment.—*Egyptian Gazette*.

A FURTHER "NEW DEPARTURE" IN THE TEA TRADE.

A most extraordinary move is now on the tapis as regards the trade in Indian tea. Several of the largest importers have banded themselves together with the apparent object of engineering the whole trade. From what we can gather, the idea is to limit auctions to 30,000 packages per week, and to hold these sales in a private room which no one can enter unless he has pledged himself in no way to deal outside these auctions. There are to be all sorts of pains and penalties for anyone breaking these autocratic rules after he has once signed away his freedom. On the face of it, the arrangement looks very onerous. Most of the buyers would rather have a press of tea now than a dribble every week throughout the summer, which has always been the recognised lazy time in the tea trade.

To put up just so many packages a week would also tend to stop at certain seasons anything like bold buying and would certainly be a check on individual enterprise. A glance at the names of the promoters shows that this latest cabal is a very powerful one; but when they set themselves up as dictators and endeavour, in order to strengthen their own hands, to completely upset the existing order of things, we foresee nothing but inglorious defeat, tempered with very little mercy from the great body of the trade. In our correspondence columns will be found a letter on this subject, in which the writer, under a veil of facetiousness, deals some effective thrusts at this "newest departure."—*Grocers' Gazette*, Nov. 7.

BURMA RUBY MINES.

LONDON, W., Nov. 6.—The last return of rubies found shows, for the fortnight ending October 4th, 680 carats, value R2,500, and for the fortnight ending October 17th, 570 carats, value R11,000. The last report is the first issued since the piercing of the rock, and now I think the shareholders may look forward to good times, if the natives do not rob too much. What with £5,000 per quarter coming in as rent from the native miners, and the increased quantity of rubies which will now be found, as the lye now reached is of superior quality, we certainly ought to be within reach of a dividend. I have never lost faith in this undertaking, and you will permit me to say, sir, that my interest is a very large one.—EDWIN W. STREETER.—*London Times*.

NATAL TEA: ESTIMATED YIELD— 700,000 lb.

Mr. G. W. Drummond, Kearsney, reports:—The past month was most unusually damp and cold, and the tea suffered in consequence. The rainfall was distributed all through the month, and the warm days were very few and far between. Under these circumstances, leaf cannot be expected to be good and sappy, and it makes the first process in manufacture—withering (a most important one) very slow and troublesome. The succeeding manipulation of the tea is also rendered difficult and laborious. Some people appear to imagine the manufacture of tea is a simple go-head process, with one object only, the saving of fuel, and we are accordingly much amused sometimes by the remarks of the noninitiated. That even a sudden change in the atmosphere requires a change in the manufacture and timing can hardly be expected to enter into the heads of those who are not "in the know," but it is a fact all the same. During the past month we expected to make a rather larger output than we did make, but still we are well ahead of last season up to date, and the tea liquors well. The estimate for the total output of the colony this season is 700,000 lb. or 140,000 lb. more than last season. Taking into consideration the increased area under full bearing, and approaching to full bearing, we shall not be surprised next June to find that we had rather under than over estimated the whole output.—*Natal Mercury*, Nov. 1.

CINCHONA BARK AND QUININE.—In the latest report to hand of Messrs. C. M. and O. Wodehouse, we read:—

The shipments of Bark from Java during September were 540,000 ½-kilos, against 605,600 ½-kilos last year, and from 1st January to 30th September 6,500,000 ½-kilos, against 4,480,000 ½-kilos. The Imports into Holland from 1st January to 31st August were 3,057,000 kilos, against 2,322,000 kilos last year. In an article in the *Ceylon Observer* of 18th September on the prospect of Cinchona, the writer states that the principal manufactories of Quinine are as follows: * * * and estimates that for these 21,200,000 lb. of Bark are required annually—but it is not so much the number of lb. of bark as the number of units of Quinine contained in the Bark that is required. Several of the factories taken into account do not appear to be working at present. The Public Sales held in London during the past month have been extremely small, and the chief point of interest in them has been the large proportion of Druggist's Bark. A good demand prevailed at the last auctions, and the value of the unit was fully ½ per lb. The last Dutch sale was held in Amsterdam on 5th inst. at which 4,700 packages Java were offered, of these 3,350 sold at an advance of 5 per cent, the average value of the unit being 2.70 cents (= ½d per lb.). As Manufacturers of Quinine still hold out for 10½d per oz., the orders which have come into the market for shipment to the United States have been executed out of second-hand stocks, and prices have advanced ½d per oz., the latest prices paid being 9½d per oz. for German (best marks) on the spot.

CHINA VERSUS ASSAM TEA.

A valued correspondent writes:—"There is no doubt that equally good tea can be made from China and Assam plants, and often in appearance the China product could give points to Assam. Well-plucked China tea, carefully manufactured, should be as brokers term it 'full of tip'—and gains in appearance what it loses in strength as compared with Assam; but for this reason I would not recommend planting out very inferior tea. Taken all round, China will not yield equally with Assam, and as a rule the manufactured article is not equal. 'Goomtee' years ago known as the 'Sink of Kurseong,' is an exception, and has surprised everyone under its present proprietor, but 'Margaret's Hope' and 'Turzun' are not entirely composed of low jät plants. The enterprising manager of 'Nonsuch' in his note in your issue of the 8th instant, does not prove anything, as he only tells us a mixture of Hybrid and China fetched the same price as Assam indigenous.

His garden is all of superior jät, and he has few bushes that could be ranked as low China, and besides he gives no details of outturn per acre from the plots plucked.

My experience is that a really good Hybrid is far superior for hill cultivation to indigenous Assam. It is harder, stands the frost, yields well, and with careful cultivation the manufacturer makes a tea second to none.—*South of India Observer.*

"The Droog" writes with regard to some former notes of his which appeared under this heading in our issue of the 8th instant, as follows:—

"The two experiments on *Nonsuch* tea were on the one hand China and Hybrid mixed in the proportion of 1-6th of the former to 5-6ths of the latter, and on the other hand pure Assam Indigenous. In the case of the samples sent home to be valued to which you referred in the same issue, you do not state whether the cultivation and general treatment of the bushes, previous to plucking, was identically the same in both cases. But there is however no doubt that much depends upon manufacture, as you very correctly remark."

[We confess that as regards this last case, the cultivation was not identical, but again we would point out that the *Nonsuch* experiments prove very little. The only conclusion to be drawn from them is that Hybrid (what class is not stated) mixed with a little China makes a high-priced tea as pure Assam.—Ed.]

Writing on the same subject a Kotagiri planter says that he agrees with us that one cannot turn out a good class of tea from a low-class China Hybrid. The tea is always weak in the cup. At the same time, however, our correspondent thinks that a good class Hybrid will turn out as good a tea as from a high-class Assam bush. In fact he says that he prefers the former kinds for these Hills.—*Ibid.*

TEA AND COFFEE IN CEYLON.

The London correspondent of our morning contemporary indulges in a little dream based on an "if" as follows:—

Thinking of the vicissitudes of Ceylon agriculture one is led to speculate what would have been the course of events if Tea had been the first love of the Ceylon Planter and it had been left for Coffee in these later days to rehabilitate the prosperity of the Colony. Imagine Ceylon, under the conditions of to-day, a prosperous Coffee producing country with estates bearing crops from 5 cwt. to 15 cwt. per acre as was the case thirty years ago. With prices over R100 per cwt., with exchange at 1s 3d. per rupee with transport by rail, with freights at 25, and London charges reduced to competition level the dreams of avarice could hardly fashion a greater potentiality of wealth than a good coffee totum. Coffee put on boardship at Colombo at R15 to R20 per cwt. would in such case bring a return of R75 per cwt., a clear profit of R250 to R300 per acre, full value for the free hold of land under

tea. Fortunately perhaps for Ceylon and her planters the temptations of cent per cent profits have not fallen to their lot: and it has been reserved for them in these singularly favourable times to devote themselves to the more certain, if less lucrative, cultivation of Tea, with respect to which it may well be doubted whether under the more trying conditions of the old coffee days it could have been made to pay at all. On the whole then we may well rest content with the prosperity that at present prevails.

TEA EXTENSION IN CEYLON AND MESSRS. FINLAY, MUIR & CO.

Large shipments of tea seed are arriving here from Calcutta, for opening up the extensive tracts of land that have been purchased by this influential firm on behalf of the Syhet Co. In addition to Warwick estate purchased for £8,650 sterling and New Cornwall for R40,000 and blocks of forest lands in Bambarabotuwa, it is rumoured in business circles that two blocks of forest in Yakdessa have also been purchased, altogether an extensive area to start with. The firm, we understand, will start business in the Fort in its own offices on the arrival of Sir John Muir and we wish it all the success its high reputation entitles it to.

THE AMSTERDAM CINCHONA AUCTIONS.

Amsterdam, Nov. 9th.

At the auctions held here to-day 4534 bales, or nearly the whole of the Java bark offered, sold at an advance of about 20 per cent at an average unit of 3½c per lb. (equal to 3-5ths d. per lb.) The following prices were paid: Manufacturing barks in quills, whole and broken, and in chips 6½c to 34½c (equal 1½d to 6½d per lb.); ditto root 10½c to 24½c per lb. (equal to 1½d to 4½d per lb.); druggists' bark in whole and broken quill and in chips 8c to 65c (equal to 1½d to 1s per lb.); ditto root 7½c to 7½c (equal to 1½d to 1½d per lb.) The chief buyers in the order of their quinine purchases, were the Frankfort factory, Mr. Gustav Briegleb, the Brunswick, Auerbach and Mannheim quinine factories. The manufacturing bark offered contained 16 tons sulphate of quinine, or 4.43 per cent on the average. About 1 one ton contained 1.2 per cent; 44 tons 2.3 per cent; 113 tons 3.4 per cent; 95 tons 4.5 per cent; 94 tons 5.6 per cent; 17 tons 6.7 per cent; 9 tons 7.8 per cent; 1 ton 8.9 per cent; and 2 tons 9.10 per cent sulphate of quinine.—*Chemist and Druggist.*

TEA AND SCANDAL.

As proving how appropriate the combination of me title is, I find that one of the cant words for "tea" is "scandal broth," and as your readers might like to know what the other slang terms connected with our staple are, I herewith give as many as I have as yet come across.

TEA IS CALLED:—Scandal broth, chatter broth, prattle broth, cat lap, slip slops, split pea, and slop (as in the sentence.—'How the blowens lush the slop, how the wenches drink the tea.')

QUEER CAT LAP.—Bad tea.

DISH OF LAP.—Dish of tea.

TO LAP CONGO.—To drink tea.

BITCH.—Among the students of the University of Cambridge a common name for tea.

TO BITCH.—To take or drink a cup of tea.

TWIST.—A mixture of half tea and half coffee, like wise brandy, beer, and eggs.

SMOUCH.—Dried leaves of the ash tree used by the smugglers for adulterating the black or bohea tea.

BOX-HAARY.—Tea and dinner at one meal.

NEWMAN'S TEA GARDEN'S.—Newgate.

TEA BOARDY (STUDIO TERM)—An epithet applied to an inferior picture, which reminds one of the old-fashioned lacquered tea-trays with landscape on them.

TEA-CHOP (NAUTICAL).—Small craft used to bring a cargo of tea alongside the ocean-going vessel.

TEA WAGGON (NAUTICAL).—A name given to the old East India Company's ships on account of their cargo.

TEA FIGHT (SOCIETY).—An evening party.

TEA-KETTLE (POPULAR).—Tea-kettle grooms or coachman are those who do general work. Tea-kettle purgers are scullery maids. "A decent allowance made to seedy swells, tea-kettle purgers, head robbers and flunkeys out of collar." A tailor's advertisement.

TEA-POT (AMERICAN).—A mispronunciation of *dépôt*, i.e. a railway station.

"Then outspoke a man unnoted
Hitherto: I heard the fellow
Say just now to the conductor
Ere we reached the second tea-pot
That he reckoned he must hook it
This here time a little sooner
If he hoped to get his portion."—In Nevada.

TEA-POT (CRICKETERS).—A tea-pot stroke, hit up in the air, giving an easy catch the results of spooning.

TEA-POT (PRISON).—Smashing the tea-pot, losing the privilege of tea from bad behaviour, and returning to the third-class. Having one's tea-pot mended, being restored to the higher class and its privileges also called "getting it down the spout."

TEA-POT SNEAKING (THIEVES).—Stealing plate, tea-pots.

"Tea-pot sneaking your mark?"

"Something better."—*Sporting Times*.

TEA-POT SOAK (THIEVES).—A thief who steals plate, tea-pots, &c.

"Tea-pot soaks will have the twitters,
Garrotters oft will suffer pain."—*Fun Almanack*.

TEA-SPON (SPORT).—£5,000.

THE DE LA MERE GIBOU (FRENCH).—Mélange inusé de choses et de mots; discours incohérent; pièce invraisemblable. Argot des couliassez.

(MOTHER GIBON'S TEA.—A senseless jumble of things and words; incoherent speech; improbable piece. Slang of the Green-room.)

Here is one of the most awful instances of calling 'cacao' cocoa that I ever met with. It appears at p. 187 of a "Treatise on the Falsifications of Food," by John Mitchell, 1848.—"Dr. Ure states that cocoa-nut shells are also used in the adulteration of chocolate, and remarks that 'of cocoa-nut shells 612,122 lb. were consumed in Ireland, and less than 4,000 lb. of cocoa. How scurvily are the people of Ireland treated by their own grocers. Upwards of 60,000 lb. of worthless cocoa-husks served out to them along with only 4,000 lb. of cocoa-beans.' You will notice that there is a cipher wrong somewhere, but the point is that 'coco-nutshells' ought in all cases to be 'cacao husks.'

In 'Cups and their Customs' (p. 47) I came across a drink called 'REGENTS PUNCH' which I copy for you as tea is one of the ingredients, and as a warning how not to do it:—"To a pint of strongly made green tea add the rinds and juice of two lemons, one Seville orange, and one sweet orange with half a pound of loaf sugar, and a small stick of cinnamon. After standing for half an hour strain the mixture, add a bottle of champagne, half a bottle of sherry, three wine-glasses of brandy, rum, Curacao and Noyau, of each a wine glass, and a pint of pine-apple syrup. Ice the compound well, and immediately before drinking add a bottle of soda-water." A. M. F.

PICE PACKETS OF QUININE FOR SALE AT INDIAN POST OFFICES:

AN EXAMPLE TO THE CEYLON GOVERNMENT.

We have received a copy of the last Cinchona Report of the Government of Bengal with samples of the pice packets of quinine which are now for sale at all Post Offices throughout the Lower Provinces. The following extract from Dr. G. King's Report shews what has been done:—Sale of Quinine at Post Offices.—The chief event of the year has

been the organization of the system by which quinine, made up in doses of five grains, is offered for sale at most of the Post Offices within the Province of Bengal. Each dose is made up in a neat closed paper envelope, and is sold for one pice. Each packet carries the royal arms as a guarantee of genuineness, together with brief instructions in the vernacular. To encourage the Post Office officials to push the sale of these packets a small commission is allowed, and considerable facility is offered for replenishing of stocks by post-masters. The quinine is made over from the factory to the Jail Department in bulk, and by prison labour it is subdivided into pice packets, 1,400 of which go to each airdropis pound. The Jail Department distributes these packets to the post-masters and collects the proceeds of the sales at the various Post Offices. A dose of pure quinine is by this means put within the reach of any person within the province who has a pice to buy it with. Thus at last, after thirty years of effort, has the end been attained which the Government set before itself when the growth of the medical cinchonas was begun in British India. That end was thus expressed in an early Government resolution on the subject:—"To put the only medicine that is of any use in the cure of the commonest and most fatal of Indian diseases within the reach of the poorest." Of the provinces usually supplied with quinine from the Mungpo Factory, Bengal is the only one into which this pice packet system has as yet been introduced. It is believed that, should the various provinces under the Government of India adopt the system, large demands will be made on the cinchona plantation, and extended planting operations may have to be undertaken. To meet such, Government have, in addition to the land reserved in the neighbourhood of Mungpo, a reserve on the Bhootan frontier in Engo Valley, in which ground has not yet been broken. The Bengal Government express great satisfaction with the arrangement and note that 475 lb of quinine were thus made up into packets for sale during the year. The paper packets are small envelopes of strong paper about $2\frac{1}{2}$ by $\frac{1}{4}$ inches and each contains 5 grains of sulphate of quinine. The price is so calculated as only just to leave to Government a very small profit on its plantation. This is shewn by the fact that while the gross revenue of the year was Rs. 1,17,768 the net revenue was only Rs. 3,171.—*Indian Forester*.

NOTES ABOUT THE MANUFACTURE OF TEA.

"RED SPIDER" kindly sends us the following notes of a recent correspondence with a neighbouring planter. They will be of interest to others:—

Q. As the thermometer of the Drier is affected by the radiation [conduction] of the heat from the iron through which it passes [with which it is in contact?] have you ever tried putting a thermometer in the drawers of the Drier to ascertain the actual heat of the air in the drawers? Just now I found with the sirocco, that when the therm. recorded 240°, a therm. kept a quarter of an hour in a drawer (with no wet leaf to affect it) recorded only 125° actual heat. Will you kindly let me know how you find it with your Kinmond?

Ans. Therm. in tea tray ganges same as on air chamber door but must be read *in situ*.

Did you read your therm. *in situ*?

Removal from tray causes instant drop of 20 degrees. We need to know heat of iron plate alone, if we go by this standard and if heat of air be less than the iron it heats so much the better, as it makes the ground safer. The difference you record is extraordinary.

HEAVY YIELDS AND HIGH-PRICED NILGIRI TEA.

Our correspondent "Red Spider" kindly writes as follows:—"I am plucking 3 leaf tea which will turn out at the rate of 500 lb. made tea per acre. This is of course unmanured field only, the average yield being only about 300 lb., which is not at all bad for these Hills. A recent consignment to the

London market of the above pickings was valued as follows:—

19 $\frac{1}{2}$ chests Orange Pekoe 1s 2d.

5 $\frac{1}{2}$ chests Broken Pekoe 1s 6d to 1s 8d.

I usually sell 2d higher than valuations.

The value of the above figures chiefly hangs on an experiment I have been making with regard to the final firing. I pack them in the chests straight from the driers and do not 'bin' them as is usual. These valuations show a distinct advance on former prices. I hope to send you shortly some further details about the 'final firing' question.

[We must congratulate "Red Spider" both on his yield and his price and shall await with great interest the further details in *re* the "final firing" experiment he has promised us.—Ed.]—*South of India Observer*.

REGULATING THE SUPPLIES OF INDIAN TEA.

The following communications explain themselves and may be read in the light of a sequel to the meeting held last week:—

Indian Tea Districts Association, 14, St. Mary Axe, E.C.
November 13th, 1893.

Referring to the accompanying letter, which I am asked to circulate, my committee will be glad if you will do all you can to assist the brokers in giving effect to the resolution.—ERNEST TYE, Secretary.

The Tea Brokers' Association of London,
118, Dunster House, Mincing Lane, E.C.
Nov. 10th, 1893.

Dear Sir,—I am desired to acquaint you that at a meeting of Indian tea brokers, held this day, the following resolution was adopted:—

"That whilst feeling it altogether impracticable to lay down any hard-and-fast rule in the matter of regulating supplies of Indian Tea at auction, this meeting is of opinion that about 45,000 packages per week to the end of the year would be a fair average supply, and will endeavour, so far as individually able, to keep within this limit, meeting again in January to consider the quantities for the spring months.

I am also to ask you to be good enough to communicate this resolution to the members of your association, and am, dear sir, yours faithfully, W. G. PRICE, Secretary.—*H. and C. Mail*, Nov. 17.

"TANOCCA": TEA-TONING TABLETS.

A week scarcely passes by without we hear of a new occupation evolved out of her inner consciousness by some enterprising and ingenious woman. Today a letter reaches me from the country, containing a packet of rather strange-looking little lozenges of a mauve colour, neither smelling nor tasting of anything particular under heaven or earth, so I read the letter for an explanation. Tea we know does not suit our digestions. Every doctor, even the least of faddists, tells us this. We shut our eyes to the fact—I know I do—and boldly declare that our four or five cups a day are rather good for us than otherwise. If so, why then that obscure heating of the heart when starting for a walk after the last cup at 5 o'clock? Why that tight little feeling across the chest? But to continue about the mauve lozenges—by name "tanocca," or tea-toning tablets. A doctor, after some years' careful investigation, has discovered exactly the right ingredient to neutralise the harmful properties of tannin, not by any means a patent medicine, but merely some simple thing in daily use in our kitchens (I am dying to tell you what it is, but at present am bound to secrecy). Three ladies living in the country, sisters of the doctor who has made the discovery, now

depend their time in making up the tea-toning tablets, of which they send me a sample. You add one or two of the tablets with every teaspoonful of tea in your pot. The flavour of the tea is improved, and besides this, the tannin is so completely neutralised that you may drink several cups without feeling any of the unpleasant after-effects, to which I have been so treacherous to womankind as just to allude. Tea treated in this way may stand as long as you please without becoming bitter.—*Englishwoman*.

CEYLON COFFEE AND TEA.

Within the last few years, so many of our readers are doubtless aware, tea planting has largely taken the place of coffee planting in Ceylon. We gather from "The Ceylon Handbook and Directory," 1893-4, compiled and edited by Mr. J. Ferguson, of the *Ceylon Observer*, and published in England by Messrs. J. Haddon & Co. and Messrs. Kagan, Paul & Co. that in many large districts once flourishing with coffee not a single acre under that shrub now remains. The island has many staple products, but chief among them for many years was coffee. There has been a good deal of controversy as to who was the first coffee planter, but the late George Bird is spoken of as "the father of Ceylon planter," and to him, apparently, belonged the honour of forming the first coffee plantation in the island. Mr. Bird accompanied his brother (Colonel Bird) to Ceylon in 1823, and Sir James Campbell, then lieutenant-governor, promised a grant of land for the purpose of coffee planting. Mr. Bird opened the first coffee estate in 1824. The first ardent adventurers pioneered their way through pathless jungle; the tracks they made were in course of time converted into highways, and comfortable bungalows took the place of rude huts. In 1845 the "coffee mania" may be said to have been at its height. Aristocratic immigrants poured into the island hoping to add to their riches by engaging in the profitable industry, but they were inexperienced. Their expenditure was prodigal, and the inevitable crash came. It is said that five millions sterling were sunk in as many years. Estates were forced into the market, and were sold off for a twentieth part of the outlay incurred in forming them. Others that could not find purchasers were deserted, and allowed to return to jungle. For nearly three years the industry was almost paralysed, but those planters who combined judgment with capital succeeded in restoring energy to the enterprise. In 1874-5 the coffee exports amounted to 988,328 cwt., but since 1883-4 there has been a gradual decline, the lowest reached being those of 1891-2, which were only 42,256 cwt. Those of 1892-93 were 55,000. Thus in the last two years the exports of coffee averaged less than 50,000 cwt.—or only about equal in quantity to the exports at the beginning of the enterprise. This decline is chiefly due to the supercession of coffee by tea. Last August there were 273,000 acres planted with tea. The exports last year amounted to 72,279,985 lb., valued at 32,527,136 rupees. It is estimated that this year's exports will be about 80,000,000 lb. The imports of tea (chiefly from India and China) have been reduced to a very small quantity, the native product being used almost universally by tea-drinkers on the island. Buyers and consumers in the United Kingdom have taken readily to Ceylon tea, and there is a large demand for it in the Australian Colonies and also in Russia, and a considerable trade with America is expected in consequence of the exhibit of the tea planters at the Chicago Exhibition. The average price obtained by the planters is about 9d. per lb., which yields them a profit of 2d. or 3d. In 1885 the price was 1s. 3d. per lb., but there has been a gradual decline since then, owing, no doubt, to the greatly increased supplies.—*Manchester Examiner*.

SERVICE IN EAST AFRICA.—Three experienced conductors are wanted for East Africa.

THE RUBBER PLANTS OF INDIA.

By CONSUL-GENERAL MERRITT, OF CALCUTTA.

Caoutchouc.—Caoutchouc, or India-Rubber, is the thickened milky sap obtained from at least six genera of plants belonging to three widely different natural orders, *Landolphia* and *Willughbeia*, to *Apocynaceæ*; *Castilloa* and *Ficus*, to *Urticaceæ*; *Hevea* and *Manihot*, to *Euphorbiaceæ*. When the bark of plants containing this substance is cut, the milk exudes and in time hardens on exposure to the air. In the plant tissue caoutchouc is found to circulate in certain vein-like vessels distributed throughout the middle, or more rarely the inner layer of bark. It is highly elastic, lighter than water, has neither taste nor smell; and that derived from the *Ficus elastica*, the principal rubber producing tree of India, consists of 87.2 parts of carbon and 12.8 of hydr. gen.

RUBBER PLANTS OF INDIA.—There are a great variety of caoutchouc-yielding plants indigenous to India, and both time and money have been spent in experimenting with worthless milky shrubs and climbers. Much has been written advocating the cultivation of rubber-producing vines, yet no lasting interest has been created in these troublesome creepers, and little has been done in the way of procuring caoutchouc from them either in a wild or a cultivated state. Experiments have been made in many parts of this country with exotic plants. Grossly exaggerated statements were given out at first in regard to the facility of production and resulting profits, causing for a short time great activity, followed, however by a widespread disappointment. People who never think of a permanent home in a country cannot be expected to make investments on which they must wait fifty years for a realisation. The effort to profitably introduce foreign rubber plants in Northern India has been a complete failure, and the product from the private plantations of the South is not likely to have any appreciable effect on exports for many years.

The present report, therefore, will be confined to indigenous plants, and as but little rubber is derived from Southern India, and that principally from neglected vines, and as the article of Indian commerce is procured from Northern India, and almost exclusively from the *Ficus elastica*, a few lines containing information acquired by conversation with intelligent practical men in regard to this tree, ought to be worth pages of suppositions obtained from contradictory authors about plants that up to this time have proved of little value.

THE *FICUS ELASTICA*.

HABITAT.—The *Ficus elastica* is found in the damp forests at the base of the Sikkim Himalaya, in Assam, Chittagong, and Burma, and probably eastward in the unexplored region beyond. It is a large evergreen tree, usually epiphytic in its young stage, but finally or originally rooting in the ground, and sending down banyan-like aerial stems to take hold and find nourishment in the soil. It requires an exceedingly damp atmosphere to do well, and, therefore, thrives best at the foot of the mountains or on the mountains themselves up to an elevation of 2,000 feet. Among forest trees it is easily first, for no other approaches it in dimension and grandeur.

GROWTH.—The seed germinating often on the summit of a lofty tree, whither it has been carried by a bird, sends down its far-reaching roots, and from the top of these grow horizontal branches and a dark green dome of leafy boughs. In time, the foster-stem having been overshadowed and destroyed, a hundred pillar-like trunks hold possession.

RUBBER GATHERING.—The trees when not under the immediate supervision of the forest conservators are tapped in the most careless manner. In the lower portions, and in the long aerial roots, diagonal cuts penetrating to the wood are made from 6 to 18 inches long, and in an elliptical form, so as to be about 3 inches across the centre, and the sap allowed to run into funnel shaped leaves or holes in the ground. It is only necessary to see the tree to appreciate the fearful risk encountered by the gum gatherers, who by no means confine their operations

to the base, but climb as high as the roots extend, and higher still along the horizontal branches, chopping with their dhavs at intervals of every few inches, making at the same time a foothold and a place from which the sap exudes. There must be two ascents, the first to tap the tree, and the second, a day or two after, to collect the gum that has formed. The tears which gather below the wounds, when pulled off, bring with them all the exuded gum, and firm when moulded together, a sticky ball.

DESTRUCTIVE GATHERING.—The quantity collected at one cutting seldom exceeds 8 to 10 pounds. Of course winter and spring are the only seasons in which the gathering is practicable, for the summer rains would wash away the tears before they had time to solidify. It is stated however, that the sap flows most freely during the rainy season. This damaging way of tapping soon makes itself apparent in large cankers and rotted off buttresses. The wonderfully deep green foliage loses its luxuriance, and dead roots and blasted branches testify to the fearful wrongs inflicted on the tree. However, it is when the wild tribes, with the customary improvidence of savages, attack the valuable rubber forests, cutting and slashing in the most outrageous manner, that the wholesale destruction begins. They slash all parts of the trees within reach, often felling them so as to render the operation of tapping more convenient. Scarcely anything can be more disheartening than the sight of hundreds of magnificent trees lying bleeding on the ground, their roots, trunks, and topmost branches covered with sickening gashes. Not infrequently these roving Vandals set fire to forests, so that tender shrubs may spring up on which their flocks may feed. More often, along the banks of rivers and their swollen tributaries, they cut away the timber, so valuable while living, and float it down to be sold for the commonest of purposes.

PRESERVATION.—It is a pleasure, however to be able to say, that the statement one frequently meets, that no effort is being made for the preservation of rubber trees is incorrect. Nothing is more interesting to observe than the untiring efforts of the British Government for the conservation of the forests and for the care of *Ficus elastica* plantations.

The immediate effect of the extension of English rule of course, is the widespread devastation of forests, since the people just beyond the limit of restraint collect for the new market the caoutchouc in their destructive way; but once under the will of the new ruler their wasteful natures are curbed, and their ruinous practices, to a great extent, stopped. The protection of areas with naturally grown rubber trees on them is exceedingly difficult, on account of the well-nigh inaccessible localities where these trees grow, and because of the unequal way in which they are scattered over vast regions. Rubber is so very portable, its removal not being confined to roads or rivers, as with timber, that depredations on the forest preserves are of frequent occurrence. Vigilance never ceases, however, and new districts are constantly added to be watched over by the officials of the forest department.

In the single province of Bengal, 11,468 square miles are under the control of these officers. One district in Assam, 8 by 30 miles, is said to contain 43,000 rubber trees, many of them more than 100 feet high.

LEGITIMATE GATHERING.—The legitimate collection of rubber in the timber reserves is conducted under rigid restrictions. Fresh cuts are made only in February, March, and April, and the trees are allowed to rest for two years between each tapping. The cuts begin about 4 feet from the ground on the main stem alone, and are not less than 2 feet apart, and penetrate the bark only.

A European house adopted the plan of running the milk into wooden bins 6 feet square, partially filled with water, on which the rubber floats after a time. While the caoutchouc is still a liquid it is removed and boiled over a slow fire in iron pans 4 by 6 feet and 2 feet deep, two parts of water are added, and the whole is stirred constantly. When coagulated the rubber is removed with iron

forks, pressed, again boiled and pressed, sun dried, and washed over with lime.

QUALITY OF RUBBER.—The rubber brought in from the region bordering on China is wretched-looking stuff, consisting of chunks resembling dark tufa or halls, 30 per cent. of which is sand, bark, and clay. Many of the dirty stringy globes the natives have to sell remind one of a ball made by a thrifty mother of different sizes of twine that has been played with in the muddy streets by her scampish sons. These unscrupulous collectors always conceal a lump of mud in the centre of the glutinous mass, imagining, since it is sold nominally by weight, that their cheating has not being foreknown and provided for. The jungle people also mix with the produce of the *Ficus elastica* rubbers derived from two large creepers, the botanical names of which are *Choumomorpha macrophylla* and *Rhynocodia wallichii*.

PLANTING THE FIGUS.—Recently the authorities have been spending large amounts of money, and wisely directed effort in planting and raising the *Ficus elastica*. The British Government has come with purpose of staying, and it can afford to wait for the large returns that are certain to be derived from its investments in plantations and forest reservations. It is a difficult thing to arrive at the truth in an investigation in regard to future productions, for those who know most differ widely in their judgment. Dr. George King, the superintendent of the Royal Botanic Garden, tells me that he "expects a decided increase in the rubber product within a reasonable period, as the effect of the protection of rubber trees within British territory," while Mr. Gustav Mann, conservator of forests, informs me "that there is sure to be a decrease of natural supply from this country." No practical scientists stand higher than these two gentlemen.

Be the results of forest protection and forest destruction what they may, the Government is using great precaution against the absolute ruin of the rubber industry, by starting *Ficus elastica* plantations in different parts of the country.

PLANTING AND CULTIVATING THE FIGUS.

SOING THE FIGUS SEED.—The seed of this tree ripens from January to March, when it is collected as it falls, and dried in the sun. It is, properly speaking, the fruit, and consists of small figs the size of a pea. These, at the time of sowing, are broken between the hands, and the seed thus mixed with the particles of fruit is sown without any attempt to clean or separate the seed. About 75 seed are in one fig. Germination takes place sometimes only three months after the seed has been sown, and as it is very small, it is scattered on the surface of the soil only. It requires as much light as possible from above; side shade is an advantage. The seed is sown on beds, or in boxes or flowerpots, and it is most essential that the drainage of the soil be perfect and that the earth never becomes soaking wet; whilst on the other hand it is never allowed to become thoroughly dry, but is kept always moist.

TRANSPLANTING.—As the seedlings are very small at first, they are treated with great care, and drip from trees above the seed bed is guarded against. The soil is kept loose and open. Vegetable mould is the best soil. When seedlings are 2 or 3 inches high, they have formed already a little thickened root, something like a small carrot, and are then transplanted very safely. This is done on a properly dug nursery bed, well drained, and the seedlings are placed about 1 foot apart, in lines also a foot from each other. After the seedlings have become 1 to 2 feet in high, they are very hardy, and can be transplanted at any time of the year; but to protect them from the deer, who are extremely fond of the leaves, and to avoid the great expense of fencing in a plantation, it is deemed advisable to transplant the young trees a second time in nurseries, giving them more room, say 3 to 4 foot square to each plant, and to let them grow until 10 to 12 feet high, when they can be

put out into the plantation without fear that the deer will destroy them. They require, however, a strong stake each, as the deer will bend the young trees down with their horns if not staked.

Seedlings of *Ficus elastica* planted in the forks of trees in the forest are very difficult to attend to, and they in consequence often become dry about their roots, which retards their growth if it does not kill them. For these reasons rubber trees planted on the ground grow much better in Assam plantations, and the latter mode of planting has therefore been adopted almost exclusively. They are not planted, however, on the ground in the common way, but on small mounds 3 to 4 feet high of earth, and the cut wood and rubbish close at hand, which suits the epiphytal habit of growth of this tree.

CUTTINGS.—This rubber tree can also readily be propagated from cuttings, if only perfectly ripe young branches or shoots are used, but young trees so raised are not so hardy as the seedlings, and do not make equally good growth in the first five to ten years.

SITUATION.—To insure the greatest possible amount of moisture in the atmosphere, the plantations of *Ficus elastica* in Assam have been made in the moist evergreen forests, near the foot of the hills, through which lines 40 feet in width were cleared 100 feet apart from centre to centre of the lines, thus leaving 60 feet of forest standing between the lines. On these cleared lines the mounds for the planting of seedlings or saplings are thrown up at a distance of 25 feet apart. Care has to be taken afterwards to prevent the forest trees left standing closing in above, over the lines and the rubber trees planted on them, which they have always a tendency to do, and which, if not guarded against, is very detrimental to the growth of the young rubber trees. This is easily effected by lopping the branches of the forest trees left standing. The undergrowth which springs up on these lines and as a rule grows most vigorously, has also to be cleared two or three times in the year for the first four or five years to admit air for the young rubber trees; but beyond this, and the putting occasionally some more earth on to the mounds on which the trees were planted, nothing is necessary. The lines for planting are cut in an east and west direction, so as to protect the young rubber trees against the strong sun in the middle of the day; the atmosphere also keeps moister in this case than if the lines were cut south and north. High ground is always best, and swampy ground where water lodges is avoided; but the tree grows very well on alluvial flats, on the banks of rivers, even though the land be inundated for few days once or twice in the year.

DURRANY PLANTATION.—The only successful plantation of any size in India is in the Durrany district of the province of Assam. Its area is now 1,588 acres and the trees are growing luxuriantly. Since it is not thought to be wise to tap the trees before they are twenty-five years old, no estimate can be made as to what the product will be. As it is said that an amount varying from 40 to 80 pounds of rubber has been taken from a forest tree yearly without injury, there is an opportunity for everyone to make his own calculation as to the outcome of the governmental experiments.

THE NATURAL SUPPLY.—When men who knew most in regard to the rubber business are asked whether they fear a decrease of the natural supply of rubber, the reply is almost always in the affirmative; but they are careful to add the lack of knowledge, which, perhaps, is unattainable, and the rapid increase of manufactories are the causes of the commercial fright.

It was my pleasure to have a long conversation with Maj. J. A. Betts, who to scientific acquirements has added that practical knowledge that comes to a business man with opportunities of travel; while an officer in the Chinese army he explored the large

islands of Formosa and Hainan, and found the forests filled with untouched *Ficus elastica*.

It is natural to reason that in all the semi-explored regions from Burmah to the Pacific these trees are to be found, and that with the subjugation of the wild tribes an amount of rubber will come from India and the country eastward, to supplement that derived from South America and Africa, sufficient to supply the world's demand.—*India-Rubber Journal*.

THE ACME TEA CHEST.

We have received from the local agents—as per letter given below—an Acme Tea Chest with the latest improvements, which has been subjected to a severe test in respect of packing, with most satisfactory results. We learned from Mr. Rutherford when in Colombo that he was present when an Acme chest (with wooden end as now supplied) was tried after a very unusual fashion; it was packed with tea, then hoisted to a considerable height and dropped on the hard floor; and yet without any of the tea being spilt or the chest damaged to any appreciable extent. The chest packed with saw-dust and sand in Glasgow and sent out here, can be seen at the *Observer* Office and its condition ought to encourage planters to use what is bound to become, we think, the favourite tea-chest of the early future.

THE ACME TEA CHEST.

Colombo, Dec. 5th.

DEAR SIR,—By request of the A. T. C. Syndicate, Ltd., we are forwarding you a specimen of the Acme Tea Chest, which has been packed with about 100 lb. saw-dust and sand, and shipped from Glasgow to Colombo to prove its stability and to enable shippers in Ceylon to judge of the packages after a voyage.—Yours faithfully,

WHITTALL & Co.,
P. pro. A. J. SAWER.

CEYLON TEA IN AMERICA.

We are indebted to Mr. J. L. Shand for the following very practical and instructive deliverance on the subject of the introduction of our tea into America. It will be read with interest by the planting community:—

"Your London Correspondent reports with fair accuracy the conversation I had with him about Ceylon Tea in America though of course I said £30,000 would mean an expenditure of nearly £30 for each estate and not £30 for every ten* estates. I have never looked upon the expenditure over the Chicago Exhibition as in any way likely to raise the price of Ceylon tea to the producer, but as a judicious hedge in a case they should come when the markets of Europe were glutted with black teas from India and Ceylon and no effort should be spared to encourage the taste for black teas in the United States. So long as the London market is relieved it does not to my mind in the least matter whether Indian or Ceylon tea goes to the States; they rise and fall in perfect harmony. With all the American bunkum and bluster about using the best of everything, you have only to look at the 'Price Currents' of the large towns to see how finely trade is cut. I would undertake to sell half next year's crop of Ceylon tea in the United States; but I should have to do it at from 10 per cent. to 20 per cent. less than I could sell it at in London.

"I have seen something of the Yankee trader by whom many interested in Ceylon tea have had their wings singed. He comes in a mysterious way intro-

*"Ten," we fear must have been a misprint for "tea," estates.—Ed. T.A.

duced by somebody you never quite know by whom and tells you that he wants to do business with you—no ordinary business measured by pounds or breaks, but by tons or cargoes. You assure him you can supply his every want and after terms have been satisfactorily discussed and a special proviso at his request conceded, that be it tea or coffee or cocoa or plumbago, he should have your sole agency for the whole of the United States. He then grasps your hand warmly, takes a friendly and what generally proves to be an eternal farewell and passes from your sight and ken for ever!

"I did not mean to say that no good could be done in the United States with a smaller sum than £100,000. I believe this sum would require to be spent if Ceylon teas were to be adequately placed before the 70,000,000 of the States and if the London market is to be sensibly relieved; but I believe that £10,000 or £20,000 might be profitably expended in subsidizing existing Agencies. What those responsible for the expenditure must beware of is the great danger of dribbling away money and becoming at the same time poorer and wiser as many who have tried to push Indian and Ceylon teas in the States have already found.

J. L. S.

[Mr. Forbes Laurie's letter given elsewhere, reached us at too late an hour to enable comment to be made.—Ed. T.A.]

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, Nov. 9.

CINCHONA.—The October exports from Java as announced by cable, show a very heavy decline compared with those of October 1892, the figures being:—

Oct. 1892. Oct. 1893.

About 800,000 Amst. lb. About 350,000 Amst. lb.

The excess of the Java shipments during the current year compared with 1892, which was about 2,000,000 lb. on September 30th, has now been reduced to about 1,500,000 lb. The London cinchona auctions of Tuesday next, which at first seemed likely to be very small, will be somewhat larger after all than was anticipated, some 700 bales of ten or twelve-year old Copra bark having just been declared for sale. A parcel of this bark, which was bought in at the last auction, has since been sold privately at 7½ per lb., which is equal to about 9s per cwt. The hide-covering of each package alone is worth about 6s. The total quantity of other barks now catalogued is 43 bales Ceylon and East Indian, 56 Java, and 190 cultivated Calisaya quills.

CINNAMON.—The demand still continues, about 300 bales Ceylon cinnamon, November-December shipment, usual assortment, having sold this week at 3½ per lb. c.i.f. terms.

COCAINE.—There has been another big drop in cocaine, the manufacturers having suddenly put the price down another shilling per oz. 1½ to 1½ 3d per oz. being the present figure for hydrochlorate in bulk. The cause of the drop lies partly in the heavy imports of crude cocaine from Peru, and partly in the determination of the older manufacturers to crush a German competitor who has lately begun to under-sell them.

COCO-BUTTER.—At the usual monthly sales held on Tuesday, 550 2-cwt. cases of Cadbury's coco-butter sold at from 12½ to 13½ per lb., marking an average decline of 1d per lb. upon the preceding sales.

NOTES ON PRODUCE AND FINANCE.

"COFFEE."—In view of the fact that the *Lancet* recently referred to the "restorative" and "refreshing" properties of coffee-tee, the following letter from Messrs. Fulbrook and Co. of Idol Lane, is not without much interest: Last June a small quantity of 'coffee-Ra,' from Ceylon, was sold in the Commercial Sale Rooms and now there is another small parcel in the market. So far as we can learn these are the first importations although we find that it has been prepared and used by the natives of Sumatra for many years. Though the product of the coffee plant (*Coffea Arabica*), the leaves before infusion closely resemble true tea (*Camellia thea*), but when infused they are easily distinguished, the former lacking the serrated edges which are characteristic of all varieties to the *Camellia*. The liquor is pungent with a spicy

flavour, for which a taste might be quickly acquired; but at present we cannot express any opinion as to whether this would be so or not. The Customs officials are no doubt convinced that, technically this product is not tea, as they have passed it free of duty. This being so, its name is misleading, and should, we think, be changed. The importation of a few half-chests may seem an insignificant matter; but nevertheless it may prove to be of considerable importance, as there is no reason why large quantities should not be produced, and it is quite possible that it may become an important tea substitute, used alone, or blended as chicory is blended with coffee. If on analysis and practical experience 'coffee-tea' proves a wholesome beverage (it may have valuable medicinal properties,) we see no objection to its use; but it should have a distinctive name—'coffee,' for instance—and pay its contribution to the revenue as other beverages have to do."

THE LAW ABOUT ADULTERATED COFFEE.—The anomalous state of the law about the sale of chicory and coffee, to which we have frequently called attention, is referred to by the public analyst for Paddington. Says this official: "You are invited to 'Try our celebrated one shilling coffee.' If you do so, you probably find, on reading through the printing on the package, that it is described as a 'mixture of chicory and coffee.' Analysis shows the chicory to form usually from 50 to 90 per cent. of the weight. Should you prosecute the vendor, you will find that half the magistrates on the bench hold that you, having asked for 'coffee,' have a right to have that and nothing else. The other half hold that you may be served with anything containing some coffee, if only it is labelled 'a mixture,' whatever you might have asked for or the vendor have advertised to sell."

THE DEVELOPMENT OF CINCHONA CULTIVATION IN INDIA.—Cinchona cultivation in India has had a chequered history, but it now bids fair to achieve its philanthropic end simultaneously with a due regard for the exigencies of finance. "Since January last," we quote from *The Times*, "any individual of the 71,000,000 who form the population of Bengal can obtain a dose of quinine at the nearest post-office for exactly one farthing." And the extent to which the native population has availed itself of this boon may be gauged by the fact that in September 120,000 of these grain packets were served out in Bengal. The experiment has proved so successful that if the supply can keep pace with the demand, a similar system will be organised throughout the other provinces. In view of the prevalence of the influenza epidemic in this country, it were much to be desired that the poorer classes among us should be similarly provided with the means of obtaining some trustworthy specific at an equally reasonable rate. As matters stand, they prefer in a great many cases to give absurdly high prices for the concoctions of charlatans.—*H. and C. Mail*, Nov. 17.

YATIYANTOTA TEA COMPANY

At an extraordinary general meeting of this Company held on Dec. 2nd, in the office of Messrs. Whittall & Co., a special resolution was confirmed inserting "£100,000" for "£30,000" in the articles of Association, and sanctioning the issue from time to time of debenture bonds for such amounts as the directors think proper, the whole not to exceed £75,000.

VARIOUS AGRICULTURAL NOTES.

DEVELOPING THE COFFEE BERRY.—A few weeks ago I referred to the never-failing energy and enterprise of Mr. Alfred L. Jones, a well-known Liverpool shipowner, who is closely connected with the African trade, and to whom is mostly due the development of Grand Canary. It is now reported

that Mr. Jones intends to organise a large coffee plantation somewhere near Lagos, acquiring for that purpose an area of some fifty or sixty thousand acres. Mr. Jones is, I believe, an excellent judge of coffee, and, unless my memory fails me, or my calculating powers are not what they ought to be, I have myself seen him dispose of no less than six cups of the finest black at a snug little lunching-club not many miles away from Cook Street, Liverpool. Mr. Jones's intention to develop the coffee-berry may in some way account for the rumour that he is shortly to be made C. B.—*Messenger*.

TEA-MAKING.—The *London Spectator*, which strains painfully after effect, has this on making tea:—"Most sensible people brew for five minutes. The large majority of foolish persons brew either a draught as bitter as Lethe, or a wash that is no better than the yellow contents of the kitchen boiler." Judging by the amount of fairly good tea one gets to drink, even at railway refreshment rooms, this estimate puts the number of fools in the world much lower than Carlyle set it.—*The Planter*.

[No. 6.

TREATMENT OF MILCH COWS.

HE treatment of milch cows in this country is a subject about which very little is known by the ordinary owner of these animals, and it is only those who have given special attention to their management, so as to get the maximum yield of milk, that have, by care and perseverance, made any progress towards discovering the best methods to be followed. The native Sinhalese cowkeeper, it will be admitted, has a very superficial knowledge of the cow, to judge by the results of his treatment of that animal, but even the well-to-do householder, who keeps a few cows for supplying his family with milk, is generally blissfully ignorant of their management. It is often mentioned as inexplicable, that a cow does not give regular quantities of milk, or that it goes off milk in a few months, or that the animal ceases giving milk owing to the death of the calf, and so on. The fact, however, is that all these circumstances are easily explainable as the result of the bad treatment that the cow has received at the hands of the cattle-keeper. We will not touch upon such questions as the selection and purchase of the milch cow, the age of the cow, the age of the calf, and other points which are all of the utmost importance to the owner of a cow, and will take it for granted that the milking animals whose treatment we are about to refer to, are already in the possession of the cow-keeper. First, as regards food. How many people are confident that they are feeding their animals on the most approved system? Whether cotton seed, gingelly

cake, cotton cake, horse gram, bran, rice, black gram or other concentrated food should form part of the diet, is generally a question thought to be immaterial, and what mixtures of these, or proportion of the ingredients, should be given, are also never seriously considered. Again, the mode of preparation of the food and the time for feeding, receive little or no attention. Even such minor matters as bathing, rubbing down or grooming and general attendance to the comfort of the animals, which have a wonderful effect on the general health, temper and even on the milk supply of the animal, are thought to be of no moment. As to milking, there are perhaps not two per cent of the so-called "cattlekeepers" (that is the cooly who looks after the cow) that can be said to be good or even fairly good milkers. Much of the secret of the milk supply is found in the milking of the cow. The gradual weaning of the calf is again a very important matter, and if not studied will produce disastrous results: either the calf is allowed to suck up a quarter of the milk, so that the cow may be humoured to give the other three-fourths, or it is kept starving while all the milk is being drawn, with the not infrequent result that the calf dies and the milk supply is stopped. Any attempt at "weaning," in the proper sense of the term, is never dreamt of by the owner of the cow, nor is made by the man in charge. Under this system it is no matter for surprise that about 25 per cent of the calves are lost, while the majority of those left, survive through a miserable existence to become ugly, mis-shapen and unthrifty animals. The native cow-keeper does not know nor care to know much about the treatment of his animals, because, no doubt, while he has no inclination to incur any extra expenditure, which is inevitable so far as he is concerned, he is content with what he gets from the produce of the animal according to his own method of treatment; for under

present conditions of milk-supply in the island, the native milkman is never at a loss to dispose of his milk, and the returns he gets are good enough for him. But the case of the householder-owner is very different, for by learning more about the management and treatment of milch cattle, he or she will not only be able to secure a more satisfactory (in every sense) supply of milk, but also gain in another way, by owning a few good cows that will *regularly* come into milk, and may be depended on to milk through a certain period. We may here refer to the prejudice that there exists in Ceylon against getting the cow into calf before she is almost dry, a prejudice which if generally prevalent, will upset all systems of dairying throughout the world, and make dairying a most unprofitable concern. If householders knew that a continual supply of milk can for many years be obtained by keeping three cows and bringing them into milk in rotation, they may possibly be inclined to drop the expensive system of buying a cow for R80 and selling her after 6 months for R25, and repeating this every 6 months, with all the trouble, worry and disappointment, and often loss, involved in purchasing milch cattle at such short intervals. The serious point, however, about all this is that the present ignorance as regards cattle management, some of the results of which (so far as the inconveniences and expense they entail are considered) we have indicated above, is tending towards the deterioration even of the animals imported into the island. A better knowledge of cattle we say, will obviate this tendency, and, moreover, be the means of saving a deal of trouble and expense (not to say that it will be a source of pleasure) to all who keep them. The masters of households cannot perhaps be expected to find time to give attention to household duties, of which the management of milch cows forms a part; but it is without doubt a duty of the lady or daughters of the house to acquire a better knowledge of this subject. Much time that is spent in a desire for something to do or wasted in an unprofitable manner, can in this way be turned to useful account, in the practice of true domestic economy. It is only a false pride that will look upon such an occupation as looking after a domestic animal (of more account than a lap dog) as a disgrace. We need not cite instances of ladies, copied as examples in other respects, who find an interest in and give a good deal of attention to dairying in all its branches. In England and Scotland a movement has been set on foot by which lectures and practical classes with reference to dairying have been inaugurated specially for ladies. In these days of progress, with lady doctors and lady signallers, it would not perhaps be too much to expect our ladies to attend a course of technical lectures on dairying and the management of milch cattle in Ceylon.

OCCASIONAL NOTES.

We acknowledge with thanks the receipt of a small parcel of seeds of the American dewberry (*Rubus trivialis*) which has been successfully introduced into North India. It is doubtful whether the dewberry will thrive in the climate of Ceylon, though it is possible that some parts of the Island will be found suitable.

We have also to thank Mr. W. A. de Silva at present in Bombay for parcels of seeds of the opium poppy (*Papaver somniferum*) and of *Guzotia oleifera* (known in India as ramle) as well as seeds of some garden shrubs.

The Colonial Veterinary Surgeon left for India on the 18th of last month on a brief holiday. While away Mr. Lye will arrange for the importation of a second batch of cows for the Government Dairy, since the first lot that came from the Bombay Presidency turned out so satisfactory and profitable.

A pure bred Aden bull sent from the Poona Dairy farm was added to the stud at present kept at the School of Agriculture.

The annual examinations at the School came off during the latter part of last month, and the School closed at the end of the month for the December holidays.

An unexpected enemy to lucerne has appeared in the field mouse. Hitherto trouble was given by this pest (which sometimes does a good deal of injury to paddy crops) owing to its partiality for seeds planted in nurseries, but it has only of late found an agreeable food in the fleshy roots of the older lucerne plants.

FRUIT CULTURE.

The climate of Ceylon is peculiarly adapted to the growth of a large variety of delicious and wholesome fruits. Many foreign fruits, such as peaches, plums, apples, pears, figs, &c., that will not grow in the lowcountry thrive well in the hilly districts. The grafted apples and plums grown by Mr. Nock at Hakgala and the nice pears and peaches at Roehampton and Happy Valley in Haputale are worthy of special notice. It is not, however, about the fruits that are grown upcountry, but of those that are grown in the lowlying districts, that I wish to make a few remarks.

The South-West of the Island with its rich soil and moist and warm climate is well suited for the growth of tropical fruits; and excellent varieties not only of oranges, mangoes, pineapples, pomegranates, &c., but also of the rarer kinds such as mangosteen and sapodilla are grown here.

Fruit culture, however, is in a very backward condition in the lowcountry. No doubt, much has been done by Dr. Trimen and his assistants to extend the cultivation of fruit by giving out plants from the Botanic Gardens at Peradeniya, Henaratgoda, &c. But considering the capabilities of the soil and climate of the South and West of our Island, it is evident that much more remains to be done in this direction. I have heard that an energetic Government Agent of one of our newly-opened Provinces, in order to encourage fruit culture, exempts poor villagers from the payment of poll tax if they were to grow some good and rare fruit trees, such as mangosteen, in their gardens. It is highly desirable that the Government Agents and their assistants should encourage fruit culture as much as they can.

When I was in the Southern Province some years ago, at the request of Mr. H. P. Baumgartner, the

then A. G. A. of Matara, I made a nursery of mangosteen seedlings in his model garden next to the Matara Police Station, as he was anxious to extend mangosteen cultivation in that town. Reference has already been made in the columns of your Magazine to the efforts made by the Jaffna Government Agent to extend the cultivation of grafted mangoes.

Occasionally we also find private individuals who take a special interest in the extension of fruit culture. Only the other day, I visited the nurseries of Mr. J. P. Abraham, at Grandpass, and found that he has a good stock of mangosteen and sapodilla seedlings.

Of course much remains to be done by way of extending the cultivation of the rarer and more valuable foreign fruits, and such of these as thrive in one part of the Island might be introduced into other parts where the climate and soil are similar. For instance, Hambantota is every much like Jaffna in these respects, and we have heard of palmyrah culture being introduced there from the North and proving a success. But why should not grape culture, which is so successful in Jaffna, be tried in Hambantota as well?

What is, however, more important is that the numerous sorts of good fruits which are already so commonly grown should be cultivated in a systematic method. A few methods by which native fruit culture might be improved may be noticed here:—

(1.) *The careful selection of superior varieties.*—It is of no use growing any miserable kind of orange, mango, or other fruit which comes first to hand. Good seeds from superior varieties of fruits should be selected for planting. But as seedlings are so slow in coming into bearing, and do not always preserve the quality of the fruit, it will be far more advantageous to have recourse to grafting and budding. The great object of grafting is to preserve and multiply varieties and sub-varieties of fruit trees, the qualities of which cannot be transferred with certainty to their offspring by seeds, and which would be multiplied too slowly or ineffectually by any other mode of propagation, as well as to accelerate and improve the fruiting of the trees.

(2.) *Suitable preparation of the land.*—For any kind of fruit culture, it goes without saying that the land must be well drained either naturally or by artificial means. A damp or wet soil is the least suited for the purpose. The land should also be broken up to a depth of at least 18 inches, before planting out the young fruit trees. It is very seldom that our native gardeners pay any regard to the drainage and cultivation of their orchards, if indeed they have any which are worthy of the name.

(3.) *Systematic planting out.*—At Bandaranagara and other parts of the Rayigam Korale, I have noticed fruit trees allowed to grow in clumps and groups while there is plenty of waste land in which they might have been planted out at regular distances. It is not uncommon that seeds thrown into the compound along with the sweepings from the house get self-sown in a group; and it is not until the seedlings from them have grown several feet high and have come to a fair size, that they receive any notice worth mentioning. But even then, either

through a mistaken notion that the plants might be injured or through laziness, the landowner does not separate them but allows them to grow *in situ*, with the result that, when they grow up into big trees, they get crowded and smothered.

Again, I have seen different sorts of fruit trees promiscuously planted together. I should think that, as a general rule, it would be advisable to plant each kind of fruit trees in separate plots. At any rate the more delicate varieties should be planted by themselves. When they are mixed up with the hardier trees, the stronger will, as it were, try to oust the weaker on the principle "might is right." For who does not know that a tender plant by the side of a rank feeder is deprived of its proper share of plant food by the latter? Besides, when the more delicate varieties of fruit trees are planted separately, the gardener will find it easier to give them the extra care and tending that they need.

It might be useful to remark in this connection that in the case of bananas or plantains, special care must be taken to plant them in a separate plot, not because they are themselves tender or delicate, but because they are such rank feeders that they will not allow any delicate fruit trees or vegetables to thrive in their vicinity. The native gardeners have some idea of this, but their explanation is that the shade of the plantain tree is detrimental to other plants. The fact however is that the plantain being a very gross feeder, sends its fleshy rootlets several yards around and greedily absorbs every particle of manure it could get, regardless of the wants of its weaker neighbours. I have found by experience that when plantains are allowed to grow on the border of a kitchen garden, the vegetables near them do not succeed well at all, and large enclosures are commonly seen set apart entirely for them in the Kandyan districts.

Some idea might be formed from what I have already said, of the irregular and haphazard manner in which fruit culture is generally carried on in the South-West of the Island, and the need there is for systematic cultivation of orchards. I may here quote the following passage from Mr. H. W. Green's "Primer of Agriculture." He says:—"I should like to see orchards of fruit trees planted over acres and acres of land in the Kalutara districts and elsewhere, instead of occasional fruit trees here and there, with no method or regularity. Apart from all other questions, there should be a good market for good fruit properly grown, with Colombo so near, a town which, since it has become the port of call for so many steamers, should certainly be able to provide better fruit than is ordinarily to be procured in the bazaars."

The Editor of the *Tropical Agriculturist* says in the last (October) number of that valuable journal:—"An orchard of mangosteens or even of oranges in these 'steamer' days would be a little fortune in itself."

The village landowner is, however, not quick enough to perceive what a paying concern a good orchard will be, and the necessity there is for extensive and systematic horticulture. There is no example which he might emulate or copy, and advice is simply lost on him. What is most needed now is a model fruit garden. Some months back it was intended to open one at

Bandaragama in a piece of land adjoining the site marked out for the future resthouse; but as yet this idea has not taken shape. I hope, however, that the present Government Agent who always takes an active interest in native agriculture will soon start a model orchard at Bandaragama, which is the station of an Agricultural Instructor. The Instructors can make themselves more useful, when they work in connexion with fruit gardens in suitable localities in addition to what they do at present, and what is more, it will give them a new interest in their work.

E. T. HOOLE.

RINDERPEST—CATTLE PLAGUE.

The first of a series of brochures which are likely to prove of much value, appears under the æges of the newly-formed Civil Veterinary Department of India on this most important disease, which is, in fact, the greatest bane to the Indian stock-owner. The report is compiled by the assistant to the Inspector-General of the C.V.D., Licut. H. A. Pease, a Veterinary Surgeon, who has had considerable experience in India. In addition to his own practical knowledge, he draws largely on all published literature and reports on the subject in a short preface to the work. Rinderpest, cattle plague or Typhus Bovis Contagiosa (Williams), or as it is commonly known in Ceylon 'murrain', and more recently named Pneumo Enteritis Contagiosa Bovis, is decidedly different in its character, and especially in its virulence in the East than it is in Europe. The latest researches have proved that this disease is, as many others now are, caused by a bacterium of the micrococcus type. As regards the development of the disease there are no two opinions among those who have investigated the subject. In Mr. Pease's words "Rinderpest is a malady which always develops by contagion; this is pretty well established at the present day; it is absolutely false to say that it may develop spontaneously." The treatment adopted for the extenuation of this disease in England is unsuited to the conditions of India. At the outset it may be stated that the disease is more amenable to treatment in a hot climate, and the percentage of recoveries is very large. From the statistics gathered from various reports during an extended period, it appears that often 60 to 70 cwt. of cases have recovered under treatment, but under ordinary circumstances about fifty per cent, and the limit laid down as a certainty is twenty per cent, taking everything into consideration. This is no mean figure when the large number attacked in the country is borne in mind, and especially when it is noted, that an animal which once recovers from an attack of this malady secures immunity from it for ever afterwards. Any system of slaughter of effected animals for exterminating the disease, as advocated by some, and more than once advocated in Ceylon, would cause unnecessary waste of life, leaving aside its utter impracticability on account not so much of the prejudices of the people, which should decidedly be respected, but also on account of the disease not being confined to one particular class of animals.

In this connection some definite information is given in the report under review of the cases

treated by Veterinary Surgeon Thacker in the Madras Presidency. He treated in all 2,541 cases, carefully watching the progress of the disease; and of these 1,763 recovered.

Preventive treatment is undoubtedly most essential, and the measures that should be adopted have, I believe, been reported over and over again in scores of publications. In Rinderpest the application of the provisions of the Cattle Disease Ordinance of Ceylon would no doubt be of great use, but certain characteristics of the disease itself will have to be borne in mind in having recourse to preventive measures. It is essential to know, for instance, that the period of incubation extends from three to twenty-one days, that all parts of an effected animal's body and the egesta are liable to convey the disease; that even after recovery the animal is liable to convey contagion for from ten to fifteen days; that the litter, bedding, stables &c. retain the contagion for not more than fifteen days if the weather be warm and if the articles be properly aerated. All this is valuable information.

As regards curative treatment it is a well-known fact that all specific fevers should be allowed to run their course. Rinderpest affects the animal for about ten days. In the meantime the treatment should be mainly confined to the supply of proper diet and the alleviation of any untoward symptoms. In this respect it has also to be borne in mind that the cost of the food and medicines used should be such as not to exceed the value of the animals which are likely to recover, and above all, these substances should be within easy reach of the villages. The experience of Indian Veterinary Surgeons have not been in vain. They have been able to recognize the value of native drugs, and how such drugs could be substituted for more expensive stuff. They know the nature, quantity and quality of the food stuffs available in the different districts and villages.

For instance, it has been found that only liquid and easily assimilable nutritious food should be given to animals effected with this disease, and that rice congee is the most easily obtainable, whereas if milk and eggs are easily procurable, these should be added to the congee, and that the addition of some papaw fruit in the preparation of this food would make it a most suitable diet.

As regards treatment: when constipation exists an ounce of sulphur administered twice daily has proved to be of use, and when diarrhoea supervenes the following is the remedy which Veterinary Surgeon Thacker and many others have successfully prescribed, viz:—

Camphor	..	2 drams
Datura (Sing. Attana)	..	2 "
Chiretta (" Binkohomba)	..	1 "
Arrack	..	4 oz.

Instead of Chiretta either Margosa bark, Cinchona bark, Tinospora (S. Rasakinda), Coscinium fenestratum (S. Weniwel), or for the matter of that Quinine may, I think, be substituted with equal benefit. The preparation of a receipt of the above description should be within the means of any villager.

When the diarrhoea and dysentery progress, another simple remedy is a decoction of bael fruit (Sing. Beli). This decoction may be best prepared by boiling 8 lbs. bael fruit broken up into pieces

in 12 seers of water. A seer of the strained decoction after it is cooled should be administered every three hours.

As was mentioned before, medicines are not so important in disease of this nature, but experience has shown us that with proper treatment 20% and more of the cases recover, and hence the cheap and easily obtainable medicines cannot but be of some use.

W. A. D. S.

Bombay, 2nd November, 1893.

[The real Chiretta is got from *Swertia* (*Ophelia*) *Chirata*, found, but rarely, in Ceylon. The *Sin. Bin-kohomba* (*Muronia pumila*) is, however, a good substitute for Chiretta.—Ed.]

GROUND NUTS AS A FEEDING MATERIAL.

The plant which produces the ground nut (also known as earthnut and peanut) is botanically known as *Arachis hypogea*, and is a common crop in South India, where about 30,000 acres are annually sown with it. The plant is grown both under irrigation and as a dry crop, and the leaves are also useful as fodder. Frequently the whole pods, with their contents are crushed in the oil mill, but the superior varieties of cake are made from the so-called nuts only. Prof. Church, in his *Food Grains of India*, gives the following analysis of ground nuts:—

Water	7.5	per cent.
Albuminoids	24.5	"
Starch	11.7	"
Oil	50.0	"
Fibre	4.5	"
Ash	1.8	"

The cake is the residue left after the extraction of the oil by means of the common oil mill used in Eastern countries.

An allowance of 6 lbs. of cake a day is sufficient to keep a horse in good working condition; for horses the cake has to be broken up and steeped for 24 hours in cold water. An allowance of 4 lb. per head for working cattle, with forage, keeps the animal in perfect health and condition. As a food for dairy cows it is admirable, both in increasing the yield of milk and in improving its quality. The butter of cows so fed is firmer and keeps much better than that of cows fed on any of the ordinary oil cakes. A daily allowance of 4 to 6 lbs. of oil cake given in the form of a paste, after soaking, and mixed with 2 or 3 lbs. of bran constitutes a perfect food for milch cows.

INDIAN JOTTINGS.

We are accustomed to see in Ceylon only the palmyrah and the coconut palm utilized for toddy drawing, but here in the Bombay Presidency the chief palm from which this sap is obtained is the date. The manner in which the sap is extracted from the date differs altogether from that adopted in the case of the coconut. After clearing away the dry leaves and petioles from the stem of the date tree, the leaves from one quarter of the tree are cut off, exposing a portion of the tender stem. The exposed stem is next punctured and a pot hung up at the place, as is done on the flower of the coconut. The

toddy drawer daily chips off a small portion of the tender stem and fresh sap is gathered every day.

The scene presented to a traveller in Central India is quite different from any thing we see in Ceylon. Here there is no stately coconut, and the jak which gives a wooded appearance to every village is absent; neither are there any green rice-fields to relieve the eye. All through the ground is flat except where there are hills, and the hillsides are nowhere utilized in these districts for the purpose of cultivation as is done in Ceylon. The cultivated lowlands extend for hundreds and hundreds of miles. The soil is a rich loam but very shallow, and hence, perhaps, the scarcity of larger trees or bushes.

The crops found growing in these places are almost all annuals, and even where perennials are grown they are treated as annuals.

Another noteworthy thing I observed was the variety of crops grown. Nowhere have I seen such a variety of plants grown in the same tract of land and sometimes in the same plot. It is not uncommon to find a plot of ground covered with alternate lines of cotton (*G. Herbaceum*) dhall (*cajanus indicus*), sorghums, cholums, millets, Indian corn and hemp (*cannabis*). There are also closely-sown tracts of *crotonaria* (sun hemp) and ramle (*Guizotia oleifera*), with its sparkling yellow flowers appearing as if the whole plant was covered with a sheet of burnished gold.

Ramle (*Guizotia oleifera*) was quite a new plant to me, and I was a little surprised that a plant so easily and almost carelessly grown has never been introduced into Ceylon, where our goyiyas would be too willing to grow a crop which did not require much care or trouble. The plant was growing well even in the poorest soil; and excepting the necessity for preparing the land before sowing no further care is taken of it.

The ramle belongs to the composite order, and grows to the height of two to three feet. The stem is thin and branched towards the top. The ovate leaves remind one of the sunflower on a small scale. The flowers are borne on the top as well as from the axils of the upper leaves, and have a bright yellow set of outer petals; in fact the whole plant resembles the sunflower on a small scale. The seeds are small and are of a shining dark color. They yield an excellent oil much resembling the Gingelly (*sesamum*) and it is largely used for culinary purposes. Baron Von Mueller, in his work on sub-tropical plant, says that "*Guizotia oleifera* is found in India and probably Abyssinia. The ramle oil is pressed from the seeds of this annual herb which yields its crop in three months. The oil is much used like *sesamum* oil as well for culinary as technic purposes."

I could not obtain any definite information as to the yield per acre.

POINTS ON BUTTER-MAKING IN INDIA.

(By Mr. T. W. MOLLISON, M.R.A.C., Superintendent of Farms, Bombay Presidency.)

A cool, well ventilated dairy kept scrupulously clean and free from any taint and unsanitary odour is necessary.

A knowledge how to clean and keep clean all milk vessels &c. is equally important.

After use, all vessels should *immediately* be washed *first* with cold water and afterwards thoroughly scrubbed and scalded with *hot water*, and set in the sun to aerate. Hot water coagulates the albumen of milk. Albumen in this curdy form adheres closely to any vessels, particularly one of wood. It is for this reason that cold water is used first. Washing soda should only be used, when through neglect, milk vessels have become foul. Butter sticks to dry wood but not to wet cold wood. Therefore steep "Scotch hands," print moulds, and other implements required for *handling* butter in pure cold water *before use*.

Cream, after it has been "separated" from the milk, is allowed to "ripen" in an earthenware jar covered with muslin, not with an airtight lid. During this process the cream should be frequently stirred, at least once every two hours. The time required to ripen cream depends upon the temperature.

Cream will be sufficiently ripe in 12 hours if the temperature of the dairy is from 60° to 75° F. In less time if the temperature is higher, a greater period must elapse if the temperature is lower. During the monsoon rains, milk will sour more quickly, and cream will ripen faster than in the hot weather. It is important that the cream should be "ripe," otherwise a less quantity of butter will be churned from a given quantity of cream. To hasten ripening, a ferment may be added to the cream. Sour milk will do, but it must be clean and free from any foreign taint or flavour. The cream is sufficiently ripe when it gets thick and mucous.

If too much milk has been left in the cream, and if this milk has soured during the "ripening" process, a quality of butter *which will not keep long* may be produced. A little curd or casein, a highly fermentable substance may have become incorporated with the butter during churning. Butter should be made in India in the early morning when the dairy is cool.

Ripe cream before it is churned should be cooled. 55° to 60° F. is the proper temperature. The temperature of cream is lowered by adding ice, or by setting the cream *in its vessels* in cold water. The cooler the cream is churned the firmer the butter will be. The churn should revolve about 55 times per minute. The best results are got when the butter "comes" in about half an hour. The cream from buffalo's milk can be churned at a higher temperature than that from cows, and the butter be equally firm. Again, if buffaloes are fed with a good deal of cotton seed their milk will yield cream, which can be churned into good firm butter at 70° F. Cream should only half fill the churn. If it is so thick that it sticks to the churn add some pure cold water. Colouring matter if desired should be added before churning. It is made from 3 oz. anatto seed digested for an hour in 8 oz. of pure olive oil and then strained through fine muslin. One tea spoonful is sufficient for the cream from 2½ gallons of milk. The lid of the churn is now fixed and the churn turned at the rate I have indicated. The cream will froth up and swell after the first few revolutions. The air that was incorporated with it is driven out and ought

to escape through a valve placed on the lid of the churn for that purpose. This must be repeated two or three times as the churning proceeds. A pane of glass is inserted in the lid of the churn. By careful observation the dairyman can see from time to time what is going on inside and can determine when the butter begins to form. So soon as this takes place cold water (about 1/10 of the cream quantity,) should be added. The object is to lower the temperature when the butter is forming in order to get it firm; also to dilute the butter-milk, so that it may be the easier to be separated from the butter globules.

The churning is again continued until specks of butter on the glass are plainly distinguishable and distinctly separate from the butter milk. Experience and judgment are necessary to decide the right moment when to stop churning. If stopped too soon, butter is lost in the butter-milk because the granules are very small. If carried on too long the butter globules aggregate and the butter becomes greasy. Moreover, it is difficult to separate the butter-milk completely by subsequent washing or working.

When churning is sufficiently advanced the butter-milk is drawn off through the taphole and strained through a hair sieve. Any butter caught is returned to the churn. The churn is half filled with pure cold water and given a few more revolutions. This water as it is drawn off is also strained through a sieve and the contents of the sieve again return to the churn. The butter is now comparatively free of butter-milk, but in order that it be washed as far as possible, while still in a granular condition, brine is now added, the solution consisting of 1 lb. of salt to a gallon of water. The churn is again half filled and revolved slowly a few times. The brine is drawn off, strained as before through a sieve. The butter is now sufficiently washed to be removed from the churn to the butter worker by means of two wooden scoops. The butter worker is a simple arrangement, whereby in a wooden trough a grooved roller kneads the butter, completely free of butter-milk. The butter milk escapes down the inclined plane which forms the floor of this trough.

The butter is now in a condition to be made up into marketable form. By the use of "Scotch hands" and a wooden print mould it can be made up at once, into "pats." Improved dairy apparatus is designed obviously with the object of making it unnecessary for the dairy man to touch with his hands either milk, cream, or butter, which is an advantage of significant importance in India.

Butter to which 3 or 4 per cent of salt was added while it was being worked on the butter worker, will keep a considerable period if carefully packed tight in an earthenware "crock" having a tight-fitting lid. Butter preserved in this way should be kept in a cool place.

THE MANURING OF THE ORANGE.

Queries on the subject of manuring the orange have reached us on more than one occasion, and it is with a view to giving our readers an idea of how this operation is carried out in a country where fruit culture has reached such a pitch of per-

fection, that we quote the following passages on *Mulching* and *Manuring* from an exhaustive paper on orange culture, written by Mr. Beuson, Fruit Expert, for the September number of the *Agricultural Gazette of New South Wales* :—

Mulching is another operation of great importance, as when properly carried out and attended to there is probably no better treatment to keep the trees healthy and vigorous. Mulching tends to keep the roots cool and to retain moisture in the soil for the use of the tree, as by the addition of organic matter the absorbent properties of the soil are much increased, thus rendering the soil better able to withstand dry weather. Mulching also tends to keep down weeds and prevents the soil from rapidly dying out. The best material for mulching is bush rakings which consists mainly of semi-decomposed leaves and small branches with a greater or less proportion of the top soil added, and when there is plenty available there is no better material either as a mulch or as a manure for orange and lemon culture. If, however, bush raking cannot be obtained a good substitute is found in old stable-manure, rotting straw, or partially decomposed weeds or other rubbish, or by growing such green crops as the cow-pea or other strong-growing leguminous plants and cutting them when coming into pod and placing them round the trees. Hot stable-manure should never be used as a mulch by itself as it is apt to injure the trees, but if it is desirable to use it fresh as a manure and mulch combined, it should always be mixed with bush rakings or some other similar substance.

Manuring.—In order to keep up the fertility of the soil it is necessary to replace the materials extracted from it by the crop that has been taken off the trees, and to do this it is necessary to have recourse to manuring. This may either be done by the addition of new soil to the orchard or by the application of farmyard or stable-manure or one or more of the various artificial manures sold for the purpose. Manuring with fresh soil is only applicable where there is a quantity of new land adjacent to the orchard from which the surface soil can be taken, but in any case it is a very costly method of renovating an orchard, as the expense of carting and spreading is very great in proportion to the good accomplished, and also it is simply a case of robbing Peter to pay Paul, as the land from which the soil is taken is impoverished to as great an extent as the orchard is benefited, and also the constant use of fresh soil tends to bury the roots of the trees too deeply unless the surface is continually being washed away. Of course in the case of wash-outs where the soil is removed from around the roots of the trees it is always necessary to cart new soil and spread it round the trees; but, except in this case, the use of stable-manure or artificial manure combined with proper mulching is preferable to the addition of fresh soil. Stable-manure acts as an all round fertiliser and supplies all the necessary plant foods, and in the case of stiff soils it has also a beneficial effect by improving the mechanical condition of the soil, thus rendering it more easily cultivated. The great drawback to the use of stable-manure is that the cost of its application, owing to the bulk it occupies as compared with its manurial value, is much greater than is the case with artificial manures, and also by its means large quantities of

weeds are introduced into the soil, thus causing extra expense in cultivation to keep them in check. Artificial manures on the other hand are in a concentrated and easily-handled form, the fertilising ingredients they contain being in a more or less soluble form, and thus readily available for assimilation by the plant or tree. The principal ingredients required by the orange for its proper development are lime, phosphorus, potash, and nitrogen, and if the soil is deficient in any of these materials the deficiency must be supplied before it can be made to produce the best returns. Lime should always be applied by itself, as, if used in conjunction with manures containing nitrogen, it will free the nitrogen contained in them, causing it to pass off in the form of ammonia vapour, and so be lost. Lime is best applied in the autumn or winter by being spread evenly over the surface of the ground, and then lightly ploughed in. Previous to spreading, it should be allowed to stand in heaps in the orchard for a short time so as to become partly air-slacked, when it can be easier and more evenly distributed, but if the soil is sour and stiff the lime is best applied hot. Lime, in addition to its manurial qualities, has also a chemical effect on the soil, as it neutralises the free vegetable acids that sour the land and also tends to break up the clayey matter of the soil, thereby liberating the potash it contains and rendering the land more friable and therefore more easily worked. Lime should never be ploughed in too deeply, it will sink fast enough by itself. Phosphorus is obtained mainly from bones, coprolites, and phosphatic guanos, but a new and cheap source is basic slag. Phosphates are usually applied to the soil either in the form of ground bones, or bone-meal when they are in an insoluble condition and not available for plant food till they have been rendered soluble by the carbonic acid gas dissolved in the water contained in the soil, so that their action is slower and more lasting than in the case of the other class—"superphosphates," where the insoluble phosphates have been rendered soluble by being treated with sulphuric acid. Thus, if a quick result is desired, you use the soluble phosphates, and if a slower and more lasting result is wished for use the insoluble or slowly-soluble phosphates. Generally speaking, the best results are derived from an admixture of the two kinds, as the soluble phosphates stimulate a rapid growth and the slowly-soluble phosphates maintain the growth when started.

Potash is usually applied either in the form of kainit or of sulphate of potash, and, as a rule, except in soils very deficient in potash, it is better to apply it in conjunction with a mixture of phosphates rather than alone, so as to obtain the best results. Nitrogen is applied in the form of dried blood, and in the refuse from meat works and boiling-down establishments, when it is always combined with more or less organic matter and phosphates. In such circumstances it is often in not a very readily available form, and its action is in consequence much slower than in the case of the other forms in which it is applied to the soil, the principal of which are sulphate of ammonia, nitrate of soda, and nitrate of potash (saltpetre). Of these latter the one almost exclusively used in this Colony is the sulphate of ammonia, which is obtained as a by-product in the manufacture of coal gas. Sulphate of am-

monia acts very rapidly and causes the trees to throw out a vigorous growth, thereby making an increased call on the roots, so that its use must always be followed by that of other manures. In order to produce the best effects sulphate of ammonia should always be used in conjunction with other manures, so that when its stimulating effects on the tree are over, the tree has the necessary plant food at hand to maintain a vigorous and healthy growth. Strictly stimulating manures such as sulphate of ammonia and soluble phosphates should never be applied except when the tree is making growth, and they should always be followed by slower-acting manures so as to get the best permanent results, as it is no use to induce a strong growth by means of quickly acting soluble manures, if after they have become exhausted there is no plant food available for the tree to maintain the increased vigour of growth imparted to it by the stimulating manures. Nitrate of soda and nitrate of potash are somewhat similar in their action to sulphate of ammonia, and what I have said about the use of the latter applies equally to them. Old and apparently worn-out orange trees can be often entirely renovated, provided the roots are sound, by following out such a treatment as I have described, and the results in any case will prove much more satisfactory than the common plan of using nothing but bone-meal. Manuring a tree continually with bone-meal and expecting to get the best results by so doing is like feeding a man on nothing but bread, and expecting to get as much work out of him as if he were fed on a properly arranged diet, for trees, as men, require an admixture of different foods to produce the best results.

THE SCHOOL OF AGRICULTURE.

DISTRIBUTION OF PRIZES.

The distribution of prizes at the School of Agriculture took place on 1st December, Sir E. N. Walker presiding, when the following Report was submitted by the Principal:—

The School of Agriculture has now had an existence of 10 years, and the policy of the Government in providing the means of an Agricultural Education for the natives of the country is at one with that of most of the British colonies. So that the importance of a preparatory course of study for such of our youth as have an interest in agricultural pursuits, is admitted by the majority of our colonial rulers. In a paper on "Technical and Agricultural Education in the colonies," read before the Royal Colonial Institute, the writer observes that "he would be a bold man who in the last decade of the nineteenth century would in the slightest degree undervalue what science can and does so largely give to agriculture; or who would argue that because yonder farmer has been a successful man, and yet could neither read nor write, he owes that success to the absence of education. In these days also education (not only in the principles which underlie his art but in the workings of the markets of the world) is so largely used against the farmer, that for the latter to neglect it would be the height of foolishness." He then goes on to show that as with the lawyer or medical man, soldier or sailor, a knowledge of the principles of his art is necessary to the Agriculturist. John Chalmers Morton, one of the

leaders in the agricultural world, said when speaking before the Society of Arts:—"The sound preliminary education for which I am to argue, is not only the foundation-stone of a future building—it is the seed of a future life, with influence and guidance in it, as well as mere security and strength. And the agriculturist, whatever the distinctive features of his occupation may be, will, I believe, quite as much as any other busy man, benefit by an education which may open his eyes a little wider than they are at present to matters which really concern himself, though they may seem outside the limits of his day's work. Such are the opinions of those who have made a study of this subject; and such opinions are the securities for the benefits of agricultural education: I do not give them by way of apology for the instruction imparted here.

In this critical age it would seem to be expected as a matter of course, (and the expectation is not uncommonly realised) that individuals and bodies (whether educational or other) should defend their position against the attack of critics; but if those who have their work to do, and are endeavouring to do it to the best of their abilities, stay to notice and consider how best to meet criticism, there will, I think, be little work done either by the private individual or the Government official.

The object of the report I am expected to put before you today, sir, is to sketch the progress of the work done in connection with this school, particularly during the past year, and this I shall proceed to do without wearying you with details, which, however interesting they may be to some, would be out of place in a public gathering such as this.

In the school proper many changes have taken place within the past year. Mr. Jayawardene, whose connection with the school dated from its very foundation, left us at the end of last year. It is only right I should mention that he rendered valuable services, particularly in the early days of the school's history, and it must be said to his credit that he was the first to attempt to carry on improved dairying in connection with the school.

Mr. W. A. de Silva has also left us for a term, having been sent by the Government to prosecute his studies at the Bombay Veterinary College, where he is doing credit to himself and to this institution where he received his education. Mr. Rodrigo has been transferred to the dairy, and he is working zealously there.

The several vacancies created by these changes have been filled to the utmost satisfaction by Mr. D. A. Perera, acting headmaster, Mr. Hoole, 2nd assistant, and Mr. Samaranyake, native instructor.

Another change of importance as regards the curriculum is the addition of a course of veterinary lectures. Mr. Lye holds a class three times a week for the seniors and once a week for the junior students. There is little doubt that his instruction will prove of value to the boys after they leave the school, though it would appear desirable that some arrangements should be made by which the students will have an opportunity of acquiring a more practical knowledge of their subject. How this is to be done—if possible—will be for the Veterinary Surgeon himself to decide.

The examinations this year were conducted by the Inspectors of the Director's Department, and some of the teachers of other Colleges.

Mr. SENEVIRATNE, Inspector of Schools, Southern Circuit, who examined the boys on Botany wrote: "The fault, generally speaking, of the candidates, was a tendency to diffusiveness. I consider the work sent in by the first six candidates as very satisfactory."

Mr. MENDIS, of the Royal College, wrote regarding the Chemistry: "I think the work is very satisfactory. The other examiners have not made any special remarks of their own, but an inspection of the marks gained, whether in the general or technical subjects, will show that the teaching at the school has been carefully carried on.

The accommodation available in these extensive buildings is now being fully utilized. A central training school for the training of Vernacular teachers has been located here. By this plan the students of the training school are given an opportunity of acquiring a knowledge of Agriculture and Botany, while the agricultural students have the option of taking instruction in Sinhalese, school management and teaching. To complete the arrangements for the training of schoolmasters there is also provided a practising school, a day school attended by about 60 boys in the teaching of whom the training students under the direction of their headmaster, participate.

The students of the School of Agriculture in addition to their class work, which occupies 4 or 5 hours a day, have 3 hours of out-door work on week days, with drill on Saturday.

The time allotted for field work is occupied in the preparation of the land for planting and in the cultivation of indigenous and introduced plants, useful either as food or fodder crops. When possible new varieties of seeds are distributed among the Agricultural Instructors. I would strongly recommend that some provision should be made for a system of regular communication with foreign, but especially Indian and Colonial Agricultural departments and societies. The benefits will be mutual. I found as the results of such communication carried on on my own account, that while Luerne, for instance, failed to grow from English seed sent by Sutton & Sons, it thrives well when raised from seed procured in India. It was, again, a remark of mine contained in a letter to a gentleman in India that led to his getting from me some *Mauritius* grass (which he had never before heard of) and introducing this important fodder crop to the district.

The Dairy, to which I shall refer later, owes its present success to the satisfactory breed of cows, that were imported from Sind, and there suitable cattle were discovered after much correspondence, and later after personal interview with authorities on cattle. I mention these facts to indicate how much benefit may be expected to arise from not a mere casual correspondence but a regular system of communication between ourselves and other Agricultural Institutions in India and the Colonies.

There has been no increase in the number of Agricultural instructors within the past year, though there are doubtless many places, perhaps more remote than the present stations, which might advisedly be made centres of Agricultural

work. I venture to think that more direct communication and consultation with this central institution will be beneficial to the instructors in their comparatively isolated and helpless condition, and if arrangements were sanctioned by which one of the officers of this school should periodically visit the Agricultural Instructors with the object of advising them and inspecting and reporting upon their work, I consider that these men could be made more useful than they are at present, and will go about their duties in a manner more satisfactory to themselves, the people of the district and the department. I doubt not if it be proved to his satisfaction that better results will be ensured by such a course, that our Director will, with his solicitude for the successful working of every branch of his department, see fit to recommend it. The idea of establishing a dairy in connection with the School of Agriculture arose more than two years ago, when His Excellency the Governor, who favoured the idea, desired the question of the practicability of starting and successfully maintaining such an institution, to be well threshed out. As the result of much deliberation the project was finally launched last July, when Your Excellency was administering the affairs of the colony. At that time there was a good deal of adverse criticism, of the policy of Government in deciding upon such a step, in some quarters, and one prominent Journalist delivered himself thus on the subject:—

"We should not be surprised if, after a term, the Dairy, after it has taught its lesson of cleanliness, health, &c., comes to be closed as the Model (impiously called Muddle) Farm, as a too expensive luxury."

Without commenting on this to say the least of it, unkind opinion, I shall now *very shortly* trace the progress of the Dairy.

During the month of June last, a herd of cows that were imported from India had to be maintained, the majority of them without giving any return in the form of milk. As a consequence, it was found at the end of that month that there was a balance on the wrong side of R148.40, the receipts from sales of Dairy produce having amounted only to R257.70, while the cost of maintaining the Dairy was R406.50.

During July the supply of milk to the General Hospital was taken up, and at the end of that month the receipts had risen to R750.24, the expenses (which still included the cost of keeping a number of in-calf cows) stood at R664.30, and the profits were R86.94.

In August the supply of milk to the following institutions was also undertaken, viz., the Lunatic Asylum, Leper Asylum, Police Hospital, De Soysa Lying-in-Home, Branch Hospital, Infectious Diseases Hospital.

At the end of August the receipts were represented by R1,248.52, the expenses stood at R737.55, and the profits were R511.47.

In September the receipts aggregated R1,245.06, the cost of working the Dairy was R751.19, and the profits realized were R493.89.

Last month the results were as follows:—

Receipts from sales of milk	R1,379.80
Cost of working the Dairy	798.67
Profits	581.13

During the present month I do not expect the profits will be below R500.

I may mention that the total outlay on cattle, buildings, appliances, &c., did not exceed R10,000. Up to the present, therefore you will I believe, agree with me in thinking that the Dairy has been a success; and as Superintendent of the institution I must acknowledge that a good deal of the credit of that success is due to Mr. Lye who has been most assiduous in his attention to the health and well being of the stock, and to the manager, Mr. Rodrigo, who has gone about his duties with an admirable spirit of heartiness.

While a dairy is a desirable adjunct from an educational point of view, to a School of Agriculture, where the students are given an opportunity of acquiring (and it is to be hoped of disseminating) a knowledge of the management of cattle according to the most approved methods, I venture to think that the P.C.M.O. will endorse my sentiments when I say that the milk from the dairy comes as "a boon and a blessing" to the inmates of the various hospitals and asylums. Moreover, the profits that arise from this enterprise, are not so trifling as not to be appreciated by the Government; while still further importance should, I think, be attached to the dairy as an instrument for good, in view of the fact that the breeding of improved stock is being carried on in connection with it.

Nine of our present lot of students will be leaving us at the end of this session, after a two years' course of training. Of these 6 are entitled to 1st class certificates and 3 to 2nd class certificates. Of those who left us in previous years and are engaged in Agricultural pursuits, 10 are employed as instructors, 3 on tea plantations, and 9 engaged in private cultivation. Three others are in the Forest Department, 5 are engaged as vernacular teachers, and of 3 who have migrated to the Straits, one is employed in the Botanic Garden.

Many will miss in this gathering the presence of Mr. H. W. Green, to whose liberal educational policy this school owes its existence.

I must not omit to acknowledge my thanks to the liberal donors of special prizes in addition to those offered by the Department.

I have now only to thank Your Excellency for having so kindly come here today, with so little time at your disposal for other than purely official duties, to give away the prizes and certificates to the successful candidates, and by so doing to encourage us in our work.

THE DIRECTOR OF PUBLIC INSTRUCTION then addressed the audience. He assured those present that the work during the past year had been very successfully carried on under the superintendence of Mr. Drieberg. It had been very interesting owing to the introduction of a Veterinary class and the establishment of the Dairy. He wished to assure them that much of the success of the Dairy was due to the exertions of Dr. Lye, the Veterinary Surgeon, who took a great deal of interest in it. It also owed its success, he said, to the Superintendent of the Dairy Farm at Poona who took much interest in securing suitable cattle. The thanks of the Colony were due to these gentlemen. The Manager of the Dairy Farm, Mr. Rodrigo, had also taken a great interest in it. He was a graduate of the school, and deserved thanks for his work. The other point he wished to speak upon was the suggestion made by the

Conservator of Forests for utilising this school for the training of men for the Ceylon Forest Department instead of obliging them to go to the Indian Government for men for this Department.

The prizes, consisting of books and certificates for nine students—six first-class and three second-class—were then distributed by H. E. the Lieut.-Governor, Mr. Drieberg reading the names.

The prize winners were:—

SENIORS.—Agriculture, A. M. Fernando; Science, D. K. William; Veterinary, S. A. De Alwis; English, G. Rajapakse; Mathematics, M. C. Cooray; Sinhalese, G. Rajapakse; Practical Agriculture, D. A. de Silva; Practical Chemistry, M. C. Cooray and S. A. de Alwis; Theoretical Chemistry, H. D. Louis.

JUNIORS.—Agriculture, G. E. H. Fonseka; Science, G. E. H. Fonseka; Veterinary, D. A. Chinniah; Mathematics, D. A. Chinniah; English, A. Jansz; Sinhalese, G. E. H. Fonseka; Field Surveying, D. A. Chinniah; Practical Agriculture, H. D. Martin; Dairy Works, G. E. H. Fonseka.

CERTIFICATES.—P. V. Fernando, A. M. Fernando, G. Rajapakse, H. D. Louis, M. A. Fernando, S. A. De Alwis, M. C. Cooray, D. A. De Silva, D. K. William.

A special prize by Mr. Rodrigo for Practical Dairy was presented to A. De Alwis.

H. E. the LIEUT.-GOVERNOR addressed the audience. He said he had great pleasure in coming there that evening and meeting the masters and students of the school. He congratulated them on the good account of their stewardship given in the report read by Mr. Drieberg, and he also congratulated those students who were fortunate enough to carry away the prizes. With those who did not receive prizes he sympathised very much, and he asked them to rest assured that although they did not obtain prizes, the instruction and the training they received there would bring their own reward in time. The Superintendent, he said, referred in his report to one of the old boys of the school who was now prosecuting his studies in the Agricultural College at Bombay, and that he was doing good work there. He could confirm that remark, and he could say more of that student—Mr. Silva he believed—as he had seen a report which he believed Mr. Drieberg had not seen, received from the Bombay authorities, and which was couched in even more eulogistic terms than the remarks of Mr. Drieberg. The receipt of that report was a great encouragement to the Government who had been able to send up this student to Bombay to prosecute his studies there, in a college which possessed several advantages, which were not to be found here. He was also glad to inform them that the Conservator of Forests had reported to him that in filling up vacancies in the Forest Department he always gave preference to those candidates who had undergone a successful course of study in the School of Agriculture, and he thought this would be another encouragement for the students of this school. His Excellency then said that Mr. Rodrigo and others connected with the Dairy were certainly to be congratulated on the very successful work they had done. With reference to some outside

criticism he said that as soon as the general community could take up such matters, and competition sprang up, the Government would readily give up the undertaking, if it was deemed necessary, but until such time came the Dairy would provide a good supply of milk. When such a time comes the Government would not regret the impetus given to the general community to take the matter up. It remained for him on behalf of Government to thank all those connected with the Dairy for carrying it to a successful issue. He was very much pleased to hear of the hearty co-operation of the Veterinary Surgeon Dr. Lye, in the work of this establishment, and this was what he expected from Dr. Lye and what H. E. had observed from several opportunities he had had of forming an opinion, but it was none the less pleasing to him and the Government to hear the public acknowledgement of it by the Superintendent. As there were other speakers to follow he would only add one word more, and that was, that he would wish those students who were now leaving the School should be successful in the world, and he hoped that they would not regret the time they had spent in this school. He also hoped that they would during their whole course of life greatly profit by the instruction received.

The Hon. E. ELLIOTT congratulated the Principal on his report, and especially as to the new departure in regard to the Dairy. He was glad to hear the financial prospects were encouraging, but he warned the Superintendent against desiring to show a profit at too early a stage; the work was experimental and pioneers generally worked at a loss. They had heard of what was doing within these walls, but he could give some account of what former students had done elsewhere, especially in the Eastern Province. He had had their co-operation of several in agricultural experiments, and was happy to be able to testify that they were all a credit to the school in which they were trained. They were capable agriculturists and intelligent workmen, who understood their work and knew how and when to plough, to sow, to water and to reap. They were, however, handicapped in their work, and rather expected like the Hebrew of old to make bricks without straw. They had no money, no seed paddy, no implements given them, but were generally attached to an ordinary village school and expected to cultivate paddy in an improved style. Progress under such circumstances was difficult, and their motto must be taken from the tortoise rather than the hare—"Slow but sure." In the Eastern Province he had been able to find funds for working on a somewhat larger scale, and attention had been paid to the improved cultivation of vegetables, arrowroot, cassava and other products which would increase the food supply in the drier zones. Cotton, too, had received attention, but the principal cultivation had been of paddy, and doubtless his hearers would like to know the result. Well, they had cultivated 221 acres in three different localities in three years, of which one was a very unfavourable one, at a cost of R3,596 paying for everything, and the crops raised had realised R4,688, leaving a profit of R1,092, which was equivalent to a

return of 14 per cent on the capital value of the land. There was a good case for paddy cultivation and irrigation. He desired in speaking on this subject, not to say anything in depreciation of other branches of agriculture. He wished them God speed, but all did not do so, and paddy cultivation was run down in several quarters, and it had been actually suggested that the production of paddy in this island was falling off. It was easy to start a hare of this sort but hard to run it down, and a simple denial would have had no effect. He had therefore compiled the tables he held in his hands, from the most reliable sources available, viz., the published Blue Book returns, showing the area cultivated in each district for the past 25 years and the estimated crops yielded. The first fact he had elicited was that the area cultivated with paddy during 1892, (613,176 acres) was the highest for the period specified, and the estimated crop was 8,363,000, say 83 millions of bushels. But as only under one-sixth of the area was profited by irrigation works, and the rest depended on the direct rainfall, the cultivation was still liable to great fluctuations, and it was not safe or fair to draw inferences from the results of a single year. It would be better to take the average of a series of years, and comparing on this basis the result of the first five of the past 25 years with the last five, the figures worked out as follows:—The average area cultivated had advanced from 511,367 acres to 574,521 acres, or an advance of $12\frac{1}{2}$ per cent, and the outturn of crops had increased from 6,268,000 (say $6\frac{1}{4}$ millions) to 9,476,000 (say $9\frac{1}{2}$ millions) of bushels of paddy, or over 50 per cent. His hearers would doubtless enquire how it was that the area cultivated had increased only one-eighth when the crops had increased one-half. The reply was simple and might be tersely put that where there was water there was no more land available, and where there was land there was no water. In the Western Province (except in the Maturajavela swamps) which were now being improved and cultivated, he was informed by a credible authority there was no great extent of waste land suitable for paddy, not already under cultivation. He could answer there was but little in Galle and none in Matara. Further east there was lots of land, but the water stored only sufficed for the land already under cultivation, but there were heaps of land only waiting until further waterworks were provided for storing the floods which now at times rolled down useless to the sea. Only a vigorous generous expenditure on irrigation was required to materially extend the cultivation of paddy, which our native friends of all classes were ready to undertake. Not only the individual called the ignorant "goyiya," but the Moratuwa capitalist, was equally willing, and as soon as ready access was provided, and when the railway to Bentota was completed, went down and competed for the lots of the land available in the Bentota Korale. Such men know what paid and what did not, just as well as any European capitalist, and though they and others had now embarked largely on the cultivation of coconuts and even tea, he did not know if a single acre of paddy land which had been in consequence abandoned.

In conclusion, Mr. Elliott apologised for the length of his remarks, but he had thought they would be of interest to the students and their friends and others interested in native agriculture, and would furnish them with information not generally available for justifying the attention and time devoted to what must always remain the chief food supply of the people.

The Rev. A. PATON who was the next speaker, said he trusted that he was discharging his sacred duties here, but outside of these he was trying to find an interest in all the life and natural products of this lovely Island, and he could conceive of no sphere for thoughtful and practical minds more full of interest and general public benefit than that of practical agriculture, in relation to the sciences. In thinking of Agriculture here we were not to think merely or mainly of the ordinary farm products of the old country, but under this we were to think of nearly all the products of the soil in this luxuriant climate and what a field was thus opened up. In their agricultural products most countries found their wealth, and this was essentially so in regard to Ceylon. Tropical agricultural products must be her strength. And everything that would contribute to the greater quantity and better quality of them was so much gain to the individual and general welfare of the community. Now very many of the sciences could lend their aid here. Chemistry, Botany, Geology, Zoology were all helping handmaids in this mighty industry. In the old land practical agriculturists had a somewhat poor opinion of mere theoretical farmers; and practical knowledge was an absolute essential. Don't let students here imagine that with a mere smattering of these sciences they are equipped; but with practical knowledge the intelligent mind that knew the laws and the general principles of these sciences as they bore upon practical agriculture was much better fitted to improve and develop the products of the soil and adapt them to its varying character. There was a curious tendency in agriculture to be conservative, and slow to adopt new systems. It is specially so with Eastern nations. Competition and the very struggle for existence had forced agriculture to advance with leaps and bounds in the old home lands, and but for machinery, and improved culture and selection in herds and flocks, farming there would practically be driven out of existence. And no one could be in this land as he had been with open eyes, without realizing that something, that very much could be done and must be done in time of an improved nature in this industry. This was not, of course, to be done by merely importing our Western modes and conceptions, but by the application of rational scientific principles to the growth and culture of the natural products, the introduction and judicious fostering of new products suited to the island, and the improvement of native breeds or the prudent selection of other breeds of live stock. In all these departments there was room for wise men doing great service. He could not help admiring the wonderful way in which our industrious and thoughtful planting community had in such a short time adapted new growths as dire necessity demanded and done wonders in improving the culture. Yet even the most

thoughtful of them admitted that scientific knowledge might be more and more demanded if their growths and quality were to be long maintained on the same soils. Something might thus have yet to be learned by all of us by the aid of science combined with practical experiment. Again, although the natural products of the island were the wonder and the charm of all who visited it, yet it was fully conceded that much might be accomplished from the commercial value point of view, by the more carefully selected seeds that were sown, and the more improved varieties of young plants that were grown. All this was the outcome of knowledge which was science. In many instances also something might be accomplished by a more varied rotation of cropping than was practised, for science told us that different crops extracted different elements from the soil, and where one would fail another would succeed. No one could observe without positive pain, the want of care and selection of the cattle in Colombo; it was little else than a public crime to see mongrel herds allowed to mix and reproduce weeds and rags, just as they chanced to mate, when the least care in the selection of the breeding stock might at least perpetuate and improve such good qualities as they possessed. Even although we might not import and cross, which might be a doubtful experiment, a little scientific knowledge of the laws of breeding and propagating might make the native breed of a much higher and better general quality to the benefit of the country. As to mutton he had to confess that he scarcely yet could distinguish between the goat and the sheep; and although we could not expect to find here the Leicester or the South-down, yet a little scientific breeding might enable us without much effort to decide whether it were lamb or kid that was being served on the table, and without aiming at a reproduction of the Berkshire pig, we might get something better than the degenerate specimens of their wild ancestors of the forest. It might indeed with some justice be urged that flesh food might not be so much required in this warm clime, but milk was of the very essence of necessity, and this he believed to be one of the most clamant wants in Colombo, and in their dairy they were doing one of the highest services to the community; and he rather thought one of the greatest pecuniary benefits to themselves. With milk at 3s. a gallon and butter at 2s. 6d. or 3s. a lb. the wonder to him was that it had been left to the Government to institute such a dairy, and that private enterprise had not taken it up. When he went home to Scotland and told some of his folks of this, they would think little of their 1s. a lb. for butter and their 10d. a gallon for milk, and there might be a rush of dairy-men to Colombo. There was great room here for scientific selection and propagation of the best class of milk producers. To the students he said, that when they left the school let them not think that their Agricultural education was complete. It was only begun, so let them walk humbly, observe minutely, experiment cautiously, and when they were old men they would only then feel how little even they know of the great principles of scientific and practical Agriculture. He knew no land that gave such

opportunities for the study of natural sciences as this, where Dame Nature seemed to spread her luxurious covering over all, and clothed everything in robes of beauty, unless it be these tiny dusky urchins, who fortunately required little of garb, except the string and charm around their loins.

The Hon. A. De A. SENEVIRATNA said he was thankful for the successful work carried on there, and the public ought to be very thankful to the Government for enabling a student of this College to prosecute his studies in India, and for the encouragement thus given to the youths of Ceylon. He was glad to hear of the success of the student at Bombay. He next referred to the valuable services of the Veterinary Surgeon in the Dairy, but said with a view to rendering such services more valuable he thought the establishment of a hospital for animals was necessary. People then would bring up animals

for treatment, and the students under the Surgeon would be able to gain a practical knowledge in addition to the theoretical knowledge they received now. He was very glad to hear that some of the past students of the school were cultivating their own lands, and by such work they could teach their neighbours a better mode of agriculture. He would be glad to hear of the increase of such students from this school. The encouragement given to students to enter the Forest Department was also a pleasing matter, and he thought a training in Forestry would also be of great advantage to those students who might wish to improve their own lands.

THE DIRECTOR OF PUBLIC INSTRUCTION then thanked His Excellency for presiding and distributing the prizes, and the gathering dispersed after cheers for H. E. and the Director. Refreshments were then served to those assembled.

MAJOR SKINNER, C.M.G.

* The TROPICAL AGRICULTURIST *

◇ MONTHLY. ◇

Vol. XIII.]

COLOMBO, JANUARY 1ST, 1894.

No. 7.

“PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

MAJOR THOMAS SKINNER, C.M.G.,*

THE GREAT “ROADMAKER” OF CEYLON; ALSO A PIONEER IN “COFFEE PLANTING.”

L O write a biographical notice of Ceylon's great “Road-maker” within the compass of a few pages, is no easy task. Even the autobiographical volume published by W. H. Allen & Co., “Fifty Years in Ceylon” gives but a very inadequate account of the career of an administrative officer whose life's work was so closely identified with the material progress of the Colony, and especially with the development of the Planting Enterprise in its Mountain Zone. We shall endeavour after very briefly noticing the main events of Major Skinner's life, to point out that portion of his work which bore more especially on the Planting Industry in Ceylon.

The subject of our sketch was born in St. John's, Newfoundland, on the 22nd May 1804, his father an officer in the Royal Artillery being then stationed there, and he seems to have been the only son of his mother who died while he was still an infant. Coming to England when 7 years of age, he was placed for six years in the charge of an easy-going Dorsetshire clergyman, and then, in 1818, left to join his father at Trincomalee, being intended for the Royal Navy. On the advice of naval officers of position, his father agreed to try him in the Army instead, and Governor Sir Robert Brownrigg early in 1819 gazetted Mr. Thomas Skinner, aged between 14 and 15, to a vacancy a second Lieutenant in the Ceylon Regiment. In this capacity, the lad in his schoolboy

jacket, had to march from Trincomalee, on his first military duty in charge of detachments of the 73rd, 83rd and Ceylon Rifle Regiments, across the whole breadth of the island—anything like a proper road being then unknown—via Kandy to Colombo, and that, too, while the country was still in an unsettled state after the Rebellion of 1818. No wonder though the appearance of, we suppose, the youngest officer in the British Army, created astonishment on parade in Kandy, and afterwards in Colombo, as he marched beside six-foot Grenadiers at the head of his detachment in “Eton jacket”; for Colombo at the time was garrisoned by a “little army” of several regiments besides Artillery, Engineer Corps and even a Troop of Dragoons. Of the youthful Lieutenant's experiences at Colombo, Kandy, Maturata—(where he shot his first elephant, a splendid tusker under circumstances that excited the admiration of the Malays for their “tuan kitchel” “little gentleman” or officer,)—and Kurunegala, much might be said. But although Lieut. Skinner, had he continued in the regular service, was bound to rise to a very high position, especially if active service in India or Europe had brought into play his strong, resourceful as well as determined character; yet his career could not have been more useful or honorable than that which followed his acceptance from Lieut.-Governor Sir Edward Barnes, in 1820, of an appointment on the great military road which His Excellency, had just commenced between Colombo and Kandy. Lieut. or rather Ensign Skinner, with two years' service, was still only in his

* We regret that the engraving of Major Skinner is blurred and otherwise that it does his clear, manly features so much less than justice.—ED. T.A.

17th year when he was placed in charge of some eleven miles of the more difficult portion of the road between Ambanpitiya through the Ballapany Valley to Waracopoly, at the head of a considerable force of unskilled labourers, the major portion being Kandyan villagers who had been in open rebellion only two years before. We wish we could wait to shew in detail, how he gained their confidence, as also complete rule over them, so that Sir Edward Barnes's frequent endorsement on the Progress Reports was "this lad is doing well with his Kandyans;" he opened his 11 miles within the year; never touched "stimulants" (although heavy drinking was the general rule among the other officers) and earned the high opinion of the Major-General Lt.-Governor. He was next moved to the unhealthiest section at Allowe on the Malaoya, where a large force under Col. Brown, R.E., was concentrated; but jungle fever having broken out, very soon Lieut. Skinner was the only effective European officer left—testimony to his temperance and good constitution which had previously carried him through severe attacks of dysentery. He could not, however, expect to escape fever altogether, and at last got so bad an attack that he was invalided to England. In 1822 he revisited his old Dorset school-master as a lad of 18, but an officer of three years' standing, who had already bagged his half-dozen elephants! So small and active was he, that in 1823 when weighed (in England) he was only 7½ stone. After visiting his father's family in Newfoundland, the young Lieutenant returning to England, embarked for Ceylon again on the 15th April 1825, the vessel carrying the headquarters of the 97th regiment and a number of distinguished officers. Chess seemed to be the chief object of attention on board, and Mr. Skinner, who scarcely knew the game, when he embarked became the best player of the ship's "club" before the voyage ended. A curious coincidence, attended both his outward voyages to Ceylon thus:—

15th April 1818, embarked off the "Falcon Hotel," at Gravesend.

10th August 1818, anchored in Back Bay, Trincomalee.

15th April 1825, embarked off the "Falcon Hotel," at Gravesend.

10th August 1825, anchored on same spot in Back Bay Trincomalee.

The distance run in 1825 was 13,581 miles.

On arriving in Colombo, Lieut. Skinner (who was only just of age) got the choice from Sir Edward Barnes, now full Governor and Lieut.-General, of becoming one of his As.D.C. or Staff Officer of Colombo. He chose the latter, laborious post without considering what it involved; for as we read the garrison of Colombo in 1825 consisted of,—

A Troop of Dragoons.

A Detachment of Royal Artillery.

A Detachment of Royal Engineers.

A Company of the Royal Staff Corps.

16th Regiment. A portion of this regiment detached.

78th Regiment.

83rd Regiment.

97th Regiment.

Ceylon Rifles.

Gun Lascars.

Armed Lascoryns.

Several detachments were drafted from these regiments, but still the garrison was large, and its duties were conducted on the most strict and rigid principles. A field officer and two subalterns were on garrison duty every day; guard-mounting was done with the utmost formality; guards were "trooped" every morning, and not the slightest deviation from established forms was permitted without the field officer of the day being called upon to give his reasons in writing. The commandant was present at guard mounting about three days in each week. I do not believe that the garrison at Gibraltar could have been under stricter discipline than that of Colombo at this time.

The Governor insisted on the young Staff Officer taking up his residence in King's House, and henceforward until Sir Edward Barnes' departure for India at the end of 1831, he lived on terms of closest intimacy with that most distinguished officer and administrator whom he admired and served with the utmost enthusiasm. Of Lieut. Skinner's unequalled activity at this time, two illustrations may be briefly mentioned: he was ordered to proceed to Negombo, 23 miles north of Colombo, make a plan of barracks there and prepare an estimate for their repair. He left King's House at 2 p.m. on his grey Arab, arrived at Negombo within 2 hours, made his measurements in an hour and galloped back in time to bathe, dress and attend a dinner party where the Governor and Lady Barnes were present. On seeing him, His Excellency, never dreaming the inspection had been made, was most indignant at the apparent dereliction of duty until he learned the facts, which pleased him immensely. Shortly after, the young Lieutenant was forced into a ride in the dark by the Governor's Military Secretary, Col. Churchill, on a wager of £50: riding to Veyangoda 25 miles and back between midnight and the hour of guard-mounting 6 a.m. He did it with half-an-hour to spare. But no officer had ever less to do with betting or gambling, equally with drinking, than the subject of our notice, and Lieut. Skinner had also an intense dread of getting into debt even for a purpose, such as buying a regimental step, which might well have justified the loan. He allowed himself be purchased over more than once; declined a purse got up by brother officers who thought it a disgrace he should be so long without his "Company;" and specially prevented Governor Barnes from giving him the preference for a Captaincy over Lieut. Rogers—afterwards Major Rogers of Uva. Rogers was the great hunter, 1,500 elephants have fallen to him altogether, and was Major Skinner's closest friend until he was killed by lightning at the Haputale Pass on 8th June 1845. In this way it happened that Mr. Skinner served no fewer than 17 years as subaltern, before he got his Company in 1835, when in his 31st year.

