TEA.—The season has been a favourable one and the Tea Crop exceeded your estimate, while quality has been quite maintained. The Home average price for the year was 9d against 9½d last year, the decrease is, however, attributable not to overproduction or the falling-off in favour of your staple, but to the general dullness of trade, owing to strikes and other causes. By comparing the Chamber of Commerce returns as appended, you will find cause for congratulation in the steady increase of consumption in all markets, notwithstanding the very satisfactory increase last year. Especially satisfactory is the large increase in France—nearly double,—in Germany, in Holland, in Russia where Exports direct are 53,272 lb. as against 400 lb. last year; in addition to which it is understood that exports from London have largely increased in Spain, in India 964,104 lb. as against 528,037 lb. last year, in Australia, in Africa, in China. The Home consumption is also highly satisfactory. Taking the proportion of the various growths of teas, Messrs. Gow, Wilson & Stauton's table gives the following figures or comparison between 1889 and 1893:—

	India.	Ceylon	China.
	per cent.	per cent.	per cent.
1889	52	15	33
1890	52	18	30
1891	49	25	26
1892	53	30	17
1893	51	31	16*

Your local Tea Company show as satisfactory earnings as formerly and the various properties changing hands during the year have done so at full prices. There has not been any appreciable increase to the acreage planted with Tea during the year, although you may expect a fair increase during 1894.

The Chamber of Commerce returns alluded to above are as follows:—

* Other countries for 1893—2 per cent.

		Cocoa.	

In the paragraph devoted to this product in the Report for 1892, it was conjectured that the Spring crop, then about to be picked, would make up for any deficiency in the crop of that year, as compared to that of 1891. This anticipation was more than realized; the majority of the crop of 1893 was Spring crop and the amount shipped for the year 29,775 cwt. is some 10,000 cwt. in excess of that shipped in any previous year. Prices which ruled high in Spring dropped heavily in Autumn, and have not yet recovered. This is due, partly to the unusually large crop, partly to a long hot Summer in Europe, but chiefly to the cessation of the American demand. Why this market has been inactive is difficult to say, but probably the reason is not unconnected with the financial crisis in that country. If American purchases are resumed, prices will at once rise considerably. In the meantime it is satisfactory to note under the above mentioned adverse circumstances, Ceylon cocoa was not quoted lower than 92s.

COFFEE.

Owing to a favourable season, the coffee still remaining under cultivation is looking well and there are prospects of a better crop during the coming year.

CARDAMOMS.

During the year no great extension has taken place in the acreage under this product; and a corresponding acreage, having ceased to yield remunerative crops in the natural course, has been planted up with tea and other products. The volume of exports is still fairly maintained as compared with last year and the prices throughout the year have been satisfactory and fairly steady.

TOTAL EXPORTS.

By the courtesy of the Hon. the Principal Collector of the Customs, your Committee has again pleasure in inviting your attention to the statements appended to this Report showing the total Exports from Ceylon during the year ended 31st Dec. 1893, and of the distribution of the Tea Crop, to the United Kingdom and to other markets. For the purposes of comparison similar statements for the years 1891 and 1892 are also annexed.

OFFICIAL ESTIMATE OF THE TEA CROP FOR 1894.

The returns from the various districts having been received, your Committee has now to announce that the total Estimate of the Tea Crop for 1894 is 83,000,000 lb.

CEYLON TEA AT CHICAGO:

LETTER FROM MR. BIERACH.

By a recent mail we have a letter from Mr. S. Bierach, late of the Ceylon Commissioner's staff and now carrying on a "pure Ceylon tea business at 132, East 23rd Street, New York." We have also received specimens of the advertising leaflet he has issued calling upon the citizens to send their orders for attention without extra charge for delivery to him until their grocers can supply them with Ceylon tea which "ranks as the purest and choicest tea in the American market" and had carried off the highest award at the Exhibition. The labels which are put on the packets contain directions "how to make a good cup of tea."—Mr. Bierach in his letter says:—

After the labors of the Exhibition, it is with much pleasure that I look back upon the work that has been accomplished. Without a question, the spicy little island of the eastern sea, your beautiful Ceylon, held a place foremost among the nations represented at the Great Columbian Exhibition. Your Queen, your Governor, your people have every reason to feel proud of the achievements on behalf of your industries. Your exhibit was unique, original, interesting, beautiful and pleasing to the artistic eye.

Ceylon did well in selecting one of its foremost citizens, the Hon. J. J. Grinlinton, to represent its interest at the World's Fair and he was ably assisted by W. Pole Fletcher, Esq. The most energetic and popular of the Foreign Commissioners, was your own Special Commissioner, who made hosts of friends by his genial disposition and good-fellowship; with an eye ever open on all occasions to the best interest of Ceylon.

Ceylon Tea, well! It was just on top without a question and as we say in America—"don't you forget it. The commendations were numerous and well deserved. Delicious, delicate, very good, why this is like chocolate, the best at the Fair—were common expressions and it was a common thing to hear at the woman's court "That cup of tea has just saved my life." I don't wonder, as many of the ladies visiting the court seemed fagged out, ready to drop; and I can assure you that it was very gratifying to see the good effect of a cup of tea. At the same time some very amusing remarks came to my ears as our teas seemed strange to a number of the visitors. One stout old lady called for a cup of tea, adjusted her glasses carefully, turned to one corner in her mind to enjoy her cup of tea quietly. With the first sip she looked deep into the cup—"Funny Tea" came from her lips; with the next sip the same expression and so on with each sip and I noticed when she returned the cup it was dry, not a drop left, it was funny but good. Perhaps the same old lady may drink Ceylon tea now and when other than Ceylon be presented her she may say "Funny Tea"! "Funny Tea"!

In the Woman's Building, on account of the smallness of our Court, it was impossible to supply the great demand for cups of our delicious and cheering tea. On account of this great pressure I am sorry to say we were obliged to turn hundreds of people away almost daily. It was a most happy arrangement when the Hon. J. J. Grinlinton secured the space in the favorite Woman's Building, for without a question, this was our pet court and added largely to our success at the Columbian Exhibition. Another happy arrangement was the building of the new tea house adjoining our main court; without this it would have been impossible to get on; people would have Ceylon tea and a place they must have and a place was provided. It was so novel and oriental that it was a pleasure to see the enjoyment of our patrons under the talipot roof quietly sipping the fragrant tea of Ceylon; going away well pleased and refreshed. This was a great satisfaction and a very great satisfaction when at the midday collection our good and genial friend Captain Hansard would hand me six to eight pounds sterling resulting from sales of tea in the cup in this new addition. Was

it a success? Well I should smile; yet another happy event that I am pleased to bring to your notice was the arrival of our good and much valued friend T. A. Cockburn at Chicago. We had to have him he was too valuable to let go, he was on his way to San Francisco, we just nailed on to him, chained him fast and it was well we did, I don't know what the women's buildings and the ladies would have done without him. It is needless for me to say he was a success. The best evidence was the great success of the women's court and it's my sincere prayer that the same success will follow our good friend to Frisco. He was a long time getting to Frisco but he finally got there and to continue the good work in the interest of Ceylon.

On June 20th, my son, S. Bierach, (junior) came out for a ten days' vacation: he arrived at a good time, proved himself quite a valuable assistant to our good friend Cockburn for twenty-five days at the Women's Court. It was voluntary on his part and a pleasure to lend his assistance to further the interest of Ceylon which he has done more or less in assisting me at local exhibitions without cost.

The many questions asked in many ways were most amusing: "Where is Ceylon? what kind of people are they? is that a man or a woman?" "No, madam, that woman is a man, the man with the large turban is a Tamil, the one with the comb is a Sinhalese" "This man," pointing to "T.A.O." is a single man? is he married? "No madam he is a single man." "Oh! does he speak English?" "Yes, madam." Then the single man would answer for himself. With all our hard work, the little amusing events from time to time were quite a relief and made life worth living at the exhibition.

It was my pleasure to assist at many receptions in the Commissioner's tea room in the upper octagon, outside of the Administration and Woman's Buildings. I do not know of another room, where so many people from all parts of our common country, Europe, India, and other countries, were entertained. One of the last affairs that I attended, as a guest, was the Colonial reception and ball at the New York state building, one of the best adapted buildings on the ground for the purpose; pure in style of architecture and containing a magnificent ball room. On this occasion, a suite of three rooms on the main floor were put at our disposal and ten of our native servants brewed and served tea to good satisfaction. I felt as proud as a Ceylon man of them, they looked so nice and clean: in fact the reputation of our native staff stood second to none at the exhibition: always well behaved and polite. I sincerely trust that the Chicago venture will prove a very great success; that the store will be blessed with good business and become self-supporting. But I do regret very much that nothing has been done as to New York, the most important city in the states. Had I the means, I would not worry myself much about it, but would sail in on my own account, to do that which is being left undone. A tea Kiosk, in a proper location, properly started, I am sure would be a success almost from the word go; in a short time become self-supporting and later, from the profits, would be the means of starting similar establishments in other cities; but the thing is to start right and in the right place.

My plans for conducting such a tea kiosk would not conflict with the retail grocer, as my purpose would be to make it self-supporting and, at the same time, have the favour and help of the dealer, in the sales of the Ceylon Tea so that the establishment would be a mutual benefit, approved by the dealer and the planters made happy with increased sales.

In closing, I wish to express my gratitude to the Hon. J. J. Grinlinton, for his kind consideration at the Great Columbian Exposition; I also wish to express my sincere thanks to W. Pole Fletcher, Esq., and Captain A. Hansard and the staff generally for the kindness shown me. Our relations have been most pleasant and I shall ever cherish my association with Ceylon at the World's Fair.

TEA IN AMERICA.

(Madras Times.)

Our Ceylon contemporaries are "booming" away about Ceylon tea; framing plans for the conquest of North America by Queen Tea, and so on. But one of them kindly includes Indian tea planters as allies, and writes on "The need of hearty co-operation between Injiau and Ceylon planters?" Will not some one suggest a Planting DINNER, to come off once a year?

An "Old Planter" writes that the recent fall in the price of tea, both in Ceylon and at home, ought to lead to fresh exertions on the part of everyone interested in the welfare of Ceylon to make known the merits of Ceylon tea. "Not an opportunity should be lost of spreading the name of Ceylon and its famous tea in every paper throughout the world." Already there are remarks that Ceylon is the chief exponent of the great art of advertisement, and yet her planters are not happy!

The *Ceylon Observer* has the unselfishness to announce that what is wanted is the formation of an Advertising Fund for Tea in America to which the planters in both India and Ceylon should contribute, and in proportion to the estimates of production framed in Calcutta and Kandy. "This fund should, first, be devoted to the paying of a standing advertisement of an attractive as well as instructive character, in the leading newspapers in America." This sudden anxiety for an alliance with India may be regarded as suggestive. [The "sudden anxiety" it may interest our contemporary to know, was prompted by the suggestion of proprietors who have large interests in both India and Ceylon.—Ed. T. A.]

Ceylon people are still discussing the question of duty or no duty as regards foreign tea, and opinions are still pretty evenly divided. The one section objects to the possibility of any tea leaving the island which is not pure native produce, and upholds the impost; while the other sees in a free port visitors of Colombo becoming the port of Southern India, and talks glibly of "blends." One thing mentioned during the discussion is interesting. Travancore tea is acknowledged to be as good as lowcountry Ceylon. Travancore will now take heart!

THE VICTORIAN COMMISSIONERS IN CEYLON.

Some weeks ago we mentioned that the Victorian Government had appointed a Commission to visit various countries in the East for the purpose of ascertaining what prospects there are of opening up a trade in the produce of Victoria with these places. Originally it was intended that the Commission should consist of Mr. David Wilson, agricultural expert, and Mr. Sydney Rowe of the Customs Department, but it was found afterwards that it would be inadvisable for Mr. Wilson to leave at present, and accordingly Mr. J. Kelly also of the Customs Department was appointed to accompany Mr. Rowe. These gentlemen arrived in Colombo last evening by the mail steamer "Arcadia" and are at present staying at the Grand Oriental Hotel where one of our representatives had a short conversation with them this morning.

We had previously learned that the reason which induced the Victorian Government to depart from the original intention to send Mr. Wilson on the mission was that the Premier was inundated with letters from those engaged in the butter trade chiefly pointing out that the export season was only half over and that it was absolutely necessary that the services of the expert should be retained to supervise the export. All the butter which leaves the colony is inspected and branded with

the Government stamp, the London buyers accepting the butter so branded as of first quality, and the people are therefore anxious that there should be no laxity in carrying out this system of branding so that the reputation of their produce should be maintained. It was also pointed out, we were informed, that there were still a number of factories to be inspected by Mr. Wilson under the bonus system which has now ceased however. The Premier accordingly called a meeting of the Cabinet at which it was decided to adhere to the idea of sending the Commission and so keep faith with those who had already forwarded samples, and after consultation with Dr. Walleston the Secretary of the Customs they appointed Mr. Kelly to go along with Mr. Rowe who had been previously chosen to accompany Mr. Wilson, on this important mission. Without going into the details of the matter, Mr. Rowe said that it was considered very essential that Mr. Wilson on account of his expert knowledge in the management and shipment of butter and cheese should be on the spot during the export season and hence the change that had been made in the personnel of the Commission.

Mr. Rowe stated that his colleague and he had credentials from the Earl of Hopetoun which they intend to take the earliest possible opportunity of presenting to His Excellency the Governor. It is also their intention to wait upon His Excellency the Major-General with the view of ascertaining whether there is any prospect of the military authorities favouring a contract for the supply of frozen meat for the army. It is part of their instructions that they should investigate the practicability of establishing freezing chambers for frozen meat in Colombo, this port forming a central depot for India and the East. In some parts of India it is said a strong desire has been expressed to have a supply of such meat, and it is thought that not merely the army but the Anglo-Indian community generally would become good customers. The Commissioners have also brought letters of introduction to some of the leading merchants here and these they will present with the least possible delay; and as soon as they can get the samples of produce cleared and secure central premises in which to display them they will issue invitations to all interested to come and inspect them. They have about 122 packages of samples and these include preserved meat, ales, jams, preserves, biscuits, hams, flour, sauces, brandy, soap, compressed fodder, butter, condensed milk, vegetable and native seeds, Eucalyptus oil and extract, leather, quinine wine, tallow and red gum syrup. Arrangements have been made with Mildura for dried fruits of this season's crop to be sent on later. It is also thought that something might be done in potatoes. "With regard to the rest," said Mr. Rowe, "this extract from the *Age* will explain."

The extract is as follows:—

"The embassy is not strictly confined to the lines of produce above mentioned. The officers will make all possible inquiries with regard to other products sent to these places by other countries, these being also produced in this colony, and the results will be reported to the Government with the general record of the trip. The officers will receive written applications intimating an intention to open up trade, and will transmit the same to Government, through whom vendor and purchaser may be placed in communication. The officers selected are regarded as eminently well adapted for the purposes of the tour, and it is expected that they will make the best of their opportunities."

We also quote another extract as follows:—

"Mr. Rowe has gone to considerable trouble to ascertain the freight charged by the different steamship companies trading with the various ports in the tour, so that when he is on the spot he will be able to formulate a comparative statement from which he may ascertain accurately the position of Australia with regard to other countries likely to be competitors. There is, of course the possibility that the prospect of developing trade may encourage shipping Companies to make rates which would be greatly to the advantage of the Colony."

The first thing claiming the attention of the Commissioners was the clearing of their samples and they were setting out at once for the purpose of seeing Capt. Bayley of the P. & O. Company and the Principal Collector of Customs with regard to this, next endeavouring to secure some cool place in which to store them. The samples have all been specially selected for the Eastern trade.

The appointing of the Commission, Mr. Rowe explained, might be regarded as a following up of the policy of the Government in promoting the development of the natural resources of the country by means of village settlements under which scheme grants are made of about 20 acres of land repayment being made in easy instalments. In pursuance of this policy promises were also given for the manufacture of butter and cheese. The bonuses for the former has now ceased, but notwithstanding that fact the export in eleven months of last year exceeded that of the previous twelvemonths by 2½ million lb. During the last few years there has been a considerable falling off both of the imports and exports of the colony, but particularly of the former, owing to the depression, but it was hoped that the efforts now being made would result in trade being greatly stimulated. Asked if efforts were being made in other directions than the East Mr. Rowe said that the Hon. Mr. Reid who had recently passed through Colombo, had taken samples of produce with him to exhibit in Canada which he would visit after he had transacted his business in London which was connected with the condition of affairs in the Agent-General's Office.

After completing their investigations in Ceylon the Commissioners will visit Malras, Bombay, Calcutta, Rangoon, Singapore and go on to Japan from whence they will return, their tour extending probably over six months.

PICKINGS WITH A LOCAL APPLICATION.

Cassia auriculata (Sin. Ranawara) is coming to be recognized as a most important tea-producing tree. The *Indian Agriculturist* quotes as follows from a Madras contemporary which recommends its cultivation as a remunerative investment:—"Under favourable circumstances it attains a fair growth in five years, when it is fit to be cut for its bark. It thrives very well on poor soil lying on high ground. It needs no irrigation and no care. It fears neither borer nor leaf disease." Even cattle and goats are said not to touch it.

Again we are told that "*Cassia auriculata* of five years' growth will yield fairly stout bark of the best quality. The plants that are cut sprout again and again indefinitely. From five to ten pounds of bark may be taken from one shrub; and at least five hundred shrubs can be grown on an acre. The yield per acre may in consequence be estimated at five to ten candel-weight, in Madras from R100 to 200. The cost of gathering the bark is about R5 per candy; and the cost of cultivation being all but nil, the reader may calculate what a large margin there is for a venture in planting *Cassia auriculata*. If the culti-

vation of the shrub is taken up by enterprising planters, who would provide suitable drying sheds with hot air ventilators, in case of rain, and a press to pack the bark tight when it is thoroughly dry, they could turn out bark of far better quality than any now available. The bark so compressed would keep much longer without losing its colour, and it would then be fit for shipment to Europe where the demand for it would be practically unlimited. Those who possess land may thus not unprofitably plant the Ranawara as shade or shelter trees and in boundary fences, and allow it to occupy the "bad-pieces" on estates.

Tanning is said to be better done in Madras than anywhere in India. Now the materials, &c., available in Ceylon are the same as in Madras, and it is also well known that the few tanners in Colombo are making a very good thing out of their business. Their only complaint is that there are not sufficient hides available and it is with much difficulty that even these are obtained. I should imagine there would be a good opening for, say, for a technical student who knows how to prepare tanning materials for export, and the extraction of animal glue from skins.

I do not know whether you noticed a quotation in the *Review of Reviews* from a paper on the opium monopoly in India, in which the writer says that the question is a more serious one than either ganja and opium, inasmuch as a great deal of the mortality among human beings from cholera and of cattle from rinderpest and other diseases are due to the fact that opium is not within easy reach of the poorer population. There are no two opinions as regards the efficacy of such in keeping both man and beast in a healthy condition, and one would almost wish that another commission might be appointed to enquire into the opium monopoly question.

TEA AND SCANDAL.

I begin my communication to you with an extract (which you may have already seen) from Heber's *Indian Journal* vol. II. p. 237. 1828.—"THE TEA PLANT grows wild all through Kemaon, but cannot be made use of from an emetic quality which it possesses. This might, perhaps, be removed by cultivation, but the experiment has never been tried. For the cultivation of tea I should apprehend both the soil, hills, surface, and climate of Kemaon, in all which it resembles the Provinces of China, extremely favourable."

At p. 23 of *The Moral Reformer* published at Boston, Mass. in 1835, I find a paragraph on "LIBERTY TEA":—"During the revolutionary war the inhabitants of New England sometimes substituted what they denominated *Liberty Tea* for that of China. It was made, according to Felt in his *History of Ipswich*, of the leaves of the plant called four-leaved loose-strife, and prepared in the following manner. The plant was first pulled up, like flax: the stalks were then stripped of their leaves and boiled, and the leaves put into an iron kettle and basted with the liquor of the stalks. After this process the leaves were removed into platters and placed in an oven to dry. A pound of this tea would go as far, so it is said, as a pound of Suchong. It sold quickly in barter at 61 sterling a pound, which in those early days was a considerable sum. Perhaps our ancestors were acquainted with the fact that the leaves of the whortle-berry when about half-grown, if dried slowly in the shade, make a beverage almost as pleasant, and quite as wholesome, as the best tea from China." *The Moral Reformer* was not an advocate for tea as will be shown in further extracts to be sent you hereafter.]

From substitutes for tea we pass easily to ADULTERATIONS, and while hunting up books on the latter I came across the annexed amusing description in Joseph T. Pope's *Lecture on Health: its friends and foes. I. Domestic Dangers*, p. 24:—"Some of the eccentricities of modern trade are delicately disclosed by a German scientist in the following little fable. There were once four flies and they were hungry. The first settled upon a *sausage* of singularly sp-

petising appearance and made a hearty meal; but he speedily died of intestinal inflammation, for the sausage was adulterated with aniline. The second fly breakfasted upon flour, and forthwith succumbed to the inordinate quantity of alum with which the flour had been adulterated. The third fly was slaking his thirst with the contents of the milk-jug, when violent cramps soon convulsed his frame and he gave up the ghost, a victim to chalk and impure water. The 4th fly, muttering to himself: "The sooner it is over the sooner to sleep," alighted on a poisoned sheet of paper exhibiting on its surfeits the figure of a death's head and the ominous words 'fly-poison.' Applying the tip of its proboscis to the paper the fourth fly drank to its heart's content, growing more vigorous and cheerful at every mouthful. He did not die: he threw and waxed fat. The fly-poison was adulterated."

This is not a joke, though you may think so. As I was searching the catalogues of the British Museum Reading Room lately for a book on Tea under the name of 'Toledo, Arouchi de,' I found not what I wanted, but instead the following AWFUL NAME:—Toledo Salm Salm Hurtado de Mendoza y Orozco Pimental Silva Gomez de Sandoval Orosio Luna Aragon la Cerda Enriquez Haro y Guzman, Pedro Alcantara de, Duke del Infantado; and the book he wrote was "Manifesto del Duque del Infantado en Enero de 1821 [giving his reasons for declining to serve his country in the present state of affairs, &c.] Madrid." I should think so!

A. M. F.

TEA BOXES.

During recent years considerable attention has been paid to the mechanical making of tea-boxes, or, more properly speaking, tea-chests. The gigantic number of these chests sent over from the growing and exporting countries is little imagined by those who are not connected with the great wholesale tea centres. The average consumption of tea in Great Britain and Ireland alone is about 30,000,000 pounds (over one-half pound per annum per head of the entire population). Every tea-chest holds about 100 lb. The yearly tea consumption, therefore, entails the use of upwards of 300,000 chests; although the absolute number of boxes made is far greater, some of them holding 50 lb. and less. The consumption of China teas have of late years fallen off in this country to a minimum, the great majority of tea sent to this market being from Assam and Ceylon, where chests of strong make only are used. The figures we have given only represent our own country's importation of tea chests and in addition there must be added that the vast importation of other tea drinking countries. The millions of boxes required may thus easily be estimated. A vast number of hands are required in the making of these boxes; the cutting of the hardwood "shoots," the dovetailing, etc. Saw mill engineers of Eastern experience have of late been paying marked attention to the making of these chests by machinery. In our last issue we gave an illustration of a "corner locking" machine (dovetailing) for tea chest purposes, made by a well-known London firm, who regularly export machinery for various trades. Messrs. A. Yates & Co. of Luddenden, Manchester, have since drawn our attention to a plant which they have just erected in Ceylon for the rapid conversion of baulk timber into shoots. They state that by this machinery, per hour, a sufficient number of "sides" can be turned out for 250-300 boxes, and that, for cost, it compares most favourably with other plants;—*Timber Market.*

INDIAN TEA SALES.

(From *William Moran & Co.'s Market Report.*)

CALCUTTA, Jan. 24th, 1894.

TEA.—On Thursday 18th instant, 8,478 chests were offered and 7,529 sold. London telegrams advising a steadier market, our prices hardened somewhat showing some recovery from the previous sales' rates.

Tomorrow about 10,000 chests will be offered, including some fine invoices from Assam.

The Committee of the Indian Tea Association have favoured us with the following interesting particulars regarding the tea crop of 1893:—

Original estimate of crop of 1893:—125,548,246 lb.

Revised estimate of crop of 1893:—126,779,773 lb.

ACTUAL OUTTURN OF CROP 1893.

	lb.
Assam	52,104,100
Cachar	18,427,544
Sylhet	19,864,305
Darjeeling	8,941,410
Teral	3,483,741
Ducars	15,381,639
Chittagong	187,653
Chota-Nagpore	288,374
Dehra Dun, Kumaon and Kangra	4,000,000
Private and Native Gardens	4,000,000

125,321,474

The total shipments to all places from 1st April to 31st December 1893 are 108,805,410 lb. The exports to the Colonies and other ports together with local consumption are estimated at 112 millions, which will leave 114 million lb. for export to the United Kingdom.

TOTAL QUANTITY OF TEA PASSED THROUGH CALCUTTA FROM 1ST APRIL 1893 TO 23RD JANUARY 1894.

	1893.	1892.
Great Britain	106,560,091	101,466,440
Australia & New Zealand	5,226,303	3,698,451
America	295,165	93,000
Bombay & Persian Gulf,	2,542,516	812,872
Snodry Ports	604,912	527,243

117,229,007 105,493,92

NOTES ON PRODUCE AND FINANCE.

THE INDIAN TEA MARKET LAST YEAR.—In a review of the tea market last year from the dealers' point of view, the *Grocer* says of Indian Tea: "Taking the year through, this branch of the trade has not been a profitable one for the dealers; in fact, the spring and summer months ended with heavy loss, owing to the bulk of supplies consisting of medium grades—they looked cheap against the high rates ruling for common tea, but buyers could find no market for them, consequently they had to resell at heavy discounts. It will be remembered that the 1892-93 crop was a very fine one, and consequently the supply of common tea was very short. Prices opened high in January, and continued so until the end of the season, with one or two reactions on account of the strong buying powers of several large blenders and packet people; in fact, the retailers of low-priced packets, &c., could have made nothing out of their turnover for the first half of the year. The crop of 1892-93 turned out exactly as we put it in our last annual reports, viz., 108,000,000 against 111,000,000 in 1891-92, while this season is expected to weigh out 115 or 116 million lb., including Travancore Teas, which are not included in the Calcutta figures. The present crop is a fair and useful one for trade purposes, being strong, but does not, of course, bear comparison with that in 1892. We have already had five million lb. more of the new crop than in the year before to same date, so that we only ought to have two million lb. extra to deal with to the end of the season. Such a state of things ought to induce confidence, considering that it is likely that present very low rates will materially increase the consumption. Deliveries for the first five months of the year fell off 4 million lb., but now we are picking up lost ground, and the total deliveries for the past year are about 109½ million lb., or, say, 1½ millions less than in 1892, which is very good, considering that 1892 showed a gain of 10 million lb. over 1891. Supplies of common and medium teas have been heavy this season. Nevertheless the run on low-priced teas has been so strong that prices have kept fairly steady. Medium teas, however, have suffered, and in the autumn good pekoes ruling about 10d dropped to 8d, and finer teas were quoted in many cases 4d and 6d per lb. easier, the value offering in pekoes between 6½d to 1s 2d being wonderful. 'Spotty,' &c., and finest teas, however, realise full rates, and are eagerly competed for. Broken pekoes

with style and fair plain liquor have ruled at a low range of prices throughout the year, viz., 7d and 10d per lb., and we close the year at 1d to 2½ per lb. lower average on pekoe souchongs and pekoes between 6d and 8d than 1892. The exports from Calcutta to Anstralia and Bombay are much heavier this season, and if prices keep low there, direct exports are likely to increase and so curtail supplies to this market. Everything points to a healthy market in the new year. Dealers do not hold heavy stocks, and prices are in a low level."

THE CEYLON TEA MARKET LAST YEAR.—Referring to Ceylon Tea in 1893, the *Grocer* says: "This favourite class of tea with the public seems to have almost reached a point at which consumption cannot get beyond for the present. Every year delivery has shown enormous increases, but 1893 is likely to be about the same as 1892, viz., 66½ million lb. The imports for the first five months were only 1 million lb. in excess of 1892, but since then the increase amounts to 5½ million lb., or say 69 millions for the year, so that we shall commence the new year with over 2 millions more stock. Of course, the high prices of common tea for the first five months of the year brought down consumption by 1½ millions lb., but the great drawback to Ceylon Tea now is the continued poorness of the crops. Even as they are, it is almost impossible to displace them in favour as far as the large blenders and packet people are concerned, and they are used up as fast as they come in. Since June 1st we have imported 4½ million lb. more than in the same period last year, while the deliveries have been 1 million lb. more than the imports, by which China suffered very heavily this November."

THE CONSUMPTION OF FOOD AND SPIRITS.—Within the last forty years there has been an enormous increase in the consumption of articles of food and drink in Great Britain, and it has been estimated that the 35,000,000 of British people annually consume upwards of 800,000,000 quarters of wheat, 93,000,000 cwt. of potatoes, 17,000,000 cwt. of vegetables, 30,000,000 cwt. of meat, 700,000,000 lb. of fish, 5,000,000 cwt. of butter, 1,000,000,000 lb. of sugar, 170,000,000 lb. of tea, 2,000,000,000 gals. of beer, 37,000,000 gals. of spirits, and 14,000,000 gals. of wine, the total cost to the consumers being about £500,000,000, or if we take the net or national expenditure, about £349,000,000.—*H. and C. Mail*, Jan. 12.

PROSPECTS OF TEA PLANTING IN CEYLON.

THE MANAGING DIRECTOR OF THE CEYLON TEA PLANTATIONS CO., LD., MR. H. K. RUTHERFORD'S VISIT TO CEYLON.

There are certainly few more sagacious or abler men connected with the Ceylon Planting Enterprise—and withal none more modest and retiring—than our recent visitor Mr. H. K. Rutherford, Managing Director of the premier Tea Company of the island. It is always as pleasant as it is profitable to have a chat with Mr. Rutherford and this last occasion when he kindly looked in upon us, on the eve of his departure, was no exception to the rule. We have already referred to the general impression of satisfaction left on Mr. Rutherford's mind by his inspection of tea plantations during his recent visit. The 7,200 acres of tea owned by his Company comprise estates from an altitude of a few hundred feet, in the Kelani Valley up, to a considerable area in our very highest district, Nuwara Eliya. Mr. Rutherford's experience is therefore as widely representative as it is valuable. Broadly speaking, he would divide the tea planting region of Ceylon into three great divisions—lowcountry, medium-elevation, and high districts—with very distinct character-

istics as to average quality and quantity of crop. Mr. Rutherford has taken a special interest in the recent discussion in our columns—begun very much, owing to his presence in the island—and he has promised to send us back his opinion on the little pamphlet containing all the letters, copies of which we were able to give him. Mr. Rutherford is not a believer in very fine plucking (leading to exceptionally high prices) as an example to be followed; nor does he believe that any estate in the higher districts can—with ordinary plucking and treatment—keep for very long, much ahead of its neighbours, although for a few years until pruning begins to tell, exceptional results may be noted. Still, as shown in the Company's own experience there are certain plantations and factories which afford some puzzling questions as to why their averages should be so much better than those of others under, apparently, the same conditions. Mr. Rutherford thinks a good or bad climate for "preparation" occasionally explains discrepancies, and certain very high (and wet) places are, obviously, at a disadvantage on this account. In judging of the Ceylon Tea Plantation Co. with its 7,200 acres of tea yielding (last year) an average of 418 lb. per acre and securing an average of about 8½d per lb., it must be remembered that little or no old—or at any rate, worn-out—coffee land is included in this extent; but on the other hand, it has to be recorded that very little manuring has taken place, save on Mariawatte which has benefited by cattle manure and the scavenging of Gampola. Otherwise, Mr. Rutherford is chary of applying manure to Ceylon tea as yet—and especially of an artificial character. He thinks there is risk of introducing some disease, or doing some mischief to the tea, through experiments in the latter direction. At any rate he has seen no sign as yet on his unmanured fields of the need of strengthening the trees. On the contrary, nothing has surprised him more than the distinct improvement which has taken place in certain fields which, five years ago, he considered doubtfully poor and weak. The additional age, cropping and tillage have vastly improved the tea bushes, no doubt owing to the roots spreading and going deeper; and altogether Mr. Rutherford leaves us with a greater belief in the permanency of tea than he held after his previous visit.

Part of Mr. Rutherford's mission to Ceylon was to visit the plantations of the Oriental Bank Estates Company. He considers they own some very fine properties, and that if a responsible system of local estate management is set up without interference from home, improved results should speedily follow.

Mr. Rutherford—like Mr. Wm. Mackenzie, the Hon. W. W. Mitchell and some other local proprietors—is by no means keen about Railway Extension to the Kelani Valley. He will not at all oppose it, of course, and the tea of the Company's plantations will all be sent by the line to Colombo; but he does not expect to effect the slightest economy thereby; while he has a wholesome dread

that one effect of Railway Extension might be to encourage the selling of more Crown Land for tea cultivation, leading to that "Overproduction" in which lies, in his estimation, the great risk of the future to the Ceylon Tea-planting Industry.

Mr. Rutherford takes a great interest in the opening of new countries to our teas, and he expressed approval of our proposition for an Advertising Campaign in America as the best means now of promoting the introduction of British-grown teas. He is very strong too that the present Customs cess on tea should be maintained for this and other cognate purposes; but he shares the view of a great many more that the day for a voluntary cess for the Tea Fund is over, since so many proprietors do not, and cannot be made to, contribute at all. He would only have us continue the Customs' cess in the future. If the Indian Tea Association proposed to work with Ceylon in advertising Pure Teas in America, we gathered, that Mr. Rutherford would favourably consider such joint action and enterprise. As Deputy-Chairman of the Ceylon Association in London, of course Mr. Rutherford fills a very important representative post in the interests of the Colony and we were glad to hear him express a lively interest in the future of the port, trade and local business of Colombo, and no less in the prospect of an Indo-Ceylon Railway. We trust, therefore, that Mr. Rutherford's connection with the Colony will long continue and that he may be able to pay more frequent visits in the future to inspect, observe and advise and to cheer us all with his own hopeful, but at the same time well-considered deductions and anticipations.

INDIAN TEA SALES.

(From *Watson Sibthorp, & Co.'s Tea Report.*)

CALCUTTA, Jan. 24th, 1894.

There was a little more life in the sales held on the 18th instant. Undesirable kinds were in full supply and sold slowly at about previous rates; the few good liquoring teas offered were badly wanted and sold at full prices. 7,420 packages changed hands.

We are indebted to the Committee of the Tea Association for the actual outturn of the Indian tea crop of 1893, the total is 125,321,474 lb. as compared with the revised estimate published on the 31st August of 126,779,773 lb. The exports to the Colonies and other ports together with local consumption are estimated by the Committee at 11½ millions which will leave 114 million lb. for export to the United Kingdom as compared with 117½ millions, which it was thought would be available when the revised estimates were published.

The average price of the 7,420 packages sold is As. 6-0 or about 7½d per lb. as compared with 10,618 packages sold on the 19th January 1893 at As. 8-10 or nearly 10d per lb. and 7,867 packages sold on the 22nd January 1892 at As. 6-7 or about 8½d per lb.

The Exports from 1st May to 22nd January from here to Great Britain are 108,222,726 lb. as compared with 101,702,288 lb. at the corresponding period last season and 101,316,925 lb. in 1891.

NOTE.—Last sale's average was As. 6-0 or nearly 7½d per lb.

Telegrams.—Reuter telegrams from London on

the 16th instant.—"Type 6 3-16,"d on the 17th.—"Tea stronger. Fine rather dearer," on the 18th.—"Offered 37,000, sold 33,000 packages. Prices unchanged," and on the 19th.—"The exports to the U. K. from all China ports from commencement of season to date show a decrease of 2,300,000 lb."

Exchange.—Document Bills 6 month's sight, 1s 3½d. Freight.—Steamer £1-17-6 per ton of 50 c. ft.

THE DUTCH MARKET.

AMSTERDAM, Jan. 6.—The cinchona bark auctions to be held here on January 25th will consist of 5,743 bales and 385 cases (about 505 tons), divided as follows:—From Government plantations, 214 bales and 15 cases (about 24 tons); from private plantations, 5,529 bales and 370 cases (about 481 tons). This quantity contains: Of druggists' bark—*Succirubra* quills, 271 cases; broken quills and chips, 90 bales 110 cases; root, 18 bales. *Officinalis* quills, 1 case; broken quills and chips, 3 cases. Of manufacturing bark *Ledgeriana* broken quills and chips, 4,479 bales; root 736 bales. *Hybrids* broken quills and chips, 343 bales root, 47 bales. *Officinalis* broken quills and chips 30 bales.—*Chemist and Druggist.*

THE "TROPICAL AGRICULTURIST" AND RUBBER.

Our enterprising contemporary, the *Tropical Agriculturist* (hailing from Colombo, Ceylon) a journal which I read monthly with great interest, presents its readers with a capital portrait of Robert Boyd Tytler, Esq., one of the pioneers of planting enterprise in Ceylon. From the same journal I learn that Dr. Trimen, the erudite and accomplished curator of the Ceylon Botanic Gardens, is publishing a work in parts on the Flora of Ceylon. It appears that 265 acres of land in Ceylon are planted with rubber trees only, but a large amount of rubber is also cultivated in between the rows of other crops. This method has been found very effectual elsewhere. In the Isthmus of Tehuantepec, in Central America, coffee and rubber are produced on the same land with great advantage.—*India Rubber Journal.*

CEYLON TEA FOR 1893.

(From *Stenning, Inskipp & Co.'s Tea Market Review for 1894.*)

THE COURSE OF THE MARKET.—The year opened with an active demand for whole leaf teas, but broken pekoes went lower. Early in February all grades gave way, but by the middle of the month a little better demand sprang up for teas up to 3½d. The quality was not attractive in March, and the demand was for teas for price, and for the few useful invoices. During April common grades hardened, and fine sold well; medium continued cheap, especially those with thin liquors. Quality in May was disappointing, and values for all but really fine fell until the middle of June, when a better enquiry took place at rather firmer prices. Common descriptions were largely offered in July, and were in good request at higher prices; medium teas also improved, and finest sold dearer. In August the quality was better, and the demand strengthened until late in the month, when, with large supplies and a decline in Indian kinds, values gave way for all but fine flavoury teas. The smaller auctions and improved quality in September caused more enquiry at higher prices. In October common and medium teas shewed weakness, but finest sold well. November auctions met a better demand, at a slight advance for all makes. This position was maintained until the middle of December, when prices became irregular for all teas over 6½d, and sales closed for the year with a decline which was heaviest on broken pekeo.

QUALITY.—Planters have evidently been most careful in the manufacture of their teas, which except during periods of adverse weather, have invariably been as good as the individual gardens could be expected to produce. It is satisfactory that the demand has been maintained both for Home Consumption and for export, and that the deliveries shew a slight increase; the average price, however, was barely up to that of 1892.

MANUFACTURE—We would direct attention to the remarks on this head on the first page of the Indian portion of this circular.

AVERAGE PRICE :

Year	Quantity	Average Price	per lb.
1893	846,762 packages, average		9½d
1892	789,231 do		9½d
1891	755,562 do		9½d
1890	535,611 do		10½d
1889	431,943 do		11d
1888	303,284 do		11½d
1887	182,955 do		1s 0½d

TRAVANCORE TEA.

(From Patry & Pasteur, Limited, Report of the Colonial Markets for the Week ending January 10th, 1894.)

Prices shew little or no improvement for all classes of leaf tea, and light liquoring pekoes, especially, were difficult of sale. For broken pekoes demand was brisk, and these sold readily at full rates.

Brand	Pek.	Bro.	Pokoe.	Sou.	Souchong.	Bro Tea Dusk.	Quantity.	Av. about.
Glenmary	..	7½d	..	5½d	4½d	94 chs.	7½d

Granby	..	6d	5½d	20 ½-chs.	6d	

Total 711 packages, averaging 6½d per lb., against same rate last week.

DRUG REPORT.

(From Chemist and Druggist.)

London, Jan. 11th.

CINCHONA.—The first auctions of the year were held on Tuesday, when a moderate quantity of bark was offered by six brokers. Their catalogues aggregated—

Origin	Quantity	Price
Ceyl. u cinchona	329 of which 329 were sold	
East Indian cinchona	506 do	397 do
West African	283 do	283 do
Cuprea bark	377 do	— do
	1785	1009 do

Suocirubra barks were in poor supply, and of Ledger's also very few parcels of any significance were offered. The bulk of the Ceylon and Indian barks consisted of original and renewed Officialis, containing from 4 to about 6½ per cent of quinine. These were very well-competed for, and occasionally a lot would be run up to quite double the starting price. The sales were undoubtedly very firm throughout, and in some cases higher prices were paid, the unit being generally quite up to that of last Amsterdam sale. It may be put at barely ¼ per lb as a general quotation.

The following were the quantities of bark purchased by the chief competitors:—

Company	Quantity	Price
Messrs. Howards & Sons	..	69,051 Kilos.
Agents for the Auerbach works	..	47,210
Agents for the Maunheim and Amsterdam works	..	32,203
Agents for the American and Italian works	..	27,449

Agents for the Brunswick works	..	14,672
Agents for the Paris works	..	12,400
Agents for the Frankfurt-on-the-Main and Stuttgart works	..	3,076
Sundry druggists	..	21,475
Total quantity sold	..	228,057
Bought in or withdrawn	..	73,919
Total quantity of bark offered	..	301,976

It should be understood that, owing to the wide range of alkaloidal value, the quantities of bark purchased by the buyers give no indication of the weight of sulphate of quinine secured by them. The following prices were paid for sound bark:—

CEYLON CINCHONA.—Original, red varieties, dust 1½d; ordinary weak shavings 1½d; dull woody; to fair bright quilly stem and branch chips 1½d to 2d per lb. Grey varieties:—Ordinary dull to fair bright quilly branch and stem chips 2d to 3½d; low weak stem chips ½d per lb.; good strong root ¾d per lb. Yellow varieties:—Good bright quilly chips ¾d to 1d; root ¾d per lb.; hybrid chips 1½d per lb. Renewed, red stem chips 1½d; hybrid shavings 2½d to 3d per lb.

EAST INDIAN CINCHONA.—Original—Common red chips 1d; grey varieties, ordinary dull dusty to good bright quilly stem and branch chips, 1½d to 3½d per lb.; yellow stem and branch chips, fair to good bright quilly 2½d to 4½d per lb.; common branch chips ½d per lb. Renewed—Grey varieties:—ordinary to good quilly branch and stem chips 3½d to 4½d; fine bright rich otto ¾d to 1d per lb. partly broken quill ¾d to 1d per lb.; fair yellow chips 3d per lb.

AFRICAN CINCHONA.—A parcel of 283 bales imported via Lisbon, sold at ¾d to 3½d per lb. for good, partly irregular quill of Succirubra character; and at 2½d to 2½d per lb. for chips of the same kind. The bark was much better packed than usual, only a few packages being country-damaged.

CUPREA-BARK.—Three hundred and seventy-seven bales of old stock were shown, but all bought in. Bids ran from ½d to 1½d per lb., while the owners asked from 1½d to 2½d per lb. according to quality. Having held the bark so long, they probably think that they may as well keep it for another while, until there is a better prospect of a rise.

The increasing alkaloidal richness of the Java cinchona is shown by the following figures, showing the quantities of bark, of various quinine percentages, offered at the Amsterdam auctions during the last three years:—

Per cent	1893	1892	1891
	Kilos.	Kilos.	Kilos.
1 to 2	187,724	148,416	366,302
2 to 3	764,057	546,095	708,601

Above 10	10,531	43,585	4,820

The proportion of root to stem and branch bark offered at the Amsterdam sales in 1893 shows a considerable decrease upon the previous year—a fact which contradicts the assertion frequently made, that large quantities of trees are still being uprooted in the island. Here are the figures:—

Sales in	Root-bark	Stem and Branch Bark	Per Cent. Of Root-bark
	Kilos.	Kilos.	Kilos.
1893	737,670	4,151,667	about 15½
1892	3,167,065	707,936	about 17½
1891	2,833,608	774,755	about 21½

The sales of quinine (in the bark), both at auction and privately, in Amsterdam are estimated as follows:—

Year	Quantity	Price
1893	149,663 Kilos.	131,620
1892	131,620 Kilos.	135,395

The first-hand stock of cinchona-bark in Amsterdam on January 1st was:—

Year	Quantity	Price
1893	14,184 Packages.	5,279
1892	11,268 Packages.	5,279

The average quinine-content of the bark offered at auction has been:—

Year	Per cent.
1893	4.60
1891	4.50
1890	4.03
1889	4.00
1888	4.12

The quantity of quinine in the bark offered for sale on Tuesday was about 11,000 lb. It is announced by cable from Java that the shipments of cinchona during December have been small—namely, only 420,000 half-kilos as compared with about 1,000,000 in December 1892. The entire shipments from January to December, however, exceeded those of 1892 by about one million half-kilos.

Another shipment of 18 bales Loxabark is on the way from Eucader. The stocks of bark in London, on January 1st were 37,387 bales, composed as follows:—East Indian, Ceylon and Java 15,242; Soft Columbian, New Guinean,

Pitayo, and Cupra 14,374; Cartagena 920; South American red bark 81; ditto Crowa and grey bark 1,100; Callaya flat and in quills 5,702 bales.

COCAINE is gradually creeping up. The manufacturers have again raised their prices by 1s 6d per oz. this week, 10½-oz. lots being now quoted at 16s, 25-100-oz. lots at 16s 3d, and smaller quantities at 16s 6d per oz. The rise is attributed to the advance of the price of crude material.

"MAZAWATTIE TEA."

It will be within the recollection of most of our readers that when the Messrs. Densham commenced their extensive system of advertising tea under the above designation, objections were raised on account of its similarity to the name of one of our most famous tea estates "Mazawattie." Messrs. Densham declared the similarity to be purely accidental. They asserted that "Maza" was an Indian word meaning "luscious" and that "wattie" was simply generic for any place of tea growth. Nevertheless, in spite of this disclaimer, the Ceylon Association in London for some time contemplated proceedings against Messrs. Densham with the object of compelling them to refrain from the use of the word. It was felt to be entirely misleading. The employment of the Sinhalese word "wattie" is confined entirely to this island, and the fact is probably well-known to the majority of tea purchasers throughout Great Britain. It is therefore possibly the case that nearly all who purchase Mazawattie tea, do so under the impression that they are served with the produce of a Ceylon estate bearing that name. Now Messrs. Densham do not profess to limit their sales to the teas of Ceylon. They sell under the title they have assumed, Indian, China, and any other tea that is offering upon the London market, as also blends of all those kinds. It is certain that the cheaper packets sold by them contain very little of the Ceylon tea to which they give prominence in their many advertisements. They have themselves, we are told, admitted this to be a fact; only asserting that their higher-priced packages are mainly composed of our teas, and that too in an almost unblended condition. However, at the time that proceedings were threatened against them by the Ceylon Association in London, Messrs. Densham pleaded in reply that they were doing an immense deal of work in advertising and pushing Ceylon teas. The Planters' Association deprecated the continuance of the system of prosecution for fear of "harassing" the trade, and this induced the London Association to allow the use of the term "Mazawattie" to continue unchallenged. Nevertheless, most people connected with Ceylon felt that the term was misleading, and we cannot help thinking that the enormous sale achieved for this Mazawattie tea has been partly due to the supposed designation.

But we now learn from our London correspondent's last letter that the sword of Damocles is hanging over the heads of the Messrs. Densham. Emboldened by long impunity, and regardless of the very apposite proverb that "those who live in glass houses should not throw stones," they contested at law the claim by a firm selling a medicated wine to use the first syllable, "Maza," of their adopted title. Their contention was defeated, and, as it appears to us, on very reasonable grounds. The defendants to that case, naturally felt aggrieved at the annoyance and expense that had been forced upon them by the Messrs. Densham. They in their turn are therefore availing themselves of a privilege allowed them by the law ruling Trade Marks, to move for a removal from the list of such of this name "Maza-

wattie" as misleading, not properly descriptive and as being based upon an intention to deceive the public. We need not go into the details of the evidence it is contemplated to adduce in support of this motion. That was stated pretty fully in our London Letter. Nor shall we attempt to prejudge the probable result to the motion to be made. At the same time, it must be said that there appears to be some chance of its resulting successfully, and holding the view we do as to the conditions and intentions which induced the adoption of the title, we shall not pretend to feel anything like dissatisfaction if the title "Mazawattie" has to be discontinued for the future.

COLOMBO TEA SALES.

We are very pleased to see the following circular letter which has just been issued by our leading Firm of Tea Brokers. The discussion started in our columns recently has thus borne fruit which we trust will afford permanent satisfaction. That can only be done, however, by all the Brokers following the lead of Messrs. Forbes & Walker and declining to enter teas in their catalogues for the following Wednesday's sales, that do not arrive in Colombo by Saturday evening. Such a rule would correspond exactly with the Calcutta one which is that no teas arriving after Sunday evening should be placed for the succeeding Thursday's sale.—The suggestion of a change of sale-day to Friday arose simply out of the difficulty of attending to samples sent out late with a mail day (as in this week) intervening. On sounding leading buyers and brokers one day in the week before last, we found, however, that the majority were quite against a change of day and that it was very undesirable on account of shipments to Australia taking place at the end of the week. We quite agreed, for this and other reasons, and in our issue of the 31st ult., we announced that what was required was a rule about not cataloguing teas or issuing samples after a certain day. This is what we find in the circular letter of Messrs. Forbes & Walker, of which we most fully approve and which we commend to the careful attention of all planters sending tea to the Colombo market:—

TEA FOR PUBLIC SALE IN COLOMBO.

Colombo, 1st Feb., 1894.

DEAR SIR,—In order that samples of teas offered for sale should receive fair and proper attention from buyers, it is very necessary that samples should reach them in good time before the day of sale, and not later than Monday afternoon for the following Wednesday's auction.

To ensure this, teas for Wednesday's sale should be in Colombo not later than the previous Saturday; and we should be greatly obliged if you would assist us in the matter by arranging that any teas you have for sale from time to time may be delivered in Colombo by that day, and we are confident that by your carrying out this suggestion we shall be mutually benefited.

SMALL BREAKS.—We take this opportunity of reminding you that non-sampling breaks of tea (i. e., lots of less than 12 chests or 18 half-chests) seldom receive the same careful attention from buyers that sampling breaks do, and consequently do not realize their full value. If, therefore, you are able to hold back small lots until a sampling break can be despatched, it would be to the sellers' advantage as regards price, and to that of buyers and brokers by reducing the number of lots to taste and value.

We are, dear sir, yours faithfully,

FORBES & WALKER.

COCOA STEALING AND THE PLANTERS OF THE NORTHERN DISTRICTS.

The planters of the Northern districts are determined to leave the Government without excuse for not granting them relief as the License and Registration Scheme appended will show. It was passed at the General Meeting of the District Association on 3rd February last. It is not a lawyer's document we need scarcely say, and is perhaps in a somewhat crude state; but it embodies the views of practical men, and is believed by them to be worthy of the consideration of Government. They do not think the scheme would be hard on anyone. There may be some objection raised to including "Colombo" in the first paragraph, but that will be for the planters to consider at the annual meeting in Kandy on the 17th February, and we hope all members interested in cocoa will attend that meeting and show by their presence there, that the subject is deemed by them to be an important one.

REGISTRATION SCHEME FOR THE PREVENTION OF COCOA STEALING.

1. That all traders in cocoa be compelled to take out a yearly license from Government.
2. That such licensed traders have their abode and place of business registered at the nearest Kachcheri.
3. That they be compelled to keep a record of all the cacao they buy and sell, giving name and nationality of seller, name of his garden and village and number of cocoa pods or quantity in lb. of cocoa purchased from each vendor.
4. That the Government Agent, his Assistant or some authorized person inspect these records as occasion may require and make notes therefrom.
5. That licensed traders in cacao found with false records and knowing the same to be false should have their license withdrawn and be liable to be prosecuted for receiving stolen produce.
6. That owners of gardens in which cacao is grown be compelled to register the same at the nearest Kachcheri, either in person or through the Arachchi of the district, giving name of the owner, name of the garden, and village, and when the extent of the garden is under 5 acres of cacao, the number of trees in bearing should be registered, where the extent is over 5 acres the acreage in bearing should be stated.
7. That district lists of licensed traders and registered cacao growers, be annually published in the *Government Gazette*, and that a copy of the list be supplied to each licensed trader and copies be procurable for payment at the respective Kachcheries, and that a copy of the list be put and kept at the Police stations open to inspection by everybody.
8. For the purpose of defraying the cost of this Registration scheme, a fee of (10) ten cent per acre should be annually charged for Registering all cacao gardens over 5 acres whether the property of European or Native and that such registration be compulsory.
9. That any one who is not a licensed trader or registered grower, found with cacao in his possession and who cannot satisfactorily account for same should be held guilty of theft of the said produce.
10. That cacao growers who are not licensed traders may purchase cacao pods from other registered cacao growers for the purpose of extending their cultivation, but each transaction should be accompanied by letter from vendor stating number of pods sold and name and address of purchaser and said letter to be produced for inspection if asked.
11. That it is the opinion of this Association that if the scheme be properly carried out it will afford a certain amount of check on the miraculous production of trees belonging to dishonest growers, and practically close the market for stolen produce.—JAMES WESTLAND Chairman, Northern Districts Planters' Association.

INSECT PESTS AND ENTOMOLOGIST.

We cordially approve of the suggestion of our morning contemporary that the offer of the post of "Entomologist" to the Government should, in the first instance, be made to Mr. E. E. Green. No better appointment could be made we feel sure and it might be possible for Mr. Green to do a great deal of work, under a system of fees (?), without giving up his present duties altogether. On the other hand Dr. Trimen recommends that the Entomologist be attached to the Colombo Museum rather than to Peradeniya. As to the Board of Reference our idea was to bring some special authority to bear on planters who neglected their duty, in reference to the destruction of *Helopeltis* for instance. Mr. Talbot offered a warning of this kind last year.

We would certainly further press that the aid of the Analytical Chemist in respect of Tea Culture and Preparation be no longer delayed. Mr. Cochran and his assistant Mr. Burnett, we feel sure, are ready to do good and most useful work for our planters, if so commissioned.

COMPARATIVE CEYLON TEA PRICES: AVERAGES.

(From a Tea Planter.)

	1889.	1890.	1891.	1892.	1893.
London	11	10½	10	9½	9d
Colombo (in cents)	46	43½	41	41	43
Colombo (in pence)*	8	8¼	7¾	6½	6½
Exchange	1/5	1/6½	1/5½	1/3¾	1/3¼
In favor of					
London	1½d	1d	¾d	1½d	2d
Freight	35s to 55s	30s to 40s	30s to 45s	15s to 35s	15s to 30s

This little table will probably prove to be an eye-opener, and afford a lesson to those planters who, by keeping the local market supplied, do more harm than good. Look at the support and encouragement the local buyers give to the Colombo market, and yet have the assurance, every now and then, to ask for more, and of our better kinds too. While the London "AVERAGE" is 8d, the local "average" ought to be at least 6d, or (reduced to cents at 1s 3d exchange) 40 cents, not 34! What is the mystery? Can the planters endure this much longer?

ONE OF THEM."

We must explain that the Colombo equivalents in pence for the 1889-92 are worked from the average rate of exchange for the year in our Directory—a rather rough and ready method. For 1893, the average for the sales for the fortnightly market reports, at the exchange of the day was added together, and so the average result obtained. We cannot, however, attribute so much importance to a comparison between London and Colombo as our correspondent does; because it is well-known that, taking the sales as a whole, the teas offered at Colombo are decidedly inferior to those presented in the London market. It is

* The figures for 1889-92 are worked out by the annual average exchange rates given in our Directory.

impossible for this, among other reasons, to offer a comparison between the results of the Sales as a whole. The only way in which reliable comparisons can be made is by taking the experience of an individual proprietor selling of same tea in Colombo and London, and it would really require him to divide his crop into two parts sending one-half from time to time to Colombo, and the other to London, and to continue this for a year, before a final and indubitable comparison could be offered. Has any tea estate owner in Ceylon done this?—There are no doubt two sides to the experience in this as in many other matters: for instance one upcountry man says. "I know sellers who could tell stories of the sacrifice of their valuable teas;" while on the other hand a big Colombo buyer is prepared to give us dozens of instances during the past year where teas bought in Colombo have sold at a heavy loss in London, and from his acquaintance with both markets he is certain that the planter who will fairly divide his crop, as we propose, will, at the end of the year, find that he has done better by local than by home sales, if he allows for interest on money, &c.

Our morning contemporary has put forth the following statement which may be given here for purposes of comparison:—

Year.	Total crop exported in lb.	Percentage of Increase.	Average price realised per lb.ence.	Total proceeds in sterling.	Percentage of increase or decrease.
1890...	46,901,554	—	11	£2,149,654	—
1891...	68,274,420	45.5	10	2,844,767	x 32.3
1892..	71,153,657	4.2	9.6	2,816,498	—1.1
1893...	84,406,064	18.6	9	1,655,227	x 42.1

The figures in the first three lines of the second column are taken from the annual reports of the Planters' Association. Those in column 4 are from various sources and the rest are computed from these data.

The result of the unfortunate decline in the value of our staple is, that whereas in 1891 there was an increase in the production of 45.5 per cent, the crop of that year realised only 32.3 per cent more than that of 1890. In other words, there was a reduction, (exclusive of exchange) of 13.2 per cent in the planters' profits. In 1892 there was an increase in the production of 4.2 per cent, but a decrease in the amount realised of one per cent. The planters produced 4.2 per cent more tea and got 1 per cent less for it! In 1893 the crop exported was larger by 18.6 per cent than in 1892, but the proceeds were only 12.4 per cent increased showing a reduction of profit (exclusive of exchange) of 62 per cent. In any reckoning of profit such as the above, the cost of production has to be taken into account, and we suspect on the majority of tea estates in Ceylon, this has fallen considerably even between 1890 and 1893.

Since the above was put in type there has come to hand by the mail, the following interesting statement of the position of Ceylon tea for five years, worked out by Messrs. Shand, Haldane & Co. This is done in a monthly form and it gives a clearer idea of the position than if made out as a weekly return. "It is curious," says our tea authority, remarking on this table,—"how one price of tea seems to fluctuate with exchange: can the mysterious person who invents fashions, also control the prices of tea and silver!"

APPROXIMATE AVERAGE VALUE OF CEYLON TEA SOLD IN LONDON FROM 1889 TO 1893.

SHAND, HALDANE & Co., 24, Rood Lane, London, E. C.

THE BULGARIAN OTTO-OF-ROSE INDUSTRY.—Mr. Ilija Stokow, Deputy for Kazanlik in the Bulgarian Sobranje, has brought in a Bill providing for strict Government control over the manufacture of otto of rose.—*Chemist and Druggist.*

THE FROZEN MEAT TRADE:
AUSTRALIA AND CEYLON.

The following is an extract from an Australian journal for which we are indebted to a local correspondent. We are much pleased to find Major-General Justice taking so practical an interest in the important matter of getting a supply of meat from Australia. Every merchant and tea planter in the island ought to feel a special concern in the starting and promotion of such a trade; for assuredly our tea exports to the Southern Colonies would increase by leaps and bounds if we were able to take an appreciable quantity of frozen meat and other produce from Melbourne, Sydney and Adelaide. Meantime we give the South Australian extract as follows:—

The Government have received the following despatch from the Major-General commanding the troops in Ceylon:—"Head-quarters, Ceylon, Colombo, October 16th 1893.—Sir,—As I am most desirous to supply the troops under my command with refrigerated instead of the very inferior class of meat afforded by this colony, I have the honour to request you that you will give me assistance to this end by furnishing me with the names of such firms in the trade as might be willing to undertake the supply. The quantities required would be 1,300 lb. daily for Colombo and Kandy. Certain initial expenses would be necessary, such as the erection of a refrigerating store and the appointment of a local agent to superintend the receipt and issue of the meat, and it would be necessary also that any firm tendering should deposit the value of one month's supply at the time of tendering to remain at interest in the Bank named by the War Department as security for the due fulfilment of the contract if accepted. If I can obtain any advantageous tender I would recommend that it should be accepted by the War Department for three years. The only local offer received is at too high a price, viz., at 5½d. per lb., the local price of country beef being only 2½d per lb. The commencement of the supply of refrigerated meat to the troops might prove the thin end of the wedge as regards the supply of the entire European population of Colombo, as the local meat, though cheap is very bad, and a considerable trade might result to the successful tenderer."

The Chief Secretary's Department will be glad to assist any South Australian exporters who desire to take advantage of the opportunity offered, and will obtain such further information as may be desired or assist by the transmission of any tender for the supply.

CEYLON PLANTING NEWS.

(Notes from Wanderer.)

Feb. 3.

Cocoa.—Prices for this product are by no means encouraging. Messrs. Wilson, Smithett & Co. in their Circular of 12th January pronounce the sales of West Indian cocoa to be satisfactory, considering the quantity offered. I wonder if the West Indian planters had the same opinion as that eminent Firm of Brokers. The output of Guayaquil cocoa has, I fear, a great deal to do with the want of orders for Ceylon cocoa from America:—

Guayaquil has exported	401,450	quintals in 1893
against	334,870	" 1892
	210,000	" 1891

The cocoa import into England in 1893 is	14,702	tons
Do	1892	13,727 "

One thousand tons or 20,000 cwt. cocoa increase means two-thirds of the Ceylon export in 1893. The consumption in England, alas! in 1893 is only 40 tons over that of 1892.

Under this heading, I may note the discussion of COCOA STEALING in the Legislative Council. Sir E. Noel Walker wants relief for the village headmen who have lost their commissions for recovery of paddy

tax, at the expense of the cacao planter. If he likes to call it by another name, I will call it "Blackmail." I remember a Government Agent of Kandy, the late Sir J. F. Dickson, having nearly an apoplectic fit, when he heard that a well-known planter in Nilambe had stopped coffee stealing on his estate by paying blackmail to the village headmen. Sir John raved and rightly so when he thought of the terrible censure such blackmailing practically conveyed on the Government's not safeguarding the tax-payers' property. Sir E. Noel Walker has no qualms of this sort. However, Sir E. Noel Walker and all Government servants had better beware lest their weakness in the protection of agriculturists, European and native, lead to their dismissal and being replaced by officials who have a higher sense of their responsibilities than recommending "blackmailing." Fancy the English or Scotch farmers having to provide from £20 to £30 a year to private watchers to protect their farmyards!

CONCERNING COFFEE.

Mocha coffee is a term in commerce which is a survival of a condition of things that no longer exists. The port of Moka has dwindled to a mere village, and the fine quality of coffee from Yemen and the opposite coast of Abyssinia never sees it. The greater facilities and better organisation and security of Aden have absorbed the traffic. The Porte has, seemingly, just awakened to this fact, and has requested—which means, in this case, commanded—the Yemen merchants to send their merchandise through Moka instead of Aden. The chief products of the Sana's district are coffee and cereals. Consignments have already arrived at Moka, including twenty-nine loads of coffee. The traders of Southern Arabia have no love for Turkish rule and its ways, and if they find that they are subject to loss, delay, and extortion by shipping their goods through Moka, they will not hesitate to return to the British port, so that unless they are fairly treated, the heroic measure devised at Stamboul is likely to prove futile.—*Echo*, Jan. 16.

RUBBER IN CEYLON.

Mr. Ferguson in his recent important work on "Ceylon in 1893," gives some interesting facts as to the rubber industry in the island:—

"Where every prospect pleases,
And only man is vile."

The Cauoutchou, or India rubber trees of commerce, from South America and Eastern Africa, are of recent introduction, but their cultivation and growth in the planting districts of Ceylon have so far not given very satisfactory results. The growth of some of the trees has been excellent, indeed wonderful, equaling in certain cases forty-eight feet in height, and forty-five inches in circumference in five years, and when more is known about the mode of harvesting the rubber, the industry may prove profitable.

There is a great demand for rubber in arts and manufactures in the United States as in Europe and encouragement therefore to give attention to the product; but Dr. Tricen [Trimen—Ed. T.A.] does not think well of rubber or guttapercha for private cultivation in Ceylon. The Government have been planting rubber through their Forest Department.—*Paper Makers' Circular*.

TEA MANURING IN ASSAM.

We manure with cat le manure and beel soil which is nothing but vegetable mould and is dug out of the beel and the garden next puts on a little poison, but I have seen no manuring to speak of, as the soil is so rich it hardly, except on very old gardens, requires it. You see labour is not what it is in Malaya and each

cooly up here costs about R60, 80 and 90 per head this for three years—so that men work a piece of tea to the death and then abandon it, whereas with labour to apply manure every year to bad parts, it might be made to hold on, though perhaps, hardly at any great profit.

Here however, I find some information in a letter and answer which appeared in some tea paper, the pith of which I will now give. Given good soil and site it is beneficial, useless or harmful to apply manure.

(a) When planting out.

(b) After first year of planting.

(c) Any time before plucking commences.

(d) Any time before the deterioration of the bushes commences.

2 If you have once commenced manuring at any of the above periods is it necessary to keep up the treatment or may you drop it at any of the stages.

3 What is the best time of the year to manure.

4 How close to the bushes without being injurious.

5 How far away without being useless.

6 How deep.

7 Is there any benefit in putting it very deep.

Reply	Scriatum
(a) ...	Useless
(b) ...	do
(c) ...	do

(d) Beneficial, may more necessary—some may differ, but remember he says given good soil and site.

2 You may drop it but you'll drop the benefit as well.

3 From the 1st of January to the 31st December, as you have the manure and labour available.

4 As close as the majority of the spangle's.

This will take the best part of two days with a largish bush—A coloured man might do it in less time by himself but not Thakoor Dass Kaniya, Kajat or any of the other coolies.

5 This is answered in the 4th.

6 Just so that when the earth is filled over it, all will be as level as things were before.

7 I should say not, because the rain will take it down in time and to feed both upper and lower circles or rootless distinctly is not, at present part of our plan though it might be a good plan.

To conclude, the flower of my experience is that to make the tea bush flush and flourish most effectually to nourish it there is nothing that can come up to a good basketful of farmyard manure i.e. cow dung, ashes and decayed straw. 10 or 12 cwt. for an ordinary bush this is used on every garden more or less, not the whole but parts.

A cheap manure is 60 lb. sulphate of ammonia 40 lb. nitrate of soda, 250 lb. bone dust 250 lb. plaster and 4 busbel salt.

Lime is a good strengthening manure—as you know.—*South of India Observer.*

TEA-SEED OIL.

Referring to our note on the offering of Ceylon tea-seed at the recent drug-auctions, a writer in the *Indische Mercur* points out that *Camellia oleifera*; Abel, a plant closely allied to the tea-shrub yielding the leaves of commerce, is largely cultivated in China for the sake of the pale bland oil prepared from its seeds. These seeds contain a considerable proportion (10 to 44 per cent.) of oil of saponine, a toxic element, and their oil, unless refined, is, therefore, unsuited for eating. The pressed cakes, containing the bulk of the saponine, are used as a hair-wash, a fish-poison and an insecticide. The seeds of the Japanese camellia (*C. japonica*) yield an oil which excels as a lubricant. Of tea oil proper (i.e., oil from the seeds of *Camellia theifera*, Griff.) two varieties are recognised—viz., the Chinese and the Assam oil. Chinese tea-seed oil is of the consistency of olive oil, pale yellow and inodorous. The oil has a sp. gr. of 0.917 to 0.927 at 51° C., is insoluble in alcohol, and congeals at -5° C. (?). It is edible, very suitable for soap-manufacture, and forms a useful lubricant. Oil of Assam tea-seed grown in Java has been investigated recently by Mr. L. van Itallie, city pharmacist, of Rotterdam. The oil is present in the husked seeds to the extent of about 20 per cent, and

can be extracted by petroleum and ether. It has an acrid taste, a pale yellow colour, very thin consistency, a sp. gr. of 0.920 at 15°, and congeals at -12°. Its iodine number (Hüll) is 88, and its saponification number 194. It contains 91.5 per cent of fatty acids soluble in water. The chief constituents of the oil were palmitic acid (about 19 per cent.), liquefiable fatty acids (oleic and linoleic acids, about 72 per cent.), glycerine (about 8 per cent.) with traces of volatile fatty acids, lecithin, and phytosterin.

It is not at all unlikely that there may be a future for tea-seed oil in the European markets, but in that case it will be necessary to supply a better class of seed than that which was shown at the auctions. It is doubtful whether it would not be the better plan to send over the oil pressed in Ceylon or India. It appears that some of the merchants to whom samples of the tea-seed have been sent are of opinion that the oil obtained from it would find a ready sale in quantity, in London, at 20l. to 22l. per ton as a safe quotation. Planters are advised to crush 5 or 10 tons of seed and send the oil over to London, on trial, in package not exceeding 10 cwt. each. "Let them," remarks one adviser, "put a brand on the packages but avoid indicating that it is tea-seed oil" (sic!)—*Chemist and Druggist.*

CINCHONA PIONEERS.

DR. SPRUCE (MAKKHAM, CROSS & LEDGER.)