But to go back, the years 1827-8-9 proved a busy time with military duty in Colombo; but there were frequent opportunities for sport, especially with elephants, herds of which in those days were frequently seen near Hanwella or Negombo, 20 miles from Colombo. The death on 28th March 1829 of Capt. Dawson, R.E., whose monument stands at the head of the Kaduganawa Pass was a severe blow to Lieut. Skinner, and the death of another officer (Lieut. W. Moore, Royal Staff Corps) led to his being appointed Deputy-Assistant Quartermaster-General on the 25th Nov. 1829. All public works in the island were at that time placed under this military department, so that Lieut. Skinner had charge of the roads and bridges made or making "in the interior," and this gave him plenty of riding and work all over the Kandyan Provinces. In Aug. 1830, Sir Edward Barnes sent his favourite young officer on a special mission to the Eastern Archipelago and Java, connected with the recruiting of Malays. A Government barque with guns, ammunition, and marine artillery and some infantry was placed at his disposal. He was absent seven months and discharged his mission to the entire satisfaction of the Governor. On his return, he resumed charge of the roads in the Kandyan Provinces. Some years before he had traced the Colombo-Puttalam road, and again in 1828 that from Gampola to Ramboda. In 1832, he was detached to open a road between Arippe, on the North-West Coast, the headquarters of the Pearl Fisheries, and Anuradhapura, the ancient capital of the island. Lieut. Skinner may be said to have been the first to discover the wonderful resources of the Nuwarakalawiya district, and in a memorable State paper in 1833, addressed to His Excellency Sir Robert Wilnot-Horton (who was a great friend of his), he strongly urged that Governor to become the "Regenerator of Nuwarakalawiya," a task which would have been readily undertaken had the revenue (only R3,700,000 per annum! then) permitted; but this regeneration had to be deferred for forty years till the time of Sir Wm. Gregory and afterwards of Sir Arthur Gordon. In 1833 when "Compulsory Service" (semi-slavery) was abolished in Ceylon, Lieut. Skinner propounded the scheme afterwards (in 1849) matured on a modified scale by Sir Philip Wodehouse, and passed as the Road Ordinance and Tax which have done so much to cover the island with a network of subsidiary principal and minor roads. Peradeniya satinwood bridge designed by his chief, General Fraser, was erected under Lieut. Skinner's care in 1833, as many as 1,200 men being employed in laying and filling up the approaches, &c.

After this a *Civil Engineer and Surveyor-General* was appointed for Ceylon, and all roads

and works were handed over to him, while the Quartermaster-General's Department undertook a military reconnaissance and survey of the Mountain Zone. On this survey, Lieut. and latterly Capt. Skinner was engaged with few intermissions, from Sept. 1833 to 1840, the total payments to his staff of Caffres—(South Africans, whom he describes as by far the best native soldiers and hardest men ever brought to Ceylon)—and coolies, being only R4,372 in the seven years!; while the one-inch Plan of the Kandyan Provinces and the General Map of Ceylon were the result of these labours. Capt. Skinner all through his career took a pride in the economy attending his work, and indeed he often suffered great privations during his survey operations. He was the first officer to explore 500 square miles of forest included in the "Wilderness of the Peak," and here are extracts from his autobiography, we cannot deny ourselves the pleasure of making:—

Although it was most interesting, it was precious hard work, delightful to think of in the retrospect. For six or seven months in every year I never knew the shelter of a roof from between four or five o'clock in the morning till seven in the evening, and occasionally much later. My fare, too, was often humble enough. On one occasion, going into the Wilderness of the Peak—which comprises about 500 square miles of splendid forest within its extreme boundaries—to make my reconnaissance sketch of it, my time being limited before the rains might be expected, I could not wait for the supplies which I had sent a corporal and another man down to Saffragan to purchase. I had expected some dozens of fowls for my six weeks' or two months' supply, but the men returned, after rather a lengthened absence, with only five miserable chickens, three of which had died from the rain and cold on their way up to the Peak, the other two had sentence of death passed on them immediately on their arrival; they all found their way into curries, the only dish they were fit for; those that had died on their way up the Peak did not die a natural death, having been killed by the cold instead of with a knife. This was all the animal food I had during nearly two months; I had a little salt fish, which was served out to me most sparingly, about a square inch for each meal, to give a relish to a little plain boiled rice. My people had a very knowing dodge of getting at my small stock of wine, under the plea that the bottles were broken by the men falling on the rugged rocky ground over which they had to travel. It appeared to me that though the bottles were broken, little of their contents were spilt.

These two months proved the hardest work I ever had, as hard, under the circumstances, as I believe any man could have endured. My wigwam consisted of five sheets of the talipot leaf, stitwed together with shreds of the same material. Each leaf was about six by four feet; three of these formed two sides and one end, with two others for the roof; along the top was a little ridge cap of the same material; the end which formed the door was always open. This tent of leaves contained my little camp bed, a small camp table, and chair. I think the talipot leaves used to cost me 13d., and generally lasted me the working season, which was six months; my lodgings, therefore, were not expensive!

I used often to see the most wonderful effects when thus camping out. On one occasion my sojourn on Adam's Peak lasted for a fortnight on the top of the cone, where I was waiting for clear weather, which I did not get, to admit of my completing my observation. One morning as the sun was rising, the shadow of the mountain was thrown across the whole land and

sea to the horizon, and for a few minutes the apex was doubled, and so clearly marked that the little shed over the impression of Buddha's Foot was perfectly distinct in the shadow. Another most curious effect was when the mist had lain deep in the valley below, between the great Peak range and the opposite range of Rackwanie, it was an exact representation of the sea; the clouds rolling against the base of the mountains resembling the surf beating against the cliffs which seemed to project into the sea, the points of the hills peeping through the mist appeared like beautiful little islands.

At another time, looking down from the cone, a small white cloud, the size of a man's hand, might be seen floating upwards, about midway between the mass of vapour sea below and the top of the peak. Sometimes, under certain conditions of the atmosphere, this little bit of fleecy vapour would suddenly expand into a huge dark cloud, and come rolling up the cone, apparently lashing it as if with its utmost fury; and then suddenly envelope it with a dark mantle—a strange contrast to the clear blue atmosphere through which but a few minutes before objects might have been seen sixty or seventy miles distant.

Many were his adventures during this survey work which carried him from Adam's Peak to the top of Pidurutalagala, and thence to Namanakulikande above Badulla. His interest in the "Wilderness of the Peak" continued very great, and if Capt. Skinner had had his way, it would have been thoroughly opened up by roads in Governor Stewart Mackenzie's day when the "rush" into planting, and especially Ambegamuwa, first commenced. What will the planting residents in Dimbula, Dikoya and Maskeliya say of the following letter addressed to the Governor of Ceylon over 53 years ago, as well indeed, of the above account of the first survey of their districts, by this true Pioneer of Planting and Civilisation?—

Ambegamuwa, 11th August, 1840.

My Dear Sir,—I am very sorry that your Excellency's letter of the 1st instant has remained so long unanswered. I received it on the eve of my departure from Colombo, and being destined for this place, as there are points in it that I could only reply to by information which I expected to receive here, I ventured to defer the acknowledgment of it till now. On my arrival here on the 7th, I found that both the Surveyors, Mr. Bagenall and Mr. Sargent, from whom I made inquiries as to the lands which had already been appropriated in this vicinity, had gone down to Palampettia with Captain Lillie, and it was only last evening that I met them. He gave me such a sweeping list of lots applied for, that I feel it would be quite hopeless my attempting to describe them to you. I will therefore request Mr. Norris to send your Excellency a copy of the general sketch of the whole, which I understand he has, and by which you will perceive that the margin of the Great Wilderness of the Peak (in this particular direction) is tolerably well allotted.

I am sorry that Anstruther and Wodehouse are so late in the field, for I should have preferred seeing them in this neighbourhood, instead of either of the two, for which the latter has such a predilection, viz. Ballangoddi and on the ascent to the Peak from Ratnapura. I fear they will both (and all the south-western falls of the great mountain zone) be too much exposed to the violence of the south-west monsoon winds, and at the elevation they would require for coffee would be subject to continued fogs for seven or eight months out of the twelve.

Ballangoddi has the additional disadvantage that it is thirty miles from water carriage by a most impracticable native path along which a loaded bullock could not travel, and the lands they might select may possibly be ten or twelve miles off this road. This is a

grave matter, selecting a site for an estate on which parties seem determined to go ahead, at the pace A. and W. seem bent on. Mr. Turnour's land here is that piece which your Excellency went over after a five o'clock breakfast on the banks of the Attella Oya, where you may remember was a pretty little waterfall. It is described by all who have seen it as the finest piece of land in all this neighbourhood. I suspect we saw the worst portions of it on that occasion. Mr. Carr's and my land is the sloping forest on the right bank (within the elbow) of the Mahavilla Ganga, the villages of Ambegamuwa being our northern boundary; but as regards relative positions of this and other estates (!!) Mr. Norris's surveying sketch will explain them better than I can. I have asked him to send you a copy of it.

With all these purchases and applications, the demand for land appears to be just as insatiable as ever, while the general cry is "Where shall we go to look for land?" In vain I proclaim that there is a choice of between 200,000 and 300,000 acres of the finest forest land in Ceylon within the Wilderness of the Peak, possessing in the most eminent degree every requisite of soil and climate, far above anything to be found on these outskirts of it.

"How are we to get at it?" is the not unnatural sequence, for although I have spent many dreary months in it, and there is not a valley I have not traversed, nor a feature, from the highest point of which, and from the top of the highest tree to be found on it, I have not attempted to sketch in my reconnaissance, I know that many a man might dive into the depth of 500 square miles of unbroken pathless forest, who would never find his way out of it again.

Will you Sir, just open your map and look at the distance between Kotmalie Valley and Ballangoddi, and consider that by opening a bridge path, and building two small temporary Rest Houses between those places, you would open out a country such as has not yet been presented to the capitalist; a large area of land with a climate more like that of Southern Europe than a region within 7° or 8° of the equator, and in which I believe may be produced most European vegetation.

I respectfully urge upon your Excellency that the object is well worthy of the trifling outlay it will cost. I leave out of the question the great advantage which would result from establishing a direct communication between the central and southern provinces of the island. Instead of, as is now the case, a traveller being compelled to go round the base of the mountains, descending from Kandy to Pallapany, thence by Ruwanwella and Ballangoddi, or if by the eastward, then over the highest mountains of the country Nuwara ELLIYA, and thence by one of the three following passes, viz. Gallagamuwa, Idulgashenia, or between that and Allipott.

I feel pretty confident that I might offer to open a 5-foot path, build and furnish the two Rest Houses, from the proceeds of the sale of land along the line during the first six months after it was opened. I trust your Excellency will excuse me if I am permitting myself to address you too freely on this subject: I feel intensely interested in it. Who can view this exquisite scenery, enjoy this perfect climate (at present the thermometer is between 67° and 68°) without feeling that it would be conferring a blessing upon humanity to be the means of removing some 20,000 of the panting, half-famished creatures from the burning, sandy plains of Southern India to such (comparative) paradise; benefiting not only them, the colony, the individual by means of whose capital they would be brought here, but also our own native Singhalese people inhabiting the margin of this wilderness, living as they now are like monkeys, for safety compelled to hide in places scarcely accessible to man, to render their dwelling inaccessible to elephants. Many totally unable to cultivate a grain of paddy, or to procure a morsel of salt, would find themselves attracted to a new centre within this, at present, trackless wilderness, which (although I have often been jeered at for stating it), I advisedly repeat, is destined ere long to become the garden of Ceylon, such a garden as has not

entered into the mind of us Pioneers to conceive—a garden of European as well as of tropical productions, peopled with European as with Asiatic faces. To facilitate this desirable end, I plead for a bridle-path as the first requisite.

Hard work and privation have endeared the Wilderness of the Peak to me. I have often had rough work in it, crossing flooded rivers, and living on edible roots and plants, which the Singhalese, familiar with forests, alone could have selected; but my last two months and a half work in it were the most trying, from continued insufficiency of food. I reached Adam's Peak as light of baggage as could be, hoping to be able to get some fowls up from Ratnapura. My messengers returned with only five; three died on their journey up, from cold and wet, the remaining two had to be killed on arrival to "save" their lives. They all in due course found their way into curries, and I could not discover which had yielded to the sharpness of cold, or which to that of steel. They constituted the only animal food I had during the ten weeks when, working every hour against time, I accomplished my task, having worked up to the top of Pedrotallagalle before the monsoon burst, and I have thought well of the sustaining properties of boiled rice ever since.

I remain your Excellency's faithful servant,

(Signed) T. SKINNER.

Of Capt. Skinner's experience as a Coffee Planter* we have the following:—

In 1840 the officers of the public service ran wild in coffee-planting. As pioneers they were encouraged, to the ruin of many; for though one or two had been very successful, others lost heavily by embarking in an enterprise of which they were perfectly ignorant. Sir W. O. Carr, the chief justice, and myself went into partnership. Our estate had only just come into bearing when the protective duties in Ceylon were removed, and the price our produce realised fell from upwards of 100s. the cwt. to 45s., the latter sum being the cost of production on the estate.

We ought to have mentioned that the Civil Department for Roads &c. got into such confusion, that in 1837 Capt. Skinner was asked to take up the duties of "Civil Engineer and Surveyor-General," and he continued in the office till 1840. How he discharged the duty can be judged by the following:—

Extract from the Address of His Excellency the Governor to the Right Hon. Stewart Mackenzie, to the Legislative Council, in January 1840.

His presence alone prevents me from bearing testimony to the unwearied activity of the Acting Surveyor-General, to the entire inadequacy of his means to overtake all that under the names of Surveyor-General and Civil Engineer would be expected from him. That he has performed a most ungracious, and a very unsatisfactory work, during his tenure of these combined offices, most zealously, I can bear most ample testimony were it necessary.

So that so far back as 1840, Capt. Skinner was

* Mr. T. E. B. Skinner favours us with the following note in answer to our inquiry as to the fate of the Major's coffee venture:—"My father owned a large tract of land in Ambagamūwa, and once cultivated jointly with Sir W. Carr, the Chief Justice, a coffee estate which proved a failure, and eventually cost him many thousand pounds sterling. Captain Evatt purchased a portion of the land and opened an estate called Koladeniya, which was also unsuccessful as a coffee estate, and subsequently Mr. H. Saunders bought the remainder of the block of several hundreds of acres which are now, I believe, in tea."

† Note.—Captain Skinner being a Member of the Council.

a member of the Legislative Council, though to the disgrace of both local and home authorities, one so pre-eminently fitted to be a most valuable legislator was never confirmed in his Council seat, notwithstanding several "acting" appointments. On the 19th Dec. 1838, Capt. Skinner was married to Georgina, daughter of Col. Burrell, C.B., Commanding the 18th Royal Irish at Trincomalee, and afterwards Lieut.-General Burrell. In 1841, the unfortunate Civil Engineer and Surveyor-General's Department again became disorganised, and the Government resolved to divide it into two, giving Capt. Skinner charge of all the Roads on a salary of Rs,000 per annum, afterwards increased in 1846 to Rs10,000. In April 1847, his regiment, the Ceylon Rifles being ordered to Hongkong, he finally retired from the Army as Major Skinner, selling his Commission after 28 years' service. In 1848 Major Skinner went on leave to England, his first absence after 23 years' continuous service including much hard work and privation; this was made the occasion for a very flattering address from the Maha and subordinate Mudaliyars (native chiefs). Major Skinner was absent in England when the so-called Rebellion of 1848 broke out; he had prophesied trouble in the Kurunegala and Matale districts from the misgovernment he had witnessed during the "forties," but his warnings were disregarded. At home, the Secretary of State for the Colonies, Lord Grey consulted him, and he drew up a very able State paper in July 1849 for the benefit of the Select Parliamentary Committee on Ceylon affairs, dealing with the social and material condition of the island and its people, among whom he had lived so long. In this, he recommended as one check on native litigation which was filling the British Courts, the revival of "Gansaibs" or "Gansabawa," another reform which it fell to Sir Hercules Robinson many years after to carry out. Major Skinner resumed his duties in Ceylon at the end of 1849. In 1850, the "Civil Engineer's" Department was separated from the Survey, and Major Skinner was ordered to incorporate it with his own, thus becoming "Civil Engineer and Commissioner of Roads," and so continuing in charge of the entire Public Works of the Colony until his retirement in 1867. In August 1854, another departure home on leave was made the occasion of a flattering but well-deserved eulogium in the *Ceylon Observer*, on the man who had given the best years of his life—from the 14th to the 50th year—to the service of the Colony, and whose name was closely connected with every line of communication opened from 1819 onwards, as well as with the great survey of the island. "Nothing but an iron frame and the most temperate habits, could"—wrote the Editor—"have enabled Major Skinner

to survive his exertions in and on behalf of the Colony. Believing, that there is not a man in Ceylon to whom the island owes so much in the way of material improvement, on which moral advancement so closely depends, we feel bound to yield him this parting tribute of gratitude which he has so well earned." On his return, Major Skinner took an active part in carrying out the public works which Sir Henry Ward so warmly promoted; but he had to oppose that able Governor in respect of his rash Railway contract, and this opposition cost him dearly—(the office of Auditor-General and a seat in the Executive and Legislative Councils)—though it saved the Colony a great deal. The first day he waited on Sir Henry Ward he laid before the Governor plans of iron bridges and urged that a dozen should be ordered out at once!

In October 1860, Sir Charles MacCarthy assumed the Government, and notwithstanding strenuous opposition in a narrowminded Executive Council, Major Skinner carried his way with the Governor, so far as to get a vote to provide for the extension of the Uva Road from Pelmadulla to Balangoda which he constructed so economically—R91,630 for 15 miles—as to have enough over to prolong the same road well on to Haputale. What the Major thought of this important line of communication may be judged from the following extract from his writings:—

The enterprise of coffee-planters could not be checked and the demand for roads was excessively urgent in order to prevent the loss of much of the capital they had invested. During Sir Henry Ward's Government he exercised a will of his own, and it required no great persuasion to convince him of these wants; but now the expenditure was not considered with reference to the increased facilities given to the planters, but to the additional charge likely to be entailed upon the revenue for additional annual expenses. The Hapootella district, a group of probably the finest estates in the Colony, furnished a painfully striking example of the need of roads. I had long foreseen the strait to which the proprietors were inevitably drifting. Their rice and other provisions could be carried to the estates by manual labour, but directly the coffee tree was old enough to yield a crop the consequences were palpable. I had long been struggling to open a road for wheel traffic from the highest navigable port of the Caltura River to the Port of Colombo, at Ratnapora through Saffragam to Ouvah, and had got as far as Pallamadula, twelve miles above Ratnapora. There still remained at least thirty-eight miles of the most execrable native mountain path, ever traversed and intercepted by rapid torrents, only fordable in dry weather. Over this path the planters sent down their maiden crops, which were always small and light, on men's shoulders.

How the planters of Haputale in the "sixties" regarded Major Skinner's work on their behalf and his services generally, may be judged from the following address, drawn up at their request by the present writer in 1865:—

MAJOR SKINNER AND THE PLANTERS
OF HAPPOOTELLA, BADULLA, AND
SAFFRAGAM.

The following address and reply have been forwarded to us, and it is with no ordinary feelings

of pleasure that we accede to the request to give them a place in our columns. By a singular coincidence, this unqualified expression of the feelings entertained towards Major Skinner by so large a section of the Planting community must have reached his hands almost simultaneously with the intelligence of his supersession in the post of Auditor-General. The present is certainly a time when in expressing their sense of the services rendered by Major Skinner, the public of this island would be simply doing a very meagre act of justice. We hope to find our suggestion acted upon by the leading members of the Planting community, in reference to petitioning the Secretary of State on the position of the Commissioner of Roads. In whatever way our Legislative Council may be constituted, the presence of the officer at the head of the Public Works Department will henceforward become of essential importance to the Government and the public.

The gentleman who sent the address to Major Skinner accompanied it with the following explanation:—

"In forwarding to you the enclosed paper on behalf of the gentlemen whose names are attached to it, I have to offer some explanation. The wish to make known their feelings of gratitude to you had been expressed among the Hapootella Planters about nine months ago, and shortly after, this Address was drawn up and circulated, which accounts for its alluding to you as Commissioner of Roads, &c., instead of your present official position. We preferred however sending you the original paper, with the names as written by the Planters themselves, some of them widely separated, to drafting another;—and to prevent any further delay it is thought best for me to send you the enclosure in this private manner, rather than wait for a convenient opportunity of meeting you publicly. It is the wish of us, Planters, however, that the Address and any few words of acknowledgment from you should be published."

TO MAJOR THOS. SKINNER,

Chief Commissioner of Roads, and

Civil Engineer, CEYLON.

SIR,—We, the undersigned Planters and other Residents in the district of Hapootella, Saffragam and Badulla proper, cannot permit the occasion of the completion of the Hapootella Road to pass without making known to you the feelings of gratitude and esteem with which we have watched your exertions for the successful execution of this great work. We need scarcely allude to the personal interest we each and all, feel in a Trunk Road opening up the districts which we represent, inaugurating a new era for a large extent of country, both in regard to European and Native Industry. We cannot but realize that after our late Governor, Sir Charles MacCarthy, who first granted a vote to commence the road, there is no one connected with the Colony to whom we are more indebted than yourself for this boon, both from the intelligent and warm interest taken, and the activity manifested in its projection and execution. Of the manner in which this has been carried out, we need say nothing here: the general expression of opinion through public channels at different times bears unqualified testimony to the substantiality of the construction and formation of the Road. Neither is it for us—comparative strangers as we are, and the great majority at least, but Colonists of a few years' standing—to touch on the great services rendered by you to the Island during a life-time so well and laboriously spent here. Commencing in 1820 we understand, as a subaltern in charge of a section of the great Kandy Road, your name has ever since for nearly half-a-century, been closely connected with the material improvements in this Colony, particularly with communications from which its prosperity has mainly resulted. Now that the period has arrived when the Colombo and Kandy Road is about to be superseded by the Railway,

it must be a source of great gratification that you have been permitted, as Head of the Public Works Department, to complete the second great line of communication between the Maritime Capital and the Mountain Zone. We hope that its completion through to Badulla may also take place under your auspices, unless well-deserved promotion should necessitate your removal from the Roads Department. But in any case your name must long be remembered in connection with the Hapootella and numerous other Roads, in the Island.

We feel some delicacy in presenting an address to you; but we do so in the hope that our motives may not be misconstrued, springing as they do from pure regard for the unblemished public and private character of a zealous and able public officer who has so long and faithfully served this Colony.

Trusting this may prove our excuse for intruding,

We remain with sincere respect, Sir,

Your Obedient Servants,

In his reply, Major Skinner wrote:—

Hambantotte, 29th January, 1866.

Dear Sir,—I had yesterday the pleasure of receiving your letter of the 26th instant, enclosing me on behalf of the gentlemen who signed it, a letter from Planters and other Residents in the districts, of Hapootella, Saffragam, and Badoola proper, and in which you were kind enough to explain why it had not been transmitted to me at an earlier date.

May I beg the favour of you, to convey to the gentlemen who have subscribed to the kind and flattering terms expressed towards me in their letter, my grateful thanks for their, I fear, too high appreciation of the services I have been enabled to render to their districts. The expression of such kindness of feeling, and of approbation of my public conduct would have been most gratifying to me at any time;—but circumstances render such sympathy specially acceptable at the present moment.

In my opinion it would be difficult to over-rate the importance (as well to the interests of the native population of Saffragam, as to European enterprise) of the Hapootella Trunk Road; and it is a subject of great congratulation to me, that I have been permitted to carry it out so far as it has at present reached with, I trust, some prospect of its progressive improvement being unchecked until it is completed to Badulla.

There are several circumstances of interest, and, I think, of instruction connected with the construction of the Hapootella Road. The estimate for that portion from Pallomadula to Ballangodde (15 miles) was £18,644—it was the lowest of several framed by able officers, about the time the cost of work was being

warmly discussed with reference to the Estimates of the late Ceylon Railway Company—which I ventured to denounce as extravagant. In the inquiry which was instituted by a Sub Committee of the Legislative Council, my testimony as to the previous cost of work in the Colony was questioned—not that I was supposed to intend willfully to mislead the public, but that I laboured under self-delusion on the subject. In adopting the lowest estimate I informed the officer who framed it, that I should take the work under my own direction, and make it practically test the accuracy, or the fallacy of my views as to the actual cost at which its various departments could be executed. At the beginning of 1863 I drove the late Sir Charles MacCarthy to Ballangodde, and had the satisfaction of shewing him that instead of the estimated amount of £18,644 having been expended on the road he had so much admired, its cost was only £9,163—when he was good enough to yield to my importunities to be permitted to carry it on for 13½ miles further, with the balance of £9,481 saved on the estimate. This is a striking instance of the value and importance of economy—but for it, in this case, I believe your carriage road would not, at the present moment, have been extended a yard beyond the Ballangodde Bridge; and it should satisfy the Government and the public, that it does not necessarily follow, that because liberal means are granted for the execution of works, the Department should lavishly and wastefully expend them. It also shows how much may be done by means of Native talent and energy—there has not been an European employed upon the Hapootella road from its commencement to the present time.

My early association with the Kandy Road has been kindly alluded to. This reminds me that it was said by no mean authority at the time, that the far-seeing statesman by whom it was designed and executed, deserved to be impeached for his extravagance in making it. When Sir Edward Barnes heard of this speech, he simply replied, "Ceylon's future will determine that point"—the "future" of Saffragam, Hapootella, and Badoola will, I trust, in a proportionate degree, prove the wisdom of that expenditure which has given to those districts an outlet without which success or improvement would have at least remained most problematical.

It must, I think, be clear to all—but those who are wilfully blind—that without good means of communication, it is impossible for any Coffee district in the present day, to struggle long with the difficulties which are inevitable in new localities—and as the success of districts is of as much importance to the general prosperity of the Colony, as the individual undertaking can be to each person concerned in it,—I trust that the policy of giving the utmost practicable aid to new districts, may not again be questioned.

It has been my best reward for the labours I have gone through,—frequently under great discouragements—to have observed, that the progress and prosperity of this Colony has followed with unvarying certainty upon the opening up of its communications, on which the greater part of my life has been engaged. It is by their preservation in a state of efficiency, and by their extension alone, that that prosperity can be maintained, or its resources further developed; and it ought to be a source of great congratulation to all interested in Ceylon's welfare, to feel that so far as the most painstaking, untiring energy, and sound judgment now brought to bear upon the subject, can ensure the judicious appropriation of means to works of improvement—there is little left to wish for. This auspicious state of things makes me wish I were capable of a few more years of good active work, that I might have the privilege of conducting the useful works which are now being initiated.

While repeating the assurance of my high appreciation of the kind feeling which has been expressed towards myself, I beg to be allowed to avail myself of this opportunity of recording my sincere thanks for the kind manner in which, I am aware, the Hapootella district has shown its estimate of the value of the services of native officers, Wellapole, Commanding the 5th, and Sherman commanding the 8th Division

of Pioneers—for, after all, it is to them and to their invaluable men, that we are indebted for results so creditable to them, and so important to the public interests.

I remain, Dear Sir;

Yours faithfully,

T. SKINNER.

J. Mitchell, Esq.,

of Kelburne Estate.—Happootella.

The death at Ramboda of his old chief General Fraser in May 1862 was a great grief to Major Skinner, especially as he was too late to be with the General at the end, as the latter earnestly desired. In March 1865, Sir Hercules Robinson arrived, and no Governor more fully appreciated Major Skinner's unequalled experience and good work. The Governor began at once to travel a great deal over the island, generally on horseback, and taking the head of the Public Works Department with him, he thoroughly profited by all he learned in this way.

In September 1865, on the death of Mr. Pennefather, Auditor-General, Sir Hercules Robinson requested Major Skinner to take up the acting appointment in order that he might preside over the Royal Commission to determine the Military Force and Expenditure requisite for the Colony. The evidence and Report of this important Commission were published in December 1865. Owing to his wife's serious illness (and subsequent death) in 1866, Major Skinner had to run hurriedly to England, and while there he was specially consulted by Lord Carnarvon, Secretary of State for the Colonies, who invited him to High Clerc. He returned to Ceylon only to prepare for retirement in June 1867, an event which was made the occasion for a universal expression of esteem and good-will, and of a series of farewell Addresses, one being from Colonists, Merchants, Planters, &c., praying the Secretary of State to make Major Skinner's a full-pay pension of £1,000 per annum. From the long farewell notice in the *Observer* we quote but one passage:—

With the formation of nearly every mile of road and the erection of every bridge in the country, Major Skinner has been more or less intimately connected either as subordinate or Chief of the Public Works Department; while we cannot forget that simultaneously he laboured, amidst exposure and privation of which present explorers of the Kandian Provinces can have but the faintest idea, in surveying and fixing the topographical features of the country he was opening up; the result being seen in the beautiful and useful Map of the Colony, and especially that of the Mountain Zone, with which his name, in conjunction with those of Fraser and Galloway, will be ever honourably associated.

A harder worked or better Public Servant than Major Skinner never lived in any Colony: as he wrote himself, from the age of 16 when he was first employed away from his regiment, scarcely any labourer could have worked much

harder or gone through greater exposure, than he was subjected to during his 49 years' service in tropical Ceylon. We have hinted more than once at the high moral character of the subject of our notice: Major Skinner was the friend of Christian Missionaries in Ceylon and of all good work in every direction. After his retirement in 1869, the Duke of Buckingham as Secretary of State, on Sir Hercules Robinson's recommendation, wished to submit his name to Her Majesty for the "K.C.M.G.;" but the veteran public servant while expressing his gratitude, declared he was too poor to covet the knighthood and begged that the honor might be "C.M.G." instead, and this was agreed to. He was consulted about the visits of the Duke of Edinburgh and Prince of Wales to Ceylon, and he kept up his taste for Natural History—Conchology especially—and his love for fishing in Cumberland, Ireland, or Scotland, till the end of his life. His daughter (Miss Annie Skinner, afterwards Mrs. MacDonnell) who edited the autobiography, thus fittingly closed the volume and the life-history of her father:—

It was my privilege to be with him during the last few years of his life, which he spent principally in visiting old friends and travelling, the latter being always a special pleasure to him. He felt his work was done, and he was just waiting for his call Home. It is not for me to add to the record he has left of what that work was; I can only speak of the brightness of the eventide, which seemed to shine more brilliantly as the end drew near. One day, looking up, he said, "My child, all, all is bright; there is not a single cloud anywhere."

On the 24th July 1877 he passed peacefully away to the Home he was so longing for, and I felt the promise was fulfilled that

"At evening time it shall be light."

So passed away in his 74th year, Ceylon's great Roadmaker, Pioneer of Progress, and most devoted Public Servant. His family originally consisted of two daughters and five sons, namely, Miss Skinner who became Mrs. M. H. Thomas, wife of Mr. M. H. Thomas, a well-known mercantile and planting Colonist still in our midst; Miss Annie Skinner, editor of the above Biography, now Mrs. MacDonnell; while of the sons, G. Skinner (the second) died as Capt. in the 15th Regiment; M. Skinner died as Commander R.N.; W. Skinner was in the Oriental Bank and was killed in Bombay by a fall from his horse. Of the two surviving, one is now (1894) Major Monier Skinner, R.E., and the other and eldest son of the family, T. E. B. Skinner, Esq., is well-known for his thirty-three years' official work in the Civil Service of this Colony, and is now Postmaster-General and Director of Telegraphs in Ceylon, one of the most important administrative posts connected with the Island.

CEYLON MANUAL OF CHEMICAL ANALYSES.

A HANDBOOK OF ANALYSES CONNECTED WITH THE INDUSTRIES AND PUBLIC HEALTH OF CEYLON FOR PLANTERS, COMMERCIAL MEN, AGRICULTURAL STUDENTS, AND MEMBERS OF LOCAL BOARDS.

Manures.

Manures are substances which are added to the soil to increase or to maintain its fertility. Manures may accomplish this in two ways; first, by the direct addition of plant food to the soil; second, by rendering available the elements of plant food already in the soil.

In the art of manuring the agriculturist has to take special account of these four constituents of plant food, viz.:—nitrogen, phosphoric acid, potash, and lime; as these, but more especially the first three, are the constituents of plants in which the soil is likely to be deficient.

Nitrogen.

Nitrogen is an element of the greatest importance to the fertility of the soil. There is, of course, an abundant supply of nitrogen in our atmosphere, in the uncombined state; but this is directly available as the food of plants to a very limited extent. The question how far it is available is one which has, of late, much

occupied the minds of scientists, and has been the subject of many practical experiments. At present the opinion is that most plants are unable to assimilate to any appreciable degree the free nitrogen of the atmosphere; but that plants of the natural order leguminosae possess to a marked extent the power through the intervention of microbes, of assimilating the free nitrogen of the atmosphere. The assimilation takes place in microbe-bearing nodules, or tubercles, which are developed on the roots of the leguminosae.

Although the free nitrogen of the atmosphere cannot be counted upon as a direct source of plant food for other than leguminous plants, the atmosphere contains a small proportion of nitrogen in the forms of ammonia and nitric acid which is brought down to the earth by the rains, and which constitutes an important part of the food of plants.

By the systematic analysis of rain water throughout the year, in various parts of the world, calculations have been made of the amount of nitrogen carried into the soil in the forms of ammonia and nitric acid. Mr. R. Warrington, F.R.S., determined the amount of nitrogen in a year's rainfall at Rothamstead,* St. Albans, from May 1888 to 1889. He found that the amount of nitrogen present as ammonia varied from '238 parts per million in the month of February, to 1'025 parts per million in the month of September, and the proportion for the whole year was '426 parts per million equal to 2'823 lbs. per acre. The nitrogen as nitrates and nitrites varied from '095 parts per million in February to '253 in September, the average for the whole year being '139 parts per million equal to '917 lbs. per acre. The total nitrogen present as ammonia and as nitric and nitrous acids is thus 3'74 lbs. per acre.

Much higher figures than these have been obtained in Germany, and in Italy the average at 7 agricultural stations representing the rainfall of thirteen years, being 1'26 parts per million of nitrogen as ammonia and '47 parts per million of nitrogen as nitric acid, or a total of 10'18 lbs. of nitrogen per acre per annum.

At the Observatory of Mont Souris, Paris, the average of ten years showed 1'82 parts per million of nitrogen as ammonia, and '70 of nitrogen as nitric acid equal to 12'36 lbs. of nitrogen per acre per annum.

On the other hand, results obtained from Lincoln, New Zealand, and from Tokio, Japan, are below the Rothamstead figures. Professor Gray found in the former country, in an average of three years' rainfall '096 parts per million of ammoniacal nitrogen and '15 of nitric nitrogen equal to a total of 1'6 lbs. of nitrogen per acre per annum.

At Tokio, Kellner found in one year's rainfall '126 parts per million of ammoniacal nitrogen equal to 1'78 lbs. per acre, and in another year's rainfall '085 parts per million of nitric nitrogen equal to 1'02 lbs. per acre, showing thus a total of 2'8 lbs. of nitrogen per acre per annum.

We are not yet in a position to make similar calculations for any part of Ceylon, as no such systematic analyses of rain water have been made throughout the year, and isolated analyses

* Messrs. Lawes and Gilbert found that the amount of nitrogen furnished annually in the rainfall to an acre of land at Rothamstead amounted to 7'21 lbs., of which 6'46 lbs. occurred as ammonia and '75 lbs. in the form of nitric acid.—*Encyc. Brit. tanica.*

cannot give even an approximation to the average amount of nitrogen in the rainfall of a country. At the close of a period of heavy rainfall in Colombo, in October 1891, after nearly 28 inches of rain had fallen, the author estimated the amount of nitrogen present in a sample of rain water as ammoniacal and organic nitrogen, and found the same to be .0903 parts per million. The nitrogen present as nitric acid was .0346. The author also determined the amount of nitrogen present as ammonia in the rain of the 14th of March 1892 (a moderate rainfall) and found it to be .11 parts per million. Two determinations are of course far too few upon which to base anything like an accurate estimate, but taking the ammoniacal nitrogen at .1 parts per million, and the Colombo rainfall at 88 inches per annum, we get about 2 lbs. per acre per annum of nitrogen in the form of ammonia; or with a rainfall of 119 inches as in the year 1891, 2.7 lbs. of ammoniacal nitrogen. The amount of nitric nitrogen would be from .7 to .9 lbs. per acre per annum. The total nitrogen would thus be from 2.7 to 3.6 lbs. per acre per annum. It is probable, however, that an extended series of rain-water analyses might show this estimate to be much too low. The proportion of nitrogen in rain water is greatest in the first portion of a shower, and especially in that which falls after drought, so that reliable data cannot be obtained unless analyses are made representing the entire year's rainfall.

The power of soil and of vegetation to detain the ammonia which falls as rain may be gathered from the fact that at the time when the nitrogen, in the form of ammonia in Colombo rain water near to the sea was at least .1 parts per million, that in the town water from Labugama Reservoir was under .01 parts per million.

We have seen that a crop of tea, on a moderate estimate removes from the soil 19½ lbs. of nitrogen per acre per annum; that a rather heavy crop of coffee, including seed, pulp, and leaves, according to Mr. Hughes' estimate removes about 21 lbs. But the supply of available nitrogen in rain water, taking even the highest estimate before us, viz., that at the Mont Souris Observatory at Paris, is only 12.36 lbs. of nitrogen per acre per annum. It is evident then that the atmospheric supply of nitrogen is insufficient to meet the demands of growing crops, which have therefore to draw upon the store of nitrogen existing in the soil, in combination with organic matters. This store must get gradually reduced beyond the point necessary to sustain an abundant crop. It therefore becomes necessary to replenish the supply of nitrogen by the application to the soil of nitrogenous manures.

Phosphoric Acid.

The next most important constituent of plant food is phosphoric acid. The original source of this substance is the igneous rocks in which it is found, in small proportion, usually less than a half per cent, and often much less, in combination with lime. As the proportion in soils is usually small, it is readily reduced beyond the point necessary for fertility, and it has therefore to be supplied to the soil in the form of phosphatic manures. Seed crops, as a rule, make a great demand on the phosphoric acid of the soil, as this substance is specially assimilated by the seeds of plants; but a leaf crop, as in the case of tea, may also make a heavy demand on the phosphoric acid of the soil.

Potash.

Most soils contain sufficient potash for the food of plants, but if the demand made by a crop on this constituent is large, the potash in the natural felspathic ingredients of the soil may become too slowly available, hence potash has either to be supplied in manure for certain crops, or it must be liberated from its combinations in the soil by the application of lime.

Lime.

Soils generally contain sufficient lime to meet the demand of plants for this ingredient. Phosphoric acid in manure is generally combined with, or accompanied by lime, so that, when phosphoric acid is added, lime is also added. When lime by itself is directly added to the soil, it is not added with the view of supplying this element of plant food, but of decomposing the mineral and organic ingredients of the soil, and thus indirectly supplying the other forms of plant food. Lime is also added to improve the mechanical condition and to correct the acidity of the soil.

To restore fertility to soil, some land requires the addition of nitrogenous manure only; other only phosphatic manures; and, in some cases, only potash manure is sufficient. In many instances, however, crops are benefited by all three constituents.

Figures are not available for illustrating the degrees of advantage obtained by the more common Ceylon products from the three important elements of plant food in manure; although, no doubt, Ceylon planters could supply information on the subject in general terms. The following table of agricultural experiments in the manuring of the cotton plant, at the South Carolina Experiment Station, carried on at the Darlington and Spartauburg Farms, the lands of which are of different character, answers the question—does the cotton plant benefit by the presence in the manure of the three constituents: nitrogen, potash, and phosphoric acid? * The figures given in the table represent the yield per acre of lint cotton in lbs., and are the averages of three years' duplicate tests on each farm. The third column gives the average of the two farms." The figure "1" in the table indicates a full dose of each ingredient as calculated from the analysis of the cotton plant for a crop of 300 lbs. of lint per acre.

Does Cotton require Nitrogen, Potash, and Phosphoric Acid?

Fertilizer—Doses.	Average Crops for 1888, 1889, & 1890.		
	Sparta- burg Farm.	Darlington Farm.	Average for two Farms

1 Potash	71	125	98
1 Phosphoric Acid	148	171	159
1 Nitrogen, 1 Potash	143	197	170
1 Potash, 1 Phosphoric Acid	162	208	185
1 Nitrogen, 1 Phosphoric Acid	203	230	216
1 Phosphoric Acid, 1 Nitrogen, 1 Potash	298	338	318

* From the Bulletin of the Agricultural Experiment Station of the University of Tennessee State Agricultural and Mechanical College.

Classification of Manures.

Manures may be divided into two groups: 1st, those in which the valuable ingredients are accompanied by so much water, organic matter or earthy substances that they can only be economically applied on land situated near to the place where the manure is produced. Farmyard manure, town refuse and compost manure furnish examples of this group; secondly, there are the manures of commerce, in which the elements of plant food are in a concentrated form, and which may be economically carried long distances to the place of application.

Cattle Manure.

Two samples of Ceylon-made cattle manure sent to the author in 1881 gave upon analysis the following results:—No. 1 is the analysis of cattle manure from cattle fed upon coconut poonac and guinea grass, the bedding being mana grass; No. 2 is the analysis of manure from cattle fed upon guinea grass only, the bedding being mana grass.

Analysis of Ceylon Cattle Manure.

	No. 1 per cent	No. 2 per cent.
Moisture expelled at 212° F. ...	80.487	74.674
Organic matter and combined water ...	14.442	19.877
Ash ...	(5.071)	(6.149)
Insoluble Silica ...	1.805	1.664
Soluble Silica209	.193
Oxide of Iron, Alumina and Phosphates569	.430
Lime497	.717
Magnesia067	.171
*Potash951	1.068
Chloride of Sodium and Soda575	.827
Sulphuric Acid159	.217
Carbonic Acid and loss239	.862
	100.000	100.000
Nitrogen416	.644
Phosphoric Acid250	.092

The most striking feature in these analyses is the fact that, of the four chief manurial ingredients, viz., nitrogen, phosphoric acid, lime, and potash, the most abundant is potash, which averages fully 18 per cent of the manure ash. The proportion of potash is much higher than in Wolf's often-quoted analyses of farmyard manure given further on; indeed, it is twice as great. Analyses of the ashes of mana grass, guinea grass, and coconut poonac, separately, would be desirable to ascertain the proportion of potash and other ingredients derived from each of these sources. The percentage of potash in the manure from cattle fed on guinea grass only is slightly higher than in the other, when calculated upon the weight of the manure as it stands, but if calculated upon the weight of the ash of the manure, it is slightly higher in that from cattle fed upon both poonac and guinea grass, the latter, *i.e.*, No. 1, has a very decided advantage in respect of phosphoric acid. I should scarcely have expected to find No. 2 richer in nitrogen than No. 1, yet such was the fact, and although, in the case of a substance so difficult to sample, from its want of homogeneity, as cattle manure is, it would be desirable to confirm this result by other analyses, the superiority in respect of nitrogen of No. 2 was borne out by analyses I made of dung

sent to me from cattle fed on coconut poonac and guinea grass (No. 3), and of dung from cattle fed on guinea grass only, in which the latter proved richer in nitrogen (No. 4).

Analyses of Cattle Dung.

	No. 3 per cent.	No. 4 per cent.
Moisture expelled at 212° F. ...	75.186	73.500
Organic matter and combined water ...	21.195	20.253
Ash ...	(3.619)	(6.247)
Insoluble Silica ...	2.221	3.667
Soluble Silica159	.328
Oxide of Iron, Alumina and Phosphates438	.499
Lime464	1.037
Magnesia086	.078
Potash091	.213
Chloride of Sodium and Soda043	.076
Sulphuric Acid078	.112
Carbonic Acid and loss039	.237
	100.000	100.000
Nitrogen392	.529
Phosphoric Acid174	.139

Then again we notice that in the dung from cattle fed both upon poonac and guinea grass, although the percentage of ash is much lower yet the phosphoric acid is higher than in the dung from cattle fed on guinea grass only.

The composition of Cattle Manures Nos. 1 and 2 may be compared with the following analyses by Professor Wolf of farmyard manure fresh and well-rotted:—

Analyses of Farmyard Manure. (WOLF.)

	71.7	79.0
Water ...	71.7	79.0
*Organic matter ...	24.6	14.5
† Ash ...	4.4	6.5

Siliceous matter	32.54
100.00	
* Equal to Tribasic Phosphate of Lime	2.23

All of these compost manures might be applied with advantage to land in the vicinity of the places where the manure was produced; but none of them unless perhaps No. 3 contains the elements of plant food in a sufficiently concentrated form to repay the cultivator for the cost of their transit to a distant estate.

The manures of commerce may be divided into the following classes :—1st, nitrogenous manures; 2nd, phosphoric acid manures; 3rd, potash manures; 4th, nitrogen, and phosphoric acid manures; 5th, nitrogen and potassic manures; 6th, phosphoric acid and potash manures; 7th, what might be called general or concentrated compost manures; 8th, indirect manures.

1st. Nitrogenous Manures.

Nitrogenous manures as the name indicates, are those which are valued mainly for the nitrogen they contain. Some of these contain the nitrogen in a form readily soluble in water. Such are the salts ammonium sulphate and sodium nitrate. In others the nitrogen exists in a more or less insoluble form. We have examples in dried flesh, dried blood, the various oil cakes, woollen waste and rags, hair, horn and leather waste.

Ammonium Sulphate.

The commercial salt contains 20 per cent of nitrogen. It is usually guaranteed to contain 24 per cent of ammonia or to consist of 93.18 per cent of real ammonium sulphate. The following is the analysis of a good sample imported into Ceylon :—

Water expelled at 212° F. ...	1.50
* Ammonium Sulphate	95.50
Volatile impurities	2.74
Fixed do26
100.00	
* Containing ammonia	24.60

Ammonium sulphate is liable to contain small quantities of ammonium sulphocyanate, which, although a more nitrogenous substance than the pure sulphate of ammonium, is poisonous to plants.

Sodium Nitrate.

When of standard purity this salt contains 95 per cent real nitrate of sodium; the remaining 5 per cent is chiefly made up of water and common salt. It is obtained from the Pampas of Peru, where it occurs in the form of a crude nitrate, and called caliche. It is in the purified form that it is exported. The amount of nitrogen present in nitrate of sodium of standard quality is 15.65 per cent, which is the equivalent of 19 per cent of ammonia.

The following is the analysis of Colombo

Soot.

Soot is used to a small extent in England as a nitrogenous manure. It contains nitrogen both in the soluble and insoluble forms. In these samples analysed by Mr. John Hughes he found from .23 to 2.85 per cent of ammonia existing as chloride and sulphate and therefore soluble, also nitrogen in the insoluble state equal to from 1.24 to 1.66 per cent of ammonia. The nitrogen in both forms reckoned as ammonia being from 1.74 to 4.88 per cent.

Of nitrogenous manures, containing nitrogen in the insoluble form, there is a considerable variety.

Dried Flesh.

Dried flesh has been used as a manure, but not extensively. It is rich in nitrogen. These samples analysed by Voeleker imported from Australia, New Orleans, and South America, contained from 11 to 12 per cent of nitrogen, and 3 to 8 per cent of ash. Since the development of the tinned meat and meat extract industries, by-products from these manufactures are utilized as manures and sold under such names as meat guanos, meat meal, Freybentos guanos, mixed scrap, &c.

Meat meal is sold according to the percentage of nitrogen present, of which there should be the equivalent of from 8 to 13 per cent ammonia. Liebig's meat meal is guaranteed to contain nitrogen equal to 13 per cent of ammonia.

Dried Blood.

When blood is thoroughly dried it contains about 15 per cent of nitrogen. Being difficult to dry, however, there is generally a considerable quantity of water in the commercial article. A sample from a quantity imported into Ceylon was analysed with the following results:—

		per cent.
Moisture	13.40
* Organic matter	80.57
† Ash	6.03
		100.00
* Containing Nitrogen	12.36
Equal to Ammonia	15.00
† Containing
Lime424
Phosphoric Acid16
Potash33

As good commercial dried blood should contain from 10 to 13 per cent of nitrogen, the above analysis may be regarded as representing a good average sample.

Woollen Refuse and Hair.

Woollen refuse and hair are used as manure on account of the nitrogen they contain. The amount of nitrogen in pure wool and in hair is about the same, and amounts to about 17 per cent. The mineral matters are small in amount about 2 per cent. Refuse wool, such as old woollen fabrics, and shoddy, are considerably poorer in nitrogen than pure wool. The nitrogen in woollen refuse, as it finds its way to the manure market, may vary from 2 per cent to nearly 12.

The mineral value of woollen refuse is lessened by the presence of water, oil, or mineral impurities; also by the presence of cotton or other non-nitrogenous fibres.

The following are Mr. Hughes' analyses of good commercial shoddy:—

		No. 1	No. 2
		per cent.	per cent.
Water	19.93	9.86
Organic matter	63.40	76.08
Ash	16.67	14.06
		100.00	100.00
Nitrogen	6.83	7.92

Crushed Oil Cakes.

The nitrogenous manures that are most in request, or most easily obtained in Ceylon, are oil cakes; of which the favorite is

Crushed Castor Cake.

This is the crushed residue of the seeds of the castor oil plant, *Ricinus communis*, after the oil has been expressed. The white castor cake is more valuable than the brown or black as a manure. The two latter contain a considerable proportion of the husks of the seeds, which are of little value, and impart the dark appearance to the substance.

The following two analyses made for a local firm exhibit the composition of good qualities:—

Analyses of Crushed Castor Cake

	Per cent.	Per cent.
Moisture ...	8.20	8.95
Oil ...	12.84	12.66
*Albuminoids ...	43.81	48.13
Mucilage, digestible Fibre, &c. }	7.51	10.09
Cellulose ...	16.45	11.34
Soluble Ash ...	6.58	5.77
Sand ...	4.61	3.06
	100.00	100.00
*Containing Nitrogen..	7.01	7.70

For manurial purposes much less elaborate analyses suffice. The following give all the details necessary to enable buyers to judge of the quality of castor cake, which, as a manure, is usually valued altogether on the basis of its nitrogen:—

Analysis of Fresh and Old Castor Cake.

	Fresh.	Old.
	per cent.	per cent.
Moisture ...	8.88	8.74
Organic matter ...	80.58	80.62
Ash ...	10.54	10.64
	100.00	100.00
Sand ...	3.08	2.70
Valuable Ash ...	7.46	7.94
Nitrogen ...	7.25	6.70

Potash in Castor Cake.

The amount of potash in castor cake appears to have been very seldom determined. The late Mr. Pringle found nearly 2 per cent. in a sample of secondary quality, while the author in a similar quality found only .91 per cent. In drawing out the tables for manuring of tea the author found it necessary to take account of the potash in second-class castor cake, and having only determined it once himself, he gave weight to Mr. Pringle's analysis, taking the figure at 1.5 a little above the mean of the two analyses. Three subsequent determinations by Mr. W. R. Burnett, F.C.S., however, have confirmed the author's figures, the results obtained being .92, .94, 1.15, so that 1 per cent. may be taken as quite high enough to represent the potash in second-class castor as cake imported into Ceylon. The following details of Mr. Pringle's analysis and of the author's. It would appear as if the potash were replaceable to some extent by lime, Mr. Pringle having found only a trace of lime, while the author found .78 per cent. If the class of castor cake represented by Mr. Pringle's analysis can be freely obtained, it would be worth to the Ceylon planter R2 per tons for its potash more than that represented by the author's analysis. The following are details of the two analyses:—

Analyses of two samples of Castor Cake. Secondary quality.

	Pringle.	Author.
Moisture ...	6.71	9.06
Organic matter ...	87.30	83.19
Ash ...	5.99	7.21
	100.00	100.00
Nitrogen ...	5.05	4.89
Sand83	2.82
Soluble Ash ...	5.16	4.39
Potash ...	1.98	.91
Lime09	.78
Phosphoric Acid ...	1.21	1.24

For the determination of potash and other mineral constituents in castor cake of the first quality, I submitted a sample of what is sold in Colombo as best quality to Mr. Tatlock, Glasgow, who for quarter of a century has been regarded as an authority on the determination of potash, and whose modification of the general process is the one generally adopted in agricultural laboratories. The following were the results obtained in his laboratory.

Mineral Constituents of Castor Cake. Best quality.

	Per cent.
Lime87
Phosphoric Acid ...	2.94
Potash ...	1.25
Ash ...	9.42
Water ...	8.40

Of the samples submitted to me the richest white castor cake contained nitrogen equal to 9.35 per cent. of ammonia; but according to Mr. Pringle it can be produced with nitrogen equal to 10 per cent. of ammonia. Of those samples analysed in 1891 the nitrogen in no case quite reached the equivalent of 8 per cent of ammonia. The following are some examples of the castor cake of commerce in Ceylon:—

Analyses of samples of Crushed Castor Cake.

Moisture ...	8.7	per cent.	8.6
Organic matter ...	80.55	per cent.	83.57
Ash ...	10.75	per cent.	8.9
	100.00	per cent.	80.09
		per cent.	11.01
		per cent.	100.00
		per cent.	5.45
		per cent.	7.23
		per cent.	6.60
		per cent.	4.34
		per cent.	6.02
		per cent.	7.31
		per cent.	6.09
		per cent.	3.21
		per cent.	6.27
		per cent.	7.61
		per cent.	6.08
		per cent.	3.92
		per cent.	6.43
		per cent.	7.81
		per cent.	6.50
		per cent.	2.87
		per cent.	6.32
		per cent.	7.67
		per cent.	6.80
		per cent.	3.95

The following is an inferior sample:—

Moisture ...	per cent.	9.10
Organic matter	80.14
Ash	10.76
		100.00
Nitrogen	3.86
Equal to Ammonia	4.69
Soluble Ash	6.48
Sand	4.28

Analysis shows this sample to be of only half the commercial value in Colombo of the second example in previous page, and of considerably less than half the value to the planter on a distant estate.

The abnormal composition of the following samples was due to the presence of bone dust:—

Analysis of Castor Cake containing Bone Dust.

Moisture ...	per cent.	7.75
Organic matter	73.65
Ash	18.60
		100.00
Nitrogen	5.75
Equal to Ammonia	6.98
Soluble Ash	13.71
Phosphoric Acid	4.87
Equal to Tribasic Phosphate of Lime	...	10.64

(To be continued.)

EXTENSION OF TEA CULTIVATION.

With Mr. P. R. Buchanan now in our midst and Sir John Muir nearly due, it is natural that we should think of the large additional extent of tea these gentlemen are likely to become responsible for. The purchase of plantations here may not disturb the planted total, though we may anticipate that all available reserves on these will be speedily utilised so far as advisable, by such enterprising capitalists. But they are also likely to open a good deal of new land in certain districts. And yet after all, probably the operations in Ceylon of the powerful Firms and Companies represented by our visitors will count for little in comparison with the extensive new gardens being opened under their auspices in India. We were warned some years ago to look out for "the Dooras" as the coming great Indian Tea District for crops; but we had no idea that Messrs. Finlay, Muir & Co. and friends had such extensive interests there as to warrant the construction of a special Railway (through a Company) to serve this district. Such is however the case, and the tea crops that will henceforward be harvested in the Dooras are bound to make a very considerable addition to the total outturn for India. We have now in Ceylon on a very brief visit, Mr. C. Anderson (brother of Mr. T. C. Anderson of Maskeliya), a tea planter of over thirty years' standing in Northern India and who, for several years back, has been doing pioneering work on an extensive scale in the Doora, on behalf of Messrs. Gillandere, Arbuthnot & Co. Mr. Anderson says that quantity not quality is the characteristic of Dooras' crops. It is impossible to make fine teas, the trees and leaves are so sappy, but 10 to 15 maunds (800 lb. to 1,200 lb.) per acre can be made on established rate of outturn over wide areas of tea gardens there; and yet strange to say the crop is all gathered in four months, October being the great plucking month. The rich soil and steamy climate are equal to the heaviest crops of leaf; but the district is distinguished for malaria—very trying to the European planters. It is, however, very well off so far for labour supply and altogether, "China" cannot be considered in the running for cheap teas with the "Dooras" and we may add with some parts of the lowcountry of Ceylon where we hear of tea being turned out as low as 20 to 21 cents per lb.

In this connection we may mention that last mail has brought us a copy of the *North British Mail* of Glasgow with over five columns in small type devoted to an extraordinary and decidedly acrimonious Correspondence between Sir Archibald Orr-Ewing, Bart., and Sir John Muir, Bart., in regard to the management and financial arrangements of the Sylhet Tea Companies in which the former holds stock to the extent of £20,000, while he complains that the shareholders are entirely at the mercy of the Chairman (Sir John Muir) and Directors and Managers who are chiefly his partners. We cannot give even an idea of the rather personal and bitter character of many of the letters given—some of them very long—but there are certain references to the proposed extension of operations in North India and Ceylon which are very *apropos* of our present subject. Before however turning to that part we may give the introduction to the Correspondence in the *N. B. Mail* of November 7th as follows:—

"Today an extraordinary general meeting of the shareholders of the North and South Sylhet Tea

Company (Limited) will be held within the offices of the Company, 22 West Nile Street, at which the following resolution will be proposed:— 'That the shareholders of the North Sylhet Tea Company, Limited, (or the South Tea Company Limited, as the case may be), regret the publication by Sir Archibald Orr Ewing of his recent correspondence on the constitution and management of the company as tending to injure the company and depreciate the value of the shareholders' property. That they hereby express their complete confidence in the directors, secretaries, agents, and managers of the company, and their high satisfaction with the management which has resulted in handsome dividends to the shareholders; and they instruct the directors to abide by and maintain the conditions on which Sir Archibald Orr Ewing applied for and took his shares. And that a copy of the resolution be sent by the directors to each shareholder of the company.'

As the London Mail did not leave till the 10th, the result of the meeting should have come, but we have no paper or advice on the subject beyond the paper of the 7th; although we infer that Sir John Muir and his friends were likely to carry the above vote of confidence and indeed much of Sir A. Orr-Ewing's criticism had been discredited. In the Correspondence we find that on 23rd September last, Sir John Muir reported he was endeavouring in London, to arrange that "suitable land in Ceylon and Assam should be placed under offer, so that it may be carefully inspected by our experts in order to make certain that it has all the requisites essential for the formation of new estates economically and successfully." On 15th October, Messrs. James Finlay & Co. report that "several important negotiations are being conducted for the acquisition of desirable land in Ceylon and Assam," and Sir John Muir two days later deprecated the publication of controversial circulars at a time when the balance of £400,000 stock was being placed and indeed until the return of Mr. P. R. Buchanan from Ceylon. The Companies under notice, it seems, have paid 12 per cent per annum to their ordinary shareholders for the past four years,—far more than most Indian Companies;—but one complaint of Sir A. Orr-Ewing was that no balance-sheets were published, "as is done by every Company I am connected with except Sir Donald Currie's miserable Steamship Company." On 21st September, we ought to have mentioned, the same critic had written that he wished "to show the shareholders of the North and South Sylhet Tea Companies the grounds on which I opposed the extension of those Companies in Ceylon and Assam." We have only one more quotation to make today and that is from a very full explanatory letter of Messrs. James Finlay & Co., under date of Glasgow, 7th October:

Full replies have been drafted to your remarks, but, in the absence of Mr. P. R. Buchanan, it has been thought better not to submit these to the shareholders till he has had an opportunity to consider your statements and the proposed replies. We feel satisfied the shareholders will consider this to be the only proper and respectful course to adopt towards one who has done so much for these Companies. Mr. Buchanan took a very large interest in their formation. At the request of the late Mr. Thomas Coats, in 1881, he accompanied the chairman, and two of the partners of Finlay Muir & Co., on their visit to North and South Sylhet, and assisted materially in the search for suitable land, which resulted in the purchase of the properties at Lulleoherra in North Sylhet, and the Balisera Valley in South Sylhet. On their return to Glasgow, in April, 1882, the chairman and Mr. Buchanan reported to Mr. Thomas Coats what had been done in India, and

after lengthened negotiations, the North and South Sylhet Tea Companies were formed in September, 1882. The memorandum of Association, and all the clauses of the Articles of Association were carefully considered and approved by Mr. Thomas Coats, Mr. Buchanan, the chairman, and others. Mr. Buchanan left some time ago, on a visit to the United States and Canada, to push the sale of the teas of the North and South Sylhet Companies in these markets. He is now on his way from Vancouver to Ceylon, to assist Fidelity Mnr & Co. in finding suitable land for our new estates. One of our most experienced Tea Estate managers from the Balisera Valley, and one of our principal assistants from the Caloutta office have also been sent to Ceylon, and the chairman sails early in November to join them—so that everything may be done to secure the best possible selection of land, and economy in the arrangements for the formation of the new plantations.

We give these full explanations as you have intimated your intention to "publish our correspondence" to the shareholders. We are sure our shareholders will join with us in thinking that Mr. Buchanan should be consulted as to the replies to be given to your letter complaining of 15 clauses in the Articles of Association, for which he is so largely responsible.

Before Mr. Buchanan left for the United States, the Directors unanimously agreed to his suggestion that, in future, the Balance Sheets and Profit and Loss Accounts should be printed, and copies sent to the shareholders. This was not done because you had spoken so offensively on that and other subjects at the two meetings of shareholders which you attended but out of deference to the expressed wish of some of the original shareholders, who thought the time had now come when we might print and circulate our accounts with safety and with advantage to the shareholders.

We do not suppose for one moment that the opposition of Sir Archibald Orr-Ewing will be allowed to interfere with, or delay, the proposed extension of planting operations in Ceylon and Assam; and so all interested in tea have to lay it to their account that a large addition to the outturn both in India and here, must be taken into estimates, in looking to the future of our staple.

PLANTING IN NORTH TRAVANCORE:

Mr. F. R. Watson, proprietor of Glen Mary, in the Peermad division of Travancore, has a favourable account to give of the progress of tea planting in that district. The outturn this year will be about a million lb. of tea; but a great deal planted is not yet in full bearing. All the forest land is in private hands; but there are large reserves to go on, on most of the estates. Experiments have begun on patena land—the soil of which is very good—and Mr. Imray, who will be remembered as a Ceylon planter, has two-year old tea on grass-land which looks very promising. The yield on the older estates is up to 600 lb. per acre; but on some of the lower and flatter portions of the southern districts, a yield of from 800 to 1,200 lb. of made tea per acre has been obtained. Travancore is evidently bound as a whole to become no inconsiderable tea district, and as soon as factories can be conveniently arranged and fully equipped, improvement in the quality of the tea may be looked for. So far, 25 to 27 cents per lb. is spoken off as the rate at which tea is placed f.o.b. at Cochin or Allepey. At the latter port, Mr. Geo. Anderson, a well-known Ceylon planter in days of old, does the mercantile business,

But although tea is making such a stir over the way, coffee is by no means ignored, and there are still fields and estates that yield paying crops, while some of the proprietors speak of opening isolated clearings with plants from Mysore seed. The latest project of railway is one to run through the State to Tuticorin, and there is a talk of improving one of the ports; but it would be far better for Travancore to be counted and treated as an outlying district of Ceylon and we can see no reason why (under a special arrangement with the native Administration) Travancore produce in tea and cinchona, should not be as free to the Colombo market as the produce of any outlying district within the island.

One ominous piece of news is hinted at. Through the completion of the great Periyar Irrigation Works and their beneficial influence on the Madura and Tinnevely districts, it is anticipated that a large number of coolies will find so much work at home as to render them less inclined to emigrate to Ceylon. But increased food in India means increased population, and any difficulty of the kind would, we feel sure, be temporary.

AMERICA FOR INDIAN TEAS.

The *Indian Planters' Gazette*, we notice, is strongly in favour of the necessity for combined action and voluntary taxation in order to push and popularise tea in America. It says:—

Admitting that the Americans are not such a tea-drinking people as their English brethren, it must be remembered that this is largely due to the rubbish which they get from Japan and China, and it is certain that once they are brought to the knowledge of good, wholesome Indian tea, they will take to it as they have done to coffee. This is no hap-hazard assertion; but the deliberate conviction of many Americans whose opinions are worth studying.

It then proceeds:—

Something must be done to find a new market to relieve the enormous out-put of the present and the progressive increase of the future, and North America is the Land of Promise for the Indian tea producer.

Discussing how this happy land is to be exploited it says:—

To do this effectually, there must be a liberal, far-reaching system of advertising and agency, and this will entail a large regular expenditure. We would suggest that a fund for this purpose should be raised by a voluntary cess on every tea garden. Now there are, roughly speaking, 340,425 acres of tea under cultivation in India. Suppose that an assessment of 4 annas an acre were made, this would yield the sum of Rs5106, which would form a capital basis for working up and pushing Indian tea in the United States and Canada, as well as in other places offering a favourable market. Union is strength, and unless combined action is taken there can be no serious campaign in North America. We would suggest that a Committee should be formed, in conjunction with the Indian Tea Association, for the purpose of formulating a scheme for this voluntary taxation in which, of course, it is absolutely necessary that every garden should take part. The best way to commence would be to call a meeting of all interested in tea to consider the scheme. If nothing else comes of such a meeting, it would certainly produce discussion on the subject, which will lead up to some combined action similar to what Ceylon planters are taking to force their teas on the American taste. We must adopt a policy different from that of Ceylon, so as to enlist the grocers on our side, making it worth their while to give our teas the preference. We feel so strongly on the point that we fear we should be wanting in our duty if we do not provoke in India that enterprise and energy which Ceylon is manifesting, to our detriment, in cutting a place for her teas in American and other markets.

NEW PRODUCTS IN CEYLON :

RUBBER AND LIBERIAN COFFEE.

When, practically, the whole planting and mercantile world of Ceylon are devoted to tea and seem to have little thought or care to give to anything else, the colonist who will stand up for other products can be called no less than a *public benefactor*. As such we class our friend "J.M." who gives us a further encouraging letter elsewhere on what Castillica and Para rubbers are likely to do, and still more what he himself has done, and is doing, with Liberian coffee. We have never ceased regretting during the past five years, the premature condemnation under which "Liberian" passed at the time "the rush into tea" began as a full tide carrying everything else before it. Now, that it is very evident, tea is to be planted both in India and Ceylon to the very outside limit of public requirements, we sincerely trust that not a few will begin to follow "J.M.'s" example and to give special attention to Rubber and Liberian Coffee as well as Cacao. In a private note, our correspondent says:—"Both Para and Castillica rubber will appear in our export returns some day to the advantage of the Colony I hope and believe." And most heartily do we re-echo both the hope and the belief.

OUR TEA SOILS : ANALYSES.

Mr. John Hughes, writing by a recent mail, says:—"I am very disappointed that the Planters' Association cannot see their way to take up my modest suggestion to expend £50 in extending the analyses of genuine Ceylon soils representing old and new estates, high and low altitudes and different methods of manufacture according to the time of year and the varying humidity of the season. I cannot spare any more time for gratuitous analytical work as my own work in London is fully established and requires constant attention."

Surely for the sake of £50, our Planters' Association will not hesitate to have this useful work done. Even if the time has not come for "manuring" tea generally; yet surely it is well to know what chemical analysts have to say, if only with reference to future action. We trust that the Committee may see their way to recommend the necessary vote at the next General Meeting.

TEA CULTIVATION : CROPS AND PRICES.

We direct attention to the letter of "Twenty-five Years a Planter" and to certain extracts from the *South of India Observer* given further on. It would be extremely interesting to learn from Mr. Rutherford, at the end of his visit, the result of his observations in our Tea Districts. For, we know that Mr. Rutherford believes that there is a great deal yet to be learned in respect of Tea Cultivation and Preparation and that there are reasons not yet made clear in explanation of the wide differences between the prices realized for teas from neighbouring estates, while the jät, the cultivation and preparation on them do not materially differ. Our correspondent today is firm in the belief that good soil, good jät of tea and a certain altitude for the plantation are indispensable in Ceylon to the production of first-class teas; and we suppose, the vast majority of our thinking and observing planters will agree in the view thus put forward. Perhaps, if there is a discrepancy at all, it will be with reference

to the "good jät." In the first place, our correspondent should define what he means by this term. He is not likely to include any China tea, or a hybrid approaching to China; and yet we had the proprietor of one high estate whose teas are regularly "galleried," declaring to us a week or two ago that he attributed part of his success in the home market to the judicious admixture in his teas of a certain proportion of the product of leaf gathered from a field he has of pure China tea; and here we have "a valued correspondent" of our South of India namesake, insisting that well-plucked China tea carefully manufactured should beat Assam, in appearance and as 'full of tip,' though not of course in strength. Still this same writer gives his voice for a really good hybrid as best for hill cultivation—superior both to China and Indigenous Assam. We know that on a plantation approaching to 5,000 feet on the Eastern slopes sharing somewhat in an Uva climate, Indigenous tea has not done nearly so well as Hybrid. What many people would like to know is the exact class of hybrid with which certain plantations—in Dimbula for instance—distinguished for heavy crops as well as high prices,—have been planted. We suspect it will be found, as Mr. Beck has indicated, in his own case, to be a Hybrid only one step off Indigenous. But higher up still and especially in the Nuwara Eliya and adjacent districts, which are liable to touches of frost, a more decided Hybrid is probably the most suitable plant to use. It would no doubt be very instructive to learn the experience of managers who have had to do with fields of "China"—there are two or three in the districts we refer to;—but we shall be surprised if we are told that the leaf is mixed with that of good Hybrid tea. We should suppose that separate preparation is indispensable to success; and we suspect the proprietor we referred to above, meant that a judicious mixture of the fully prepared tea from his China field, with its abundance of tip, added to the value of the rest of his tea? In any case we should be glad to have the opinions of planting authorities on the question now raised, and its discussion might be one way of informing Mr. Rutherford and others interested, of the varying opinions held throughout the country.

"CREEPERS" GALORE:

NO MORE TEA ASSISTANTS WANTED IN CEYLON.

An experienced planting authority feels constrained to deliver himself of the following Protest against the wholesale importation of "paying pupils"—otherwise known as "creepers"—in some of our planting districts:—

"I hear eleven new creepers are expected at once—all to pay premiums to, and butcher bills for, their importers—and all to live in a small corner of the Dikoya district. It is really time our Press, and the London Press too, exposed this trading in young men. I think I may safely say that no father knowing how little chance there is of his son's getting profitable employment here or of buying an estate where no one will sell at a reasonable figure, would pay a premium to have his son taken to Ceylon as a ' Creeper.' But touts and agents are employed, and glowing accounts given, with the result of the golden harvests of a hundred guineas! Seeing that proprietors do not multiply, while creepers arrive in scores, if not hundreds, the chances of employment or purchase are poor indeed. The trade was until recently in the hands of a very few, and a rich living it brought them. But their example is now being followed by many. I pity the poor deluded young men who are the victims."

THE VANNI—DRY GRAIN CULTIVATION.

Dry Grain cultivation generally means, chenaing, and on the evils of chenaing (a) all who are most entitled to speak on the subject are agreed. It is demoralizing to the cultivators, because as long as they can obtain large returns of grain, even though of inferior kind, with the minimum of trouble, they will engage in no other kind of cultivation, and it is also most wasteful, destroying good forest and causing an enormous waste of good material, and, at the same time, ruining the soil. It may be said that where dry grain cultivation is much practised the cultivation of paddy diminishes in a corresponding degree.

But where there is a failure of the paddy crop or no paddy can be cultivated for want of water, or where, as at Putukkudiyiruppu in 1875-1879, some time elapses before land can be brought into a fit state for paddy cultivation and the people have no means of support in the meanwhile, chena cultivation under proper restrictions (b) has to be tolerated (c), but it should be confined to lands that

a An ndaiyar (Melpattu south and east) says "if permission to clear chenas were restricted much advantage would result of the increase in the cultivation of paddy lands which would ensue." Diary of 19th September, 1864.

Another ndaiyar (Putukkudiyiruppu) stated to Mr. Dyke that the system of chena cultivation was "very pernicious in destroying young valuable trees and preventing the owners of paddy fields getting labour for cultivation." 9th September, 1859.

Mr. Fowler says, "The more I see of this district the more firmly I am convinced that chena cultivation has been the main cause of the poverty and disease which have prevented the district from even partially regaining its former prosperity." (Adm. Report 1887.) And again, "The Varakkudi system seems to me to have grown out of the attempts of the paddy land owners to protect themselves against the evils of chena cultivation. Unless some such an agreement is made the labourer will whenever he gets the chance, cultivate a chena for himself and the paddy land is left uncultivated and the tank neglected with the results to be seen in every direction. I believe that chenas should be entirely forbidden whenever an acre of available paddy land remains uncultivated. It is true that when a failure of crop occurs some of the land owners are among the first to cry out for chenas but that is in order to escape the burden of supporting their Varakkudis till the next harvest, overlooking the fact that they will get no harvest without labourers." (Adm. Report 1886.) See also Mr. Ellis' Adm. Report 1880; Vincent's Forest Report, Sess. Papers 1882, page 379. For an account of the Varakkudi system see the chapter on "Labour."

b The rules as to chenas in force in the Northern Province under the Forests Ordinance will be found at the end of the chapter.

c The Mudaliyars state that "the cultivation of dry grain is very important to the people. There are many who have no paddy land and no means of cultivating the paddy lands of others, no cattle, &c., and who cannot procure employment under those who have paddy lands." Diary of Mr. Dyke 26th August, 1842.

Other reasons given to Mr. Dyke why dry grain cultivation could not be altogether prevented were that in the wet season, with the fields sown and the tank full there was, as regards many villages, no place free of jungle to which the village cattle, buffaloes and black cattle could be driven to pasture but the old chenas, and (2) the want of a supply of elu (gingelly) would be much felt. (15th September 1859.) This was before the day of village clearings.

At the beginning of the British administration the evils of chenaing do not seem to have been realized. The collector reports in 1808 as if it were a subject for regret that the rain during the summer months of that year caused a diminution in the cultivation of natcherry by preventing the burning of the woods.—Diary, of December, 20th, 1847.

have already been subjected to the process within recent years.

The dry grains cultivated are kurakkan, varaku and gingelly. The jungle is cleared in April, May, or June; in July or August when high winds are prevalent it is burnt.

The land is not ploughed, it is not always turned up with the mamotty even. Sometimes it is merely scored or scratched with a sort of pointed stick.

For varaku cultivation a very small mamotty (illuppan) about 2 inches wide by 3 long, is used to cover the grain when sown.

Another kind of mamotty larger than this, about 4 inches by 6 is used in kurakkan and gingelly cultivation for hoeing. It is known as the *mantu kottakkura manveddi*.

There are two kinds of kurakkan known as *pancha* or *ilam*, i.e., "soft," and *kal* or *van*, i.e., "hard" kurakkan.

The former is sown between September and November and ripens in 3 months and the latter is sown in October or November and reaped in February or March.

Varaku *panicum miliaceum* is sown in August and September in new chenas and in October in old chenas. It is reaped in February or March. Most of the varaku produced in the district is grown at Putukkudiyiruppu where it forms the chief food of the people. Ellu or gingelly (*sesamum indicum*) is sown in March or April and ripens in June or July. There is a great demand for gingelly principally for oil.

Chena paddy (*ita nelli*) which is sown in August or September before the rains, and ripens in two or three months, is sometimes grown at Tanynuttu and in Melpattu North.

For the cultivation of this chena paddy the jungle is cut in April and burnt about June. It is generally sown in low ground and therefore the jungle must be burnt when there is no rain to make this low ground damp.

Sami (*panicum miliare*; Sin., *mineri*) is sometimes cultivated in small quantities in *pulavus* like gingelly.

Payaru or green gram (*phaseolus mungo*; Sin., *min eta*) is sometimes sown with kurakkan and varaku in small plots of ground on ant hills and along the fences. *Kollu* or gram (*dolichos biflorus*) is also sown at the same time with kurakkan and varaku.

Varaku lands are cultivated for three successive years and are called by different names according to the year. Thus the first year they are called

1. *Putukkadu* (new jungle).
2. *Pulakkadu* or *pulavu* (tilled land).
3. *Kurupuddi*.

Kurakkan is cultivated for two years successively. The land has the same names.

It is said that thirty years must elapse before the jungle can be cultivated for a second period.

As to the comparative fertility of *putukkadu* and *pulakkadu* Mr. Flanderka remarks "it is stated that *pulavu* cultivation yields a better crop than *putukkadu*. This is contrary to my impressions but that there are some grounds for the assertion appears from a statement subsequently made by the udaiyar of Karunavalpattu that '*putukkadu* under favourable circumstances yields a better crop than *pulavu* cultivation, but insects more generally infest the former and consequently the crop frequently suffers much damage.'" (a)

In the Wanny (meaning the Vavuniya District and the inland pattus of the Mullaitivu District) *putukkadu* is stated to yield a better produce than *pulavus* and more grain has to be sown in the latter than in the former. The proportion was said to be *putukkadu* 6 seers, *pulavu* 7 seers, but

at Putukkudiykuppu it was said that the ground being very hard the reverse was the case.

Gingelly is cultivated in *putukkadu* immediately after the *kurakkan* or *varaku* is reaped, and seldom or never in *pulavus*. People sometimes sow gingelly on lands cleared for *kurakkan* or *varaku* which may not have been cultivated. It yields if there are good rains 90 to 100 fold, but generally from 10 to 30 fold.

I find the following statements in Mr. Flanderka's diary.

1. 1 seer of gingelly, 6 of *kurakkan*, 8 or 9 *varaku*. 10 or 12 of paddy, require the same extent of ground. (a)

2. One man can sow an extent of ground in a day which requires 10 to 15 marakkals of paddy (b) 12 seers of *varaku*, 8 of *kurakkan* and 2 of gingelly.

3. The hire of an acre for jungle cultivation for one season is for *pulavu* cultivation 3 marakkals grain; for *putukkadu* cultivation 4 marakkals grain (c)

To which may be added an extract from Mr. Dyke's Diary (d) as to the capacities of paddy and dry grain as food, and the reason why the latter is so popular. The following statement was given to me but I do not feel confident of its correctness.

Paddy, 90 parrahs; paddy and dry grain—paddy, 45; dry grain, 32.22.

The dry grain therefore is shewn to go much farther than paddy. Persons of the lower orders do not like to live exclusively on either. Dry grain is considered a stronger, more stimulating food, and as such in certain proportions desired by the labouring man. Above that proportion, however, it is heating and unwholesome.

As to the yield of the principal dry grains it was stated to Mr. Turnour in 1807 that *kurakkan* gave 25 fold in Mulliyavalai, from 30 to 40 fold in Tunukkay, and from 150 to 200 fold in Kavikkadumulai south, and that *varaku* yielded 60 to 70 fold (Mulliyavalai).

As the extent of land cultivated with dry grain is fluctuating and, as it were, accidental, it affords no criterion of the prosperity of the inhabitants, and it is therefore unnecessary to give any comparative statement shewing how it has varied at different periods. (e)

FARMING IN THE SCOTTISH HIGHLANDS.

An ex-Ceylon Planter, now a farmer, writes from Aberdeenshire under date 14th Nov.—“Surely this has been the record year for Scotland in the way of weather, for here we are in the middle of November, half our ploughing done, half our turnips stored, and lovely mild calm weather overhead. I hope this sort of weather has come to stay with us!”

SALE OF A TEA ESTATE TO THE SYLHET COMPANY.

The price paid by the Sylhet Company to Mr. Hannam for Warwick estate, New Galway District, is £8,250. The extent planted is 214 acres with 10 acres reserve. A large bungalow built by Mr. Dingwall was included in the sale. Mr. A. F. White continues in charge of the estate. The Company have also purchased New Cornwall estate and there was a rumour that they might try to go in for the whole valley or district.

a 29th August 1848.

b This is rather a high estimate, it is not usually more than 8.

c 9th October 1849.

d Diary of 2nd November 1848, a parrah may be taken to be $\frac{1}{2}$ of a bushel.

e A sufficient idea may be formed of this by referring to the table of dry grain tithe appended to the chapter on the Grain Revenue.

THE CALIFORNIAN EXHIBITION OF 1894: “A CEYLON TEA COURT” PRIVATELY ARRANGED FOR.

WHAT ARE THE GOVERNMENT AND PLANTERS TO DO?

We have already alluded to the Californian Exposition to be opened at San Francisco in January 1894, and the splendid opportunity it will afford for making our tea and other produce known in perhaps the richest State in the whole of the great North American Republic. Most fortunately for Ceylon, a representative Court and more especially of our teas, has already been arranged for by private enterprise without, so far, costing a rupee to the Colony! On the contrary, the Commissioner to Chicago has made money out of the Californian Exhibition by selling or leasing one of his Courts and insisting on cash payments from the intending exhibitors of a Ceylon representation. This seems rather hard treatment of gentlemen who, running considerable risk, must benefit the tea industry of Ceylon, however little profit, even if none at all, they make for themselves. The mainstay of this enterprise in providing a Ceylon Court and special Show of Ceylon Teas at San Francisco is a Mr. Foster (long engaged in the Japanese Tea Trade in California) and his colleague and co-adjutor—who very much prompted Mr. Foster to this movement—is Mr. T. A. Cockburn (the “T. A. C.” Correspondent of the *Observer*), who has had much experience as planter in this island and who is esteemed by all who know him. Messrs. Foster and Cockburn are to show and sell none but pure Ceylon teas; they have incurred a heavy initial expense and they risk a great deal more. We, therefore, consider that they deserve the cordial good wishes and the support as far as possible, of every tea planter in the island. Mr. R. V. Webster in the letter we published the other day, thought it a “monstrous” thing that Messrs. Foster and Cockburn should have to pay R480 a month for the use of one of the Ceylon Court structures lent by Mr. Grinlinton and he suggests that the Court should be lent to them free for the six months of the Californian Exhibition. This would seem certainly a very moderate concession and if the entire cost of the Ceylon-Chicago Show turns out to be well within the funds collected up to the end of this year, we think the Planters' Association might well move the Government to remit this rent on a satisfactory assurance being obtained that the Ceylon Court in the Californian Exhibition had been properly started and that none but pure Ceylon teas were shown therein.

But we go further, and so strong is our opinion of the splendid field for our teas opened up in California that we should press on the Planters', and Tea Fund, Committee to do everything in their power to countenance and promote this attempt to make the Ceylon Court a distinctive feature of the Californian Exhibition. Mr. Cockburn deserves exceedingly well of his brother-planters for the good work he has already done at Chicago, and

this we have no doubt will be testified to by the Commissioner. He ought surely to have a grant of tea from the "Tea Fund Committee" to use in his Court; and why not also have both him and Mr. Foster nominated Honorary or Deputy Commissioners to represent Ceylon at San Francisco? If the Government could be moved on the recommendation of the Planters' Association to give a nomination-letter of this kind, it would cost nothing; but it could not fail to be much appreciated by the recipients and to strengthen their position amazingly among the Californian officials. It would serve too, to bind Mr. Foster with his extensive tea interests, to the Ceylon product and to a personal permanent interest in the Colony. Failing such a letter of appointment from Government, we think the Planters' Committee might ask their Chairman and Secretary to issue (under the broad seal of the Association!) a letter recognising the position of Messrs. Foster and Cockburn as representing the tea interests of the Colony in the "Ceylon Court" of the Californian Exhibition. After reporting to us what they had done in ordering some hundred pounds' worth of useful and curious Ceylon exhibits to show off the Court, and in arranging for supplies of Ceylon tea of superior quality, Mr. Cockburn adds that "recognition by the planters would be some reward for a great deal of hard work in their interests, while an appointment as Honorary Commissioner at San Francisco would undoubtedly give one a better status" and would, in our opinion, enable more to be done for the products of the Colony, more especially tea.

THE NORTH AND SOUTH SYLHET TEA COMPANIES (LD.).

It is on behalf of the above Companies that Sir John Muir, Bart., of Deanston, and Mr. P. R. Buchanan of Leadenhall Street are now in our midst. Each Company has a capital of a million sterling with £600,000 paid up, and to this £200,000, in each case, is to be added for the purpose of acquiring new land in Ceylon and Assam and opening out tea estates thereon. It is proposed ere long that both Companies shall be amalgamated into one large Public Company with a quotation on the London, Glasgow and other leading Stock Exchanges.

The present estates of the Companies are mainly situated in Sylhet and the Dooars and they comprise an area of 64,323 acres of land of which 20,376 acres are planted with best jât from 1 to 10 years old. These estates are most fully and permanently equipped in every way, the block cost on 30th November 1892 being £1,037,821, or nearly £50 per acre—so that it is no wonder they are deemed among the finest tea estates in the world. Their crop in 1888 was 5,678,379 lb. But in 1892 it increased to 8,359,972 lb.—the cost, including all charges in India and at home, being slightly under 6d per lb., which must be considered very moderate. When in full bearing the area now planted should yield 12 million lb. and at a lower cost for production. From 1882 to 1887, no profits were made; but in 1887 and 1888 the profits

yielded to shareholders compound interest at a per cent per annum for the six years. For the last four years, an average dividend of 12 per cent per annum has been paid. Last year, the net profits after paying all interest on Loans and Deposits was £95,882 and after paying 12 per cent, £22,847 was carried forward in addition to £20,000 previously at credit of Reserve Account. It will thus be seen that the Company is a very successful and a very strong one. And now they want to extend their operations into two more of the best tea fields in the world—Assam, with its finer quality of tea; and Ceylon—“where tea can be produced from first-class estates at a lower cost even than in Sylhet and the Dooars.”

The Directors (who include besides the gentlemen already named, two Messrs. Coats of Paisley, Sir Robert Drummond Moncreiffe, Bart., of Moncreiffe and Messrs. Murray and Brown, Merchants, Glasgow) “have fully considered the question of over-supply and they are of opinion that this danger does not exist seeing that the annual consumption of tea in the world, exclusive of tea-producing countries is 450 million lb., and of this quantity India and Ceylon, which produce the finest teas in the world, only contribute 170 million lb.”

This is very reassuring and we cannot complain of the Estimate, for we believe its original source is our own compilation for “The Ceylon Handbook and Directory.” Still, India and Ceylon now produce fully 200 million lb. between them, and it will be a hard fight before they drive China out of Russia and North America. No doubt it has to be done and will be done and we should hail any movement which draws the Indian and Ceylon planters closer together so that they may fight “shoulder to shoulder” in the struggle against China and Japan teas.

What Sir John Muir himself thinks of the prospect may be judged from the fact that he holds £100,000 stock in each Company and that he intends to increase his holding by £50,000 in each—making £300,000 in all, or nearly one-fifth of the whole capital subscribed.

We cannot but wish well to Companies with which the future prosperity of Ceylon is likely to be so closely identified.

In this connection we may formally welcome the establishment of the Colombo branch of Messrs. Finlay, Muir & Co. of Calcutta, which will commence business on Monday, the 11th, inst., in temporary offices in Messrs. Escaquet & Co.'s block of buildings. Messrs. Wm. Walker, C. G. Ballingall and A. Fairlie—members of the Calcutta House—are to be in the meantime resident in Colombo and to sign the Firm. Mr. Walker has had altogether fifteen years' residence in Calcutta and will probably be going home from Colombo after the business here is fully started. Three such notable additions to our mercantile community are not often made all at once and we give Messrs. Walker, Ballingall and Fairlie a hearty welcome. Sir John Muir and Mr. P. R. Buchanan have started upcountry on a visit to the planting districts and propose returning via Ratnapura and the Kaluganga to Kalutara.

A BOOM IN TRAVANCORE.

A tea-planting correspondent writes to the *Madras Times*:—A small boom in Travancore places a going on, and the cheaper ones are being picked up rapidly. If the railway goes to Quilon a very large acreage will be turned into tea and cocoa,

A CEYLON PLANTER AT CHICAGO
EXHIBITION:
HIS LAST LETTER FROM CHICAGO.
BOUND FOR CALIFORNIA.

Chicago, Nov. 5.

"The Editor, Ceylon Observer,"

DEAR MR. EDITOR,—This is probably the last letter I will trouble you and your numerous readers with from Chicago. The Fair is

A THING OF THE PAST

and its glory is departed.

We have had a very busy month, and as you would learn from telegrams and papers, the crowds have been enormous during the month of October.

CEYLON AND CEYLON TEA

were ever in the front, and we did a large business, although the purchasing powers of the vast crowds were not so great in proportion to numbers, as in some previous months.

The number of cups served during October was 125,000, and packets of tea sold numbered 31,000, which is a very large thing indeed. Ceylon *shut down* serving tea on Saturday afternoon at 2-30 p.m., the 4th Nov. (being the last to go), in

THE WOMEN'S BUILDING PAVILION

the last cup being poured out by the writer and handed to a charming young lady by Mr. Bierach, the fair recipient being on this occasion the guest of the Ceylon Commissioner.

THE THREE REMAINING CEYLON COURTS

are to be sold by auction on Saturday, the 11th inst., at 11 o'clock, Mr. Foster and self having already bought one for San Francisco. This looks like the beginning of the end.

I fear my letter will be tinged by sorrow and sadness; for, to one who has seen the bustle, animation, life, grandeur, and surpassing beauty of the Wonderful White City, to one whose romantic mind, sensitive nature and poetic ideas are not quite rubbed out by this matter-of-fact end-of-the-century, it is

A BATHER SAD AND DEPRESSING SIGHT,

though in its stillness, quiet and deserted appearance, there is an indescribable grandeur yet, which peoples it in the imagination with the vast multitudes, from amongst whom a few, let us hope, constant, good and true, life-long friends have been made.

CEYLON TEA TO THE FRONT.

To the end, Ceylon maintained her position in the forefront. At a largely attended reception given in the New York State building, on New York Day, the famous Ceylon tea was served at one end of the room, while Indian tea was dispensed at the other end. Arrangements being as usual in the efficient hands of our Mr. Bierach, who was an honoured guest on the occasion.

There were ten of our natives there from 8 till 11 p.m., 8 men and 2 women, all nicely dressed, and not until the last of the Indian attendants had gone, did the Ceylon people begin to think of going home. There have been some other receptions of a similar nature, but I need not describe them; they were always a success, the tea being highly praised, and all arrangements being efficiently carried out by Mr. Bierach.

VISITORS TO THE FAIR.

We have had several visitors from your island, Mr. Hancock, who enquired after many old Balangoda friends, including Stuart A. Rolland & Brother of Coorg. He was delighted with what little Ceylon had done here. Mr. Valentine of Travancore again visited us, after having had some good shooting on his way home. We have had some pleasant chats with Mr. R. V. Webster, the genial manager of the Ceylon Co-operative Tea Gardens Co., whose teas have been awarded a gold medal here. He was accompanied by a large party of friends from Halifax, N.S., who thoroughly enjoyed themselves and our famous Ceylon tea.

Mr. Webster has done a large amount of business since his arrival in Canada and the United States, and I hope to meet him later, in San Francisco.

Our latest visitor was the well-known and esteemed Mr. Kerr of Ambagamuwa, who, though a little too late, saw a great deal during the short time he had at his disposal here.

THE EARL AND COUNTESS OF ABERDEEN

were entertained by our Commissioner one afternoon, and were loud in their praises of our beautiful building and all the wonders it contained.

THE MURDER OF THE CHICAGO MAYOR.

The terrible murder of the esteemed Mayor of Chicago, Carter Harrison, within a few hours, one may say, of the official closing of the Great Fair, and to whose great personal interest, the success of the Fair is largely due, seemed to cast a shadow of sadness and sorrow over the closing days, and deepens the depression one feels while out there now. He was within a few days of his marriage to a lovely young lady, which makes the occurrence all the more sad.

PECCANT NATIVES.

I regret to say that some of the natives, towards the end of things, did not continue to maintain that high character they have earned during the continuance of the Fair, but misbehaved rather badly. They are being sent back to Ceylon in disgrace, by an early steamer.

THE PERMANENT WOMEN'S BUILDING.

I had great pleasure in presenting to Mrs. Potter Palmer, on behalf of the Hon. J. J. Grinlinton and with the compliments of the Ceylon Commission, a few very pretty Kalutara baskets. These were much prized, and are to have a place in the permanent Women's Building which is to be built here soon, and towards the erection of which Mrs. Potter Palmer has munificently donated the sum of \$200,000 and promised as much more as may be found necessary.

PACKING UP.

We are now all very busy helping with the packing up, and the store in State Street, which is being put in order, requires a great deal of the time and attention of our Commissioner. I think most of us are glad the Fair is over, for it has been very hard tiring work, and a great strain on most of us. The weather is now very cold, and we are beginning to feel it; though doubtless we will not get so fagged as during the very warm weather. We are all fairly well, with the exception of colds and neuralgia now and then.

I will be through with the Commissioner about the 15th, and must then pack up for San Francisco, where I will have plenty of the same kind of hard work to do.

MY NEXT LETTER,

Mr. Editor, will probably be dated from Detroit Michigan, whither I go about the 20th for a short rest, and to look up the Tea Trade there, as everything must now be done to keep up the interest excited in our teas by the World's Fair here.

CALIFORNIA MIDWINTER EXHIBITION.

I hope to leave with my Ceylon Court and natives for San Francisco towards the last of November. I trust I shall receive some encouragement from the Planters' Association and the Planters and Proprietors in the way of exhibits, &c., &c. These should be addressed to Messrs. Foster and Cockburn, Ceylon Pavilion, Manufacturers Hall, Midwinter Exhibition, San Francisco California.

ON THE WAY HOME.

I believe the Assistant Commissioner and natives leave early in December for Vancouver, on their way home, Mr. Grinlinton goes to New York on business and returns to finally see that our store has been working well during his absence in charge of Mr. Bierach. Our popular Commissioner goes back via

London, and no doubt will meet with a deservedly hearty and cordial welcome from all classes of the community he has served so well; for our great success here it must always be remembered is very greatly due to him, and his pleasant and agreeable manner invariably enabled him to get what he required for Ceylon.

Mr. Bierach goes to New York or Toronto to Manage some Exhibitions there, or at both of these places, and probably have the valuable assistance of Mr. Wallace who has been a most energetic salesman at the Main Court having himself, I believe half of all that has been sold there. I believe Captain Hansard, our kindly good-natured friend returns to Canada, and thus we, who have worked together, and worked hard for Ceylon, are to be scattered once more all over the world. May we meet again! Of Mr. George Marr's plans I cannot speak just at present, but he has also worked very hard for some time now on behalf of Ceylon and the Commissioner:

MANY PECULIAR QUESTIONS

were asked me latterly by the country people, but most of them I have forgotten. One party asked me "if I could tell them when the Lagoons were going to be fed." I told them they were not fed till midnight, and I believe these people wait till then, or till they were put out. Another party asked me "when the wooded Island was to be burned," while another learned professor from the country inquired "if there were any Lagoons in the Women's Building."

PRaise FOR THE COMMISSIONER.

Now I must say goodbye Mr. Edi'or, and let my last words be those of thanks, heartfelt thanks to the Hon. J. J. Grinlinton for many kind words of appreciation and thoughtful acts that made life worth living during the turmoil of the Fair. Sic Transit Gloria Mundi's Fair, T. A. C.

P.S.—I notice

AN EXTREMELY CHILDISH LETTER

in your latest Overland signed "A Tea Planter"; but I think he is sufficiently answered by "Another Tea Planter": the letter in question is beneath contempt.—T.A.C.

NEWS FROM THE CENTRAL PROVINCE; PLANTING AND OTHERWISE:

(Notes by Wanderer.)

Dec. 8th.

CONDITIONS FOR GOOD TEA PRICES AND GOOD CROPS.—Given tea bushes of good jāt, fair soil, no coarse plucking, plenty of factory room, so that no process in the manufacture has to wait for the other, and there you are! I feel sure the excellent Chairman of the Ceylon Tea Plantations Co. and new Director of the Oriental Bank Estates Co will admit that the foregoing will ensure a steady market for the producer.

CEYLON TEA IN AMERICA.—Mr. J. L. Shand's experience of would-be American dealers in Ceylon tea is very amusing. Mr. Shand does not much believe in the Americans taking anything but cheap tea from us. Mr. Forbes Laurie writes sensibly, except when he writes of a Company he evidently knows nothing about, the Ceylon Tea Co., Limited, which, he writes, is "a concern without sufficient individual responsibility or control, or without satisfactory results." What do Messrs. Whittall & Co. say to Mr. Laurie's further remarks? "It only benefits, so far as I learn those who obtain commissions on the operations translated," which I presume means "transacted."

The *North British Daily Mail* issues of the 7th and 10th November treat their readers to a "little washing of dirty linen" on the part of BARONETS SIR JOHN MUIR and SIR ARCHIBALD ORR EWING. It arose in the first place from a desire that they should see "eye to eye" in the matter of "good commissions"

and "extra dividends." A letter from Messrs. James Finlay & Co. to the latter Baronet contains the following tit bit:—"We have referred to risks run in connection with the management of the Sylhet Tea Companies' business in India. They are of course pecuniary risks, but we had, and have especially before us the great risks to health attendant on the supervising and inspecting estates, when the jungle is being cleared, and the land being turned up after lying dormant for hundreds of years, poisonous gases are thus let loose and permeate the whole atmosphere." The above reason is given why the Calcutta Agents should get 3½ p. c. commissions. However, the other Baronet knocks that argument on the head by curtly remarking "I have never suggested that the salaries of the managers of the tea gardens should be reduced. I would treat them most liberally. It is they who run the risk of fever, not Messrs. Finlay, Muir & Co. and Messrs. James Finlay & Co."

EXPORTS OF TEA.—November 1893 shows a total export of 9,300,000 lb. in the eleven months of 1893 over that of 1892. The total Ceylon Exports will run to about 83,000,000 this season. We shall be anxious to see how this abundant supply will be taken off. Messrs. Gow, Wilson & Stanton are pretty chirpy in their Circular of the 17th, November. They say "with continuance of steady buying from the country, dealers have found constant replenishing of stock a necessity." Also they add: "It is too early yet to estimate the probable result of the Commissioners' labours, but the market of North America certainly appears to be taking a gradual liking for Indian and Ceylon Teas. It seems probable that the development of the trade may soon be rapid and encouraging."

COCOA.—It is pleasant to note in Messrs. Wilson, Smithett & Co's circular, by last mail, that the stock of Cocoa has been somewhat reduced. The copious rains we are now having checks setting of blossom for Spring, but there is still plenty of time, and the weather must soon harden.

YOUR SCOTCH PADRE IN COLOMBO spoke splendidly at the Prizegiving at the Agricultural School. His remarks were eminently sensible, and worth listening to. When the Presbyterian Churches of Scotland commence Missionary work in Ceylon, which they ought to have initiated long ago, they could not do better than start Agricultural Schools in the villages, and appoint as president of the Mission, Mr. Paton.

INDIAN TEA SALES.

(From *Watson, Sibthorp & Co's Tea Report.*)

CALCUTTA, Nov. 29th, 1893.

There was a good general demand for all grades in the sales held on the 23rd inst. Teas under eight annas were rather dearer, the finer sorts sold very irregularly but without quotable change in the general value, 16,185 packages changed hands.

The average price of the 16,185 packages sold is As. 6-11 or about 8½d per lb. as compared with 15,873 packages sold on the 24th November 1892 at As. 8-5 or about 10d per lb. and 14,188 packages sold on the 26th November 1891 at As. 6-9 or about 9d per lb.

The Exports from 1st May to 27th November from here to Great Britain are 85,783,589 lb. as compared with 81,764,277 lb. at the corresponding period last season and 82,265,748 lb. in 1891.

NOTE.—Last sale's average was As 6-10 or about 8½d per lb.

Reuter telegraphs from London on the 21st inst.—"Type 6-7-16d," on the 22nd—"Pekoes 3d to 1d lower. Broken pekoes, 1d lower. Pekoe souchongas. 3d lower" and on the 23rd—"Offered 39,000, sold 32,000 packages. Common qualities firm. Good to fine unchanged."

Exchange.—Document Bills, 6 months' sight, 1s 3-9-16d.

Freight.—Steamer £2-0-0 per ton of 50 c. ft.

TEA.

(From William Moran & Co.'s Market Report.)

CALCUTTA, Nov. 29^h, 1893.

On Thursday, 23rd inst., 16,500 chests were sold. For the better grades, and good broken pekoes especially, the market was somewhat irregular; but prices on the whole tended downwards. For Bombay, there was a strong demand for suitable breaks of pekoe and pekoe souchongs. All common kinds were very firm.

Tomorrow 15,000 chests will be offered.

CEYLON TEA IN AUSTRALIA.

TEA IN MELBOURNE.—The principal events in the tea market have been the auction sales on Tuesday and Thursday. Considerable catalogues of China tea ex "Taiyuan." Of low common 705 half-chests were sold at 7½d. Sales of common at 5d to 5½d amounted to 2,693 half-chests, and 4,200 boxes common at 6d to 6½d showed relatively full value to buyers. Catalogues comprising 340 chests and 112 half-chests Ceylon were sold as follows:—Broken pekoe, 32 chests at 7½d to 1s; pekoe, 47 chests at 7d to 9½d; and pekoe souchong, 171 chests at 6½d. Since the auction close upon 2,000 half-chests congo, then withdrawn, have been placed privately at prices a shade firmer. Sales have also been made privately of 700 quarter-chests S. O. pekoe at up to 9d. The Custom-house statement of receipts and deliveries of tea at the bonds for the week ended the 11th inst., together with the stocks in bond at the close of the week, is as follows:—

—	Deliveries.		Stocks on Nov. 11.	
	Receipts into Bond.	For Home Consump- tion.		For Export.
	lb.	lb.	lb.	
China ...	412,080	46,804	47,022	3,162,910*
India ..	123,183	23,421	24,350	991,305
Ceylon ...	10,284	5,834	6,466	209,741†
Totals..	546,550	76,059	77,838	4,363,956

* Exclusive of a portion of shipments ex "Taiyuan."
 † Exclusive of shipments ex "Australia" and "Orizaba."

At the corresponding date last year bonded stocks consisted of 3,147,387 lb. China, 779,539 lb. Indian, and 317,569 lb. Ceylon; total, 4,244,495 lb.

TEA AT SYDNEY has been rather slow of sale. Several large buyers are away, and importers of Indians have not cared to go on at the low prices which were accepted at auction last week. Supplies of Indians and Ceylons have been more than sufficient for immediate requirements, and the market consequently is weak. The position as regards China teas is unchanged. The demand has been principally for descriptions ranging from 6½d to 7½d. There has been no important auction sale this week, but the market will again be tested on Wednesday next.

ADELAIDE.—The tea market is well supplied, and while small lines of Ceylon and China sorts are selling no big business has matured during the week. Markets in Melbourne are easier, and local cellars are not so firm as a week or two ago. Coffee business is small; value of prime high-grown samples 1s 3½d; low-grown inferior, 1s 2½d to 1s 3d per lb. d. p.

NEW ZEALAND, Nov. 11.—The trade in cocoa and coffee is lessening under the change of season, and candles are quiet. There has been a trade sale of Indian and Ceylon teas during the week. Bidding was spiritless, and although several parcels were placed the tone of the market was dull, and prices in favour of buyers.

TEA CULTIVATION: HOW TO GET GOOD CROPS AND GOOD PRICES."

We have been looking over the letters of our correspondents (see further on) signing:—"A Planter since '59," "Kalutara," "Altitude," "D.," "M. H. T." "M.," "F. G. A. L.," "An Old Planter," "18 Years," "W. M.," "Planter," "F. C. G.," "Manager," "30 Years' a Planter," "Geo. Beck," "M." and "W. J. A."—representing altogether a great variety of practical experience. The discussion on this subject was commenced by a planter who laid down three conditions:—good soil, good jât and a good or high elevation above sea-level. To these a well-known Dimbula planter ("W. X. B.") added a good, commodious, well-fitted and clean Factory (including a good teamaker) as not the least of the indispensables to the turning out of good tea: indeed he would consider the factory more important than jât, above a certain altitude especially. In the view that Indigenous or closely allied jâts were not so desirable as a Hybrid at a high elevation, or even than a good China in the highest fields, a number of planters concur. But there is another point on which all seem to agree and it is one to which perhaps a sufficient amount of attention has not been given hitherto in Ceylon. It is the great drawback attending a mixture of jâts and the attempted manufacture of leaf of varying size and quality at the same time. Now in how many places in Ceylon—planted in the years when not so much was known about jâts or when men were too poor to be particular about their seed—do we see bushes and fields showing a great variety of jât from a really good desirable Hybrid down to something worse than any ordinary China tea bush. How impossible it must be to manufacture even, nice-looking or good teas under such circumstances? And therefore, evenness of jât as well as quality, might well be classed among the conditions already named. We remember hearing from an Assam planter, a good many years ago, how careful they were to get rid of plants from their nurseries and even from the fields, that indicated an inferior jât and how each manager prided himself on the evenness of his show of tea-bushes. We do not know of the practice of pulling out inferior bushes is still in vogue; but as a Ceylon proprietor (now on a visit to the island,) with much pioneering experience in our industry, confessed to us the other day, there is no question of the superiority of Assam teas for make and appearance over "Ceylon's" as a whole. We have little doubt that much of the success of Henfold is due to evenness of jât and besides good crops. Mr. Beck, we learn, is not to be content till he brings his average up to 1s 6d! All success go with him in the attempt.

There can be no question as to the influence of fine and careful plucking on good prices; but there is still a difference of opinion as to the advantage of only taking off 200 lb. an acre and getting a price among the highest averages, instead of 500 or even 600 lb. with much lower prices. There is nothing like the actual test of experience and one proprietor we know whose teas are regularly "galleried" is fully content with the profits which a limited gathering and high prices give him. On the other hand, some who have tried both systems insist that very fine plucking,—taking off the immature bud, &c.—is far more trying in the end to the bushes than ordinary medium plucking. It was found to be so at least in the early days in the Kelani Valley, where fine plucking was tried on one plantation for a long time. But we are not clear that the same experience will hold good at a higher elevation,

There is no question of the superiority of Indigenous tea for the lowcountry. It gives "double the profit" yielded by ordinary Hybrid, is the way one enthusiast puts it, and the tea seems less liable to insect attacks. Then one or two of our correspondents thoroughly believe in the good results from manuring, not only as to yield, but as to *quality* of tea; but this latter must depend a good deal, we should say on the kind of manure applied. In one case, at least, we remember an experienced planter attributing a fall in price to the ranker leaf produced by certain manures. We are glad to find not a few writers urging the analyses and aid which Mr. Hughes has been so long advocating, and we trust to see the Planters' Association vote the needful £50 at an early date. The discussion is by no means at an end,—we have several letters to follow,—and we trust, among the rest, "Old Planter" will continue his useful practical hints for the benefit of the younger generation of his brethren. We shall probably reprint the whole of the letters in a small pamphlet as a useful means of reference to very varied and valuable experience at this stage in the history of THE TEA PLANTING ENTERPRISE IN CEYLON.

TEA SHORT LANDED?

Considerable dissatisfaction has been manifested for some time past in the tea sales owing to breaks of attractive tea being given out from the chair as two packages short, or one package short, as the case might be, the inference desired being that the said packages were not to be found. For a time no suspicion of anything to the contrary was aroused; but it is no secret now that some gentlemen in brokers' offices are in the habit of supplying their friends with tea, and the presumption gained ground that instead of buying single packages of the wholesale dealers they were quietly getting behind the backs of both the wholesale and retail trade and abstracting as many chests from the sale as they required, and paying the importer the same price as the break sold at under the hammer. When the practice was first commenced a more straightforward policy was pursued, and the auctioneer used to announce "We take back three at a penny per pound profit," and immediately a brisk competition ensued, the profit being humorously termed a "gratuity." But the days of gratuities have passed away, and for a considerable time the sellers have helped themselves to whatever they wanted at cost price. But in these days of publicity it is not easy to keep anything private, and the practice has at last got "blown upon," and, as we think, very much to the importers' interest. It is well known that many of the largest buyers feel very strong upon the subject, and simply refuse to bid for any break of which the quantity is diminished by one or two packages; and if the seller knocks the break down in sale, and then states that it is one package or two packages short, they decline to take delivery, and throw it back on the sellers' hands. We confess we are not surprised that buyers should feel strongly upon this matter, and importers will do well to insist on their brokers entirely discontinuing the practice. Whatever annoys the buyer damages the price, and, on the contrary, whatever pleases the buyer, even to a very limited extent, makes him bid up to his valuation, and thereby benefits the seller. The immense quantities of tea that have now to be dealt with in Mintoing Lane make the seller more or less the servant of the buyer, and it is an admitted fact that in every instance in which the buyers have maintained any proposition it has been found judicious to meet them. The case at present under consideration is one in which immediate concession is the only wise course, and it is to be hoped that the importer will see the justice of it.—*H. and C. Mail*, Nov. 24.

NOTES ON PRODUCE AND FINANCE.

INDIAN COFFEE.—The effect of the revolution in Brazil on the Coffee Market has not been great at present. Owing no doubt to the fact that values of Rio and Santos coffee are too high already, or that no importances whatever is attached to these communications, the market has remained exceedingly flat. However bitter the war may rage between the two contending parties, one thing is certain—neither the arrival of supplies nor the export of coffee seems to be affected by it in any way, for both continue to arrive in the usual manner. Business in these coffees has practically come to a standstill, holders' ideas having become quite prohibitive. The proportion in value between Brazilian and fine-coloured coffees, such as East India and Ceylon sorts, has now become so exceedingly small that the trade has given up buying the former, and has directed its attention more to the latter, and prices which a short time ago were unobtainable for these fine sorts are now offered in several quarters. We hear, says the *London Commercial Record*, of the Neilgherry crop, "Ferndale," having realised the full value of 100s c.f. Trieste, and of the Mysore estate, "Murgaddy," having been disposed of at 100s c.f. for the same port. Further bids are made for various other estates on the basis of the above prices; but business so far has not resulted, owing to the firmness with which planters adhere to their high prices. Particularly the owners of coffee estates in the southern districts of East India, such as Wynaad, Neilgherry, Shevaroye, Nainpathies, Pulneys, &c., &c., are exceedingly obstinate, as their crops, owing to an unsatisfactory south western monsoon, are small, and will hardly come up to the yield of those in 1892-93, whereas the more favourable prospects in Coorg and Mysore, where crops of about 25 per cent. over those of last year are expected, make planters less extravagant in their ideas. It is estimated that the total yield in all the coffee-growing districts in East India will reach about the same figure as that of last year, and under most favourable circumstances may even exceed this total by about 10 to 15 per cent. If a better spot demand here would set in to clear our somewhat heavy stocks of fine colony coffee, a good business on arrival terms in these sorts would doubtless result.—*H. and C. Mail*, Nov. 24.

BLENDED TEA IN BOND.—We understand that, at the next meeting of the committee of the Planters' Association, the subject of blending imported tea in bond will be brought up for discussion. The local agent of Mr. Lipton has, we learn, addressed the Planters' Association Committee with a view of obtaining its assistance in securing from Government the privilege of blending tea in bond in Colombo under proper restrictions. As already pointed out by us, Mr. Lipton has decided to take up the work of pushing Ceylon and Indian tea in Australia, but, owing to the import duty on tea imported into the island, he is unable to carry on the business in Colombo. Instead of that, all the Ceylon tea intended for the blend has actually to be shipped from here to Calcutta before it can be sent to Australia. In this way Ceylon is losing all the business, and, in the course of conversation with Mr. Duplock we were told that, if Mr. Lipton were compelled to work his Australian business to a great extent from London he will be compelled to make use of the same blends as are now in use there, and this means, in the case of the cheapest blend (sold for 1s per lb.), that a certain proportion of it would be China tea. On the other hand, if facilities are given for blending in bond, the whole of the tea would be either Ceylon or Indian. There ought to be no difficulty in arranging this with the local Customs provided Government will acquiesce, and we do not suppose that the Planters' Association will raise any objections. Mr. Duplock will go up to Kandy on Friday (8th Dec.) so as to be ready to answer any questions required by the Planters' Association.

THE SUPPLY OF, AND DEMAND FOR FIBRE: PALMYRA AND COIR FIBRE AND MANA GRASS.