On another page of this issue we record the death of a modest but accomplished scientist, whose name will ever remain linked with those of the other pioneers of the greatest achievement of this century in the domain of practical economic culture of medicinal plants. Dr. Spruce, with his fellow-workers, Markham, Ledger and Cross, belonged to that band of men of various nationalities, embracing, as representatives of Britain, Dr. Royle and John Eliot Howard, of Holland, Mr. Teysmann and Dr. de Vry; of France, Dr. Weddell; and of Germany, Dr. Franz Junghuhn and Mr. Hasskarl, whose efforts laid the foundation of the cinchona industry of India, Ceylon, and Java, which has been a boon to the health of millions and a source of prosperity to hundreds. The fact that the *Succirubra* seeds, of which Dr. Spruce was the successful collector have produced the trees which, from a practical manufacturing point of view, have since been proved the least valuable of the principal varieties of cinchona does not in the least detract from the merit of his services. At the time when the South American cinchonas were introduced into the East our knowledge of the commercial value and the botanical divisions of the plants was extremely limited, and it was the purest chance that caused the task of collecting the red variety to fall to Dr. Spruce. It is now, after a quarter of a century of experience, an admitted fact that the climate of Ceylon is not really so well suited for cinchona propagation as that of Java, or even of certain parts of India, and there are probably few candid planters in the British dominions who will not acknowledge that as a class, their colleagues in Java have conducted the industry upon more scientific lines and with a clearer perception of its future development. Dr. Spruce has lived to know that the majority of the red bark trees raised from the seeds which he collected with so much toil in the moisture-reeking forests of Ecuadorian Andes have met with the inevitable fate of weaker species—extermination. Still, if he had any practical acquaintance with the cinchona trade, he must also have known that for nearly 25 years these trees lined their owners' pockets with gold, while he, without whose services their culture would probably have been much less easily accomplished, was vegetating in a Yorkshire village upon a paltry hundred a year as his share of the spoil. The familiar line about obtaining "great pensions and great praise," which was true enough of the general to whom it was addressed, would certainly be quite misapplied to the cinchona-pioneers, at any rate to those who happened to work for the British Government. Yet these men, whose work was of an essentially civilising and peace-

ful nature, carried their lives in their hands quite as much as others of their class, say the "pioneers" whose adventurous march into Mashonaland was rewarded with farms and gold-claims. But the cinchona-collectors only brought wealth to others, not to themselves. Many of them returned in shattered health; all had braved danger, fatigue and hunger, uncomplainingly. In our obituary notice of Dr. Spruce we refer to the manner in which his services were required. Mr. Orce, who collected seeds of red as well as of yellow bark, and who afterwards procured seeds from the barks of Colombia and valuable india-rubber-yielding plants, received two sums of 300*l* each for his entire services. Mr. John Weir, who served in the expeditions in a more subordinate position, has had nothing at all, and lives, also crippled for life, on the interest of a sum of 600*l* subscribed by members of the Horticultural Society. Mr. Charles Ledger, to whom we owe the introduction into the East of the most valuable of all cinchonas, has seen his name immortalised in that species, but of money he received none whatever. He died some years ago, poor and old, at Tucuman, in Argentina.

These facts are not new to those few persons who are acquainted with the history of the drug in a wider sense than that of mere growing and selling in the market. They are all set forth in Mr. Clements Markham's "Cinchona." But they will probably come as a surprise to most of those whose interest in the drug has been purely commercial, and into whose pockets the millions profit of the enterprise have gone.

Of the "pioneers" who laid the foundation of the cinchona industry in Java, Dr. Hasskarl, who alone was concerned in the actual procurement of the plant in South America, still lives, we believe, in a small German town. Mr. Teysmann, under whose care the first plants were grown in Java, and Dr. Junghuhn who afterwards superintended the cultivation, have died long since. The evergreen Dr. de Vry, who was also prominently associated with the earliest Java cinchona industry as a chemist, still lives, a hale octogenarian, at the Hague, and reads his *Chemist and Druggist* regularly. Whether Holland has treated the men who did the earliest rough work for her more liberally than Britain treated her servants we do not know.

Now that so many of those who played prominent parts in the cinchona industry 35 years ago are dead, it would be of little practical use to go further into the question of the injustice that has been done them. As for Dr. Spruce, his demands were always modest, and he probably thought himself not too ill-used when, after much dunning by influential friends, the Government at last raised his pound-a-week pension to the "living wage" of two pounds. A title of such sums as many commercial men made out of the enterprise of himself and his colleagues would probably have overwhelmed him. The French pilot in Browning's poem, who saved his country's fleet from destruction by the Britishers and then, when asked by the King to name his own reward, applied for one day's leave, and was granted all he asked and nothing more, is the type of men of Dr. Spruce's calibre. They, like Cromwell's "russet-coated captains," are the sturdy workers upon whom ever the brunt of battle falls, while those who stop quietly in their counting-houses or on their estates rake in the shakels. Fortunately for this country she has never wanted men of the type of Richard Spruce. Had he never become connected with the cinchona enterprise he might have continued botanising on the American rivers, and returned to rank with Wallace and Bates as a naturalist. As it is he has lived forgotten for twenty years, and a little paragraph in the daily papers is all that has reminded the world of his death.

SPRUCE.—Dr. Richard Spruce, a botanist and explorer who rendered eminent services to his country as a scientist, and as one of the chief members of the South American expedition which resulted in the successful establishment of the Cinchona industry in the eastern hemisphere, died on Thursday last, Dec. 28, at Coneythorpe, near Malton, Yorkshire, aged 76

years. Richard Spruce was born at Ganthorpe, in Yorkshire, and from his youth devoted himself with a passionate ardour to the science of botany. In 1837, when 20 years of age, he made his first attempt at literary scientific work in a "List of the Flora of the Malton District," and in the course of the next nine years he published a number of botanical papers dealing with the Muscology of Great Britain, the Killarney district of Ireland, and the Pyrenees. His work attracted the attention of Alexander von Humboldt, who at that time had only recently returned from South America, of Sir John Hooker, and of the late Earl of Carlisle. Their appreciation of Dr. Spruce's services assisted him in obtaining an appointment from the authorities of Kew Gardens as a botanical collector and investigator in tropical South America. On June 7th, 1849, Dr. Spruce left Liverpool for Para in Brazil, which was to be the starting-point of his expedition, as it had been that of Alfred Russell Wallace and H. W. Bates only a year earlier. In September 1849, Dr. Spruce, still following in the wake of the first-named of his fellow-scientists, began to work his way up the river Amazon, and some of its principal tributaries. This journey carried him right into the heart of Northern Brazil and to the confines of British Guiana, and was productive of most valuable botanical and geographical results. The years 1850 and 1851 were spent in botanical exploration on the Rio Negro, another tributary of the Amazon, and in November 1851 Dr. Spruce, in a boat measuring about nine tons, fitted up by him expressly for that expedition, started for the head waters of the Rio Negro river, leading to that unknown no-man's-land between Venezuela, Ecuador and Brazil, where, three centuries earlier, the Spanish *conquistadores* of Peru placed the mythical cinnamon country, in the vain search of which so many brave Castilians lost their lives. From 1852 to the end of 1854 Dr. Spruce explored these regions, never visited by white men before, or forgotten since the days of the Pizarros. From the Brazilian rivers he penetrated into Venezuela, where he explored the Orinoco and some of its principal tributaries, re-emerging into comparative civilisation in Brazil in 1854. His next voyage was by one of the newly-started Amazonian steamers through Brazil into Peru, and thence by foot through the forests into Ecuador. As an instance of the enormous richness of the flora which Dr. Spruce had set himself to investigate, it may be mentioned that on one of the Peruvian rivers he collected no fewer than 250 species of ferns within an area measuring only fifty miles in diameter. On his Ecuadorian journey Dr. Spruce was forced to abandon all his collections and baggage in the forest to escape death by starvation or by drowning, the rivers having swollen suddenly by torrential rains. January, 1858, found the scientist at Ambato, in Ecuador, and it was at that place that he first became associated with Mr. Clements Markham's cinchona enterprise. Mr. Markham, having assigned to himself the task of procuring seeds and specimens of the calisaya trees of Bolivia, representing the "yellow" bark variety, had obtained the services of Mr. Pritchett for similar work with regard to the "grey" barks of Huanoco, and was looking round for another coadjutor to perform the function of collecting the "red" or succinbra barks of Ecuador, which his attention was called to the extraordinary occurrence that the very man whom one would pick out of a nation for such a mission—Dr. Spruce—already happened to be on the spot at Ambato. The Indian Government agreed to the doctor's employment, and Dr. Spruce, always modest in his requirements, characteristically wrote:—"My present occupation yields me about 20*l* a month, and as the one proposed to me is of uncertain duration, I think 30*l* a month is as low as I could rate my services, besides the expenses incurred in collecting and transmitting the plants to Guayaquil." Singularly enough, the Indian Government did not attempt to best down the bargain, and Dr. Spruce was engaged.

It is almost needless to say that the Republic of Ecuador at that period was in its normal condition of revolutionary convulsion, and the fact did not tend

to facilitate Dr. Spruce's work. With indomitable energy, and in spite of continued rheumatic and nervous attacks caused by the fogs and damp of the forests, the trackless condition of the country, and the biting cold of the mountain region, Dr. Spruce brought his expedition to a successful issue, and by the end of 1860 he returned to the port of Guayaquil with a supply of over 100,000 well dried and ripened seeds of various kinds of the *Chinchona succubra* species. Packed in 637 Wardian cases these seeds left South America on January 2nd 1861, to become the progenitors of the million of red-cinchona trees in India, Ceylon and Java, of which the bark has placed thousands and thousands of pounds in the pockets of planters, middlemen, quinine-manufacturers, and pharmacists.

Dr. Spruce's total receipts for these services were 857*l.* in salary. He returned to England in 1861, and had the satisfaction of hearing his scientific work publicly acknowledged by the President of the Linnean Society, Mr. Bentham, in a speech in which it was stated that "Dr. Spruce's researches into the vegetation of the interior of South America have been the most important since the days of Humboldt; not merely for the number of species which he has collected (amounting to upwards of 7,000), but also for the number of new generic forms with which he has enriched science; for his investigation into the economic uses of the plants of the countries he visited; for several doubtful questions of origin as to interesting genera and species which his discoveries have cleared up; and for the number and scientific value of his observations made on the spot and attached to the specimens preserved; all which specimens have been transmitted to this country, and complete sets deposited in the National Herbarium at Kew." Among the natural products which Dr. Spruce has made known to science and commerce are numerous trees whose timber and other products have since proved to be of the greatest value. Among them is one entirely new species of trees producing the finest kind of indiarubber, which Dr. Spruce found on the Rio Negro. His MSS. contained, besides notes on all the plants collected, vocabularies of 21 native languages of the Amazon Valley, meteorological observations, barometric levellings, &c., of all the regions visited, and other facts of the utmost importance to science. When Dr. Spruce's mission was at an end, the Government also considered its obligation to the invalid explorer closed, and in spite of Mr. Clements Markham's efforts on behalf of his colleague, the suggestion to reward Dr. Spruce's service with a small pension was rejected without consideration. In 1865, however, mainly through the influence of the Carlisle family, Lord Palmerston granted him 50*l.* a year for life, and in 1877 the Indian Government added another 50*l.* a year, but with characteristic parsimony refused to date that recognition from the time of Dr. Spruce's return from South America, though earnestly entreated to do so by Mr. Markham.

From the time of his return until his death, Dr. Spruce lived in retirement in the neighbourhood of his native village, respected by all who knew him, no less for his scientific eminence than for his modest and keenly disposition. He was buried on New Year's Eve at Terrington churchyard, in the grave where his father and mother are also laid at rest.—*Chemist and Druggist*, Jan. 6.

MESSRS. HAWES & CO. ON CEYLON TEAS.

A London Merchant sends us cuttings from the *Morning Post* with recent market reports of the redoubtable Mr. Hawes or his Firm on Ceylon Teas. There is no abatement of the tone of hostility towards our product which marked the long correspondence we had with Mr. Hawes when in London, in the *Financial News*. It is, however, desirable that planters should know what is said of their product in hostile

quarters, and there is always "a grain of truth" mixed with exaggerations in such cases, that it may be profitable to ponder over. We give the reports as they have reached us, as follows:—

TEA.—Messrs. Hawes & Co. report:—"The unfortunate decline in the quality of the Ceylons now, and in those which have been arriving the past six weeks, is further marked again in today's offerings, and the trade fully realise the fact of this inferiority by knocking quotations down on teas from some gardens that sold last Tuesday another 2*d* to 2*1/2* per lb and in some instances even more. This applies only to the thin and undesirable invoices. Wherever the teas have represented quality very good prices have been realised. Common pekoes and pekoe sonehongs ruled from 5*1/2* to 5*3/4* per lb., the lowest quotations we have had for this class of tea for many months. Fine teas however were very scarce, and finest only represented by one estate, viz., the Ormidale, and although this invoice was up in quality to the last, they fetched the splendid prices of 1*s* 3*3/4* for pekoe and 1*s* 7*1/2* per lb for broken pekoe. All fine and finest grades of tea are growing daily more and more scarce and dearer, and there seems little chance of any quantity arriving at present. Ceylon planters boast that they can produce it if they like, but it is strange, with such strong inquiries and extreme prices obtainable for it when it does come, they do not send more. The say, 'quantity pays better than quality,' but present quotations of 5*d* to 6*d* per lb for their common and good common leaf teas, and 7*d* to 8*d*. per lb for common broken pekoes, cannot be very remunerative. China tea has been nearly wiped out of appreciation and consumption by this course, and as we have predicted for the last three years, so we do again, that unless Ceylon restricts her output and improves the quality of it, the preference hitherto given to her teas will soon cease, and she will leave the field entirely to her competitor, India whose teas, though generally not so flavoury, are stronger, better cured, and therefore better to hold, and more profitable to the general dealer. Total offered today, 17,781 packages, the bulk of which were sold. 331 packages of Javas of very common quality passed at low quotations."

TEA.—Messrs. Hawes & Co. report:—"The week opens with a heavy auction of Indian tea, viz., 20,646 packages. The bulk consisted of common to medium grades, which passed decidedly with more spirit than was apparent last week in the biddings, and all fine medium to fine sorts marked very strong to advancing prices. The market privately is quiet. Tomorrow about 18,000 packages Ceylon will be offered; unfortunately the average quality of the teas shows no improvement." London Produce Clearing House quotations for good common China congou:—January-February, 5 3-16*d*.; March to December, 5 4-16*d*. per lb. Fair whole-leaf Indian—January-February, 6 3-16*d*.; March, 6 4-16*d*.; April-May, 6 5-16*d*.; June to December, 6 6-16*d* per lb. No contracts have been registered.

Messrs. Hawes and Co. report:—"Today's Ceylon offering comprised 17,264 packages. The general quality was again very disappointing, but the low quotations of last week produced increased inquiries, and all around today's sale passed with a rather better tone. All teas with any approach to thick good quality fetched full prices, but these sorts continue extremely scarce—almost always where quality is found the liquors are too thin to be useful to the trade. The 773 chests Java teas of common to useful qualities sold steadily, a fine invoice from Perbawatte making the average of 9*1/2* per lb. Of China greens 2,485 packages were sold; undesirable Ping Sueys sold flatly but good quality was well paid up for." London Produce Clearing House quotations for good common China congou:—January to December delivery, 5 3-16*d* per lb. Fair wholeleaf Indian—January, 1 2-16*d*; February, 6 3-16*d*; March, 6 4-16*d*; April, 6 5-16*d*; May to December delivery, 6 6-16*d* per lb. Contracts registered 1,000 chests Indian.

THE REUNION VANILLA CROP.

The exports of vanilla from Réunion, according to official figures which have only just been published, were 70 tons (value 67,760*l.*) in 1891, and 96 tons (value 115,200*l.*) in 1892. Réunion is the largest vanilla-producing country. The fruit is exported mainly by the Messageries Maritimes steamers to Marseilles and Havre at a freight of nearly 10*l.* a ton. It is mostly bound for the French Market: Paris, Bordeaux, and Nantes; but a considerable quantity goes to Hamburg for German, Austrian, Danish, and Norwegian use. The London market is supplied mainly from the Seychelles and Mauritius, and receives very little vanilla from Réunion, even *via* France. The vanilla pod loses about three-quarters of its weight in preparation. It is either plunged in boiling water or heated in ovens. It is then placed in the sun, carefully covered over to prevent undue heating, after which it is dried under cover and closely watched for the slightest trace of moisture. The whole treatment takes about three months.—*Chemist and Druggist.*

THE GIBBS AND WINSLAND TEA DRYER.

A number of gentlemen interested in Ceylon tea planting, including Messrs. R. B. Hector, Norman Grieve, J. L. Shand, W. Herbert Anderson, C. Anderson, Powell Jones, &c. paid a visit to Gillwell Park, Chingford, on the 3rd inst. (Jan.) to inspect the Gibbs and Winsland tea dryer and to see it at work. The fuel question was one of the chief points of interest in connection with this visit, as in view of the threatened scarcity of wood in the tea districts of Ceylon, the inventors of the Gibbs Dryer wished to prove to those present that the smokeless furnace, by utilising all the heat that either wood coal or coke contains, would be of especial value at the present time. In the trial referred to the action of the furnace was shown chiefly with wood as fuel. A quantity of coarse, wet tea was dried on the Gibbs and Winsland cylinder by means of the wood fire. The quality of the hot air used was then carefully tested and the improved condition of the tea thus dried acknowledged. For the information of those who are not acquainted with the Gibbs and Winsland Dryer the following particulars will be of interest:—

The Gibbs and Winsland Cylinder for the first few feet of its length is provided with lipped shelves, so that when the lumps of wet tea between the rollers are fed in, these shelves lift them up and let them fall lightly through the streams of hot air issuing from the end of the air duct. This action effectually separates the lumps, and at once arrests fermentation. The temperature and volume of air in this end of the machine is perfectly under control and easily regulated. When the tea has thus been freed from its first moisture and thoroughly separated, it passes into the partitions with which the remaining length of the dryer is provided, and in these it slides slowly round, and is gently turned over at each revolution of the cylinder, thus constantly exposing fresh surfaces of the tea to the drying action. These partitions represent, in fact, a series of trays with lateral shelves in their centres, which assist in the uniform distribution and separation of the leaf. The air duct consists of a series of circular tubes, each tube being slightly tapered, so that annular spaces are left at the joints, through which the heated air issues, and assists in carrying the tea gently forward towards the discharge end.

Before reaching that end, however, it passes over three graduated wire screens, so that three different grades of the finer leaf are delivered from the machine, thereby avoiding over-drying, whilst the coarser tea is retained for final delivery at the end of the cylinder. The inclination of the cylinder is easily adjustable, and as the rate of progress of the tea through the dryer depends upon the inclination given to the machine, it will be obvious that the exact degree of dryness required is readily obtainable. A further means of

control over the firing can be obtained by varying the speed of rotation of the cylinder, and for this purpose when desired taper cone pulleys are supplied with the machine at a small additional cost. It will be obvious that the gentle movement of the rotating trays avoids any breaking or "greying" of the tea, and that by this movement every leaf gets its fair and equal share of the hot air as well as of the transmitted heat. The process, being entirely automatic, involves no skilled labour. One man or boy is required to feed in the tea, and it is delivered into chests or trays at the screens, and at the discharge end. The hot air is supplied through a powerful compound fan from the now well-known smokeless furnace, which has been for many years in wide and successful use, with an acknowledged economy of from £50 to £70 per annum on each dryer. This furnace has neither bars nor doors; the fuel is simply fed in at the top of a brick box, and all the products of combustion are drawn down through the red-hot fuel, and being mingled with fresh air in proper proportion, are freed from all injurious taint, in proof of which it may be mentioned that the teas dried by this system have realised top prices in the London market for the past three seasons. On estates where there is a frequent need of lime for building, repairs, or composts, it is expensive to purchase, and in wet seasons, soon becomes worthless, whereas limestone can be kept in store for any length of time without deterioration, and can be converted as required into excellent lime if utilised as a filter or foundation in the fuel chamber of the furnace and this, besides the economy, assists in promoting perfect combustion.—*H. and C. Mail.*

INDIAN TEA.

A POLICY FOR PRODUCERS.

To the Editor of the *Home and Colonial Mail.*

SIR,—A good opportunity has come for those who believe that it is good policy to regulate supplies to put theory into practice.

Some 75,000,000 of the crop have been sold, leaving about 40,000,000 to sell, or at the rate of 2,250,000 per week for the 18 working weeks available, if it is planned to close sales by end of May. This would allow for 27,000 or 28,000 chests per week instead of the 50,000 chests hurried forward this week on a market standing at nearly the lowest point on record.

All the arguments that held good when the scheme was broached have extra weight now, and at this time of the year it is possible to regulate the sales with reasonable chance of benefit, for it is no secret that the "free sellers" who will not hold are coming to the end of their crops; while it is clear to any one conversant with the inner working of the trade that a few weeks of sales moderate in size would put the market in a much better position.

The trade held 30,000,000 of stock, as against 20,000,000 in merchants' hands. It is to their interest to see a rising instead of a falling market, and they would be the first to help lift prices a little, if they saw importers showing a little more confidence and stability.

Some of those who backed Mr. Peek's scheme are acting up to their belief, but they need the more general co-operation of the large holders. The chance of a 10 per cent or 15 per cent advance from the ruinous price now current is surely worth going for.—Yours, &c.

Jan. 16th, 1894.

—*H. and C. Mail.*

SIGMA.

MAURITIUS.

Port Louis, Jan. 11

THE WEATHER AND THE CROP.—We have partially been watered during the last few days, but showers we have had are not sufficient for the young plantations. The crop can be considered to be now completed on all the estates which are, however, still engaged in turbinating works.

VANILLA.—The market is dull. We have to quote the sale of a few lots good quality at R18 to R19 per kilo. As we mentioned in our last, the total outturn of the crop will not exceed 5,000 kilos. We quote nominally:

1st quality	R20 to R21	per kilos
2nd "	18	" 19 "
Good to Middling	14	" 15 "
Vanillons	8 to	" 9 "

COFFEE: 224 bags from Bombay, 47 from Colombo and 22 from Seychelles.—*Commercial Gazette*, Jan. 11.

INDIAN TEA NOTES AND NEWS.

Our Morianic correspondent writes on 20th January 1894:—Pruning now finished in most gardens and deep hoeing and building the order of the day.

Our Dehra Dun correspondent writes on 22nd January 1894:—The last three days we have had 2.58 inches of rain, which has done good to both tea and the Rabi crops. We may now hope for a good spring crop, and as soon as it clears we intend increasing our hoeing "vireks"

Our Dam Dim correspondent writes on 23rd January 1894:—Pruning is now in full swing and most gardens will have this work finished about the middle of February. On old estates extensions are not so general this year though several new gardens are being opened out, nearly all to the east of the district; the weather still remains very dry, coldish and hazy.—*Indian Planters' Gazette*.

THE AMSTERDAM CINCHONA MARKET.

Amsterdam, Jan. 11.

All the analyses for the cinchona-bark sales to be held here on January 25th have been completed. The manufacturing bark contains 22 tons sulphate of quinine, or 4.61 per cent on the average. About 3 tons contain 1.2 per cent, 58 tons 2.3 per cent, 114 tons 3.4 per cent, 144 tons 4.5 per cent, 77 tons 5.6 per cent, 43 tons 6.7 per cent, 22 tons 7.8 per cent, 9 tons 8.9 per cent, 1 ton 9.10 per cent, and 2 tons 11.12 per cent sulphate of quinine.—*Chemist and Druggist*.

NATAL TEA SEASON.

Mr. G. W. Drummond, of Kearsney, sends the following report:—As regards the tea industry in this district, December came in like a lion but went out like a lamb, and the lamb-likeness still continues, owing to the very changeableness of the weather this season. The young rising flushes have been repeatedly checked by sudden cold winds, accompanied sometimes by heavy rain from the south-east. By the end of January, half the tea season may be considered over, and if it turns out to be a poor month estimates will not be reached, and the 650,000 lb. (or 700,000 lb. if weather favourable) for Natal will become a vanishing quantity. In five or six weeks' time, however, I shall be better able to inform you what the outlook for the whole season is likely to be. We are ahead up to date, but nothing to boast of, except a distinct improvement in quality of tea.—*Natal Mercury*, Jan. 15.

LONDON REPORTS ON TRAVANCORE PRODUCE.

TRAVANCORE TEA.

(From *Parry & Pasteur, Limited*. Report of the Colonial Markets for the week ending Jan. 17, 1894.)

Bon Ami was the best Tea offered this week, the broken pekoe being remarkably thick in liquor. Brighton broken pekoe, also, was coloury and thick, but did not possess the strength of the former. For the rest prices remain unchanged, except that occasionally a slight improvement was noticeable for the better styles of pekoe.

INDIAN TEA SALES.

(From *Watson, Sibthorp & Co.'s Tea Report*.)

CALCUTTA, Jan. 31st, 1894.

There was a good general demand in the sales held on the 25th instant: allowing for the difference in the rate of exchange there was no material change in values except that good liquoring teas of all grades, specially pekoes, were again in strong request and realised rather higher prices. 10,665 packages changed hands.

The average price of the 10,665 packages sold is As. 6-0 or about 7d per lb. as compared with 11,502 packages sold on the 2nd February 1893 at As. 8-6 or nearly 9 1/2d per lb. and 14,323 packages sold on the 2nd February 1892 at As. 6-0 or about 8d per lb.

The Exports from 1st May to 29th January from here to Great Britain are 109,732,406 lb. as compared with 102,618,410 lb. at the corresponding period last season and 103,243,186 lb. in 1891.

NOTE.—Last sale's average was As. 6-0 or about 7 1/2d per lb.

Exchange.—Document Bills 6 months' sight, 1s 2 1/2d.

Freight.—Steamer £1-17-6 per ton of 50 c. ft.

(From *William Moran & Co.'s Market Report*.)

CALCUTTA, Jan. 31st, 1894.

On the 25th instant 11,323 chests were offered and 10,906 chests sold. There was rather more spirit in the biddings and prices showed some slight improvement. There will be no sale this week.

LIBERIAN COFFEE IN SELANGOR.

Some of the Liberian coffee gardens look in very fairly good condition but there is room for the exercise of the personal influence of the District Officer, in counselling the native planters to keep their gardens free of weeds, to prune their trees not to plant too closely and not to expect crops of sugarcane, plantains, tapioca, Indian corn and sirih from one and the same bit of land. As to the topping of coffee, there is the authority of Mr. T. H. Hill to the effect that it is better not to top. Throughout the District of Ulu Selangor a considerable quantity of land is being taken up by foreign Malays for coffee and garden produce and for padi planting and it will repay the District Officer and Assistant District Officers to encourage and advise them so far as they can. These foreigners say that they prefer to come inland to taking up padi land in the Coast Districts for the reason that they find a ready local market in a mining district which is not to be found in the Coast Districts where there is no mining population.—*Official Report*.

TEA AND ITS ENEMIES:
SHOULD WE HAVE AN ENTOMOLOGIST
AND BOARD OF REFERENCE
IN CEYLON?

Travelling a few weeks ago with two residents having a keen interest in the prosperity of the Colony (albeit neither planters nor estate proprietors), the question was started of how best to deal with the acknowledged enemies of the tea plant and more especially the one that is most prevalent and troublesome, known under the different names of tea-bug, mosquito blight or *helopeltis antonii*. Both our interlocutors had thought a good deal on the subject and one of them shadowed forth a scheme which, after thinking it over and consulting several leaders of the planting community, we deem it well to lay before our readers and especially those interested in plantation property and the permanence of the Tea Industry of the Colony.

In doing so at present we are choosing a time when we believe there is not much trouble with any enemy. Plantations are reported to be comparatively free of *helopeltis*; but that is no reason why steps should not be taken for ensuring the systematic destruction of the insect when it appears again and perhaps in great numbers. There is, let us premise, not the least reason for anxiety as to this particular pest. It has nothing in common with the fungus which wrought destruction in our coffee, and moreover it has been known on tea in India for the past thirty to forty years probably. There is no plant living which has not its enemy, and we are quite aware that Ceylon planters are apt (after the trouble they have passed through with coffee) to be rather too sensitive about little "poochies" or other intruders on their tea, cacao, rubber, timber or fruit trees. The Director of the Royal Botanic Gardens, Peradeniya, tells us that, very naturally, he is getting a little tired of having reference made to him as to what caterpillar this is, or what moth or fly the other may be. Why, caterpillars and insects of all degrees must have some food to live on! And it is too bad to pursue, phial or match-box in hand, individual caterpillars or moths, to label them enemies and to despatch them forthwith to either Editor or Director! If the caterpillar so dealt with were able to advance a motto to the planter, it would be "Live and Let Live."

But while this hint may be necessary in the case of a few who are too keenly alive to the presence of insect enemies on their products, there are, on the other hand, some planters with a tendency to neglect an undoubted pest, *Helopeltis* for instance, when it gives evidence of its presence in such numbers as to demand immediate attention, and when an early start on the part of the coolies under master's instructions, would probably save a worse outburst later on, on the manager's own and perhaps his neighbour's tea. There is no use denying the fact that in certain districts at certain periods of the year, this *helopeltis* mosquito can be exceedingly troublesome; but it is just as certain that if taken in hand at once and systematically, it can be very readily caught and destroyed. There is a belief abroad that its attacks are confined as a rule to lowcountry districts. But this is a mistake. The case indeed, that started one of our fellow-travellers in his consideration of the subject, occurred in reference to a high district. He had been residing with a planter who was busy catching and destroying the insect, and yet he had encountered other planters belonging to the same district who utterly denied that

helopeltis had been seen within its bounds! Now with such a fact and its denial coming under his own notice, our friend argued that much might be going elsewhere unreported, if not denied and that there was at least a danger of some men neglecting their plain duty to the detriment of their neighbours and of the industry at large. He saw, in fact, a state of things, which called for a remedy, and he pointed out to us the direction in which he thought that remedy might be applied.

Before we go further, we may, however, afford some additional evidence of lowcountry districts such as the Kelani Valley not being the only sufferers from the attacks of mosquito or *helopeltis*. Here for instance is an answer to our inquiry from an experienced manager of a plantation at a medium elevation:—

"*Helopeltis* did a great deal of damage here last year from July to October, when it disappeared; it began again to attack the bushes in one field in the beginning of this month, but at present there is very little of it.

"Most of the Sinhalese coolies refuse to catch the insects, but I am glad to say the Tamils have no such scruples, and soon get very expert at catching them. I think Mr. Clark of the Peradeniya Gardens was mistaken about the plant (dog's tail) on which the *helopeltis* is said to breed; for I have examined hundreds of the plants and have never seen a sign of the insect on them. There is a good deal more information wanted about it than is available. It is difficult to realise the amount of mischief a few of the insects can do to a flush, until one goes with the pluckers through a field infested by them."

It is clear then that while *helopeltis* may be most troublesome on lowcountry gardens, it is found to be present at 2,000, 3,000, 4,000 and even close to 5,000 feet if not on our very highest gardens. We are aware that it has been seen on some of the last-named; but we have never heard of any special attack.

And here we may stop to say that, as one contemporary urges, there is good reason for saying that Ceylon planters are in danger of losing their prestige for being in the forefront of intelligence as practical workers in reference to our latest staple, tea. There has been a squeamishness abroad about the very name of science and scientist in connection with the tea industry. Writings in our own and in other columns during the past year, and especially letters of so competent an authority as Mr. John Hughes and other contributors to the *Tropical Agriculturist*, about the need of bringing science to the aid of the tea planter, have been ignored and neglected. No one has even taken up Mr. Hughes' suggestion that, at least, £50 might be voted by the Planters' Association for chemical analyses. We do not mean to say that scientific cultivation has been neglected. We are aware of planters who are quietly doing very good and most profitable work in the application of manures, and who are keenly alive to everything directly bearing on their work, so far as their individual influence may extend. But little or nothing has been done by the representative body within this era of tea, in reference to the chemical analysis of tea soils, or towards invoking the aid of the Analytical Chemist in respect of the several operations for tea preparation in the factory. Here Indian planters have gone ahead, and we expect shortly, to lay printed results before our readers that will show how much has to be learned in regard to the processes that are now dealt with, more or less haphazard, by native tea-makers. This is, however, by the

way, and only to show that there is some need for Ceylon planters pulling themselves together, and not ignoring each fresh suggestion for a united effort towards improvement.

Now, in respect of Insect Enemies on Tea or other plantation products, the suggestions made to us have taken this form:—(1) that a Board of Reference should be officially established consisting of the Director of the Botanic Gardens, the Chairman of the Planters' Association and a skilled Entomologist to be appointed from home (Dr. Trimen has given so much good advice in his day in reference to insect pests, that many forget, as he himself complains to us, that he is not an Entomologist); (2) that legislation should be provided directing, under penalty, Superintendents of estates when any insect or other trouble is seen attacking his product or products to any extent, to report the same (confidentially of course) to the Board (this would ensure attention in the early stages of any attack); (3) that the Entomologist should then visit the estate and advise what ought to be done and see that precautions and steps for the destruction of insects, &c. were at once commenced. The great advantage such a systematic arrangement in coping with *helopeltis* would be found in the security for prompt and simultaneous destruction. At present, one planter may be doing his best to get rid of the insects, but, through his neighbour's do-nothingness his tea will be favoured with fresh visitations; for again, at present, there may be denial of the existence of anything to be killed in a district although certain owners more watchful than the generality are busy at the work of extermination. Of course, the Entomologist when not specially engaged, could make the round of the planting districts and investigate as to several puzzling facts connected with insect visitors, noted by planters; why some fields or plantations escape altogether, while adjacent ones are troubled; why some have only short, and others prolonged, attacks; and, aided by Dr. Trimen, he could no doubt carry on useful investigations in other desirable directions in reference to the life history of *helopeltis*, red-spider and any other similar pest.

One indirect advantage to the Ceylon Tea Industry from the establishment of such a Board as he suggested, our friend pointed out, would be the increased degree of security which absentee proprietors and mortgagees would feel in reference to tea property in Ceylon. It would, in this respect, be like an Insurance Board. Absentees would feel that a new and most important check on the neglect of property had been devised, officially sanctioned and legislated for. This would give them special confidence in their Ceylon estate securities and make tea and other planting investments out here all the more popular.

We do not know how far this may be; but we have done our duty in laying these several suggestions before our planting community at this time. There is no denying the great service which an Entomologist attached to the staff at Peradeniya could render to the Colony. It is not alone on tea and cacao, that insect pests appear. Only the other day we had specimens of betel leaves eaten by an old and somewhat persistent enemy, and cocoon beetles of different species, would of themselves afford an important subject of investigation to an expert of the right stamp. We do not want an unpractical recluse of the type satirized by Wendell Holmes—the man who refused to be called a Scientist or even an Entomologist, nor would he be thought to have mastered the *Coleoptera*—all he could pretend to be by way of title was a *Scarabeist*! What is required is a shrewd observant

and generally interested man of science, with the needful training in Entomology, but with the wide and practical views to which Dr. Trimen himself has so long accustomed our Planting Community.

THE SUPPLY OF QUININE.

The quinine market was very lively last week due mainly to the fact that visible stocks at the warehouses and docks of London were very low. Instead of about 7,000,000 oz., the whole stock, excepting these in private warehouses, were believed to be less than half this total. There has been a sharp rise, and the situation is intensified by rumours of a decline in the cultivation of cinchona in Ceylon, and a falling-off in the export from Java. It is said that £25,000 or £30,000 would buy the entire visible stock in London.—*H. and C. Mail*, Feb. 9.

THE PRICE OF STANDARD SILVER.

The following important table, giving the average yearly price paid per ounce for silver bullion purchased in the market for coinage purposes, was inadvertently omitted from our almanack. Mr. Buchan, manager of the National Bank, has kindly supplied us with the monthly averages for last year, and it is interesting to notice the almost continuous sinking gradation in the fluctuation of prices since 1883, and this year has experienced so far an additional decline to 29d. per ounce. The price of silver is doomed, apparently to continue to decline and if in the same ratio as it has done within the last ten years, it is only a matter of calculation—not a very cheering one!—when we shall be able to purchase our silver or rupees almost at the price of old iron!

TEA IN AMERICA.

A planting correspondent writes:—"I don't think Ceylon will gain by joining India in advertising in America; it would only be giving India the benefit of the Ceylon energy without any compensating advantages. Ceylon has worked successfully hitherto in pushing her teas independently, and I think the same policy should be continued in getting a footing in America and Russia."

In fighting against 90 million lb. of Japan and China "trash," it would be well that the producers of pure teas should present a united front and not seem to be rivals against each other. At present, many American dealers use Indian tea to oppose Ceylon, and *vice versa* and do harm to both. Whatever tells in favour of Ceylon (or India) should tell also in favour of all British-grown teas. In Melbourne, it was by the Indian and Ceylon tea representatives filling the press with scientific analyses and showing the great superiority

of Indian and Ceylon teas to China, that the first hold on the Colonial market was got.

Many Ceylon planters seem to forget that it is much the same whether Indian or Ceylon tea is sold in America so long as China and Japan are ousted: for, every ton of Indian tea sent to America is so much withdrawn from competition with Ceylon in London!

MR. H. K. RUTHERFORD COMPLETES HIS INSPECTION AND LEAVES FOR ENGLAND.

MARIAWATTE TEA PLANTATION AVERAGING OVER 1,100 LB. FOR TEN YEARS ON THE ORIGINAL 104-ACRE FIELD.

Mr. Rutherford has not been idle since he landed in Colombo on 18th November last; and it is very satisfactory to learn that his inspection of tea plantations both of his own Company, (the Ceylon Tea Plantations Co.) and of other Companies with which he is connected, has been thoroughly satisfactory and that he carries back with him to London, on the whole, most favourable impressions of the present condition of our Tea Industry, so far as it has come under his notice. The C. T. P. Co.'s 7,200 acres we may mention averaged about 418 lb. per acre last year, while the net average price per lb. will be above 8d.—Mr. Rutherford leaves (Feb. 1st) for London by the ss. "Arcadia."

Respecting Mariawatte—the most famous perhaps of the premier Ceylon Tea Company's Gardens, we have been favoured by the Manager in answer to our inquiry with the following interesting particulars:—

"Mariawatte crop for 1893 was 374,949 lb. tea=808 lb. per acre all over. The old 104 acres gave 1,110 lb. per acre, so you see it is not falling off. The whole estate, with the exception of about 30 acres, was pruned during the year. The rainfall for the year was 86.22 inches, which is 12.86 inches less than the previous year's. The outturn of tea from the Factory was 734,760 lb."

It is of special interest with the close of the decade of full bearing to give the crop year by year for the original 104-acres field planted in 1879:—

Average crop per acre:	
1884 .. 1,050 lb.	1890 .. 1,347 lb.
1885 .. 1,133 "	1891 .. 1,114 "
1886 .. 1,018 "	1892 .. 1,114 "
1887 .. 1,115 "	1893 .. 1,110 "
1888 .. 1,018 "	
1889 .. 1,094 "	Total .. 11,113 "
Average .. 1,111 "	

BADULLA PLANTING PRODUCTS.

TEA.—This product may now be said to be our chief staple, and your Committee are glad to report that during 1893 considerable progress has been made in its construction and extension. The crops during the year have been good, the yield per acre has been large, and estimates in most cases have been exceeded. Prices generally have been above average. Estimates of the probable out-put of tea from the districts during 1894 have been framed by your Committee. Your Committee are further pleased to note the introduction of fresh capital to the district, and they feel that the Badulla and Madulima districts under tea cultivation have a great future before them.

COFFEE.—The cultivation generally of this product is on the decline, crops as a rule have been poor but in a few instances moderately good crops have been secured,

COCOA.—The season for cocoa has been a fairly good one, but your Committee regret to notice the fall in price of this product.

THE EXHIBITION OF VICTORIAN PRODUCTS.

Messrs. Rowe and Kelly, the Victorian Commissioners, went up to Kandy for the purpose, we understand, of having an interview with His Excellency the Governor, to whom they bear a letter of introduction from the Earl of Hopton, and also with His Excellency the Major-General, with regard to their mission to enquire and report upon the prospects of a trade being established with Ceylon in the products of the colony they represent. In a previous article we enumerated the samples of produce they have brought with them and which they intend to exhibit in the Wharf & Warehouse Company's store beneath the offices of the P. & O. Company; and in our advertising columns the list is repeated with brief notes on the various items. The wines have been specially selected for use in Eastern countries and comprise clarets, sherry, port, burgundy, riesling, hock, chablis, frontignac, muscat, shiraz, chasselas, etc., and the brandy has been distilled from wine chosen for its excellent quality and flavour. In the brewing of the ales which are to be exhibited the best malt and hops have been used and they are said to be very well suited for hot climates. Of preserved meats there is a very large assortment including sheep tongues and trotters, beef, roast meat, corned beef, luncheon beef, chicken, ox-cheek and vegetables, mutton, roast mutton, corned mutton and boiled rabbit. The butter for which there is an ever increasing demand in England and the cheese are made up in tins and jars of various weights. Condensed milk is another specialty. It is pure milk from the cow reduced to one-fourth its original bulk by condensation and without the addition of sugar, and when distributed keeps, according to the sanitary condition of the store, from one to three weeks, and in some cases two months exposed to the atmosphere. Hermetically sealed and kept in frozen storage it should keep sweet and miscible indefinitely, and kept a few weeks unbroken out of the frozen storage should be good several days after opening. In order to bring it to ordinary milk three parts of water evaporated from it in manufacture require to be restored. Another specialty and quite a modern discovery is compressed forages consisting of chaff, bran, corn cake, (composed of crushed oats and crushed maize); and forages for horses, cattle and sheep (composed of chaff, oats, maize and bran in varying proportion). These feeds, we are assured, contain only what we have specified, no foreign element whatever being used in the process of compression which adds very largely to the keeping properties of the fodders which are highly nutritious, distributed easily and find their normal in bulk, in mastication so that animals cannot bolt their food. They will not spontaneously ignite and if placed in fire will not flame but smoulder away. For storage, shipment, or road transit they are well adapted, the saving in freight alone, it is said, being a handsome profit. It will be noted also that in the advertisement the Commissioners give prominence to Eucalyptus extracts and oils which they say are very efficacious in colds and affections of the chest and throat as well as a disinfectant in sick rooms. Of their quinine wine likewise they have very high testimonials. As already stated all in-

terested will shortly have an opportunity of testing for themselves the quality of the produce and as the exhibition will last only one day which has yet to be fixed, it is hoped that as many as possible will avail themselves of it. The Commissioners have a vast extent of territory to get over yet and they are anxious to push on as rapidly as possible. In a conversation which one of our representatives had with them they expressed themselves very much gratified with the manner in which they had been received by the Government officials they had waited upon, as well as others particularly mentioning the Hon. Mr. Reid, Principal Collector of Customs, and Mr. Mason from whom they had received every facility for the removal of their samples. Mr. Raven of the Grand Oriental Hotel, where the Commissioners are staying, has kindly undertaken to supervise the arrangements in connection with the luncheon which is to be served on the occasion of the Exhibition. Questioned with regard to the proposal to establish freezing chambers for meat at Colombo the Commissioners said they had reason to believe that if the contract for supplying the Army could be secured—and they thought the general European community would also give their support—private enterprise would be ready to take up the matter. As a centre for supplying other places Colombo possessed immense advantages, and if only the thing were started they believed that a very extensive and paying business could be done. As showing the vastness of the frozen meat trade in Australia, Mr. Kelly mentioned that one firm alone had storage for 35,000 carcases and could turn out 1,200 a day. We notice from an article in the *Asian* that the Government of India has concluded an arrangement with one of the Colonial meat preserving companies for the supply of a certain quantity of tinned meat and mutton for the use of the European troops in such cantonments where the local supply during the hot weather and rains is either insufficient or too inferior a quality to put before the men.

THE LARGEST TEA FACTORY IN CEYLON.

A VISIT TO GALAHA TEA FACTORY.

(By our own "Inspector.")

"Tea" is a small word, but it has much greater interest to us than the size of the word would suggest. We in this island are, however, not the only inhabitants of the world interested in the word: high and low, rich and poor alike of almost all the civilized nations feel the power of the simply expressed monosyllable. Its influence may be silent, like all great forces, but it is undeniable. Not many generations ago, against great odds of prejudice and ignorance, we find tea introduced to our homes. Our maternal ancestry while mentioning the word under their breath found means somehow to get acquainted with its properties and to enjoy its spell, for, as has been said, in cannily arranged nooks and corners of the fireside, where no prying eye could reach, they set the dreaded pot, which brewed the pernicious liquid! The suggestion that a person was a victim to the habit of tea-drinking lowered at once all respect. This is now all changed, step by step the qualities and

BENEFITS OF TEA-DRINKING MADE THEMSELVES

felt, if not apparent. World-wide reputation and worship has followed, and today the edict has gone forth that all nations must bow down before this charmer of our feelings. We have long ago acknowledged its power, and our interest at present centres in the means of preparation and despatch of tea from what is undoubtedly the best equipped and largest manufactory of tea in Ceylon.

It was on a beautiful day, not uncomfortably hot that we alighted at Peradeniya station. Here,

we took the opportunity of seeing the effects of

THE RECENT FIRE AT THE NEW PERADENIYA FACTORY.

Rebuilding operations had commenced, and almost under the open heavens a few of the machines which had only been partially destroyed and had been repaired were at work busily making tea. It will be seen that no time has been lost, in seeking to put new life into what became the dry bones of a factory. The terrible effects of fire were here quite apparent. Heavy beams and pillars of iron were twisted and turned like wire into innumerable fantastic shapes and forms.

From Peradeniya we drove to Galaha factory, some twelve miles along a most tortuous although otherwise good road, and arrived in time to see the finishing touches and final trial given to a beautiful

NEW ENGINE AND ENORMOUS BOILER

recently added to the factory, before the engineers Messrs. Walker, Sons & Co., Kandy, handed it over as ready for use.

The boiler, one weighing over nine tons, had been dragged over this tortuous road by five elephants, and in driving along we could not help remarking of the careful and persistent efforts that must have been exercised to have safely housed such a huge boiler. The time taken to haul the boiler along these 12 miles could not be considered slow work although it took a fortnight, and Mr. Hall, the manager, expressed the opinion, in which we concurred that it was most creditable and satisfactory to have accomplished the journey at all. The road is very narrow, and sharply winds out and in along the side of the valley of the Mahaweliganga with often a most precipitous front. To follow some of the twists in the road, jacks had to be used to cant the boiler round, and the bridges on the route had to be most substantially supported.

However, the boiler was safely in its place when we arrived, with steam indicating between 60 and 70 lb. of pressure, ready to fulfil the purpose for which all the labour, and, we may add, expense, was incurred. The cost, we understand, for both boiler and engine will be from R14,000 to R15,000,—rather a heavy item, like the boiler itself! The engine and boiler have been brought out from England, and were manufactured by Marshall, Sons & Co. of Gainsborough and London.

THE BOILER IS OF THE MULTI TUBULAR TYPE,

giving a large heating surface, as all tubular boilers do. Consequently the quick and easy raising of steam as well as maintaining the pressure, is no difficulty. When we were present the difficulty was to keep down steam, an unusual occurrence, we thought, with the pump forcing water into the boiler, and the damper on. Perhaps the size of the boiler—equal to developing 100 horse power—explains the matter. The length of the boiler is 19 feet and 7 feet in diameter. It is placed in a separate compartment, about 25 feet from the engine, in an out-house built against the lower end of the factory, which is built in the form of a "1." The boiler is substantially built round with brick-work, and looks very comfortable in its position. The furnace would naturally be expected to be spacious, and occupies almost half the boiler space, although not the full breadth, and its "drawing" power is all that could be wished. The smoke from the furnace besides passing through the tubes goes back beneath the boiler, and then branching into two, goes along on each side, then through the main flue and up the chimney. The main flue from boiler to chimney is about 15 feet long, the chimney itself being about 60 feet high, standing on a neat base of masonry, 10 feet high. The length of flue, therefore, is so great that there is

NO POSSIBILITY OF SPARKS PASSING THROUGH THE CHIMNEY,

and this certainly is in every respect an important advantage for safety from fire. The chimney is made of wrought iron and rivetted, and built in three sections. These sections had been joined together, and the whole raised in one piece by the aid of a crab-winch, without any hitch, by Mr. White, the engineer in charge. Access to the

flues for cleaning purposes is well provided for, and may be had from either of three sides—a door being placed at the ends and on one side. A door is also placed at the base of the chimney for cleaning the main flue. The other particulars of the boiler are a double set of water gauges, and a double set of safety valves—a dead weight safety valve and a lever safety valve. This is an arrangement for safety, for should any one of these from any cause cease to act the others would be quite equal to all emergencies, and work might proceed as if nothing had happened.

One of the neatest as well as

PRETTIEST PIECES OF MECHANICAL WORKMANSHIP

in connection with the installation and placed in the engine room, is a self-acting duplex pump, made by the famous pump-makers, J. H. Carruthers & Co. of Glasgow. In appearance it is a mere toy, but so effective that, Mr. White informed us, it is quite capable of supplying a boiler double the size of the Galaha one. The pump is worked independently of the engine, and may be started in the morning and set at a slower or faster speed to suit the requirement of the boiler, and then there is no need for more attention during the whole day. Is a country where no reliance can be placed on native labour the advantage of this pump is obvious. A neat arrangement in connection with the pump in the feed tank. A pipe conducts water from the turbine which also may be regulated to supply the pump according to need. The tank is in two compartments one receiving the water, and overflowing into the other from which the pump draws it. The tank is simply of concrete sunk in the floor, with connected drains below for cleaning purposes, and running into a drain, also used when emptying or cleaning the boiler. The pump works beautifully, forces the water through a vertical heater, and then the feed pipe from the heater to the boiler is carried along the main steam pipe thus helping to keep up or increase the temperature of the water before it passes into the boiler. The pipe connections between the boiler and the engine have been ingeniously arranged by Mr. White to relieve the strain by expansion and contraction, upon the joints, and a main cause of trouble from leaky connections will thereby be prevented. The exhaust steam is used for this heater which means a saving of fuel. It stands about 8 feet in height, is circular, and about two feet six inches in diameter. Passing on to the engine and its other connections, the first object that strikes a visitor is the

ENORMOUS FLY WHEEL, WEIGHING OVER THREE TONS, and above eleven feet in diameter. This fly wheel also acts as driving wheel, being wide enough to take on two belts, to run on a double ground faced pulley, six feet in diameter, and twenty inches wide. The engine is of 80 horse power, lies on the basement of the building, and works the belting at the easy angle of about 45 degrees, on the pulley connected with the main shafting on the second floor. In the same room is the turbine, of 40 horse power, and fitted with Lord Kelvin's patent suction pipes. Its connected shaft runs parallel with the main one, so that either the turbine or the engine may work singly or work in harmony according to necessity, but either will drive the machinery. This duplicating of the driving power is absolutely necessary in view of the contingency of possible accident to either engine or turbine. It would indeed be a serious matter to have the factory cease work for even a day, when it is understood that in the busy season as much as between

25,000 AND 30,000 LB. TEA LEAF

are brought into the factory! The new boiler and engine is, therefore, simply a paid up policy of insurance against the loss that would result from want of water in the dry season, or the breakdown of the turbine, an example which smaller factories have wisely not overlooked.

The end of the shafting protrudes through a most substantially built stone wall separating the factory from the engine and boiler house, taking on the

pulley which is strongly supported by two massive wrought iron brackets, one of them lying at an angle similar to the belt, thus being in the line of the greatest strain. There will be a platform round these brackets to give free access to the bearings for oiling purposes. The crank shaft of the engine is supported on one side in a recess in the masonry and to the shaft is attached double linked leather belts for driving the governor. While looking on, various tests were made by taking off and putting on machinery to ascertain the effect on the speed of the engine, but the

SENSITIVENESS OF THE GOVERNOR

at once checked and regulated the steam so well that no perceptible difference in the speed of the engine showed whether the machinery was being driven or not. Another feature of the engine is the length of the piston-rod, which is extended back beyond the cylinder, in a brass covering. This arrangement he-sides supporting the piston block in the cylinder, makes it possible, were it necessary, by taking away the cover, to attach a condenser to the engine. A self-oiling arrangement, worked by steam, is also attached to the cylinder. In almost every respect means have been devised whereby the engine may do mechanically everything necessary for the most effective and easy running, with only the attention of the manager or his assistant given to it, to see that all is right, say when starting in the morning. The relief from anxiety to those in charge of the factory by means of these machine contrivances may be understood, which will undoubtedly react most beneficially on the other work of the factory.

The engine has a solid concrete bed, five feet deep in the ground, and three feet above. Consequently the vibration was *nil*, and as to the smoothness of the working of the engine, as we remarked to Mr. White, the engineer in charge, less sound was made than that occasioned by the tick of a common clock! This not only speaks for the manufacturers, but also for the fitting engineers, who carried out the installation—Mr. H. R. Porter, the representative at Kandy of Messrs. Walker, Sons & Co., and his assistant, Mr. Jas. White. Both hail from the "Land o' Cakes," the latter from the Clyde, and along with the hearty, albeit canny, manager, Mr. Hall, and "oursels," we had a real Scotch gathering. The excellence and handiness of all the arrangements, not only of the motive powers, but of all in connection with the factory were almost apparent on entering on an inspection of the place.

No one but those who have seen the present-day process of the manufacture of Tea in Ceylon can have any idea as to what a high state of efficiency the art of tea-making has attained. In younger days our only conception of tea-making was a bland Chinaman with a long pigtail hanging down his back, rolling the leaf between his hands, as he sat in the sun—we were not sure whether for his own comfort or the drying of the tea, but it appeared a jolly process. The halo about these Chinese pictures had perhaps more effect in disseminating a thirst for knowledge regarding the taste of tea than perhaps we practical people of the present time would credit. The oldest of us are just grown-up children, and a picture, however crude, if striking and peculiar, has a power of attracting attention and impressing its feature upon the mind, especially when often met, that cannot but convey sensations which will operate through our life. And we believe that such was the case with China tea. The impressions caused by means of Chinese characters and pictures, even continued to these matter of fact days, will not easily be eradicated from the mind with all the hard logic of the superiority of Ceylon and Indian tea. One of our first impressions on seeing a chest of the

HIGHLY PRAISED CEYLON TEA

was that there was something about the bare wooden boxes, that betokened a dubious origin, and a lack of Oriental romance that almost crushed every prepossession in its favour. No doubt the aim of the Ceylon planter is practical honest trade

but sight should not be lost of the ideas that Western peoples have of the East and that add a glamour of enchantment to its products. No doubt if the Ceylon planter could spare a few cents of profit on their chests to adorn them slightly on the outside, the inside contents would have a higher flavour, and the packages a greater attraction, even to Mr. Worldly-Wiseman of Mining Lane!

However, I have digressed from the primitive mode of Chinese tea making, with which Ceylon tea manufacture shows an extreme contrast. We do not know how long, or how many hands would he required to make, in China, say the

130,000 LB. OF TEA,

which the Galaha factory sends out in a day! But the Galaha factory is equipped with the highest productive machine power for all the processes of tea making, whereas the Chinese, with his usual conservatism has still his delights in "the good old times." This has been in Ceylon's favour, and long may Mr. John Chinaman enjoy them!

As we have said, Galaha Tea Factory is built in the form of the letter "T." The cross wings at the top are an addition to the original factory. The former is about 150 feet long by 40 feet wide, the latter 200 feet long by over 60 feet wide. It is built on an island in the Deltota-oya river, picturesquely surrounded by beautiful hills. Looking down upon its glistening white walls, and innumerable windows, with its neatly kept green sward, more like an English lawn for fresh greenness, the quiet content of the outside appearance betokened nothing of the steady, quick motions of machinery inside. We felt charmed. The immediately surrounding estates belong to the proprietors of the factory, the Messrs. Strachan, but beyond lay numerous well-known estates, such as Mr. Lipton's Pooprasie estate, Le Vallon, &c. There is a tale in connection with the contour of one of the surrounding hills, which has a very striking likeness, in profile, to a certain Colombo V.A. It is a terror to Mr. Hall: as its shadow is always beside him! Should he at any time feel inclined to shirk his duty, one look at the "sleeping warrior," is enough to check and prove corrective! It keeps him wideawake—as no doubt the V.A. knows!

THE WATER POWER

comes from the river named, which was comparatively low at the time of our visit; but in time of flood we understand, it rises to five and six feet higher. To reach the factory from Mr. Hall the Manager's bungalow, which is built on the rise of a neighbouring hill, we descend to cross over a footbridge, suspended on wires. We shouldn't have liked our friends, who believe us to be feetottlers, to seem pass over this bridge, or they might believe that the Galaha manufacture was rather more exhilarating than the usual run of tea! But we managed by steady efforts to get over, One gentleman, however, it was reported, who tried something stronger than the Galaha brew, disagreed so much with the bridge, or the bridge with him, that he spitefully waded through the river! Mr. Hall thought him foolish, and so did we.

We entered the factory where the leaf is weighed. This is on the second floor, and the ground on this side of the factory makes it possible to pass into the building, over a wooden bridge way from the road which runs round the factory. We were at once in the

WITHERING LOFTS,

and felt the warm air upon our face. Both the second and third floors are used for withering. Mr. Hall pointed out that at present they were busily renewing the withering tats, which has to be done every 5½ years or so. The renewing of these clouds of tats would be an expensive item of itself, we thought, but Mr. Hall, it was quite evident, had made them well serve their day and generation, if such a term may be allowed, before he bestowed them probably as good conduct badges to the coolies to wear round their loins! These two storeys have tiers of these tats from floor to ceiling in unbroken continuity, except where a passage is needed to pass from one part of the building to the other. And in the newer part

of the factory an ingenious way of building these tats enables them to be very easily and quickly removed and narrow passages formed anywhere for the convenience of the work. This arrangement greatly facilitates operations in connection with the withering of the leaf.

The hot air supplied to these large withering lofts comes from five frieg driers on the first floor. The floors, right above the fans of these driers have been cut away, and No. 4 galvanised mesh fixed in. A continuous stream of hot air rises, through these openings, and permeates the whole place. These openings, however, are in the older part of the building, and Mr. Hall, always having an eye to careful improvements, has under consideration a scheme whereby the heated air from the older building may be by a

SYSTEM OF FANS,

drawn more rapidly throughout the newer part, and the heavily laden, moist air expelled from the building. He is first to try the effect of two 48-inch fans, to be driven by belts from the main shafting on the first floor. The floor of the newer part of the building is of English pine, specially imported, and we noticed that the heat of the place had little or no effect upon this wood whereas in the older building, where native wood is used, the heat has contracted it, and left small openings between the boarding. Eight shoots from the second and third floors, for sending the withered leaf down, are placed directly over the rollers, for feeding the machines direct from the lofts. These are the principal features of the withering lofts, but there is one matter, which Mr. Hall has not overlooked to which we may refer. The openings in the floors for allowing the heated air from the driers to ascend to the lofts are almost fatal to the successful extinguishing of fire, should there be such an unfortunate occurrence. One course would be to have means for closing them, and Mr. Hall has likely provided for this, but what he aims at is the extinguishing of fire at the outset. He is arranging to have hose pipes, connected with a forc-pump attached to the turbine, on each floor of the building. This will be as good as a fire brigade, and is only another instance of the general adaptation of means to meet the demands for efficiency and security from loss.

Passing down to the first floor, where all the

OPERATING MACHINERY

is placed we see the green leaf in process of manufacture into black tea, in all stages. At one end of the factory the leaf is placed in the rollers, and from one machine to another it progresses, till it is, at the other end, weighed, soldered up, and nailed in chests, ready for delivery. This beautifully lighted and airy floor is about 200 feet long, and in the centre and along the entire length shafting runs, supported by brackets attached to the second floor. This shafting from 4½ inches at one end, tapers down to 2½ inches, and drives the whole of the machinery direct without the intervention of counter shafting, except in the case of the sorting machines, which work in one of the cross sections formed by the "T" shape of the building. As we have said either the engine or turbine, or both together, may drive the shafting, but whereas the engine will have to be started in the engine-house the turbine may be started from the first floor, by an operator at one of the

LEAF ROLLING MACHINES.

These rolling machines are eight in number—six "Excelsiors" and two "Rajahs"—and are placed four on each side of the shaft, at the end of the building nearest the engine and turbine. On our visit they were rolling about 10,000 lb. of leaf per day, but in the busy season, say from the middle of March to the middle of June, from 25,000 to 30,000 lb. of leaf is rolled easily. Below each of these rollers, the floor, which is of concrete, slopes downwards, so as to receive a barrow for holding the rolled leaf. These barrows carry the leaf to the nearest machines—roll sifters. But it may also be mentioned that beneath each of the rollers, the slope for the barrows is continued in a small drain, and when cleaning these machines, a hose has simply

to be attached to the turbine pipe and allowed to do its work, the water running into the drains and passing out through the main into the river.

There are

TWO OF MICHIES ROLL-SIFTERS, which although old-fashioned, do their work very well, and Mr. Hall seemed quite attached to them. After separating the rolled leaf from the insufficiently rolled, the latter going through the rollers again, it is put on fermenting tables, each about 50 feet long, made of No. 4 galvanized weaving. This plan allows the air to circulate about the leaf which tends to keep it cool.

From the fermenting tables the next step brings us to the

FIRING DRIERS.

There are five of these machines, all Jackson's "Victoria"—four of A. size and one B. size. Two of A. size were working on the occasion of our visit. There was nothing worthy of special note about these machines. They were ranged in line on one side of the building.

We next moved on to the sifting room which is partitioned off from the rest of the machinery. The partition is well filled with glass so that standing at the top end of the building, one has a complete view of the tea-making machinery of the factory almost at a glance. In the sifting room, two of JACKSON'S "EUREKA" SIFTERS

were working and an "Invincible" tea-cutter by the same inventor. These machines are worked, as we have said, from counter-shafting, along with two fans for drawing the bloom coming off the sifting tea out of the room. There are half-a-dozen grades or more of tea, sorted by each of these machines, which have simply to be carried in chests to the weighing machine, placed a short distance from the door of the sifting room, and then soldered in sheet lead and the chest lid nailed on, and bound with the usual wire binding.

The coolie in charge of the soldering has a small forge for heating his irons, and the usual shapes for forming the lead-lining of the chests, half-chests, quarter-chests, down even to ooe or two pond packets. Two other coolies were busily nailing the boxes, and preparing them for transport to Colombo by train. About a dozen carpenters altogether are kept employed making the tea chests, &c., for the factory.

After finishing the factory inspection, the next interesting matter was the formation of the

WEIR FOR CARRYING THE WATER TO THE TURBINE.

A great part of the weir which is nearly 250 yards long, is built of solid concrete, six or seven feet high. The entrance runs right across the river, trapping all the water in the dry season, but in time of flood it, of course, is over-flowed. This would have been a most expensive work, and an engineering triumph into the bargain.

Our inspection of Galaha Tea Factory has revealed perfect arrangement in every detail, and we cannot pass a higher or weightier opinion than that expressed by Mr. Rutherford of Mariawatte, when he said that any other factory he new of was not to be compared with it. Both Mr. Hall, the manager, and Messrs. Strachan, the proprietors, are to be congratulated on their model factory, and the designer, Mr. H. R. Porter, of Messrs. Walker, Sons & Co., Kandy, shares the honour.

Mr. Hall informed us that last season—July to June—1893-94, he made 1,200,000 lb. tea. The most green leaf taken into the factory in a day was 27,000 lb. and he expects in the coming season that the greatest intake will exceed 30,000 lb. The capacity of the machinery now in the factory is about 1,500,000, but by working a few extra hours Mr. Hall thinks he could overtake the manufacture of 2,000,000 lb. of made tea per annum. The factory is independent and not run in connection with any single estate, tea being made for a dozen neighbouring estates, and purchased for manufacture from 25 to 30 different native growers.

In connection with the Gourakellie Group of estates, belonging to the Messrs. Strachan, the tea of which is manufactured at the Galaha Factory, a new tramway line for carrying the plucked leaf from the estate

to the roadway has just been decided upon. This tramway will be about a mile or more in length, and will cost about Rs.15,000. This will be of great advantage and saving for coolies have had to bring leaf for the factory across a most precipitous valley to the roadway. Messrs. Straoban are to be complimented on this further evidence of their enterprise.

Messrs. Walker, Sons & Co., Kandy, are also the successful contractors for this work. This branch of the firm, we understand, is extremely busy at present, and have work on hand for over a dozen different estates, entailing work of installing new engines and boilers to erecting entirely new factories. A factory based on the latest or most modern arrangements equal in size to Galaha factory has been secured in India. We were kindly taken over their commodious workshops at Kandy by their energetic and hospitable assistant Mr. White, and everything there betokened good management, and the determination to keep up with the most recent requirements and improvements of every branch of their varied business. Mr. Porter, their kindly, but practical manager, was literally "up to his eyes" in work, but amidst it all we had a hearty welcome from him.

THE NEW BOOK ON TEA.

We have to acknowledge the receipt from the Secretary to the Indian Tea Association of a first copy, for review, of what is to be widely known as Bamber's Text-book on the Chemistry and Agriculture of Tea. It is published under the auspices of the Indian Tea Association and there can be no doubt of the immense service which that body has thereby rendered to the important industry they represent. The Planters' Association of Ceylon, we consider, should lose no time in utilising the services of Messrs. E. E. Green, M. Cochran and other scientists available locally, for investigation and compilation towards the publication under their auspices of a Text-book for Ceylon in respect of departments in which there is evident deficiency. Meantime, pending our full notice of the Indian volume, we cannot help at once quoting the full "title" and "contents" of the same:—

A Text Book on the Chemistry and Agriculture of Tea including the Growth and Manufacture, by M. Kelway Bamber, M.R.A.C., M.R.A.S., Eng., F.C.S. Member of the Society of Arts, London, late Chemist to the Indian Tea Association, Calcutta.

CHAPTER I.—History of the Tea Plant, Origin of Tea Culture in India, Discovery of Tea in India Physiological Botany, the Tea plant and its varieties, Origin of Hybrids.

CHAPTER II.—The Formation of Soils and their Chemical and Physical Properties, Tea soils of China and Japan, Tea soils of Assam, &c.

CHAPTER III.—Mannres and Mannring, Experiments in Chittagong, Experiments in Assam, Object of Mannring, Composition of the Ash of Tea Wood and Leaves, Composition of Manures, Oil-cakes, &c., Bheel soil, Cattle Manure, Bone Manures, Granos, Mineral Mannres.

CHAPTER IV.—Plant Constituents, Mineral and Organic Nutrition of Plants, Germination, Proximate, Constituents of Tea, Chemistry of Tea.

CHAPTER V.—Cultivation, Light (*sandy*) soils Heavy (*clayey*) soils, Drainage, Clearing, Nurseries, Filling in vacancies, Seed Garden.

CHAPTER VI.—Pruning, Plucking in China, Plucking in Japan, Plucking in Assam (India).

CHAPTER VII.—Manufacture in China, Manufacture in India, Withering, Rolling, Oxidation, Firing or Drying, Re-firing and Packing.

CHAPTER VIII.—Insect Blights, Coleoptera Beetles, Heterocera Moths, Mosquito Blight, Green Fly, Red Spider, White Ants, Fungoids, &c., Appendices. The Appendices are as follows:—

- 1.—Analysis of Ceylon Tea, 1880, by Mr. Dunn, and 15 samples of Indian Teas by J. O. Nowbery.
- 2.—Extract of Dr. Diver's paper on the Chemistry

and Composition of Japan and other Tea. 3.—Extract from the Journal of the Chemical Society, 1887, on the Composition of Tea Leaves, with Tables. 4.—Extract of letter from the Sub-Divisional Officer, Sunamganj, to the Deputy Commissioner of Sylhet re Cost of Lime for Manurial or other Purpose. 5.—Analysis of Tropical rain for Nitrogen and Chlorine. 6.—Extracts, &c., from letters received from Managers and Agents re Manurial Experiments. 7.—Tables, &c., showing the Results of the Silcoorie Manurial Experiments, Cachar. 8.—Table showing Results of Experiments at Larsingah, Cachar. 9.—Table of Manurial Experiments at Amluckie, Assam. 10.—Tables of Manurial Experiments in Nowgong, Assam. 11.—Tables of Manurial Experiments at Doloo, Cachar. 12.—Tables showing the Value per unit of Manures in 1888.

And, finally, from the Preface we quote a few passages:—

In this work on the Chemistry and Agriculture of Tea, an endeavour has been made, without entering into the minute details of cultivation, &c., to lay before the planter the main chemical and physical facts affecting all the processes included in the cultivation and manufacture, and to point out, where necessary, the means that may be adopted to increase or modify the natural influences at work.

A brief account is given of the original introduction of the plant from China as collated from Ball's "Cultivation and Manufacture of Tea," and Fortune's "Wanderings in China," and the discovery of the Indigenous Variety in Assam; also of the soils on which it is grown in the former country, in order to contrast them with those which have been selected for its growth in India.

The functions of the various parts of plants and their importance in the vegetable economy are fully dealt with to point out the effects of plucking, pruning and root cutting, and to show the necessity of performing these operations on scientific principles as well as in a practical manner.

As this book is chiefly the outcome of the investigations on tea soils and manures in 1891 and manufacture in 1892, it will probably be expected that certain manures will be recommended for application to particular soils, and as far as possible this has been done; but the experiments, which have been made, have not been sufficiently satisfactory, or conducted over a period long enough to warrant any more definite statements on this subject. The composition and relative value of different kinds of manure (chiefly those procurable in India) have been given to assist the planter in selecting those, which, if employed, would yield the most satisfactory results, and to prevent the useless expenditure of money on unsuitable material.

In dealing with the manufacture, I have necessarily been somewhat brief, as the experience that can be gained in only one season, and in a single district, is not sufficiently large to enable me to speak confidently on every phase of this subject in regard to all the districts where tea is grown, especially as climate influences so largely affect the various processes employed; the chemical changes however induced in the manufacture have been explained, which should enable the planter to modify the latter according to his surroundings, and as his own experience may suggest.

NOTES FROM RUSSIA: TEA GROWING.

Odessa, Dec. 20.

Besides grain, Russia is going to grow other produce to cover her own wants—and to export, if the production grows large enough. They are trying now with tea. In the district of Tcharokin, near Batum, in Caucasia (Russian Armenia) tea plantations are being laid out, and the English steamer "Myrmidon" has brought 1,200 cases containing tea trees from Hankow to Port Said, where they were shipped on board the "Azoff," an Odessa China trading steamer,

which brought them here. Along with these trees fifteen Chinese arrived to teach the method of growing and handling the tea. During the last few months also the "China Trading Company, Leon Rabinovich, Limited," here has been registered by the Government and has commenced operations. As to another important article of the future, I may quote another. Of this already 700,000 poods (36 lb English each) were grown this year in the district of Erivan only (Russian Armenia), which makes 15 per cent more than in 1892.—*British Trade Journal.*

YATADERIA TEA COMPANY.

At the annual meeting of the shareholders at 13 Queen Street, Mr. Starey in the chair, the report was adopted and dividend declared as per Report:—

The balance of profit (including R11,217.25 brought forward from last year, after writing off for depreciation of buildings and machinery, and also a further 15 per cent on the amount in the New Oriental Bank Corporation, as shown by the accounts) is R73,454.46. Of this sum 23,750 has been absorbed in paying an interim dividend at the rate of 12½ per cent; and the Directors propose that a further dividend of 12½ per cent, and a bonus of 5 per cent, absorbing R33,250, be declared and made payable on the 23rd February and that the remainder of R15,454.46 (after paying R1,000 special fee voted to the Directors at the last General Meeting) be carried forward: It will be seen that the property representing capital stands in the Balance Sheet at approximately R286 per acre cultivated, as compared with about R279 in the previous year's accounts. The additional Roller and Drier referred to in the last report have been erected, new troughing and silt boxes of iron have been supplied for the water-course, and a dam for storing water is in process of construction. The permanent bungalow for the Superintendent has not yet been built.

The total tea crop was 485,448 lb., or 2,748 lb. more than estimated in the last report; and but for unfavourable finishing weather in December, the excess might have been larger. The plucking area was 579 acres, 28,224 lb. leaf, producing 7,092 lb. tea was purchased at a cost of R2,056.01.

The total quantity of tea for disposal was 492,540 lb., of which 275,940 lb. were sold locally averaging 34.72 cents per lb., and 216,600 lb. were shipped to London averaging 36.23 cents per lb. The cost of the tea delivered to buyers, including all charges and depreciation of buildings and machinery, was 22.66 per lb. (being 1.43 cents less than in 1892). The net value realised from sales was 35.38 cents per lb. 2.46 cents less than for the previous crop). The sum written off for depreciation represents 2.65 cents per lb. of the cost.

The Company's property (including 51 acres purchased during the year) consisted on the 31st December, 1893, of:—

700 acres Tea—viz:—	Average yield from 579 acres = 838 lb. per acre
Acres Tea	yield in 1893
172 planted in 1885;	907
208 " 1887;	884
100 " 1888;	885
41 " 1889;	822
6 " 1890;	552
52 " 1891;	881
121 " 1892; not in bearing;	
253 " Forest, &c.	

953 acres as per last report.

51 acres purchased from natives in 1893 (a further 40 to 50 acres is being arranged for.)

1,004 acres.

The Directors propose an extension of about 70 to 80 acres in 1894. There were no extensions in 1893 but the whole area was supplied as thoroughly as possible. The estimated crop for 1894 is 525,475 lb., tea.

THE TEA ENTERPRISE AND SCIENTIFIC EXPERTS.

"TENTACLE"'s letter will do good in rousing attention to all sides of the question, albeit it rubs some of us the wrong way. He will see that we by no means mean that "fresh blood" should be imported in order to give the planters the needful scientific help and to carry out important investigations, although our language in hurriedly descanting on our need, may have implied as much. We quite favour the utilisation of scientific knowledge and training in the persons of both Messrs. Cochran and Green, and we would once again urge that if the appointments were "official," it is not alone "tea" or "planting" generally, that would benefit. "Tentacle" asks us what good Scientists of the most varied attainments could have done for us in the face of the coffee fungus calamity which first appeared in 1869. Now if there be one lesson more than another taught us by the experience of 1869-81 ("the twelve years' conflict" as we may call the period) it is, "how much the planters lost by *not* attending to the teachings of science!" We take a full share of blame ourselves; for we, equally with the whole body of planters, failed in 1869-70, to give due attention and weight to the opinion of the late Dr. Thwaites, one of the greatest Fungologists the world ever knew, and even when many years after, Dr. Marshall Ward worked out the life history of the fungus and fully confirmed Dr. Thwaites' opinion as to the great difficulty, if not impossibility of getting rid of it, there were not a few in the community inclined to doubt. Had we all accepted the scientific view ten years earlier than most people did, how much needless expenditure might have been saved; and had planters in most of the old coffee districts begun to set their houses in order, and prepared for the "inevitable" in respect of their coffee, so might they have turned their attention, time and money to other products many years before the actual crash came. Our experience of coffee leaf disease, is therefore, to our mind, all in favour of Science and Scientists and against trusting alone to the practical man going by the rule of thumb or by his own experience only. On the other hand, we entirely sympathise with the wise words with which "Tentacle" winds up his letter and commend them to the attention of the leaders of the Planters' Association. The prudent course would be to refer the subject to the consideration of a Sub-Committee which after consulting with Dr. Trimen, Messrs. Cochran, Green and others, might report to the next General Meeting.

BURNING OF BLOOMFIELD TEA FACTORY, MASKELIYA.

We regret to learn that a telegram has been received in Colombo, announcing the total destruction by fire of the Tea Factory on Bloomfield estate, belonging to the Upper Maskeliya Tea Company. No particulars have yet come to hand as to how this has happened. The buildings and contents were fully insured—in the Hongkong office, we believe. The Company is very fortunate in having a factory on the adjoining estate of New Brunswick, in which they can carry on the preparing of their teas.

It is strange how, after a long interval with no casualty, two such fires as those of Peradeniya and Bloomfield should have occurred so close together. The present time of drought upcountry is one

when special precautions should be taken in connection with tea factories; but we trust this is the last fatality of the kind for the present year.

GRAIN CROPS IN CEYLON.

The Season Reports for the Quarter ended December 31st, 1893, as well as an abstract of same for January last, are published in Friday's "Government Gazette"—the former giving the average rainfall in inches during the quarter, and to end of quarter from beginning of year as well as the average to end of corresponding quarter of previous of three years, besides price per bushel of paddy and dry grain respectively in the quarter and the previous one, as also in the corresponding quarter of 1892. On the whole the Crops and Prospects during the quarter have been favourable, except in some parts of the North-Western Province owing to want of rain. There also had been a scarcity of food in the Nuwarakalawiya district of the North-Central Province.

The reports of Crops for January last cannot be said to be cheerful in the Western, Northern, North-Western and Sabaragamuwa Provinces, and in the Trincomalee district of the Eastern Province. In the Western Province the yield has been small in Siyane, Salpiti and Hapitigam Korales and while there has been a plentiful supply of jak fruit in the Colombo though plantains are rather scarce and dear. Jak is reported to be scarce in the Kalutara district and the prospects of the Coconut crop for 1894 appear also to be not very favourable in the Colombo district. In the Northern Province rain is badly wanted in some divisions of the Jaffna District, while in the Mannar District, excepting a few villages, "unless good rain, which is most unlikely fall within the next fortnight," the paddy crops will fail. On the contrary, the dry grain crops are very good throughout the whole district and are being reaped. In the Kurunegala District of the North-Western Province the harvest will undoubtedly be short everywhere, except perhaps in Weenda; Dambadeniya expecting only one-fourth, Dewawedi and Katugampola one-half of the average output, but it is said large areas in Kinyala are chenaed and will probably supply deficiencies in paddy. Prospects in Wannu on the whole, but the health of the people and cattle are reported to be tolerably good. In the Province of Sabaragamuwa the present dry weather is unfavourable to the second maha; paddy plants in Nawadun Korale in the Ratnapura District, while the late maha crops in Galboda and Kinigoda Korales and Beligal Korale in the Kegalla district were damaged owing to drought. In the Trincomalee district except under tanks crops in blossom and in ear are withering for want of moisture. For the rest of the island fair prospects are reported.

TEA AND SCANDAL.

I am sorry I cannot send you the music (by Henri Pontet), as well as the words (by Knight Summers) of the following piece on TEA; but no doubt those who wish will set it to a tune of their own. It, adapts itself admirably to my title, and is called "Five o'clock Tea":—

One summer's day, at a Five o'clock Tea,
There sat a boy of belles;
Of this and that they freely discoursed,
Those dames and demoiselles.

Said a stately dame: "Have you heard the news?
They quickly responded "No."

"I'm told Miss F. is engaged at last,"
"No, truly, you don't say so."

"Do you take sugar? Do you take cream?"
Delightful Five o'clock Tea.

"Now quickly draw near, and you all shall hear;
But it's *strictly* between you and me."

"Now who is it to?" they eagerly asked.
"I fancy the name is Brown."

The effect was like an electrical shock,
That name was met with a frown,

"I must warn Miss F." one lady cried;
 Said another; "He's jilted me;
 This monster from breaking another heart,
 Must surely prevented be."
 They take no sugar, they take no cream,
 'Twas a bitter Five o'clock Tea;
 They were ready to weep, and vowed vengeance
 On the head of that fickle B. [decp
 So off they hastened to tell Miss F.,
 Who fainted without delay;
 Then wrote in a passion, with many a dash,
 To break off the match that day.
 Now all the while 'twas a different "Brown,"
 As was proved by the injured youth;
 And gaily they laughed on their wedding-day
 At the gossip's lack of truth.
 The news of the day, I venture to say,
 You'll hear at Five o'clock Tea;
 But take it with salt, lest you be at fault,
 This advice pray accept from me.

Gideon Nye wrote a capital book on 'Tea and the Tea-trade,' in the American language in 1850, and from p. 40 I quote a factious account (taken from *Punch*), of an "Interview of the Tea Deputation with Lord John Russell":—

"On Wednesday, the 16th January, a deputation from Liverpool, headed by its members, waited on Lord John Russell and the Chancellor of the Exchequer with the laudable desire of obtaining their consent to a reduction in the Tea duty. The business commenced by a few words from Sir Thomas Birch, who was very appropriately selected on this occasion, for, as the premier (must have mentally) remarked "Birch has always been looked upon as one of the principal representatives of Tea in this country. Mr. Cardwell went into the arithmetic of Tea, and proved that while in the United Kingdom the consumption amounted to only a pound and three-quarters per head, it was nine pounds per head per annum in the Australian colonies. This, at a spoonful each and one for the pot, gave several million cups of Tea to the colonists, while at the same strength of brewing, there would be little more than a dish (of Tea) per diem for the inhabitants of Great Britain. Mr. Ed. Brodribb enlarged on the subtle merits of Tea, and insisted that although mere spoons had sometimes made a stir in Tea, there was now a small but determined Tea-party springing up in the Kingdom, and with all respect he would say that the Government would eventually be teased out of the duty. Another member of the deputation took a view of the matter in reference to the agricultural interests, urging that so long as the genuine tea was kept out of the country by the heavy duty, the hedges of the farmer would never be safe from those depredators who plucked a spurious sort of Twankay from the sloe, and stole for the tea market that which was neither Hyson nor His'n. After a few further remarks from other members of the deputation, Lord John Russell courteously acknowledged himself a friend of tea, and though some called tea mere slop sent over by our foes, the Chinese, he was not one of those who regarded it as a "weak invention of the enemy." After intimating his willingness to take a tea-leaf, if practicable, out of the book of Free Trade, he assured the deputation that he and his friend the Chancellor of the Exchequer would, some day, after dinner, take tea into their best consideration.

A visit to the Manuscript Room of the British Museum is always full of interest. Here are some verses by a Henry Power, that I found there, but at what date written I cannot tell.

VERSES ON THE INDIAN SERPENT GECCO.

Such deadly poyson lyes within
 This sea-green lizard's speckled skin,
 That with more revengeful spite
 It kills beyond our Acconite;
 The divellish Indian knows its force,
 And by it kills without remorse.
 Against their darts dipt in this juice
 There are no antidotes in use,

The cursed Basilisk, which kills
 By looks, to this in venom yields.

(Note.—The RATTLE SNAKE is also frequent in Virginia; the proper antidote for it is Radix Polyrrhiza.)

ON THE SENSITIVE PLANT.

Why fleest thou, (pretty plant,) my touch,
 And shrivels in thy leaves so much
 Hath Daphne left Apollo's tree,
 And is she flitted into thee?
 Then welcome, nymph, thou need'st not fear
 Thy old pursuing ravisher.
 Apollo sticks still to his bays,
 And haunts not such like plants as these.
 The sea and air, though both abound
 With horned creatures; and the ground
 Puts forth her horns also, and wears
 In this plant his Brow-Antlers;
 Into the rocks and stones it shoots
 Its fibrillous holdfast roots.

OF THE PLANT CALLED BILLING-BING.

Though acid Citron juice our teeth doth sting,
 The edge is taken off by Billing-Bing;
 As greater pains always assuage the lesse,
 So doth all others this plant acidnesse.

OF THE PINE-APPLE.

Do not your palates much provoke
 With this sweet Indian artichoke,
 Nor with their luscious strawberries,
 For in them all their venom lies,
 By which lethiferous fatal juice
 They will a bloody flux produce:

A. M. FERGUSON.

MR. M. K. BAMBER'S TEA BOOK:

With regard to rolling, he alludes to the too common practice of over-filling the machine and in accordance with the whole of his system of manufacture, advocates the keeping of leaf "cool"—and recommends the "Rapid," with its latest improvements, as the most effective machine extant. The next chapter is on 'oxidation,' which is described with truth as the most important process in the whole manufacture. Mr. Bamber prefers the term "oxidation" to "fermentation," and referring to the old process of allowing the leaf to lay in heaps for many hours, he says the temperature would rapidly rise to 90 to 100 degrees, and a kind of fermentation would set in accompanied by decomposition.

In fact the old-fashioned process is entirely condemned as further on the author says a separate room apart from the machinery and protected from the sun by a double roof is necessary, as it is impossible to oxidise the leaf properly or obtain a good color if the room is too hot. This will come as a blow to old-fashioned manipulators, who ball their leaf and smother it in blankets for hours in the loft above the fires!

A temperature of 85 degrees Fahrenheit, is the highest for the roll to generate, but in following the method advocated we have found on these hills that a good color is obtainable at 75 degrees and lower. Thin layers of roll moistened with a spray of water and covered with damp cloths, are the means employed to keep the leaf cool and to obtain color by oxidation. Over-withered leaf will turn out dull or dark in color, but Mr. Barber says this is partially curable by the application of clean water during the rolling process, or better when the leaf is put out to oxidise, as by this means the sap is more diffused over the leaf.

To prove that the process required is oxidation, not fermentation, a series of experiments was undertaken, the result of which are given, all going to prove that the change in the leaf in the so-called fermentation is due to oxidation.

According to this authority in the old process of a long ferment, the acidity of the sap is increased unduly and the leaf becomes sour and rancid, which can be only corrected by rapid and high firing (which is also

objectionable) and then only at the expense of losing the essential volatile oil, which is dissipated during the process. The whole chapter requires careful reading and practical experiment will convince the sceptical of the advantage of the system.

A carefully written and thought-out chapter on "Firing" follows in which much practical information is given; and with the exception of a sharp heat several degrees over 212 degrees F. at first, to stop oxidation at once and even a low firing is advocated and all later experiments have confirmed the opinion that slow-fired teas are more flavory and pungent than those worked off under high temperature. The necessity of dry air is properly insisted on, otherwise the leaf becomes stewed before it is dried and further the output of the machines is greatly reduced per hour. Contrary to the system adopted by old fashioned planters, Mr. Bamber says that *final high firing* is the cause of loss of flavor, as this time the leaf has or should have little moisture in it, and that little is rapidly converted into steam and this mechanically carries off with it the essential oil, which is exceedingly volatile, and which, when present in the fully prepared tea, is *flavour*.

Dry fuel is properly insisted on, also regular scientific stoking; reasons are given and these paras should be translated in the vernacular, for posting up in a conspicuous part of the factory, for owing to carelessness in stoking and wet fuel, irreparable injury is annually done to enormous quantities of tea.

Mr. Bamber says, "A low temperature for this final firing has been employed on many estates for some time, and it has most invariably been found to produce a flavory and valuable tea, so that the analyses merely confirm and explain the benefit of such a process."

A treatise on different machines and the regulation of draught in those worked with a fan concludes this chapter, but not before further caution is given against the evils of high firing. An initial temperature of 260 to 280 degree until 50 per cent of the moisture is expelled; a second and third firing, at 220 and 180 degree respectively are recommended, but this, though undoubtedly correct and likely to retain the essential oil, in the leaf, and thus flavor, would be too prolonged a process and beyond the firing resources of most factories. Final firing and packing are instructive and it will be news to most planters that tea should *not* be packed hot—but the reasons for arriving at that conclusion must convince the reader of its correctness.

THE INTRODUCER OF THE CINCHONA PLANT INTO JAVA.

Hasskarl.—On January 5th within eight days of his British fellow-scientist and worker, Spruce, Dr. Justus Karl Hasskarl, the introducer of the cinchona-plant into Java, died at Cleve, in Germany at the age of 82. Hasskarl was born on December 6th 1811, at Cappel, where his father, who traced his descent to a Swedish family which had settled in Germany at the time of Gustavus Adolphus, during the Thirty Years' War, held an official position. During Hasskarl's childhood his father was transferred to Bonn, and there the subject of this note visited the Gymnasium. Botany was his favourite subject, and in 1827, when his school-days closed, he obtained a small appointment at the Botanical Gardens at Poppelsdorf, near Bonn. His drafting into the military service in 1830 intercepted his botanical studies for a couple of years, but as soon as he could free himself he returned to the profession to which his inclination drew him, and found a place as manager of Mr. Weyhe's horticultural gardens in Düsseldorf. Hasskarl conducted a botanical class in connection with the establishment, but it would seem that his employer refused to allow him to teach any but the most elementary principles of the science and that, as a result of differences on this point, Hasskarl was dismissed in 1834. In the meantime a paper of his on *Cunninghamia sinensis* had attracted some attention in scientific circles, and means were found to enable the young man to return to Bonn and finish

his training at the University, where, in addition to botany, he studied medicine. During the time he contributed several papers to the *Regensburger Flora*, and received the high distinction of being appointed a member to the Regensburg Botanical Society. In the following year Hasskarl was thrown into contact with Professor Goldfuss, the geologist who made him his temporary assistant at the Natural History Museum. A wealthy Rotterdam ship-owner who visited the museum, and appears to have had a certain ambition of figuring as a Mæcenas in a cheap way, offered to provide Hasskarl, who longed for a chance of botanical-work in the Tropics, with a free passage to Java in one of his ships. The offer was eagerly accepted, and in 1836 Hasskarl sailed (via Baltimore) for Java. The journey took 210 days and the young man arrived at his destination practically penniless. Fortunately he attracted the attention of a compatriot, Dr. Fritze, chief of the Dutch-Indian Medical Service, who found him a berth at the Buitenzorg Botanical Gardens, not so famous then as they have since become. For nine years Hasskarl held that appointment. In 1846 he threw it up in anger owing to a mis-understanding with Teysmann, director, about a certain improvement in position which Hasskarl claimed to have had promised to him, and returned to Europe, leaving the introduction of a systematic arrangement of the collections at Buitenzorg and the first catalogue of the gardens as mementoes of his work. Hasskarl, now a married man, established himself in Düsseldorf, earning his living by casual journalistic work, translation of scientific books into German, land, original work—among the latter a book: "*Pantæ Javanicæ rarioris, adjectis nonnullis exoticis in Javæ hortis cultis descriptæ*," which appeared in 1848. About that time the Dutch Government decided to send an expedition to South America for the purpose of collecting cinchona-seeds and plants. The command was offered to Dr. Junghuhn, also a German botanist, who had done excellent work in the Dutch Indies, where he appears to have made Hasskarl's acquaintance. Junghuhn, after long consideration, declined the post, and recommended Hasskarl, who accepted immediately, and left Holland in 1852.

Hasskarl was instructed by M. Pabud, the Dutch Minister of the Colonies, not to confine himself to the collection of *Calisaya* (then looked upon as the most valuable species), but to gather plants and seeds of as many varieties as possible. Early in 1853 the doctor set foot in Peru, and immediately proceeded, via Lima, to the Andes, which he crossed in May, by the Tarma road. Unfortunately he happened upon a track where the richer varieties of the cinchona were absent, and the only kinds he discovered were: one to which he gave the name of *C. ovata*, but which has since been re-named *C. Pabudiana*, *C. pubescens* and *C. amygdalifolia*, of which he collected the seeds, and *C. lanceolata* of which he secured plants. Hasskarl continued his journey to Cuzco, and thence to Sandia, in the Province of Carabaya, on the Bolivian frontier, the home of the best *Calisaya* trees. Arrived too late in the season to gather any seed, he was forced to return without this prized variety to Lima, whence he forwarded the collected seeds by post to Holland. The plants were sent on via Panama to Wardian cases; but through some misunderstanding they were returned to Lima a few months later, and had all died when they arrived there. In the spring of 1854 Hasskarl again set out for Bolivia. War had broken out meanwhile between that country and Peru, and the Bolivian frontier was closed to all persons from the sister-republic. Hasskarl, under the assumed name of José Carlos Müller, therefore established his headquarters at Sandia, as near the Bolivian frontier as he could get, and thence sent out expeditions to collect *Calisaya* plants. In this he was fairly successful, and in June, 1854, he returned to the coast with 400 *Calisaya* plants (seeds he could not obtain), only to find, when Arequipa was reached, that the Dutch man-of-war which was to carry the collection to Java had left a few days previously. He caught up the ship at Callao and reached Batavia on December 13, 1854.

A few months after Dr. Hasskarl's return to Java, the ship in which his family were sailing from Holland to rejoin him foundered off the Dutch coast. The Doctor's wife and his four daughters were among the eighty passengers who perished in the waves. Shortly after this domestic calamity, Hasskarl had the misfortune to differ from Dr. Junghuhn, who had meanwhile returned to Java, and among whose duties was that of supervising the new cinchona-culture, on many vital principles of the system of cultivation. The breach between the two men became too wide to admit of satisfactory co-operation. Hasskarl therefore resigned, leaving Java in 1856 with all the honours of war, in the shape of many orders and crosses, and a life-pension of about 85*l* a year. Since that time the Doctor has lived in retirement in Germany, the recipient of many official honours and much beloved by his neighbours in the little German frontier-town where he spent the last thirty years of his life. Dr. Hasskarl is survived by his second wife, a Dutch lady. During the last few years his memory almost entirely failed him, and he had long been quite incapacitated for work. It is a singular fact that the most valuable of all cinchonas, the *Ledgeriana* variety, was not introduced into the Indies by any of the collectors especially appointed by the British or Dutch Governments, but by a private trader in South America, the late Mr. Ledger, who collected the seeds with the assistance of an Indian carrier, one Manuel Inca Maemani. When the Bolivian authorities discovered the part played by this Indian *cascaillero*, they threw him into prison for assisting the foreigner in robbing the country of one of its chief riches, and there he perished miserably. Not a single one of the various species introduced by Hasskarl is nowadays planted in the East for commercial purposes: Notwithstanding the fact that Hasskarl's South American mission produced no permanently successful results, time has amply shown that the methods of cinchona-culture adopted by him, and (to some extent) also by Traysmau, were scientifically correct.—*Chemist and Druggist*.

TEA CURING MACHINERY.

In our issue of May 6th, 1892, we made reference to the important character of the machinery that the competition of India and certain British Colonies with the long-established tea trade of China had brought into use. We then wrote under the impression that the machinery was of so highly effective a character that little or nothing could be added to it to improve the quality of the finished tea turned out by it. But it has become known to us that in that impression we were mistaken. It is true, perhaps, that as regards the machines themselves improvement was scarcely possible, but even this approach to finality did not overcome a tendency to inequality of production, which was especially noticeable at varying seasons of the year, humidity in the external atmosphere being responsible for a variation in this that often reduced the price obtained for the tea made by more than 50 per cent. While, therefore, it appeared to be almost impossible to devise improvements in the machines themselves, it at length became manifest that some alteration of procedure was necessary if a level of quality was to be maintained. It struck an intelligent observer that the drying apparatus was being worked on a wrong *ab initio* principle. The air discharged from the fan drawing it through the furnace and over the tea was suffered to escape into the room containing the drying machines. This air was necessarily charged with the moisture extracted from the leaf during its treatment. And yet the same air is, under existing methods, suffered to re-enter the furnace and again pass over the tea trays. Hygrometrical tests made have shown that this air is charged up to 100 per cent with humidity. On entering the furnace this becomes developed into a steamy vapour most injurious to the drying tea. Manifestly, therefore, the remedy must be in preventing air so charged from re-entry into the drying chamber. One estate which has made the change has, we are

informed, found as the result that its teas maintain an almost level quality throughout the year. A further improvement, it is said, will result from permitting the air so discharged from the fans to play upon the tea leaf during the preliminary process of withering. At present this process is assisted during damp weather by passing over it a strong blast of dry heated air. The result of this is unsatisfactory, as it produces a hardness and dryness not desirable in this first stage of treatment, and it besides induces a premature fermentation highly detrimental. The system now proposed is to lead the warm humid air discharged from the fans in the drying-room to the withering chambers, these being made as air-tight as possible, and having their only vents on the floor level, so as to insure the escape of the colder air only. While, therefore, the machinery used will remain as at present, the method of working it and the adaptation of its is-using products will alone be changed; and this, it is confidently expected, with most profitable results.—*Engineer*.

REVIEWS.

CEYLON HANDBOOK AND DIRECTORY, 1893-94.

"Ferguson's Ceylon Handbook and Directory" is one of the most complete works of its kind, and its value is proved by the fact that it has been issued regularly since 1855. Not only does it give complete lists of the principal Europeans and natives in the island, but it also affords much statistical information as to the progress of this important dependency, recording the chief events of historical interest from year to year, and detailing the public works that have been undertaken or accomplished. It is from such materials alone that the history of Ceylon can be accurately traced. Mr. J. Ferguson, who edits the Handbook, has had long experience in the country, and has drawn together a vast array of statistics bearing upon every branch of Government, of industry, and of commerce. Under the heading of Public Works he has detailed the progress of railway extension, the building of a new harbour at Colombo, the water supply works there, and the important department of irrigation works; and he explains with great fulness the financial condition of the island, especially with reference to the undertakings for the public benefit. Proposals of great practical importance which are yet under consideration are fully described, amongst these being the schemes of railway extension which will ultimately unite Ceylon with the South Indian railway system; the introduction of tramways at Colombo, and the reclamation of the foreshore in the neighbourhood of the capital. In criticising recent legislation on the subject of taxation, Mr. Ferguson expresses himself as decidedly against the abolition of the Paddy Tax, a reform which was introduced at the instigation of the Cobden Club, but which the writer anticipates will have most disastrous results. He maintains that the removal of this tax has been misrepresented to financial reformers in this country, and points out that it has already brought about a protective policy whereby middlemen are enriched at the expense of the poorer classes in a manner totally opposed to the fundamental tenets of the Cobden Club. From the figures given by Mr. Ferguson it appears that while about £400,000 are spent on intoxicating drink in Ceylon the cost of education only amounts to £230,000; but he looks hopefully forward to the time when these figures will be reversed. According to the last census the total population was 3,007,789, but of these only 599,554 of all ages could read or write. The industries of Ceylon have been recently undergoing much alteration. Tea-planting has now become a most important occupation, and the cultivation of coffee, cocoa, cinchona, and spices forms a very valuable addition to the rice-growing which was once almost the only agricultural industry. Comparative tables of exports and imports show that Ceylon is recovering rapidly from the depression from

which it suffered severely a few years ago. The Handbook for the current year is a bulky volume of about 1,500 pages, and this shows in a very palpable manner the progress of Ceylon during the last half century. (Colombo, Ceylon: Messrs A. M. & J. Ferguson.)—*Dumdee Advertiser*, Jan. 18.

TEA GROWING IN AZORES:—WHERE NEXT?

The British public has of late years been well informed regarding the teas imported from the great producing districts in India, Ceylon, China, Java, Japan, etc., each of which puts forward the superior merits of its leaves to such an extent as to create confusion as to which cup really cheers the most. We were not prepared, however, to hear from Mr. William Jackson of Thorngrove* that this leafy crop is now being grown, harvested, and manipulated so near our own doors as at St. Michael in the Azores, but that this is so certified by Mr. Jackson's having received a chest of tea prepared by a complete set of machinery sent by him to a planter there some time ago. We learn that the tea has reached Thorngrove in the most perfect condition, having all the fine brisk "nose" it would have had when discharged from the drying machine, and this is no doubt due to the fact that it would take little more than a week to bring it from the factory in which it was made. The leaf might have been growing on the bushes not over a fortnight ago. We learn, however, that it must have been plucked from young bushes, and although beautifully made tea, it does not possess the strength and pungency of our colonial teas, but Mr. Jackson is of opinion that when the bushes mature, and a little more experience is gained in the tea-house, the teas will be very similar to the Ceylon growths. During a fortnight's holiday one might run down to the Azores, and, after a saunter through the tea gardens, pluck some nice oranges from the trees, and enjoy them as well as the "onp" in the shades of the sunny groves.—*Aberdeen Free Press*, Jan. 15.

BARK AND DRUG REPORT.

(From the Chemist and Druggist.)

London, Jan. 18.

ANNATTO appears to be very scarce in good quality, and bright seed sold an advance of about 40 per cent at today's auctions, three packages good Madras seed out of a parcel of 22 realising 6d per lb.

ARECA-NUTS.—The market is considerably over-supplied, and although the holders of most of the lots show today bought in their supplies at 20s per cwt. nominally, one firm sold 20 bags "without reserve" at a heavy decline, 1 parcel realising only 8s 6d to 8s 9d per cwt.

CINCHONA.—Next Tuesday's London cinchona auctions will be very small in extent, only 1,100 bales Ceylon, East Indian, and Java, and 85 bales African bark having been declared. At today's auctions very little South American bark was offered. Sixteen bales bold flat orange Calisaya bark, imported via Hamburg, are held at the rate of 1s 8d per lb. for sound quality; and two bales short stout mossy Guayaquil were withdrawn. The exports of cinchona from Guayaquil (Ecuador) in 1892 were 21,282 kilos, valued at 7,290 sucres. From Tacna-Arica (Peru) they were in the same year, 12,978 kilos, valued at 22,905 pesons.

COCA LEAVES.—A parcel of 13 bales recently imported from Pacasmayo (Peru), and showing a good green, rather thin and broken leaf, or Truxillo character, but deeper in colour, was bought in at 1s per lb.; only 7½d per lb. was bid for it. Tenpence is wanted. One bale not quite so good sold at 9d per lb. Another lot of 21 bales small green, but broken, Truxillo leaves could not find a buyer.

CUBEB.—There was a pretty heavy supply today, and the market is tending distinctly lower, although no actual sales were made at auction. For fair sited, slightly stalky, brown berries (out of a parcel of 70 bags) 45s per cwt. was offered, but the broker would not sell below 37s 6d per cwt. Other lots, aggregating about 70 bags, were bought in at figures ranging from 52s to 70s per cwt.;

* Mr. Jackson of Tea Roller fame, of course.—Ed. T.A.

50s per cwt. would be taken for fair brown berries, slightly stalky, from Singapore.

KOLA.—Firmly held at 1s to 1s 2d per lb. for good bright West Indian. Only one bag from Grenada sold today at 1s per lb.

BLOOMFIELD FACTORY, MASKELIYA.

We learn now that Bloomfield main factory building caught fire in the roof about 2 p.m. on Thursday (Feb. 8th) and all woodwork of building and machinery was almost completely consumed. There was not much tea in the factory fortunately, as a dispatch had just been made, and the Brunswick factory is the one principally used by the Company. It is not expected that the loss is likely to be over Rs,000 and this is fully covered in the Hongkong office.

PLANTING LAND IN THE UPPER VALLEYS OF THE AMAZON:

PERU AND PLANTATION COLONIES.

The magnificent lands in the upper valleys of Amazon, selected by Commissioners from Ceylon, have not as yet been turned to much account—judging from the last report of Mr. Robb, the planter in charge of the incipient colony, which had been kindly placed at our disposal and which we append. There are various reasons for this backwardness. In the first place the Peruvian Corporation has to get its mind disabused of the idea that Europeans can successfully colonise and labour on these purely tropical lands. This experience is now in course of being gradually, if somewhat painfully, acquired at no small cost to the shareholders, and in another year we may expect to hear of the suggestions of the Commissioners as regards the importing of Chinese labour being fully adopted. These recommendations were, we have reason to believe, so decided and strongly enforced, that this portion of the original Report had to be modified to suit the palates of the Board. As in a good many more countries, there is an ignorant, selfish antipathy to the frugal, industrious Chinaman in South America.

Some time ago we read in the Government organ of Peru that:—"The Chinese would be absolutely useless, quite unadapted for field labour (!)—their work would never give to our failing agriculture the help it really required. Our populations in the course of time would gradually assimilate itself to the repugnant Asiatic without our agriculture obtaining any benefit. We would fill up the country with a multitude of corrupt men who would mix with our lower orders and produce a degraded progeny. Lima would soon be desolated by plagues introduced by these filthy creatures. They might ultimately swamp us, our Government and institutions, &c." Precious institutions indeed, which at present only afford scope for the development of political cheap-jacks, representing the acme of all ineptitude; and precious self-government, under which they only breathe freely who have nothing to lose! A country in which every honest man is in danger, and where the privileged jobbers themselves tremble for their dignity and their life, is the description of Peru as it is, which has reached us.

This brings us to the most serious desideratum in Peru, which must be overcome before it can ever prove a paradise for the planter. Here, there is no question of lack of energy in the Corporation, or lack of money, much less lack of faith in soil or climate; but a too well-founded

distrust of the *bona fides* of the wretched Government in Lima. Already they have broken faith over and over again with the Corporation, who only three years ago saved the country from absolute bankruptcy, repudiating engagements deliberately entered upon and declining to give up securities legally mortgaged. There is in short, no security for property or life in such a country and, as the Incas long ago found out, but little inducement for industry where the Spaniard reigns supreme. The land may be more inexhaustible than anything we can point to in Ceylon,—the vegetation more luxuriant than on the richest deltas of India— and we may send over trained experts and introduce supplies of the most competent tropical labourers in the world; but until something like righteousness rule over this long-benighted land, all agricultural enterprises must prove futile. Nevertheless, the experiment is useful, and Mr. Robbs' Report very interesting, though the confirmation of previous reports as to the capabilities of the land, is nothing more than we would have expected.

Doubtless, the day will yet come, when this, the largest reserve of tropical forest on the globe will be seriously encroached upon; and, when pushed to it, the resources of civilization will be sufficient to solve the difficulty; but meanwhile, the utmost we expect from the present effort, is only the production of a few encouraging samples, which may be necessary in order to convince the sceptical investor, and prepare the way for future operations. Mr. Robbs' Report as follows, is addressed to Mr. Mackenzie whom he has since succeeded as chief of the new Colony:—

COLONIZATION DEPARTMENT.

The Peruvian Corporation, Limited, 27th July, 1938.
R. F. Mackenzie, Esq., Perené.

Dear Sir,—I herewith beg to hand you my Report on the Colonization, Lands, Prospects, etc., for the year ending 30th June.

"COLONIZATION."—I very much regret to say that during the past year not so much progress has been made by the Colonists as we could have wished. Some have done fairly well, and have now got a good footing on their lands, with nice crops of maize, gucca, beans, vegetables, etc., and with a little ground cleared for planting coffee at the end of the year, and I think it but fair to especially mention the Colonists around Metraró and Denville, as being the most industrious. Others have not done well, and have been the cause of much trouble and expense. A few have abandoned their chacras and left this part of the country, and some who remain will, I am afraid, never be successful. The cause of this can without doubt be attributed to the most undesirable class of Colonists introduced, such as runaway sailors and adventurers of every description, who arrived in the colony absolutely destitute, and without responsibility of any kind. It cannot be expected that such men will ever make successful Colonists. Their wandering habits never allow them to remain long in a place, and work of any description is distasteful to them. A single man without means, let him be ever so good and anxious to do well, can never make any real progress or be a successful Colonist. In the first place, he has to cook his food and attend to his house, which occupies a good part of his time, and, on the other hand, he cannot cultivate with any chance of success, more than about three acres of land, the produce of which would barely keep him alive, far less enable him to repay his debts.

If successful Colonists are to be established on the lands, they will have to be selected from a very different class than heretofore, and as a rule families only, with a little means of their own. With the kind assistance given by the Corporation they would, in a few years, form a home and reap the benefit of

their labours. I am very sorry to say that French and Italian Colonists appear to lack that steady perseverance shown by the more Northern races, and it is from the latter class I would recommend the trial of a few families. It would be far more satisfactory to have, say a dozen good families with means of doing well, than a host of greedy avaricious adventurers, whose whole aim is to get what they can out of the Corporation without doing anything in return.

The injudicious selection of lands has been the cause of much trouble and Colonists leaving;* and it is a matter of regret that more care was not taken by the representatives of the Corporation, who settled them. A number located at Punisaa, above San Luis, had no possible means of getting out their crops, and in consequence have lost heart and left. Others have been settled on sand-beds swarming with ants and other destructive insects, and cannot be expected to remain contented. These people have since been removed to better lands, and no doubt they will now do well. It would be to the interest of the Corporation to seriously consider the introduction of colonists with means, as they would not only be the backbone of the Colony, but would act as a stimulus to others. There are undoubtedly good men at home, who would be only too glad to know of this territory, and its capabilities, and with such Colonists, a very different result would be obtained.

LANDS.—The lands around Perené are not of a desirable nature, and are unfit for anything further than light crops, such as maize, rice, etc., but a few miles down the River I have found excellent lands, suitable for tropical cultivation of any kind. In most instances I found the lay of the hills so steep that cultivation was out of the question, but, on the other hand, I also found valleys and slopes that would be hard to surpass in any part of the world, and it is in such localities that we can look for success. There is a great variety of soil, and for the most part extremely rich. In many places I find a rich dark loam with a rocky, gravelly bottom, and in other places it inclines to a sandy clay. I would especially mention the valley of the Yuravaki, as an exceptionally good site, both as regards lay of land and suitability of soil, but undoubtedly there will be other parts equally good when opened up. Along the banks of the River several valuable claims are to be found, extending for hundreds of acres, and for sugar-cane or rice culture would be very profitable.

CULTIVATION.—It has never been my lot to live in a country where the necessities of life can be so easily grown, and a Colonist with a little foresight can soon furnish nearly all he requires for his table from his own estate. Maize, rice, vegetables, fruits, etc., all grow freely and with little or no trouble. Oranges, lemons, and citrons, also grow in abundance, and with a little trouble orchards could be laid out and any quantity of fruit grown for canning purposes. European fruits could in many places be planted and grown with success, and I hope the day is not far off when I may be able to introduce them. Coffee, cocoa, coca and rice will, I believe, form the principal products of the Colony, and with judicious management rich harvests should be reaped. The climate here is especially adapted to the cultivation of coffee, which bears enormous crops without any trouble and very little expense. Tea would, I believe, grow luxuriantly on the slopes, and is well worthy of a trial, although on account of the scarcity of labour it would never become a general industry, as it requires too much manipulation. There are numerous other products found which are of immense value in the European markets, and when things are a little advanced I shall have time to look into the matter and report to you more fully on the subject. As in every country we have pests, and here ants are our greatest. To certain crops they do considerable damage, but

* This refers to a few Colonists settled by advice of Senor Delgado, the Peruvian Minister of Agriculture.

if the land is well selected they can, with a little trouble and care, be so kept down that the damage done is trifling.

TIMBER.—With an outlet towards the Atlantic, the timber on the territory would become a source of great income. On walking through the forest I encountered immense trees of cedar, mahogany, walnut, and rosewood, some walnut trees near Metraró would give boards of about 15 to 18 inches wide, but with the present means of conveyance could not be exported. There must be a sufficient number of valuable trees growing within reasonable distance of the Perene, and its tributaries, to make lumbering an industry of great importance. Numerous other kinds of various qualities are found very suitable for boarding and general building purposes.

"NURSERIES."—I have now got about 10 acres of land cleared and ground will soon be got ready for seeds of all kinds. At present I have coffee seeds sown, which should give about 80,000 plants, and with the extra seeds to be sown shortly will enable me to supply all demands for this season. A small bed of Huanaco coffee seeds sown last autumn have done exceptionally well, and I hope to be able to have the seedlings planted out for seeding purposes as soon as the rains commence. The introduction of blue mountain coffee seeds would be of the greatest benefit, and could be set apart and grown to supply seeds for Colonists. A little later on I may be able to collect plants and seeds and make an exchange with the authorities of the Botanic Gardens, Jamaica.

DENTVILLE.—Not much can be said about this little town in the meantime, but I have every confidence in saying that it will rise to be a very important place, as well as a very pretty one. Although it lies rather low and is enclosed by an amphitheatre of hills, a strong breeze blows up the valley of the Perene, and makes the temperature nice and bracing. During the rainy season, a little trouble was caused by malaria, due no doubt to the dampness and thick forest around, but I am of opinion that this will disappear as it is opened out. Besides the Indians' houses, I have erected two new ones which will suffice for the housing of the present population. The Plaza, or Square, is now marked off, cleaned and ready for buildings, and in due time the ground will be laid out with the necessary walks and beds. Along the river bank, for about 2 miles, a splendid drive or walk can be laid down with very little expense, as the place abounds with palms and other ornamental trees, and I hope in due time to take this in hand.

ROADS AND BRIDGES.—In spite of the great difficulties to be contended with, I have great pleasure in saying that this important work is being carried on quickly. It is of the utmost importance to the rapid development of the Colony that special time and money be devoted to this great task, as without means of conveyance into the interior we can never expect to make any marked headway. The road that is being constructed between Perene and Dentville is an excellent one, and when completed will be of the greatest importance to the Colony. Not only will it be a great highway into the interior, but vast tracts of valuable lands on both sides of it can be colonized. The river communication is only open for a few months in the year, and no dependence can be put on the Indians for supplies or taking away produce. They dislike hard work of any kind, and having their own little affairs to attend to no reliance can be placed on their services; also I may add, that the navigation of the river to Dentville is so dangerous that balsas with cargo run a great risk of getting upset on the journey down. The bridges are also being pushed on, and in about two months I expect to see the bridge over the Paucartambo completed.

"PROSPECTS."—From an agricultural point of view the prospects of the Colony are very encouraging, and the Colonist, notwithstanding the difficulties of establishing himself, will find his labours amply rewarded. The man who is afraid of hard work need never come here, as an idler cannot get on in this country. To men with a little capital this territory

presents a field unsurpassed in any part of the world, and with roads a little more advanced hundreds of colonists can be settled within easy reach of the markets. Every kind of produce sells readily, as the demand far exceeds the supply. In concluding I would add that all that is required to make this a great Colony is the emigration of Colonists with a little means to give them an interest in their estates.

I remain, dear sir, yours faithfully,
(Signed) JAS. ROBB.

P.S.—I omitted to say under the heading of "Nurseries" that one crop of rice and two crops of maize were raised at Dentville, as an experiment, with complete success. In my next report I shall be able to deal more fully with these matters.—J.R.

"WHAT THE ANALYTICAL CHEMIST CAN DO FOR THE TEA PLANTERS."

In the hope that the Planters' Association at their approaching meeting may refer the whole subject of Scientific aid for the Planter to a Sub-Committee for Report, we would call attention to another Department in which good service could be rendered. The ANALYTICAL CHEMIST can always furnish useful and valuable information by the examination of a Soil, and that without having recourse to very elaborate and expensive analyses. The more valuable, as well as the less valuable constituents of a soil are drawn from two sources, viz. the atmosphere, and the purely mineral part of the earth. The virgin forest has for ages been assimilating and accumulating in the soil the wealth derivable from the atmosphere. By a simple determination of the amount of nitrogen in a sample of unmanured soil, the analyst can reckon up this accumulated capital. In like manner, by a determination of the phosphoric acid in a soil, the analyst obtains an excellent index of the mineral resources of the land from an agri-horticultural point of view. No one should purchase land from which the forest has been cleared, without getting a report on the contents of the land, so far as the nitrogen and phosphoric acid are concerned; but even a nitrogen determination only, is a valuable test of the fertility of a soil. A high percentage of nitrogen is the record left by long existing luxuriant forest, and such forest could not have existed without a sufficiency of mineral plant food as well.

To illustrate further the value of a nitrogen determination in samples of soil—suppose we have two soils equally favoured in other respect but one containing only .1 per cent of nitrogen, while the other contains .2 per cent, the latter has additional capital in the form of nitrogen, which may be understood by the consideration that nitrogenous matter equal to about 17 tons per acre of castor-cake of 6 per cent nitrogen would require to be incorporated with the soil of the former land to bring the nitrogen up to the amount in the latter.

The services of an Analyst are also useful in determining the value of the Rainfall, and in all agricultural experiments in which it is necessary to record the character of the soil and composition of the manures employed. In connection with the purchase of Manures, the services of an analyst sooner or later become indispensable, wherever the manures of commerce come to be largely used.

We may illustrate, e.g., the use of analysis in the purchase of such an excellent manure as castor-cake. The best quality contains about 7.7 per cent of nitrogen; but most of what is sold contains less; a great deal of it only contains 6 per cent and under. If these two quali-

ties are bought and sold at the same price, either the merchant or the planter throws away money, as the difference in their agricultural value, when expressed in money, is fully R15 per ton. If such a manure is bought on analysis at so much per unit, this is at once evident. Suppose the value of the unit of nitrogen to be R9.20 we get as the value of the better quality $7.7 \times 9.20 = R70.84$ per ton and of the other quality $6 \times 9.20 = R55.20$ per ton.

Supposing these to be the respective values per ton in Colombo, many planters might prefer to purchase the cheaper article; but it would be really more economical to purchase the dearer when carriage to the estate has to be taken into account. In buying castor cake the planters' main object is to get a supply of nitrogen delivered* at the estate at the cheapest rate. Now a ton of the best quality of castor cake referred to contains fully as much nitrogen as a ton and a quarter of the other, and it has to be carried, say a hundred miles, at 12½ cents per ton per mile. The following shews the price of the same amount of nitrogen on the estate in the two cases:—

Cost of 1 ton best castor cake	...	R70.84
Carriage for a hundred miles	..	12.50
Total cost	...	R83.34
Cost of 1¼ tons castor cake	..	R70.84
Carriage for a hundred miles	..	15.63
Total cost	..	R86.47

It is manifest, then, that the effect of analysis is both to keep up the quality of manures offered for sale, and to adjust price to agricultural value.

After all that has been said about the need of watching and determining the proper degree of fermentation and watching other stages in the process of manufacture, we are surprised to have a good authority write to us:—"I do not see at present that the Chemist can be of any great use in the factory. All the processes at the factory are conducted with a view to bring out the best flavour of the tea, and in this the palate seems to be a better guide than chemical analysis. The tea manufacturer tastes the teas made daily, and he knows how the taste is affected by modifications in withering, fermenting and drying. Should it become an important question at any time to try to increase or to diminish any of the natural constituents of the tea, then tea analyses would become indispensable." This may, however, be the very point of importance even now, and, therefore, there is surely room for a series of chemical experiments in the Tea Factory which might yield results of considerable importance to the practical teamaker. In this, we believe, Mr. Rutherford quite agreed.

OUT OF EMPLOYMENT.

SLACKNESS IN PLUMBAGO AND DESICCATED COCONUT INDUSTRIES; HOW CRIME IS INCREASED.
(From a Correspondent.)

A large number of men have been thrown out of employment in consequence of the stoppage in most localities of plumbago digging and the closing of some desiccating mills. The price of plumbago has gone down fearfully and the smaller proprietors

* Castor cake which is richest in nitrogen is also richest in phosphoric acid and potash. Castor cake containing 7.7 per cent of nitrogen was found to contain also no less than 4 per cent of phosphoric acid.

who work their pits on "advances," have decided to stop work waiting for better prices. A few of the larger proprietors, however, are working their pits and have a large quantity of plumbago in their stores. It is amusing to hear these men speak of the "coming war" which is destined to send up the price of plumbago to a height never before reached. Whether the "corners" created in consequence will in the end benefit them or otherwise, it is difficult to see. Corners certainly are the most dangerous of things and may make havoc in quarters least expected. In the case of desiccated coconuts overproduction is certainly the cause of the stoppage of demand. There was an unheard-of rush for this manufacture and the supply has exceeded the demand. The fibre industry is also being rushed. Mr. Harrison, late of the Police, opened a manufactory at Wattala, about four miles from Colombo, and now one sees mills put up in every direction. Mr. Harrison's experience has to be noted. Wattala and the villages about were infested by the most dangerous characters. The Ragama gang after the murder of the famous Ragama Mudaliyar were broken up and scattered themselves in the villages. There they carried on cattle stealing, gambling, high-way robbery and all sorts of crimes. The headmen were powerless to act. Mr. Harrison employed all these thieves in his mills, giving them a good day's pay for a good day's work. He had some difficulty at first but eventually succeeded and at the present moment cattle-stealing is a thing unheard of thereabouts. Unfortunately the closing of the plumbago pits has let loose in the villages a lot of desperate characters. It is no secret that many a man "wanted" is in some one of the pits and prefers the rough work and comparative freedom there to the penal diet in Welikada. These men thrown out of employment have gone back to the villages and are doing a deal of mischief. There is no doubt that the boutique looting at Mirigama was planned and carried out by these men.

CACAO CULTIVATION.

WATTEGAMA, Feb. 15.—Thanks for the very useful Almanac. One is struck with its monopoly of space by the tea enterprise. Some day let us hope cacao will be a more prominent feature than at present! Too much of this very unpleasant wind prevailing here, 0-85 in. rain is all we have had, on one day, since 22nd ult., when we had 5 in. on the evening of 21st and morning of 22nd—a record for 24 hours in this district for past 8 years!

Can you get us particulars from various countries of total imports of cocoa into England in 1893 and the world's production! "Financial Reform Almanac for 1893" gives:—1891—total 192,813 cwt. retained for home consumption and 279.08 cwt. total imports. [When our "F. R. Almanac" for 1894 arrives, we can give later information, and the figures for 1893 perhaps from the *Economist* about the end of March. The nearest approximation to the World's Production and Consumption we give in our "Hand-book," page 176j; but we find a big slip here as regards the United Kingdom in estimating 100,000 cwt. in place of 200,000 cwt., for consumption, although on page 607 we gave the detailed table our correspondent refers to. We shall be on the lookout for later information.—Ed. T.A.]

A NEW BOOK ON COFFEE.—We shortly hope to have the pleasure of reviewing Mr. Robert Elliot's new book on "Gold, Sport and Coffee Planting," which will, we understand, be for sale at Messrs. Higginbotham's. Among other subjects of general interest to planters, Mr. Elliot has gone to the pains of collecting a mass of practical information dealing on the manuring of coffee in Mysore.—*South of India Observer*.

Correspondence.

To the Editor.

"MILK TREES" AND A RECENT ARTICLE.

London, Jan. 19.

SIR,—With reference to D. Trimen's letter in your issue of Dec. 1st., I would point out that he will find a description of *Clusia galactodendron* on page 301 of the "Treasury of Botany" (1876 edition). The plant belongs to the Order *Guttifera* and does not appear to be identical with *Brosimum galactodendron* which is described on p. 171 of the same work, and which as he says belongs to the jak tree family. *Brosimum galactodendron* or at least the juice of same contains a large proportion of resinous matter, and possibly in cases of dysentery it would prove as equally efficacious as that of *Clusia galactodendron*.—Yours truly,

THE WRITER OF THE ARTICLE ON "MILK TREES" IN "CHAMBER'S JOURNAL."

[We thought it best at once to refer the above to the learned Director of our Botanical Gardens and here is his reply:—

Clusia Galactodendron, Desv.—I am obliged to your correspondent for pointing out that this name is given in that useful and generally accurate book, the "Treasury of Botany." But it is not maintained by botanists; and Plombon and Frisana, the monographers of the Order *Guttifera*, say that, judging from Desvaux's description and figure published in 1840 (which is absolutely all that is known about it) the plant probably does not belong to that family at all. This was written in 1860, and unless there have been some further independent observations elucidating the plant, that is the state of things with regard to it. Desvaux's plant was not a *Clusia*, and there is not evidence to show what it was.—HENRY TRIMEN.—ED. T.A.

LIBERIAN COFFEE, &c.

Upcountry, Jan. 27.

SIR,—Since the failure of the Coffee Enterprise, Ceylon has certainly recovered from its ill effects, but only yet partially, and it is still after all a poor place. Tea cultivation has done its best for her. Extended cultivation of this product cannot do very much more. In fact, it may do less good and possibly harm, unless the so-called minor products meets with more support. Cacao has at last now been properly recognised as an assured product, and its successful cultivation on land, other than those "level as a table," is daily being proved, and there is very much more land suited than people imagine. As a by-product it ought to be grown on many a tea estate where the soil and climate, etc., is suitable. The product, however, now drawing increased attention in a quiet way, is Liberian coffee and that notwithstanding its liability to attacks of leaf-disease.

When this variety was introduced into the Island, the disease had already done its work for the Arabian variety. Financial failures, especially of banks dealing with constituents in this Island, the fall in the price of Arabian coffee and the continuation of low prices of coffee for several years tended to make speculators very loth to venture in the cultivation of Liberian coffee. The first and early cultivation of this product was certainly not encouraging. An average local price then of R4 to R4.50 per bushel at most only covered expenses. The present prices, still rising,

leaves a considerable margin as profit. The Indian and local market readily take up all now procurable at these rates, and certainly a million bushels will not meet the demand even at the enhanced rates and when the cultivation expands with very much less effect and expense, the product will find its way to America (United States) where it is in much demand. There is much land now being planted with cacao and interplanted with tea. Much better if Liberian coffee is interplanted in most of these. Of course, the mistake of distant planting, &c., &c., should be avoided. As much crop per acre can be got from this coffee as from coffee Arabica if properly attended to. As to the cleaning difficulty, there is really none if the fruit is picked when thoroughly ripe, and before it begins to dry. Tea-pickers are taught to pick the right leaf, and with a little care this coffee can be picked at the right stage. For a special pulper Messrs. Walker & Sons will readily turn out one. The habit of this plant is to throw up several suckers, almost a month or two after planting. Do not pick off all. One or two at least should be allowed to grow, and all topping must be at 5½ to 6 feet. The Liberian is a "slower" plant than the Arabian. Give it time. Manure if the soil is poor. Handle fairly. Pruning is rarely needed. In picking leave the fruit stems. Pick clean. Exceptional trees have given a bushel and half of cherry, that is to say, seven to thirteen measures of parchment, but a measure per tree is enough and pays well. If you see the fungus, whistle, and if you can spare the labour remove badly diseased leaves, and don't lose heart. In 1878 I wrote that Arabian coffee will in ten years be so affected by the disease, that the yield will be brought down to a one sixth. The yield by that time was even less. Liberian coffee will last its twenty years and more, and the price is unlikely to fall, much less than R8 per bushel, in the Island. Borneo, the Straits Settlements, Madagascar and other places are finding their way to make this product pay. Let old Ceylon do its best, with its cheap labor, good roads, and many, many other facilities, and I defy any of the other young colonies to compete with her. When 100,000 acres are opened there will be a marvellous change in the financial prospect of the Island—a change that would have occurred earlier if "wait-a-bit-Jim" did not rule the Island. The natives will not plant tea largely, and will not be trained to benefit by it; but Liberian coffee as with cacao now they will plant if the Government takes and adopt proper measures.

Cotton cultivation would never suit them. If the natives and European planters only grow coffee enough to bring into the Island R2,500,000 only, a large bulk of it would remain for circulation here, and the Island will substantially benefit by it as it did when Arabian coffee thrived. By this I mean civil servants, merchants and their employees (countless), petty traders, bankers, shopkeepers and Government railway too, and not non-resident European capitalists. Then Ceylon will be what it was, and not what it is now, still straggling, and no capital of its own worth mentioning, having really for its stay at home capital as much as an ordinary American millionaire can boast of. WAKE UP.

GRASS FOR MILK COWS; FOOD FOR PIGS; CRYSTALLIZING FRUIT.

DEAR SIR,—Will you kindly inform me in your columns what kind of grass is best to grow in dry places for Milk Cows. Mauritius only thrives in

ravines or where there is plenty of rain; in the hot dry months experienced in Uva, this kind does not thrive except in ravines. I have heard of some Australian grass, but forget the name. Guinea grass is not thought to be good for milch cows. Any hints as to the best mode of keeping cattle in good condition and securing good rich milk, will much oblige.

Also about Pigs; what is the best food for them, both green and dry? What is the most hardy breed? As a constant reader of the *Tropical Agriculturist*, I have already received much valuable information from it.

As regards Fruit, has anyone ever tried crystallizing it in Ceylon; would the climate at 5,000 feet even be against it? What is the process of crystallizing?

—Yours faithfully,
AGRICULTURIST.
[We have been favoured with the following opinions from a good authority on some of the questions asked:—

"In my opinion there is no better grass than *Paspalum conjugatum* for the elevation and locality of your correspondent. It is a native of Brazil and West Indies but has become naturalized in many places in Ceylon. It grows well on even poor patana and cattle eat it greedily. It stands drought well and spreads rapidly.

"*Bromus Schraderi*.—Prairie grass is another excellent grass for an elevation of 5,000 ft. but it requires good land and good cultivation under which conditions it stands drought well. Seeds of this can be obtained of any nurseryman either in Australia or England. Seeds of the *Paspalum* I believe can be obtained from the Royal Gardens, Peradeniya or no doubt roots could be got from any upcountry planter who has established it, or in limited quantities from the Hakgalla Gardens. I know of one planter who got 2,000 roots about three years ago who has now enough to plant 10 or 12, or even more acres.

"I am surprised to learn that Guinea grass is not considered good for milch cows. My experience of it in the West Indies is that it is excellent, but 5,000 ft. elevation in Ceylon is rather too high for it to thrive except on very good land.

"With regard to pigs I don't think there is any better than the Berkshire for this climate and there is nothing better than boiled Indian corn and rice for fattening them. For store pigs any garden refuse such as cabbage leaves, potato peelings, turnip top to be chopped up and boiled and mixed with a little coconut ponnac will be found to suit them and keep them in good condition."

Who can tell us about the "crystallizing of fruit" in Ceylon? There is no reason why an industry should not be established.—Ed T.A.]

LOW PRICES AND INCREASED SUPPLY.

Upcountry, Jan. 29.

DEAR SIR,—If you have not seen the following extract from the "Scramble for Gold" in the *Nineteenth Century* for Jan., it may be of interest to me, it appears, to represent our position, exactly, with regard to tea:—

"The tendency of lower prices in many if not in most cases is to increase supply rather than to diminish it, because of the efforts producers made to cheapen production by going into it on a larger scale."
AN OLD COFFEE STUMP.

BLENDED TEA IN BOND.

DEAR SIR,—In the *Ceylon Observer* of December 7th I read with interest an article on the above subject, and very much hope the Planters' Association will not be led away with what sounds a very tempting offer on the part of Mr. Lipton's agent—that Mr. Lipton has decided to push Ceylon tea in Australia. Knowing the blends Mr. Lipton sells in England and Ireland I hope the day will never come when Mr. Lipton can print on these packets—Packed in Ceylon."

In the event of not being allowed to blend in bond. Mr. Lipton threatens to send out from London to Australia some of his Blends, some of which are said to contain a *certain portion* of China. (Yes—I am very certain some of them do contain a *certain portion*.) By the time Mr. Lipton pays freight from China to London and back to Australia. I am afraid he won't find himself in a good position to compete with firm on the spot who import direct from China and Ceylon and put up Ceylon tea with a *certain portion* of China in packets, and strange to say some of the firms in Australia sell this mixture as a Ceylon Blend; others even go so far as to sell it as pure Ceylon tea. It is a great mistake to think London firms are the only firms who know how to take the public in.
R. V. WEBSTER.

[Mr. Webster can scarcely be said to be a disinterested party, and he is ignorant of the fact that the choice of a depôt for Mr. Lipton's blending business for Australia and the East, lies between Colombo and Calcutta.—Ed. T.A.]

THE TEA ENTERPRISE IN CEYLON—ITS DIFFICULTIES AND DANGERS—AND SCIENTIFIC EXPERTS.

Peradeniya, Feb. 1.

DEAR SIR,—Your leader of yesterday on the subject of Tea and its Enemies is a most cheering sign of the shrewd eye some at least of the many engaged "in Tea" have to possibilities of improvement. It is because I believe the planters are men of enterprise that I write to heartily endorse your suggestion of bringing expert opinion to bear on the many difficulties and dangers which beset "Tea."

In England this principle has been steadily ignored, except by brewers and perhaps a few others, with the result that Continental nations, especially Germany, can now vie or more than vie with England in many manufactures.

The ignorant may imagine that the "trade mark" "made in Germany" is only indicative of highly coloured prints or loosely-jointed tin British soldiers; but to all workers and students in Chemical or Physical Laboratories—in short to all whose task it is to *conduct exact and careful experiments*—the error of that belief is only too well known. England has produced many brilliant chemists: Priestley, Davy, Faraday; yet it cannot make their tools, neither apparatus nor pure chemicals. It has reared Botanists and Zoologists of first rank: Darwin, Owen, Huxley, yet it must send to Germany for their microscopes. Instance might be piled on instance; but enough has been said to show that in those operations requiring particular skill Germany is gradually forging ahead. The reasons are doubtless many, and first in the opinion of one who has lived among the Germans and likes them, is the national character of steady application to the matter in hand; but by no means least among the many reasons is the attention to details, both in their own and as those who have worked in their research laboratories sometimes find, their neighbour's method and subject of work. As a result of this in the Fatherland every modern manufactory has for its analyst a very well-trained and often brilliant scientist—in England little boys of 12 or 14 are often employed in large factories because "they only have to add one liquid to another till 2 colours—those of the resulting liquid and of a standard solution—are identical." No wonder aniline dyes are now all but entirely made in Germany!

England is to be pitied rather than blamed—she became involved in the run-down of science 80 years ago and to her own surprise—and often incredulity—produced scientists of world-wide and world-long reputation; but her rank and file had

not even the merit of being well drilled. The "Science fever" was upon the land and youngersons, the human debris of the professions, declared themselves scientists and too often obtained responsible posts. The 'confidence trick' cannot be played often on the same person, least on that of an English Company. Their corporate argument was "this man is a failure. So is science applied to arts." "Let us stick to our fetish empiricism." They did so; but Germany's fetish in the meantime was, 'technical schools.' So that now Goldsmith might reconstruct, could he live again, his famous lines to "trade's unfeeling train give up the land and reposses the swain."

The moral is obvious and one hopes more likely of adoption in Ceylon than at home. Science sharpens your trade tools—it is like Touchstone, the whet-stone of the wits. Use this whet-stone or shall we say use it more. That this letter is written by one who has only been in the Colony a few months will not cause its rejection, that the mentor is what is usually called a man of science, will not discount the advice given, the writer having experienced Ceylon hospitality is emboldened to believe.—Yours, &c. K. W. T.

THE TEA ENTERPRISE AND SCIENTIFIC EXPERTS.

DEAR SIR,—There's a good deal of good sense in much that "F. W. K." urges in his letter to you; but his remarks are too general to do much good in such an absolutely non-scientific community as we find in Ceylon. He must say out more clearly and definitely what he would have us do? You, Mr. Editor, make some effort to do this in your separate paragraph, for there you enumerate Chemical, Entomological, and Botanical experts as necessary advisers for planters, presumably as residents in our midst; and to give you your due, Sir, you have done all you can towards helping the planters in these matters, as witness the valuable contributions of Mr. M. Cochran in the *Tropical Agriculturist*, and your persistent advocacy of employing the services of him and Mr. Hughess.

Now, being mentally troubled with a scientific twist myself, I am not likely to argue against the wisdom of bringing science to bear upon all our trades and occupations. I think this is done far more extensively in England than "F. W. K." would make out, or is perhaps aware of; still it is quite possible that Germany is forging ahead in advance of our manufacturers in such matters; but it would be interesting to hear what leading and experienced English manufacturers themselves have to say in the matter, and quite necessary to do so before being alarmed by such irresponsible wailings as those uttered by "F. W. K." We may let that pass, however. Let England look after herself. Germany is a poor country, and only by doing her best can she pay her way, and it will take her all her time and all she knows to keep pace with France and America. Of course, we feel her competition most in our Colonies, and it is perfectly sickening to see so many articles marked "made in Germany." It will take a good many years to convince Englishmen that this is not the "Hall-mark" of rubbish, compared to what his own country produces; but let our manufacturers and our striking, domineering workmen look to it, and let us know why this is thus. Look, too, at the vile mud from the Seine and the Po forced upon us in the name of "butter," not a particle of which ever saw the cow, while Ireland wastes her energies in senseless and worse than

useless patriotism, and New Zealand and Australia look calmly on—either of which countries could keep us supplied, at less cost, with the wholesome product of the cow. I wonder if this tinned clarified mud is also imported into Australia itself? I remember years ago, before such preparations were known being always able to buy the most delicious Irish salt butter in kegs: where is it now? Importers greedy of gain have forced this vile substitute upon us.

But to the point: suppose every District Association had possessed its own Chemist, Entomologist and Botanist in 1867, would that have stayed the ravages of *Hemiteia vastatrix*, or delayed the fate of coffee for one single day? Well, Sir, leaving this question for you to answer also, let us imagine these three experts already appointed, established and at work in our midst, what would they find to do? Take the Chemist:—is not Mr. Cochran at hand to analyse any soil or manure, any planter might desire to have? Of course he would have to pry a good fee, but would the official chemist work for us all for nothing? His life would be pretty burthensome in that case, and who would decide whose turn should come first? Or setting Mr. Cochran aside, is England now so far off and the "Sample Post" so expensive, that any planter who likes, or the Planters' Association compulsorily on their behalf, cannot get their analyses done far cheaper and better at home? But, perhaps, the official Chemist would go about the country preaching and teaching. What?—Now, take the Entomologist. Does not Dr. Trimen in his communication to the *Observer* of 2nd Feb. (see page 589) to which I have already referred, give the best answer to like questions concerning this expert? "Everybody knows that plants are the natural food of insects," he says, "and the home of innumerable fungi, and must be aware that only in a few obvious cases, as when extremely abundant, any damage is done worth mentioning." And he also remarks:—"Sending every insect or fungus they may chance to find already amounts to an absurdity." What would the poor official Entomologist's life be worth if he were compelled (and if not compelled I see no use for him) to examine and report upon every mortal insect sent to him? Else how would he work? Then as regards the Botanist, what would his hands find to do that Dr. Trimen does not do, or is not ready to do for us?

Well, all this reads very much like cold water and discouragement; but I mean that only in depreciation of too hasty action. Let our political "Planters' Association" turn their attention for once to Scientific Agriculture. Perhaps some of us outsiders, who now hold aloof would then join them. Let this Association of planters as such—not as sucking politicians striving to qualify themselves for the Legislative Council)—assisted by the advice of the scientists already named: (Trimen, Cochran, Green, Armitage, &c.) first formulate a scheme, definitely setting forth *what it is we want, and what we expect each of the experts named to do*; for if these experts be appointed—however they may be paid, before this essential first step is taken and is well considered and defined, only a ridiculous *fiasco* would result. As you know, Sir, Science is almost my religion, and it is to keep it from being made absurd that I thus seek to restrain action that is aimless and chaotic, until formulated and made clear. It is those men who know least about Science (amongst whom in these three departments I am one of the most ignorant) who expect most and demand that "experts" should be infallible.

TENTACLE.

AN ENEMY OF THE GREVILLEA OR SILKY OAK OF AUSTRALIA.

DEAR SIR,—By this post I am sending a tin box containing caterpillars with nests and eggs which I have found feeding on (*Grevillea*) silky oak leaves growing on an old nursery. I suppose they are somewhat akin to our old acquaintance the *cinchona* caterpillar, at least they work in the same fashion. Perhaps when Mr. *Cinchona* Poochie retired from want of employment, these took over the working rights and goodwill of the business. I should be glad to hear if they are common as they seem to be pretty destructive. Thanking you in anticipation.—Yours faithfully,
M.

[Mr. A. P. Green thinks the caterpillar is of a common moth, but he is waiting for development in order to identify it properly.—Ed. T.A.]

NORTH BORNEO NEWS.

Kandy, Feb. 3.

DEAR SIR,—The *British North Borneo Herald* for January is interesting reading, and the following extracts will show your readers that Tropical Agriculture is looking up in "New Ceylon":—

TOBACCO: A COMPARISON.

It may be interesting to our readers to note the annexed comparative statement of the first seven years of the tobacco industry in Sumatra, and British North Borneo. A perusal will show that so far Borneo has no cause for self depreciation at her elder rival's expense.

Comparative statement of imports of fine leaf tobacco into Holland from Sumatra and Borneo for 7 years. The totals are:—

Sumatra crop:—1864 to 1870: crop 9,770 bales equal 1,764,000 guilders.

Borneo crop 1886 to 1893: 35,796 bales equal 4,514,500 guilders.

The prospects for 1894 on all the estates are better than they have ever yet been, and are so not only as to quality but in some instances as to quantity also.

COFFEE.—A great advance has been made during the year just past in the cultivation of Liberian coffee. Mr. W. B. Pryer, the energetic Manager of the various estates of the Borneo Development Corporation, has now about 280 acres in an advanced state showing great promise of big crops by the end of the year. It is barely two years since the jungle was felled for this planting, and the condition of the trees bear eloquent testimony to the grand capabilities of the soil of North Borneo for this product. In Marudu Bay the Tertipan estate, under the management of Mr. T. Johnstone, late of the Segalind river, Sandakan Bay, goes hand in hand with the successful results achieved on the Byte Estate. Mr. W. E. Roberts of the Trading and Planting Company has also a nice compact and flourishing area laid out in Liberian coffee on the Segalind river.

A South American Chinaman came on to the Byte the other day. He would not believe that the slashing plants up to 7 feet high with their large glossy dark green leaves were coffee at all, and would not be convinced until he had picked a cherry and seen the beans in it! "Why" he said "coffee with us never grows half this size and has little yellowish leaves" and he took up ten acres of forest and ordered 5,000 seedlings on the spot.

—Yours truly, W. D. GIBBON, Agent.

TEA PLANTATION NEAR COLOMBO: AN ENTERPRISING DUBASH.

Colombo, Feb. 19.

DEAR SIR,—We have the pleasure to inform you that some 7 months ago, our partner Mr.

C. G. Mathew, opened a tea estate in the village called Mampy—a place lying at a distance of 10 miles from Colombo and 5 miles from Moratuwa. We send you herewith a sample of 5 tea leaves plucked from the young plants about 5 months old and request very kindly to give your opinion of it in your valuable paper and oblige.—We are, dear sir, yours faithfully, For C. MATHEW & Co.

THOMAS PAUL.

P.S.—The name of the estate is "St. Mathew's estate."

[Nothing could be healthier or more promising for size than the tea leaves before us, and if they are taken from a clearing only five (?) months old, their growth is simply astonishing.—Ed. T.A.]

INSECT PESTS AND OUR ENTOMO- LOGIST.

Feb. 22.