The Fibre trade is one with which many of the Colonies of the British Empire are largely concerned. Ceylon itself has an important interest in it, for not only do we at present export a very considerable quantity of the article, but we indulge the hope that the future may see that export largely extended. The information conveyed by our London Correspondent on this subject—see *Tropical Agriculturist*—will be read with interest by many throughout the limits of this island. It would seem to be the case that, until there occurs that general revival of trade for which we have so long been waiting, there is but little chance of the demand extending. Indeed, at the present time, it is only the common descriptions of fibre that are much sought after in the London market. Our correspondent surmises that the present stagnation is largely—indeed mainly—due to the depressed condition of the shipping trade. Until there is once again inducement for building new ships, the demand for rope, into the manufacture of which coir fibre enters more especially, must, he considers, remain dull. Then again, there can be no doubt that the substitution of wire rope for all the standing rigging of vessels, an application which seems to be daily widening and to be likely to still further develop, has much to do with the present slackness of demand rope made from fibre. We are told that even for that known as Sisal, which enters largely into the composition of the more valuable qualities of rope, the demand is at the present time rather slack. Coir fibre, however, of which our exports mainly consist, has such a variety of applications in mat-making and other kindred employments that probably the requirement for it will remain steady, while higher-priced sorts of fibre find but a slack market. That produced by the Palmyra palm, we are told, is mainly used for brush and broom making. Now there is a certainty that the requirements of home households will always use up a large amount of this description; but the export trade in these articles has experienced a severe reduction in amount, and so long as this continues it does not seem likely that the present rate of consumption of this article is likely to extend. This particular description of fibre has, we are told, received of late the attention of the brush-making trade because the supply, hitherto abundant, of Piassava,—a stiff fibre until now largely exported from the Brazils,—has recently undergone diminution. Whether the growth of the plant producing this last is likely once more to receive extension we are not told; but palmyra fibre has been found to be so efficient and so cheap a substitute for it, that, perhaps the conservatism of trade will maintain the present position of our local production. In view of the money brought to among the inhabitants of our Northern and Eastern Provinces by the late demand for palmyra fibres, it is to be hoped this anticipation may be realised. At all events we should say that the prospects of a maintenance of the existing demand are sufficiently good to induce those possessed of palmyra tops to extend its cultivation as recommended in a recent article in our columns.

It is to be feared that the hope at one time entertained that that wild product of many of our waste lands, mana grass, would find adaptability in many descriptions of home manufacture must now be given up. The experiments conducted with it, although their results appeared

at first to promise well, have not brought about this desirable result. They may be said, indeed, to have terminated in failure. It has been tried for all sorts of purposes, among others for the manufacture of gunpowder; but for this as for all the other branches experimented with, it has been finally declared to be unsuitable. Sisal fibre, we are somewhat surprised to learn, varies so greatly in quality that the price in the London market varies from £19 up to £45 per ton; but for the higher-priced qualities there seems to be but little present demand, doubtless on account of the restricted quantity of the better description of roping now required, for the reasons before stated. Perhaps Mr. Joseph Chamberlain, M.P., who has just returned from his visit to the Bahamas, undertaken mainly with the view of inquiring into the cultivation of the plant yielding this fibre, may be able to give information likely to revive the hopes once held as to the commercial value of the product. The henequen of Mexico, again we are told, is not keenly sought after just at the present time, though but a short time ago it was booming among the London manufacturers. In the United States, it is still much in request. We had formed bright anticipations, that the proposal to use coir fibre as a protection against water entry in men-of-war would have caused a stimulated demand for it, but our correspondent tells us that inquiries have resulted in his learning that as yet no disposition has been shown to make any considerable use of it for that purpose. Altogether we must conclude that, we shall have to await a revival of trade before we can write hopefully as to the prospects of our various fibre industries.

THE REV. A. PATON ON CEYLON TEA.

A series of very interesting letters by the Rev. A. Paton on Ceylon—its life, products, and varied attractions have been appearing weekly in some of the Scotch papers. Some 20 in all have been written, and while they are characterized by a pleasing literary touch, they are not mere surface sketches, but are full of close minute observation and accurate information. While not neglecting his church work he seems to have seen intelligently much in the island and represented it faithfully. This is what Ceylon requires. One of his recent articles we observe is on Coffee and a Coffee Estate, with a short review of the reign of King Coffee. Two others have been upon the growth and manufacture of the tea very accurately and clearly described. They wind up with the sensible advice to all to ask for Ceylon tea, and see that they get it fine. Among the hundreds of families who read these, those on tea at least seem to have attracted the attention of the Duchess of Buccleuch, who in autumn with the Duke and their family reside at the beautifully situated Castle of Drumlanrig, close to Mr. Paton's home in Scotland. We had it on independent information that inquiries from the Castle soon were made for Ceylon Tea. The chances would be that it would be some blend and not pure Ceylon tea that would be got. It is a pity that some of our choicest tea could not thus be tried by Her Grace, who is a lady of the finest taste, and intimately associated with the highest Court circles. Although Mr. Paton has to leave us in a few days, the tea planters must feel he has done them good service, and that he has earned some claim to be supplied with Ceylon tea for the rest of his life.

TEA AND SCANDAL.

The only NEW TEA-NAME I have to add to my list is that of "Kingella," egotistically so called by Robert King of Paddington.

This is what J. Albert de Mandelslo said in 1602 at p. 195 of his "Voyages and Travels" concerning our NEW PRODUCT. "As for *Tea* it is a kind of *Thee* or *Tea* but the plant is much more delicate and more highly esteemed than that of *Thé*. Persons of quality keep it very carefully in earthen pots well stopp'd and luted that it may not take wind, but the *Japponeses* prepare it quite otherwise than is done in Europe, for instead of infusing it into warm water, they heat it as small as powder and take the tea as much as will lie on the point of a knife and put it into a dish of Porcelain or earth full of resting water, in which they stir it till the water be all green, and then drink it as hot as they can endure it. It is excellent good after a debauch, it being certain there is not anything that allays the vapours and stills the stomach better than this herb doth. The pots they make use of about this kind of drink are the most precious of any of their household stuff inasmuch as it is known that there have been *Tea* pots which had cost between six and seven thousand pounds sterling."

While I was at Aberystwyth in North Wales lately I made the following notes on the names of some WELL-KNOWN ESTATES IN CEYLON:—

Penmyydd. The name signifies "mountain-top," and was given to the village from respect to the mansion of the same name which is famous for being the place where Owain Tudor was born in 1384.

Peurhos. The name of this village signifies the "top of a meadow or plain." From *pen*, heard, end, and *rhos*, meadow, moor.

Peurhyn. *Rhyn*, means a promontory. *Rhe, run, rain*, and *rhyn* are derivatives of the Sanskrit *ri. Rhedeg*, running, *reindeer*, the running deer, *rhe*, swift. **Penhyn**, a point of land that runs into the Sea. *Rhine*, a rapid river. The *Rhyns* are numerous in our island. **Rindow** point near Zington; **Pearhyn** in Cornwall; **Rhynid** in Perth: the *Rins* of Galway, &c.

Abergele. This pleasant market town is so called from its situation near the mouth of the river *Gele*. The river according to some, derives its name from *gele*, leech. A considerable number of leeches were seen at the estuary in olden times, but we are inclined to think the word is a contraction of *gelen*, ooze, so called from the very nature of the water.

Bugely (? Begele). *Ben*, an ox; and *gely*, a corruption of *gelly*, grove, signifying "the buffalo of the forest."

The above show the use of philology: I add one to show its abuse:—

Wrexham. Somebody, more wittily than correctly said that *Gwreccsam* means *Gwraig Sam*, Sam's wife!

STRANGE FACTS ABOUT TEA AND COFFEE.—On account of the vast difference existing in the chemical constituents of water in various districts up and down the country, many of the great wholesale tea and coffee merchants have had to have analyses of the different waters in every town and district in Great Britain made, and this at enormous expense.

The reason of this is that a tea or coffee which comes out full of fine flavour and body in one town becomes a very poor decoction indeed in another, this being on account of the difference in the effect produced by the two qualities of water, just as the waters of Burton or Dublin particularly favour the brewing of ale or stout respectively. It, therefore, becomes necessary, in order to preserve the reputation of any well-known tea, that a somewhat different blend of tea or quality of coffee, though with the same label shall be sent to different districts according to the peculiarity of the water.

One great tea-firm is declared to have expended upwards of ten thousand pounds in chemical processes during the past five-years. (*Answers* Nov. 18th, 1893.)

A CEYLON PLANTER IN BRAZIL:

Rio, Oct. 31st, 1893.

COFFEE.

Coffee continues to come down country; it finds a ready sale at well sustained prices from twenty

to twenty-four milreis an arroba (15 kilos). This gladdens the heart of the coffee planter, for the cost of production has not increased in anything like the same proportion.

Crops for the coming season 1894-95 are expected to be large, for *old coffee* has given small crops during the current season. These six months have been all that could be desired for forming young wood and frosts have kept away.

LABOUR SUPPLY.

Chinese labour supply has not as yet come within practicable attainment, and the cholera keeps hanging about the Mediterranean ports, which has put a stop to Italian Immigration. A. S. B.

P.S.—By this steamer a small box of coffee seed goes to Mr. Cowley, East Africa, as a trial. This news is for Mr. Percy Braine. A. S. B.

PLANTING ODDS AND ENDS.

(From an ex-Ceylon Planter.)

CINCHONA.—Some of my late planting neighbours may be glad to read the following cutting from a paper, which seems to hint at there being a good time coming for those who have saved some of their cinchona trees and not cut them all down when quinine was a drug in the market in more senses than one:—

"At intervals of a few years cinchona cultivation is sure to crop up, the demand for quinine being well sustained, especially in the United States, and in other countries in which fevers and ague prevail. Cinchona has been rushed on several occasions, one of the most noteworthy having taken place in Ceylon after the failure of coffee in consequence of the disease which destroyed so many plantations. From these and other causes the quinine market has been glutted, but indications are not wanting of a rise in the value of that all-important medicine. The magnitude of the demand will be better understood from a statement recently published by a New York house that the imports of quinine (as sulphate and in the bark) into the United States in 1892 amounted to at least 4,500,000oz., or half the estimated output of all the factories in the world. Stocks in the States having become much lighter, it is argued that the consumption of quinine in America must be on the increase; also that generally all over the world the consumption is ahead of the production, and that the surplus stocks of former years are being used up. Cinchona culture was commenced on a small scale in Queensland some years ago; it would be interesting to know how the industry has fared. In 1881, the *Cinchona Planter's Manual* was published by Messrs. A. M. and J. Ferguson, Colombo, Ceylon. It is a comprehensive work, and fully up to the times—in matters of culture and marketing."

TEA AND BRANDY.—The superiority of tea over brandy in many cases is beyond question. The idea still lingers that alcohol keeps out the cold. As a matter of fact mountaineers have found by repeated experience that the opposite of this holds true. *Home paper.*

The truthfulness of the foregoing I can testify to from personal experience and no one has better opportunities for testing than the residents among the cold, high hills of New Zealand, where I dwelt so long.

HOW TO GERMINATE TEA SEED.

A Kotagiri planter of much experience kindly sends us the following valuable notes:

"Unless you are perfectly sure of a long break of fine weather do not sow your seed in open nurseries; but germinate them under cover. Heavy rain rots the seed so this is an important point. Dig a hole about 3 feet deep or less, fill in with well stamped fern till half full. Then cover with a layer of soil. The seed may now be put in, slightly covered with about an inch or less of light sifted soil or sand. Keep it damp by watering about twice a week. I

have had splendid results by adopting the above plan. This of course is with sunk seed, floatage taken out." — *South of India Observer.*

LONDON REPORTS ON TRAVANCORE PRODUCE.

TRAVANCORE TEA.

(From *Patry & Pasteur, Limited.* Report of the Colonial Markets for the week ending Nov. 22, 1893.)

Enquiry having improved for low-priced kinds, prices show a slight advance on last week's rates.

UVA PLANTING REPORT.

Badulla, Dec. 9.

The MONSOON has so far been a very seasonable one. Rain has fallen almost every day since its burst, and while there has been plenty of moisture there have been very few severe rainstorms and there has been much less damage than usual done by the monsoon burst.

TEA.—A great deal of land is going into tea this season, and though there is still lots more planting to be done, many clearings are finished. As far as I know, the tea extensions are chiefly confined to planting up or extending existing estates, formerly in coffee. I have not heard of any new estates being opened this year. The weather has been a little against tea this month, unpruned fields showing a tendency to Oangy. But our estates have done so extraordinarily well this season that we must expect a slight check. Many fields and many estates here. I am told, have averaged over fifty pounds made tea per acre per month since the commencement of the season, and these months are our worst months. I fully anticipate phenomenal yields this year with ordinary weather in April and May.

PRICES too leave nothing to be desired and I am surprised that no one has suggested "The Ouvah Climate" as a factor in stand-out prices. Bogawantalawa, the Agrads, and Kandapola are all more or less "Ouvah"—and the Ouvah Factories proper, whatever their elevation are certainly supporting the theory. I consider prices in the district wonderful, when the quantity of bought leaf is considered and the elevations of the estates on which so much of it is grown.

COFFEE is looking fairly well, and Spring crops are much better than was at one time anticipated. Bug has done us great harm this year in the district; and Autumn crops, though short, have come up to estimates and have been of exceptionally good quality.

I see the EASTERN PRODUCE AND ESTATES COMPANY have commenced operations in the lowcountry by purchasing forest presumably for cacao. I believe that this is the commencement of great extensions in that district, and I shall be greatly surprised if in ten years time, Kumbakkani is not the centre of a large and populous district. Not only cacao but Liberian coffee, coconuts, etc., will all grow there and long dispised Monragala, now, one of the most thriving cacao districts, is proof that the climate is all that is required to this cultivation, and there is no finer or better cropping cacao in the island.

The PASSARA ASSOCIATION BREAKFAST to Mr. Fisher was a wonderful success. The thoroughly cordial friendly feeling existing amongst the members was most marked, and (as Mr. Fisher said) the existence of such a body was the best proof possible of the change which had been brought about in the past few years by tea. Everything showed progress and pointed to better times.

CEYLON AND JAMAICA AT CHICAGO EXHIBITION.

The Ceylon Commission were to contribute specimens of graphite, or plumbago, from the well-known veins in the mountain ranges in the southern part of the island; and Jamaica, the only other British possession represented, was to present a small collection of clays and pottery sand, ochre, salt from Turk's Island, and grey copper ore. Jamaica is not yet a mineral-producing country; but it is believed to be rich in metalliferous minerals. At the time of the writer's visit to the Fair, neither the Ceylon nor the Jamaica collections had been received at the Mining Building.—*Home Paper.*

TEA IN MINCING LANE.

A circular was recently issued, with the names of several large tea dealers and importers attached, suggesting that the offerings of Indian tea should be restricted to 30,000 packages per week. It was also proposed that only those who joined an association and paid a subscription should be allowed to bid at the Mincing Lane auctions. A meeting of the principal dealers has been held to consider the matter, but no one came forward to support the resolution. It was apparently felt that the scheme would never work. In the first place, it would have only led to a combination amongst the buyers not to oppose each other at the auctions; and, secondly, if teas are to be sold by public auction, it would be impossible to put restrictions on would-be buyers.—*Manchester Guardian, Nov. 13.*

BARK AND DRUG REPORT, (From the *Chemist and Druggist.*)

London, Nov. 16th.

CINCHONA.—Tuesday's auctions comprised a somewhat larger quantity of bark than has been offered for some time, but the greater part of it consisted of old Cuprea which scarcely counts from a quinine-maker's point of view. Of Ceylon cinchona only two small parcels were shown. The five catalogues aggregated:—

	Packages	Packages
Ceylon cinchona	151 of which	128 were sold
East Indian cinchona	336 "	244 "
Java	56 "	35 "
S. American (Calisaya)	77 "	40 "
	623	447
Cuprea bark ...	619	289
	1,272	736

The quantity of Bolivian calisaya-bark originally advertised was 190 packages (all ½-cwt bales imported via Hamburg), but the greater part of it had been sold privately before the auctions commenced.

The Ceylon and East Indian cinchas contained a good deal of "druggists'" bark, and as a matter of fact a considerable proportion of these varieties was bought by drug-firms. Competition was fairly active throughout the sales, but many of the largest parcels were limited above the current market-price. Holders apparently feeling more confidence in the future of the drug. The unit may be placed at fully ½d per lb., or a shade above that of the last London auctions and slightly above the Amsterdam parity.

The following are the quantities purchased by the principal buyers:—

Agents for the American quinine-works	43,627
Messrs. Howards & Sons	37,501
Agents for the Mannheim and Amsterdam works	24,880
Agents for the Paris factory	14,820
Agents for Auerbach factory	2,480
Agents for the Brunswick factory	2,333
Various druggists	27,279

Total quantity of bark sold	154,720
Bought in	84,940
Total quantity of bark offered	239,660

It should be taken into account that the quantity of bark offered affords no indication of the amount of alkaloids secured by the purchaser.

The following prices were paid for undamaged bark:—

CYLON CINCHONA.—Original—Red stem and branch chips, fair bright quills $1\frac{1}{2}$ d to $1\frac{3}{4}$ d; fair grey stem chips $1\frac{1}{2}$ d per lb. Rather dull Renewed red stem chips $1\frac{1}{2}$ d per lb.

EAST INDIAN CINCHONA.—Original—Ordinary to good bright quill red stem and branch chips $1\frac{1}{2}$ d to $1\frac{3}{4}$ d; fair to good bright shavings $2\frac{1}{2}$ d to $2\frac{3}{4}$ d per lb. Fair grey chips $2\frac{1}{2}$ d per lb. Good quilly yellow stem and branch chips $3\frac{1}{2}$ d to $4\frac{1}{2}$ d per lb. For a rather better parcel, a bid of $4\frac{1}{2}$ d per lb. will be submitted. Sound root $2\frac{1}{2}$ d; bold mixed but damaged ditto $4\frac{1}{2}$ d per lb. Mixed bright quilly chips $3\frac{1}{2}$ d per lb. Renewed. Red chips, ordinary to fair $1\frac{1}{2}$ d to $2\frac{1}{2}$ d per lb.

JAVA CINCHONA.—Fair small yellow chips realised from $1\frac{1}{2}$ d to $3\frac{1}{2}$ d per lb.

SOUTH AMERICAN CINCHONA.—Of 77 $\frac{1}{2}$ -cwt. bales fair bright but rather irregular cultivated callsaya quills 40 sold at $2\frac{1}{2}$ d to $3\frac{1}{2}$ d per lb.

CUPREA BARK.—The sales comprised 649 bales (of about 120 lb. each) of this bark, imported between 1881 and 1880. The owners declared that they could not afford to have the bark re-weighed (the last samples were drawn in 1887 and 1888), but they offered to make an allowance of $3\frac{1}{4}$ lb. per bale for loss in weight, a compromise which appeared acceptable to the buyers. With some difficulty 289 bales were disposed of at $1\frac{1}{2}$ d to $1\frac{3}{4}$ d per lb. for ordinary dusty quality, the bulk of it being purchased by an American firm. The remainder was limited at prices running from 50 to 80 per cent above the bids made.

There has been an import of 142 bales West African bark from Lisbon this week. The total quantity of sulphate of quinine represented by the bark offered on Wednesday was about 2,500 kilos, the East Indian bark alone containing about 1,900 kilos. Since the auction over 200 bales Cuprea and a parcel of East Indian bark have been sold privately.

London, Nov. 23.

CINCHONA.—Among the South American bark offered today were 81 bales old Pitayo of 1880-2 import, of which 54 were sold. Common woody and dusty brought $1\frac{1}{2}$ d to $1\frac{3}{4}$ d, badly damaged at $\frac{3}{4}$ d per lb. Nine bales fine bold sound, of Callsaya character, smoky flavour, were well competed for, and realised $6\frac{1}{2}$ d per lb. Genuine flat Callsaya bark is exceedingly scarce, and would probably realise 2s per lb. for fine quality. Two bales broken bright grey East Indian quill sold at 6d per lb., a very high price. Only a few lots of South American Guayaquil bark were offered, but these did not find buyers.

COCA-LEAVES.—Very neglected. For 5 bales good bright green Truxillo offered at auction only $2\frac{1}{2}$ d per lb. was bid. Another lot of 11 chests, dark bold leaves, of Huancoco character, mouldy flavour from Ceylon, were bought in.

CUBEBES.—A parcel of 15 bags, offered "without reserve," and consisting of small partly shrivelled dusty and stalky berries, sold at 5s to 5s 6d per cwt., which marks a decline of about 7s 6d per cwt. Another lot of four bags very stalky small dark berries, however, which realised 6s per cwt., showed much better value. For bold brown berries without stalk 6s per cwt. is asked. A considerable quantity is to be offered tomorrow morning. The general aspect of the article seems to favour lower prices.

KOLA-NUTS.—West Indian kolas, of which several parcels were offered today, were very strongly competed for, and sold at an advance of about 2d per lb., fair to bright brown quality realising from 7d to $8\frac{1}{2}$ d per lb., and fine bright $10\frac{1}{2}$ d per lb. About 10 packages were offered and sold.

QUININE.—Scarcely any business has been done this week. The nominal quotation remains $9\frac{1}{2}$ d per oz. for second-hand German bulk.

VANILLA.—About 200 packages were offered, for which there was a good demand at steady prices for short, and rather better rates for fine pods. Fine 8 to $8\frac{1}{2}$ inches brought 14s; good chocolate 6 to $7\frac{1}{2}$ inches, 8s to 9s; ditto, short lengths, from 4s to 7s 6d; and fey to common, from 3s 9d down to 1s 3d per lb.

CONGO RUBBER,

The report of the Belgian Upper Congo Trading Company, presented at the General meeting of the shareholders in Brussels the other day, shows a gross profit on the African undertakings for the financial year 1892, of £54,116. After writing off against real property and river vessels in Africa, a sum of £8,000, £4,000 for insurance, and providing for various expenses, there remained a net profit of £29,153, out of which dividends of 6 per cent. on the preference shares, and 4 per cent. on the ordinary shares have been declared. The report states that the business of the

company has greatly expanded. The number of trading stations has increased from nine in 1889, fifteen in 1890, and seventeen in 1891, to thirty-four last year, and new ones are still being established, the total in May this year being forty-one. Last year 90 tons of ivory and 126 tons of rubber were secured, as against 47 tons ivory and 26 tons rubber in 1891. The present year also promises satisfactory results, 42 tons of ivory and 90 tons of rubber having been already collected at the end of May.—*India Rubber Journal.*

FLOWERS AND PERFUMES.

While ordinary perfumes are obtained by soaking the flowers in melted fat, the more delicate and subtle ones, such as those of jasmine, jonquil, and tuberose are extracted by laying the flowers on thin layers of wax spread over glass frames. In process of time the grease sucks up the delicate scent, and fresh flowers are supplied until a sufficient strength of perfume is attained. A pound of this delicately scented wax represents the essence of from six to eight pounds of flowers. 'In the pure dews of a little bottle of perfume,' says *Black and White*, in an illustrated article describing the process of manufacture, 'lies the hoarded sweetness of perhaps a thousand blossoms.'

TEA AND TRADE IN GERMANY.

British traders have long been flattered in a dubious manner by German imitators of their wares. From imitation by misrepresentation is an easy process, and the genius of the Teuton has been quite equal to the occasion. Aided and abetted by the Fourth Estate, his latest development, as shown in a letter from a correspondent in another column, is the circulation of misstatements about the London tea trade, the magnitude of which has attracted curious attention in Germany. It seems that the consumption of tea in the Fatherland is increasing largely, and a determined effort is being made to stop importations from England and to obtain the business direct. Apparently the first step towards this is to discount the quality of the English article, which is alleged to be adulterated in a manner that is not only impossible, but simply preposterous under the surveillance which the Customs and Inland Revenue authorities are bound to exercise over anything which is subject to duty. So large is the production of tea, and so small the profit, that, ethically apart, the game of adulteration is not worth the candle. The Germans are such careful students of English newspapers, that we hope our contemporaries will take up the matter and expose the absurd misrepresentations to which our correspondent draws attention. There is nothing like carrying the war in to the enemies' camp.—*Commerce*, Nov. 8.

PICKINGS WITH A LOCAL APPLICATION.

The Kow Bulletin mentions that the SEEDS of *Entada scandens* (the Sinhalese *Pus-wel*) have been known to have been picked up at Swansea Bay, in the Orkneys, the Norwegian coast and the Azores. "There is little doubt," says the Bulletin, "that in all these instances the seeds had come from tropical America obliquely across the Atlantic; but the most interesting point is that after floating for weeks, and may be months, in sea water they retain their germinating power." "The hard polished pericarp of *Entada scandens* would seem to be well adapted to keeping the endocarp water tight. It is quite common at some seasons of the year to find the seeds of *Pus-wel* and the more or less decayed fruits of "Kadurn" cast upon our shores with other detritus. Under the title of "An Industry for Europeans" the *Indian Agriculturist* has an article (Nov. 11th) on COCONUT PLANTING, with the following introduction:—

"I am sure that this branch of planting does not receive half the attention it deserves from Europeans in India. Yet in Ceylon it is a very favourite form of investment, and coconut topes in Ceylon are eagerly sought after by both Europeans and Natives. As an

investment coconut-planting is considered far safer than barks, and yields, moreover a much greater interest. The profits are not very high compared with tea and coffee, but the initial outlay and subsequent cultivation required are of the smallest. The returns per acre are not—I am talking of Ceylon—much over R150 per acre on the average, but well-cared-for estates yield more, like R200 annually. A yield of only fifty nuts per tree will in a good year—like 1892-93—bring in as much as R130 per acre, while on well-cultivated land the yield is sometimes as high as 150 nuts per tree, which in a good year mean almost R400 per acre. Of course the one great disadvantage is the length of time required before they begin to yield—from six to seven years—but this again is no longer than in the case of cacao.”

Then follows a series of notes on coconut cultivation, culled from various numbers of the *Tropical Agriculturist*, and embodying the views of your well known correspondents W. J. and W. H. W.

“The new fodder plant, *POLYGONUM SACHALINENSIS*, which your London correspondent refers to, is already known to Bengal as knot grass or *Machute*. The *Indian Agriculturist* thus describes it: “The roots branch on all sides, and pass horizontally from the rhizomes, penetrating the hardest soils and developing new shoots, which further increase the size of the clump. The stems are numerous and closely set; they vegetate early, and are not long in attaining a height of nearly ten feet. The experiments as yet made are sufficiently conclusive as to the value of the plant as fodder. A young plant put into the ground is not slow in covering a surface 3 feet square with its leafy branches. The first cutting is made when the stems are from 3 to 4½ feet high; if the second growth is strong enough a second crop is gathered, but in the following year three or four cuttings can be made. The total quantity of the green yield is said to be about from 44 to 88 lb per square yard or about from 95 to 190 tons per acre. Cattle are extremely partial to this grass.”

RAMBLING NOTES BY A TEA PLANTER, TEA PLANTERS' BLIGHTS.

RED SPIDER—GREEN FLY—MOSQUITO.

As a planter long resident in Assam the Red Spider has been to me a matter of absorbing interest for many years. Who is he? Where does he come from? Where does he go to; and if he has any place to go to, above all things, why the deuce does n't he go there? We are told that everything exists for good. What good is the Red Spider? I take Gladstone's test. I spread out the map of my garden, and I challenge the red spider to put his finger, if he has one on any spot and say “there I did good.” Certainly in one sense of the word he's here for good, because the confounded thing won't go away, but what moral benefit does the world in general or the tea planter in particular derive from the Red Spider? What is his purpose in life? What is the object of his existence? There is certainly one quality he possesses: he's a splendid example of perseverance and pluck. I've seen him squirted at with all sorts of chemical mixtures, I've seen him choked with *gobur* and *watty*. I've seen him apparently buried alive in lime. But he only moves quietly on and comes up smiling on a neighbouring bush. His persistence in the face of all efforts to effect his removal gives me the idea that he thinks he serves some moral purpose; but if so he's awfully mistaken. If that's his purpose in life, he's a most hopeless failure. The Red Spider, far from a beneficial influence, exercises a demoralising effect on both planters and garden.

There is another pest we've got, called Green Fly. I often wonder who gave him that name

He may be fly, but he's certainly not green. Did you ever try to catch a Green Fly? As for being green if you look at him you'll see he's perfectly white. Did you ever hear of a Green Fly being caught by a Red Spider? I trow not. There is nothing green about a Green Fly except his name. Did you ever hear of a planter doing anything to a Green Fly? A Red Spider he'll go for, but a Green Fly never. He's the only blight that war is not declared against. I can't say a Green Fly is welcomed, but he's tolerated. Planters seem agreed that the only thing is to grin and bear—planters may not all succeed with the grin, but they all have to bear it. It isn't that he does no harm: he does a very considerable amount.

The Mosquito is the greatest enemy the Tea Bush has. There is no moderation about a mosquito. The same skill and determination the other branch of the family displays in working through the net which surrounds a sleeping victim is displayed by the fiend in mosquito form that attacks our bushes. The Red Spider dries up and discolours the leaves, the Green Fly stunts the bushes, but the mosquito goes for the sap of the bush—just as the domesticated mosquito goes for the life blood of his victim, so does the garden mosquito go for the life blood or sap of the tea plant. The planter has declared unceasing war against the mosquito. Early in the morning and late at night the planter endeavours to catch him, and in the day assaults him by every means in his power. Science has been brought to bear on him; all the concoctions that chemistry can think of have been forced on him by means of hideous and fantastic-shaped syringe pumps. Inventors have been encouraged to rack their brains for means to destroy him. But to no avail. He has been tempted by torches and treacle, he has been smoked and burnt; but no planter can yet claim to have utterly vanquished him. The mosquito displays a curious fancy in selecting the portions of a garden he means to settle on: sometimes low pruned tea, sometimes high, sometimes low land, sometimes at the edge of the tea near the jungle, sometimes in the centre of the garden. Now he settles on an undrained plot, and again he takes up his abode in a well-drained piece. No planter has yet discovered with certainty the reasons which guide his selection, but every planter knows that once selected nothing will induce him to leave it. The planter may ticket him, docket him, and make notes about him in his diary; he may prune the piece down and burn it; he may hoe it or let it run to jungle; he may drain it, manure it or leave it severely alone: but there the mosquito remains and there he makes his first appearance each season. The mosquito maketh the face of the planter to grow long, it maketh his heart to grow sad, it killeth his tea bushes, it diminisheth his outturn, it maketh his profits to disappear, yea it causeth him to lose his bet, and now there are these three blights Red Spider, Green Fly, and Mosquitoe, but the most awful of these is Mosquitoe.—*Nilgiri News*.

COMPRESSED TEA.—With reference to a paragraph about some compressed tea which, when used after being left open for a year, proved very good indeed, a correspondent who knows about tea says that it always improves by keeping, so long as it is compressed or shut up in an airtight box or enclosed in lead. Some doctors say that tea should never be drunk till it is a year old at least; and quite new tea, as every planter is aware, is medicinal in its properties.—*M. Mail*.

PLANTING PROSPECTS IN EAST AFRICA:
THE FUTURE EL DORADO FOR YOUNG
CEYLON PLANTERS.

There has been strong criticism lately on the continued influx of young Englishmen as Tea Planting Assistants—in vulgar parlance “creepers”—into Ceylon, in view of the fact that there is not likely to be any prospect before them in the island after they have qualified as planters. This is very true, and more especially in respect of teaplanting, whatever may be said of other products which are now, we are glad to think, receiving renewed and increasing attention. But are we not apt in extending such criticism to forget that Ceylon is the best School in the world for the future Tropical Planter to attend? And who dare say when regard is had to COFFEE, cacao, palms, rubber, &c., that the work of tropical planting is overdone, so that there is no scope for the young man with enterprise and energy, who has learned how to manage native labour and to open a plantation on the most approved principles? We venture to aver that in different parts of the world there is room for a large addition to the lists of planters, and we go further and urge that the drawbacks to pioneering and planting work in North Borneo, the Straits Settlements, New Guinea and East Africa are not greater than—if so great as—those presented to planters in Ceylon forty or even thirty years ago. We would ask our “creepers” then to go at their profession with a will—to look beyond Ceylon, if need be for their future scene of work; but to cultivate habits of hard work and even privation, so far as compatible with health, in anticipation of taking up the labour and responsibilities of pioneers in new planting territories. One further piece of advice we would give to newcomers, namely, try to learn about coffee and cacao cultivation and curing, even more than about tea, while in Ceylon. From this, it may be deduced that the men who should take on “creepers” are, pre-eminently, our friends in Uva and Matale: Managers with appreciable areas of our old staple or of cacao under their charge.

But now to turn to the future Eldorado of young planters—men, we mean of the right stamp who will not be afraid of hard, rough work and perhaps oft-repeated disappointment to begin with,—we think it should be found in Imperial British East Africa, or Ibea it is called from the initial letters by which the territory was first described—provided the British Government as it is urged, take a share in developing colonization and settlement by the construction of a road, if not railway. There is every encouragement to do so; for in part of the territory to be developed, rubber-yielding trees are said to grow in abundance, while in another division coffee is said to be indigenous. Abyssinia has always been spoken of as the habitat of coffee and the mountain ranges and country we speak of may be said to be a continuation of Abyssinian territory. The lower or coast region is described as the land for cotton, rubber, oil-seeds and sugar, and Persian and Indian immigration is to be promoted to take up these industries. The European coffee planters are expected to occupy the highlands. The risks attending the employment of capital in coffee planting in Eastern Ibea, even now, we are told, are very small. Forestland with rich soil is freely available; the climate is suitable; and above all, suitable labourers are said

not to be wanting, of varied temperament:—“men like those of the Wat-ro on the north bank of the Sabaki river and said to be capable field hands, while they and the Wakerali and Giri-amas are peaceful and agricultural people.” We need say nothing on the point that coffee is as a product now at a high premium, that there is the greatest possible encouragement to cultivate it especially in British territory. German East Africa has, however, been first in the race; or has followed closely on the Blantyre plantations farther South. Ceylon is represented by Mr. Cowley in the one and by Mr. Brown in the other. But more promising than either of these territories we should judge is Eastern Ibea for men with some capital, a proper training, pluck, and habits of hard work and self-denial. We feel sure that men of the type of the Tytlers, Nico’s, Martins, Haddens, Rudds, Moirs of the “forties” in Ceylon would speedily carve a splendid tropical plantation Colony out of Eastern Ibea—between Mombasa and the country 400 miles inland. Here are a few extracts from official reports:—

“Singwaia to Arbagowandi.—The road strikes inland through forest soil, very rich, heavy, black loam. In about half an hour the forest ceases, and we come upon an extensive area of open very flat country; the path greatly overgrown, now passes through what was originally forest and is now a succession of extensive ‘shambas’ and the richest and most fertile country imaginable. Soil exceedingly rich and, where no cultivation exists, the country is overgrown with a high rich grass fully six to seven feet high. In the month of September, 1891 Captain Dundas partly explored the lower lands of the Kenia mountain slopes, and he describes the Wathaka country as “a beautiful, fertile, highland district, a land of numerous villages, fine pastures, and well-tended plantations.” The Mbé tribe, not far distant, “possess cattle, sheep and goats.” Food was cheap and abundant, the country being almost entirely given over to cultivation, for which it is better adapted than for cattle-grazing. To the south was the great mountain range of Mumoni (with the darkly-wooded river flowing along its base)—the rolling fertile country of Mbé which intersected the country with numerous beautifully clear streams, coursing down the valleys between the slopes. The Kikuyu country is equally attractive. According to the same explorer, it is “a densely populated district the villages lying on the slopes of the hills, which were a mass of luxuriant crops, beautiful trees, and sparkling streams flowing southward.”

It is evident from this there is in British territory more than one highland region of special fertility only waiting to be developed into prosperous coffee districts. All that is wanted to cause an influx of capitalists is a railway or even improved road communication. But 400 miles are too many for cart transport to cover. Only a railway can meet the necessities of the case and once it is carried inland for an appreciable distance, we may expect land to be freely taken up by individual capitalists and Syndicates—and to what country can these turn, save Ceylon, for the trained enterprising pioneer planters with whom will rest the development of a coffee region which eventually may extend to an area that will make it a rival to Brazil itself? In South America, the coffee plant is an introduction: in North-East Africa it is in its native home. That the future of coffee is greatly with East Africa is our firm belief. We have written to a representative Ceylon planter near to the region we speak of, for his account of the present condition of affairs and the prospects, and so soon as his answer arrives, we shall lay the same, along with a good deal more information from official reports, before our readers.

ECHOES OF SCIENCE.

DIAMONDS have been manufactured by the French chemist, M. Gustave Rousseaü, by simply heating coal gas under atmospheric pressure to a temperature between 2,000 and 3,000 degrees Cent. The gas was saturated with vapour of benzine and passed into a hollow block of quicklime, in which a voltaic arc was kept up. Unfortunately, the gas leaked, but still, after two hours, he found both graphite and black diamonds or carbonado. Acetylene has given the same products by the same treatment, and he intends to try condensed carburets derived from coal tar or petroleum residuum. The diamonds are very small.

Turquoise has been found in the Jarilla mountains of Dona Anna county, New Mexico, as well as in the Burro mountains, Grant county, where the well-known prehistoric mines are situated. In the Jarillas, too, there are signs of old workings among the cacti and palmias of the arid soil. The matrix or mother rock is trachyte as at Burros, and the gems are found in a shaft which has been sunk in a crevice of the rock. It appears that the turquoise has been formed from kaolin by alteration. It occurs in nodular masses nearly in inch thick, and is green as well as blue in colour. When first found the tint is of magnificent ethereal blue, which dims on exposure. A piece of an indigo colour will fade to the tint of a thrush's egg. That near the surface is apt to become white and friable. If after drying, the stone adheres to the tongue it is of little value. The Mexicans of the district believe that the "Old Pueblos" and Aztecs worked these mines, and it is certain that the Pueblos still prize the gem, which they call "Shoo-ar-mé," even more than the Navajo Indians do. The Apache Indians call it "Steh," and care little for it. The Mexican name is "chor-chu-a-ty," which is like the Aztec "Chal-chi-hni-tl" of several authors.

The fire in a house which was recently traced to a burning-glass or lens exposed to sunlight in one of the rooms is parallel by one occasioned in a New York warehouse by sparks coming from the friction of the hind wheels of a van against the curb-stone. Another curious case of fire is also reported from America. A jet of gas from a small leak in the fittings was ignited by the induced electricity of a thunderstorm, which created a tiny spark in some electric wires near the gas fittings. Obviously, had the electric wires not been run near the gas pipes there would not have been any danger of this fire. Sparks in underground wires have been known to explode the mixture of gas and air in cavities near the gas-mains of our London streets.

The grape harvest of France this year has not been equalled during the last hundred years, notwithstanding the attacks of three enemies, the oidium in April, mildew and the phylloxera. The extraordinary crop is due to the favourable climatic conditions of the summer. The flowering took place in dry weather, and the light rains of April followed by the drought of July and August were just what the vines wanted. We may add that we have seen both white and red grapes ripen this year on the walls and roofs of houses in the open air near London.

There has been a plague of wasps in France as well as in England during the past summer and the occasion was seized by more than one naturalist to observe and experiment on the insects. M. Milne-Edwards found that their ordinary food having failed at Pas-de-Calais the wasps fed on the sap of young elms; and M. Marchal succeeded in transforming a working wasp into one capable of producing eggs by giving it the proper nourishment.—*Globe*.

THE QUEENSLAND STATE NURSERIES.

[Extract from the annual report of the Overseers at Mackay and Cairns.]

MACKAY.

Mangos.—A very important matter will, as soon as the irrigation work is complete, be gotten with—viz., the propagation of the Indian mangoes. The stocks for marching these upon are all contained in tins and boxes so that they can be placed round the growing

trees; these tins and boxes which have to be watered every day to keep up the flow of sap necessary to the success of the march, to carry the amount required, would have entailed more labor than could have been given, but the water can then be run close to where required. The imported plants have grown well, most of them being now good-sized trees, and will, I expect, fruit this season.

Sugar-cane.—Considering the want of rain, the five varieties from Mauritius have grown well, and about 18 tons of plants have been sent out, the reports of which show that they have done remarkably well; the greatest demand being for the Rose Bamboo, Striped Bamboo and Louzier. There are a large amount of Louzier, Bronchen Royee and Bronchen Blanche left.—*Sugar Journal*.

BANANAS IN QUEENSLAND.

For some years past the farmers who live in district on the seahoard in the North of the colony have been shipping this fruit to the southern markets, and after many reverses for some time, established a fairly remunerative trade there. This led to further extension of the area planted with consequently great increase in production, the quantity of bananas grown being on an average fully three times greater than in 1889. This large increase in production, combined with the quantity imported from other countries into Sydney and Melbourne, which was more than could be properly consumed in those cities, has operated adversely towards the banana-planter in Queensland, so reducing the price of the fruit as to render it almost unmarketable. The difficulties in connection with the freighting a fruit so easily damaged, and requiring so much space as the banana, have always been a difficulty in the way of export, and would operate still more adversely in a prolonged transit. The recent shipment of this fruit to Vancouver has shown that under present conditions the banana is not available for distant consumers. I am not aware that much success has attended the endeavors made to convert this fruit into a more exportable form, either by preserving, drying or grinding it into flour.

There were 3,059 acres planted under this crop in 1892, being 838 less than in the year previous, but the average yield 4,667.43 dozen per acre in 1892, was so great in improvement on the result for 1891, that the lesser area in the year first mentioned returned 2,632,894 dozen more fruit to the grower than were obtained from the larger average in 1891.—*Sugar Journal*.

VARIOUS AGRICULTURAL NOTES.

BRAZIL COFFEE SEED FOR EAST AFRICA.—Mr. Scott Blackaw, in a letter which will appear further on, reports that a small box of coffee seed is being sent from Brazil to Mr. W. H. Cowley in German East Africa, as a trial.

COFFEE.—Messrs. I. A. Rucker & Bencraft report on Nov. 16th as follows:—

Some five weeks ago we remarked, after reviewing the position, that we found it impossible to treat values such as were then current as other than normal. Since then mild coffees have advanced, say 6d to 1s, and Brazil coffees several shillings. It is roughly computed that about 75 per cent of the consuming trade is now done in roasted blends of coffee, and of course as long as the retail prices remain unaltered in an advancing market, the tendency is to use more of the inferior, less of the superior descriptions. At all events the fact remains that for some time the values of the lower grades have been getting nearer and nearer to the range of prices current for mild coffees. If, however, retail prices are presently advanced, there may then be a better demand for mild coffees. For the last few days markets have ruled quiet, with an easier tendency, today things are steady but in the long run probably the market is rather strengthened than otherwise by such reactions.

"WEEDS: THEIR USE AND ABUSE"—might well be the heading of the critical dissertation to which our correspondent "Holloway" treats us today. There is nothing however, like practical experience and we understand that the experience gained by the writer under notice, has been so convincing that some five or six planters in the neighbourhood have adopted his practice, so that it would certainly appear to be an illustration of "no rule without an exception." It will be observed however that the critic carefully limits the cases in which he would advise weeds to be cultivated and then dug down.

THE TRADE OF ZANZIBAR.—From a report on the trade of Zanzibar, prepared by Mr. Rodd, the British Consul there, we learn that the increase in foreign trade there is due chiefly to ivory. Owing to the large quantities of grain shipped from Bombay and Calcutta, the principal share of the import trade falls to British India, but among European countries Great Britain holds her own against Germany, which stands second on the list. The exports show a falling off, Mr. Strickland, however, proves that this decrease is less real than it appears, inasmuch as the high figures attained in 1891 were due to an unusual export of accumulated ivory to Europe by the German East Africa Company prior to the removal of their headquarters from Zanzibar to Darassalam. There was also a decrease in the export of cloves and hides.—*British Trade Journal*.

GERANIUM OIL.—Regarding this oil, we read as follows in Schimmel & Co's Report:—"Towards the end of May such a catastrophe befell the Island of Réunion that it will probably suffer for many years from the after-effects. The Banque de Crédit Agricole et Commerciale failed, and two other banking houses were so much affected by this stoppage that they could only continue to trade upon a limited scale. The loss to the public is at least ten millions of francs and the cultivation of many of the estates of the colony, depreciated by bad finance and management, is about to be abandoned altogether, as all spirit of enterprise has been effectually paralysed. From Algeria strong and general complaints reach us of the damage which has been caused to the geranium-plantations by several months of drought. But this damage can only have taken place in quite a small part of the geranium fields, as artificial irrigation, which enables the grower to obtain three crops in a season instead of one, is now the general rule. The assertion that the oil obtained from naturally-watered plants is of finer quality than that of the others has also proved a fiction. The chief requisite is, that distilling takes place while the leaves are fresh. No information is yet to hand concerning the result of the disillation in Spain. As regards quality the geranium oil from that country continues to occupy the leading place. The so-called Indian geranium or palmarosa oil has maintained its elevated price-level and is scarcely likely to become cheaper again, as the consumption in India itself has increased considerably of late years."

TEA PRODUCTION AND CONSUMPTION.—It may have taken many people by surprise in view of all that has been written about "over-production" to learn that the North and South Sylhet Tea Companies' Directors could speak of a tea consumption of 450 million lb. in non-producing countries against only 170 millions lb. exported from India and Ceylon. That estimate was framed early in the present year when it was quite correct. Now the exports must be put at nearer 210 than 200 million for both countries, and looking ahead a little we suppose we must face the time when India will be exporting .. 150 million lb. and Ceylon .. 100 .. "

Total.. 250 .. "

Now against this, how does the consumption in Europe, America and Australasia stand, not to speak of minor countries. Here is the aggregate of our latest revision of estimates:—

	In million lb.
United Kingdom	210
Russia	75
Rest of Europe	22
Australasia	28
United States and Canada	106
Total..	441

This is from the latest review in our "Handbook" and if we add some 4 million for North and South Africa and 40 to 50 million lb. for Asiatic countries outside of China, India, Ceylon and Java, it must be seen that the Sylhet figures are more than justified. The great matter now for Indian and Ceylon planters is to win over (first) North America; (2ndly) Russia and next the rest of Europe and all Australasia to their teas, and to get them to give up the use of the China article. There is certainly vast room for expansion in the demand for teas in the countries just named.

CACAO COFFEE AND TOBACCO IN NORTH BORNEO.—We call attention to the encouraging letter of Mr. Henry Walker in another column. If North Borneo is going to do so well in "cacao," there ought to be somewhat of a "rush" of young men with some capital thither; for cacao is one of the most valuable products to cultivate. But North Borneo is also doing well in coffee—both Arabian and Liberian—and the planter who prefers this Colony to East Africa has the assurance of easier transport, more available experience and companionship. The cheap dollar, too, tells in North Borneo's favour.

THE EXTENSIVE AND INCREASING DEMAND FOR INDIA-RUBBER renders it possible—says *Nature*—that the supply will eventually become exhausted, so attempts at artificial cultivation of rubber trees are being made in various rubber producing countries. Mr. Hart remarks, in the June *Bulletin* of the Royal Botanic Gardens, Trinidad, that rubber has been procured in the Gardens from *Castilloa elastica*, and that trees of a mature size will produce it in paying quantities. It has also been proved that *Heveas* of several species will thrive well in Trinidad. In this connection a paper by Dr. Ernst, on the cautchoué of the Orinoco, published in the first number of the *Revista Nacional de Agricultura*, and included in the *Bulletin*, is of interest. Dr. Ernst says that the rubber of the Orinoco is extracted from the juices of the *Hevea braziliensis*, Mull, a tree belonging to the family *Euphorbiaceae*, and not to that of the *Hevea Guayanensis*. The milky juice obtained from the tree, through incisions made in the bark, has the consistency of cream, and the rubber existing in it in minute globules constitutes from thirty to thirty-three per cent, of the weight. The rubber collectors of the Amazons employ the slow, primitive, and contaminating process of evaporating the juice in the dense smoke of a wood fire, in order to separate the rubber from it. A far better method of obtaining coagulation is to add a six per cent. solution of alum to the juice, and then submit the coagulated rubber to pressure in order to extract the water it contains. Dr. Ernst thinks that every effort should be made to extend and conserve the forests, thickets, or groves of rubber trees, suggesting, among other things, that when the collectors work a grove they should be made to plant a certain number of trees. Only by such means, and by adopting a chemical mode of coagulation, can the rubber production of the Amazon territory be increased in quantity and improved in quality.

Correspondence.

To the Editor.

CEYLON RUBBER: A FINE SAMPLE AND GOOD REPORT ON MATALE RUBBER.

London, E. C., Nov. 9.

DEAR SIR,—We are in receipt of your favour of 18th ult. with sample of Ceylon rubber for which we thank you. The quality of this rubber is very good and should any quantity arrive in good condition it would sell here at about 2s 3d per lb. probably. As you know most of the rubber from your market is of much inferior quality to this, in fact we may say this is the finest sample we have seen of Ceylon rubber.

If you could establish it in the market here, it would in our opinion come into competition with Fine Para, say about 4d to 5d per lb. less money. In small quantities it would hardly realize its full value as large consumers want a regular and fairly large supply of clean rubber and this should sell readily (as fine Columbian does at 2s 3d—2s 7d per lb.) when fine Para is 4d to 5d more.—We are dear sir, yours faithfully,

S. FIGGIS & CO.

[The above refers to the sample of rubber produced in the Matale district, and sent us by our correspondent "J. M." about the middle of Oct.—Ed. T.A.]

THE CULTIVATION OF CACAO WITH LIBERIAN COFFEE.

North Borneo, Nov. 18.

DEAR SIR,—It would confer a great favour on me if someone of your many correspondents would kindly inform me if cacao requires shade when planted with Liberian coffee.—Yours faithfully,

HENRY WALKER.

[We believe cacao is found to be all the better of shade trees in Ceylon even when planted with Liberian coffee, though of course the shade need not be so continuous or dense. The best illustration we can think of is Udapolla estate, Polgahawela, where cacao, Liberian coffee and shade trees are intermingled. In one or two cases, cacao has been planted with coconuts—in the Kurunegala district—and we believe the experiment is considered a success—though there has scarcely been sufficient time to judge of crop results. We have just been hearing from Mr. Vanderpoorten of a flourishing cacao estate in the island of Fernando Po, West Coast of Africa, without any shade.—Ed. T.A.]

CEYLON RUBBER. THE MATALE SAMPLE.

Kandy, Dec. 2.

DEAR SIR,—I feel indebted to you for the excellent report you have obtained from London and published in your issue of 29th November, and which shows that the quality of rubber obtained here from the Castilloa Elastica is first rate, and ranks not little below the value of Para. Indeed the prices quoted, say 2s 3d to 2s 7d, when Para might be 4d to 5d more, are extremely encouraging.

I was first led to address you on the subject on perusal of your very interesting reports upon coffee and rubber planting in Mexico in which it appeared that shade trees for coffee were being discarded in favor of Castilloa Elastica which had given good results with the two enterprises coffee and rubber, going on together.

This seemed to me very important, for now-a-days shade is so largely used in some of the lowcountry products that to find one which shall be a source of profit in itself without injuring the superior product it is sheltering and protecting would be invaluable. Ceara rubber has no merits as a shade tree; it is greedy, it does not like being tapped too young; it has nasty ways of falling to pieces before a gust of wind, and in some strange fatality always falls on its richest neighbour, and then while almost too soft for any use whatever, yet lingers unrotted on the ground to the disgrace of any tidy clearing. It is the attraction and delight of wild pigs, who work in disorderly fashion in quest of its tubers. If, therefore, Castilloa prove good shade for coffee in Mexico, why should it not for similar purposes in Ceylon render us aid also? What value, for instance, it might have given to old coffee fields before abandonment? The lapse of cultivated fields of striken coffee into useless chena and rubbish has always been a regretful remembrance to me. There were hundreds of acres all over the lowcountry that might have been filled with products of some kind, if in those days we had had the knowledge, the seed and the stimulus of encouragement.

I think I saw in your paper that the authorities at Peradeniya had not entertained a high opinion of the Castilloa rubber, as to growth or yield. The question of value, however, is quite set at rest by your London valuation. We do not seem to have statistics available as to yield; but I am sorry that there should seem to be discouragement as regards growth from so authoritative a quarter, and I hope that despite this there will be somebody with sufficient faith to try the experiment.

It does not do to yield to temporary discouragement, for I remember some years ago, when prices were poor, Liberian coffee fell into discredit and I was advised to root out mine. Yet I have got in some R20,000 in value of that product since then, though my small area has been crowded out by other trees, and succumbing sometimes to the various ailments and diseases coffee is heir to, and suffering from its overcrowding also, it still forms a valuable portion of my property and yields me a welcome addition to my annual returns that might have been wanting if the early discouragements had not been faced and repulsed.—Yours faithfully,

J. M.

WEEDS ON PLANTATIONS AND HOW TO DEAL WITH THEM.

Marakona, Dec. 2.

DEAR SIR,—The editor of the local "Independent," in his issue of 20th November, has given us in a leader his experience as to allowing "Weeds" to grow on estates, and winds up by advising not to try the effect of weeds. Let us now analyse his objections, taking each paragraph separately and my reply to each following on the same:—

"It was the lot of the writer, during many of the earlier years of his sojourn of nearly half a century in Ceylon, to wage a war à l'outrance against the deadliest enemy of the coffee bush, weeds. There was but one estate, when this warfare commenced, that had been kept free of weeds for more than two, or at most three years, and there were not a dozen that had even been kept clean during their first year. There were two principal reasons for this state of affairs. One was deficiency and irregularity in the labour force. The other was the inexperience of the planters as to the practical means of exterminating weeds. So far as we can recollect there was

no one at that time who doubted the mischievous effect of weeds on the coffee. The weeds had no friends till long after clean weeding had been universally practised, and then there were only one or two who pleaded for their being tolerated or encouraged. One persistent advocate of weeds was allowed to use the columns of a leading paper for some time, but he made few if any converts, and at last the editor refused to publish his letters any longer. The subject was exhausted."

The editor does not mention here the greater enemy superintendents had to contend with, the black bug; and the then proprietors the financial crisis. If it was the weeds, then how is it the leaf disease and green bug killed our coffee outright though our estates were kept clean. The advocate for weeds later on was Mr. Halliley, who signed his name to his letters, so it is no secret.

"An attempt was made, when planters were seeking advice about the cultivation of Tea, by experts from India, to let weeds grow on the Tea fields, as they said was the practice in Assam. Happily, this part of their advice was not followed by the Pioneer Tea planters of Ceylon; and we have not heard of any more of the praises of weeds for many years, until the *Magazine of the School of Agriculture* published, in its latest number, a plea on their behalf. The author who is quoted by the editor of the *Magazine* divides the whole obtrusive family of uninvited guests of the farm and field into two classes; and while making friends with one of these classes, he extirpates the other as relentlessly as experienced Ceylon planters do the entire family."

I for one have proved that weeds at times and in some land, are of the greatest assistance to make earth into soil and soil into mould and latter strengthened my trees and gave me good crops (see my letters to *Observer*, 17th August, Sept. 17th, Oct. 19th, 1892; see also "Magazine of the School of Agriculture of January" 1893.) I maintain in some lands weeds are necessary to make the upper earth into soil, to give vigour to young plants and enable them to get a firm hold in the sub-soil.

"Our readers must not suppose that we deny, or ever denied the good that some weeds, under certain circumstances, are capable of doing in agriculture. We have not been actuated in our intolerance of weeds, either by ignorance or blind prejudice. Nor do we dispute that the plea and the practice of the author, who is quoted in the article under review, may both be sound under certain conditions. If, for example his beneficent class of weeds are not so intermingled with his enemies that, in ordinary farm practice, the latter may be extirpated without destroying the others; or better still, if the welcome guests come unaccompanied by the enemy,—and if the land is not so steep that in stirring the soil to remove the weeds a large portion of the best of the surface mould is not sacrificed in the operation of weeding,—and if there is a winter season to give the farmer a fair chance,—and if the fields are left unnumbered after each crop, as is the case generally with the crops cultivated in temperate climates,—then, under these conditions, weeds are not the same thing at all, as when good, bad and indifferent kinds come all together,—and when the fields are on steep land, where, even with a good system of surface drainage, loss of soil cannot be avoided if it be disturbed,—and when a forcing climate encourages the growth, especially of indigenous weeds, without intermission all the year round,—and when the plough and other mechanical means of weeding are entirely unavailable and even light-hand tools are rather objectionable: under these conditions, we repeat weeds are an unmitigated evil."

I say weeds of most kinds are useful under certain conditions; same as fire or water. You must remember that when you have a rich loamy virgin soil you require no weeds. Then by all means keep your estate clean; but when you have to plant up old lands that were in coffee once or have been changed repeatedly and kurrakan grown on it, or

your soil is very griddy, then weeds are of great help, but you must learn what weeds to encourage, how large to let them grow, when and how to work them in the soil, &c., how far to keep free of weeds around the plant—on steep land they can be made to save soil from washing away.

"Circumstances alter cases. In Ceylon, experience has proved that it is not possible to obtain the little beucht weeds are capable of affording, without incurring infinitely greater loss and disadvantage. We can never forget the sickly yellow tinge that a crop of growing weeds imparted to the coffee bushes, even on the finest estates! When the coffee was maturing, and the beans were hanging out the foliage of the bushes, under the double strain, turned nearly white, and there was often a considerable fall of leaf. The sudden transition from this sickly, semi-moribund state of the coffee bushes to the rich dark colour natural to them when in health and vigour, that occurred after weeding, was conclusive evidence against the weeds. It put all argument as regards the injury they inflicted beyond dispute."

In Ceylon it is possible to grow weeds for benefit of coffee, tea or cacao, I have done so with marked success in land where I found soil griddy, poor or steep. I have seen splendid coffee in heavy weeds from 1858 onwards; some did suffer from the weeds, where the weeds were properly used soon after crop when labour was available, the coffee did not suffer, in fact soon recovered from effects of crop and gave good crop afterwards. Cacao requires a great deal of vegetable matter and lime.

"The writer had the good fortune to engage the services of the late Captain Blackmore in 1845 to manage the Elkacua estate, on which there was one particular hill round three sides of which a cart-road ran. Here weeds were rampant, the land was steep, weeds were very vigorous, and the bushes, which were wide apart, suffered severely. The plot consisted of but a few acres, and seemed to be the very place for an experiment. The side round which the road did not run was bounded by forest, that completed the separation of this plot from the surrounding coffee fields. The new manager was instructed to cut surface drains through the plot, so as to stop, as effectually as possible, all loss of soil from wash. He was a man of experience, a strict disciplinarian, and carried out his instructions, to the letter. The next step was to extirpate the weeds, which were of the worst kind and thoroughly established in the soil. Each portion of the plot, as soon as it was cleared of the old roots and of everything but the coffee bushes, was kept clean by monthly weeding. The effect of this treatment was magical. The plot which, previously, had always been an eyesore, in four or five months' time, put all the fine coffee to shame. The rich colour and luxuriance of the foliage formed a striking contrast with all the fields adjoining unconvincingly proved the injurious effects of weeds and also the practicability of extirpating them."

No wonder coffee, far apart, land steep, weeds allowed free growth, and giving crop did suffer; had those weeds been kept low so as only to cover ground a few inches and some of the weeds cut down and used as manure the coffee would have kept in good heart. Now what will the editor say to the other picture: a land where no plants even no weeds would grow on was forked and limed, then weeds carried to and planted on the land. Weeds then did grow; when six inches high they were dug under, again allowed to grow, again dug under and limed, then planted with cacao (part of a flourishing estate) now cacao trees are giving good crops.

"Notwithstanding the conspicuous success of the experiment above mentioned, it was many years, before surface draining and monthly weeding were generally carried out. In the interval, the effect of a dead mulch of mana grass was tried with such marked success on the Yacdesa estate, that a live mulch was tried on Hal Oya in Hantana district. The estate

was clean, and had been remarkable, when in its weedy state, for a kind of *crotolaria* of extremely rapid growth, and very easy to manipulate. A plot of land was selected for the experiment of growing this plant as a live mulch on the ground amongst the coffee. Seed was easily procured, and the land was sown with it. The field was soon covered with the *crotolaria*, which grew luxuriantly, and was taken up at maturity, just before it seeded and was spread on the ground as a mulch; but the experiment failed. The mulch was not nearly so effective there as on the stiff soil of Yakkessa, and was not good enough to compensate for the injury, slight as it appeared to be, that was done to the coffee while the mulch plant was growing. Other indigenous plants have been similarly tried, experimentally, but the result of a long, patient, and exhaustive experience of weeds in Ceylon plantations is so conclusive that notwithstanding the virtues set forth in the Magazine under review, our advice to anyone about to try the effect of weeds on his estate would be like Punch's advice to people about to marry—**DONT.**"

I have used manure on Woodstock estate as a mulch and on other estates as a manure, when out fresh with good results. Some parts of estates I keep clean, some in weeds, turf, &c., as I find it necessary for the good of the plants.

My advice to planters: study the wants of your plants, treat them well, preserve what soil you have, in good soil keep estate clean, grow weeds and turf where plants requires it; and marry—or you go to the wall.—Yours faithfully,
HOLLOWAY.

QUESTION: WHY SHOULD THE GOVERNMENT PUT A BOUNTY ON CHINA TEA TO THE INJURY OF INDIAN AND CEYLON TEA PLANTERS, AND OF THE BRITISH CONSUMERS?

SIR,—I think it is high time that this question should be honestly put to the British public.

Firstly, because it is a fact.
Secondly, because it is unjust.
Thirdly, because it cannot be to the interest of consumers, that they should be forced to drink China rubbish simply because it pays the grocer, through a slip of the Government to give it them.
Firstly, as regards the fact, Sir David Barbour and the Governor-General of India have both publicly stated that the stability of the rupee at 1s 4d. is assured, and the opinion of such high authorities is conclusive. It means, as far as the tea planter in Ceylon and India is concerned, that a permanent premium is to be placed on the import into England of China teas, for, if the rupee in India and Ceylon continues to represent 1s. 4d. when the same weight of silver of the China currency has become worth only 1s., the China grower will be able to put as much tea into London, of a given quantity for 1s as his Indian rival can, of the same quality, for 1s 4d.

With regard to my second point, that this is unjust, this goes, I think, without saying, but there are always people who can put up with any injustice practised on others, and by such I have been told that, after all, we, tea planters are not the only class that has suffered by bounties. That sugar producers have suffered exactly in the same way by the bounties put on beet sugar by France and Germany. In reply I say, that, if the two cases were parallel two wrongs don't make one right. But there is this important difference. In the case of sugar it was the foreign Government that gave the bounty, and Great Britain, the victim of free trade, could do nothing to protect its sugar planter. But in the case of tea, we find the British Government rushing to the opposite extreme and itself subsidising the foreigner to take the bread out of the mouth of British producers. If this is not out-Heroding Herod I don't know what is.

My third point, that this bounty on China tea is against the interest of the masses may be best served by an illustration. The grocer will now buy a small

quantity of Ceylon tea, which pays him least and mix with it a larger quantity of China tea which pays him most, and will call this in large letters, *Pure Ceylon Tea*. On the back of his packet will be a microscopic label:—

Shifter Shuffle and Fudge,
Importers and Blenders of Indian,
Ceylon and China Tea.

The trick of palming of other teas under my own estate's name has been played freely on myself, so I ought to know.

HARCOURT SKRINE.

Osborne estate, Dikoya, Ceylon, Nov. 28th, 1893.

II.

SIR,—In my preceding letter I have endeavoured to represent to the public the injustice being done to Indian tea growers as well as to consumers by the currency legislation of the Imperial Government, and I use, the word Imperial advisedly, because the mischief has been effected by the Indian Government under instructions from England.

Let us now consider three possible remedies, premising that the object of each proposition is merely to place us, Indian tea planters, as we were as regards China and to ensure the consumers at home getting a good article.

The first and most obvious remedy is simply that of putting a fresh 3d a lb. duty on China teas, during such time, at any rate, as the Government continues to maintain the rupee at a dishonest value. The Chinese Government could not justly complain because there would be no injustice in the matter. The British consumer would not complain because it would be the means of protecting him from a spurious article.

A second remedy is the abolition of the duty on Indian and Ceylon teas alone. This would have the same result for the Indian planter, the Chinaman and the British consumer as the former proposition and it should especially command itself to Mr. Gladstone as a means of fulfilling one of his forgotten pledges of a "Free breakfast table."

A third solution of the difficulty is that the Indian Government should be ordered to stop tinkering with the rupee, and to allow it to revert to its real value.

Although Sir David Barbour has said with perfect truth that it is in the power of the Government to fix the rupee at 1s 4d, it is perfectly easy to show from his own mouth that the maintenance of it at this rate can only be effected by enormous loss to the Government itself to be followed ultimately by a financial crisis more appalling than that which, for the time being, he has staved off.

Sir David Barbour himself stated with equal publicity in 1892 this axiom:—That any enhanced value placed on the rupee by closing the mints would be lost by a corresponding influx into circulation of false coins. Already we see letters in the Indian newspapers showing that this is going on on a grand scale in the Native States, and this is confirmed by the enormous purchasers of bar silver since the Government mints were closed.

This is a nice nut for Lord Elgin and the Imperial Government to crack, and we may leave them to crack it, since it is only the business of these letters to offer solutions the difficulty which is affecting tea and British consumers of tea.—I am, &c.,
HARCOURT SKRINE,
Osborne, Dikoya, Ceylon, Nov. 28th, 1893.

NEW PRODUCTS: MAGUEY OR ALOE AND HENEQUEN.

SIR,—In a recently published book called "Tropical America" I find the following concerning the "maguey or ixtle, a kind of aloe or cactus which will grow freely on the most barren land. It says (p. 325) that the most remunerative agricultural

* Tropical America. Edward Stanford, 26 Cockspur Street, Charing Cross, 1893.

export" (from Mexico) "is the fibre of the maguey — it is one of the most useful fibres known in textile industry. In this motley throng, the maguey armed with its bristling sheaf of sword blades forms the rank and file. All the way from Tehuantepec to the Rio Grande it is seen; now massed in cultivated fields of hundreds of acres, and again straggling in neglected wildness by the roadside or on the rocky crests of inaccessible hills. So sluggish is its vital action that it grows and thrives where other forms of vegetation perish from sheer inanition.—As a valuable fibre plant the maguey is the basis of an industry which is steadily increasing in importance." Again on p. 336:—"The shipments of ixtle (maguey) and other fibres have quadrupled in volume;" and p. 327: "The maguey grows without cultivation in every hollow and on every hillside."

Of another fibre called "henequen," it says that in 1890 over 5,000,000 dollars worth was carried to the American market.—"The henequen farmers live at Merida in great comfort and spend money freely" (p. 294).

If you have not already quoted the above, it may interest or even eventually prove profitable to such of your subscribers as are possessed of patana land or abandoned coffee.—Yours truly, X.

[A great deal of information about these and other fibres is given in past numbers of the *Tropical Agriculturist*.—E. T. A.]

TEA CULTIVATION: IN CEYLON—No. 1

WHAT ARE THE CONDITIONS NECESSARY TO SECURE GOOD CROPS AND GOOD PRICES?

DEAR SIR,—Seeing that our ehrewd old friend Mr. Rutherford is again in our midst with the purpose of making a regular tour round our planting districts, would it not be advisable to ask him to be good enough to keep his eyes skinned whenever he comes across an estate which gets "stand-out" prices for its teas, and before taking his departure from our flavory isle to oblige us by giving his ideas as to why these favoured few get such *fine prices* and such *large returns* per acre.

My idea is that good jât, good soil and a good high elevation are all absolutely necessary to obtain this enviable position. With any two of the above, you may get a fairly decent average; but you will never be "galleried" in the London lists nor will your returns as to quantity be anything beyond the general run.

With all these bad, it is a very blue look-out unless you have such a stimulating climate that it compensates for the lack of soil if nothing else.—Yours truly,

25 YEARS A PLANTER.

No. II.

DEAR SIR,—You cannot make a "silk purse out of a sow's ear" is a true saying. Neither can you manufacture really *first-class* tea from poor jât soil, and at a low elevation.

I do not believe in a mixture of Indigenous, Hybrid and China jât. The same process for withering leaf, etc. does not suit them, and the consequence is an out-turn "uneven," etc., etc.

See Colombo brokers' reports, and in how many instances you will note "uneven" etc., etc., mentioned. This proves how many estates in Ceylon have a mixed jât, hence the great difficulty in manufacturing a uniform high standard tea.

To enable the planter to turn out a *high-classed tea*, uniform jât is one of the essentials.

I do not agree with your correspondent of "25

Years," that good jât is necessary at a high elevation; by good jât I mean "Indigenous."

I am inclined to think that at an elevation of 4,000 at 6,000 feet above sea level, a China jât or Hybrid will give the best quality tea.

Analysis of soil is highly desirable. It will enable the planter to supply the necessary components for propagating "flush" that can be worked into well flavoured high class teas.

A PLANTER SINCE '59.

No. III.

DEAR SIR,—"25 Years a Planter" says, "with any two of the above" i. e. (good jât, good soil, and a good high elevation) you may get a decent average but you will never be "galleried" in the London lists nor will your returns be anything beyond the general run."

If by the above "25 Years a Planter" means that estates in the lowcountry do not make such good profits per acre, as estates at high elevation, I believe he is quite wrong, and till he gives figures to prove his assertion, will continue to think he is wrong.

If he will look at Messrs. G. White & Co.'s last month's sale list he will see,—putting the question of elevation on one side altogether—Kalutara holds a most respectable position amongst the Ceylon averages, while taking its heavy yield and cheap production into account I question, if as a district, it is beaten in the island in profit per acre.

Mr. Rutherford's advice is always valuable and I hope he will give it to the public before he goes. As a matter of fact, China tea is more tippy and flavory than high jât tea, but the finest indigenous will not flush at very high elevations.

The great advantage of high jât tea in the lowcountry is its immunity from blight and insect pests, its large cropping qualities and the deep thick liquor it gives.

I am convinced that acre per acre on an average soil, "Indigenous" gives double the profit of hybrid teas, in the lowcountry; and three times that of low jât, hybrid, and China.—Yours faithfully,

KALUTARA.

No. IV.

DEAR SIR,—As regards yield and quality of tea at high elevations, I have had soil, elevation and a fair jât to work upon. My best teas were characterized by both flavor and strength, and from individual fields I have obtained yields of 400 lb. to 500 lb. per acre. My own theory regarding flavor is that it is very much dependent upon climatic influences. The best teas are undoubtedly made when the flush is not of too vigorous a growth, and I think the sap undergoes a ripening or mellowing process. This, of course, is more the case at high elevations than at lower elevations where the growth is always forced.

Jât affects yield more than quality. A good Hybrid is the best for high elevations. ALTITUDE.

No. V.

Central Province, Dec. 1st.

DEAR SIR,—Flavour in tea is chiefly, in my opinion a matter of elevation combined with a more or less dry climate; but yield and strength are mostly, I should say, a question of soil and jât.

At the highest elevations I am doubtful if jât is so all-important either in the matter of yield or strength; further experience it seems to me is wanted on this point.

Cultivation will help us largely so far as yield and strength are concerned, but I doubt if there is any artificial process as yet available to help us in this matter of developing flavour. Plenty of power, with a good system and plenty of withering accommodation, will no doubt give the best result from the leaf available, but before you have a chance of being "galleried" the natural conditions must be in your favour unless very fine plucking is adopted and the yield sacrificed.

I see no reason, however, why we should stand still and do nothing, and it seems decidedly a pity that the P. A. have vetoed the proposals of Mr. Hughes. Definite and reliable experiment is chiefly what is wanted. D.

No. VI.

A GOOD WORD FOR GOOD FACTORIES AND THE ENGINEERS.

Palmerston, Dec. 1st.

DEAR SIR,—With reference to letter of "25 Years a Planter," he misses out one very responsible factor, which to my mind is quite equal to any of the other three reasons, viz. jāt, soil and elevation he brings forward, why some estates get "stand out" prices from the others, I mean a *thoroughly good* Factory with first-class machinery, ample withering room, plenty of ventilation and cleanliness pervading the whole building and surroundings.

With a good Factory, I have seen splendid teas made, from indifferent tea bushes as regards jāt and soil. With the three first advantages, viz. good jāt, good soil and high elevation, fine teas can be made, and generally are in *good weather*, but it requires a first-class Factory to turn out good tea in all weathers, and in quantity all the year round. A bold, well-marked leaf-flushing jāt of Hybrid Assam seems to be the best kind of tea bush upon the hills (4,000 feet and upwards.) It flushes better than Indigenous and more steadily, and gives as good a sample of made tea.

We tea planters are indebted to Mr. Jackson and other Engineers more than we admit for the good teas we turn out.—Yours faithfully, W. C. B.

No. VII.

A GOOD WORD FOR "CHINA"—AND STILL MORE FOR A GOOD HYBRID.

DEAR SIR,—I agree with the correspondent of your Indian contemporary, that well plucked China teas, carefully manufactured, should have a good appearance, be "full of tip" and, I would add, should possess as good a flavour as Assam though lacking the strength. As far as my experience goes there is no question that as good tea can be made from low jāt, as from high—provided that no bad leaf is taken. The great advantage of high jāt over low lies in the larger yield per acre, in cheaper plucking; by less frequent necessity for pruning. China tea here never runs over 15 months, whilst high jāt flushes for 21 months to two years, and I have fields of indigenous Manipuri pruned two years and a half ago still flushing vigorously.

Fine quality and flavour depend, I should say, more on elevation soil and climate than on jāt. Good manufacture will keep and make the most of "flavour," when it is there, but can never put flavour into a tea where it does not naturally exist. I do not consider that the large leaf of "Indigenous," either Assam or Manipuri, makes good tea. Our average price here has sensibly fallen since some 80 acres of the latter have come into bearing. The tea made from it is coarse and common. At this elevation 3,500ft. to 4,300 feet I prefer a good Hybrid.—Yours faithfully, M. H. T.

No. VIII.

Nov. 30th.

DEAR SIR,—To obtain high prices and large yield no doubt, good soil, jāt and high elevation are, all necessary; but I believe fine teas in smaller quantities

can also be made from inferior jāt, given the other two conditions. To obtain really high prices, in my opinion, requires not only very fine plucking but very *careful* plucking (and manufacture); no hard leaves and AS LITTLE STALK AS POSSIBLE; but this, of course, makes the yield per acre comparatively small. Nearly all the samples of teas I have tasted from very high elevations have plenty of flavour but lack strength.—Yours truly, M.

No. IX.

Blair Athol, Dikoy, Dec. 1

DEAR SIR,—I hasten to comply with the request contained in your letter of 29th ult.—

1. TEA CULTIVATION IN CEYLON.—With regard to your correspondent's remark as to a large yield, I quite concur with him in thinking that good jāt and good soil are indispensable, and there is no doubt that good elevation is necessary for very flavoury and "stand out" teas; and if Mr. Rutherford, after his tour of inspection, is able to give any hints how to secure both big yields and high prices, he will be conferring a boon on his brother planters, and enable Ceylon to cut out all competitors in the tea markets of the world.

2. With regard to CHINA v. ASSAM TEAS, I believe, that with the same efficiency in the factory, equally good teas may be turned out, as regard "make" and "appearance;" but there will be no comparison in strength, the China being weaker in "cup," but more "tippy" in appearance. I have not had sufficient opportunity of comparing flavour; so cannot answer this point. I would not recommend anybody to plant China teas in Ceylon, though I would much prefer to have a field of pure China, rather than an indifferent Assam Hybrid.

I quite think with your correspondent that a really good Assam Hybrid is superior for our hill cultivation than pure Indigenous Assam.—Yours faithfully,

F. G. A. LANE.

No. X.

DEAR SIR,—In reply to yours re Tea Cultivation in Ceylon, I do not know that my opinions can be of much value to your readers as I do not get the fine prices or the large crops your correspondent refers to; but I have often thought that fine prices and large yields seldom go together. I have been led to this conclusion from the fact that many estates which at one time topped the list for price, have of late years been satisfied with medium prices; no doubt they found it paid them better to produce more to sell at fairly good figures than persist in their struggle for top rates.

Your correspondent speaks of the favoured few getting these fine prices, as it is not everyone who has the necessary requisites favourable to the production of high priced teas, yet there can be no doubt that more good teas could be produced if the buyers gave more for them. What is the good of competing for a top place when 11d is only paid for a tea thus reported on?—"Rather pretty small wiry black leaf with some fairly bright tips. Infused leaf fairly bright and even. Full pure flavoury liquor." It would be a waste of good leaf for growers of low-grown tea to attempt to compete for top prices as their climate is against the production of these teas, but all in favor of producing good average quality with large yields per acre which is what they look for, and believed to pay best.

A few of the conditions which occur to me as being necessary to secure good crops are 1st. good soil, virgin forest (if it can be got). Elevation must depend on choice of district. Average temperature and well distributed rainfall, of say from 120 to 180 inches annually, and if in a windy district, a mild visit of the one monsoon is quite enough to rid the bushes of spider, rust or other pests that tea is more or less liable to suffer from.

2nd. The suitable land secured, comes the question of seed, and as there are many well-known proper-

ties in Ceylon famed for their good seed there need be no difficulty in getting the genuine article from many reliable sources if early application is made for it:

3rd. To open forestland for tea planting in the N. E. monsoon, commence the felling early in the year, if at a high elevation to give plenty of time for the timber to dry; otherwise a bad burn may be the result and costly and unsatisfactory clearing up may hinder your other works.

4th. The land felled and well cleared, either by a good burn, or the removal of the timber for fuel; the roading and draining should next have attention and be well done from the first.

5th. Lining and holing is next and of much importance. First the distance apart the tea is to be planted, and more I think have erred in planting too far apart than too near, 3½ ft. × 3½ or 3 ft. × 3 ft. is more likely to give satisfactory returns than the former. As the bushes shelter each other better from the wind when closely planted and when a death occurs the vacancy is not so apparent and the necessity for supplying is not so great.

Having decided the distance apart and lined your field accordingly cut good holes say 18" × 12" one on lower side of each peg; don't move the pegs.

6th.—Filling these holes with the best top soil requires careful supervision as coolies are apt to do the work slovenly, and only half fill them; although, they may have the appearance of being heaped at the bottom they are empty and become reservoirs for the rain water to rot the plants.

7th.—The next work and most important is the planting. This can be done with seed plants, or stumps.

If the former two germinated seeds about three inches apart and shade them, if the plants (to be planted) are small also shade to protect them from sun and wind, plants, if both grow one to be pulled out when it becomes a good-sized plant, if stump they require no shade when planted early in the monsoon.

8th.—Now go on, keeping your planted land free from weeds in the most approved system, i.e., by carefully weeding once a fortnight or three times in two months, carrying off in bags any weeds collected.

9th.—By two years or thereby your tea will probably be fit to centre or cut down at nine or ten inches from the ground. In doing so cut only the strong centre stems, allowing all the others to grow. In another 6 or 8 months if the old and new wood has grown well, apply your knife again, by cutting right across at a foot from the ground or some may recommend cutting at 20 or 22 inches, the former (at a foot) is preferable, if the tea is likely to suffer any from wind.

10th.—Keep your coolies from the bushes until the young shoots are well grown and you are able to leave three leaves above the fish leaf, having taken off the flush and all above the third leaf,—shoots under the plucked ones don't touch for several rounds.

11th.—Keep a watchful eye on your bushes and as the flush gets into good plucking order gather it.

The foregoing I consider a few of the conditions necessary to secure good crops, but as I have already taken up too much of your space, and your readers' time at present, I may have something more to add after I get my November accounts off.—Yours truly,
AN OLD PLANTER.

No. XI.

Dec. 1st.

DEAR SIR,—In reply to your questions my opinion is that *China Tea* if of good jāt, i.e. pure China and not a low class hybrid (which is often mistakenly called "China") will make magnificent tea and give a fair yield of say 350 lb. per acre, vide Labookellie estate and Tomagong estate both of which have considerable fields of China jāt tea.

A really good hybrid I consider the best for hill cultivation 3,000 feet and over. But for the low-country there is nothing like indigenous Assam.

I agree with "25 Years a Planter" as to good jāt, good soil and good cultivation being requisites for large

yields above 3,000 ft., but good prices can be got from poor jāt tea, if fine plucking is resorted to, even if the soil is comparatively poor as was proved in the case of Luccombe estate in Lower Maskeliya which, if my memory serves me right, at one time topped the market when fine plucking was resorted to.

In the lowcountry my experience is small, but as far as it goes "good soil" is not necessary for large yields but good jāt is a *sine qua non*. Really fine quality, does not seem obtainable in the lowcountry, but the quantity makes up for this.

Green Teas, curiously enough, seem to be better in quality and liquor when made from lowcountry teas and Messrs. Whittall & Co.'s experiments in this direction will be watched with interest.—Yours truly,
18 YEARS A PLANTER.

No. XII.

DEAR SIR,—“25 Years a Planter” asks you to get Mr. Rutherford to give his ideas as to why some estates get fine prices and large yields. The question is a large order even for Mr. Rutherford, and “25 Years a Planter” goes on to say that his idea is that “good jāt, good soil, and a good high elevation are all” absolutely necessary to obtain this enviable position, &c. &c. High elevation no doubt gives fine flavour, and this commands a “stand out” price, but I have yet to learn that high elevation also means a large return per acre. I fancy were it known what yield per acre some of the “stand out” places give “25 Years a Planter” would rub his eyes, although I do not mean to say that a very small yield and top prices are to be sneered at; far from it. It must pay as I do not think the Ceylon Planter is one to sacrifice £.—s.—d.—for the honor and glory of showing highest averages in London list, or be as “25 Years a Planter” says “galleried.” Stand-out prices however sometimes come to those not blessed by being at a “high elevation” of jāt and soil are half the battle, be the elevation high or low, the other half is worse to fight, as it means constant care in the field and factory, and unless this constant care is given no “stand-out” price will come.

Surely “25 Years a Planter”'s last para requires no answer, as he would be a “blamed” fool who planted a bad jāt in a bad soil at a bad elevation whatever the last may mean.

CHINA versus ASSAM TEA.—This heading in *South of India Observer* does not I think touch us in Ceylon, as the “situation” is so different. In the Tea Gardens of North of India frost and a cold season (a winter) have to be contended with, and the hardier the plant is the better; but while allowing that a hybrid of China and Indigenous Assam may be the plant “par excellence” as to flushing, etc., how is it that the Assam planters will tell you that given a good Indigenous he has no fear of *Helopeltis* or Mosquito. Trees and shrubs in different countries and even localities grow very differently. I have seen China tea in the Foochow districts growing and flourishing, bushes 90 years old such as you cannot see in any other place, but these bushes were not treated as *China* tea is in Ceylon; each bush was a giant in size. Here *China* tea is cut down to six inches “as a pruning,” this in a short time making a cover more like a grass field than a field of tea. Nature intended the plant to grow a bush or tree; the Ceylon planter makes *China* tea a creeper, (creepers seem to be a paying idea in Ceylon). Nearly all pruning is too severe in Ceylon, a trip to the tea districts of China and Japan would show what size a tea bush can attain. Still as long as the best Indigenous resists *Helopeltis*, etc., better than Hybrid or China, then Indigenous is the tea and let us pray that John Chinaman may never take to machinery for tea, or he will still be a thorn in our side; his conservatism is our safety.
W. M.

No. XIII.

Dec. 2.

DEAR SIR,—I quite agree with you in thinking that Mr. Rutherford's opinion on the conditions necessary

to secure both yield and prices, would be very valuable and should be obtained.

Possibly too, he may discover why certain estates with good soil, jät and elevation, the three requisites you quote, and presumably, able management, have deteriorated in the last few years and command a much lower price in the market than formerly, whilst others in the same neighbourhood and apparently subject to the same conditions are prospering.

Many questions will arise on this subject; climate, the times and extent of pruning, the methods of plucking, treatment of young tea, manuring and of course manufacture.

It would be difficult, nay impossible, to lay down fixed laws for the culture of tea in different districts and at various elevations and probably in most cases the success of individual gardens is due to the ability and discrimination of the Superintendent in seizing upon the special characteristics of climate, soil and jät.

Very likely Mr. Rutherford, with his previous long experience and a fresh tour through the planting districts may have much valuable advice to offer on these points.—I am, sir, yours faithfully, **PLANTER.**

No. XIV.

Kandapola, Dec. 2.

SIR,—In compliance with your request that I should give you my opinion with regard to tea cultivation, as to what are the conditions necessary to secure good crops and good prices; while good jät, good soil and a high elevation are invaluable, I think given a medium elevation (say 2,500 feet and over) that fine prices and fairly large returns can be secured by judicious cultivation and the application of manure. I believe that manure not only increases the yield but also improves the quality of the leaf. Careful plucking (inclining to fine rather than coarse plucking) and taking the young flush just when it is ready, combined with close attention to details in manufacture (which must include a "hard wither") will in my opinion result in the outturn of tea, the prices obtained for which will be well above the market average.—Yours faithfully, **F. C. G.**

No. XV.

DEAR SIR,—I have had China, Hybrid and Indigenous Assam tea to deal with, and in my opinion jät has little to do with turning out good tea compared to elevation and soil, and given both these latter, then, to make really stand out teas, that would attract individual attention in Minoing Lane, yield must be more or less sacrificed for finer pluckings at closer intervals, except during the months when the season causes the flush to be so delayed in coming forward as to effect the same result?

MANAGER IN A LARGE WAY.

No. XVI.

DEAR SIR,—“Twenty-five Years a Planter” wishes Mr. Rutherford to tell us his ideas as to why a favoured few estates get such fine prices and such large returns per acre and proceeds to state that his idea is that “good jät, good soil and a good high elevation are all absolutely necessary.”

The fine prices are, as a rule, undeniable, but the large returns compared to lowcountry estates I doubt; elevation and soil alone appear to be insufficient to produce “gallery” prices without good jät—look at the prices obtained from some of the highest estates in the island. My idea is that the continuous fine prices from high estates are due, besides the adjuncts named by your correspondent, to the fact that the bushes will continue to flush for three years without pruning and the leaf is produced from brown matured wood instead of being the outcome from comparatively newly-pruned bushes.

30 YEARS A PLANTER.

No. XVII.

Henfold, Lindula, Dec. 2nd.

MY DEAR SIR,—I have an average soil for the *Agros* a very good jät, a mean elevation of 4,500 ft. and an average yield of 550 lb. per acre. I prune every eighteen months. All my tea but sweepings goes into the London market, and I shall have an average this year, possibly, of 1s 2d.—the average to date of last sale wired is 1½d. I have an actual acreage in tea of 508 acres; my total acreage is 572 acres. I got my best tea seed through Messrs. Mac Neil & Co. of Calcutta. It is Keline “magenta,” one remove from Manipur indigenous, dark in the leaf which is very corrugated and with a long tip; the flush is much more yellow than that of a lower jät; the yield is very large. About one-fifth of my acreage is of this jät.—I am, yours faithfully, **GEO. BECK.**

No. XVIII.

DEAR SIR,—Given a sweet, rich soil,—jät, so long as it be even of its kind, does not materially affect prices. At any elevation a high-class dark-leaved Hybrid once removed from Indigenous, yields heavily, whilst best withstanding severe weather and insect pests I find the estates that regularly get the best prices for all-round breaks are at an elevation of 4,500 feet and upwards, and are yielding from 450 to 500 lb tea per acre as a result of rich soil and not of forcing climate.

An all-important factor in the production of flavor and quality generally is unlimited and well ventilated withering accommodation. Were this more generally provided, Ceylon might ship treble the quantity of “finest” teas that it does at present.

M.

No. XIX.—OHINA VS. ASSAM TEA.

DEAR SIR,—A good hybrid at all elevations over 2,000 feet is decidedly desirable, both for yield and quality, so far as my experience goes. I have not had enough to do with the lowcountry, but even then I should say a first-class Hybrid, such as I have seen produced by Mr. Sandison, from some of his seed bearers near Katnapura, would be better than pure Indigenous, certainly as good.

To procure good prices one must have good soil, good jät all over, elevation and fine plucking; and above all by careful manufacture with ample space or natural withering. A dry climate is not absolutely a desideratum, witness Ormidale in Upper Maskeliya, with say a rainfall of about 120 inches. One great drawback to Ceylon planting is the unevenness of jät over almost every estate. This was unadverted strongly on by Mr. Berrywhite on his visit to Ceylon.

W. J. A.

No. XX.

DEAR SIR,—I am in receipt of your letter with enclosures.

I quite agree with your correspondent “25 Years a Planter” that it would be most beneficial to Ceylon if such an undoubted authority as Mr. Rutherford would keep his “eyes skinned” as he travels about and would let planters know before he leaves the island if he can assign any cause for certain gardens getting big yields and tall prices. Some of his own Company’s gardens always get fine prices for their teas—1s 1d to 1s 2d average year in and year out. Why? Can he let us know whether it is due to elevation and superior jät and soil solely or is it due to a superior way of manufacturing. One garden—Wallaha—makes its own tea and the tea of other gardens too and Waverley also I believe. Can Mr. Rutherford tell us why they get such fine price for their own teas and the gardens whose teas they make? He would confer a benefit on Ceylon generally if he could and would.

I believe years ago a Committee of Planters met and formulated a series of questions re manufacturing and distributed copies among shrewd

planters who gave their ideas as to rolling, firing, fermenting, &c. Now things have greatly changed since then—we have new machinery entirely, far more rapid driers and rollers that work off leaf quicker than formerly. I suggest that the Planters' Association hold an Inquiry into Tea Manufacture and appoint a Committee who shall formulate a new series of questions to be submitted to planters who get crack prices. Some may object to give their *modus operandi*, but many having Ceylon's interest at heart, ought to be able to shed a flood of new light on the subject. Their answers should be published and we all would be the gainers I doubt not. If crack price men will step forward, some valuable hints will be the result and the less clever planters will very likely have the pleasure of seeing their diminishing prices again rising to stay there and poor China teas will be still further ousted.

I certainly think fine jāt makes better and stronger tea than poor jāt. It has more strength and finer bigger tips; though whether it has better flavor may be doubted, seeing the fine prices some Darjeeling gardens get, where, I believe, they have a lot of inferior and China jāt.—I am, yours truly,

FINE TEA.

No. XXI.

Talawakele, Dec. 4th, 1893.

DEAR SIR,—You ask my opinion on the "South of India Observer" correspondent *re* China *versus* Assam variety of tea bush and the letter of "25 Years a Planter" in your paper.

There can, I think, be no question that equally good tea can be made from the one as the other, but I can go no further in agreeing with the correspondent of the Indian paper. No doubt the China variety could often give points so far as appearance goes (if that is worth anything nowadays), but only when the yield of the former is less than half that of the other. If, say, 250 lb. to 300 lb. per acre (I suppose the average China yield) is taken off both varieties, not only will Assam jāt beat in cup, but in appearance as well. It is when you take the normal yields of both, viz. in the case of China jāt 350 lb. and that of Assam 600 lb. to 800 lb. that the appearance may sometimes be in favour of the former. But if the yields are kept at about the ratio I name, so far as quality goes, good jāt has no advantage over inferior.

I do not think there is anything very mysterious for our "shrewd" friends to unearth regarding the reason for two estates at the same elevation and neighbourhood differing so much in quality as they sometimes do. Given gardens at the same elevation and aspect with the bushes and the leaf receiving the same treatment, soil alone can be the cause; neither jāt nor anything else can be responsible. Were it not invidious in such a discussion to name estates, I could point to several instances of the kind where too the ones producing the poorest teas have the advantage in elevation and yet the prices far below the others. A mere glance at the soil in one or two instances in my mind at the moment, is enough to account for it.

No doubt the eyes cannot always be relied upon to say which is the most suitable for tea, for we see places with apparently as good soil as that on the neighbouring one producing inferior tea. Where the treatment all through is the same and the production kept to the same weight per acre, everything points to soil alone being responsible. Nor do I think that any series of chemical analyses would help us to supply what the soil might be deficient in, for the reason that on a 200-acre estate as many different soils can be found.—Yours faithfully, J. S.

No. XXII.

Dec. 4.

DEAR SIR,—"*Tea Cultivation in Ceylon and China versus Assam Tea*"—with regard to the former, the principal conditions necessary to secure good yields and good prices are fair jāt of tea, good soil, well

cultivated, and careful manipulation of the leaf. I have not the slightest doubt myself, but that manuring with good tillage gives increased quantity and better quality. As to China *versus* Assam Tea I have had no experience with the former.—Yours truly,
A BELIEVER IN GOOD TILLAGE.

No. XXIII.

Wana Rajah, Dec. 4.

DEAR SIR,—As for the discussion on the different qualities of China, Hybrid and Indigenous tea, I have not much experience in the former; but I consider it is a nice, agreeable and flavouring liquor, although not very strong and pungent. As for Hybrid and Indigenous the nearer you get to the latter the better in every way for quantity, quality and cheap plucking and I have never seen any reason to suppose this did not apply to all elevations. With fine jāt and high elevation, no one would think of pruning oftener than once in two years and many would not do it so often as that.—Yours truly, W. T.

No. XXIV.

DEAR SIR,—I am of opinion that a good Hybrid, good soil and high elevation with careful plucking and manufacture will give good returns and fine prices. I do not think Indigenous Assam will do well at this elevation, 5,500 to 6,200 feet. I have fairly good jāt on this estate, some fields giving as much as 840 lb. to 870 lb. of made tea per acre—average for the year being 600 lb. per acre. I would recommend Indigenous at a lower elevation 3,000 to 4,000 feet. China or any medium jāt seem to stand the frost better than high class jāt but we seldom have frost in this district. W. N.

No. XXV.

DEAR SIR,—When I planted up the estate I purposely put in a very mixed jāt in order to get what I thought would be a good natural blend; but it is impossible to get an even wither from leaves of so many different textures, all coming in together, and that materially interferes with the result I had in view.—Yours truly,

AN OLD PLANTER.

No. XXVI.

DEAR SIR,—With regard to China *vs.* Assam Tea, my opinion is that pure China is almost preferable to a low-class "Hybrid." The former will give satisfactory results if pruned low and plucked hard, but the low Hybrid is generally of an obstinate nature and yields very mixed sort of leaf whatever treatment it receives. But for Ceylon nothing comes up to a good Hybrid both for quantity and quality.

We have much to learn yet as to why neighbouring estates vary so much in prices. Of course, good leaf and careful manufacture always tells to a certain extent, and my own experience is that so long as I had young fields coming on and plucking leaf from high running shoots before the knife had been regularly applied to them, my teas were occasionally "galleried," and although I still get steady prices it would appear that there is a *something* about the quality of tea made from young high bushes which is lost after regular pruning has been carried out.

With regard to the difference in yield, other circumstances being the same, the estates that have been successfully planted always do best, and will be in full bearing about six years old; whereas the places that have a large percentage of supplies and seedy bushes will still be backward at that age, will be nine or ten years old before the maximum yield is attained, and even then will probably be disappointing compared to the other. And of course a different system of pruning or cultivation generally would also show very different results.

I have tried *fine* plucking, but find the medium course pays best, and what I study more than the teas that are "galleried" are my

PROFITS PER ACRE.

No. XXVII.

DEAR SIR,—I agree with the *South of India Observer's* correspondent that tea of pure China jât if in good soil, highly cultivated, carefully pruned and plucked and the leaf carefully manufactured can be made to produce a tea equal in appearance to Assam Hybrid, but not equal in strength or flavour or likely to realise as high prices.

I further agree with him that a good hybrid is the most suitable and most profitable for hill cultivation at least in Ceylon. China or any poor jât may give fair returns when young and if in good soil, but the roots spread too rapidly, and throw up so many shoots that yield and flavour must fall off and the cost of cultivation increase especially with regard to pruning to keep the bushes in bearing and out of blossom and seed. I do not think that Assam Indigenous is suitable for hill cultivation in Ceylon. It grows long shoots resulting in slow and poor flushes and a poor tea.

The valuable information on tea that Mr. Rutherford has supplied us with must make every one interested in this product, welcome him back to the country, not only for what he has already done but for fresh advice he is likely to be able to give us.

He may see or think of changes in the style of cultivation, plucking and manufacture and any opinions of his would be of very great interest and value, especially on the point of how to get the most profitable return from estates, good, bad and indifferent.

The question of whether high prices with a smaller yield or lower prices with a larger yield pays best, still seems rather uncertain.

Could Mr. Rutherford be induced to add to our obligations to him by giving us any fresh opinions he may form from his visit before he leaves for the old country again. J. S. T.

No. XXVIII.

DEAR SIR,—“25 Years a Planter” is right in his ideas. Given an estate, with good jât, good soil, and high elevation, its teas are bound to fetch a good price with very ordinary manipulation.

With constant care in the field and factory its teas will always give a *stand-out* price.

By sacrificing quantity such an estate might almost at any time be *galleried* in the London market.

These are conditions, however, with which only a few estates here and there have to deal.

Ordinary jât, moderate soil, and medium elevation represent the bulk of Ceylon estates.

Jât undoubtedly gives *strength*, and is of much importance.

Good soil gives quantity; but I don't think it has anything to do with flavor, or so little that it may be dismissed from our calculations.

To get strength and flavor combined which will give *fine* prices, we need an exposure and elevation that prevents the tea flushing *too quickly*; the longer a shoot is in coming to maturity without getting hard, the better will be the quality of the tea made from it.

This I think is the reason why so many of the high estates get a uniformly better price than the low-country and medium elevation places, whose teas flush so rapidly that they are (so to speak) in the tea pot, while the leaf on the higher estates (it may be in equally large quantities, because there are a greater number of buds and shoots on the bushes) is developing into that delicate pleasant flavour, which will always command a high figure.

The best tea I have tasted was on a Kandapola estate; its exquisite quality I attributed entirely to the length of time the shoots had been in maturing on the bush.

Medium elevation estates can get large returns per acre and good prices, but can only be *galleried* at the expense of quantity, and that to an extent that will never pay. OLD HAND.

No. XXIX.

DEAR SIR,—“25 Years a Planter” says the three desiderata—good tea, good prices and good yield—are only obtainable under the three conditions of: good jât, good soil and elevation, and that the absence of any one of these conditions will certainly prevent their combined realization? It is an open question whether there do not exist many known exceptions to this rule. But, as a rule, the said three conditions are good and desirable things; though in the nature of things they are not, and cannot be, possessed by nine-tenths of the Ceylon estates. We must strive to secure the good prices and good yield, without at least one of them—elevation.

1. Soil should give quantity everywhere.
2. Elevation do quality.
3. Soil and elevation do quantity and quality.

This almost irrespective of jât, though good jât improves the yield if not the quality.

The question then seems to merge into one of jât.

Quantity.—I do not think “only China,” or *mixed* China and Assam will ever yield anywhere such large pluckings as *only* good Assam.

Quality.—I think “only China” fields will give as good *quality* as only good Assam yields. But *mixed* China and Assam can scarcely give such good quality as only the one or the other, because of the fundamental difficulty of obtaining a good and *even* wither from leaf of many textures, and good tea depends very much upon an *even* wither.

“30 YEARS A PLANTER.”

No. XXX.

Dec. 5.

DEAR SIR,—I agree with “25 Years a Planter,” but would add *good shelter* as an essential to secure the best prices with best returns per acre. Poor soil with poor jât will never pay, no matter what the elevation. A good jât in poor soil will change its character and very indifferent results: at a high elevation. A medium classed hybrid flushes best; at a low elevation the higher the jât the finer will be the returns. A. F. S.—

No. XXXI.

Dec. 5.

DEAR SIR,—With regard to the letter from “25 Years a Planter” there is no doubt that high elevation, good soil and good jât are the most important factors in obtaining both large yields and good prices. But I think also that climate has much to do with it and is it not a fact that as a rule June, July, August and September are our best months for good teas, both in Dimbula and Udapussellawa, although in Dimbula it is wet and in Udapussellawa it is dry during those months?

Is it possible that the south-west monsoon carries tea flavour? Why do teas from the same estate vary considerably during the twelve months?

For good prices also it is essential that a *quick* good wither should be obtained, and I have rather a strong belief that the *situation* of a factory (and at all events of its withering rooms) is of more importance than is generally supposed. The wither I look upon as the chief point in the factory work though every stage is of importance. My ideas may be all wrong, but such as they are I give them.—Yours truly IGNORAMUS.

No. XXXII.

DEAR SIR,—From what I see of tea at a medium elevation and in fairly good soil, really good jât pays much better than Hybrid or China; but what I stand in need of here is a good Factory to be able to always turn out good tea. This is only a matter of money, but these trifles are not always easily overcome.—Your truly, MEDIUM ELEVATION.

No. XXXIII.

Upcountry, Dec. 7.

DEAR SIR,—Mr. Shelton Agar could give you some valuable information *re* "Tea cultivation in Ceylon: good crops and good prices." Agar's Land, I think, took the cake for sometime in price and I fancy without any great outlay on either factory or machinery. Now I fancy both have been improved, but where are the prices?—Yours truly,

AN OLD COFFEE STUMP.

[The same question may be asked of a good many estates besides Agar's Land; for instance Rookwood, Blackstone, Hoolankando and even Portswood. May we not understand hope that the proprietors found coarser plucking, more crop and lower prices, pay better?—Ed. T.A.]

No. XXXIV.

Dec. 8.

DEAR SIR,—With reference to the letter of "25 Years a Planter", I should say speaking from experience, that given good jāt, and good soil, good tea can be made at a low elevation say 400 ft. to 600 ft.

Tea made at that elevation has not what is known as "hill flavour" so marked as tea grown at a high elevation; but if properly manufactured it has a malty flavour which secures a good price; and what is wanting in flavour is made up in strength and thickness of liquor. To find out and carefully carry out the style of manufacture suitable to the estate has a great deal to do with making good tea. That means attention to the various details of manufacture, withering, rolling, etc. From poor soil, good tea cannot be made in any profitable quantity. The yield per acre is greatly affected by shelter and aspect. Flavour is purely a constituent of the soil. It can be preserved or lost in the manufacture, but cannot be produced. Without scientific knowledge such as suggested by Mr. John Hughes, I do not think we will be able to account for the different results from apparently similar soils on adjoining estates. This very question has been put to me by Mr. Rutherford since his arrival in the island.—Yours faithfully,
A TEA PLANTER SINCE 1879.

No. XXXV.

Elevation, 4,200 to 4,600 feet, Dec. 8.

DEAR SIR,—"25 Years a Planter" is right as to elevation, soil and good jāt being required to give high price teas with large yields; but should have included climate and cultivation and not have ignored advantages in manufacture. All these must be favourable in order to get the highest prices with the largest yields. There are good profits and fair teas made under less favourable conditions; but the above results are not obtainable without them.

Given natural advantages, there is, as a matter of fact, considerable difference in results which can only be accounted for by extra care in cultivation or manufacture—in detail.

I have known whole fields on some estates, badly planted at first, utter failures, and after several years the trees were uprooted, and the same ground replanted under proper treatment and up to the present moment they are one and all giving fine yields of leaf; and so with manufacture, much depends on the factory accommodation and machinery, and how to use all to best advantage and make the most of the loaf from the field.

I have found at this elevation a good Assam Hybrid give best results, but I have never been able to get the same results all the year round without changing the plucking. If highest prices are to be maintained, it is absolutely necessary to pluck finer at certain seasons than at others and of course this means less quantity for the time; and so it is entirely a question of which pays the best; and the demand of the home market easily settles that.

CACAO, COFFEE AND TOBACCO IN NORTH BORNEO.

BY AN EX-CYLON PLANTER.

Sandakan, Nov. 29.

MY DEAR "OBSERVER."—I think your T.A. is more interesting than ever with its Biographical Notes and handsome Portraits. Your notes on R. B. Tytler's career are particularly so and I specially note his reliance, so well justified, on cacao, to which I am giving a good deal of attention. I think we have an ideal climate for cacao, hot and moist with no prolonged drought, as you will see by the adjoined table and notes:—

THE CLIMATE OF CEYLON AND NORTH BORNEO—COMPARED:—

Average.	Rainfall inches.	Wet-days.	Heatst fall in one day.	Wet-days per month.	Mean temp. of the air in the shade.	Absolute Max. Min.	Mean.	Relative humidity.
Columbo, Sea Level Ceylon 23 years.	86.82	152	11.90	4 to 19	80.9	88° 90°	76° 85°	64 to 80
Sandakan, Sea Level Borneo 4 years.	129.59	181	8.12	3 to 26	86.6	70-95	74° 86°	70° to 85°
Kudat, Sea Level Borneo 4 years	99.95	162	10.30	7 to 26	81.4	62-96	75° 87°	
Kandy, 1,650 feet Ceylon.	82.67	200	8.86	5 to 23	76	58-84°	72° 79°	
Dumbara, 1,500 feet Ceylon.	55.78	122	4.00	3 to 17				
Taritepan, Sea Level Borneo 1 year.	114.38	148	3.87	7 to 21				

The lowest temperature recorded at Kudat in the four years was 62 deg. which coupled with the great heat in the daytime and the saturated state of the air affords some conception of the dew fall which is notably heavy in North Borneo. Kudat in April 1891 had no rainfall—a rare occurrence in North Borneo. Toritipan has been opened two years and the longest recorded dry interval in 14 days. It is this equable distribution of rain that enables Tobacco to be grown in North Borneo.

Toritipan is the name of the coffee estate I opened after my return in 1891 where there are now 105 acres in Liberian coffee and 32 being planted. As an experiment we put in an acre or two of Arabian coffee which has grown very fast and one year old plants have blossomed freely and the blossoms are setting. This is probably due to our cold nights, and the low temperature is probably due to our hill system of which you Ceylonites have little conception. We began about a mile and a half from the sea and at sea level, but we are working up and I think the top elevation within our own land must be 2,000 feet; we have a splendid water supply and splendid soil. I wish some of your fellows would come and see the Liberian, the first planting of which are being topped at 5 feet 6 inches, and there is a little crop and I can show some very satisfactory cacao, the planting of which is receiving from me and the manager, Mr. Thomas Johnston, a great deal of care. Of course, we have

our troubles, but land and local transport are cheap and silver is in our favour. Eight dollars to the pound is now the exchange and with Liberian coffee at 37 to 40 dollars per picul, we have a fair prospect before us of doing well. I hope to plant 80 to 100 acres each year and to get Arabian coffee on the higher land. But I would like to see some Ceylon men invest a little money here, and invest it in person. The Government is willing to sell land at very low prices to immediate planters (to which end some free grants have lately been made) and that is a good set off to the difficulties in planting in a newly-opened country. There is plenty of sport to be had in the way of sambur and wild cattle and also rhino; elephants are barred, as we have not many and they may be useful some day.

You will be glad to hear our tobacco estates are thriving and more fields are to be opened on all the estates next year, 1894.

Wishing Ceylon a prosperous New Year.—I am yours sincerely,

HENRY WALKER

OTTERS IN CEYLON

Hanwella, Dec. 12.

DEAR SIR,—With reference to your note re "Otters in Ceylon" they are often seen in thekada Barawa forest swamp at Hanwella. This forest is one extensive swamp of about 1,500 acres, almost all being submerged even during very ordinary floods in the Kelaniganga. In dry weather when there is no water over the place, these amphibious carnivorous animals flock into the stream which runs through the forest. These and "Kabaragoyas" very freely interfere with the increase of our fresh water fish which abounds in Barawa.

Once I came across a dam and two cubs and managed to get hold of the latter. I had them with me for sometime and then presented them to a friend in Colombo to be sent to Australia. I know that dogs and jackals hunt otters at low water in lagoons and streams—hence their increase is somewhat checked.

G.E.A.

HIGH AVERAGE PRICES FOR TEA: MR. BECK IN CORRECTION.

Henfold, Lindula, Dec. 15.

DEAR SIR,—It has been stated that I have said that I shall not be content until I have raised Henfold prices to an average of 1s 6d. I have never said this; but I should have no objection to the average named with my present large yield per acre, and I should be still more glad if many others shared my good fortune. I do not think, however, such an average can be obtained except by fine plucking, and what we are trying for is the happy medium between the highest obtainable price and the largest obtainable yield.—Yours faithfully,

GEO. BECK.

MOSQUITO BLIGHT IN TEA.

Dec. 15.

DEAR SIR,—I write in the hope that the planting member will put a question in Council with regard to the Government forcing people whose gardens are attacked by mosquito blight to send an official notice to the nearest Kachcheri and take reasonable means to exterminate the pest.

The alarming increase of *Helopeltis* during the last 18 months shows that unless active measures are taken to stamp it out as recommended by the Director of the Botanical Gardens, it will do for tea (or certain jats of tea) what leaf disease has

done for coffee, and not only this but it will spread to cacao gardens all over the island with ruinous consequences to our most promising product.

The difference between *Hemiteia vastatrix* on coffee and *Helopeltis* in tea and cacao is that while the former was beyond human control the latter by prompt and concerted action can be kept in perfect check; if not eradicated. When we find in countries where locusts are common, laws forcing all the inhabitants to join in their general destruction,—when we find in Britain and other countries laws relating to cattle diseases by which the owners of herds in which disease appears and who fail to notify such outbreak to the authorities at once, are liable to criminal prosecution and the animals are slaughtered in every case and farms proclaimed publicly as infected and when we find (in Trinidad I think) a coconut beetle law whereby the owner of any coconut tree attacked by beetles is bound to notify such attack and destroy the tree and larvae at once,—I do not think it is too much to ask Government to pass a law which shall prevent the further spread of *helopeltis* as it has disastrously attacked thousands of acres of tea in Ceylon already. I was told of one estate of small area where it has practically been eradicated lately and on which no fewer than 150,000 mosquitos were destroyed, and the estate a very fine one is flushing as well as ever. But what induces me more than anything to address you now is another phase in the question that has just come to my notice.

I refer to gardens owned by high caste Buddhists who believe it is a sin to take life and who will not willingly permit its being done.

Such gardens are scattered all over the low country and in Dolosbage and some of the other up-country districts, and if no steps are taken and taken promptly they will be simple breeding grounds for *Helopeltis* which will attack and destroy flush in all directions on estates in the vicinity of the gardens.

The matter was brought to my notice by a superintendent who started catching mosquitoes with his pluckers and paid them by the number they caught. The first day some of the high caste Sinhalese women refused to catch them on the ground that it would be taking life and one of them (whose husband owns a plot of tea) said she would not destroy life even if she got R10 a head for the work.

This was discouraging, but next day matters were worse, when the whole of the Sinhalese refused to catch the insects, leaving the Tamils alone to do the work. They had apparently been talked to after work and the sin they were committing pointed out to them.

I went over myself and tried all I could do to point out the stupidity of their action, especially as some of them have plots of tea of their own, but nothing would induce them to listen to (what I thought was) reason.

I even went as far as to point out that on sundry occasions I had seen them busily employed hunting for insect life in each other's heads, but it was wasted breath as they said they always let them go which accounts for their numbers in Ceylon perhaps!—Yours faithfully,

L.D.

OTTERS IN CEYLON; TRAPPED BY THE SCORE: STALKING AND SHOOTING CARP FOR OTTER!

Nuwara Eliya, Dec. 16.

DEAR SIR,—I notice in one of your recent issues you ask for some information about Otters in Ceylon,

Since Trout acclimatising has been tried her I have taken rather an interest in Otters and their habits, and I have trapped over 20 of them in the lake and river.