DEAR SIR,—Now that the planters in Ceylon are asking for an entomologist the following extract from a memoir of the late Mr. J. Wood-Mason, who was Professor of Comparative Anatomy in the Medical College of Bengal, Fellow of the University College of Calcutta, President of the Microscopical Society of Calcutta, Vice President of the Asiatic Society of Bengal, Superintendent of the Indian Museum, etc., taken from the last report (1893) of the Trustees just received will be read with some interest. I send it to you in case you care to publish it.

If it has not already been published, it will I am sure, prove of service to planters if you reprint the late Mr. Mason's report in the *Tropical Agriculturist*. The report contains some references to Ceylon. The tea bug in Assam, according to Mr. Mason, "is so closely allied to a Ceylonese insect which was described and figured a quarter of a century ago by the French entomologist Sigroret, under the name of *Helopeltis Antonii*, as to have been considered by no less an authority than Professor Westwood to be only a variety of it."

"The tea-bug", says Mr. Mason, "belongs to the Indian-Malayan fauna, and extends in its distribution from North-Eastern and Southern India including Ceylon through the Philippines to Waigian and New Guinea."—Yours truly,

INTERESTED.

(Extract from memoir of Mr. Wood-Mason's Scientific Career printed in the Annual Report of the Trustees of the Indian Museum for 1893.)

In 1881 this study* had to be put aside for the time being, as the Government required a scientific officer to investigate the insect pests affecting the tea plant in Assam. Mr. Wood-Mason was not anxious to undertake this deputation, for he had no taste for the practical or economic side of the question, and he, no doubt, correctly anticipated that nothing short of a panacea capable of remedying all the ills from which the tea plant suffers would satisfy the expectations of those connected with the tea interests, while he must have foreseen that an investigation that had to deal with the subject *ab initio* was not likely to prove either final or conclusive, and that any measures he might suggest must, from the circumstances of the case, be in the nature of experiments. However, he was induced to undertake the deputation and his report of the results contains a very full and interesting description of the "Tea-mite and Tea-bug of Assam,"† with a synopsis of the opinions of the planters themselves on the various remedies that had been tried or suggested.

* Invertebrate fauna.

† A pamphlet of twenty pages!

VARIOUS AGRICULTURAL NOTES.

THE FLORIDA LEMON-CROP this year is estimated at between 25,000 and 50,000 boxes; and as the United States uses a million boxes of Sicily lemons annually it will be a long time before Florida has any lemons to spare for making essence of lemon. The freight on a box of lemons from Sicily to New York is 32c, and from Florida to New York 50c. Florida has produced about five million boxes of oranges this year.—*Chemist and Druggist.*

ORCHILA WEED.—This is a kind of weed called in Tamil *Marappasi*. It grows on trees. It has now become an article of trade. At present the trade in it is very brisk. It is sold in the markets in the different parts of the Peninsula. The price of the article ranges from four to six cents. It is being bought in large quantities from the villages and sent to Colombo whence it is transported to Europe where they extract a kind of dye used in colouring cloth.—*Cor. "Jaffia Catholic Guardian."*

TEA MANUFACTURE.—We call attention to an extract showing how Mr. Bamber treats the subject of manufacture in his new book. He gives several valuable hints, and advocates a low temperature for final firing, while he insists that sufficient attention is not given by teamakers and their coolies to the importance of having dry fuel for the drying machines. There is much in the book that ought to be read and duly weighed by all tea planters.

NORTH BORNEO ADVANCING.—Mr. Gibbon has later advices from British North Borneo to the effect, that all their revenue farms have been disposed of at much higher rates for 1894 than 1893, and that a representative of the Arensberg Co., one of the largest growers of tobacco in Sumatra, has visited North Borneo, and is so well satisfied with the crop of tobacco in 1893 that he has decided to open on a large scale a concession they own in the Kinabatangan in the Sandakan Province.

THE JADE INDUSTRY of Burma, owing to the increasing demand for the stone in China, has room for great expansion; at present it is monopolised by a Burman Chinaman, and the mines are worked in the most primitive method by Kachins. The country (Mogoung) is covered with dense jungle and very rough, and renders prospecting difficult. It only requires European experience and appliances to develop this industry, which the *Mandalay Herald* considers one of the most remunerative undertakings in Upper Burma.—*Pioneer.*

NEW PRODUCTS.—We regret to learn that Cocoa is in dull demand in the local market: R55 to R58 per cwt. for a product that has been as high as R90, is not encouraging; but we should think the depression is sure to be temporary. Cardamoms, on the other hand, are occasionally in brisk demand for the Indian market, Bombay especially; but R1.50 to R2—a good price locally at present—compares but poorly with the R10 per lb., which Ceylon cardamom growers got when they only sent a small quantity into the market.

SUCCESSFUL TEA COMPANIES.—The Yatederia Tea Company is certainly one of the most prosperous in Ceylon with its wonderful crop of 838 lb of tea per acre as an average yield for last year over 579 acres! No wonder though the fortunate shareholders were able to get dividends aggregating 30 per cent.—The Castlereagh Company just shows the contrast which must often be presented between tea on old coffee land and on virgin forestland: but still the modest dividend of this Dikoya Company (6 per cent.) is not to be sneered at and the shareholders may hope there is better time coming.

THE ENTOMOLOGIST.—There is no use in further foretelling what may be said at the meeting on the 17th Feb.; but we cannot help mentioning that Mr. E. Green is precisely the very man Dr. Trimen would like to see as Assistant Director of the Colombo Museum with special charge of the Insect Collection. It would be part of the duty of such an officer to examine into, and report upon, insects injurious to crops. But neither Dr. Trimen nor ourselves, of course, have any idea whether Mr. Green would be inclined, or be able, to take such a post, if Government were induced to offer it. Much would no doubt depend on the salary attached to it.

TEA SALES IN MINCING LANE.—Two alterations are said to be on the *tapis* in connection with these sales of importance to planters. First, it is proposed to increase the recognized size of "breaks" of tea. But we hope due notice of any approved change will be given to planters; because it must be rather hard to start a new rule at short notice to planters—a rule moreover which might take effect in London before it was at all convenient to arrange for the change out here. The next proposed alteration is one certain to benefit planters, namely, permission to make bids by $\frac{1}{4}$ of a penny in place of $\frac{1}{2}$ as a minimum. Very often, buyers would give $6\frac{1}{4}$ for tea when they could not afford $6\frac{1}{2}$. The only drawback to the change is the increased time that it might take to get through a sale by multiplying bids. We shall see how "Mincing Lane" deals with each of these propositions.

TEA IN AMERICA.—So far as we have been able to gauge planting opinion on our recent call for united action in America, there is a disinclination here to make any move towards asking Indian planters to co-operate—a feeling that Ceylon may do its own advertising work and a determination to hear what the Commissioner has to say and to study his Report before making any new departure. At the same time, there is an equally decided feeling abroad, we believe, against any more individual or retail store subsidizing, so far as America is concerned, and the belief is growing fast that whatever is done with the general cess should be for the benefit of all present dealers in our teas and all who may take it in hand, through the general, widespread advertising of its qualities. Mr. Lipton is now regarded as a true benefactor, so far as his American campaign is concerned, and the fact that he—one of the largest retailers in provisions—has confined himself entirely to wholesale business in tea, is regarded as very significant. Mr. Lipton is now on his way to Calcutta; he, like Sir John Muir and Mr. P. R. Buchanan has large interests in Ceylon and is very probable that in his opinion was also on the side of a joint advertising campaign, and a proposal came here from the Indian Tea Association, it would be favourably considered. We see a plea urged once more for Ceylon manufacturing green teas (of course like the best of Formosa) for America; but in view of the inferior and "faced" (as well as the pure) green teas sent to the United States from the Far East, is it not wise policy to avoid such and to call the Americans to turn to new and absolutely pure teas? The time is ripe, we think, to get them to leave off the Japan and China product altogether and to turn to pure British-grown teas; and our belief is that a joint campaign and an advertisement in every American newspaper repeating the information which confounded the Australians in 1881 would very speedily give India and Ceylon a large proportion of the 80 million lb. now consumed in North America.

ROYAL GARDENS, KEW.—Bulletin of Miscellaneous Information, October and November, Contents:—Botanical Exploration of Sikkim-Tibet Frontier. Poling in Agave Plants. Coffee Cultivation in the New World. Resources of British Honduras. (D.) The Prieto Fibre Extracting Machine. Arrowroot. New Orchids: Decade 7. Jarrán Timber. Miscellaneous Notes.

EAST AFRICA.—Inquiries have been made lately for Ceylonese to take up subordinate posts on the estates of the German East Africa Company. The starting salary is said to be £5 per month, with an annual increment of £12 until the expiration of the engagement. We should have thought that Southern India would have been a better recruiting ground, and we note that there is a Tamil man among the three persons who have been actually engaged in Ceylon.—*M. Times*.

THE "AGRICULTURAL GAZETTE" of New South Wales, Vol. IV. Part 12. Dec. 1893 has for contents:—Hemp (*Cannabis sativa*, Linn) by J H Maiden. Notes on Experiments with hemp by G Valder. Native Bread or Native Truffle (*Polyporus Mylitta*, C. et M. Syn. *Mylitta australis*, Berk.) by J H Maiden. Botanical Notes by J H Maiden. Experiments with Pulses by G Valder. Heredity in Bees by W Abram. Report on the Manufacture of Condensed Milk by E O Wood. Orchard Manures by A H Benson. Poultry by S Gray. Seasonable Notes. Practical Vegetable Growing, Directions for the Month of January. Orchard Notes for January. General Notes. Trade with Canada; Analyses of Mannrial Matter; Distribution of Tobacco Seeds; Hawkesbury College.—Agricultural Societies' Shows, 1894.

AGRICULTURAL EXPERIMENTS IN BURMA.—While Government undertakings in this direction always end in a loss, private ventures in agricultural pursuits appear to be remunerative. This fact is very clearly pointed out in the last Report of the Land Records and Agricultural Department of Burma. We should like to see fuller details given in the report, treating on the different agricultural implements used in the various experiments, without which information we fail to see if any improvement can be made. We may remark that the Agricultural Reports of Burma, published within recent years, are gradually losing their interest and are certainly wanting in this respect to those published in bygone years.—*Indian Engineering*.

AN ENTOMOLOGIST FOR THE TEA DISTRICTS.—A proprietor who approves of the appointment of an Entomologist to help Dr. Trimen, writes:—"If the Government refuse to make the appointment, I would suggest that the planters engage a competent man to be paid out of the Customs cess on tea, in which case, of course, his whole time and services should be given to the tea plantations. As a scientific Inspector attached to the staff of the Association such an appointment could not fail to be beneficial."—It would be preferable, however, to have an official appointment made and the services of the Entomologist available for pests affecting native agriculture as well as tea, we think.

ENTERPRISING MALAYS: Progress in Taiping.—In Mr. Duberly's Administration Report for December in this part of the Straits Settlements, we read:—

I regret that Mr. Ward, who has been surveying much of the sugarland lately given out, left at the end of the month, to take up his appointment in Ipoh. During the four months he was here he surveyed nearly 3,000 acres, averaging about 300 a block. Much of this land taken up is useless for cultivation without expensive bunds, which hitherto only Chinese capitalists or the Government could afford to make. It is, however, significant of the progress that is being made and of what can be done by a little co-

operation amongst the Malays, that the Banjer immigrants have now decided to construct a bund for themselves, on the coast, near Kuala Kurau, on it being distinctly explained to them that they must help themselves in these matters, and it is worthy of remark that this same land was formerly occupied by Malays introduced by the late Mr. Denison, but was subsequently abandoned for want of a bund.

THE DESTRUCTION OF THE PERADENIYA FACTORY.—We learn that Messrs. Walker Son & Co. have taken a contract to repair the Peradeniya factory lately destroyed by fire for R34,000. We suppose, therefore, that this represents the total extent of the damage done to the building.—[Adding R12,000 for the tea destroyed that will make R46,000.—Ed. T.A.]

A LEADING FOCHOW TEA BUYER passed through Colombo homeward this week and he declared to a Colombo merchant that his experience in tea buying in China during the past two years was extremely favourable in respect of profits. But, he added, "if you Colombo people are going to send 78 to 80 million lb. and the Indian planters 120 million lb. to the London market in 1894, I shall very likely run down to the Australian Colonies and endeavour to start a local tea business of my own." This, certainly, does not indicate much confidence that even with the advantage exchange gives, the China tea buyers expect to do better business this coming season.

OUR TEA PLANTERS have heard, not only of that "common sense" and rare sagacity for which they are distinguished, but also of the light of science to guide them in the intricate processes of tea manufacture where common sense, far as it goes, does not go far enough! This is all the more necessary, seeing that our neighbours in India have already made great advances in this respect, having employed a scientist for some time past to investigate the chemical results of each stage of the processes now in use, with a view to such modifications as may conduce to a superior-quality of tea. We are convinced that by means of patient research and strict analysis the conditions that conduce to excellence of flavour and permanent retention of the aroma of the product will be eventually discovered.—Local "Inteudent."

COFFEE CROP PROSPECTS—We regret to say—are not so good in the Dimbula district as they were at the same date last year. Of course very little of the old staple remains, Tillicoultry having the largest acreage perhaps, with certain fields on Devon, on some estates in the Agras, notably Balmoral with 100 acres and the St. George Group with about 60 acres. On Diyagama the coffee is about all cut out. So far, on Tillicoultry and the Agra places, there is not the promise of blossom one would like to see, although it is perhaps too early to speak definitely of what the season is to be.—March blossoms in days of old were chiefly depended on. Every bushel of coffee in a year like this is a matter of importance.

VICTORIAN PRODUCE.—We have already welcomed Messrs. Rowe and Kelly and tendered our best wishes (by no means 'useful' ones) for the success of their mission to this Colony. We now beg heartily to congratulate the great southern Colony on the selection made for their agents, gentlemen who, while true sons of Victoria (never having left its shores before) are so thoroughly equal to the duty devolved upon them. We feel sure that Messrs. Rowe and Kelly will make friends and secure the attention of business men wherever they go, and we are hopeful that in the case of Ceylon, the result of their visit may be found in a large development of our intercolonial trade. Colombo merchants and others were invited to examine the samples of produce recently in the offices, of the Wharf and Warehouse Company.

BRITISH-GROWN TEA FOR NORTH AMERICA.

We have so often urged Indian tea growers to look to North America and Australia for a market for their teas, as the limit of consumption is being rapidly reached in the United Kingdom, that we feared we were at times wearying some of our readers. We have sometimes felt that we were as one crying in the wilderness, and that our voice was spent on the desert air, so little response had our utterances awakened. The justice of our remarks has been duly acknowledged: but those from whom we expected some show of energy have like sleeping men turned, as it were, on the other side and slept, apparently annoyed at having been disturbed. It is a most disheartening task to din into the ears of English listeners the eternal words "awake and advertise, and look for other markets for your teas, or else you will be left in the procession" as the Americans style it. We are, however, determined to continue the ding dong and we have received no small measure of encouragement from a Ceylon contemporary who has joined us in the cry and from several magnates in the tea industry, who have resolved to aid us in the work. The *Ceylon Observer* says in plain direct terms that North America must be won over to British-grown teas, and whatever the jealousies between India and Ceylon, both countries must remember they are brothers and must join forces to fight what an old planter used to call the heathen-grown tea of China and Japan. These are words of wisdom, and before going further let us remark that if Ceylon is twitted with lack of energy, what must be the charge laid against India, which is 50 per cent. behind the little island in push and go in popularising its teas? We have held up Ceylon as an exemplar of enterprise and regarded it as leaving no means untried to extend the sale of its teas, and we confess to an admiration for its promptness and boldness. If, however, it is held Ceylon is not up to the mark in enterprise, what, we ask, must be said of India? It is really astounding to see the apathy of tea planters and dealers in this country, and the small encouragement given by Government to promote the spread of Indian teas, when we consider the enormous interests at stake, which in a few years might from sheer negligence be grievously imperilled.

We agree with the *Ceylon Observer* that we are at present face to face with the most important practical problem affecting the future of British-grown teas. It is simply this, to conquer North America for them, driving out the Japan and Chinese leaf, and, comprehensively speaking, persuade Anglo-Saxon man to drink none other but British-grown tea. In the United States we have a population of 67,000,000 who consume from 80 to 90 million lb. of Japan and China tea, the greater part being of the former denomination. As our Colombo contemporary observes, there is not a pound of this tea which is not artificially treated with substances more or less deleterious, and the Americans have no idea of the pure unadulterated article. We do not hazard it as an opinion, but as a conjecture, that the reason our American cousins have taken so largely to coffee is because they have been sickened with the Chinese rubbish foisted on them as tea. Thirty years ago, we are told, Japan teas were unknown in America, but as soon as it was seen that they were purer and suited the American taste better than the Chinese, they at once took hold of the public. The China tea was almost ousted from the country so that now we find Japan supplying the United States almost exclusively with the leaf. Now what has happened in the case of Japan running China from America might be repeated in regard to British Indian grown tea pushing Japanese out of the market.

The Americans are not wedded to Japanese tea; but took it because they could get no better, and if British-grown tea were properly

placed before them, they would undoubtedly throw over Japan and drink none but the infusion of the pure Indian and Ceylon leaf. Having acquired a taste for green teas, it is not natural to expect the Americans to abandon them for black teas and to suit themselves to our likes and dislikes. On the contrary, we must, following the general trade rule, adapt our manufacture to the predilections and wants of our customers, and supply them with an unadulterated green tea in place of the artificially faced and glazed and otherwise adulterated leaf which comes from Japan. A writer in our Colombo contemporary puts the case very clearly when he says that seeing the Americans prefer green tea to black, especially the faced teas of Japan, the proper course to pursue would be to supply the article the consumers require, particularly as British planters are turning out more black tea than can be conveniently consumed without a serious fall in the price occurring. "What we ought to do," continues this writer, who of course is addressing himself solely to Ceylon planters, "is to get down some men from Japan who could show us how to make tea exactly similar to that shipped from Japan, and also how to face it according to the taste of the American market, and how to pack it attractively. Then we might be able to find a market in America for some 20,000,000 lb. of our tea, and so relieve the London market. But until we do that we shall not ship much tea there." In this matter of manufacturing green tea, there are a number of commercial considerations which cannot be altogether disregarded. Bombay took from China last year a little over four millions and a half pounds of green tea; but the article is at a discount in Russian Asia where we are urged to introduce Indian-grown tea. The quantity of green tea imported there was ridiculously small. Planters would therefore have to ponder the question whether the green tea campaign in the United States would not affect the opening for black tea in Central Asia, and even Russia proper. It must not be forgotten that out of the hundred millions of the Czar's subjects nearly two thirds are inveterate tea drinkers. With the Russian the samovar is as sacred an institution as the British tea pot, and while the higher classes drink none but the best of teas for which they pay top prices, the lower orders are noted for their interminable power of imbibing the "fragrant decoction" made from the commoner sorts such as those that are now flooding the London market.

How to prosecute a campaign in America for ejecting foreign for British grown tea is a somewhat difficult problem under circumstances stamped with the fatal words *laissez faire*. India is stoutheaded and indifferent, and appears blind to the advantages of modern advertising of the type that has made Lipton a power in the tea drinking and provision world, while the Government are seemingly as uninterested in the matter as they are in the development of Nova Zembla. Yet it is to their interest that the planting resources of India should develop, and it is their first duty to see that they are encouraged and strengthened in every possible way. With one exception, all the Australian Colonies have State-aided agencies for pushing Colonial products, and the several Governments identify themselves in every movement which can advance the agricultural or pastoral interests of their Colonies. The result is that we find Government agents scouring the continent for securing markets for Australian frozen meat, and the article has been placed on what to the ordinary observer appear to be impossible markets, while an enormous impetus has been given to the producing powers of the Colonies. If the Indian Government would take example by Australia then we should find quite a revolution in the tea industry, especially in respect to finding new fields of consumption for what in a very short time will be a surplus that must perilously affect all Indian tea enterprise. We have not a Government sympathetic towards planters like that of Ceylon, and we are afraid that it is useless attempting to create one. So that Indian planters must simply look after themselves, and trust to their energy and acting

up to the principle that unity is strength, and combined effort and skilful advertising the surest way to success. But how is this tea campaign in the United States to be prosecuted; how must the millions of our American cousins be converted to the gospel of our drinking pure healthy British-grown tea? We have proof on all sides that Indian and Ceylon tea have obtained a footing in the States. Mr. Buchanan, who is now in our midst, states—and his word is authoritative—that the two very largest and oldest wholesale tea houses in Chicago have begun to take an active interest in Indian and Ceylon teas, and that if encouraged—and not annoyed—by the producers or by so-called "official" rival agencies, they will speedily take up our teas very freely and heartily. Mr. Buchanan most fully approves of what Mr. Lipton is doing as a wholesale merchant of acknowledged standing in Chicago and New York. None of the regular American houses will feel jealous of him, or of any other individual wholesale or even retail effort. The *Ceylon Observer* believes, with Mr. Buchanan, that it would be unwise in the extreme to start an official planters' store in the United States for distributing tea either by sale or otherwise, for this would at once excite the hostility of the principal tea dealers and retail sellers. What India and Ceylon should do is to avoid cutting into the regular trade; but as our Colombo contemporary says "pursue an open, straightforward and business-like course, in mutual confidence and co-operation, making known the goodness of their product and loyally backing up all the dealers who are prepared to take it up."

A Colombo paper asserts that Ceylon must play her own hand, as it is useless expecting loyal support from India, and there is an insinuation that we are too jealous of that Colony to join hands in a campaign in America. For obvious reasons we shall say nothing on this topic at present, but we observe that the *Ceylon Observer* takes a much more generous view of the situation and repudiates the charge of want of co-operation on the part of Indian planters or even petty jealousy. "Is he (the opposing contemporary) not aware—says the *Observer*—that the foundation of the present splendid trade in India and Ceylon teas in Australasia was laid at the Melbourne Exhibition in 1881 when the Indian and Ceylon Commissioners worked together like brothers in mutual co-operation and in a long and stern fight against China teas which were analyzed and exposed in the public press again and again.

[Then follow a further extract from us.—Ed. T.A.]
The *Observer* earnestly counsels laying aside all petty jealousies, if such exist, and Ceylon and India joining their forces to invade America, and conquer it for British-grown tea. The first thing is to form a special advertising agency for America and this is what our contemporary recommends:—"We have only now to point out to the planting community and especially to the Chairman and Committee of the Planters' Association and Tea Fund, the importance of losing no time in taking action towards securing the co-operation of the Indian Tea Association in Calcutta, in the formation of a special Advertising Fund for America."

We cannot too strongly commend these remarks to the consideration of the Indian Tea Association and Indian planters in general. Now is the time to follow up the success which has attended our efforts at the Chicago Exhibition, and it would almost amount to criminal negligence to keep quiet and not stir a hand to seize the market which the United States opens for our teas. If we do not adopt a forward policy, assuredly Ceylon will, and in that case will reap all the advantages that must flow from opening out a new market. Whatever policy is adopted—whether we play for our own hand or unite with Ceylon—the executive forces of our planters must be up and doing, and quickly too, for there is not a moment to be lost, as China is on the alert as well as Japan the latter being no mean adversary in point of quick, keen, and bright competition.—*Indian Planters' Gazette*.

DRUG REPORT.

(From Chemist and Druggist.)

London, January 24.

CINCHONA.—As already foreshadowed in our last issue, the cinchona-auctions this week were very small in extent, the seven catalogues totaling up as follows:—

	Packages	Packages
Ceylon cinchona ..	324 of which	298 were sold
East Indian cinchona ..	321 ..	876 ..
Java cinchona ..	62 ..	67 ..
West African cinchona ..	65 ..	65 ..
	1392	1269

The cinchona offered included a very large proportion of fairly good East Indian Officials and Ledger bark, Succirubra kinds being comparatively scarce. The demand was fairly well maintained throughout the auctions, and prices generally ranged firm at an average unit of fully $\frac{3}{4}$ per lb.

The following were the principal buyers:—

	Lb.
Messrs. Howards & Sons ..	85,470
Agents for the Brunswick factory ..	78,918
Agents for the Auerbach factory ..	61,883
Agents for the American and Italian works ..	29,665
Agents for the Mannheim and Amsterdam works ..	24,249
Agents for the Paris factory ..	7,274
Agents for the Frankfort-on-the-Main and Stuttgart works ..	6,780
Various druggists ..	17,455
Total quantity sold ..	313,323
Bought in or withdrawn ..	20,545
Total quantity offered ..	333,868

It should be understood that the quantity of bark purchased affords no guide to the percentage of quinine in that bark. The following prices were realised for sound bark:—

CEYLON CINCHONA.—Original. Red varieties: Dull and woody to fair bright quilly stem and branch chips 1 $\frac{1}{2}$ to 1 $\frac{3}{4}$; broken and dust $\frac{3}{4}$ to $\frac{1}{2}$ per lb. Ordinary to dull root 1d to 1 $\frac{1}{2}$ per lb. Yellow, small to good bright chips 1 $\frac{1}{2}$ to 3 $\frac{1}{4}$ per lb. Renewed. Dull red chips 1d to 1 $\frac{1}{4}$ per lb.

QUININE.—There has been a decline of some importance in the market this week, and yesterday 10,000 ounces second-hand German in bulk changed hands at 16 $\frac{1}{2}$ per ounce; today, however, the market is much firmer, and at least three sales have been made at rising prices, namely 10,000 ounces at 10 $\frac{1}{2}$ d, 8,000 at 10 $\frac{3}{4}$ d, and 5,000 (late this afternoon) at 10 $\frac{3}{4}$ d per ounce. Holders generally now ask 11d per ounce. The market's quotations are unaltered. The demand in the United States is said to be larger than usual.

THE INTERNAL TEMPERATURE OF TREES has formed the subject of some investigations by M. W. Prinz, (*La Nature*). The results show that the mean annual internal temperature of a tree is practically the same as that of the surrounding air, but the monthly means differ by two or three degrees. In general it takes a day for a thermal variation to be transmitted to the heart of a tree. On some days the internal temperature differs by as much as 10° C. from the air outside, but generally the difference is only a few degrees. When the air-temperature falls below the freezing point, the internal temperature of a tree descends to a point near that at which the sap freezes, and appears to remain there. The maximum temperature of the interior of the trunk of a tree may occur some time before the maximum is reached by the surrounding air, owing to the action of the spring sun upon the tree while devoid of foliage. During the high temperatures of summer, the internal temperature was proved by the investigations to be about 15° C with a variation of 2° C. at the most. Speaking generally, a large tree is warmer than the air in cold months, and a little colder than the air during the summer months.—*Nature*, Jan. 18.

THE CHEMISTRY AND AGRICULTURE OF TEA.

Our local Analytical Chemist, Mr. M. Cochran, makes the following remarks on Mr. Bamber's volume after glancing over it:—"The portion which treats of the composition of soil and the manuring experiments is very interesting. A feature of the book is the determination of the proximate constituents of tea after the method of Dragendorff. This analysis could not have taken Mr. Bamber less than three weeks. I notice, however, the analyst has had to adopt for the determination of the volatile oil, a process which I think would only yield an approximation to the truth. Indeed I know of no process for this determination which I would call satisfactory. Mr. Bamber has furnished us with a record of excellent work, but there are not altogether wanting signs of haste in the preparation of the book. His examination of tea prunings is very incomplete without a nitrogen determination. The results of his analysis of the ash of tea prunings, especially in the matter of phosphoric acid, seem to me inconsistent with the very reliable analysis of J. Cripps of ash of tea *i.e.* young leaves which he quotes, also inconsistent with Kellner's analysis of young and old leaves and with my own analysis of prunings. Too few analyses of prunings however, under all conditions of season, latitude, climate, &c., have been made for me to venture to say that Mr. Bamber is wrong. I think, however, that the phosphoric acid in the ash of tea prunings, *viz.* 23 per cent., is much higher than is likely to be found in the ash of any Ceylon tea prunings. It is only fair to add that the prunings dealt with by Mr. Bamber appear not to have included old leaves; but only wood and the leaves used for manufacture. As a basis for calculation one would have wished that the analyst had supplemented the ash analysis with the percentage of ash in the prunings and the weight of prunings per tree or per acre."

COFFEE LEAF DISEASE AND THE LATE DR. THWAITES, F.R.S.

Our morning contemporary does a grave injustice—no doubt unwittingly—to the skill and reputation of the man to whom even Darwin looked up in Fungology, when he writes of the late Dr. Thwaites as follows:—

If the services of an expert mycologist had been available when leaf disease first made its appearance, it would have saved the grave misconception into which the Director of the Botanic Gardens fell in regard to that fungus. His belief that it had come to stay, although it proved in the end to be correct, was founded upon an erroneous supposition. He believed that the fungus permeated the whole internal structure of the plant, as in the potato disease, but such was not the case. The spores attacked the bushes from *without*, entered it through the pores, or stomata of the enticled of the leaves, germinated there, and sent its mycelium through the tissues of the leaves, eventually bearing their fruit *outside* the leaves in the shape of the familiar orange powder which often covered nearly the whole under surface of the leaves. Now what do we find in Dr. Thwaites' Administration Report for 1871, long before Mr. Marshall Ward came to the island:—

During several of the past months my attention has been a good deal directed to a peculiar kind of disease with which the coffee plant has been affected, and I have had much correspondence with planters on the subject. This disease was first brought to my notice by some specimens of coffee leaves infected with it, which were sent to me from an estate in Madulima. These leaves were more or less discoloured in spots or blotches, and on the under side

of them was a powdery substance, easily rubbed off, of a pale orange colour. It was at once evident to me that the disease was a species of fungus which was growing within the tissue of the leaves, and that the powdery matter on their under sides consisted of the spores or reproductive bodies of this fungus. I immediately sent specimens of the diseased leaves to my friend, the Rev. M. J. Berkeley, our greatest authority on these matters, for his inspection. He pronounced the fungus to be a species of great interest, quite new to science, and shortly afterwards sent a description of it to the *Gardeners' Chronicle*, in which it was published in the number of November 6th, 1869, under the name of *Hemiteia vestatrix* of Berkeley and Broom. The rapidity with which this coffee leaf disease has spread throughout the coffee districts of the island, has been perfectly marvellous and it is probable that not a single estate has quite escaped, though it has appeared in a very slight degree on some. The most striking effect of the disease was the premature fall of the leaves; in the worst cases the death of many of the branchlets followed, with the drying up of the young fruit upon them. In poor soils the trees themselves suffered very much, but in richer soils a new flush of healthy young leaves soon appeared, and if these leaves had time to come to maturity before the period of flowering, a good crop of fruit usually followed. I have not succeeded, after most diligent search, in finding this peculiar form of fungus, which is easily identified by the help of a good microscope, upon the leaves of any other species of plant but the coffee, except on the closely allied *Coffea Travancorensis*, one of our indigenous plants, and upon this only very recently.

That, we think ought to settle the matter of Dr. Thwaites' understanding and appreciation of the coffee leaf fungus from the outset of its appearance in Ceylon.

COLOMBO MERCHANTS ON THE TEA BOUNTY-ADVERTISING SCHEME FOR AMERICA.

A leading Colombo merchant thus expresses himself in answer to our inquiry:—

"I can't say I am altogether in favor of the bounty scheme, I think it is wrong in principle to seek Government aid to enforce such a thing, and there are so many cross questions; for instance, who would pay the 'cess' on teas sold locally, the estate or the local buyer? In buying, one can't advance less than 1 cent at a time so that it seems to me that the buyers would pay. Now the buying is to a large extent for Australia and the effect will be to handicap the Australian trade in order to foster the American trade. Same with the trade opening up with India and Persia Gulf. This however might be got over by the export duty being levied only on exports to United Kingdom. How would home Companies and proprietors like this?"

"But supposing all such cross issues could be overcome, would the 'bounty' act as an inducement to the American people to give up green teas and take to black? I think the proposed bounty is one farthing per pound. What is that on the cost of a pound of tea to the consumer? Nothing; and it will be very little inducement to the retailer and importer who together form the 'trade.'—I don't so far oppose the scheme, but at the same time I can't see where any real benefit from it is to come in."

The managing partner of another leading firm, one largely interested in the American tea trade, also writes that he has not made up his mind finally on the bounty scheme. Still another leading merchant says:—

"I hardly know what to think about Mr. Laurie paying the subsidy in London. Of course there could not be a better man, but I am rather inclined to limit it to shipments made from Ceylon, and certified by the consul here as for America. This, however, is a matter I have no fixed opinion about as yet."

From another business man we had a strong and spontaneous expression of opinion in favour of spending the £5,000 in direct advertising, rather than in a bounty distribution.—Still another merchant who favours the bounty system has expressed the opinion that its distribution should be confined to shippers of tea from Co'ombo, the American Consuls certificate being sufficient; but that would leave out all tea for the Canadian Dominion, &c. In this way, the "cess" might make up for all that passed under Mr. Morey's notice, perhaps 50 cent per lb. in place of the 1½ cent. Mr. Laurie estimated 1—It will be judged from the above that the Mercantile community are by no means clear as to the best course to follow. The subject is likely to be discussed at the Annual Meeting of the Chamber of Commerce on the 2nd proximo.

EXPORTS OF CEYLON TEA TO AMERICA &c.

A Colombo merchant deprecates our criticism of the Distribution Returns of Exports published by the Chamber of Commerce, as follows:—

"I don't see why you should be down on the returns from the Customs and Chamber of Commerce. They are made up from the Customs entries and steamer manifests, which are the only available sources of information. We know well enough that a large proportion of the tea, which goes to the U. K. never goes near the London market, but if you tell a planter that, he smiles sweetly, and has no idea of believing you in the least. I suppose every firm in the Fort ships some tea to America."

We expressly guarded ourselves by writing in conclusion that "neither the Chamber nor Customs can know the real destination of large quantities of tea shipped." Nevertheless, we must hold that some degree of censure is attributable, unless we are to believe that no member of the Committee of the Chamber in passing the Annual Distribution Return for publication could take upon himself to add a note in the case of "China" for instance, to the effect that "most if not all the tea so entered went really to America"; and opposite "America," that the figures given by no means represented all the tea sent from Ceylon to the North American Continent. This might be breaking through precedent; but it would have saved not only planters, but even several members of the Colombo mercantile community from a great misconception as to last year's tea exports from Colombo to America. Indeed, as our correspondent knows, he himself was the first to enlighten a prominent Dimbula planter who came to us full of the discovery, as he felt sure not a single planter in the country had any idea of the true state of the case. By all means let us have an explanatory note to the Distribution table in future, to prevent grave misconceptions: a very few words will do.

A merchant whose opinion we asked as to whether all tea which escaped record for "America" in Colombo, was likely to be included in the British Customs returns of re-exports westward, replies:—

"Your question is a most difficult one to answer. Where we have through Bills of Lading transshipment Liverpool or London, I should say the teas did not reappear as exports from Great Britain; but where the Bill of Lading is only to the United Kingdom I should say that the teas did appear as

exports from the United Kingdom although not entered for duty."

It will be remembered that the figures given by Messrs. Gow, Wilson & Stanton for Ceylon tea exported from the United Kingdom to America are:—

To United States in 1893, equal to ..	707,567 lb.
To Canada do. do. ..	731,760 lb.

Now from Colombo, Mr. Morey reports as passed for the

United States in 1893, equal to ..	250,945 lb.
------------------------------------	-------------

While for the Canadian Dominion including British Columbia, Nova Scotia, &c., besides Newfoundland, Bermuda, &c., the total cannot have been less than .. 200,000 lb.

Total 1,890,272 lb.

This would give us 1,890,270 lb. as the approximate total of Ceylon tea for America last year in place of 1,549,767 lb. May we speedily see these figures increased manifold.

YATADERIA TEA COMPANY OF CEYLON, LIMITED.

ANNUAL GENERAL MEETING.

The sixth annual ordinary general meeting of this Company was held at the offices of the Company, 13 Queen Street, Fort, on February 21st, pursuant to notice. Mr. H. V. Masefield was in the chair, and the following shareholders were present:—Messrs. D. Fairweather, J. H. Starey (Managing Director), B. G. L. Bremner (Secretary), J. R. Fairweather, A. Orchard, C. M. Gwatkin, J. A. Martin, and by proxy A. H. Digwall, and W. W. Church.

The SECRETARY read the notice convening the meeting.

The minutes of the annual general meeting held on February 28th, 1893, and of the extraordinary general meeting held on August 4th, 1893, were read and confirmed.

The report of the Directors having been taken as read, Mr. Masefield moved that the report of the Directors and the accounts for the year 1893 be received and adopted.

The MANAGING DIRECTOR, in seconding the adoption of the report, commented upon the accounts and the general progress of the company. It was satisfactory that while the market for Ceylon teas had fallen more than a penny in the year, the difference between the cost and the selling price of the company's teas had fallen only about one cent; and though the revised crop estimate had not been obtained it was encouraging to know that the crop from the 527 acres under leaf in 1892 had in 1893 exceeded the previous year's returns by 15,000 lb. tea. The leaf area in 1893 was 52 acres more than in 1892. December had been a disappointing month for crop in consequence of the early close of the N.-E. monsoon. Between cost of the teas and sale price there appeared a balance of gain of 12.72 cents per lb. The actual profit for the year, after liberal provisions for depreciation, was over 32 per cent., and after dividing 30 per cent there remained, with some 6 per cent brought forward, more than 8½ per cent to carry forward. The reserve fund which had been approved of at the previous meeting after some discussion had been found most necessary, and it would be seen on reference to the balance-sheet that it was not only fully employed in the business of the company, but that in view of the purchase of land and the extensions in prospect, the directors had decided to place the further sum of Rs.5,000 to the fund, and the speaker regretted that it had not been determined upon in

time to be mentioned in the report. It would appear in the current year's accounts and while he was aware the shareholders present concurred in this policy, the Company would have the opportunity of confirming this decision at the next meeting. The balance carried forward thus curtailed would exceed R10,000. The reason for declaring a dividend of 25 per cent and a bonus of 5 per cent instead of a dividend of 30 per cent was that the directors hoped to see dividends of 25 per cent maintained, but not more, and if there should be more available it was deemed better to regard it as extraneous to the dividend, otherwise there might be disappointment when in an unfavorable year the returns fell short. The bonus therefore should be regarded as exceptional. He was glad to be able to say that the labor force was ample, and that coast advances had been reduced to R8 per head, which was a moderate captation for the district. There had been virulent fever throughout Kegalle last season, and though it was likely to cost the company rather more the directors and superintendent were arranging for a resident dispenser (for whom a house was being built) a neighbouring estate sharing in the expense. The average of leaf plucked per cooly had improved on the year by nearly $\frac{1}{2}$ lb. leaf. The factory output was $\frac{3}{4}$ lb. per cooly less than in 1892. Besides the additions to the machinery reported there had been iron troughing and silt boxes supplied for water course, and a dam is under construction to collect water at night, which is now wasted, though badly wanted. Further 15 per cent had been written off the New Oriental Bank Corporation debt, in the expectancy of receiving ultimately R6 per R10. The capital account per acre had increased by R7 per acre to R286, due to more machinery. Ample provision is made for depreciation on the sum of R12,849, and this provision is R2,500 less than in 1892. The estate had been supplied throughout with basket plants, and no more of this would be attempted in the old tea. In regard to 1894, the estimated crop is 765 lb per acre off the increased area of 700 acres to 80 acres new clearings are contemplated, of which 30 acres cleared. 51 acres had been purchased, and the purchase of 50 acres more was arranged; so that the total acreage would be about 1,050 acres. The rates for rice and transport this year have been reduced. The estimated outlay on capital amount for the year is nearly R15,000, which justifies the reserve fund. The number of shareholders is 41, and the last price paid for the shares is R287.50, which may be regarded as equivalent to R778 per acre cultivated. The Directors had considered the advisability of planting cocoa, and it had now been decided to acquire, if possible, a small reservation for experimental planting, and it was hoped that nearly 25 acres might be set out, which would be sufficient to test the question, and hereafter it might be determined to invest the reserve fund in such cultivation.

Mr. J. A. MARTIN proposed that a dividend of R12.50 per share for the half-year ended December 31st, 1893; (making with the interim dividend of R12.50 per share paid on August 1893) 25 per cent for the year 1893, and a bonus of R5 per share, or 5 per cent for the year 1893, be declared and made payable on February 23rd, 1894. Mr. A. ORCHARD seconded, and it was carried.

Mr. J. A. MARTIN proposed that Mr. John Helps Starey, who retired by rotation, be re-elected. Mr. J. R. FAIRWEATHER seconded, and it was carried.

Mr. C. M. GWATKIN proposed that Mr. John Guthrie be re-elected auditor at a fee of R100 per annum. Mr. J. A. MARTIN seconded, and it was carried.

Mr. A. ORCHARD proposed a vote of thanks to the Board and officers, and especially to the superintendent of estates, Mr. J. R. FAIRWEATHER. Seconded by Mr. J. A. MARTIN and carried.

The usual vote of thanks to the Chairman was then tendered.

PASSARA PLANTING PRODUCTS.

Tea is becoming more and more the staple of the district. The cultivation steadily increases and promises to give good and regular returns. The yield per acre is excellent, quite equal to that from any other up-country district, while prices have been quite satisfactory. There is a large acreage available for tea still untouched, and if the market remains fairly firm and silver steady, tea cultivation in the district will rapidly develop. Statistics were collected of the estimated yield for 1894 and the total yield was 1,700,000 lb. from 7,400 acres of all ages.

COFFEE on the contrary is fast disappearing, though 3,366 acres are still shown as under that product. Your Committee can hold out no reasonable hopes of any revival: green bng has firm hold of the few remaining fields and even high cultivation is found powerless to combat this pest successfully.

CINCHONA is almost a thing of the past; no healthy fields remain and the few estates that have any left growing in tea or coffee are rapidly removing it to make rooms for a more paying product.

CACAO however, is rapidly coming to the front about 1,000 acres being under that cultivation. Monaragala especially having proved itself admirably suited to that product. The fields are regular and well grown, and compare favorably both in appearance and yield with any in the country. Crops for the past year have been most satisfactory and have realized very full rates. Considerable clearings have just been completed and there are prospects of very large extensions during 1894. Your Committee are of opinion that there is a very great future before the lower parts of this district, both in this product and also in Liberian coffee:

EXHIBITION OF VICTORIAN PRODUCTS.

The exhibition of these products took place at the premises of the Wharf & Warehouse Company at Leyden Bastion on the 16th Feb. The products were neatly arranged upon four lengthy tables, one being devoted to wines from a number of leading vineyards in the colony, another brandy, ales, and seasoned timber. On the other two tables preserved meats, jams, sweet biscuits, forage, corn cake, soaps, &c. were attractively arranged. All the various products were shown in their original packages, and were without exception neatly designed and labelled, while for handiness, for transport purposes quite equal to what is used with European or American similar foods. Besides being exhibited under their original coverings, opportunity was afforded to visitors to practically test or sample the goods. For this purpose Mr. Raden of the G. O. H., arranged to serve a luncheon on a table placed at the head of the others, and a large number of the official, mercantile and the general community availed themselves of the opportunity thus afforded.

The Exhibition was opened by His Excellency Sir Arthur Havelock, Governor of the Colony, who was accompanied by Mr. Ogilvy, P. S. Besides His Excellency the following gentlemen were present:—

Hon. O. P. Layard, Attorney-General; Hon. R. Reid, Principal Collector of Customs; Hon. R. K. MacBride, Director of Public Works; Hon. J. J. Grinlinton, Chicago Commissioner; Hon. W. W. Mitchell, Mercantile Representative; Hon. L. H. Kelly, Planting Representative; Messrs. W. T. Pearce, General Manager, C. G. R.; W. L. Crawford, Principal Assistant Colonial Secretary; Lieut. Col. Surgeon Maturin, and Mrs. Maturin; Messrs. Pole Fletcher, Assistant Chicago Commissioner; Geo. Wall, Editor, "Independent"; F. Booth, Manager, Wharf and Warehouse Company; S. Bowley, P. & O. Company; V. A. Julius; Majors Forbes and Rigg; Mr. and Mrs. O. E. Symons; H. VanCuylenberg; Mr. C. Driberg, Principal, School

of Agriculture, and Mrs. Driberg; T. Smith, & Co. His Excellency was received by Messrs. Rowe and Kelly, the Victorian commissioners, who conducted him round the exhibition, and gave particulars of the exhibits. On completing his inspection His Excellency was conducted to the table where luncheon was served, and Mr. Rowe on behalf of himself and Mr. Kelly as representing the Government of Victoria thanked His Excellency for his kind patronage and presence on that occasion, and stated that they expected soon to have a large intercourse of business between Victoria and the British Colonies of the East. He desired that His Excellency and others present, would test their produce at the lunch set before them.

His Excellency in reply thanked the Commissioners very much for their kind welcome, and hoped that both the colonies would be much benefitted by an interchange of their products. Ceylon was one of the most charming countries in the world, and was stated by some to be the site of the Garden of Eden. Good beef or mutton, had not likely been a necessity in the Garden of Eden, but it was one of the deficiencies of that beautiful island, and if Victoria could help them in this way His Excellency and others would be greatly obliged. He expected the present exhibition to be the inauguration of an extensive trade between the two colonies.

His Excellency on leaving, again expressed himself to the Commissioners as much gratified with the display of Victorian products, and that the hams, wines, fruits and butter were excellent. He wished every success to the Colony of Victoria in trading with the island of Ceylon.

The following were the list of exhibits:—

WINE.—Claret; Hermitage; Carbinet; Ohasclas; Sherry; Port; Red (1890); White (1891); Hermitage and Riesling 3 year's old; Claret; Burgundy; Obablis; Hook; Obablis; Claret (1); Claret (2); Shiraz, dry; Shiraz fruity; Riesling; Claret (1890); Burgandy (1890); Chablis (1891); Riesling (1890); Port; Chablis; Claret; Burgundy; Rissling; Frontignac; (White); Hermitage (Red); Muscat; Burgundy; Hook; Claret Med. body; Claret Light; Champagne, Dry Special; Port; Claret (Reserve); Claret (Black Label); Frontignac; Sherry; Chablie.

BRANDY.

ALES.—Ale—Bitter; and Lager.

QUININE WINE.

PRESERVED MEAT.—Beef—specially for ship's rations; Sheep's Tongues; Sheep's Trotters; Beef, Fresh; Beef, Roast; Beef Corned; Beef Luncheon; Chicken; Ox Cheek and Vegetables; Mutton; Mutton Roast; Mutton Corned; Rabbits—boiled; Hams; Mince Meat; Rabbits, assorted.

CONDENSED MILK.—Pure cow's milk without the addition of sugar.

BUTTER.—In tins and glass jars; Butter in tins; Butter in glass jars; Butter in tins, sterilised; Butter.

CHEESE.—In tins.

JAMS.—Greengage, Golden drop, Plum, Diamond plum, Orlean plum, Damson, Purple gage, Yellow gage, Raspberry, Black currant, Apricot, Gooseberry, Marmalade, Quince jelly, Magnum Bonum plum, Marmalade.

PRESERVED FRUITS.—Plums, Greengages, Golden props, Apricots, Peaches, Quinces, Pineapples, Tomatoes, Tomatoe.

SAUCES.—Tomato.

BISCUITS.—Combination, Combination, Gem, Marie, Jubilee, Milk, Cabin, Trader's Cabin, Pilot, Plantation, Plum pudding.

FLOWER.—Patent roller, Superfine Stone, Roller.

COMPRESSED FORAGES.—Marks, V. P. 27 and 41 Obaff, Bran, Corn cake, composed of 20 lb., crushed oats and 8 lb. crushed maize; Forage for horses, cattle and sheep, composed of 16 lb. chaff, 8 lb. oats, 2 lb. maize, and 2 lb. bran.

TALLOW.—Mutton, Mixed.

EUCALYPTUS.—Extract of.

FRANKOLINE.—For healing wounds.

SEEDS.—Vegetable and Native.

LEATHER.—Sole, in sides.

SOAPS.—Toilet.

PRESERVITAE.—A preserver of milk, cream, butter, &c.

RED GUM SYRUP.—Syrupus Eucalypti, Rostrati, Bosisto's). A safe and efficient remedy for chronic dysentery diarrhoea, &c. Also recommended as a gargle for sore throat.

One of the principal exhibits is by the Fresh Food and Frozen Storage Company which is said to have the largest butter factory in the world. In their factory 15 tons of butter are made in a day, and a 1,000 tons of this butter are sent to the London market every year. The uniform quality of the butter has won for it great reputation in England and up to 10s per cwt. is given over the price offered for other butters in the market. Another large exhibit is by Mr. G. F. Morris of the Fairfield Vineyard, Their vineyard has about 700 acres alone of vines in full bearing. The wine made by this firm has already established a reputation in Europe. Forty gold medals have been awarded to this firm for wines. Another vineyard sending wines is the "Excelsior," which calls itself the champion of the Goulburn Valley. It has secured no less than 106 prizes at exhibitions. Goulburn Valley, Charterhouse, Tooronga, Coblenz and Castleburg, Mount Prior, Irvine's Great, All Saints, Bendigo Vineyards and others send wines which is a large and varied exhibition of itself. The wines were said to be full bodied or fruity and very palatable.

Another large exhibit is by the Flemington Meat Preserving Company, who send tinned sheep's tongues, trotters, beef, roast beef, corned beef, luncheon beef, chicken, ox cheek and vegetables, mutton, roast mutton, and corned mutton. Other smaller exhibits by other companies or firms were also select.

Madua raisins and dried apricots, numerous preserved fruits and vegetables, hams, cheese, &c. and an exhibit of a large assortment of soaps for household and toilet purposes, did not exhaust the variety of products offered to export from Victoria.

All showed that a great future lies before this Colony.

VARIOUS AGRICULTURAL NOTES.

"HELOPELTIS" is, certainly, says a tea inspector, one of the most puzzling of pests that planters have to deal with, for, as you say, certain gardens are never touched by the insect, while others all round may be regularly infested. The loss in the Kelani Valley alone in one season from this cause would surprise a good many people if summed up.—We have heard that the loss on one group of estates was considered equal to 30,000 lb. of made tea, one season. That would pay for an Entomologist for some time. Very amusing are some of the contrivances adopted to catch the "wee scoon'rels" (as the Jamaica Scot termed the mosquito): we heard of one planter who hung out brilliantly lighted lanterns in his tea field, smearing the sides of the glass with the juice of the jak fruit, expecting a great haul or the helopeltis attracted to the light. But, alas the haul was of every imaginable insect under the moon, say, save the helopeltis! That particular "creetr" cares nothing for light—he is a lover of darkness as might be expected from his bad reputation and destructive work.

A CEYLON PLANTER IN SELANGOR.—Mr. T. Gibson has come here to take over the management of Messrs. Huttenbach's coffee estates. A considerable extension of the area now under cultivation will be made. The firm intends to purchase and cure coffee at Klang. The machinery for the purpose has just arrived, and Mr. Gibson will also manage that part of the business.—*Straits Budget.*

RUBBER IN INDIA.—The only successful plantation of any size in India, says Consul-General Morrell of Calcutta, is in the Durrany district of the Province of Assam. Its area is now 1,538 acres and the trees are growing luxuriantly. Since it is not thought to be wise to tap the trees before they are twenty-five years old, no estimate can as yet be made as to what the product will be. As it is said that an amount varying from 40 to 80 pounds of rubber has been taken from a forest tree yearly without injury, there is an opportunity for everyone to make his own calculation as to the outcome of the government experiments.

RUBBER TREES AS SHADE FOR CACAO.—Our friends of the *Indianrubber Journal* and others interested in extending the cultivation of rubber-yielding trees will not be pleased at the latest news from our planting districts where ceara rubber trees have been growing along with cacao and have been utilised as shade for the latter. Both in the Dumbara and Matala districts, we learn, it has been decided that the ceara does harm rather than good to the cacao, and the command has gone forth to cut down the former. This is especially the case in Dumbara. However, there are satisfactory reports as to the progress of Para and Castilleo rubbers in our Sabaragamuwa and Western Provinces, and we hope the cultivation of these will yet prove remunerative.

TEA TABLOIDS.—We cannot in honesty say that the cup of tea infused from samples of the tabloids (manufactured by Messrs. Burroughs, Welcome & Co. at the instance of Mr. John Rogers formerly of the Kelani Valley) can be said to compensate for the cup made from the article as turned out by the estate factory. The delicate aroma and refreshing taste were absent at any rate in anything like the same degree as that to which we are accustomed. Nevertheless, we were assuredly drinking tea and tea that would be considered by no means bad in the olden days when all Ceylon tea-drinkers had to depend on the 5-catty tea boxes imported from Hongkong and sold for R10 each—or 2 rupees (4s) per lb.! There can be no doubt too of the convenience of these tabloids for many purposes—for travellers for instance—and the great chemists who have taken their preparation in hand, are quite capable of making them of all degrees of strength, including a quality guaranteed to contain as little of tannin as the mildest (weakest) of China teas. This would suit the old women (male and female) who may have been frightened by certain medical dicta about the danger of drinking strong tea, or tea at all in fact. Even the late Sir Andrew Clarke, in a moment of weakness was guilty of some such heresy, or at any rate of exalting China at the expense of Ceylon and Indian tea. We showed him when in London how wrong he was, at least in not distinguishing between delicate and strong Ceylon teas and was able indeed to remind him of his first cup of Ceylon tea which was drunk at the house of Major Forbes (of the Scottish Ceylon Tea Co) which he, Sir Andrew at the time, declared to be the most wholesome refreshing cup of tea he had ever drunk.

THE COMING COCONUT CROP is expected to be short owing to the unusually dry weather for some time past. We hear that Mr. J. D. Vanderstraaten's enterprise in leasing and then improving the cultivation of and manuring Coconut gardens, is having a great influence on the natives in the Negombo district who are following his example very reely, in utilising ashes and poonac for their palms.

THE OUTLOOK FOR COFFEE.—The American *Grocer* takes a sanguine view (see *Tropical Agriculturist*) of the crop prospects, anticipating 13½ million bags for 1894-95 against actual requirements for the world of only 11 million bags! We do not believe in such estimates. True, coffee culture has been greatly extended in Mexico and Central America; but when we find "New Zealand" and "Transvaal" dragged in as prospective coffee producers, we are not inclined to think much of the anticipations put before us.

THE JAMAICA PLUM.—The Jamaica plum or tree tomato (*Cyphomanda betacea*) is said to be an excellent fruit, having a beneficial influence on the liver, it can be eaten as a dessert fruit out into two, or it may be cooked like an ordinary tomato. It is exceedingly well adapted for export, as the skin is tough, and will keep perfectly for a month after picking. The cultivation of this fruit may be taken up in the higher elevations, as it is likely to grow well at from 2,000 to 5,000 feet. The plant is an erect shrub. Seedlings will bear fruit in from one or two years; cuttings in less than a year. It is reported that the seed has been distributed by the Jamaica Botanic Gardens to the hills of India.—*Madras Mail.*

THE GROWTH AND GIFTS OF THE BANANA (A TROPICAL LILY).—"Banana cultivation in Jamaica" is instructively sketched by Mr. Allen Eric in the *Canadian Magazine* for November. The banana is described as "perhaps the most popular and most widely consumed fruit grown on the face of the earth." The extent of the banana trade is suggested by the fact that in 1892 the United States imported 13,000,000 bunches. The banana, it appears, belongs to the lily family, and is a developed, tropical lily, from which, after ages of development and growth, the seeds have been eliminated and the fruit greatly expanded. The banana plant being seedless, is propagated by suckers requiring about eleven months for the tree to get its growth and the fruit to mature. It is very prolific—that is, the yellow variety—forty plants can be grown in a thousand square feet, which will bear 5,000 pounds of fruit annually and it is possible to grow as much as 175,000 pounds of bananas annually on a single acre of ground. The banana plant has a soft stalk, is from 10 to 18 feet in height. Each plant bears only one bunch of fruit which hangs with the "hands" curving upward. The description of the starting of a new plantation may be thus condensed:—The dense tropical growths of bush, trees and creepers are first cut down and when these have sufficiently dried, fire is set in several places on the windward side. A few hours of crackling flame, and the field is covered with a pall of gray ashes, and with black tree trunks. The ground is ploughed. The banana sprouts or suckers, are then set in the rich black soil. The suckers look like clumsy clubs from one foot to four feet long and from two to five inches in diameter. In eight or nine months after the planting, the plants will have their plumes, 18 feet high, sheltering bunches of full fruit which is ready to cut in two or three months thereafter. Each three or four months a new set is allowed to come on to take the place of the older ones as they mature their fruit and are cut down. By this plan three or four crops of 190 to 225 bunches each, or 570 to 900 bunches per acre per annum can be obtained; and by planting fields once succeeding months, the fruit is ready for export the year around. A plantation requires to be replanted with new shoots about once in every five years in order to maintain the highest quality of the fruit.

TEA CURING MACHINERY.

We would call the attention of those of our readers who are engaged in the manufacture of tea to the extract from the *London Engineer*, which we give in another column in reference to this subject. It is curious to notice the views which sometimes find expression in the home papers regarding Indian matters. The process of tea manufacture, and the machinery in use in modern factories, has been so often and so fully described that we are somewhat surprised to see our contemporary describing, as if it were something new, the idea of utilizing the hot air from the driers, in the withering lofts. As is well known this has been tried for a very long time, and experience has shewn that when properly applied it gives good results under certain circumstances, on cold days for instance. So far as we are aware, however, far from having the withering lofts closed against the admission of any but the hot air, it has been found that the latter can only be admitted very sparingly as an auxiliary to the cold air. Again, it is not quite correct to say that in ordinary circumstances in firing the tea, the same air is used over and over again. As a rule the drier furnaces are low down, near, or below, the floor level, so that the air issuing from the machine at a temperature of say, 200° would not be likely to find its way back again, provided it could find any outlet at a higher level, as it generally can. To supply the furnace and the heating stove—the drying air does not of course pass through the furnace at all in modern machines—a current of cold air find its way in through an open window, or perhaps more usually through the door which is generally found opposite the machine for convenience of getting in fuel, etc. We hope before very long to be able to begin a series of articles fully illustrating tea machinery, from the time of its first introduction, and we shall be glad to receive from any of our readers items which may have an historical interest regarding the subject. We cannot quite agree with our contemporary in thinking that anything like perfection has been arrived at. New patents are continually being taken out, and we look forward to seeing many more important improvements introduced. —*Indian Engineer*.

TEA CURING MACHINERY.

(From *London Engineer*.)

In our issue of May 6th, 1892, we made reference to the important character of the machinery that the competition of India and certain British Colonies with the long-established tea trade of China had brought into use. We then wrote under the impression that the machinery was of so highly effective a character that little or nothing could be added to it to improve the quality of the finished tea turned out by it. But it has become known to us that in that impression we were mistaken. It is true, perhaps, that as regards the machines themselves improvement was scarcely possible, but even this approach to finality did not overcome a tendency to inequality of production, which was especially noticeable at varying seasons of the year, humidity in the external atmosphere being responsible for a variation in this that often reduced the price obtained for the tea made by more than 50 per cent. While, therefore, it appeared to be almost impossible to devise improvements in the machines themselves, it at length became manifest that some alternation of procedure was necessary if a level of quality was to be maintained. It struck an intelligent observer that the drying apparatus was being worked on a wrong *ab initio* principle. The air discharged from the fan drawing it through the furnace and over the tea was suffered to escape into the room containing the drying machines. This air was necessarily charged with the moisture extracted from the leaf during its treatment. And yet the same air is, under existing methods, suffered to re-enter the furnace and again pass over the tea trays. Hygrometrical tests made have shown that this air is charged up to 100 per cent with

humidity. On entering the furnace this becomes developed into a steam vapour most injurious to the drying tea. Manifestly, therefore, the remedy must be to prevent air so charged from re-entry into the drying chamber. One estate which has made the change has, we are informed, found as the result that its teas maintain an almost level quality throughout the year. A further improvement, it is said, will result from permitting the air so discharged from the fans to play upon the tea leaf during the preliminary process of withering. At present this process is assisted during damp weather by passing over it a strong blast of dry heated air. The result of this is unsatisfactory, as it produces a hardness and dryness not desirable in this first stage of treatment, and it besides induces a premature fermentation highly detrimental. The system now proposed is to lead the warm humid air discharged from the fans in the drying-room to the withering chambers, these being made as air-tight as possible, and having their only vents on the floor level, so as to insure the escape of the colder air only. While, therefore, the machinery used will remain as at present, the method of working it and the adaptation of its issuing products will alone be changed; and this, it is confidently expected, with most profitable results.

BARK AND DRUG REPORT.

(From the *Chemist and Druggist*.)

London, Feb. 8.

CINCHONA.—Tuesday's bark-auction, following so closely upon the recent excitement in the quinine-market, was looked forward to with some expectancy and in the confident hope of showing firm quotations. The quantity of good bark offered was small, the seven catalogues including of:—

	Packages	Packages	
Ceylon cinchona ..	390	of which 149 were sold	
East Indian cinchona ..	389	do	353 do
West African ..	223	do	210 do
Bolivian cinchona ..	489	do	434 do
Cuprea bark ..	520	do	16 do
	1916		1162 do

Although the supply of East Indian barks offered was comparatively small, the assortment was much finer than usual; it included several piles of excellent Leiger and Officialis, original, as well as renewed. At first competition was a little slow, but in the course of the auctions, and especially when high-class barks were reached, it became very lively. Good lots sold at some increase upon the last auction-rates, the unit for such kinds occasionally reaching 1d per lb., while upon an average it may be quoted at 2d to 3d per lb. Some parcels were bought in because they were too highly limited. It may be remarked that the agents for the Philadelphia factory who have lately bought very little, were today the largest purchasers.

The following are the approximate quantities of bark bought by the principal buyers:—

Agents for the American and Italian works ..	Kilos.
Messrs. Howards & Sons	62,650
Agents for the Mannheim and Amsterdam works ..	49,500
Agents for the Brunswick factory	21,325
Agents for the Paris factory	16,401
Agents for the Auerbach factory	15,506
Agents for the Frankfurt-on-the-Main and Stuttgart works	4,120
Sundry druggists	3,000
	22,234
Total quantity of bark sold	194,433
Bought in or withdrawn	115,658
Total quantity of bark offered	310,594

WEST AFRICAN CINCHONA.—This variety of bark was represented at the auctions in considerable quantities 225 bales of it being shown, of which 210 sold with fair competition at 2½ to 3d per lb. for fair medium-sized silvery quill, and 2½ to 2¾ per lb. for small and bold slips (and broken quill mixed. Nearly the whole of the parcel which was recently imported via Lisbon) was in sound condition.

SOUTH AMERICAN CINCHONA.—The sales included 439 packages cultivated Bolivian Calisaya bark, of which 434 (all ballots of ½ cwt. weight) sold with good competition

at steady prices—viz 3½d to 4½d per lb. for dull irregular to fair quill. The whole of these parcels was sea-damaged. For a lot of 55 larger bales of better quality, partly sound, a bid of 44 per lb. was refused.

CUPREA BARK.—Five hundred and twenty bales of old eupca bark (1882 and 1883 import) were again offered. Various bids, ranging from 1½d to 1¾d per lb were refused for them, but at last 16 bales of common damaged bark found a buyer at 3½d to 4½d per lb.

There has been a very considerable diminution in the stock of bark in Amsterdam during the month of Jan., the supplies in first hand having been reduced from about 12,000 to about 8,000 bales. On the other hand, the exports from Java during the month of January were heavy, nearly 974,000 half-kilos, against about 980,000 half-kilos in January 1893. The total weight of quinine in the bark at Tuesday's auctions was about 4,700 kilos.

COCAINE.—The most interesting article of the week in the chemical trade has been cocaine, which has undergone another sudden and important modification in price. The manufacture of this important drug, so far as our market is concerned, is in the hands of two British and five German manufacturers. One of the latter quotes a price which places him outside active competition; another of them has recently started business, and has given much annoyance to his colleagues by underselling them, and thereby occasionally disturbing the market. The three remaining German makers and the two Britishers have a kind of understanding, by virtue of which they quote the same rates, and make simultaneous alterations. For some weeks the price has gradually been advancing, and on January 10th the figure of 18s for bulk was reached. The new manufacturer on Monday last, apparently quite unexpectedly, sent out a circular quoting 3d below this price, but he does not seem to have effected any sales, and it is questionable whether his price has ever been an effective one; at any rate, it was withdrawn almost immediately after it had been published, but not until a good many second-hand holders, more or less scared by the apparent drop, had parted with greater or smaller quantities at from 15s 12d to 15s 6d per oz. This remained the state of the market until yesterday, when suddenly the combined manufacturers announced an advance of 2s per oz. all round, bringing up their quotations for 100 oz. lots to 18s between 25 and 100 oz. to 19s 3d, and smaller quantities 18s 6d per oz. The outsider, if we may so call him, did not put in an appearance on Change yesterday, where there were many anxious inquiries for him, but today he announced that he had withdrawn his quotation and expects a new one tomorrow. The cause of the advance is generally attributed to the smallness of the supply of crude cocaine, but it is questionable whether some arrangement has not been arrived at whereby the outside firm has been admitted into the combination. During the last two years the alterations in the quotations have been as follows:—

1892:—	Jan.	March	April	May	Aug.	Nov.	
Per oz...	23s 6d	22s	21s	19s 6d	18s 6d	19s	
1893:—	Jan.	May	July	Sept.	Sept. 18	Oct.	
Per oz...	19s	18s	18s 6d	17s 9d	15s 6d	15s	
					Nov.	Dec.	
					Per oz...	14s	14s 6d

QUININE.—The excitement caused by the publication last week of the quinine stocks in the London warehouses abated considerably on Friday last. On that day 15,000 oz. second-hand German bulk quinine sold for spot delivery at from 11½d down to 11¼d per oz. From then until the middle of this week the market remained completely stagnant, and prices were tending slightly weaker, but on Wednesday buyers came forward once more, and 20,000 oz. second-hand sold on the spot at 11¼d per oz. There are now no sellers below 11½d per oz. The following are the manufacturers' quotations: Howard & Sons, bulk 1s 2½d to 1s 3d; vials 1s 3d to 1s 4d per oz.; Pellier, vials 1s 5d to 1s 5½d per oz. B & S, Auchbach, Zimmer, Jobst, and Brunswick, bulk 1s 1d per oz. Fabrica Lombarda, bulk 1s 1d; vials 1s 3d per oz.

VARIETIES OF EUCALYPTUS FOR OIL.—The distillation of the oil—says the Journal of the American Medical Association—was first initiated by Baron von Mueller. E. amygdalina yields more oil than any of the other varieties and is therefore almost solely employed for the purposes of distillation. It is also one of the best for subduing malarious effluvia in fever regions, although it does not grow abroad quite so well or quickly as E. lobulus. The respective hygienic value of the various trees may to some extent be judged by

the percentage of oil in their leaves, as stated below:—

	Per cent of Oil.
E. Amygdalina	3.313
E. Oleosa	1.250
E. Leuceoxylon	1.060
E. Gonioealyx	0.914
E. Globulus	0.719

The lesser quantity of oil in E. globulus is compensated for by the vigor of its rapid growth and early copiousness of its foliage. It readily adapts itself to other climates and hence abroad nearly all of the varieties of the oil are known as globulus. During the last twenty years the blue gum has come into high repute as a sanitary tree. A high authority states that the sewage systems of large towns in warm climes would be simplified if each house had the evergreen gum tree in the backyard. The disinfecting and deodorizing virtues of the tree are unquestionable. Flesh of any kind is as well preserved by eucalyptus as by creosote while beef sprinkled with eucalyptus will dry hard without putrefaction. It is fatal to bacteria and other micro-organisms. It may be injected into the veins and arteries of cadavers for purposes of preservation. It is also a good admixture in dressing gangrene.

THE MAGAZINE

OF

THE SCHOOL OF AGRICULTURE,

COLOMBO.

Added as a Supplement monthly to the "TROPICAL AGRICULTURIST."

The following pages include the contents of the *Magazine of the School of Agriculture* for March:—

Vol. V.]

MARCH, 1894.

[No. 9.

SYSTEMS OF CULTIVATION.

TO MAINTAIN the fertility of land is the ultimate object of every practical agriculturist. In a sense every measure that the intelligent cultivator adopts in his agricultural practice is calculated not to exhaust his soil, but, to maintain the fertility of the land. For instance, the ordinary process of "working the soil" by whatever means, aims at making the soil fertile, in the real sense of the term, namely, capable of 'bearing fruit'—of producing crops. There may, however, be said to be a number of so-called "systems of cultivation," adopted to varying conditions and circumstances, and intended to maintain the fertility of the land under cultivation.

Not long ago Jethro Tull, the father of modern husbandry, believed in the possibility of growing the same crop on the same land year after year without manure, provided deep and thorough cultivation was practised. On virgin soil it may be possible to continue to grow the same crop year after year, or to cultivate a perennial plant without the addition of manure to the soil, but no intelligent cultivator expects land treated according to this system, to yield a remunerative return for any length of time. Tull, however, did great service to the cause of agriculture. He was the inventor of the drill, and the result of his three great principles, drilling, reduction of seed and absence of weeds helped to bring about a complete reformation in the agriculture of his time: and by his attempt to cultivate without manure, he at any rate showed the agriculturist that thorough working and pulverization of the soil render a much smaller application of fertilizers necessary. It was of Tull that Dr.

Johnson remarked: "His deeds, his triumphs were of the peaceful kind, with which the world in general is little enamoured; but their results were momentous to his native land." His drill is said to have saved to the world in seeds alone the food of millions.

Our correspondent W. A. D. S. in his last instalment of notes which appeared in the January number of the *Magazine*, describes the method adopted by the Indian cultivation, and shows that the principles of Tull, viz., drilling, saving of seed, and absence of weeds have been recognised by the ryot. The question of weeds has been a vexed one amongst us, that is in connection with the cultivation of perennials. In the case of annual or biennial herbs and shrubs, however, there is no doubt but that every means which secures freedom from weeds to the growing crop should be availed of. Another system where the use of manure is theoretically tabooed is that known as Smith's *Lois Weedon* system. This would seem to be a modification of Jethro Tull's idea. According to it three rows of seed are sown at suitable distance apart, and a breadth of land equal to that occupied by the seed is left unsown between each set of rows. The fallow of this year is in crop next year, and the crop of this year in fallow the next, and so on. With deep and thorough frequent tillage this has been proved to be a successful system.

In his book on India, Professor Wallace mentions that Mr. Ozanne, of the Bombay Agricultural Department, had a series of most useful experiments going on at the time of his (the professor's visit) and says:—"I was particularly struck with his *Lois Weedon* plots growing wheat year after year on the same area, though not exactly in the identical part of the soil. The crop was sown in groups of three rows, twelve inches apart, with intervening spaces of fallow land. The land which is under crop the first year is fallow next year, and *vice versa*. The advantages are that the crop has the benefit of the whole air space, while the land has a rest every alternate year. I believe it is possible that this system may have a great future in India."

OCCASIONAL NOTES.

The Government dairy has just passed through troublous times, which came upon it with special severity after its unbroken period of prosperity since its establishment. The epizooty commonly known as murrain appeared among the stock early in January and carried away a number of the stock belonging to the dairy. There is reason to hope that the plague has now been stayed, and it is a source of satisfaction that the majority of good milkers have escaped its ravages.

A new class of students, consisting of 16 boys, were admitted into the School of Agriculture on January 15th, when the school re-opened after the Christmas holidays.

A new school, which is intended to be a centre of agricultural work, has been opened at Dip-pitigala in the Sabaragamuwa Province, and Mr. Alwis who completed his course at the School of Agriculture last year has been appointed the teacher. This is the fourth appointment of an Agricultural Instructor in the Province, and shows the solicitude of the Government Agent for the welfare of the inhabitants of his dominions in which so much remains to be done in an agricultural way.

It will no doubt delight the hearts of the members of the anti-opium league to learn that a quantity of the seeds of *Papaver Somniferum* sent to us from India for trial, totally failed to germinate.

WORKING UP THE SOIL.

The subject of ploughing is treated of in the following practical manner by Mr. G. H. Turner in the *Southern Cultivator*. In answer to the question why do we plough? he replies:—

1. To bury a surface growth of sod under the soil, where, by its decay, it will add its elements of fertility to the general stock of plant food already in the soil.
2. To kill weeds, thereby obtaining a clean surface, so that crops may enjoy undisputed and sole possession of the soil.
3. To thoroughly pulverise the soil, so as to make a perfect seed bed for the young and growing plant.
4. To break the crust after each rain, so that the land shall imbibe its full share of heat, air, and moisture. In preparing the land for the reception of the seed it is highly important that the husbandman should know just exactly how to plough, but after the ground is all prepared and the crops are planted it becomes doubly necessary to know not only how to plough and when to plough, but also why it is necessary to plough at all, and what we expect to accomplish by it. In whatever manner the ground may have been prepared for the crop, whether by ploughing deep or shallow, surface cultivation, oft repeated, should be the order of the day for any and all crops that have to be cultivated by ploughing and hoeing. This "surface cultivation" not only kills all grass and weeds, but, breaking the crusts after

each rain, opens up the soil to the air, allowing it to enter, to be absorbed by the soil, and to pass out from the soil freely. This loose surface soil is, in short, the lungs that enable both the soil and the roots of plants to breathe. This "breathing process" is not only of prime necessity to the healthfulness of the growing plant, but it is also essential to that important process termed "nitrification," by which organic nitrogen in the soil is changed into nitrates, the form in which nitrogen is appropriated by plants almost exclusively. Nitrification requires a pretty high temperature, but in soils that contain a liberal supply of humus, and are stirred frequently with the plough cultivator or harrow, will go on rapidly in warm weather. Large quantities of land are so close in texture, so tenacious and air-excluding as to be almost barren (this is the case with a great many of our pastures), yet these same semi-barren soils contain, in their natural state, inexhaustible quantities of plant food, often proving to be the strongest soils we have. This state of semi-barrenness is sometimes due to too much water, but still oftener to a lack of aeration of the soil, or, to make the matter as plain as possible, a lack of lungs to breathe with. This "breathing process" can be brought about by drainage where the lands are too wet; by deep ploughing on all soils that will stand deep ploughing, and thorough ploughing on any and all soils. Thorough cultivation, including sub-soil ploughing, harrowing, rolling, etc., unlocks the stores of plant food the soil contains. Where the ground is lumpy and cloddy it is in too coarse a form to be utilized by the roots of plants; no matter how rich in plant food these coarse particles may be, they must be thoroughly pulverised by frequent and thorough cultivation before they can be made available as plant food. The more frequent the cultivation and the more complete the pulverisation of the soil the greater the quantity of plant food that is made available, and the more rapid and luxuriant will be the growth of the plants. One fact should always be borne in mind—namely, that plants do not eat; they drink; consequently no matter how voracious a feeder a plant may be it cannot eat clod, nor appropriate it to its uses in any manner. A clod is dead property; worthless, unprofitable, good for nothing. Most men are inclined to complain when forced to pay tax on a horse that is dead and buried, or a horse that has been consumed by the flames. A clod is equally dead.

We come now to what we consider to be the most important reason of why we plough—namely, conservation of soil moisture. To conserve the moisture that is deposited in the earth by rains and melting snows, and even by dews, necessitates deep preparation of the soil previous to planting, so that the rains may be readily absorbed. When absorbed it must not be allowed to escape by evaporation; but if the full benefit of the winter and spring rains are to be realised the moisture must be carried quickly down beyond the immediate reach of the evaporating influences of the sun. Stored deep in the earth, a perpetual reservoir, it is ready to be brought to the surface for the use of the growing plants when needed by the "capillary action" of the earth.

In order to make this matter plain to the average reader we would say that after every rain the soil is settled down, the particles of earth are packed nearer together, and the spaces between them are small. A number of these small spaces joined together make little tubes, called "capillary tubes," and in these water will rise from below. If the soil has not been disturbed after a rain these tubes come to the surface, and so does the water in them. The water coming to the surface evaporates and escapes, consequently is lost as far as that individual crop is concerned. When the soil has been ploughed the spaces or tubes are made larger, and water will not rise in large tubes. Hence it comes up as far as the small tubes are undisturbed and stops there, and the loose soil above prevents its rapid evaporation. In this way and by these means the natural pores of the earth are closed; the loose dirt serves as a "mulch," and the soil moisture is conserved in time of drought and retained in the soil (exactly where it is needed) from one rain to the next. This mulch not only prevents the escape of soil moisture, but it also tends to check the intense heat of the sun in its downward progress to the roots of plants. Both of these are very important matters during spells of long continued hot, dry weather.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

The five sub-kingdoms which have now been considered, viz., *Protozoa*, *Cœlenterata*, *Echinodermata*, *Annulosa* and *Molusca*, are commonly grouped together under the name of *invertebrata* or invertebrate animals. There now only remains the sixth and last as well as the highest sub-kingdom, that of the *vertebrata* or vertebrate animals.

SUB-KINGDOM VI. VERTEBRATA.—The name of this sub-kingdom is derived from the general, though not universal, presence of the bony stem known as the vertebral column, spine or backbone. In its most complete form the vertebral column consists of a number of separate bony segments or vertebrae, arranged so as to form a bony axis upon which the part of the nervous system called the spinal cord is supported. In some cases the vertebral column is partially bony or permanently cartilagenous, or again is replaced by a notochord "a peculiar gristly or gelatinous rodlike structure, consisting of cells enclosed in a fibrous sheath."

Characteristics.—Body composed of a number of definite segments placed one behind the other in a longitudinal series. The main masses of the nervous system are placed upon the dorsal aspect of the body and one cut off from the general body cavity. The limbs, when present, are turned away from that part of the body on which the main masses of the nervous system are placed, and are never more than four in number. In most cases a backbone or vertebral column is present in fully-grown animals.

Class I. Pisces, comprise the fishes which form the lowest class of vertebrata. Respiration in them is carried on by means of gills placed on either side of the neck of the fish. Water is admitted by the mouth by means of a series of

fissures in the throat, and after passing over the gills, it makes its escape by a single opening on the side of the neck called the gill-slit, which is covered over by a kind of folding door called the gill-cover. The heart usually consists of one auricle and one ventricle. The blood is cold, and the limbs when present are in the form of fins. As members of this class we may mention the shark, herring and eel. Under it are included all salt-water, fresh-water, and mud fish.

Class II. Amphibia. Among the amphibians (animals living both in land and in water) respiration is carried on at first exclusively by means of gills, afterwards by lungs, alone or associated with gills. The skull has two condyles, the limbs never occur as fins, and the heart of the adult consists of two auricles and one ventricle. The common amphibians are the frogs, toads and newts. In the true frog the upper jaw always carries teeth, and there is a tongue, like that of the toad, fixed to the front of the mouth and free behind, which it can protrude at will. The typical frog has enormously-developed hind legs, the toes of which are united by membrane or are webbed; they swim very powerfully and can take extensive leaps. The tree frog is adapted for climbing trees, which it does by the help of suckers developed on the ends of all the toes. The fishes and amphibians are classed together as *Ichthyopsida*.

INDIAN JOTTINGS.

An interesting correspondence was recently published in the Bombay papers in the form of a report to the Bombay Municipality from its Health Officer, Dr. Weir, regarding the connection between epizootics and epidemics. Rinderpest and foot and mouth disease broke out in Bombay early this year. The Health Officer points out that these animal plagues are generally followed by human plagues, inasmuch as the air is infected with diseased germs. This, it appears, is not the first time Dr. Weir drew attention to the subject, for it is said that years ago even when Veterinary experts were doubtful regarding the true nature of rinderpest, he fought single-handed and took steps to prevent the spread of animal plagues solely with a view to preventing the outbreaks of human maladies. Besides, from that time, that is since 1874, he has carefully studied the subject and collected all available evidence on it and hence now speaks authoritatively. This throws a new light on the question of animal diseases. They are bad in themselves in causing material loss to the people, depriving them of their supply of meat and milk and the labour of the animals in the cultivation of the soil and the carting away of the produce. The agricultural labourer is the first to suffer from these causes, and oftentimes it happens that the wealthier classes, who are capable of devising measures for the prevention or suppression of these diseases are seldom affected, and hence rarely take a lively interest in the subject, particularly as they are unaware of the suffering and loss the poorer classes undergo on this account. But when it is now known that

animal plagues are followed by human diseases, it becomes a general question, and as everyone values his own health, he will no doubt take an interest in preventing a fruitful cause of disease.

In my last notes I had occasion to say something about the system of native agriculture in the remote districts of India. One thing which strikes a traveller most when passing through an agricultural district is the absence of any formidable weeds even in neglected lands. This no doubt is not a very promising sign, for whatever weeds may be accused of, they at least tend to show that the land is capable of supporting some growth upon it; besides, a weed is a natural renovator of neglected land. The weeds here are comparatively small, and nothing like our *lantana*. It cannot be said that *lantana* has never been introduced to these districts, and hence it had no opportunity of showing its power of propagation, for many a stray plant here and there is met with. Perhaps this shows that we have better soils in Ceylon.

The worry and trouble which the ryot in India has to undergo in raising a crop are more than an outsider could think of. For instance, in addition to an indifferent soil and the scanty rainfall, he has to wage a perpetual war against beast and birds at the time his crop ripens. Various devices are adopted to drive away the birds which flock in thousands to pick the grain from the ripening ears. There are scarecrows set up which take the form of men and beasts, rattles of various descriptions worked by strings, and lastly, the posting of men and boys in convenient places, among the crops to act as living scarecrows, and, when birds alight on the plants to give vent to such unearthly sound as would frighten even bolder robbers.

The powers of the buffalo in many parts of Ceylon are, so to speak, "wasted," for the only work he is expected to do is ploughing or puddling and threshing. One cannot quite understand why he is not made use of more. He is a strong animal capable of carrying much weight. It may be thought that as the buffalo is so fond of water that it would not be possible to drive him about on a road in a cart or with a load on his back. But this love of water in the buffalo could very easily be "cured." No one ever thinks of condemning the ox or the horse as incapable of doing work in an open country, because they originally lived in woods and plains away from man. In many parts of India the buffalo is not excused on account of his love for water, and he has to take his share of work. In Bombay are kept hundreds of milch buffaloes, which do not get any marshy place to wallow in, but are housed as cows are. There are again hundreds of working buffaloes which are used in mixing mortar for building purposes. These animals work in the hot sun without any apparent inconvenience, and drag the beam of the mortar mill round and round. In the hill-country it is a common sight to see buffaloes drawing heavy carts here and there about the streets, and they do it with greater ease than the ox. It is not unusual to see a buffalo and an ox forming the pair in a cart and

working together quite contentedly and disproving the truth of a common Sinhalese proverb. The great use to which the buffalo is put is as a water carrier. In many old towns the streets are all watered with water carried on the back of buffaloes in leathern bags. The *bishtee*, or the water carrier, in addition has to supply the house with water, and he does this with the aid of the enduring buffalo. I may mention, what would seem curious to the owners of buffaloes in Ceylon, that the working animals are shod as bullocks are.

The donkey is another animal which is much in evidence in some of the Indian villages. Its use is limited to only one class of people. The other castes believe that the animal is not meant for them. These poor animals, though they do much work, seem (unfortunately) to receive very little food and less kind treatment in return. They are generally small creatures, with dirty coats and slit noses and are made to carry heavy loads. In fact, the load sometimes put on their backs is heavier than what a man could carry. However heavy the load, the donkey seems to carry it about patiently. The greatest use to which the donkey is put is to drag the scavenger's cart. Every old Indian town has a special gang of scavengers of its own. These men are born scavengers, their fathers before them were, and their sons after them will be the same; in fact, the scavengers form a distinct caste of their own, and an important class they are, for the public cannot do without them and their companions the donkeys. The city of Bombay, with one of the richest Municipalities, the best-organized Health Departments, and with a supply of the latest sanitary appliances, felt its dependence on its horde of scavenging men, women and children during the late Mohammedan riots, when owing to their not attending to their work for a few days, the insanitary condition of the city made its guardians fear that the results of a plague may be more disastrous than those of the riots.

W. A. D. S.

BOMBAY.

PRESERVATIVES FOR CREAM AND MILK.

This subject has been treated of in the Journal of the Royal Agricultural Society, England; and it would be interesting to many, in a climate such as ours, in which milk and cream and butter are liable to turn bad in a very short time, to note the means which have been adopted to keep these products of the dairy in a state of preservation. One method of gaining this end (which however would seem to be an imperfect one) is sterilizing, which is effected by raising the temperature to 150° or 160° F. and then reducing it below 40° F., thus killing the lactic acid organism. This is said to be suitable for factories or large producers, but on the whole it is by no means a convenient method.

The other means, and that commonly in vogue, is the use of preservatives; and as regards this means the question arises, to what extent is

the use of preservatives desirable or permissible? Many different preservatives are in use, but most of them have a common foundation—boracic acid or a mixture of borax (baborate of soda) and boracic acid. Although one may very rightly object to anything of the nature of a drug in food, it has not been shewn that boracic acid when used in such proportion as is necessary to keep cream and milk sweet for a reasonable time has any harmful effect. Salicylic acid was formerly in much use, but it cannot be too widely known that its use is distinctly dangerous, that it has been condemned by medical authorities, and its sale not allowed under the English Food and Drugs Act, and that it should on no account be used in connection with food. Boracic acid, or a mixture of borax and boracic acid is therefore the safer substance to use; but great caution must be exercised especially in dealing with milk, on account of the greater quantity that is consumed. It may, indeed, be well supposed that in the case of infants, whose diet is so largely composed of milk, the consumption by them of milk to which preservatives have been added may be harmful. The amount of preservatives necessary for keeping cream or milk for a short time is very small. The following recipe is that of a mixture which will keep cream quite sweet for 4 or 5 days in England, even in hot weather, it is said:—1 oz. boracic acid, or $\frac{1}{2}$ oz. borax and $\frac{3}{4}$ oz. boracic acid dissolved in a quart of hot water. This will suffice for 20 gallons of milk or a table spoon of the solution to a quart (1 to 3,200 parts). Much stronger solutions are in constant use, as large a quantity as 1 oz. boracic acid being sometimes put to 2 gallons. But when strong solutions are used, some other substance must be added; for water will hold but a small quantity of borax or boracic acid in solution, and only a limited quantity can be put in without weakening the cream or milk, besides which the acid would give a bitter taste. Hence glycerine and gelatine are sometimes used as preservative mixtures. Both will hold a large quantity of borax and boracic acid in solution, and take away, to a certain extent, the bitter taste, though gelatine does so more effectually than glycerine: $2\frac{1}{2}$ oz. of gelatine steeped in 2 or 3 oz. of water, and dissolved in a solution of 1 oz. of mixed borax and boracic acid in a pint of hot water will, when cool, form a jelly which will keep any length of time. A tea spoon of the jelly will, it is said, preserve a pint of cream from 7 to 9 days in England. If these mixtures are used they should be added very sparingly, as a large quantity would artificially thicken the cream.

Sterilization and the use of preservatives, it must be remembered, only destroy or arrest the lactic acid ferments, and do not affect the numerous other bacteria which go on multiplying with the age of milk. It is, therefore, reasonable to suppose that milk and cream may not be wholesome even though they may not have turned sour. And to keep milk or cream for any length of time would appear undesirable. We should bear in mind that milk and cream are eventually perishable articles, and are intended for immediate consumption, though

by the careful and limited use of preservatives they may be kept for a short time without any deleterious effects.

NOTES FROM THE NORTH.

(Continued from page 59 of No. 8.)

10. The tillage done by the Jaffna cultivator is more thorough in its nature than that practised by cultivators in other parts of Ceylon. He ploughs and reploughs the land over and over again, so that the ridges which are invariably left after the first ploughing with the ordinary native plough may be entirely broken up, and he does not restrict his ploughing to the paddy land, but he ploughs the garden land, and in fact he is said to plough all land that can by any possibility be ploughed—a practice unknown in the Sinhalese districts. In the case of tobacco lands, instead of the first ploughing, the soil is in most cases turned over with the mamotty, and in the last ploughing the soil gets so loose and pulverized that the plough works without any pressure on the handle.

11. The Jaffnese make up for the poverty of the soil by careful manuring, making use of every available scrap of manure. But the mistake they make in common with the Sinhalese goiyas is to leave the heaps of cattle manure in the open, exposed to sun and rain—a mistake that can be very easily rectified.

The sheep is the animal largely used for penning on garden lands for manure so as to utilize both the droppings and the urine. The Jaffnese generally prefer goat mutton, and they have some prejudice against eating the mutton of the sheep connecting certain skin diseases and impurities of the blood with it; and the wool found on them is next to nothing. But they are highly appreciated for the manure they yield, and rich gardeners own them by hundreds.

12. The practice of applying green leaves to the soil is a very good one, and cannot be too highly recommended for the Jaffna soil which is naturally poor in humus. During the month of January we find gardeners eagerly buying up leaves that grow on the hedges, trees and undergrowth of the compounds and taking them by cartloads to their tobacco lands. There are many kinds of leaves which are very much sought after by gardeners for this purpose, and there is no doubt that experience forms a safe guide to them as to which to select and which to reject. But there is one species of plant very commonly used as green manure which is deserving of special mention. I mean the common shrub called *Tephrosia Tinctoria* by botanists, and known as *kavitai* in Tamil and *pila* in Sinhalese. This plant stores up valuable nitrogenous matter which it probably takes from the air. Being a leguminous crop it is also rich in lime, so that it must be a very suitable manure for tobacco.

13. The algae or sea weeds washed adrift to the shore are very commonly used in Jaffna as a manure for garden lands and paddy-fields, provided they are not brackish. Sea weed is peculiarly rich in the alkalies potash and soda, and is used as

a top dressing or is buried composted with cattle manure. Being fairly quick in decomposition it before long yields its manurial properties to the crops.

14. Bone dust is used all over the south and west of the island by the Sinhalese goiyas for manuring their paddy lands. But the Jaffna cultivators being mostly Sivites seem to have some antipathy or prejudice against the application of bone dust to paddy. But one who knows how plant food is, so to speak, purified before it is taken in by the rootlets of plants should not have any objection to the use of bones on the score of uncleanliness. Even the most offensive manure is transformed into useful vegetable matter after it is taken up by plants.

Every animal that we rear represents a certain amount of bone-forming material taken from the soil; for all the phosphate of lime that goes to build up the bony framework of animals can be ultimately traced back to the soil. If therefore this substance is not returned to it in some form or other, it will gradually become poor in bone-forming materials until at last the supply is entirely exhausted. Hence arises the importance of bone dust as a manure. But, of course, in the case of Jaffna lands, as cattle manure is very freely used, small quantities of bone dust applied with the former so as to supplement it will be quite sufficient.

E. T. HOOLE.

(To be continued.)

GENERAL ITEMS.

A most interesting paper is published in the *Allgemeine Forst und Jagd, Zeitung* of November, 1892, by Dr. Seiroko Honda of Tokio on his enquiries regarding the influence of the height above the sea-level on the growth of forest trees, and their reducing factor.

The enquiries and valuation surveys have been very searching and extended over areas of elevation ranging from 900 to 1,050 metres, from 1,050 to 1,200 metres, from 1,200 to 1,350, and from 1,350 to 1,500 metres.

The result of the experiments are shortly summarized showing that with increase of absolute elevation of the locality, the following changes take place in the growth:—

A.—THE INDIVIDUAL TREE.

1. The increase in height lessens regularly and distinctly.
2. The basal increase also decreases, but less so than the growth-height.
3. Increase in volume lessens gradually.
4. The stage of immaturity in all these directions is prolonged.
5. The form of the bole becomes less and less cylindrical and approaches more and more the neiloid.
6. The proportion of the increase of the several parts of the tree decreases from the bottom towards the top of the stem.
7. The reducing factor becomes smaller.
8. The crown formation gets lower in proportion to the bole.
9. The proportion of small branch wood increases.

B.—OF THE FOREST.

10. The actual number of stems per area increases, whilst however—
11. The number of stouter and dominant trees decreases.
12. The mean height of the forest decreases.
13. The total basal area decreases, not very apparently, but belongs to a great extent to trees of inferior growth.
14. The outturn in timber, scantling and first-class wood decreases distinctly.
15. The outturn in small branch wood increases to some extent.
16. Trees of the same age are more inclined to form groups.

Says the *Indian Agriculturist*:—Years ago it was thought that none but a skilful person could grow grapes. Now the person who has not intelligence enough to grow grapes for his family should be pitied. Grape-growing is the simplest of all things. And think what the yield may be of one grape vine; consider that it will bear grapes as long as you live, though it be a hundred years. Bear in mind this, that the old wood that has borne grapes once never bears grapes again; but that the wood that is formed each season is the bearing wood for the next season; also note that if all the new wood is left on, the vine will bear a hundred times more clusters than it should: thus all the clusters will be small and imperfect. But if nine-tenths of the new wood is cut away, leaving only two or three buds of the new wood on each stalk, the yield will be increased ten-fold—and the size of the clusters be much larger. The United States is rapidly taking the lead in grape culture.

The following is the first forecast of the Madras paddy crop of 1893-94:—The latest reports, giving the area figures up to the end of November for Government villages, show that there have been 128,800 acres more sown with this crop than is usual. This represents an increase of 2.6 per cent on the normal area. The increase is common to all districts, except Madura and Tinnevely, where the area sown is slightly below the normal. Compared with last year, the area sown is about 3 per cent less, the decrease occurring in the Deccan and Carnatic districts, where the sowings in 1892 were exceptionally large and early. The reported estimated average outturn works out to between 11 and 12 annas for the whole presidency—16 annas being taken to represent a full average crop. In parts of the four northern districts, the crops have been injured to some extent by the exceptionally heavy rainfall of November, or doubtless the probable outturn in these districts would have been greater. In the Deccan and Carnatic districts, the usual rainfall of the north-east monsoon was rather late, and, especially in the latter group of districts, the young crops suffered a good deal in consequence during October. Similar reasons have retarded cultivation, and to some extent lowered the probable outturn in the extreme south. On the West Coast the season has not been quite so favourable as in 1892. On the whole, however, the crops are good, and the probable average outturn may be estimated at rather above the rate specified in the table above, which is obtained from the tehsildar's reports.

RUBBER FROM COTTON SEED.—Artificial India-rubber from cotton seed oil is one of the latest industrial products. It is claimed to possess commercial adaptations of peculiar practical value. The manufacture involves a process not yet given out to the public by the discoverer, who states that while experimenting with cotton seed oil to produce a varnish for paintings he obtained a substance entirely foreign in its make up and properties to what was sought—not a varnish, but rubber. So simple is the process, as alleged, that it is not within the protection of a patent, the only safeguard being, therefore, in the secrecy of the process, by the use of which, it is asserted, only 15 per cent is required of the genuine rubber to produce an article which can in no way be distinguished from the ordinary crude indiarubber, it is said, even by experts in the handling of the latter article. Arrangements have been made for its extensive manufacture and its application to the various purposes so long peculiar to the natural material.

The tree producing Chaulmugra oil, which has been found to some extent efficacious, in the treatment of leprosy, is *Gynocardia odorata* a moderately-sized glabrous evergreen, readily known by the hard round fruits which grow

on the stem and branches, and resemble a Brazil nut without the hard shell. The fruit is so unctuous that the oil can be expressed by the hand. The seed yields under hydraulic pressure from 25 to 30 per cent of oil. Chaulmugra seeds generally sell in Calcutta at R5 to R7 per maund (82 lbs.), the oil at R60 to R70 per maund wholesale, and its retail price is R2½ to R3 per pound.

"Preservitas," a Victorian product lately exhibited with other Victorian produce in Ceylon is thus referred to by the *Queenlander*:—A new use has been found for preservitas, a compound of boracic acid which is employed very largely in Victoria for preserving butter in good condition. Ham and bacon are protected from the ravages of the maggot fly by dipping them in a solution of "preservitas" in water. In solution, at the rate of one or two handfuls to each gallon of water, it cannot possibly be hurtful to meat or hams that may be immersed in it. The flies seem to frequent the bacon after being dipped the same as before, but the important point is that none of their eggs ever hatch. It is thought that the same good results would be obtained by immersing cheese for a moment in this solution.

“PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

JOHN GAVIN,

PLANTER AND MERCHANT.

INTRODUCTORY.

OR one who did his full share of work as a Pioneer Planter in “the forties,” and who rose to be the head of the most important Planting Agency House in Ceylon, John Gavin left

singularly few references to himself in our local annals. He was reserved and retiring in disposition; averse to taking any part in public life, although keenly alive to all that concerned the development of the Planting Enterprise in road and railway construction. During his later years in Kandy, when, as the leading man of business and perhaps the wealthiest citizen, he might have been expected to share largely in the responsibilities of the Planters' Association and Legislative Council, his deafness operated against his moving out of his own immediate sphere of business. He gave his influence, however, to the resuscitation of the Planters' Association in 1862, and even occupied the chair for a few months in that year before his retirement from the Colony. But it was as a practical planter and a strictly honorable merchant and estate agent that Mr.

Gavin was best known and will be longest remembered in Ceylon. He rose to be the head of the leading Agency House of Messrs. Keir, Dundas & Co., Kandy, who, at the time he handed the business over to Messrs. G. D. B. Harrison and W. M. Leake, were known to have on their books over a hundred of the most prosperous plantations in the island, for which as agents and business managers—generally for absentee proprietors—they received in fees and commissions at the rate of £100 each plantation per annum, making an income from this source alone of £10,000 a year. In few men has so much confidence been shown by his brother colonists as in the subject of our notice, and the sobriquet of “Honest John,” by which he was most widely known, shews that to him might be applied the description which John Ruskin placed on the grave of his father,—“an entirely honest merchant.” We must now proceed, however, to give an account in consecutive form of the life and career of Mr. Gavin, although the writer having only met him once, soon after his own arrival in the Colony in 1861, finds himself rather in the position of one who has to make “bricks without straw.” To one or two relatives and friends of Mr. Gavin he is indebted for the memoranda which have enabled him to present the following brief and imperfect memoir.

AN HARD-HEADED ABERDONIAN.

In speaking of the early Planting Pioneers of Ceylon, one is inevitably reminded of the "granite city" and the district of which it forms the capital. "Tak' awa' Aberdeen and twal miles roun' an' faur (where) are ye?" is specially applicable to the beginnings of the Planting Industry in Ceylon. John Gavin was pre-eminently a large as well as a hard-headed 'Aberdonian.' His portrait, it will be noted, does not belie the description. He was born in September, 1819, at Strichen, Aberdeenshire, where his father, Dr. Gavin,—after retiring from the Navy—acquired a very large practice to which his son—a brother of John—succeeded. The sisters of our Mr. Gavin again married well-known men, one of these, Dr. Anderson of the Gymnasium, Aberdeen, whose sons as Anderson, Anderson & Co. became the founders of the Orient Steam Navigation Company; and another sister was married to Dr. Anderson of Morpeth, the father of John and Geo. Anderson of Philpot Lane, both of whom like their uncle, became closely connected with Ceylon. Mr. Gavin was educated in the Parish School of Strichen—at a time when the parochial system of Scotland afforded the most admirable groundwork for a youth's education of any school-system in the world. He afterwards passed to a Grammar School or College in Aberdeen. Intended for mercantile life, we next find him as a mere stripling, (17 or 18 years at most) in a merchant's office in Manchester; but this did not suit his health; for after no long interval he had to return home and the old Doctor set him to farming on a farm tenanted by himself. John Gavin continued here for several years—perhaps five—until the farm was given up on his father's death; and then John went into the Agency Office of the Union Bank in Peterhead as an Assistant Accountant. Passing from thence to the same Bank's office in Aberdeen, he, very soon after, followed in the track of a good many of his countymen to the Far East of Ceylon. He was now in his 24th year, and it must be confessed had had an admirable training as farmer, banker and businessman to qualify him for his future career of coffee planter and merchant.

IN CEYLON AS PLANTER.

Mr. Gavin landed in Ceylon on the 4th July, 1843, and very soon got employment under what was then the leading planting house, Messrs. Acland, Boyd & Co. By them, one account says, he was sent to Galoya estate above Peradeniya, where he was in charge in September of that year. Another report, however, is that Mr. Gavin was first sent as assistant to Windsor Forest and Kelvin estates, Dolosbage district, and thence he was removed to Mooloya estate, Upper Hewaheta, which he

opened and continued to manage for some years. After this, he had another move to Kondesalle in the Dumbara Valley. Here he was manager when the dark days of 1847-8 overtook Ceylon—wild speculation being followed by depression and stagnation intensified by the low price to which coffee had fallen after the abolition of the differential duty which protected British-grown from the competition of Java and Brazil coffee. So low did the price fall, that in 1849 it was only 3s. per bushel in Kandy, and the natives did not take the trouble to pick their crops! Two crops of Badulla coffee were sold at the estates' stores for 3s. a bushel; and a dealer elsewhere has related to us that he bought a bushel of rice and a cwt. of native coffee for the same price 9s.! One-tenth of the plantations originally opened were at this time abandoned; while others were sacrificed for "a mere song." An estate that sold in 1843 for £15,000 was in 1847 knocked down at auction for £440 only! Hindugalla plantation, Badulla, which had cost £10,000 realized at sale but £500; and these are specimens of many more similar transactions.

MERCHANT: "HONEST JOHN."

Messrs. Acland, Boyd & Co. succumbed, and in 1848 Mr. Gavin joined another of the firm's employees, Mr. Pitts, in establishing the Kandy Agency firm of Messrs. Pitts & Gavin. It was a time when it required no ordinary courage, perseverance and hard work to make a profitable business, and Mr. Gavin had undoubtedly all these elements; but after a few years, the death of his partner broke up the firm, and (in 1856) Mr. Gavin saw his way to do better by placing his services as managing partner at the disposal of his countrymen, Messrs. Keir and Dundas, who had established the firm still known, by their name in the Central capital, and which was destined to rise to its highest pitch of prosperity under Mr. Gavin's guidance. It was before this time that Mr. Gavin's plain, straightforward speech and just dealings had earned for him the title of *Honest John* among the planters.

EARLY EXPERIENCES AS PIONEER.

Before, however, approaching the prosperous days of the "fifties," we may refer back to some of Mr. Gavin's early experiences as a Planter, to shew how well he deserved the good fortune which afterwards overtook him, mainly, however, as the result of his own industry, shrewdness and integrity. The proverbial £8-6-8d. per month did not even come to John Gavin at the outset of his career as planter: he started rather on a salary of £5-10s. or 55 rupees a month, and he has been heard to describe

his bedstead in his earliest bungalow or shanty as a plank laid on two boxes and his only seat another box. A young Scot not afraid to "rough" it after this fashion, of course, managed "to live on his pay" of £70 per annum, and in the following year he was drawing £120. His employers had discovered the value of his services, and indeed if John Gavin did not feel bound in honour to the firm that had first taken him up, he could have commanded in the outside market £200 to £250 very early after learning his work and showing of what stuff he was made. Many young men of that time felt no scruple about throwing up engagements on the plea of being underpaid; but John Gavin was not one of them; and in his case as in that of others we know, who regarded their word as their bond, even though they were sometimes called "softies" by their companions,—there was no loss but great gain eventually from holding to their posts on limited pay and building up for themselves, the most valuable thing in the world, namely, *character*. Of his interest in his work as planter we have evidence in an extract from a letter placed at our disposal, which Mr. Gavin wrote to his brother-in-law, Mr. Thomson, so far back as November, 1844, some fourteen months after his arrival in the island. He writes:—

"The grand item of expenditure on a coffee estate is *weeding*. This the beginners did not think of very material importance, and when they found out the mistake committed, why the ground was thoroughly filled with seed, and from the rapid manner in which vegetation goes on, it is next to an impossibility now to have them extirpated. Now had this been attended to from the commencement, a very great annual saving would have been effected on this one item. And further, is it not natural to suppose that by judicious management in this respect the trees would have yielded a better crop, and a better sample. The present *generation of planters* enjoy the advantages of the well-bought experience of those who have gone before them, and I have no hesitation in saying that under ordinary circumstances an estate may be formed and brought into bearing for little more than one-half what many of the old ones have cost.

"The cultivation of sugar is at present occupying a considerable share of popular attention, but many seem doubtful whether it will succeed so well as anticipated. It is not cultivated to any extent in the interior, I am well acquainted with one estate which is certainly very promising. * * * * I hear that the half of it was sold the other day for £23,000—one hundred tons is the estimated produce for this season."

VISIT HOME AND RETURN.

Mr. Gavin paid his first visit to the mother-country after eight years in Ceylon, in 1851—the year of the first Great Exhibition in Hyde Park. After his return he had some six years of assiduous work in Kandy, building up and extending his influence as a businessman and latterly greatly strengthening the position of his firm, "Keir, Dundas & Co." One who knew him in those days, reports to us that "the small talk of the great Kandy Agency House was in the department of Mr. Dundas, while the practical business was attended to by Gavin. He was a very shrewd man of business—a capital judge of men, and as a hard worker himself, he fully appreciated the habit among his subordinates and superintendents." Mr. Gavin was a great admirer of Sir Henry Ward, and a great believer in, and advocate of, the Colombo and Kandy Railway. He had seen so much of the difficulties attending the transport of crop in his early planting days, that he went beyond his fellow-colonists and quite as far as the Governor himself in his determination to support a locomotive line at any cost. We find that in a letter to his brother-in-law, Mr. Thomson, under date so far back as March, 1847, he writes of the difficulty of transit of produce to Colombo, and speaks of a line of rail, but was not then very sanguine of it ever being made. Here is an extract:—"Much of last year's crop has still to find its way to Colombo owing to a deficiency in the means of transit, and to remedy this evil a *Conveyance Company* is being energetically organised for the purpose of establishing a regular and safe mode of conveying produce to the shipping port until the line of rail is carried out, which will not be, I fear, for some years to come, and I doubt if it will ever be completed, at all events for the sum estimated. Many unforeseen difficulties will, I am confident, encounter the Engineer on approaching the mountainous region, and snudry gorges and ravines will meet him which he little dreams of. These obstacles may, however, be got over, but it is impossible that any engineer from home can estimate Asiatic labour at its proper value."

"THE LAST ROSE OF SUMMER."

It was perhaps not to be wondered at, therefore, that when the majority of the public in Colombo and Kandy got alarmed at the unconditional way in which Sir Henry Ward pledged the Colonial revenue and credit to the Railway Company formed to construct the Colombo and Kandy line, Mr. Gavin stood out as one of the two or three Colonists who alone supported the Governor in this crisis. At a public meeting in Kandy called to discuss the situation, Mr.

Gavin was in a minority of one in standing up for Sir Henry Ward and the Railway, under those conditions, and it was then he got dubbed "the last Rose of Summer" of the planting community. Our senior who, along with his colleague, Dr. Elliott, led the opposition to the Governor and carried the day at the time, often told us in the "sixties" and "seventies," that he believed Sir Henry Ward and Mr. Gavin were after all right, and that the Railway would have paid the Colony even at double its eventual cost, had it only come into existence ten or even seven years earlier than it did, and so saved the frightful expenditure of cooly and bullock power, and the absolute depreciation and loss of crop experienced during the interval.

MARRIAGE.

At the end of 1858, Mr. Gavin paid a long visit home remaining nearly two years only returning at the end of 1860. During this time he got married, his bride being Miss MacAndrew of the Knoll, Elgin.

From the columns of the *Colombo Observer* of June 1860, we take the following notice:—

MARRIAGE OF MR. GAVIN OF CEYLON.

We copy the following paragraph from the *Banffshire Journal*:—

ABERCHIRDER.—Since the arrival of John Gavin, Esq., at Auchintoul House, he has, by his numerous acts of generosity, endeared himself to all classes of the community, and Thursday last being the day fixed for his marriage with the beautiful and accomplished Miss M^{rs} Andrew, of the Knoll, Elgin, the inhabitants of Aberchirder, to testify their respect for Mr. Gavin, resolved to get up a demonstration in honour of the occasion. From an early hour on Thursday, numerous flags were displayed in the most conspicuous parts of the village, and a large bonfire was kindled in the Square, materials for which, were largely contributed by those who had experienced the benefit of Mr. Gavin's bounty on this, as well as many other occasions. The health of the happy bride and bridegroom were also pledged in copious libations of porter and ale, which were distributed among the lieges. The old women, especially, bestowed their best blessings on Mr. Gavin, who so seasonably relieved their wants during the late severe season. The day's proceedings were wound up by a ball at Auchintoul, where a large number of the youth and beauty of the place assembled. Refreshments were abundantly supplied, and the healths of the happy couple were proposed and drunk with Highland honours. The dancing was kept up with great spirit till an early hour next morning.

A FAMOUS LAWSUIT.

Mr. and Mrs. Gavin did not remain more than two years in Ceylon after they came out at the end of 1860. In December 1862, Mr. Gavin retired, disposing of the good-will of his firm to Messrs. Harrison and Leake, and Mr. and Mrs. Gavin finally left the island in January, 1863, taking up their residence at West Park, Elgin, and continuing there from 1863 to 1866. Mr. Gavin had, however, one visit to pay to the island in the interval (in the winter of 1864-5) in connection with his fine Dodangalla coffee property in the Medamaha-

nuwara district: This had become the subject of a lawsuit, on all fours it was supposed with the great Rajawella case which the Lindsay family had won over the Oriental Bank. The Dodangalla case was in the names of "Lindsay vs. Clerihew"; but the defendant was really Mr. Gavin, for he had purchased the place as forest-land from Mr. Clerihew and had turned it into a coffee plantation. He was told at the time there might be trouble, and after the Rajawella result, no one had the slightest faith in his defence of the case leading to anything but additional costs. Nevertheless, Mr. Gavin fought the battle right to the bitter end and eventually illustrated "the glorious uncertainties of the law" by winning against the plaintiff Lindsay in the Privy Council, thereby adding to his reputation for native shrewdness and doggedness. Dodangalla estate is still held by Mr. Gavin's family, though no longer cultivated.

IN CONCLUSION.

We have two testimonies to add from old residents who knew Mr. Gavin. Mr. Edward J. Young of Rangalla who served under Messrs. Keir, Dundas & Co., in the time of Mr. Gavin, writes:—"John Gavin was a very fine specimen of our countrymen, sturdy, shrewd, truthful and strictly honest: at the same time he was a very retiring man and hardly ever intruded in public matters, and was indeed little known in Ceylon except to a few personal friends." Mr. W. D. Gibbon—himself a countyman of Mr. Gavin, writes:—"After he had joined the great Kandy Agency House, I knew Mr. Gavin well. My first recollection of him was when I recovered consciousness from delirium caused by rheumatic fever—soon after I came to the island in 1855,—and found him seated by my bedside. I exclaimed:—"Oh Dr. Gavin, how did you come here." He was so like his medical brother! He often came to see me in my illness and talked Buchan and its folk, of whom we never tired speaking. His houses at Katukelle and Harramby were ever open to me. He was a shrewd man, a good judge of men and appreciated hard work."

There is not much more to add. In 1866 Mr. and Mrs. Gavin removed from West Park to Wester Elchies, on Speyside, Morayshire, and here the subject of our notice died on the 12th February, 1876, at the comparatively early age of 56½ years. Mrs. Gavin still survives, having removed from Elchies to Earls Cross, Elie, Fifeshire, in January 1878. Their family consisted of three sons and five daughters, one of the former being Mr. H. J. Gavin now on Mahousa Estate, Madulkele, while another, Mr. Norman Gavin, is the head of an Engineering firm in Johannesburg, South Africa. One of the daughters again was a distinguished student at Girton, and is now Principal of the G. P. D. School at Shrewsbury.

THE EARLY EUROPEAN COCONUT INDUSTRY IN THE BATTICALOA DISTRICT.

(By an Old Resident.)

In connection with the early history of coconut planting in Ceylon is associated a name that is impermissibly bound up with the history of the struggles of the Anglo-Saxon race in establishing British supremacy in the East—David Ouchterlony—an adventurous young soldier, who found a congenial sphere for the display of individual bravery in the Indian border warfare of the tens and the twenties of this century. At one time, against the short-statured but brave and hardy mountaineers, the Ghontees of the Himalayas, at another time in Central India storming the hitherto impregnable clay for trees of the Maharaja of Bhurpore, had he lived in modern times he would have won the Victoria Cross a dozen times over. A beautiful monument, eighty feet high, on the Calcutta maidan in memory of Sir David Ouchterlony, the thousands of acres in the Ouchterlony valley in South India, the one thousand five hundred acres of the Easter Seatown coconut land in Batticaloa, and other tangible acquisitions, perpetuate the daring deeds of the once obscure young soldier.

EUROPEAN PIONEERS.

Captain Holderness was sent out to open the land in the forties. He was a big swell, had many attendants about him, and kept an ever-open town house in a way befitting his gallant master, but, as is usual with such young men, he succumbed to disease early in life. This unforeseen event brought to the fore his assistant, Mr. John Carey. Quiet, unassuming, frugal almost to a fault, he seized "the tide in the affairs of men" and thanked Providence for it from his usual corner seat in the Wesleyan Meeting House. Retrenchment and a wonderfully economic management formed the order of the day, and his grateful master gladly allowed the blooming *sinne durai* all the legitimate fruit of his exertions in appreciation of the changed situation. Invergue, 200 acres, belonged to Mr. S. Keir, and Kirankulam, 200 acres, belonged to Messrs. MacKilligan and Maxwell, while Springfield, 200 acres, belonged to Messrs. J. Thomson and others. They were absent proprietors, and their estates were managed by Messrs. Drummond and Shand.

SOBER ISLAND.

There was also another little bit of property opened by a doctor (probably Dr. Jallond) and jocularly known as the "Gallipot." But it has come into an honorable use. The doctor's "Gallipot" was the only health resort and seaside bungalow for Europeans and respectable natives for a long time, besides Dr. Soutain (reserved), Kochchi Kativvu and Bone's Island, open to all, and so called after a Collector and Judge of seventy years ago who owned it, but which subsequently became *par excellence* the "Sober Island" of the Burgher community, and is now subjected to all the vicissitudes of a varying tidal erosion as at Crow's Island at the mouth of the Kelani river.

BURGHER AND NATIVE PLANTERS.

One by one many of the original owners of estates in Batticaloa, not realizing any profitable returns from the tenth year, as they fondly expected, while they had to meet heavy bills on account of their superintendence, gladly parted with their properties, often for much less than what they would have become worth had they allowed a growth of another decade to their trees. Among those that scrambled for prizes was a Burgher gentleman of Russo-Polish origin, who threw up a good Government berth and turned coconut planter. But for any one to play the part of a *peria durai* on a young estate, unless backed by ancestral wealth or other sources of income, is rather risky, and in eight years he was ruined for life, lost everything, and he and his wife died within four months of

each other. Another Burgher gentleman was more fortunate. He was at first content to become a kangani under an European, then overseer, and then a conductor; the surplus of his salary he invested in the adjoining jungle, and eventually he came a successful "creeper." He left very few blood relatives here; the nearer ones were supposed to be in "Potguter Land," South Africa. He had several idiosyncracies, one of them being a hatred of European medicines, and he died a martyr to his opinion. Another successful speculator in land was Dr. M. Covington.—Local "Times."

CEYLON AND INDIAN TEA IN AMERICA.

Mr. P. R. Buchanan writing from Nuwara Eliya on the 15th ult., favours us with the following explanation of his views and of the working of the "Scheme" suggested by Sir John Muir and himself:—

"It is quite true I should prefer to see the commission go direct to the distributor, but it would be almost impossible to check claims. If however our representative clearly pointed out to the dealers that this allowance was made, I am satisfied it would find its way to them intimately. I do not know why the payment should not be made to the importer into America as easily as to the exporter and I should certainly prefer this, but it seems to me Mr. Grinlinton's opinion on such a point ought to be decisive.

"If our representative is to carry samples, endless questions of whose samples, what sample, would arise. All large houses in Canada and most large dealers in the States get samples of Ceylons and Indians themselves and our tea representative could always put a dealer in the way of getting them if necessary. We should avoid his being mistaken for a regular 'drummer' and we should certainly see that we do not place him in a position in which his actions might be misinterpreted, such as pushing any particular tea &c. He must be, like Cæsar's wife 'irreproachable.'

We see the force of the objection taken to the distribution of samples. Granted also that the commission be paid to exporters, we see that Mr. Grinlinton gives as one reason, the simplicity and accuracy ensured through the Consul's certificates for shipments. Are then shipments to the Canadian Dominion (including British Columbia) to be excluded from the bounty? Surely not, for there is a splendid field for the extension of the demand for British grown teas in Canada, and its towns were specially mentioned in the Schemes as coming under the direct cognizance of the Agent in his travels. Then, again, if Mr. Grinlinton would consent to accept the post of Agent, on the terms specified, as a contemporary hopes, he would surely much prefer to represent all British-grown teas—India as well as Ceylon—than to have another Agent—like Mr. Blechynden probably—following his heels, or preceding him to the different towns? It is very amusing to see how petty feeling develops! At the time we started the proposal that Ceylon and Indian tea-planters should co-operate, we were told that as Ceylon should certainly not approach India, it would be time enough to discuss the matter when a proposal was made on behalf of the Indian planters. Now that the proposal has come and been formulated, the very fact that it was unsolicited, is used in some quarters, to tell against it! We sincerely hope, however, that the majority interested in Ceylon tea will rise to a broad and business-like view of the case now presented to them. In a nutshell, it is—Are there to be two separate, and possibly, rival Agents to represent British grown teas in America, or only one? Division and Opposition; or Union against the common foe, represented by China and Japan teas?

THE TONACOMBE ESTATES COMPANY OF CEYLON, LIMITED.

Application has been made by Messrs. de Saram for the registration of this Company which is being formed for the purpose of purchasing the Tonacombe, Dewature and Liffon estates in the district of Badulla for £18,000 sterling. The nominal capital of the Company is to be £600,000 divided into 1,200 shares at £500 each. The subscribers to the memo and articles of association are Messrs. Edward Christian, F. J. de Saram, W. H. Figg, J. Buchan, F. W. Bois, and C. A. Leechman.

We find from our Directory that the acreage of Dewature is 366,—163 being cultivated (141 in tea and 22 in coffee); of Liffon 415,—178 being cultivated (68 in tea and 110 coffee); and of Tonacombe 770,—320 being cultivated (215 in tea, 42 in coffee, and 63 in cardamoms). The total acreage of the three estates is 1,551, the area under cultivation being 661 acres.

AMERICA FOR BRITISH-GROWN TEAS :

THE CAMPAIGN AGAINST CHINA'S AND JAPAN'S ;
SHOULD THE HON J. J. GRIDLINTON NOT REPRESENT
INDIAN AND CEYLON TEAS WITH £12,500 PER ANNUM
AT HIS COMMAND—RATHER THAN CEYLON ALONE
WITH ONLY £5,000 ; WHILE A RIVAL
AGENT FOR INDIA WOULD HAVE THE
DISPOSAL OF £7,500 ?

In commencing the discussion well-nigh two months ago, which we hoped would lead to a joint effort to capture America, for Indian and Ceylon teas, we were quite aware that the proposal would not be a popular one with the majority of Ceylon planters. The men of the present day have forgotten how their representative at the Melbourne Exhibition fought shoulder to shoulder with the Indian Commissioner and Tea Agent in exposing the inferiority of China teas. Of late years, a local feeling of rivalry with India has sprung up, and in respect of America especially, this has been fostered by the more prominent part taken at the Exhibition by Ceylon, although a contemporary in taking credit for all the expenditure at Chicago, forgets that it includes the whole of our products and representation, as opposed to the Indian outlay which was for tea alone. We can, however, get no good reason from the planting districts why Ceylon should not, henceforward, work with India in America in promoting the introduction of British-grown teas in supersession of inferior China's and Japan's. The average Ceylon planter who wishes "the right little, tight little island" to work on its own account, will have nothing to do with his brother-planter in India, and can give us no better reason than the Dean of Christ Church got from his witty pupil over 200 years ago:—

I do not like thee, Dr. Fell—
The reason why I cannot tell
But this I know, and know full well,
I do not like thee, Dr. Fell.

In saying no reasons are given, we err. Two have lately appeared in print, but they are both based we think on an entire misapprehension. One is that Ceylon having spent so much at Chicago and elsewhere to get her teas introduced, Indian planters—who have done so much less—want now to profit by our work by holding on to our tail or skirts. Now there are two misapprehensions here: (1) that Indian tea proprietors have not spent as much as Ceylon in making a market for their teas in North America. We are assured that they have spent fully as much if not more—though not in the Chicago Exhibition—and the proof is (2) found in the actual exports of Indian

as compared with Ceylon tea for last year to America. We cannot offer a fair comparison between the exports from Calcutta direct with those from Colombo, because the former would require to be checked by the Consular return. In the case of Ceylon, the Chamber of Commerce only showed Exports to America for 1893 equal to 112,240 lb. We have been able with the help of Mr. Morey and mercantile exporters to raise this to 351,000 lb. The Calcutta figures show 295,165 which if corrected in the same way would probably grow in proportion. At any rate, the exports of Indian and Ceylon tea to America in 1893 from the United Kingdom compare as follows:—

To N. America.

Ceylon tea in 1893	...	1,437,327 lb.
Indian	„ „	1,499,763 „

It is evident therefore that India is not behind in the start towards capturing the American market, and it is equally clear from the proceedings we recently gave of the Indian Tea Association in London—which, by the way, none of our local contemporaries has published,—as well as from what has occurred in Calcutta, that Indian tea planters are determined, whether their Ceylon brethren join them or not, to take further active steps towards capturing America. But it is suggested by Mr. D. Kerr of the Scottish-Ceylon Tea Company—who gives some excellent advice based on his personal visit to America which we shall take over—as an objection to association with India, that it is "too loose-jointed." This must refer to the difficulty of the collection or of the management of the fund allotted to America. But when it is known that certain Calcutta firms who command by far the greater portion of the Indian crops are prepared to guarantee the £7,000—or whatever sum be fixed for India—and to hand the same over to a joint representative Committee, this difficulty should vanish. Then let it be remembered, India is prepared at once to begin with her £7,000. Ceylon so far as we can understand, will not have any ce's available before 1895. One objection offered is that if Ceylon raises £5,000 for her 90 million lb. tea, India giving £7,000 is not in proportion. Well, it represents 126 million lb. at the same rate; but we feel sure it will readily be made £7,500 to represent 135 million if that will satisfy Ceylon.

The way is now clear, we think, to see exactly where the two countries or rather the two industries stand. India, as we understand it, is quite prepared to start a campaign on her own account conducted by an agent and staff with £7,500 behind them. This could be put in operation we suppose by July next. Then according to the objectors, Mr. Gridlinton would be asked to follow suit early next year for Ceylon, with a backing of £5,000 in all. How much better, under these circumstances, we say, to take up Mr. Gridlinton's services on behalf of both countries and industries—for British-grown teas in fact—and so give him a backing of £12,500?

In this connection we direct attention to the really admirable letter of Mr. Westland, Chairman of the Northern Districts Association, called forth by an inquiry from our contemporary. We think Mr. Westland has solved the problem better than any one as yet. Sink the bounty, he says, and get Mr. Gridlinton to represent the British-grown teas of both countries and put at the disposal of himself and the joint Committee the whole £12,500 to spend (after providing salaries and allowances) as they think wise. Once on the spot

and in consultation with all the large wholesale houses on behalf of India as well as Ceylon teas, Mr. Grinlinton would speedily learn what would suit the case best, whether to spend a few thousands in advertising, or to commend back to his joint Committee the starting of a bounty commission. The great matter now is to vote for the selection of Mr. Grinlinton as sole responsible Representative for the teas of Ceylon and India to open a Campaign throughout the length and breadth of North America with a view to ousting China and Japan teas. With a joint fund equal to £12,500 per annum to begin with, and yearly increasing, this could not fail to become a very important mission and one which would draw the attention of the whole Tea Industry to the work of our Commissioner. We feel sure that Mr. Grinlinton will rise to the occasion and if he is given a free hand, we may expect a speedy impression to be made on the American markets; and then the great fact to be remembered, is that every ton whether of Indian or Ceylon tea diverted across the Atlantic is so much less pressure on Mincing Lane—an all-important consideration for both India and Ceylon.

DEATH OF AN OLD COLONIST.

MR. JOHN BROWN DIES ON HIS WAY TO CAIRO.

It is with much regret that we receive the above sad intelligence. Mr. Brown, who had been out on one of his usual winter trips to Ceylon, began to feel poorly in February and his departure was hastened by medical advice, while for the same reason his son, Mr. Alfred Brown, accompanied him in the ss. "Oceanien" on the 4th ult. from Colombo, intending to go as far as Aden. Mr. Brown, senr., had not then, however, improved in health, as was anticipated, and fortunately it was decided his son should go on to Egypt, so that he was with his father to the end. The sad news reached Mr. Wardrop by telegraph from Alexandria, intimating Mr. Brown's death yesterday while *en route* to Cairo. For several years back, Mr. Brown has been known to have a weak heart, accompanied by a tendency to bronchial affection, and it is for this reason he, of late years, avoided the English winter and early spring. But the end had to come and the sad part is that the invalid's strength did not keep up until he reached his family who were awaiting him on the Continent.

So has passed away a Colonist whose engineering skill, activity and enterprise had a good deal to do with the development of Ceylon from the "fifties" onwards. Few individuals, indeed, have left their mark so clearly on the progress of the colony. Mr. John Brown came out originally as the Engineer in charge of the Waterworks for Mr. Tytler's Rajawella, which included what were then one of the largest turbines and most powerful pumps anywhere in the world. When this work was completed—at a cost we believe of £20,000—Mr. Brown, like so many practical engineers before and after his time, turned his attention to planting, and he became part-proprietor with Messrs. Norman Stewart and Macintyre of a fine block of land near the famous Spring Valley estate in Uva, which they developed into the Glen Alpine estate. How after his partners had retired home, Mr. Brown—at a time when Ceylon Limited Companies were few and far between—arranged for the establishment of the Uva Coffee Co., Ltd., with Glen Alpine as the nucleus, and the Spring Valley and afterwards Hunasgiriya

Companies is matter of local history and no less his founding of the Colombo Commercial Company, now representing—under the able management of his son-in-law Mr. Wardrop,—so important a section of local mercantile, agency, engineering and building business. Mr. Brown's Coffee Companies stood out long after most investments in our old staple; but at last the time came when they also had to go in for "tea" and the activity and interest which the old veteran manifested in the transformation would have done credit to a much younger man. Of Mr. Brown's inventive genius in respect of coffee pulper, wire shoots and other estate-labour-saving contrivances, as also in respect of tea-rolling (the roller being the cause of litigation still in force), and tea-drying,—his desiccator being a great success—we need say nothing beyond the mention. One who well deserves to be enrolled among the Pioneers of this Planting Colony—both as Engineer, Planter and Merchant—has passed away, and our special sympathy is due to members of his family, both here and in England. Mr. Brown was twice married: his second wife, who survives, being a daughter of the late Mr. James Abernethy, head of the well-known Aberdeen Engineering Firm.

COFFEE IN JAVA.

Amsterdam, Feb. 21.—From a reliable source it is reported that the newly-appointed inspector, Dr. Burck, who has made an investigation about the compulsory coffee cultivation in Java, does not consider the condition so gloomy as was generally presumed. In Central Java the prospects are not encouraging, and in many districts there the Government will have to give up the cultivation, like has been done already in the districts of Bantam and Japara. However, in Eastern Java, and especially in Probolinggo and Bezoekie, there is an abundance of magnificent grounds suitable for the cultivation of coffee, and also in the Praeger districts the soil is certainly not exhausted. Dr. Burck seems to be a strong promoter of the system of granting an extra payment for the construction and maintenance of coffee lands, besides the price paid for produce delivered.—*L. and C. Express.*

INDIAN PATENTS.

Calcutta, Feb. 22.

The inventor of the under-mentioned invention having respectively failed to pay within the time limited in that behalf the prescribed fee, it is hereby notified that the exclusive privilege of making, selling, and using the said invention in British India and of authorising others so to do has ceased:—

TEA-SIFTING.—No. 60 of 1889.—H Sabow's invention for a cylindrical vibration tea sifting machine. (Specification filed 14th November 1889.)

The fees prescribed in Schedule 4 of Act V of 1878 have been paid for the continuance of exclusive privilege in respect of the undermentioned invention for the periods shown against each:—

DRYING APPARATUS.—No. 90 of 1888.—Samuel Celand Davidson, Merchant of Sirocco Works, Belfast, Ireland, for improvements in apparatus for employing heated air in drying or baking vegetable or other substances. (From 6th March 1894 to 5th March 1895.)

TEA DRIERS.—No. 80 of 1888.—Henry Thompson, Engineer of Trinity St., Gainsborough, Lincoln, England, for improvements in the method of, and apparatus for, drying tea leaf. (From 17th April 1894 to 16th April 1895.)

TEA ROLLERS.—No. 142 of 1888.—Henry Thompson, Engineer of Trinity St., Gainsborough, Lincoln, England, for improvements in machinery or apparatus for rolling or curling tea leaf. (From 17th April 1894 to 16th April 1895.)—*Indian Engineer.*

ROYAL BOTANIC GARDENS ADMINISTRATION REPORT FOR 1893.

DR. TRIMEN is usually first in the field with his Administration Report which is always one of the most generally interesting. This year forms no exception to the rule, and through the courtesy of the Government Printer, we are enabled to issue all the more important portions of the Report as a Supplement, and to be bound up with our *Tropical Agriculturist*. This being the case, there is less necessity for us to run over the contents; but a very few remarks may be permitted. The erection of the new large Conservatory in the Peradeniya Gardens is noteworthy, as well as the improvement of the Herbaceous Ground. In reference to the removal of old trees, one would have liked to learn the dimensions of the *Grevillea Robusta* originally planted in 1856, and so 17 years old on removal. This must have been one of the oldest "silky oaks" in the country and a comparison with some of the *Dimbula* giants might be instructive. That 2,016 travellers from other countries should have visited the Peradeniya Gardens last year, is certainly worthy of record. Twenty years ago, the number per annum could scarcely exceed the odd 46! Several improvements to the Hakgala Gardens are also noted, and Mr. Nook supplies a great deal of interesting as well as useful details. His cure for a "black grub" will be noted by horticulturists; the damage done by the small moose-deer is annoying; the "rose garden" must now indeed be a sight when in flower, with an addition of 96 varieties last year from Worcester. Heneratogoda Gardens have certainly fulfilled their main function when we learn that no less than 75,000 seeds of *Hevea* rubber have been sold to planters last year; besides 10,000 plants *Liberian* Coffee, 2,700 pods of *Cacao*, &c. Anuradhapura Gardens are doing fairly well and Badulla Gardens have become quite an ornament to the town.

Coming now to the part most generally looked for, the "Notes on Economic Plants," Dr. Trimen has not much of novelty to relate this year; but he emphasises his fear about the *over-production of tea*—the only danger he foresees to the industry—and would have the acquisition of new land for planting made as difficult as possible! He must remember, however, that in many cases land is wanted by existing holders as reserves for firewood. As regards considerable blocks, it is evident the Government are acting in accordance with Dr. Trimen's advice. Very useful information is repeated in reference to *Helopeltis*—"mosquito blight" being a most unfortunate name, for it is not a mosquito at all—and all tea planters especially in the lowcountry will carefully note what is said. Dr. Trimen is as eager as ever for the extension of *Liberian* Coffee and *Cacao*, and he has also a good deal to say for the cultivation of certain kinds of rubber. He recommends the *Brazilian Hevea* when the cultivators can wait 12 years for profitable returns; the *Castilloa* does not give promising results so far; but the *Ceara* might do in fields where the trees could be cut down every 10 to 12 years, each tree giving 1½ lb. dry rubber or 1,500 lb. at 1,000 trees(?) to the acre. If such a harvest were worth £150 or even £100 every acre, it might certainly be profitable to plant and wait a decade, seeing that so little cultivation is required in the interval. Of other minor products, Dr. Trimen has a good deal to tell us, the most interesting reference being perhaps to *Nutmegs*, of which, it is certainly strange an appreciable quantity does not appear in our exports. We

suspect the produce of the many trees scattered up and down the country is all used up locally, finding a market in the town bazaars? Sir John Wilson had a number of fine teas on his Nilambe plantation; and Mr. Chas. Shand planted those which have delighted so many travellers in the Ratnapura resthouse grounds; while Dr. Trimen tells us, he has supplied 118,000 seeds during the past 10 years to intending cultivators. We ought, therefore, soon to see, a steadily increasing record of exports. Mr. Nook's success in potato culture at Hakgala is noteworthy and ought to encourage fresh efforts in *Uva* generally, with railway transport available to so good a market as Colombo. Mr. T. Christy's new fodder plant is to have a fair trial. Finally, we are pleased to learn of the progress made with the second and third parts of the "Handbook to the Flora of Ceylon," which when completed, will give this island (as Dr. Trimen believes) "an account of its native vegetation more detailed and complete than that of any other Colony."

CINCHONA BARK PROSPECTS.

In their latest market report Messrs. Wodehouse & Co., Mincing Lane, give some interesting statistics respecting Bark exports from Java and India and the imports of bark and quinine into the United States. We quote as follows:—

EXPORTS FROM JAVA.			
	Jan./June.	July/Dec.	Total:
	Eng. lb.	Eng. lb.	Eng. lb.
1893.....	4,455,900	3,732,000	8,187,900
1892.....	2,896,600	4,294,700	7,191,300
1891.....	3,030,600	5,668,900	8,699,500
1880.....	2,757,300	4,533,900	7,291,200

The shipments from Java during January were 974,000 Amsterdam lb. against 980,000 lb. last year, but we understand that about one-fourth of this is coming forward by sailing vessels.

EXPORT FROM BRITISH INDIA 1ST JANUARY TO 30TH NOVEMBER.			
	1893.....	1892.....	1891.....
	lb.	lb.	lb.
1893.....	2,709,673	1,911,837	2,627,440
1892.....	2,254,786	1,911,837	1,911,837

IMPORTS OF BARK AND QUININE INTO UNITED STATES 1ST JANUARY TO 31ST DECEMBER.			
	1893.	1892.	1891.
	lb.	lb.	lb.
Cinchona Bark..	2,138,128	3,144,284	2,861,000
	oz.	oz.	oz.
Quinine	2,777,567	3,486,922	2,527,000

It will be observed that the total from Java last year in 8,187,900 lb. really affords a larger supply of quinine than the maximum export (15,364,912 lb. in 1885-6) from Ceylon; for the latter barely averaged 2 per cent of quinine, while the Java bark last year gave the high average, according to Mr. Bohringer, of 4½ per cent. The comparison then would be—reducing both exports to one per cent—as 38,892,52 lb. for Java against 30,729,824 for Ceylon,—apart from the greater ease in working off 4½ as compared to 2 per cent bark and only half the cost in freight. Java has, therefore, in every way beaten the cinchona bark record, and the future of the bark market, so far as we can see, lies altogether under the control of its planters.

We are surprised to see that the consumption of quinine and bark has by no means made progress in the United States during the past three years. In India, thanks to the enterprise and liberality of the Government in distributing a million and a half of packets through the post office for the benefit of people in fever-stricken districts, the consumption is increasing steadily. There is an enormous field for the sale and use of quinine in Southern China, Northern Burma, Siam and Tonquin which has yet to be exploited.

CEYLON MANUAL OF CHEMICAL ANALYSES.

A HANDBOOK OF ANALYSES CONNECTED WITH THE INDUSTRIES AND PUBLIC HEALTH OF CEYLON FOR PLANTERS, COMMERCIAL MEN, AGRICULTURAL STUDENTS, AND MEMBERS OF LOCAL BOARDS.

By M. COCHRAN, M.A., F.C.S.

(Continued from page 588.)

CHAPTER X.

WATER.

CLASSIFICATION OF WATERS—STANDARDS OF PURITY FOR POTABLE WATER—CEYLON SPRING WATERS—HOT MINERAL SPRING WATERS FROM STRAITS SETTLEMENTS—RAIN WATER—WATERS FROM STREAMS—COLOMBO TOWN WATER FILTERED AND UNFILTERED—AVERAGE COMPOSITION OF COLOMBO WATER SUPPLY—WATER FROM VARIOUS DEPTHS OF LABUGAMA RESERVOIR—KANDY PUBLIC WATER SUPPLY—COMPARISON OF COLOMBO, KANDY AND ENGLISH WATER SUPPLIES—COLOMBO DRAINAGE WATER—STANDARD ANALYSIS OF SEWAGE.

The Royal Commission on water supply of 1869 classed unpolluted natural waters in respect of their freedom from the most objectionable impurity in potable water, viz., organic matter, in the following order:—

- 1st. Spring water.
- 2nd. Deep well water.
- 3rd. Rain water.
- 4th. Upland surface water.

In respect of wholesomeness, palatability, and general fitness for drinking, the following, according to Dr. Frankland, was the classification of waters in order of excellence that was adopted:—

- Wholesome. { 1. Spring water.
- { 2. Deep well water.
- { 3. Upland surface water.
- Suspicious. { 4. Stored rain water.
- { 5. Surface water from cultivated land.
- Dangerous. { 6. River water to which sewage gains success.
- { 7. Shallow well water.

When analysing waters with a view to pronounce upon their fitness for drinking or cooking purposes, it is necessary to have some standard of purity, by which to interpret the analytical results obtained. Many such standards have been proposed from time to time, and, though none of them will apply in every case, so as to dispense with the necessity on the part of the analyst for the exercise of his own judgment after taking local circumstances into account, the value of a good general standard of purity is unquestionable. Of the different standards proposed, none will be found more useful for the guidance of the analyst or of sanitary authorities, than the four-fold classification given in the seventh edition of Parkes' Practical Hygiene, the more important features of which I here reproduce.

1. Pure and Wholesome Water.

Character or Constituents.	
Physical characters	Colourless or bluish tint, transparent, sparkling and well aerated, no sediment visible to the naked eye, no smell, taste palatable.
Chemical Constituents.	Grains per gallon.
1 Chlorine in chlorides under	1.0000a
2 Solids in solution	5.0000b
" volatile	1.0000b
N.B.—The solids on incineration should scarcely blacken	
3 Ammonia, free or saline under	0.0014
Ammonia, albuminoid under	0.0035
4 Nitric Acid No ₃ in nitrates	} 0.0226
Nitrous acid No ₂ in nitrites	
5 Oxygen absorbed by organic matter in 15 mins. by permanganate and acid @ 80° F. (27° C.) under	} nil.
Do in 4 hours at 80° F. (27° C.) under	
6 Hardness, total	0.0100c
" fixed	0.0350c
7 Phosphoric acid in phosphates	6°·0
Sulphuric acid in sulphates	2°·0
8 Heavy metals	traces
9 Hydrogen sulphide, Alkaline sulphide	traces
	nil
Microscopic characters	nil
	- Mineral matter; vegetable forms with endochrome; large animal forms; no organic debris.

REMARKS.—Turbidity, due to very fine mineral matter, is sometimes associated with pure waters: thus, minutely divided, calcium sulphate will not subside in distilled water.

a This may be exceeded if from a purely mineral source.

b The solids may be exceeded in chalk waters where they are mostly calcium carbonate.

c The oxygen absorbed may be exceeded in peat or upland surface waters.

A water such as the above may generally be used with confidence, in the absence of any history of possible pollution, or of any recent and appreciable change in the amount of the organic constituents.

2. Usable Water.		3. Suspicious Water.	
Character or Constituents.		Character or Constituents.	
Physical characters	... Colourless or slightly greenish tint; transparent, sparkling and well aerated, no suspended matter, or else easily separated by coarse filtration or subsidence; no smell, taste palatable.	Physical characters	... Yellow or strong green colour, turbid; suspended matter considerable; no smell, but any marked taste.
Chemical Constituents.	Grains per gallon.	Chemical Constituents.	Grains per gallon.
1 Chlorine in chlorides under	3·0000a	1 Chlorine in chlorides	... 3 to 5a
2 Solids in solution total	30·0000b	2 Solids in solution total	... 30 to 50
" volatile	3·0000b	" volatile	.. 3 to 5
3 Ammonia, free or saline	0·0035c	3 Ammonia, free or saline	... 0·0035 to 0·0070
" albuminoid	0·0070d	" albuminoid	... 0·0070 to 0·0087
4 Nitric acid No ₃	0·3500e	4 Nitric acid No ₃ in nitrates	0·35 to 0·70
in nitrates	... "	Nitrous acid No ₂ in nitrites	0·0350
Nitrous acid No ₂ in nitrites	nil	5 Oxygen absorbed by organic matter in 15 min. by permanganate and acid @ 80° F. (27° C.) under	0·0210f
5 Oxygen absorbed by organic matter in 15 min. by permanganate and acid @ 80° F. (27° C.) under	0·0210f	Do in 4 hours at 80° F. (27° C.)	0·1050
6 Hardness, total	12° 0	6 Hardness, total	above 12° 00
" fixed	4° 0	" fixed	.. 4° 00
7 Phosphoric acid in phosphates	traces	7 Phosphoric acid in phosphates	heavy traces
Sulphuric acid in sulphates	2·0000g	Sulphuric acid in sulphates..	2·0000b
8 Heavy metals, iron	traces	8 Heavy metals—iron	... traces
9 Hydrogen sulphide, alkaline sulphides	... nil	9 Hydrogen sulphide, alkaline sulphides	... nil
Microscopic characters	... Same as No. 1.	Microscopic characters	.. Vegetable and animal forms more or less pale and colourless; organic debris; fibres of clothing, or other evidence of house refuse.