No doubt they play great havoc among fish, as one can see the remains of carp almost any day along the edges of the lake, and I have known them kill 40 or 50 carp in *one night* in the small breeding pond at the Kaocheri bungalow, and the slaughter seemed to have been for mere sport, as most of the fish were left in a heap on the bank. However it was master otter's last hunt, as he was trapped the next night. They have also taken some of the trout from this pond; still somehow I don't think that they kill many of the trout, for when the river has been very low, I have marked trout left left unharmed for weeks in pools from which they could scarcely escape, and in which otters must have been swimming about night after night, as I could see their fresh tracks on the shore next morning.

The chief food of the otter out here is evidently land crabs which are to be found everywhere. Otters I believe to be about the *commonest* wild animal in Ceylon as I see numerous marks of them wherever I go, low-country as well as high, and they are great travellers as I often find their tracks a long distance from water but numerous as they undoubtedly are they are rarely seen owing to their nocturnal habits; I have only seen one myself at liberty and that was many years ago in a stream in the Knuckles. I have heard of residents here, just at dusk or early morning seeing some, and no doubt they are occasionally seen, but I expect in some cases as the saying goes, "it is not all gold that glitters," for just after the 5 otters were seen in the lake the other morning a brave sportsman appeared with his gun and started to stalk them; he soon saw what he took to be the otters popping their noses above water for breath and after a careful aim he blazed away and killed *three*, but on landing his game they were found to be *carp*. These fish go about in dense shoals, and on a fine sunny morning they love to bask close to the surface of the water.

I think that otters live chiefly in close rocky jungle, as I notice most of their runs lead into the thick jungle, but they evidently move about a great deal, as after catching one or two I often won't notice a track for months, when suddenly a lot will appear again.

I have heard of a nest of young otters being found under the wooden boards of a cistern in an old pulping-house in Dimbula; the nest was found when the building was being pulled down; but I am surprised, considering their numbers, that more otters are not caught. I have never seen a native with one, and though I hunted a pack of beagles for many years, they never got on an otter and I have rarely heard of other sportsmen who have come on them in hunting, but no doubt a *properly trained* otter pack would afford grand sport in any of our hill districts.

The otters that I have caught are generally about 40 inches long. I have seen the skins of a much larger variety in Kandy, and I am rather inclined to think that there is another and smaller kind than the one that frequents Nuwara Eliys, but of this I am not sure.—Yours faithfully,

CHAS. YOUNG.

CACAO CULTIVATION IN CEYLON.

DEAR SIR,—I shall feel obliged if you or any of your correspondents will kindly inform me as to what is the highest elevation at which cacao is

grown in the island, its variety and whether shade is as essential to its successful growth at the higher elevations as it is in the low country. Any other information on the subject will be much esteemed by—Yours faithfully, M. M.

[The highest altitude for a single tree growing of which we have heard is on Keenakelle estate Badulla—4,000 feet above sea-level, in a sheltered, nook however, and with exceptionally good soil; but it took a long time to come into bearing we believe. In Uva and Pundaloya, there is cacao regularly planted up to 3,000 feet, but we do not know if shaded?—ED. T.A.]

JUNGLE EXTERMINATOR.

DEAR SIR,—I see you had a paper on the "Jungle Exterminator," the prospectus of which I saw some time ago, and I think if you look into it you will see that a chemical that destroys the existing plant life is bound to have a very bad effect on the soil in which the particles of the plants get scattered.

If it were clearing work for the site of a building, of course, it would be all right; but where reproduction of forest trees or cultivation was wanted, the very particles which would otherwise in themselves help to fertilize the soil, would in this case be the means of checking vegetation completely. Of course I may be wrong in my view of it as I don't know what the chemicals used are; * but as far as I can remember the mixture was guaranteed to kill even the roots when put into them.—Yours truly,

OUR FORESTS.

THE NATIVE STATES (says the *Singapore Free Press*) ought to take a leaf out of the Ceylon book. We have touched on the matter before and it will do no harm to mention it again. The Native States do not nearly advertise themselves enough in one sense. Through Singapore there streams a never-ending succession of globe-trotters, often people of large means. While in Singapore they do the gardens, the waterworks, and have a day at Johore; and the tale of our attractions is over. If they are as enterprising as the late Mr. Harrison of Chicago they might charter a steamer and go and look for the equator, or at least for some place where the equator may be conceived to be. But as to the Hinterland of the Malay Peninsula they knew nothing; Selangor, Perak, and Pahang are probably not even geographical expression to them. Yet it is to be confessed that there is much in the Native States to interest the traveller, and there is not a little that might attract the investor. Most of all, apart from mining which might or might not recommend itself as a region of enterprise, there is the possibility of investment in planting. To a Yankee capitalist who might think of taking of coffee land in the Peninsula as merely one out of his hundred irons in the fire, it would be of interest to see coffee estates in bearing, to chat with the managers, to hear of prospects. It would be nothing out of the way for him to acquire a tract of land and give an active young planter a billet on it as manager. That sort of thing would occur, and not seldom; if it were encouraged to occur, and it would be for the good of the State, especially a State where the Chinese practically monopolize the tin mining, and the fostering of planting is left to the European.

* Of course some chemicals although poisonous in large quantities would become fertilizers in small quantities; but it would take time for the soil to comminute them.

THE LANKA PLANTATIONS COMPANY,
LIMITED.

ENCOURAGING REPORT: UNANIMOUS
MEETING.

An ordinary general meeting of the shareholders in the above company was held on Wednesday at the offices, 12, Fenchurch Street, E.O. Mr. Geo. ALLEN presided.

Mr. C. M. ROBERTSON (the secretary) read the notice convening the meeting, and also the minutes of the last meeting.

The CHAIRMAN said: Gentlemen, I think those who have read the report carefully will be fairly satisfied with the progress we have made during the year. We seem to have emerged from a time of great difficulty and trouble into something like prosperity, and it appears to me that our misfortunes are now at an end. (Hear, hear.) We have had to change our front three times, and now, finally, we have the Estates planted with tea, which has this advantage: that it is of a

MORE PERMANENT CHARACTER

and is not affected in the same way as coffee. For instance, the coffee crop depends almost entirely upon the weather, at a particular season so that, should the season be unpropitious, the crop is destroyed, whereas with tea we have it growing the whole year round, and it is able to be picked at all seasons. Therefore, taking one thing with the other, we have every reason to believe that tea is the more profitable. As far as I can make out there seems to be

NO LIMIT TO THE AGE

of the tea-plant; I understand that in China the tea plant continues to yield well for upwards of fifty years. Another interesting fact is with reference to its root, which goes down to a considerable depth into the ground, and gets all the benefit of the moisture which ought to be there. I heard the other day—but it is almost incredible—that the root is sometimes known to extend as far as forty feet. On the other hand, the coffee plant has a surface root. You will see in the report a short *résumé* of our year's operations, and I think I can safely say that with the exception of the Spring Valley and Ouvah Companies, we are the only Company that has

SUCCESSFULLY TIDED OVER

the coffee crisis. I think that is a tribute to our perseverance and patience. If you refer to the balance-sheet you will notice that during the whole of this period we have only increased our capital account by £6,900, and that has been in developing the Rillamulle and the Yattawatte estates. These estates are likely to be two of the best on our books, and may turn out to be our very best possessions. All the other alterations that have been made have been charged to the suspense account, the creation of which was authorised in 1885, and since that time we have

PUT TO THAT ACCOUNT £17,473,

and have written off £6,946. At the end of 10 years the earliest items in the account will be knocked off, and so far reduced, and I suppose the ultimate result will be that this money will be used to liquidate the only debt we have, and that is the two sums lent by Sir R. P. Harding and myself some years ago. In the account there is an item for machinery, etc.; I do not know why that was put to any other account than the suspense account; but, at all events, we have written off about 60 per cent of that amount, and now we propose to add the balance of £832 to the suspense account. As far as the Yattawatte estate is concerned the reports we have of it are of an

EXTREMELY SATISFACTORY CHARACTER.

You will see from the accounts that during the year we have received £1,170 from coffee, £6,451 from cocoa, and £14,048 from tea. I should like to read you an extract from the superintendent of my own estate. He is referring to the coffee crop, and says: "I went yesterday through Totnlagalia, and was very pleased to see how well the coffee looked, and what a good crop, was on the trees." We are keeping in cultivation all the coffee plants as far as possible, but when they fall out we plant tea in their

place. As far as cocoa is concerned that promises to be

THE MOST PROFITABLE ESTATE

we have. The amount of cocoa produced for the year, as I have before stated, represents £6,451 which can be only called a tremendously large profit, and, though we cannot always expect such good results from this product, the further development of this estate ought to bring us in a very handsome return. As far as our tea plantations are concerned I have pointed out the advantages they have over coffee and cinchona, and we are extending, as far as opportunity serves and the means allow, the cultivation of tea. You will see from the report that our average pluckings of tea is about 300 lb. an acre, and we are expecting, before very long, to get 350 lb. an acre. If you calculate that out, that will make a difference of a sixth in the income derived from tea, which, of course, will mean

A DESIRABLE ADDITION

to our dividend. Some people say, how is it you do not pay the enormous dividends that some of those new Companies pay? The answer is plain. When we bought our estates we thought coffee was at the lowest point: but we were mistaken. These new Companies, however, have come in at the lowest point, with the result that they have made a great profit—and that is the short and long of it why we cannot pay such high dividends. Of course the great thing is, or will be, to extend the markets for tea. Some Ceylon people started a small company to send tea over to America, to the Chicago Exhibition, and it is to be hoped that they will by this means help to cure the Americans of their partiality for Japan tea, and teach them to patronise the Ceylon instead. I am glad to find in a circular issued by Wilson, Smithett & Co., that the exports of Japan teas are falling off, and that the

EXPORTS OF CEYLON TEAS

are on the increase. The circular states that "for the nine months the imports show an increase of 4,000,000 lb., whilst home consumption has only expanded to a very moderate extent; it is satisfactory, however, to note that, with a total decrease in the export, Ceylons mark a very satisfactory increase." That is very gratifying, as it shows that Ceylon teas are being more appreciated. The next thing I should like to refer to is this question of the price of tea. This

DEPENDS UPON THE MAKE,

and it is to that that we specially call the attention of our superintendents and firm on the other side. If you calculate you will find that an increase of one penny a pound in the price of tea is equal to a one per cent dividend upon our stock. It is, therefore, of the utmost importance that the tea should not only be well made, but that the demand should increase to raise the price. I do not know that there is anything else that I can add, I have been through all the salient points of the report; but if any shareholder desires further information I shall be happy, as far as I am able, to give it him. Our books, I may tell you, and our correspondence, and everything else are always

OPEN TO THE SHAREHOLDERS

for their inspection, and I think I can take credit to myself and the other directors that we have done the utmost we could for the company. (Hear, hear.) I will now conclude by moving the adoption of the report and statement of accounts.

A SHAREHOLDER:—Do the company contemplate increasing the cocoa plantations?

The CHAIRMAN:—Yes; you are informed of that in the report. It says, "The directors desire to extend the cultivation of cocoa to the full extent of the suitable land; eighty-five acres have been planted during the late financial year, and arrangements are in progress for increasing the acreage to 600 acres by the end of 1894." To do this we have permission to raise some further preference stock. But I do not think it will be necessary, because, as the suspense account, becomes available, I think we should develop our estate out of that.

Mr. EDWARD PETTIT seconded the motion for the

adoption of the report, and the resolution was carried unanimously.

The CHAIRMAN, in moving the resolution for the declaration of a dividend of 3 per cent. on the ordinary shares, said it was very gratifying to find that they could pay a dividend of 3 per cent. That was more than they had paid for a long time. They must take into account, however, that the sales of cocoa had realised rather exorbitant prices; but, taking the average, he did not see why they should not always do as well as this year—in fact, he hoped they would very soon be able to pay a great deal

MORE AWAY IN DIVIDENDS

than this year. Another thing to take into account was the amount they had carried forward, and the sums they had written off, for if they had not written off these sums they would have been able to pay 4½ per cent.

The dividend was unanimously agreed to.

The retiring directors (Mr. George Allen and Mr. Pettit) were unanimously re-elected, together with the auditor, Mr. John Smith.

Mr. COLLINGS proposed a vote of thanks to the chairman and the directors, and thanked them for the attention they had paid to the affairs of the company. It was gratifying to feel that the company was emerging from that slough which had blackened their interests for so long a time.

Mr. SMITH said he had much pleasure in seconding the vote of thanks.

The resolution was put to the meeting, and unanimously accorded.

The CHAIRMAN: Gentlemen, on behalf of myself and the board of directors, we thank you for the recognition of our services. The directors are all very large shareholders, and, apart from doing our duties as your directors, we have a very large share in the company ourselves, and it is a matter of very great consequence that we should make the company a success. The proceedings then terminated.—*Investors' Guardian.*

NOTES FROM HAPUTALE.

Dec. 14.

Dense fog and mist with rain characterises our weather at present and we would like to see the sun again, to cheer us during the festive season. To give you some idea of our late weather, I send you the rainfall on an estate at the west end of the district, which you may rely on as correct, for the friend who sent it to me is well-known as a very correct enumerator and good reliable planter:—

Jan.	10.78 inches	Aug.	0.22 inches
Feb.	7.07 "	Sept.	0.29 "
March	16.60 "	Oct.	8.00 "
April	10.57 "	Nov.	40.69 " !!!
May	3.06 "	Dec. to date 10th	5.66 inches.
June	3.83 "		

ANTI-PEST FOR PADDY &c.

The *Gazette* of 15th Dec. contains an amusing Correspondence, published by direction of "His Excellency the Governor," respecting the virtues of a certain "Anti-pest" brought out by Strawson's, Limited, about which Messrs. LeMesurier and Starey (the two gentlemen who did most to knock over the Paddy tax in Ceylon: where are their gold medals by the way?) are naturally of one mind. Our surprise is that the Ceylon Government did not order a hundred dozen (thirteen to the dozen, remember) of the "Anti-pest" right off on the spot. Certain we are that the money would be as well spent as through some, at least, of the irrigation votes, and on the principle now established, to be consistent, the Government ought to see that the land-owners and other gentlemen who have been relieved of their one special tax (if not rent) are supplied out of the general revenue, with improved implements such as ploughs, winnowing and threshing machines, and freely with anti-pest, as well as with improved means of irrigating their fields. Possibly the publication of the Correspondence is a preliminary to the step in this same right (?) direction. A fresh trial might be made

among the Tissamaharama rice-growers whom Mr. Lushington reported to be rapidly "amassing wealth," and the result could then be watched in the improved local rice which—as the Government Agent for the Western Province said in his Administration Report,—fell's alongside of imported rice in every village bazaar in his province. This does not, of course, mean that more rice is grown in Ceylon than the cultivators can consume, and as for Protection and Bounties given (in irrigation) out of the rice-tax paid by the townspeople, the thing is not possible.—The *Gazette* correspondence is as follows:—

In continuation of the *Gazette* notice of August 17th, 1893, His Excellency the Governor has been pleased to direct the publication, for general information, of the following letters on the same subject.—By His Excellency's command, E. NOEL WALKER, Colonial Secretary.—Colonial Secretary's Office, Colombo, December 12th, 1893.

Copy referred to.

The Assistant Government Agent, Matara, to the Government Agent, Galle,—Matara Kachcheri, November 24th, No. 1,009, D 2. SIR,—In returning the annexed letter from the Manager of the Eastern Produce and Estates Company, Limited, I have the honour to state that I believe the Sprayers will be found very useful. 2. They appear to be of exactly the same pattern as the one I obtained at first, and are about half the price.—I am, &c., C. J. R. LEMESURIER, Asst. Govt. Agent.

The Eastern Produce and Estates Company, Limited, to the Government Agent, Galle, Colombo, November 16th, 1893. SIR,—I have the honour to invite your attention to the paper sent herewith describing the "Antipest" brought out by Strawson's Limited, for whom we have been appointed Agents in Ceylon. It is a Sprayer, improved in design, and cheapened in price, to be used either with powders or liquids for removing or preventing blights, fly, insects, and fungus on growing plants economically, and without injury to the plant. Believing that it would be particularly serviceable for use in paddy fields, we introduced a machine (not improved, and costing nearly double the present price) to the notice of the Assistant Government Agent at Matara, where it attained such marked success that six more were ordered. The official report of the experiments there was published in the *Government Gazette* of 25th August last, page 1,871. Experiments are now being tried upon paddy by the Assistant Government Agent at Kegalla. The price here is Rs5, each Antipest; renewal parts are kept in stock at moderate prices. If you think proper to bring the machine to the notice of the larger paddy growers and influential men in your district, I believe it will be of great benefit to them. We shall endeavour to sell the machine as cheaply as possible (receiving our commission from our principals), and for the first 12 machines which you order we will supply 13, at the cost of 12. I believe we have a really valuable invention for treatment of insect pests that may become of great importance to Ceylon, which is my apology for inviting your attention to this matter.—I am, &c., JOHN H. STAREY.

DAVIDSON'S "SIROCCO" TEA DRIER.

LONDON, Nov. 24.

During the course of this week, I met at the Ceylon Association Rooms, in company with Mr. Leake, Mr. McGuire, the agent in Ceylon for

DAVIDSON'S "SIROCCO" TEA DRIER.

He had, he told us, been anxious to tell us the most recent developments in the manufacture of tea. After visiting an immense number of factories on estates in Ceylon, in Assam, Sylhet and other planting districts in India and elsewhere, he had arrived at the opinion that there existed fundamental errors in the present system of manufacture, attention as to which must greatly improve the character of the outturn produced. Although the factories in Ceylon were not perfect, they were very superior in many respects, Mr. McGuire observed, to those he had visited in India. They were better arranged, more neatly kept, and altogether gave evidence of more careful attention bestowed upon the several processes connected with tea preparation. The prime objection taken by our interviewer to present arrangements is that the exhaust air from the fans working tea driers of different patterns is evolved into the room in which those machines are placed,

This air is, of course, laden with moisture derived from the leaf over which it has been passed. In that condition it again re-enters the heating furnace to be once more passed over the tea. The humidity contained in this air is by the fire converted into steamy vapour, certain to prove deleterious to the tea to be dried by it. In fact, as Mr. McGuire remarked, the machines are made to use air charged with that very quality of the outside atmosphere which it is the special object of the planter to avoid. Hygrometrical tests made by him had yielded as high a measure of damp in this air as 100 per cent. It was obviously desirable that the exhaust from the fan should not be permitted to re-enter the furnace. It should be led to the outside of the room in which the driers were placed, fresh air, in as dry a state as possible, alone being permitted to enter the furnace. Mr. McGuire said that this rule,—under his advice,—had already been adopted on one or two Ceylon estates, and with the most marked beneficial result in the quality of the tea manufactured. He cited one instance of such an estate, the product of which, when manufactured during the warm, dry season, always fetched at the home auctions 1s to 1s 1d per lb. But such tea as it produced during the more humid seasons always fell off so in quality that the average for it did not exceed 7d to 8d. The result of the adoption of the new method had been to equalize the quality of the outturn throughout the year, and the higher average of price was now maintained for all shipments made from this particular estate. Although quite unacquainted with the details of tea manufacture myself, it seemed to me that the argument upon which Mr. McGuire based his proposal in this respect must be a sound and commonsense one. I examined the brokers' sale lists to test the correctness of the statement made as to the averages now obtained by the teas of the estate referred to, and found therefrom no reason to doubt that the figures had been correctly quoted.

The second point to which our attention was next drawn had reference to the present system pursued for withering tea. Mr. McGuire remarked:—"Before entering upon this I should like to give you a homely example in illustration of the matter. If a laundress hangs her washing out to dry on a warm, still day, it dries soft and pliable. If, on the contrary, she exposes it when a wind is blowing freely, it dries it is true, but it dries hard and harsh. Now it is the latter result, I contend, which is produced by passing a blast of air over tea leaf to assist withering. Not only does it harden the leaf, but it induces a certain amount of premature fermentation which is distinctly detrimental. It is the essence of my plan that the withering floors should be so arranged above that containing the driers that the air discharged by the fans of the latter shall ascend through pipes into the withering rooms, these being divided into several compartments to enable tea in separate stages to be kept distinct for exposure to the warm, moist air ascending from the drier fans. The humidity of that air, while its heat assists the withering, will preserve the pliability of the leaf, a point of essential importance." Mr. McGuire then exhibited to us plans for a model factory in which his new system could be given the fullest effect to. Some new machinery, he said, would be required to introduce the new method recommended, but it would not be costly. One planter, he told us, had just left for Ceylon taking with him the machinery required for making the change on his estate, and he predicted that before long such a change would be very generally adopted. He pointed out as an

essential feature of his proposal as regards the withering rooms, that both the inlet and outlet for the air should be on the floor level. This would ensure that the colder air would sink and pass out, while the warmer incoming air would rise evenly throughout the room to take its place. Other details were referred to in our conversation, but these were of minor importance, and no space can be spared for their mention. Mr. McGuire told me that he was returning to Ceylon shortly after Christmas to take charge of the factory being erected for the proprietors of Davidson's Sirocco Patents in Colombo, so you will very soon be able to obtain full information from himself on all points of his proposals. These, he believes, will effect a new departure in the manufacture of tea, and one he feels confident that will prove of great value to all tea planters.

CINCHONA ALKALOIDS V. OPIUM.

The question asked by Mr. Caine in the House of Commons on Monday night, relative to the sale of cinchona and cinchona alkaloids by the Indian Government, has probably some connection with the well-known views of the member for Bradford on the opium question. The advantages of quinine over opium as a malarial remedy have often been pointed out, and since the cinchona planters in India and the East have fallen upon lean years they have repeatedly tried to devise means for a successful propaganda in the interests of quinine among the Chinese and the natives of Indo-China. Whether these natives will appreciate the promptings of the commercial-philanthropic movement, and forsake the soothing opium in favour of the, at best, tasteless quinine, is another matter. Mr. Caine paid a flying visit to British India a couple of years ago, and has since then zealously thrown the mantle of his protection over the toiling millions of India. But whatever Mr. Caine's motives or the result of his action may be, it will be interesting to have a detailed account of the turnover of the Indian quinine-factories. Much has lately been done to cheapen and popularise the locally-made febrifuge, and of the latest efforts in this direction full particulars were given in this journal a few months ago. It is noteworthy perhaps, that Mr. Caine's question follows closely upon an article in the *Times*, giving particulars of the system of retailing quinine in India. Particulars of the manufacture of quinine in India, and its distribution, have repeatedly been given in this journal, but it is interesting to notice that, according to the *Times*, month by month the applications for quinine at the Indian post-offices (where the drug is retailed in farthing packets) have steadily increased, and that in September no fewer than 120,000 doses were served out through this channel in the single Lieut-Governorship of Bengal. The quinine is made up in little airtight packets, each containing 5 grains, with the Royal arms as a guarantee of its purity, and the price and quantity clearly printed in the vernacular language. The 120,000 packets thus sold in Lower Bengal during the month of September were independent of the crowds of fever patients at the village and district dispensaries. The quinine is made over in bulk from the Government factory to the Gaol Department, and is subdivided by prison labour into farthing packets, 1,400 of which go to each pound avoirdupois. A certain number of the 5-grain packets is sent to every postmaster in the Lower Provinces of Bengal, and a small commission is allowed on the sale.—*Chemist and Druggist.*

THE CINCHONA TRADE.

Sir,—It is some time since I have troubled you with observations on the position of cinchona. My present excuse for doing so is that you yourself have adopted the cloak of Cassandra, and have done so at a time when it is most threadbare. I see that in your reports on the cinchona sales you have for some time spoken of them as "unimportant," "most unimportant," and "the least im-

portant held." Pardon me, sir, if I say that they are the most important ever held. The small amounts catalogued show the unwillingness of holders to sell, the inability of producers to harvest, at present prices. They show that the lowest declivity of the wave has been reached, and that it will rise, whatever manufacturers say. I have pointed out before that manufacturers are pursuing a somewhat dangerous course in forcing down the unit below production and fair return level, instead of working, to a certain extent, hand in hand with the producer. I would now, without any antagonism to the manufacturer, emphasize this. If he looked sufficiently into the classification of the bark he has for some time purchased, he would understand my argument. He would see that he has forced the cottier to sell his goose, instead of the golden eggs it lays. They are hardly "golden" now, but that does not affect the argument. Let us start with the time when it paid the producer to shave, to strip, or to coppice in rotation. That was a time of legitimate harvesting, and did not reduce the world's visible supply of bark. But the time came when such legitimate harvesting increased the supply beyond the apparent demand, and this was largely aided by the fact that Ceylon uprooted large areas of cinchona, either because it was dying out in an unsuitable soil and climate, or to make room for tea. By this the unit was forced down, and I do not deny the planters' self-guilty responsibility in this first act of the tragedy. In this act I myself have several times assumed the part of monitor. Then comes the second act. In this the manufacturers forced down the unit beyond justifiable limits, while still making large profits on their sales of quinine. The result is that the producer has to abandon legitimate cropping, and has to increase his amount of bark put into the market by thousands of pounds, obtained from wholesale coppicing or uprooting. His profits per pound were reduced to a minimum; hence he had to increase his output.

Third act. The manufacturers join hands and say the unit is to go lower yet. They are encouraged in this by the large and forced exports of bark from the producing countries. Naturally, they succeed in forcing down the unit, but they have forgotten to gather statistics as to the proportion of root-bark and of stripped chips they are purchasing—i.e., how many geese instead of golden eggs. For it stands to reason that root-bark means uprooted trees, that stripped chips mean bark from either uprooted or coppiced trees. Uprooted trees mean in actual diminution of the world's visible supply of bark; coppiced trees mean a diminution of such supply for from five to six years. To illustrate this statement let me quote the Amsterdam sales held on October 5. Out of 4,485 bales 1,072 were root-bark. That is to say, the whole of the bark sold was from uprooted trees, or their equivalent. I would go further than this and state, "That as a larger amount of the bark was *Ledgeriana*, of which the roots are small, the amount of rootbark is in over-proportion to the rest of the bark by a large amount." This seemingly strange fact I would account for by the further fact that the *Ledgeriana*, is a most tender tree, the bark of which is apt to die back under any circumstances, but especially after shaving; that hence a large amount of trees were unrooted which had not their bark, or next to none. You may go back through late Amsterdam sales, and with my statement for a guidance you will find the same moral in every one of them. With regard to Indian and Ceylon barks, it is needless for me to insist that during the last year or so, if not before, by far the larger amount of bark has been cropped by coppicing or uprooting. I would go so far as to say almost the whole, and if you go into the statistics of stem-chips and root you will see that I am right. (N. B. Off *Succirubra* roots about $\frac{3}{4}$ h. of bark can be realised per tree; off *Hybrids* and *Condaminea* about $\frac{3}{4}$ h.; off *Ledger* about $\frac{1}{2}$ h.) Let me turn now to another phase of the question that the sale price still pays the producer. However

he gets his bark; whether by shaving, uprooting, or coppicing, the producer cannot put his bark into the market under 1½d per lb., though I fancy that in uprooting or shaving it costs him more. And the without up-keep of his estate, his managing-expenditure, or his interest on capital. The average percentage at London auctions is, say, 2½ per cent.—i.e. at a halfpenny unit the bark realises 1½d. per lb.; hence the planter loses a farthing or more per lb. on the mere cost of harvesting and putting in the market. The same planter's average is 4½ per cent. hence he secures 2½d average price, which would, apparently, show him to be a gainer of $\frac{3}{4}$ d per lb. even at present prices. But, in his case, greater difficulties of labour and the question of exchange on silver again reduce this apparent surplus to a deficit. Nor must it be forgotten that in both cases the average yield is taken. Half of the bark from India is a little over 1 per cent. half the bark from Java a little over 2 per cent. and, therefore, 50 per cent. of all the bark shipped is incurring even greater losses than are estimated as above. The other half is, no doubt, making some profit, but will this make up for the world's dwindling supply?

The fuss that has been made about the Java planters agreeing to place only 75 per cent of their estimate in the market is incredible. They cannot help themselves, and if the present unit continues they cannot even put 50 per cent of their estimate in. This fourth act is very plain: there will be a slight improvement in prices, and the market will again be flooded with bark, thus enabling manufacturers to force down the price once more. Whether, in their own interests, they will be justified in doing so remains to be seen. There is a fifth act to come, in which next to no bark will be obtainable from Ceylon or India, and when even Java will have largely reduced her output. It is then that Nemesis will wait on the manufacturers. The smaller amount of bark will necessitate competition among them, and will force up the prices again. Will they then be able to force up quinine in the same ratio? Whether I am right or wrong the future will prove. Whether the manufacturers should ascertain the actual facts of the case, as shown by me, it is for them to decide. For them, also, it is to decide whether to act on these facts. Nor should they forget that the gulf they are clearing for planters will, later on, yawn for themselves. Slight concessions on their part and co-operation with the planters will help both sides. For myself, I am content to sit still and wait, as I am certain of the issue. I am taking no bark off my trees, and I notice that my neighbours are reducing their output.—Yours faithfully,
J. V. ROSENBERG.

Dsviklam, Br. India, Oct. 12th

P. S.—Might I suggest that, in common fairness, you should give, not only the large export from Java, but also the small export from India and Ceylon, in our notes on the bark-market!—*Chemist and Druggist*.

TEA IN AUSTRALIA.

MELBOURNE, Dec. 2.—In Ceylon, over 600 packages have changed hands at prices ranging up to 10½d. A little business has been done privately in Indian. Of Ceylon 205 chests and 126 half-chests, including some lower grades than have lately been on the market, were offered; sales amounted to 205 chests and 101 half-chests at 5½d to 6½d; for pekoe souchong, which showed weakness, and 10½d for broken orange pekoe.

SYDNEY, Dec. 1.—In tea rather more business has been done during the week, the impression being pretty general that prices have now touched bottom. Stocks at the moment are ample; but, as the Calcutta and Foochow markets are now about closing for the season, some improvement may be looked for shortly. A small catalogue of Ceylon was submitted at auction without reserve on Wednesday last, 29th ultimo, and sold as follows:—24 chests flowery pekoe, 11½d; 9 half-chests broken pekoe, 8½d; 20 chests pekoe, 7½d; 18 chests pekoe, 6½d; 13 half-chests pekoe Souchong, 6½d; 8 half-chests pekoe Souchong, 6½d. In China teas clean common congou in original weights is offering at 5d per lb., and between this price and 6d excellent value is obtainable.

IMPROVING THE MANUFACTURE OF TEA.

Finality is a term which can never, it would seem, be correctly applied to any particular process or to anything else. It may be said, however, that one special process, the one in which we in this Colony are especially concerned, that of the manufacture of tea, seemed in some of our recently-equipped factories, to have been brought to as a high a pitch of perfection as was likely to be reached. But the statements made to our London Correspondent by Mr. McGuire, (see page 484) a gentleman well-known here through his connection with Davidson's Siroccos, would seem to indicate that we have not yet attained to the desired point. Indeed, the mistake he has referred to, would seem to attack the very A B C of our method, and we fancy there are few who will not recognise it as an error, or who would not wish to be able to correct it. It should be satisfactory to us all to receive the assurance given by that gentleman that, although there are conditions that need amendment in the Ceylon practice, our system is yet much in advance of that of our Indian fellow-tea planters. Now Mr. McGuire has professionally visited a large number of the estates in Assam, Sylhet and other districts of Northern India wherein tea planting is carried on. It is evident, therefore, that his knowledge of the subject of tea curing has been obtained from a varied experience of the methods pursued here and in India. Mr. McGuire has cited as evidence of the correctness of the alterations he recommends, that on a certain well-known Ceylon tea estate, the introduction of his new method has had the effect of levelling up to the maximum prices obtained for the produce of that estate the production of all the year round. It has been well-known hitherto that the quality—and consequent price—of tea sometimes varies according to the season in which it is made. In the special case quoted, tea made during fine and warm weather always fetched an average of from 1s to 1s 1d per lb. But tea made while dampness prevailed in the atmosphere sank to an average of about 7d only. The result to the improved method introduced by Mr. McGuire has been to equalize the price of tea leaf all the year round to the top level. Our London Correspondent tells us that he has verified the assertion by reference to the brokers' list of tea sales. There is no doubt that to achieve such a result as this it would be worth the while of tea estate proprietors, especially in wet districts, to incur some extra outlay upon the remodelling of their factories. This, we are assured, is not likely to be very large in most cases. At all events, if the fact be as above stated, it is not likely that the proprietors of large gardens would cavil at the necessary outlay. Some time back, we discussed in these columns, the desirability of taking steps to remove humidity from the air used in the several processes of manufacture, for all seemed to agree that this exercised a very material and injurious effect. As we understand the suggestions made, the main conclusion is that the air drawn through the driers by the fan should not be permitted, as at present, to escape into the room in which the drying process goes on. It is discharged from the fans laden with the humidity it has extracted from the leaf, and at present it is again drawn into the heating furnaces and re-discharged upon the leaf, bearing with it that humidity converted into steamy vapour certain to be injurious as likely to promote quick fermentation. Mr. McGuire's contention is that *fresh* air alone should enter the

furnace, while the air once used should be discharged outside of the drying room. There seems to be commonsense in this suggestion. It can be of no use trying to obviate the effects of dampness in the outside atmosphere, if we deliberately draw air into the furnace largely charged with this quality by previous use. The next objection taken with regard to existing practice relates to withering. It is sought to assist this process at certain periods by a blast of heated air. The effect of using this, we are told, is to harden the leaf. The illustration of clothes dried in warm and still weather and of those dried on a windy day is an apt and pertinent one. The suggestion now made is that the air discharged by the fan from the driers should be conveyed by pipes to the withering floor, where its warm, soft influence would, it is said, be of special value in producing that gradual withering which it is most desirable to obtain. We leave practical planters to discuss the two points chiefly raised in the above, only remarking that every advance or alteration of process calculated to improve the quality of our teas is to be welcomed from whatever quarter it comes. It seems to us, too, that a great deal still has to be learned about tea leaf and its manipulation in the factory, before tea planters can feel that they have fully mastered their profession.

 THE PACKAGES USED BY CEYLON
 TEA PLANTERS

not being strong enough to bear transhipment to the Continent. They complain that when sent there the boxes arrive broken and show considerable loss of tea, and this, it appears, cannot be recovered from the shipowners. They add:—"In the mutual interest of shippers and consignees we shall be glad if you will ventilate this grievance in the Ceylon press." This is undoubtedly a matter which should receive the greatest possible amount of attention from your planters. It is probably the case that a great deal of the tea purchased here and forwarded to the Continent has had to be rebulked in this country. We know that some persons regard the practice of rebulking here with favour. They hold that it enforces a levelness in the quality and measurement of the contents of the chests that cannot be obtained by any other methods. But my letters recently conveyed to you a complaint made to me by a leading firm of brokers as to the tendency among your planters to pack the chests too tightly, and its result in producing a large amount of broken and dust tea. This tendency the firm in question declared to be the main cause for the necessity for rebulking. They pointed out the loss arising from it, and furthermore stated that the chests so dealt with could never be efficiently closed again so as to bear re-export without injury to their contents. Anyone who has visited one of our tea warehouses and seen the patched-up condition of a large proportion of the tea chests, from Ceylon would readily endorse this complaint. An attempt to redress the cause for this would probably go far towards meeting the grievance stated by Messrs. Malcolm, Kearton & Co., but it seems to be likely that, apart from this particular feature, the chests themselves are inherently too weak to bear more than just the journey home to London. As so much of the tea destined for the continent is purchased here in the open market, your planters cannot discriminate so as to pack teas for the re-export service in specially strong cases. So it seems to be the only resource, if the evil stated is to be avoided in the future, that endeavour should be made to

generally increase the strength of your tea boxes all round. How this may best be done it is impossible for me to suggest. There would be objections, we presume, to increase the thickness of the boards used as this must add somewhat to the freight charges. Still it must be most important, at a time when every effort is being made to open to your teas the Continental and other foreign markets, that all cause for probable complaint should as far as possible be removed. No doubt, independently of the loss in quantity complained of, the quality of the contents of weak boxes must be deteriorated, and this may result in giving Ceylon teas a bad name among Continental users. Messrs. Malcolm, Kearton & Co. are the purchasers and exporters here of the teas required by Mr. Rogivuc for his Russian trade, and it is more than probable that that gentleman has been one of the foremost sufferers from the defects they complain of. It is to be hoped your planters will find some means to add strength to their boxes. First and foremost they should try in the direction formerly pointed out to obviate the necessity for rebulking here. That as I have written seems to be the most prominent matter to take precaution against. Then, if the extra thickness of boards suggested should entail some increase in the cost of freight, it may be the better economy in the end to incur it rather than to run the risk of your teas getting a bad name among Continental buyers. I feel convinced that sufficient attention is not given in Ceylon to this matter of packing tea. You attempt to cut the cost of this too fine, and my visit to tea brokers and others rarely pass without my having to listen to grumbling of some sort or another with respect to this special point. The evil is general and striking and no effort should be spared for its future avoidance.—*London Cor.*

THE ACME TEA CHEST.

We learn that Mr. Andrew Polson, who was recently in Ceylon, has now arranged with the Acme Tea Chest Syndicate Ltd. to come to Colombo and establish a depôt for the sale of their patent chests. Mr. Polson hopes to arrive in Colombo by the s.s. "Austral" on or about 7th January 1894, and before this date a large stock of the boxes will arrive. The following letter speaks for itself and is of so much interest to planters that we do not hesitate to give it a place:—

Copy.

16, Philpot Lane, London, 7th Oct.

To the Acme Tea Chest Syndicate, Limited, Glasgow. Dear Sirs,—In reply to your enquiry regarding the last parcel of tea consigned to us in Acme packages, we beg to inform you that the tea arrived in good condition, and on comparing this parcel with a similar shipment in wooden packages, the following results were shown.

ACME PACKAGES.	WOODEN PACKAGES.
Freight per 100 lb. 26s 4d	Freight per 100 lb. 30s 3d
Dock & Landing charges do 43s 7d	Dock & Landing do 51s 4d
70s 1d	81s 7d

Loss in weight $\frac{1}{2}$ per cent. Loss in weight 1 per cent.
—We are dear sirs, yours faithfully,

(Signed) ANDERSON BROS.

NOTE.—Showing in favour of Acme $11\frac{1}{2}$ on freight and landing dues and $\frac{1}{2}$ lb. of tea at 10s, in all 1s 4 $\frac{1}{2}$ d per 100 lb. of tea.

[What is said in our London Letter about defective tea chests, ought to be carefully weighed by planters.—Ed. T.A.]

THE CEYLON LAND AND PRODUCE COMPANY, LIMITED.

Report of the Directors, to be submitted to meeting of Shareholders, 11th day of December 1893.

The amount at credit of Profit and Loss Account, after reducing the mortgage over North Matale estate by £1,500, is £11,191 9s 4d which, with the sum of £1,341 11s 7d brought forward from last year, leaves £12,533 0s 11d to be dealt with.

On the 1st July last an Interim Dividend of 7 $\frac{1}{2}$ per cent on the Ordinary Shares, and 3 per cent on the Preference Shares was paid, and your Directors now propose to pay, on the 23rd day of December, 1893, the balance of the fixed cumulative Dividend on the Preference Shares (3 per cent), making 6 per cent for the year, 7 $\frac{1}{2}$ per cent on the Ordinary Shares, making 15 per cent for the year, and in addition a bonus of 5 per cent on the Ordinary Shares,—all free of Income Tax. It is also proposed to take from the Profit and Loss Account a sum of £4,000 for the further reduction of the North Matale mortgage. This will leave a balance of £2,646 0s 11d to be carried forward subject to the Directors' remuneration for the year under review, to be fixed at the General Meeting and to the payment of Income Tax, &c.

The result of the operations during the past season has been satisfactory, and is owing, in a great measure, to the large crop of cocoa, and to the high prices secured therefor.

TEA.—The year 1893 opened fairly well, so far as prices were concerned, but after January the Market fell away until June, when the lowest point was reached, and rates began to rise gradually. These fluctuations, caused to some extent by the state of trade, were however chiefly due to the quality of arrivals, which in the spring and early summer was disappointing. When, however, more favourable weather for manufacture was experienced in the island, and better teas came forward, the weekly average again tended upwards. On the whole, this year's crop is considered by the trade to be inferior to that of 1892, but no doubt prices have been adversely influenced by the larger supply of Indian tea, which although not of fine quality, was of useful character and very moderate in price. During the ten months from January to October, 725,100 packages were disposed of at public auction, the average price being 9d. per lb., against 705,640 packages during the same period in 1892, with an average of 9 $\frac{1}{2}$ d per lb.

COFFEE.—This article has sold at a high range of values throughout the year, and it is gratifying to your Directors to report that the output from the Company's estates has again realised very satisfactory prices, 95s. per cwt., the highest price paid during the year being obtained for Liberian from North Matale Estate.

Cocoa.—Your Directors have again a satisfactory report of this article to put before you. The demand during the early part of the year was good, but subsequently subsided, partly in sympathy with that for other kinds. It is encouraging to have to report that the prices obtained for the Company's produce again compare very favourably with the figures of other estates, and the highest price ever obtained for this growth was for a parcel of North Matale, which realised an average price of 130s 9d. per cwt.

At the request of the Board and some of the largest Shareholders, your Chairman visited Ceylon in the early months of the current year. He made himself thoroughly acquainted with the work being carried on at each Estate by frequent inspections, and on the whole found the operations thereon being conducted satisfactorily. He reports that the Company's Cocoa Estates were looking remarkably well, and gave instructions to plant up all available and suitable land belonging to the Company with this product, to be interspersed with Coffee where thought desirable. Instructions were also given by him to fell the greater portion of the jungle on Fetteresso, and plant it up with the best kind of Tea. About 35 acres—mostly in grass which had nearly all died out—on Dickeria is also being planted with Tea. This area adjoins the fine fields of Tea on Nikakotus, and it is hoped that the Dickeria clearing will be equally successful.

Special attention was also given to the two Estates—Owella and Strathisla—which had almost entirely gone out of cultivation, the result being that about 40 acres of the former are in process of being planted, the principal product being Coconuts; whilst about 90 acres of the latter property will be planted with Cocoa and Coffee. The Directors express a hope that the efforts made in this direction will meet with success.

The Directors are pleased to note that your Chairman also reports that the Company's Tea Estates look remarkably well.

The following Statement shows the acreage of the Company's Properties at date:—

Name of Estate.	Tea.	Coffee and Cocoa.	Forest, Grass, Chena, abandoned, &c.	New Clearings.	Total Acreage.
Alloowiharie and Dickeria...	15	373	247	35	670

	1621½	1158½	1539½	235	4554½

The Mortgage Account, which originally stood at £15,000, has now been reduced to £6,000, and on the 8th inst. it will be further reduced to £5,000.

INDIAN TEA INTERESTS AND THE CHICAGO EXHIBITION.

Mr. Blechynden may not be a combination of Barnum, Jay Gould, and Artemus Ward's showman; but judging from what he was done at the exhibition, his most determined antagonists at Darjeeling must recognise that he has not been a failure. That he might have done better would have been possible, had the Indian Tea Association had a larger grant at its disposal,—for the Government grant of £40,000 was ridiculously small—and had the Government of India taken a real interest in the representation, which unfortunately they did not. Whatever the reason, Mr. Blechynden was snubbed at the outset by Sr Henry Trueman Wood, the Secretary of the Royal Commission, and treated as a bagman or *bicri-rivallah*. He had to meet a continued contemptuous opposition from this official and the Royal Commission clique, as well as a hundred silent influences, which were exerted from head-quarters at home. And it was certainly not advertised that he received the same hearty support from his constituents in India that Mr. Grinton obtained from Ceylon. And here we are asked to pause at the cunning arrangement whereby Mr. Blechynden got the better of his Ceylon rival. The teas were given a poetic name. One was the "Light of Asia," another the "Star of India," and the third "Lalla Rookh," and, served by the gaudily-dressed Khitmagar, each must have tasted like nectar to the sentimental American demoiselle. Having "mashed" the American public through the Khitmagar, Mr. Blechynden next proceeded to get Indian tea planted on the trade. He has acted on quite a different system to Mr. Grinton of Ceylon who believes in advertising and running against the trade. Mr. Blechynden is working in with some wholesale houses, thereby, says the correspondent from whom we have already quoted, being enabled "to work with a very small outlay, spending nothing whatever for advertisements." We do not believe in cheese-paring or doing the mean in pushing any business and as advertising is the soul of success we cannot commend any cheap and nasty method, such as that conveyed in the expression "spending nothing whatever for advertisements." We trust that Mr. Blechynden has been successful in choosing his tea-mediums, for according to the

system he has been permitted to adopt, a deal depends on them; but so shrewd a man is not likely to fall into any error on this head, at least we hope not. There is so little publicity given the doings of those officially interested in pushing Indian tea in America, that the outsider cannot pronounce an opinion as to the scheme which it is thought advisable to adopt for pushing our teas in the States. If Mr. Blechynden has justified the confidence reposed in him, he should be undoubtedly supported by the whole tea confraternity of India, and considering the interests at stake, we must confess we are rather surprised that no movement has been made *pro* or *con* in this respect, while the whole of Ceylon has been in a state of excitement for the last month or two as to how to follow up the success of the Ceylon Court in pushing the Colony's teas. Fussy, flashy work is not required and perhaps is to be deprecated; but we should like to see some outward and visible signs of enterprise in the matter of backing up the position that has been attained in America by Indian teas. Honour to him who takes the initiative for this end.—*Indian Planters' Gazette*.

ASSAM RUBBER.

The extension and development of any of the sources of rubber supply are matters of vast importance. All persons connected with the rubber industry are directly concerned in the question, and cannot but take a warm interest in anything that relates to it. We learn with great satisfaction that Assam Rubber is going ahead. The new rules introduced during the year, with the sanction of the Government of India, by which the old system of farming the collection of rubber was abandoned, and replaced by the imposition of a duty of R12 per maund, on all rubber imported from beyond the border, or collected from trees growing on Government forest land, have worked very successfully from a financial point of view. The receipts from the duty collected during the past season have amounted to over R50,000, as compared with R25,535 received from the contractors in the previous year, 1891-92. These rules only came into force on November 1st 1892, and there was naturally some little delay in getting them understood by merchants and others interested in the rubber trade. But when this was accomplished, the new arrangements seemed to have worked fairly well, and to have given no cause of complaint to either hill-man or trader. And, although the exports of rubber were 1,800 maunds less than usual up to 31st of last March, the returns of the following three months, ending June 30th, 1893, prove that the trade has pulled up its leeway, and even exceeded figures of recent years. Continuously increasing augmentations may confidently be expected.—*India Rubber Journal*.

NOTES ON PRODUCE AND FINANCE.

THE SALE OF INDIAN TEA.—There is a letter signed "F. Peek" in last week's *Grocer*, in which the writer points out that a great deal of misapprehension seems to exist in regard to the proposal recently made to, and considered by, the Indian Tea Districts Association, to regulate the quantities of Indian tea to be put up weekly for sale by public auction. The writer says the facts of the case are simply these;—The whole trade of the country, and chiefly the importers, have from time to time suffered from excessive quantities of tea being suddenly forced upon the market by public sale, producing a feeling of panic amongst buyers, who were not only unable to understand the reason for such urgency, but also unable to value properly such excessive quantities in the short time allowed. The proposal made to the Indian Tea Growers' Association was that at the end of each month the quantities to be put up for sale during the month following should be regulated and published, the quantities each week being as nearly equal as possible. The effect of this would have been to give confidence to the buyers, to enable

them properly to value the teas, and also to give time to the warehouse-keepers properly to prepare the parcels for sale. As there are always some ill-conditioned members of every trade who will accept every benefit, but seek only their own interest by holding aloof from any arrangement, the scheme included the formation of an association to prevent such persons from sacrificing the interest of the whole trade for their own individual benefit, by binding buyers to abstain from purchasing at any irregular sales held by such individuals. The scheme, which appears to have unnecessarily frightened the Association, was in the interest of all connected with the trade, but chiefly of the growers and importers. Buyers of tea will, no doubt, protect themselves by ceasing as much as possible to hold stocks, which may at any time be seriously depreciated by excessive quantities suddenly being thrown upon the market. It is rather difficult to understand this treatment of the question by the importers.

A TRADE VIEW OF LAST WEEK'S TEA MARKET.—Indian tea has not been so liberally offered, says the *Produce Markets Review*, and in the earlier part of the week prices ruled steady to firm, but at the later sales there was an easier tendency. Exceptionally good value is now offered in the medium grades, a large business having been transacted, and it is doubtful if these teas will be obtainable at the present low quotations later on. At any rate, buyers appear convinced that the present is a favourable opportunity for holding stocks of fair dimensions, and in this it would seem that they are quite justified, as it is doubtful if teas of similar quality will be forthcoming in the later imports at the current low quotations. The commoner descriptions, although showing no appreciable change in value, will, from all accounts, be plentiful, and prices may not be maintained, as the future supplies bid fair to be quite equal to the demand. Pekoes and broken Pekoes between 1s and 1s 6d are now being freely brought forward, and can be bought considerably under the prices ruling a few weeks ago, while as they have probably touched about the lowest point the trade is purchasing more freely. The market continues to be only moderately supplied with Ceylons, and prices show no alteration, the improvement in the value of all good descriptions being well maintained. Of the quantity offered at auction a large proportion was of very indifferent quality, and there is still a dearth of broken Pekoes possessing both point and strength under about 1s per lb. There has been more demand for Common Pekoe Souchongs.

CINCHONA CULTIVATION.—The cultivation of cinchona bark in Ceylon has rapidly given way before the more profitable cultivation of tea. Java, on the other hand, is going ahead with great strides with cinchona. Java cinchona proves too strong a rival for the Ceylon bark, as its richness, being to a great extent Ledgeriana, naturally commands the demand. It is obviously more remunerative for a consumer to purchase at a little higher price a bark yielding 4 to 5 per cent. instead of 2 to 3 per cent., as is the average yield now of the Ceylon cultivation. Almost in the same measure as the exports from Ceylon have decreased those of Java have increased, as is shown by the following figures:—

Exports from Ceylon.		From Java.	
1890	lbs. 7,195,713	...	7,291,169
1893	3,098,277	about	9,000,000

Java has not been able to make up for the reduced supplies from Ceylon, hence a yearly decline in the total figure of imports and a steady reduction of stocks.—*H. and C. Mail*, Dec. 1.

THE DUTCH MARKET.

Amsterdam, Nov. 23.

The cinchona auctions to be held in Amsterdam on December 14th will consist of 6,047 hales and 195 cases, weighing about 544 tons gross, divided as follows:—From the Government plantations 343 bales, about 33 tons; from private plantations 5,704 bales and 195 cases, about 511 tons. This quantity contains:

Of druggists' bark—Succirubra, quills 128 cases; broken quills and chips 59 bales and 67 cases; root 58 bales. Of manufacturing bark—Ledgeriana, broken quills and chips 4,587 bales; root 880 bales. Hybriden, broken quills and chips 448 bales; root 4 bales. Officialis, broken quills and chips 11 bales.—*Chemist and Druggist*.

THE LAST CINNAMON SALES.

We quote as follows from Messrs. Wm. Jas. and Hy. Thompson's Circular, to hand by last night's mail:—

London, 27th Nov. 1893.

Monday Afternoon.

The quarterly sales today comprised the following assortment:—

478 bales, against 435 bales 1st sort Ceylon last year.			
570 do do 753 do 2nd do do			
370 do do 485 do 3rd do do			
227 do do 185 do { 4th and unsorted			
690 do unworked 687 do unworked.			

2337 bales Ceylon, against 2495 bales Ceylon.

— bales Tellicherry do do
431 bags chips do 938 bags Chips

Since the last sales there has not been much business done on the spot, but several parcels again sold to arrive latterly at 6½d per lb. c.f. & i. terms.

Today there was very little demand throughout, and only about half the above quantity sold at ½d to 1d decline upon current qualities. Good and fine went slowly at 1d to 1½d per lb. reduction.

Quotations as follows:—

	Per lb.	s	d	s	d
Ceylon 1st sort, fine and superior	...	0	9	@	1 4
do do do fair to good	...	0	7½	do	0 8
do 2nd do good to fine	...	0	7½	do	1 1
do do do low to fair	...	0	6½	do	0 7½
do 3rd do do fine	...	0	5½	do	0 10
do 4th do	...	0	5	do	0 8½
do Unworked	...	0	4½	do	0 6½

Chips went at 2½d to 2¼d. Cutting and Quillage 4½d to 6½d per lb.

The next sales are to be held on the 26th Feb. 1894. —*Local "Examiner."*

THE VISIT OF SIR JOHN MUIR, BART.

HIS IMPRESSIONS OF CEYLON.

The *P. & O. ss. "Chusan"* which left on the 21st Dec. for Calcutta took away Sir John Muir who had been in our midst for over a fortnight on business connected with the Sylhet Tea Companies of which he is the distinguished head. Lady and Miss Muir came out from home by the "Chusan" and along with Sir John were the guests during the day of His Excellency the Governor and Lady Havelock at Queen's House. In the course of the afternoon Sir John, accompanied by Lady and Miss Muir, visited the offices of Messrs. Finlay, Muir & Co., who are the local agents for the Sylhet Companies, and there a representative of the *Observer* had the privilege of a few minutes' conversation with the doughty, shrewd, and genial Baronet, and Mr. Buchanan with whom Sir John visited our tea districts, spending altogether ten days upcountry. Sir John expressed himself as extremely delighted with his stay in the "spicy isle" and spoke in most grateful terms of the kind and cordial welcome that had been extended to him on all hands. Speaking of his trip upcountry he said that he had visited Dikoya and Bogawantalawa, where he saw very fine tea indeed and had the pleasure of meeting the Hon. L. H. Kelly and Mr. Clements; Dimbula where he met a very good specimen of a Scotchman in Mr. Sinclair of Bearwell; Nuwara Eliya and the Warwick

group of estates, "in which," he added with a smile "we are interested"; Haputale where he was cordially received by Mr. Lloyd; and Badulla where Mr. Fisher, the Government Agent, extended his hospitality. From Badulla he returned to Nuwara Eliya via Wilson's Bungalow, and on Monday came down to Colombo. He was unfortunate in having wet weather at the Sanatorium, but generally his impressions of his visit to the planting districts is of the most favourable character, and he seems determined, so far as he can, to still further strengthen the connection which his Companies have so far established in Ceylon. "We have had plenty of properties offered to us but"—and there was a twinkle in his eye as he spoke the qualifying sentence—"we don't want to pay too dear for our whistle. The whistles are very good but they are asking too much for them, and we can afford to wait a while. We are not in a great hurry." Sir John seemed to be particularly well impressed with our high grown teas, and he concurred in Mr. Buchanan's remark that while one could not really compare Indian and Ceylon estates—the good in both would last—our teas growing at a high elevation were better than some they had seen in Darjeeling. "We have shown our confidence in Ceylon by our investments," he continued, and we wish to strengthen the planting industry here as much as we can, and to work in harmony with everybody engaged in the enterprise with which we have identified ourselves here. In all matters connected with tea planting we should like to see Ceylon and India working together. We have been working together, but we might have done far more, and I am hopeful that in the immediate future Ceylon and India will go hand-in-hand in endeavouring to conquer America." The reference to America at once suggested Chicago and Mr. Buchanan remarked that he had had the pleasure of inspecting our court at the Exhibition and he added "most certainly tea planting had justice done to it there. Speaking of Belgravia Mr. Buchanan mentioned that the real acreage was 297. With regard to his future movements, Sir John said that of course he would visit the Companies' estates in India and endeavour to conclude negotiations which were on foot for investments in Assam. He hoped to be back in England by April next returning via Colombo. We wish our distinguished visitor and his good lady and daughter *bon voyage*.

NEWS FROM THE CENTRAL PROVINCE :
PLANTING AND OTHERWISE.

(Notes by Wanderer.)

Dec. 21.

TEA has been flushing well up to end of last week, but the cold N.E. winds have set in, and have in a measure checked the intake. However, there is enough tea in the *Factories* and in *transit* to swell the total exports from Ceylon in 1893 to over 83,000,000 lb. if there is sufficient shipping to take it away by 31st of December. I notice the total export to 18th inst. is 79,100,000 lb. or about 10,000,000 lb. more than at same date of 1892. Some planters are of opinion that in the first few months of 1894, we should repeat the experience of 1892, and frighten the tea dealers. However, we have the probability of a very dry ending to the N.-E. monsoon, which means rust in the high estates and helopeltis in the lowcountry. This will no doubt prevent our flooding the markets with our fragrant loaf.

THE PLANTERS' ASSOCIATION will have their big guess of tea exports for 1894 out by the end of January. The Committee of last year is rather blamed for cutting down *District Estimates* too severely.

PUSHING TEA in America and Russia as recorded in the minutes of last Tea Fund Committee afford the thinking planter some arithmetical puzzles. If Mr. Rogivue with the aid of, say, £800 from the Tea Fund in *money* and *tea* can push Ceylon tea to the extent of 125,000 lb. in Russia, what quantity ought Commissioner Grinton to put on the American market for £20,000? I think he ought to wait for his C.M.G., and K.C.M.G. or even higher honours till the end of 1894. The Australian Commissioner waited till the results of his labours were seen. So brass bands playing the "Conquering Hero," Royal barges, &c., may safely be postponed till we see Ceylon tea in America imports raised to 3,000,000 lb.

MR. WHITTALL'S death is a loss to Ceylon. He arrived in Ceylon at a very critical time in the history of the colony. His outspoken criticism of the state of matters, though not relished, did good. He was forcible, and what he said and did put us all on our mettle. No one admitted the pluck of the planter more than he did. Last time I saw him he said, "There is no need for my remaining here or even coming out again. The country is now in full swing with a product which it can grow to any extent. I can work in England better than here to push Ceylon tea in the world's markets." Little did either of us think that within five weeks he would be taken.

CACAO.—I am glad to note America is increasing its imports of cacao. Wilson, Smithett & Co. still report an excess of stock over last year. I doubt the wisdom of our Planting Member in postponing action in the Council till the Government can find out what the Police Magistrates in the lower districts are doing! The Police Magistrates in these districts are as good men as can be found and anxious to reduce cocoa stealing in the interest of the native as much as the European grower. The man that ought to be caught and lashed is the receiver.

THE "Sir John Muir" Cos. could not better initiate the work they have before them, as their leader told your representative, "of strengthening the connection it has with Ceylon," than by making the village of Belgravia a pattern to the other villages of the planting districts.

STEADY MARKET.—Messrs. Rucker & Bencraft's idea of this article seems to be rather a funny one. In their circular of the 30th November under "Rum" they say market steady. No sales reported. I don't think I should like such a steady market for tea.

TEA PLANTING IN INDIA.—The planters in Chittagong, Dooars, Konyon Valley, Neilgherry and Terai will not smile when they read their averages in Messrs. Gow, Wilson & Stanton's circular of 1st December quoted 6½d, 7d, 6½d, 7d and 6½d respectively. Travancore is pretty fair at 8½d.

MARKET FOR TEA SHARES.

(FROM OUR SPECIAL CORRESPONDENT.)

Thursday evening, Dec. 7.—Rather more business in shares has again characterized this week, and with further interim dividends in prospect, the tone is "a shade" steadier.

"Mincing Lane" has again steadied slightly owing to rather more limited sales, but the tone is still not very bright, and heavy supplies of medium-class Teas seem rather frightening buyers.

News from the producing districts confirms previous anticipations of a somewhat early closing up of the season but under more favourable conditions for manufacture and consequent improved quality.

Interim Dividends.—The following further interim distributions are now announced :—

Jokai	"	5 per cent
Chubwa Prof.	"	3½ " "
Chubwa Ordinary	"	3½ " "

Ceylon Shares.—Ceylon Plantations Company. The only business reported is a retail transaction in the Ordinary shares at 15½, but without any more shares altered under 15½ or thereabouts.—H. and C. Mail.

NOTES FROM OUR LONDON LETTER.

LONDON, Dec. 8.

AN OBJECTIONABLE PRACTICE—PUTTING LEAD IN TEA.

Messrs. Tetley & Co., of 31 Fenchurch Street, wholesale tea dealers, have addressed the Secretary of the Ceylon Association in London making complaint of a practice which it would seem is not an uncommon one on the part of your tea planters. It is that of endeavour being made to equalize the tare of different packages by putting in pieces of lead among the tea to make up the weight deficient in the tare of particular chests. This practice Messrs. Tetley assert to give rise to much inconvenience. Grocers into whose hands chests so weighted may ultimately come, form the impression that they have been defrauded of tea to the quantity represented by the weight of the inserted lead. This of course is not the case. The full amount of tea is contained in the chests, the lead only balancing the inequality in the weight of the chest and lining itself. But Messrs. Tetley write:—"It will save considerable friction and often loss of money to the wholesale dealer, if this could be avoided in future." It must surely be objectionable to introduce lead among the tea? We often hear it contended that even the lead lining is not a thoroughly wholesome method of packing; but to introduce cut lead, must, it seems to me, considering that it is absolutely enveloped by the tea, be a practice distinctly injurious. It was thought that the complaint made by Messrs. Tetley must refer to only a few isolated cases, but enquiry made convince us that other instances are not unknown. Thus Mr. Shand, we hear, has had several occasions of similar complaint under his notice which have caused him to refer the subject to Ceylon. Doubtless those among your planters who have hitherto pursued the course complained of will, when the dislike to it entertained here is made known to them, avoid a repetition of it. For it is not as if the amount of lead inserted is always trifling. It has been mentioned to me that in one of the instances brought to Mr. Shand's notice as much as 2 lb. of lead was found in a single chest.

THE GEMMING AND MINING COMPANY.

I am sorry not to be able to send you with this a copy of the report of the Gemming and Mining Company of Ceylon, though it may reach me after I have been compelled to close this letter. From the copy seen by me it would seem that during the year reviewed by it the Company merely succeeded in making their receipts and expenditure balance, but only by the sacrifice by the director of the fees they were entitled to for the year. This is not a very promising result, and it would not surprise me to hear that the directors may ere long consider it necessary to take steps to bring their operation to a close.

CEYLON MICA IN ADELAIDE.

Mica.—At auction on the 9th inst. 234 cases mica were offered, but only the large and medium sizes found buyers, consisting of about 60 cases at very firm prices. Small sizes were not in demand, and were all bought in. The bulk consisted of Calcutta, but a parcel of Ceylon amber of sizes varying from small to medium was offered, and an offer of 1s 6d per lb. recorded. A small lot of green black Ceylon of uneven surface was offered, but only 3d per lb. bid.—*Adelaide Observer.*

CEYLON TEA IN AUSTRALIA.

Tea has shown rather more activity, having been assisted to some extent by the cabled information of the virtual closing of the Foochow market with a total export for the Australian colonies of only 12½ million lb. In view of the great increase in the imports of Ceylon and Indian teas, the quantity named should, however, be ample for requirements.—*S. M. Herald.*

DRUG REPORT.

(From the *Chemist and Druggist.*)

London, Nov. 30.

CINCHONA.—Tuesday's cinchona auctions were moderately extensive in quantity. Nine brokers offered bark, and their catalogues totalled up to—

	Pkgs.	of which	Pkgs.	were sold
Ceylon cinchona	341	do	258	do
East Indian cinchona	1,211	do	1,097	do
Javan cinchona	72	do	72	do
African	63	do	63	do
South American	395	do	114	do
Cuprea bark	318	do	32	do
	2,600		1,836	

The quality of the bulk of bark offered at auction was exceedingly poor. There was but little competition among the quinine-makers, and no alteration can be reported in the unit value which remains as nearly as possible 2d per lb.

The following are the approximate quantities of bark purchased by the principal buyers:—

	Lb.
Agents for the Auerbach factory	85,896
Agents for the Paris factory	62,390
Messrs. Howards & Sons	61,643
Agents for the Brunswick factory	50,658
Agents for the American and Italian works	25,823
Mr. Thos. Whiffen	15,336
Agents for the Frankfurt o M and Stuttgart works	13,588
Agents for the Mannheim and Amsterdam works	8,600
Sundry druggists	6,684
Total quantity of bark sold	357,703
Bought in or withdrawn	124,822
Total quantity of bark offered	506,526

The comparative amounts of bark purchased by individual firms are no guide to the quantity of quinine acquired by the buyers.

CEYLON CINCHONA.—Original: Red varieties, ordinary dull to fair bright quilly branch and stem chips 1d to 2½d; grey chips 2d to 2½d; yellow ditto 3½d to 3½d; hybrid ditto 2¼d per lb. Renewed: Red stem and branch chips, ordinary to good bright 1½d to 2½d per lb.

JAVA CINCHONA.—Seventy-two bags were offered, and all sold, fair yellow chips at 2½d to 4d, root at 2½d per lb.

SOUTH AMERICAN BARK.—Of 518 bales Cuprea, all of 1832-33 import, only 32 bales of ordinary dusty quality sold at auction at 1½d per lb., offers of from 1d to 1½d per lb. being refused for other lots. Since the auctions, however, quite 150 bales more have been disposed of. Of 395 ½-cwt. packages cultivated Bolivian Calisaya quills 14 bales sold at 4d to 4½d per lb. fair quill, analysing 5.49 per cent sulphate of quinine.

COCA LEAVES.—It is said that the New York market has been cleared of the common kinds of Truxillo coca, everything below 7d per lb. having been acquired by manufacturers. Huanoco is firm at 1s 3d per lb. c.i.f.

ROSEHAUGH TEA CO., LD.

Further particulars have been brought by the mail of the construction of this Company. The capital we understand is £52,000 divided into 390 ordinary and 130 preference shares of £100 each. Present issue £39,000 in ordinary and £13,000 in 5 per cent preference shares. The Company's office is at 130 Fenchurch Street, and the London agents are Messrs. Nevett, Oswald & Co., while the Ceylon agents are Messrs. George Stewart & Co. The properties which have already been purchased by the Company are:—Heatherley in Kalutara for £10,000, Culloden in the same district for £20,000, Meeracotta in Maskeliya for £12,000 and Sanquhar in Russellawa for £10,000.

VARIOUS AGRICULTURAL NOTES.

THE MORAWA KORLE TEA Co.—This Company is the latest addition to the list of our sterling Tea Companies, and has been formed out of the Ensalwatte and Silvakande estates, including a fair extent of new land which is about to be opened in tea. The company is to a great extent a private one, large interest in it being held by Mr. J. Boustead, senior. We are glad to hear that all the newly-opened land is doing well, and that the tea is realising good prices. Messrs. Boustead Brothers are the local agents.

SALE OF HANIPHA ESTATE, PASSERA.—Dec. 17th.—At the instance of Mr. Mackay John Sobie, of the United Service Club, Edinburgh, the above property was put up for sale by public auction yesterday, at 12 o'clock noon, by the Fiscal of the Uva Province, for the recovery of the sum of R45,000, with interest thereon of 8 per cent. per annum from 1st January, 1885. The estate was bought by Mr. W. Stewart Taylor for the plaintiff for R3,512. There were present at the sale Messrs. G. K. Deaker and Charles Henry. The latter represented Mr. Davidson of Kalutara.—*Badulla Cor.*

AN INTERESTING REPORT ON COFFEE CULTIVATION in the South American Republics and the West Indies has just been published in the United States. Venezuela, says the report, ranks next to Brazil as a coffee producer, containing large districts "admirably suited for the growth of coffee." In Ecuador "there are undoubtedly large bodies of land suitable for coffee culture," but the berry is not as extensively cultivated there as in the countries last-named, coffee being third in value among Ecuador's exports. The Guianas and most of the larger West India islands produce coffee, Jamaica exporting it to the value of \$1,381,114 in 1890-91, Puerto Rico to the value of 3,000,000 pesos, and Guadeloupe 181,000*l.* worth in 1888. The coffee of Jamaica, like that of Hayti, is of fair quality, a little stronger than Java and milder than Rio.—*Colonies and India.*

THE BLANTYRE PLATEAU, E. AFRICA.—A. Werner writes to *The Speaker*:—"We started about sunrise, and as the day went on, the clear air and unclear air became brighter, and the sky more intensely blue. The Angoni moved at a sort of slow jog-trot, which was far from unpleasant, and encouraged one another somewhat after this fashion:—

The Man in Front: Tu-tu-tu-tu-tu (crescendo, ending in a yell).

The Man Behind: Ho-ho-ho-ho-ho (dying off to a grunt).

All, (not exactly in unison, but in a sort of dropping fire, so to speak): Tieni msanga! tieni msanga! (Let us go quickly!) Fired by which laudable resolution they run a little way. Then the man in front begins again (in a series of quick gasps):—

To-to-to-to-to!

The Man Behind (like the fiend who so worried Dante): Arri, arri, arri!

Somebody Else (in the rear, with reminiscences of the war-path): Whu-yu!—(a sharp, shrill whistle, in two notes.) Etc., etc., etc.

Then, when the road begins to ascend a little—a chorus of mutual entreaties and exhortations: "Mbolembole! (Softly!) Don't run!" etc., which I couldn't help thinking superfluous advice.

The road (twenty-eight miles from Katung's to Blantyre) was made by the African Lakes Company, I believe in 1876. It is not very well adapted for wheeled traffic, but as the wheeled conveyances in the country could almost be counted on one's fingers, this is no great loss, and it is a very creditable piece of engineering. It rained as we wound up and up the slopes, ceasing for a little, and then once more settling into a steady, even downpour, till at

last the gray granite boulders on Sochi came in sight, and by-and-bye the white verandah of Mandala House—already a historic building—and then we crossed a stream and ascended a hill, and turned into the avenue of tall blue-gums, at the end of which the white dome and red-brick walls of Blantyre church burst on one's view. And so the *ulendo* ended up with a kindly Scottish welcome, a blazing wood-fire—and tea!

COFFEE.—How is it that the price of our old staple has not advanced beyond R16-50 a bushel? This price was obtainable at this time last year; but with the troubles and stoppage of trade in Brazil, we should have expected the rate to be nearer R20 per bushel by this time.

CONVICT CULTIVATORS.—In discussing the subject of agricultural education some time ago, we suggested that it was practical to utilise the jails as a sort of primary school for instruction in agriculture. Our remarks were followed by a letter from a correspondent who signed himself "Not a Jail Superintendent," and who said that in Assam it had been proved that prisoners can be utilised, and at any rate made to grow their own food.—*Pioneer.*

THE CEYLON LAND AND PRODUCE Co.—We may certainly congratulate the shareholders in this Company on having one of the best securities for continued prosperity that we know of, namely, a large and flourishing acreage of cacao and Liberian coffee to back up their tea. We are glad to see that some coffee as well as cacao are being planted and that a start is also made in coconuts. Verily this Company is going to justify its name as an all-round Ceylon Produce Company. The ordinary dividend for the year seems to have been 15 per cent with 5 per cent bonus—or 20 per cent in all? Few Companies can equal this.

CEYLON TEA IN AMERICA.—In another column will be found a letter by Mr. A. E. Wright giving an extract from a letter from the Commissioner on this subject, and advising the formation of a Company in London to carry on the work in America. For ourselves we are inclined to the opinion that with Lipton and other Ceylon merchants already in the field the work of establishing and carrying on stores must be left to private enterprise. There might be no harm in the Tea Fund giving assistance in opening new centres, and the Committee ought to begin by advertising as largely as possible taking care to make contracts in the first place with those newspapers that may have suffered by the collapse of Mr. Elwood May's Company.

TEA CULTIVATION IN CEYLON: THE CONDITIONS FOR GOOD PRICES AND GOOD CROPS.—We have received quite a number of suggestive letters from planters of experience on this subject, which we shall lay before our readers, day by day, as space will permit; and we cannot help thinking that a good many besides Mr. Rutherford and other London residents connected with tea, will be interested in the discussion and the information adduced. One fact given to us separately by one of the writers is of so much importance in its bearing on "jâts" that we give it prominence at once. Our friend writes:—

"The China jât tea at Loolecondera always brought 2*d* to 3*d* per lb. less than the Assam hybrid of very moderate jât."

That ought to settle the question as regards China jât at the elevation of Loole Condera; but it does better in proportion, we believe, at an altitude of 6,000 feet and over in the island.

THE ANONAS.

The Anonas are deciduous, of compact habit of growth, from ten to twenty-five feet high, and experience shows that the Cherimolia is the hardiest as well as the finest flavored variety grown. It is a native of Peru, whence it has been introduced into Mexico and many other warm countries. The flavor of the Cherimolia has been compared to a blending of pineapple, banana, strawberries and cream, and various other "good things;" yet others are not so enthusiastic in its praise. Another South American species, *Anona squamosa* (Sweet Sop, or Sugar Sop), has been successfully fruited in San Bernardino county, California; in its native habitat it commences to bear fruit in the second or third year of its growth. It is indigenous to Tropical America, and was carried to Asia soon after the discovery of America, and is now cultivated in nearly all tropical countries; this is one of the species which readily sprout from the roots when cut down by frost. In some of the West Indies this fruit, in its season, forms almost the sole sustenance of the poorer class of inhabitants. While not equal to *Anona Cherimolia*, it is considered one of the finest of fruits; it is too soft for transportation when in its best condition for eating; the unripe fruit is sometimes cooked with ginger, to counteract its astringent qualities.

Anona reticulata, "Bullock's Heart," so called from the form of the fruit (this common name is, however, misleading, as it would apply to several species), is indigenous to Brazil and has been in cultivation about 200 years. It is considered as next best to *Anona squamosa* in quality and is the true "Custard Apple."

Anona glabra, the "Wild Custard Apple" of South Florida, is said to be indigenous to Florida and the West Indies, has fragrant fruit of the size of a pippin apple and ripens in August. It is also called Pond Apple, and by the Spanish-speaking people Mamon.

Anona pyriformis and *Anona glabra* are said to have fruited in San Bernardino county, California, but I have not been able to find any description of *A. pyriformis*.

Anona muricata, "Sour Sop," is a native of the West Indies, where it is a favorite. It is a large, green fruit containing a soft, white, juicy pulp, from which a cooling drink is made; it is one of the most beautiful of the genus but is not so hardy as the other species. I have received seeds of this species from the Botanic Gardens of Trinidad, West Indies, but they sprouted and grew in transit, and this, with other accidents which befell them after their arrival, destroyed the whole consignment.

Anona longifolia, the long-leaved Anona, is a native of Guiana, South America, the pulp of the fruit is flesh colored.

Anona palustris, "Alligator Apple," or "Cork Wood," from South America, has smooth, leathery leaves, large heart-shaped, sweet scented fruit. In Brazil the wood of this tree is used as a substitute for cork.

Anona paludosa is found in swamps in the West Indies.

The *Beriba*, a species of Anona found in Brazil, is a quick growing tree, with large fruit, the flavor of which resembles that of the Cherimolia.

Anona montana. Among other species of Anonas, for which I am indebted to the director of the Botanic Gardens of Jamaica, I received specimens of the foliage of *Anona montana*, which grows wild in the Island of Jamaica.

There are several species mentioned in various publications, some of which are doubtless local varieties, or synonyms of well known species. Among them are, *A. africana*, *A. cenera* (West Indies), *A.*

mexicana, *A. trilobata* and *A. senegalensis*. The last mentioned has bluish-green leaves and small fruits with dark-red pulp, the flavor resembling the *A. Cherimolia*.—*American Agriculturist*.

PROSPECTS IN CALIFORNIA.

In your impression of last week a correspondent desires some information as to the prospect of employment in Denver. I cannot furnish this, but I enclose a letter from a friend—one of two young men who left Edinburg a few years ago in search of a home in California. Their experiences may be interesting to some of your readers. W. S.

Orange County, California, U. S.

Now about California as a field for a young man to invest £300 or £400 in a fruit ranche, I would advise no person to buy land for fruit-raising at present prices (from 100 dols. to 300 dols. unimproved), as our orange growers have had a severe lesson this year. For the best orange growers have in past years been getting fancy prices, say from 3-50 dols to 4-50 dols. and even 6 dols. in many cases for a box of oranges containing 128. Now this year growers have had to come down from their "high nail" and be thankful to take what they could get. The reason for oranges being so low is that there has not been sufficient demand at the prices asked for the supply. Next year the supply will be double what it is this year, and will go on increasing for many years to come. The question that confronts we growers is, "How and where are we to market our crops in future?" People here who should know what they are talking about say there is no fear of over-production. I am not quite so sanguine as they are, and would therefore advise great caution in buying fruit land at present, at last until we know how we are going to market our crops in future. My partner and I have 20 acres, 10 of which are in oranges, walnuts, lemons, and prunes. The other 10 acres we utilise in growing potatoes, cabbage, and Indian corn. These 10 acres should really be planted with some kind of fruit trees, but we will not plant out any more trees until we know how things are going. We, of course, are two bachelors, and do everything ourselves. We have a cow, a pig, about 120 hens, 2 horses, &c. We do our own cooking, washing, milking, churning, baking, &c. The eggs and butter which we sell pays for our monthly grocery bill; this is the best way to make a small ranche pay for the first three or four years until the trees begin to bear a sufficient crop of fruit to pay expenses. You will see from what I have said that a young man coming out here must make up his mind to rough it, as there are no home comforts to be had on a bachelor's ranche here, and he will have to do things that he never would have dreamed of doing in the old country. £300 would buy ten acres of unimproved land at present prices, that is 150 dollars per acre. To improve that land by planting trees and putting up a small shanty and a barn for hay, implements, &c; also, to buy two horses and a few hens, and furnishing the shanty, would take between £150 and £200 more—in all, say, £500. A young man could live and feed his horses, &c., for £40 a year, and with care in looking after his hens he could live, I believe, for £30. The climate here is the most glorious a man could possibly wish. It is almost eternal summer. There is a rainy season, but we don't see much of it. It is supposed to begin about November and last until March, during which time we get a heavy shower of rain now and again until we have had about from 7 to 12 inches. Then we see no more rain until next winter. I have never seen the thermometer at freezing point yet, and in summer it seldom goes over 95 degs., which is nothing as compared with 75 degs. at home. The air here is quite dry. I have once seen the thermometer at 120 degs., and next day at 112 degs., but that was very exceptional, being almost unknown in this part of California.—*Scotsman*.

Correspondence.

To the Editor.

CEYLON TEA IN AMERICA.

Bedford, Nov. 30.

DEAR SIR,—In reference to my letter of the 9th inst. I have had a long letter from our Commissioner at Chicago telling me of the good work he has been doing there for Ceylon in reply to mine of the 18th Oct., and I quote a few passages which are of vital interest to Ceylon, and will interest your readers. He says:—"Government have telegraphed authorizing me to open a tea store at Chicago notwithstanding my position as Commissioner; the difficulty I had was removed, and I have intimated that I had placed \$10,000 towards stocks and wages which, with the promised £1,000 from the Tea Fund, must do till I obtain further information as to the intentions of the Tea Company at Kandy which wired me that the Tea Fund having voted £1,000, Company do Ceylon work. This means I believe that they will meet my requisitions for supplying of tea, but as I must have the store fully stocked with some 20,000 lb. of tea (to do any good) before I leave this, I have of course had to send large indents to London which are now arriving day after day and I must meet the bills.

"I have stated officially that I would with the aid of the £1,000 do what was needed until the Planters' Association and the Tea Company had decided what they would do, and I have given them to the 30th June 1894 (to which period only I engage the staff of employees) and make the needful arrangements. The only responsibility beyond that time being the rent \$4,800 per an. (or about £1,000 a year) of a store and basement, the latter for wholesale goods, in the principal street of the city, I simply lend my money without interest till 30th June 1894. Had I waited until money came from Ceylon, the time would have gone and there would have been no store at all; as it is we are two months late in starting it."

You will see from the foregoing that Mr. Grinlinton has done more than could have been expected from him in the interests of Ceylon, and I trust that the results that his Chicago store will shew, by June 1894, will encourage the formation of a large Company in London, of say not less than £100,000 to properly work America, as in that country they respect concerns with a large capital.—Yours faithfully,
A. E. WRIGHT.

HOW TO INTRODUCE CEYLON TEAS INTO AMERICA.

SIR,—I have read with interest the many letters in the Ceylon papers upon the best methods of extending the sale of our teas throughout America. Varied has been the correspondence, and many opinions have been expressed, most writers being inclined to think that we should not submit our teas to the hands of Lipton or any dealers beyond our control. Upon that I hold quite different views, the objection is all very well as far as it goes, but what adequate means have we for disposal of teas in any quantity except through the legitimate methods of trade? With all their *mixing* I fancy any of the large dealers could pass more of our teas *mixed* with others into America in a year than we are likely to sell in ten by our limited methods. Now what is the history of the past or what has been the natural mode whereby China teas have been, and are being, gusted from Europe.

To answer the last question I remember the time when I first took some "Loocandura" tea homo with me to the parental abodes, how it was duly admired and approved, and then how, upon my return home after a month's absence, I found "the dear old China" stuff had assumed its old position, and upon my asking the reason I was told it was preferred to Ceylon teas; how I then recommended mixing it with the "beloved China," and how this mixture was doubly approved and used until in due time the taste was acquired for pure Ceylon. This was a domestic record of what has transpired in thousands of households in Great Britain, Australasia, and possibly, hundreds in Russia in and out of this has grown the special taste and desire for our teas.

Through the legitimate trader, bound to us by certain conditions and in a Catholic spirit, is the course I should advocate; for whenever we have departed from the line of individual responsibility, *i.e.*, the man himself—I mean with his own money in contra-distinction to the American speculator and his kind—we have spent our rupees with no adequate nor abiding result. Take for instance the Ceylon Planters' American Tea Company, for all the money expended what have we got? It would be interesting to ascertain the actual quantity of Ceylon tea sold through the Agency of that Company, and then to calculate the cost per lb., for I am convinced the result would not justify the outlay.* Then followed the local Ceylon Company, a concern without sufficient individual responsibility or control and without satisfactory results; that is, it has been nobody's business, nobody in particular has done anything. It only materially benefits, as far as I can learn, those who obtain commissions on the operations translated. I do not wish to be hard upon anyone, but in the preceding two instances have we had the material for any world-wide pushing and extension of our tea sales, or for any *abiding* good!

Now I need hardly say that our sole object is to make the great American people take our teas; by hook or by crook we must force them—all such business comes to this now-a-days—"on account of our importunity;" at least such is the cause of our success so far, there must be an individuality in it, and what has been done upon a small scale can usually be also undertaken upon lines of larger magnitude.

The Tea-Fund has done immense good, but it was proved that its assessments were only paid by 35 per cent of those who directly benefited by its operations. About two years ago, I was, I believe, the first to suggest to the Planters' Association Committee at Nuwara Eliya that the best plan would be to collect the necessary funds for the Chicago expenses by means of an export duty upon tea, which, I think, has proved fair and just to all. Let us adhere steadily to the export duty and use the result as a means of pushing Ceylon teas. Say for instance the future five years' exports should aggregate 80,000,000 lb. yearly, one-eighth cent per lb. export duty per annum will yield \$100,000, or, say, £6,000 sterling. Let £1,000 of this be used for general purposes for the Tea Fund as hitherto, and let £5,000 be devoted yearly entirely to the introduction of our teas into America; and that through the hands of those who thoroughly understand how to do it—not by means of companies of our own formation, but of individuals who have established themselves and so indicated their

* Nonsense, the fruit of the advertising will be gathered far and wide.—ED. T.A.

suitability—let them try their effect upon that immense and still increasing nation.

Simply speaking, my plan would be for the Planters' Association of Ceylon to offer 4 per cent *ad valorem premium* for all *bona fide* shipments of Ceylon tea to America from either London or Ceylon; or what would be about the same thing and more simple, pay the shippers at the rate of £1 sterling per 1,000 lb. of tea on all manifests of tea so shipped. This would provide for introducing 5,000,000 lb. into America yearly, and when that quantity was exceeded the shippers would be satisfied with a lower rate upon larger transactions.

I only bring this forward in its crude form, and I do not think there would be any great difficulty in putting it into practice. Its great feature is that the demand for our support can only be made when the tea is shipped and afloat, and at so small a premium as 4 per cent, it would not pay to re-ship it again from an American port elsewhere. The cautious and over-careful, as they always do, will see many difficulties, but all I can say is that, even if we are "got at" by someone it will not be worse than we have already experienced with practically little or no result; and I am convinced that some measure of this sort through the legitimate channels of trade will be better than large sums spent in schemes without very distinct and responsible heads.

We have at great expense sent our best man to Chicago to publish the merits of our teas. We must not stop now, but go on, and all I desire to urge is that we should throw up our failures and extend only upon some business principles. If 4 per cent does nothing else it can be beneficially used for advertising by those into whose hands we place it; far better than we could do so ourselves, and, as far as we are concerned *no shipments no payments* by us. The introduction of 5,000,000 lb. of Ceylon tea to begin with annually into America will be cheaply purchased by so small a sacrifice, if we can only arrange with men like Lipton to open the campaign; and what is $\frac{1}{2}$ cent per lb. on 80,000 lb. of ea (the average yield of an ordinary estate) but R100, about £6-10 sterling annually.

It is quite true and natural that Lipton and his kind will seek their own interests, yet if they put in 96 per cent. of the risks we can surely add the 4 per cent., and although not much of itself, it may be just what is wanted, and will always be 4 per cent more than unhelped dealing will produce, so will always be some indocement. There would have to be certain facile guarantees; such, for instance, in London, as bonded warehouse and dock warrants; also any quantity under 1,000 lb. could hardly be recognized, at least unless it was so evident that no little concurrent proof was needed—but these are matters of detail. In further explanation I certainly do not mean Lipton to the exclusion of others, but anyone or any number who will undertake to put our teas on the American market. From all I can learn America is not as other countries; it requires greater push and commotion to bring a new article into use there than elsewhere; and we must not forget that our teas are practically unknown among the masses. Again, two other points must be gained, a general acceptance of our teas to some large extent, and the result must be a *permanent* and *abiding* hold upon the country.

In conclusion, I make no pretensions that my scheme is fully worked out; merely that it is practicable and meets the position in what I consider to be a universally applicable spirit. If there should be no shipments there would be no expense,

and it is quite on the system of modern business which, from a political point of view, should be free-trade; and from a business point of view should be published and supported by every legitimate means.—I am, &c.,

WM. FORBES LAURIE.

BEST TEA SEED.

Dec. 10.

DEAR SIR,—With reference to the discussion now being carried on re *cat, yield and prices* of tea, do any of the purchasers in Ceylon of "Macipuri" or "Singlo" Indigenous Seed imagine they get the genuine article delivered in Colombo for from R80 to R100 for maund? If they do, they are very much mistaken. As to *Assam Indigenous*, (vide M. H. T.'s letter No. VI in your issue of the 5th inst.) there can be no such seed, as Tea is not indigenous in "Assam"—Yours faithfully,

ASSAM.

[Is this not a little hypercritical: the habitat of tea being between Assam and China?—Ed. T.A.]

THE "JUNGLE EXTERMINATOR."

Dec. 15.

DEAR SIR,—There was a Mr. Sherwell here sometime ago, agent for the "Jungle Exterminator," but he left the Island shortly after his arrival, and Messrs Cargill & Co. took up the agency, I think. I offered Mr. Sherwell 20 acres' account to experiment on and to pay him the same rate as it cost to uproot the weeds and defray his personal expenses during the experiment, but he refused the offer which seemed to me a very good one and asked R50 a day as payment during the work without any guarantee as to results and all the cost was to be borne by me (except the powder itself) so I naturally declined. If the "jungle exterminator" is anything like what we are told it is in efficiency there would be a large field for its sale in Ceylon and it would be an immense boon to the public.—Yours faithfully, L. D.

A WORD FOR THE DESPISED CREEPER.

Dec. 17.

DEAR SIR,—So much has been said of late, in no very complimentary terms about the much despised "Creepers," that it is time some of them said a little in their own behalf. I am inclined to imagine that the planter who refers to the "trading" in that commodity and the paying of "butcher's bills" thereby, would not only be content with that disbursement, but in addition would make the "creeper" pay the dresses of his "ladye faire." All pity extends to the "creeper" who goes into his "parliar." "Honi soit qui mal y pense!" I fear he must have advertised for a "creeper" offering "home comforts and a father's care" and been unsuccessful and so the hen that was to lay the golden eggs, became a thing maligned. I wonder if he ever heard of the "fox and the sour grapes" or of its unfortunate brother without a tail. If not, perhaps, Mr. Editor, you will kindly tell him these stories.

According to him Ceylon is played out, forgetting the fact that she makes a good nursery of supply for Africa in the future, for instance. That she is not quite done up, however, the following facts will help to prove:—

Ten months ago I came to Colombo and arranged to "creep" with a "gentleman." After 6 weeks, I was offered a crih as an S. D. and not only was allowed to take it, but after I was settled down to work I was the recipient of a cheque for the balance of a quarter's board of which I had not partaken. When I had been an S. D. for about 4 months I was recommended by the gentleman who pays his "butcher's bills."

off "creepers" for another place with a rise of salary and my P. D. not only allowed me to apply, but assisted me with a good testimonial. The result was that I was appointed to take over at R100 a month, with the understanding that if I showed capability I would get an addition of R50 at the end of six months. If I am not fit at the end of my time, the blame must rest with myself. It was a "creeper" who was invited to fill the place which I vacated and as far as I know gives perfect satisfaction. Another friend of my own after a six months' "creep" began at R100 a month and is now doing well. I wonder what the old planter has to say to these items? Is it not possible that he runs down the "creeper," because, forsooth, he reminds him a little of another "creeper" that makes the tree it grows on finally die. I would not be surprised if these are his thoughts, and if so I would suggest that in the meantime he study how to die gracefully, *i.e.*, that he contrive how best to return to "the old country" after imparting to a younger generation, all the knowledge he possesses. With such planters as he, I would advise "creepers" on landing in Colombo to "burn their ships."—I am, dear sir, Yours truly,
"CREEPER."

AN ENEMY OF CACAO.

DEAR SIR,—I enclose two specimens of a small beetle which, since two years, has killed a fair percentage of the cacao trees, not only in the Kurunegala district but, I am told, in other cacao growing parts of the island. It attacks in preference the best trees in the lower parts of valleys, and although I have cut down and burnt the victims, the pest is on the increase. Just as with the coconut beetle, the damage is accomplished when the sign of it appears. Can any of my brother planters suggest a remedy?—Yours truly,
CACAO PLANTER.

[Would our correspondent send us two or three specimens in a match-box or phial: those received in paper were crushed out of all recognition.—Ed. T.A.]

JAT AND MANUFACTURE.

Ambagamuwa, Dec. 19.

DEAR SIR,—Now that this momentous question seems to be occupying the minds of all tea planters kindly permit me to ventilate my humble ideas regarding the cause and effect of low priced tea. Ját in my opinion is decidedly not the ruinous factor by a long, long way. In support of this bold assertion I will lay before your readers my personal experience and leave you and them to draw your own deductions. In the "eighties" I was manager of some estates in Dolosbage. One property in particular had an entire field of the rankest low ját tea (China) and of a no mean acreage for that time of the tea enterprise. I regularly plucked over this field simultaneously with the Hybrid fields bordering on Indigenous and as a natural consequence my leaf was daily well mixed up. My genial friend on the adjoining estate who had the manufacturing of this leaf along with his own, was always able to produce a tea which commanded tall prices and to the time I left in '89 he still held high rank in the sale of firm prices, not to say that he is not holding his own at date. As another instance, take "Blackstone" in Mr. Barber's time. Is there an estate with a more mixed ját than Blackstone? How stood Mr. Barber? Some say, "Oh! he went in for extremely fine plucking." This is only talk: he always plucked the bud and two leaves—perhaps not quite medium. But what was the secret? His withering. I often saw his leaf spread out to wither—the leaf was not so very fine as you

would fancy, but withering was resorted to, to a satin softness. Never did I see leaf spread out more evenly and such a wither I never clapped eyes on. Be it remembered he was only getting his yield off about $\frac{1}{2}$ or a little more of the present acreage then in full bearing and consequently his factory and withering space was then ample for his requirements. Take "Blackwater." Look at the jump it has recently made. How account you for this? Has Blackwater an even ját? A more mixed one scarcely exists, from the "Simon Pure" down to the lowest China, and yet the estate ranks now almost first for Ambagamuwa. You have not far to look for the reason of this sudden upward spring. The magnificent new roomy factory giving loads of withering space, the Manager will tell you is the only secret.

The above suffices to maintain my theory of "not ját but manufacture." To further strengthen my views, I will quote one of Ceylon's best authorities, alas! now no more,—I allude to the late Mr. William Cameron. What was his advice to me?—"Always carefully supervise your pluckers; tea making must begin in the field; do not graze over your bushes; keep to an even plucking, say bud and $2\frac{1}{2}$ leaves; wither your leaf to a silken softness, which you can only acquire by having heaps of withering space; spread out your leaf one deep, evenly and sparsely; roll till you think you have the leaf cells were broken and then you need entertain no qualms of conscience as to the future of your tea when in the market." Speaking of ját, he only said "What is good at one elevation may not pay in another, that is for each man to find out for himself, at no doubt some cost!"

Will those advocates of ját tell me of their personal experience, whether or not leaf from a low ját and leaf from the real "Simon Pure" bud and 2 leaf or bud and $2\frac{1}{2}$ leaf plucking, withers simultaneously and if not, why not! The constitution of these leaves all will admit will differ in no way in an 8 or 9 day system of plucking. All that can be adduced is that there would be a difference in size of leaf. Does it therefore necessarily affect the withering process if the leaf is carefully spread out and not jammed. I cannot for the life of me see how such a coincidence is possible with carefully laid out leaf. In 50 per cent of our factories we are far from having the required withering space at our command; I am not an exception. Under these circumstances leaf is spread out indiscriminately, the chances being that the smaller leaf gets smothered over by his bigger and more formidable brother and has therefore not the ghost of a chance of withering air, with the result that the leaf is only partially withered. Plenty of withering space therefore can alone rectify this primary evil. Remember I am only writing on medium plucking. Again, sir, there are not a few amongst us who are so situated that a given estimate must *volens volens* be secured. To give this ridiculous mandate due effect on some estates, anything but a medium plucking can be expected. On one property I actually saw whole twigs with 4 and 5 leaves attached brought into the factory. I certainly believe in a good ját and have planted nothing but the finest hybrid and some indigenous; yet I say and maintain that ját does not and will not interfere with good results, if you are plucking carefully and withering well, soil or elevation a *sine qua non*. If you have not the former, make it with liberal cultivation.—Yours truly,
C. T.

LEAD IN TEA-BOXES.

Kandy, Dec. 27th.

SIR,—I enclose copy of a letter received from the Secretary, Ceylon Association in London.—I am, Sir, yours faithfully,
A. PHILIP.

Secretary to the Planters' Association of Ceylon.

4, Mincing Lane, London, E.C. Pec. S'h.

A. PHILIP, Esq., Secretary, Ceylon Planters' Association.

DEAR SIR,—I have the pleasure to enclose copy of

letter received from Messrs. Joseph Tetley & Co., the well-known wholesale Tea dealers. I have heard from other sources similar complaints and it may be well that Messrs. J. Tetley's letter should be published in Ceylon for the information of all concerned.—I am, dear sir, yours faithfully,

(Signed) Wm. MARTIN LEAKE, Secretary.

31, Fenchurch Street, London, Dec 5th
W. MARTIN LEAKE, Esq., Secretary to the Ceylon Association in London, 4, Mincing Lane, E.C.

DEAR SIR,—We wish to call your attention to the practice which obtains in Ceylon of putting loose pieces of lead (often of considerable size) in the packages of tea to equalize the tare.

This lead gets mixed up with the tea and when the Grocer opens the packages and finds it there, he immediately concludes that the tea has been abstracted and this put in to make up the weight, and it is almost impossible to convince him that he has not been robbed.

It would save considerable friction and often loss of money to the wholesale-dealer, if this could be avoided in future, and we trust that you will bring the matter before your Association with a view to having the practice stopped.—We are, dear sir, yours very truly,

(Signed) JOSEPH TETLEY & Co.

TEA CULTIVATION IN CEYLON: GOOD CROPS AND GOOD PRICES—No. XXXVI.

DEAR SIR,—There is no gainsaying what your correspondent, "25 Years a Planter," says as to good jät, good soil and high elevation being necessary to secure stand-out prices and large returns combined, and not even Mr. Rutherford can arrive at any other conclusion. At the same time I think the personal equation is one which must not be omitted from the calculation. Given all the advantages named an estate may fail to obtain all the benefit of its position through the incapacity of the manager or his inability to grasp all the necessary factors which go to make the complete whole. In the first place the Tea is made in the field, that is to say the quality of leaf is the first, and most important consideration as upon this depends the simplicity or complication of the subsequent manufacturing operations. Without good leaf you cannot obtain the most important condition necessary to first-rate manufacture, viz. a good even wither and that is where so many Factories fail; with good leaf evenly withered all the subsequent operation fall into their natural place; when the reverse obtains you have all the complications of hard and unwithered leaf to deal with which gets broken and finds its way into the grades to which it does not properly belong. Everyone who had the privilege of seeing the late James Taylor make tea, will remember with what care he picked his leaf over and how he insisted upon regular plucking at unvarying intervals. I speak of the days when Mr. Taylor was allowed to be the first authority on Tea in the island, and before he received his instructions from the London Office of his later employers. I think, therefore, that what I have called the personal equation is a material consideration. To make stand-out teas you certainly require ample withering accommodation and good machinery and unwearied supervision and for large yield combined a high class (A) and strong soil in a favorable climate. I do not myself object to pure China Tea at high elevations; it is extremely hardy and yields fully as much leaf on the best jät and it has first-rate flavour, but a low-class hybrid is ruinous whatever soil it is in and only pays in the most forcing climates. As the prices fall lower, and the margin for profit smaller, I believe the estates with low jät will gradually go out of cultivation.—Yours faithfully,

W. D. B.

No. XXXVII.

DEAR SIR,—I do not think anything like a hard-and-fast rule can be laid down for Tea growing or Tea making. What suits one district may not suit

another generally speaking. Flavour is not got from tea grown at a low elevation and it is better to go in for strength, hard rolling and more ferment. Medium elevations 3,000 ft. to 4,500 ft. get as a rule both flavour and strength, and the planter has to choose which is best with the soil at his disposal and the climate in which he works. At high elevations the matter is simple enough; with ordinary care, both flavour and strength can be got, and these are got to perfection in districts like the Agra and Kandapola.

Quality vs Quantity.—This depends entirely on the plucking. Fine plucking gives quality at the expense in extreme cases of 50% of quantity. Whilst the principal item of Estate Expenditure "Plucking" costs very nearly double when fine is resorted to. The relative advantages of Fine vs Coarse all depends on the market. When India is sending fine tea it behoves Ceylon to lay low, and send quantity as she did last year. Now Indians have fallen in quality, Ceylon is called upon for fine tea.

I am very partial to jät. I don't think it can be too good, up to 5,000 ft. It goes without saying that you get more leaf, and a flush from high makes a far better tea than the same size leaf from low jät, both in strength and flavour. The few enemies (*Helopeltis* for one) are much worse, the lower the jät. SUPDT.

No. XXXVIII.

DEAR SIR,—Referring to the letters you have received from correspondents about the flavour and quality of Ceylon teas, no doubt you will have been struck with the fact that hardly one of the writers has arrived at any definite conclusions on the subject.

One "thinks" this, another is "of opinion" that, and there are those who "believe" and "assume" that certain conditions are necessary to bring about given results; but it is hardly creditable to us that our KNOWLEDGE of tea cultivation and the manufacture should not have advanced a little further by this time! A series of carefully conducted experiments in the different tea districts, directed with a view to ascertaining what ARE the characteristics necessary to produce flavour and good quality teas would be very interesting and instructive, and the results, I am sure would be startling to those who assume that *flavour* teas can only be made at extreme elevations. I have often felt that in a country like Ceylon, where people have exceptional means of comparing and imparting to each other the results of observations and experiments, we should not be so much in the dark as we are on many matters relating to the great industry to which we are engaged.

It is not only on subjects connected with manufacture, &c., that further and more reliable data is required, but the vexed question of Fine versus Coarse and Medium. Plucking has never yet been handled in a manner calculated to carry conviction to the soul of a donkey. *Mauving* in its varied phases and aspects is another matter presenting features of special interest to the producer and it may be hoped that on this subject at all events we shall soon be benefiting by the accumulated experiences of many in our midst.—Yours faithfully

"YOU KNOW WHO."

No. XXXIX.

DEAR SIR,—Tea cultivation in Ceylon and China v. Assam Tea.

I think good soil, not exhausted by long coffee or other cropping, will, combined with a high elevation, give a finely flavoured and a strong tea, and consequently a high-priced one, even though the jät is not very good; but to get at the same time a large yield an indigenous or a high class hybrid jät is necessary. China tea or a low class Hybrid will not run long without pruning, and will not, therefore, give large returns anywhere. The dark-leaved Manipuri indigenous or the hybrid once removed from it is a hardy, good finishing jät at any elevation, while the light-leaved indigenous is more delicate and is only suitable for certain localities.

When estates at a high elevation find it necessary to manure to keep up their yield, it is thought by many that there will be a loss of flavour in their teas; but this I should think, would only be true to a certain extent as there is no doubt that climate alone has a good deal to do with the superior flavour of upcountry teas.—Yours faithfully,
J.

No. XL.

Elevation, 4,200 to 4,600 feet, Dec. 13.

Dear Sir,—I mentioned in my reply to the first part of your inquiry that a good Assam hybrid of Kelvin jat, had been found by me to give really good results both in price and yield, but it may be quite possible that a near remove from Indigenons—judging from Mr. Beck's experience on Henfold and that of some others—gives even higher quality and more strength. It is not claimed for this tea that I know of, that it gives larger yields than a good Assam Hybrid and perhaps it may not give quite so large a yield per acre; but after all, experience with us is young yet and time alone will teach us which last the longest and is most successful.

China jat well cultivated gives good flavour and fine tea, but is wanting in strength and as far as I have seen cannot compare in yield to the other teas. W.

No. XLI.

CHINA JAT AT A HIGH ELEVATION.

Saumarez Estate, Udugama, Dec, 15.

DEAR SIR,—In reply to your enquiry of 4th inst. the bulk of my experience as a tea planter was gained at 5,000 feet elevation on ——— estate where we had some 130 acres of China jat tea. At the time of my leaving the estate last year we were getting some 300 lb per acre from this area and I am able to say as a fact that I was never able to produce such a fine class of tea from the Assam hybrid plant as from the China. On several occasions I had sold the China tea, unmixed with Hybrid, in the London market and never failed to obtain a higher value for it than for the Hybrid tea, kept separate though manufactured at the same time and in every way subjected to the same treatment. The liquor obtained from the China jat could not compare with that resulting from the Hybrid in the matter of "strength" but for "flavor" it was unmistakably superior, and whenever I was asked to produce a nice sample of self-drinking tea I invariably manufactured it from the China variety. I cannot say how far this difference in favor of the smaller jat would obtain at lower elevations, but I certainly am of opinion that for places at 5,000 feet and upwards, it would pay to have 30 per cent and the estate planted with it, for putting price on to the teas and giving them a delicacy of flavor not obtainable from the Hybrid plant. As to the question of one place giving better prices than another, I see nothing wonderful in it. With the varying soils and climates of Ceylon it would be wonderful indeed were it otherwise and when all is said and done and given a uniformly proper system of manufacture, such as consists in a good even wither, say 100 lb green leaf down to 60 lb, and a slow firing carried on at low temperatures, there will always be the fortunate proportion who will maintain a leading position. Many places, however, at present which might do better suffer from defective manufacture, firing their teas too quickly at too high temperatures, with the result that their teas will not keep and the flavor is burnt out of them.—I am, dear sir, yours faithfully,
EX-SUPERINTENDENT.

No. XLII.

Dec. 17th.

DEAR SIR,—To obtain good crops from good tea where the soil, climate and everything else are favourable, are only reasonable expectations fulfilled, but it is

quite another affair looking for and expecting similar results from poor wornout coffee lands without cultivation. By cultivation I mean more than weeding, pruning and plucking—all very important in their way, but are we in many instances not too apt to fall into the idea that with our climate and soil the tea bush will do all right without going to the expense of manuring. How often do we hear tea will grow on any soil and "at any elevation," and on the strength of this knowledge it is allowed to grow, and to get all out of we can, we worry the very life of the bush by hard plucking and pruning. Take an unmanured field that has been hard plucked from one leaf or even one and a half above the fish leaf, and pluck that steadily for a year or fifteen months and when you come to prune it you find the wood weak and wiry and unsuitable to carry your wood for next year's crop. Result, cut lower still or you get less crop next year. Now low pruning is all very well, but to go on pruning lower and lower every year does not improve the size of your bush and it will end in having to give the field a two years' rest from plucking. Had this field been manured, hard plucking would not have had so disastrous an effect; the bushes would probably have gone on flushing from 18 months to two years and the wood to be pruned be a very different looking material.

It may be asked why isn't more manuring done? For the reason probably that it is doubtful whether it will pay. There can be no doubt of the good effects of cutting large holes between every four trees and burying prunings and of cattle manure applied in, say a basket or two to each hole, but then cattle manure cannot always be had and the application is expensive, but that burying and prunings and the right sort of artificial manure with them, is a success is beyond a doubt, a good investment for the proprietor and is a certain means of making the tea on old land give good crops, has been proved. Manuring may be likened to judicious advertising, the more you spend on it having gained a knowledge of what your soils require the better the results.

The comparison between the unmanured and the systematically manured fields of an estate is such that there is nothing more evident than a reference to the books that it pays to manure well, and that manure has rightly the credit of making tea give good crops.

The subject "good prices" is too large an order for my entering upon. Our teas don't get the prices they deserve and probably won't, until America begins to indent more largely for the Elephant Brand, if by that is meant the finest of our teas. Then let us hope our R. P.'s now 11d, will be fetching 1s 1d to 1s 2d.

To make good tea one must have first good leaf, ample withering accommodation, good machinery, abundance of power, a scrupulously clean well kept factory, and coolies well drilled in their work, and one who knows the work and can work the coolies in charge.—Yours truly,
AN OLD PLANTER.

LIGHTNING AND TEA.

SIR,—I have read with interest and regret Mr Crabbe's communication from Passara regarding the death through lightning of his cattle. It is seldom one hears of animal life being destroyed in this manner; but I have lost quite recently several small patches of tea through this action. Generally an isolated cinchona tree appears to have been struck, and the surrounding tea bushes for a few yards round have been killed.

Can you or any of your readers inform me if tea acts more particularly as a conductor to lightning than coffee and cinchona, and if the soil on the spot is detrimentally affected for replanting? For many years coffee and cinchona grew luxuriantly on the exact spots where lightning has destroyed the tea, and I am at a loss to know why hardy tea should be so afflicted.—I am, &c.,
—Local "Times."

UYA.

MEDICINAL PLANTS IN INDIA.

It is much to be regretted that India possesses no experimental agriculturist of the stamp of Sir John Lawes of Rothampton, whose letters to the London *Field* render our contemporary so popular among the more enlightened class of British farmers. True we have the usual reports from the Government farms, but they convey little of interest, and are altogether useless to the ryot, while the matters dealt with do not concern Europeans. What we really require, scattered throughout the Empire, are plantations devoted to the raising of exotics and such indigenous roots, plants, etc., that would prove of sensible value to the community at large. The work on the present Government farms should be confined merely to the raising of food grains and edible roots, that would prove of service in times of scarcity or actual famine, and, in conjunction therewith, a system of irrigation that the native could afford to resort to in order to save his crop when the rainfall fails.

What we would, in our present remarks, specially direct attention to is the importation of drugs and utilisation of our indigenous ones, so as to bring remedies for sickness within the reach of the poorest. What the introduction of cinchona has done in the way of combating fever and other malarious maladies should be energetically followed up in other lines, for it is not going too far to assert that there is not one single drug, mineral or vegetable, in the British pharmacopoeia that either has not its prototype in this country, or could be grown successfully in one or other of the various climatic localities India furnishes; yet in many cases we send the raw material home re-importing it at such heavy cost that the prepared drug is sold at, frequently, 300 per cent higher than if it were manufactured in the country. It is gratifying therefore to notice that this matter is being brought to the front, and we only wish we could say being taken in hand. *Podophyllum peltatum*, the various descriptions of dandelion, *taraxacum*, and their allies grow so prolifically at an elevation of from 4,000 to 6,000 feet along the 26th and 28th parallels of latitude, that every household in India should possess their valuable extracts, and though natives, as a rule, suffer but little from hepatic diseases, the drugs above mentioned would prove an incalculable boon in European barracks and private houses, while the process of extracting the drug from the plants is so simple and inexpensive that the cost would be too trifling for consideration. If any one will take the trouble to run his eye over a list of the remedies usually employed in Indian diseases he will not fail to notice how easily they are procurable and at what a small outlay. We affect, or at least the old school of medical practitioners affect to despise the drugs employed by the *hakims* in remote villages little reflecting that the initial knowledge of all medicines employed in Europe was obtained from the far East, and that they are employed down to this day, though clarified and, perhaps, rendered more attractive by the bestowal on them of euphonious names. Even many of the old women's "simples" of a bygone age figure in the present list of remedies, faintly disguised by Latinised names.

The Government of India has lavished large sums of money in the introduction of exotics, and though such a proceeding may be considered commendable, a good deal of this expenditure might have been saved had a thorough exploration of the botanical

resources of the country been undertaken by men who would have first considered whether taking the diversity of climate into consideration, the exotics they were about to import did not already exist within our borders. It has been asserted that *Cinchona crista* grows wild in the eastern mountain ranges and, certainly, the plant brought in bears a strong resemblance to it; while we do not believe that the bark of the Mishmi *tree*, or the shrub from which it is derived, have ever been thoroughly analysed. With the large areas now under cinchona it would, of course, be of no great commercial importance were the two febrifuges above alluded to turn out a variety of the Central American one, though identification might induce the authorities to pause ere committing themselves to incur the cost of introducing some lauded plant. Had we known anything of the botany of Assam, for instance, or taken the trouble to sift out the thread-bare bazaar story of the Buddhist pilgrim the costly expedition of Mr. Fortune to China would not have been undertaken. The more jingly classes of our fellow-subjects may be said to possess a pharmacopoeia of their own, and one, apparently, quite as effectual as ours; doubtless, were these remedies examined, many would be found to be known to us, under different names, but at the same time the probabilities are that a considerable amount would turn out novelties, none the less valuable though on that account. "Simples" some of these may be considered, but, as we have shewn, similar herbs and roots, erstwhile collected in England, have been deemed of sufficient importance to be incorporated in the list of European medicines. It may be objected to by some that we possess no suitable spot where all drugs could be manipulated and prepared for consumption, but if this objection be admissible (an assumption in which we by no means concur) those drugs requiring particular climates could, without any undue expense, readily have suitable sites found for the purpose; but we know of no drug derived from the vegetable kingdom that would need anything different than the climate of the metropolis in the cold weather.

Our tea planters, unfortunately, are hardly just now in a position to take this matter in hand, and we must fall back upon settlers and, perhaps, the hill jails; but what is chiefly required is an interchange of views and relations of experiences, similar to the letters and communications that used to appear in the "Journal of the Agri-Horticultural Society" some few years since. It may be argued that this matter is solely one for the Government to take up, but we cannot see this as, though the cultivation of medicinal plants would bring down the price of drugs fully two-thirds, there would still, for many years to come, be a steady demand at remunerative prices; hence the cultivator would realise a good income. All Government need be asked to do would be, that it should deal with the local instead of the foreign producer, provided, of course, that the standard of quality were maintained. Government would, of course, merely take the raw material, working it up in its own laboratories and perhaps, it would be better if all drugs were treated under authoritative supervision, for it is not so very many years ago since an official of the Educational Department, in his own estimation a qualified chemist—was placed in charge of the quinine factory at Darjeeling, making such a muddle of matters that somehow or other a highly deleterious compound was turned out. The rearing of exotics or utilisation of indigenous herbs need by no means be confined to purely medicinal plants, but might be extended to those which come under the denomination of medical comforts, for though a considerable quantity of farina is obtainable for European consumption, the fictitious price at which it is retailed places it far beyond the means of even the middle classes of the native community, and this surely should not be the case in a country like Bengal, at any rate where arrowroot and tapioca may be considered weeds. The preparation of these two is so very simple that the establishment of centres for their manufacture might well engage the attention of those rich, well-intentioned philan-

thropists, whose only idea of helping the less fortunate countrymen in times of distress is the digging or filling up of tanks.