REMARKS.—In some usable waters such as peat waters, the colour may be yellow or even brownish. In some also the taste may be flat, or only moderately palatable.

a This may be much larger in waters near the sea, deep well waters or waters from saline strata.

b The solids may blacken but no nitrous fumes should be given off.

c This may be greater in deep well waters.

d This may be larger in upland surface waters, peat waters, &c., when the source is chiefly vegetable.

e The amount of nitrates varies greatly so that an average is of doubtful value.

f The oxygen absorbed may be greater (about double) in upland surface waters, peat waters, &c.

g In some waters the amount may be larger.

A water such as the above will in most cases be usable, but it will be improved by filtration through a good medium.

REMARKS.—When the impurity is mostly vegetable, the colour may be very marked in usable water.

a In some cases the chlorine may be greater.

b This may sometimes be larger.

A water such as the above ought to excite suspicion; its use ought to be suspended until enquiries about it can be made; if it must be used, it ought to be boiled and filtered.

4. Impure Water.

Character or Constituents.	
Physical characters ...	Colour yellow or brown, turbid, and not easily purified by coarse filtration; large amount of suspended matter; any marked smell or taste.
Chemical Constituents.	Grains per gallon.
1 Chlorine in chlorides above	5.0000 ^a
2 Solids in solution, total	50.0000 ^b
" volatile	5.0000 ^b
3 Ammonia, free or saline	0.0070
" albuminoid	0.0087
4 Nitric acid No ₃ in nitrates	0.7000
Nitrous acid No ₂ in nitrites	0.0350
5 Oxygen absorbed by organic matter in 15 mins. by permanganate and acid at 80° F. (27° C.) above	0.0700 ^c
Do in 4 hours at 80° F. (27° C.) above	0.2800
6 Hardness, total	20.0000
" fixed	6.0000
7 Phosphoric acid in phosphates	very heavy traces
Sulphuric acid in sulphates above	3.0000
8 Heavy metals	any except iron
9 Hydrogen sulphide, alkaline sulphides	present
Microscopic characters ...	Bacteria of any kind; fungi; numerous vegetable and animal forms of low types; epithelia or other animal structures; evidences of sewage; ova of parasites, &c.

REMARKS.—Dark-coloured waters may be usable, when the impurity is vegetable.

a Chlorides *per se* are not hurtful unless they are magnesian or in some quantity.

b Some waters which are organically pure contain a great excess of solids.

c In absence of free ammonia, or much chlorine, this may be due to vegetable matters.

N.B.—The inferences to be drawn from biological examination (cultivation of minute organisms in nutrient media) are still too uncertain to enable any definite rules to be laid down. Generally speaking the fewer organisms the better, especially when they liquefy the gelatine or other medium in which they are grown.

A water such as the above ought to be absolutely condemned; should stress of circumstances compel its use, it ought to be well boiled and filtered, or, better still, distilled.

Ceylon Spring Waters.

As an example of the freedom from organic matter of Ceylon spring water of the best quality, I might instance a spring water which flows into the scouring culvert of the Labugama reservoir. This water when tested was found to be as nearly as possible quite free from organic matter, the number obtained expressing albuminoid ammonia, being only .0001 grains per gallon.

Springs fed by river waters may show a very much higher proportion of albuminoid matter.

The following are examples of Ceylon spring waters of a much lower degree of purity than the spring at Labugama.

No. 1 represents water from overflowing spring near spill of the Maha Eliya at Ambala.

No. 2 represents the same after being filtered through sand only.

No. 3 represents water from Ambala main springs.

No. 4 represents filtered water from Ambala main springs.

Analyses of Spring Waters.

	1 Grains per gallon.	2 Grains per gallon.	3 Grains per gallon.	4 Grains per gallon.
Free and saline ammonia	.0062	.0004	.0385	.0011
Albuminoid ammonia	.0021	.0063	.0090	.0103
Total dissolved solids and solids in suspension	31.0000	40.0000	29.0000	32.5000
Solids volatile on ignition	7.5000	8.0000	8.0000	6.5000
Fixed mineral matter	23.5000	32.0000	21.0000	26.0000
Chlorine	3.1390	5.0413	2.1400	4.1900

Nitric acid	do	.1995	do	.2888
Total hardness	17.1000	15.3800	*	*
Oxygen absorbed in four hours	.0888	.0888	.0236	.0872

* Not determined.

Neither of these two waters, either in the filtered or unfiltered state, is of first-class quality. The filtering medium has added to instead of subtracting from the solid ingredients.

Hot Mineral Spring Water.

The following analyses of hot mineral spring waters received from the Straits Government, through the Medical Department, are interesting from the large percentage of alkaline silicates present. On boiling down these waters silica separated from solution and the water became very alkaline.

These waters are evidently of somewhat the same character as the Geysers of Iceland. They were clear colourless without smell or marked taste. The amount of sediment in the samples as received was very small, that in the sample marked 'Komong' being however several times as great as in any of the others. In the samples marked "Ayer Panas" and "Pulan Tebang" there was just sufficient lime to saturate the sulphuric acid present. In the other two there was a balance of lime which was calculated into and reported as carbonate. These two latter were harder waters than the others as the soap test showed.

Analyses of four Samples of Water from Hot Mineral Springs from the Straits Settlements.

Name of Spring.	Ayer Panas.	Chirana Petei.	Komong.	Pulan Tebang.

α Not determined. No. 3. Colombo well water is not to be regarded as typical of Colombo well water as the surroundings of this well were of an exceptional character.

Rain Water.

It is a point of agricultural interest to ascertain the composition of the rain which falls throughout the year; but no systematic analyses shewing the composition of a year's rainfall have been made for any part of Ceylon. Some remarks on this subject will be found at page 447. The following are analyses of waters from running streams on Raxawa Estate:

	1.	2.
	Grs. per gal.	Grs. per gal.
Free and saline ammonia	.0033	.0018

Albuminoid ammonia ...	·0021	·0024
Total solids ...	2·5200	2·2400
Solids volatile on ignition ...	·9100	·8400
Fixed mineral matter ...	1·6100	1·3000

a Inappreciable. *b* Presence marked.

From a chemical point of view the filtered water was the purer, but, from a biological point of view, the unfiltered water was much the purer. When tested with sterilised agar agar, the unfiltered water was found to be practically sterile, while the filtered water had a high zymotic power.* Water which passed through a filter which had only been three days in use was practically sterile, but when the filter had been 28 days in use, it has found to have conferred considerable zymotic power upon the water.

The following is the average of the monthly analyses of Colombo Town water, during the year 1891, a year of exceptionally high rainfall, also the average for the previous sixteen months:—

	1891. Grains per gallon.	Sept. 1889 to Dec. 1890. Grains $\frac{1}{2}$ gal.
Free and saline ammonia ...	·0010	·0009
Albuminoid ammonia ...	·0050	·0055
Total solids ...	1·8700	2·0225
Solids volatile on ignition...	·9380	·9836
Fixed mineral matter ...	·9320	1·0389
Chlorine ...	·1561	·1627
Iron ...	·0340	·0551
Nitrites ...	absent	absent
Oxygen absorbed in 4 hours	·0263	·0308

The average colour of the water from August to December 1891, when a two feet stratum was viewed through a Lovibond's tintometer, was matched by 2·2 degrees of yellow and ·5 degrees of red.

The zymotic power of the water from July to December 1891 was very low, not averaging more than a half colony per cubic centimeter of water. It was observed that a low degree of colour was associated with a low zymotic power, the latter property increasing with the colour.

* By "zymotic power" is simply meant power of developing minute organisms in sterilised culture medium without indicating that the organisms so developed are either of a harmful or harmless character.

The following table of analyses exhibits the constituents, the physical and microscopical characteristics of the water of the Labugama Reservoir at various depths, viz., 12, 24, 36, 48 and 59-feet from the surface, also some of the more important determinations in the examination of water from the Wakoya stream which flows into the reservoir, and of water from a spring which flows into the scouring culvert of the reservoir:—

Physical characteristics	12 feet below surface of reservoir.		24 feet below surface of reservoir.		36 feet below surface of reservoir.		48 feet below surface of reservoir.		Scouring sluice 59 ft. below surface of reservoir.		Wakoya stream.		Natural spring.

Analyses of Samples of Water from Labugama Reservoir drawn 8th March, 1888.

When the sample bottles were opened in Colombo the water from 12 feet depth had a slight smell, but was almost quite free from colour. The other four samples from the reservoir had a marked smell. Their colour seemed to have deepened considerably during the twenty-four hours after they were drawn, and a quantity of ferruginous sediment had been precipitated from solution. The samples from the Wakoya stream and natural spring were clear, colourless, free from smell, and remained so till they were analysed.

The analyses shew that the amount of free and saline ammonia increases to a very marked degree with the depth. At the depth of 12 feet there was the merest trace, (no doubt due to the fact that the samples were drawn in time of drought). At 24 feet the amount of this ingredient had risen to the proportion that is present in suspicious waters, while at 36 feet and all below this it had risen to the amount found in highly impure waters. The amount of albuminoid ammonia did not vary to any marked extent with the depth. As the albuminoid matter decomposed, its nitrogen would be partly liberated in the form of ammonia, which would therefore increase the item which appears in the analysis as free and saline ammonia. The amount of organic matter as inferred from the loss by ignition of the total solid residue did not vary in a definite manner with the depth; but the amount of oxidisable matter increased with the depth, as represented by the amount of oxygen absorbed from potassium permanganate.

The amount of mineral matter increased with the depth.

Nitrous acid was only detected in the sample from the depth of 48 feet.

The microscopic examination shewed that the more highly-organised living forms, such as cyclops quadricornis, were only to be found in the upper stratum of water. In a deposit collected from the wire gauze strainers, through which the water passes before entering the main leading to Colombo, the prevailing organic forms were the same as found in the water of the upper stratum of the reservoir, viz., numerous cyclopes, and other members of the entomostraca, thousands of brown globular-shaped monads with very slightly protruding oral orifices. After keeping the deposit for some time, living forms of low type, such as were found in the lower depths of the water, made their appearance. It is worthy of note that the sample of water brought from the Wakoya stream, the main feeder of the reservoir, absorbed more oxygen from potassium permanganate than any of the five samples drawn from the reservoir. The sample brought was too small to investigate the cause of this; but it

was probably due to the iron being originally present in the state of a protosalt, and passing by absorption of oxygen to the state of a persalt, whereas the iron in the water of the reservoir had already been exposed for a much longer time to the oxidising influences of the atmosphere. It was quite otherwise with the small sample of water brought from the natural spring in the scouring culvert. This contained a minimum of albuminoid matter, and also absorbed the least amount of oxygen of any of the samples. If we may assume that this is the same water as that in the reservoir after having been subjected to a process of natural filtration, which has removed the organic matter and the iron, it gives a fair idea of what Labugana water would be like after passing through filtering beds.

During the day time the temperature of the water is highest at the surface, and decreases towards the bottom of the reservoir; there cannot therefore be any convection currents tending to bring the impure water from below to the surface. During the night any convection currents caused by the cooling of the surface would only extend to a short depth, but these, together with the wind, must ensure the aëration of a certain stratum of water. I am of opinion that the inferiority of the lower to the surface water is not due to impurity rising from the bottom, but to the want of aëration of the deeper water and decomposition of the organic matter in the water itself. The increase in the amount of free or saline ammonia must be due to the descent of dead and decaying organic remains continually going on, the ammonia set free by the process of decay passing into solution. The deepest water having been longest exposed to this process necessarily contains most ammonia.

The following is the analysis of a sample of water from the Kandy public water supply (December, 1891), and, in a parallel column for comparison, I put the analysis of the Colombo public water supply for 1891:—

Analysis of Kandy and Colombo Water Supplies.

	Kandy. Grains per gallon.	Colombo. Grains per gallon.
Free and saline ammonia...	·0014	·0010
Albuminoid ammonia ...	·0035	·0050
Total solids ...	3·6400	1·8700
Solids volatile on ignition ...	·8400	·9380
Fixed mineral matter ...	2·8000	·9320
Chlorine... ..	·3685	·1561
Nitrous acid	absent	absent
Nitric acid	·1777	·0114
Iron	trace	·0340
Oxygen absorbed from potassium permanganate, in presence of acid, in four hours, at the ordinary temperature	·0080	·0263
Total hardness	1·7000	·5000
Color	Less than Labugana water	2·2° yellow ·5° red

This sample of the Kandy water supply contained less albuminoid matter and less iron; it also absorbed less oxygen than the Colombo water supply; on the other hand the lower proportion of chlorine and nitric acid in the Colombo water indicates a gathering ground freer from animal impurities.

The following is a comparison of Colombo and Kandy water supplies, with English water supplies, in the matter of free or saline and albuminoid ammonia:—

	Free and saline ammonia. Grains per gallon.	Albumenoid ammonia. Grains per gallon.
Average for 34 English towns, together with Edinburgh, Dublin, and Swansea	·0007	·0042
Average for the eight London water supplies	·0007	·0039
Average for the Colombo water during 1891.	·0010	·0050
Kandy water supply, a single sample, 1891	·0014	·0035
Labugama reservoir in time of drought 8th March 1888: From 12 feet below surface	·0001	·0088
" 24 " " " "	·0064	·0094
" 36 " " " "	·0252	·0094
" 48 " " " "	·0491	·0094
" scouring sluice 59 feet below surface	·0532	·0106

Colombo Drainage Water.

The following is the analysis of a sample of drainage water from a canal in Colombo, after it has received the waste water, from a coir fibre and desiccated coconut works. The water had a black appearance and a disagreeable smell.

Waste water from coconut product works contains both an organic principle of the nature of tannin, and also sulphur compounds. The former meeting with the iron in the canal water, natural to Colombo surface waters, produces a dark fluid of the nature of diluted ink. The following are the analytical results:—

	Grains per gallon.
Total solids	88·2
Organic matters	28·7
Mineral matters	59·5
Chlorine = common salt	44·16
Sulphur	·410
Iron	·560
Free and saline ammonia	·011
Albuminoid ammonia	·339
Equal to albuminoid matter	1·743
Oxygen absorbed from potassium permanganate in fifteen minutes at ordinary temperature	8·590

This water differs in several respects from ordinary town sewage, and notably in the comparatively small amount of free ammonia it contains. The large amount of oxygen absorbed shows that the water contains a large amount of decomposing organic matter.

Water in which coconut husks have been steeped has usually a very offensive smell owing to the presence of sulphuretted hydrogen or of sulpho-carbon compounds; but this disagreeable smell arises from the fact that the water in which husks are steeped is usually of a brackish character, such operations being usually carried on on backwaters that communicate with the sea. It is owing to the sulphates in such waters being reduced by the organic matter of the husk that the disagreeable smell of sulphur compounds is due. The same result is produced when well waters containing sulphates are used.

Distilled water in which a husk had been steeped for several days had a brown colour but no unpleasant smell, and when husks were treated with Labugama water, which is almost free from sulphates, the resulting liquid had a smell which could scarcely be called disagreeable. This water differs much in character from that of the sewage water of a large European town.

The following determinations by Mr. R. S. Thomson, F.I.C., exhibit the important characteristics from a sanitary point of view of the composition of an average sample of sewage deduced from numerous analyses of sewage, principally that of Glasgow; but including also that of Leeds, Totenham, Sheffield, Aylesburg and Bradford.

Standard Analysis of Sewage. (THOMSON.)

	Grains per Gal.
Free and saline ammonia	5·0
Albuminoid ammonia	·3
Nitrates and Nitrites	none
Oxygen absorbed in one hour	1·5
Chlorine	5·0

Mr. Thomson uses the figure 5 in the above analysis representing the amount of free ammonia in fresh sewage as an index to the proportion of sewage in water proved to be polluted. The nitric and nitrous acids in polluted water are due to the oxidation of ammonia. Hence he calculates the amount of ammonia equivalent to the nitric and nitrous acids present, and this added to the free ammonia found he calls "free ammonia originally present." With these data the following sum in simple proportion gives approximately the percentage of sewage that has gained access to the polluted water. For illustration, let us suppose the polluted water on analysis was shown to have had ·5 per cent of "free ammonia originally present."

Grains per gallon of free ammonia in sewage.	Grains per gallon of free ammonia originally present.	100 per cent of sewage.
5	·5	100 : 10

This water therefore contains 10 per cent of sewage.

When the sewage contamination of Colombo well waters, No. 1 and No. 2 (page 658) is calculated in this way from the analyses, No. 1 is shown to have been contaminated with 2·9 per cent, and No. 2 with no less than 11·5 per cent of sewage, a most undesirable state of matters.

The Labugama water supply has happily delivered the inhabitants of Colombo from the necessity of drinking such contaminated water.

THE WOOD OF THE AMERICAN TURPENTINE TREE.

The value of the American long-leaved Pine (*Pinus australis*) depends chiefly on its turpentine and timber, but the value of the latter, as set forth in a report to the Foreign Office, by the Consul at Pensacola, would seem to be so far in excess of any other timber, that it is worth recording. In tensile strength it is stated to approach and perhaps surpass cast iron. In cross-breaking strength it rivals the Oak, requiring it is believed 10,000 lb. pressure per square inch to break it. In stiffness it is superior to Oak wood by 50 to 100 per cent. It is best adapted and much used for the construction of heavy work in ship-building; the inside and outside planking of vessels, taking the deals and planks of the best quality. For house-building it is used almost entirely in these parts, and in buildings for railroads, railroad cross-ties, viaducts, and trestles, this wood is foremost. The finer grades and the curly wood are very much used for the nicer and unpainted wood in the best dwellings. The hardness of this wood especially fits it for planks and flooring. The finer

grades of curly Pine are used for the manufacture of furniture; and it is said that for bedsteads it is admirably adapted, as the resinous wood is a preventive to inroads of insects and such pests. The resinous products of Pine wood supply many parts of the world with pitch, resin, and turpentine, and contrary to opinions formerly held in this respect, it is said that the tapping of the Pine tree for turpentine strengthens instead of weakens the wood.—*Gardeners' Chronicle*.

COFFEE PROSPECTS FOR THE CURRENT YEAR.

Unfortunately there are not many estates in Ceylon which are interested in the prospects of coffee, for only on a few high-lying places is any appreciable acreage left of our old friend. Last year many thousands of acres were finally got rid of after being deprived of their primaries and allowed to throw up suckers for a time. On some few estates outside of Uva, and on many in Uva, however, there is a certain acreage which so far has escaped the destroyer, and, if a favourable season can put a crop on the trees that are left, then they ought this year to justify their retention or make way for a product which gives better returns. We suppose the old coffee trees will have to do this in any case before long; but we hope that the excellent prospects before those who have been bold enough to keep their best coffee going so long will be rewarded with a comparatively good crop this year. It is many years since so favorable a season for coffee has been experienced. Indeed, one of the oldest and most experienced planters this side of Nuwara Eriya tells us that he never remembers a more favorable season. The amount of sunshine so essential to harden the wood and bring on spike has this year been abundant, and yet the drought has not been so prolonged as to weaken the trees and prevent the blossom from setting. Fairly good showers fell all over the hill districts a week or so ago, sufficient to set one blossom and bring on another which is now in small spike. Not only so, but the trees appear to be unusually free from disease—both leaf disease and green bug—and promise with a little help from manure to carry their crop well. But we imagine that they will require this assistance in almost every case. Nor is this likely to be omitted, so that there is every prospect that those estates with any acreage of coffee left will secure an unexpectedly large return from a source from which little has been obtained for some time past. We hear that Wannarajah, for instance, has a magnificent blossom set, and as the Company has a very considerable acreage under coffee still—and very good coffee too—it ought to do exceptionally well this coming year. All coffee in Dikoya ought to do well, for wherever there is coffee there is blossom, and this holds good of all districts without exception. That it will set and mature well is earnestly to be hoped, for all very weak and diseased coffee has long since been cut out, and only the best has been retained; so that, with care and "backing," a fairly good crop ought to be secured. It must not be forgotten that all estates in the Island have long since made themselves independent of coffee; so that what they secure from that source is more or less in the nature of a windfall—and a very welcome one. We wish we could think that it presages a new era for coffee in Ceylon; but in all probability this crop will be the last much of it will bear, for the trees in all probability will be weakened, and this will tend to hasten their removal to give air and light to the tea, which in most cases has long since been planted beneath. It is, however, in Uva that the largest area of coffee remains, and it is there where the present reason will have the best effects. All that is required to allow the trees to carry their crop in that quarter is an absence of green bug for a few months, though, of course, the high-lying coffee will not blossom so freely at this time of year as that at a lower altitude. In any case there is every pros-

pect that a good return will be obtained from all coffee that has been kept up at all, and, coming at a time when prices for tea are anything but good, it will be a very welcome windfall.—Local "Times."

VARIOUS AGRICULTURAL NOTES.

THE ARACARIA AT KEW.—From the *Kew Bulletin* we learn that sections of the trunk of this famous tree have been placed in the Museum. The trunk measures about 30 feet in height, and is 1 foot 4 inches in diameter at the base. Nothing is said about the transverse section, but a careful study of the rate of growth in different years would have exceptional value from the known history of the tree from infancy, till its premature decay a year or two ago.—*Gardeners' Chronicle*.

THISTLES.—Baron Sir Ferdinand Von Mueller has prepared for the Agricultural Department of Victoria an illustrated account of the commoner Thistles. None of these is indigenous in Australia, but having been introduced, they have thriven to such an extent, that a special law has been passed to facilitate their eradication. The first thing to do is obviously to be able to recognise the offender—and this is facilitated by the pamphlet before named and to know his mode of life, which requires observation on the part of the cultivator. Meanwhile, it shows some remissness on the part of chemists and cultivators that they have not ere this been able to utilise these plants in some way. Has any analysis of a Thistle been made?—*Ibid*.

BRANCHES CASTING THEIR TIPS.—This habit is especially affected by trees that are accustomed to cold climates. A. F. Focoste has recognised it in certain American and other trees, viz., *Catalpa speciosa*, *Staphylea trifolia*, *Ailanthus glandulosa*, *Esculus hippocastanum*, *Tilia americana* and *platyphyllos*, which shed the tips of their branches at the end of the period of vegetation. He considers that this habit has been acquired in order to secure a determinate growth of the branches, and to obviate the useless expenditure of energy when the branches are killed back by winter frosts, as is always the case with many trees.—*Ibid*.

TROPICAL GARDENING IN BRITISH GUIANA.—We are frequently asked to mention a book on gardening within the tropics, and do not always find it easy to do so in a way suitable to our correspondent's requirements. The present little book is well suited for its purpose. It is the work of Mr. J. F. Waby, who has had long experience as a gardener in the West Indies and in Guiana, and is published in Demerara at the Argosy Press. It deals with the general preparations, such as formation of drains, walks, hedges, shelters, &c., the construction and maintenance of the flower garden, the kitchen garden, and the orchard; and the last section is devoted to the several methods of propagation. All this is included within little more than 150 pages, so that it is evident the writer does not waste his words.—*Ibid*.

CALIFORNIAN FRUIT.—A Californian correspondent sends us the following from a San Francisco paper:—Sixty-six carloads of fruit were hauled over the summit of the Sierra Nevadas yesterday on their way east, while the daily average for some weeks has been between 50 and 60 cars. Six 12-wheel compound locomotives are doing little else but hauling these fruit shipments. It generally requires two of these big locomotives to pull 20 loaded cars up the steep grades and through the snowsheds. Each car contains 24,000 lb. of fruit and 6 tons of ice, while the weight of each car is about 22 tons. Recently, 1,550 carloads of fruit were sent east from Sacramento. For the same period last year the cars numbered 1,100, or an increase for this year of 450 carloads. This large increase is attributed to the fact that the fruitmen, being unable to sell much fruit to the canners this year, are selling as much as they can in the eastern markets. The increased shipments have made it necessary for the railroad to haul hundreds of cars back from the east empty to fill the demand for more cars here.—*Ibid*.

PLANTING AND COLONISING IN UPPER PERU.

With reference to Mr. Robbs' recent Report, and our review of the same, we find the latest official information in respect of Immigration, Colonising and Lands in Peru to be contained in the following letter from the Consul-General in London addressed to the Editor of *Commerce*:—

EMIGRATION TO PERU.

To the Editor of *Commerce*.

Sir,—The President of Peru has sanctioned a new law with respect to immigration, and as I consider that this should be generally known, I now beg to give you a translation of the principal clauses, which I trust may be deemed worthy of publication in your esteemed and valuable journal.

The Congress of the Republic Peru considering that the natural resources of the Republic will be largely developed by a system of immigration which shall bring labour and capital to its territory, has enacted the following law:—

ARTICLE 1.—The State protects and encourages immigration.

ARTICLE 2.—The following are considered as immigrants:—1. All foreigners belonging to the white race, of less than sixty years of age, who shall come to the Republic to establish themselves therein and abide by the provisions of this law, after duly presenting to the authorities appointed by the Government a certificate from the Peruvian Consul or agent abroad in which the profession, trade, or calling of the immigrant is specified, and also a statement as to his moral character. 2. The colonists especially contracted to work in determined places in the Republic, provided they come under the provision of the last paragraph.

ARTICLE 3.—All immigrants are entitled—1. To be lodged and maintained by the nation during the seven days following that of their arrival. 2. To introduce, free of all fiscal duty, their personal effects, domestic furniture, a sporting gun, agricultural implements, and the tools appertaining to their craft or trade, in such quantities as may be fixed by the Government.

ARTICLE 4.—Besides the concessions referred to in the preceding article, all colonists will also be entitled to the following:—1. A third-class passage on board the vessels which shall carry them to the Republic. 2. To the number of hectares of land that the Government shall designate in the "colonies." 3. To be taken from the port of landing or from the place where they are lodged to the colony at the expense of the Government. 4. To be maintained by the Government during three months at the colony. 5. To be exempted from payment of any direct tax during five years. 6. To receive the agricultural tools and implements that the Government shall designate.

ARTICLE 5.—The supreme Government shall have a right to contract in Europe for the colonisation of such places as it may deem convenient.

ARTICLE 6.—The Public Works Department will have under its care the encouragement of immigration and colonisation.

ARTICLES 7 to 14 (inclusive) refer to the organisation of a central Board of Immigration and Colonisation at Lima, with branches in the different provinces, and to the duties of the members and of all consular employes with respect to immigration generally.

ARTICLE 15.—Pending the establishment of a proper locale for the reception of colonists the Executive is authorised to assist with sixty centavos and thirty centavos daily the adult colonists and the children under twelve years of age respectively.

ARTICLE 16.—All immigrants brought into Peruvian territory by virtue of the law of November 23rd 1889, in respect of the extension of the Oroya Railway and the colonisation in connection therewith, are not included under the present law.

I may add that the whole eastern slopes of the Andes in Peru afford an ample field for colonising

enterprise, and that the soil is especially adapted for the cultivation of cocoa, coffee, tobacco, coca, maize, and other tropical and inter-tropical productions, while the rubber and many medicinal plants and herbs, and also valuable timber, including mahogany, rose-wood, oak, walnut, &c., are abundant in the extreme. I may add that any information on Peru will be readily given by me at any time to intending immigrants.

Please accept my best thanks for the publication of this information, and excuse me for taking so much of your valuable space.—Yours faithfully,

FEDERICO ALFONSO PEZET, Consul-General.
London, January 15, 1894.

REPORT OF THE AGRICULTURIST DEPARTMENT OF MADRAS.

We acknowledge with thanks the Report on the operations of the Department of Land, Records and Agriculture, Madras Presidency, for the official year 1892-93. We note that the advances made during the year under the Land Improvement and Agriculturist's Loans Acts amounted to Rs. 2,75,007 against Rs. 1,685,665 disbursed in the previous year. Nearly the whole of the sum was disbursed in the first six months of the year, as on account of financial considerations, it was found necessary to discontinue temporarily the grant of loans after the 30th Sept. 1893. But for this restriction it is expected that the advances would undoubtedly have been much larger. The large demand for loans is said to be due to the great impetus to well-sinking consequent on the recent drought in several districts. Over twenty-five lakhs of rupees have been expended on the extension of irrigation works and the repair of minor tanks. In a drought-stricken Presidency like Madras, such expenditure must be a source of the greatest gratification to the Indian cultivator.

The result of the inquiry into the subject of Brush-making Fibres is given at some length. Kivu fibre has been found to be unsuitable for horse brushes, and the price asked for fibre of good quality in South India viz., 1 to 2 rupees a pound is considered prohibitive.

The Report mentions that specimens of palmyra fibre imported from Paumban to Colombo for the manufacture of brushes for rough use, rough hats, mats and baskets, and valued at Paumban at Rs. 10 per cw. was considered by the Inspector-General of Ordnance as unsuitable for making gun-brushes though it might do for making other brushes, but that a specimen of the fibre prepared in South Arcot, at a cost of about 3 annas a pound was deemed a good substitute for Picava in making gun-brushes. It is thus evident that by careful selection and treatment, an abundant supply of palmyra fibre equal to Picava could be procured. It is stated that a large trade in the fibre has sprung up recently on the coast of Madras and Tanjore, the product being imported by private agency.

Reference is made to Dr. Warth's discovery of a large deposit of phosphatic nodules in the Trichinopoly district. The nodules are said to contain about 57 per cent of phosphate of lime though the large proportion of calcium phosphate and other mineral ingredients makes it doubtful whether they could be economically imported for conversion into superphosphate. It is suggested that the nodules might be locally utilized for tea and coffee, that is, after being finely ground. Phosphatic nodules, it may be mentioned, are explained by geologists to be concretions that have been termed round bones, &c.

During the year the total loss of cattle from disease is put down at 112,442 deaths of which 10,104 are attributed to rinderpest or cattle plague.

MESSRS. DAVIDSON & CO.'S SIROCCO WORKS.

Now that Mr. Macguire has arrived, active steps are to be taken for the erection and completion of the Colombo Factory which the well-known

Bsifast Tea Machinist and Inventor is to devote to the manufacture or storage of everything needful to the Tea Planter. The arrangements are to be fully adequate and with a staff of four European Engineers devoted entirely to Tea Factories and Machinery—no work being taken in General Engineering or Building—Mr. Davidson hopes to be of special service to the Ceylon Planters. He has already devised a "model factory" and that the new Colombo Staff are not likely to be idle, is evident from the fact that orders sufficient to keep them busy for a year have already been booked.

THE TEA TRADE

has undergone a complete change, and the mixing is now done for them in the central warehouses of London by specially-trained "blenders," with the obvious advantage that grocers can draw their weekly supplies made to suit any taste, and need not hold large stocks, liable to depreciate day by day. With any resumption of demand, however, from provincial dealers—which is by no means impossible in the more hopeful outlook for trade generally—the effect would be quickly noticed in Minging-lane. For nearly twelve months the value of tea has been declining, until recently it touched the lowest price on record. Now, it seems probable that the pendulum will swing the other way, for a time at all events, and, if it do so, even consumers of the cup that cheers will not grudge a turn of fortune to those who are engaged in its production and distribution.—*Financial News.*

THE VALUE OF MICA AS A MANURE.

A Pulney correspondent, in writing to this paper a short time ago, mentioned that mica was to be found in very great quantities in his district. He further expressed his opinion that, as mica contained a large amount of potash, it would be a great thing for coffee planters if a method of extracting the potash could ever be discovered. Our correspondent further said that, as potassic mica cannot be formed without potash, the presence of mica on the surface argued a large reserve of potash in the soil. His two arguments are obviously contradictory as, if a large reserve of potash is in the soil, the extraction of this element from the surface mica, is on the face of it, needless. Moreover, on referring the question to Mr. D. Hooper, Chemical Analyst to the Madras Government, we find that mica by no means invariably contains potash, the percentage varying from nothing to only 11 per cent. As regards the extracting process, the potash contained in the mica is so intimately combined with silica, that, with the present prices of potassic salts, it would never pay. So that our Pulney correspondent's theories are inconclusive, to say the least.—*South of India Observer, March 3rd.*

COCOA CULTIVATION: CROPS AND RAINFALL.

The pressure caused by the many meetings and much "speechifying" has delayed the publication of the letter and useful returns on this subject sent to us by Mr. Chas. Gibbon and given further on. The cacao shrub undoubtedly loves moisture in its own congenial climate, and where favoured with a good soil and protection from wind. An old planter with much experience in manuring, has never met with a plant that responds more readily and certainly to liberal cultivation. At Wattegama, Mr. Gibbon's

annual rainfall has ranged for seven years between 69 and 90 inches, the average being about 77 inches. November and December are the two great crop gathering months, as much as 67 per cent of the total being credited to these two months of one year, and that the rainfall has a decided effect on the crops can be readily inferred from Mr. Gibbon's table.

TEA AND SCANDAL.

The earliest notice of Tea by a European writer is said to be the following:—"They also (the Chinese) have also an herbe, out of which they press a delicate juice, which serves them for drinke instead of wine. It also preserves their health, and frees them from all those evils that the immoderate use of wine doth breede unto us." (p. 75, A Treatise concerning the causes of the Magnificence and Greatness of Cities, Divided into 3 Books, by Sig. Giovanni Botero, in the Italian tongue, now done into English by Robt. Peterson, Lincolnes Inne Gent London. 1606.)

Sir Thomas Herbert, in 'Some Year's Travels' (p. 376.) says:—"Their (the Chinese) drink is commonly hot, and by its taste and colour appears to be coffee. They drink oft and little." And I find in the 'Atlas Japonensis' by Arnoldus Montanus, translated by John Ogilby, (p. 64.) 1670, this account of tea amongst the Japanese:—"The Blood of the Grape is altogether mannow to them, but instead thereof they make their wine of rice, but most of all they are delighted with water heated and mixed with the powder of Chia. In nothing they are more curious and diligent than in making this compound, which the Grandees themselves pride to prepare when they entertain their friends; for which purpose, to make this their special liquor, they have particular places in their houses, where in a kind of furnace over a gentle fire it stands infusing, from whence, when they are visited by strangers, lifting up the lid, they take it up in dishes and present it hot, trowling the cup around one to another."

"Their several vessels which they use in this preparation are a kind of Limbeck or Furnace, Tunnel, Stone, Cruses, Spoons and Pots, in which they keep both the Herb and Powder of Chia. Their last compliment, which they are most proud of, is to show them their wealth, boasting their accumulated treasure. But their forementioned drink the Japanesses esteem and value more than we our precious stones and inestimable Jewels."

In 1774 the American papers teemed with attacks upon Tea, some in poetry, a specimen of which I send you, taken from the *New Hampshire Gazette* of July 22nd of that year. It is rather revolting in its references to the mummies that used tea to be shipped along with the fragrant Chinese herb:

1
Rouse, every generous, thoughtful mind,
The rising danger see;
If you would lasting freedom find
Now then abandon Tea.

2
Scorn to be bound with golden chains
Though they allure the sight;
Bid them defiance if they claim
Our freedom and birthright.

3
Shall we our freedom give away,
And all our comfort place
In drinking the outlandish TEA
Only to please our taste?

4
Forbid it Heaven, let us be wise,
And seek our country's good,
Nor ever let a thought arise
That Tea should be our food.

5
Since we so great a plenty have,
And all that's for our health,
Shall we that baleful herb receive
Impoverishing our wealth?

6
When we survey the bloodless corpse
With putrid matter filled,
For crawling worms a sweet resort
By us 'reputed ill;

7
Noxious effluvia sending out
From its pernicious store,
Not only from the foaming mouth,
But every lifeless pore.

8
To view the same enrolled in Tea,
Besmeared with such perfumes,
And then the herb sent o'er the sea
To us it tainted comes;

9
Some of it tinctured with the fith
Of carcases embalmed;
Taste of this herb then, if thou wilt,
Sure, me it cannot charm.

10
Adieu, away, O Tea begone!
Salute our taste no more,
Tho' thou art coveted by some
Who're destined to be poor.

A.M.F.

PICKINGS WITH A LOCAL APPLICATION.

The question of cattle-branding may be looked on from two aspects, that of the humanitarian and that of the farmer. There is no doubt that the practice of branding artistic designs on the body of a bull in this country is a cruel one, and as such, should be prohibited. In Australia it is suggested that a small distinctive brand should be set on the cheek instead of a large one on the ribs or rump where the hide is of the most value. Other plans suggested, and some of which have been carried out, are branding in the region of the foot, or making distinctive marks on the tail or ears. The subject of branding, especially in Ceylon, is certainly deserving of consideration, so that some opinions may be arrived at, as to the best method of securing the object it seeks without spoiling hides or causing cruelty to animals.

"Paper," says the *Indian Agriculturist*, "can be manufactured out of almost anything that can be pounded into pulp. Over fifty kinds of bark are said to be used, and banana skins, bean stalks, pea vines, coconut fibre, clover and timothy hay, straw, sea and fresh water weeds and many kinds of grass are all applicable. It has also been made from hair, fur and wool, from asbestos which furnishes an article indestructible by fire; from hop plants, from husks of any and every kind of grain. Leaves make a good strong paper, while the husks and stems of Indian corn have also been tried, and almost every kind of moss can be made into paper. There are patents for making paper from sawdust and shavings, from thistles and thistle-down, from tobacco stalks and tanbark. It is said that there are over 2,000 patents in America covering the manufacture of paper."

The man who sets himself up as an expert at forecasting the weather by means of signs, is a proverbially false prophet. The following indications given by a "certain old farmer of Niigata (Japan)—as the result of many years of practical experience," will no doubt be welcome to our local weather prophets: at any rate it will be interesting to know how these portents compare with local experiences of weather signals:—

1. Signs of clear weather:—When the charred soot which forms on the wick of the old-fashioned Japanese lamp is red; when the rising sun is redder than usual; when a dog comes out of shelter to sleep in a more exposed place; when the western sky is red at the retiring of the sun; when an echo is heard to the pigeon's coo; when the kite ories in the evening; when a rainbow spans the East.

2. Signs of rain:—When the eastern wind blows; when a rainbow appears in the morning; when the morning is dewy; when the earthworm crawls out of the earth; when the crow washes himself in the water (rain next day) when the morning mist goes Westward; when the cock goes to roost later than usual; when the sun is surrounded by a corona; when the dog goes to sleep under the floor of the house (rain next day); when the kite flies toward evening; when the moon looks low.

3. Signs of wind:—When the stars seem to waver in their places; when the clouds fly rapidly in

detached fragments; when the smoke does not escape from the house in the morning; when the sun appears unusually red in rising; when the clear sky is felt oppressive; when the ravens croak in unusual groups; when the murmur of the river is heard louder than ordinary. The south-wind is a sign of a stronger wind to come.

In the *Mayflower*, an American monthly, mainly devoted to Horticulture, a correspondent (James Stinson, M.D.) writing about the confusion of the words *cocoa*, *cacao* and *coco*, attempts to clear it up thus:—

Kindly permit me to call your attention to an inaccuracy in Mr. Raud's article, "COFFEE and COCOA."

The spelling and pronunciation of four very different articles I now give you, viz.:

CACAO (*Kah-Kow*). *Theobroma Cacao*; the Chocolate berry tree.

COCA (*Ko-Kah*). *Erythroxylon Coca*; the Coca leaf bush of Peru and Bolivia.

COCO (*Ko-Ko*). *Caladium esculentum*; the Coco root.

COCOA (*Ko-Kwah*). *Cocos nucifera*; the Coconut Palm.

Cacao (*Kah-Kow*) is derived from the Portuguese "*cacau*," which was derived from the Mexican "*cacautl*." So it is an error (let me say a very general error) to write it "*Cocoa*"; also to pronounce it "*Ko-Ko*."

Cacao (*Kah-Kow*), Portuguese "*cacau*," Mexican "*cacautl*," is the correct spelling and pronunciation of the article mentioned by Mr. Rand.

[But Mr. Rand is quite wrong in his pronunciation of the name of palm and in his not seeing that the English form of *Cocos nucifera* should be "Coco"-nut. We never heard of the "*Caladium esculentum*," being called "Coco."—ED, T.A.]

PRICE'S PATENT CANDLE COMPANY, LTD.

Commerce devotes 14 pages to an account of this Company (fully illustrated) with its capital of £600,000 and 2,000 employees. We quote a few passages as follows:—

The history of Price's Company is, to a large extent, the history of candle-making in Great Britain. It was, as a private concern, among the first to apply in commercial enterprise the discoveries of Chevreul one of the greatest of all chemists; and as a joint-stock corporation, has continued to hold the first place among the candle manufacturers of the world. In 1829, the plan of separating coconut oil into its solid and liquid components by pressure was patented by Mr. James Soames, of London. This patent was purchased by Mr. William Wilson and his partner, who, trading upon it under the title of "E. Price & Co.," perfected it as to manufacturing details, and brought it into good use for the production of coconut candles and lamp oil. Mr. William Wilson, the founder of this business, became a candle manufacturer more by accident than design. He was a member of an old Lanarkshire family, the Wilsons of Cleuch, and had followed what had been the custom of the family for many generations, the eldest son inheriting the property, the younger ones going out into the world to score off their own bats. He made his way to Gotenburg in Sweden, where he was taken in hand by a wealthy Swedish mine-owner. Here he made a large fortune, and returning to England, he bought Cleuch from his brother. As a result of finding ironstone on his estate, he was tempted to build the "Wilsonstown Iron Works," where he lost all his money. This only served to put him on his mettle, for he came to London and made a fresh start as a broker in Russian merchandise, and became very successful. Not liking the business, he availed himself of the opportunity for leaving it that the patent I have mentioned provided. His first partner was Mr. Lancaster. Afterwards, when more capital was required, some members of the then great India house Messrs. Cockerell & Co., became partners. The name

of the firm was first "E. Price & Co.," taken from an aunt of Mr. Lancaster (Mrs. Elizabeth Price). On Mr. Lancaster retiring from the partnership, it was changed to "Edward Price & Co.," being a trade name only, so that it may well be described as a Price-less business. The coconut candles, though much superior to tallow, were insufficient for a great business, so the French process of making "stearine" candles was adopted in the works. The first great move forward was made by Mr. J. P. Wilson, a son of the founder, who on the sudden great demand for good cheap candles for illumination on the Queen's marriage, combined the pressed coconut with the tallow "stearine," and thus made the "composite" candles, the first really good cheap candles in existence. This was a most important invention, but circumstances preventing its being patented, competitors, were, after a time, able to proffer it the sincerest of all forms of flattery. The next move was the introduction of more advanced chemical processes. For this Mr. George F. Wilson, F.R.S., another son of the founder, and one of the present directors of the Company, was mainly responsible. Inventions were made and many patents taken out. The place became known as a scientific factory, and as the head of its industry throughout the world. A very early improvement introduced by E. Price & Co., consisted in the substitution of mats made of coconut fibre for the canvas which had been, up to that time used in the pressing of fats. This application of coconut fibre was made previously to its employment in the manufacture of floor-cloth. It may seem to some only a trifling improvement, but no material has been found, up to the present time, to supersede this fibre for many kinds of work with the hydraulic or screw press. In 1831 the candle manufacture in England was set free from the Excise supervision to which it had previously been subjected. From that date, then, its progress became possible. After a time E. Price & Co., found it necessary to establish steam mills in Ceylon for crushing coconuts, to extract the oil as the raw material for the London factory; and the business then requiring, for this and for other purposes, more capital for its proper development than they had at their command, Mr. Wilson's partner sold his share, in the beginning of 1835, to the capitalists referred to. With these gentlemen as sleeping partners, and with the aid of two of his sons, Mr. Wilson continued (under the name of "Edward Price & Co.") to carry on the concern, until it passed in 1847 into the hands of "Price's Patent Candle Company." Of this Company Mr. William Wilson became the first Chairman, and his sons, Mr. James P. Wilson and Mr. George F. Wilson, the two Managing Directors. Palm oil, treated by Chevreul's process of lime saponification, was brought into a limited use for candle-making by Messrs. Blundell & Spence in 1836, but the dark colour of the candles produced prevented their general use. There is another and more general application of palm oil, the ways of which are better understood "on the other side," where in so many things they have given us the straight tip. But on this it is not necessary that I should enlarge.

COCONUT PLANTING IN THE PUTTALAM DISTRICT.

It should cheer Mr. Lushington to learn of the great progress made of late years in the direction which he so strongly urged when Assistant Agent for the Puttalam district. It is clear now that the country between Chilaw and Puttalam is destined very soon to be the scene of as continuous coconut cultivation as that between Negombo and Chilaw, or even the country on this side of Negombo. And the sooner the better for the health as well as the prosperity of the people. The traffic along the West Coast route from Colombo northwards to Puttalam is simply enormous and is bound to

go on growing. If a railway is justified between Colombo and Galle, much more we should say is it a necessity between Colombo and Puttalam and if made as part of the connecting line between Ceylon and India, so much the more important would it become with its through, as well as local, traffic.

Meantime, the planting of coconuts on every acre of land that the Government choose to sell in the Puttalam district is a matter of special importance. Already as much as R110 an acre have been paid for some of the lots, and it is evident that the natives are keenly alive to the value of forestland suited for the palm. It is not generally known that there are gardens and plantations of coconuts in the immediate neighbourhood of the town of Puttalam from 30 to 40 years old and that steady average crops of from 1,600 to 2,000 nuts per acre per annum are gathered from these estates, the trees coming into bearing at a comparatively early date. From the letter of an intelligent native gentleman, Mr. J. A. Wijesinha, we quote as follows:—

"Europeans are beginning to go in freely for coconut planting and a few gentlemen have purchased some large blocks of land. The block near Santiakalli is to be opened up under European supervision, Mr. Daniel, an nponcountry planter, having come to take charge. Puttalam district is well adapted for coconut cultivation and trees come into bearing as soon as in Madampe, Marawila, &c.

"People from many parts of the island now come here either to buy land or lease coconut estates, and good competition may be expected for all Crown lands which may be sold in the future."

SALE OF ESTATES.

The price paid by Mr. Gaddum of Gampola for Bukande and Ambalawa estates, the sale of which by Mr. A. C. White's Attorney has been referred to by a contemporary is, we believe, over £5,000. These well-known Kaduganawa estates contain about 1,250 acres of land, of which about 350 are in tea.

HOW THE LONDON TEA SALES ARE MANAGED.

In a recent letter to the *Home and Colonial Mail* on the regulation of auction tea sales, one signing himself "Sigma" directs attention of sellers to the unwisdom of crowding so much into the catalogues for one day, and leaving the other days of the week with but little selling.***

It would be wiser at once to limit sales to two days in the week, and divide the quantity equally between Monday and Wednesday.

If this were done, probably the Ceylon importers would manage their sales more cleverly than they do at present, and divide their offerings between Tuesday and Thursday, instead of printing (as they have done) 23,000 packages for next Tuesday's sale, and (so far) none at all for their second day, Thursday! It is impossible for the buyers to value 23,000 packages of Ceylon tea, containing from 700 to 800 separate samples, carefully; and it is a matter capable of scientific demonstration that buyers who have been sitting in the heated and exhausted atmosphere of a stuffy sale room for three or four hours are so jaded that they have lost the spirit to bid properly.***

CEYLON PLANTERS IN PERU.

We have on previous occasions called attention to the explorations carried out by one or two ex-planters of cinchona and coffee in Ceylon, and by a trained botanist formerly connected with the Ceylon Botanic Gardens in Central Peru, on the Eastern side of the Andes. The explorers in question were commissioned

by the Peruvian Corporation, Limited, who have acquired an extensive grant of land along the Perene river in the so-called Montana or forest region of Central Peru. From a note in a recent issue of the "Kew Bulletin" it appears that the work of clearing and planting the land in question is being pursued with great energy. Coca will form one of the staple products of cultivation, and there is little doubt that in course of time the corporation will become a regular importer of the leaf, if not of cocaine itself. As the company's land is in one of the classic cinchona districts (although most trees have probably been destroyed by this time), it is not too much to expect that in time the cultivation of that now somewhat discredited tree will be taken in hand. The chief place of the new colony is called Dantville after the chairman of the corporation.—*Chemist and Druggist*.

A SUCCESSFUL COLONIAL INDUSTRY.

The Natal Tanning Company, having expended £6,800 on site, buildings, and plant, and produced manufactured leather to the value of £5,000 within 18 months, have just received the Government reward of £1,700. The Company is now supplying machine belting, which is used with every satisfaction on the N.G.R., the N.H.B. coal mines and sugar estates.—*Natal Mercury*.

DELI PLANTING RETROSPECT.

Last year, owing to favourable weather and less prevalence of seedling disease, the tobacco crops turned out good both in quality and quantity; the yield being estimated at 165,000 piculs. The planters are highly satisfied with the quality, as the leaf generally happens to be light in colour. They also have another reason for satisfaction in that the cost of production has been very low owing to the fall in the dollar, and hence they look with confidence to the results of last year's crop which, by last advice, was rapidly being got ready for shipment. The crop of 1892 brought to market in 1893 fetched fairly satisfactory prices which might have ranged higher had not the currency crisis in the United States interfered with purchases there. The state of health on the estates continued good throughout the year and the death rate among the coolies kept at normal figures.—*Straits Budget*, Feb. 6.

THE TEA OUTPUT IN NATAL.

Mr. Drummond's report on the prospects of the output of tea for the season shows that the estimate will in all probability be exceeded. Experience has shown that the industry is one that has a future before it, and with improved methods of production and manufacture, which we note with satisfaction are being contemplated by growers, we hope the day is not far distant when Natal teas will be able to hold their own in foreign and colonial markets with the teas of other countries:—

Mr. G. W. Drummond, of Kearsney, favours us with the following gratifying report:—We have just concluded a very satisfactory month, taking it all round. As regards quantity, January has the record up to date, we having turned out over 73,000 lb. at this factory during the past month. With the quality, too, we have every reason to be satisfied, as it undoubtedly shows a great improvement. This is due to a more rapid and better style of picking. Favoured, too, with good weather, we have been able to wither well and manufacture rapidly. A little more rain is now wanted. One wet day a week would suit us exactly. As we now stand, with the season half finished, we have no doubt that our estimate will be reached, unless something unlucky happens between this and April. This also applies

to the estimate for the whole Colony, which was originally put down at 650,000 lb., or 700,000 lb., if weather favourable. On dit, a new tea factory will be started next season in this district perhaps two new factories.—*Natal Mercury*, Feb. 9.

THE NEW BOOK ON TEA.

We are disappointed in the non-arrival of a supply of Mr. Bamber's book, despatched on 8th Feb. from Calcutta and still (after 21 days) somewhere in a B.I. steamer! Meantime Mr. Cochran has been looking over what is, we believe, the only copy of the book in the island and he writes of one part:—

"I was disappointed with the table of rainwater analyses. There were so many mistakes in the calculations of parts per 100,000 into lb. per acre which one could check, that I felt distrustful of the figures which I could not check. So I have sent to the Director of the Alipore Observatory for copy of the original or of determination for some other year. It looks as if Bamber had simply taken the table on trust. Even the title of the table does not correspond with the table itself. The former says 'parts per 100,000 and grains per gallon,' the latter gives parts per 100,000 and pounds per acre."

PLANTING PIONEERS IN CEYLON.

One who prizes the *Tropical Agriculturist* and its varied contents, writes as follows:—

I was much interested in the chatty and clever sketch of old Andrew Nicol which I have just been reading. I remember his visit to the island in the seventies when I was in Kandy, and his manner of greeting old Fredk. Solomons which caused intense amusement to the onlookers. He peeped into the Central Town Library—evidently in search of some Proctor, and espied his old friend reading some paper:—"Good gracious Solomons," was his exclamation, "is that you? I thought you had gone to heaven, long ago!" The bystanders, I fancy, took in the humour of the greeting more readily than the octogenarian who had been addressed!

I had intended supplementing the sketch of R.B.T. with a few reminiscences of my own; for I carried a letter of introduction to the Patriarch from Lorenz when I went up to Kandy in "the sixties" to report my first P.A. meeting. My amusement at his topee and his environment was only equalled by my appreciation of his geniality and kindness when he asked me to be his guest at the P.A. dinner, then an annual function. I had however accepted the honour of attending as the guest of the Chairman, G. W.

THE DRYING OF COCOA.

With reference to the letter of "Cocoa in Wet Districts," Mr. Maquire of Messrs Davidson & Co of "Sirocco" fame sends us the following which is of interest to planters:—

COCOA PRODUCTION.

CONSUL WYNDHAM, in his report to Lord Salisbury on the trade of Paramaribo for the past year, gave some details on the production of cocoa. He says that the production of cocoa advanced from £108,470 in 1890 to £112,354 in 1891, or an increase of £3,884. This is in spite of a rainy season. It is to be expected that yearly more cocoa will be exported as the young plantations begin bearing, but the past two years have been very wet, and the crops have been largely damaged. The value of the exports in 1891 to America, France, Great Britain, Demerara, and the Netherlands amounted to nearly £8,000 more than in 1890. These are the chief experts. The balance was used in the colony or was held over the year awaiting shipment. Four different systems of cocoa drying are in use or have been tried.

FIRST:—Sun-drying on large trays or trans run out from under sheds when the weather is favourable, and brought under cover in rainy weather.

SECOND:—Drying on brick floors under which furnaces are placed.

THIRD:—Fruit-drying machines of various sizes.

FOURTH:—A system of drying by steam outside and enclosed cylinder has been tried, and another of drying by hot air in a revolving cylinder is about to be tried.

Of the first, it may be said that it is unsatisfactory as it is dependent on the season, and a wet season may cause much loss of good cocoa by its becoming sour before it is properly dried. Of the second, that it is apt to shrivel up the beans and to discolour them: of the third, that fruit driers, even the best and most expensive as yet introduced, have only served to partially dry the bean, and save it until it can be sun-dried ready for sacking: of the fourth, that the machine requires some alterations: as it stands it appears rather to cook than to dry the bean: and lastly, the revolving cylinder has not yet had a fair trial.

An English firm has patented a cocoa drier, called, I believe, the "Sirocco," which was lately tried at Trinidad before the Governor of the colony and several officials and planters with satisfactory results. Details of the trial, however, are not yet to hand, but if on receipt they prove the machine to be a success, I think the member of the firm who visited this colony, and invited the planters and the Government to send some one to represent the colony at the public trial of the "Sirocco" at Trinidad, even offering to pay all the expenses, will have no cause to regret his trip, and that orders for the Drier will reach him from Surinam. Coffee can as yet scarcely be regarded as an article of export, the total import of 1891 amounting to only £59, but for the last four or five years coffee planting has been on the increase, and in two or three years more Surinam coffee will again be on the market. Mr. Maquire tells us that the results of the experiments made with the Sirocco were very favourable; but it was found that cocoa had to be very slowly dried and at a low temperature to prevent discoloration and internal fermentation. The best results were got with a maximum heat of from 180° to 200° Fahrenheit. In Java too Messrs. Davidson have been making important experiments in the drying of cocoa and coffee as well as tea. A specially capacious Sirocco for the slow drying of "Cocoa" has been designed and one has just arrived at Colombo which will be tried ere long on a cacao plantation and the results published.

LIBERIAN COFFEE IN SAIGON.

The following inquiry reaches us from a mercantile house in the Far East:—

"We should feel very much obliged to you if you could tell us whether in coffee-growing countries, which have a rainy and a dry season, the ripening of the fruit takes place during the wet or the dry season. The plants on our plantation began to blossom in the middle of March 1893 and, according to our last report of December, nearly all the fruit were still green with the exception of a very few which showed a reddish shade, not cherry red as they ought to be when ripe. When this report was written, the dry season had set in for about 3 weeks, and our Manager expressed grave doubts whether the fruits would ripen at all after having been so long on the tree and still showing a green appearance."

The complaint about the great delay in Liberian coffee cherry ripening up, is one of long-standing in Ceylon. To ripen properly, coffee wants occasional light showers of rain as well as sunshine. The coffee referred to, we should say, was suffering from the three weeks' drought: a shower or two would benefit the trees and crop.

A TRULY WET DISTRICT.

LAGGALA DISTRICT, March 1.—Lovely weather here at last, after what has been a rather wet season. Up to 16th February (as you will see by the accompanying figures, when the weather cleared up; and since then simply perfect, with thermometer all day between 60° and 75° Fahr. Heaviest rainfall in 1894 in 24 hours was between 21st and 22nd Jan. when 15.50 in. was registered, and on 9th Feb. 1894 while a large portion of the country was being burned up 5.90 in. was registered. I believe the heaviest rainfall yet recorded in this district fell in January 1892 when 153.30 in. was registered for the month. But what seems almost incredible the little appearance of surface wash after these heavy rains are over. On the light soils of Ambagemwa I have seen a far greater destruction from a north-east shower of 3 in. to 4 in than you do here after a day's rain of four times that quantity. Tea has now commenced to flush in earnest, so anticipate a busy time for the next few months. Hoping my less fortunate neighbours may soon have a share of the good things so plentifully showered on these parts.

[In these times of drought throughout the country. The accompanying figures may come in as a refresher to your readers.]

Memo. of (B. G. Laggala) rainfall from 1st January 1891 to February 1894:—

THE LONDON STOCK OF QUININE.

"We will go further, and express our belief that ... the era of quinine at 9d per oz. and less may be regarded as closed, and (that) we shall probably shortly arrive at a time when 1s or thereabouts will be the normal axis round which, with a short radius, prices will revolve."—(C and D., December 23rd 1893, p. 895.)

The quantity of sulphate of quinine stocked in the public warehouses in London has always been a dubious factor in estimates of the prospects of the drug. It will no longer be so in future. A few weeks ago representations were made to the Docks Committee and the other warehouses known to hold stocks of quinine, asking them to publish, from the beginning of the New Year, monthly returns of the stocks, imports and deliveries of quinine, as is done in the case of many of the principal drugs and with nearly all the staple articles of colonial produce. The memorial was backed by many influential persons connected with the quinine business, and as the principal holders of the stock were either on the side of these demanding publicity or remained neutral, the Docks and other warehouse companies assented to the proposal. The official returns have not yet been published at the moment of writing, but they were known to a small number of interested parties as early as midday on January 31st and on the afternoon of that day the London drug trade generally were acquainted with the figures, which proved to be smaller than was generally anticipated, the total being about 3,227,000 ounces net, of which 2,465,000 are held at the Crutched Friars warehouse of the Dock companies, 665,000 at Smith's warehouse, 62,000 at Bull Wharf, and 35,000 at Red Lion Wharf.

It is to be hoped that the warehouses will add to the figures of the present stock those of the supplies in their charge on the corresponding dates of the five years immediately preceding, as well as statistics of the receipts and deliveries during that period. Such figures would be of great value as showing the ratio of decrease of our stocks, for it is generally believed that the supply here has dwindled rapidly, at any rate since 1890.

The 3,227,000 oz. now in the London warehouses form the bulk of what is known as the "second-hand stocks" of quinine in the central markets. A certain quantity is held in small lots by private holders all over the world, but this is probably not a very large one. What supply there may be on hand at the factories is a matter for conjecture, but it will not have an appreciable effect upon the market. It is also impossible to state what relation the stock in London bears to the average requirements of the world, but judging roughly by the total imports of quinine salts into the United States (by far the largest consumer of the drug), it is estimated that the warehouse-stock in London would satisfy those wants for about four months.

The knowledge of the imminent publication of the "quinine-returns" caused a good deal of excitement in Minoing Lane this week, and at the Commercial Sale-rooms "guessing-competitions" were entered into freely by brokers, dealers and jobbers. It would be unpleasant to some of the gentlemen who took part in this amusement to reveal their individual estimates, and as no purpose of general utility could be achieved by doing so we refrain. It may be stated, however, that the estimates varied from 1,000,000 to 5,000,000 oz., and that some of those who were believed to have the best opportunities for judging came nearest to the extremes of under and over estimation. But what of the *Chemist and Druggist's* estimate? readers will ask. Well, we have no reason to hesitate in repeating what appeared in the issue of this journal of August 27, 1892 (page 345), under the heading of "What is our stock of quinine?" It will there be found stated that when the drugs stored at the old Fenchurch Street warehouse were removed to Crotchted Friars in January 1890, the total quantity of quinine transported was 2,829 cases weighing 125 tons 16 cwt. 1 qr., but that, owing to the steady diminution of the supply, the stock at the time of writing might be assumed to be little over 3,500,000 oz. In this note we only referred to the stock at the Dock warehouses, but when our estimate was challenged by the agent for one of the German factories, who believed even 3,000,000 oz. to be an excessive figure for the whole of London, we explained that we did not believe that the stocks at the other warehouses were large enough appreciably to affect the total, which we then placed at slightly above 3,000,000 oz. Allowing for the shrinkage of the stock which has since taken place, our estimate was clearly correct. We claim no credit for this, inasmuch as our figures were based upon official statistics supplied to us, but we are justified in pointing to the moral that it is safer to trust to the unbiassed opinion of an independent organ than to the reports of interested private persons.

As will be seen upon a reference to our Trade Report, there has been a strong and active speculative movement in quinine this week. It is to be hoped that this will not increase when the stock-statistics become generally known, but that the drug will be allowed to settle down quietly at the figure justified by the evident smallness of its supply.—*Chemist and Druggist.*

BENTOTA: PLANTING AND NEWS REPORT.

March 1.

The weather is the general topic of conversation just now: "extraordinary drought," "scarcity of water," &c., is what you hear all around. No doubt the weather is very trying but I do not think the drought is anything worse than usual at this time of the year—7.09 inch of rain to end of February compared with 7.91 last year. There is a good deal

of fever prevailing about the villages just now, but of a very mild type, mostly forerunners of oolds; but I hear dysentery has broken out in an epidemic form in some villages near the sea coast, notably at Alutgama and Kalavilla. The air is very still this morning and clouds are banking up. The paddy crop is now being reaped and the outturn very poor. Appuhami however gives his fields no rest, for no sooner is one crop off than operations are commenced for another. Poor fellow, he needs all he can get to keep up with the times. An out-of-the-way villager told me the other day he spent R3-75 per month on opium, and brought me 12 baskets at a very cheap rate, as he was hard-up. I must have the drug at any price. Our roads are in good order, but if the powers that be will take a hint and put that piece of road from the Railway Goods Shed to the Roman Catholic Church in shape before the rains set in, it would be to every one's advantage. It is very much out of repair and will be nothing but a bog in wet weather.

DIVERSIFIED CROPS IN BRAZIL.

The *Rio News* urges Brazilian planters to give more attention to the production of food stuffs. It advocates this upon patriotic grounds, rather than from the standpoint of profit; frankly acknowledging that diversified crops may not be of great advantage to the rich planters. Since the abolition of slavery the home production of food products for home consumption has almost disappeared. This is a great disadvantage, for foreign importations must be paid for in gold, a very expensive medium in Brazil. The *News* says:—"In the present emergency, the difficulty is further increased by the risks encountered in foreign trade, and these risks may still be largely augmented. The government and the large landholders could not render a greater and more patriotic service to Brazil, at this juncture, than to give the fullest encouragement to the production of food. Cattle-raising in the interior cannot fail to result profitably, while the production of maize, rice, beans, mandioca, potatoes and all kinds of vegetables and fruits would at once give employment to the thousands of poor people who have nothing to do, and who could thus easily earn a comfortable living. It would be sound policy to give away small farms to those who will undertake to cultivate them, and special rates could easily be granted by the railways as an inducement for them to send their products to market. The permanent prosperity of the country depends more upon these small industries than upon the great coffee and sugar plantations and the Government should use its best efforts to encourage them."

Thirty years ago in the United States the South was dependent upon the Northern States for a large proportion of its food supply. Cotton, sugar and rice were grown to the exclusion of other products. Since the war a great advance has been made in the cultivation of cereals, garden truck of all sorts of fruits. No section of the country has leaped forward with such strides as the Southern States during the past twenty years. We have no doubt that diversified industries could be proportionately as advantageous to the Empire of Brazil. Coffee planting will not always be as profitable as now. High cost has placed a premium on coffee growing in all coffee-producing countries. In the course of a few years we will enter a period of low-priced coffee, simply because production will forge ahead faster than consumption increases.—*American Grocer.*

LIBERIAN COFFEE.

The Resident of Selangor notes with satisfaction that he has sanctioned two grants for blocks of land of 500 acres each for Liberian Coffee at Kajang, the first *bona fide* applications for land out of the home districts of Kuala Lumpur and Klang.—*S. F. Press.*

MR. BAMBER'S NEW "TEXT BOOK ON TEA."

[We are indebted to Mr. Cochran for the following epitome from the new book on tea, in reference to withering and rolling.]

I had no idea that I had been favoured with possibly the only copy of this book as yet in Ceylon; otherwise I should have hesitated to draw your attention to one or two of its defects before the undoubted merits of the book had been referred to in some detail. The following gives an epitome of the result of Mr. Bamber's observations and experiments on the first of the manufacturing processes, viz., the Withering, the truth of which experienced manufacturers will be able to appreciate:—

WITHERING.

In the process of withering there is little chemical change beyond the loss of moisture, unless the leaf gets brusshed. Leaf plucked in wet weather "should be rather overwithered to concentrate the sap" and should be subjected to more prolonged rolling, while leaf gathered in dry weather requires less withering the sap being more concentrated, and it also requires less rolling.

As a general rule the best withering is carried on till 33 per cent of moisture is driven off. Properly withered leaf should give out a fresh pleasant aroma quite different from the ordinary vegetable smell of badly withered leaf. Artificial withering by drawing dry or heated air over the wet leaf is recommended especially for damp climates. Unless the leaf is very wet or only at the beginning of the process Mr. Bamber would not allow the temperature of the air that is drawn over the leaf to be at a higher temperature than 90° Fahr. In any case after the excess of extraneous moisture has been driven off at say 106° Fahr., the temperature should be reduced to or under 90° Fahr.

In India withering in the sun is little practised as the tea so treated is considered to be inferior. In Java however it is said that the sun is necessary to bring out the flavour. The great objection to overwithering, is that it concentrates the sap too much which should be avoided for the following reasons:—1, "The contents of the cells of the leaf will have contracted so that the cell walls will tend to collapse instead of burst when the leaf is rolled."

2. "A portion of the contents of the sap will have been deposited from solution owing to the concentration."

3. "There will not be sufficient sap to be exuded over the whole surface of the rolled leaf, and the color obtained during the oxidation process will be uneven."

The liquor from tea that has been overwithered is liable to be deficient in pungency and strength.

The objection to underwithered leaf is that it breaks in the process of rolling. "A large amount of sap is expressed from the coarser leaf discolouring tip, and giving the finer teas when sorted a dull appearance and coarse pungent flavour and taste."

It might be unfair to the author to epitomise further. Practical men will find that the other subjects of the chapter which deals with the manufacture viz; the rolling, oxidation or fermentation and the drying or firing will repay their study. They will be specially interested to note how the firing should be conducted to conserve the volatile oil. Here science has been anticipated by experience, as Mr. Bamber says that the method "has been employed on many estates for some time, and it has almost invariably been found to produce a flavoury and valuable tea so that the analyses merely confirm and explain the benefit of such a process."

I have only today referred to one chapter of the book; but the whole book will be found replete with interest both to the scientific and to the practical reader.

ECHOES OF SCIENCE.

It is a well-known fact that lightning strikes some kinds of trees more than others. Firs in our country oaks, ashes, white poplars, and elms are often struck, while beeches and walnuts very seldom suffer. Vines, cotton plants, and palms are peculiarly susceptible to lightning. There is also evidence to show that varieties of the same tree growing in different countries and climates differ in their immunity, probably owing to the quality of the wood and sap; so that statistics for one region may not be reliable for another.

M. Dimitre has continued his experiments on this subject by subjecting specimens of living wood of equal dimensions in the direction of their fibres to the spark from a Holtz electrical machine, and finds that oak is easily penetrated by it, while black poplar, willow, and especially beech, are much more resisting. In all these cases the heartwood is the least conductive, and behaves like laburnum. In fact, the starchy trees poor in oil, such as oak, poplar, willow, maple, elm, and ash offer much less resistance to the spark than beeches, walnuts, birches, and limes, which are "fat" trees. Pines, which contain a good deal of oil in winter, but have little oil in summer, are much more resisting in one season than the other. In summer time the wood is as easily pierced by the spark as oakwood, and in winter as difficult to penetrate as beechwood. When the oil of beech and walnut wood is extracted by ether, the spark easily goes through. The dead wood of starchy trees is more easily pierced than the living wood, a fact which militates against the common idea that sap conducts the discharge. The bark and foliage of trees are, according to M. Dimitre, bad conductors. The above observations agree in a general way with statistics of lightning strokes in Europe. Thus, in the forests of Lippe, from 1879 to 1885, and in 1890, there were 159 oaks, 59 pines, 21 beeches, and 21 other kinds of trees struck.—Globe.

OPENINGS IN EAST AND SOUTH AFRICA.

On the occasion of the delivery of a lecture before the members of the Royal Colonial Institute we devoted some considerable space to the consideration of the openings there might be in South-Eastern Africa for men trained in the highly efficient school afforded by this colony. Since then, there has been a good deal of further discussion in this journal on the subject, as well as on the prospects this island affords for the large number of young men resorting here for training, and generally known by the *soubriquet* of "creepers." For some time, it seemed as if we were to be overrun by such importations, and it is easy to understand why this should provoke much adverse criticism. There is, however, several openings, we may hope, through which the future may be brightened for these young and numerous aspirants to planting success, and South-Eastern Africa seems to be one of them.

Ceylon has always been, and probably will continue to be, the finest training school for those who desire to fit themselves for planting pursuits elsewhere. Through the experienced teaching that may be obtained here, pupils can be qualified in the best and most practical way for promising enterprises in other fields. Among such fields, we believe few are likely to be found equalling in their promised advantages the newly opened-up territories in East and South Africa. To those young men whose deficiency of capital must prevent their embarking for themselves in our own more settled industry, the territory we speak of, must offer great attractions. What thousands of pounds could not accomplish here, we estimate that hundreds may secure in these new lands. We need not again dilate upon the many advantages of soil and climate on which we dwell in our previous articles. Our London Letter just received, however, narrates the result of a conversation held with our old fellow-colonist, Sir G. W. R. Campbell, who has prominently allied himself with some of the many Companies or Syndicates now being formed with the object of aiding settlement in these newly-obtained regions. Sir George has expressed himself as fully sharing our view that within them, exist opportunities of a most promising character for the overplus of our own planting community. He has described to our correspondent how it comes about that lands of high capacities for production will be obtainable at exceedingly low rates. It would be of little avail, we imagine, for men wholly untrained in the pursuits of agriculture to occupy these lands. They are especially suited, Sir George Campbell thinks, to the production of sub-tropical growths, among which may be prominently classed both cacao and coffee. Land that in Ceylon would cost some R200 to R250 an acre—supposing that suitable land really remains anywhere in the island, in any quantity—could now be obtained in Matabeleland for a few shillings. We are not all disposed to regard Sir George Campbell in the light of a prejudiced advocate. He has, of course, personal interests to serve; but we know his sense of honor and his feeling of attachment to the island in which he served so long, both to be too great, to permit of any suspicion that he would tell us that which he did not sincerely believe to be true. It may be said that Sir George has no personal knowledge or experience of the countries with which his advice deals. But, on the other hand, the connection he has formed relative to them, and the information he must have acquired from those who have visited the localities, must fit him in no inconsiderable degree to offer counsel

on this subject. It is his opinion that the South African lands now about to be opened to British enterprise must afford a most promising field to young planters who have acquired in this colony a knowledge for the exercise of which there remains but little scope here. Even presuming that there are many of the latter, whose means scarcely admit of their commencing undertakings on their own account, their possession of diplomas of competency obtained in Ceylon must induce the ready acceptance of their services by those possessed of the means for such undertakings. As was pointed out to our correspondent, the lands handed over to those who fought against Lobergula are now to be acquired on the most favourable terms, and we do not doubt that the Bulawayo Syndicate of which Sir George Campbell is chairman, would not only be ready with advice to intending purchasers, but might be willing to aid with cash advances such thoroughly-qualified men as Ceylon might send to the new fields of planting enterprise.

THE CHINA TEA TRADE.

(From "Hongkong Weekly Press," Jan. 18.)

Attention is once more directed to the threadbare subject of the decline of the China tea trade by the recently issued decennial reports of the Imperial Maritime Customs. The trade is no doubt capable of revival but the probability of the necessary measures being taken to bring a revival about is as remote as ever. What are wanted are improved methods of preparation, lighter taxation, and increased facilities for bringing the leaf from the producing districts to the port of shipment. According to Mr. Hughes's Amoy report, the high rate of taxation and heavy cost of transportation over a difficult and imperfectly developed route from the interior amount to something like 34 per cent. on the original value. Yet nothing is done, either in the way of reducing taxation or increasing the transport facilities, towards improving the chances of China tea in competition with the production of other countries. The competition of India and Ceylon has not reduced the export from Japan, and there is no reason why China tea also should not have held its own except the want of adaptation to new conditions on the part of the Government, the growers, and the manufacturers. The loss of the trade seems in fact to be regarded with comparative indifference. One reason for this is no doubt the smallness of the export trade as compared with the home trade in the article, so that the falling off in the former represents but a small percentage on the grand total. The Chinese are a nation of tea drinkers. The home consumption has been estimated at 800,000,000 lb. per annum, which is probably under rather than over the mark. This large home consumption must be the explanation of the fact noted in the Amoy report, that notwithstanding the falling off in the export trade in tea not a symptom is discernible to show that any serious difference in the welfare of the people has taken place. Mr. HUGHES says:—"No doubt a great many of those formerly engaged in the Amoy Tea districts have transferred their labours to North Formosa, many also have gone to swell the rising tide of emigration to Java or the Straits: but the bulk, it may be assumed, remain on the old ground, exercising their native ingenuity and industry in extracting from their fertile soil a crop of some farm produce sufficient to meet their simple daily wants, stoically indifferent to the loss of an occupation in which they had been once supreme, and which, under proper guidance and encouragement, they might still conduct with advantage to themselves and with substantial benefit to their country." Foreigners have tried in vain to induce the Chinese to adopt foreign supervision and improved methods of preparation, by which the cost could be materially reduced and the taste of the consuming markets be better catered

for. The chief handicap on China tea is, however, the heavy lekin charges to which it is subjected and the expensive transport; but the Government is apathetic in the matter, making no effort to save the trade, and even Sir Robert Hart some years ago pronounced against any reduction in the duty. Foreigners therefore can only look on helplessly while the trade dwindles away. To them the matter is a serious one, however insignificant it may appear to the Chinese. Fortunes are no longer to be made in the China tea trade, a bare living being almost all that those still engaged in it can hope to earn. There is a diminished trade, with smaller profits, and more mouths to share them. As Mr. Farago says in the Foochow report, "Owing to the diminished profits on tea several of the large mercantile houses keeping a number of employes were compelled to close their doors. In many cases, however, the withdrawal of large firms led to the establishment of one or two minor houses doing similar business, but on a more modest scale. Although, therefore, the extent of business now done by foreigners is fully fifty per cent. less than at the beginning of the decade, the numerical strength of firms is greater at present than it was ten years ago." At Foochow, at all events, whatever may have been the case at some ports, there has been no development of any other branch of commerce to make up for the tea trade, so far as foreigners are concerned. No new article of export has made its appearance, while as to the import trade Mr. Farago tells us that "the effort to oust foreigners from every branch of trade has, in the case of cotton and woollen goods, been successful; the last representative of a foreign hong engaged in the piece goods trade was withdrawn prior to 1882, and the business now remains entirely in native hands." "Old Foochow," whose boast it used to be that it was "the most aristocratic port in China," seems indeed to be in a very bad way.

THE DECLINE IN THE TEA TRADE OF FOOCHOW AND AMOY.

Mr. E. Farago, Commissioner of Customs at Foochow, in his decennial report gives the following gloomy account of the tea trade:—

In regard to the pursuits of the people, so far as can be gathered from the only information available, it is to be feared that, instead of material progress there has been a steady decline, and that in point of resources and commercial activity the outlook is not so promising as it was 10 years ago. The tea industry, for instance, which ranked for many years as the most important in the province has during the decade commenced a receding course. This is the more to be regretted as the cultivation of tea did not involve an unusual expenditure of labour though it required, during the season of picking the exercise of patient care and experienced judgment. It left also a large part of the year free for other occupations; and, best of all, was tolerably certain to be remunerative. It was so attractive and profitable that families would follow the same pursuit from generation to generation. Once in possession of a suitable plot of land, the only necessary step was to set out the young plants and leave them to grow. No expense for fertilisers was incurred, but, as a sort of substitute, in the spring of each year the soil around the roots was loosened. At the end of three years from the time of setting out, the leaves were fit to be picked and prepared for market. For years past, however, the business has been in a declining state, and to illustrate its present condition it is only necessary to call attention to the figures showing the export of black tea to foreign countries, namely, 1882, 649,755 piculs; 1891, 335,651 piculs.

The history and cause of the decline have been reviewed at length in each of the annual Trade Reports for the past 10 years, and need not be referred to here, except to record the fact that the marked falling off in the quantity of tea exported from Foochow, consequent upon its deterioration in quality and the inability to lay it down in the home markets at a cost

that would enable it to compete successfully with the products of other tea-growing countries constitutes the most important change that has occurred in the province during the last 10 years, in so far as its far-reaching effects on both the material prosperity of the people and the resources of the Government are concerned.

Although the amount of capital now employed in the tea trade is much less than formerly, it cannot be ascertained that it has been directed to the promotion of other branches of industry whose home is in this province. There are various local enterprises, such as the growth and curing of tobacco, the manufacture of paper, and the importation of sugar, oil, cotton, and woollen piece goods etc., which have been in existence for many years, but which have not met with sufficient appreciation, either here or at other places in the province, to indicate a growing demand and to warrant the employment of increased capital.

Not less discouraging is the report given by Mr. T. F. Hughes, the Commissioner at Amoy, who writes:— "The decay in our local tea trade is certainly the most notable circumstance in connexion with the recent mercantile history of this port; its beginning dates from a period anterior to 1882, but the downward progress has been more marked during the past 10 years. A feeble improvement took place in 1885, when it was thought that the French operations in North Formosa would interfere with the Tamsui export, and when there was, in consequence, an extra demand for the Amoy product. But the improvement was found to be merely transient; it was only like the spasmodic flicker of an expiring lamp, making things look bright for a fleeting period, but giving no earnest of a vitality likely to stave off the final extinction that is bound to come. The totals for the last five years will best explain the melancholy decadence:—

1887	1888	1889	1890	1891
Piculs	Piculs	Piculs	Piculs	Piculs
41,820	39,227	25,002	24,396	23,910

When we consider that in 1877 the export of Amoy Teas amounted to upwards of 90,000 piculs, it will be seen what a serious change has come over this branch of our trade. The reasons for this rapid wiping out of an important and local industry are not far to seek; they have been often dwelt upon and are well known to all. In the Report for 1881 it was stated that the quality of Amoy Tea was bad, and was yearly deteriorating; by that time careless cultivation and dishonest packing had already killed the Amoy Coogou trade, and though local Oolongs were then still in almost as great demand as ever, a combination of causes were at work which soon began to prejudicially affect Oolongs as well. When the cultivation of the same class of Tea was developed in North Formosa, Amoy Oolongs lost their hold on the American market. The new plantations turned out leaf of finer flavour and of better finish than the old ground, exhausted and badly tended as it was; and whilst, on the one hand, the original poverty of the Amoy cultivators prevented them from spending extra labour on the necessary improvement of plant and soil so as to produce a better paying article, their dwindling profits year by year compelled them, on the other hand, to retrench in the very directions that still further diminished the quality and value of their product. So the vicious circle went on, vanishing profits making improved cultivation less and less possible, and increased faintness, in the cultivation making the leaf less and less valuable, until now Amoy Oolongs are said to be hardly worth the cost of shipment. Badly handicapped as they also are with a high rate of taxation and a heavy cost of transportation over a difficult and imperfectly developed route from the interior—a combination of expenses amounting to something like 34 per cent on the original value,—the wonder is that, with yearly increasing quantities of better and cheaper produce from other countries to compete against, their existence as an article of export has been so long maintained. There will probably always be a demand for

low priced Teas, and under present conditions this is the only chance for the continuance of trade in Amoy Oolongs; but other countries are now creating for that demand, and unless some radical change quickly takes place, the forerunning shadow of which is not yet apparent, the Amoy Oolong trade will soon become as extinct as the Amoy Congou trade. There is no question here of any rivalry with what Sir Andrew Clark describes as the nerve disturbing, t-a-intoxicating Indian and Ceylon varieties. Amoy Oolongs, like those from Tamsui, find their market in America, where they come into competition only with the Japan product and there is, unfortunately, no doubt as to which kind is likely to gain the complete control of that market, in many respects—with its yearly increasing population and its extending influence—the most promising market in the world. In the last 10 years the export of Japan Teas to the United States is said to have nearly doubled; in the same time the Amoy export thither has fallen more than 50 per cent. The Tea duties in Japan are said to be less than half of those ruling in China; but it is more than probable that extra care in cultivating and a willingness to adopt the latest and best contrivances for preparing the leaf have done more for the development of the Japan tea trade than even light taxation. As an instance of the different spirit which pervades the rival producing countries, it may be mentioned, on the authority of a Yokohama journal, that at least one enterprising Japanese has already invented a tea-preparing machine on modern principles, which is said to be excellent of its kind. It need hardly be said that either any machine nor any improvement on time-worn methods has been as yet adopted by the Amoy cultivators, and no local effort worthy of the name has been made here to improve upon the ancient order of things.

And yet it might be thought that the recovery for this district of such a large circulation of capitals as the tea business of former days brought was an object worthy of an energetic struggle. Even 10 years ago the annual export of Amoy teas represented over a million of dollars more than it does today, and such a heavy yearly loss to a district which, after all, is not very extensive, would, it might well be supposed, urge the losers to make every effort to regain the position thus forfeited. But, so far as ordinary observers can detect, no such effort has been thought of; no outcry such as would have been heard in any other country has been raised; not a symptom is discernible to show that any serious difference in the welfare of the people has taken place. No doubt a great many of those formerly engaged in the Amoy Tea districts have transferred their labours to Nurtu Formosa, many also have gone to swell the rising tides of emigration to Java or the Straits; but the bulk, it may be assumed, remain on the old ground, exercising their native ingenuity and industry in extracting from their fertile soil a crop of some farm produce sufficient to meet their simple daily wants, stoically indifferent to the loss of an occupation in which they had been once supreme and which under proper guidance and encouragement, they might still conduct with advantage to themselves and with substantial benefit of their country.

EARLY PLANTING TIMES BY AN ANCIENT. K.C.B.

The town of Kandy, charmingly situated amid encircling hills, cannot be said to possess a balmy or exhilarating climate. In constant sympathy with weeping skies above, Kandy may be called the "town of tears." Towards the month of November 1853 (the year of the Mutiny in India) I found myself a visitor at the old Club House, now the Queen's Hotel, waiting for the Sexton's flea-bitten Arab mare, well known in those early days, as by far the best nag for hire in Kandy. I had a long ride before me which brooked no delay and the prospect was not a very pleasant one, as the rain was falling steadily if not heavily. I was bound for the Elephant Plains estate, in a northern coffee district,

At last after waiting a long time all things have an end. Beeswing, Muttu and self started in the early morn for a spot among the Kandyan mountains, called Otta Karen, or in English "one bazaar," which I was informed also boasted of a private resthouse. Our journey was not altogether too pleasant, for we had to do battle with rain, heat and wind, as we ascended the Kandyan hills, and it was high noon day ere we reached the "one bazaar" and pulled up in front by a very tiny cot, or cottage, called by courtesy a resthouse. After shouting for some time a very small specimen of humanity appeared and said "I am the resthouse-keeper." "Glad to see you." I replied, "for we i.e. the mare, Muttu and self are hungry and tired." "Come in Durai, I will give breakfast." "Well, what have you got, appu?" "Got, got, sir, sardines and boiled eggs." "Well, appu, those victuals are for folks with weak digestion, is it not so? but look you here, appu, I am fainting from hunger, and must have a real good breakfast, do you hear me?" "Master please wait a couple of hours and I give master grilled chicken and curry and rice." I was tired and did not care to dispute the arrangement, only stipulating that Beeswing should have a couple of measures of clean paddy without delay. Somehow, I forgot to include Muttu in the feeding arrangements; and my scribe guide made me aware of my cruelty, later on, and before we reached the E. P. estates. The appu took his time to give the grill and onry and rice; Muttu took his time before he brought Beeswing round to the front-door; and it was late and cloudy and dreary and 3 o'clock of the day ere we started again for the K.'s district and for the E. P. estates. Muttu led the way, and suddenly turned off the Queen's highway and leading me first of all, down a very sleepy hillside, then through a rapid stream and on to a native hamlet, where Beeswing and self narrowly escaped being chucked into a sweet-potatoe garden by the horns of a venerable and snarly Sinhalese buffalo who made a determined charge at horse and rider, and missed his mark, through the agility of Beeswing and the ability of her rider. My scribe friend enjoyed the occasion greatly and said good, "Good," the only English word he seemed to know. Having escaped destruction from the venerable buffalo, I inwardly rejoiced; but Muttu had another penalty in store; for before we reached the tavalam road and right in the centre of a patch of jungle, some one, to prevent right of roadway from being disputed, had hewed down a giant of the forest and let it fall across the road. I could see Muttu's face beaming with joy—no *chorru* for Muttu, eh! doubtless he inwardly exclaimed, "Now, master—what do?" But Beeswing and master were equal to the task, and over went, planter and mare, to the astonishment and delight of the cunning horsekeeper, who again and again exclaimed "Good, good." Soon we reached the wretched tavalam road, along which we travelled for some miles, when a swift-flowing stream confronted us, and over which old Charon ferried us in a boat made from two hollowed trees fastened together with coir-ropes. Then we entered the Stygian regions, gloomy and dreary, till at last emerging from the primeval forest, we arrived at what—for all the world seemed to me to be an Irish village, it consisted of a couple of dozens of mud huts of all shapes and sizes, enlivened by the grunt of half-a-dozen long-snouted swine, and here Muttu pulled up and exclaimed "Totum, dorrie, histate dorrie."

THE RESOURCES OF BRITISH EAST AFRICA.

At the Imperial Institute on Jan. 29 a lecture was given by Mr. W. A. Fitzgerald on the "Agricultural Resources of the Coast Lands of British East Africa." The Marquess of Lorne presided, and there was a crowded attendance.

Mr. Fitzgerald explained that he was not an official of the British East Africa Company, but went there to inspect the country and to report

upon the facilities it afforded for tropical agriculture. The sphere of country under British influence extended from Wanga on the Umba River northwards to the Juba River, a total coast line of over 400 miles, within which were to be found safe and commodious harbours, large navigable rivers, flourishing towns, and a rich and fertile territory. The portion he visited included the tract between Mombasa and Port Durnford, and extending inland at one point to over 100 miles. The district was in the very centre of the tropical zone, and was subject to the influence of the S. W. and N. E. monsoons. The average rainfall along the coast was from 35 inches to 40 inches, the greater part falling during the S. W. rains, while the temperature averaged about 80 degs., and at Mombasa did not exceed 78 degs. The coast was flat and low, its leading characteristics being coral rocks, winding inland creeks, and dense thickets of mangroves. A large portion of the country abounded in vegetation, among which would be found the baobab, the dome palm, and forest trees, while beyond in the waterless and barren district were many varieties and aloes and fibre-yielding plants. There were three navigable rivers—the Tana, Ozi, and Juba. The greater portion of the coast land was composed of rich and fertile soil, and the only available labour was afforded by slaves; but the British East Africa Company had inaugurated the gradual emancipation of the slaves by introducing free labour. No doubt, owing to the extreme fertility of the soil, agriculture had heretofore been carried on by means of the rudest and most primitive implements. Slaves were purchased for about 7*l.*, and became the property of their owners for life. Their life was not so intolerable as was generally imagined. They were not overworked; they had one or two holidays every week, and opportunities of earning money for themselves. The various tribes inhabiting the district were described and illustrated by line-drawings. A good deal of the produce was cultivated in open fields, but palms, fruits, bananas, sugarcane, and the more valuable products were grown within carefully fenced plantations. A large number of palms were cultivated from the coconut downwards, and there were indications that in point of yield and time of bearing the coconut palm of East Africa would soon compare favourably with those of India and Ceylon. Among grain, rice, maize, and millet were largely grown, and there were a number of indigenous oil yielding plants. Tobacco and cotton also promised well, and there were several varieties of rubber-bearing plants. There was a great demand for labour, and Mr. Fitzgerald suggested that India would provide an inexhaustible recruiting ground. In conclusion the lecturer showed a number of views of the coast scenery and the natives, with explanatory comments.—*O. Mail.*

JAPANESE TEA.

There appears to be some real, yea, much-talked-of, movement for the improvement of Japanese tea. Mr. Otani Kehei, President of the Japan Tea Manufacturing Company, has been giving some information on the subject to a representative of the *Kokumin* newspaper. According to this information, Japanese tea merchants have at length awoken to the fact that if their industry is to be developed, nay, even preserved, they must abandon the defective methods which have hitherto impaired the reputation of the product. In the Prefecture of Miye, the chief tea-producing district of Japan, the Local Assembly has voted a sum of 1,500 *yen* annually for three years commencing from the current year to be applied to the improvement of tea culture and preparation. It is not a large sum, but the fact that the assembly has voted it is significant. The formation of the *Kwantō Seicha-kai* on behalf of which Mr. Mayeda, ex-Vice-Minister of Agriculture and Commerce has shown so much solicitude, must be mentioned in the same context. This Association is to commence operations on the 12th of next month, and is expected to exercise a very beneficial influence on the tea industry throughout the districts eastward

of Hakone. Then we have the Japan Tea Manufacturing Joint Stock Company which aims at the direct export of the staple. The Company has not yet actually commenced operations, but its bye-laws being framed, and its preliminary arrangements completed, it will doubtless get to work at an early date. Direct export is an old fancy of the Japanese. It has always proved disastrous to those attempting it, and the tea business presents probably the most difficult field of all for such essays. Mr. Otani, however, declares that the Directors of the new Company are thoroughly alive to the difficulties of the task they have set themselves, and have made preparations of a complete character. It is to be hoped that he has reason for his words. The processes of re-firing and re-packing to which Japanese tea is subjected at the open ports constitute a tax with which it ought to be possible to dispense. But we have grave doubts whether the Japanese can effect this reform without foreign cooperation.—*Japan Weekly Mail.*

FINE COFFEE: A TRADEWINNER IN AMERICA—WHY NOT TEA.

Next to fine butter and the best flour, no one article exerts such an influence for good or bad upon consumers as coffee. It is the one thing which Americans are fond of and for which they are willing to pay a good price. There cannot be too high an estimate placed upon grade and having the coffee fresh roasted. Coffee rivals beer in being a national beverage. If the quantity of coffee used is reduced to gallons of infusion the result shows a consumption of one to two gallons per capita greater than of beer.

Consumers may find fault about price, but they will have that which pleases the palate. Good coffee goes far to make the reputation of a store. It causes people to talk about and to advertise the place where it can be had.—*American Grocer.*

[But why not, properly-made tea of fine quality? —Ed. T. A.]

DO COFFEE AND TEA FACILITATE DIGESTION?

This question is treated by C. Falkenhorst in a short paper in the *Gartenlaube*, Leipzig, December, which he devotes to a review of the recent experiments of Schulz-Schulzenstein, published in the *Zeitschrift für Physiologische Chemie*, and designed to throw light on this much-disputed question. This paper is reproduced by the *Literary Digest*.

This celebrated chemist prepared from the fresh mucous membrane of a pig an extract which approached very nearly in character to the gastric juice, and first tested it with the albumen of a boiled egg. The operation was completed in eight hours, and 94 per cent. of the substance converted into digested albumen. He then submitted a decoction of tea and coffee, severally, to the action of the same preparation. In the case of the coffee 61 per cent, and in the case of tea 66 per cent of the albuminous contents was digested, thus confirming the observation frequently made by physicians that boiling materially prejudices the digestibility of albuminous substances.

Treating more particularly of coffee, he observes that it contains several active principles, each of which exercises an influence on the system. The most important of these are: First—Caffein, which raises the activity of the heart, operating, in small quantities as a wholesome stimulus, but as a poison when taken in excess. Second—an aromatic substance, which operates principally on the nerves, acting in moderate quantity, as an agreeable stimulus; to this is attributable the phantasies so frequently experienced as a result of coffee drinking. Third—The coffee bean contains tannin, to which it owes its bitter taste, and this,

as is well-known, enters into combinations with albumen which materially prejudices its digestibility. These three principal substances vary very much with the method of preparation. If the coffee is simply infused in water at the boiling point, and allowed to cool at once, we get little caffeine, a great deal of the aroma, and scarcely a trace of tannin. If we allow the coffee to boil for a time, the aroma is dissipated, passing off with the steam; we get more caffeine, and the longer it is boiled, the more tannin is dissolved out.

These experiments confirm the view generally expressed by physicians, that coffee long boiled prejudices digestion, while a simple infusion facilitates it; but its beneficial action in the latter case is now shown to be due, not to direct chemical action on the albumen present, but indirectly to its action on the nerves of the stomach promoting the secretion of gastric juice. In other words, its action is physiological, not chemical.

Turning now to tea, he finds its constituents very nearly similar. The tea leaves also contain caffeine (called, also, theine), aromatic substances and tannin. Consequently in tea, as in coffee, the properties of the beverage depend very much on whether it is an infusion or a decoction.

The problem is very simple. The traveller on the march will find himself benefited most by the caffeine, and to secure this the coffee must be brought to, and maintained for a few minutes at the boiling point. But to take boiled coffee after a full meal impedes digestion and heightens the heart's action unduly. On the other hand, an infusion of tea or coffee, taken at such times, facilitates digestion and exerts a whole some and exhilarating action on the nervous system. Long boiling, or stewing near the boil, of either tea or coffee, brings out all the tannin, which is always prejudicial to digestion. As a consequence, the practice of keeping tea or coffee hot upon the stove is a pernicious one.—*American Grocer.*

THE OPENING FOR PLANTERS IN SOUTH AND EAST AFRICA:

LONDON, Feb. 16.

You were told in my last letter that it was probable that

SIR GEORGE CAMPBELL

might be seen by me before next writing on the subject respecting which you have lately shown so great an interest—the future of South-Eastern Africa in its possible relation to Ceylon. During the week Sir George has kindly granted me the opportunity of a long conversation upon this matter. He told me he strongly endorsed the view put forward by yourselves, that in the first-mentioned country there might be found the latter's opportunity in respect to the openings it may hereafter afford to many young men trained among you in tea and coffee and other cultivation. He acknowledged that nothing could better fit a man for embarking in planting operations in the newly-opened-up regions of South Africa than a preliminary training in such a school of teaching as Ceylon affords. According to all accounts that we receive from you, there is likely, ere many months pass, to be a large number of young men who have become so qualified for whom it will be impossible to find fitting employment in Ceylon. It is well-known that such a surplusage is ever a source of social discontent and of social danger. Sir George Campbell believes that a field is opening

IN SOUTH AFRICA

that might successfully receive as many of the

above class as you will be able to spare to it. He remarked to me:—"Of course, I am not able to speak to you on this subject from knowledge locally acquired. All I may say, therefore, must be subject to discount from this cause. Still, as you know, I have taken a very considerable and widely distributed interest in the Companies now formed for developing the agricultural and mining industries in Matabeleland, and I have necessarily been brought into personal contact with many men who from their local knowledge may be regarded as authorities. It has been necessary for me to closely examine and sift the information gained from these, and as the result to my having done so I have honestly adopted the conclusion that South Africa is to be the future El Dorado of our British youth. Of course, I am not alluding to such settled lands as those of Natal and the Cape Colony. Those who seek to try their fortune in Matabeleland must make up their minds to a rougher life and to possibly greater vicissitudes than are now experienced by those who have passed through the fire in the two more advanced colonies. But I can imagine no better opening for a young man who has acquired planting knowledge in Ceylon than the magnificent table-lands of the Matabele region affords. The climate, from all accounts, is perfect, and the soil of the utmost fruitfulness, and in many parts entirely virgin. What we of the Buluwayo Syndicate, of which I am Chairman, are doing, is securing at very nominal prices the concessions of lands and mining claims made to those who volunteered for the campaign against Lobengula. Each of these are to be allowed to select 5,000 acres and 120 claims (I must state these figures under reserve, not feeling sure that my memory accurately retains those given me by Sir George.—Correspondent.) There are, of course, very few of the recipients of these concessions who have the capital to develop them for themselves. They will, therefore, part with a portion of them in order to secure sufficient capital to attempt the development of the balance. This necessity it is of which the Buluwayo Syndicate is taking advantage. Our first step has been to secure as large a proportion of these concessions as we can obtain. And you must recollect that each *cessionnaire* has the privilege of selecting his own lands and claim, a privilege, of course, that will extend to those purchasing his rights from him. So it is not to be doubted that before very long we shall have acquired a very large amount of very valuable land most suited to sub-tropical agriculture, as well as a very considerable number of mining claims. There will certainly soon be a rush to secure these lands and claims. It has been so in other parts of the new South African territories, and it will find a parallel in Matabeleland. Naturally we, who are putting our money into this speculation, look for a good return from it. When I tell you that one such Company I am connected with has already been able to pay us a dividend of 125 per cent, you will admit the possibilities which we believe to lie before our venture. You will have seen that the Buluwayo Syndicate has already quadrupled its original capital. That increase, when proposed by me, was at once subscribed for among the shareholders present in the room, and any further amount we may require can be got without difficulty. I do hope those in Ceylon who do not find their prospects bright will give consideration to the possible field opening for them in South Africa. I fully think it would be to their advantage to do so. The climate seems to be most suitable, and railways already have come within the reach of a few days' travel,

and of course this facility will soon be extended."

I asked Sir George how the

BRITISH COLUMBIA SCHEME

about which I lately wrote to you as one in which he had an interest was progressing, and he tells me he fears it must be for the present abandoned, owing to the difficulty of raising capital. He said that the best offer received for underwriting the capital of £250,000 for this was £50,000, a tax that the promoters did not feel justified in assenting to. He further told me that inquiry made as to the Highland Crofters whom it had been proposed to establish on the new lands had revealed their unfitness for emigration. As I had before learned of these people, the inquiry demonstrated that they are thriftless and lazy in a most exceptional degree, and that they are unwilling at all times to do anything to improve their position, preferring any form of loafing to steady industry to earn a livelihood. Any ideas of transferring them to British Columbia had therefore been wholly abandoned.

THE FINEST TEA EVER GROWN.

A small consignment of tea from the Monnt Vernon Estate, Ceylon, was sold on 13th inst. by public auction at the Commercial Sale Rooms, Mincing Lane at £8 10s per lb. It was pronounced to be the finest ever grown.—*L. and C. Express*, Feb. 16.

TEA AT £8.10s. PER LB.

"Actually the very finest tea ever grown" must needs be a costly article. The proportion of living mortals who can detect shades of superiority among wines of the first class is very small. It is easy to think, perhaps, how many of our fellow-creatures who boast a cellar have never tasted a really great wine; though they have paid for one often enough. As for cigars, there are so many princes and millionaires about that undistinguished persons can never hope to enjoy the experience necessary for cultivating a finished taste. But tea is everybody's drink—that is, almost. A hundred thousand inhabitants of this island are connoisseurs, probably. And, besides, there is a market for the best in Russia, America and Australia, to name only the principal tea-drinking countries. Therefore, "actually the very finest ever grown" must be subject to world-wide competition. But when all allowances are made eight pounds ten shillings per pound sounds impossible. Do the Emperor of China pay so much? Perhaps he does, but his Majesty is not supplied direct from the auction room. Such, however, was the price which business men paid for a lot of Ceylon tea on Tuesday at the Commercial Sale Rooms, Mincing-lane. It must be presumed that they were not less sane than other people. They expected to make a profit too, no doubt. It would be really interesting to know who buys and who drinks that superlative decoction.—*Evening Standard*.

THE OUTLOOK FOR COFFEE.

A prominent firm in the coffee trade has issued as its habit, a lengthy circular reviewing the position of coffee.

Evidently the authors of this circular believe in big crops in 1894-95 and afterwards, for they estimate the crops of the world at 13,500,000 bags, of which Rio, Santos, Victoria, Bahia and Cereia are to furnish 8,500,000 bags.

Who will carry the surplus coffee? is the question asked, and answered only suggestively, but with the intimation that prices must yield, as capital will not invest for itself at extreme figures,

being content to "carry surplus supplies for account of others." It is claimed that the United States does not need to carry as large stocks as formerly, owing to the custom of large dealers buying in primary markets. In conclusion the circular says:

The continuance of high prices has not only stimulated increased production in all regular coffee-growing countries, but has been the means of opening up other lands to the cultivation of the bean, where planters have been attracted by the lucrative returns elsewhere to make the venture, even to the extent of abandoning other lines. In this respect we may mention the Sandwich Islands, New Zealand* and the Transvaal*, and in a short time we shall not be surprised to learn that these places will raise sufficient coffee to admit of exports. We consequently incline to the opinion that the period of high values for coffee—say from 1887 to 1894—will be followed by a season of a lower range, in the same way that the high prices from 1873 to 1879 were followed by a range of very low values, and if present prices should undergo a reduction of 50 per cent they would then be considerably higher than those which existed from 1882 to 1886. In the foregoing we present our ideas based upon the question of probable supplies, without considering other elements, like speculation and sentiment.

Let us first note the statistical position of coffee, based upon the official report of the New York coffee exchange. From that we compile the following statement:—

Visible supply of (Jan. 1, 1893.....	3,106,271
the world, (Jan. 1, 1894.....	2,433,248

Stocks in Europe, Jan. 1893...	1,208,030
Stocks in United States, Jan. 1 1893.....	419,241
Receipts in Europe, 1893 ..	6,473,801
Receipts in United States, 1893 ..	4,057,516

Total supply, Europe and U. S., 1893...	12,153,538
Less stocks, Jan. 1, 1894 ..	1,540,243

Deliveries { 1893... ..	10,614,340
for { 1892.. ..	10,967,162

The above shows decreased receipts and a reduction in the world's visible supply of 673,023 bags, indicating light crops in 1893-4, and consumption below the previous year, but not as marked as the decrease in receipts.

It is apparent that 11,000,000 bags measure the world's requirements, with coffee at high prices. The question as to the future is one of supply and demand. If the former reaches, as is estimated, 13,500,000 bags, then prices must recede if the consumption is to increase. Low prices stimulate consumption, and large crops means lower prices.

The opinion expressed in the quotation given above from the trade circular is well taken. For several years there has been a large extension of the area devoted to coffee in Brazil, Mexico, Central America, United States of Colombia, Venezuela, Liberia, on the Malabar coast, and other points. It is about time that the product of new plantations should have a direct influence upon supply.

The Java crop of 1894-95 is now estimated at 1,250,000 piculs. The 1893-94 crop in the East Indies was unusually light, some districts in Java not yielding one-tenth of the previous season's crop, or about 71,000 piculs, against an estimated out-turn of government coffee in 1894-95 of 750,000 piculs, besides 500,000 for private account. Brazil has furnished for the past few years about 55 per

* Quite new to us to hear of New Zealand and Transvaal as coffee producers: we do not think the statement is correct.—*Ed. T. A.*

cent of the world's requirements, or say, 6,000,000 bags. The 1894-95 Brazil crop is variously estimated, but none figure less than 7,000,000 bags. Guatemala, in spite of crop injury, will have a crop ahead of last year.

The outlook at this time is highly encouraging for large supplies and lower prices. A bull speculation under the circumstances would be the maddest sort of folly. Cheap coffee is a boon to the dealer as well as the consumer. It affords opportunity to push a profitable branch of the retail grocery business and is a splendid advertising factor. Coffee is a trade winner, and it is the popular national beverage.—*American Grocer*.

A COLOMBO COMPANY TO MAKE TEA LEAD.

We call attention to the advertisement on this subject. When once the Customs duty on pig-lead is taken off, no doubt such a project will be desirable in planting interests, and planters ought to support it.

We may state the intention of the Company to be formed, is, to make tea lead on the spot, from the raw material imported, and it is expected this can be done at a good profit, independent of the difference between imported tea lead cases, and cases made in the country. Machinery will be imported with all the latest improvements with an expert in charge. The Company will take over the Mattakkuliya Mills belonging to Messrs. Stevenson & Co. at valuation. The capital required will be considerable owing to heavy stocks being required. Planters taking an interest in the Company will certainly benefit by it. The capital will be Rs200,000 with power to increase; Rs100 shares. Mr. Alexander Stevenson, senior, will be Managing Director after the formation of the Company.

The letter from Government on the subject of the duty is as follows:—

Colonial Secretary's Office, Colombo, Jan. 22.

GENTLEMEN,—In acknowledging the receipt of your letter of the 30th November 1893, suggesting that pig-lead imported for manufacture in the island, should be passed through the Customs Free of Duty. I am directed to inform you that a decision cannot be given immediately, but that the subject is under consideration.—I am, gentlemen, your obedient servant,

(Signed) H. L. CRAWFORD,

for Colonial Secretary.

Messrs. Stevenson & Sons.

WYNAAD PLANTERS' ASSOCIATION.

We have received a copy of the proceedings of the annual general meeting held at Poothacoolie bungalow, on Wednesday, 14th February, when a report was submitted of the proceedings of the Association since 1st October 1892. The report stated that the past year had been made memorable by the fact that a conference of representatives of all planting Associations had been held and that the foundation-stone had been laid of a United Planters' Association of Southern India; also that their political status in the country had been so far recognised that H. E. the Governor of Madras had promised that, if nothing unforeseen should occur, he would nominate a member of their community to the next vacancy on his Legislative Council. They complained that they could not get coolies owing to the impunity with which a class of dishonest contractors was able to rob these men who took advances without meaning to bring in coolies and they were told in reply that when they did get coolies, they should

pay them and treat them better. Since a confidential letter from the Government of Madras to the Government of India was published the *Madras Mail* had advocated their cause in a leading article which had elicited from the Private Secretary to the Governor a disclaimer on the part of Government of ever having intended to impute to them ill-treatment of their coolies. The correspondence had resulted in a promise from His Excellency to receive a deputation of planters to further discuss the matter with him. The Government of Madras had responded favorably to their memorials representing their grievances caused by the recent Revenue Settlement of the District and had promised redress to those who had suffered hardship.

With regard to minor matters, they had this year been given a Telegraph Station at Meppadi and a grant had been made of Rs7,400 for the improvement of the Mysoore-Chundale road, which though inadequate in itself is a step in the right direction. Though, as far as the secretary was aware, no receivers of stolen coffee had been convicted during the year, yet there had been increased activity among the police; constables who were also coffee planters had been removed from the district and the composition of the force had been generally improved.

As regards their prospects Arabian coffee was still doing well in places, and where it had failed Liberian and tea were rapidly taking its place. There was a scare at one time that Liberian coffee seed taken from trees of the second and third generation from the originally imported ones, had deteriorated, but on a reference to Mr. Thisleton Dyer, Director of Kew Gardens, they were assured that this was not likely to be the case. Young tea clearings were growing luxuriantly and the reports and valuations already made on samples of the leaf, held out promise that they should be able to hold their own with the best estates in Assam. So it was to be hoped that Wynaad had at last passed through the lowest ebb in its fortunes and would soon recover the position that it used to hold among planting districts.

INDIAN TEA DISTRICTS' ASSOCIATION CHICAGO EXHIBITION.

A circular to the following effect is about to be issued to the members:—

"The Chicago Committee have considered a preliminary report by Mr. Blechynden, the Special Commissioner at this Exhibition, of the operations he had conducted during the past year. They are of opinion that the results obtained so far are satisfactory, but that immediate steps should be taken to keep Indian tea before the American public for another year or two, as otherwise the Committee think that the expenditure already incurred will have been wasted, and that the knowledge of Indian tea gained by the work done at the Exhibition will soon die out.

Under the circumstances, the Committee desire me to recommend to your earnest attention the necessity of the firms and Companies in London interested in Indian tea advising their Calcutta agents to support the resolution a copy of which is subjoined."

Resolution of Chicago Committee, passed at a meeting held on February 13th, 1894:—

"That Messrs. Reid, Murdoch, and Co.'s proposals for the continuance of the efforts to push the sale of Indian tea in America by advertising, giving away samples, &c., are generally approved of by the Committee, and that the Calcutta Association be requested to arrange for the supply of funds by a levy on the members on the same scale as last year, the funds subscribed to be remitted to this Association for disposal.

"That a copy of this resolution be sent to all members with a circular explaining the advantages of a continuance of the work already done in America, and a request that instructions be sent to their Calcutta agents to meet the proposed levy on members to supply funds."

ERNEST TYE, Secretary.

London, February 14th 1894.—Local "Times."

VARIOUS AGRICULTURAL NOTES.

TEA CROPS.—We continually hear vague statements as to the outturn of tea estates and districts—both in India and Ceylon—but when we see that the N. and S. Sylhet tea companies with their 20,000 acres only turn out some 8,000,000 lb. or an average of about 5 mds. an acre, we imagine the figures are from favored plots, for the N. and S. Sylhet Companies are situate in the Doosrs and Sylhet, the highest yielding districts in India.—*Nilgiri News.*

PROCEEDINGS OF THE AORI-HORTICULTURAL SOCIETY OF MADRAS for October-December 1893 has the following contents:—*Euryale ferox*, Andaman plants, Plants from Calcutta, Wire trellis, Beetles, Water channels for Nursery, Seeds to Chepauk, Nicholeen's Dictionary, Pions Tsiela, Proceedings for November 1893, *Taxus* (Cytisus proliferus), Cyclone, Rain Gauge, Rain-tree growth, *Bambusa siamensis*, Garder engaged, Proceedings for December 1893, Paperoli Seed, Tree Seeds, *Chrysanthemum*, Committee Member, Special Prize, and Financial Statement.

"**AGRICULTURAL GAZETTE**" of New South Wales for January has the following contents:—Useful Australian Plants, J H Maiden, the Black Bean or the Moreton Bay Chestnut, ("castanospermum australe.") A Conn. Two Fodder Plants interesting to the Woolgrower ("Medicago orbicularis and Medicago scutellata.") J H Maiden, Cape Cotton ("Gomphocarpus fruticosus," R. Br.) J H Maiden. Botanical Notes, J H Maiden; a Native Senna, the Corn Gromwell, "Gnaphalium japonicum, Thunb." Experiments with Pinser, G Valder. Notes on Righarking and Sapping—Based on Foresters' Reports—compiled and annotated by J H Maiden. Poultry, S Gray, the Orpington. Practical Vegetable Growing, directions for the month of February. Orchard Notes for February. General Notes, the Export of Wines, Planter's Friend, Rust-resisting Wheats, a new calf-feeder. Agricultural Societies' Show 1894.

A SCHOOL OF FORESTRY TO BE ATTACHED TO THE SCHOOL OF AGRICULTURE.—We hear that a proposal has been made by Government for the establishment of a School of Forestry to be attached to the School of Agriculture and that negotiations on the subject are going on. This is a very good idea indeed; and we believe was first suggested by Mr. Seneviratne at the last Prize Distribution at the Agricultural School. But it is to be hoped that the school will not be entirely dependent on the School of Agriculture, and that fresh students will be advertised for, instead of the admissions being confined to those already in the School of Agriculture, whose range of education does not go high enough for the work. A separate institution like the Technical School will be more satisfactory in more ways than one.—*Cor.*, local "Examiner."

EXPORT OF TEA TO RUSSIA.—There are not wanting those interested in the progress of British-grown tea in new directions who declare that the future race will be not so much as to Ceylon and Indians against China, as between America and Russia in the matter of consumption. I was asking an exporter the other day in what light he regarded the remarkable expansion of exports of Ceylon tea to Germany, seeing that all attempts hitherto to find a market for a Ceylon trade in that part of the continent have completely failed. I was assured that it was so; Germans are more disinclined to the use of the fragrant leaf than the French, and that is saying a good deal, but it is the fact that German ladies have never taken to the social institution of "afternoon tea" as have the leaders of society in Paris. By far the larger portion of the so-called shipments of Ceylon tea to Germany, say nine-tenths in reality, are in transit to Russia; so that we must add the exports to the latter country to the figures for Germany, less one-tenth of the latter, in order to obtain the correct results of our tea trade with the country of the Czar. If this be done, it will be seen how largely this portion of your trade has expanded within the last few years, thanks to Mr. Rogivue.—*London Cor.*, local "Times."

ON CUTTING THROUGH A TEAK LOG in the saw mill's at Her Majesty's Dockyard at Sheerness, a hollow place was discovered in the centre, in which was a bird's nest, containing four eggs. The log formed part of a consignment of timber delivered at the dockyard some months since from India.—*M. Mail.*

PROGRESS IN THE WEST INDIES.—Says a correspondent of *Commerce* as a proof of progress in small West Indian islands:—

There are clubs, and pleasant society, and we have telephonic communication with nearly every estate in Antigua and St. Kitts. Every planter can speak from his estate to the town, and also to every other planter. There are still a few conservative persons who will not accept the innovation, but they will not hold out long. We have 296 miles of wires in Antigua, and about half that in St. Kitts, and the rent is only £4 10s per annum.

THE PRIVATE COFFEE CROP IN JAVA for 1894 is estimated at 523,940 piculs, against 159,408 piculs in 1893, and 402,495 piculs in 1892. The Government crop is estimated at 311,140 piculs, which was expected to be larger, but generally the outturn is under the estimate. The first estimate of the 1893 crop was for the Government 144,496 piculs, and the outturn 69,093 piculs. The above figures show that the Government coffee cultivation is constantly decreasing in importance, and is exceeded by the private cultivation. The crop promises to be early this year, and the first arrivals may be expected in April next.—*L. and C. Express*, Feb. 16.

A GIANT TREE.—The Southern Hemisphere, as well as our own, appears to have had an extraordinary fruit season, if the following item, which we glean from a Cape journal devoted to agriculture, can be taken as a criterion. At a farm two hours from Oudtstroom, called Vergelegen, there is an Orange-tree 38 feet high, the circumference of the lower branches being about 100 feet. After a great many had been taken off, the remaining Oranges were picked, and upon being counted were found to number 9,000. A few years ago the same tree yielded 11,600. The largest Orange trees are supposed to be these in Asia Minor, near the site of ancient Tralles, at Aidin Guzel Hisar; but they do not approach this Cape prodigy.—*Gardeners' Chronicle.*

THE TEA SEED SEASON—says *The Planter*—is now in full swing in Cachar, and managers are taking delivery from the various seed-growing concerns. Up to date the seed has turned out very well, the percentage of bad seed being very low. The seed from the well-known Cossipur estate has been very good indeed; also that from Alys. The Manipur and Tamnu seed is expected down shortly, and should turn out well. Intending purchasers had better be sharp in registering their orders. The Tamnu seed is about the best on the market for all flat and bheel gardens. In buying seed from Tamnu or Manipur purchasers should take into account the long distance it has to travel, and the consequent loss in weight. One maund of seed from these districts is about equal to one and a half maunds of seed freshly plucked and locally. Last year, I saw some of this seed from Tamnu which turned out 90 per cent. good on arrival in Cachar. This seed should be immersed in slightly tepid water for two hours, immediately it reaches its destination, and then put in germinating beds. With all the new extensions and new gardens, there is likely to be a great scarcity of good seed this season.

COMPRESSED FODDER FOR STOCK.

Those who visited the exhibition of Victorian products in the Wharf & Warehouse buildings last month will remember the exhibits of compressed fodder, of which there were four specimens, viz. chaff, bran, corn cake composed of 20 lb. crushed oats and 8 lb. crushed maize; and lastly the forage for horses, cattle and sheep, described as being composed of 16 lb. chaff, 8 lb. oats, 2 lb. maize, and 2 lb. bran. The following from the *Melbourne Argus* gives some information on the subject of compressed fodder:—

Reference was made in the Victorian Parliament to a new form of compressed fodder, about which more is likely to be heard, as it seems to offer special facilities for an export trade in this particular product. Westcott's Patent Compressed Fodder, as it is termed, is being prepared at the Austral Otis Works, South Melbourne, for purposes of experiment, and results show that the reduction is carried to a remarkable extent without, as far as can be seen in any way, injuring the fodder. For many years past methods towards this end have been patented, but the failure in all has been that something had to be added to or taken from the fodder. Some glutinous medium, such as treacle, was largely applied in nearly all of them, and this the inventors state was one of the methods which Sir Frederick Sargood states he saw applied in Germany. The main principle used is hydraulic pressure, and samples of oats, bran, chaff, and all three mixed, with maize added, may be seen at the works by those interested. A bran block after being compressed can be cut into blocks with a circular saw, and resembles more than anything else a block of *kauri pine*, yet pressure upon the ends break it up easily. Some idea of the pressure used is gained from the fact that a ton of chaff can be put into 40 cubic, while 120 cubic feet is the smallest bulk obtainable in any other way, and a reduction to 40ft. to the ton brings it to the bulk at which lowest freights are charged for shipping. So far as the experiments made show the possibilities, the cost of preparing it in this way, inclusive of chaffing, will be 25s per ton. Mr. Connor, M.L.C., who made the experiment of sending home chaff lately, paid 15s per ton for preparing it in a bulk of 120st. to the ton, and 35s per ton for freight. With the chaff condensed, as in this case—his three tons into one—he would have made a good profit. The charge of 25s per ton quoted by the inventors includes chaffing, compressing, and placing in a jute wrap and binding with iron hoops ready for shipment or carriage any where. The plant proposed for working it on a large scale would make, it is considered, 100 blocks an hour, and for convenience in handling it is proposed to make them up in blocks of 281 lb. each, these blocks measuring 16in. x 9in. and 6in. thick. Four of these blocks, or 1 cwt. of fodder, would have a bulk of two cubic feet. The firm have given the compressed fodder to their own horses, which show a preference for it as against the feed as ordinarily mixed, and the fact of the fibre in all cases being thoroughly crushed will, it is thought, make it a more economical food to use. This may be admitted, since the expense of crushing oats for feed is considered by most people to be fully covered by the extra gain in its quality as fodder. The fodder in its compressed form has been examined by representatives of the leading shipping firms, who state that it has none of the disadvantages of chaff, when shipped in its ordinary form, such, for instance, as risk from fire. Samples of the fodder have already been sent to the West Australian gold-fields for use by carriers, and to India with one of the last shipments of horses, and reports will be obtained in due course as to its suitability for the Indian trade, but more especially to the prospect of sending

fodder in such a form to India. Many gentlemen interested in stock have inspected the fodder so prepared, and the general opinion is that the process is likely to be of great value even if limited to Australia, but that it offers altogether new possibilities in an export trade.

TEA PROSPECTS IN "THE DUN."

A correspondent writes:—"Last year was the best year as far as tea is concerned that the Dun gardens have had for a long time, but so far this year the prospects are even more promising. Steady rain fell without intermission the whole of yesterday, the 28th February, and before that fall over 6½ inches of rain had been registered. Yesterday's fall cannot have been less than 2 inches, and as the rain was steady, the greater portion of this must have sunk into the soil, and become available for the bushes. In some of the gardens the bushes have already begun to flush, and plucking should be in another fortnight, provided the weather does not turn cold. The spring crop, which is an important one in the Dun, will consequently be an unusually large one."—*Pioneer*.

LONDON REPORTS ON TRAVANCORE PRODUCE.

(From *Patry & Pasteur, Limited*, Report of the Colonial Markets for the Week ending February 14th, 1894.)

TRAVANCORE TEA.

Bon Ami showed the best quality of the teas offered this week, although all the four estates in sale proved useful quality. Broken pekoes attracted most attention.

	Bro.	Pekoe.	Sou.	Souchong.	Bro Tea Dust.	Quantity.	Av. about.
Bon Ami	10½d	8½d, 6½d	5½d	—	6½d, 5d	215 chs.	7½d
Aneimudi	9½d	7d	6d	—	7½d, 6d	166 ½-ch	7½d
Wallardi	8½d	6½d	5½d	—	5½d, 4d	87 chs.	7½d
Parvithi	9½d	6½d	6d	—	—	84 ½-ch	7d
Total 550 packages, averaging 7½d per lb.							

DRUG REPORT.

(From *Chemist and Druggist*.)

London, February 15.

ANNATTO.—The recent strong advance in the price of annatto seed has bought forward several lots which were shown at today's auctions. None of them, however, were of very desirable quality, and of the 82 packages shown, only 11 boxes of very dull colour sold at 1½d per lb.; fair quality was bought in at from 4½d to 5d. The market is tending easier.

CASSIA FISTULA.—There is now a fair supply, 45 bales of Java pods lean to medium fair bright being bought in at 35s although when a bid of 18s was made it was ear-marked by the broker; for better class pods 25s is asked. Another lot of 21 bales lean wormy dry pods was bought in at 20s per cwt.

CUBERS.—It is reported that there has been a fairly good demand for cubers lately, and one broker reports private sales of good blue berries at 60s per cwt. A general survey of the market, however, indicates a lower tendency for the article. At auction 70 bags were shown and bought in at from 55s to 57s per cwt., for fair small brown berries somewhat mixed with stalk from Singapore.

QUININE.—There has been an almost total absence of business this week, and the market is less strong upon the surface, although the position of the drug remains sound. Today we hear a bid of 11½d per cwt.

was refused for German bulk quinine in the open market; but at auction 1,000 oz. Fabrica Lombarda quinine, in tins (year of import not stated), sold very cheaply at 11½ per oz. In addition to this lot there were 7,500 oz. of B & S and Brunswick quinine in sale. These were bought in at from 11½ to 12½ per oz. The demand in the States during the last two months of 1893 is said to have been unprecedentedly large. The total annual consumption of quinine in that country is now estimated at from 4,000,000 to 5,000,000 oz.

PICKINGS WITH A LOCAL APPLICATION.

The BEEFWOOD TREE (*Casuarina Equisetifolia*) has been recommended by the "Kew Bulletin" for planting on sandy shores in tropical countries. The tree is being extensively planted in West Africa, and a report by Dr. Rowland on the sanitary condition of Lagos refers to the *Casuarina* as of very rapid growth, and preferring a sandy and saltish soil. It is suggested that the tree might be advantageously cultivated on the borders of swamps where the *Eucalyptus* will not succeed.

An Australian paper is serious in its recommendation that a NOXIOUS INSECT BILL should be passed, "prohibiting diseased plants of any kind being introduced, whether infected with fungoid diseases or infested with insects." It is suggested that every imported plant or tree of whatever kind should be quarantined and be either fumigated, or disinfected by other means: further that every person sending fruits across the country should be compelled to have his fruit cases dipped in boiling water and that fruit shops should be subjected to thorough examination and supervision. "The machinery of such an act," concludes the Australian paper, "need not be difficult to form."

WOOD FOR PIANOS is kept as rule for 40 years before it is considered sufficiently in condition to be used: wood for tennis raquets are said to require at least 5 years' seasoning.

COFFEE LEAF DISEASE IN CEYLON.

Ceylon would seem to be earning a bad name as an infected area of coffee leaf disease. The *Kew Bulletin* for December mentions that Mr. Thisleton Dyer (who was consulted by the Foreign Office as to the advisability of enforcing certain regulations for prohibiting the importation into Central Africa of any seed or plant likely to introduce the coffee leaf fungus) gives it as his opinion that it was without doubt from Ceylon that the disease was conveyed to South India, Sumatra, Java and Mauritius: and he again repeats "it is clear that starting from Ceylon a wide area has been progressively infected, extending, at the present time, from Natal in one direction to Fiji in the other." Dr. MacGregor, who was charged with the duty of stamping it out in the latter country reported that the probability was pretty strong that the disease was introduced in, and spread from the charcoal packing of imported seed, and that it was by no means impossible that the disease was introduced in the clothing or personal effects of some person or persons arriving from Fiji in Ceylon.—*Com.*

A NEW FODDER PLANT.

An interesting account of a new fodder plant that has been turned to good purpose in the Australian colonies is supplied by a correspondent of the *Field*. He says: "There are few people who suffer so much from the constant want of a sufficient rainfall as our far-off cousins who dwell beneath the Southern Cross. Many expedients have been had recourse to by Oceanian stockmen to tide their flocks over perilous times, with various results. Perhaps one of the most successful fodder plants introduced into the Antipodean colonies is that known as the tagasasti (*Cytisus proliferus*), the seed of which in 1876 was

imported by the late Dr. R. Schomburgk, of Adelaide from Madeira to South Australia. The plant, which is now receiving the undivided attention of the colonists, belongs to the genus *Legumenes* or *laburnum*. It, however, differs from the beautiful English tree, inasmuch as it is not poisonous, the yellow *laburnum* blossoms having proved fatal in several instances to stock. The tagasasti, on the other hand, is the principal green forage for cattle and horses, not only in Madeira, but also in the other Canary Isles, and the Azores. When first introduced by Dr. Schomburgk, it met with only a lukewarm reception by Australian farmers. During a severe dearth of supplies, however, in 1886, the merits of the immigrant plant were tested. The shrub gave every satisfaction, and, flourishing in the genial climate of South Australia, has increased in favour with the colonists ever since. In regard to its propagation, the seed can be sown broadcast in the ordinary way, it being first soaked in warm water for a few hours so as to soften it, and allow it to germinate more quickly. When the plants come too quickly, they should be thinned, and those taken up planted elsewhere, about 8 feet apart. For the first couple of years the crop does not obtain its full development, but in the third year the full yield of forage is obtained, and continues annually. If permitted, the plants will grow to a height of from 8 feet to 10 feet, but the usual plan adopted is, about twice a year, according to their growth, to cut them down to within two or three feet of the ground, so that they may become bushy. Tagasasti fodder has the advantage of containing a large quantity of nitrogenous matter, the estimated proportion being 1.136 of nitrogen, against 1,028 yielded by the finest clover hay. Every 100 lb. of fodder is calculated to produce 2.60 lb. of meat, and animals fed on it come into condition more rapidly than with any other kind of food, except corn. The forage is usually prepared by mixing 85 lb. of green tagasasti with 20 lb. of chopped straw. This amount is considered sufficient for the daily nourishment of either a horse or a cow. The theory propounded, that tagasasti fodder will fatten stock more rapidly than hay, is due to the presence in the shrub of an essential oil, which is supposed to retard waste of tissue and thus cause fattening; on this account tagasasti is recommended for feeding those animals not used for working purposes. The plant, though rather intolerant to frost readily adapts itself to climate. Excessive rain or drought has no detrimental effect on it; it luxuriates in light, sandy soil, and with but slight attention soon stocks land where it is sown with a profitable supply of fodder. Both cattle and sheep delight in the green forage derived from the tagasasti shrub, and the colonists of South Australia have been left a lasting memorial of the enterprising Dr. Schomburgk.—*Farmer and Stockbreeder.*

MYSORE A PARADISE.

"Gold, Sport, and Coffee in Mysore." By Robert H. Elliot. With a Map, in colours. (Westminster: Archibald Constable and Co.)

Those who, like ourselves, have a pleasing, if not exactly lively, recollection of a book published in 1871, under the title "The Experiences of a Planter in the Jungles of Mysore" will be glad to see Mr. Elliot in print again. According to him there is no place on earth that is better than Mysore for those who have their own way to make in the world. There is sport galore, from bear and tiger to snipe. There is gold in abundance if you are content to dig deep for it, and we are told that the chairman of one company, whose shares were a little while ago worth next to nothing, has recently apologised to his meeting of shareholders for paying no more than a fifty per cent. dividend. But coffee planting is almost a gold-mine in Mysore. So to the problem, "What shall I do with my son?" the answer now presented is "Send him to Mysore." And the State—for it is one of the native States once administered by ourselves but now handed

back to a native ruler—is governed on the most modern and enlightened principles. It has a representative assembly. It has a Dewan, or Prime Minister, who seems to have the knack of satisfying everybody, European or native. Yet still it is not happy. It has always the fear of famine before its eyes. And the only way in which famine can be surely averted is by digging very deep wells, so as to store the water which at certain times comes down with something more than plentifulness, but runs off or gets absorbed, and is not always at hand when the thirsty grain or coffee plant wants it. Of old, moreover, the natives used to hoard grain, after the mode of Joseph in Egypt. They hoard money today, and unhappily money does not always buy grain when grain is scarce. Yet they have more money than ever, and there are plenty of railways, and more are being made, and there are more in projection, so that where money is, grain need not be far off. The reason there is more money is the amount of wages that are distributed continually, either by the mining companies or by the coffee planters, without any corresponding increase in the expenditure of the people, whose caste system binds them very generally to vegetarianism and teetotalism. With a wise and economical administration, there ought to be no difficulty in finding funds, under all the circumstances, for the desired deep wells. But the Government cannot do all at once, and, according to Mr. Elliot, the reason private persons will not do it is because Mysore is prevented by the Indian Government from putting the land revenue on a fixed basis, for it is liable to a revision every thirty years.

Indeed, there is a very great deal of food for thought in Mr. Elliot's pages. He thinks things out for himself. He cannot do away with the Indian Congress, but he evidently loves the people he has so long lived amongst. He cries out not so much against missionary work as against missionary work on the lines laid down by Bishop Wilson, which involve the renunciation of caste, and caste he regards, with Bishop Heber and others, as a social arrangement with which Christianity need not come into conflict. So long as converts have to give up caste they will always be the dregs of the population, or hypocrites making a change of religion for the hope of worldly advantage.

To all sorts and conditions of men this book appeals. But probably the greater number of readers will relish best its sporting pages. Mr. Elliot is a mighty hunter, and was Nimrod. His tales of great game and how to encompass its death are stirring indeed. We must borrow from him at least one story, premising that very much better, though longer, ones remain behind. He bears willing witness to the pluck, readiness and endurance of the natives who took to the jungle with him, many a time and oft, occasionally, alas, to meet the fate that, according to Hindu belief, is written on the forehead of every man that is born into the world, though we cannot read the invisible characters—compare the passage in Revelations about the elect. Of the nerve of some natives let this passage speak:—

I have alluded to my second gun-carrier on this occasion as being a man who had the greatest power of remaining still under all circumstances, on shooting, when it was necessary to do so, and I may also mention that he was a man who combined the greatest coolness with the greatest daring. He was of a Hindoo peasant family, entered my service as a workman, rose to be a duffadar or overseer, and for many years has been head overseer on my coffee estates, and he is as good as a planter as he is as a shikari. I could give many instances of his cool daring. On one occasion

a wounded tigress—it was the cold weather season when everything was still green about the edges of the jungle—went into a ravine which was flanked by a great bed of ferns about five feet high. The natives looked at this bed into which the tigress had disappeared with considerable doubt, and one of them said, "How is anyone to go in here?" "I will show you," said Rama Gouda quietly, and he picked up several large stones, threw them into the ferns, and then plunged into them. I afterwards killed the tigress on foot in the ravine, but of course he ran the risk of coming upon it in the ferns. But the coolest thing I ever knew him to do was when a manager of wire wanted to fire at a tiger as it was approaching him. It was in the days of the muzzle-loaders, and as Rama Gouda knew that to speak would be fatal, he quietly but firmly put both his fingers on the caps when my manager represented the gun at the tiger, and kept them there till the tiger had reached the proper point for action. Then he withdrew them, and my manager killed the tiger. It is contrary to all rule, on account of the dangers, to fire at a tiger till he has passed you, and as the manager and Rama Gouda were seated on the ground, if the tiger had been fired at face to face an accident might have occurred. On only one occasion did I ever see him disturbed, and that was when he took up a position at a beat for big game. Presently he heard a hiss, and on looking round found a reared-up cobra about to strike at his naked thigh. He saved himself by a jump on one side, but he showed by his eye when he mentioned the circumstance that he had been somewhat commoved.

Altogether Mr. Elliot is in this part of his work a very charming companion. The chapter on gold abounds with practical hints, although the author assures the reader he has no gold interests whatever. Naturally the chapters on coffee planting are the most minute in their details, and the latter part of the work is just a little tiresome in its dogmatism on questions which it does not need a long residence in India to apprehend in many bearings that do not come home to the often isolated Briton, with his next neighbour a dozen miles distant. However, there is no need for anybody to read Mr. Elliot's lucubrations further than he cares to do, and we can declare there is enough and to spare without wading through the currency theories of the author, who, being a Scot, is, of course, born with a mission for putting everybody right on financial subjects: There is one passage, however, in this section that we must quote:—

The Government proposes to impose, and will impose if it can force up the exchange, an export tax (or what is practically an export tax) of 7 per cent which is to be ultimately raised to 21 per cent. And we have now to follow out the effects of this on the producers, the people generally and the financial prospects of the State. The producers in India of articles for foreign exports either, as the planters generally do, send their products for sale to London or as the main body of producers do, sell them to merchants who export the goods. Both these classes of producers are of course much benefited by a low rate of exchange—the former when they sell in gold and remit money to India to pay for the upkeep of their estates, and the latter when they find that the merchant can afford to pay more rupees than they could when exchange was higher. If then, to put the case in a more precise way, the Government succeeds in forcing up the gold value of the rupee, and the merchant is thereby compelled to turn his sovereign into fifteen rupees instead of sixteen rupees, it is obvious that to make the same profit as before he must give the seller of produce one rupee less. Now let me take the business with which, as a planter, I am most familiar. I have roughly estimated the total value of the coffee annually produced in Mysore to £370,000, and if for the sake of even numbers, we knock off £70,000 a 7 per cent export duty on this will amount to £56,000, and if the Government could raise as it proposes the rupee to 1s 6d, £168,000 a year

would be the price that the measure would entail on a portion of the inhabitants of the native State of Mysore on this single article of export.—*Daily Chronicle.*

PERUVIAN COLONISATION.

The Peruvian Corporation, Limited, has undertaken an interesting experiment in planting enterprise. It has obtained possession, for the purpose, of a tract of country in Central Peru, east of the Andes. It extends for a distance of about 40 miles along the course of the Perene river, a tributary of the Amazonas, from the River Eneño (1,700 feet) to the Cascades (1,050 feet), and to a distance of 30 miles on either side of the Perene. The land was reported on to the Corporation by Mr. P. D. G. Clark, a member of the Gardening staff of the Royal Botanic Gardens, Ceylon, in 1891. West of the area is the Chanchamayo Valley, traversed by the River Chanchamayo, which runs into the Perene. An account of its products will be found in the "Reports from the Consuls of the United States" for June 1893. The railway from Callao and Lima has been now completed to Oroya, 136 miles from Callao. Mr. Daugherty, the United States Consul reports: "From Oroya to the head of the valley of Chanchamayo, one of the most fertile districts of Peru is a distance of about 40 miles and the products of this valley that find their way to the coast now come on the backs of mules, donkeys and llamas to Oroya over rough mountain roads, which for most of the distance are mere paths." The enterprise is still in its infancy. The following papers are published for general information. They have the merit of avoiding too rosate a picture of recognising difficulties, and of fairly indicating the conditions which will alone command success.

THE PERUVIAN CORPORATION, LIMITED, TO ROYAL GARDENS, KEW.

66, Old Broad Street, London, E.C., 4th Oct. 1893.

Dear Mr. Thiselton-Dyer,—I think you know that we are doing a little planting in the Andes in Peru near the Perene river. Our man there says he has got 80,000 seedlings of coffee obtained no doubt from his own district. He expresses a desire now to have a quantity say five bushels of Blue mountain seed. Can you kindly tell me the best person to write to in Jamaica. The idea of having two classes of coffee growing is, I believe, that by this means he hopes to avoid the diseases which did so much harm in Ceylon and elsewhere, from propagating too closely from one jät. I enclose you copy of a letter from Mr. Robb, dated 27th July last giving a general report for the year ending 30th June, which may interest you, and perhaps you may think fit to incorporate some of it in your *Kew Bulletin*. Mr. Meckenzie is in charge of the Colony up there, and Mr. Robb, the writer of the letter, is the man who has been in special charge of the nurseries—Yours, &c. (Signed) ALFRED DENT.

W. T. Thiselton-Dyer, Esq., C.M.G., Royal Gardens Kew.—*Kew Bulletin*

[Mr. Robb's letter, we have already published.—*Ed. T.A.*]

IMPROVED BEE-KEEPING.

(a) The methods adopted by our peasantry with regard to the management of bees, and the production of honey, are of so crude and unscientific a nature and are indeed based rather more upon superstition than on a knowledge of the habits of the bees; that unless such bee-keepers can be persuaded to adopt a more modern and scientific system the industry of bee-keeping in Jamaica will still in general remain stagnant, and all but unremunerative, as it has been for years past.

(b) The common plan for removing the honey from the hive is quite barbarous; the bees are made to leave the hive by the use of smoke. Many of them get signed and burnt by the careless way in which the smoke is applied, and the flavour of the honey is spoiled; the combs are then scooped out without regard to the different grades of honey which a hive always contains. These combs are then placed

upon a sieve and chopped up; the product being caught in a receptacle below.

(c) The honey thus obtained is a mixture of bee bread,—or pollen—the juices of young bees (or larvae) and exuvia and excreta, —which if known of by the general public, they would be more careful to ascertain from what source they get their honey. Indeed, I have been informed from good authority, that a shipment of honey of this kind was once made from here, and on arrival at its destination it was found to be of such bad quality that it was sold to a firm of blacking manufacturers at the rate of 6d per gallon. The bees thus deprived of all their honeycombs are again returned to the empty hive to get on as best they may.

(d) A much better plan would be to make several holes in the top of the hive and place upon it another box of somewhat smaller dimensions, in the roof of which there has been previously fixed a piece of comb as an attraction for the bees to ascend. As the hive increases in wealth and population and the honey season advances, the bees will soon turn their attention to the upper box or "super" and as their instincts always lead them to store their honey in the upper part of the hive it will be speedily filled with dainty white combs which will contain the most beautiful honey. It will be seen that by this arrangement not alone is the store-house kept separate from the nursery, or lower box, with its pollen, brood-foods, and larvae and exuvia which are always associated with the honey when the nursery and larva are not separate; but on the improved plan the honey can be removed without disturbing the hive proper, and if the "super" be again prepared as mentioned above and replaced, the operation may be performed two or three times during the honey season, and perhaps at each removal as much as a gallon of good honey will be obtained, making, say three gallons in all, worth 2s. 6d. or 3s. per gallon. One stock will therefore yield between 7s. 6d. and 9s.

(e) If this be compared with the usual method, the fable about the goose and the golden eggs may be applied, for by the old plan we get, say, half as much honey, and that of a very inferior quality, and at the same time stand a chance of losing our bees by depriving them of all their honey at one time.

(f) Of course the results obtained by the above improved method are not to be compared with those of a still more complicated and indeed highly scientific plan known as the movable comb hive system, where as much as 1 cwt. of honey per hive is not at all infrequently obtained. But as this plan would require a rather more lengthy explanation than space at command will permit, and as at the same time the method and apparatus would be somewhat beyond the means of the general Jamaican peasant Beekeeper,—it may as well be left out of view—for the present at least.

(g) Not alone is the present system of management open to vast improvement; but the type of bee itself may also be improved. For instance, suppose we have six hives of bees, the results from each may be very different; at the beginning of the honey season we place upon each a "super," two of our six stocks start ahead with a will and fill their "supers" as fast as they are replaced, the other four perhaps refuse to enter, or after all only partially fill their "super," then they may each swarm two or three times thus furnishing us with an increase from which we hope to have great results in the future; but our apiary has not been increased with a type of bee whose instincts lead them to amass honey far in excess of needs, but with a type whose nature impels them to start new colonies, and thus this type will be strongly impressed upon the best life of the future in our apiary. The peculiarity will be reversed with the two good stocks which on account of constantly being deprived of their storage honey, have had no encouragement to swarm, and as the object of bee-keeping is to get honey and not swarms, the Bee-keeper should endeavour to restrict the multiplication of undesirable and

small strains, and seek the slower increase of those which give the best honey results.