Our remarks would be incomplete without referring to some recent correspondence as to the feasibility of cultivating *Salap misree*. That it can be raised much the same as other tubers was demonstrated by General Mather at Mussoorie, whose stock was derived from the Nilgiris where it is known to the Badaghurs as "little man's bread," and though of undoubtedly the same genus is far inferior to that obtained from Kabul, being but half the size and, apparently, when grated and boiled with milk deficient in mucilage. Whether, even, the true *Salap* possesses all the qualities ascribed to it we are not here prepared to argue, but its popularity is so great in Persia that there must be some foundation for belief in its powers. The fresh tubers might be obtained either through the European employes of the Amir at Kabul or, perhaps, from Quetta, but if not the Consuls in Central Persia might be able to supply it, and probably the hills north of Dehra would be the most suitable localities in which to essay its propagation. The exact locality where that exported to Persia and the small quantity that finds its way into British India is not known, the itinerant traders who purchase their requirements at Khanda-har and Kabul being unable to give any reliable information; but as its prototype grows in the Nilgiri's there should be no difficulty in selecting a suitable site. We have devoted, it may seem, rather too much space to this latter vegetable, but if all is true that is said of it, is fully deserved prolonged notice. We should imagine some of our tea planters might endeavour to retrieve their position in attempting the raising of medicinal plants instead of throwing their properties on the market as the daily papers show us they are doing.—*Asian Sporting Newspaper*.

TALGASWELA TEA ESTATE CO., LD.

The dividend on the preference shares at the rate of 7 per cent per annum for the year ending 31st Dec. 1893 was paid in full to the shareholders on the 2nd Jan. Mr. T. C. Owen having left for England and resigned his seat at the board, the visiting of the Company's estates has been taken over entirely by Mr. E. S. Grigson. The meeting of shareholders will be held about the 10th of February when it is expected a substantial dividend will be declared for the past year.

FIBRE AND COFFEE CULTIVATION.

There appears to be hardly any department of the vegetable world—using the term in its widest sense, to include both greater and lesser vegetable grists—that does not directly or indirectly bring grist to the mill of the British manufacturer of implements and machinery. It is exceedingly encouraging to know that Mr. Chamberlain is recently reported to have said, with reference to his well-known interest in the Bahamas, that he met Sir Ambrose Shea in Canada, and that he was so thoroughly convinced by the eloquent arguments of the Governor of the policy of expending money in the fibre producing industry, that he decided to embark a considerable amount of capital in its expansion. And he has had no reason to regret that he has taken that step. He states he felt that in doing so he would not only receive a fair return for his investment, but do something towards benefiting the people of the Bahamas. Mr. Chamberlain might have added that he felt also that he was benefiting the implement and machinery trades of England, for undoubtedly foreign fibre culture assuredly has this satisfactory tendency. Increased demand for machinery which treats cocconut fibre is at the present time resulting from what is taking place in New Guinea. The natives of British New Guinea have adopted the serious task of raising cocoanuts for export. During 1890, acting under

the direction of the Government officers, they planted 1,500 coconut trees, and last year the number planted on Fanko Island alone reached 12,000. About 2,000 cocoanuts were also set on the mainland. In all 15,000 cocoanuts have been rooted, and it is intended to extend the work, because, if successful, the cultivation will be a great source of revenue in about ten years' time. Makers of implements and machinery applicable to coffee growing will be commercially interested to learn that a Liverpool syndicate, at the head of which are Mr. Alfred L. Jones and Mr. John Holt, of Liverpool, has procured what will probably be one of the largest, if not actually the largest, coffee plantation in existence. The place is situated about 75 miles from the town of Lagos, on the West African Coast, and is about 50 square miles in extent. In order to grasp the enormous size of the venture it is necessary to realise that it would cover a quarter of the distance from Liverpool to London, one mile in width. The land, which is under English protection, was acquired about two years ago, for the raising chiefly of African coffee, and already there are about 10,000 trees rooted. It is proposed to put at least 120,000 plants down within the next five years, and as the ground is said to be adapted for rubber growing it is likely that this product may also be cultivated. A town is being erected close by, called Jonestown, and a second one is to be named Holttown.—*Implement Review*

ANDREW NICOL, Esq.

* The TROPICAL AGRICULTURIST *

◇ MONTHLY. ◇

Vol. XIII.]

COLOMBO, FEBRUARY 1ST, 1894.

No. 8.

“PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

ANDREW NICOL, M.L.C.,

MERCHANT; AND PIONEER IN COFFEE, COCONUT AND TEA PLANTING.

[The following account is mainly from the pen of our esteemed correspondent “Old Colonist” who originally came to Ceylon to begin work as a Planter on one of Mr. Nicol’s estates, and who therefore knew the subject of this memoir and his relative, Mr. Sangster Martin, very intimately. We have personally, added a few dates and incidents, more especially in reference to Mr. Nicol’s mercantile career and also the “Appendix.”—Ed. T.A.]

VISITORS to the beautifully situated, though rather quaint and decaying little county-town of Banff, may see by the Lowshore, the antique churchyard, and on entering in, can read from a plain head-stone the following inscription:—

“Sacred to the memory of James Nicol, Collector of Customs at Banff, who died 24th April 1849, aged 82. Also, of his spouse Margaret Stephenson, who died 23rd December 1864, aged 82.”

These were the parents of Andrew Nicol who was born in Banff in 1819. William Nicol, the successful ship-owner, merchant, banker of Bombay and Liverpool, M.P. for Dover, &c., was an elder brother by a previous marriage.

Banff was a “brawer” burgh in those olden days than it is now, and the Collector of Customs was a man of no mean importance. Many yet alive have a pleasing recollection of James Nicol, whose keen intelligence and kindly social qualities won him a distinctive position even amongst the dignified denizens of the proud capital of Banffshire.

Young Andrew, too, is well remembered, as a clever but rather impetuous and ‘royt’ rogue of a red-haired loon. He was educated at the old Grammar School, the present handsome and well-equipped Academy not being yet in existence. Andrew was an apt scholar, could hold his own with the best budding intellect in Banff, and as he was destined for a mercantile life, the time soon arrived when it was deemed desirable that he should be sent to some business centre where he would have better opportunities of acquiring the necessary experience.

To Hamburg he went, early in his teens, and from thence to Malta while yet a young man. After some years in Malta he proceeded to Bombay, where he entered the office of the already famous house of William Nicol & Co., of which his half-brother was head. Leaving Bombay in the early “forties,” the subject of our brief memoir now made his debut in Ceylon, soon turning his attention to Coffee, the favourite and most promising product of the day. We first hear of him in distant Uva, where he foregathered with a few congenial spirits to discuss planting matters and much else besides. T. L. R. Shand, for instance, could give many racy reminiscences of this meeting i

but to planters the most curious and interesting sequel was, that neither was much enamoured with Badulla, or had little inclination to tackle the difficulties of transport then apparently regarded as insurmountable.

Be that as it may, it is passing strange to think of the Messrs. Shand with much more practical knowledge, wandering away to invest in the wilds of Sabaragamuwa, while the rather happy-go-lucky subject of our notice, drifted in an opposite direction, and within five-and-twenty miles of Kandy selected one of the very finest blocks of coffee land ever found in Ceylon.

The district of RANGALA, as selected by Mr. Nicol, had indeed few if any equals in its day. At a suitable altitude, well sheltered, abundantly watered and with a fine free subsoil, it soon reached the top of the list for heavy bearing. While other hill districts in the Central Province had to be content with from 3½ to 5 cwt. per acre, and even Badulla could only average 7 cwt., Rangala produced year after year 8 cwt. per acre all round,—some states, such as *Battegalla*, more than doubling this quantity. This latter magnificent property of about 300 acres in bearing gave, for a long time, about 4,000 cwt. annually—and some years, much more if it could have been gathered! A short labour supply was at that time, the general experience.

The block of land selected by Mr. Nicol included what was afterwards formed into *Rangala* (proper), *Battegalla*, *Ranwella*, *Galbodde* and *Ilagolla*. All the rest such as Lovegrove, Loonagalla, &c., were subsequent purchases. To T. Pride he sold Rangala; *Battegalla* to W. N. Duckworth; and *Ranwella* to Dr. Duncan; reserving only *Galbodde* and *Ilagolla*, by no means the best of the bargain for himself.

It must be confessed that as a practical planter Mr. Andrew Nicol was a doubtful success. It has been said with some degree of truth that brains are rather an encumbrance to a planter than otherwise, being apt to lead him away into side-issues incompatible with the steady, plodding perseverance necessary in a good manager of estates. A. N.'s planting operations were rather of a spasmodic character; but being of a sanguine temperament and well supported with capital, he went boldly in, and often succeeded where better but more timid planters failed.

The difficulty was to keep him on the estates. The life was then much lonelier than it is now, and was of course a great change to one accustomed to the bustle of office work. Nevertheless Mr. Nicol was of a roving disposition, and would, disappear for weeks, no one knew whither, except the few coolies who accompanied him into the Bintenne country.

It was on one of these excursions that he penetrated through the Veddah country and reached Batticaloa to find coconut planting progressing under the fostering care of O'Grady, Carey, Munro and Cumming, all plucky sportsmen and most congenial spirits. Ever ready to invest and throw in his lot with such friends, Mr. Nicol lost no time in applying for a block of land. The land was soon surveyed and in due course purchased, so that next year when he returned to Batticaloa on a shooting trip, he found himself proprietor of some 500 acres of finely-situated land by the sea-side including a pretty little bay; the surveyor having for convenience run the chain right across its neck,—so including the water in the acreage. At first Mr. N. was rather pleased with this arrangement; but on second thoughts he saw such an excellent opportunity of giving the Government Agent a rap over the knuckles, that he could not resist the chance. Few men could write more caustically,—especially to officials,—and we can readily imagine with what delight he dropped down upon the Government with a formal complaint, the gist of which was that he “decidedly objected to have to purchase from them any portion of the *Bay of Bengal!*”

There was no replying to such a letter save by sending a Surveyor at once to cut off the disputed water, or rather to deduct the extent from the acreage. But the day came when A. N. repented him of his rashness! In after years when the coco-palms began to yield their increase, the little bay proved very convenient for the natives to stealthily approach the beach in their canoes and help themselves. Exasperated by this, Mr. Nicol bethought himself of putting up a strong fence across the mouth of the bay, and hoping his previous letter had been long ago forgotten, wrote offering to pay for this privilege. But in this case the biter was bit; the Government Agent replying that “the Government of Ceylon decidedly objected to sell to him or to any one else any portion of the *Bay of Bengal!*”

By this time the subject of our memoir was in his 31st year; the palms were progressing satisfactorily at Batticaloa; the coffee clearings at Rangala making rapid strides.

T. Pride—a model planter—was doing admirable work on Rangala estate, while the courtly W. N. Duckworth on beautiful *Battegalla* was sadly puzzled what the deuce to do with it. Dr. Duncan toiled away with tolerable success on his rigged brae-face; while that great gamester, R. Gerard was supposed to act as planting adviser and Visiting Agent for *Galbodde* and *Ilagolla*. Gerard was by no means a pukka planter, but a so-called lucky man: everything he had hitherto touched having turned into

gold. When *his* career, however, comes to be written, it will be found to contain a shocking bad example and dreadful sequel. His style of visiting may be inferred from the fact that some years after this, when asked if he would take a walk down and see Galbodde, he replied: "No faith ye, my boy, I had charge of the estate for two years and never yet put a foot upon it."

In short, the management of Galbodde and Illagolla was up to this time not quite a success. Money was liberally spent, but the work was only done by fits and starts, without any method and with very little profit.

Fortunately for himself and fortunately for Rangalla, Mr. Nicol at this time hit upon the idea of indenting on home for a thoroughly competent manager, and in 1851 Mr. *James Sangster Martin* appeared upon the scene. Martin took in the situation almost at a glance, and in a marvellously short time blossomed forth into one of the best and most careful estate managers Ceylon ever saw, though strange enough, up to the last he never could utter an intelligible sentence in Tamil! Seeing his success, Mr. Nicol soon sent for another of the same ilk. The result was Mr. *John Martin* in 1854, and a very fit addition to the staff he proved to be, as his career, in Dimbula chiefly, ever since—for he is still with us—was amply shown. With such assistance, the Rangalla pioneer was now a made man, and could devote his leisure to business, pleasure or politics as the spirit might move him.

It is curious by the way, to compare here the two rising young Scotchmen of that day:—both coming M. L. C.'s, both born in the *same year*, in neighbouring townships. But here the similarity ceases. The seer of Dumbara (R.B.T.) with his self-acquired capital and education gradually developing into a John Bright amongst planters; while our friend of Rangala with his almost classical learning and unlimited credit, was rapidly ripening into the Roebuck of Ceylon.

A comparison might also be made with another Colonist already referred to, Mr. Charles Shand, who became merchant as well as planter like Mr. Nicol. For, in 1854, the subject of our notice became the head of a mercantile house in Colombo, which had previously been in existence for a good many years as "Messrs. Dowdall, Cargill & Co." It now became "Messrs. Nicol, Cargill & Co," Mr. Nicol's partner and manager being Mr. S. T. Richmond (who still survives in Colombo as our oldest mercantile resident). Mr. Richmond arrived in Bombay in 1842, and came down to Colombo in April 1848, settling here with Messrs. Dowdall, Cargill & Co. in the

following year.—Another partner in the new firm was Mr. Alexander Campbell White, also an old Bombay merchant, and who has lived to become one of our most extensive proprietors of plantations.

About this time (1854) Mr. Nicol took his first trip home, becoming tenant of Auchintoul House, Marnoch, Banffshire, where he was joined by his friends, W. N. Duckworth and R. Gerard. "Three lively blades" they were, as many in the neighbourhood could testify.

In 1856, however, the redoubtable Andrew Nicol was fairly captured by the then reigning belle of Banffshire, Miss Stronach, who, amidst all the troubles of life that were yet to be faced, proved a most devoted, charming and in every way suitable helpmeet for him.

Two years later, viz., in 1858, we find Mr. Nicol once more *en route* for Ceylon, accompanied by Mrs. Nicol and several relatives. He had now to return to work in earnest; for, during his absence, the notorious Frank Hudson* had made sad inroads upon the capital of his firm (Nicol, Cargill & Co.), having received heavy advances without giving adequate security; the consequence of which was that Mr. Nicol had reluctantly to take over several of what appeared at the time to be rather undesirable properties in Dimbula and elsewhere, and to endeavour to work out the loss as best he could.

Other estates more or less desirable, Ballacada, Cabroosa, &c., of which he had been part owner, now fell entirely into his hands. It was a brave and hard struggle, all the harder that the unlimited banking support gave way when most needed. Albeit, right pluckily did Mr. Nicol put his shoulder to the wheel, ever to be found rushing in red haste from Colombo to Dimbula, and from Dimbula to Rangala or Matale, always off at a tangent, and always with a certain kind of erratic love for planting and gardening. Give Mr. Nicol a couple of good peaches in Colombo at tiffin, and next morning he would rush up to Lunugalla to plant the stones, returning in time to dictate few drastic letters. No man ever enjoyed his own letters more; and no man who knew him, ever felt any the worse for them. As a rule he was a liberal employer, but subject to fits of economy; as when he wrote in red ink across the Ballacada Estate subscription to a Kirk:—"Save your soul at your own expense, Sir," and returned the a/c to the manager.

It was about this time (in the year 1869) that he first dubbed himself "*The poor but industrious*"

* Supposed to be a natural son of Sir Hudson Lowe and the founder in Colombo of the short-lived firm of Hudson, Chandler & Co.—F. Hudson's after career has been an extraordinary one as Hotel Manager, Billiard Marker, &c., and it is not finished yet we believe.

Planter," a cognomen which stuck to Mr. Nicol through the remainder of his life. The description occurred in this wise:—he had freely and generously given to Government a building at Teldeniya to be used as a Post Office; but after a time the Government Agent probably forgetting the circumstance, and only remembering him as proprietor, wrote officially requesting him to have the premises whitewashed without delay. This called forth a characteristic letter in which A. N. deplored the meanness of the Ceylon Government, who not content with sitting *rent free* had the effrontery to ask him, "A *poor but industrious planter*," to whitewash their Post Office for them!

To see Andrew Nicol at his best, however was to meet him casually at an out-of-the-way rest-house. To hear him tackle the appu, see him tuck up his shirt-sleeves, beat the steak, or teach the astonished cook how to fry sardines in paper. Then after dinner to hear him chaff Charles Shand about his "enterprising spirits in Sabaragamuwa," or Alexander Gibson as to his investments in the wilds of Hapntale,—contrasting these with his own profitable places and capable men in Rangala, generally winding up the evening with a few yarns illustrating his prowess as a sportsman. Here is a sample taken down *verbatim et literatim* 33 years ago:—

"We were bothered with a brute of an elephant at Batticaloa. Jock Cumming had been after him for days, but could not get near him. I was living in a small talipot hut, and at night my servant lay at my feet. One night I was awakened by the shrieks of my appu, and a strange, rattling, thumping noise in the roof. With my dim floating light I could just see the huge trunk of an elephant swinging backwards and forwards right above me; his head filled the doorway, and he had evidently made up his mind to have a lark with us at his leisure. I mounted to my elbow, slipped my hand below my camp-bed, where my rifle lay, always ready loaded; steadily and deliberately I took my aim, and fired. There was a terrific snort, a trumpet and something like an earthquake. I replaced my rifle, turned on my side and was asleep again in 5 minutes, but in the morning a large rogue elephant lay dead in front of our hut!"

It was about this time—1861—that he became Planting M.L.C., and on the whole a very good and useful member he made. "The Council have no longer all their wits about them" said the senior Editor of the *Observer*, when Mr. Nicol retired, on account of another visit home in 1862. On this voyage, Mr. Nicol's experience and fertility of resource as a pioneer and jungle resident came well to the front; for the P. & O.,

Steamer "Colombo," Capt. Farquhar, in which he left Galle in November of that year, ran ashore on the North end of Minicoy island, and although passengers and crew were all saved, they had rather a dreary time of it ashore, until they were able to communicate with the Coast of India and Colombo. Mr. Nicol excelled himself as hut-builder and caterer on this occasion, and ladies and children felt much indebted to him.—In 1863, Mr. Nicol retired from mercantile business, his Firm being merged in that of Messrs Fowlie, Richmond & Co., and to this house there came to Ceylon, three members of the community, still in our midst—Messrs. W. Law, R. L. M. Brown, and William Somerville.

In 1864 Mr. Nicol once more returned to his native town, and took up his residence at St. Ann's Hill—a villa in the suburbs. But Banff had greatly changed, *bona-fide* friends were fewer, the many who claimed acquaintance were poorer, while he himself was not richer. He was pestered with begging letters, and particularly deplored the growing want of independence amongst the rising generation. The boys he said "could no longer play at marbles or kick a foot-ball without electing a Secretary to beg, while women forsook their sacred household duties, to meet where the maximum of talk and minimum of work, qualified a Committee to beg." Now Mr. Nicol was by no means an illiberal man; but like all gentlemen of experience preferred to dispense his own charities. The climax seemed to come in the formation of a "Bathing Club," a few dirty boys having resolved upon an occasional dip, and elected a Committee, whose Secretary—James Watt—was instructed to write to the retired Ceylon Planter for a subscription. This tickled A. N.'s sense of the ludicrous, and called forth one of his inimitable letters, in which "although deprecating anything that would tend to destroy the fine spirit of independence amongst Scottish youth," he continued,— "there was something so commendable in the Banff young men voluntarily undertaking to wash themselves, that he had much pleasure in sending a subscription of £2 2s, and would be glad to continue this annually, provided that the money was spent on soap. The Secretary quietly pocketed the sarcasm with the cheque, and took care never to omit year after year while they both lived to apply for the "soap money."

But although Mr. Nicol had a natural horror of appearing on subscription lists, few men, perhaps, gave more liberally or mostentatiously, and to many who had the very reverse of any claim upon him, Frank Hudson, for instance, who had done more to injure and ruin him

than any living man, appealed to him in his direst necessity, and was not sent empty away.

For ten years, Mr. Nicol continued in Banffshire, chiefly occupying himself with fishing and shooting. Then, after 1874, Mr. and Mrs. Nicol spent four or five years on the Continent of Europe for the education of their children. Then during a few years more Mr. and Mrs. Nicol, with their interesting and accomplished family of daughters, moved about from place to place; now at Elgin; now at Glassaugh or Grantown; now holiday-making in Jersey, or travelling in Germany. Mr. Nicol himself, however, made two trips to Ceylon during the "seventies." Then about 1880, he with his family, settled down in London for residence.

In 1885 he again found it necessary to return to Ceylon through the exigencies of that fell leveller, the coffee leaf-fungus, a crisis, however, which brought out many of the best qualities of Ceylon's leading pioneers.

Although no longer young, and no longer supported by unlimited credit, with his own native shrewdness and latent energy alone Mr. Nicol met the disaster. Right manfully did he set to work and right honourably did he meet all his engagements. During the critical days of transition from coffee to cinchona and cinchona to tea, Mr. Nicol lived closely on his Dimbula estates, working with a will and cheerfulness that put to shame many a younger man, so that at the end of four years, viz. in 1889, his estates were once more in a fairly flourishing condition. But by this time his own health was far from satisfactory, and when he returned home, as he did in the spring of this year (leaving Ceylon in February 1889),—his friends saw with concern that the end was drawing near. It was hoped that in the genial climate of Elgin, life might peradventure be prolonged yet a few years. But it was not to be; and on Sunday 23rd June, 1889, at the residence of a son-in-law, Andrew Nicol passed peacefully away at the age of threescore and ten. Altogether, it is said that Mr. Nicol had made the voyage between England and the East no less than twenty-three times, an evidence of his energy and activity.

APPENDIX.

It may be of interest here to shew what was said of Rangalla—the district above all others, identified with Mr. Andrew Nicol,—in our "Directory and Gazetteer" for 1859, the first published at the *Observer* Press. We also give a list of all the Coffee and Coconut properties owned by Mr. Nicol or his firm, in that year

in the Rangalla and Dimbula Districts, and in the Eastern Province:—

RANGALLA.

This fine District was separated from "the Knuckles" by the Committee of the Planters' Association in 1856. They defined it as bounded North by the Cottaganga; East by the Knuckles and Medamahaneura ridge; South by the Bambragamma Oya; and West by the Hoolooganga. The Statistics referred to 8 Estates, the names of which were furnished to us as follows:—Cotaganga; Girinde Elle; Lovegrove; Gallebodde; Rangwella; Battagalla; Rangalla No. 1; Rangalla No. 2. The acres in bearing were returned at 1,200; not bearing 500; total 1,700. The average cultivation on Estates was, therefore, 239 acres, and the crop being returned at 9,000 cwt.; the average yield per acre was so high as 8 cwts. The labour requirements of the District in crop time cannot be less than about 3,500 coolies. The Girinde ella Estate lies to the North of the Cottaganga River, and is therefore not strictly within the limits fixed by the Planters' Committee; but it belongs to the District and must be included. It will be observed that our list now embraces 12 Estates, the cultivation on which is as follows:—Acres in bearing or partially so 1,800; young 700; total 2,500; and more land is being opened this season. From this acreage the estimated crop of 1853-59 is set down at 13,500 cwts. or 7½ cwt. per acre. Cultivation was commenced in this District in 1843-45, and none of the land opened has been abandoned. The elevation is from 2,500 to 4,500; the general altitude being 3,000 feet. It would be difficult to say which aspect is best—altho' the field which has borne, for a series of years, the largest crops happens to have an Eastern exposure. It cannot be denied, however, that the climate is, at times, too wet to be pleasant. The average temperature is from 60 to 68°. The District is not injuriously affected by wind, but Bug occasionally appears.

Correspondence.

To the Editor.

A COMPLAINT ABOUT CEYLON TEA PACKAGES.

DEAR SIR,—For the information of planters and in the interest of the trade, we send you for publication the enclosed correspondence. Please omit all names.—Yours faithfully,
pp. BATHGATE, PIM & Co., F. F. STREET,
Colombo, January 5th, 1894.

To—

Dear Sirs,—We purchased in sale 30th of August last a parcel of pekoe from the above estate. The constituent to whom we shipped this tea complains that it "was badly tainted with the smell of the wood—a strong smelling pine most unsuitable for tea." We have no record in our books as to whether these were local or imported packages; but from the description given them by our correspondent, we think they must have been Japanese Cedar. If this is the case we think planters' attention should be drawn to the matter through the medium of the press, that their use may be discontinued in future.

We have always contended that Japanese cedar packages ought not to be used for tea, but that Japanese *Moni* packages are the best in use.—We are, dear sirs, yours faithfully,

pp. BATHGATE, PIM & Co.,
(Signed) F. F. STREET.

Colombo, December 18th, 1893.

Messrs. Bathgate, Pim & Co.

Dear Sirs,—We much regret the complaint to which you refer in your letter of the 18th instant. The tea in question was not made at ———, but we passed your remarks on to the superintendent of the estate, and he informs us that the packages were not made of Japan Cedar but of Pine wood obtained from English packing cases.—We are, dear sir, yours faithfully,

Colombo, December 29th, 1893.

GERMAN EAST AFRICA: INFORMATION WANTED.

SIR,—Will you or any of your numerous readers please furnish, through the medium of your invaluable journal, the following information for the benefit of the Young Ceylon Creeper?

A certain metropolitan firm, I see is advertising for Ceylonese, understanding planting, and wishing to go abroad, to proceed to German East Africa to join the planting line thither, on a term of engagement for three years. The salary held out by them is 5, 6 and 7 sovereigns* for the first, second and third year respectively.

Do you think this is a sufficient inducement for "Young Ceylon" to proceed to distant Africa and will this suffice to keep them going comfortably there and enable them to bring a "renny" on their return?—Yours truly, "CREEPER."

A HINT TO DIRECTORS OF TEA AND PRODUCE COMPANIES.

SIR,—Now that the Directors of the various Tea and Produce Companies in the island will soon be issuing their Reports for the past year, there

* Per mensem? equal to R80 to R112. It depends entirely on the cost of living in German East Africa:—for many years at the beginning of the Planting Enterprise in Ceylon, the allowance to young European Planting Assistants was £8 3s 4d (under R82) per mensem—and not a few saved money, in those very cheap days for food and servants.—ED. T.A.]

is a suggestion that I should like to make, and which I am sure will recommend itself to all shareholders and to others looking out for investments, and that is, that each report should contain a detailed account of the acreage of the Company i.e. so many acres of tea (or other produce) planted such and such a year, and so many acres of forest, &c., &c.

The only Company that gives this information in detail in its report at present, so far as I am aware, is the Yataferia Tea Company, and I should like to recommend to other Directors, the embodiment of this useful information in their reports.
SHAREHOLDER.

CHINA V. CEYLON TEA.

Kandy, Jan. 11.

SIR,—The ever-increasing area cultivated with tea seems certain in the near future to produce a lower range of prices than now prevail. In view of this and of a probable struggle of the survival of the fittest it seems strange that so much apathy is displayed by planters and exporters on the great experiment now being tried in India to make the rupee artificially dearer, and so to force and unnaturally high exchange that tells directly against the exporter of tea from India and Ceylon and offers a premium to his competitor in China.

Sir John Lubbock and other strong monometalists are now said to be urgent for the imposition of an import duty on silver entering India; should their counsels prevail China will be the only great market left for the metal. Certainly there is no danger of the Chinese imposing a duty; they want all they can get, and are not at all particular whether it is coined or in bars. It looks as if at no distant date the Mongolian will get for a shilling as much silver as is contained in a rupee, and if simultaneously with this the Government of India succeeds in establishing the artificial value of sixteen pence for the same coin (which is what they profess to be aiming at). It needs but a small arithmetical calculation to show that the tea exporter from India and Ceylon will be handicapped to the extent of 33½ per cent as against the merchant exporting from China.

Surely this cannot be fully understood by those interested in the great tea industry or they would speedily make their voices heard in condemnation of this great financial experiment which has already increased the debt of India by many millions sterling and is rapidly leading the Government into unknown financial depths.

I am not at all interested in tea, but beg to subscribe myself
A STUDENT OF THE
GREAT SILVER QUESTION.

CARNIVOROUS PLANTS.

DEAR SIR,—I should like to know if your readers have found in Ceylon those pretty little plants the Sundews, or Droseras. I do not find mention of them in Trimen's Flora of Ceylon, in the first vol. where I should think they ought to appear if at all. Two species, the *rotundifolia* and *longifolia* are found on the Pulney Hills, S. India, at an elevation of 5,000 to 7,000 feet. A few days since I found the *filiformis* at the sea level. Loudon puts its native country as New Jersey. I have seen it near there, but had no idea it would grow here. The little plants with their purple flowers almost covered the ground for some distance with their dewy fly traps. Numerous flies had been caught. Some of them of ordinary size. The

leaves about two inches in length are mere stalks covered with reddish hairs. In some cases the fly was rolled up in the tip. In others where it stuck near the middle of the leaf the stalk or leaf was bent into a semicircle around it to bring more of the glutinous hairs to bear on the prey and dissolved it. One leaf I noticed had two of these curves in its length around two little flies. These plants could hardly have been introduced, for they were six miles from any mission house, and if they were at all abundant in the peninsula I think I would have seen them before—Yours truly

“OBSERVER.”

[Dr. Trimen is good enough to give us the following note on the above:—“We find three kinds of Sundew in Ceylon, *Drosera Burmanni*, *D. indica* and *D. peltata*. The first is generally distributed in wet places throughout the island, the second rather rare and confined to the low-country and the last is found only in the hill-country and is common about Nuwara Eliya. All three also inhabit Peninsular India, and the first two are no doubt the *D. rotundifolia* and *D. longifolia* of your correspondent (being very like those English species at first sight). As to *D. filiformis*, it is only known as a N. American plant, and I should be glad to see specimens of the species considered to be the same found by your correspondent, if he will kindly send a few. In the sequence of natural orders followed in my Flora the *Droseraceae* come in the second part, soon to be published.—HENRY TRIMEN, Peradeniya, Jan. 9th.—Ed. T.A.]

THE TEA CHESTS OF THE FUTURE.

DEAR SIR,—A fine to-do about Acme boxes. There are strong doubts as to their ultimate success. I should say the rumour of the disease in the Momi trees was rot, pure and simple. My Jap friend's agent was here three months ago and he says the supply is practically inexhaustible. There are two quarters where the interest in the near future may be to run down and run out Momi boxes if possible in view of the Udugama Company and the Acme boxes, but they won't succeed! There is nothing to touch Momi at present.

MOMI FOR EVER.

[To which we reply that the “rot, pure and simple” was contained as we stated in advices sent from Japan to a mercantile house, whose interests are by no means adverse to the trade in Japan tea chests.—Ed. T.A.]

STOWING TEA AND BOXES' SUPPLY.

DEAR SIR,—In re the remarks the other day re Tea boxes, &c., the idea of screw-jacks in stowing tea boxes is absurd. With cotton bales and similar elastic goods you can understand it. Besides they would not have time to work them here. I have myself stowed cotton and know all about it. A man came to me to know what truth about Momi running short? By and by I'll send you the Jap reply. It is all rot that rumour.—Yours, &c.

TEA BOX.

THE TEA QUESTION:—XLIV.

DEAR SIR,—The essential conditions for the “production of good tea”—which ought, but does not always, mean also good prices—have been pretty well threshed out in the forty-three letters from practical men published by you. Such a collection of views does good if it only sets men thinking and comparing; but I don't think anything very novel has been elucidated, or anything which a practical man with an estate already planted up and factory already built and

fitted, can seize upon to enable him to do better than he always has done. As, for the majority of estates, such questions as “elevation, jât and soil” are fixed and settled quantities, it seems to me almost superfluous to discuss them in public*. But ‘How to produce the best made tea under these fixed conditions?’ is for each planter a problem for his own solution. My own opinion is that good tea of the various sorts can be made anywhere and everywhere, with care in plucking, withering and firing, and sorting. But as regards “stand out” teas of exceptional values, how can they be of any interest to any but a few? What is the practical use of discussing this question by planters at large? The Ceylon planters already turn out good teas in immense quantities for which they do not receive approximate fair value from the trade. It is not so much that the several estates which used to get high prices produce worse tea than they did, as the fact that we others have caught them up with a general rush, neither doing themselves nor ourselves any good. Our great enemies are the buyers and the trade who, by competing and cooperating with each other to pay as little as possible, nearly destroy the tea producing industry. The real question for discussion is “How to get value for good tea?”. The tea we make is good enough.

A TEA MAKER.

GRIEVANCES OF CACAO PLANTERS.

Wattegama, Jan. 20.

DEAR SIR,—Is Government not going to protect us cacao planters? Here is some experience as reported to me:—A boy caught rehanding with pods in his possession gets off scot-free, because no other offence was proved against him.

A boy caught with pods in his possession was let off because he was too young for punishment (8 to 10 years old).

A boutiquekeeper was found in possession of some 10 pods of green cocoa in his house. He accounted for them that a relation had sent them to him at his request for planting the seed in his garden—voluntary statement; now all the pods were green and unfit to plant as the man knew well when he made that statement. Some pods had been robbed from a native close by his boutique, yet the later would not go to Court as he would not spend the same amount of money as the other man could. The peace officer took the man to the Magistrate and there being no complainant (who lost crop) the man was let off.

A boutique man was found in possession of half-cured cocoa. He first said he got it from his brother's garden. Then, when that garden was visited and no signs on the trees of pods having been plucked, he said he bought it from a native. On going to the native's garden it was found he had only Caraccas whereas at least half of the cocoa taken was Forastero. He further said he bought the whole for 4d from that man whereas that man said he only sold him and got paid for 2d. No theft could be proved by planters, so no case was allowed to be taken. We want a law to enable us to get hold of the receiver; either he must prove where he got the produce from in a proper set of books or stand the consequence for having produce in his possession for which he cannot account for.

Several cases for cocoa theft have been proved in our Court and proper punishments given to those convicted, which certainly ought to deter others from thieving.

*Our correspondent forgets that there are still young planters and “seeking” capitalists in the land!—Ed. T.A.

On looking over the list of cases for trial in the Supreme Court, I find burglary with theft and murder are on the increase.

The question is why is this? Are our ordinances defective or are they not properly administered? It is now said the Supreme Court is against Magistrate granting search warrants unless the applicant can swear that he is positive the stolen property is in the man's house which he wishes to search.

This is no doubt right when application is made to search the house of a man of good repute; but when it is made to search a man's house, who was before convicted, or is a well-known suspected thief, receiver or gambler though never convicted before; then a search warrant should be granted at once; and as private as possible for there is always a lot of hangers-on in our Courts who on hearing of a search warrant being applied for at once; send the man word (knowing criminals pay well for such information) and the man can protect himself for the search warrant. We have the born thief who cannot allow a chance to rob escape him. It is these thieves we must watch and when caught give them a severe punishment; yet some of these men can be made good citizens if properly managed. Look at our Australian Convict Colony and even in Ceylon we have some, after serving out their sentences have become good citizens. Unfortunately there is many false cases brought to our Courts and very great responsibility rest with our Magistrates to sift the evidence. Often the false evidence is given fearlessly by hired witnesses who have been well trained what to say. On the other hand there is some truthful witnesses who hesitate in giving their evidence which Magistrates often think or say to make up false evidence, whereas in point of fact they are most anxious to speak the truth and hesitate as they do not wish to tell an untruth. I have been in Courts and heard some cases tried in which the side that brought forward the false evidence gained the day for the very reason above quoted. I knew the whole facts from both sides, but could say nothing as I was not a witness. Yet I could not blame the Magistrate as I should have given a similar decision on the evidence. I being behind the scene with proof that the evidence on the side that gained the case was as false as it could be, was unable to give the help to the innocent party as the Magistrate told me when I got up to speak—as I was not on the witness list to sit down. This refers to a case decided some years ago at Panwila. If conviction is obtained by false evidence, that brings hatred and a man wrongly convicted very often when he returns from jail becomes desperate and looks to have revenge on his false accusers and so eventually becomes a criminal himself, whereas there are others who suffer in preference to take revenge and return again to jail; in these cases the Salvation Army has done a great deal of good in recovering criminals from their bad ways.

HOLLOWAY.

TEA-BOXES.

A Paper in the *Planter's Gazette* contains a report of an interview with Mr. F. Boulbee, of the firm of Messrs. A. Yates & Co., of Luddenden via Manchester, upon the subject of tea-boxes. Messrs. Yates are said to be "practically famous the world over" as saw-mill Engineers and wood-working machinists; and Mr. Boulbee is referred to as having had very wide experience as a saw-mill Engineer in the Far East. He has given special attention to the subject

of producing good tea-boxes at low prices. Seeing that the main cause of the present expense is to be found in the distance the "shooks" have to be carried, the remedy that naturally suggested itself was to produce them on the spot. Experiments have been tried and the outcome of them is that Messrs. Yates have patented an invention for machinery and plant for tea-box making, which they are now supplying at a figure that is within the reach of all planters, and the adoption of which should lead to a very considerable saving in their annual outlay, while at the same time rendering them independent of any outside supply. Many tea gardens have ample power for driving the box-making plant during the months when the power is not required for manufacturing tea. And even where this is not the case a central box-making factory might be established. Hitherto the great expense has been in the cost of bringing the log to the factory to be "broken down" and prepared for sawing up, and when sawn up, shipping to the various gardens. In the ordinary way the "breaking down" would have to be done by a Rack Bench, Timber Frame, or Band-Shaw, which are not only most expensive in themselves, but require heavy and expensive foundations on which to work with great power to drive them. Messrs. Yates & Co. claim that the machinery which they have patented as the result of Mr. Boulbee's researches, entirely obviates all these obstacles. They maintain that all that is required is that the tree in the jungle should be cross cut into short suitable lengths which can be easily split up by a simple and effective machine into any size that may be required for cutting the "shooks." This machine can be worked either by hand or power, requiring "only one horse nominal" to drive it. When not required for splitting logs for "shooks" it can, by a simple and inexpensive attachment, be converted to the purpose of splitting up firewood for heating the boilers or even utilised in preparing the tea. Some of our planting readers may be interested in reading the following description of the plan:—

The Patent Log Splitter and Breaking Down Machine is capable of dealing with logs up to 3ft. in diameter and 3ft. 6in. in length, and is reckoned to prepare sufficient stuff for 350 tea chests per day or if not employed on this, to split up from 3,000 to 5,000 billets of firewood, according to size in the same time. The stuff having been "broken down" into convenient sizes, is then hauled over to the "shook cutting bench," which is known in this country [England] as Yates and Boulbee's Patent Self-Feeding Safety Saw Bench. This unique machine is perfectly automatic in its action, absolutely safe, and will accurately saw up a sufficient number of "shooks" or strips for 250 to 300 boxes (according to size) per diem of eight hours. This bench is also arranged for cross-cutting ends and for jobbing purposes generally. In addition to the above machines it is recommended that an improved Box Maker's Planing and Thickening Machine, fitted with tonguing and grooving attachment for jointing the "shooks," and a checking machine for sides and ends be added, which complete little plant would turn out first class tea chests accurately made, giving equal tares, and saving "bulking," which is a most important consideration. Messrs. Yates supply a complete plant as described above for £300.—*M. Times.*

COFFEE MACHINERY.

French makers of decorticators, pulpers, and winnowers specially suited for treating coffee, should send their price-lists and models of machines. It would also be well if some coffee-producing countries could be mentioned where any maker has placed his machinery. All price-lists, prospectuses, and catalogues in Spanish should state the exact amount of work done by each machine. The "hacendados," or landed proprietors of the Yungas, would prove very profitable clients for such apparatus capable of being actuated by men, horses, mules, or oxen.—*French Chargé d'Affaires à La Paz.*

CEYLON MANUAL OF CHEMICAL ANALYSES.

A HANDBOOK OF ANALYSES CONNECTED WITH THE INDUSTRIES AND PUBLIC HEALTH OF CEYLON FOR PLANTERS, COMMERCIAL MEN, AGRICULTURAL STUDENTS, AND MEMBERS OF LOCAL BOARDS.

By M. COCHRAN, M.A., F.C.S.

(Continued from page 452.)

Coconut Poonac.

Coconut poonac is the residue of the kernel of the fruit of the coconut palm, (*cocos nucifera*) after the greater part of the oil has been expressed from it. As a manure it is much inferior to castor cake. The following two analyses exhibit its composition:—

Analyses of Coconut Poonac.

	per cent.	per cent.
Moisture ...	13.00	11.20
Organic matter ...	80.79	79.70
Soluble ash ...	5.09	6.47
Sand ...	1.12	2.63
	<u>100.00</u>	<u>100.00</u>
Nitrogen ...	3	3.33
Equal to ammonia ...	3.64	4.04

Crushed Tallow Oil Cake.

This substance is made from the seeds of one of the Tallow trees. An analysis to test its value as a manure yielded the following results.

Analysis of Crushed Tallow Oil Cake.

	per cent.
Moisture ...	10
* Organic matter ...	86.30
Ash ...	3.70
	<u>100.00</u>
* Containing nitrogen ...	2.31
Valuable ash ...	2.51
Sand ...	1.19

The sample was in a fine state of mechanical division, 92.6 per cent. passing through a sieve of 10 meshes to the lineal inch and 82.4 through a sieve of 28 meshes to the lineal inch.

Judging from the chemical analysis it is not equal to coconut poonac as a manure.

PHOSPHORIC ACID MANURES.

The following are the manures which are purchased for their phosphatic ingredients only:— Bone ash, animal charcoal, mineral phosphates, such as phosphorite and coprolite, superphosphates from mineral phosphates, superphosphates from bone ash, animal charcoal, precipitated phosphates and basic slag.

Bone Ash.

The two following analyses quoted from "Chemistry: Theoretical, Practical and Analytical" shew respectively the composition of pure bone ash from the mixed carcase bones of an entire ox, and also the composition of a commercial sample of bone ash:—

Analyses of Bone Ash.

	Pure.	Commercial.
Water and carbon ...	1.86	6.70
* Phosphoric acid ...	39.55	33.68
Lime ...	52.46	43.37
Magnesia ...	1.02	1.14
Oxide of iron17	.58
Carbonic acid, alkalies and substances not determined } ...	4.43	4.84
Siliceous matter51	9.69
	<u>100.00</u>	<u>100.00</u>
* Equal to tricalcic phosphate } ...	86.34	73.52

From 70 to 75 per cent. tricalcic phosphate represents the commercial standard of purity for this article.

Animal Charcoal.

The following according to Krocker is the average composition of animal charcoal:—

	per cent.
Moisture ...	2.350
Carbon and volatile matters ...	12.388
Lime ...	38.416
* Phosphoric acid ...	29.690
Carbonic acid ...	2.400
Sand ...	13.300
Other matters ...	1.456
	<u>100.000</u>
* Equal to tricalcic phosphate ...	64.105

The composition of waste animal charcoal varies between wide limits, depending on the use to which it has been put. It is only when its power of decolorising liquids for which it is chiefly used in the arts has become spent, that it is sold to the manure manufacturer, to be converted into superphosphate. The following, according to R. Weber, represent the limits between which the ingredients of animal charcoal vary.

Composition of Spent Animal Charcoal. (WEBER.)

Phosphates ...	from 50 to 82 per cent.
Calcium carbonate ...	5 to 10 "
Free lime ...	1 to 6 "
Sand ...	2 to 28 "
Water and carbon ...	9 to 26 "

Mineral Phosphates.

These are mostly used for the manufacture of superphosphate; but when finely ground may be applied to the soil direct. The following from

"Chemistry: Theoretical, Practical and Analytical" represents the percentage composition of some of them:—

Analyses of Mineral Phosphates.

	Norwegian Apatite.	Canadian Apatite.	Spanish Phosphorite.		Cambridge coprolite.
			Superior.	Ordinary.	
Water	.90	.91	3.59	1.00	4.04
Loss on ignition					
Phosphoric acid	35.69	33.27	33.38	28.67	26.62
Lime	46.39	45.56	47.16	40.60	43.30
Magnesia	.74	—	trace	1.48	.95
Potash	.36	—	—	—	.58
Soda	—	—	—	—	.64
Ferric oxide	1.29	—	2.59	.63	2.18
Alumina	1.53	—	.89	.50	2.05
Carbonic acid	none	—	4.10	4.67	6.82
Sulphuric acid	.29	—	.57	.90	.91
Chlorine	1.62	—	—	—	—
Fluorine	—	—	—	.67	—
Siliceous matter	11.62	10.38	3.71	20.92	8.19
Phosphoric acid reckoned as tricalcic phosphate	77.90	72.62	72.87	62.59	58.11
Carbonate of calcium	none	—	9.31	10.62	15.50
Lime for 100 phos. acid	130	137	141	142	163

According to Mr. Pringle (*Tropical Agriculturist* 1891) both bone ash and mineral phosphates, which are to be applied directly to the soil as manures, should be in a state of division, such that 90 per cent. passes through a sieve of 80 meshes to the linear inch. The same agricultural chemist says: "Of mineral phosphates high class Spanish called Estramadurite, has from 75 to 82 per cent. phosphates; inferior qualities are often in the market with only 50 per cent. or so in them. Canadian and Norwegian apatites and Aruba phosphate are generally very rich, having sometimes as much as 90 per cent. tricalcic phosphate. There are a great number of others; but these are the most suitable, and I prefer Aruba, as it is as soft and as easily decomposed as bone ash, and is generally cheaper."

Deposits of guano are met with which have parted with nearly all their nitrogen, and are valued on the basis of their phosphoric acid. Some of these guanos contain phosphoric acid equivalent to upwards of 70 per cent. tricalcic phosphate. These, as well as bone ash and mineral phosphates, are used in the manufacture of superphosphates. From phosphatic guanos, by treatment with sulphuric acid, are prepared the superphosphates that are richest in soluble phosphates. As these guanos are free from excess of lime, and contain almost no iron and alumina, practically the whole of the phosphate can be rendered soluble, and they yield a superphosphate, containing from 40 to 45 per cent. of soluble phosphate, i.e., tricalcic phosphate rendered soluble. Bone ash contains a little lime not combined with phosphoric acid, which is converted into gypsum, thus adding to the non-

phosphatic ingredients; hence bone ash superphosphates are not quite so rich in soluble phosphates as those made from high class phosphatic guanos, still the superphosphates made from bone ash are of excellent quality, and may be reckoned to yield from 35 to 40 per cent. of soluble phosphates. Mineral phosphates yield superphosphates rich in soluble phosphates, in proportion to the richness of the mineral phosphate, to the fineness of the grinding of the mineral and to its freedom from iron, aluminum, and calcium carbonate. A range of from 20 to over 40 per cent. of soluble phosphate may be looked for in this class of superphosphate. From Carolina river phosphate 30 per cent. and from Cambridge coprolite 25 per cent. soluble phosphates are said to be fair yields.

The following is Kroecker's analyses of a superphosphate made from Baker guano:—

Analysis of Superphosphate.

	per cent.
Moisture	...
Chemically combined water	...
Combustible matter	27.00
Soluble phosphoric acid	21.31
† Insoluble do	1.05
Sulphuric acid	24.65
Lime	23.20
Magnesia	1.30
Alkalies	.40
Insoluble matter	1.00
	100.00

* Equal to tricalcic phosphate rendered soluble ... 46.52

† Equal to tricalcic phosphate ... 2.29

The following are the analyses of two samples of superphosphate imported to Ceylon:—

Analyses of Superphosphates imported to Ceylon.

	per cent.
Moisture	...
Chemically combined water and	...
Combustible matter	21.78
Soluble phosphoric acid	15.66
† Insoluble phosphoric acid	1.50
Sulphuric acid	29.06
Lime	23.35
Magnesia, alkaline salts and oxide of iron	2.35
Insoluble matter	6.30
	100.00

* Equal to tricalcic phosphate rendered soluble ... 34.21

† Equal to tricalcic phosphate ... 3.27

The following is a better sample of superphosphate, the results being also reported in a different form from the above:—

	per cent.
Moisture and other volatile matter	24.10
* Monoalcic phosphate (biphosphate)	26.84
Insoluble phosphate of lime	1.24
Calcium sulphate (hydrated)	46.39
Alkaline salts	1.08
Insoluble matter	.35
	100.00
* Equal to tricalcic phosphate	42.02

The following analyses by Tatlock represent superphosphates in the most concentrated form which has come under the author's notice. They were manufactured in the year 1892:—

Analyses of highly-concentrated Superphosphates

No. 1.		per cent
Phosphoric acid soluble in water	...	32.81
Equal to tribasic phosphate of lime	...	71.62
or		
Phosphoric acid soluble in citrate of ammonia	...	37.10
Equal to tribasic phosphate of lime	...	80.99
No. 2.		per cent.
Biphosphate of lime	...	56.10
Equal to soluble phosphates	...	87.83
Insoluble phosphates	...	12.17

If the price per unit of phosphoric acid in the above does not greatly exceed that in ordinary superphosphates, it is evident there would be a very material saving in freight, by the importation of such highly concentrated superphosphates as compared with those of ordinary quality.

Precipitated Phosphates.

Another highly-concentrated form of phosphate of lime is sold as a manure under the name of precipitated phosphate. It is manufactured by passing ammonia gas into superphosphate of lime, the result being a mixture chiefly of tribasic phosphate of lime and sulphate of ammonia. The sulphate of ammonia is removed by washing, and the dried residue contains from 70 to 80 per cent. of tribasic phosphate of lime.

Another method of manufacture is by the addition of lime to a solution of superphosphate, which throws down tribasic phosphate of lime along with bi-phosphate. The tribasic phosphate of lime obtained in this manner is much more soluble in water (and therefore much more readily assimilated by plants) than is tribasic phosphate of lime as it exists in mineral phosphates.

This form of phosphate appears to be better suited for soils deficient in lime (like those of Ceylon) than acid manures, and as a further recommendation it does not injure the bags in which it is packed like superphosphate. Its employment on Ceylon estates would altogether depend on its effectiveness and cost when compared with bone dust.

Basic Slag.

Another form of phosphate is deserving of notice which goes by the name of Thomas Basic Slag, the reputation of which has gone on steadily rising. It is a slag produced in the manufacture of steel from pig iron by the Thomas and Gilchrist process. The slag consists chiefly of phosphate of lime, with excess of lime, the percentage of phosphate of lime varies from 30 to 42 per cent, but it can be purchased under the guarantee of containing phosphoric acid equal to 37 per cent. tribasic phosphate. It is sometimes sold in such a fine state of division, that 75 per cent of the powdered substance passes through a sieve of 168 meshes* to the square inch, in this fine state Thomas phosphate of 40 per cent. tribasic phosphate is said to be four times more soluble and effective than steamed bone meal (Griffiths). The unit of phosphoric acid in this substance is also, as yet, cheaper than in nearly all other phosphatic materials in England, but in Ceylon it could only compete with bone dust in the event of its being found to be more effective as the cost per unit of phosphate of lime would be R1.80 as against R0.70. It might be expected to give especially good results on land deficient in lime as it contains some free lime. The fact that it is comparatively soluble and therefore readily assimilated by plants is due to the phosphoric acid

* It is most effective when ground much finer than this. It may with advantage be reduced to an impalpable powder.

existing not as tribasic phosphate, the most insoluble form which phosphoric acid assumes, but combined with four molecules* of lime instead of three as in tribasic phosphate which renders it basic and more unstable. It is worthy of remark that this manure contains oxide of manganese, which is not usually regarded as a necessary constituent of manures; but it is nevertheless a substance which is always present in tea leaves, while it is not an abundant constituent of the soil. Dr. Griffiths in his work on manures, mentions that samples of good quality analysed by Dr. Voeleker and Mr. Bernard Dyer, show percentages of 19.12 and 19.94 respectively of phosphoric acid, which are equivalent to 41.74 and 43.33 per cent. tribasic phosphate of lime.

The following is a full analysis of basic slag of a more ordinary quality by Mr. Tatlock:—

Analysis of Basic Slag.

	per cent.
Lime	47.65
Magnesia	4.74
Oxide of Iron	12.56
Oxide of Manganese	2.69
Alumina	4.58
Silica	12.02
* Phosphoric Acid	15.09
Sulphuric Acid	.27
Sulphur as Sulphide	.15
Carbonaceous Matter	.25
	100.00
* Tribasic phosphate of lime	32.94

POTASH MANURES.

The greater part of these manures that are valued on the basis of their potash only, come from the German mines, prominent amongst which are those of Stassfurth. The following analyses by F. Fursky (Bied. Centr. 1882) exhibit the composition of the Stassfurth manure salts.

Percentage composition of Stassfurth Manure Salts:—	Purified potash-magnesium-sulphate.		Purified potash-sulphate.		Four times concentrated.		Thrice concentrated potash manures.		Concentrated potash manures.	

Calcium sulphate	58	28	62	38	25	20	38	62	69	35
Magnesium sulphate	36	28	38	20	20	25	25	20	12	35
Potash sulphate	53	17	97	20	—	—	—	—	23	15
Magnesium chloride	—	—	—	—	25	25	24	24	1	15
Potassium chloride	—	—	—	—	82	57	52	38	22	95
Sodium chloride	3	52	—	—	14	23	26	30	32	34

* The name tetracalcium phosphate has been given to this combination to distinguish it from ordinary tricalcium phosphate.

The following are older analyses by Professor E. Wolff shewing the average percentage composition of German salts, and the amount of potash guaranteed :-

Average percentage composition of German potash salts. (WOLFF)

	Potash guaranteed.	Potassium sulphate.	Potassium chloride.	Magnesium sulphate.	Magnesium chloride and magnesia.	Sodium chloride.
...	10-12	18-25	— 22	15-25	3-6	35-55
concentrated	25-26	22-26	19-22	15-20	3-6	20-35
three times concentrated	30-34	—	48-55	5-10	3-6	30-50
four times concentrated	38-42	—	60-67	—	3-6	30-40
five times concentrated	50-55	—	80-85	—	3-6	10-20
Crude potassium-magnesium sulphate	15-17	27-30	—	25-30	3-6	25-40
Leopoldshall (Anhalt) Kainit	13-14	23-25	—	25-30	(?)	30-45

The following shews the composition of a sample of kainit, imported to Ceylon, submitted to me for analysis. For the sake of comparison I give also Voelcker's analysis of kainit :-

Analyses of Kainit.

	per cent.	Voelker. per cent.
Moisture ...	6.24	3.36
Water of combination ...	12.81	10.88
Potassium sulphate ...	22.51	24.43

Magnesium sulphate ...	14.23	13.22
Magnesium chloride ...	13.16	14.33
Sodium chloride ...	29.01	30.35
Insoluble siliceous matter...	.36	.71
Alumina30	
	100.00	100.00

Another of the Stassfurth salts called carnalite has the following composition, quoted from Richardson and Watt's Chemical Technology.

Analysis of Carnallite.

	per cent.
Chloride of potassium ...	24.27
Chloride of sodium ...	4.82
Chloride of calcium ...	2.82
Chloride of magnesium ..	30.98
Sulphate of lime ...	1.05
Oxide of iron14
Water, &c. ...	35.92
	100.00

The above is a crude miriate of potash. Commercial miriate of potash contains 88 per cent. pure miriate.

PLANT ASHES.

The value of plant ash as a manure depends chiefly in the amount of potash contained in it. Besides potash, plant ash frequently contains appreciable quantities of phosphoric acid, and sometimes large quantities of lime. The amount of potash and lime vary between wide limits. The following exhibits the composition of several samples of wood ashes submitted to the author for analyses :-

Analyses of Wood Ashes.

	per cent.	per cent.	per cent.

Sulphuric acid	2.42
Chlorine	3.40
Carbonic acid &c.	32.76
Insoluble siliceous matter	3.01
	100.00
* Equal to calcium carbonate	43.75
† Equal to potassium carbonate	29.01

The following is the analysis of a remarkable sample of wood ashes, which exhibits potash at about its minimum, and lime at its maximum. It is the ash of the tree known by the Sinhalese as the kumbuk, which is one of the genus Terminalia. On sifting the sample through a sieve having 900 meshes to the square inch, 1.17 per cent. of quartz sand was separated. The ash, freed from the small quantity of quartz, had the following composition:—

Analysis of Wood Ashes of the Kumbuk Tree.

Phosphoric acid	trace
Carbonic acid and other constituents	39.35
	100.00
* Equal to calcium carbonate	100.00

A portion of the lime was in the caustic state, which accounts for the fact that it contains as much lime as is present in chemically pure carbonate of lime.

A venerable specimen of this tree grows at Mutwal, Colombo, which the late Mr. W. Ferguson measured in the year 1850, and found the girth close to the earth to be 45 feet, and 21 feet at 12 feet above the ground. Mr. Ferguson states that he had his first view of the tree from the sea near Negombo, about twenty miles distant. The calcareous nature of the ashes of the kumbuk tree is well-known to the natives of Ceylon.

Ashes of Marine Plants.

On sea coasts, where sea weed abounds, it has been largely used for manuring the land bordering on the sea; but the large percentage of moisture in marine plants prevents its use on land, at any great distance from the sea. I am unable to quote the analyses of any cut or drift weeds found on the Ceylon coasts; but very elaborate analyses

of sea weeds, and especially of the ash of sea weeds, known as kelp in Scotland and Ireland, and varec in France, have been made in connection with the iodine industry. These may be found in Richardson and Watts' Chemical Technology. Viewed as a potash manure, it will be sufficient to quote the analyses of the late Professor Anderson of Glasgow, of the mixed cut and drift weeds in the state in which they are actually used, i.e., with small shells and marine animals adhering to the plants, which increase the amount of phosphoric acid and nitrogen.

NITROGENOUS AND PHOSPHATIC MANURES.

Amongst the more important manures that are valued both for their nitrogen and phosphoric acid, may be enumerated crushed bones, fish manures, guano and nitrogenous superphosphates.

Crushed Bones.

The value of crushed bones for agricultural purposes depends both upon their chemical composition, and also upon the state of division to which they have been reduced. The finer, the state of division, the more rapidly does bone become decomposed in the soil, and the greater is its value. Differences in the state of division are distinguished by the names bone dust, bone meal, bone flour.

In making a mechanical analysis of crushed bones, Krocker uses three sieves. What passes through No. 1 sieve with 4,000 meshes to the square inch is termed *very fine*.

What passes through sieve No. 2 with 2,000 meshes to the square inch is termed *fine*.

What passes through sieve No. 3 with 1,000 meshes to the square inch is termed *tolerably fine*.

Krocker gives the following as the average of a large number of analyses of bone dust. I quote from Dr. Frankland's work on "Agricultural Analyses:—"

A. Chemical Composition. (KROCKER.)

	Steamed per cent.	Unsteamed per cent.
Moisture	5.30	7.50
Organic matter	33.40	38.00
Phosphoric acid	22.80	19.50
Lime	27.70	24.20
Carbonic acid	3.80	4.10
Ferric oxide90	1.20
Magnesia alkalies } Sulphuric acid &c. }	2.50	2.00
Insoluble matters	3.60	3.50
	100.00	100.00
Nitrogen	3.80	4.05

B. Mechanical Composition.

	45	56	65	75	20	31	35
I. Very fine	45	56	65	75	20	31	35
II. Fine	12	20	15	12	8	9	15
III. Tolerably fine	16	18	12	9	14	18	14
IV. Coarse	27	6	8	4	58	42	36
	100	100	100	100	100	100	100

The following represents the composition of a number of samples of bone dust submitted to me for analysis:—

Analyses of Bone Dust as used in Ceylon.	Steamed.				Unsteamed.			
	8.10	4.32	6.62	7.73	8.36	5.92	27.57	21.12
Moisture	8.10	4.32	6.62	7.73	8.36	5.92	27.57	21.12
* Organic matter	29.30	26.72	24.02	29.44	25.90	21.12	27.57	21.12
† Phosphoric acid	24.31	25.13	21.50	22.87	24.13	21.12	27.57	21.12
Lime	31.58	32.65	29.12	32.22	32.26	33.84	33.84	33.84
Magnesia alkalies } Carbonic acid fluorine, &c. }	3.71	6.22	5.78	6.04	7.47	8.28	8.28	8.28
Insoluble matters	3.00	4.96	12.96	2.70	1.88	3.27	3.27	3.27
	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00
* Containing Nitrogen	3.77	3.13	3.20	3.71	3.52	3.29	3.29	3.29
Equal to Ammonia	3.06	3.07	3.89	4.51	4.27	4.00	4.00	4.00
† Equal to tricalcic phosphate	52.37	54.86	46.94	49.92	52.67	46.11	46.11	46.11

* The average amount of nitrogen in the unsteamed bones was 3.5 per cent and in the steamed 2.56 per cent. The average amount of phosphoric acid in the unsteamed bones was 23 per cent and in the steamed 22.5 per cent.

The following is the analysis of a sample of bone meal prepared in Colombo:—

Analysis of Bone Meal.

	per cent.
Moisture	7.70
* Organic matter	29.50
† Phosphoric acid	22.63
Lime	29.40
Magnesia alkalies, carbonic acid &c.	6.27
Insoluble matter	4.50
	100.00
* Containing nitrogen	3.50
Equal to ammonia	4.25
† Equal to tricalcic phosphate	49.54

The mechanical condition of this sample of bone meal was such that 96 per cent passed through a sieve having 17 meshes to the lineal inch, and fully 70 per cent passed through a sieve having 30 meshes to the lineal inch.

No sample of the finest form of crushed bones, viz., bone-flour has as yet been submitted to me for analysis. According to the late Mr. Pringle, bone flour should be in such a state of division that 90 per cent should pass through a sieve having 80 meshes to the lineal inches.

The following shew the composition of two amples of refuse bone dust :—

Analyses of Refuse Bone Dust.

	per cent.	per cent.
Moisture	5.42	10.98
Organic matter	8.42	9.84
† Phosphoric acid	8.48	14.89
Lime	14.32	20.32
Oxide of iron and alumina	2.52	12.27
Magnesia alkalies, carbonic acid, &c.	5.05	
Sand	55.79	31.70
* Containing nitrogen equal to ammonia	100.00	100.00
† Equal to tricalcic phosphate86	1.01
	20.63	32.51

Besides raw bones and steamed bones, another bone manure called degelatinized bones is used as manure. This consists of bones from which the greater part of the gelatine has been extracted by boiling. The residue, after drying, is friable and can be easily reduced to a fine state of division, and is sold as degelatinised bone meal. The following three analyses of this material are given by Mr. W. Ivison Macadam :—

Analyses of Degelatinized Bone Meal.
(W. J. MACADAM.)

	per cent	per cent	per cent
Moisture	6.52	9.12	12.24
* Organic matter	15.08	11.27	16.18
Alkaline salts	1.27	1.06	.73
Phosphates	64.24	63.82	65.36
Carbonate of lime	10.65	6.87	4.62
Silica	2.24	7.86	.87
	100.00	100.00	100.00
* Containing nitrogen equal to ammonia	1.67	1.82	1.92

In this material the phosphates are considerably higher, and the nitrogen considerably lower, than in other forms of bone dust.

So long as the supply of bones keeps pace with the demand as it has done hitherto, bones are likely to remain the chief and most economical source of phosphates for Ceylon agriculturists.

(To be continued.)

ARBORICULTURE.

There are some things that the past generation of Anglo-Indians understood better than the present, and one of these was arboriculture. It is not necessary to adduce many arguments in proof of this assertion. Those who may entertain any doubts on the subject have only to take a glance around to convince themselves that what I state is correct. Let any one take a long drive or ride along the now neglected grand trunk road, and say whether any finer specimens of trees are to be found along our modern roads than are to be met with along the grand trunk road. The early pioneers of Western civilisation in this land of sun and heat thoroughly understood the value of trees to man and beast. In this they were simply following in the footsteps of the Mogul conquerors, who in their turn were following the Eastern proverb, which says: "Plant a tree, dig a well, and go to heaven."

It is not, however, so much the planting of trees that I take objection to in these days, as the selection of them for arboricultural purposes. In the old days our forefathers very wisely chose such trees as the Mongo, the "Bargad" (*Ficus Indica*), a few other varieties of the great fig family, such as the "Peepul," the "Gooler" and others; the "Khirnee" (*Mimusops Kaki*); the "Maulseri" (*Mimusops Elengi*); the "Mowha" (*Bassia latifolia*); the well known Tamarind (*Tamarindus Indica*), and such like. It will be seen that every one of these affords magnificent shade; and, with the exception of the "Mowha," are evergreen. In addition to their shade-yielding quality, every one of them has an economic value, and yields a fruit. The natives eat the fruit of the Peepul, Bargad and Gooler, while birds of all kinds are fond of it. Most of these trees are alive with birds of sorts on a hot summer's day. The fruit of the Khirnee is not at all bad, and is held in great favour by the natives; while that of the Maulseri is also much valued by them. Moreover, this tree yields a powerfully-scented flower, which is in great demand by the natives for *poojah* and for making into garlands. I need not enlarge on the Mango and Tamarind, nor about the Mowha, as the fruit of these is well known. In addition to this, I would add the Jack Fruit tree (*Artocarpus integrifolius*), which is not at all used for arboricultural purposes. It is easily grown, germinates freely, and affords a fine shade, being evergreen, and bears a fruit which commands a good price. The "Sheeshum" (*Dalbergia Sisso*), is a good timber tree, but is not evergreen, nor does it give a good shade; but it is now very largely used for avenues.

Turning now to the trees mostly used for arboricultural purposes, I note the following:—The "Sirris" (*Albizia Lebeck*.) This is a most unsatisfactory tree. It is not evergreen, and yields a poor shade. Moreover, the wood is spongy, and a strong breeze will knock off large branches, while a storm will uproot scores of them. Always after a storm our public roads are strewn with Sirris branches torn off, and numberless trees uprooted. Yet there seems to be a *penchant* for planting this tree along our roads, to the exclusion of most others. Its only advantage is its quick growth, and the deliciously-scented flowers it yields in March and April. Next is the *Millingtonia Hortensis*, known to natives under the name of "Per Chameli" which freely translated means "Giant Jessamine." This also is not suited for avenues. It is tall, of pyramidal growth; yields scarcely any shade, and has brittle wood. A strong wind even will uproot the oldest tree, as its roots do not descend beyond a few feet below the surface of the ground. Why it is planted along our roads I have failed to find. Like the Sirris it is of quick growth, and bears highly-scented flowers in November. It has a very spongy bark, which would, perhaps, be useful for corks; hence its old name of *Bignonia Sub-rosa*. Then we have the Neem tree (*Melia Azadirachta*.) This is a very useful tree, but it is not evergreen, and is not suitable for avenues, yet it is largely used for such. At the present time these trees are shedding their leaves, and look very unsightly. The Teak (*Tectona grandis*), is also much used for avenues in some parts. In Upper India they are deciduous, and present an unsightly appearance when shedding their leaves. As a timber-yielding tree it has no equal in the world, but as an avenue tree it is useless. The "Papri" (*Pongamia Glabra*), is another tree I frequently see planted along roads. It is also deciduous, and altogether ugly and quite unsuited for arboricultural purposes. The "Lassora," (*Salvadora myca*), I class in the same category with the last named. The Sheeshum I have already referred to, and I do not recommend it for avenues, except in places where nothing else will grow. The different species of *acacia* are quite unsuited for arboriculture also. They answer very well for clumping and forest purposes.

I would, therefore, make the following suggestions for the improvement of arboriculture:—Nurseries should be established at certain centres, where the

species of trees I have recommended above should be raised. All of them can be easily propagated by seed. When they are one year old they will be fit for transplanting. It would, however, not do to cut down existing trees of undesirable species at once; but the seedlings of the desirable varieties should be planted in the spaces between the existing trees, and well looked after. They should be protected from the ravages of cattle and goats, as at present, until they are big enough to need no further protection; and when they have attained sufficient height to afford shade the old and useless trees should be cut down to make room for the new ones. Those species which bear good fruit, such as Mangoes, Tamarinds, Jack-fruits, Khirnees, Maulseris, &c., should, when about to bear fruit, be farmed out to contractors, and the sale proceeds utilised for the maintenance of nurseries, and other requirements of the arboricultural department. An additional advantage of this system would be that the trees would be well looked after by the contractors for the sake of the fruits, and arboricultural operations would be self-supporting to a large extent: at present Government lays out money without any return whatever.

It will, however, be useless to expect anything like satisfactory results if arboricultural operations are to be carried on under existing rules, when the responsibility for success or failure rests with an ill-paid native, who has not the least notion as to what is really necessary. The work should be entrusted to a European or Eurasian possessing some technical knowledge about trees in general, who should receive a decent salary, and be made responsible for everything within certain areas. This would not only ensure good value for money laid out, but would open up an avenue of employment for the sons of Anglo-Indians who do not look for very high wages.

The importance of trees in the economy of nature is well understood by most people. Tracts of country which never before received rain, and were practically desert wastes, are now smiling with the verdure of trees, and receive a fair rainfall. One such place is Mooltan in the Punjab; Aden is another. I could name several such places which have benefited vastly by the systematic planting of suitable trees. Vegetation gives rise to evaporation of moisture which in its turn attracts the moisture always suspended in the atmosphere, and thus produces rain. Therefore, arboricultural operations carried out systematically have an important bearing on the economy of nature. J.
—*Pioneer*.

FACTS ABOUT BANANA MEAL.

A COMING INDUSTRY.

A Mr. Hartog, who went in the beginning of last year to Surinam (West Indies), is in possession of a method of preparing fine dry meal from bananas and plantations. The chemical analysis of both sorts of meal have proved that the chemical composition of different banana and plantain kinds is almost identical. The principal stuff the meal contains consists of 80 to 85 degs. of starch. This composition induced him to seek the adoption of the meal for purposes where other stuffs containing starch are employed, and he chose, in the first place, the fabrication of alcohol and glucose (grape sugar). As he did not dispose of very large quantities, he was forced to apply to laboratory experiments that were made at the Government Institute of Alcohols in Switzerland, fixed at Berne. The gentlemen there made alcohol of the meal, and wrote as follows:—

"Il résulte de ce qui précède, qu'il vaut tout à fait la peine d'utiliser ces surines pour la fabrication d'alcool. La qualité de l'alcool de farine de bananes peut aussi être envisagée comme bonne." In the conversation about the object with those gentlemen, they gave their opinion that the value of the meal would at least be that of maize, the starch

quantity of the meal being greater, the same opinion was given by some manufacturers of alcohol in Switzerland and in Holland. As proof of how many stuffs can be employed for alcohol manufacturing, it may be said that one not very large manufactory in Holland employs in average 25,000 tons of maize a year. The same gentlemen, in Berne, made experiments with glucose making, and said:—"Il est évident que la farine de bananes traitée de cette manière pourrait être encore utilisée pour la fabrication de glucose." The value of the meal for glucose would be more than one and a half times that of maize, for maize is not employed for that fabrication, but only dearer sorts of stuffs, as potato and sago meal. A certificate for the employment of the meal for glucose manufacturing can only be given by employing at least a ton of the stuff, but there is very great probability it will also do for that purpose. In the following calculations he estimates the value of the meal on the basis of maize, that is, at this time being delivered by ship in Europe at £5 to £5 10s. For manufacturing 1,000 tons per year of meal there would be needed an installation that would cost, delivered and fixed in the estate, £2,000 to £2,500. For a second 1,000 tons a similar installation would be needed, for it would be difficult to make larger installations. For this reason it would also be profitable to make the manufactory on the estate itself, for using the bananas and plantains. The fabrication of 1,000 tons will be taken as a basis. Cost of reaping the fruit, preparing it and making the meal, delivered on ship if there is water in the neighbourhood, can be put at 18s. to 20s per ton; for freight to Europe, 18s. to 25s. per ton. Thus the average cost for the meal delivered in Europe would be £2 per ton. He said the value would be at least that of maize, or £5 to £5 10s., so that there would rest per ton of meal £3 to £3 10s. So that for 1,000 tons an installation of £2,000 to £2,500 is wanted, and a quantity of bananas or plantations of about the double or the triple of the meal in average 2,500 tons, whilst the revenue would be £3,000 to £3,500. In the above given cyphers all exaggerations are avoided. So it is probable that the quantity of 1,000 tons, can be surpassed, and the cost of manufacturing can be reduced, whilst the price of the meal would increase if it will do for glucose manufacturing.

L. E. ASSER, C.E.

[We have examined specimens and samples—both of the banana spirit and banana flour—and are satisfied that there is a great future before this industry.—*Editor*.]—*Horticultural Times*.

"WHAT TO DO WITH OUR GIRLS?"—A suggestion which we originally put forward in a letter to the *Pall Mall Gazette* in 1884—that brother and sister, where there were large families, should be prepared to begin a colonial life together,—has been taken up by the Lady Lecturer Miss Shaw in her paper on the "Australian Outlook" before the Royal Colonial Institute. We quote as follows an editorial note in the *Daily Chronicle*:—

Miss Shaw's practical suggestion towards the solution of the problem, "What shall we do with our Girls?" that every boy who is sent out to Australia to try his fortune should take a sister with him, is opportunely supplemented by a bitter cry for "more girls" from Canada. The *Canadian Gazette* is responsible for the statement that the parting pathetic message of a young Irishman to one of last year's delegates was, "For heaven's sake send us some girls!" The lament, it seems arises from the absence of good "lady helps." This is the harder to understand, because servant-girls in the north-west receive £60 a year, with board and lodging. That they get married is only the natural result of these circumstances; so that, whether a woman wishes to lead a life of single blessedness or become the better half of a farmer, North-West Canada would seem to be an admirable place for her,

CEYLON TEA IN AMERICA AND AUSTRALASIA.

We call attention to a very interesting and suggestive letter from Mr. Wm. Watson—formerly so well-known in Ceylon in connection with the Oriental Bank Corporation and now occupying an important position in the banking world of New Zealand. Mr. Watson has taken a great deal of interest in the introduction of Ceylon tea into that Colony and in the letter before us he gives us the results of his experience, rightly judging that it affords valuable lessons with reference to the important question now before Ceylon planters as to what is best to be done in America. Our correspondent shows that now the only part of New Zealand where "pure Ceylon tea" does not seem to be sold is in the province of Auckland. This it is satisfactory to remember, is just the part that is about to be exploited by Mr. A. Thom who is on his way to settle there and to whom the Tea Fund Committee have extended special aid. We trust Mr. Thom will very speedily supply the want pointed out by Mr. Watson. As to present consumption, it is made clear to us by Mr. Watson that considerably more than one-half the tea consumed in New Zealand is from India and Ceylon and he thinks that if the same course is followed in America, there ought very soon to be a demand for 45 million lb. of Ceylon and the same quantity of Indian tea in the United States and Canada. The latter dependency is already, we know, a fairly good customer for British-grown teas and there can be no doubt that following on the Ceylon Court at the Chicago Exhibition, the efforts made in New York, Chicago, St. Louis, Philadelphia, &c., ought to lead to a large increase in the consumption of our teas. Mr. Lipton is committed to their wholesale distribution and a number of British merchants are sending in teas through their agents apart from what the Commissioner's Chicago store may do. Meantime, we attach much importance to the effect on California and the Pacific Coast States of the Ceylon Tea Court of Messrs. Foster and Cockburn at the San Francisco Exhibition and we expect to see this followed by the establishment of regular stores after the fashion described by Mr. Watson in New Zealand.

Since writing the above, we have received an interesting letter from a well-known Ceylon planter dated "San Francisco, 16th Nov." We leave "D. K." to tell his own story of his experiences in the States, but it is very satisfactory to see that he speaks so highly of the venture of Messrs. Foster and Cockburn in California, as well as of the Ceylon Courts in the Chicago Exhibition.

CEYLON TEA IN AMERICA.

Dunedin, New Zealand, Nov. 27, 1893.

DEAR SIR,—I was much interested in reading in the *Overland Ceylon Observer* of 26th October your London correspondent's accounts in his letters of 29th September and 5th October of his interviews with Messrs. H. K. Rutherford, J. L. Shand, W. M. Leake, J. Whittall, and J. Roberts.

Perhaps, as one who had the experience of popularizing Ceylon tea in this Colony, I may be allowed to say that I agree with the views expressed by Mr. Rutherford and Mr. Leake as against the others, but I should be in favour of

establishing stores in the principal Northern Cities for the sale of "Pure Ceylon Tea" rather than attempting to work at first through established traders. That all tea traders in America would ultimately sell pure Ceylon tea I believe as firmly as I do. That they would oppose it at first, and to shew my reasons for this belief I will recount, as briefly as possible, my experiences here. I assume, of course, that the observations of the Americans who tasted the Ceylon teas at the Chicago Exhibition were correct, viz:—that the Ceylon tea was much superior to what could be procured in ordinary stores in America.

When I came here in 1886 there was no pure Ceylon tea exhibited for sale in Otago, and very little, if any, sold by the pound in New Zealand. I got a few hundred pounds of it sent by a Colombo firm to a wholesale grocery firm in Dunedin, which took a year to work off, the wholesale firm reporting that it was unsuitable to the trade.

I next tried the family grocer; he first tried the sample I gave him by chewing it, and finally decided it was too dear to make a profit out of, for, said he, "we get nothing on sugar, soap, candles, &c. and have to take it out of tea." By these and other experiences it was soon made plain that it was not to the interests of the trade to substitute strong Ceylon tea at 10d to 1s C. F. I. for weak China tea which they purchased at 6d and sold at 2s 3d, 2s 6d, and 2s 9d according to the customer. Persuasion was of no use; force had to be applied and it was.

In 1889 the Kiosk of the Planters' Association at the Dunedin Exhibition was, as a show, very successful. But we were not permitted to sell tea by the packet there, and had nothing else been done than what was done in the Kiosk. The prospects of introducing Ceylon tea into popular consumption would not have been encouraging—so a small local Company was formed, and a shop was opened in our principal street, where we sold wholesale and retail pure Ceylon tea. For a short time the opposition of tea dealers was very strong. Their advertisements (of which I sent you copies at the time) depicted Ceylon tea as injurious, and sickly to the taste, and even pictorial cartoons were resorted to in the hope of bluffing us out of the market.

But when they found we had come to stay, they swiftly changed their tactics, and our shop did not sell the quantity some shareholders expected, because every shopkeeper took to selling pure Ceylon tea.

What the Kiosk at the Exhibition began the shop carried to perfection in Otago. In Canterbury and Wellington private stores were opened for the sale of pure Ceylon and Indian teas only, and like results followed. My business takes me over all New Zealand and the only place I get China tea to drink now is in the Auckland province, where, so far as I know, there is no shop for the sale of Ceylon and Indian teas only, although every respectable shop sells some of these teas.

It may be said that the circumstances in America are different from those in New Zealand. No doubt to some extent they are, but is there not in the vast population of the States, especially in the cooler climates, millions who would drink good tea? It is by the working farmer and the artisan that the bulk of the stimulating and refreshing Ceylon and Indian teas are consumed in Australasia, and these are the customers whom we should very soon reach in the States. Then what about Canada with its population equalling that of all Australasia? And what of the increasing sobriety of the English-speaking people whereby consumption of tea per head is sure to increase?

The imports of tea into New Zealand during the year 1892 were as follows:—

From	lb.
United Kingdom	7,837
Victoria...	1,750,527
New South Wales	273,606
Tasmania	20
Fiji...	658
Hongkong	2,7807
Bengal...	576,621
Bombay	2,400
Ceylon	597,065
Singapore	222
West Coast America	13
China	466,934
South Sea Islands	6
Total..	3,703,716

valued at £139,876 or 9.06 pence per lb, in Bond. The total amount of tea entered for Home consumption in New Zealand in 1892 was 4,088,349 lb. The population of the Colony including Maoris on 31st December 1892 was 692,426, thus the average consumption was 5.90 lb. per head of the whole population.

Now the average price of the tea imported being 9.06 pence we may safely assume that at least two-thirds of the imports from the United Kingdom, Victoria, and New South Wales were Ceylon and Indian teas, which would make the total of these teas as follows:—

From—	lb.
Ceylon	597,065
Bengal and Bombay	579,021
United Kingdom	224
Victoria	1,167,018
New South Wales	182,404
Total...	2,530,732

or 3.65 lb. per head of the population.

Surely it may be estimated that one-third of the population of the United States and Canada might be induced, as were the people of New Zealand to consume per head an equal quantity, viz.:—3.65 lb. of Ceylon and Indian Tea. Taking these populations at 75 millions would give a consumption in the future of over 90 millions lb., probably half of which would be Ceylon tea. And who is bold enough to say that the lowcountry of Ceylon will not contribute in the future another 45 millions lb. per annum to swell your present export?

At all events having spent £30,000 at the Chicago Exhibition in my opinion Ceylon would do well now to supplement that outlay in the manner I have indicated.—Yours very truly,
W. WATSON.

NOTES ON PRODUCE AND FINANCE.

COFFEE-TEA.—This new product under analysis compares with ordinary Ceylon tea as follows:—

	Per cent.	Per cent.
Theine	1.56	3.96
Tannin	11.75	13.08
Mineral matters—Soluble	3.75	3.17
Mineral matters—Insoluble	1.75	1.45
Mol-ture	8.05	7.05
Total matters extracted by boiling	40.50	39.10

Though it might possibly serve some purpose in the hands of adulterators, coffee-tea is not of much account when taken as a proposed rival to tea or coffee. It has no flavour worth mentioning, nor a sufficiency of the important principles of tea.

"PRODIGIOUS STRIDES" OF CEYLON TEA.—In the last issue of the *Grower* there is an article in which praise of Ceylon tea from the trade point of view, is tempered with a few mild hints about deterioration. The writer says:—"That this description of tea re-

tains its hold upon public consumers no one can deny, and, from the nature of the statistics now to hand, there is no indication that the limits of importation and consumption have yet been reached. The loadings of Ceylon tea in the United Kingdom during the month of November, as shown by the Board of Trade returns just issued, were 6,300,330 lb. against 4,538,374 lb. in 1892, and 3,607,831 lb. in 1891; and for the eleven months the total was also heavy comprising 68,160,971 lb. in comparison with 61,391,307 lb. last year, and 57,307,971 lb. in 1891 for the same period. This is strong evidence of the productiveness of the island of Ceylon in growing such an immense weight of tea for shipment to this country, and forms a striking contrast to the 50,000,000 lb. which were imported in 1890-91, the modest 27,900,000 lb. sent forward in 1888-89, the scanty supply of 15,614,000 lb. in the year previous to that, and the pretty amount of 1,533,000 lb. shipped hither during the season 1882-83. Before that time Ceylon tea was comparatively unknown as an article of commerce, and its introduction here in 1876 marked quite a new era in the history of the trade. Every year since then the consumption has advanced with prodigious strides, from mere nothing to an almost fabulous quantity, and the duty-paid entries for home use, as officially stated, for the past eleven months embraced 59,630,270 lb. against 59,139,997 lb. in 1892, and 47,208,925 lb. in the corresponding period of the former year. It is likewise worth while to mention that not only in the United Kingdom, but on the continent and elsewhere, the habit of drinking Ceylon tea is being rapidly extended, and partly through the agency of the Chicago World's Fair, this year, when British-grown tea was exhibited to all corners, the demand for the great speciality is likely to go on increasing as one season succeeds another, and consignments augment in proportion."

THERE HAS BEEN DETERIORATION.—It is a characteristic of Ceylon tea that it gains in popularity the more widely it is known, and this partly accounts for the relatively firm prices which it realises at nearly all times of the year. That description and Indian share a kind of monopoly in supplying the demand for tea generally, and although connoisseurs in China growths maintain that their favourite teas are the best and cheapest, whether regard be had to quality or value, the broad fact remains that the Ceylon leaf sells the most readily and fetches the longest prices. This was particularly the case with Ceylon tea earlier in the year, when all ordinary grades were rather scarce, and really desirable sorts enjoyed a preference above all others. Since then, however, there has been a distinct deterioration in the quality of the imports from Ceylon, and, concurrently with this inferiority of the teas themselves, a gradual decline in quotations has been observable. Still, in spite of these disadvantages and drawbacks (which may be only temporary), and notwithstanding that the current rates are a penny to threepence per pound below those in December last, Ceylon tea is at present dearer than any other sort, especially for the common qualities.

ENTHUSIASTS THINK IT UNRIVALLED.—Statements such as these furnish additional proof of the high, if not somewhat exaggerated esteem, continues our contemporary, in which tea coming from Ceylon is held by the trade at large, no less than by an ever-widening section of the consuming public, who like a class of tea which is a compromise between the excessive astringency of the rough Assam descriptions and the thinness and insipidity of certain blends of China teas. A fresh stimulus to the home consumption of the article has no doubt been imparted by the reduced prices which have been established of late, and further heavy clearances may now be expected. At the same time, the production in the island seems to go on unhindered for the area under cultivation now covers about 200,000 acres and gives employment to fully 1,000 European planters and 250,000 Indian and Sinhalese labourers. By some enthusiasts Ceylon tea is considered unrivalled for its twofold virtues of strength

and flavour, and its supply being spread pretty equally over the whole year, the market is not so apt to change from one extreme to another or suddenly rise and fall as that for China and India teas which have more well-defined intervals for a glut of supplies or periods of comparative scarcity than are experienced for Ceylon when arrivals of the latter are evenly distributed throughout the season.

BONDED GOODS.—According to the monthly particulars supplied by the B Bill of Entry relating to the quantities of bonded goods remaining in the Customs and Excise warehouses of the United Kingdom, the stock of tea at the end of November was 100,080,968 lb., against 92,967,191 lb. a year ago and 100,685,155 lb. in 1891, that of cocoa, 12,347,411 lb against 10,248,220 lb and 11,625,889 lb. coffee 200,443 cwt. against 122,613 cwt. and 104,247 cwt. respectively, the bonded stock of currants being 433,978 cwt. against 519,780 cwt. and 522,042 cwt. and of raisins 125,765 cwt. as compared with 224,707 cwt. and 169,695 cwt.

TEA AND COFFEE PROSPECTS IN UGANDA.—In his paper read before the Royal Colonial Institute on Tuesday night, Captain W. H. Williams said, referring to the cultivation of coffee and tea:—"Coffee now grows almost wild in Uganda, and on the islands it is generally eaten by the natives as a sort of sweet-meat, if one may so call an article which is merely plunged in warm water and dried. Properly roasted and ground it makes most excellent coffee, and there is little doubt that the climate and altitude of Uganda are suitable for the growth of coffee of a superior description. Tea also, though here I am speculating should grow, as the rainfall is good."

THE COFFEE CROP OF GUATEMALA.—According to a telegram from Washington on the coffee crop of Guatemala will not be so abundant as was anticipated. There has been an extraordinary rainfall in Guatemala since the early part of last April, and in some districts the coffee berry shows signs of shrivelling as the result of excessive moisture and insufficient sunshine. It is estimated, however, that the crop will reach 55,000,000 lb., a slight excess over last year's production. The want of sufficient labour has interfered materially with the development of the coffee industry in Guatemala. A trial of Japanese labourers is about to be made. The Gilbert Islanders, imported last year, have not proved a success.—*H. and C. Mail*, Dec. 15.

CO-OPERATION IN THE TEA INDUSTRY.—We understand that a meeting of the general committee of the Indian Tea Districts Association, held this week, the question of closer co-operation between the Association in Calcutta and that in London was again the subject of discussion. A prominent member of the general committee of the Association in London was requested, on the occasion of his forthcoming visit to India to broach the subject with the leaders of the industry in Calcutta, with a view to arriving at a scheme which might tend to considerably strengthen the position of the industry. A proposal, it may be mentioned, was made some time ago to the Calcutta Association for linking the two associations together, and providing resources for the expenses of both out of one single fund, levied pro rata on all the tea properties, an amplification merely of the system already in vogue for the raising of funds in India for the purposes of the association having its headquarters there. The proposal is one which appears well worthy of full consideration, and we welcome any such attempt to give greater strength to the efforts of those who work for the common benefit of tea planters and tea proprietors.

THE DECAY OF THE CHINA TEA TRADE.—A Lancashire correspondent, *apropos* of the decay of the Chinese tea trade, asks:—Does the immense diminution in the China tea trade to Great Britain curtail our cloth exports to that market? It may not be generally known how great that diminution is. What China has lost the East Indies and Ceylon have more than gained. It would hardly appear

that Ceylon requires a protective bonus of 3d per lb. Tea imports into Great Britain:—

	East Indies and Ceylon.		China.	
	lb.	£	lb.	£
	Millions.	Millions.	Millions.	Millions.
1881 ..	46.1	3.12	164.5	8.13
1882 ..	53.9	3.57	154.1	7.63
1883 ..	61.	3.88	156.2	7.64
1884 ..	66.1	3.93	144.4	6.40
1885 ..	68.6	4.05	139.8	6.47
1886 ..	81.	4.66	145.1	6.42
1887 ..	97.8	5.01	119.7	4.67
1888 ..	113.	5.63	105.4	4.34
1889 ..	127.2	6.17	88.8	3.62
1890 ..	146.3	6.98	73.6	2.82
1891 ..	172.	8.1	61.9	2.41
1892 ..	178.1	7.85	56.9	2.06

In 1881 the total imports of tea into Great Britain amounted to 210 millions of pounds, and in 1892 they amounted to 237 millions, being an increase of about 13 per cent. In 1881 China exported 189 per cent more than last year. In 1892 India and China exported, say, 286 per cent more than in 1881. In value the East Indian tea exports have increased by 4 millions sterling; those of China have diminished by more than six millions. China, therefore, has now six millions sterling less to pay for her imports, and to keep the balance of trade in her favour. Now, singularly, it happens that the declared yearly value of cloth and yarn exported to China from Great Britain during the years 1887-1892 averaged £5,920,000, a trifle under the six millions which China has lost. The Chinese Government might think it a just *quid pro quo* to shut out English cloth. Having lost such a huge slice of her tea trade, how can China find the means to pay year after year for an equivalent in imports? May she not have been compelled to reduce her imports to some extent, to do without them, or to fall back upon home production?

LAST WEEK'S TEA SALES.—There has again been a large quantity of Indian Tea brought forward at public auction, aggregating upwards of 48,000 packages. On Monday, says the *Produce Markets Review*, about 22,000 were catalogued, and a reasonable time elapsed prior to the sales for dealing satisfactorily with this quantity, but not so with a similar weight offered on Wednesday. Consequently, many of the Teas received but little attention, as it was practically impossible to taste and value upwards of 500 breaks in the limited time at disposal. The principal feature, however, is the comparative steadiness of the market, and, although prices were certainly irregular on Wednesday, and in some cases lower, the depreciation was in no case important, which to a great extent supports the opinion that values are more likely to harden than otherwise later on. The unprecedentedly low prices for some grades are producing an effect on the consumption. With a continuance of the heavy deliveries of the past.

THE INDIAN CURRENCY.—A great portion of the silver imported into India before and after the closing of the Mints came from Austria-Hungary in the form of Maria Theresa thalers. Of these, according to the official returns, five thousand one hundred and ten kilogrammes went to India, via Trieste, in August, eleven thousand seven hundred and fifty kilogrammes in September, and even greater quantities in October and the first half of November. The Vienna correspondent of the *Standard* says that the trade must have been very profitable, for, chiefly on account of the Trieste merchants, the Mints of Austria and Hungary turned out, during the first three-quarters of the current year, three million Maria Theresa thalers, the same as in 1892, as against only one hundred and sixty-six thousand two hundred during the whole of 1891. Last August alone about six thousand kilogrammes went to Turkey and one thousand kilogrammes to Egypt, nearly all the rest going to India. The Ministers of Finance of Austria and Hungary have refused to allow more thalers to be coined during the present financial year, on the ground that the Mints cannot be further used for coins in which Austria has no interest.

Consequently, three million thalers are likely to re-entend the maximum annual output.—*H. and C. Mail*, D.co. 22.

LONDON REPORTS ON TRAVANCORE PRODUCE.

TRAVANCORE TEA.

(From *Patry & Pasteur, Limited*, Report of the Colonial Markets for the Week ending December 6th, 1893.)

There has been a better selection of these in sale, and prices paid today were generally higher for estates showing good quality, amongst which are Belford, Great Valley, Bonaccord and Vembenard.

CEYLON AT CHICAGO.

AMENDED LIST OF AWARDS. OUR COMMISSIONER IN LONDON.

The Hon. W. W. Mitchell in forwarding to us the following copy of a letter from our Chicago Commissioner and amended list of awards states:—
"A telegram from London dated yesterday intimates that Mr. Grinlinton has arrived."

The Ceylon Commissioner's Tea House, 72, State Street, Chicago, U.S. America, Nov. 27.
The Hon. W. W. Mitchell, M.L.C., Colombo, Ceylon.
Dear Sir,—With reference to my letter of last week enclosing you a list of Awards, I beg to call your attention to the fact that the names of some of the tea estates are misspelt, the original list made for the Committee of the Awards have these errors in it, and they were typed without noticing anything wrong, till this morning when I discovered the errors myself. I trust this letter will be in time to stop the names from being published wrongly. But if not, attention might be drawn to the fact at my request and the matter set right. You will oblige me by taking immediate action so as to save the Proprietors and Superintendents of the estates annoyance.—Yours very truly,
J. J. GRINLINTON,
Special Commissioner for Ceylon World's Columbian Exposition.

LIST OF AWARDS.—Group VIII. TEA.

Black Tea:—Brunswick Estate, Holmwood, Pedro, Durkeld, West Hall, Dunotter, Dambullagalla, Rockwood, Blair Athol, Ardlaw and Wishford, Buxton, Aberdeen, Henfold, Portswood, Ovoca, Gartmore Court Lodge, Hetherett, Kintyre, Gluedevou, Claremont, St. Clair, Dambetenne, Pooprasie, Mousa Kande, Laymatotte, Vellai Oya, Broad Oak, Korudu O s, Yapame, Charley Valley, Invery, Uda Radella, Giron Ella, Mincing Lane, Tillyrie, Lynetd, Columbia, Ooonagalla, Anocombra, Rabatungoda, Glu Taaffe.

Green Tea:—Claremont, Kintyre. Brunswick. Portswood.

Group VIII.—Hon. J. J. Grinlinton (Ceylon Commission): Euble and medicinal seeds.

Group IX.—Orient Company, Ltd.: Ooir yarn and fibre. D t o, palmira fibre.

Group VIII.—Messrs. Mackwood & Co.: cinnamon.

Group XIV.—Hon. J. J. Grinlinton (Ceylon Commission): Large model showing cultivation of Tea, Rice and Coconut.

Group XVI.—Hon. J. J. Grinlinton: Agricultural implements.

LIBERAL ARTS DEPARTMENT.

Group 149—Vannappuwa Boarding School (Convent of the Holy Family): Embroidery, faces, cushions, &c.
J. J. GRINLINTON.

FLUSH WORM IN TEA.

The name of this troublesome little insect has not yet been fixed. Some call it caterpillar which is right in a way, but is too broad in its meaning to at once indicate, what is meant. I prefer the term *Flush Worm* or *Leaf Roller* (as it used to be called.)

I put three of these little creatures under a shade with a few tea leaves for them to feed on (they make a powerful lot of manure please note) and in a few days like Pharaoh's kine, one had devoured the other two and had become a tremendous size. A few days later the worm became a chrysalis, from which emerged a pretty moth with 2 grass-hopper like legs set behind, with which it moved smartly away. (The Chloroform with which I used to settle the creature nearly settled me.)

I gave the moth and one caterpillar to some Agricultural students to procure for me a scientific report, giving a full array of technical terms, but they, alas! did not keep their promise to do so and so for the time being my labour has been lost and the world of Planters deprived of much useful information.

The practice on some estates of picking off *Flush Worm* leaf and throwing it down, is useless as a preventative, as the worms crawl out and get on to the tree again. I had a basket of leaves left in my verandah to see what would happen, and in the morning I found the roof of the verandah covered with the worm.

I now have the leaf separately brought in and the whole (50 lb. out of 1,000) buried or burnt; but if my neighbours rear fine broods of moths that come flying in, of what use is my work?

I think it would be as well to offer rewards for the moths and to regularly bring in and burn all poochie leaf. The women can easily bring in the leaf separately in their cloths daily, and the extra cost is say 3 pies a lb or 8 annas a day on a large estate picking 1,000 lb. daily.

I am going to offer rewards today for the moths at 1 pie per moth for a start and will report result. I do not think many moths will be found in these cold months. September is the month of active insect life and it is then we must look out.—S. I. Observer. RED-SPIDER.

DON'TS FOR TEA FACTORIES.

A contemporary gives the following concise bits of advice to those having charge of steam boilers:
Don't expect too much of a steam boiler.
Don't overwork it, for overwork has a bad effect on a boiler.

Don't neglect it, for a boiler can't be expected to keep itself in good condition.

Don't overheat it, for a boiler is very sensitive to extreme heat.

Don't cool it suddenly, for a boiler has a way of resenting such treatment that is apt to be expensive to you.

Don't let it leak, for leaks and explosions are sometimes spoken of in the same breath.

Don't work it when out of order, for a partly disabled boiler is likely to become permanently so if kept under steam.

Don't neglect making necessary repairs to your boiler, for delay means danger in such cases.

Don't let an inexperienced man fire it, for a boiler will show by the way it performs its duty that it knows the difference.

Don't open the furnace doors unless it is necessary, for every time you do it the cold air rushes in and lowers the temperature, and retards the work of steam-making.—*Planters' Monthly*.

TEA AS AN INVESTMENT.

At the present moment the mania in Tea Companies is rife, and on every side we hear of attempts, if not actual success, in amalgamations. What the idea of those pulling the ropes is, is another thing. It may be that the Director advocating amalgamation views with distrust the outcome of his own individual property in the near future, and views with envy some new garden being opened out, and likely to come to the relief of the falling fabric of an old garden, or it may be that our Director has some near and intimate friend whom he wants to let in for a soft thing. At any rate, we will not enquire too closely for what concerneth it; the rage is for big Companies, and the answer one receives, if an attempt is made to float a Company with, say £12,000 to £16,000 is—"not big enough" why didn't you make it £50,000? From one point of view the promoter is right; that there is quite as much, if not more, trouble in floating a small thing, as there is a big one. The organisation of the huge Companies now being launched is simply reverting to the old days of "promotion." Let us hope that the same dire results will not be the outcome, and that history will not repeat itself.

There are risks in every line of business; and in tea the risk is very much less than it used to be. The means of communication are so much improved, the quality and description of land to be operated upon are all well ascertained beforehand, and the periodical visits of approved supervisors are so altered from old days, that failure is now the exception, and not the rule as in old times. When one of the largest ventures in tea, in existence, was first started, only a couple or so of tea factories were considered necessary, but after a time it was found that double the quantity not only entailed little or no more expense, but that the smaller quantity in each factory far more than compensated any extra expenditure by the superior quality turned out, and thus substantial facts establish the truth of our remarks above, that smaller ventures give better results than gigantic ones.—*Indian Planters' Gazette*.

THE AMSTERDAM CINCHONA AUCTIONS.

Amsterdam, Dec. 14.

At today's auctions of Java cinchona bark, consisting of 6,242 packages, 4,609 bales sold (and 1,308 were disposed of privately immediately after the close of the auctions) at an improvement in price, compared to the November sales, of about 15 per cent. The average unit today was 3 86c per half-kilo, against 3 38c in November. The prices realised were:—Manufacturing barks in quills, chips and ground from 8½c to 42½c (equal to about 1½d to 7½d per lb.), ditto root from 9½c to 31c (equal to about 1½d to 5½d per lb.) Druggists' bark, in quills and chips from 10c to 80c (equal to 1½d to 1s 2½d per lb.); ditto in root from 8½c to 11½c (equal to 1½d to 2d per lb.)

The principal buyers were Mr. Gustav Briegleb of Amsterdam, the Brunswick, the Auerbach, the Frankfurt o/M, and the Amsterdam Quinine Works.—*Chemist and Druggist*.

AVENUE TREES ON THE NILGIRIS.

Avenue trees on the Nilgiris serve a twofold purpose, they afford shelter during the hot season from the heat of the sun, which is intensified by the rarified atmosphere, and they protect against bleak winds that prevail during the monsoon. Those who have journeyed between Coonoor and Ootacamund, in the height of the south-west, can testify to the relief they experience from the wayside trees against the drifting rain and piercing cold that work through the thickest of over-coats. These trees are of the two varieties of the Acacia, forming rather a dense fence than an avenue, and are valued by the Public Works Department as much for the service they render in consolidating the roadways as for their utility to the traveling public as a shelter-belt. Some eight or nine years ago, it was suggested that this avenue should be continued to Pykara and Neddiwuttum to perform the same efficient functions on that blown thoroughfare, but the advice, so far as we are aware, remains unappreciated. There are gaps in the 22 miles of distance between Ootacamund and Neddiwuttum where the force of the wind is great enough to unseat a horseman, and accidents have sometimes occurred of this nature, at a spot named the "Devil's Gap." Even the hardy Acacia, here, has a struggle for existence, and it was several years before any planting succeeded even on a limited scale. Long stretches of mileage, to this day, have to be traversed, without the friendly shelter of a single tree, against the fiercest blasts. Coolies are known to have succumbed to the inclemency of the weather on this road, and scarcely a monsoon passes without one or two casualties. The village monygar buries the corpse at the public expense, and nothing more is heard. Some years ago, an avenue was started on this road and continued for a distance of two miles from Ootacamund but it is now in the main of the blue gum, which is ill-adapted for a shelter-belt when planted in single file as these have been. The trees, however, have attained a splendid growth, so unlike the drawn branchless specimens we are accustomed to see in plantations. The umbrageous crown affords a partial shade on a hot day, but the trunk three feet and more in diameter in some instances, is no protection against wind and rain. Similar planting was done on the road to Kulhutti and is equally objectionable, though this road is not so exposed to the south-west as the one to Neddiwuttum. It is only recently that attention has been given to utilising the Forest trees of the Nilgiris. Many of them like the *Ilexes*, the *Elwocarpi*, the *Eugenias*, and the *Meliosmas* are of fine umbrageous habit and long lived and would do admirably for Avenues, yielding a cool and perfect shade, and, if planted in rows of three or four deep, be equally effective as protection against wind and rain. Big trunks bare to a height of twenty or thirty feet and giving a checkered shade are not the trees for an avenue. The two partial efforts at avenue planting in this District, which we have noticed, are all that the Local Fund Board have done, not counting the insignificant and unsuccessful planting of such new lines as the Connemara Road where the fencing is more prominent than what is inside. With an inexhaustible supply of acclimatised exotics available in the Public Gardens, and skilled agency in the person of the Director at hand,

the neglect of this important branch of Arboriculture is most deplorable, nor does our Sanitarium present us with ornamental planting of this class. It possesses the advantage of climate and soil in addition to those other two noticed above; and yet we look in vain for a specimen avenue in Ootacamund. Cast your eye up or down the Church-hill road, where something has been attempted by way of road side planting, and what do you observe? An heterogeneous collection of Cypresses, Silver oaks, Blue gums, Oaks, Acacis, Chestnuts, &c., mostly stunted and deformed, of all ages and sizes and presenting the appearance of past neglect. The Cypress is of a habit of growth that disqualifies it for a road side tree, and yet it was universally adopted, some twenty years ago, with the result that after frequent mutilation, it had to be rooted out. The ornamentation of our thoroughfares with avenue trees is an undertaking not yet systematically attempted. It demands an eye to landscape effect, a thorough knowledge of vegetable growth, and an intimate acquaintance with the species that will thrive and make an ascertained rate of growth in our climate and soil. We trust Government will take this matter in hand and have it carried out, either by the Garden or Forest authorities which are the only ones that can be relied upon for executing a set plan over a term of years.

Again let us try to imagine the appearance of this town arborically, if the Municipality succeeds in adopting a policy of extermination against the ubiquitous blue gum. It appears that nothing in the way of tree growth will be left and our hill sides will be completely denuded. With an indefinite number of handsome trees established in the gardens, how few are to be found in the grounds of private residences? The Americans have among them what is styled an "Arbor Day." It is observed as a public holiday, and on that day it is incumbent on a very patriotic citizen to plant one tree at least with his own hand. If we were to introduce a similar holiday in Ootacamund, if not throughout the district, we should have from 12 to 15,000 ornamental trees annually, and the whole area would be speedily covered. To reduce promiscuous tree growth to order and ornament is an easy matter the rules and regulations for which may be left for consideration to a future day.—*Nilgiri News.*

TEA AND SCANDAL

In "The Closet of the Eminent Learned Sir Kenelme Digbie Opened," (1669), I find at p. 155. "Tea and Eggs." The Jesuite that came from China Anno 1664, told Mister Waller that there they use sometimes in this manner. To near a pint of the infusion take two yolks of new laid eggs and beat them very well with as much fine sugar as is sufficient for this quantity of liquor. When they are very well incorporated, pour your tea upon the eggs and sugar, and stir them well together. So drink it hot. This is when you come home from attending business abroad and are very hungry and yet have not convenience to eat presently a competent meal. This presently discusseth and satisfieth all rawness and indigence of the stomach, fieth suddenly over the whole body, and into the veins and strengtheneth exceedingly, and preserves one a good while from necessity of eating. Mister Waller findeth all those effects of tea thus with eggs. In these parts he saith, we let the hot water remain too long soaking upon the tea, which makes it extract into itself the earthy parts of the herb. The water is to remain upon it no longer than whiles you can say the Miserer, Psalm very leisurely. Then pour it upon the sugar of sugar and eggs; thus you have only the spiritual

parts of the tea, which is much more active, penetrative and friendly to nature. You may for this regard take a little more of the herb, about one dram of tea will serve for a pint of water, which makes three ordinary draughts."

In John Ash's curious Dictionary published in 1795, the following definitions are given:—"Coco (an incorrect spelling). The cacao or cocoa tree. Cocoa (in botany). A species of the palm tree. And John Peehey, in "The Complete Herbal of Physical Plants" (1634), mixes them up in a horrible manner. He says:—"Coconut Tree, in Latin *Palma Coccifera* A liquor is drawn from this tree called Buri, which intoxicates like wine. It hath a pleasant sweet taste. An hot water or spirit is drawn from it by distillation. Sugar also and vinegar is made of it. Fine polished cups, tipped with silver, are made of the bark of it. The liquor, or wine, is very good for consumptions. A milk is drawn from the kernels beat and pressed without the help of fire, which is very good for killing worms, eight ounces of it being taken in the morning with a little salt. The liquor contained in the kernel extinguishes thirst, cures fevers, cleanses the eyes and the skin, purifies the blood, purges the stomach, relieves the breast, tastes pleasantly and yields a great nourishment. It is said of it that it is meat, drink and cloth. *Chocollet* is made of it. It grows in the Spanish West Indies and lasts an hundred years."

I thought Cacao was only a comparatively recent introduction into Ceylon! But W. M. Harward, in "A Narrative of the Establishment and Progress of the (Wesleyan) Mission to Ceylon and India" (1823), says, at p. xiv: "Among the trees of Ceylon may be reckoned the Chocolate and Coffee trees. When mature in growth they are about the size of the English siber tree."

Daniel Defoe, at p. 154 of his "Political History of the Devil" (1754), makes a very curious mistake in Scripture relationship. He says:—"He (the Devil) planted envy in the hearts of Miriam and Aaron against the authority of Moses to pretend God had spoken by them as well as by him, till he humbled the father and made a leper of the daughter."

I am enjoying a leisurely read of Percival's Ceylon; but I am puzzled to know what he means by saying (p. 239) that "When they (the Mahondrews) go abroad, their rank and wealth entitles them to be carried in coolies or palankeens." Does he mean "doolies?" He also (p. 206) speaks of "the talipot hooks or files, called by the natives oloes"; and his spelling of coir is curious: "Coarse cloths and calicoes were the chief articles thus imported by the Dutch, and in return they carried back areka and cocoa-nuts, and coya or cordage made from the cocoa-tree." (p. 78.) A. M. FERGUSON.

COFFEE INVESTMENTS IN MYSORE.

A young gentleman, Mr. Lucas, who has been learning his work under Mr. John Logan, our popular Volunteer-Major, has I believe bought Mr. Sanderson's—he of elephant catching fame—coffee estate in the Chamrajnugur Taluk Mysore. He leaves in a few days to take it over. Mr. McClaren has also bought land somewhere in the Mysore Province and will also be leaving shortly. Mr. Meenatchee Iyer's success at coffee planting at Bangalore is already attracting the investment of English capital in land thereabouts. I hear that a Mr. Strickland of Munzerabad has bought up about 200 acres under a tank somewhere near Bangalore, and probably we will be soon hearing of others following this example. In such good repute are coffee investments just now and long may they continue so!—*Nilgiri News.*

DARJEELING DISTRICT NOTES.

(From a Correspondent.)

The destroying hailstorm also made itself very unpleasant on one or two occasions. Seeyok garden was deprived of most of its first flush by a severe

storm, which occurred early in the season; and another garden lower down the hill was the recipient of equally bad luck.—*Indian Planters' Gazette*, Dec. 23.

A BIG AUSTRALIAN TEA FIRM: THE PLAIN STORY OF HOW A GREAT BUSINESS GREW.

It is not so many years ago since the founder of the firm of James Inglis & Co., arrived in Sydney, after a long and honorable career in India as a planter. He was then quite an unknown man here, shattered in health, and possessed of little more than a good education, a hopeful heart, and a fair amount of energy and pluck. For over a year he managed and edited what was then one of the only two morning daily newspapers in New South Wales—namely, *The Newcastle Morning Herald and Miners' Advocate*. The other was *The Sydney Morning Herald*.

During the famous Exhibition in the Garden Palace, Mr. Inglis was the chief exhibitor in the Indian Court. His brother, the Hon. A. B. Inglis, President of the Calcutta Chamber of Commerce, and a Member of the Viceroy's Council, had been one of the leading spirits in forming what was then known as the "Calcutta Tea Syndicate," and our Mr. Inglis was appointed their agent here. At that time Packed Teas and Blended Teas were for all practical purposes unknown, and Indian and Ceylon teas had only been heard of as a sort of museum curiosity. Mr. Inglis, with the aid of one or two friends, blended and made up small packages of Indian teas, which were displayed for sale at his stall in "The Garden Palace," and this may be said to have been the beginning of a revolution in the tea trade of Australia, which, in its far-reaching results, is one of the most interesting chapters in the history of commerce ever recorded.

In 1880, Mr. Inglis was chosen by the Indian Government to represent it as Executive Commissioner at the great Melbourne Exhibition of 1880-81, and here Mr. Inglis again came to the front as a good administrator and a practical common sense man of business.

Knowing the excellence of the Indian product, and seeing how the tea trade was suffering from many abuses, Mr. Inglis started a tea-room, in which the pure strong flavory teas of Assam, Darjeeling and other Indian districts were dispensed to visitors free of charge; and as the beverages was handed round by Indian servants picturesquely attired, and its merits were judiciously advertised, the Indian Tea Rooms presently came to be looked upon as one of the chief attractions of the great Exhibition.

In this way, and by lecturing, Press writing, and an energetic, enthusiastic advocacy on all occasions, Mr. Inglis speedily came to be looked on as a veritable apostle of the gospel of pure tea, and after a generous and substantial recognition of his services by the Indian Government, he began in a quiet humble way to build up a business of his own as a tea merchant.

The first start was in a small office in Bridge Street with six half-chests of Darjeeling pekoe. That was only twelve years ago.

The firm now employs, in all, no less than nine constant travellers. The office staff numbers eleven. The packing department alone, with the blending floors, give employment to over 40. The firm rent and occupy four large commodious warehouses in Dean's Place, off George Street. They have their own stables in Phillip Street, and have founded a branch house in Darragh's Buildings, Queen Street, Brisbane. They are well represented by special Agents in New Zealand, Messrs. Hall and Son, Auckland; in Tasmania, H. K. Fysh and Co., Hobart; West Australia, Sandover and Co., Albany, and their hands are known in every colony of Australia, although at present no business is done in Victoria.

Indeed, the rise and progress of the firm reads like a romance, but is a standing challenge

to the mendacious and cynical detractions of of hostile critics who are prone to say that there is no enterprise in Australia, and that the commercial life of Sydney is paralysed and played out.

Mr. Inglis, with instinctive intuition, discerned the splendid future that lay before this magnificent colony. He could not fail as a travelled, observant man to see the magnificent possibilities of Sydney as the future mistress of the commerce of the Southern Pacific, and he did wisely in choosing Sydney as the theatre of his life's supreme struggle.

For some time the outlook was anything but inspiring; but Mr. Inglis comes of a race that is not easily daunted. He was fortunate in securing the services of a good judge of tea as a buyer and salesman, and after a short time he admitted that gentleman to a partnership, which continued for five years. After that time a harmonious severance took place. Mr. Inglis took a fresh warehouse in his present premises in Dean's Place, and was again fortunate in securing the services, as Partner of one of the best tea men that Australia has ever seen—Mr. John Parker. Mr. Parker had graduated in a good school, and under his able management the business still continued to expand. A happy inspiration led Mr. Inglis to hit on the name, "Billy Tea," as the designation for their leading brand of blended teas and this has now become a household word, synonymous with purity, fragrance and every pleasant-gastronomic association, throughout the length and breadth of Australasia.

The output of "Billy Tea" alone now reaches the enormous total of 600,000 lb. per annum.

With other blends, and with the large bulk trade and sales of teas imported direct from the countries where they are grown, the firm are now doing one-sixth of the total tea trade of Australia.

Mr. Parker enjoys the rare qualification of having been a personal buyer on the Foochow market. He is, therefore, intimately acquainted with every device of the astute Mangolian on his own ground; and his life-long practical knowledge of the trade, both in the old country and in Australia, makes his experience as a bleader, buyer and caterer for the taste of the public simply unique, and second to none. The firm have now their own expert (trained under Mr. Parker in their own sale rooms) attending the Annual Sales in Calcutta, so that they are in receipt of just exactly what suits the requirements of their trade purchased by their own buyer, and sent down direct, without the intervention of any agent or middle man.

In Ceylon they have standing contracts for the whole of the choicest growths of three of the most famous gardens in the Island of Spices. These are sent down here, subject to the firm's approval, and, if not up to their high standard for their well-known Ceylon blends in gunny packets, they have the option of sending them in to public auction at the growers' risk.

The travellers of the firm are among the most reliable, experienced, and respected of the genial Fraternity of the Road, and some of them have been connected with Mr. Inglis since the early struggling days.

Surely the builders of such a business may be pardoned for a little honest pride in the plain unadorned recital of such a growth as this. They started with a belief in the supremacy of Sydney as a Commercial Centre; in the marvelous resources and progress of Australia as a whole. They believed in the generous recognition of quality and honest dealing, which is a characteristic feature of the Australian people. The Australian hates a sham. The story of the Billy Tea Enterprise proves that he knows and appreciates a genuine good article when it is submitted to his approval. The firm, too, unlike many of its competitors, have been loyal to the storekeeping connection all through their career.

They are wholesale merchants only. The best storekeepers throughout all the Colonies (except Victoria, which has not yet been touched) keep the goods of this firm, and trust to their well-established reputation for giving the best value and the purest quality that can be got for money.

They claim to have made myriads of friends by being straightforward, frank, honest, and attentive to the requirements of the trade. The reputation of their blends is highest in the market.

Of course, such a success could not wholly escape from the sneer of envy, and the crooked devices of jealousy. As Mr. Inglis has said, "our methods of advertising, our labels, get up, and, our very phraseology have been slavishly copied or blushingly pirated; but we still prosper. Billy Tea still keeps the lead. The sale of all our recognised blends still keeps increasing. Our aim is simply to maintain our proud position as the leading tea merchants of Australia by merit alone; and, if our friends and patrons will only continue their confidence in us, we think we can point to our past career as a guarantee of good faith for the future, and may look forward with confidence to a renewed period of active growth and prosperity, in which we hope every interest in these great Colonies may equally participate, and so bring about speedily a glorious fulfilment of the prayer and prophecy combined, which is included in the national aspiration, *ADVANCE AUSTRALIA.*"—*The Famous Billy Tea Budget.*"

A SOUTH OF INDIA PLANTING RETROSPECT 1893.

The past year will be a memorable one to Southern Indian Planters both tea and coffee—as having shewn greater activity than many of its predecessors, a greater inclination for discussion of their interests in the public Press, and last but not least, the "fait accompli" of a Planters' Conference at Bangalore. Coffee crops.—1892 was far from satisfactory and 1893 seems to have been a year that on the whole is satisfactory; lower elevation gardens promised well, but blights of kinds did their duty, and the early rains during blossom disappointed many a hope. Prices have continued remunerative and a casual fluctuation of a shilling has hardly affected returns. Taking the district generally we believe that planters would admit a good general average year. We have visited the district, and as tho' in tea, nature has bestowed her favors unequally, there is little to complain about.

Parchment as a rule is heavy, which is a grand consideration. Early rains destroyed blossom, and late rains caused a certain amount of "rot"—but with a steady market, and a fairly steady exchanged gardens generally will vary from large profits to paying their way. Coffee generally has suffered from blights, and black bug seems on the increase, but the damage it does to crops seem to be a disputed point amongst practical planters. "Hemelleia vestatrix" or the familiar leaf disease is favorably reported on, and should this dread disease gradually pass off, a more hopeful future is in the dim vista. Scientists say it is carried on an atmospheric wave—and we believe all fungoid diseases are of more or less of this character. Borer which has played such havoc is local—and requires more local investigation. Individual action is hopeless with a caterpillar and moth pest such as this. When as we hear gardens have faced the loss of 10 per cent of their plants by uprooting and burning, it is time Government stepped in, and Mr. Lawson should apply, by the direction of Government, his keen acumen like Dr. Trimen in Ceylon, to fight the disease and prevent the decay of a valuable and thriving industry.

The fall in the price of Cinchona bark, has naturally closed this industry with the exception of Government Gardens. The value of the unit having reached such a figure as to scarcely pay the cost of barking, packing and shipping of any except bark extraordinarily rich in alkaloids.

To tea planters the year has not been entirely satisfactory. Prices have receded from the opening of the market, and though the statistical position is strong, and China exports continue to decrease, prices except for teas with point and character have been unsatisfactory. Tea at the present time is becoming

such an important factor in Southern India that to secure the attention of Mincing Lane, planters cannot be too particular in what they place on the market. It has been proved to demonstration that with an average output such as Hill gardens generally produce, 6d to 7d can hardly pay. Wyasa! with its forcing climate and higher output can afford to take liberties, but Hill planters on looking over the past season's averages must realize that if the local market failed them and they were dependent on London—the teas at present produced would be distinctly unremunerative.

The slow progress of the Nilgiri Railway has been a source of regret to all interested in the expansion of the planting industry on these hills—and we hope to see more activity during the ensuing year. The railway as at present projected will only be of use to a small portion of the planting community, and we hope before long to hear of an announcement of its extension to Ooty, and on to Gudalur, thence connecting us with the main arterial system of railways in India via Mysore—and then should the West Coast Railway become an accomplished fact, the position of planters of Southern India with regard to transport would be second to none in any other part of India.

Altogether notwithstanding blights and an abnormal season the past year must be looked upon as satisfactory, and with capital, energy, and intelligent interest in cultivation, a renewal of former years of prosperity may be anticipated down South.—*Nilgiri News*, Dec. 23.

COFFEE PROSPECTS IN BRAZIL, JAVA AND GUATEMALA.

(From *James Cook & Co.'s Monthly Despatch*,
December 22nd.)

On the 1st December there was a further reduction of 12,000 tons in the stocks in Europe and of 4,000 tons in the United States compared with the previous month. The arrivals, owing to the smallness of the present Brazil crops, mark now some important falling off being for the first eleven months, in Europe and the States together, 646,160 tons, against 679,660 in 1892. Deliveries in the States for the same period shew a decrease of over 20,000 tons.

Throughout this month business generally has been extremely dull, and very poor deliveries for the current month must be expected. The Revolution in Brazil not only continues, but has assumed serious proportions, and it has now become dangerous to make shipments, if not almost impossible. The quality of the coffee now coming into Rio and Santos consists to a great extent of Café das Aguas. Advices from various authorities state that the present Brazil crops have been over-estimated, and the general figures of the new crops are reduced to about 7 to 7½ millions of bags. The Commissarios give 3 millions as the next probable yield of Rio. The latest accounts from Java still give hopes of a crop of about 1,250,000 piculs, of which a large proportion for private account, and it is thought that the first arrivals may be received in Holland as early as April.

From last advices to hand regarding the Guatemalan crop, it is stated that it will not be so abundant as was anticipated. There was an extraordinary rainfall in some districts since the early part of April, and the bean, in consequence, shews signs of shrivelling as the result of excessive moisture and insufficient sunshine. It is estimated, however, that the crop will reach about 420,000 bags, which will shew a slight excess over last year's production, and it is stated that the want of sufficient labour has interfered materially with the development of the coffee industry in Guatemala.

KAURI SHIPMENTS.—The Kauri Gum export from New Zealand last year amounted to 8,705 tons valued at 517,678*l.* Most of this goes to America.—*Chemist and Druggist.*

TEA PROSPECTS:

HAS HIGHWATER MARK BEEN ATTAINED IN CEYLON?
SHORT SHIPMENTS IN JANUARY.

BALANGODA TO BE A GREAT TEA DISTRICT.

There is a feeling abroad in some quarters, that, whatever may be the case for exceptional properties, taking the tea industry as a whole, the top of the tide of prosperity has been attained in Ceylon. Whether this be the case or not, it cannot be said that the present year opens very favourably for our staple product. A recent Special Telegram to us records a fall of a half-penny in the weekly average, and we have just made: one of the heaviest monthly returns of shipments, namely about eight million lb. in December, while the Colombo sale has also seen one of the largest offerings on record. All this may not be considered very encouraging for the planter, and there are those amongst us—business men—who prophesy an even lower range of prices, for common teas especially, during the current year. No doubt this reckoning is to some extent based on the expectation that China exports to the United Kingdom are to increase as well as on an increased production in India and Ceylon. But all this, it may be said, is looking too far ahead. Short views are safer from a business point of view, and it is well to remember that the fact of the range of prices being lower now than prevailed at the opening of 1893, is regarded as placing Ceylon teas on a sounder basis; while as regards quantity, the immediate prospect is by no means of heavy shipments. Indeed, as against eight million lb. in December, the total shipments for January are not expected to exceed six million lb. Our observation upcountry goes to show that the colder and drier weather has given a decided check to flushing, and unless there is improvement, despatches to Colombo may be so short as to affect even the above estimate for shipments during January.

On the other hand, we can see little abatement in the inclination to plant up reserves and extend cultivation; and while the total additional acreage in most districts with no new land available, may not be very great, yet the aggregate for the island will be considerable—quite enough we should say to justify us in asking British investors who may be intending to place capital in opening up new tea gardens in India, to pause, and ask themselves, is it safe to count on America and Russia coming to the rescue of British grown teas as the Directors of the North and South Sylhet Tea Companies anticipate? What these Companies are going to do in Ceylon alone will mean no inconsiderable addition to our crops after a few years. There is not much room for them to develop in Dimbula; but in New Galway, the fine Glenashie block of forest is bound to be turned to account; while in Balangoda we learn of very active operations being undertaken to extend the planted area. Balangoda is indeed fast rising into importance and promises a few years hence to become quite a leading tea district. There is as fine tea for growth to be seen within its bounds—notably on Mr. Bastard's property of Keenagaha Ella, on Agar's Land and Chetnole—as in almost any district in the island; and Mr. E. M. Leaf is at present opening considerable clearings on the land he has leased from native owners, some of which is described as very suitable for tea, in lay, quality of soil, &c. The purchases of Messrs. Finlay, Muir & Co for the Sylhet Companies in this district, have not yet been publicly reported; but it seems they have

obtained large blocks of land in the Hopewell and some other properties, aggregating perhaps 1,500 acres, and are ready to open up to the full capacity of the available labour supply and other conveniences. Work has already commenced, and there is at least no lack of capital or enterprise to get all pushed on. The benefit to the district of the incoming of influential capitalists as proprietors is undoubted. It will put Balangoda on a new footing of importance and already road improvements are in hand, or under consideration. Indeed, for the first time in the history of one of the oldest tea plantations in the district a horse was seen upon it the other day, to the astonishment of some of the native residents who had never seen such an animal before! The advent of the horse and rider was rendered possible through the opening of a bridle-road on behalf of the Sylhet Companies' new properties. Further improvements are sure to follow; and in all future estimates of the maximum export to which tea production in Ceylon is to attain, due allowance must be made for the once despised coffee, but now popular and rapidly expanding tea, district of Balangoda. This expansion, however, has not to be allowed for in the current year's tea crop estimates nor in those of 1895; and public interest upcountry for the time, is chiefly concentrated on the District returns now being compiled by the various Associations for the Crops of 1894. It is evident that the Planters' Association Committee in making up the total will do well to arrange for a revision about the middle of the year after the pattern set them by the Indian Tea Districts Association in Calcutta. The considerable discrepancy between the Ceylon official estimate and the actual result, in the present year, shows the necessity for this revision, and it is quite evident that for a crop dependent so greatly all the year through, on the weather, it is useless to adhere to estimates framed in the first two or three months without subjecting the same to revision, six months later on.

COFFEE PLANTING AND PROGRESS
IN EAST AFRICA:

A RAILWAY PROJECTED IN THE SHIRE DISTRICT.

We are glad to learn from our Blantyre Correspondent by a recent mail that coffee planting prospects continue so good. He writes:—

"An excellent crop has been gathered this year, it did my heart good to see the young estates about Blantyre in June last quite red with cherry—far too heavy a crop for three years' old coffee. The lower Shire (our river) is nearly dry again and nothing to be had in the stores."

He includes the following notice which is of special interest as showing the rapid development likely to take place in this part of Africa. The case of the Blantyre planters would seem to be parallel after a fashion to that of their brethren in the Kelani Valley—uncertain water communication necessitating a railway. The notice is as follows:—

A MEETING OF LANDED PROPRIETORS, MERCHANTS AND OTHERS

Will be held in H. M. Vice Consulate, Blantyre, on Friday Evening the 13th inst. at 8 o'clock, to obtain an expression of opinion with a view to supporting a proposed scheme of railway communication between the Lower and Upper Shire (Lake Nyasaa).

As the absolute necessity of railway communication is daily becoming more apparent, the whole future of the country depending upon cheap and speedy communication with the outside world it is hoped all

interested in the development of the country will find it convenient to attend.

A. Sharpe, Esq., H. M. Vice Consul, has kindly granted the use of his large room for the occasion.

JOHN BUCHANAN, Michiro, Oct. 16th, 1893.

The mail also brings us from his relative in East Africa a copy of a photograph of the late "Mr. Alexander Brown," so long identified with the Ceylon Planters' Association, and a true Planting Pioneer of the early days. It is sent to be included in the Portrait Gallery of the *Tropical Agriculturist*.

In this connection, we have to acknowledge the receipt from Mr. Wm. Smith of Belgravia of a copy of Buchanan's "Shire Highlands," and he is good enough to write as follows:—

"Among your many services for the public good contemplated articles on Africa as a field for planters cannot fail to be valuable. East Africa has long had a great charm for me. I am sending you today Buchanan's, Shire Highlands in case you have not got it as it contains a deal of information on the country, and coffee &c. I gave—a reading of the same book, which decided his going to Africa. That much roughing (and possibly a sacrifice of some lives), may be required; to develop this next great British coffee growing country, is quite likely; but as sure as all the other elements of success are there, the men are to be found and Ceylon should supply a large contingent. I wish I could turn the dial back 30 years and I would gladly lend a hand." We shall be glad to refer once again to this book for all that bears on the planting enterprise in connection with the latest published and personal information that may be available to us. It is something for young men of the right stamp to have the encouragement of veteran coffee planters like the patriarchs of Dimbula, in looking to East Africa as a field for their enterprise.

OF CACAO.

(Communicated by a Cacao Planter.)

The great increase which the railway shows of cacao carried in 1893 as compared with 1892 is apt to mislead. It is very much brought about by the fact that the 1892 crop was late and the 1893 early, so that both went to swell the total.

The 1893 crop is about winding up now, and it has not been a bad one on the whole. The drought however did, I think, affect the size of the pods, and we would all have done better but for the dry season. What we mourn now are the low prices. Even the Moorman is choked off, and rubbish which last year he was prepared to risk the loss of his soul for, today he won't look at, and if he does offer for it; there is a sad absence of the speculative spirit, which he has all along manifested when dealing with this product. The truth is he wants it for nothing.

We are all looking to the new year to put some vitality into prices. The report from home by last mail is that cacao valued at 105s to 106s was withheld as,—so queer was the market,—it was doubtful if even 98s could be got for it. Samples had been sent to the United States and South America without resulting in a single order. The demand for the States is dead for the present, and no orders are expected from that quarter till the tariff question is settled one way or another. We may look for a revival soon; anyhow those who ship are I think better placed than those who sell locally.

DAYS OF OLD: A LEAF FROM THE FAR EAST.

Through the good offices of Mr. Wm. Watson of Dunedin, we have received the following interesting criticism on an editorial note on "George Bird," which appeared in the *Observer* of 9th September last. The writer, Mr. J. C. White of Darling Downs, Queensland, it will be observed,

goes back wellnigh sixty years in his recollections of Ceylon. It is a pity that no portrait of the first of Ceylon Coffee planters (Mr. Geo. Bird) is available for our *Tropical Agriculturist* Portrait Gallery. Mr. White's paper is as follows:—

GEORGE BIRD—COFFEE PLANTER AT GAMPOLA, CEYLON.

I was for a considerable period on Colonel Bird's plantation with his brother George, and I left the service after George Bird was married. There were only two coffee plantations in Ceylon at that time—Bird's at Gampola and one belonging to General B. E. de Gouvea, at Peradeniya. We had elephants at work, but each animal was driven by a man sitting on his neck armed with a goad called a *Pingoe*, I believe. I never heard of an elephant mad to work by word of mouth. This goad is like a boat-hook with sharp steel points—the straight one to urge them on and the others to restrain or pull them up. George Bird was a fine specimen of humanity, standing about 6 ft. 2 in., very powerful, but the story of his counteracting the force of an elephant and pulling him back with the handles of the plough is evidently a fictitious yarn got up by the Kandyans, to show the invincible power of the English Invaders who captured the Kingdom of Kandy after the British had been conquerors of the Dutch Possessions on the Coast of Ceylon.

The plantation was cleared and stumped, then ploughed, and planted with young trees grown in boxes from the berry. Along the rows of coffee trees, bananas were grown as a shade, but found not to answer. The trees near the bananas bore a yellow tinge of leaf gradually assuming a greener tinge as they stood away from the banana which impoverished the soil. The cost of an elephant in those days was 100 Rix-dollars=£7 10s.—The capture of Kandy was a very tame affair.

J. C. WHITE.

Darling Downs, Queensland, 8th November 1893.

DR. TRIMEN'S "FLORA OF CEYLON."

From the "Journal of Botany" for December, we append a general and appreciative notice of Dr. Trimen's "Flora." The Editor seems to have failed to get any Indian specialist to criticize the book, which is no doubt what Dr. Trimen would best like.—We learn that Dr. Trimen is now at work on Part 3 of the "Flora." We quote as follows:—

NOTICES OF BOOKS.

Handbook to the Flora of Ceylon: containing descriptions of all the species of flowering plants indigenous to the Island, and notes on their history, distribution, and uses. By Henry Trimen, M.B. (Lond.), F.R.S., Director of the Royal Botanic Gardens, Ceylon. With an Atlas of Plates, illustrating some of the more interesting species. Part I. Ranunculaceæ—Anacardiaceæ: with plates i—xxv. Published under the authority of the Government of Ceylon. London: Dulau & Co. [8vo, pp. xvi, 327: plates, 1to, i—xxv.]

It is to be regretted that a notice of this important work has not been undertaken by some one who, from his acquaintance with the flora to which it relates, would be able to discuss it from a botanical standpoint. But as our attempts to secure such a reviewer have been unsuccessful, and as the book presents noteworthy features apart from its technical value, it seems desirable to call attention to these, leaving for some future occasion and abler critic a more detailed notice.

Dr. Trimen's name, since he left this country for Ceylon in 1879, has ceased to be familiar to British botanists. It may well be that later generations are unaware how completely the *Flora of Middlesex*, published in 1869, revolutionized the method on which local floras were constructed. It is not too much to say that that book has influenced every subsequent local flora worthy of the name; and it has always been understood that its execution was mainly due to Dr. Trimen, although another name

also appears on the title-page. The same note of originality is struck by the Handbook now under notice.

Glancing through the various Colonial Floras which have been published or executed in this country, it is manifest that they have for the most part been undertaken by botanists whose knowledge of the plants described was derived mainly, and in most cases entirely, from herbarium specimens. The author of the *Flora Australiensis* was never in Australia and, although working in close proximity to the Royal Gardens at Kew, very seldom examined living plants for his descriptions; the monographers of the incomplete *Flora of Tropical Africa* were never in that country; Mr. Baker's knowledge of the *Flora of Mauritius* is entirely derived from the herbarium; and so we might continue. The result in all these cases is the production of handbooks extremely useful for herbarium work, but by no means so suitable for use in the field. Moreover, the condensation necessary renders it impossible to give notes on local uses and names, even when information as to those is forthcoming.

Dr. Trimen's aim is not so much the convenience of the herbarium botanist as "to enable observers in Ceylon to ascertain the name of any plant they may find growing wild." He would do for Ceylon what the Hookers and Babington have done for England, the good effect of which, in these days of minute investigation into structural details, is somewhat apt to be overlooked. He has given analytic keys, and his descriptions are, he says, "as little technical as I can make them, consistent with accuracy." These descriptions have "been made, whenever possible, from fresh living specimens"; such apparently trivial, but useful, particulars as the time of flowering and colour of flowers are given with brief notes "on the history and nomenclature [both scientific and vernacular] of the species, on any special peculiarity in its structure, and on its properties, products, and uses." Some of these things are of small moment to us at home, but every one who has worked in the field knows their practical value.

It is in this way that the method of the *Flora of Ceylon* is distinct from all its predecessors, and Dr. Trimen is to be congratulated on the success with which he has carried out his plan. While, however, complimenting him on his work, we are inclined to think that the practical convenience of those who will use the book in the field might have been further consulted by a diminution of its bulk. The work is announced as forming two volumes of two parts each, with a hundred quarto plates. These latter can of course be left at home, but somewhat less substantial paper, and a certain economy in printing which might have been adopted without in any way interfering with the appearance of the book, would have rendered it much easier for use in the field. On the present scale, two parts will make a somewhat unwieldy volume, while four separate instalments are inconvenient to carry about. Perhaps a thin-paper issue may be contemplated for this purpose; if not, we beg to tender the suggestion.

The handsome coloured plates "are a small selection only from the extensive series illustrating the Ceylon flora which is preserved in the Library of the Botanic Gardens at Peradeniya. This was commenced more than fifty years ago, and has been steadily continued under successive Directors. It now numbers several thousand drawings, and has been wholly the work of three members of one Sinhalese family, employed successively as draftsmen on the Garden staff—Haramainis de Alwis, and George and William de Alwis, his sons."

We understand that the second part of the *Flora* is well advanced towards completion, and we trust that the blight which so frequently falls upon works of this kind will in no way impede its progress.

PLANTING NOTES FROM HAPUTALE.

A Planter writes:—"Holloway's" letter on page 471 amused me greatly. There can be little doubt that green and succulent plants applied as

a fertilizer are of the greatest service to lands that require humus and are wanting in vegetable constituents. This is the reason that friend Holloway found in olden days: that the old coffee trees responded to masses of goat-wood grown under the trees—no contract weeding then—the weeds were pulled up before seeding and carefully buried in close to the feeding roots of the trees. Some estates that I know well in the "sixties" greatly increased their crops where the goat-wood was thus utilized. Green crops are grown on the Continent, I am informed, and used as manures. I think a kind of lupin is used, but you will be able to give your readers full information on this very interesting subject. [The *Tropical Agriculturist* has given much information on the subject.—ED. T.A.] Most of the estates I have had to cultivate in Ceylon are very deficient in lime and most of them wanting humus.

There has been a great deal of fever prevalent in some parts of this district these last 3 or 4 months, and I would advise that in future when new clearings are to be opened out in low-lying districts, where malaria must be expected, that before felling the jungle, a temporary hospital be put up, so that fever coolies might be quickly and systematically attended to, and medicines and suitable conjies given them. Many coolies' lives might be saved if a hospital, a temporary one, were used on new lowlying estates. A high caste middle aged nurse and a male attendant would suffice. The hospital could be made of jungle sticks and thatched, and have a division in the centre, one half for the men and the other half for women and the children and the Doctor would know at once when he visited where to find his patients.

TEA DRINKING BY NATIVES IN INDIA— [AND WHY NOT SIMILAR ARRANGEMENTS IN CEYLON?]

With reference to your note regarding tea drinking amongst natives in your issue of the 16th inst., the cup that cheers, but not inebriates is becoming universally popular, more especially amongst Mahomedans. The trade at our doors should on no account be despised.

For native consumption 1 lb. or even $\frac{1}{2}$ lb. packets, are out of the question, as the proportion of the population who either could or would afford to pay for such an amount is infinitesimal. To attract consumers we would suggest the opening of agencies in Ooty, Madras, Bangalore, and Sanderabad for the sale of 2 oz. packets, say at an anna or $\frac{1}{2}$ annas each. The tea should not be Red leaf or Congo, which the native is quite 'cute' enough to detect as inferior, but a good "Pekoe Souchong" put through a breaker, which would be attractive, and at the same time have a flavory liquor. We are convinced that if a few gardens combined and gave this suggestion a trial, a big trade would eventually result. It has succeeded elsewhere and why not here?

We would also suggest that planters should make up 1 oz. and 2 oz. packets to be kept at the factory to be sold to Bad-gas and other coolies, at the lowest remunerative rate—being able to obtain their pannikin of tea at next door to cost price, now that tea drinking is a habit, would go a long way to stop the petty theft of tea from the factory, and with tact and a little supervision, might become an important factor in factory accounts.—P.—*South of India Observer*, Dec. 30,

HAPUTALE REVISITED.

(By an Old Uva Pioneer.)

In the year 1860 a young planter dismounted at the "Haputale Pass" from his pony (a screw of sullen and uncertain temper), and for sometime stood entranced with the scene that stretched itself before

his eyes so suddenly and unexpectedly, over sixty miles of lowcountry to the sea-bordered horizon, and the salt-pans of Hambantota. This scene became familiar enough to him in after years, for he was now at the end of his journey, and was about to take up his abode not many yards from the spot where he then stood, though the only buildings anywhere visible were the Government resthouse, a short distance back along the road, and the store and bungalow of the Superintendent of the estate far down below. No one who has contemplated this view from the Haputale Pass can ever forget it, particularly if the conditions of the season, and the time-of-day prove favorable, affording a clear atmosphere and right illumination of the scene. But, compared to the busy and untidy foreground of today, it was infinitely more impressive when seen through the framework of Nature's own providing of grass, and tree, and fern, as may still be enjoyed by the traveller on the "railway line" today, from the Idulgashena Pass.

When seen for the first time, under these favourable conditions, the effect upon the mind and imagination is most powerful and lasting, both upon man and beast and bird, as witness the following instance. A pair of geese, reared at some distance, one day wandered to the verge of the Haputale "Pass," on such a bright and clear day as just indicated, and seeing apparently the whole world far below them, they spread their wings and soared away and were never again seen by their owner! Down the "Pass" the forest had been cleared only for a few hundred yards, and then the road (a riding one only) entered and ran for miles through a magnificent jungle—nearly all the huge trees, whose branches met overhead [the high-road of troops of Wanderoo monkeys] having their tall trunks covered with a sturdy creeper, destined if time allowed to kill its support, and to grow proud and strong in its place, serving the noble forest tree as some "Colombo Agents," in those days, served their unfortunate clients the planters, and so the creeper got to be named after them "the Colombo Agent."

That veteran planter, "Archibald MacPhail, J.P.," still hale and stalwart, whose hospitality we have just enjoyed, was already then—and for some years had been—opening estates "down the Pass," and he still lingers on the scene, a model and an example to the present generation of younger planters and a proof that a temperate life and constancy to work and duty, are conducive to strength, health and a vigorous middle age. He has seen king coffee reigning in all his glory, (both making and marring his own, and the fortunes of many other men) succumbing to the attacks of his many enemies, retiring to end his days in what was always his stronghold and fortress "Old Haputale." On Roehampton, and on some parts of the Haputale and Kahagalla estates—(but especially on Roehampton)—may still be seen fields of coffee as healthy-looking, as vigorous, and in as "good heart" as any ever seen in the best days-of-old, hiding all the ground with a noble screen of leafy branches from root to top. So we saw them in this month of December 1893, from thirty to fifty years old, and with a good show of green berries for spring crops—a crop scarcely known on the Kandy side. But, doubtless, the fine old clusters and bunches, at every eye, are things of the past—single or double berries only being seen in their place, which makes all the difference between 10 cwt. an acre and 2 and 3 cwt. an acre. In proportion as coffee is slow to retire, so is tea slow, in this part of old Haputale, to advance—not in growing when once planted, but in the reluctance of the old planters to change their allegiance from the one to the other. And so it comes about that this the chief aspect of the scene near the "Pass," from a planter's point of view, is not much changed to the scrutiny of the young planter's eyes, who, we have seen, first looked upon it 33 years ago, and as Mr. MacPhail has known it all along. Time did not admit of a visit to such places as "Kelburne," "Pitarumalie," and the hundred and one estates beyond, to Leangawella on

on the one hand, and to Kalupabani on the other, where, doubtless, a different story might be told. But nature no longer reigns undisturbed at the Pass itself. Here, how changed the scene! No prophet could have convinced the planters of those old days that a line of Railway, equal to anything in the world, would come to that spot, and that it would be surveyed and cleared, and levelled for the erection of a busy railway station, engineers' works and stores and a native population large enough to entitle it to be called a "town"! But so it is! And the planters, visitors and holiday-makers do not now depend for oxen and upon supplies carried on coolies' heads from Nawara Eliya, when rotten beef and mouldy bread was always their fare in rainy weather. To obviate this the writer built the first shanty ever erected on this now busy spot. A speculative Moorman volunteered, in consideration of certain "advances," to buy and kill a bullock every week, and in order to make this sure, our own kitchen became the first butcher's shop. So, too, stubborn and shuck ponies are no longer the planters' sole means of travelling up to Nawara Eliya, often having to run the list of many a paddy-field well-stocked with only half-tamed charging buffaloes,—which often put our lives in danger, but for the prowess of a well-trained dog sent to their heels, after whom they would wheel and go in hot pursuit to our own salvation many a time! But fiery eeds of this kind* are not yet quite died out, for such a one met us and bore us triumphantly to our destination on the first day. This destination was the "Happy Valley Industrial and Reformatory Schools," or rather to their founder and governor, the Rev. S. Langdon, whose humanity and love for these human wails and strays are only equalled by his business capacity and tact of management. He has secured for his schools a tract of land midway between Haputale and Bandarawella, and the Railway Extension not only runs through it, but a Railway station (to be called "Talawa") is in course of formation quite close to his house and schools; and I fancy now "all the King's horses and all the King's men" could not move him from his coign of vantage. But whether the "peace of the Valley" will be fled when he has for his neighbours a good many companies of soldiers, if not whole regiments from India, remains to be seen. What sort of scene these wide-rolling, far-extending patana plains will present 33 years hence is as difficult to foretell as it has to foresee the present changes 33 years ago.

We should add a good deal—if space and time permitted—to the above reminiscences and happy references to the Haputale of the present day. The railway journey has already been fully described in our columns—with the wonderful first view of Uva which, on a clear day, opens to the traveller when he emerges from the tunnel—dividing the South-west from the North-east monsoon. All round the Oheeya Valley and Horse Shoe Gorge, the railway ride is both unique and most enjoyable under the same condition of fine weather; but the panorama to watch for, is undoubtedly that obtainable for a few seconds only on approaching Idalgashena, when the lowcountry becomes visible all the way to the hills of Kataragam and the salt-pans of Hambantota. The delight over this journey in bright sunlight and clear weather between May and September will be enhanced by the fact that rolling cloud masses if not heavy rainstorms are then the distinguishing features on the Western or Dimbula side of the ranges. When the Resthouse or Hotel is finished at Haputale Pass, it will certainly be freely patronised by visitors as will no doubt that at Bandarawella six miles farther on. But the Pass must always hold its own with sight-seers for the grand panorama of the lowcountry it affords.

* Who would persist in standing stock-still when especially urged to fly!

A telegram to the *Observer* showed what we thought of the progress of the farther Extension: the heavy slips on the road and railway near the Pass must cause a good deal of trouble; but otherwise a great deal of the section is ready for ballasting—if not ballasted. Platelaying, however, cannot commence it seems until the Kurunegala line is disposed of, as the same workmen are to be utilised. The Talawa (Happy Valley) Station will be a very prettily situated one. Our companion has written too hurriedly to do justice to all we saw of the most useful and commendable work promoted in the Orphanage and Reformatory—the former under the immediate direction of Mr. Tomlinson, and the latter under Mr. and Mrs. Cotton whose agricultural, planting, and dairy operations are deserving of all praise. About 120 Reformatory lads are thus kept hard at work in most useful occupations (carpentry, shoemaking and tailoring besides) and their contented, bright as well as sturdy appearance speaks volumes for the goodness of the climate and the influence of regular work and meals. As by far the greater number of these lads are from the Western Province, as well as of the 50 Orphans, Mr. Langdon's "Happy Valley Mission" has incurred a special claim on Colombo as well as Uva residents, and we should be very glad to be made the medium of donations to clear away debt and support the work. Not the least interesting feature was the dairy—which may be extended to meet the requirements of 200 military men when they come into their tented Camp in the neighbourhood—and the promising tea-clearing; and the little, homely but comfortable chapel—midway between Orphanage and reformatory—with its mica window panes and thatched roof. A visit to "Happy Valley" will be one of the interesting sights for railway travellers when the Talawa station is open and a fee (if not donation) might well be made conditional, as a means of aiding the work.—Our companion well describes what we saw on Kanegalla under the auspices of one of the most sterling colonists—and pioneers—of the old school, Mr. Macphau whose kind heart and other sterling qualities are so fully appreciated by a wide circle of planting as well as other friends. Would that Dame Fortune in his case, had dealt in some proportion to merit. How many tales of bygone days of the "Fifties and Sixties" had we to listen to or share in! Of Davidson, Macfarlane (who fell a victim to smallpox), Thomas Wood, Yankee Bayley, Pines, clever Henry Don, Byers, Erdale Hope Baillie and all the rest. We wished, we had time to go and see Goumotava where we found Kieller in 1865 putting in his first coffee clearing, and which is still in such fine heart, and down the Pass, to see the change in many old properties—but better luck next time. It was rather exciting to have the exact spot on Haputale pointed out where the murdered tappalman in 1861 was picked up, and the search carried on for the murderer, resulting in the arrest of one of the leaders in the search,—the estate carpenter and of his subsequent conviction and hanging!

DO PLANTS DREAM?

"Chapters in Modern Botany." By Professor Patrick Geddes. University Extension Manuals. (London: John Murray).—

In spite of Professor Geddes' disinterested advice to the student (on p 145) not to read text-books, we have read through this one with the greatest delight. Even had Mr. Geddes preaced his book with the remark to which we had just referred instead of discreetly planning it well towards the end, curiosity alone would have led us to look through anything

written by him. The present work is a most charmingly written account of some of the more striking phenomena of plant-life; it is indeed splendid of its kind, as it is hardly to be said. We come across next to nothing of "parachlyma" "scleretchyma" and all the other "enchyma"; "archegonia" and "antherida" are let severe alone; there is no discussion as to the morphology of "laticiferous vessels," &c. In fact, it is a little too much upon the "University Extension" model which tends to present the student with the plums before he has fairly earned them by resolutely digesting the crust. We do not of course apply this criticism to the volume, but to the system which it represents. Professor Geddes frankly carries out the system which we deplore in its present form as tending to puff out the student before he has been well seasoned with a good dose of the elements.

The book plunges at once into an extremely interesting but outlying department of botany, the nature and habits of insectivorous plants. In this country there are at least three types of insectivorous plants. There is the sundew, its leaves glistening with innumerable droplets in which mincey flies are lured; the utricularia provided with little bladders, into which inquisitive insects—also minute fish, which Mr. Geddes does not mention—poke their noses, and are caught straightway and eaten. In the tropics are stranger forms still, with huge "pitchers" serving a like purpose. It has been shown that from these leaves and pitchers is exuded a juice strictly comparable to the gastric juice of our stomachs, and that the plants are in every sense of the word carnivorous. Thus one of the barriers between animals and plants was broken down completely by the researches of Darwin, who first systematically investigated the matter. These insectivorous plants show curious though necessary resemblances in related matters to the animals whose nature they have adopted; they both can and do suffer from indigestion; they are apt to starve (though this has been denied) if animal food be persistently withheld from them. The plants related to catch their prey in a passive fashion; Venus' fly trap is an insectivorous plant which shows more activity; the leaf is extended like an open hand. When an insect touches it the two blades at once close upon each other, and there the fly remains until death and dissolution are accomplished. The plants too, can hardly be hoaxed; we can catch out a spider again and again from his lair by gently tickling the web with a twig, but a drop of rain or a puff of wind does not cause the diolæ; the impact must be from some substance which is digestible, and therefore useful to the plant; the minute droplet of ammonia will cause a contraction of the leaf as surely as the largest wasp that can be accommodated within the closed trap. The diolæ is even an epicure, though not a teetotaler; it will take milk and wine but not sugar or tea. So surprising are these facts that it is remarkable to hear of people who are not content with them, but must endeavour to improve upon them by the addition of monstrous and pointless legends. A traveller has related how a dog was captured by the intricate network of a shrub; the fibres writhed round it severed the muscular bands, and sucked at and "pucker'd up" the skin. When the intrepid traveller attempted the release of his dog the plant turned its attention to him, and "the twigs curled like living sinuous fingers" round his hand! Far more reasonable, as well as more poetical—in that it expresses a profound truth—is the legend of the Dryad and the tree. The phenomena of life and the "physical basis" of life—protoplasm—are identical in the animal and in the plant. This indeed is one of the important generalisations that Mr. Geddes keeps continually before the reader. Insectivorous plants not only digest and absorb their food like Christians, but they sleep afterwards; and some vegetables even appear to dream, for a sensitive plant was once seen to twitch its leaves without any stimulus having been first applied.

Another botanical by-way along which Mr. Geddes so pleasantly escorts us, leads to the curious inter-

relationship between animals and plants exhibited by the "bul's horn thorn" and ants. This shrub has hollow thorns, in the interior of which ants of a particular kind take up their lodging. They excavate and devour some of the soft tissues of the plant; and in return for the hospitality thus generously given, the insects protect their host from the inroads of the leaf-eating ants; the latter if unchecked would divest the thorn of its leaves, and so cause its death. The book, indeed, abounds in interesting matter, often solid in character, but always well told; the only fault we have to find with it is its shortness; it would be very easy to put up with a longer work from the same pen.—*Daily Chronicle*.

TROUT FOR MYSORE AND COIMBATORE.

The speckled beauties which give one such delightful sport with a light fly rod on a pleasant summer's day at home are now to be introduced to the clear cold streams of the Biligiri Rangan Hills. A batch of 15,000 trout ova for Mr. Randolph Morris are on their way to Madras in the "Golconda," and should arrive by the middle of January. A portion of the consignment is intended for presentation to H. H. the Maharajah of Mysore. The young fry, when six months old, are to be sent into the stream which runs down the gorge to the Chamara Nagar Kheddah. The rest of the trout (if sufficient batch out) will be divided between the rocky little river which runs for over a mile through the Attikan Estate, and another mountain stream that runs through the Kollegal taluq to the Cavery.—*M. Mail*.

VICTORIAN PRODUCTS FOR THE EAST.

Mr. D. Wilson, the Victorian Government dairy expert, is to make a tour through the East with a view to finding new markets there for Victorian products, such as wines, canned fruits, butter, cheese and tinned meats, &c. The *Melbourne Argus* prints a copy of the letter of instructions issued to Mr. Wilson by the Minister of Agriculture in Melbourne as follows:—"1. You will visit first Ceylon a country of 3,000,000 inhabitants, the European portion of which entirely live upon supplies imported from Europe, the greater portion of which we can supply. 2. From Colombo you will proceed to Bombay, strike inland from there, visiting the principal distributing centres of inland India, visit Calcutta, thence to Bombay by rail. I wish you to thoroughly test India, especially the military centres, because I have good reason to believe that in tinned meats, fruits, wines and especially tinned butter, there is a large trade to be done. 3. You will then visit Rangoon, the capital of British Burma, which has a population of 7,000,000, (Rangoon has a population of 180,000, and is the port of supply for millions living inland). 4. You will then proceed to the Straits Settlements, of which Singapore is the capital. This country is largely peopled by Europeans and belongs to the British. It has a large population of nearly a million and with Batavia, capital of Java, supplies nearly all the archipelago with imports supplied by English and United States merchants. 5. Batavia, the port of Java, will be your next port of call. Java is one of the oldest-established European settlements in Eastern Asia. It has a population of 23,000,000. The import dues are very moderate, and the Queensland Royal Mail line from Australia to London calls there on the outward and homeward voyages. There is steamer communication amongst nearly all the islands from Java. 6. From Java you may find it necessary to go to British North Borneo and some of the islands, returning to Singapore, thence to Hongkong. The bulk of Opium trade with other countries passes through Hongkong, which is a free port. To give an idea of the extent of trade carried on through this port, there were 17,000 vessels entered and cleared in 1890, the imports mostly coming from the United States, which country, having a climate opposite to ours, will scarcely affect our trade. As is of course well known, Hongkong is a British port. You will then go to Nagasaki, Kobe and Yokohama,

and will probably call at Macao, Canton, and Shanghai. It is most important you should call at Yokohama, Kobe, Nagasaki, the chief ports of Japan, as their imports from the United States amount to over 4,000,000 per year, and the import duty is extremely moderate. From Mr. Marke, the Japanese Consul, I learn (and whom you should interview before leaving) that Japan is most anxious to cultivate a trade with the British Colonies, and is well worth a special visit. The present shipping service would serve us for a time." No doubt Mr. Wilson's mission will be productive of much practical good to the Colony.—*Colonies and India*.

QUININE RIGGING.

Whenever a little speculative movement occurs in quinine, paragraphs "writing up" the drug mysteriously appear in journals that in ordinary times take no interest whatever in the chemical market. Hitherto the anonymous correspondents who precipitate these messages have shown a particular liking for the *Financial News* and have generally whispered their confidences into the furry depths of that noble journal's aural organ. Last week, however, the Friend of Man who is so anxious to put his fellow-mortals' savings into a good thing, got hold of the City Editor of the *Daily News*, with the result that a queer little paragraph appeared in Monday's issue of that journal, under the heading of "An Influenza Market."

"Since influenza has become an institution with us, and now regularly pays an annual visit, speculation in quinine," says this Solomon, "has become both sound and profitable. Anyone buying it during the autumn months of the year is usually able to turn over his purchases at a profit of fully 20 per cent. during the winter. One of these little spurts is just now in full swing, each day witnessing a fractional rise, and from 8 1/2d., at which sellers were offering a few months ago, quinine has advanced to 10 3/4d. per oz. The general position of this article, however, is much sounder than in former years, the number of second-hand parcels having been so much reduced that now the chances may be said to be almost wholly in the hands of the fabricants (sic!) A further shaking out occurred last week, when the London agent for the large German factories, after onerous offering, became a buyer. Another point is the steady hardening in the value of cinchona bark, from which quinine is manufactured."

After this the paragraph proceeds with the familiar tale of the "grubbing up" of the Ceylon cinchona plantations and the rest. It is truly moving to think that in spite of low profits and bad trades, there should be so many nameless philanthropists in Mincing Lane always ready to tender disinterested advice about the investment of savings. The person who "influenced" this paragraph is commonly thought to be the agent for one of the German quinine-makers, but it is only fair to say that that gentleman denies the sort impeachment. But, whoever he be, he is no doubt, investing all his own spare cash in the drug. It may be well, perhaps, to remind the good people who take the *Daily News* investment-tips that hitherto outsiders speculating in quinine have generally, as the Americans say, come out at the little end of the stick. There is a lady as well-known in the quinine market as is the distressed widow with the silver spoons or the German gentleman with the walnut sideboard to readers of the *Telegraph* advertisements. This lady once bought quinine at 10s 6d an ounce, because she read in her daily paper that it was cheap at the price. Periodically she tries to "realise," and writes a circumstantial letter to some wholesale drug-firm or another asking what they can get her for her investment. The reply is, say, a shilling, or tenpence, whereupon the indignant female swoops down upon the drug-firm and, waving a Stores catalogue into the face of the principal, demands to know what he means by offering her tenpence when the Stores catalogue gives the price at 3s 6d? It is paragraphs such as that in the *Daily News* that are responsible for the existence of this type of investor.—*Chemist and Druggist*.

THE CENTRAL PRICE OF QUININE.

The natural price is, at it were, the central price to which the prices of all commodities are continually gravitating. Different accidents may sometimes keep them suspended a good deal above it, and sometimes force them down even somewhat below it. But whatever may be the obstacles which hinder them from settling in this centre of repose and continuance, they are constantly tending towards it.—ADAM SMITH.—“Wealth of Nations,” Book I., ch. 7.

In the excellent letter from Baron von Rosenberg, the Indian cinchona planter, which we published a few weeks ago, many weighty reasons were given why cinchona bark ought to rise considerably in price within the near future. And the reports which have since been received from Java, now the key of the bark-position, go a long way to confirm the belief that during the coming year there may be a considerable decline in the cinchona exports from that island. Other factors which will make for higher prices of the chief cinchona product are the admittedly large decrease in the London bark-stocks, which have fallen from 49,502 bales of all kinds on Dec. 1st, 1892, to 39,654 bales on the 1st of this month, and the supposed, but unascertainable reduction in the supply of second-hand quinine existing in this metropolis and other centres of the trade. We have often been reproached with manifesting in this journal an undue partiality for what are called “bear” arguments, and with laying too much weight upon indications of approaching falls in price. Supposing—that we do not altogether deny—that such a tendency has really found expression in these columns, the cavillers might be answered with the words that if they wish for facts in justification of these alleged views, they only need to look around them and compare the prices of the leading drugs now and, say, ten years ago. So far as quinine is concerned, our often-expressed disbelief in any prolonged improvement in the market so long as the notoriously existing causes of over-supply were not removed has certainly been justified by events, but we fully recognise that in the course of the year which is now closing the conditions favouring lower prices have undergone considerable modifications. We will go further, and express our belief that if the information upon which we must base our views can be decried upon (and unless systematic speculation should depress prices unduly) the era of quinine at 9d per oz. and less may be regarded as closed, and we shall probably shortly arrive at a time when 1s or thereabouts will be the normal axis round which, with a short radius, prices will revolve.

We base these views upon indications revealed by a general and careful survey of the cinchona and quinine markets, and not, we hasten to add, upon the speculative movement which in the course of the last fortnight, has caused quinine to advance from 9½d to about 10½d per oz. These sudden eruptions of hotchy speculation threaten to become chronic about Christmas-time, and they really deserve no encouragement from dealers who are anxious to see a steady constant improvement in the market, such as the present state of bark production and quinine consumption appears to warrant. The circumstance that some firm or another ostentatiously buys one or two hundred thousand ounces of quinine, not because it is actually required by consumers, but simply because it is thought advisable to give a flip to the market, cannot improve the commercial position of the drug in the long run, inasmuch as it simply transfers to speculator B. what was previously held by speculator A. The mere speculator, it is well to remember, is equally the enemy of the manufacturer and of the consumer. Like the “menial servant” upon whom Adam Smith is so severe, his services to the community, such as they are, perish in the very instant of their performance, and seldom leave any trace or value behind them.

Looking simply at what happened during the closing months of the last four years, we shall find that on each occasion the quinine-market began to show a sudden revival shortly before the Christmas holidays, and that the excitement generally lasted until the New

Year's business had fairly commenced, only to evaporate like the oft-quoted baseless fabric of a vision, about the middle of the first month. Thus:—

In Dec., 1889, quinine rose rapidly from 13½d to 14d per oz., and to 16½d per oz., in Jan., 1890, after which it began to decline.

In Dec., 1890, quinine closed firmly at 12d. Early in Jan., 1891, it rose to 12½d per oz., after which it began to decline.

In Dec., 1891, quinine rose from 8½d to 9d, and in Jan., 1892, to 9½d, after which it began to decline.

In Dec., 1892, quinine rose from 9½d, to 9½d per oz., and in Jan., 1893, to 9 9-16th d per oz., after which it began to decline.

On none of these occasions, it is well to observe, was there any backbone in the article. Combination-rumours, influenza, sometimes the mere idea that the drug was cheap, were the guiding motives of the speculators, and in each case the movement ended in leaving consumers generally more distrustful of the drug than ever. It is only fair to state, however, that a not inconsiderable proportion of the sales which have been made this month are said to have been made to wholesale druggists and other *bona-fide* consumers.—*Chemist and Druggist.*

A RETROSPECT AT QUININE.

In the preceding article we have pointed out that quinine and, for the matter of that, cinchona-bark, are in an economic position which justifies a rise in their prices apart from all merely speculative market-rigging. We are, in fact, firmly of opinion that at the present time there exists a strong undercurrent in the quinine market making for higher prices, and that, as soon as the frothy surface-wash of speculation has subsided, that undercurrent will begin to make itself distinctly felt. We have already roughly enumerated some of the causes that lead us to expect a gradual improvement in the drug and we may perhaps add another, which may possibly count for a good deal. It is the fact, if not actually written, understanding to refrain from cutting which has for some time existed among the German quinine manufacturers. Since it has been concluded the market has been singularly devoid of excitement, and it is questionable whether the “understanding” would bear the strain of any sudden manifestation of rash speculation, such as may very conceivably await us next year. But if the quinine-makers abstain from playing at cross purposes they can do very much to increase the stability of the market and in the present disorganised condition of the cinchona growing industry they can make their weapon cut both ways by keeping quinine prices up and the bark-unit down. Appearances certainly favour the expectation that 1894 may be the most interesting year in the quinine-market since 1884.

The great majority of wholesale druggists, brokers, and shippers will certainly be only too glad to turn their backs for ever upon cheap quinine. There is scarcely a man among them who has not had cause to regret having touched the drug in the way of business for the last ten years. It is to be hoped that those who after waiting with a patience worthy of a better cause, have ere now ridged themselves of their stock at a sacrifice will have learned wisdom by experience, while those who have clung to their costly holdings throughout the evil time may now love them the more for the dangers they have passed, and rejoice in the possible advent of a time when they shall be able to sell them with a better prospect of a fair return. We are afraid that these speculators will hardly be able to find cause for loving us that we did pity them, for had they taken this journal's advice to heart earlier they, would not now be holders of expensive stock at all.

The bark-growers too, or such of them as have weathered the storm, and who have tasted the bitterness of all sorrows of remembering earlier happy times during later years of misery, will again feel hope rise high within them when within the near future they hear, as possibly they may, of steadily-

rising units and contemplate the increasing store of wealth accumulating in the dermis of their *Lagerianas* and *Officinalis*.

How far removed does not the time appear when all the drug-world wondered whether quinine could possibly fall as low as 5s per oz. ! And yet it is on ten short years ago since that dreaded cataclysm befell the drug-trade. On January 24, 1884, after the breakdown of the short-lived notorious "combination" 10,000 oz. of Zimmer's quinine were sold "without reserve" by public sale in Mincing Lane at 5s to 5. 3d per oz., a decline of 2s per oz. from the quotation of December, 1883. A twelvemonth later, at the end of 1883, second-hand German bulk quinine, which had then already become the bogey of the market, might be bought at 3s 8d per oz. and since then, with scarcely a rally the quinine-prices have sunk lower and lower. Until 1883 and 1884, those comet-years of the quinine-trade, an occasional drop or rise of a shilling per oz. or so was regarded with comparative equanimity. It is true that it was on record that once—in 1864, we believe—quinine had sold at as low a figure as 4 per oz., but it was hardly expected that so low a price would ever return. When in 1886 half-crown quinine became a horrible reality, and still more so, when afterwards, in the same year, 1s 10d per oz. was momentarily quoted, the trade generally began to think that rock-bottom had been touched, and it is a curious and instructive pastime to re-read some of the circulars issued at that period by firms who demonstrated with the utmost vigour, and staked their reputation upon the correctness of their opinion, that the process of depreciation could no further go. Nevertheless, in November, 1887, 1s 3d per oz. was accepted in the wholesale market, and in the drug-auctions of May 16th 1889, "shilling quinine" became an historic fact. Nay, the descent into Avernus continued until this spring, when a parcel offered at auction in London only realised 8¹/₂ per oz. Those who "assisted" at that sale may perhaps carry about with them for the rest of their lives, or at any rate until the advent of artificial quinine, the proud remembrance that they witnessed the lowest quotations on record in the history of the article.—*Ibid.*

BARK AND DRUG (VANILLA) REPORT.

(From the Chemist and Druggist.)

London, Dec. 21.

COCAINE.—Last week we announced that an advance was imminent. Since then it has been actually declared. All the makers (excepting one or two whose quotations are not competitive) now ask 14s 6d per oz. for hydrochlorate (in the) in 100-oz. lots, 14s 9d for 25-100-oz. lots, and 15s for less than 25 oz. Delivery may be taken within three months at these prices. The quantities of "crude cocaine" exported from Peru during 1882 were as follows:—London, 2,72 lb.; Hamburg 432 lb.; New York 221 lb. The total weight of 3,625 lb was valued at £23,422 10s.

QUININE.—Last week the market closed firmly, with some little business in second-hand foreign bulk quinine sold at 10¹/₂d per oz. and on Friday about 3,000 oz. changed hands at from 1¹/₂d to 1³/₄d per oz. Early in the week a further stage in the advance was reached by a sale, on Monday, of some 25,000 oz. at 10¹/₂d per oz. Since then the market has become quiet again, and no further business has been reported. Today the position is:—Sellers at 10¹/₂d, buyers 10³/₄d per oz. Nothing doing. The German makers have progressively raised their quotations to 11d per oz. for bulk quinine in quantities and 1s per oz. for smaller lots. The richest parcel of cinchona offered at last Thursday's Amsterdam auction was one of 23 bales crushed day's Amsterdam auction, containing the equivalent of 12 1/2 per cent of sulphate of quinine. This lot sold at the rate 4¹/₂d per half-kilo, or say 7¹/₂d per lb. Amsterdam terms. The average unit was 3 7/8; 1,004 kilos at 4¹/₂d, 44 kil at 4c 7,893 kilos at 4³/₄d, 2,004 kilos at 4³/₄d the unit. The chief buyers were:—

	Kilos.
Mr. Gust Briegleb who bought about	8677
Mr. J J Louët F. Isser do ..	3743
Messrs. W. Schöffler & Co. do ..	3673
Messrs. Pharm. Hand. Versen do ..	3400
The Amst. Quinine-works do ..	2033
Mr. J. de Lig. do ..	88
Various buyers do ..	431
Bought in or withdrawn	6005

The general tendency was firm with a good demand. A few parcels of unusually fine drug-grade bark in heavy mossed silvery quill, about 10 inches in length were offered

and realised the equivalent of 1s 2¹/₂d per lb (80c per half-kilo.) The tendency in this class of bark was irregular, but very firm for fine quality. The following table shows the quantitative equivalents of sulphate of quinine in the bark offered at the Amsterdam cinchona auctions this year, together with the quantities sold and the average units. It should be borne in mind that in many cases a considerable proportion of the bark withdrawn at auction was immediately sold privately after the sales:—

Date.	Offered, Kilos.	Sold, Kilos.	Unit, cents
January 12th.....	23,300	13,200	8 1/2
February 16th.....	14,250	10,250	8 1/2
March 23rd.....	23,000	15,600	8 1/2
April 27th.....	14,500	12,500	8 1/2
June 1st.....	22,000	12,000	8 1/2
July 6th.....	25,250	12,550	8 1/2
August 31st.....	25,200	7,000	8 1/2
October 5th.....	18,500	13,400	8 1/2
November 9th.....	17,250	16,500	8 1/2
December 14th.....	24,500	20,500	8 1/2

VANILLA.—The following figures are given as representing the annual crop of Vanilla in the island of Bourbon during the last two years:—

Year	lb.	Year	lb.	Year	lb.
1873-74..	21,568	1880-81..	50,658	1887-88..	155,995

MARKET FOR TEA SHARES.

[FROM OUR SPECIAL CORRESPONDENT.]

THE YEAR 1893.

Dealings in Tea Companies' shares have again been on an increasing scale. This is largely due to the greater publicity which is now given to them in the press as well as to the greater interest which has been aroused in the public mind by the fact that these securities have not suffered so much as other classes of similar investment securities from the stock which has affected the stock market generally.

The rupee exchange, which it was anticipated at one time would exercise an unfavourable influence on Tea Companies' results, has so far been harmless, and we are informed that the 1893 rate for Tea Companies' remittances will likely prove to be something like one penny per rupee more favourable to them than in 1892.

The tendency towards amalgamation among Companies has again this year been remarkable. We have to chronicle the registration, under the Joint Stock Companies Acts of more than one group of estates; the Luckimpore Company has been absorbed by the Majuli Company; the Chubwa Company has swallowed up the Nonoi Company; the Mowund Company absorbs the Gotoonga estate; and the Shumalengger Company has acquired the neighbouring Kamhyathi estate. The coming year will probably witness further similar conversions.

To give our readers some idea of the range of share values during the year, we quote beneath some of the best known shares, with their variations in price:—

MARKET STOCKS, 1893.

—H. and C. Mail.

THE CULTIVATION OF LIBERIAN COFFEE in Java (say Messrs. James Cook & Co.) is largely on the increase, as is also the case on the Malabar Coast.

PLANTS AND SEEDS FOR EAST AFRICA.

Mr. F. Missmahl, a German visitor who has an Agricultural Diploma and who has been agriculturally engaged in Roumania, is going to East Africa to grow seeds and plants for distribution, and intends visiting Heneratgoda, Peradeniya and some plantations to learn all he can. We bespeak for him due attention. We have been telling Mr. Missmahl that we suspect he will find coffee-planting on his own account more profitable than the starting of a garden with diversified plants, at this early stage in the development of German East Africa. But he assures us that there are more plantation Companies and a larger number of individual planters engaged, than we are aware of. There can be no doubt that "coffee" is at present *par excellenc*, the plant to cultivate for "profit" and quick returns in East Africa; but it will be very interesting to watch how Mr. Missmahl succeeds with his Nursery and Experimental Garden. He should be subsidized by the Imperial German authorities. We are anxious to see the relations between Ceylon and all the Settlements in East Africa drawn closer and closer, and we hope the day is not far distant when we may have direct steamer communication between Zanzibar and Colombo.

ROYAL BOTANIC GARDENS, PERADENIYA.

We have to acknowledge the receipt of a copy of the "Fourth Edition" just published of Dr. Trimen's "Hand-Guide to the Royal Botanic Gardens, Peradeniya, with a Plan"—printed in very neat style at the Government Press. The pamphlet covers 40 pages including Regulations, Preface, Introductory, Itinerary and Guide, Price List of Seeds, &c., and Selected Index. We quote the preface as follows:—

PREFACE.

This short Descriptive Itinerary does not attempt to give a full account of the Gardens, but has been drawn up in order to assist visitors—with the aid of the Plan—in finding for themselves the principal objects of interest in these extensive grounds. The route given can be followed almost throughout by carriages. It is of course not intended that it or any other particular course, should be necessarily taken; but in a single visit of limited duration it is probably the best that can be followed. But to really see the Garden, enjoy its beauty and variety, and investigate its treasures the visitor should leave his carriage at the gate and explore the narrower roads and paths on foot. A Catalogue, containing considerably more than 3,000 species, being the ascertained contents of the Gardens at the end of 1886 was published in 1888, and can be obtained at the Lodge, price One Rupee. January 1, 1894.

THE TEA CHESTS OF THE FUTURE; TARIFFING AND BULKING: AND SHIP STOWAGE OF TEA CHESTS.

If the report which has just arrived from Japan to the effect that some disease of a serious nature has attacked the trees which supply the timber for tea boxes, prove to be correct, a new interest will be given to the question of the tea box of the future. We learn that one mercantile importing house, at least, has had such an advice from Japan, and that the supply of tea boxes thence is expected to be affected. In that case, as well as in view of recent complaints of certain timber tainting the tea, we may expect increased attention

to be given to steel substitutes for which at present "Acme tea chest" holds the field. We cannot help believing that here we have the "tea chest of the future": more particularly when we learn from the Syndicate's agent, Mr. Polson, who has just returned to Ceylon (en route, after a short interval, to Calcutta) that his principals are sparing no expense in experiments towards further improvements in rendering the steel plates more flexible and in otherwise meeting the requirements of practical planters. When we mention that Sir Wm. Arroll has helped largely with his advice in respect of the special treatment of the steel sheets, we may feel sure that everything that technical ingenuity can devise on the Clyde will be tried to carry this Acme tea chest manufacture to a great and lasting success. The latest departure is the laying down of plant to turn out 20-lb. boxes, for which we learn large orders have already been booked and these are expected to be exceptionally popular. Mr. Polson will be able to show samples before the end of the month, and we would suggest to him then, to have a gathering of mercantile and planting gentlemen interested, and apply tests to the different boxes so as, if possible, to overcome prejudices still entertained as to these being sufficiently safe (in respect of collisions) and tight to warrant their use for Ceylon tea in large quantities. The time is fast approaching when Ceylon planters will have to look into the present taring and bulking charges at home and it is very fairly anticipated that the use of steel chests should remove the necessity for anything more than nominal charges. Mr. Polson is prepared to send upcountry a chest, filled with sand and sawdust, as received from Glasgow, so that planters may see for themselves how these chests stand transport, and a sample can also be seen at this office as previously intimated. We have no interest to serve in thus discussing "the tea chest of the future" than the good of the tea planting community and we are ready to publish any experience adverse to, as well as in favour of, the use of the "Acme" tea chests.

Complaints have of late reached us as to the damaged condition in which no inconsiderable proportion of the timber chests in which tea is shipped from Ceylon reach the mother country. We have before referred to these complaints, and have raised the question as to how far it would be possible to increase the strength of these chests without adding unduly to their weight and bulk. It has been suggested to us, however, that it is not improbable that the damage that has been complained of, may, in a great degree, be due to the means employed by shipmasters to obtain a close stowage of their cargoes. It is well-known how essential it is that this should be as effective as possible. Any chance of the "working" of the different items of which such cargoes are composed is an element of danger. If the least movement be permitted, there is always the chance of a gradual settling down and of an ultimate shifting, such as has led in numerous instances to the total loss of vessels. It is not to be wondered at, therefore, that those charged with the responsibility of preparing ships for sea should resort to very powerful agencies for the compression of their loading. Chief among such agencies is the employment of the screw-jack, an instrument of almost unlimited power. The precaution, we believe, is always taken, when working with this, to place boards so as to ensure that the pressure of the screw is applied over considerable areas and not upon individual

packages. If equalization of the pressure could be ensured by such means, probably we should not have to suggest that much of the damage experienced to tea chests may result from force so applied. But is it not be impossible to guarantee this? Must it not be likely that some chests, however carefully stowed, may so far project beyond the others as to receive an undue proportion of the strain applied by the screws? Were the cargo entirely of a compressible character, such as bales of cotton or wool, it would not be likely that damages would follow such inequality of pressure. But a tea chest has no such property, and the protrusion of a single angle of the box beyond the face of the others must ensure its destruction. We cannot of course, profess to say if this view of what may take place on board ship may be accepted as accounting for the complaints to which we have referred. There are those among our readers who are better acquainted than we can be with the methods used for ensuring tight stowage of the tea chests loaded in our harbour. But if the practice, as has been suggested, no one can deny that it is likely to be responsible for the damage stated. We should ourselves think that it must be possible to tightly stow packages so regular in shape as our tea chests without resorting to such forcible measures as that to which we have referred. There is, however, a further possible cause of injury that suggests itself. It is a common practice, we believe, for ships to use as dunnage—in packing up material—coconuts in large numbers. These, of course, have a commercial value on arrival, and we can, therefore, understand a preference being shown to their use for this purpose. But coconuts often have sharp points about them. They are, moreover, exceedingly hard, and if husked before being used as dunnage they must be very unpleasant neighbours for the soft wood of which our tea chests are mainly composed. The points mentioned seem to be worth the attention both of shippers and stevedores, and possibly some inquiry might be attended with beneficial results.

HAPUTALE REVISITED.

Our planting contributor and ourselves omitted to refer specially to what is, next to the Railway, the most prominent sign of progress at the Haputale Pass, namely, the first-class Iron and Machine Works and Store of Messrs. Walker & Greig, where Mr. Stewart and his Assistants are ready on the spot to serve the planters from the repair of a coffee pulper up to the erection of a first-class Tea Factory. What would not the pioneers of the "Forties" and "Fifties" give to have had a busy Factory of this kind within their reach. No employers are doing more to promote habits of industry, observation and intelligence among the natives of the island than the heads of our various Iron Works and other Manufactures throughout the planting districts as well as in Colombo, and Messrs. Walker & Greig, with their several branches, are not the least important on the roll.

THE TROUT EXPERIMENT AT NUWARA ELIYA.

THE PRESENT STATEMENT OF AFFAIRS.

A correspondent writes to us:—
Mr. Fowler has got everything in order to receive the ova expected by the "Golconda" about the 11th inst. Mr. Tringham, the Local Board Secretary, goes down to bring them up. This batch consists

20,000 ova from Burgess, of the Midland Counties Fish Culture establishment, Malvern Wells. The cost including freight is over £20 sterling. The Committee has ordered altogether 60,000, as you will see by the minutes of the meeting held on November 8th and Burgess has sent 5,000 in excess of order. The committee ordered 20,000 from Anrrows of Guildford, 20,000 from Burgess of Malvern Wells, and 20,000 from Armistead, of the Solway Fishery, Dumfries.

THE COMMITTEE.

It may be well to publish the names of the Committee (who have power to add to their number). The funds all pass through the Local Board accounts, but are expended in accordance with the resolutions of the committee. The members are as follows:—

Mr. O. H. Bagot, Capt. Bayley, Messrs. G. Beck, A. F. Brown, A. L. Cross, J. E. A. Dick-Lauder, A. H. Dunsinure, T. Farr, Gordon C. Fowler, E. Jeffries, G. Talbot, A. Tatham, A. K. Wilson-Wood, and the members of the Local Board:—Messrs. G. A. Fowler, Dr. Crab, J. Wickwar, C. Liesching, W. H. Hawkes, and J. H. Starry.

AN EXPERT WANTED.

Mr. Fowler has been trying to secure some of the large fish for the breeding ponds, but so far has only caught one, a female fish of 2½ lb., which he caught at Sita Ehya, and which is now in the pond. One of the committee men went out today, and in two hours caught eight trout in the Nuwara Ehya stream, all of which were too small for the breeding ponds, and were returned unhurt to the water. This is very satisfactory as shewing that the trout turned in last April by Mr. Fowler have thriven. (I am afraid that it is only too certain that these are the fish turned in and not locally-bred fish.) The large fish must be taken out before this year's fry are put in, and Mr. Fowler hopes to secure a good stock for the ponds. No one has yet responded to Mr. Fowler's appeal for assistance from some one who has had practical experience at home of spawning fish artificially; but it is hoped that before next cold season we shall hear of an "expert." For this season there are ample supplies of ova from England; but we look forward to the day when we shall be independent of imported ova. The following is a list of subscriptions:—

Received up to 29th November...	R1,460
C. Marland	30
G. Beck	30
A. W. Jackson	30
J. Root	30
A. O. Rolt	30
J. Ferguson	30
Hawtrey Thwaites	30

Total up to date R1,670

In view of the liberal response to Mr. Fowler's appeal for funds, the Committee largely increased his estimate for ova, and instead of only 20,000 ordered 60,000; and other expenses will of course be higher also.

MORE FUNDS REQUIRED.

A great deal still remains to be done, however, and more funds are required to make the hatchery complete. It ought to be entirely rebuilt and enlarged, and the water supply should be made far safer than it is at present. This will be necessary even if, as I confidently hope, we succeed in obtaining ova from Ceylon-bred fish, and it is to be hoped that those interested in the matter will not withhold subscriptions on the ground that others have already subscribed so much. Watchers to protect the fish are absolutely necessary and this will form a serious item of expenditure if a sufficient number be employed. Of course the Local Board cannot be expected to do more than to protect the fish within the limits of the Board, but it will be advisable to keep watchers for other streams also, as under the new Ordinance, the trout are legally protected in all waters.

THE SCHOOL OF AGRICULTURE IN 1893.

During the past year the work at the Colombo School of Agriculture has considerably extended its scope. The original object of the School was to train young men who would either as private landowners cultivate their own lands according to the enlightened principles taught at the School, or as agricultural instructors inculcate these principles in the Schools to which they are attached and also practically illustrate their teaching by means of Experimental Gardens. An Elementary Work on agriculture has for some years been used as a text book in all rural Government schools. With a view to still further enforcing Agricultural Education, the Director of Public Instruction has centralized the various schools for training vernacular teachers in the School of Agriculture, so that the future teacher may enter upon his duties of educating the village youth, with a theoretical and practical knowledge of Agriculture. To follow up this good work and to aid not only in the improvement of native agricultural methods as at present practised, but also to extend the scope of native enterprise in the direction of fruit and vegetable culture and the raising of fodder crops, and generally of products, whether indigenous or introduced, suited to the conditions of the people, a more regular system of itinerant inspection on the part of the Agricultural School authorities is desirable, so that their efforts might be more far-reaching and effectual in results. The curriculum of the School has been added to by a course of Veterinary Instruction imparted by the Colonial Veterinary Surgeon who has also given his attention to the subject of Cattle Disease in Ceylon. A Government Dairy was started in June last under the auspices of the School of Agriculture, with the object of carrying on dairying and demonstrating the feeding and management of stock generally on a proper basis, of securing a supply of pure milk for medical institutions in the capital, and at the same time of carrying on breeding operations with imported stock of good quality. This venture has so far proved a successful and remunerative one. It is in contemplation to increase the usefulness of the School by introducing into the curriculum additional classes with a view to utilizing it as a preparatory School for those seeking employment in the Forest Department.

THE PLANTING DISTRICTS OF CEYLON REVISITED.

(By a Haputale Planter.)

To the traveller, cast by chance or some more specific agency, upon the shores of our little tropical island, a cup of TEA is perhaps a cup of tea, just as to some quite moral people a promise is a promise, or to some physical souls a primrose is a primrose. But let the stranger tarry a little among our palm trees until prickly heat or some other factor terminative of human conduct pushes him along the lines of greater traffic, and behold a revolution of proportions in his mind. Tea will presently subtend one of the biggest angles in his consciousness. It will be magically raised from the dead monotonous level of particular things to the height and dignity of a large generalisation. It will no longer be thought of cup by cup nor will the issue merely lie between sugar or no sugar, cream or no cream. By some sudden genius of transformation it will be conceived of in districts at one moment and in millions of pounds avoirdupois at another. A hundred heterogeneous phenomena, such as limited liability companies, railways coolies, missionaries, hopes, bank balances, prayers—all these and many more are seen to fall into relations with tea, as with something absolute. Here, a few degrees from the equator, the wandering stranger finds himself in the midst of a development which has perhaps burst its bonds in the constitution of things as sudden, and exuberantly as anything of its kind which history records. But enough of this stranger.

To myself, returning to Ceylon after an absence of four years, the proportions and activities of our great TEA INDUSTRY are as pleasing as they are surprising. Living on the other side of the world, it

is very well to hear that the tea area is extending by thousands of acres. It is very well to hear of yields of 500, 600, and 700 pounds to the acre. It is mighty well to hear of golden streams setting from our great Western Babylon to our Eastern Port of Colombo. It is very well, even if not quite so well, to hear of Indian interlopers coming down like fallow deer to slake their thirst at our drinking pools. It is all very well to hear that the planters through the ranks of shareholders in tea companies, that they are heard chanting *Magnificats, Te Deums*, and songs of placebo, to tunes of ten, twenty, and thirty per centum. All these things I say are good to be heard, they are things gracious and of good report; but it is another thing to come and know them in the concrete. Mere cognitions of your headpiece, by means of testimony, are in one category of knowledge and sensuous intuitions are in another.

Being under a necessity to return to England as quickly as may be, I have not been able to see a great deal of the TEA DISTRICTS, but for most part I have been over the same ground as when I was last here; and the comparisons I am able to make between things now and things four years ago are very satisfactory. It seems to me that in old tea fields the bushes spread thicker and wider, and cover the ground better than ever with their rich shades of green. Young fields of tea seem to me of a lighter green than young fields used to wear, and if this really is so, it no doubt indicates more care in the matter of seed. The railway journey from Peradeniya to Nannoya gives a traveller some idea of the scale on which tea planting is being carried on. Looking out upon the great ranges of tea, I was disappointed to see that more has not been done in the way of timber clearings. Having regard to the enormous consumption of fuel, and upon a general consideration of agricultural economy in relation to insect pests, I cannot but think that on many places more plantations should be made.

There is a point beyond which it were unwise to press the much enduring Ceylon public; so I shall spare your readers a recitation of feelings proper to a first journey over the HAPUTALE EXTENSION. And indeed there are some emotions too sacred for words. However, I pay the extension my passing tribute and record my satisfaction in travelling for once like a white man to Haputale. This extension is truly a tremendous device, and in proportion to its mileage has been probably more expensive of human hopes and tears, of rupees currency and *Quamdiu Domines*, than any line on the face of the earth.

With TEA IN HAPUTALE I was very pleased. In this district time is on our side. At the higher elevations there are most luxuriant fields of tea producing heavily and yet annually improving. At lower elevations plants are more difficult to establish and the importance of good soil is great, but with careful selection, good work, and perseverance, I confidently look forward to fine fields of tea in heavy bearing. Those who remember the tyranny of coffee leaf at those lower elevations can scarcely doubt but that tea will flush heavily when the trees get well down into the good soil.

Taking a ricksha I went down a good way into Udapussellawa. I went 18½ miles down the cart road, with two Sinhalese, in 3¼ hours. I heard the other day of a reverend theologian whose bowels of compassion were greatly moved when he travelled in a rickshaw. I certainly cannot think it a proper means of locomotion for parsons, and I fear lest it may be imputed to them for unrighteousness. To myself, however, to be taken along by black men in the shafts, is a curious study in social physics. It helps me to realise man's connexion with lower animal forms, and I am such that I have more joy over one good induction *a posteriori*, than over ninety and nine transcendental speculations *a priori*. Go on faster, thou immortal bullock, else my umbrella shall sound on thy headpiece and mend thy saggard pace. Art thou reminded of Amos? They drink wine from their cups and anoint themselves with the best oil and concern themselves not at all for the sorrows of Joseph? Who or what am I that I should put thee to

such inferior uses? My answer to thee is in the language of the artificer in Isaiah. My answer to thee is Aba! Thou art a man and my brother—hereafter, it may be, to be preferred before me? Thou shalt go the faster now.

There is beautiful tea to be seen in Udapusselawa, and Ragalla particularly is a place which promises great things. I saw the Galaba factory four years ago and it seemed a very big place there. It is now doubled in size. The Turbine develops 40 or 50 H.P. and works so well and so quietly that a Yankee would call it a high-toned power. A large engine has just been erected which will work up to 100 H.P. I saw eight Rollers of the largest size, three Victoria A Driers and a Victoria B withal. At this factory they sometimes take in 25,000 lb and even more in one day. If any one wants to have the reality of our tea industry borne in upon his mind, if he would realise it as a big going concern, he can scarcely do better than obtain permission to visit this magnificent Factory.

The heat and mosquitoes of COLOMBO are not favourable to a new-comer who attempts to scribble, and these must be my excuses for the rough way in which these notes are put together. What I have set down may be of some little interest to my old friends and acquaintances in Ceylon. The number of them unhappily gets fewer and fewer.

THE FIRE AT NEW PERADENIYA FACTORY: DAMAGE R30,000.

PERADENIYA, Jan. 10.

The damage to the New Peradeniya factory was surveyed today by Messrs. Lamont, Gibbon, Edwards and Anderson. The loss will exceed R30,000 including the tea destroyed. The machinery will mostly repair. The rollers and dryers are little worse and the engine and water wheel are untouched. Expected to resume work next week, and in two months the factory should be straight. The fire must have occurred through a spark getting in at the top floor. Things were dry, and a high wind blowing the whole went in forty minutes. The loss is fully covered through the Economic Office and will be settled shortly.

CEYLON TEA IN NEW SOUTH WALES.

A tea dealer writing under date 23rd December, reports that "Sydney market is glutted with ordinary Ceylon teas. I have over 6,000 lb. of— and other teas in store waiting a better market. Just now my customers can buy fair Broken Pekoes (lowcountry) cheaper in Sydney than I can buy the same in Colombo! Some in Ceylon must be losing heavily by the present state of our tea market. For high class teas there is a fairly good market still."

TROUT OVA FOR NUWARA ELIYA.

The B.I. ss. "Goloonda" has duly brought the consignment of trout ova for Nuwara Eliya and Mr. Tringham took delivery this morning and is off with the same by afternoon train. But there are some doubts as to success, because Burgess has sent this consignment in a closed case, while Andrews always left the top open so that ice could be dropped into it. Two other consignments for Madras were on board made up after the old fashion. It is only when Burgess's case is opened that the result can be known. We hope all may turn out well.

BALANGODA DISTRICT.

A correspondent writes:—"I believe the Sylhet Tea Company has only as yet acquired the one block (Hopewell), 540 acres or so, from the trustees

of Mrs. Geo. Armitage; but they are understood to be negotiating some more of the big blocks—of which there are a good many in the district—of forest-land with the native and European proprietors. We wish them all success; for so influential and go-ahead a proprietary is likely to put a new face altogether on the hitherto despised Balangoda' district."

NEWS FROM THE CENTRAL PROVINCE: PLANTING AND OTHERWISE.

(Notes by Wanderer.)

CEYLON TEA.—The circulars of the Mincing Lane Brokers, which came to hand by last mail, clearly show that the trade is willing to take our tea freely so long as they get it cheap. Fortunately the low rates of exchange made it possible for us to do so, but I fear the circulars, published in the first week of January, will not be pleasant reading, for both Reuter and Messrs. Forbes & Walker's late telegrams report an easy market. No wonder with a total export of over 84,000,000 lb. in 1893! The cold hard dry weather is now stopping flushing, and by the end of January our home friends will see that there is no cause for alarm that we are to overdo our production in 1894. Russia seems to be now really alive to the virtues of Ceylon tea, thanks to Rogivue. It will be a neck and neck race for a Knighthood between our American and our Russian Commissioners. The tea stock (Ceylon) in end of December is lower than it was on November 30th.

GOVERNMENT RESERVES.—Ceylon planters deprecate these being sold to the Indian Companies that have recently commenced business here. By all means let them buy opened land, or reserves, if there are any, in private hand. They ought not to be encouraged by the Government to earn dividends at the expense of old Colonists, who turned unproductive coffee and tea estates into paying tea gardens, that have enabled the Government to abolish the paddy tax, and to carry out expensive Irrigation Works, and extensions of railway, that will in a short time bring in handsome revenue to the Colony. [There is no truth whatever in the statement that Indian Companies or their representatives have applied to Government for "concessions," or large blocks of Crown land; we have this on best authority. What the Companies in question are doing is bringing capital in for the benefit of the planters, who sell to them, and of the Colony.—Ed. T.A.]

RAILWAY TO THE KELANI VALLEY is I am glad to see, being energetically pressed on the attention of Government. A deputation will soon wait on the Governor who will doubtless give the matter the consideration it deserves. Very little has been done for the lowcountry planter, and it is time he got a share in the benefit of railway travelling. There have been more accidents to travellers on the Awisawella and Ratnapura coaches than on the whole of the railways of the island in the last three years.

BREAKFAST RAIN WEATHER GAUGES.—It is reported that a lazy S. D. on being taken to task by his more active P. D., for not following his tea pluckers sharp to the field, gave the excuse that he had been endeavouring to find out for himself the truth of the extract from *Chamber's Journal* you published in the *Tropical Agriculturist*. After watching carefully the bubbles in his cup of coffee for an hour, he came to the conclusion that it would soon rain, and he thought that a little delay might save him the trouble of visiting the pluckers whom the expected rain would drive to the lines. Has any P. D. stopped the T. A. lately?

MR. HOLLOWAY has made the discovery that plants have a language of their own, and they speak through their "bark." Probably it is in Dog Latin. This discovery of Mr. Holloway's appears to be the missing link between the "Animal" and the "Vegetable" world. We have often heard of dogs having a hard harsh

bark, but it appears the plant has a sappy bark. The bad looks of a dog may be the sudden death of him, but the "Illook" plant will, according to Mr. Holloway, on page 386 of the December number of the *Tropical Agriculturist*, actually do good to his fellow plant, cacao.

CURIOSITIES ABOUT ORANGES.

The name "orange" is from the Latin *aurum*, meaning gold or of golden colour. The fruit was originally a small bitter berry about the size of a common early Richmond cherry, and very seedy. It has been cultivated in Hindustan from a very remote period and was taken from that country to Arabia and Persia in the eighth or ninth centuries. It is said to have received little or no attention from cultivators of fruits in either of the countries last mentioned above prior to the beginning of the tenth century, there being a tradition that it was a "curse" fruit sent by Mohammed to destroy the unfaithful. This reminds us that our common tomato was formerly supposed to be poisonous, it being now less than fifty years since it was only grown as a garden curiosity. But to the orange: In the tenth and eleventh centuries the horticulturists of Oman and Syria began the cultivation of the tree in earnest, the fruit going under the name of "bigarade." By the end of the twelfth centuries of the Levant, the returning soldiers of the cross (crusaders) bringing it with them on their return from Jerusalem. It was well known, but not extensively cultivated in either Italy, Spain or France before the middle of the sixteenth century, 400 years after its introduction into the first named country, the hindrance being a survival and an addition to the old anti-Mohammedan tradition, viz.: That the use of the fruit would cause the partaker to enroll himself with the legions of Islam whether he desired to or no.

The Spaniards finally attempted and succeeded in cultivating in their West Indian colonies, and from there it found its way into Florida, Central America, Mexico and California, always improving in size and flavor until it became what is today, one of the most perfect of fruits.—*Florida Journal*.

TEA AND SCANDAL.

William Salmon was evidently a queer fish, for he did not think much of TEA. In his *Family Dictionary* (1,710) he says under the heading THERE, TEA:—"It grows in China, Japan, and other East Indian countries. It has a pretty fragrant smell and is of two sorts viz.—The Green and the Boba, both of them growing on a Thorny shrub in those countries. They cool, refresh and are vehemently diuretic, whereby it is said to be good against dropsies, gout, and stone because it clears the reins of all the mucilaginous and tartarous matter which breeds it. Our English Tea, which is only sloe leaves gathered in May whilst they are young, answer all the ends of the Indian Tea, having the same colour, taste and smell: nor can the wisest man distinguish between the form of the leaves, when both are scalded, so as to know the East Indian Tea from our English, the shape, magnitude, edging and colour of each leaf being exactly the same. And therefore I commend our English sloe leaves in the place of the Indian Tea, since the wisest of mortals cannot distinguish them when scalded, nor yet discern any difference in the liquors, either in colour, taste, or smell. But if any is to be preferred it is the English, because it is a perfect cure for the colic, which the other is not, but is said rather to cause it in many constitutions or habits of body."

But we must not allow tea to have all the speaking. Poor old COFFEE must have its *spoke* in the wheel too; so I interviewed a curious little book at the Museum last week, intitled "The nature of the drink Kanhi, or coffee, and the Berry of which it is made. Described by an Arabian Physician, Dr. Pocock, translator, Oxford. Printed by Henry Hale in the years of our Lord 1659." It is in English and Arabic. I send you the English only:—"*Bun* is a

plant in *Yaman*, which is planted in *Adar*, and groweth up and is gathered in *Ab*. It is about a cubit high, on a stalk about the thickness of one's thumb. It flowers white, leaving a berry like a small nut, but that sometimes it is broad like a bean, and when it is peeled parteth in two. The best of it is that which is weighty and yellow: the worst that which is black. It is hot in the first degree, dry in the second. It is usually reported to be cold and dry, but it is not so, for it is hitter, and whatever is bitter is hot. It may be that the score is hot and the *Bun* itself either of equal temperature, or cold in the first degree. That which makes for its coldness is its sickeness. In Summe it is by experience found to conduce to the drying of rheums and flegmatick coughes and distillations and the opening of obstructions. It is now known by the name of *Kobwah*. When it is dried and thoroughly hoylet it allays the ebullition of the blood, is good against the smallpox and measles and bloody pimples: yet causeth vertiginous headache and maketh lean much, occasioneth waking and the emords and asseweth lust, and sometimes breedeth melancholic. He that would drink it for liveness sake and to dismiss sloabfulness and the other properties that we have mentioned let him use much sweetmeats with it and oil of pistacces and butter. Some drink it with milk, but it is an error, and such as may be in danger of the leprosie." A. M. FERGUSON.

INDIAN PATENTS.

Calcutta, the 14th December 1893.

Applications in respect of the undermentioned inventions have been filed during the week ending 9th December 1893, under the provisions of Act V. of 1888, in the Office of the Secretary appointed under the Inventions and Designs Act, 1888:—

No. 343 of 1893.—Edward Robinson, of 4, Castelnau Gardens, Barnea, S.W., in the County of Surrey, England, Merchant, for apparatus for drying tea, grain, and other substances.

No. 346 of 1893.—William Jackson, of Thorn Grove, Mansfield, Aberdeen, Scotland, Engr., for improvements in tubular heating stoves, more especially intended for heating air for use in drying tea or other produce.

No. 347 of 1893.—William Jackson, of Thorn Grove, Mansfield, Aberdeen, Scotland, Engr., for improvements in apparatus for subjecting materials to the erection of hot air or for analogous operations, more especially intended for use in drying tea leaves, coffee, and other produce.

No. 352 of 1893.—Henry Thompson, of Trinity St, Gainsborough, Lincolnshire, England, Engr, but at present residing in Calcutta, India, for a new or improved process for rolling tea, and improvements in tea rolling and curling machines applicable thereto.

No. 293 of 1-93.—Walter Charles Church, of No. 6, Trinity Square Brixton, in the County of Surrey, England, Engr., for improvements in or connected with steam and other motive fluid engines. (Filed 25th Nov. 1893.)

No. 294 of 1893.—Walter Charles Church, of No. 6, Trinity Square, Brixton, in the County of Surrey, England, Engr., for improvements in compound steam-engines. (Filed 25th Nov. 1893.)—*Indian Engineer*.

GUATEMALA COFFEE.

The coffee crop of Guatemala, according to information received by the Bureau of the American Republics, will not be so abundant as was anticipated. There has been an extraordinary rainfall in Guatemala since the early part of last April, and in some districts, the coffee berry shows signs of shriveling as the result of excessive moisture and insufficient sunshine. It is estimated, however, that the crop will reach 55,000,000 pounds, a slight excess over last year's production. The want of sufficient labour has interfered materially with the development of the coffee industry in Guatemala. A trial of Japanese laborers is about to be made. The Gilbert Islanders imported last year have not proved a success.—*American Grocer*.

STAPLE EXPORTS FROM CEYLON FOR TEN YEARS 1884-93 AND DISTRIBUTION FOR TWO YEARS.

Through the courtesy of the Secretary of the Chamber of Commerce in sending us copies of the annual tables compiled in his office, we are enabled to offer some remarks on the results. Of course it will be remembered that in the Chamber's return, only Exports for the two ports of Colombo and Galle are taken into account; but as a matter of fact from these alone are our principal products sent across the seas. At the same time there will always be a difference between the Customs' and the Chamber's returns for the calendar years, for this reason. The Customs enters in its Export return every shipment as it passes on board vessels in the harbour and on 31st December may have in its total a good deal of produce that has not left our harbour; while the Chamber of Commerce makes no entry in its Export return until the vessel has cleared and left our shores. We published the total of our chief Exports for 1893 according to the Customs' figures on the 9th inst. and it will be interesting here to compare the same with the Exports as given by the Chamber of Commerce, thus:—

Staple Exports from Ceylon during 1893.

	Chamber of Commerce.	Customs.	Difference.
TEA lb....	84,406,064	81,319,035	3,087,029
COFFEE cwt.	55,190	55,417	227
COCOA cwt.	30,658	29,741	917
CINCHONA BARK lb.	3,571,325	3,440,715	130,610

It will thus be seen that in each case the Customs' returns are below those compiled by the Chamber, save in respect of coffee. The previous year's comparisons were altogether the other way; and no doubt the Customs credited to 1892 shipments which the Chamber brings into 1893. The difference is but trifling in respect of coffee and cinchona, nor in cocoa is it very appreciable. But a difference of 3,087,029 lb. in respect of tea is more serious.

We have now to note especially that while between the extremes of the decade, tea has risen from 2,403,095 to 84,406,064 lb., we would have a pretty equal rate of great annual progress save for the small increase in 1892 over 1891 of less than three millions lb. But if the return of 68,274,420 lb. for 1891 be treated as quite exceptional—as, in fact, ten million lb. above what it ought to have been,—then we get a fairly regular outturn rising since 1888 by 10 to 12 million lb. annually until between 1891 and 1893 we have a rise of 16 million lb. or 8 millions per annum. We must, of course, await the estimate of the Planters' Association before referring to the probable outturn for 1894; but we believe the general current of opinion points to a figure approximating to 89 or 90 million lb. (with not more we trust than 76 or 77 million lb. to go to the United Kingdom) as the anticipated official estimate for the present year.

THE United Kingdom has taken nearly 11, out of the 13 million lb. of increased shipments of our tea last year; Australasia (not "Australia" as the Chamber's table has it, for the latter term does not properly include New Zealand) is our next best customer taking very nearly all the balance (about 2 million lb.) of the increase; and India—whose tea Ceylon shuts out by an import duty—stands third in order of our customers. Then comes a great interval before we get to Germany; "Chins" (what does this mean?—Ceylon tea sent to blend?); Africa (which beats America!); America and Mauritius. The rest of our customers taking much below 100,000 lb. are insigni-

ficant. But we may class all our tea customers together more fully as follows:—

	1892.	1893.	Increase. lb.
UNITED KINGDOM ..	64,815,075	75,500,077	10,685,002
AUSTRALASIA ...	5,166,154	6,968,956	1,802,802
INDIA ...	528,037	964,104	436,067
CONTINENT OF EUROPE	255,458	387,111	131,653
CHINA "	103,988	188,099	84,111
AFRICA ...	64,728	114,857	50,129
AMERICA...	110,079	112,440	2,361
MAURITIUS ...	89,617	110,079	20,462
MALTA ...	18,326	38,435	20,109
SINGAPORE ...	11,381	21,906	10,525

Total ... 71,153,657 84,406,064 13,252,407
We trust that this is the last annual return in which "America," even for direct shipments, will make so poor a show.

The large increase in the export of "cocoa"; the immense tumble-down in cinchona bark, and the slight increases in respect of both coffee and cardamoms are notable features of the returns for 1893. Cinnamon, too, shows up well; but not so coconut oil in which there is a very marked decrease as also in copra and pongac, compensated to some extent perhaps by the immense development of the local manufacture of "desiccated coconut," the shipments of which last year totalled nearly 6½ million lb. and the increase in the number of coconuts shipped. Our only mineral of commercial importance, plumbege, compares but poorly with 1892, and the main products generally do not show any special improvement save "Palmyra Fibre" which has shot up in a wonderful way to 35,004 cwt.

We reserve a more detailed consideration of our leading exports for an early issue.

TEA, WOMAN'S RIGHTS, AND LOSS OF TEETH.

What is the connection between these three oddly assorted subjects? Dr. J. Murray Gibbes, of Australia, affirms that tea excites the nerves, and that as women drink more tea than men, consequently their nerves get more excited. Nerve excitement causes a feverish rash for openings and professions for women; these entail mental labor. Increase of mental development in women can only take place at the expense of their physique. "Therefore," Dr. Gibbes concludes, "in two generations or so both men and women will be toothless!"

Not where they stick to coffee or beer. We know maidens of three score and ten, inveterate tea drinkers, whose teeth are sound and whose nerves are of iron. The abuse of tea, however, as of other stimulants, carries with it a train of disorders.—*American Grocer.*

TEA PLANTING AND WILD TRIBES IN NORTH INDIA.

Ceylon planters may have their worries and troubles, but their lot is a happy one compared with that of their brethren in North India bordering as wild tribes, where the authorities are obliged to issue warning notices like the following:—

DEAR SIR,—As I received information that it is likely that Bhotiahs from the portion of Bhutan bordering on British territory may visit tea gardens on the frontier during the cold season with the object of stealing guns and ammunition, it would be as well to take precaution for the safe custody of any guns or rifles you may possess and to direct your registered chowkidars to keep a watch over any Bhotiah who may come to the Gardens and report their movements to the Police.

The correspondent who has sent us the above mentions that his neighbour's tungalow was looted and his guns and ammunition and his assistant's gun stolen.

EXPERIMENTS IN TEA-GROWING.

Experiments in the cultivation of tea are being made at Ohakva, a few miles distant from Batoum, the climatic conditions of which place are specially suited for growing tea trees. Several thousand trees, says the British Consul, have recently been planted by a wealthy Moscow tea merchant, who, the Consul understands, is about to engage the services of experienced Chinese tea planters to look after his plantations.

There is an unlimited area of pasture land during the summer months on the highlands of the Trans-Caucasus, and the lowlands afford abundant pasturage during the winter months. Cattle-rearing is, therefore, much resorted to by the population, but the scarcity of fodder last winter, owing to cold and snow, cattle plague, foot and mouth disease, pleuropneumonia, and other disorders which have been prevalent during the year, caused the mortality among livestock throughout the country to be enormous.—*Commerce.*

LIBERIAN COFFEE IN JAVA.

The *Indische Mercur* states that:—"In many parts of Java, where the plantations of coffee Arabica seems to become less profitable, there will be a better future by planting Liberian coffee, because this species does not want such a rich soil and climate, and does not suffer so much from the blight. Till at present, the Government has not done so much in planting Liberian for their own account; but seeing the good results private planters were getting with Liberian coffee, it proposes now to give a great extension to that culture. Up to the present time only 2,800 acres are planted by the Government, and the Javanese are extending for their own account also greatly that species."

TEA PROSPECTS.

With the Ceylon teas' average in Mincing Lane again touching its lowest point at 8d and the probability of a large increase of stocks when the "Oshshire"'s and other large cargoes get home, the prospect is certainly not a cheerful one. But on the other hand we may recall the fact that of Indian teas there have been unusually large offerings of late, and that there is no appearance of specially heavy stocks. Again shipments from Ceylon are likely to be light not only for January, but probably also for February. There are those who anticipate that 6 million lb. may cover the total shipments to the United Kingdom not only this month but also in February. This would merely mean the same quantity for the two months as in the same period of 1893, as may be seen from the following return of monthly shipments for three seasons according to the Chamber's figures:—

	SHIPPED TO THE UNITED KINGDOM.		
	1891.	1892.	1893.
	lb.	lb.	lb.
January...	5,162,518	4,920,866	5,766,144

VARIOUS AGRICULTURAL NOTES.

THE UPPER AMAZONIAN BASIN.—We learn that following in the footsteps of Messrs. Sinclair and Ross, an Aberdonian Mr. Bobb is now in charge of a "Colony" of settlers in the interior of Peru on the headwaters of the Amazon's tributaries. We suppose coffee and cacao will be chiefly cultivated.

DESICCATED COCONUTS.—A correspondent writes:—Work in almost all the desiccated coconut mills in Colombo, are at a stand still since the middle of last month, and the poor labourers—no fewer than two to three hundred in each mill—are thrown out of employment just now. It is said that there is hardly any demand for desiccated coconut during this season of the year in the English market, and hence this sudden stoppage of work. It is to be hoped, however, that ere long work will be resumed in these mills for the benefit of all concerned.

TEA CULTIVATION—is now being tried by the farmers of the Lydenberg district in the Transvaal!—no doubt prompted thereto by the success which has attended certain tea gardens in Natal.

THE RATNAPURA PLANTING DISTRICT.—We hear very encouraging accounts of the progress of tea estates in this neighbourhood: the growth and appearance of young clearings are described as very good.

CHEMICAL INDUSTRY IN JAMAICA.—The West Indies Chemical Works (Limited) is the title of a new enterprise about to be established at Spanish Town, Jamaica—says *Chemist and Druggist*—the object being the extraction of dye from logwood, cashaw, and other vegetable substances.

MESSEURS. DAVIDSON'S SIRICO WORKS.—Several weeks ago our London correspondent reported an interview he had had with Mr. Macguire of Messrs. Davidson & Co. regarding a new system of tea drying to be introduced and now we see that the steps which he indicated are being taken to enlarge the premises of the firm in Colombo for the exhibition of the new machinery. This extension of business occurs very opportunely in view of the state of the local labour market as it will no doubt provide employment for a number at all events of those who had been employed at the Government Factory.

THE "AGRICULTURAL GAZETTE" OF NEW SOUTH WALES. published by the Department of Agriculture, Vol. IV. Part 10 from October, 1893, has reached us. It has for contents:—

Useful Australian Plants by J. H. Maiden, Ironbark; Botanical Not * J. H. Maiden *Acrotriche serrulata*; *Lomatia silaifolia* (The Parsley Fern); *Owenia acidula* (Coar); Pruning, A. H. Benson; Plant Diseases and their remedies, N. A. Cobb, Diseases of the Sugarcane. Practical Vegetable Growing Directions for the Mouth of November; Orchard Operations for Nov. General Notes. Experimental Tobacco-growing; A Market for Prunes, Combs' Sugar tables; Fruit Store at Palmdale, Oudimbah; The introduction of the Honey Bee; Marketing Oranges; Pigs and Fowls as Insect and Weed Destroyers; Protection of Plants against the Livz.—Agricultural Shows, 1893.

Mr. Maiden shows that there are five kinds of iron-bark in New South Wales. We shall quote largely from his paper into the *Tropical Agri. cuuri st.*

THE STOPPAGE OF BRAZILIAN TRADE.—The London *Times* correspondent writes strongly about the evils wrought by the present state of affairs in Brazil. His figures for exports are of special interest. We quote as follows:—

A complete reorganization of administrative and financial methods is an absolute necessity if Brazil is to be saved from bankruptcy. He adds:—That Brazil has very great resources capable of rapid development under good Government nobody disputes, but such development and progress need encouragement of a kind non-existent in the country under the present régime. As a rough estimate of the value of produce exported by the entire country the following figures may be taken as approximately correct:—

Coffee, say, 6,500,000 bags of 60 kilos (150 lb.) each	£29,070,000
Rubber, sugar, and tobacco	6,000,000
Cotton	500,000
Hides and skins	350,000
Other products	1,200,000
	£36,050,000

Coffee and rubber have been the two mainstays up till now, but cereals and many other products for which Brazil is dependent on the outside world could be grown in the southern States, not only for home consumption, but also for export.

FINE YIELD OF TEA.—A crop of 700 lb. an acre all over is expected from some of the tea fields in Upper Haputale this year! It will be difficult to test this for any considerable acreage elsewhere in the island.

CHINA TEA.—The writer on this subject in reference to the cheapness of silver, should know that the question is one which has been exercising the local planting and mercantile public a great deal and that there is a Commission at this moment sitting upon it, or upon what is very much the same thing, our currency problem. At the same time he should also know that London tea experts and dealers do not think that the British public could go back to the use of China tea to any serious extent even if it were still further cheapened; but this opinion is by no means infallible and it remains to be seen what this season may shew to us.

TABLOID TEA.—We have circulated the packet of tea tabloids round the Fort, so that merchants and others interested can see for themselves what they are like. Mr. John Roger, the patentee, is full of faith in his invention, and hopes to be in Ceylon shortly for the purpose of obtaining some information with regard to the system of manufacture now carried out, as some tea is found very difficult to compress into tabloids. For our own part the tabloids seem to have lost much of the flavour that the tea must have originally contained, but it is possible that this may be overcome by some change in the process. At all events it would be a great thing if this drawback could be overcome, as the cheapness of the tabloids would recommend them to thousands.

THE PACKING OF EGGS.—It is well known, says a continental contemporary, that eggs by being packed in chopped straw, hay, or sawdust acquire an after-taste. This inconvenience may be overcome by a new and original method of packing, which has recently been patented by F. Seyferth, of Hamburg. In accordance with this new method the eggs are put into watertight vessels which can be closed on all sides, the lid is put on, and then through an opening the interstices between the eggs are filled with water or a solution of salt. Through this method, the effect of which seems incredible at first, the breakage of eggs is rendered absolutely impossible, provided the vessels used for packing are absolutely full of the liquid; while the eggs cannot acquire the slightest after-taste. Moreover, the frequent drying-up of the contents of the eggs is rendered impossible.—*Commerce.*

COFFEE AND COCOA IN JAMAICA.—The *Jamaica Post* urges greater attention to the preparation of these products. In its issue of December 2nd we read:—"The cocoa crop is now in full swing, and from all accounts is a satisfactory one. In some districts an unusually good yield is reported. Unfortunately our strictures on cocoa apply equally to coffee. Bad curing or rather no curing at all, is the rule. As we recently pointed out, there is more care now devoted to this crop than hitherto, among the large growers. The fermenting is better understood and also more extensively practised, and a number of drying machines are now in use. We have not heard of Ceylon prices being reached yet, but no doubt with increased experience, better results are in store. A great deal of the land now lying waste might be profitably planted in cocoa. Requiring as it does, so little expenditure in its preparation for market, it is very suitable for the man of small means. Careful planting, provision of shade, pruning and manuring at the right time are all it needs. In the curing of the bean, there is as we have already stated, much room for improvement."

EAST AFRICA FOR PLANTERS: UGANDA—FROM THE COAST UPWARDS.

Just as we are realising up about East Africa and its resources and capabilities as a great plantation country, there comes to us the report of a lecture before the Royal Colonial Institute by Capt. Williams, the companion of Capt. Lugard in Uganda. There are so many portions of this paper of so much practical interest that we must at once lay them before our readers. After discussing very favourably the prospects of a railway from the Coast to Lake Victoria, we have a description of the country from the maritime district up to plateaux of an elevation of 8,000 feet or superior to our Nuwara Eliya and Horton Plains:—

Leaving out the coast belt, which is extremely fertile, and from which the exports of coco nut products, India-rubber, grain, &c., must become yearly more important as the country settles down, and labour and capital become more plentiful, we have at intervals a number of the "cases" in the desert which now have no market for their crops beyond the passing caravan, but whose people only require encouragement and protection to very largely increase their output. And, again, it must be remembered that you must not consider the number of people now settled in a certain spot. Conditions of life in Central Africa are so hard that you have only to establish yourself in a suitable place, and plenty of people with their families are only too glad to come and live under your protection. Such places are Feita and Kibwizi. Further on, within a short distance of the point beyond which the rail should not go for the present, you have the best portion of the Wikamba tribe, who are industrious and friendly. They are now being used as ports between their country and stations nearer the coast, while when I came down myself I met another number of them going to or returning from the coast, taking down cattle, goats, sheep, ivory and zinc and bringing up cloths, beads, and wire. I was much struck with the very remarkable change and improvement in these people. They have ever been friendly, with a few local exceptions; but now they seem quite to consider themselves as coast people, and to look nothing of a couple of hundred miles' march to the sea.

KIKUYU.—Still further on you come to the Kikuyu country—a perfect Garden of Eden. Imagine a rolling plain with abundant water and such soil as is only found on the site of a virgin forest, the whole surrounded by most beautiful forests which descend to plains teeming with game of all kinds. Being at an elevation of 6,000 feet, the climate is most delightful, while English vegetables grow in the most luxuriant manner and of most excellent flavour.

KIKUYU FOR PLANTERS.—You can, as far as I could see, grow anything at any time; peas, for instance, are fit to eat in six weeks after they are planted. The natives used to be very troublesome; but I think those little difficulties are about over, and I prophesy a great future for this district when transport arrangements make it possible for planters to dispose of their produce. Leaving Kikuyu we come to Lake Naivasha and the Masai plains, where you see large herds of cattle and donkeys in splendid condition, showing how good the grass is. And here, coming in contact with the Masai, we must consider how they are likely to interfere with our schemes. There is little doubt that the Masai have been through very hard times. The cattle disease swept off their herds in thousands, and their young warriors were reduced to begging for food. So far we have been good friends with those who live in the kraals round the lake, and I think most of us have a sort of sneaking regard for the Masai. The great trouble with them is that they are most incorrigible marauders, going long distances for cattle. But they only do rather better what all their neighbours do if they are strong enough. It will not be an easy business to stop these raids. But still I think it may be done without destroying a brave and warlike people, for their organisation in small

kraals situated in open country makes them peculiarly vulnerable, while they have not the organisation and discipline so conspicuous in the Zulu and Ma'abele warriors. They acknowledge no paramount chief, so that you may have trouble with one lot without your relations with the others being affected. On the whole, I do not think that the Masai question need be looked upon as very serious.

MAU AND THE ANGATA NYUKI PLAIN.—Soon after leaving Lake Nakuru, on the road to Uganda, you rise gradually through a charming country, with plenty of grass and water and full of game, up to the elevated plateau to the west of what is called in the maps the Mau escarpment. Here, again, you have a fine country. At an elevation of about 8,000 feet there are belts of forest, plenty of water, and most excellent pasture. The soil is not so rich as Kikuyu, but the country is quite as salubrious. Whether anywhere in Equatorial Africa English children can grow up healthy and strong I am unable to say; but this district, which is of considerable extent, is certainly as healthy as the Indian hill stations in the Himalayas, and it has the great advantage—that its occupation by a white population does not involve the gradual but none the less sure dispossession of the natives, as the whole district is practically uninhabited owing to fears of raids from the Wanandi and Masai. But let me not be misunderstood; it is not as a colony that I think these countries will be valuable. Except in isolated spots, colonisation is quite impossible. If we are to rule these countries we must have spots in the interior where the administrative work can be carried out under more satisfactory conditions than usually obtain at lower altitudes. No one who has not had experience can conceive how much your work and difficulties are increased by the enervating effects of the climate, which weakens and debilitates even the strongest.

KAVIRONDO.—Leaving this elevated country we gradually descended into the valley of Kavirondo, and from there to the lake pass through an extremely rich and fertile country, which, however, owing principally to the recent ravages of smallpox, is not so thickly populated as it was when I first arrived there. Here the ordinary native grains grow with hardly any labour—it suffices to scratch the ground and throw in a little seed to ensure a splendid crop. I do not think that this country, which affords typical example of grain cultivation in Equatorial Africa, will ever become a wheat-growing district, for the simple reason that wheat is not tall enough and strong enough to kill the weeds without a great deal of labour, which is dispensed with in the case of maize and other native grains whose stalks grow to a great height. But it will, and even now does, produce a large quantity of food, and is a capital base for expeditions proceeding north towards Lake Rudolf to search of the ivory which exists in these countries in great abundance, sufficient for many years to come. People say that the elephant is the curse of Africa, and if there were no elephants there would be no slaves. I cannot see that this is true. Undoubtedly the ivory trade has been made still more profitable because the typical trader, so well described by Sir Samuel Baker, played a very simple and pretty game. He looted cattle and exchanged them for ivory; and then, when he wanted porters, he captured what he required and sold them together with the ivory, when he got to his journey's end. But these ideas are, thanks to the way the European nations have in the last few years pushed right into the heart of Africa, getting quite out of date. The risk of being caught is too great for most of these schemes, though of course cases do occur at intervals, but nothing like what one has read of. Then comes the important question of labour supply, and this will certainly be a difficulty at the first, although under the example and kind treatment of planters trained in such a school as Ceylon affords, we should expect it to be overcome. We do not think Capt. Williams if he knew

our planting country and men, would consider that they could not develop plantations of their own, as well as act as buyers of native produce:—

LABOUR.—But there is one difficulty which at once occurs. Where is your labour coming from? And this is one of the greatest questions in Central Africa. No man will do any work unless he is absolutely obliged. He will, as a rule, work hard enough building houses or fences for himself or his chief, but the actual work of cultivation he leaves to his women-kind—and wonderfully good they are. The soil of Uganda, except in patches, is nothing extraordinary. The extreme fertility is due to a good rainfall and an African sun, added to a very laborious but most excellent method of cultivation. There is no scratching the ground in Uganda and getting a crop. With their hoes set like axes they cut a sort of trench and then chip away at the edge, heaping the earth up so that they have a sowed twelve or fourteen inches deep, in which you can grow anything. Of course such labour could never be used to grow great breadths of grain. Fortunately, the staple and favorite food of most of the lake tribes is the plantain or green banana, which, when once established, provides a large quantity of food per acre, while care and attention, more than severe labour, are required to keep them in order. In a really good banana plantation you will hardly see a weed. The stalk which has once produced fruit is cut down with it, and is split up and laid most carefully over the ground. A banana plantation, therefore, appears to be carpeted with dried leaves and fibres, which exclude the light from the ground, and so prevent weeds growing. As a food the green banana is most excellent and nutritious, not sweet as many of us might suppose, but when steamed (and no black man would dream of boiling them) very like our own potatoes.

Cultivation which produces such excellent results in a soil mostly of different quality will produce anything for which the climate is suitable; but such labour is difficult to supervise and I think we shall find that in Uganda the European planter will not be common, but that paternal and enlightened Governments will put these people in the way of growing whatever may be found after experiment to pay best, while the Europeans will merely concern themselves with buying the crops, and with superintending the more important processes at some central point—amounting, in fact, to a sort of co-operative arrangement, in which the people had the maximum of independence, seeing that they need not work unless they wanted money. Fortunately, as a compensation to their idleness, their vanity will make them work by fits and starts sufficiently to obtain clothes in which to display themselves.

In the discussion which follow Capt. Lugard generally approved of Capt. Williams' paper, but he put the first section of railway required at 2.8 miles. Mr. W. Fitzgerald with experience of the Coast region of East Africa gave useful information:—

The whole sphere of the portion of African territory under present discussion lies well within the tropics, and is subject to the influence of the S. W. and N. E. monsoons. The mean temperature may be given throughout as 80°, and the lowest temperature experienced by me was 64°. The average annual rainfall I should be induced to put down at between thirty-five and forty inches; and though I am aware that other records give an average of nearly fifty, I should be inclined to accept the lower record as the most accurate. Dry seasons occur here as elsewhere; but any one with Indian experience who has visited Africa will agree with me that, in point of fertility of soil and general agriculture capabilities, the advantage is immeasurably in favour of Africa. The country, as a rule, along the coast lands is very flat and low, generally fringed with mangroves in the middle and southern portion, behind which extends dense bush, and behind this again forest. The cultivated area is comparatively small, and slave being the only labour employed, this area is certainly decreasing yearly in extent. The soil I would describe,

without entering into technical details, as everywhere extremely fertile, and certainly, in my opinion, eminently adapted for the cultivation of all the more important tropical products as well as grain and oil crops. Let me instance the following. The coconut, especially, grows exceedingly well, and there are great future possibilities connected with its cultivation which could be extended to an enormous extent; and I would here quote as interesting a broker's report on a trial shipment of copra sent home from the I. B. E. A. Company's plantations at Meludi. "Your small shipment created great interest in this market, and, excepting Cochiti, we have rarely seen finer copra; the nut is of great beauty and thickness and well matured, and the quality is fine. It is also well sun-dried and fairly clean, and suitable in every way." This lot (about ten tons) eventually sold for the very excellent figure of £14 5s. per ton, being £1 higher than the then ruling prices. This fine copra is used on the continent, not for oil but for the manufacture of margarine, or goes to the best milk. It was further stated to yield the following very satisfactory crushing results; 64 per cent of oil. Equal, or greater, in importance ranks cotton; and the fact of its adaptability for our rivers is evidenced by the wild varieties of this, found growing all over the country. Apart from the very encouraging valuations of his mail quoted by Captain Lugard, let me give also the following later broker's report:—

- S. A. Island cotton grown at Mombasa in very light soil, and much previous cultivation. } 4d average price.
- Do Grown on Company's plantation near Meludi. } If a Sea Island spinner could use it, 8d to 8½d; otherwise 6½d to 7d.
- Do from Uru district. } Is per lb and described in report as a decided success, the staple of good length and strength.

It is not yet definitely settled which variety of cotton is the most specially adapted for cultivation, and experiments are still being carried on in the Company's plantations for the purpose; but that the latter is well suited for its cultivation, and has a great future before it, there can be no doubt. I may further mention that a native cotton is at present actually cultivated on the coast land north of Lamu. I do not wish to enter here into fuller details on the coast lands, but let me repeat that nearly all of the more remunerative products could be cultivated with profit with skilled Indian labour to guide and stimulate the large native tribal population inhabiting the coast zone. I am led to take a very sanguine view of the prospects of this portion of the country. The great advantages also that the coast lands offer as an outlet for the surplus population of the teeming millions of India struck me from the first, and has also, I understand, attracted the serious attention of the Company; and the benefits of an Indian immigration with the Hindoos, love of thrift, and careful habits need not be emphasised by me. Great possibilities exist for more extensive cultivation; and when one reads of the vast expenditure incurred by the Indian Government for large irrigation schemes, one realises the great future that must exist for the coast lands of East Africa in this respect, and which the ever-flowing waters of the three great rivers of the Sabaki, the Tana, and the Yuba place within their easy reach. One word more, and I then take leave of the coast lands. The richness of the soil is further proved by the luxuriant growth of the Guinea grass an excellent and most nourishing fodder for cattle and horses, and which is here found growing wild everywhere, and also by the dwarf palm, the *Chameops humilis*, a noted characteristic of good soil which is found growing in dense thick clumps along the greater portion of the coast land from the leaves of which the natives make mats and grain bags, and which is so useful for other articles of European necessity and the supply of which is

practically unlimited. Lastly, the forests behind supply gum *copal* or *rubber*. This last is derived from the indiarubber vines or *Landolphia*; the discovery of the most valuable variety of which, the *Landolphia Kirkii*, yielding the pink rubber, we owe to Sir John Kirk, our late Consul-General at Zanzibar. So much for the *coast lands*; and, charmed as one is by the encouraging outlook here, turning our attention now to the interior we learn, from the interesting Paper we have just listened to, that Africa, even here, has more bright promises to hold before us, and Captain Williams's testimony, conclusive as it is in itself, is further strengthened by the strong and weighty evidence that Captain Lugard has placed at our disposal. Even in the comparatively poor and barren country that has to be traversed before reaching the higher levels nature is still bountiful. Speaking of this part, Captain Pringle of the Railway Survey says that two species of *Celaenales*, which is one of the commonest plants in the first 300 miles from the coast, produce a fibre worth of £30 a ton when cleaned. Capt. Lugard, speaking of the same aloe, describes it "as growing in absolutely illimitable quantities over hundreds of square miles." And, personally, I was much struck, in the small portion of this area visited by me, by its great similarity to the description given by Mr. Orss of the home of the Ceara rubber tree in South America. And when we came to the highlands of Kikuyu and the still higher plateau of Mau, it is difficult for us to realize that we are actually speaking of Africa and its once supposed deadly climate when we read of the wonderful country to be found here with its bracing climate, fertile soil, abundant rainfall, numerous streams, fine timber forest, and rich grazing; and the wonderful possibilities of future settlement and extended cultivation that this description opens up. And when we approach at last the shores of the Nyanza itself we find ourselves in a country whose unimpaired richness has won for it in the name just quoted, by Captain Williams, of the "Pearl of Africa." Describing the valley of Kaurondo, Captain Pringle speaks of it "as a veritable land of milk and honey," with the finest millet he had ever seen, evincing the wonderful fertility of the rich alluvial soil. Coming to Uganda itself, Captain Lugard has presented us with a vivid picture of the country, with its undulating low hills rich fertile valleys, and the extensive marshy swamps with their rank growth of elephant grass and papyrus. Here again the growth is all tropical, the rainfall abundant; cotton, coffee, tea, tobacco, rubber are all indigenous, whilst we further learn that vanilla grows wild and that the date-palm is simply found everywhere. Bananas and plantains are extensively cultivated, forming the staple food of the people and being suggestive to our minds of a future profitable fibre industry. Finally, the description given of the climate, temperature, soil, and rainfall of Uganda certainly bears out the anticipations and hopes that have been raised of a great agricultural future in store for this country; and, personally, I have been struck with the apparently great adaptability it possesses for the successful cultivation of, amongst others, the following special products: Cotton, rubber, jute and coffee. The following very favourable leading broker's report on a sample of Uganda coffee brought home by the Railway Survey, I have particularly noticed, viz.: "The present value is about 75s to 76s per cwt. We have shown this sample to other experts, who agree with us that under careful cultivation and proper curing on the same system that coffee is cured in India, the value could be considerably increased, probably to 97s or 98s per cwt." I know how great a desideratum amongst planters in India to possess some of the African indigenous coffee-seed to replace the local seed so weakened and deteriorated by the destructive fungus, *Hemileia vastatrix*. The eyes of planters and business men have long been turned to Africa, and I may quote here an extract from a letter to me of one of the leading Mysore planters: "For many years I have thought of Africa for coffee, and now that there is a prospect of the railway being made to Victoria Nyanza, I hope yet to

accomplish my desires." May we not hope so too; may we not confidently believe that the British nation, realizing at last not only the responsibility placed upon it by the recent march of events in Africa, but also the wonderful fertility and undoubted possibilities for agriculture, trade, and commerce of the country lying within the British sphere will afford the necessary and only means for its profitable and successful development by means of a railway? not Uganda, which is unnecessary, nor to Kibwezi, for here I venture to differ from Captain Williams, but to Kikuyu, which should be the terminus—a distance of only about 300 miles from the coast. When, as I have remarked before, we glance at India and observe the wonderful development brought about there by British occupation and enterprise, can we have a shadow of a doubt as to the wonderful commercial and agricultural prosperity which the establishing of railway communication must surely bring to Africa—a country which, taken as a whole, certainly possesses many greater possibilities?

There can be no doubt after this that the portion of East Africa referred to in the lecture, is destined at no distant date to be a great producer and exporter of coffee, cocoa, rubber, cotton, fibre, &c. We trust it may be all kept under British auspices and we anticipate that both native emigrants from India and young planters from Ceylon will be required and utilized in developing the regular and properly cultivated plantations which are bound to be established.

NOTES ON PRODUCE AND FINANCE.

TEA CULTIVATION IN THE CAUCASUS.—The Russian authorities, who have not hitherto done much with their tea planting experiments in the Caucasus, seem determined to give the enterprise a fair chance. They allege that up to now the absence of expert who understand Chinese methods has been the stumbling-block, the conditions and the nature of the soil in certain regions of the Caucasus being favourable to tea culture. A large consignment of young plants, with the soil still attached to the roots, and carefully packed in wooden cases, has just been landed at Batoum, direct from Hankow. This shipment is accompanied by fifteen Chinese planters and an Englishman, who has had a long experience on Chinese plantations.—*H. and C. Mail*, Dec. 29.

ENEMIES OF TEA.

Red Spider is very bad in the Nilgiris and deep trenching and forking do not seem to help tea to throw off the disease. The sulphur treatment is recommended: but there appears to be some doubt on the subject among some planters. A writer to a Southern contemporary on the flush worm says the pest is so serious that an organized agreement amongst planters to burn the whole flush for a fixed period from first observation, is the only method of practically exterminating the insect. Is not this like soaking a dog with kerosine and setting fire to him to kill the fleas?—*Indian Planters' Gazette*.

CEYLON TEA "THE FUTURE TEA FOR AMERICA."

The *Commercial Enquirer* of New York gives prominence to the following:—

A private letter from Mr. S. Bierach, on the staff of the Special Commissioner for Ceylon, assures us that Ceylon teas are on top and "were the talk of the Columbian Exposition." "In less than four and one-half months 459,649 cups were served and 106,623 packets sold, and no end of medals awarded to the various estates of the island." "Ceylon tea is the future tea of America."

[So may it prove.—Ed. T.A.]

HOW TO WIN NORTH AMERICA FOR BRITISH GROWN TEAS.

THE NEED OF HEARTY CO-OPERATION BETWEEN INDIAN AND CEYLON PLANTERS.

"America for honest, pure teas—and away with faced, deleterious Japan and China trash," may well be the cry heretofore of every Indian and Ceylon tea planter! We are face to face with the most important, practical problem affecting the future of British-grown teas. There is a stiff contest before us, and if British tea planters are only true to themselves, and to each other, it is one in which they must conquer and that right speedily. They have a good, pure article to offer,—they challenge inspection and scrutiny and testing in every shape,—and they especially demand that the truth should be known about the absolute trash which so many Americans are now drinking as tea. There is not a lb. of the 50 million lb. of Japanese tea sent to the States, which is not artificially treated with substances more or less deleterious. We had the fact acknowledged by the largest American tea buyer in Japan, when we crossed the Pacific with him in 1884. His term of service was nearly over then and he was indifferent as to a change in the tastes of his fellow-countrymen. Thirty years ago Japan teas were probably unknown in America; but they were taken in hand and very speedily ousted those from China to a large extent. Now, of both Japan and China, it is estimated that from 80 to 90 million lb. are consumed in North America; and it would be a real service to the consumers themselves—not to speak of the planters,—if they could be induced to transfer their taste and custom to Indian and Ceylon tea instead. The Americans are the least conservative people on this face of the globe. They have no deep-rooted prejudices against a new article. The experiences of the Ceylon and Indian Tea Courts at the Chicago Exhibition show that they are quite prepared to appreciate our pure, wholesome teas and the time is fully ripe for that advertising crusade right through the country from North to South and East and West, which would bring home to every intelligent man in the country, the deleterious nature of the tea now mainly consumed, and the benefit, in every way from using a pure article. It is not simply that we want to supersede 80 million lb. of the China and Japan product in the United States and Canada; but we want to see the mass of the people realising what a wholesome infusion of tea really means,—

"The cups that cheer but not inebriate."

For, it is quite certain that the reason why vast numbers of Englishmen, Scotchmen and Irishmen, who always drank tea in the old country, have taken to coffee in their new homes across the Atlantic, is found in the impossibility of their being able to get good tea such as they had been accustomed to. Here again, the opportunity for an advertising campaign is a golden one; for coffee is now both scarce and dear beyond all recent precedent, while good, pure tea is uncommonly cheap.

We hope our planting readers have given attention to the information we were yesterday enabled to lay before them respecting the condition of the American tea market through the courtesy of Mr. P. B. Buchanan. The conditions of the case having been laid down and the grand opening created by the Exhibition advertising fully realized, it remains to point out how the planters should follow this up, and initiate an

advertising campaign in support of the wholesale dealers who have already taken, or who are willing to take, up Ceylon and Indian teas. We think it will be generally acknowledged that Mr. Buchanan is right that the time for anything like an "Official" or Planters' Store is now past. It is not simply that such houses as Mr. Buchanan's own have established Tea Agencies in America, but there is Mr. Lipton—another Ceylon tea estate proprietor—who has begun work in earnest as a wholesale tea distributor; and there are other mercantile firms in London—as the late Mr. Whittall assigned us a few months back—and in Colombo who are beginning to do an increasing tea business with America. If the Chicago Store opened by Mr. Grimlinton be continued by our Commissioner and certain individual Ceylon planters on their own account, good and well. But it is quite clear that the planters of Ceylon as a body—the Association or the Tea Fund—should have no more official connection with it. We have the authority of Mr. Buchanan for stating that the two very largest and oldest wholesale tea houses in Chicago have begun to take an active interest in India and Ceylon teas and that if encouraged—and not annoyed—by the producers or by so-called "official" rival agencies, they will speedily take up our teas very freely and heartily. Mr. Buchanan most fully approves of what Mr. Lipton is doing as a wholesale merchant of acknowledged standing in Chicago and New York. None of the regular American houses will feel jealous of him, or of any other individual wholesale or even retail effort. Their country is "the biggest in creation," it may be repeated; there is room enough for all, and the population is increasing by leaps and starts. All that India and Ceylon planters require to do in order to attract trade and conquer, with their teas, is to pursue an open, straightforward, businesslike course, in mutual confidence and co-operation, making known the goodness of their product and loyally backing up all the dealers who are prepared to take it up.

We have said that the time has come for India and Ceylon planters to co-operate—to fight shoulder to shoulder—at any rate so far as the America market is concerned. We are most fully convinced of this, and we think no time should be lost by the Planters or Tea Fund Committee in inviting such co-operation from the Calcutta Association. We regret very much that our evening contemporary should have been led into writing as he did a few evenings ago; but we hope he will, on reflection, see the wisdom of a change of attitude. It is a great pity that the part we italicize in the following otherwise sensible passage should have been written:—

That the limit of expansion in the consumption of tea at home has now nearly been reached can no longer be concealed, and it behoves all who have the interest of the enterprise at heart to bring this point forcibly home to those who contemplate extending the area under tea. It is well they should have the fact brought home to them that the market bids fair to be overstocked with tea in the near future; and we are glad that Messrs Gow, Wilson and Stanton have not hesitated to set this point clearly forth. New markets are sadly wanted, and it cannot be said that Ceylon planters have not done their best to open them up. *The only pity is that our efforts are so poorly supported by India; but we have long ceased to look for hearty co-operation in that direction.* Whatever is done must be done by ourselves unaided, and we hope that the Tea Fund Committee will take a large and comprehensive survey of their duties during the coming season.

We are at a loss to know to what our contem-

porary refers. Is he not aware that the foundation of the present splendid trade in Indian and Ceylon teas in Australasia was laid at the Melbourne Exhibition in 1881 when the Indian and Ceylon Commissioners worked together like brothers in mutual co-operation and in a long and stern fight against China teas which were analyzed and exposed in the public press again and again. Sir Edward Buck and the Hon. James Inglis now of Sydney—who represented India and its tea respectively—will testify how cordially they were supported by the late Mr. A. M. Ferguson (as Ceylon Commissioner) in this matter, while they as readily backed his efforts on behalf of Ceylon. We have yet to learn that the Indian planters have since refused to join in a joint proposal, or that the course pursued at Chicago was owing to any coolness on their part. In any case, whatever cause of dispute or rivalry there may have been in the past should surely, henceforward, be buried. The occasion now presented is one eminently demanding union and co-operation between the representatives of British-grown teas. They will have quite enough to do in facing and ousting the common enemy, namely the interior, deleterious China and Japan teas.

What is wanted is the formation of an Advertising Fund for Tea in America, to which both countries or rather the planters in each, should contribute, and in proportion to the estimates of production framed in Calcutta and Kandy. This fund should, first, be devoted to the paying of a standing advertisement of an attractive as well as instructive character in the leading newspapers in America. Moreover, it should cover the cost of sending a well selected and guided corps of Indian as well as Ceylon native servants to traverse the country from one end to the other; and thirdly to provide a series of lectures throughout the United States and Canada such as attracted so much attention at the Exhibition. We may explain what is meant by sending native servants. We all know the great attraction the Sinhalese and Tamil servants proved at the Exhibition Tea Courts, and how much their services were in request. The same is true to a great extent of Mr. Blechynden's native staff at the Indian Court. Mr. Buchanan took the trouble to inquire of the managing partner in one of the largest wholesale Tea Houses in Chicago in what way he and other tea producers in India and Ceylon could best help the dealers in bringing their teas into use. "Lend us your native servants," was the reply, "not for our warehouse use, but to send on a round of service to our customers—a week's service in each town will do—when well-advertised as ready to supply and serve tea at certain retail stores, such places will be crammed all the week through and a certain taste and demand for your teas will very likely be established as the result." This, if backed up by steady advertising, was in the opinion of practical men in Chicago and New York, the best way to go to work, and with this assurance that the results could not fail to be seen, almost at once, in special orders for British-grown teas.

We have only now to point out to the planting community and especially to the Chairman and Committee of the Planters' Association and Tea Fund, the importance of losing no time in taking action towards securing the co-operation of the Indian Tea Association in Calcutta, in the formation of a special Advertising Fund for America. We venture to be urgent, because not only are we sure that the Commissioner when he renders his report very shortly, will agree that the field in the United States is ready to be occupied; but, because

the present time affords a most favourable opportunity for securing the co-operation of our Indian brethren in the way we speak of. So good an opportunity, indeed, may not recur. We refer to the presence in North India for the next six weeks or so of Sir John Muir and Mr. Buchanan, and to their exceptional position as both interested in Indian and Ceylon teas. We feel quite sure that both these gentlemen are ready to promote co-operation between Indian and Ceylon planters in a campaign to win America for British-grown teas and from their influence in Assam and other districts, there can be no doubt of success attending such efforts in India. Messrs. Finlay, Muir & Co., of Calcutta—as the figures we recently published of tea shipments indicated—influence a very large proportion of the tea property in Northern India. Indeed, we cannot be far wrong in putting their interest and influence as approximating to *one-fifth of the entire tea production of India*. Not only so, but combination in Assam and other Northern tea districts is further rendered comparatively easy, as more than half the industry is represented by three Calcutta Firms and nearly the whole is in the hands of, comparatively, a few large Companies. Under these circumstances, it is evident that if the Ceylon Planters' Association seek the co-operation of the Indian Tea Association, while Sir John Muir and Mr. Buchanan are on the spot, a ready and hearty response is likely to be forthcoming. The best method of securing the American tea trade, not at this or that point, but as a whole, all over the continent, is undoubtedly the question of the moment for all tea planters. A big and united effort is specially required. The way is now made plain for such an effort: surely the opportunity will not be neglected or ignored? Let it be remembered that half efforts never accomplish anything. No one can say that in fighting Japan and China teas in America, the interests of Ceylon and Indian planters are not identical; or that with a common, a powerful and entrenched enemy to face, attack and drive out, it will be well to continue to cherish petty jealousies (if such do exist), to magnify minor even if diverse interests, and to refuse to work shoulder to shoulder with one great and all-important object in view? If, however, our advice is not taken,—if nothing is done to promote united action in a determined persistent campaign—all we can say is that Ceylon as well as India planters will deserve to see their teas remain at the present low level, or even to drop to a lower level, of average price. But we are persuaded better things of the great tea representatives of both countries; for we think they must see with us that the occasion now presented is preeminently one so far as their industry is concerned, which may be illustrated in the words of the immortal bard:—

"There is a tide in the affairs of men,
Which, taken at the flood, leads on to fortune,
Omitted, all the voyage of their life
Is bound in shallows and in miseries."

A NEW MEXICAN COFFEE DISTRICT.

Land in the districts of Culcatlan and Teotilan del Camino, State of Oaxaca, Mexico, suitable to the cultivation of coffee and other export articles, has been greatly developed. It is predicted that the extensive zone comprising these districts will shortly attain great agricultural prosperity, as the persons at the head of the principal undertakings are thought to be energetic and capable.—*American Grocer*.

THE VISIT OF MR. P. B. BUCHANAN TO CEYLON—AND BRITISH-GROWN TEAS IN AMERICA.

Mr. P. B. Buchanan left Colombo for Calcutta by the s.s. "Pekin" on Jan. 18th, last. Mr. Buchanan has seen a good deal of Ceylon during his present visit, and he takes an interest—as might be expected from his antecedents—in a great deal beyond the tea and planting enterprise with which his firm and partners are so closely identified. Mr. Buchanan is well-known in metropolitan circles for his philanthropy, as well as for his extensive tea connection through his Leadenhall Street Firm. He is second only to Sir John Muir in the great enterprises just started for extending the interests of the North and South Sylhet Tea Companies in Ceylon as well as India, and he is now proceeding to join Sir John in Calcutta, preparatory to a joint visit of some four weeks' duration to Assam and the DOORAH. Returning thence, both gentlemen will revisit Ceylon on the way home. Mr. Buchanan probably coming first, as he leaves Mrs. and Miss Buchanan at Nuwara Elyya for the present.

It is not generally known how great an interest Mr. Buchanan has taken for some time back in developing a demand for British-grown teas in America. With this object in view, he has paid no less than three visits to the United States and Canada during the past eighteen months. Mr. Buchanan soon found out that there was no hope of developing any considerable trade in Indian or Ceylon tea save by working through the large wholesale firms. Anything like the establishment of rival retail stores in the principal towns, he would regard as a means rather of retarding than of promoting the object in view. Such stores may attract a local paying trade for the particular proprietors, but the whole of the demand they will create will be as a drop in the bucket of the wholesale and steadily increasing trade which it should be the object of British planters to establish. Indeed, anything like an "official" Planters' Store—a Store bearing the authority of the planters in Ceylon or India—he would regard as the worst enemy of the true interests of the planters at large, which Mr. Buchanan considers to be, the gradual winning over of the large tea distributing houses which have got a more complete hold in the United States, than perhaps in any other country, of the retail trade. Mr. Buchanan accordingly set himself from the first to show that he and his partners—and he very large present and prospective tea interests they represent—did not wish at all to meddle with retailers, or to do otherwise than supply the distributing houses and the trade wholesale. It must be confessed, however, that on his first visit early in 1892, Mr. Buchanan experienced but scant encouragement. The big tea firms in New York and Chicago scoffed at the idea of Indian or Ceylon tea coming in to disturb their established trade in Japan's and China's—chiefly the former. They did not care for any such intrusion or rival; nor did they fear that the comparatively limited number of tea drinkers among the people of America would dare to make a change. The business offers which Mr. Buchanan could make to them were not sufficiently attractive, and he came at last to see that if he wished British-grown teas to gain a footing in the country, he must establish his own Agencies and Depôts for the supply wholesale of the trade. With this object in view, he looked out for Agents of experience in the American tea trade, and having found suitable men with a full knowledge of the market in the States and Canada,

and the necessary go-aheadness to push a new enterprise, he established three Agencies in New York, Chicago and Toronto. His Agents went to work among the established tea firms, but they also found it uphill work, and when Mr. Buchanan returned on his second visit in the winter of 1892, although some impression had been made and the big houses were more willing to receive and test samples of Indian and Ceylon teas, yet the immediate prospects were by no means brilliant. When, however, Mr. Buchanan paid a third visit in August last year, he found a marked change for the better in the situation. A demand had set in, and some of the very largest and longest established distributing houses had begun to placard their warehouse walls with 'stocks of Indian and Ceylon teas on hand' or words to that effect; and in the price-currents and pamphlets set out to retailers, some of them more effective advertisements referred to the new (and previously despised) teas. Indeed, Mr. Buchanan found leading men in the tea trade ready, last year, both in New York and Chicago, to discuss the possibility of ousting Japan tea altogether; for, they admitted—some of them—that the 90 million lb. of teas at present sent to North America from Japan and China included a very large proportion of adulterated stuff and trash. They mentioned indeed that the deterioration in Japan teas was increasing, and that just as the United States had turned from China to Japan tea not many years back, it would not require a very long campaign, if properly directed, to create another revolution and win the greater part of the 90 million lb. consumed, for India and Ceylon teas with a steady developing consumption. This, we may be sure, was welcome news to the representative of large British tea interests. Mr. Buchanan has no doubt, that the Exhibition and its display of both Ceylon and Indian teas distributed by natives in the cup to all visitors, had a good deal to do with the change of feeling. He gives the highest credit to the Ceylon Commissioner whom Mr. Buchanan emphatically thinks was the right man in the right place to push Ceylon teas in the Exhibition. The representative of the Indian teas also did well. But the Exhibition is all over; and the practical question now is, how best can the Ceylon and Indian planters follow up the preliminary work and win the United States and Canada for British-grown teas, ousting out some 90 million lb of adulterated and inferior Japan and China teas. On this subject, we shall treat tomorrow.

EAST AFRICA FOR PLANTERS.

A communication to the Royal Geographical Society states that Mr. Crawshaw, a Government official in British Central Africa, has recently visited the Angoni country near Lake Nyasa. He found the Nyika Plateau, which was traversed on the way, a magnificent country, inhabited by a scattered population of Anyika, living in huts built on narrow terraces on the mountain-side or in caves, and cultivating peas as an almost exclusive crop. In this district there are some fine mountains, exceeding 8,000 feet in height, the principal town of the Anyika on the slope of Kantorongondo, being nearly 6,000 feet above the sea.—*Nature*, D. c. 28.

OUR TEA EXPORT TRADE.

84,887,656 LB. SHIPPED IN 1893.

The Chamber of Commerce is not yet in a position to issue their annual table showing the total Exports from Colombo and Galle for 1893,

in contrast with the previous nine years. But we suppose the figures summing up the Export table in the weekly Price Current this time may be taken to represent the results for the past year. There is nothing so startling as our contemporary made out the other day through a mistake of his in addition of only 10 million additional pounds of tea! The actual total export is given at 84,387,656 lb.—an advance of no less than 13 million lb. on the return for 1892! The estimate of the Planters' Association was far below the result; and it looks rather as if henceforward with tea we may have something like alternate crops, an experience which, if established, would lead us to expect in 1894, but a limited increase on last year's figures. Thus for 1890 we got close on 47 million lb.; for 1891 over 68½ million lb.; for 1892 only a fraction over 71 million lb. Judging by analogy, we might expect the export for 1894 to be under 90 million lb. The figures for the past ten years may be given as follows:—

TEA,
lb.

Total Exports from 1st Jan. to		Dec. 31st	1893...	84,387,656
Do	do	do	1892...	71,133,657
Do	do	do	1891...	68,274,420
Do	do	do	1890...	46,901,544
Do	do	do	1889...	34,048,85
Do	do	do	1888...	24,381,296
Do	do	do	1887...	13,800,545
Do	do	do	1886...	8,111,137
Do	do	do	1885...	4,411,578
Do	do	do	1884...	2,403,095
Do	do	do	1883...	1,641,810

TREE PLANTING.

To the Editor Indian Engineer.

Sir,—In hard soil mixed with friable rock it is found that the growth of the tamarind tree is retarded when pits of the ordinary dimension of 3' by 3' by 3' are used.

I wish to produce a sort of inverted crater by the explosion of gunpowder—how is this feasible? A star shaped trench round the charge hole would give points of least resistance—and intermediate pillars would be left. The roots would readily find their way through the galleries of loosened soil, and water chutes or earthenware vessels buried round the trench would tend to draw out the roots. I should be glad to receive any hints or be informed of any practical work on the subject.

ROAD AVENUE.

COCONUT AND CINNAMON CULTIVATION DURING 1893; ALSO CACAO, PEPPER, RUBBER, &c., IN THE NEGOMBO DISTRICT.

(By a Practical Planter.)

A few notes on the weather and the progress of cinnamon and coconut cultivation in Kadirane in particular, as well as other industries in the Negombo district generally, during 1893:—

WEATHER.—During the first half of the year the weather was favourable, the rainfall having been above the average and well distributed over the period. From July to October it was very dry: the latter month was exceptionally so, with only 3.52 inches of rain as against an average for 8 years of 13.66 inches. November was wetter than usual but in December the weather was normal. At the monsoon burst in April severe thunderstorms were experienced which did considerable damage to coconut trees. On one plantation alone as many as 31 of the palms were lost that month from the effects of lightning. April was also noteworthy for a heavy fall of rain on

the 21st-22nd, which ganged 6.65 inches: this was the greatest quantity registered in any 24 hours in the period under review. Appended are the figures of rainfall for the twelve months with the means for the corresponding periods during the last 8 years contrasted:—

Number of Days	Months	Means during 8 years
5	January	2.10
7	February	2.80
11	March	3.27
12	April	12.16
19	May	11.71
12	June	6.77
4	July	3.18
6	August	1.65
4	September	4.70
12	October	13.66
21	November	11.27
5	December	4.56
118		77.83

CINNAMON.

The deficient rainfall in 1892, which resulted last season (May '92-April '93) in one of the smallest crops on record, has also had a disastrous effect on the output for the current season, the growth of the bushes having been seriously affected. Crop prospects have been rendered still more unfavourable owing to harvesting operations having been hindered by insufficient rain in the latter part (July-Oct.) of the *Maha Mosama* (May-Oct.) It is therefore likely that the crop of 1893-94 also will be below the average. The Colombo market price for the spice averaged about 39 cents per lb. as compared with about 35 cents in the previous year. Owing to the persistent low price of the bark which not very long ago sold locally for a rupee and more per lb., cinnamon has lost favour with the villagers and in those coconut gardens, which in the days of high prices were planted up with the fragrant laurel to the detriment of the existing palms, the work of nprooting it had gradually gone on for years till it received an impetus in the extraordinary advance in the price of coconuts at the latter end of last year. Scarcely any cinnamon is now to be seen in the villages where it had been planted in every available spot, up to the very threshold of the dwellings. In the Negombo district generally, even on some of the larger high class estates whose spice has a reputation in the London market—cinnamon has been, and is being superseded by coconuts wherever the soil is considered suitable for the latter, and the acreage under the former has decreased year by year. Despite this fact there has been an enormous increase, within the last dozen years, in the quantity of bark exported as shown by the following figures taken from the Table of Exports of Ceylon Produce, compiled by the Chamber of Commerce.

QUANTITY OF CINNAMON EXPORTED FROM COLOMBO AND GALLE.

	Quill lb.	Chips lb.
In 1882 ...	1,587,016	422,915
„ 1892 ...	1,947,538	615,155
„ 1893 ...	1,995,257	667,155

The increase is due, of course, to extension of the cultivation in other places, especially in the Southern Province where the annual return in virgin soil is said to be as large as 250 to 300 lb. per acre, while the yield in the wellnigh exhausted sandy soils of Kadirane and Ekel is only about 75 to 100 lb.

The export of cinnamon is now more freely distributed than it was some years back; the direct shipments to the Continent of Europe (Germany especially) in 1893 having been as large as 1,265,949 lb. while there were appreciable quantities shipped to America, the Far East, India, and Australia.

COCONUTS.

The year under notice was favourable. The crop was generally satisfactory and the price exceptionally good.

The industry of preparing desiccated coconuts for confectionery, which first began in Colombo under European auspices, rapidly caught on and extended to other points, the development in two years being

wonderful. In 1891 the quantity of desiccated coconuts exported was 1,416,330 lb., in 1892 3,849,724 lb. and in 1893 the export reached nearly 6½ million lb. equivalent to about 19½ million nuts! The increased demand for nuts resulted in keen competition especially in the districts from which the several factories drew their supply, and in the latter part of 1892 the price in the N-gombo district rose from R31 to R41 per thousand. At the beginning of 1893 the best nuts were selling for the unprecedentedly high rate of R50 per mille, but by the end of June the price had gradually declined to R36. There was a slight advance since the year closing with the quotation at R37. The average price for the year was R40.50 as compared with 38.25 in 1892. It is feared, however, that the high average of 1893 will not be maintained as the trade in desiccated coconuts would appear to have been already overdone. The smaller factories have now ceased work, while the larger ones are restricting their output.

As stated before, under the heading of Cinnamon, the cultivation of coconuts is being extended on all sides and every available piece of land is being planted up with it, while neglected gardens are being taken in hand and improved under the stimulus of high prices. The several industries in the products of the palm have developed in a remarkable way. There are now in the district at least two oil mills with hydraulic machinery, driven by steam power, besides a number of chekous worked by cattle and hand, 2 desiccating factories, and 6 or 7 coir fibre mills.

CACAO.

Experiments in this district have proved that cacao of the hardier variety known as Forastero could be profitably grown with coconuts wherever the soil is suitable, provided the trees are given sufficient space, but the advisability of cultivating valuable new plants, either separately or intermixed with the older products, does not seem to be recognized by even the more intelligent of our wealthy native land owners.

PEPPER

grows well in several parts of the district and its cultivation is eminently suited to the villager from whom, however, it does not generally receive the attention which it deserves. Except in poor light sand and low marshy land, pepper will grow in nearly every description of soil and almost every jak, mango and areka tree, and probably forest tree, in the several villages might be made to support each a profitable vine.

INDIARUBBER

of the Ceara kind has also been tried here, but it has proved a failure. It is a hardy tree and flourishes in comparatively poor soil justifying all that has been said of its quick habit of growth, but its caoutchouc-yielding capabilities have been much exaggerated. The yield of milk is too small to make its cultivation profitable at the existing prices of rubber.

CATTLE.

Except from about August to October, when the natural pasturage was scanty and somewhat parched up, owing to want of rain, the cattle were generally well off for fodder. There was no epizootic disease of any kind during the year. The last epidemic was an outbreak of foot and mouth disease in May-June 1892.

VARIOUS AGRICULTURAL NOTES.

MR. LLOYD is building a fine factory on the Western Darjeeling Tea Estate, which will soon be ready to contain the new electrical apparatus, which is to take the place of the old fashioned steam machinery usually in vogue on most gardens. Managers will await with interest news of its working capabilities. If it is satisfactory, it is not unlikely that electrical machinery will be employed on other new gardens, as the necessity for a factory arises. Certainly, there is no reason why electricity should not be employed in tea factories; as well as in other factories however, time will show the success of the Western Darjeeling Tea estate venture.—*Indian Planters' Gazette*, Dec. 23.

SUGAR FREE OF CUSTOMS DUTY in the United States is good news for tropical planters, because cheap sugar is always a help to a larger consumption of tea, coffee, and cocoa.

THE FIRE AT NEW PERADENIYA FACTORY.—We had hoped to hear that the rumour which reached us on January 8th as to the factory being burnt down was exaggerated, but it has unfortunately turned out to be too true. It is some satisfaction to know that the place was insured—we trust fully—and if we might be allowed to point "the moral which attends the tale" of this occurrence we would urge upon all proprietors the advisability of seriously considering whether they should not at once take steps to similarly safe-guard themselves. This we think they might easily do with the co-operation of traders by forming a Mutual Fire and Marine Insurance Company for the island. They would thus not only be providing against a contingency which may happen at any moment, but doing a public benefit by encouraging the retention of money within the colony which otherwise finds its way elsewhere.

CHINA AND CEYLON TEAS—We call attention to an interesting letter given on page 554 from the *Shanghai Daily News*, which contains a good deal of plain speaking about the quality of China tea and the local burdens on the same. The information is of special value to us with reference to the possibility of a revival of the China trade to the United Kingdom should exchange continue favourable. We are told how "large consignments" of China tea have been shunt out of New York as unfit for human food. This is news to us, and exact particulars of this experience to be obtained, no doubt, in New York, should form a splendid advertisement for the clean y-prepared, pure Ceylon teas. In fact much use might be made of "K.S."s letter altogether and its frank admissions, in this connection. Of course, the object of "K. S." is to get part of the 30 per cent of Chinese official exactions on tea remitted: we suppose this levy may be considered as equal to at least 21 a lb., a rate which may be considered equivalent to the exchange advantage recently, if not at present, held by China over Ceylon teas.—It is not likely that there will be any reduction of the official levies this year at any rate. The news of Russian buyers leaving Foochow in disgust is hopeful for Ceylon if true: we only wish they would come to Colombo instead. Russia is only second in importance, as a new country for our teas, to America.

ODDS AND ENDS.

GIFTS FROM CEYLON.

Some months ago, in the columns of *Sala's Journal*, I saw that Mrs. Sala had received a present of a chest of tea from some unknown donor in Ceylon, and she apparently was anxious to write personally and thank the very kind sender; but, as no letter reached her with the gift, the only thing she could do was to say "Thank you" in the columns of the journal, and to add that both G. A. S. and herself deeply appreciated the kindness. She adds:—"The Ceylon Tea is now being daily appreciated and, as we are 'whales' at tea, you may depend upon it that the big case from Ceylon received a very warm welcome." The donor may not have seen the journal in which the above acknowledgment appeared, and so I insert the information here.

DRYING TEA LEAVES BY ELECTRICITY.

I quote from a weekly paper:—

"Another use has been found for electricity. In Ceylon experiments have shown that it is more economical to dry tea leaves by its agency than by the old method, and extensive plants have been erected for that purpose."

On which estates have these extensive plants been erected? You make no mention of them in the *Observer*, and that is a very unusual thing when a piece of news of so highly interesting a nature is at your disposal.

MAZAWATTEE.

The name of this highly advertised blend of tea is becoming more popular every day, and as I write, I have before me a paper entitled "Hearth and Home" in which appears a picture of a lady dressed apparently in a coat of chain mail, with a wide piece of Cannanore stuff thrown gracefully over the left shoulder and falling in draperies around her, after the style of the clothing in which one is arrayed on coming out of a Turkish bath. The title of the picture is "Tea-gown for Mazawattee."

INDIAN TEA FREE OF DUTY.

One of the cries raised by the Ceylon planters against the admission of Travancore tea to Ceylon, free of duty, is that they fear the indifferent quality of the tea, and that it might be reshipped from Colombo under the name of Ceylon tea to the detriment of your colony. As touching on this subject I may mention that, for some time back, I have been drinking tea, shipped by a Colombo firm, the brand of which is "Highfield"—factory bulked. Now, according to the "Ceylon Directory," there is no estate in the island rejoicing in that name, but there is a "Highfield Estate" in Coorg, and I presume therefore that I have been drinking Indian tea of late, and, if such is the case, and it is a fair sample of the tea that the Travancore planters wish to get into Ceylon duty free, I can only say that there is no fear of any injury arising to the good name of your chief product, as the "Highfield" tea is a good deal better than a great many samples of *pukka* Ceylon tea that I have tasted.

PROVINCIAL SEASON REPORTS FOR CEYLON.

From the abstract of season reports for December mail, published in the "Government Gazette," we gather that at the Western Province paddy crops are progressing while jak and breadfruit are plentiful, and there is no scarcity of other vegetables, though in Hapitigam, Korale plantains are scarce and dear owing to drought. The crops in the Central, Northern and Southern Provinces too are reported to be fair; but in the

North-Western Province, though the prospects are good, rain has been short in the Kurunegala district and the paddy crops are suffering somewhat. In the North-Central Province there was slight rainfall during the month, though most of the tanks are full and scarcity of food in some villages still continues. In the Province of Uva kurakkan and Indian corn are promising well, except in Buttala where kurakkan plants are reported to be diseased. In the Eastern Province, paddy plants in some pattus of the Trincomalee district are reported damaged by rain and flood. Lastly in the Province of Sabaragamuwa crops are favorable and the Kegalla district is free from cattle disease and the general outlook satisfactory.

WEEKLY SALES OF PRODUCE IN COLOMBO.

A new idea so far as Ceylon is concerned and one which we believe has met with the general approval of the merchants and brokers of Colombo is that weekly or fortnightly sales should be held of such produce as coffee, cocoa, cardamoms, cinchona bark, &c. The idea originated with Messrs. Delmege, Forsyth & Co. who wrote to the Chamber of Commerce about it and in compliance with their suggestion a circular was issued resulting, as we have said, in a favourable opinion being generally expressed. It is considered that these public sales would be much more satisfactory both to the buyers and sellers, than the present way of disposing of such produce, as buyers would know exactly how the market stands, and sellers would be sure to get the best value for their produce. It is said that a broker can hardly be expected to spend days in negotiating the sale of a small lot of cocoa or cardamoms, and unless he does so he cannot be sure that he has found the best buyer for it. On the other hand offerers for such lots do not know to what extent their offers may have been inadequate.

Discussing the matter with one of our representatives, a prominent mercantile gentleman said brokers were far too busy attending to matters of freight and exchange as well as tea sales to continue to spend the great amount of time that they now did in going round the merchants and endeavouring to sell a small parcel of 50 or 60 cwt. of cocoa or 1000 lb. of cardamoms. If a broker did not wait upon all the firms how was he to know that he had secured the best buyer for the produce? There might be several merchants, any one of whom might give more for the parcel than he had been offered by those to whom he had shown it. Under the present system a purchaser did not know whether he had given more for his purchase than he ought, and an offerer whose price was not accepted did not know how much too low his offer was. At a public sale a buyer knew exactly how the market stood, but when he bought privately he did not know whether he had paid too much or offered too little. In the same way unless a broker sold these things publicly he did not know whether he had got the best value for the seller or not. If anybody had any objection to these public sales, if he was a seller it was because he imagined that by private sale he occasionally got more than he ought from the buyer because the latter did not know the real state of the market, and if he was a buyer it was because he thought he occasionally got produce cheaper than he would if it were sold publicly. It had been suggested that sellers of such produce would put limits upon their lots which there was no chance of buyers paying at these public sales and that therefore they would have to be bought in by

the brokers, and that the brokers would afterwards have to take them round for private sale as if there had been no public sale; but this would remedy itself by the force of circumstances and the brokers would have the remedy in their own hands by simply refusing to take the parcel round and cutting it up again at the next sale.

CEYLON PLANTING NEWS.

(Notes by Wanderer.)

TEA PRICES are getting worse and worse. Exchange falling is the only comfort we have. It is time the Planters' Association published their estimate of Tea for 1894. A jump of 11,000,000 lb. in 1893 will probably be followed by a jump of only half that amount in 1894. Then we shall struggle on to reach the 100,000,000 lb., perhaps repeating the struggle in coffee days to reach the 1,000,000 cwt., and after that—No! I don't like to even dream what may then follow. A cheap tea market now may prevent the China tea buyer going out with great expectations and large Bank credits.

ROADS.—The road from Galagedara to Kurunegala, I think, takes the cake for bad order. I was told that it had been lately repaired. If so, so much the worse for the officer in charge.

WEATHER AND COCONUT CROPS IN KURUNEGALA.—Weather is very dry in the Kurunegala district and if rain does not fall soon, the coconut crop will be light, and the blossom for 1894 crop will also be harmed. The dealers in this product may have to pay through the nose in two or three months' time.

FACTORY FIRE INSURANCE.—The canny planter, backed up by a portion of the Ceylon press, often sighs for an Island Office willing to take lower terms than those granted by the respectable offices that are already at work. A friend and I the other day made a calculation and we came to the conclusion that the prospects of such a Company making much of a dividend to their shareholders were not radiant. Let us presume there are 500 estates in the tea districts of Ceylon that insure their factories up to Rs30,000 each paying a premium of 7.8.11 per cent per annum, which will give the proposed local Company a gross income of Rs131,500

Say the Company put aside a reserve of 33 per cent to meet losses 43,833

And to have one factory a year totally destroyed. The above reserve would not help them much. That there are factories burnt we have manifold proofs. Heatherley, Campden Hill, Agra and New Peradeniya factories have been total losses in the last three or four years. [But there is other business besides factories?—ED. T.A.]

1893 has been a bad year for insurance factories at home. They have had to face a dry season and labour troubles. Regarding the latter, a fire insurance paper makes the assertion that there was an unprecedented number of incendiary fires, many of whom, respectable assessors assert, were deliberately planned for the purpose of getting the few billings for labour expended on extinguishing the flames.

EXCHANGE below 1s 3d for six months' bill is a good thing for the tropical agriculturist. As the Indian Government Chancellor of the Exchequer has thrown up the sponge, and ceased to bolster up the rupee, the China tea man will not have an undue advantage over his Indian and Ceylon brother.

HELOPELTIS IN TEA.—What was likely to be another bad attack of helopeltis in the Kelani Valley has been nipped in the bud by vigorous catching of the mosquitoes. When any puncturing of leaves appears even on individual trees, planters should at once offer suitable inducements to make the coolies catch the insect. It is the only way we know of at present to keep down the pest.

TEA IN FRANCE.

A strong effort is being made to introduce tea drinking into France. We notice that a Chinese tea-agent is making a small fortune in the south-west provinces of France by selling Chinese tea got up in packets covered with Chinese characters and designs. The majority of the country folk take the tea out of curiosity, and the general opinion is that it is a capital medicine, especially for old people! The Palais Indien Tea House Company will make another campaign in Paris, if the necessary funds are forthcoming.—*Indian Planters' Gazette.*

PLANTING AFFAIRS IN NORTH BORNEO.

The crop from the Kina Butangan estates, the district from which the better class of wrap tobacco has been obtained as yet, averages about six and a half peculs a field. This is a good deal better than last year, but does not, of course, compare with Deli, where 10 peculs are sometimes obtained; but if prices of this year's crops are the same as those obtained this year for last year's crop, the result will be very profitable. The Arcadsburg Company, the largest of the large Deli Companies, obtained the best results—7½ peculs on their estate on the Temegang, a tributary of the Kina Butangan. They had but 50 fields, but are so encouraged with the result that they are now opening up double that number for next year's operations.

In Malluda Bay, up to 10½ peculs have been taken this season, but the value of the tobacco from that district has not hitherto been equal to that from the Kina Butangan.

The effect of the small spirit has been that two or three Europeans who were about the place hoping for something to turn up have obtained billets, and that no coolies are now to be had locally, all having been picked up.

In various quarters remarks have been made as to the little attention yet bestowed upon other products than tobacco, and there are many people who pin their faith to coffee, Manila hemp, and sugar in preference. These views seem to be justified by the manner in which these various things thrive when tried. On the 9th inst., the Governor paid a visit to the Development Corporation's estates on the Byle and Weston Jarvis rivers, where he was shown a considerable acreage under coffee, hemp, and padi, and two small cattle-power sugar mills. The coffee plants were very strong and vigorous and large for their age, those planted in April, 1892, having their branches covered with ropes of fruit. A flush of bloom had taken place the day before, and on all the trees of over 14 months of age berries were forming. The sugar mills were on quite a small scale, but the various operations were carried on without hitch or difficulty, and sugar produced at a profit, with every promise that on however large a scale matters were undertaken the result would be the same; while the Manila hemp up to 16 months of age was showing large and handsome stems, the first of which were ripening and being converted. When the padi crop is harvested a lot of men will be freed for this industry. The padi was of unusual size, shoulder high, and with very large heads. Health on the various estates was simply perfect, there being no one ill at all.

Coffee is now at a price—\$40 per pekul—in Singapore which it has never reached before. Sugar is in increasing demand in Hongkong for refining, from whence it is shipped to Japan and America, composing a large portion of the cargo of the increasing number of steamers which cross the Pacific. Manila hemp is in constant and steady demand. All three products are giving very good returns to the growers at present, and as they are all grown only in gold-currency countries at present, it is felt that North Borneo, a silver currency country, will have a very important advantage in competing with them—an advantage so great that it must perforce draw attention ere long, with the white metal so low as it is at present,

The Borneo Coffee Company's plantations at Terri-tepan are just as good as those nearer Sandakan, and are also heavy with fruit.

The timber trade progresses steadily. One ship is in port at present loading for China, and another one is expected soon. The "Memnon," the steamer which runs between this and Hongkong, takes up as much as she can carry every time, and most of the Singapore-bound steamers take some, which is used by the coal company at Labuan.—*Colonies and India.*

ACME CHESTS AND EVEN TARES.

The local Agent writing to an estate proprietor makes some remarks which are worthy of note:—

"What I want to get at is to see if I can get the charges for taring done away with. Once get this recognised and the bulking is bound to follow. The even tares of these packages kills the loss of tea, as the $\frac{1}{2}$ chests are all just under 14 lb. so that this is a big advantage in itself as against uneven tares, where you may lose almost $\frac{1}{4}$ of a lb. of tea, in addition to the 1 lb. draft allowance. With chests of even tares, not an ounce of tea ought to be lost to the grower and it will come to this before very long. I am not advocating the safety of our package or its liability to carry tea in good condition to the markets of the world. (We who have been watching this for the last 18 months are quite satisfied as to this.) It is to get practical tests to save the planter losing his tea unnecessarily and to save unnecessary charges in London that I am determined to work out chests of even tares and unvarying tares, through all difficulties, whether the chests are wood, or lead, or steel, is what will bring this about."

DRUG-TRADE OF 1893:—QUININE, &c.

Commercially and industrially, 1893 has been a thoroughly bad year. Instead of the generally expected trade revival, business has been duller and commercial distrust greater than at any time within the last twenty years, and it is no exaggeration to say that, so far as the drug trade is concerned, there have never been so many complaints of *malaise* as during the year now drawing to a close.

QUININE AND CINCHONA.

Although it appears impossible to obtain any official confirmation of the facts, it seems certain that in the spring a sort of understanding was arrived at between the quinine-manufacturers, who had been in the habit of making speculative sales on the competitive system, to cease from cutting prices, and to put some limit upon the making of contracts for future delivery. These measures have served to impart a little more confidence in the quinine-market, and this has been accentuated by the belief that there will shortly be a considerable reduction in the supply of cinchona-bark. Quinine has risen from 99-16d per oz. for second-hand German in January to 10½d per oz. in December. It is, perhaps, as yet somewhat too early to say that the prediction made by the Java Planters' Association in a report issued in March last, that the 1893-94 crop of Java cinchona bark would show an increase of 17 per cent by weight, and about 23 per cent by quinine-value, over the crop of the previous year, and be far and away the biggest crop on record, has been quite incorrect. But at any rate, there has been a very considerable decline in the Java exports during the last three or four months, and it is thought that the early months of the coming year will show a further diminution in the supply. Ceylon, it seems, will, soon cease to count as a bark-producing country, and the Indian supply is also falling off. The quinine unit in Amsterdam fell from 5½c. in January to 2½c. in October, but advanced again to 3½c. at the December auctions.

Another noteworthy feature in connection with the cinchona trade has been the clearing out of considerable portion of the old stocks of Pitajo, soft Colom-

bian, and Cuprea barks held in London since 1880 to 1883. At auction after auction these barks have been offered for sale, and very frequently business was concluded at from 1d to 2d per lb. for bark which, when imported, was worth from 1s to 3s per lb.

Camphor has followed a declining tendency, and the same applies to Soudan gum acacia, Zanzibar cloves, rhubarb, China soy, buchu leaves (now only a little more than one-third of their January price), and musk-Gum tragacanth, and Tiuevelly scuna have ruled high in price, and Canadian castorom has brought figures never thought of before—viz., 140s per lb. Lastly, otto of rose has advanced nearly 30 per cent as a result of successful speculation, while menthol is nearly 80 per cent higher in price than it was a twelvemonth ago.—*Chemist and Druggist.*

A TRIPLEX TEA DRIER.

LONDON, Jan. 5.

Allusion has been made above to the severity of the weather here yesterday. To that severity must, I imagine, be attributed a disappointment experienced by myself. Mr. Hector had written to me some days previously asking me to be present—of course on your behalf—at a public exhibition at Chingford, Essex, of a new Triplex Tea Drier stated to be an improvement upon the Gibbs-Barry machine. As it was known to me that but one of these machines was in work in Ceylon—on Mr. Channing Esdaile's estate—it had seemed to me that it might be of interest to your readers did I record of it my personal observation. Accepting therefore the invitation, I made arrangements, at great personal inconvenience, to be present at the trial, and with many a shiver in the fearful blasts of easterly wind which attacked me, put in an appearance at Liverpool Street terminus at the appointed early hour. But seemingly, I was the only one of all those invited who had dared to brave the inclemency of the day, for waiting to see the fixed train take its departure, not a sign could be seen of the numerous company that had been expected. Probably notice of the altered intention had been circulated and sent in error to my Club address instead of to my private one. Candidly, one could hardly be sorry, in such bitter weather, that my experiences in reaching Liverpool Street had not to be extended further. At that terminus I met a lady, formerly resident in Ceylon, who had just arrived from the country to see a relative attacked by illness. She was literally blue with cold and shaking from head to foot as we stood for a minute or two conversing. I never recollect a more bitter day.—*London Cor.*

THE ACME CHESTS.

We have now received from Mr. Polson a sample of the very neat 20lb. Acme tea chests—tare 5lb. They are exceedingly neat and the local Agent may well write:—

"These are the boxes for fine teas and not one of them need even be opened at the Customs."

BARK AND QUININE.—We are tired of hearing of old stocks of cinchona bark and quinine being cleared out; but the story is repeated in the annual review of the drug trade (see above) and yet prices do not rise! However, we see that our contemporary (of *Chemist and Druggist*) only speaks of "a considerable portion" of the old stocks of South American barks held in London since 1880-3 (!) as being cleared out. Let us hope that the remaining part will shortly disappear and so leave a fair field and no favour for bark planters in supplying current demands.

INDIAN TEA IN AMERICA.

The Chairman (Indian Tea Association) stated that the Chicago Exhibition had now been closed, and Mr. Blechynden had, with the approval of the Sub-Committee, transferred his exhibits to a winter exhibition which was being held in New York and which would be open for about two months. The cost of this new enterprise would be about 2,000 dollars, and a remittance of £400 had been sent to Mr. Blechynden to meet the expenses, the Committee having still a balance in hand on this side of about \$18,000.

It is proposed that Mr. Blechynden should remain in America for a further period of six months; or, so long as funds permitted, in order to travel through the States and Canada, endeavouring to push the interests of Indian tea, and follow up the advantage gained at Chicago, and the Committee of the Indian Tea Districts Association, London, had been requested to arrange with him as to his plan of operations after the exhibition at New York was over, when he would be able to return to London and consult with them.

Read letter of 30th October, from Messrs. G. Musson & Co., Commission Merchants, Toronto, Canada, stating that they were open to receive consignments of India tea, the demand for which was growing very fast in Canada, consumption increasing every year, and that a good trade could now be done. It was decided to acknowledge the letter, stating that attention would be drawn to it in the published proceedings of the General Committee.—*Indian Planters' Gazette*.

TEA FREIGHTS.

The *Indian Planters' Gazette* of the 13th inst. has an article on the subject of tea freights in view of the dispute between the Conference Liners and the Indian Mutual Line just started. In the first place it points out a number of objections to a radical disturbance of the existing arrangements. It states that the class of vessels has been objected to. The insurance item is one of importance in a transaction of this kind—for if the vessels engaged are such as are employed in ordinary tramp work and not of the first class, the insurance will be considerably higher than that for tea shipped by Conference Liners. This is a circumstance which requires to be carefully considered. The present Conference has a difficulty at times, when running from twelve to sixteen steamers a month, in avoiding what are known as "shuts out" of tea during the busy months. Again it is but a matter of rule-of-thumb calculation to find out whether it is possible for steamers which cannot sail oftener than once in three weeks to carry a minimum of 8 million lb., or say 12 000 tons measurement a month. If they cannot meet the demands made on them—it stands to reason that shippers will put to a great loss, for they will have to warehouse their teas on arrival, if no ships of the India Mutual Line happened to be handy. We have been shown the seriousness of this disability, and the loss that must accrue to shippers not being able to send their chests to the jetty at once, while the freight penalties incurred in such a case are no light matters. It is also important to remember that supporters of the Conference have a guarantee that their teas will be laid down in London \$5 a ton for freight cheaper than the shippers by the India Mutual Line. The largest shippers, such as the gardens owned by Messrs. Finlay, Muir & Co., Messrs. Mackinnon, Mackenzie & Co., Messrs. Maoneil & Co., and the great Companies such as the "Assam," "Jorehaut" and others we could mention, are committed to the Conference and to speak plainly, if they can lay down their teas, some 80 million lb., at a lower rate than small shippers, they can materially under-sell the latter in the London Market. This, too, is a consideration which has not been sufficiently weighed by those who have attached themselves to the new combination, and there has evidently been a tendency to swell out the small concessions and advantages which the new line

will give, forgetting the main thing in regard to the regular despatch of tea and laying it on the market at a cheaper rate than might possibly be done by any other organisation.

THE IMPORTS ON CHINA TEA: CHINA, CEYLON AND INDIAN TEA COMPARED.

To the Editor of the *North-China Daily News*.

SIR,—We are so accustomed to accuracy in statement and to sound argument from the pen of Mr. R. E. Bredon, that we read with regret his remarks on the Tea Trade in the Decennial Report on the Trade of Shanghai, 1882-91, and his pleadings in defence of maintaining a burdensome duty, which is sapping the life of the trade.

We thought the time had gone past when the chosen beverage of millions of Europeans should be stigmatised as "acid decoction," and this reference to India and Ceylon Tea is particularly unfortunate, appearing as it does at a moment when very large consignments of China Tea are being "shut out" of New York as unfit for human food. One would think from Mr. Bredon's eulogy on China Tea that it was all "well-flavoured and wholesome." If it were so there would be no difficulty in winning back the favour of the British Public. Anyone who has ever had the misfortune to go through the London stock of China tea in the spring of a year knows the difficulty there is in finding a single parcel which is not stale, smoky, or vile beyond description, so different from the bright fresh teas which are pouring in from Ceylon especially, and which attract simply by the purity of their quality. The special mode of curing used in Ceylon and India may not be suitable to China, but it goes without saying that prompt curing and beyond everything cleanliness in all the processes are absolutely necessary to make good tea. These three conditions are as conspicuous by their presence in the India and Ceylon industry as they are by their absence in the China tea trade. One of our Consuls once called China tea as now prepared "perspiration-saturated" stuff, and we fear he was not far wrong. There is no point about the ordinary China tea which is sold in London that an energetic dealer or grocer can brag about to increase its use, and this is more to be regretted as the Chinese have undoubtedly the finest raw material in the world to work upon. China Congou is the dearest tea, quality considered, in the London market.

As to the more rational system of buying we fear this was only a temporary hopeless apathy consequent on previous heavy losses and fear of incurring further risk. Human nature has not changed in the past ten years, and buyers are just as prone as ever to rush headlong after any imagined chance of profit; witness the mad rush of buyers for Russia in Hankow in 1891.

When we come to the next point in Mr. Bredon's report, viz.—the inland taxation, owing to the transit pass system, can never exceed 50 per cent of the maritime duty, we confess we are staggered at the assertion. Either the native tea-men exaggerate most profoundly or Mr. Bredon shows a want of exact knowledge which we do not expect in one who has held a high position in the I. M. Customs for so long. The following are some of the charges which tea-men state are paid as inland taxes:—

Province of Anhui, (Moyunes, Fychows, etc.)—		H. Tls.
Likin—Haikuan Tls. 2.08 per 120 catties...	1.66 a pcl.	
Kootong barrier tax, 4 maos a picul ...	40 "

The maritime duty is Haikuan Tls. 2:50 a picul in each case.			

The transit pass system has been discouraged by our Consuls, and it is within the memory of all that applications for passes were refused by H. B. M.'s Consulate in Hankow unless the foreign applicants could allege an interest in the teas to be brought down. Native tea-men have hitherto been unable to obtain transit passes in their own names, we do not know whether Mr. Bredon's remarks point to a change in this particular.

The point we should like to urge on every one who has any influence in China is that the duties and inland taxes are crushing the life out of the trade. On the average price of tea these amount to fully 30 per cent., and they are so onerous that they leave only a bare pittance to the grower of the leaf. The profit on producing is so small that there is no encouragement to improve the culture or to adopt any means of improved curing. The teas are packed for foreign use in filthy hovels instead of in clean well-ventilated factories. So little care is taken, especially in the Foochow districts, that much of the leaf actually perishes before it is cured, as the presence of black unsightly leaf in the infusions testifies. Nothing is done to preserve the beautiful flower flavour of the original leaf. Most Russian buyers have left Foochow because of the deterioration in manufacture, and unless something is done to improve Hankow teas the trade there will likewise suffer.

Any true friend of China who has the ear of her rulers will not lull her to sleep by such advice as Mr. Bredon's, but will point out the weakness, and show the way to that improvement which shall again put her trade in tea in a satisfactory and remunerative position. The possibility of great competitors such as India and Ceylon rising in spite of their produce being "aoid decoction," and taking away a vast portion of an established trade, shows there is something to be corrected in China. Without duty more money would be expended on improved culture, on proper factories, and on increased plantations, all of which would tend to bring back buyers to the "well-flavoured and wholesome teas" of China growth.

"The aim of the ruler should be the welfare of the governed."—I am, etc., K. S.
3rd January.

POTATOES.

Mr. E. S. Beaven writes to the English Mail of November the 15th:—

"A square field of very uniform soil was planted with 31 different varieties of potatoes. With the exception of a strip of 24 perchos extending through the field and taking in a portion of the ranks of each variety, the whole was sprayed twice with "bonillie Bordelaise." The composition of the mixture was 20lb sulphate of copper and 10lb quicklime in 100 gallons of water. The area sprayed was one acre, and the following table gives the results (calculated for each variety in tons per acre)—viz. (1) total crop raised, and (2) rate of gain or loss per acre on the sprayed area compared with the area not sprayed."

We omit the table but out of the 31 varieties experimented with, we may mention that the best six were, in order of merit, *Imperator*, *Serius*, *Fidler's Colossal*, *Reading Giant*, *Webb's Stourbridge Glory* and *Blane Reisen* which gave yields of from 19 to 22 tons 16 cwt per acre. The earlier varieties gave smaller crops, about 14 tons but were

ripe some 2½ months before the others. The average of the whole was 15 tons 8 cwt, the average gain due to the application of the *bonillie* was 1 ton 1½ cwt. "For the most part, the earlier and the main crop varieties of potatoes did not suffer appreciably from disease, and on some of the less hardy sorts the effect of spraying this year was to cause a very perceptible check to the growth of the foliage, more than counterbalancing any small gain which would otherwise have been made. In the case of the latest varieties, however, the effects of the spraying are most marked. Many of these remained green and continued their growth for an additional month where they sprayed."

The gains, where they have been made, are almost entirely due to prolonged growth rather than to a reduction in the proportion of diseased tubers, which throughout the plots did not amount to ½ per cent of the crop, and on the undressed sections were less than 2 per cent.

It will be noticed that the crops are very heavy. The land was in good condition and received a uniform dressing of 10 cwt to the acre of the complete chemical manure recommended to the committee last year by Dr. Muoro, containing equal parts of sulphate of ammonia, superphosphate, and kainit (an impure form of potash.—Ed.)

We must call the attention of our readers to the fact that sprayed applications of *Bonillie Bordelaise* is only effectual for the English variety of potato disease, the Indian ring-disease must be treated in a different and more expensive manner. In this latter case the soil itself must be saturated with the *bonillie*, as the ring-disease attacks the plant *under-ground*, and not by means of the leaves. We have found ourselves that the ring-disease attacks both English and country varieties. We shall be glad to give any further information on this matter if required.—*South India Observer*.

TEA—INDIA AND CEYLON IN 1893.

REVIEW OF CROPS FROM THE DIFFERENT INDIAN DISTRICTS.

The advent of the new year enables us to form a retrospect of tea for 1893, and in doing so the only possible conclusion to arrive at is that it compares unfavourably with its predecessor as to quality, and some of the tea districts have also to face a serious deficiency in quantity. This is notably the case with Darjeeling, where, without fear of contradiction, it can safely be stated that 1893 has been one of the worst seasons experienced in the hills. The weather was abnormally cold, and after a record of rain in July, mosquito blight set in with a severity utterly unknown hitherto, affecting both quality and quantity, and to quote a planter of great experience, "there was hardly a really busy week throughout the season." There have been some fine invoices sold in this market, chiefly from the higher elevations, but the deficiency in output all round has been so serious that prices have not compensated. It is pleasing, however, to see daily advertisements of ad-interim dividends, proving that even with a bad season the average of Darjeeling teas, with a modicum of output, distinctly proves in their case that quality pays, whereas quantity spells failure.

The Darjeeling Terai on the contrary has done better as far as regards quantity, blight having been less and only made its appearance later in the season. Prices, however, have shown no improvement, and the average for the season is again terribly low and only in a few cases can shareholders hope for any return. On the other hand we fear that many concerns have been worked at a loss, and further large areas will be abandoned in 1894; when it is considered that every acre of old plant in the Terai represents R400 to R500, the aggregate abandoned during the last three years will represent many lakhs of rupees.

The Doars, owing to extensions, will show an increase, but the old gardens have not responded to the estimate formed as to their capability, and the

tea has been poor throughout the season. There will not be the flourish of trumpets that dwarfed all other districts at the end of 1892. Scarcity of labour and the struggle for it is a very serious factor in the Dooars, and a disagreeable incident connected with it during the past year surely should prove to all connected with the industry that it should be a case of "Live and let live."

The outturn in this district has grown to such dimensions and the average yield is so extraordinary, that it is a matter for serious reflection, as new extensions come into hearing what is to become of all that class of tea that is manufactured. Quality in the Dooars seems to be cut of the question, the amount of leaf at times to be dealt with seems to be beyond the power of even the most energetic manager to cope with; that and the want of labour can be the only excuse for the teas that have been offered during 1893. That it is not the fault of the plant must be admitted, or we should not hear of sales of tea seed from the Dooars, which is now becoming a remunerative part of some of the better known gardens. Whether the amount of withering accommodation is inadequate, which strikes us as most probable, or whether it is the machinery, must be left to those most interested to determine, but the fact remains the same. Dooars tea taken as a crop by itself has been most disappointing during 1893.

Cachar and Sylhet grouped together have had an average yield, whether due to new extensions or heavier plucking is not easy to determine. In some cases in Sylhet old gardens have done badly; the weather has been indifferent and unseasonably cold during the busy months from June to September, and the quality poor as compared with 1892. The appearance of the tea, as usual with Cachar, shows great care in manipulation, but there has been no body—light in the cup is the characteristic of this district. Great hopes were entertained that with the new Bheel gardens and their fine plants, there would be a distinct improvement in the quality, but it cannot honestly be said that so far these hopes have been realised. We hear in some instances of a serious falling-off in the yield of some of the older Bheel gardens, attributed to the heavy drainage that was requisite and the consequent loss of soil after any heavy downpour. In grouping these districts together it is only fair to add that with respect to some of the new gardens in South Sylhet the average yield equals the best part of the Dooars, and both this District and Cachar are fortunate as to their labour, as even with imported labour, owing to a far healthier climate, there never is the terrible death roll that hampers Assam; there is an amount of indigenous labour that renders many parts of the districts quite independent of foreign labour; the final result is that 1893 has not equalled its predecessor. The fall in the market, coupled with an inferior crop, must tell heavily on the results.

Assam has the same tale to tell; the teas have been indifferent, not attributable to want of care but unreasonably cold weather in the best months of the year. The estimates have been in most cases exceeded, and as far as quantity is concerned 1893 must be considered a good year, but the fall in value has been considerable, and two annas a lb., equal to 10 a maund, may be without exaggeration placed as the loss compared with 1892. This spread over the heavy yield from Assam, as will easily be seen, is a terrible total, and shareholders cannot expect much in the way of result. There has been in Assam, as elsewhere, exceptions to the rule, but taken as a whole Assam has not done well. Those gardens that have maintained their quality have done fairly well and have incontestably proved that Assam can produce a quality of tea that defies competition from other districts, and if it were not for the terrible labour difficulty, and consequent struggle for it, that handicaps Assam so seriously, there can be but one conclusion that as a tea producing district Assam has no rival, and we would preach and impress on all concerned quality *versus* quantity, feeling convinced that a yield of six maunds

per acre in Assam will give better results than ten maunds from any other districts, of course, provided, and as stated above, that quality is made the first consideration. As compared with 1892, when the prices paid for the good quality of that year unfortunately induced the heavier plucking in 1893, the latter year cannot show, even with its larger outturn, anything like the results of its predecessor.

We cannot conclude this epitome on the past tea season without drawing attention to the steady increase from Ceylon and that of a class of tea that directly comes into contact with the lower grades from India, and also at a time of year when India, as regards production, is dormant. Before the advent of Ceylon as a big tea-producer the months of April, May and June in London enabled that market to dispose of the balance of the Indian crop, but with an export from Ceylon in December 1893 of eight millions as compared with five millions in 1892, it is very evident there will be no period of rest, and that new teas from India will no longer command, as in the past, fancy prices; that of itself should be another and stronger inducement to seek quality and not quantity. As stated in the earlier part of this article Darjeeling, which seldom exceeds three to four maunds per acre, can, owing to its better value, show returns that compare more than favourably with other districts that yield double and treble the quantity. Quality, therefore, not quantity, is our motto and advice for 1894.—*Capital*.

KOLA NUT.

We are indebted to Mr. W. T. Robson—whom we welcome back after much wandering in out of the way lands, to settle for some time on his Matale properties—for a sample of "Pure prepared Kola" by our old friend Mr. T. Christy. When we saw him last in London, Mr. Christy was full of the bright prospects before this food-product. It is deemed an excellent substitute for chocolate, but it is evidently, difficult to get into use; for we notice that in the very latest market report it is still classed as a "drug" and the information given indicates an over-supply and weak demand. There is not much chance of a large supply from Ceylon; for we know of no planter who has so many Kola trees (*Cola acuminata*) as Mr. Robson himself—some 400—of which, however, only a few are in full bearing. The plant is described by Mr. Aymer as developing into much the same appearance as a mangosteen and to be handsome and attractive. Fortunately, to counterbalance the slack demand in England, there is a market for the fruit, even in its green state in Calcutta, for what purpose is not very clear, though one suggestion is that it is used by toppers, and possibly by Opium-eaters who want to conquer the habit? In any case, as an undoubtedly valuable food-product, Kola deserves more attention than it has received and we hope Mr. Robson will yet reap substantial benefit from his trees and from such extension of the cultivation as he may undertake.

BARK AND DRUG REPORT.

(From the *Chemist and Druggist*.)

London, Jan. 4.

ARECA-NUTS.—The market is much over-stocked with this drug, for which the use is comparatively limited; several parcels were shown at auction today, and bought in at from 15s to 20s per cwt. according to quality; the highest bid obtained for rather ordinary arecas was 5s 6d per cwt.

BALSAM OF PERU.—Very scarce and high in price. Seven shillings a pound is the lowest figure for good quality. One or two parcels are landing, but were too late for today's auctions.

CINCHONA.—Several recent arrivals of South American Huancoco bark, which has not been imported for many months, were placed on sale today; they numbered altogether 86 serons, the whole of which sold with good competition at somewhat irregular and generally very high

prices, fair bright grey quill at 11d to 1s 1d, small an more or less damaged at from 10d down to 6d, ver small and common down to 2d per lb. Of genuine Lox bark 13 packages were offered and sold at 1s 10d pe lb. for fair bright quill, and is 3d to 1s 4d for smal ditto. Of a new parcel of 21 bales flat Bolivian Calisaya imported via Hamburg 5 sold, fine pale orange quality at 1s 8d per lb. A bale of bright Cartagena offered without reservc, realised only 3½d per lb.

COCOA.—Prices remain very low, but a fair proportion of the leaves offered today found buyers. Twelve cases from Colombo found purchasers at 8d per lb. for medium to bold green, partly dark mixed leaves of good flavour, and from 3d down to 1d per lb. for dull brown to common dsaged ditto. Of a parcel of 25 bales South American leaves, five sold at 10d per lb for fair but broken Truxillo, damages bringing 6½d per lb. Fine broken green ditto realised 1s 2d, and strong brown Huanoco leaves 1s 4d to 1s 6½d per lb.

COCAINE.—The market is firm, at 14s 6½ per oz. hydrochlorate. The outside maker who recently under-sold his colleagues now quotes 4d per oz. more than they do.

KOLA.—In slow demand at somewhat casier rates, rather dull West Indian seed brought 7½d per lb.

QUININE has been quiet this week. Since a sale of 5,000 oz second-hand German bulk at 10½d last Friday, no business has been reported at all until at today's auctions, when 5,000 oz. of B. & S. quinine in 100 oz tins sold at 10½d per oz., showing the market to be very firm. It is reported that there are scil-rs of Whiffen's quinine in second-hand at 11d. The maker's quotations are unaltered.

TONQUIN-BEANS.—In plentiful supply, but there is very little demand. Fair black to good bright frosted Para were bought in at from 2s 3d to 2s per lb., and ordinary, very fxcy at 1s 4d per lb.

VANILLA.—A very large supply, numbering over 500 packages, sold with good competition at an advance of 6d to 1s on short and 1s to 2s on long beans: five bold 15s 6d to 17s 6d; good 6½ to 8 inches, 10s 6d to 14s; fair to goods, 4 to 6½ inches, 6s 9d to 10s; ordinary fxcy and brown from 4s 6d down to 2s per lb.

LONDON REPORTS ON TRAVANCORE PRODUCE. TRAVANCORE TEA.

(From *Putry & Pasteur, Limited*. Report of the Colonial Markets for the week ending January 3rd, 1894.)

Owing to the crush of tea coming in from India and Ceylon, and the low prices current for medium, these have not sold as readily as they deserved, although prices compare well against other sales.

The quality shows slight falling off on previous sales, the chief feature being the lightness in the liquor.

	Bro. Pek.	Pekoe.	Pek. Sou.	Souchong.	B. T. Dust	Quantity.	Av. About

CEYLON TEA IN AUSTRALIA.

(From *Alfred Harvey & Co's. Monthly Tea Report*.)

SYDNEY, Jan. 9th, 1894.

GENERAL.—The usual cessation of public sales preceding and immediately following the Christmas

and New year holidays has this year been more marked than usual, no tea being printed between the 7th December and 9th January. Consequently, there is little to report of general interest. There is no doubt, however, that importers of Chinas are most decidedly firm, and also that the few sales that have been effected have shown that full prices were obtained. Rates paid gave an advance of ¼d to ½d per lb. upon last auction's lowest prices.

Indians having had large sales, with still a fair quantity available, there is no change in values to be noted, but it is generally conceded that higher prices than those now ruling must be expected, because present results must check purchases upon colonial accounts at the closing sales in Calcutta. At first glance the quantity already shipped shows a large increase, but when it is considered how short of stock we all were at the commencement of the season, and also the large increase in consumption throughout the colonies, it will be apparent that the probabilities favour higher rates through a shortage of leaf alone. Ceylon have probably had a quieter month than an any time for the past eighteen months. Arrivals have been a little heavier, but sales were almost confined to the dealers. The recent falling-off in the demand for Ceylons was in a measure due to the poorness of quality submitted—a fault doubtless due to the demand for low price kinds; but still the cost in Colombo of all grades has been so much above present colonial rates that the shippers, in their endeavours, to suit us for price, have failed in quality, and so the sale of Ceylons has been seriously checked.

CEYLON—There have been no public sales during the month, but 700 packages are printed for today's sales. Private sales have been few, and prices are without change. A few fannings and broken leaf sold from 5½d to 5¾d; whole leaf souchongs, 5¾d to 6d; fair pekoe souchongs, 6½d to 6¾d; decent pekoes, 7d to 8d; and fine quality, 8½d to 10d. Nothing choice offering. Stocks in bond on 30th December were 243,611 lb.

NOTES ON PRODUCE AND FINANCE.

CEMENTING THE UNION.—The visit of Mr. J. Bery White to India, with *inter alia* a friendly mission to approach the Calcutta Tea Association, with a view to bringing it in closer touch with the Indian Tea Districts Association in London, will be extremely useful. No one knows better than Mr. White the necessities of the tea industry at home and in India, and the happy effect of combined effort. A judicious blending of tea interests to use a familiar term, is of the greatest importance for mutual protection and the commercial welfare of tea enterprise.

GLIMPSE OF THE PAST.—The great China tearace that once caused such a flutter of excitement in Mibcing Lane is now but a memory. Only the other day, as it seems, the name of the first vessel to arrive with the new season tea was in everybody's mouth, and now we have men of twenty years' experience in the tea trade regarding the race between fast vessels as a piece of antiquity. In an account of the tea trade past and present, combined with a plea put forward on behalf of the professional tea blender, contributed in a letter to the *Grocer*, the editor, Mr. C. S. Hicks, says, by way of preface: "After having had several years' experience in general merchants' business (import and export), I entered Messrs. Harrison and Grosfield's sale-room some 20 years ago to learn the tea trade. Even then everyone was looking back on the 'good old times,' just as people do now. Indian tea was of course, known, but the bulk of trade, say two thirds, was done in China tea, and the event of the year was the great China tea race; for instance, that between the *Taeiping* and *Ariel*, which vessels passed the *Woosung* lightship together lost sight of each other all the way till they came together in the chops of the Channel, and raced side by side up to the mouth of the Thames, arriving in dock within thirty minutes of each other. The 'finest tea the world produces' had not been discovered at that time

at 1s 7d per lb but people were foolish enough to pay as much as 3s 6d per lb to ordinary retailers for tea worth the money. There was, however, plenty of packet tea about, which was largely composed of Saryunes, with a little pugest Indian—red dusty stuff that no self-respecting retailer would sell today. The trade had been done in the past by the large London and Liverpool houses selling to the big provincial firms, who in their turn supplied the ordinary retailer; but when I entered it the smallest orders were being eagerly looked after by the largest dealers. The blended tea trade was, however, in its infancy. The use of Indians and Ceylons to the exclusion of China tea, and the increase of the blended trade, have practically gone on together, and the reason is obvious. In the old days everyone lived more slowly. There was more time to do things, and tea-tasting was interesting. Even if it did take up time, it didn't matter so much to the retailer; but as imports became larger, the large dealers had to divide the buying more and more, until now there are not only Indian and Ceylon and China departments, but the former are again split up into broken and leaf departments, so as in some way to deal with the vast masses of tea under which the market is almost at times submerged. The retail buyer got in his turn a larger assortment, a kind of *embarras de richesses*, and at the same time the other branches of his trade extended in every direction, until he now has a hundred things to sell where his grandfather had one."

A TRADITION OF MINCEING LANE.—The writer of these experiences, by the way, enlivens them by an expression in which he shows that the "good old" feeling in favour of China teas will come out occasionally in the tea dealer of twenty years' standing. He says:—"I think if the retailer will look at the question fairly, he will see that the whole system of trade has altered and is still altering. In the old days some of the China teas did improve and thicken by keeping. The machine-made and rapidly prepared Indian and Ceylon teas deteriorate even in a month or two, and are not to be recognised as the same tea in three months." If there is any tea trade a century hence, and tea-tasting is not a lost art, the tradition of the "good old days" when China supplied the entire market, and very frequently abused the privilege, will linger as one of the splendid traditions of Minceing Lane. Meantime, the "machine-made teas of India and Ceylon" sell remarkably well. Notwithstanding the sneers of the unbeliever in their keeping qualities, as pointed out elsewhere, however, it will be a really unfortunate thing for tea and tea-drinkers if the fact be lost sight of that flavour is necessary as well as strength.

THE TEA BREWING QUESTION.—It is proved by statistics that the British people, at least, when they are on their native soil, are the greatest tea drinkers in Europe, and it is time that they understood a little more about the brewing of it. If anything is calculated to cause a reaction against tea drinking it is the objectionable way in which it is made and served not only in the majority of public places, but by the average housewife. The prevailing idea is to draw all the strength out, without regard to any other consideration. It is against this that medical men rail, and because they see how difficult it is to induce the tea drinker or the domestic teabrewer to understand the matter aright. This neglect of a proper method of brewing tea may be good for the tea trade for the time being, but it will ultimately tell against it. Instructions as to the brewing or infusing of tea should be issued on every possible occasion. Just as instructions are issued regarding the proper use of other domestic articles, the uses of which are not generally understood. This tea-soup item is a serious factor in the question of our tea consumption and how best to promote it. Cups of say—infused Java leaf of a certain kind—and this rough tea finds its way into a great many tea shops where strength and very little else is required—taken at frequent intervals would make the owner of a cast-iron stomach quail. If people could be made to

understand that delicacy of flavour is not to be brought about by making "hash" of the tea leaf, it would be infinitely better in the long run for all concerned in the supply of tea. The use of tea and not its abuse is the point to which attention should be directed.

TEA IN CENTRAL ASIA.—The Earl of Dunmore, in his recently-published book on the Pamirs, writes as follows: "Before leaving Kashgar, I bought, amongst other things, some fresh eggs and honey. . . . The honey has come in very useful, as Ramzan (*his servant*) forgot to buy any sugar, and Kashgar tea without sugar or milk is a trifle bitter, and so last night I tried putting a spoonful of honey in my tea, and it proved a gigantic success; in fact, I prefer it to sugar, as it not only takes away the bitter taste, but gives the tea a delicious flavour."

TEA PEDDLERS IN AMERICA.—"Peddling" tea is an increasing business in the United States. Perhaps the introduction of Indian and Ceylon growth have given an impetus to the business, but it is to be feared that the tea peddled is for the most part Chinese or Japanese. According to a New York paper: "As there are retail dealers who confine themselves to selling teas and coffees, so there is a class of peddlers that go from door to door in the residential parts of the large cities for the purpose of making sales of teas. Some of these itinerant purveyors of the profitable staple carry their stock in a neat valise, and as they are usually careful regarding their personal appearance, they are more successful in obtaining a hearing from housekeepers than the unkempt, rough-looking, bawling individual who paddles fruit and vegetables, severe as the competition is which the city grocers experience at his hands. The class of tea peddlers which use waggons to travel about in and to carry the daily supply, is much better known to the grocery trade than are the men who depend on Shank's mare to reach the public, and its inroads on the tea trade of the grocers are the cause of bitter complaints from some of the latter, but we question if the wagon peddlers are as dangerous as the pedestrian vendors, so far as the tea trade of the grocers is concerned. The wagon men no doubt sell more tea individually than a single foot peddler can sell, but it is the greater numbers of the latter that makes their competition a serious matter. Only a very small cash capital is required in starting as a tea peddler on foot, and as the number of unemployed men, especially book-keepers and others not used to manual labour is always considerable, while the common notion that grocers' tea profits are exorbitant probably induces a good many of the unemployed to try their luck at selling tea, it is likely that a much greater quantity of tea passes into consumption through this channel than the average grocer suspects."

COFFEE GROWING IN JAMAICA.—A bulletin has recently been issued by the Bureau of American Republics, showing the methods of production and facilities for successful cultivation of coffee in various countries. In regard to Jamaica, it is stated that the island exports annually from 800,000 to 900,000 lb. of coffee. The value of the exports of this article in 1891 was about one-sixth of the total export. More than half the coffee exported is taken by the United States, but consists chiefly of the lower grades, the better and higher-priced qualities going to England. Jan. 5.

THE PROSPECTS OF QUININE (and therefore of Cinchona Bark) are decidedly good, according to the *Chemist and Druggist*—a journal usually regarded for some years back as inclined to take a gloomy view of the market. Now, it will be seen by articles in our *Tropical Agriculturist* that our contemporary insists that prices must rise during the present year: stocks are low and the bark supply is to be short. An amusing deliverance on quinine speculations in the past also appears elsewhere.

THE CEYLON TECHNICAL SCHOOL.

Pressure on our space prevents our, editorially, doing much more than congratulate the Director of Public Instruction and the Principal of the new School on the very successful inauguration which Jan. 19th witnessed. Mr. Human has, simply, done wonders in the short time available to him. We had no conception of what we were to see and were quite astonished at the varied, most suitable and complete arrangements in the different class-rooms—from the carpenter's benches through the engine-room and the machinery onwards to the lecture hall itself and all adapted out of the old St. Sebastian coffee store, with the very minimum of structural alterations. Verily Mr. Human—considering the men and material and means at his command—has proved himself “a genius” in his “infinite capacity for taking pains about the little things” which go to make up the Ceylon Technical School as it stands, a credit to the Colony and to all connected with it. If we are supposed to exaggerate, we can only say to the sceptical,—Go and see for yourselves: Mr. Human will be glad to welcome interested visitors and to give them the opportunity for seeing his pupils at work. But it is not simply in outward matters that the Principal has worked wonders: he has already wrought a great change in the spirit of the young lads who have come under his influence, and an *esprit-de-corps* is established which promises well that the first year's class, at least, will result in a series of handicraftsmen of which any colony might be proud. Mr. Human is evidently a man after St. Paul's own heart in his love of good, honest work; for what has the great Apostle written in his letter to Titus:—“Let ours also learn to maintain good works (‘profess honest trades,’ as one old version has it) for necessary uses that they be not unfaithful”, and again “If a man would not work, neither should he eat.” It would have delighted Mr. Ruskin had he seen the rows of bright-faced intelligent-looking lads who faced their Technical Instructor yesterday, evidently with full faith in him and his mission in this Far Eastern land; and many of them, we feel sure, will show the truth of Hugh Miller's saying—the result of much experience—that young men who work as skilled handicraftsmen are far more likely—if they do justice to their opportunities for observation and reflection,—to develop mental power and ability all round, than those engaged in the mechanical and too often monotonous, deadening routine of office clerical work. All success then, we most heartily wish for the CEYLON TECHNICAL SCHOOL and its Principal and his first year's list of pupils.

OPENING OF THE TECHNICAL SCHOOL.

The first session of this Institute was opened on the 19th January by His Excellency the Lieut. Governor Sir E. Noel Walker, in the presence of a large gathering of ladies and gentlemen—including Dr. Copleston, the Hons. W. W. Mitchell and R. K. MacBride, Messrs. D. Mantell, Surveyor-

General, P. D. Warren, P. Arunachalam, John Ferguson, G. J. A. Skeen, H. Cottle, J. S. Drieberg, W. H. Wrightson, C. A. Lye, Rev. C. Koch, J. W. O. De Soysa, P. Ramanathan, C. Drieberg, A. E. Brown, W. Cantrell, H. Ewart, J. B. Cull, J. Harward, H. F. Tomalin, James Peris, C. M. Fernando, W. H. Davies, Dr. J. Loos, T. E. de Sampayo, Tudor Rajakakse, W. O. De Silva, Jayawardene, Rev. De Winton, Mr. Beven, the Hon. AbdulRahiman, Revd. Fathers C. Collin and Davy, Mrs. Copleston, Mrs. W. W. Mitchell, Mrs. Human, Mrs. Cull, Mrs. Warren, Mrs. H. L. Crawford, Miss Kendal Watson, Miss Vandort, Miss Loos and several others.

The proceedings began by His Excellency the Lieut. Governor calling upon the Superintendent to submit a short report.

The Superintendent's Report.

Mr. HUMAN, who was received with applause, said he had only a very brief statement to make as the institution had been in existence such a very short time and he had no record to produce as to results. The first practical operations connected with the installation of the school were commenced in the first week in July, last year. The machinery was received from England then. The first thing they had to think of was to erect the machines and engine, and that work was done by Sinhalese almost entirely, more particularly by the foreman G. Silva and by Romulus Pieris, foreman carpenter of the establishment, and he wished to say that great praise was due to these men who worked under the supervision of Mr. Van Dort and worked extremely well under many disadvantages for they were short of appliances, and had no proper tackle. They had not had even a jack or pulley block to lift the weights with, and yet the machinery erected would, if examined and tested, be found to be truly and properly fixed. That work which extended over about four months had to be supplemented by the construction of other appliances, and in that very good help was rendered by a few volunteers who were going to be students of the school; and such progress was made that the school was opened on the 10th November. They had 53 applications for admission into the school. Fourteen of those had been admitted without examination, as they possessed certificates from the Cambridge University Board; of the remaining 39, 23 gave evidence of sufficient knowledge to admit them to the full course of instruction and 11 were allowed to join in the 2nd division, so that they might have an opportunity of qualifying as soon as they could to begin the higher work. Forty-eight students, it would be seen, were thus on the roll when work was begun in November for the short course of six weeks. Of those 48, 46 had sent in declarations to the effect that they intended continuing their studies during the current year. Twenty-three applications had been made for admission this year, nineteen of which had been accepted, 16 being admitted into the first and three into the 2nd division. They thus began the session of 1894 with a total of 65 on the register, 53 being in division 1 and 12 in division 2. (Applause.) Applications had come in within the last few minutes, and also since the examination had been held. Besides, provision was being made for a few students from the Royal College attending the classes there so as to add to the course of the instruction they received at the College, workshop practice and drawing. Arrangements were also being made for students of the Institute to attend workshops, mills and factories in the city. Messrs. Walker, Sons & Co. had expressed their willing-

ness to allow the students to visit their steamships and workshops, and no doubt the students would be very pleased to have the opportunity of seeing the actual engine and boiler rooms of the steamers and the work in the foundry; and among other places they would be able to visit and learn something at the Spinning and Weaving Company, the Government Printing Works, the Government Factory and the Railway Workshop. He had pleasure in announcing also that a series of lectures would be given during the ensuing year. He was sorry to say that one of those who had promised to lecture, was unable to do so, namely Mr. George Wall, whose state of health, unhappily did not permit him to come down to Colombo. Mr. Drieberg of the Agricultural School had promised to lecture on Practical Chemistry and Mr. Skeen on Printing, and there were others who were thinking over the matter; and he hoped he would be able to arrange interesting lectures. He might say, in closing that the Technical School showed signs of more or less vigorous infancy, and it only required to be nourished a little bit, and he thought it would grow up to a strong and healthy man. (Loud applause).

The Director of Public Instruction.

MR. J. B. CULL said that the school represented a new feature entirely as regarded education in the colony and he hoped it would receive the support of those concerned with the prosperity of the community. He noticed, with regret, that Mr. Wall was not among those present. Mr. Wall was one who was pre-eminently prominent in ensuring the establishment of the school, and his absence was all the more to be regretted as it was due to ill-health. The existence of the school owed more to the constant energy and interest of Mr. Wall than almost to anyone else, and everybody present would join with him in regretting Mr. Wall's absence. Mr. Grinlinton was another gentleman who had also interested himself in establishing the school, and he, though away at present, would soon be able to see for himself the working of the school. Next he proceeded to say that he wished to recognize the able work done by the Superintendent of the school and his co-operator in fitting up the school (applause). Mr. Human and his Assistant had laboured assiduously and right practically with regard to the work of the school and in erecting the machinery, and he did not think anybody could carry away the impression that the work was not well done. He had invited to be present representatives of the scientific departments of the Government and he was glad to notice the Director of Public Works, the Surveyor-General, the Government Printer, and representatives of the Railway Department, and he hoped that they would be able to promise help. He might also say that His Excellency the Governor was entirely in accord with the hope of such promises being forthcoming so that the Technical School might be able to supply some of the public departments with trained and efficient hands. Apart from that he urged the offering of prizes by the influential and wealthier native gentlemen of the island, for he had no doubt that many of them were interested in the new development of educational progress in the island. The Technical School represented an entirely new departure and it had been long clamoured for and he thought they might well ask that the representatives of the various communities should come forward with encouragement. He was not speaking in an eleemosynary sense—he was not asking for charity but for prizes to encourage the students. He thought they might also receive a great deal of

co-operation from the Managers of other Schools in Ceylon. He was glad to recognize the able work that many Mission Schools were doing towards industrial and educational progress, and Father Collins being present he mentioned those with which he was connected. Evening classes for technical instruction, he might say in conclusion, was another important point and it was proposed that such classes should be established in the course of a short time—in addition to the classes during the day—for the benefit of those—chiefly mechanics—who were busily engaged during the day in their own legitimate work. In conclusion he said there had been a cry about the overstocking of the clerical market, and this Institute he hoped would be the means of relieving that. (Applause.)

The Bishop of Colombo.

DR. COPLESTON, who was next called upon, said he spoke as one of the general public, who were seeing for the first time what had been so well begun, upon so good a scale and with such evident thoroughness. It pleased one very much to pass through the rooms and see the provision which had been made for this important branch of education. From whatever point of view he looked upon it they must regard it as a matter of congratulation that that great step, which was so necessary as an element in modern civilization, had now been taken in the colony. Modern civilization had made technical learning a matter of necessity. No doubt, in past times, in Ceylon as elsewhere, a great deal of skill and love for art, even in the humbler branches of handicraft, had been handed down from father to son and at first sight what might strike one was "why should I come to a school to learn the principles of that which men have been in the habit of learning by assisting their fathers, and succeeding to the places in which their fathers worked or managed their work?" But as it had been found in Europe, so it would certainly be found here. The old guilds of craftsmen had to pass away though they cherished a very noble spirit and produced very splendid results in their time and the system of apprenticeship which succeeded them had also in its turn to give way to this larger system of scientific teaching; for, after all, with the advance of knowledge and rapid specialization and immense competition in every branch of trade and manufacture it was only by having access not to what one's father happen to know or to what was known to have been in practice in one's neighbourhood, but to the very best knowledge and the best collected result of study upon the subject, that any manufacturer or producer could expect to hold his own. Those who had been a few weeks in that school had probably already learnt that. At first they might have wondered what was the good of coming there to be taught a matter so simple as the handling of tools, the use of the various materials and their different strengths and capacities which they thought could be better learnt by practice or which perhaps they thought were known by every one; but he was sure they could not be six weeks in that school without finding out that it was essential, if they were to make the best use of the materials which God had placed under their control, that they should have science in the best form in which they could have it at the back of their handicraft. He rejoiced for another reason apart from these, which were of an economical nature, in seeing that school so handsomely started, because he thought it was a witness to

THE DIGNITY OF MANUAL WORK

—a principle which all people had been from time

to time too slow to recognize and which he supposed had been terribly overlooked in the circumstances in which the people of this country had for some centuries been. In England people had learned, of late, mainly he thought, far beyond what they had learned from any other man from the teaching of Mr. Ruskin, what was meant by the dignity of labour. They had learned that those arts which were called humble gave, as he said, occupation to the noblest human intelligence and that there was not any longer to be any hard and fast line of distinction between the thinker and the worker; that the worker should be sometimes a thinker and the thinker sometimes a worker with his hands and both in the highest sense gentlemen. He felt that in this country in particular whatever put the seal of authority and intelligence upon this principle that handicraft and manufacture were capable of being both ennobled and ennobling was to be desired in even higher regions than the economical one; and he rejoiced to see the tables covered with the materials for drawing, for surveying and for experimenting upon the various forces of nature and the methods at which the different materials with which we are supplied by nature behaved. He rejoiced to see them because he thought they would lead everyone who had to deal with trades and manufactures and even the humblest handicraft to feel that he was in contact with that which was great and ennobling, and divine. He had had some opportunities of seeing the want of this kind and scientific appreciation of the things with which a man dealt. He was acquainted with a considerable number of gentlemen who are owners of plumbago mines, and he had not often found that one knew what plumbago was composed of or what its characteristics were, and he could not help thinking that they would individually make much larger profits and also have much greater enjoyment in their occupation if they knew and understood these things; they would work their mines not only with greater safety and greater pleasure if they knew beforehand what strength of timber and kind of timber should be used and what positions of it best secure the object they had in view. As he said at the beginning he spoke as one of the general public and he would add his word in support of what fell last from the D.P.I. He thought they could not but see that the Government was acting very liberally in this matter and had done its part, and those who were capitalists and owners of property and manufacturers could show their appreciation of that liberality and that spirit on the part of Government by founding prizes and scholarships and such things as the Director had suggested. (Applause)

The Mercantile Member.

The Hon. W. W. MITCHELL thought the occasion of their meeting that day was essentially one for congratulation. Technical education had been adopted or was being introduced into most countries and the reason of that was that it was an called for and had become.

ABSOLUTELY NECESSARY.

The course of education in Ceylon he might almost say had hitherto been of such a nature, perhaps in the absence of knowledge of anything better, that the youth of the country had been accustomed to fall into the groove of studying more especially for the medical, legal or clerical professions. They were met that day to inaugurate or initiate

A NEW DEPARTMENT.

The prospectus or syllabus which was in their

hands showed that something had altogether or at all events in a different direction was to be entered upon. The objects of the school and the teaching were that harmonious development might be obtained of the faculties by a systematic training in applied science. There was no doubt that the daily use of tools, and knowledge of the processes and materials must be of great value to a man in any walk of life but particularly to a man who intends to follow out a career in applied science, and in the use of them he would undoubtedly acquire

HABITS OF PRECISION

and method and painstaking effort. That school had undoubtedly begun under most favourable auspices. He thought they would all admit that they had been fortunate in securing the services of a most able Principal (Applause) and he likewise thought that under his guidance they might safely augur that the school would attain success. (Applause). He would however warn the pupils that the success of the institution would also very largely depend upon them. (Hear, hear). He would therefore ask them in the coming session to do all they could to gain as much credit for the school as lay in their power. They should not only be regular in their attendance there and diligent in the performance of their duties but careful in the home preparation of their studies for a great deal depended upon that. A great deal of the advantage they would get there would depend upon the preparation they made outside these walls. Reference had been made by the D.P.I. to the prizes that might be offered and he thought that the suggestion that to nominations to some the Government departments was a very excellent one. He would at the same time hope that the pupils would not look entirely to that, but would rather try to strike out new ground for themselves—would try to improve the existing industries of the country or direct their knowledge to the introduction of new ones (Applause). In this connection he might perhaps refer to the fact at least what he hoped to be a fact before very long that there was a disposition on the part of the Government to

REMOVE THE IMPORT DUTY UPON RAW MATERIALS.

Now, if that were carried into effect there was no doubt it would give a great impetus to institutions of this kind which directed their efforts to the manipulation of raw material, applying science to it in order to produce the manufactured article. (Hear, hear). He would not detain them longer as there were other speakers. He had great pleasure in being present, but he felt regret at the absence of those whose names had been mentioned. To these names he would add that of the late Sir Samuel Grenier who manifested a great deal of interest in the initiation of the scheme of technical education and not only in the country but when he was at home he worked along with him (Mr. Mitchell) in endeavouring to further the interests of the Institute. How far their labours had been successful that gathering showed (Applause.) He trusted that when the term was over there would be a very excellent record of good work done (Applause). He had not

THE GIFT OF PROPHECY,

but if he did possess it he would be inclined to exercise it that day and say that that school would be a success (Applause). The D.P.I. had asked that promises might be given of prizes; he had thrown out a sort of challenge. Well, he accepted that challenge (Applause) and he would

be very happy to take the first two subjects in the list, drawing and workshop practice, and offer a prize for proficiency in them. (Applause).

The Surveyor-General.

Mr. MANTELL, who was the next speaker, said he had very much pleasure in being present at what was practically the opening of that long talked-of institute. It dealt with a very important branch of education which as it were completed what was begun in the elementary schools, and gave the students a good practical grounding in Science. With his friend Mr. Mitchell he thought the Government had been peculiarly fortunate in having secured the services of Mr. Human, being eminently qualified for the position of Superintendent of that school. One only required to make a round of the rooms to see how careful were the preparations he had made for putting before the student in a practical manner the principles of dynamics and other things. This kind of school had been a great success in the great centres in England—in London, Manchester, Glasgow, Stockport and other places—and he hoped it would be a success in this country. (Applause). There could be no doubt that the Bishop struck the key-note of this institution when he said that it showed the dignity of labour, (Applause.) In this country every description of

HANDICRAFT WAS VERY POOR AND INFERIOR.

Those who knew European countries and were able to compare the work that was done there with the work that was done here could not but be struck with the inferiority of mechanical work of every kind in this country; and they would join with him in hoping that this institution would result in an improvement in that respect. Trades would not be taught the boys there, but they would be taught the principles and the details of work, and that was a great advantage. Reference had been made to nominations being given to students of that Institute for some of the Government Departments such as the Survey and Public Works Departments, and he should say that a good certificate from the Principal of that school showing that the student had been good in his conduct, had attended the whole course, and been a good student, would have great weight with the heads of these Departments and with the Government in considering any applications for situations by these boys. (Applause.) The D.P.I. had spoken about promises being made, and he might say that he intended to propose to Government that all the theodolites, levels, barometers and other instruments of a scientific nature might be sent there to be cleaned and repaired. This he had no doubt Government would consent to, and it would be a benefit to the school and to the students. Those of them who intended to become land surveyors would have the opportunity of seeing a theodolite taken to pieces and understanding the mechanism and construction of the instrument. Another promise which he might hold out was that he thought he would be able to induce some of his officers to gratuitously give lectures to the students on the use of the instruments he had mentioned and on the art of surveying and levelling. (Applause). For himself he might make another promise and that was that he would gladly give a prize for one of the subjects taught and which he would arrange with Mr. Human afterwards. (Applause).

The Director of Public Works.

The Hon. Mr. MACBAIN began by saying that he was afraid there was hardly anything left for him to promise as most of the promises that were

wanted had already been made. He had been asked by the D.P.I. to say a few words to the students who had been admitted to participate in the advantages which, by means of this institution, H. E. the Governor had placed within their reach. In the first place he expressed the hope that they would attend the classes with

PUNCTUALITY AND REGULARITY.

and work with diligence, obey the orders of the master, conduct themselves in an orderly manner, conform to the rules of the institution, and not fail to embrace the opportunities they now had of gaining technical knowledge under Mr. Human who, he believed, was competent to instruct them. (Applause). When the necessity of a Technical School in Ceylon was first alleged it appeared to him that the want, to begin with, could be met, temporarily at least, by schools of Drawing and Design attached to the Government Factory and Railway Workshops; but perhaps it was better, and he had now no doubt it was better that Government should have taken up the scheme in the present systematic manner. He read not long ago that the lack of technical instruction in England was responsible for

THE FAILURE OF THE ENGLISH ARTIZANS

in competition with continental workmen. That was to be deplored, but as technical schools were now to be found in every city and large town in Great Britain the reproach was not likely to be of much longer duration. For his own part he had not that faith in a technical institute that he had in

THE APPRENTICE SYSTEM.

and the aim of this institution he thought should be to supplement that system and not to supplant it (Hear, hear). Government having considered that there was sufficient proof of the need of technical instruction of some sort in Ceylon, had provided for it and the syllabus of the course was now before them. Judging from that syllabus he had no doubt that very great benefit could be derived by the Government Factory Apprentices from that institution and it was his intention to report accordingly to Government. (Applause.) He would venture to suggest and emphasize that the first step to be taken is teaching of

ELEMENTARY DRAWING.

A man who could express his ideas in drawing as well as in writing was very much more competent than a man who could not do so and for a superintendent of workmen or a workman himself facility in drawing was almost an indispensable qualification. Once the students learnt to draw his position was so advanced as to almost completely remove his preliminary difficulties; but they must remember that a certain standard of general proficiency was indispensable so that they might understand the principles of the subjects which they were being taught. He would advise that many hours in each week should be devoted to elementary drawing, and that afterwards the more advanced drawing and fresh drawing should form the second course to be pursued; and he would direct their attention to building-construction, to plumbers' work, decorators' work, modelling and to applied mechanics. Any attempt to

TURN ARTIZANS INTO BACHELORS OF ARTS

was, he thought, to be deprecated, and he was of opinion that there was great danger in filling their minds with ideas beyond those of artizans. In Ceylon they had skilful workers in gold and silver, lapidaries, wood-carvers, stone cutters, jewelers

and other art craftsmen, and he thought that what he was now recommending to them was the course they should adopt in the studies which they should take up there. Mr. R. F. Chisholm, Fellow of the Royal Institute of British Architects, lately a high official under the Indian Government, wrote some time ago admirable notes on technical instruction in India addressed to the Gaekwar of Baroda, an enterprising native potentate whose prosecution of public works had been marked with immense liberality. He would recommend that a copy of this pamphlet should be procured. Mr. Chisholm's view was that some as teachers skilled workmen should be obtained from Europe every year for six months and he placed them in the following order:—(1) carpenter and joiner, (2) painter and glazier, (3) decorator, (4) stone carver, and (5) plumber, and he advised that they should be followed by the higher artisans, (6) potting foreman, (7) superior house decorator, (8) glass-blower. He commended that view to everyone who was interested in the success of this institution. The hon. gentleman then proceeded to say that this was the first occasion he had known of any educational function passing off without mention of the advantages of what was known as the physical education of the Ceylon youth and he hoped it augured well for their future and for their requirements of technical knowledge. He referred to

CRICKET, FOOTBALL AND TENNIS.

He had no desire to speak disparagingly of any of these games, far from it, but this he did not hesitate to state, that the Ceylon youth was too much given to these games, and one had only to pass by any of the open public squares or public spaces in Colombo to see cricket engaging the attention of the Ceylon Youth from seven o'clock in the morning till sunset. (Laughter and a voice: "What about Golf?") He had been asked "what about Golf?" and he could do himself there. He admitted that he was an enthusiastic golfer. Golf, however, was not a game; it was a scientific pastime (Great laughter).

He remembered well that fine soldier Col. Boyes who commanded that magnificent regiment, the Gordon Highlanders, in Ceylon, and who was an enthusiastic golfer, reprimanding a friend who was rather a scoffer at the Royal and Ancient Art of Golf, telling him that Golf was

NOT A GAME BUT AN ART,

and as much an art as painting a picture or composing a poem. (Laughter). He could say to the students that any one of them at the end of six months' practice would find it easier to take the engine there to pieces and put it together again than make a good round of Golf after three years' practice. He would not detain them any longer—he thought he had taken up too much of their time already—but he would give the students one piece of advice and that was to be accurate.

ACCURACY

was the first principle of technical knowledge. It was wise to distrust that which seemed most probable to take nothing for granted. In the matters of detail the whole secret of the world really lay. Let them look to the details and the larger matters would generally take care of themselves. Let them be diligent and obedient to the Principal of the Institution, and endeavour to be wise and active. The wise and the active conquer difficulties by daring to attempt them; the fool and slothful shrink at the sight of toil and trouble and make the impossibilities they fear. (Loud applause)

Mr. Ferguson Editor "Ceylon Observer."

Mr. J. FERGUSON said that while it gave him much pleasure to be present at so interesting a function, still he felt he had been specially invited as a witness to the compact or understanding that day entered into between the Heads of Departments and other official and unofficial leaders on the one side and the Principal of the Technical Institute on the other. The Director of Public Instruction knew how careful they were to record facts and figures in Baillie Street, and so he and his lieutenant, Mr. Human, shrewdly felt that it would be well to have a referee in future years to testify to the covenant that day entered into. But while he (Mr. F.) was ready to make this record, he could not but feel a personal interest in the inauguration of Technical Instruction in Ceylon: indeed in one department he claimed to be a worker in the field; for since Ceylon supplied the world with the finest cinnamon, coconut oil, cocoa, tea, and in its day, coffee, it had rightly got the highest reputation as a plantation colony, and recognizing this fact he, thirteen years ago, had started what might be called a monthly Technical Instructor or Compilation in Tropical Agriculture, now represented by a dozen goodly volumes. Five years ago, the Technical School of Agriculture came into existence, and its Magazine followed, and was incorporated with its predecessor, so that the work of Mr. Driberg and himself went circling round the sub-tropical world, month by month. This carried the name and reputation of Ceylon far and near, as was shown when the head of the Agricultural Department in Washington told him in 1884, without knowing that he was interested, how the Ceylon periodical was valued in his reference library and carefully filed month by month. Now he had mentioned this simply to indicate a possible prospect before Mr. Human and his School: after a time, possibly a "Technical Instructor" Magazine would appear and if it dealt with the very interesting indigenous handicrafts mentioned by the Director of Public Works, in their present or original mode of working and then after the application of Western Science, that alone would make the magazine of interest far beyond the bounds of Ceylon. But whether such a publication appeared or not, of one thing he was quite sure: that Mr. Human's pupils, after supplying pressing local requirements at first, would very soon begin to look beyond the island for a field for advancement. Already young Ceylonese were doing good work in the countries all round them, some getting as far as South Africa and America; and most certainly young men trained to a handicraft, as Mr. Human would have lads of the right stamp trained, could look the whole world in the face and go anywhere. With so many of the island's sons going out in this and other ways, a favourite toast in Ceylon would soon be the old Jacobite one of "Over the water." Of course, there were drawbacks to young men in beginning technical work here; one had been referred to in the traditions of indolence which appertained to the people and island. But other countries had their adverse traditions, for instance on the Borders of Scotland, the ancestors possibly of His Excellency the Lieutenant-Governor, certainly of himself (the speaker), were ill thieves and robbers:

"They stole the bees that made their broth,

From England and from Scotland both."

(Laughter). Fortunately in his own case, his forefears had moved a long time ago to the Highlands where there was little or nothing to steal and so they had to go to work. What he

would like to see revived to some extent in the present day was the old proverb on which the Jews acted that parents who did not train their sons to a handicraft tempted them to become thieves. Fortunately Mr. Ruskin's teaching was beginning to take deep root and attached to nearly all Public Schools now in the old country were carpenters' if not engineering shops. They had all been taught to admire self-made men, but trained skilled hands were better as might be seen from that master of humour, O. W. Holmes' description in the "Autocrat of the Breakfast Table" of the self-made-Irish Carpenter's house built by himself from drain to chimney top.—Now he would wish to press on the 63 pupils enrolled that day, that in a very special degree the reputation of the new school would depend on how the first year's class did credit to their Principal and his Assistants. Let them remember, too, that they were part of a large band of Technical students at work in the world, although so far as England was concerned, only 20 years had elapsed since the movement began, 10 since the Central Institute at South Kensington was formed and only 5 years since the English Act for the promotion of Technical Instruction was passed. In conclusion he would urge the pupils to remember that half efforts never accomplished anything, and while taking advantage of the instruction, the apparatus and opportunities presented them in the School, to realize that for their advancement they must rely mainly upon themselves. The plodding industrious lad who was temperate in all things and careful about the little habits which went to build up a solid character—the most valuable thing in the world,—never failed to get on. A capacity for taking pains about little things was among the most valuable of the talents; and he would wish them to enter into the meaning of a good old Scotch saying with its modern application,—“there's nae luck like pluck.” When they were faced by difficult, long or laborious tasks, let them recall the favourite proverb of Sir Walter Scott—himself one of the hardest of workers—“Time and I, gentlemen, against any twol” (Applause).

The Solicitor-General.

Mr. P. RAMANATHAN afterwards made a few remarks urging the students to consider well what had fallen from the other speakers. When they assembled next year about this time he fancied they would not have to listen to speeches, but to listen to the results that the students had achieved under the instruction of Mr. Human and his assistants. As a native of Ceylon he would be most pleased to hear that they had utilized to the full all the advantages which they had. (Applause)

The Lieut. Governor.

HIS EXCELLENCY then said it must be very gratifying to the Director of Public Instruction and to the Superintendent of the Institute, as it had certainly been to him as the principal officer of the Government to find that so many leading members of the community were in a position to take and express a practical interest in the institution and to promise encouragement and co-operation. It was a disappointment to them all that His Excellency the Governor had not been able to be present. His Excellency, as those who had worked with them in bringing the institution to the present point knew, had taken a great interest in its starting of the Technical School, and it was only from the unavoidably short notice in fixing this meeting and from the Governor having made other engagements, that he was prevented from being

there. This might be looked upon as the formal opening of the school, but from what the Superintendent had stated it would have been gathered that the institution had already been opened and been at work for some six or seven months, and he thought the Director of Public Instruction and the Superintendent had done wisely in waiting to ask them to come there until the workshops had been completed and fitted. Although Mr. Human had been in their midst for nearly twelve months, and they were only now having the first formal meeting in connection with the Institute, he had been by no means idle. When Mr. Human came first among them he found them, as he would not tell them but as he (H.E.) was prepared to confess, utterly ignorant as to the mode in which they should arrive at the objects and which they seemed to be coming so near now, and he had converted the place as they had seen that day into a scene of very very practical industry. (Applause.) Some of the speakers had been good enough to make complimentary remarks regarding what Government had done in promoting this institution. It was always very agreeable to give and to do a good thing, and he was very glad of the opportunity of expressing the obligations which he as a member of the Government, and he was sure the Governor himself felt to the gentlemen who had given their counsel and kind assistance in the work. Mr. Mitchell had taken the warmest interest in it, and Mr. Geo. Wall, whose absence he joined with the others in regretting. He was sure that it would have been most gratifying to the venerable gentlemen who had taken such a special interest in the institution—and he believed from associations of his youth had special reasons for being interested in such work—to have been present and to see the excellent start which the Institution had made under Mr. Human. He joined too in the remarks which had been made as to the absence of another gentleman, Mr. Grinlinton, but he would soon be among them. He had been absent nearly thirteen months doing most useful work and they hoped to be able to cordially welcome him back again in a few days. He had their work most thoroughly at heart and in his usual business life and practical manner furthered its objects. His two colleagues in the Government service had anticipated some remarks he had intended to make in the direction of the hope that might be held out of appointments in their respective departments of Survey and Public Works to boys who passed through that College, for he was sure that the education which candidates from that College had would relieve these officers of a considerable amount of trouble in technical education, but he wished the boys not to look to the Government Departments for their best employment or as their chief goal. He hoped they would go out and get employment on their own account and do much better than they could in the public service. (Applause.) He would be glad if one of the effects of the instruction imparted in that College was to divest into other employments a great number of those who now flocked into the clerical service not only of the Government but of the colony generally where they received far less pay than they would receive as practical mechanics. He thought he was right when he said that in the Railway Department and possibly the Public Works Department there were natives who had worked up from boys and now earned R3 or R4 a day which they never would get in the clerical service except under the most fortunate and exceptional circumstances. His hon. friend

on his right (Mr. Mitchell) had referred to a subject which certainly had a connection with the object of that institution, and that was the duty on raw material. He was not aware whether his hon. friend was trying to draw him, but this much he would say, that the abolition was one which he thought had the sympathy of every officer of the Government, certainly within the last six years, but the difficulty was whether that would be the only point in the tariff that would be touched. If his hon. friend would undertake that that would be so a very great difficulty would be removed from the way of the Government. (Hear, hear.) Before sitting down he would like to say that Mr. de Soysa, for himself and Lady de Soysa, had been good enough to say that he and Lady de Soysa would each give a prize to the Technical Institute. (Loud applause). He was also authorized to make another gratifying announcement and that was that Messrs. Walker Sons & Co. had been good enough to offer for competition among the students a free apprenticeship in their large and important workshop, and that the "Times" Printing Office had made the same offer. His Excellency concluded by congratulating Mr. Human on the success which he had so far attained and offering best wishes for continued success in the responsible work he had undertaken. It had been very gratifying to him to be present and he hoped they might have many more as successful—meetings in the future. (Loud applause).

The proceedings terminated with cheers by the students for His Excellency, the Bishop and other speakers and the ladies.

A letter we understand was received from Mr. Pearce, General Manager of the Railway expressing his regret at being unable to be present owing to his having to go upcountry and promising all the support in his power to the Institute.

We take the following from the local "Times":—

DESCRIPTION OF THE BUILDING.

The entrance is exactly opposite the Colombo railway terminus. Entering the gates one crosses a barbecue, flanked on one side by a long building, some 300 feet in length, and at the top by a more compact block about half the length. The former building is utilised as the workshop in the metal-work and wood work branches; the upper building being devoted to physics, mechanics, drawing, and mathematics, while the reading-room, the lecture hall, and the secretariat offices are also here. The centre of the barbecue is broken up, and one soon learns that this is the result of the principal of the school being firmly imbued with the doctrine of *mens sana in corpore sano*, the demolition of the barbecue having been started to make room there for a tennis court. Entering the school by the ordinary door, one finds oneself in a hall which is in every way suitable. There is an office near the doorway in charge of Mr. Hoole, the clerk and registrar, and opposite on the notice-board are several announcements not the least interesting, being a list of the pupils who have enrolled themselves, and who number in all 63. Near the entrance hall is a small reading room—at present without reading material, but in which it is hoped to eventually establish a small library for the use of the pupils. Above the entrance to the school is the office for Mr. Human, the Superintendent, and Mr. VanDort, the assistant Superintendent, while, making one's way through this, one reaches the mechanics and physics laboratory.

THE LABORATORY.

The latter is already fitted with appliances for laying a foundation of technical knowledge. For instance, at one side of the hall there is a rather elaborate cistern for measuring the flow of water,

which, of course, depends upon the head, or pressure brought to bear on it, and the size of the orifice through which it passes. There are many ways of regulating the pressure provided, and, further, there are many sizes of orifices to be used in the measurements. There are also several apparatus for finding out the laws of friction; others for demonstrating the principles of the beltings used in shaftings; others again for finding out the energy stored in revolving bodies; others for finding out the resistance of beams, &c., &c., &c. The stock of appliances is not large, but it is nearly enough for present purposes and, furthermore, there is this to be said of it—it was all made here.

THE LECTURE HALL.

Adjoining the mechanics room is the Lecture Hall, where today's gathering took place. This is a light and airy building with seats rising one above another from the Lecture platform, which is provided with the familiar blackboard and instructors' table, 70 or 80 can be seated comfortably in the hall, and at a pinch a hundred could be accommodated. Going on through the building, one comes to the drawing school a big hall exceedingly well-lighted. This is fixed up with 25 separate tables and chairs, each pupil having a separate chair, table, drawing-board and J. square. All the necessaries here are made of Ceylon wood, and they were all made at the school; and it is noteworthy that this is the first time Ceylon timber has been successfully used for drawing boards. They are all made of *Unamadilla*, and are very suitable, all the boards having kept their shape well, a thing that has not been attained before. For the present only mechanical drawing will be attempted; but later on the pupils will be set to plan drawing and survey-drawing.

THE WORKSHOPS.

Adjoining the drawing-room is a class room to be used chiefly for mathematics. Here again provision has been made for 25 scholars, and it may be remarked that 25 has been taken as the unit in the arrangements. Mr. Human himself fixed it at 25. Government never expected to get more than 10, and then thought that the scholars would have to be paid to come, whereas all the 60 odd students who have enrolled themselves are paying as much as R70 a year. Passing from the top block to the long building, one comes first on the fitting shop and the metal-working shop, which is fitted with 12 vices and well supplied with tools, many of which, we may mention, were made on the premises. In the centre of the metal-working shop there is a 5-horse-power vertical engine, supplied by Marshall, Sons & Co. and to this is attached a shafting which already drives machines for turning, drilling, and planing metals, but will eventually drive the machinery used in wood work. The place is excellently fitted up, and this fact the more impresses itself on one when one hears that in raising it the authorities had no such aids as pulley-blocks and screw-jacks, there having been a difficulty in getting them. In this strait Mr. Gabriel de Silva, a clever Sinhalese, formerly with the Commercial Company, was very serviceable, and great praise is due to him for the result accomplished, all the machines having been set dead true. The wood-turning lathes are being made at the school itself, and are already well under way. There will be five of them all. These will be fixed in the wood work-shop which is a continuation of the smithy (a shop-fitted with forge, anvil, and tools, and continuing from the metal-working shop.) There are ten carpenters' benches with additional appliances, such as straight edges, shooting boards, &c., and there are other tools of excellent designs in an almshouse.

ATHLETICS.

Passing through the carpenters' shop one comes out again on the barbecue with its embryo tennis court, and learns that already an athletic club has been started, and that the scholars are now doing all they can to get a cricket ground of their own and to establish a T. S. C. C. as soon as possible.

Such was the building in which the meeting took place today (Jan. 19th), and where the scholars will begin work in earnest on Monday next. Much has been accomplished and Mr. Hume and his assistants deserve great credit for what has been done. More, of course, remains and it will be some time before everything is complete; while eventually the question of securing another building will have to be gone in to, as the present buildings are only intended to be temporary. For the present, however, they will do very well. It is time, though, to get on to

VARIOUS AGRICULTURAL NOTES.

TEA AND ITS ENEMIES.—We call attention to the planter's letter on "Mosquito Blight"—the very troublesome pest sometimes affecting Ceylon tea, as it so often does that of India. The call for united action and even special legislation, is by no means unwarranted.

WELL WORKED TEA would give an easy average of 1,000 lb per acre in S. Wynaad, writes Mr. A. C. Griffin in the *Nilgiri News*. "It is *par excellence* the district for tea, if the labour question can be satisfactorily arranged—and, this being so, I would most certainly recommend tea capitalists to give the district their attention."

PLANTING IN NORTH BORNEO—in coffee and tobacco especially—is beginning to attract a great deal of attention in the home press, and we should not be surprised to see a good deal more of British capital flow in that direction. There is a settled Government, fair amount of labour and easy transport; and coffee is going to be a scarce product.

THE PRESERVATION OF WOOD.—In a communication to the Paris Academy of Sciences on the preservation of wood from larvæ, M. E. Mer says that the sapwood is attacked because it contains starch, and the hard wood is presumably free from attack because it has ceased to contain starch. He proposes to ring the trunk of the tree at the upper part in spring, and suppress all buds, the idea being that the alburnum will thus be cleared of starch by the autumn, and the trees may be felled as soon as the leaves begin to fall. It is suggested that carpenters and joiners will be able, if this practice is pursued, to use a portion, or nearly all, of the sapwood. There are, however, other reasons why sapwood should not be used except for the very commonest purposes; but the experiment is worth trying, if one knew the best age of the tree.—*Public Opinion*.

TEA PROSPECTS are improving and it looks as if the bottom price were reached recently when the local markets average was only 34 cents. Reuter now reports a firm market at home and we trust the improvement will continue. As regards the current year's exports, if Australasia takes 10 million lb., and all other countries outside the United Kingdom 5 million,—which it is not unreasonable to anticipate,—we might reckon on the total exports to the mother country from Ceylon in 1894 exceeding those for 1893 by only a very few, perhaps 2 or 3 million lb.—Since writing the above, we find corroboration of our estimates in this mail's Report from Messrs. Forbes & Walker who estimate as we did, about 90 million lb. as the total for Ceylon exports in 1894, of which 78 may go to the United Kingdom—that is about 2½ million lb. more than in 1893.

BONDING TEA FOR BLENDS AND DIFFERENTIAL DUTIES.—The Planters' Association and Mr. Harcourt Skrine's letters elsewhere raise some most difficult questions; our last suggestion—and one that should meet the immediate difficulty—is to enter into a separate arrangement with the Travancore Native State for its teas to be admitted

freely to the Colombo markets. Treat Travancore in fact in every respect as an outlying district of Ceylon which it virtually is. But this, after all, can only be a temporary expedient; for the interests of the port of Colombo—as a great Central Trade Depôt for the East and South—cannot for long be subordinated to the maintenance of these import duties on tea and bark. When Ceylon tea has been twice rejected on its own merits by the Melbourne Customs and sent back to Colombo, we are scarcely in a position to boast of the name of "pure Ceylon tea." Is it not a fact that our tea is all sold now whether in the London, Australian or American market, entirely on its merits?—In respect of Mr. Skrine's letters, there is no question that a very important debate can be raised in the House of Commons as to the effect on Indian and Ceylon teas *versus* China, of the official interference with the rupee; and we see no reason why this discussion should not be raised on a United British Planters' Petition? It would be most interesting to hear what Mr. Gladstone would say on the question of the Indian Government *establishing a differential position in favour of China and Java teas!*

PLANTING IN THE NEGOMBO DISTRICT.—We call attention to the interesting notes on last year's experience placed at our service by a planter in the Negombo district (see page 549). Poor old cinnamon—once the Queen of Ceylon Products and almost the only one whose original habitat is with us—has fallen so low that even the villagers have given up cultivating it, or rather have rooted it out,—“why cumbereth it the ground,”—and its production is now almost entirely confined to the regular plantations. What has been lost in cinnamon, has, however, been more than gained in the popular and prosperous coconut palm; while it is of special interest to learn of successful experiments with cacao in the Negombo district and of the growth of pepper. This last is a product which every Assistant Agent ought to try to push among his headmen and villagers. In the time of the Dutch, Ceylon was considered of more importance as a producer of pepper, than even of coffee; and in the Kegalla district with both sides of the Kelani river to the coast were the best pepper growers. Why should they not be revived?

CURIOUS BOTANICAL FACTS (?) IN "FOUL PLAY."—A correspondent writes:—"I have been reading 'Foul Play,' by Charles Reade and Dion Bouicault; and have been greatly amused with the botanical absurdities committed by the writers in their description of the resources of 'Godsend Island' in the Pacific. The narrative altogether reminds one forcibly of that old friend of our youth, 'The Swiss Family Robinson,' but surpasses the latter in some respects. Fancy a mattress made of plantain leaves, sewn together with thread from the same tree! (The plantains, by the way, are described as 'long yellow pods, with red specks, something like a very large banana!') Plantain leaves are also used for walls to a house! Then we are told that the hero 'gathered a few cocoa-nuts [*sic*] that had burst out of their ripe pods and fallen to the ground'! Again we read of 'cocoa pods' each as big as a large pumpkin (coconuts are evidently meant). The heroine is naturally 'very proud of some pods she had found with nutmegs inside them'; and this same young lady, after a severe illness, when too weak to walk, makes a rope of coconut fibre (how she got the latter is not said) forty yards long; and this rope the hero takes in his teeth, climbs a coconut palm eighty feet high, and hauls up a heavy spar, all by himself! It is altogether too funny."

DR. VOELCKER ON INDIAN AGRICULTURE.

In previous articles we have dealt more especially with Dr. Voelcker's remarks and conclusions regarding the principal details of agricultural practice in India, and we shall now proceed to discuss his recommendations for its improvement. It may be well to note in passing that he is of opinion that the ryot is very ignorant in regard to the selection and change of seed, as well as most improvident in this respect. He accordingly recommends that the Government should undertake seed-growing on an extensive scale. "There ought to be not only experimental farms," he says, "but seed-growing farms, where the ryot could buy pure and good seed at a moderate cost"; and "not only must the seed itself be available, but encouragement and facilities must be given for the purchase of good seed." To this end he recommends that the system of making loans for the purchase of seed should be extended and developed in ordinary times, as well as in times of drought. This of itself is an extensive programme for our Agricultural Departments to undertake, and it is to be hoped we shall see some genuine effort put forth to secure the benefits that should result from the adoption of a really good system of seed supply. In connection with this subject it is worth while to quote another statement of the learned Doctor, to the effect that an impetus can, in some cases, be given to the extended cultivation of remunerative crops "by the adoption of better modes of cultivation or of manufacture"; and again: "I believe that good may be done, also, in increasing the variety of crops grown, and in obviating thereby the placing of so much dependence on one crop alone." "Improvement," he states in another place, "both in crops and in their cultivation, may be effected by a transference of the methods of one country or locality to another, and he mentions numerous instances where local Indian practices might be advantageously transferred from one district to another, observing that "the practice of other countries, as seen in the case of the many imported crops now common in India, as also in the planting of sugarcane, may often be usefully adopted."

Dr. Voelcker's main conclusion, however, is that though in some parts of the country the agricultural practice is so good as to leave little room for improvement, in others there is considerable scope for it; whilst we have demonstrated, by a detailed examination of his remarks on certain specific items of practice, that the scope for improvement is on his own showing much wider, and that the subject imperatively demands attention. Still, he is probably correct in saying that the first effort at improvement in the more backward districts should take the form of instruction in the better practices of the most advanced Indian agriculture, except in those most important matters with which we have already dealt, viz., the management of life-stock, the supply of manure, the tillage of land, and the supply of moisture for the sustenance of the crops. The main difficulties in the way of improvement doubtless are the prevailing ignorance of possibilities, and the want of power to appreciate those possibilities. Dr. Voelcker tells us that our Agricultural Departments themselves have not at present this knowledge, nor are they so organised and equipped as to be able to properly study the possibilities of improvement, which it should be their duty to demonstrate to the people. Another difficulty is that education has not yet reached the masses, while the tendency of education in the past has been in too purely literary a direction that draws the rising generation away from the land. Again, "the condition of the cultivating classes, the peculiar circumstances under which husbandry is carried on, the relations of the State to the people, and many other factors, have to be taken into consideration," before suggestions for the improvement of Indian agriculture can have a reasonable chance of being carried out. Agricultural education and organised agricultural enquiry are named as the means of overcoming these difficulties; and we propose to say

a few words regarding each. We shall first of all deal with the latter agency, reserving our remarks on education. In the matter of agricultural enquiry, then, Dr. Voelcker sub-divides the subject into practical enquiry, scientific enquiry, and enquiry by means of experimental farms. The former must, he says, precede both the latter, and he defines it as to the obtaining of knowledge respecting agricultural practice "as it now is, of the practical issues involved, of the conditions under which it is carried on, and of the rationale of existing practice. "Before any improvement in the agriculture of a country can be effected," he writes, "the first preliminary is that a knowledge of the country, its conditions, and its needs, be obtained. I may also say that, as regards India, comparatively little is known of its agricultural methods, and they have only been, so far, the subject of casual and isolated inquiry by individuals. —Indian Agriculturist.

LOCAL TEA-PLANTERS (says the S. of I. Observer) do not seem to be yet aware of the fact that their monopoly in the South India markets will shortly become a thing of the past. Mr. Lipson is a strong man, and men who go in for the grocery pound-packet line will shortly be fancy, be inclined to be abusive when this gentleman's name is mentioned. The flavour of his tea may perhaps rival its cheapness, but a combination of the two is formidable.

THE MAGAZINE

OF

THE SCHOOL OF AGRICULTURE,

COLOMBO.

Added as a Supplement monthly to the "TROPICAL AGRICULTURIST."

The following pages include the contents of the *Magazine of the School of Agriculture* for February:—

Vol. V.]

FEBRUARY, 1894.

[No. 8.

A FOREST SCHOOL.

THE idea of starting a School of Forestry in connection with the School of Agriculture has as yet merely been mentioned, and some little time must no doubt elapse before it takes a practical form. There is no question that the suggestion is an excellent one, and the fact (mentioned on last prize-day at the School of Agriculture) that the Conservator of Forests is in favour of it, augers well for the project, for with Mr. Broun's experience as a professor at the Imperial Forest School, Dehra Doon, and as the present head of the Forest Department in Ceylon, his co-operation in formulating a scheme for the study of forestry will be invaluable. The proposed new departure of specially training all young men who will in future be employed in the Forest Department, in whatever capacity, should, moreover, meet with the highest approval of advocates of technical education.

We often hear and read of the neglected raw products of our native forests which might be turned to useful account. With the employment of intelligently trained forest guards, surveyors and overseers, a preliminary step will have been taken towards a better study of the natural resources of this country.

The proposal to affiliate the Forest School to the School of Agriculture is also a happy thought, since the two institutions will manifestly have many common subjects for study, and be mutually helpful to each other, while the cost of carrying out the new project will no doubt be lessened by the proposed affiliation.

OCCASIONAL NOTES.

Professor Hendrick, lecturing lately on the subject of "Farmyard Manure and Sea-weed,"

advised farmers to take care of the soluble portions of both kinds of manures.

How many hundreds of pounds have been lost by farmers through the escape of the soluble portions of the manure heap? This is a question not easily answered, and scientific lecturers on farming can render no greater service to the agricultural community than by insisting on the fact, and suggesting methods for preventing the waste. 100 lb. of cows' dung contains $\frac{1}{2}$ lb. of ammonia and $\frac{1}{2}$ lb. of phosphates, while an equal quantity of the urine of the cow contains thrice these amounts of both constituents. Potash, on the other hand, is about equally divided between the dung and the urine. The quantities of these constituents appear small when compared with what of them can be obtained in much less bulk of artificial manure. But farmyard manure performs other functions, and the urine being so much richer in these principal constituents, it is of the utmost importance that it be absorbed by materials which give the best possible results as general manures. Therefore it is of value to know that, as an absorbent, peat-moss litter stands first; then comes straw, and last of all sawdust. The last is the best absorbent, but in fertilising properties of its own it is very deficient. The most serious loss to the farmer, however, does not arise from the use of defective absorbents, but from the leaking away of a valuable liquid manure, which is thrown off in fermentation. All this should be saved in tanks rendered impervious by clay-lining, and all manure beds should be similarly dealt with,

Soluble, when freely interpreted, means being easily washed away with water, and seeing that sea-weed was taken out of the water, this at first sight appears a somewhat foolish observation. But sea-weed when in the water was alive, and deriving sustenance from its natural element; when placed on the land it died, and its cells being broken, what became soluble could not be replaced. The lesson obviously is to apply sea-weed to the land directly, and let the soil to

be fertilised secure all the benefit possible from the escape of the fertilising agencies. Bulk for bulk, sea-weed and farmyard manure contain about equal amounts of water, carbonaceous matter, and fertilising properties. The proportions of ammonia in both are about equal; but in sea-weed there is more potash and less phosphates. Consequently, it is a highly useful ingredient in promoting the growth of clover, and when supplemented with phosphates it is one of the best land manures for turnips or other crops. Farmers who have a strip of beach on which is cast up the wreckage of the waves, are thus well off, and do well to husband all their resources.

The older and commonly accepted belief is that cellulose is a definite chemical substance which constitutes the cell wall or framework of the plant's tissue; that in young plants this material is softer and more soluble than in older plants; that, in short, as the plant matures the cellulose gradually becomes converted into—or, to put it more correctly, the cell wall becomes encrusted with—a substance called *lignin* or *lignose*. This lignin abounds in "woody" vegetable matter, and is the substance to which its woody character is owing. This is the commonly-accepted belief; but recent researches in this interesting but extremely difficult department of agricultural chemistry tend to show that the real nature of cellular tissue is by no means so simple, and that cellulose, instead of being one substance, is made up of a number of different substances, and that, further, its nature differs with its source. Thus we have the celluloses, got from different sources, distinguished from one another according as they are associated with bodies such as lignin, pectin, pentosan, and fat. Thus the cellulose of flax is known as pecto-cellulose, because it is associated with pectin bodies. Similarly straw cellulose is known as pentoso-cellulose, ligno-cellulose (jute), and adipo-cellulose (the cuticle of potato or apple). These different kinds of cellulose differ considerably in the percentage of carbon they contain, and are also distinguished by other chemical properties which we need not enumerate here. The important practical point to be noticed here is that cellular tissue is a substance which differs in different kinds of plants, and that even in the same plant it differs in different parts and at different stages of its growth. Imperfect, therefore, as our knowledge of the nature of cellular tissue—revealed by recent research—is, it serves to increase our mistrust in the present method of estimating "soluble carbo-hydrates."

GROUND NUTS.

The cultivation of ground nuts and the extraction of ground-nut oil, have been more than once recommended by us as a suitable industry for the natives of Ceylon, and it would now appear (from the following notice in the *Indian Agriculturist*), that the prospect for those adopting it, should be a bright one.

It may be remarked that the exportation of

ground-nut oil from Pondicherry to Rangoon, Singapore, Mauritius, and Calcutta is assuming a very important aspect. According to the report of the Pondicherry Chamber of Commerce for the first nine months of the present year, just published, it appears that a total of 15,177 barrels of this oil has been exported up to 31st October last as compared with 11,845 barrels in a similar period last year; and that during three months ending 31st October 2,257 barrels have been exported to Mauritius as against 350 barrels exported during a similar period of last year. This shows a very rapid growth of this trade, especially with Mauritius, and by the end of the year it will show still more favourably as there are one or two sailing vessels, that are expected, that are already chartered to take full cargoes of ground-nut oil to Mauritius. The despatch of this oil to Calcutta in any large quantity has only been of recent occurrence, but it seems to be increasing, as 550 barrels are being shipped in the *S.S. Palitana* for Calcutta. It is a remarkable thing that this industry is entirely in the hands of the natives. The north end of Pondicherry is covered with small oil mills, and they are at work all day long. The village of Valavanour in British territory, about 6 miles from Villapuram on the Pondicherry branch line, also supplies a large quantity of the oil for exportation. There are no less than 300 mills that work in this village. There is no doubt that it is difficult to compete with the native method, as the plant of an oil mill of native construction will probably not cost more than R20, and the labour is carried out by bullocks, which alternately till the ground on which the nut is cultivated, haul the produce to the mills, turn the mills themselves, and, when the oil is made and put in barrels, drag the barrels to the station, and finally are fed entirely on the leaves and stalks of the *arachis* and the oil-cake that remains after expression of the oil. It is here that European methods might find an outlet, as the rude oil machines of the native only expresses from 25 to 30 per cent of oil from the nuts that contain over 50 per cent, and recently efforts were directed towards attempting to heat and re-crush the oil-cake; however, it is evident that the second and third crushings which take place under steam or hydraulic power are more expensive than the first, and further both together do not give more than 20 per cent additional oil, and that of inferior quality. It has, therefore, been proposed, and put in practice, at Marseilles, where most of the ground-nuts are treated, to extract the second oil chemically, by the aid of sulphate of carbon. This is found to extract nearly all the remaining oil at a very much lower cost than re-crushing, and the oil thus produced is not inferior to the second and third oils extracted by the old process. There is, therefore, but little doubt that a steam mill that combines the two processes, viz., extraction of the first oil by pressure, and of the second and third by chemical process would be much more economical and likely to succeed. As it is a success in Marseilles, there is no reason why it should not be so in India also.

We read that the cultivation of the plant is about to be introduced into Borneo.

INDIAN JOTTINGS.

All land here is ploughed with the native plough, an implement not much superior to the Sinhalese one. It prepares a nice seed bed and one cannot see the reason why the plough is not more generally used in Ceylon in dry land cultivation. After the first ploughing the cultivator uses a leveller to pulverize and level the soil. This leveller is made similar to the Ceylon one but with one exception, in that it has a concave sharp metal surface where it touches the ground, whereas the Sinhalese implement is simply a plank of wood. I am inclined to think that this plough and leveller are not capable of being improved to any great extent, far less of being replaced by any European ones, for the soil is often so shallow that a deep furrow would be most undesirable, and it is no wonder that such eminent agriculturists as Dr. Voelcker and Professor Wallace have agreed that the native implements cannot be replaced on most Indian soils.

With the exception of one or two plants, such as the Ramle and Crotalaria, which are sown very thick, most of the crops are grown in systematic lines. It was not an uncommon sight to see even twenty to thirty acres of land planted with Indian corn, cholom or dhall in regular lines equidistant from one another; and even in the case of such small grain as the varieties of millet (*Setaria*, *Panicum*, *Paspalum*, &c.), the seed are sown in shallow furrows made about a foot apart. This system of growing plants has many advantages over the careless system of throwing seed broadcast.

I must not omit to mention the manner in which the seed is sown in lines. Stretching a rope and making furrows with the mamoty would consume so much time as to make regular planting a tedious and almost an impossible task. All the furrows are made with a plough, and just at the time the furrow is being made the seed is dropped in by another contrivance attached to the plough. This latter is nothing but a long funnel ending at the share. The wide mouth of this funnel lies alongside the handle of the plough and the tube runs as far as the ground. The ploughman guides the plough in quite a straight line, making a furrow of the required depth, and a woman, or a boy, with the bag of seed attached to her or his neck, keeps holding the funnel with one hand and dropping in the seeds,—at the same time covering the furrow slightly with soil.

The system of growing several crops in the same land in different lines has many advantages. It is said that the Japanese and the Chinese always follow this method. But in China and Japan the cultivator pays a deal of attention to manuring, whereas in India, manuring is a much neglected item in agriculture. The fertility of the lands are kept up to a great extent by this system of growing a variety of crops. For instance, in a plot of land we meet with four crops, a line of cotton, one of corn, another of dhall, and the last of a fibre plant, dry hemp. The four plants being distinct types, do not exhaust the same elements of plant food,

while the leguminous crop serves as the nitrogen supplier to the rest.

The average rainfall of the districts I was just speaking of was said to be only 35 inches, but at the time I saw the place, the soil all through had a fine moist appearance. The natural rainfall being so small, the cultivators are accustomed to adapt themselves to the surrounding conditions, and they have become adepts in the art of irrigation, without which instead of smiling fertile fields we will very probably see a tract of waste land.

Bombay, 28th Oct. 1893. W. A. D. S.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

SUB-KINGDOM V. MOLLUSCA.—The Mollusca derive their name from the fact that they are usually soft-bodied (Lat. *mollis*) though they generally possess a hard outer covering or "shell," and hence the term "shell-fish" applied to the members of this sub-kingdom.

The following are the characteristics: animal soft bodied, usually with a hard covering or shell; not exhibiting any distinct segmentation; nervous system consisting of a single ganglion or of scattered pairs of ganglia; a distinct heart and breathing organ may or may not be present.

The sub-kingdom mollusca may be conveniently divided into two divisions: molluscoida and mollusca proper.

Under molluscoida come (1) the Polyzoa, animals forming compound growths or colonies both in the sea and in fresh waters. They possess no heart, and the mouth of each member of the colony is circled by ciliated tentacles. The sea-mats and sea-mosses belong to this class. (2) The Tunicata, animals either simple or compound, enclosed in a leathery or gristly case, and possessing an imperfect heart. The leathery integument referred to is remarkable for the fact that it contains what appears to be nearly if not quite identical with "cellulose," the starchy body which forms the woody parts of plants. The Tunicata are commonly known as "sea squirts" owing to the power they possess of ejecting a stream of water when touched or otherwise irritated. The Tunicata are all marine animals. (3) Brachiopoda, animals simple, enclosed in a bivalve shell, having the mouth furnished with two long fringed processes or "arms." To this class belongs the so-called "lamp shells" so commonly found on the seashore. All the Brachiopoda are natives of the sea.

The Mollusca proper may be also placed in four classes: (1) Lamellibranchiata, animals having no distinct head or teeth, with the body enclosed in a bivalve shell, and one or two leaf-like gills on each side of the body. To this class belong the oyster, muscle and cockle. (2) Gastropoda, animals possessing a distinct head and toothed tongue, a univalved or multivalved (never bivalved) shell, and moving about either by creeping on the flattened undersurface of the body ("foot") or (when swimming) by finlike modifications of the same. To this class belong the whelk, periwinkle and snail. (3) Pteropoda

minute oceanic animals swimming by means of two leaf-like appendages on each side of the head. They are found in all seas and sometimes occur in such numbers as to discolour the water for miles. They constitute the chief article of food of the whale and are themselves carnivorous. (4) Chephelapoda, the last and highest class of the mollusca, animals with eight or more processes or "arms" placed round the mouth, which is furnished with jaws and a toothed tongue; they also possess two or four plume-like gills, a muscular tube or funnel placed in front of the body, through which is expelled the water used in respiration, and either an external shell or an internal skeleton. To this class belong the cuttle fish and their allies, the ammonites, the paper and pearly nautilus. The pearly nautilus is well known by its beautiful shell, which is coiled into a spiral, and is composed of many chambers walled off from one another by curved shelly partitions, perforated centrally by apertures, which transmit a membranous tube or "siphuncle." The separate chambers of the shell are filled with gas, and appear to act as a kind of float, reducing the specific gravity of the shell to near that of the surrounding water. The animal inhabits only the last and largest chamber of the shell.

ANTHRAX.

Re anthrax and anthracoid diseases in Ceylon: there is cause for suspicion that they prevail in many places, but remain undetected, and are often communicated to man also. The following cutting which I preserved from the *Ceylon Independent* some months ago, is very suggestive of anthrax. However, the affection may however quite possibly be something else altogether:—

A NEW DISEASE?—A correspondent writes to a contemporary:—"For some considerable time past a disease named by the native 'Beebula Ledda' has been travelling through the villages of Pittagalla, Omattee, etc., in the Bentota Korale, and has now made its appearance at Elpitiya. The disease begins with fever, and then one small watery bubble (Beebulla) becomes visible and the patient dies. It is said the disease is highly contagious, and the native vederalas have no treatment."

In this connection there was a long correspondence in the vernacular papers and one correspondent had mentioned the fact, that the disease was first prevailing among cattle and subsequently effected men.

Anthrax is caused by the presence of a *Bacillus* which multiplies rapidly in the animal body and destroys the vitality of the blood, and the *Bacillus Anthracis* is one of the most easily detected under the microscope. So it would be well if a Veterinary Surgeon, or for the matter of that a medical man were to examine the alood of *Kandamale* cattle or *Bibulaleda* man and determine whether any anthrax Baccili are present, and if so the connection between cattle *Kandaamle* (or as it is now termed *Laryngitis Contagiosa*) and *Beebulaleda*.

W. A. D. S.

FROM THE NORTH.

The paddy crops now growing in Jaffna have been injured by an insect called *arakkoddiyan* which is the larva of a butterfly common in the North. Although some attempts were made by the cultivators to get rid of the larvae by collecting and destroying them, yet they had come in large swarms and had done their worst in several parts before their ravages were checked. These caterpillars had also eaten up the grass which grew along the ridges of the fields, and some cows which were fed with the worm-eaten grass happening to die almost immediately after, their death was attributed by the villagers to some peculiar effect of these larvae. A study of entomology would be very serviceable in combating the attacks of such insect pests.

2. The young paddy plants that were eaten by the insects revived and grew up when the welcome showers of rain fell about X'mastide, and if a few showers fall again this month (January) they would make the paddy recover considerably from the havoc caused by the pest and bear fairly good crops.

3. While the paddy-fields in the North frequently suffer from want of water, it must be remembered that there are lands in the centre and south of the Island which are injured by too much water. For an excessive and injudicious use of water is quite possible even in the irrigation of a semi-aquatic plant such as the paddy. Moderate flooding and drying in alternation at suitable stages seems to be best for paddy; and this, I believe, has been proved by the Hon. Mr. Elliott, (who always takes an active interest in paddy cultivation,) in a series of experiments he carried on at Matara.

4. The scientific explanation of the desirability of alternate flooding and drying is not far to seek. As the result of this alternation of condition, a soil contracts as it dries and expands when it once more becomes wet. Anyone who has observed the cracks that appear in land in dry weather will understand how helpful the contraction is to the aeration of the soil. Not only will there be large cracks formed, but small ones running like a network over the field, and the entire mass will be fissured in every direction. As a consequence, the soil becomes pulverized and aerated to a considerable depth, and both soil and subsoil are benefited.

5. The soil in most parts of Jaffna is more or less sandy, and underlying it is a stratum of lime stone rock of coral origin. The formation of this coral statum has been accounted for in the following way by the late Mr. A. M. Ferguson and others. The sea water off the Northern coast is impregnated with carbonate of lime, and the coral insects have been, for countless ages, incessantly at work, elaborating this substance into coral stones of beautiful shapes. From the violence of the waves and by the process of natural decomposition, the coral thus formed has been broken up into very small particles and again agglutinated together by the superabundant carbonate of lime into lime stone rocks called breccia into which dead and broken shells also entered. Blocks of this limestone breccia make excellent building material, and we are familiar with it in that form.

6. The formation of this calcareous stratum beneath the soil is very interesting from an agricultural point of view; for much of the good effect of the numerous irrigation wells by means of which the Jaffna peninsula is cultivated like a garden, is due to the fertilizing influence of lime dissolved in the water. It will be useful in this connection to mention that although water containing lime in solution is good for irrigation it is not so for cooking purposes, especially for cooking pulses such as dhall and gram, as limewater forms an insoluble compound with the nutritious principle called legumin. and thus tends to harden the pulses and makes them difficult of digestion. Hard-water (*i.e.*, water containing lime) is also said to cause urinary disorders; and it is not improbable that diabetes which is a too common complaint in Jaffna may be in some measure due to the lime dissolved in the water used for drinking and culinary purposes.

7. The sand which covers a vast extent of the peninsula, and in which the coconut and palmyra palm grow freely is, according to Sir Emerson Tennent, a transported soil, and has been carried hitherto by currents from the coast of Southern India sweeping down across the Palk's Strait and striking on to our coasts. To currents such as these is also attributed the red soil called *chempadu* which extends over some considerable area, and which, unlike the soil in most part of Jaffna, is very fertile. Its deep red colour is owing to the admixture of iron, and being largely composed of lime from the comminuted coral underlying it, it is susceptible of the highest cultivation and produces crops of great luxuriance.

8. The freedom with which solanaceous plants such as tobacco, brinjal and chillies, and leguminous plants such as pulses and beans grow in Jaffna may be chiefly accounted for by the richness of the soil in lime obtained from the underlying calcareous stratum, and the lime contained in the irrigation water which has already been mentioned. For it is a well-known fact that these two classes of plants require a comparatively large proportion of lime. The predominance of sand in the *chempadu* and other fertile soils imparts a looseness of texture to them and makes them specially suited for the free growth and development of the various kinds of yams and roots ranging from the purple 'king yam' downwards.

9. The formation of the soil of Jaffna makes it highly suited for fruit culture. Its dry porous substratum of coral formation affords a natural under drainage; and it may be that the secret of the success of the grape vine in Jaffna may lie in this peculiarity of the soil. Almost all Jaffna fruits in general have been spoken of in high terms, the grafted mangoes, the delicious oranges, pomegranates, grapes, &c. coming in for praise from strangers who have tasted them. But here too as in other parts of the Island, fruit culture is capable of much development, and such a paying concern as grape culture, which is at present more or less confined to the town, may well be extended to other suitable parts of the Peninsula.

E. T. HOOLE.

(To be continued.)

THE SOIL-INVERTING PLOUGH.

No. 11 of the Agricultural Ledger Series edited by Mr. Edgar Thurston, reporter on Economic Products to the Government of India, gives some evidence in favour of the soil-inverting or mould-board plough over the native implement of India, which is not very different from that used also in Ceylon. Of the improved ploughs we are told that they are generally made wholly of iron, and fitted with a broad curved piece called a mould board, which inverts the furrow slice, that is, turns it upside down. The beam is of wood like that of the country plough, and is connected with the yoke in the usual manner. The idea that the soil-inverting ploughs are too heavy of draught for country bullocks is said to be unfounded, as they have been drawn by cattle with the same ease as the country plough.

In order to compare the soil-inverting plough with the native implement, two plots on the Dumraon Farm, each 800 square yard, were ploughed up and both cropped with wheat, and treated exactly alike in all other respects. The cost of cultivation was the same in both plots. The increase in outturn obtained by means of the inverting plough over the outturn obtained with the country plough is shown below:—

YEAR.	GRAIN PER ACRE.		STRAW PER ACRE.	
	Increase.	Decrease.	Increase.	Decrease.
	Mds. s.	Mds. s.	Mds. s.	Mds. s.
1885-86 ...	2 16	...	3 21	...
1886-87 ..	1 14	...	1 8	...
1887-88 ..	1 35	0 14
1888-89 ...	1 4	...	1 35	...
1889-90 ...	2 4	...	4 16	...
1890-91 ...	0 30	...	0 19	...
Average ...	1 24	...	2 12	0 14

Both the plots having been continually under wheat for several years and received no manure, their outturn was gradually decreasing. In 1891-92 it was, therefore, thought desirable to change the crop; and the experiment was accordingly discontinued on the two plots, which had been hitherto reserved for the trial. It was, however, made in two other plots, with the result that the use of the inverting plough gave 1 maund 26 seers of grain and 3 maunds 1 seer of straw more per acre than that of the country plough. The result leaves no doubt that the outturn of wheat can be increased to a certain extent by the use of the soil-inverting plough.

The effect of soil inversion was equally conspicuous on paddy. The trial with this crop was carried out in exactly the same way as with wheat. The results are shown in the following statement:—

	Increase of grain per acre.		Increase of straw per acre.	
	Mds. s.	Mds. s.	Mds. s.	Mds. s.
1886 1 6	...	9 16	...
1887 0 35	...	2 38	...
1888 1 8	...	2 8	...
1889 3 1	...	6 2	...
1890 0 24	...	3 20	...
Average ...	1 15	...	4 33	...

The experiments are specially instructive, and may dispel the generally accepted idea as to the unsuitability of soil-inverting plough in India.

Dr. J. W. Leather, Agricultural Chemist to the Government of India, informs the Editor that "at Cawnpore an improved plough having an iron share, and ploughing 5" deep, has been tested against the country plough since 1881. Six years' experiments, during four of which they were made in duplicate, showed, *with one exception*, a distinct increase in the cotton crop, and eight years' experiments, of which seven were made in duplicate, and in which wheat was the crop, showed, *with one exception*, an increase apparently due to the improved plough. Leaving out of consideration the actual increase obtained, which varied considerably, it must be remarked that, assuming no effect on the crop, there is still a saving of half the labour. The improved plough is drawn perfectly well by even a "small" pair of bullocks, and the number of ploughings necessary is reduced to half." This testimony on behalf of the improved plough is valuable considering the source whence it springs, and goes to corroborate the evidence of agricultural instructors in Ceylon. In speaking of the improved plough, however, we do not insist that the implement is *always* suitable to the conditions under which the native implement is used.

GENERAL ITEMS.

The seeds of the plant known as rangle (*Guizotia oleifera*) sent us by Mr. W. A. de Silva from Bombay have put forth a most healthy growth, and the plants are now producing a showy golden yellow blossom. The plant as its name implies produces oil-bearing seeds, and we hope to complete our experimental cultivation of rangle, by extracting some of the oil in order to find out what percentage of oil is yielded by the seed.

The difficulty of keeping coconut oil, when cold-drawn by hydraulic pressure, has apparently been solved in Jamaica. There the ripe coconuts are kept with the outer husk on in a hot, dark room until the kernel is found to rattle. The nuts are then cut by a circular saw, when the kernel drops out. The oil prepared from these kernels, though kept in an uncorked bottle, was found to be perfectly sweet after the lapse of fifteen months.

OIL FROM EGGS.—Extraordinary stories are told of the healing properties of a new oil which is easily made from the yolk of hens' eggs. The eggs are first boiled hard and the yolks are then removed, crushed, and then placed over a fire where they are carefully stirred until the substance is on the point of catching fire, when the oil separates and may be poured off. One yolk will yield nearly two teaspoonfuls of oil. It is in general use among the colonists of South Russia as a means for curing cuts, bruises, etc.—*Albany Argus*.

Reana Luxurians, a native of South America, has been described as surpassing all other plants in the amount of forage produced per acre; over fifty tons per acre of green fodder being got in some places. It is like Indian corn in having

separate pistillate and staminate flowers on the same stalk, bearing its grain on a spike, one seed above the other diminishing in size upwards,—the grains being nearly triangular and the ears numerous at each top joint. It produces numerous suckers, one grain planted on each mound 2 feet apart have been known to produce as many as 26 stalks. The plants can be cut several times during season, and ratoons like canes. The stalks contain from 8 to 10 per cent. of sugar. At the Poona Farm, *Reana Luxurians* was grown experimentally and gave a yield of 80,778 lbs. per acre; but a note about its cultivation there is not very favourable. The permanency of the crop is said to be doubtful. The young shoots were found to spring slowly from the root stumps, and appeared less vigorous each time a cutting is taken. In the Deccan at any rate the plant cannot be rated as a perennial.

Professor Sachs, of Wurzburg, asserted, and the Royal Institute for fruit and vine culture at Giesedheim has tried experiments, and is apparently satisfied, that sulphate of iron is a valuable stimulant to plants that are suffering from chlorosis, absence of the proper green colour. They gave small trees 2 1-5th lb. of copperas, and large trees 4 and 2-5th lb. The results, it is said, were most gratifying. Strange to say in some cases where the trees were suffering from the attack of aphides as well as deficiency of colour in the leaves, the aphides disappeared, and frequently the leaves became healthy within a few days after the treatment. The sulphate of iron was dissolved in water, and applied near the roots. Early spring is the best time to try the experiment. Some soils do not require the addition of sulphate of iron.

Madras is said to be favoured by nature as regards the raw material required for tanning goat and sheep skins: the raw skins possessing special properties which fit them for preparation into "morocco leather." The principal tanning bark used is that of *cassia auriculata* (the Sinhalese Ranawara), and the process adopted in the preparation of the skins would seem to be almost exactly the same as the method followed by our tanners in Ceylon.

A correspondent is desirous of further information on this point and quotes the following extract from a newspaper—"The skins of Sondeli or musk-rat are imported into Suakin for the purpose of manufacturing from them a perfume (!) much used by the Soudanese. The imports of these skins into Suakin amounted to 375 lbs. last year; they came from India, and to a small extent from Massawah. The total value of the skins was £319." Dr. Watts, in his Dictionary of Indian Products, Vol. v. page 307, says "amongst the chief Indian musk-scented animal, is the so-called musk-rat, in reality it is a shrew, but its odorous secretion is not utilized." Further in Vol. vi, Part I, p. 397, of the above work, Piesse, of perfumery fame, says: "The ducts of the musk-rat are not used in perfumery" (among civilised people). Trade in musk-rat skins appears to be of some importance with the Soudanese, as one pound in weight realises almost a sovereign.

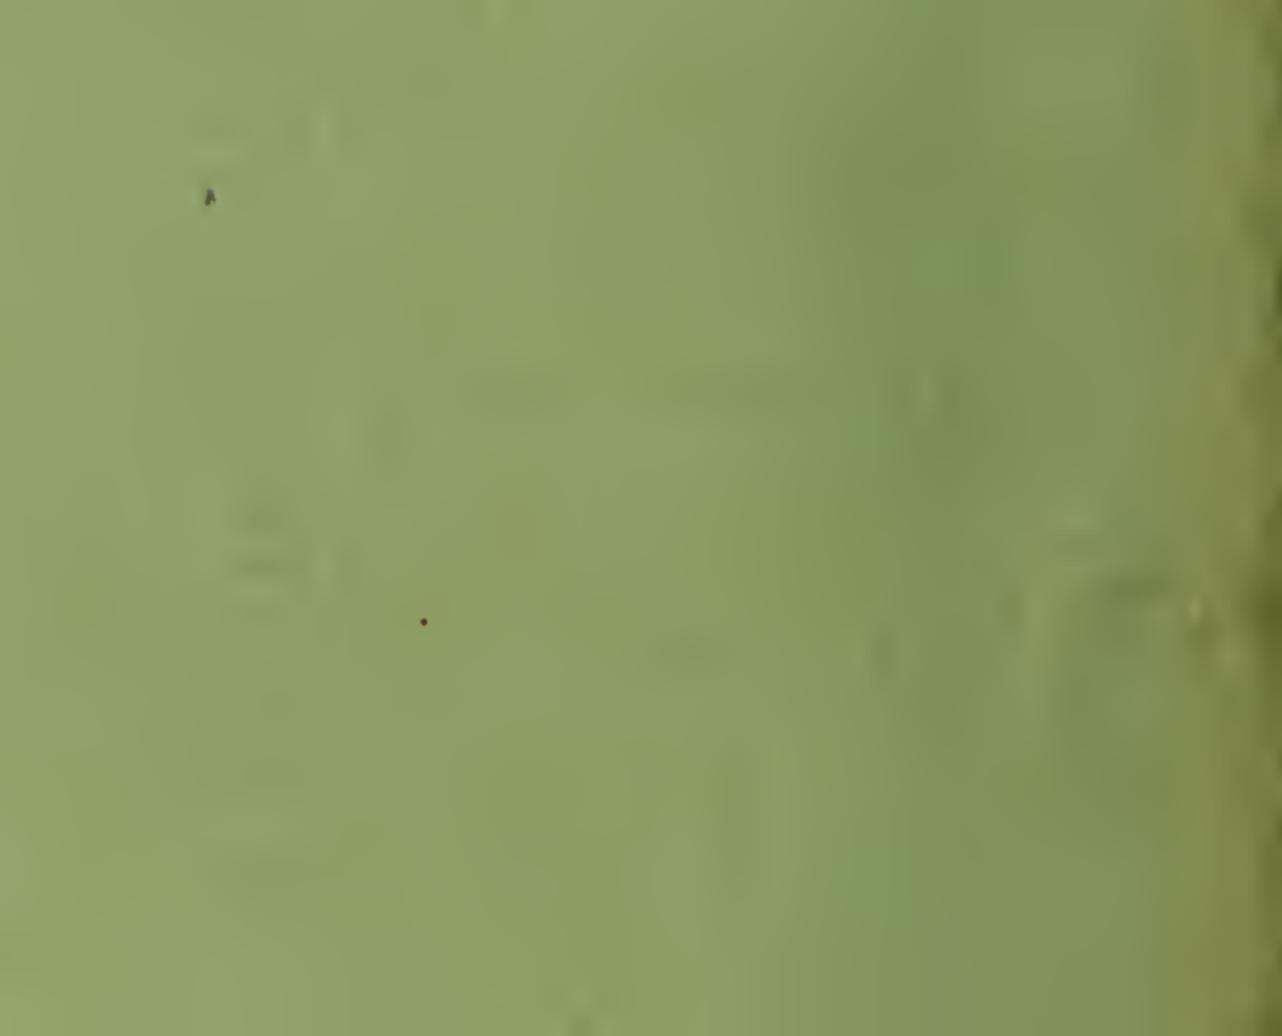

JOHN WALKER, Esq.

No. 9.

“PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

JOHN WALKER,

PIONEER ENGINEER, INVENTOR AND PLANTER IN CEYLON.

AFTER John Walker had retired from business, and made a home for himself in Stirling, it was always a great pleasure for him to meet an old Ceylon man. Stirling, as one of the show places of Scotland, has for the stranger much to attract. Not to speak of its great natural beauties—the view from the Castle and the Back Walk; the Carse; the Links of the Forth; the Abbey Craig and the grand amphitheatre of hills around—the whole neighbourhood is simply redolent of Scottish history, and saturated with the best traditions of Scotland. To John Walker it was a high day when he had a Ceylon man fresh to the ground, bent on sight seeing; and if the visitor had time to spare, the ordinary tourist's circle was widened, and the village of Donne would claim part of a day. That was, John Walker's birthplace; 26th August, 1819, being the date when he was born.

He was one of a large family, and in due time he attended the school in Deanston, a

mile distant from Donne village, and picked up his education there. That he was an apt scholar is evidenced from the fact, that for two years he was engaged as pupil teacher; and when he elected to throw up the scholastic profession into which he was drifting, and apprentice himself as an engineer, the Deanston dominie, was by no means sure that the choice was a good one, and argued strongly against it.

Deanston in those days had a large cotton mill, and besides the spinning and weaving department, Messrs. James Finlay and Co., the proprietors, had also attached an engineering shop, and were large agricultural machine-makers. The then manager, the late Mr. James Smith, was rather a distinguished man, highly esteemed, and of considerable inventive ability. He was said to have assisted Sir Richard Arkwright in inventing his spinning frame, which perfected Hargrave's spinning-jenny; he was also the inventor of the system of Agricultural draining yet in vogue and the immense water-wheels which still drive the Deanston

Works,—the largest wheels in Scotland save one—were his design. There is yet to be seen at Deanston another of Smith's machines, an ingenious contrivance by means of which the sluice at the river Teith, from whence the water is drawn to provide the power to work the mills, automatically rises and falls with the state of the river.

The present proprietors of the Deanston works are Messrs. Finlay Muir & Co., who are also represented in Ceylon in these days.

Some years ago I accompanied John Walker to Doune, and the Deanston works were also visited. Pointing up to one of the windows in the factory, he said: "It was opposite that window where my bench was, and where I served my apprenticeship." Across that stretch of years, which lay between the beginning of his active life, and the then near end of it, there had been woven in a very varied experience. But the nature of the boy apprentice was not very different from the nature of the elderly man. In his early days, he was much thought of in his native village, and the old women of the place used to look to him to have their clocks regularly seen to, and kept in order. When he had retired from Ceylon and had more money to spare, his visits to Doune were frequent, always in the interests of somebody; for, in his quiet way, he was ever a ready helper and a sympathising friend to the needy and those who were ready to perish.

During the years of John Walker's apprenticeship he had his wits sharpened, and his mental horizon enlarged; for his fellow-workmen were rather above the ordinary stamp. Picked men, who were intelligent and argumentative, with the Radical element as well as the Tory among them. The Corn Laws had not then been repealed, but the Chartists were abroad; and the anti-Corn Law agitation was stirring the land. From time to time the Deanston workmen were visited by fervid speakers, whose addresses threw a bone of contention among them, over which, during meal hours and on the way to and from the village of Doune, the rival politicians worried and debated. Travelling preachers too, of sects known and unknown, would come in the long summer evenings, and in open air addresses handle the mysteries of faith with a freedom, which although common enough in these days, was not so frequent in those, and pass on leaving behind them topics for discussion which would last for many days, and give much food for thought.

Some time after John Walker had completed his apprenticeship, there was a change in the policy of the Deanston works. The machine making part of it was given up, and the majority of the men had to go elsewhere for work. He got an opening in Manchester erecting cotton spinning machinery, but it was only temporary employment, and after some little time he returned to his home at Doune.

His next venture, was made under his old manager, Mr. James Smith, who engaged him to attend at the various Agricultural Shows throughout Scotland and England, for the purpose of fitting up and exhibiting the improved agricultural implements which Mr. Smith had designed.

Thus he saw about him a good deal, and when later on he was offered the post of engineer to Messrs. Wilson, Ritchie & Co., Colombo, it seemed but a continuation of the wandering life he had before been having. It was however not without mature consideration that he accepted the post; the name of Ceylon was not so well known then among the people of Scotland as it is today, and that it was considered rather a hazardous affair was evidenced by the fact, that when the engagement was signed, in the Glasgow office of Messrs. James Finlay & Co., the cashier who had the transacting of the business made a mental calculation, named a very modest sum, and looking in a wistful way at the young engineer said, "At the end o' the term, ye may ha *that* saved, *if ye wather it oot.*"

This did not sound very encouraging, but the die was cast, and he sailed from Glasgow in November 1842. The voyage was a stormy and protracted one, and it was not till the May of the following year that the ship sighted Ceylon, and dropped her anchor in the Colombo roads.

The Ceylon engagement did not prove a success, and before it was out John Walker rebelled. He was employed in the mills of Messrs. Wilson, Ritchie & Co., and the treatment which that firm gave their engineers was rather harsh. Things came to a head when some oil tanks had to be rivetted in the open yard, and the cost of erecting a temporary shed of cadjans, to screen the engineers from the fierce sun, was made the cause of offence. Mr. David Wilson made it hot all round regarding what he considered this luxurious way of working, and when John Walker, as mouthpiece of the others, protested against the treatment, and insisted that without the shed they would not work, the small band of rebels were told that they might leave if they liked, and at once, provided that their passage money was returned.

Mr. Ritchie was rather taken aback when his offer was accepted by John Walker; he was the only one of the delinquents,—there were two others, I think—who had saved enough to do this, and he then and there went to the bank, drew the money, paid it, and took his discharge. He was however refused a character! It was not a very bright outlook for the young engineer, in a limited circle like the Colombo of those days, without a character and in search of employment; but providence in the shape of the minister of St. Andrew's, the late Dr. Macvicar, came to his help. John Walker had gone one day into the Fort, to try once more if he could hear of any chance of work, when he met Dr. Macvicar. He was a member of Dr. Macvicar's congregation, and the doctor stopped, inquired what he was about, and how he was getting on. Learning how matters stood, he kindly gave John Walker letters of introduction to several of the Colombo firms. When David Wilson heard of this, he was very angry and wrote indignantly to the Padre for interfering with his employees! A warm correspondence was the result, but the minister claimed to have as much if not more interest in his parishoner's welfare than the merchant had, and that in trying to help him into employment he was but simply doing his duty.

John Walker never forgot the kindly help which Dr. Macvicar had given him, and when he visited Scotland, he always found time to call at the Moffat Mause, where Dr. Macvicar had his home, to renew the acquaintance-ship that had stood him in such good stead in the day of his need, and as an expression of the gratitude which still filled his heart.

Through the minister's introductions he was soon employed, being engaged as engineer for the "Perth" estate in the Kalutara district, where sugar cultivation was being gone in for on an extensive scale. This was in the year 1845. "Perth" estate was expected to be an El Dorado, and every thing in regard to the management was in keeping with the golden prospects, which were hoped to be realized in the near future. The staff was numerous, and highly paid; the outlay on buildings and machinery was of the most liberal nature; the cultivation was costly, and the end was—a collapse. During the time, however, when all was hopeful, the "Perth" estate was the scene of many a revel; and the "high jinks" at the manager's bungalow were on the same magnificent style as the estate was worked. Money was no object, and troops of revellers came from Colombo to assist in the spending of it. In time, however, the purse strings tightened. Sugar grew well enough, but there was a difficulty about the crystalizing.

What seemed all right when packed into casks one day, was found if kept for but a short time to have become moist again. So the work had to be done over. Besides this, there were yearly deficits. Proprietors, however wealthy, can't live always upon hope, and thus it came about, that in course of time one after another of that highly-paid staff were dispensed with, and John Walker alone remained to guide the broken fortunes of the "Perth" estate.

It was rather a lonely life he led when all the Europeans were gone but himself, and the most exciting element in these quiet years was an occasional visit to Kalutara, to serve as juror. Beef, not to speak of mutton, was then hard to obtain in the lowcountry; the village fowl was the stand-by, and so often and in so many forms did it appear on his table, that he felt after a time, almost ashamed to look a living one in the face! To supplement his scanty larder, he went in for breeding the guinea fowl, doing so with great success, and in after days had much to tell of the bird's habits. He had no love for sport, but he assisted the "Perth" coolies on one occasion to dig a leopard out of a hole in which it was sheltering and saw it dispatched with the labourers' mamoties. John Walker was nine years on "Perth," and although the life was a placid and not unpleasant one, there was little prospect ahead, so he too at last resigned. He was getting a little tired perhaps of Ceylon, besides he could afford a trip home.

Before sailing for Scotland, which he did in 1854, he paid his first visit to Kandy, and was offered employment by the late Mr. William Turner, an engineer, who supplied the planters with their machinery, and whose place was in Trincomalee Street. The prospects held out were not however sufficient to induce him to postpone his trip, so he returned to Scotland.

After having spent some time among his friends, the need by-and-bye arose to look out again for something to do, and as there was at that time a great demand in Melbourne for sawn timber to be used for building purposes, John Walker and his brother-in-law the late Mr. George Clarke,—years after a partner in Messrs. John Walker & Co.,—arranged to buy the requisite plant, and go out together and start a saw mill in the colony. The matter was well thought out, and the prospects of success were fair, but the ship in which they sailed went ashore on a bright moonlight night on the coast of Ireland, and became a total wreck. Although no lives were lost, the whole of the ship's cargo was, and the saw-mill machinery with it.

After the wreck, John Walker returned to Glasgow, and while there accidentally met Mr. William Turner of Kandy, who had come home

in rather poor health. Mr. Turner renewed the offer he had made to John Walker some months before, but not until it was modified into a partnership did he accept and abandon all idea of trying his fortune in Victoria.

Before starting again for Ceylon he married a Miss Fortay, a connection of his own, and shortly after the wedding he sailed for the East. The voyage was a very unfortunate one, for the ship met heavy weather in the South Atlantic, and became so leaky that she had to put into Bahia to refit. While waiting there his young wife died of yellow fever. Anxious to get on, and especially to get away from a place which must have been rendered hateful to him, he left the leaky ship, and finding another bound for Colombo, and about to sail, he elected to come on in her. He was the only passenger and had rather a rough time of it. The captain was somewhat of a bully, and the sailors were not very well used. Before Ceylon was reached, the growing discontent among the crew was apparent to all, and one fine Sunday morning they struck and refused to work. Jack had turned Sabbatarian; he did not like every day to be esteemed alike, and was not going to have it. When the captain learned how matters stood, he mustered the crew on the quarter-deck and addressed them in foreible language. But neither that nor his pistols could induce them to do unnecessary work on the Sabbath, and after much bluster, the skipper yielded the point, although with rather a bad grace. Later in the day it became evident that "Satan finds some mischief still, for idle hands to do!" for the captain's Sunday pudding mysteriously disappeared from the galley, and just when about to be served up. This was past bearing, and again the crew were mustered, and individually questioned regarding the daring act. Nothing however was elicited; a more innocent set of men never sailed under the British flag; they did not even know that there had been a pudding prepared for dinner; certainly not for theirs; and one who had been the ringleader of the morning's revolt, and a sea-lawyer to boot, emphatically protested against the captain even *looking* at him as if *he* had taken the "puddin'". A sad falling away here!

After arrival in Colombo, John Walker proceeded to Kandy, and began there his work in connection with coffee machinery which was in time to carry his name into every tropical country where the plant was grown, and raise his firm into the premier position of pulper-makers. His partner, Mr. William Turner, returned home in a few years, in ill-health, and left him free to carry out his own plans.

About this time the business and premises of Messrs. Affleck, Engineers, Kandy, were through the death of the uncle and nephew for sale. Bogambra mill's where their works were situated, were better in every way than the shop at Trincomalee Street. John Walker arranged to buy them, and in due time vacated the old premises where he had been for several years. In taking over the Affleck's business, the book debts were included in the bargain, and an allowance of 5 0/0 was deducted to meet any losses which might arise. A home actuary, whose duty it was to look into the terms of the arrangement, was very emphatic on the inadequacy of the provision made for bad debts, and declared that from 25 0/0 to 33 0/0 would at home have certainly been allowed. He did not see how 5 0/0 could possibly cover it. John Walker used however to tell—to the credit of the Ceylon planters—that although he had to wait for a very long time for some of the accounts, yet eventually—with but one insignificant exception—the whole of them were duly paid.

Besides being an engineer, John Walker was also a planter, having from time to time been possessed of "Meetota," in Medamahanuwara, "Mahaoya" in Dmblara; and "Roseneath," "Hermitage" and "Anniewatte" in Hantane districts. On his visits to estates on professional duties he got well acquainted with the planting districts, heard of and saw all that was going on, and was ever ready to try on his own properties, the newest methods of cultivation. Where he could advance the planting interests he did it, and it was through observing the rude and inefficient style of tracing drains, by means of a plank which had to be dragged all about the place, that made him think of the Road Tracer which goes by his name to this day. What a relief this simple instrument was to the planter with a large clearing to road and drain, as compared to the lumbering old style, goes without saying. It was a success from the first, won its way wherever it was tried, and it was a great satisfaction to the inventor, when he learned that the Survey Department had found out its worth, and used it on one of the then proposed routes of new railway, in taking the flying trace. Today there is hardly an estate in the island which has not got one of "Walker's Road Tracers," and in many other lands where the inventor has never been heard of, this handy little instrument is extensively used and thoroughly appreciated.

His Patent Disc Pulper too has carried his name to the far ends of the earth. I shall not attempt to adjudicate as to which one among the different patent pulpers, that in the old days competed for place; deserved the highest position;

but it may safely be affirmed that John Walker's Patent Disc Pulper ranked second to none. It took him years to perfect. The perseverance, watchfulness and patient study which he expended on his machine are known only to a few. It was long before he was satisfied—if he ever was satisfied—albeit the machine was one to be proud of, and did its work expeditiously and well.

John Walker's relations with the planters were always pleasant; and many of the older generation who had dealings with him, tell even yet of the kindly consideration, meaning often money and risk, which he was ever ready to extend to those on whom circumstances were hardly pressing. Being an eminently honest man himself, he regarded all with whom he came in contact as possessed of the same sterling quality, and although on the whole his estimate of his fellows was a true one, yet several times he was sadly deceived, and had subsequently to regret that he had not been more distrustful. When he was retiring from active service, it was a satisfaction for him to look back on his career, and be able to say, that although much tried at times in the matter of estate accounts, he had never once in the course of his business life got a superintendent into trouble with the estate agents. The Sinhalese who passed through his hands, benefited much by the thorough training he gave them, becoming really reliable workmen, and the esteem in which they held him, merged in many cases almost into the warmth of affection.

When John Walker retired from Ceylon he made the town of Stirling his home, and was soon as actively employed there as he had been when living in the East. The Stirling Royal Infirmary, and the Industrial School, were special hobbies of his, and he spent much of his time seeing to the interests of those deserving institutions. He was not in any way a pushing or forward man, but the very reverse. To do his work quietly and without ostentation were truly characteristic of him, and when his fellow-townsmen would have advanced him into higher honour, and more prominent place, he would have none of it. After he had settled in Stirling he made several trips to Ceylon, to inspect his estates and see to his business. These trips he thoroughly enjoyed, and it was very instructive and amusing to notice how quickly the impecunious learned of his advent, and how ready they were to be helped by him. To meet an old planter was an especial pleasure, for in the conversation the past lived again. Although not much of a joker himself, he had still a keen sense of humour, and would enjoy a story with the best, even although the flavour was an ancient one.

He had a fine constitution. For many years both in the lowcountry and on the hills he had worked

hard, but in appearance and vigour he always compared well with those who had never been in the tropics. He was temperate in all things. On his last visit to Ceylon, he did not display his usual activity, and although no hint came from him that he was not as he had been, he steadily declined any outings which demanded hill climbing or short cuts. He would sit at times when unobserved with his watch in his hand, counting his pulse beats. Heart disease was hereditary with him, and admonitory symptoms, which he kept to himself, were doubtless the reason for his so doing. But he would have no fuss about this any more than he would about anything else.

He died in Stirling on the 1st Oct. 1889. The end was sudden, and amid the brightness of preparation for a daughter's marriage. *Angina pectoris* was the cause, and between the spasms of that painful malady, and with clear evidence that the end was near, he summed up in his quiet way God's dealings with him: "Goodness and mercy" he said "have followed me all the days of my life." That was his testimony. That he did not conclude the extract from the Psalmist: "I will dwell in the House of the Lord for ever," was thoroughly characteristic of him: but that he had this hope bright within his heart cannot for a moment be doubted.

His loss was much deplored. At the annual meeting of the Directors of the Stirling Infirmary held shortly after his death, H. D. Erskine, Esq., of Cardross, said:—"He was sorry to say that during the last year the Directors had sustained a very grievous loss in the death of the Chairman of their House Committee, Mr. Walker. Many good men had given their services to the institution since it was opened, but no one was more able than Mr. Walker both by circumstances and inclination to devote himself more exclusively to the services of the Infirmary than he did. They might almost say he died in the service of the Infirmary, for he went home from one of the meetings which he came to at great risk and inconvenience to himself, to die. He was sure he was expressing the feeling of that meeting when he said they all felt the deepest gratitude that they had been given the loan, even for such a short time, of the services of such a good man."

John Walker was married a second time in 1860 to the eldest daughter of the late Mr. William Dewar, West Indian Merchant. He had a family of five sons and six daughters. One boy died in infancy, and his eldest son is today following his father's profession in Ceylon. In 1884 he retired from Messrs. John Walker & Co., but retained his interests in the firm of Walker & Greig, of which firm at his death he was sole partner.

CINCHONA IN CEYLON.

We notice that our contemporary, the *Observer*, has taken up the subject of Cinchona cultivation in Ceylon. From information derived from a dealer in Loudon, from the command of the market that Java has obtained, and also from alleged unsuitability of Ceylon soils, the editor of that journal infers that, for the present at least, Cinchona in Ceylon would not pay. We do not dispute that the present price of bark in the London market would be unremunerative for Cinchona grown on lands in this Island, if expressly opened for its cultivation, and having no other resource. Nor do we question the command which Java presently possesses of the Cinchona markets. But we venture to give our opinion that the fault of the Ceylon Cinchona enterprise was not in the soil, which we believe to be well suited to the cultivation of the bark, though probably less rich than that of the Java plantations.

Since Tea began to engross the attention of Ceylon planters and has led to the neglect, in a greater or less degree, of Cinchona, we have several times addressed remonstrances against the discontinuance of that enterprise, on the following grounds, (1st) that the success of Java and the comparative failure of Ceylon in that enterprise was not a matter of soil, but of system. Secondly: that the evidence of the results obtained in Ceylon, in the few cases in which a sound system was adopted, was decidedly favourable. Thirdly: that in the present state of the Tea enterprise, other collateral advantages that might be secured by Cinchona cultivation on the Tea plantations and on adjoining lands would compensate for the comparatively low price of bark.

Before adducing our reasons in support of the views implied in the foregoing conclusions, we cannot resist a feeling of humiliation in the confession that is practically involved in the giving up of Cinchona as a "bad job", after the success Ceylon planters have achieved in every other agricultural enterprise in which they have embarked in earnest. The energy, intelligence and skill which made Ceylon *Coffee* the consort of that great trade by virtue of its manifest superiority,—that caused Ceylon *Tea* to take a leading place in a market that was already fully and satisfactorily supplied, by actually superseding and displacing the old established supplies,—that has produced *Cacao* that commands a far higher price in the open market than the boasted produce of the West,—and in short, that has succeeded in every other enterprise except Cinchona, ought to be able to give substantial reasons for so remarkable an exception. Seeing that Ceylon planters have proved, by their latest success in Tea, that they have not lost their cunning—that, in short, neither their capabilities nor those of their soils are at fault, there is no reason why they should not equal or even surpass their rivals in Java, if they adopted the same system.

The system of Cinchona cultivation that was almost universally adopted in Ceylon was radically wrong. The most valuable varieties of the tree were hybrids. The seed of hybrid plants, as all botanists and gardeners know, can never be relied upon. Plants so raised from the seed of the richest hybrids usually come up in great variety, and not one in twenty is at all true to type. Like the seed of apples which may produce crabs, or of oranges, which may produce limes, citrons, or lemons, valuable hybrid cinchona seed may produce varieties which are very rarely true to type. The propagation of valuable varieties of Cinchona should, therefore, be affected as are apples, oranges and other special varieties, by grafts or cuttings. In Ceylon, the mode of propagation that was almost universally adopted was by seed, and therefore the two species of pure breed, the seed of which was true to type, were almost the only kinds that were cultivated, namely: *officinalis*, for which the climate was not suitable, and *succirubra*, which was poor in alkaloids. Propagation by grafts or cuttings was far too slow to suit the emergency of the time, when cinchona was introduced into the Island and was therefore practised only in rare cases, and then only

from stocks that were not of high class. Such, however, as they were they remained true to type.

Nearly all the first nurseries at Hakgalla were of cuttings from the original stocks sent from home. These plants were sold or distributed, and found their homes chiefly in Haputale and Hewaheta. A few were planted elsewhere. The writer's experience of the trees produced from the Hakgalla plants convinced him, but unfortunately too late, that they were far superior to any of those produced from seed. They were not attacked by the fatal pest, canker. After 20 years' growth, a small plantation of ten acres of these plants had to be abandoned in consequence of the failure of the coffee estate to which it belonged. An attempt was made to uproot the trees for the sake of the bark, but they defied the manoty, and would have needed dynamite.

The first experience of the Java planters was, like ours, of plants raised from seed; but fortunately, for them, the species they showed were utterly worthless namely: *Josephiana*, *Palmdiana* and the like. They had no inducement whatever to persevere with the cultivation of such species, and they were therefore taught a lesson, of which the partial success of the Ceylon planters with *officinalis* and *succirubra* prevented their learning the force. Java plantations were in consequence, gradually stocked with plants propagated on true principles from approved varieties. Once on the right track, they naturally chose select stocks from which to propagate, and hence their success. Ceylon planters, on the other hand, persevered in their reliance on a faulty system whence came their comparative failure.

In dealing with the erroneous system on which the enterprise was pursued in Ceylon, we have also shown, in the second place, that the plants that were produced from cuttings were more durable, more successful, and less liable to canker than trees raised from seed. Trees raised from seed nearly all suffered, and a large proportion of them died from that disease prematurely.

With regard to the third point above mentioned, we maintain that it is inexpedient for large tracts of tea to be practically continuous, as such a condition would facilitate the rapid progress of any pest, - that it is advisable, for that reason, to plant belts of trees to intercept the continuity of large areas of Tea and to segregate them,—that cinchona trees, while serving that purpose effectually, would also yield bark of a value equal to that of Java, and which, even in the present state of the market, would yield a considerable return. If peeled while standing, for the sake of procuring "renewed" bark, the trees would nevertheless eventually be coppiced, and the stems would be useful for firewood.

The Ceylon planter, if he raised his plants from prime stocks, would be on equal terms with his Java rival as regards the quality of his bark, and would beside have collateral advantages such as we have specified, which would make him less dependent on the state of the market for bark than his rival.—Ceylon "Independent."

THE COCONUT INDUSTRY AND THE PALM OIL TREE.

A correspondent, in a private letter, asks us to state the nature, communicability and extent of the diseases to which the coconut tree is liable, and where information can be got on these points, and on the cultivation and yield of the palm oil tree. The most formidable disease—if disease it can be rightly called—of the coconut tree in Burma and the West Indies appears to be the red weevil, and information on that insect and the mischief done by it in Honduras is to be found in the *Kew Bulletin* for last February and March. Here this weevil commonly destroys coconut trees when they are just going to begin bearing, and cases of bearing trees being destroyed by it, though not quite unknown are very uncommon in this country; but in Burma and the West Indies even trees in bearing appear to be not infrequently destroyed from this cause. Coconut planters in this country are

careful to destroy all the weevils and weevil grubs that they can find, but our comparative immunity from this pest is probably due chiefly to most of the weevils being devoured by insectivorous animals before they have time to breed; and as cultivation is extended, we must expect the number of insectivorous animals to decrease, because of the clearing of the jungles in which they find cover. Tea planters do not seem to be injured by chafer grubs, but latterly much damage was done by these insects on some coffee estates, and the most probable cause of their increase was the banishment, by the extensive clearing of jungle, of wild cats and other natural enemies of the chafer beetles. With our wishing to raise any needless alarm, it therefore behoves coconut planters in this country not to be over-confident that they will always have the comparative immunity from the red weevil as the same have had in the past. The coconut weevil, as they said in our last issue, is not to be confounded with the rhinoceros beetle, which, although it does do some injury to coconut trees, is nevertheless a comparatively harmless enemy and one comparatively easily combated. The weevils (*Rhynchophora*) are one of the most numerous families of the *Coleoptera*; they are all phytophagous, and they are very destructive to vegetation, not so much because of their appearing in vast numbers, as caterpillars, apides and locusts do, as by reason of their attacking plants in a vital part, so as to kill them, or in the seed, and thereby preventing their propagation. One very minute weevil feeds in its larval state in the seed of the kital palm, and although the ground under a kital tree may be thickly strewn with seeds, yet it is difficult sometimes to find one without a weevil or weevil grub in it, and many of the seeds contain several of the insects.

Besides the coconut weevil, coconut trees in some of the islands of the West Indies appear, from statements which we have read from time to time in the newspapers, to be affected by a fatal fungoid blight, but we cannot name any publication in which information in this point can be found. In this country trees in apparent health are sometimes broken off by the wind, and when the broken part of the stem is examined, nearly all the wood at that place is found to be decayed. This is not an infectious disease, and it is generally believed to be caused by the roots of the tree getting down to an unhealthy subsoil. There does not seem to be any known remedy for this disease, not would a remedy for it be of much practical use if one were known, because the first intimation of the disease is usually the fall of the tree.

There is not apparent any present indication of the coconut plantations of this island being likely to be affected by any serious blight, but in view of what has happened in other coconut-growing countries, it is not wise to be over-confident of a similar calamity never being possible here. The tea planters are continually being warned regarding the imprudence of depending too exclusively on a single product, but nobody seems to think it necessary to give a similar caution to the coconut planters; and yet, supposing the chances of disaster to be equal in both cases, the warning is more needed in the case of coconuts than in that of tea, because the coconut plantations cover a larger extent of ground than the tea plantations, and a failure of the former would be a much greater calamity to the permanent population of this island than a failure of the latter would be. The late Mr. George Stuart, the founder of the firm of Messrs. George Stuart & Co., used to say, "I always hang an anchor out to windward," meaning that he never trusted entirely to a single investment, and the result of his following that policy proved its prudence.

As regards the yield and cultivation of the palm oil tree (*Elais guineensis*), there is not likely to be any reliable information available, for although about a million hundredweights of palm oil are annually imported into the United Kingdom (chiefly from Lagos, which is the centre of palm oil trade)

yet it seems to be all the produce of trees growing wild in the African jungles, and the tree, though not unfrequently planted here for ornament does not seem to be anywhere cultivated as a commercial product. The circumstance of the tree growing wild in the African jungles need not, however, prevent its being profitably cultivated here, for cinchona grows wild in the jungles of South America, and that did not prevent its being a profitable product here until the price of it became unremunerative by reason of over-production. The following statistics of the vegetable oils imported into the United Kingdom and exported from it in 1882 are taken from a table in the *Encyclopædia Britannica*, Vol. XVII., p. 745, and they show the importance of palm oil in British commerce in comparison with other vegetable oils:—

		IMPORTS.		
		Quantities.		Value.
Castor	...	163,970 cwts	£264,551
Coconut	...	133,782 cwts	210,054
Olive	...	23,450 tuns	974,154
Palm	...	813,870 cwts	1,240,836
Seed	...	14,507 tuns	406,807
		EXPORTS.		
		Quantities.		Value.
Castor	...	24,288 cwts	£ 40,057
Coconut	...	134,368 cwts	205,788
Olive	...	3,668 tuns	166,693
Palm	...	428,162 cwts	642,204
Seed	..	1,162 tuns	37,279

In the beer and wine trades a tun is a measure of capacity, but a tun of oil seems to be 20 hundredweights; and of the five kinds of oil enumerated in the foregoing table of Imports, it will be seen that the quantity of palm oil is the greatest and that of coconut oil the least. But besides the palm oil, which is obtained from the fibrous husk of the fruit, there is also a large importation into the United Kingdom of palm kernels, which are ground and made into palm nut oil and palm nut oilcake, and the oilcake is said to be superior to any other for feeding cattle. For the reason already mentioned, the average annual yield of a palm oil tree is probably not yet known, but the fruits are said to yield a larger percentage of oil than can be obtained from olives. From these facts it will be seen that *Elais guineensis* is not the useless tree that many here suppose it is, and it would undoubtedly have given in this country a much more profitable result than has been obtained from the other West African product. Liberian coffee, had it received the same attention with which Liberian coffee was at one time favoured.—*Catholic Messenger*.

TEA NOTES FROM LONDON.

LONDON, Feb. 2.

THE FINEST TEA EVER IMPORTED FROM CEYLON.

A letter from Messrs. Anderson Brothers informed me that they had at their office temporarily what Messrs. Gow, Wilson, & Stanton had pronounced to be the finest tea they had ever seen imported from Ceylon. On my calling in response to that letter this tea was obligingly shown to me. It certainly was the most astonishing tea, both in appearance and fragrance. There were two lots of one pound each only. One of these was identical in quality and appearance with the "Golden Tip" not long back sold for £35 the lb at the public auction to the Mazawat's Tea proprietors. But the second, as to which such experts as Messrs. Gow, Wilson, & Stanton had passed such eulogy, far surpassed the first in all characteristics. It was almost as fine as

enuff, and was a mass of tiny gold specks, without any of the admixture of black particles observable in the first sample and in that of previous public notices. Messrs. Anderson had kindly kept the tea for me until it was possible for me to call, and then at once despatched it to the brokers for sale. Messrs. Gow, Wilson & Stanton had declined to value either sample, feeling it to be impossible to assign a price. Probably the tea will be bought as on former occasions of a similar kind offering, for the purpose of advertisement; but we suspect the day for this has long gone by, at least so far as to encourage any expectation that prices of a rate known in the past can now be realised for it. The veteran Mr. A. O. White, the well-known "Knuckles Brick" of the forties, is the owner of this tiny but choice break of Ceylon tea. It was grown on his Mount Vernon estate, and that garden will now possess the reputation of having sent home what the most experienced firm of brokers in London has declared to be the finest tea they have ever seen imported from Ceylon. Messrs. Anderson have kindly promised to let me know what prices are obtained for the two small samples, information that will at once be passed on by me to yourselves.

"MAZAWATTE TEA" AND THE CEYLON ASSOCIATION
IN LONDON.

During the week I had conversation with a member of the Tea Committee of the Ceylon Association in London, and my view was expressed to him as regards the course taken by that Committee in refusing to permit Mr. Leake to make the affidavit with respect to the title of "Mazawatte" as a trade mark. His reply to me was:—"You will know that when that trade mark was first adopted I objected to it as strongly as anyone else, and would then have gone for a prosecution. Of course, it is a misleading name to have assumed. But in spite of that I think the Committee did rightly to refuse to appear as active supporters of any steps taken against Messrs. Deansham's interests. By very extensive advertising of Mazawatte tea, which everyone believes to be a Ceylon tea, they have well served Ceylon by making it a household word. Then they have at the same time worked up an enormous trade, and are among the largest purchasers of Ceylon teas in this market. It would scarcely serve us, we think, to now break down this gigantic business. No, I have never myself tasted Mazawatte tea and probably never shall. It may be that it would not suit my palate. But you see, if the Ceylon Association were to actively offend Messrs. Deansham, they might change their present tactics by abandoning Ceylon teas, and we might drive them altogether into the arms of Assam, Siam, Japan, and other tea-growing countries and districts. I tell you the condition of the home tea trade is such that we cannot be too careful. We are forced now to sell all our teas under our own names. Lipton, you know, is a grower as well as a buyer, and he is also a seller at the auctions, as well as a retailer all the world over. He sends to the auctions all such of his Ceylon teas as he does not care, for some reason or other, to retain himself. I don't say anything against the qualities of such teas, but what I do know is that the dealers won't buy any tea that they suspect to be Lipton's, because he is his own retailer. If we don't give our name with the lots they immediately think they may be some of Lipton's, and then unanimously refuse to make a bid. For this and the foregoing reasons given you, I am strongly disinclined to any attempt to disturb the present channels through which Ceylon teas reach the public. The

fact seems to be that the Messrs. Deansham are much personally liked, and we suspect that that fact has had as much weight in inducing the action by the Committee as any consideration for the existing sources of distribution to the public."

The question of

SMALL BREAKS OF TEA

is again engaging attention by both the brokers and the dealers. You will recollect that this matter was mooted some time back, and it was then hoped that your planters would find it to be possible to avoid the sending home of such parcels. This hope has not, however, been realised. The brokers complain that they are as numerous as ever. The definition of what constitutes a small break is ten whole or twenty half-chests. It is the practice of the brokers when lots coming under that definition appear in the lists, to omit putting them up to auction in their regular turn, and to postpone doing so until the whole of the larger breaks have been disposed of. The result to this practice has been that when they are offered there remain but few bidders in the room, and the consequence follows that biddings become slack and that such teas are sold below their real value. The brokers suggested to the Ceylon Association in London that to obviate this it would be as well only to include such breaks in the lists of Thursday, a day when these lots are not so full as on Tuesdays. But the Tea Committee of that body object to this proposal, as it must still continue the difficulties following on a limited attendance. They prefer, and have suggested, that they should still find a place in the Tuesday lists, and that they should be sold at the same time as the larger breaks but in a separate room. The two proposals mentioned are to be—or may by this time have been—submitted to the Tea Dealers' Association. As the last mentioned body represents the purchasing element, its decision upon the two propositions must be valuable and will probably decide the future course of practice. We expect to learn as to this very shortly. It has been mentioned to me by an expert that these small breaks are usually of the finer sorts of tea, this necessarily arriving from each estate in smaller quantity than the less valuable varieties. It must therefore be of much importance to secure the best competition for them, and this it seems certain is not to be got at the Thursday's sales. Although the alteration in procedure now proposed may do somewhat to improve the prices now obtained for these small breaks, it yet behoves your planters in their own interests to avoid shipping them as far as possible. The brokers have added to their proposition mentioned above the further one that the limitation of classification shall be extended; but instead of the number of chests and half-chests now determining the term, this shall be for the future 12 and 24 respectively. If this be done, the proportion of tea to be offered in a separate room will be increased so as to attract a larger attendance of bidders. This is a matter that will no doubt be decided when the main question has been considered, but it is perhaps open to doubt whether the acceptance of the proposal would have the result anticipated. The real panacea would be to abolish the small breaks as much as possible, not to add to them. So long, however, as your planters find it to be imperative to make such small shipments, difficulty must always be experienced in disposing them of, and your growers must make up their minds to receive relatively unsatisfactory prices for them whatever be the efforts to meet the case made by the brokers and others on this side.

CEYLON MANUAL OF CHEMICAL ANALYSES.

A HANDBOOK OF ANALYSES CONNECTED WITH THE INDUSTRIES AND PUBLIC HEALTH OF CEYLON FOR PLANTERS, COMMERCIAL MEN, AGRICULTURAL STUDENTS, AND MEMBERS OF LOCAL BOARDS.

By M. COCHRAN, M.A., F.C.S.

(Continued from page 517.)

Fish Manure.

Waste fish, dried and ground, when prepared with care, supplies a manure that is very rich in nitrogen, and contains also a considerable proportion of phosphates. It is a substance, however, of exceedingly variable composition, and none of the samples prepared in India which have come under my notice approaches in richness the higher qualities of fish manure known in commerce as Polar fish guano and American fish manure.

The following analyses of these two high-class fish manures are quoted from an article by Mr. W. Ivison Macadam, F.L.S.C., in the *Indian Agriculturist*:-

Composition of Polar Fish Guano.

Moisture	per cent. 10.54	per cent. 9.98	per cent. 8.48	per cent. 5.72	per cent. 10.18
Nitrogenous matter	56.48	56.04	57.24	64.04	53.64
Alkaline Salts	2.56	1.23	1.18	1.32	1.24
Phosphates	26.48	28.43	29.04	23.36	29.84
Carbonate of Lime	3.06	3.48	3.63	4.54	4.12
Silica	.88	.84	.43	1.02	.98
	100.00	100.00	100.00	100.00	100.00
Containing Nitrogen equal to Ammonia...	11.15	9.81	9.96	10.21	10.12

Analyses of American Fish Manure.

	per cent.	per cent.
Moisture	20.52	22.64
* Nitrogenous Organic matter	57.16	49.68
Alkaline Salts	1.98	1.36
Phosphate	13.52	15.44
Carbonate of Lime	5.78	9.92
Silica	1.04	.96
	100.00	100.00
Containing Nitrogen equal to Ammonia	9.03	7.96

The following are analyses of samples of fish manure sold in Ceylon:-

	per cent.	per cent.	(Hughes' per cent.)	
Moisture	10.75	14.75	5.24	23.60
* Organic matter	36.80	39.45	31.18	13.32
† Phosphoric acid	5.14	4.52	5.24	5.71
Lime	11.00	10.96	6.20	9.42
Carbonic acid, Magnesia alkaline Salt, Oxide of iron &c.	9.51	9.17	3.37	3.27
Sand	26.80	21.15	48.77	44.68
	100.00	100.00	100.00	100.00
* Containing nitrogen Equal to Ammonia	4.32	4.55	4.01	4.25
† Equal to tricalcic Phosphate	5.25	5.52	4.87	5.16
	11.22	9.87	11.44	12.48

Guano.

Amongst manures which supply both nitrogen and phosphates, guanos are conspicuous, especially those from countries with a dry climate. They consist of the excrement and bodies of sea birds which have accumulated on islands or lonely sea boards. When the climate is dry, these deposits retain most of their nitrogen. They also contain phosphoric acid in both a soluble and an insoluble form. Peruvian and Ichaboe guanos are of this class. The other class of guanos, in which the nitrogenous substances and that portion of the phosphoric acid united to the alkalies, and therefore soluble, have been washed out, has already been noticed. They are the phosphatic guanos, valuable for their large percentage of tricalcic phosphate.

As examples of Peruvian and Ichaboe guanos, I again quote from Mr. W. Ivison Macadam, in the *Indian Agriculturist*:-

Peruvian Guanos.

Moisture ...	per cent. 16.82	per cent. 11.68	per cent. 17.68	per cent. 16.72	per cent. 11.64	per cent. 11.48
* Organic matter and Ammonia ...	per cent. 33.56	per cent. 39.56	per cent. 37.46	per cent. 31.32	per cent. 35.52	per cent. 34.56
+ Alkaline Salts ...	per cent. 17.16	per cent. 16.64	per cent. 15.52	per cent. 17.24	per cent. 17.28	per cent. 18.42
Ordinary Guano Phosphates ...	per cent. 27.52	per cent. 21.88	per cent. 24.38	per cent. 26.96	per cent. 23.48	per cent. 28.82
Silica ...	per cent. 4.94	per cent. 10.24	per cent. 4.96	per cent. 7.76	per cent. 12.08	per cent. 6.72
* Containing Nitrogen equal to Ammonia ...	per cent. 100.00					
+ Containing phosphoric acid equal to Bone Phosphate rendered soluble ...	per cent. 9.14	per cent. 11.32	per cent. 10.72	per cent. 8.32	per cent. 10.24	per cent. 8.47
Total Phosphoric acid as Tricalcic Phosphate ...	per cent. 11.16	per cent. 10.21	per cent. 10.14	per cent. 11.42	per cent. 8.68	per cent. 10.76
	per cent. 38.68	per cent. 32.09	per cent. 34.52	per cent. 38.38	per cent. 32.16	per cent. 39.58

Equalized Peruvian Guano.

This term refers to Guanos which originally contained less ammonia than those of the Peruvian type, but which have had the ammonia made up to the standard of good Peruvian guano, by the addition of sulphate of ammonia. It should contain not less than 8 per cent of ammonia. The following is an analysis by Tatlock :—

Analysis of Equalized Peruvian Guano.

(TATLOCK.)		per cent.
* Phosphoric acid	14.20
Lime and Alkaline Salts	15.49
Organic matter	50.51
Sand	7.87
Water	11.93
		100.00
* Equal to Tribasic Phosphate of Lime Nitrogen	31.00
Equal to Ammonia	7.29
		8.85

Since writing the above I have analysed a sample of whole fish manure containing nitrogen 6.72 per cent equal to ammonia 8.16 per cent phosphates 11.76 per cent and sand only 2.3 per cent.

Ichaboe Guano.

Moisture ...	per cent. 19.52	per cent. 20.54	per cent. 19.47	per cent. 19.68	per cent. 19.78	per cent. 20.99
* Organic matter and Ammonia ...	per cent. 38.94	per cent. 47.36	per cent. 39.82	per cent. 40.26	per cent. 41.83	per cent. 47.34
+ Alkaline Salts ...	per cent. 8.92	per cent. 9.28	per cent. 11.46	per cent. 11.27	per cent. 8.17	per cent. 10.38
Ordinary Guano Phosphates ...	per cent. 13.21	per cent. 17.16	per cent. 14.41	per cent. 14.13	per cent. 14.38	per cent. 12.07
Carbonate of Lime ...	per cent. 3.87	per cent. 5.12	per cent. 5.12	per cent. 4.98	per cent. 5.17	per cent. 2.38
Silica ...	per cent. 15.54	per cent. 5.54	per cent. 9.72	per cent. 9.68	per cent. 10.67	per cent. 6.87
* Containing Nitrogen equal to Ammonia ...	per cent. 100.00					
+ Containing phosphoric acid equal to Bone Phosphate rendered soluble ...	per cent. 12.62	per cent. 14.21	per cent. 12.42	per cent. 12.83	per cent. 11.34	per cent. 15.76
Total Phosphoric acid as Tricalcic Phosphate ...	per cent. 7.12	per cent. 7.52	per cent. 6.17	per cent. 5.84	per cent. 6.27	per cent. 7.16
	per cent. 20.33	per cent. 24.68	per cent. 20.58	per cent. 19.97	per cent. 20.65	per cent. 19.23

Meat Guano.

I have already referred to the form of Meat Guano or Meat Meal valued only for its nitrogenous contents. Another form of this Substance is sold, which includes a variable proportion of bones, under the name of mixed scrap. It ought to contain from 7 to 8 per cent of ammonia and from 30 to 40 per cent of phosphates. Both the phosphates and the ammonia, however, are often much lower than this. In the following example the phosphates are particularly deficient :—

Analysis of Meat Guano. (TATLOCK.)

* Phosphoric acid ...	per cent. 6.04
Lime and Alkaline Salts ...	per cent. 11.64
Organic matter ...	per cent. 58.85
Sand ...	per cent. 16.11
Water ...	per cent. 7.36
	per cent. 100.00
* Equal to Tricalcic Phosphate of Lime Nitrogen ...	per cent. 13.20
Equal to Ammonia ...	per cent. 5.04
	per cent. 6.12

American animal Guano, from tinned meat establishments, according to Griffiths, contains from 3 to 5 per cent of Ammonia and from 35 to 45 per cent of Phosphates.

Nitrogenous Superphosphates.

This class of manures is prepared by heating either nitrogenous phosphatic materials such as

bones or Peruvian guano and sulphuric acid, or by heating mineral phosphates in the same way, and adding some nitrogenous material, such as sulphate of ammonia, to the mixture. In the case of superphosphate made from bones, two kinds are distinguished. When about one-third or less of the bone phosphate has been rendered soluble by treatment with sulphuric acid, the resulting manure is termed vitriolated bones, when more than a third of the bone phosphate is rendered soluble, the resulting manure is called dissolved bones. The following are examples of vitriolated and dissolved bones :—

	Vitriolated bones. (MACADAM.)		Dissolved bones. (MACADAM.)	
Soluble Phosphate (Equal to Bone Phosphate rendered soluble) ...	6.87	8.31	11.74	14.92
Insoluble phosphate ...	(10.72)	(12.96)	(18.32)	(23.28)
Hydrated sulphate of Lime... ..	27.72	25.34	9.86	16.14
Alkaline Salts ...	26.28	26.28	36.24	32.16
Silica	2.64	2.17	2.18	2.56
* Organic matter and Ammonia	3.43	5.13	3.62	3.12
Moisture	20.82	19.65	20.52	17.64
	12.24	13.12	15.84	13.46
	100.00	100.00	100.00	100.00
* Ammonia	2.46	2.46	2.16	2.83

The following is the composition of a sample of dissolved bones imported to Ceylon :—

	per cent.
Soluble Phosphate	12.53
Equal to Bone Phosphate rendered soluble	(19.62)
Insoluble Phosphate	17.06
Hydrated Calcium Sulphate	31.68
Alkaline Salts, Magnesia, &c.	2.90
* Organic matter, Ammonia, &c.	19.89
Moisture	10.10
Siliceous matter	5.84
	100.00
* Containing Nitrogen equal to Ammonia	2.78

NITROGENOUS AND POTASSIC MANURES.

The best example of this kind of manure is the substance met with in commerce under the names nitrate of potash, nitre, or saltpetre. What is met with in commerce, varies in composition, to a very great extent, according as it is crude or refined nitre. It is a substance, therefore, which should be purchased under some guarantee as to the percentage of real nitre present. I have had samples submitted to me for analysis under the name of nitre which contained from 3.22 to 93.25 per cent of real nitrate. The following are examples :—

Analyses of Nitrate of Potash.

	per cent.				
Moisture	9.34	6.10	3.91	2.72	3.60
Organic matter	1.64
Calcium Sulphate	1.31
Calcium Nitrate47	1.70	.12	.21
Magnesium Sulphate	1.044626
Iodine sulphate36
Do chloride	29.12	38.00	6.47	5.72	2.23
Potassium sulphate33
Potassium chloride	52.64	6.31	8.38
Potassium nitrate	3.22	47.83	79.08	91.40	93.25
Insoluble matter	1.69	.9604	.09
	100.00	100.00	100.00	100.00	100.00
Nitrogen45	6.70	11.03	12.65	12.91
Potash	34.74	27.05	42.14	42.58	53.45

PHOSPHORIC ACID AND POTASH MANURE.

There are no very concentrated manures of this class met with in commerce; but certain plant ashes, turf ashes and coal ashes may be taken as examples.

GENERAL OR CONCENTRATED COMPOST MANURES.

The compost manures previously noticed had their valuable constituents mixed with so much comparatively worthless material that they scarcely come under the class of commercial manures at all, but may be profitably prepared on the estate, or near to the place where they are to be applied. We have, however, examples of commercial manures, which supply all the essential ingredients of plant food in a concentrated form, such for example is the superphosphate manure called Sombroorum, formerly well known in Ceylon, an analysis of which will be found at page 499, vol. 1892-93. The following mixture of white castor cake, bone meal and nitre affords another example of this class of manure :—

Analysis of a mixture of White Castor Cake, Bone Meal, and Nitre.

	per cent.
Moisture	7.52
Organic matter	46.96
* Phosphoric acid	9.04
Lime	11.54
Salts of Potassium	18.52
Carbonic acid, Magnesia Alkaline Salts, &c.	3.68
Insoluble Siliceous matter	2.74
	100.00
Nitrogen	6.88
Equal to Ammonia	8.35
* Equal to Triatomic Phosphate	19.73

We have additional examples of concentrated compost, or complete manures in the fertilizers known as Odani's special fertilizers for coffee, tea, and tobacco. The following are examples of these, the analyses being by well-known chemists :—

Analyses of Coffee, Tea and Tobacco Fertilizers.

	Coffee fertilizer, Dr. Voelcker.	Tea fertilizer, Dr. S. Macadam.	Tobacco fertilizer, Mr. J. Cripps.
	per cent.	per cent.	per cent.
Moisture	13.55	13.04	13.41
Water of combination and organic matter, including Salts of Ammonia	22.74	23.26	26.35
Monobasic Phosphate of Lime (equal to Tribasic Phosphate of Lime rendered soluble by acid)	15.53	16.82	15.77
Insoluble Phosphates	(24.32)	(26.24)	(24.69)
Sulphate of Lime	5.89	2.81	1.47
Alkaline Salts and Magnesia	24.95	28.42	29.20
Insoluble Siliceous matter	14.35	12.92	11.08

Equal to Sulphate of Potash	4.88	5.17	3.88
	9.03	9.57	7.18

INDIRECT MANURES.

Besides manures which directly supply the three chief elements of plant food,—nitrogen, potash and phosphoric acid,—other fertilizers are used on account of their properties of liberating the plant food in the soil, or of destroying excess of vegetable matter, correcting acidity of the soil, fixing ammonia and getting rid of various pests. Such substances are lime in various forms other than phosphate, common salt and sulphate of iron. It is also claimed for the last that it acts as a direct manure in increasing the production of chlorophyll.

In Ceylon, mountain limestone occurs of very pure quality; dolomite also is found.

The following shows the composition of the purer forms of Ceylon crystalline limestone:—

Analyses of Ceylon Limestone.

	per cent.	per cent.
Calcium Carbonate	93.79	97.00
Magnesium Carbonate	2.51	1.77
Carbonate of Iron	.68	} -23
Phosphate of Lime	.15	
Alkalies	.20	
Organic matter and moisture	.47	
Silica	2.20	1.00
	100.00	100.00

Both of these are richer in calcium carbonate than the coral sold in Colombo, which has the following composition:—

Analysis of Ground Coral. (HUGHES.)

	per cent.
Moisture	52
Organic matter	1.94
Carbonate of Lime	92.40
Carbonate of Magnesia	trace
Oxide of Iron and Alumina	.75
Quartz and insoluble Silicates	2.01
Sulphate of Lime	.68
Alkalies, Chlorine, &c.	1.70
	100.00

The following shows the composition of Ceylon magnesian lime stone or dolomite:—

Analyses of Dolomite.

	per cent.	per cent.
Calcium Carbonate	50.16	74.52
Magnesium Carbonate	26.00	19.33
Oxide of iron and Alumina	3.66	.35
Alkalies and traces of Phosphoric acid	.18	.20
Insoluble Siliceous matter	19.88	5.35
Moisture	.12	.25
	100.00	100.00

Coral and limestone are generally burned in a kiln to render the lime caustic before it is applied to the land. This burning, especially as performed on estates, frequently leaves a considerable proportion of the alkaline earths in the mild form of carbonate. The following shows the composition of a sample of estate made lime submitted to the author for analysis:—

	per cent.
Moisture	6.56
Lime	37.57 = Calcium carbonate
Magnesia	21.22 = Magnesium carbonate
	113.77
Oxide of iron and Alumina	1.70
Alkalies	.90
* Carbonic acid	24.31
Insoluble matter	7.74
	100.00
* Equal to lime	30.94 = (Calcium carbonate ... 55.25)
Or to	Lime 19.76 = Calcium carbonate ... 35.29
	Magnesia 7.99 = Magnesium carbonate ... 16.77
	52.06

In this sample of caustic lime and magnesia which has evidently been prepared by calcining dolomite, not more than about 54 of the original 113 parts of carbonates has been changed to the caustic state.

For the purpose of destroying plants characteristic of peaty land, lime from the purifier of gas works is sometimes applied to land. This substance is said to destroy the coarser grasses, and to bring

the soil into a state more favorable to the growth of a sweeter and more nutritious herbage. It is usually exposed to the air for a considerable time before it is applied with a view to change the sulphuret of calcium into gypsum. This substance is sometimes applied to land in England, in the proportion of 2 tons per acre, both on account of its chemical qualities, and of its effect upon the mechanical condition of the land, rendering stiff heavy soils more porous. I give below Professor Voelcker's analysis of gas lime, and, for comparison with it, Mr. Hughes' analysis of a sample of gas lime from the Colombo Gas Works.

Composition of Gas Lime dried at 212° F.

(VOELCKER.)

	per cent.
Water of combination and a little organic matter...	7.27
Oxide of Iron and Alumina with traces of Phosphoric acid ...	2.49
Sulphate of Lime (gypsum)...	4.64
Sulphite of Lime ...	15.19
Carborate of Lime ...	49.40
Caustic Lime ...	18.23
Magnesia and Alkalies ...	2.53
Insoluble Siliceous matter28
	100.00

In fresh gas lime the porportion of water varies usually from 30 to 40 per cent.

Analysis of Gas Lime from Colombo Gas Works. (HUGHES.)

Moisture ...	16.96
* Organic matters ...	2.82
Carbonate of Lime ...	61.70
Caustic Lime ...	7.01
Sulphide of Lime ...	1.71
Sulphide and Cyanide of Iron ...	2.40

	100.00
* Containing Nitrogen30
Equal to Ammonia36

Common Salt.

Some writers to the Ceylon press state that common salt has been applied with advantage to coconut land situated in inland districts.

The composition of common salt from sea water in Europe is found to vary between the following limits:—

	per cent.	per cent.
Sodium chloride from	89	to 96.5
Magnesium Chloride ..	.2	to 1.58
Magnesium Sulphate ..	.4	to 6.20
Calcium Sulphate ..	.33	to 2.35
Water ..	—	to 6.30
Insoluble matter ..	.07	to 3.60

The following in like manner exhibits the composition of European Rock Salts:—

Composition of Rock Salt.

	per cent.	per cent.
Sodium Chloride from	96.7	to 100
Calcium Chloride ..	—	to .68
Magnesium Chloride ..	—	to .97
Potassium Chloride ..	—	to trace
Calcium Sulphate ..	—	to 1.65
Magnesium Sulphate ..	—	to 2.30
Magnesium Carbonate, ..	—	to .15

Calcium Carbonate ..	—	to .16
Ferric Chloride ..	—	to .05
Insoluble matter ..	—	to 3.35
Water ..	—	to .63

Sulphate of Iron.

It was formerly considered that most soils contained sufficient iron for the use of plants, and that iron in any form except peroxide exercised rather a hurtful effect on plant life. As the result of many experiments, however, Dr. Griffiths, author of. ("A Treatise on Manures) already quoted appears to prove the efficacy of applying iron in a soluble form even to land already containing a considerable proportion of iron in an insoluble form. Dr. Griffiths says, that his original proposition, "that a fairly large proportion of soluble iron in a soil is favorable to the growth of plants developing a large amount of chlorophyll has been confirmed by all his subsequent investigations. He strongly recommends sulphate of iron both as a manure and as an antiseptic substance for application to other manures. Amongst the many plants that are benefited by it he mentions several that are cultivated in Ceylon, viz., Tobacco, Indiarubber, Palm trees and Rose trees. Thus from experiments on tobacco grown in England he has formed the opinion that the best manure for the tobacco plant is a mixture of 4 parts sulphate of potash, 1 part iron sulphate, 1 part ammonium sulphate. He quotes also Sibson's analysis of a favorite horticultural manure called Zotikos, which in addition to a fair proportion of all the other manurial constituents contains also 2.40 per cent of iron sulphate. The following is the:—

Analysis of Zotikos. (SIBSON.)

Iron sulphate (Fe ₂ So ₄) ...	2.40
Organic matter and Ammonia Salts ...	34.28
(Containing Nitrogen 4.4 = 5.34 of Ammonia)	
Sulphate of Lime ...	16.04
Monocalcium Phosphate ..	7.48
(Equal to Bone Phosphate made soluble 11.67)	
Insoluble Phosphates ...	8.13
Nitrate of Potash and Alkaline Salts, ...	15.20
(Containing Nitrogen 1.5 = 1.8 of Ammonia)	
Insoluble matter ...	2.13
Moisture ...	14.34
	100.00

This manure is much used by florists in England.

In nearly all his experiments with iron sulphate Dr. Griffith's applied it in the proportion of ½ an cwt. per acre, and he states that the limit of one cwt. per acre should not be exceeded, as sulphate of iron in excess is poisonous to plants.

To destroy fungal spores in farmyard manure, he waters the same with a solution of sulphate of iron containing ½ lb. to a gallon of water, and to prevent the escape of ammonia from farmyard manure, as well as to destroy injurious germs, he recommends it to be watered with a solution containing 1 lb. of the salt to a gallon of water. Commercial sulphate of iron contains, besides ferrous sulphate, a small proportion of alum. ferric sulphate, and other ingredients.

Valuation of Manures.

Wherever the manures of commerce are used to a considerable extent, the price is based on the chemical composition as determined by analysis. The manure is either sold at so much per ton with a guaranteed analysis, or it may be sold at so much per unit of one or more of the three important constituents: nitrogen (or ammonia), phosphoric acid (or phosphate of lime) and potash, found by analysis to be actually present.

By the unit of any ingredient is meant the one-hundredth part of a ton of that ingredient. The unit has a commercial value affixed to it based on the price of the ingredient in manures at port. The price of a unit is therefore not a fixed quantity; but fluctuates according to the law of supply and demand. It has to be adjusted from time to time as the market varies when commercial transactions are conducted on the basis of analysis. It will, however, be of considerable use if I give here a list of values of units of manurial ingredients, even although, by the time it is in the hands of the public, its accuracy will be only approximate.

The following is the rule for finding the commercial value of a manure at port from its analysis. Multiply the percentage of the valuable ingredient in the analysis by the price of the units, the product or where there is more than one valuable ingredient, the sum of the products will give the commercial value of the manure:—

Table showing the commercial value in Colombo of one-hundredth part of a ton of the important constituents of manure:—

	R.	c.
* Ammonia in sulphate of ammonia containing 24 per cent of ammonia ...	12	16
Ammonia—equivalent in nitrate of potash containing nitrogen equal to 14 per cent of ammonia ...	12	15
Ammonia—equivalent in nitrate of soda containing nitrogen equal to 19 per cent of ammonia ...	9	25
Ammonia—equivalent in steamed bones	9	00
Ammonia—equivalent in dried blood, oil cakes and fish manure ...	7	00
Ammonia—equivalent in bone dust	6	75
Phosphate of lime soluble as in 40 to 50 per cent superphosphate	3	25
Phosphate of lime insoluble as in fish manure and steamed bones ...	0	90
Phosphate of lime insoluble as in bone dust ...	0	75
Phosphate of lime reckoned as tribasic in basic slag ...	1	92
Phosphate of lime insoluble in finely-ground mineral phosphates ...	1	78
Phosphates in oil cakes ...	0	80
* Potash in nitrate of potash ...	2	50
* Potash in nitrate of potash imported from Europe ...	3	90
Potash in sulphate of potash 27 %	4	89
Do in kainit 12 % ...	6	27
Do in muriate of potash 50 % ...	3	64
Do in oil cakes ...	2	00
Soluble ash in oil cakes ...	0	75
* Liable to considerable fluctuation.		

A few examples of the method of using the units for the valuation of manures will made the matter clear: thus, suppose we have a good sample of nitre containing 12.45 per cent of nitrogen which is equivalent to 15.11 per cent of ammonia and 41.92 per cent of potash.

Ammonia	15.11	×	R12.15	=	R183	59
Potash	41.92	×	2.50	=	104	80

Value per ton in Colombo ... R288 39

Take an example of steamed bones containing 2.52 per cent of nitrogen equivalent to 3.06 per cent of ammonia and 50.5 per cent of phosphate of lime.

Ammonia	3.06	×	R9	=	R27	54
Phosphate of lime	50.50	×	R0.90	=	45	45

Value per ton in Colombo ... R72 99

Take an example of good bone dust containing nitrogen equal to 4.5 per cent of ammonia and 50 per cent of phosphate of lime.

Ammonia	4.5	×	R6.75	=	R30	38
Phosphate of lime	50	×	R0.75	=	5	25

Value per ton in Colombo ... 67 88

Take an example of good castor cake containing 7 per cent nitrogen equal to 8.5 per cent of ammonia and 7 per cent of soluble ash.

Ammonia	8.5	×	R7	=	R59	50
Soluble ash	7	×	R0.75	=	5	25

Value per ton in Colombo ... 64 75

Lastly, take an example of inferior castor cake containing nitrogen equal to ammonia 4.69 per cent and soluble ash 6.48 per cent.

Ammonia	4.69	×	R7	=	R32	83
Soluble ash	6.48	×	0.75	=	4	86

Value per ton in Colombo ... R37 69

It will be abundantly evident from the last two examples, that, from a commercial point of view, when a manure is purchased on the basis of its analysis, for application at no great distance from the place of purchase, it does not greatly matter whether it is rich or comparatively poor in fertilising ingredients; but the economy of purchasing a manure rich in fertilising ingredients is apparent when the manure has to be carried a considerable distance. Thus, in the two examples of castor cake just referred to, one ton of the better quality has a manurial value equal to 1.72 tons of the inferior quality. Let us suppose each manure has to be carried a hundred miles at 12½ cents per mile per ton, the cost on the estate of equal quantities of the valuable constituents of the manures may be calculated thus:

Cost of 1 ton castor cake good quality at port	=	R64	75
Carriage on same for 100 miles at 12½ cents =		12	50

Cost on the estate ... R77 25

Cost of 1.72 tons inferior castor cake at port	=	R64	75
Carriage on same for 100 miles at 12½ cts. =		21	50

Cost on the Estate ... R86 25

By purchasing one ton of the manure of good quality the planter would thus save R9 in carriage compared to what he would have to pay for the same manurial ingredients in the inferior manure.

TEA LEAVES AND INSECT ENEMIES.

Tea leaves on a Nuwara Eliya garden attacked by a "poochie" pronounced by a planter to be helopeltis, although the flush was not affected, were thus noticed by Dr. Trimen a few weeks ago:—"The tea-leaves you sent me a few days since are damaged by some sucking insect probably a bug. The marks look like those caused by helopeltis, but I do not think that insect extends to so high an elevation as Nuwara Eliya, nor does it often attack old leaves, much preferring (unfortunately) the young 'flush.'"

In another letter Dr Trimen remarked:—

"I think I see pretty well all the so-called 'diseases' of the crops here and should be sorry to do anything to further encourage the planters in sending every insect or fungus they may chance to find on their plants to know if it be 'serious.' The practice already amounts to an absurdity. Everybody knows that plants are the natural food of insects and the home of innumerable fungi, and must be aware that only in a few obvious cases, as when extremely abundant, any damage is done worth mentioning.

"I have no time to do more than roughly examine the hotel leaves. The malady is a well-known one, and I will see if anything has been published about it in India or elsewhere. But to attempt to work at it myself is out of the question, at all events for the present; as I am quite overwhelmed with a multitude of subjects, besides the steady grind of the 'Flora' which occupies all leisure time." This shows the need of an Entomologist to attend to insect pests which are really troublesome.

PLANTING AND EXPORT TRADE INFORMATION.

(From Annual Report of the Planters' Association of Ceylon.)