(h) This may be perhaps one cause of the unremunerativeness of our native Jamaican bees as compared with the imported strain which I and other more advanced bee-keepers have obtained from other countries (America, England and Italy) where bees have been carefully kept for generations.

(i) It may be well to mention that bees play a great part in the production of crops. Nature seems to have placed honey in the flowers not so much for supplying food for bees and other insects, but that fertilisation of plants may be accomplished.

The bee in flying from flower to flower gets dusted with pollen from the anthers or male organs of blossoms, and in this way it is conveyed to the stigmas or female organs. It is interesting to note that when a bee starts on a foraging tour she confines herself to one description of flowers, for perhaps if this were not so the mixture of different pollens might interfere with their proper actions of fertilisation.

(j) It will therefore be seen from this action of bees on plants that the agriculturist owes as much to the "little busy-bee" as does to his own skill and experience in tilling the soil and in choosing his seeds.—*Indian Agriculturist.*

THE AMERICAN MARKET AND INDIAN TEA.

TO EDITOR "HOME AND COLONIAL MAIL."

DEAR SIR,—With reference to the somewhat desultory discussion that took place after Mr. Blechynden's interesting account of what he had done for the representation of Indian Tea at the "World's Fair," I should rather like to emphasise my remarks as to the importance of continuing our efforts to push the sale of Indian tea in America by pointing out that Mr. Blechynden in a preliminary report to the Chicago Committee of the Indian Tea Districts Association, distinctly gives it as his opinion: 1. That if nothing more is done now, the money spent by tea proprietors will practically be wasted; and 2. That he equally clearly brought out yesterday that he believes that if we continue to push our teas in America, we can eventually secure a large market for them there.

If Mr. Blechynden is correct in the above assumptions, surely it behoves all Indian growers to support the movement, recommended by the Chicago Committee, to make a further levy for this object, which, as I stated yesterday, was only what was originally proposed and largely approved of.

Whether Ceylon teas are more suitable than Indian for the American market does not appear to me to be a matter of much importance; we may be sure that our Ceylon friends won't be behind us in pushing their wares, and it must be clear to all thinking persons that, unless we, or they, or both find other markets for our teas, we shall soon have prices here even lower than they are at present, owing to the ever-increasing production. So long as Pekoes and Orange Pekoes sell at from 6½d to 8½d per lb. we certainly can supply leaf suitable to the American trade; which will doubtless be soon educated to appreciate the value of the liquors of our larger-leaved grades, if not for consumption alone, certainly for blending with the inferior China and Japan teas at present in use.

History repeats itself, and I confidently expect to see the tea history of this country repeated in America if we only make use of our opportunities to facilitate it.—Yours faithfully,

ARTHUR BRYANS.

45, Leadenhall Street, E.C., Feb. 21st, 1894.
—H. & C. Mail.

INDIAN TEA IN AMERICA.

How NOT to do it.—The meeting of the Indian Tea Districts' Association, held for the purpose of hearing an account from Mr. Blechynden of the work done at Chicago on behalf of Indian tea, was

not characterised by any show of enthusiasm. This quality is one of which Ceylon tea proprietors have the monopoly apparently. Whether it is that the owners of many Indian tea gardens can afford to conserve their energy while Ceylon planters feel that now is the time to go ahead, or whether the former are less sanguine by nature, the fact remains that Indian tea proprietors in London, with a few notable exceptions, are much more difficult to "enthuse" and slower to act than their Ceylon contemporaries. The United States market for tea has not hitherto offered excessive encouragement to either the Indian or Ceylon tea grower. A market where the demand has, up to a recent date, been exclusively for China and Japan teas is not to be captured for the mere asking. It requires a long and patient siege, and the expenditure of a considerable store of ammunition in the form of energy and the sinews of war, before the taste of a nation can be changed. Mr. Blechynden is hopeful of the future, but the majority of the members of the Indian Tea Districts' Association seem to agree with the principle expressed in the proverb about "hope deferred," moreover they are cautious and wary, and of the "don't seem to see it" order. The fact is that the interests of Indian tea planters are not as concentrated as those of Ceylon. Their gardens are in various parts of India, and their interests, at least, so it may be inferred, are scattered as their tea estates. Subsidy or a general "whip round" is a pastime that is apt to grow wearisome to them unless the result looks immediate. No doubt these were the causes which led to the tame result of Tuesday's meeting. The meeting was not sympathetic, so far as a united effort was concerned. Practically it heard Mr. Blechynden, and resolved to do nothing trusting, we presume, to the chapter of accidents or private enterprise to develop the business of pushing Indian tea on the American market. This masterly policy of inactivity may be commendable from the point of view of extreme caution, but it does not solve problems. As our correspondent Mr. Bryans points out, re-echoing Mr. Blechynden's opinion and emphasizing his own endorsement of it, if nothing more is done the money already spent is wasted for nought, and at the same time a genuine opportunity is neglected of following up a trade already initiated.—*H. and C. Mail.*

HANDBOOK OF THE FLORA OF CEYLON.—The rich flora of the island of Ceylon found an early historian in Hermann (1717), followed by Linæus, who worked out Hermann's materials afresh in his "*Flora Zeylanica*," 1747. This was before the publication of his binominal system of nomenclature; and it was not until 1824 that there was another substantial addition to the botanical literature of the island, when Moon's Catalogue appeared, "for the use of the Sinhalese." Then came Thwaites' *Enumeratio Plantarum Zeylanicæ*, containing descriptions of a large number of previously undescribed species. This was completed in 1864. Dr. H. Trimen succeeded Dr. Thwaites as Director of the Royal Botanic Gardens, Ceylon, in 1880, and he is now issuing at the cost of the Ceylon Government, under the above title, the results of his unremitting studies of the flora since his appointment. This is called a "Handbook," but it is really a very elaborate work; the first volume including only the natural orders *Ranunculaceæ* to *Anacardiaceæ*. At this rate the vascular plants will occupy five volumes, to say nothing of the plates, of which twenty-five of quarto size accompany the first volume. Dr. Trimen's work is of a most thorough character, written wholly in English, and on a most excellent plan. It embodies a complete re-elaboration of Hermann's original Herbarium, the foundation of Ceylonese botany. Dr. Trimen has further cleared up, with all the critical insight of a skilled and practised botanist a number of species which were either imperfectly understood or badly described, or even, perhaps, erroneously included in the Flora. And he has added many new species, the result of his prolonged explorations of every part of the island.—*Kew Bulletin.*

CARRYING TEA-LEAD LONG DISTANCES: APPLICATION OF THE SILO SYSTEM.

We direct the special attention of practical tea planters to the interesting letter which the Manager of a large group of Indian tea plantations sends us under the *nom-de-plume* of "Press" and which will be found given elsewhere. We should like to have the opinion of some of our experienced Ceylon Managers on this application of the "Silo" system to the transport of tea leaf. Our correspondent alleges that he has proved his system by actual trials and has received good valuations for teas made from his "unwithered" leaf, and he is so confident of success that he has taken out a patent for the "spring-chest" described in his letter. It will be apparent, he adds in his private communication, to any one who has studied the "Silo" system that heating or rapid fermentation is impossible in leaf subjected to sufficient pressure. Why not then apply this to the transport and preserving of tea leaf for a short time?

We fully recognise the importance of the proposal and the idea of being able to dispense with "withering" altogether, is an entirely novel one and one well worthy of experiment. Our preconceived notions go quite against the experience of our correspondent in reference to making good tea from leaf pressed down and carried a long distance. In Kelway-Bamber's new book on tea, we find one passage which may be quoted as bearing to some extent on the point at issue. He writes:—

It is almost an impossibility to obtain a satisfactory wither from leaf that has been allowed to turn red, either through being pressed in the baskets, or from being carried in bulk for long distances. Such leaf always becomes more or less black on withering, and portions of the leaves become crisp and brittle, which are broken in the rolling process. It also rarely develops the aroma common to well-withered sound leaf, and must result in the production of a poorer class of tea. There is apparently no remedy when once the damage is done, so that prevention must be adopted as far as possible, by not allowing the leaf to be pressed down, or retained in the baskets for too long a period, and by hastening the means of transit, when the leaf has to be carried in bulk from out-gardens to a central factory.

But distrusting our own judgment in a matter which belongs so much to the actual work of tea planters, we sent a first copy of "Press"'s letter to an experienced Ceylon Manager who has had a good deal to do with manufacturing tea from leaf carried a considerable distance, by rail and otherwise to the factory. Here is how he writes in reply:—

"It is difficult to give an opinion on the 'Silo' system for tea leaf advocated by 'Press,' without seeing his experiments carried out; but I would be inclined to doubt if the results would be so satisfactory as he says. I do not think it is possible to get 240 lb. of green tea leaf into a box 22" by 20" by 19" (the size of an ordinary tea chest) without expressing most of the juices of the leaf, which would then make a very poor quality of tea. Heating and fermentation would surely take place where there is moisture, and it would take considerably less than 17 hours to make the whole mass red and sour. I have seen leaf turn greenish yellow after it has been 45 minutes in a withering machine, and leaf treated in this way gave a stewy tea, not at all desirable,

"If 'Press' put pressure on the leaf sufficient to insure that 'no fresh air could get into it and to express any gases formed,' he must have expressed (and lost) the juices as well. I do not think his system is one that will 'replace the present extensive and expensive appliances necessary for withering.'

"I do not know about the carriage of withered leaf for long distances; it has to be carried green generally, owing to want of withering and making appliances, and for this I am afraid the system would not answer, as the leaf would probably get heated and red, and in any case it would be so bruised that it would blacken when placed on the withering tats. The only successful way of transporting leaf long distances is to spread it thinly on trays where the air can get to it freely, and that plan is too expensive to be of any practical use. I have had leaf hard pressed (from carelessness) into baskets, and in the centre, where the pressure would be greatest, I have generally found it a mass of oaked, red, vile-smelling stuff, and I fear the 'Silo' system would give similar results. Fodder preserved by the 'Silo' system is always supposed to ferment and get slightly acid."

It will be seen that the experienced Ceylon Manager is inclined to criticise and to be sceptical; but we trust that he and other Superintendents with the needful opportunities will make some experiments in the line indicated by "Press" and will report on the same to us for the *Tropical Agriculturist*. It must be remembered that this monthly periodical forms an admirable medium for recording the experience of both Indian and Ceylon tea planters, and the time has now fully come when there ought to be an interchange of ideas, opinions and results gained by experiments,—perhaps, however, under very varying circumstances,—between residents in the tea-growing districts of North and South India and those of Ceylon.

CEYLON TEA IN AMERICA.

We have been going a little further into the figures for tea export to America, both from Ceylon, and the United Kingdom, the American Consul (Mr. Morey) kindly giving us the benefit by his returns for the past four years so far as shipments to the United States are concerned. To these we have to make a separate addition for the shipments from Colombo direct to the Canadian Dominion (including British Columbia) and Newfoundland. Then the shipments direct from the United Kingdom we take from the reports of Messrs. Gow, Wilson & Stanton. Here is the total result for the past four years:—

Export of Ceylon Tea to North America.

	1890	1891	1892	1893
<i>U. K. to</i>	lb.	lb.	lb.	lb.
United States ..	322,539	417,982	710,305	705,567
Canada, &c. ..	201,979	410,958	613,817	731,760
<i>Ceylon to</i>				
United States* ..	245,809	268,954	195,779	250,945
Canada, &c.† ..	40,000	50,000	60,000	100,000
Total ..	810,327	1,147,894	1,579,901	1,688,272

These figures show a slow but steady advance: the export having more than doubled in four years; but curiously enough 1893 showed less progress than any other year.

* Figures got from American Consul.

† Estimates only; pretty safe for 1893, but mere guesses for the other three years.

SELANGOR: ADMINISTRATIVE AND MATERIAL PROGRESS.

We have had lying by us for some time Mr. E. W. Birch's Administrative Report as Acting British Resident of Selangor. It is an able and interesting document and we regret that so much delay has occurred in making our readers acquainted with some of its salient points. One does not find it easy to follow all the divisions and subdivisions of the Straits Settlements, and we do not profess, in the absence of a map from the Report, to comprehend the bearings of Kuala Selangor, Ulu Langat, Ulu Selangor, &c.; but of the first-named, we are at once interested to read—

Kuala Selangor is essentially the agricultural and fishing district of Selangor. It is watered by two fine rivers, and throughout it there is to be found land suitable for the cultivation of rice. It has been predicted that, when the railway to Ulu Selangor from Kuala Lumpur is completed, the district will decay. The prediction is quite groundless, and I take this opportunity of earnestly recommending that a colonization scheme be taken in hand. Kuala Selangor wants nothing but people, and the State has in the head of the Public Works Department an officer who, from his experience in Ceylon, could carry out a scheme for irrigating and draining a large tract of country in this district, which would induce settlers to flock in. It would be costly, but remunerative; and, though Selangor has set before itself the duty of railway extension, it should be borne in mind that there are other interests to be considered than the carriage by rail, from the interior to the coast, of the tin raised from the mines, and from the coast to the interior, of the rice to feed the miners.

It might be possible for the Straits Government to interest the Indian authorities in encouraging emigration from one or other of the overcrowded, but uncertain rice growing districts of Southern India—where a good many of the people are often on the verge of scarcity if not actual famine—to a district which "wants nothing but people" and these, a people who will take readily to cultivation. Under "Ulu Langat" we have on the other hand, a paragraph of interest to European colonists:—

At Dusun Tua, the site of the Government Bungalow, there is fine river-lathing and some very hot sulphur springs, the water from which has been led through iron piping into a comfortable bath house: the bungalow is beautifully situated, and being only 16½ miles from Kuala Lumpur is a very accessible and popular resort. Mr. Lawder has taken great pains in improving the place. The land beyond this is well adapted for coffee, and I should much like to see that kind of cultivation tried by Europeans in this direction when the road is more advanced.

The extraordinary way in which the export of tin ore from Selangor has developed is only paralleled by the rise of our own tea exports: the rise being from 6,948 piculs of tin ore in 1887 to 81,862 piculs in 1892, and this is said to be mainly through the influence and good management of the Straits Trading Co. The following is the most important part of Mr. Birch's Report, so far as the planting enterprise is concerned and it shows good progress and a good promise for the future:—

Coffee planting in Selangor continues to be popular, the area of land granted for that purpose in 1892 being nearly 2,000 acres. The European owned estates are now 17 in number with a total acreage of 91,464 acres, of which about 1,600 have been planted. It has been said, and with much reason, that as coffee planting is now established in Selangor the same arguments do not exist, as formerly, for extending to the planters Government assistance in the way of loans. While the steady increase in the number of estates argues well for the future of Selangor as a coffee-producing country, it should be

remembered that it is still to the interest of the State to attract planters, and that no inducement will prove so attractive as the success of those who first ventured. To this end it will always be advantageous to the Government to assist, whenever it is necessary to do so, the men who have put all their available ready money into the opening of estates in the country, and who by extending their operations will be enabled to work more economically while waiting for their returns. I may add that the State is peculiarly fortunate in possessing in its coffee planters an estimable body of gentlemen. The export of coffee from Klang for the year is returned at 1,121 piculs, of the value of \$25,534.

* * * There are seven European owned estates in the Klang district of which five are cultivated. The export of tapioca was 5,386 piculs, of a value of about \$20,000. * * * The S'ping concession (Kuala Langat) of 10,111 acres is largely cultivated with gambier and pepper and the export of those two products in 1892 was of the value of over \$100,000. H.H. the Sultan took the greatest interest in the extension of padi cultivation, and advanced, out of his private purse, a sum of about \$3,000 to cultivators of small holdings. The Raja Muda's property at Bandar Langat was rescued from the appearance of neglect into which it had fallen. The small coffee plantation on Jugra Hill changed hands and promises to be remunerative to its new owner. The Javanese holdings at Klanang are well cared for, and the road to Klang is being rapidly occupied as the soil is said to be very fertile.

That there has been progress may be judged from the "budget" allotted to the P.W.D. under Mr. C. E. Spooner formerly of Ceylon. The total was 808,000 dollars, namely 380,000 for works and buildings, and 428,000 for roads, streets and bridges. Only about 600,000 dollars were, however, actually expended. It is interesting to see several familiar Ceylon names referred to:—

Mr. C. E. Spooner was in charge of the Public Works Department, and by his untiring energy and great capacity for hard work he has made a considerable improvement in the manner in which public works have been carried out. He reports that he has received every assistance from the members of his staff. They were as follows:—

Mr. H. F. Bellamy, Deputy State Engineer; Mr. Speerig, District Engineer, Coast Districts; Mr. Stoker, District Engineer at Ulu Selangor; Mr. Paxon, in charge of the Waterworks; Mr. Norman, Architect; Mr. Van Rooyen, Clerk of Works at Ulu Langat; and Mr. MacGregor, Office Assistant. Also in the following:—

Mr. A. R. Venning's praiseworthy care of Sydney Lake and of the Gardens is rewarded by the pride with which all residents of Kuala Lumpur regard them, and by the expressions of admiration which fall from all visitors.

Of the Ceylon system of road upkeep, we are told,—

To commence with, the system did not work as economically as was anticipated, but it was pushed forward with great energy and the roads on which the metal was spread were much improved. The system cannot, however, be criticised in fairness until it has been tried for three years, as the essence of it is the gradual addition year by year of metal laid evenly along the whole surface from end to end of each road. Mr. H. F. Bellamy, whose loyal co-operation and willing work were much appreciated by the State Engineer, writes of it as follows:—"There can be no question that the system introduced is undoubtedly the best one, and the condition of the majority of the roads in the Kuala Lumpur district proved it." Mr. Bellamy is an officer of much road-making experience and was for some years head of the Public Works Department in Selangor. His opinion is endorsed by the three other officers in charge of districts.

Selangor is very fortunate in its opened Railways:—

The total sums spent on railways in Selangor amounted at the end of the year to \$2,092,574, and the net profit on that outlay for the year was

11.04 per cent, while the profit on the capital account of the Klang to Kuala Lumpur line alone was approximately 19 per cent.

As to Extensions,—

The first of the three sections of the Ulu Selangor Extension—viz., that from Kuala Lumpur to Rawang, 20 miles—was completed, and was opened by H. E. the Governor, accompanied by H. H. the Sultan, on the 7th of November, and one train each way was run over it to the end of the year. It was almost 17 months overdue, and was not fully ballasted when taken over. Shortly after the section was opened two of the embankments slipped, but not so seriously as to interfere with traffic. The traffic showed signs of a steady increase, and there can be no doubt that the line will prove a financial success. The Contractors, Messrs. Campbell & Co., came to the conclusion that it would not be possible for them to carry out their contracts with the expedition required by the Government, and as the loss occasioned by the delay was great, I deemed it my duty to urge that the contracts be taken out of their hands. This was approved of by His Excellency, and liberal terms were arranged in Singapore with Messrs. Campbell & Co. The Serendah Section of 4½ miles, the completion of which was 12 months overdue at the end of the year, and the Kuala Kubu Section, 13½ miles, which was to have been completed in April, 1893, are now being pushed on departmentally. On their completion depends largely the laying out of the two towns of Serendah and Kuala Kubu, as building operations there are retarded by the difficulties of transport.

Mr. Watkins reports as follows:—"Survey work during the year has been principally confined to exploration work on the main range of the Peninsula, with a view to the extension of the Selangor Government Railway into Pahang. Considerable progress has been made with the survey over the Ginting Peras gap, the results of which have been made the subject of several special reports to Government. This route, which is assumed to be about 87 miles long, follows the line now under construction to Pudothence through the rich mining district of Sungai Besi to Cheras, then following the valley of the River Langat in a northerly and north-easterly direction it passes the village of Utu Langat, and follows the River Langat past Lui to its source at Ginting Peras, which is crossed at an elevation of about 1,500 feet. Descending into Jelabu the route runs past Glami, Titi and Rawit, through the concession of the Jelahn Mining Company to the River Triang, thence it follows the River Triang to Pelangi, a point about 40 miles from Ginting Peras and from this point it follows a north-easterly direction to Temerlo at the mouth of the River Semantan on the Pahang River, which it is proposed to make the terminus of the Selangor Government Railway in Pahang."

On the subject of Education, Mr. Birch has some sensible remarks:—

Vernacular education is in my opinion useful in so far as it makes the Malay regular and cleanly in his habits; but, where it exalts boys, as it often does, above the level of the calling of their fathers, who for the most part will always remain small agriculturists or fishermen, it does more harm than good. It is of course necessary to create a class of interpreters, schoolmasters, clerks and policemen; but the education now afforded only effects that object to a limited extent, and it would be preferable to establish a thoroughly good boarding-school in Kuala Lumpur where a higher education could be given to the highest scholars of the vernacular schools than to scatter broadcast over the country, schools for which it is difficult to find efficient masters.

And finally the closing paragraph of the Acting Resident shows how well he has identified himself with the fortunes of Selangor:—

The year was one of great prosperity. Selangor was not affected by the wave of commercial depression that disturbed the Colony. It was able to shew, like the sister State of Perak, that it could lend substantial help to its poorer neighbours; it carried on, without assistance from outside and at a cost of half a million of dollars, its policy of railway

and telegraph extension; its revenues produced a far larger sum than had ever been previously collected and I am glad to be able to add that the sanguine estimates of its probable revenue in 1893, which I framed and of which H. E. Governor readily approved, are being more than realised.

We cannot help taking a close interest in the development of the Malayan Peninsula more particularly in its plantation settlements: the recent trip of two Ceylon men—Messrs. W. Forsyth and J. G. Fort—has given us later information, the practical portion of which, as related to a contemporary, we are embodying in the *Tropical Agriculturist*. Very soon we shall no doubt have fresh Administrative Reports from both Perak and Selangor, and it will be interesting to see what changes and progress another year has brought forth.

NOTES ON TROPICAL PRODUCTS.

Certain tropical products, their management and prospects—are usefully discussed and in considerable variety by our well-known friend Mr. Thomas Christy, in a series of chatty notes which will be found in our *Tropical Agriculturist*. He has even come advice to give about the introduction of Ceylon tea into America and very good advice it is, so far as it goes. Of a certain tea trade in Germany, we have some repulsive details, and we trust with Mr. Christy, that an effectual stop may be very speedily put to this trade. What is said about rubber, might induce Ceylon growers with any appreciable supply (but, alas, there are none such)—to put themselves into communication with rubber manufacturers for their mutual benefit. Mr. Christy's report on Fibres bears out what we have learnt elsewhere and is very discouraging. "Snakes alive" seems to be the moral of his lively paragraph on snakes and mosquitoes—one way to get rid of the latter we have always understood is to have no water-pond or pool near the bungalow, so as to give them no means of multiplying! What is said about packages and lead in the tea will attract the attention of our tea planters.

THE AMALGAMATION OF TEA COMPANIES

in Assam goes on apace. The Luckimpore Company is absorbed in the Majuli, the Obuhwa has swallowed up the Nonoi, and the celebrated Gotoonga Estate has become a part of the more famous Moabund Company.—*Nilgiri News*.

TABLET TEA

which, unlike brick tea, is made from the finest quality of dust, shows a marked increase. Two Russian firms are the only makers of brick tea in Kienkiang. One of them has at present the monopoly here of the manufacture of the tablet tea, which is finding a market even outside Russia, in Germany and France. Last year's report spoke of it as "the best and most convenient form of tea that one can possibly imagine for travellers, backwood-men, or armies in the field." There would seem to be no reason, however, why whole leaf tea should not be compressed into nearly the same compass by suitable machinery, much as some kinds of tobacco are treated and in that case, the leaf being unbroken, one would expect the aroma to be better retained. By an arrangement of the mould the cake could possibly be divided into rations, and thus economy of space in the traveller's box, the army commissariat, and the man-of-war's storeroom would be combined with simplicity in use. Samples of brick and of tablet tea are forwarded with this report for the inspection of anyone interested in the subject. The manufacture is only carried on here in August, September, and October.—*Kienkiang Consul's Report*.

CEYLON AND INDIAN TEA IN AMERICA : OUTLINE OF A SCHEME FOR JOINT ACTION.

There is one correction we have to make in reference to the American operations of Messrs. Finlay, Muir & Co. and allied firms. We spoke of their large expenditure in promoting the sale of Indian teas; but that expenditure covers Ceylon teas as well. For, their Agencies in America are supplied with Ceylon as well as Indian tea. Sir John Muir's firm, indeed, now forms a connecting link between the two countries, and it is fitting that the proposal recently placed before the Calcutta meeting should have come from its representatives. Following up that proposal (cordially adopted by the Indian Agents) that there should be a combination between the planters of India and Ceylon in pushing the sale of their teas in America, Sir John Muir and Mr. P. B. Buchanan have now drafted the rough outline of a scheme for the consideration of those engaged in the tea enterprise here. They have sent this suggested scheme to the Chairman of the Planters' Association and a copy has courteously been placed at our disposal. It is by no means intended as a "cut-and-dried" affair to be forced on the Ceylon planters and merchants; but is rather the contribution of gentlemen very largely interested in the question, to the discussion which is now under special consideration both here and in India. With this needful prefatory explanation we give the Scheme as follows:—

"That a first-class man not interested as a planter or proprietor in tea growing, but if possible, with a knowledge of the American tea trade, be engaged to act as a resident representative for Ceylon and Indian tea in America, for a period of not less than three years on a salary, to include travelling expenses of £1,500 per annum, and an allowance for entertaining not to exceed a further £500 per annum.

"The duty of such representative would be to cultivate the acquaintance and periodically visit the principal wholesale distributors in the United States and Canada to urge and encourage them in every possible way to extend their dealings in Ceylon and Indian teas, and to send weekly reports of such visits to his employers, making any suggestions which might from time to time occur to him for the furtherance of the trade.

"If he considers it desirable a troupe of native servants should be placed at his disposal, whom he could lend for short periods, to the various distributors, for the purpose of advertising.

"He should on no account sell any tea himself, or carry any samples, but should simply advise the dealers (if required) as to the methods of procuring the teas they might require, placing at their disposal a printed list of the names and addresses of the various merchants, brokers and others, dealing first hand, in Indian and Ceylon teas.

"It would be advisable, though not essential, that he should be able to give instructions in blending, if asked to do so.

"In order to assist in advertising the article, a commission as proposed by the Hon. J. J. Grinlinton of say £1 on every 1,000 lb. of tea should be allowed on all exports of Ceylon or Indian tea from any part in India, Ceylon, or Great Britain to America, and this payment should be made with all possible promptitude. With a view to making the most of the funds available, and also to prevent useless opposition, and confusion, it is desirable, that Ceylon and India should carry out the scheme in combination each country paying

a share of the representatives' salary, and general expenses, in proportion to the crop it produces, and each country contributing to the Commission Fund in proportion to the quantity of its tea exported to America."

We may say at once that the proposal in the first clause to appoint a special travelling representative for a period of three years with a handsome salary, travelling expenses and entertaining allowance, seems, to us, a very good one, both feasible and likely to yield adequate results. A Ceylon gentleman interested as tea proprietor and agent to whom we mentioned the matter today, thinks the net salary of such joint representative of Ceylon and Indian teas, ought not to be less than £1,500 and that a separate allowance of £2 per day ought to be made for travelling expenses, since the special duty of the Agent ought to be to travel as much as possible and not to confine himself to any limited circle, however comfortable. The instructions given in the second paragraph seem very much to the point, though no doubt, they form but the nucleus of the Special Letter of Instructions which would have to be drawn up by a joint Committee representative of the Indian and Ceylon planters, to guide the Agent in his operations and these instructions could be extended or modified from time to time, as seemed wise from the experience gained. From all we have read and heard of the great interest taken in native servants in America, we think it very politic to adopt the suggestion in the third paragraph; but that could be left for the Agent to decide. We are surprised to see that it is considered desirable that the representative should distribute no samples, although it may be advisable that he should give instructions in "blending." If one of the recent experiences in America be that a great deal of the tea sold as "Ceylon" or "Indian" in the stores, has no claim to either designation, it would certainly seem to us that our special Agent should be in a position to shew any householder applying to him, what genuine British-grown teas were like. Small sample packets distributed in this way ought to be a splendid advertisement.

Finally, it would seem that Sir John Muir and Mr. Buchanan tack on—as a compromise?—the bounty scheme to that of the appointment of a special representative and propose the payment of £1 for every 1,000 lb. exported, in all the baldness of the original scheme. We are surprised at this, and further that nothing is said about the payment being made (as Mr. Buchanan hinted had his preference) to the wholesale American importing houses, rather than to the exporters. To pay the latter—as one authority has shrewdly said—will be to place a bounty on the export to America of cheap, inferior, rather than of good teas! But this part of the scheme can be left for the report of the Sub-Committee of the Chamber of Commerce. No doubt the special Agent would have more discretion as to any advertising which he considered desirable, and as to giving Newspaper editors sample boxes of tea as suggested long ago by Dr. Duke. The last question of all will be how are the funds to be provided? Suppose we take 7 million lb. as the aggregate export of Indian and Ceylon tea for the year beginning July next 1894-95, the commission proposed would equal £7,000; the cost of the Special Agent £2,600; for native servants, advertising, &c. say £2,400 and we get a total of £12,000 or about £200,000. In the proportion of £80,000 for Ceylon to £180,000 for India, the sum of £210,000 ought

to be a feasible collection at the rate of the small cess now imposed on the Ceylon Customs. But whether that cess can be continued and the money handed over to the Planters' Association or a Special Committee, it is for the Government to say. In the case of Indian tea, the necessary collection, we understand, would be guaranteed by a Committee of Calcutta Tea Agents. There are no doubt difficulties in the way of working out a joint Scheme; but we see nothing insuperable, while it is certainly very desirable to have neither the opposition nor the confusion sure to result if separate agencies and schemes are established in America for India and Ceylon teas, instead of one joint representation on behalf of British-grown teas.

Since writing the above, a merchant addresses us:—"I send you the *Shipping and Commercial List, New York*, see the article in *Ceylon Tea*":—

THE TRAFFIC IN CEYLON TEA.
Davenport, Iowa, Feb. 9, 1894.

Editor *Shipping and Commercial List*.
You would oblige me very much, if you could give me the amount of Ceylon teas brought to the United States in the year 1893. Thanking you in advance for the trouble.

Very respectfully yours,
CHARLES BEIDERBECKE.

[The importations of Ceylon tea are so light and irregular compared with other grades, that no record is kept of receipts. It is estimated that the arrivals of India, Ceylon and Java teas during 1893 aggregated about one million and a quarter lb., which is a small increase over previous years. The insignificance of this amount can be better appreciated when it is stated that the total annual consumption of tea in the United States is between 80 and 90 million pounds. Great efforts were made by the planters of Ceylon to introduce and popularize their teas in the United States by establishing a branch house in this city, which was conducted at considerable expense; although the new enterprise was well advertised and pushed energetically it failed to accomplish the desired object. Consumers of teas in this country held on to the unfermented, tannin teas of China and Japan, because they had not cultivated a taste for the other and because of the difference in price, probably. The promoters of the Ceylon Tea Company made a mistake, no doubt, in ignoring the regular importers and jobbers. The latter could have been of considerable assistance in advancing the interests of Ceylon tea. To create a demand for any new article, it is necessary to advertise liberally, meet competition in price, and prevent opposition by having the article pass through the regular trade channels.—Ed.]

Very important we deem the above counsel.

INDIAN TEA DISTRICTS ASSOCIATION: CHICAGO EXHIBITION.

A meeting of the Indian Tea Districts' Association was held at the offices, 14, St. Mary Axe, E.C., on Tuesday, for the purpose of hearing an address from Mr. Blechynden on the work done at Chicago in the interests of Indian Tea and its future prospects in the United States.

The chair was occupied by George Williamson, Esq., Vice-President of the Association, and amongst those present were Messrs. R. G. Shaw, A. Bryans, R. B. Magor, W. Roberts, C. W. Wallace, R. Lyell, G. W. Christison, G. Seton, T. Carritt, F. Bullock, G. White, H. Esroshaw, A. G. Stauton, W. H. Verner, D. M. Stewart, D. F. Sefton, G. Henderson, A. Thompson, C. M. Jack, Keith, and G. Gunnick.

Mr. Blechynden, who was warmly received, commenced his address by giving particulars of the difficulties he had had to contend with in securing a suitable space at the Exhibition. When he

arrived in Chicago he found that only 500 feet had been allotted, and having explained that this was quite insufficient—as in addition to the Indian Tea Industry, he, with Mr. Tellery, represented the Indian Art Ware—he was, after some difficulty, enabled to secure 3,000 feet in the Manufactures Building. Owing to difficulties raised by the Secretary of the Royal Commissioners, this space was reduced to 1,500 ft., an allotment so insufficient for the purpose that it was relinquished, and after negotiating for two months, a site for a pavilion was finally decided upon. The building, which was erected at the north end of the grounds, where all the State and foreign buildings were, cost 15,000 dollars. The Exhibition was managed by several committees, and concessions were most imperfectly dealt with by them. Owing to this difficulty three months elapsed before they were able to sell tea. After innumerable rebuffs and delays permission to do so was given on August 29. Mr. Blechynden then read a descriptive account from the Official Directory of the World's Fair of the building which was erected at the exhibition. The site he considered was a very good one, being at the junction of four roads and in the midst of a great thoroughfare. Large pyramids of samples of tea were placed on either side of the entrance to the building. Ten natives and six girls were employed and after permission was given to sell tea two carriers were engaged. It was difficult to calculate the number of cups of tea that were given away free of charge before obtaining permission to sell, but roughly it might be said that the number was about 1,000 a day—in all 100,000. The grand total of the number of cups of tea given away and sold was 220,000. The tea was found to be agreeable to the tastes of the public and the grocers who visited the exhibition were always taken amongst those who were partaking it in order that they might hear other people's opinions about it. It had been said that the American water was unsuitable for making tea, but he (Mr. Blechynden) found no difficulty in making tea of the most excellent quality in America, and he thought this erroneous theory might be at once exploded. Two qualities of tea were sold at the exhibition, one called "The Light of Asia," was sold at 1 dol. per lb and the other called "The Star of India," was sold at 80c. per lb., and as a proof of the estimation in which the tea was held Mr. Blechynden stated that orders had been received from practically every State in the Union. 1,500 grocers in different parts of the United States were handling the tea before he left. His earnest wish was that visitors to the Exhibition might be induced to purchase the tea after they arrived home, and it was with this object in view that sample packets of tea were given away, and he regarded the object attained in this respect as of more value than the tea that had been sold. Good work had been done in securing the assistance of Messrs. Reid, Murdoch, & Co. This firm does an immense business, and employs 64 travellers, who go through all the towns and villages in the Western States. Had the plan been adopted of setting up a store for the sale of Indian tea, as was at one time contemplated, it would have been impossible to have employed such a large number of travellers. The arrangements made with Messrs. Reid, Murdoch, & Co. were that they were to be supplied with teas of two standard qualities at market prices, four months' credit being allowed, this being the usual trade custom in America. The firm undertook to print the teas in packets. The difference between Indian and Ceylon tea was not yet recognised, Indian tea being often sold as Ceylon. Mr. Blechynden then referred to future operations and read the following letter on the subject which he had addressed to the Chamber of Commerce at Calcutta: "When I left Calcutta it was the intention of your Committee to continue pushing teas in this market for a period of two years. This was also approved by the London Committee, and has the warm support of all who are in any way interested in Indian teas with whom I have discussed the subject. All agree that the one method of in

roducing Indian teas into this market is to influence and interest the consumer. The plan I have suggested and which appears to be favourably received by everyone, is to follow the lines upon which we are already working. These lines are familiar to all in this country who have tried to introduce or are interested in any special food product. The system of holding food shows periodically in different parts of the country is an organised one, and the State Fairs held annually offer the best means of reaching the consumer. Adopting the common system, I would propose employing, say, half a dozen of native servants, and travelling about the country from one show to another during the season which extends through the winter and spring. For the rest of the year, still following the usual methods, the servants could be kept for a month or more at a time in grocery stores. With six men at least three stores could be worked at the same time in different parts of a city. At the expiration of a month the men would be transferred to other stores, or in the case of smaller cities to other cities. In connection with the grocery stores, I propose little changes. My idea is to have a series of three or more carefully prepared lectures, illustrated by slides of tea gardens, &c., and to make such a series interesting, other matter of a descriptive character, regarding historical spots in India, dresses of the people, caste, and kindred subjects, might be introduced. The lectures might be given independently of the stores in the regular manner, selling tickets of admission, giving the grocer a certain number, proportionate to the number of pounds of tea he purchases, for distribution to his customers for the tea. Such lectures should include the distribution of tea in the cup at their close. The arrangements we have made with Reid, Murdoch, and Co., in the West, and with Leggett in the East, would be utilised by having their travellers in different parts of the country to arrange for the stores and put one into communication with the right people.

The expenses attendant on this scheme will be pretty heavy as they include not only salaries, but travelling expenses, cost of tea and also cost of cream and sugar, transport of crockery and other items.

In addition to this in attending shows there would be the cost of the space and of erecting the booths.

It is true that some portion of the expenses during the show season would be covered by sale of tea in the cup; but as is shown by our receipts at New York, this will not be very much.

The whole of the time spent in grocery stores would be non-productive directly, yet this is considered the best means of getting at consumers as well as grocers. Such a plan as I have sketched out would cost about \$1,000 per month, apart from my salary, should you wish me to carry on the business, and I would not be prepared to accept less than I now receive and expenses.

Work on this line has been done in this country by several houses interested in cocoa, for instance, and by such great firms as Armour's, who will contract to supply a whole army with food, by Swift's, one of the largest pork packers in Chicago, and others of a similar calibre. I repeat that all whom I have consulted agree that in doing this you reach the consumer, and create a demand quicker and more directly than by any other known method.

I have spoken of using Reid, Murdoch, and Leggett and am aware that there may exist some feeling in the minds of the members of the committee that we are advertising only certain brands of Indian teas by connecting ourselves with these firms. My own opinion is that it is inadvisable to advertise Indian teas generally to the consumer, for I think that we should have certain standards of what we recognise as good Indian teas, and that it is impossible to erect and sustain such standards without giving them defined names, under which those who desire to purchase can buy them. In doing this it is, I submit, not very material to us that we are giving direct advantages to certain firms. But if the committee think that this feature of the

scheme is undesirable it can be met in two ways. One is to advertise the tea used simply as Indian tea. The alternative is a suggestion which recommends itself to me strongly but which the Association may hesitate to add for other reasons besides the obvious one that will interfere in a measure with private enterprise. The plan I refer to is to adopt four or more standards, give them specific names, and retain these names as the property of the Association. By this means, in addition to the indirect benefit to the industry at large, the Association would, in the end of its operations be in possession of a distinctly valuable asset which it could deal with either by selling to a company, transferring it to the agency firms, or in other ways. There is no doubt that, by advertising certain blends under distinctive names, these names acquire a fictitious value, and the Association may therefore be prepared to consider whether it cannot retain for itself some portion of this advantage. In any case, I maintain that it is essential to the interest of Indian teas to employ at all times certain standard blends. As soon as a taste and demand is created for any given blends, of Indian teas, the substitution of other blends, either in the legitimate course of business, by enterprise and advertisement, as well as by fraudulent substitution will inevitably follow.

Were such a thing possible the Association might consider the amalgamation of its funds with those of Ceylon, the object being a common one to relieve the London market. In doing this it might be a feasible thing, but it would be the work of time, to interest such firms as Lipton's, Tetley's, and others who are trying to do a packet trade in this country and who use both Indian and Ceylon teas. Such a scheme while ensuring larger funds, would detract in some measure from the present neutral attitude of the Association, acting in the interest of the industry wholly.

I have in the foregoing suggested three distinct bases for the same scheme. The method to be pursued would in each case be the same. On my return to India I would be prepared to go further into details than is possible by correspondence."

Mr. Blechynden concluded his address by suggesting that it might be possible to have an Indian tea room in the large towns similar to that in the Exhibition, also that firms which are trying to push Indian tea on its merits might be encouraged either directly or indirectly.

A long and somewhat desultory discussion was then carried on by Messrs. Bryans, Oarritt, Thompson, Stanton, Seton, Shaw, and Venuer as to the general position, but no proposition was put before the meeting. One or two members expressed the opinion that Indian could only be introduced slowly, and that it was useless to attempt to force the market, as people in America had been accustomed to drink a light kind of tea, the place of which could only be taken by thin flavourless Indian tea selling about 6d per pound. It was pointed out, however, that India and Ceylon produced a large quantity of this sort of tea, and that the markets here would be much benefited if fresh outlets could be found for tea of that kind, and that difficulties of some kind or other were always experienced in opening up new markets. The general opinion was that the quality of tea purchased for America ordinarily was of the most inferior quality, the appearance of the leaf being more considered than the quality of the liquor, and cheapness being the one consideration. The question as to the consumption of tea in America having been raised, Mr. Stanton gave the following particulars: In 24 years the consumption had increased from 40 millions to 88 millions. In 1869 the consumption was 1.08 per head of the population. At the present time it was 1.33.

The proceedings closed with a cordial vote of thanks to Mr. Blechynden for his address.—H. and C. Mail.

PUN ON PITT'S TAXATION AND TEA.

"With his tax upon powder and tax upon tea,
Not a bean will be left—not so much as he left!"

THE COMMERCE OF EAST AFRICA.

Yesterday, before the London Chamber of Commerce, Sir A. K. Rollit, M.P., in the chair, Mr. George S. Mackenzie (director of the Imperial British East Africa Company) read a paper on "The Commerce of East Africa and its Prospects of Future Development," Mr. Mackenzie, premising that he spoke only as a member of the Chamber, remarked that he was desirous of advocating measures for the protection of the common interests of Great Britain and Ireland. At a time when they were suffering from serious commercial stagnation, it was desirable that Chambers of Commerce throughout the country should consider, not only how we could best maintain our hold on the markets we already occupied, but how we were to ensure elbow room for their future expansion. (Cheers.) The development of British East Africa would not only affect our trading community, but would afford a new and much needed outlet for the energies of the young men of this country in commercial and administrative offices, just as India and our other dependencies had done in the past. When they considered the rapid progress that had been already made in the face of great difficulties, they might rely upon development of the country in the near future if only the task were undertaken with intelligence and persistency under the new conditions of a British Protectorate. (Cheers.) Whether chartered companies under the now altered conditions were any longer a necessity or not, it was an indisputable fact that it was largely owing to their intervention that this country enjoyed the commanding position it now occupied. (Cheers.) The activity of the German, Belgian, and Italian Governments in developing their commercial interests was calculated seriously to injure British trade in African territory if some corresponding steps were not adopted by our own Government. As a London merchant, and as one who had resided for two years at Mombasa, he had no hesitation in saying that East Africa justified far more sanguine hopes than Persia, for example, ever did or had done. All that he believed to be necessary in order to open up this vast undeveloped and important field to the commerce of this country was a strong, just, and liberal Government, which would maintain law and order and improve the means of communication and transport by the construction of telegraphs and a trunk road, or better still, a railway. (Cheers.) The only obstacle to the immediate construction of a line from the coast to the Great Lake Victoria was the hesitation of Parliament to guarantee the interest on the required capital. The presence of the British East Africa Company did not now and never had impeded the action of her Majesty's Government. The company was ready to continue to carry on the administration of the territory under fair conditions; on the other hand it was equally prepared to stand aside if her Majesty's Government considered, in coming to a settlement, that such an arrangement would best further the public interest. (Cheers.) Mr. Mackenzie then exhibited and described specimens of the native products of British East Africa.—*O. Mail*, Feb. 23.

CEYLON PLANTING NEWS.

(Notes by Wanderer.)

March 10.

SUCH RAIN as has fallen has been most tantalising. Certain districts have been favoured, others have had only a few drops. If we have not soon a general fall

of 3 or 4 inches, there will be a loud and bitter cry.

TEA COMPANIES.—With the exception of Yatateria these so far have not declared dividends equal to last year.

COCOA.—The grower of this product is at present not so pleased with himself as his tea brother. R55 as against R80 per cwt. locally makes a great difference. Stocks reveal the cause of the fall. Wilson, Smithett & Co. in their last circular quote:—

Guayaquil shipments, 1893 403,707 1892 315,255

Grenada " — 23,556 — 15,480

Messrs. Rucker & Bencraft in their last circular give the stocks thus:—

1894 84,840—1893 72,599

Till these stocks and surplus shipments have been righted, cacao planters will have to lie low.

CINCHONA PLANTERS will likely soon have a fair time of it. The stocks of cinchona and quinine in bottles are much reduced, and the unit stands close on the penny. Let it go up to 2d and the Ceylon press will have a good time in advertising cinchona seed, seedlings and plants. We shall also have experts giving us the relative virtues of hybrid Nos. 1, 2 and 3. How the wheels go round?

TEA PRICES.—The Tea Clearing House returns show that the gamblers there believe more in a rise, by last mail, than they did in the beginning of January. The future rate for December 1894 is now quoted for fair whole Indian leaf 62-16d. In January it was only quoted for that period 65-16d., a rise of 7-16d.

ANOTHER TEA ESTATE FACTORY BURNT.

We learn with regret that Alton Estate Factory (Maskeliya) has been burnt down. It belongs to the Ceylon Tea Plantations Company, and besides their own teas, they make the teas from Beaconsfield estate (United Planters of Ceylon Co.) adjoining, and of these there were about 15,000 lb. in store at the time. No doubt the place was insured; but will the insurance cover liability for outside teas in store? The estate is no doubt liable.

An Upper Maskeliya correspondent writes:—

"You will be surprised to hear the Alton Factory was burnt down completely on Friday night at about 10 o'clock; nothing saved but the books. Everything was burnt within an hour, and I was told a lot of tea packed and ready for despatch belonging to Beaconsfield estate, all destroyed by the fire." Another report runs:—"It is the most complete wreck imaginable; the rollers, frames, the Siroccos and desiccators, and wheel, also turbine spouting and pillars are to be seen, but the rest is flat, a charred heap; tea, everything gone, the sheets of roofing twisted in all directions and utterly useless. It was caused by the chimney of the No. 1 which went bang through two floors; it happened about 1 hour after they stopped work. Mr. Welldon on getting news of it started out and saw the factory that Mr. Liesching built a sheet of flame and before he reached the dam the other was in a blaze. The only thing left is the receiving house; everything below is gone for ever. Of course a factory is most inflammable, but the gums, bamboos and even tea over the stream are bad y scorched; they got out the hose, but the great heat prevented them using it. Blairavon tea only went out of the place a few hours before it was burnt.

A Maskeliya correspondent of the local "Times" writes as follows:—You will be sorry to hear that the factory on "Alton" estate has been totally destroyed by fire. It occurred on Friday afternoon, and, from what I can gather, everything has been destroyed. All the the machinery

and iron work is twisted out of shape and useless. The whole thing did not occupy much time, I am told, and was over in about an hour. The estate belongs to the Ceylon Tea Plantations Company, and the factory was, of course, insured. How the fire originated I have not heard; but I am told it is supposed that a spark from the engine falling on the tatts set the whole building in a blaze."

INDIAN AND CEYLON TEA IN

AMERICA:

SIR JOHN MUIR'S VIEW.

At the Grand Oriental Hotel on the afternoon of 12th March, one of our representatives had the privilege of a conversation with Sir John Muir. During the day Sir John was busily engaged with the gentlemen who attend to the interests here of Messrs. Finlay, Muir, & Co., but notwithstanding the pressure of engagements and the demand which these made upon his time, Sir John readily accorded our representative an interview and received him most courteously. The chief topic of conversation was the proposed combination between the Indian and Ceylon planters for the introduction of their teas into America. This was a subject which Sir John said he had discussed with the members of the Indian Tea Association at a very representative meeting at Calcutta, and the unanimity of opinion in favour of the scheme was most cordial, the planters also expressing their readiness to assess themselves to the extent of two annas per acre of tea opened out and one half-anna per maund of tea produced in order to provide a fund to accomplish the desired object. This assessment, it was calculated, would realize about R100,000, and there was no doubt (added Mr. Buchanan who was present during the interview, as was also Mr. Fairlie) that the Indian people would contribute their full proportion to any fund that was organized. The Indian planters, continued Sir John, considered that their interests were identical with those of their brethren in Ceylon, and what they felt was that if they could manage to sell five or ten million lb. of tea in the American market, it did not matter whether it was Ceylon or Indian tea so long as it was British-grown, and the London market would be materially helped thereby. "I am satisfied," said Sir John, "that co-operation between Ceylon and India is the right thing—that instead of each working independently and probably pulling different ways they should work in harmony for their common benefit. That is what I said to the people in India, that is what I say to the people in Ceylon, and that is what I will say to the people in London. I promised to the Indian planters that if our Ceylon friends would be good enough to give me the opportunity, I would fully explain to them what had passed at the meeting and endeavour to convince them that that is the proper course to pursue."

Asked about his Company's tea property in India, Sir John said that in two districts of Assam they had greatly extended it, but it would take a considerable time to open out. With regard to Ceylon he said he was still willing to consider reasonable offers, but there was no occasion for rushing and he could afford to wait till a favourable opportunity occurred for extending his Company's holding here.

Sir John leaves for his country on 14th March, and resumes his voyage to Europe in the "Clan Macarthur" a fortnight hence. Sir John goes to Warwick estate, and after that to pass a few days

with Sir A. Havelock; then back to Dimbula and Kandy by the 21st and to Colombo to leave for home about the 24th March.

THE INDIAN AND CEYLON TEA INVESTORS' EXCHANGE (LIMITED),

to which we referred the other day, mentions in its prospectus:—

The Company is formed to supply a much-felt want:—A centre where buyers and sellers of Tea Shares and Properties may be brought into ready contact; and where reliable information for Investors in Tea Securities may be obtained, and advances on sound security negotiated. Ceylon, more particularly, from the enterprise of its Planters, should command the confidence of Investors. Since the collapse of Coffee, Tea from a shipment in 1882 of 500,000 lb., reached in 1893 an export of nearly 83 million lb. The large profits yielded by good management give the greatest encouragement for the future prosperity of the Island. The Tea Properties that changed hands in 1893 alone represented over £500,000, clearly showing the increasing attraction this Island has for Investors. Ceylon offers one of the best fields for Young Men with Capital; and apart from its interest as a field for enterprise, it has comforts and social amenities that few of the Colonies possess. The Company represents, in London, the established Agencies in Ceylon of—The Ceylon Investment Registry, Nuwara Eliya. The Ceylon Lands Registry Office, Kandy.

And invite attention to the Annexed List of valuable Properties now offered for Sale, besides many other smaller Properties, which are on the Register.

From the increase in the number of Public Tea Companies formed, a ready market now become necessary where Ceylon residents at home may have the medium for dealing in those shares, and the Company for this purpose will represent—Messrs. George Armitage & Co., Sharebrokers, Colombo; with whom they will be in telegraphic communication as to the state of the local Share Market, &c. Mr. Douglas Durnford will manage the Share Department.

Mr. Russell Grant is Manager and it is rumoured that Mr. Forbes Laurie is interested in the Company. The list of properties for sale include a good many districts.

TEA MAKING AND HIGH PRICES.

We take the following from the London Letter of the local "Times":—

AGRA PATANA TEA.

In my last letter I directed attention to the stand-out averages realised by Mr. Wickham's Agra Patana tea, not merely on account of its advanced value, seeing that not long since higher figures have been realised by parcels from other estates, but because the tea of this estate has been steadily advancing to its present position gradually during the last few years, and because the value is not to be attributed to very fine plucking. Last year, in the corresponding period of the season, the marked average for Ceylon tea, as reported in the Brokers' circulars, was 9½d; the average then realised for the tea from this property was 11½d, which shows a gain of 1½d per lb. This year, the market average being 8d, the produce from this estate realised an average of 1s 4½d, or 8½d above the general average, a gain of sufficient amount to justify an inquiry on my part as to the reason. I have selected this period for the purpose of comparison because I learn that during the past twelve months a departure from the ordinary system adopted in the initial and important process of "withering" has adopted, which I consider calls for some remarks from me. Although I have had no personal experience in the manufacture of tea, I have had very many conversations with some of the most experienced tea-makers from your Island, and have

always been impressed by what I learnt from them as to the need for some improvement in the commonly adopted style of "withering" more, in short, in keeping with the original method of the Chinese. Tea making is agreed to comprise chemical and mechanical processes, and though no one suspects the Chinese of much chemical knowledge, there is no doubt that in blindly following the methods handed down to him by his predecessors, he was to a large extent carrying out a system of chemical processes. It is true that your Island planters have advanced a long way ahead of the Chinese makers of tea, whilst the Celestials have ceased to turn out the finely flavoured teas of thirty or forty years ago save in certain districts, and so they have lost their old repute. But in considering how often Ceylon tea-makers are charged with turning out leaf inferior to that which they placed on the market of a few years ago, it may be as well if we ask why this is, and whether they have gone too far in their mechanical modification of the old Chinese methods.

THE DAVIDSON SYSTEM OF WITHERING AND ITS RESULTS.

Experts declare that, unless the "withering" be properly conducted, unless tea be subjected to precisely the right degree of "coring" in the withering, it is in vain to expect to turn out a first-class tea with the true aroma and strength. It is precisely in this respect that Mr. Wickham's tea has during the last twelve months proved such a decided success that he has left all competitors behind in the advanced quality of his tea—not as regards any one particular grade, but in respect of all. The withering has been conducted under the advice of Mr. Davidson of tea-dryer fame, who has been the means of introducing boards instead of Hessian sacking or other material, and at the same time paying the closest attention to the gradual drying of the leaf by means of a current of warm, but not hot, air passing through and over it. Care has to be taken that the withering is not pushed to excess, for by so doing the leaf will run a chance of desiccation, in which case it will not give a full-bodied liquor. The due proportion of leaf freshly gathered to be spread on the withering boards or shelves is about a pound and a half to every nine square feet of surface; where it should remain until the middle of the following day. Its proper degree of wither is known by the pleasant aroma arising from it, when it may be passed on to the roller. Beyond this system the Davidson Dryer is calculated to perform the work of tea-coring by a slow rather than by a rapid, desiccation; for reflection will show that a high temperature, no matter for how short a period, will seriously affect the character of the leaf, dissipating the fine elements which go to impart the quality of "point" so much sought for by tea buyers.

Assuming, as I do, that this system of tea manufacture explains the superior quality and value of this particular make of tea, it will be highly interesting to watch the results of future sales of the produce of this estate. It is possible that any falling-off in the quality of particular estates, instead of being due to deterioration of soil, may be owing to errors or defects in manipulation caused by a desire to work off increasing flushes of leaf, a point which it will be well to have determined. In writing as I am doing, I am merely conveying a lesson given me by another, and must not be supposed to be taking up the role of amateur tea maker. At the same time, I would like to suggest whether, as a non-absorbent material is suggested for a withering surface along which the dry, but not hot, air may circulate, a common cheap description of papier-mache might not serve the purpose, glazed on one side. I throw out the suggestion for what may be worth.

PLANTING IN JAMAICA.

SUGAR, COFFEE, CACAO, COCONUTS, &c.

The Returns in the Collector-General's Report showing the areas of crop and pasture lands under cultivation compiled from the ingivings made by taxpayers

are for the year 1891-92 and do not therefore come under a series of papers treating of the island in 1892-93. The figures show the acreage vested in individuals or trusts as 1,958,678—a decrease when compared with previous years. While this is so the acreage in wood and ruinate has also decreased, a circumstance which cannot be explained by the fact that the lands have found a place under the different heads of cultivable areas as many collecting officers are inclined to do. The Collector-General in commenting on the decrease states that the greater portion of the falling off is to be ascribed to the reason that the property tax had not been paid. Of tilled lands estates cover an area of 32,466 acres, this being a decrease on the preceding year's figures but only to the extent of 20 acres. Notwithstanding this slight falling off the Collector-General gives it as his opinion that there is no reason to believe in a permanent arrest of the hitherto steadily diminishing cultivation of this product. It is, however, not always safe to deduce conclusions as to the economic condition of the future from a series of statistical returns; disturbing factors are not unlikely to occur to change the course of agricultural activity and even in the ordinary progress of events, by the utilization of cheap and efficient machinery, the introduction of central factories, &c. we may see the industry obtain a new lease of prosperous life. At present the cultivation is practically confined to large estates, 90 per cent. of the total area representing the proportion paid on by the proprietors or representatives of estates on which the manufacture of rum is combined with that of sugar. In districts where the soil is suitable for bananas, the case is gradually being ousted by its more remunerative rival.

Despite increase in value the coffee industry has not made such strides as might have been expected. The acreage under cultivation in this shrub was 21,450; in 1893 it was given as 42,518, and there was an apparent decrease of 1,026 acres when compared with the preceding year. The reasons given for the difference are three—smaller acreage returned by large planters; settlers preferring to return their land in provisions when under more crops than one; and taxes outstanding. Still, in view of the good prospects for this industry this cannot be taken as satisfactory. Ginger shows a restricted cultivation—only 142 acres as compared with 228 in the previous year. There were only 6 acres arrowroot. The growing of Iudun corn is mainly confined to the savannah land of St. Elizabeth and the acreage is diminishing year by year, owing, it is said, to the severe droughts experienced in the districts where it is cultivated. Tobacco is to be seen mostly in St. Andrew and St. Catherine but in the aggregate it shows a decrease. The area under coconuts and bananas show increases by 1,165 acres and 4,900 acres respectively. On these produce the Collector-General says: "Although much of the increase in the case of bananas is due to extended cultivation, a considerable portion, and in the case of coconuts which take many years for the trees to reach maturity, nearly the whole of the increase is due to better classification, taxpayers taking some time to get accustomed to alterations in their form of ingiving, and especially so where they have, as is the case in very many instances, the choice of some three or four headings, any one of which could with propriety be used. In connection with the cultivation in bananas, the area in cocoa must be considered because, as pointed out, in last year's report the placing of bananas on the schedule has caused lands planted through with both cocoa and bananas to be returned as under the latter head; however in such cases cocoa will ultimately claim precedence, being the more enduring plant." The area under ground provisions was 87,975 as against 8,584 in the preceding year.

The land returned as in guinea grass was 123,060 acres, a smaller acreage than the year before but above the average and the difference must be attributed to ordinary fluctuation. Common pasture shows an increase of 3,649 acres. Pimento lands are however, included under this heading. As we have already said the area in wood and ruinate has fallen off.—*Gleaner Packet*,

PLANTING IN THE STRAITS SETTLEMENTS:

AN INTERESTING TOUR BY CEYLON MEN.

CEYLON MEN AND THEIR ENTERPRISE IN THE STRAITS.

Mr. Forsythe and Mr. Fort left here on January 15th; arrived at Singapore, the pair spent two days there, after which they went by steamer to the extreme eastern point of the Johore Peninsula where they inspected a very fine coffee estate called Penerang, managed by Mr. W. W. Bailey, formerly of Ceylon. The estate consisted of about 400 acres of Liberian coffee, and Mr. Forsythe says, was excellently worked. It was opened about ten years ago with sago, which was followed up by cocoa, and eventually by coffee. The younger clearings promised very well indeed. Returning to Singapore, they proceeded to Pinang, and thence to Port Weld, leaving which they went up eight miles to Taiping, the capital of Perak. During their stay here they visited Waterloo estate, which lies about 16 miles from Taiping, and here they saw Arabian coffee growing on the hills. The estate is the property of Sir Graeme Elphinstone. Leaving Waterloo, they went about three miles to a spot known as Lady Weld's bungalow, near which they visited an estate now being opened by Mr. Lutyens, brother of the Mr. Lutyens Ceylon men are familiar with. It is being opened in Liberian Coffee and coconuts for Sir Graeme Elphinstone and Mr. Donald Mackay, who is at present in Colombo. Work there had only just begun. The pair stayed the night with Mr. Lutyens and pushed on the next morning to Kwala Kangsa, the native capital of Perak, Kwala Kangsa being the place where the Sultan's palace is.

TRANSPORT DIFFICULTIES.

At this point Mr. Forsythe broke off to mention that the difficulties in regard to transport were very great. The transport of passengers and their luggage is all done in that part of the world by means of vehicles resembling exaggerated rickshaws, drawn by country-ponies, and the harness put on these quadrupeds is by no means reliable; so much so that Mr. Forsythe says he had occasion often to regret that coir rope was not made in the country, long delays for patching up the harness following the frequent breakdowns. When they reached Kwala Kangsa they found it difficult to get any vehicles for the day. Prior to their arrival, the Sultan had started off to Ipoh to open the section of the railway from Ipoh to Batu Gajah, and His Highness had engaged 70 carriages for his wives and families, and neither the money nor the influence of the Resident himself could procure the two visitors a vehicle. They managed to get on by slow stages to Kumuning estate, owned by Mr. Heslop-Hill, late of Ceylon, and there they saw some 250 acres of Liberian coffee of all ages up to 8 or 10 years, the trees being laden with crop.

GAIETIES IN PERAK.

Next they reached Ipoh, which is an important mining centre, and having breakfasted there they went on with the Resident to Batu Gajah to see the demonstration over the railway opening.

COFFEE IN SELANGOR.

Returning to Ipoh, the visitors proceeded to Mengang-di-aiwan, an important mining centre that has sprung up so recently that it is not marked in the maps issued in 1892. It contains, however, a population of 8,000 to 10,000 people, principally Chinese. From that they went on to Tapa, where they stayed with Mr. Wise, the magistrate, who took them to a Liberian coffee estate of fifty acres belonging to Mr. Baldwin, and also to a gold mine where there was a 5-head stamp at work. "They had not got very much gold," added Mr. Forsythe, laughing, "but they were expecting it." From Tapa they drove six miles to Tapa Road Station, where they caught the train to Telok Anson, and then took steamer to Klang, which is a port near Kwala Lumpa, the capital of Selangor. From here they visited five or six coffee estates (all Liberian), the

oldest coffee being upon Weld's Hill, belonging to Mr. Heslop-Hill and lying about a mile and a half from Kwala Lumpa. It is a small property, but with very fine highly cultivated coffee. The other estates were all in young coffee, and were promising very well indeed. After spending a few days there, the two travellers returned to Klang, and on the way they were much pleased with the native coffee they saw growing on the flat lands. They next took steamer for Port Dickson, the Port for Seremban, the capital of Nnngai Ujong, and, half way between Port Dickson and Seremban, they came on a very fine estate indeed, called Linsim, the residence of Mr. Heslop-Hill. It consisted of 300 acres of coffee, the younger fields being particularly fine and here their investigations into coffee practically ended.

THE LABOUR TROUBLE: A COOLY-CRIMPING GOVERNMENT.

And here it will be well to give Mr. Forsythe's opinions as he expressed them. "That coffee grows and crops well there cannot be a shadow of doubt" was his first judgment. "But one of the first things that strikes a Ceylon man is the great difficulty in connection with labour, not only because the labourers demand very high wages; but because there are so many restrictions in the way of recruiting, and because the Government, which is engaged in different public works, never by any chance gets any labour on its own account, but, by paying a higher rate than the planter can afford to pay, indirectly crimps the planters' labourers.

TAMIL COOLIES' PAY.

"A Tamil cooly gets from the planter 30 to 35 cents of a dollar a day, just double the rate given the Ceylon labourer. He knocks off work at 2.30 in the afternoon, and, if he works for six days in a week, gets a Sunday name thrown in, free, gratis, and for nothing. The average cooly receives 9 to 10 dollars a month, and grumbles at that. A carter driving a mail-cart, complained to me most bitterly that he had got to take his cart and pair of buls six miles along the road and six miles back and feed them every day, and he only got 12 dollars a month. Of course, on the other hand, food-stuffs and clothes and cooly requirements are double what they are here; but still at the end of the month the cooly comes out with a handsomer balance than he makes in Ceylon.

THE LAND OF THE CELESTIAL.

"Practically the Chinaman, from Pinang to Singapore, is the master of the situation. He bosses everyone, whether European or otherwise. He is in every occupation and every calling, from that of rickshaw-cooly—the lowest of the low—running a rickshaw in Singapore streets, to that of the *town*, or gentleman, who owns half a dozen carriages and runs a magnificent house, and lives at the rate of many thousand dollars a month. The hardest worked Chinese are the rickshaw-men and the miners. Chinese estate laborers get more money a day than Tamils. They get half a dollar a day. They are willing to work at task work or contract work; but their chief attention is devoted to mines and mining. A Chinaman is a born gambler at heart, and his employer at a mine always gives him a share of the find, though he really profits little by this, as every Chinese headman or employer at a mine, when he gets a grant for mining and obtains perhaps a hundred *sinkies* (indentured coolies from China), secures in connection with the grant a license to run a gambling farm, and an opium farm, and when the Chinaman gets his pay (say about once a quarter or less often) he goes and gambles with it on the gambling farm, or spends it on the opium farm, and so it goes back to the employer. Indeed, instances are known where mines do not pay from the tin got from them, but only pay through the profits derived from this system.

A WEALTHY COUNTRY.

"It is impossible to calculate the enormous wealth of the country. I heard of an individual instance where a Chinaman, who had taken up a mining grant of two acres got 170,000 dollars' worth of tin out.

of it in nine months. The Government of Perak obtains its revenue from the 10 per cent. export duty it derives from tin, and in 1875 that revenue was 226,000 dollars, whereas in 1893 it had jumped to 2,535,000. There is no export duty on coffee yet, though Government reserves to itself the right to exact 2½ per cent later on. Another peculiarity about tin is that even the most expert miners are not able to tell by the nature of the land or the appearance of the soil, until they have thoroughly overhauled it, whether it will turn out a very rich tin country or an absolutely barren one. It cannot be prospected like gold-land can, and this makes the gamble all the greater, and it is that gamble that the Chinaman revels in."

JOHN CHINAMAN.

"A Chinaman combines all the virtues and all the vices of humanity, and the European is at the disadvantage of never getting to the bottom of him. I have seen them working as carpenters and boot-makers in Singapore and Pinang, and I believe, outside the miners, the bulk of these artisans work 18 hours out of the 24 hours in a day; and it is no wonder they are objected to in America and Australia. To a traveller like myself, passing through the country, it appeared as if the States were governed by the Europeans, and that the Chinaman romped in and made all the dollars. In return for this kindly British protection, the Chinaman heartily despises the 'foreign devils' and especially amused at their honesty." "Tamils don't mine," he continued, "they only work on estates or else are employed in making roads."

MALAYS AS LABOURERS.

"The Malay is a study in himself. He seems to observe with perfect equanimity the Chinaman and the Javanese, and the Boyanese, and the Tamil, coming into his country and working and making money. He does not care to work himself, and his idea of perfect happiness seems to be to live upon the large rivers and spend his time in fishing. He works sometimes, if he feels inclined. He assists the Chinaman in finding out suitable tin country; and he assists the European in felling jungle; but only when he likes. He looks upon himself as superior to all foreigners in the country, Europeans included. His wants are exceedingly small, and he is utterly devoid of ambition, either for wealth or position. He is a Mussulman and true fatalist. Go where one will, one is struck with the fact that the native is much more on a footing of equality with Europeans than he is here. Whether that is good or bad it is not for me to say. The prevailing language is Malay. Tamils speak it well, though Chinaman don't. They adhere to their own dialects, and a man from Swatow cannot understand a man from Canton. This is another difficulty for the employer of labour. It seems to me that, if a planter is to be a success in the Straits, after mastering Malay he must make it his business to study the characters and natures of the very many different classes of labourers he is brought in contact with. He will have to put aside all Ceylon preconceived notions as to how labour should be worked. Mr. Lutyens was the only planter in Pinang who told me he could work Chinese labour in quantity, and that he felt confident he could work a gang of 500. Chinamen and Javanese work steadily and well at earth work and are very useful in opening up new clearings. Indeed, some of the planters are of opinion that the Tamil is not required upon the estate till it comes into bearing; but then he becomes essential."

THE LAND.

Mr. Forsythe says that, taking it all over, Perak is the finest State, and that it contains thousands of acres suitable for growing coconuts. The patches he saw, when travelling through the State, and the amount of nuts on the trees, beat anything he had ever seen before; but all the coconuts grown (and the cultivation is confined to Province Wellesley, Penang, and Malacca) are used for food consumption,

he opines, for he saw no signs of copperab or coconut oil.

GOVERNMENT REGULATIONS.

"I do not think the land regulations in either State (Perak or Selangor) are favourable to the planter. By land regulations I mean the regulations as to the sale and leasing of lands. There are far too many provisos and restrictions, and I think much more land would have been opened up if Government would grant it on easier terms to bona fide planters who are willing to take up the land and plant it and not to hold it. Government charge 25 cents of a dollar per acre per annum. That seems light; but it is not when you see the restrictions and regulations. One quarter has to be planted in such and such a time, failing which Government can walk in and take over the unopened land. Of course it may not do so, but it legally can, and a planter may not have been able, through unforeseen contingencies, to have complied with what was demanded of him. I cannot help thinking, that in both States Government put too high a prospective value on their land. And it must be remembered, too, that timber there is a Government monopoly. A man cannot sell timber even from his own land. Undoubtedly it is a fine country and grandly timbered; but Government is too chary of disposing of land outright at a nominal sum. Still, the value of the land is what you can get from it, and planters are not going to open up the country in Selangor with such regulations as are in force at present. There are only about 1,600 acres planted in Selangor, and about 600 in Perak, so far."

ROADS AND RIVERS.

Perak, Mr. Forsythe added, is splendidly roaded, and the main trunk-road through the State compares favourably with our old Kandy road, which is about the best in Ceylon. The rivers are grand, particularly the Klang and Perak Rivers, on which there are crowds of small steamers plying up and down. Steps are being taken to bring the railway facilities right up to those points of the rivers where steamers can get deep draught, so as to make as many ports as possible, and he regards the prospect for the future of the States as very good. One other thing may be mentioned, and that is that the travellers heard and believe that Arabian coffee grows well in the hills on the Pahang side, but Pahang is a vast unexplored tract known so far only to Mr. Edmund Watson, who was down in Kwala Lumpa and saw Mr. Forsythe and Mr. Fort; and to Mr. Wise, who is away in distant Pekan.—Local "Times."

HYBRIDISATION OF THE ACACIA.

The difficulty of distinguishing one from another the four hundred species of Acacia is often very great, as in many cases the difference is slight.

After seeing how freely they cross-fertilise when growing together in the Riviera gardens, I do not hesitate to express my opinion that many of them are natural hybrids. When growing together in variety, as they do here, it is natural that they would hybridise one with the other.

Around the plants that have produced seed, hundreds of young seedlings spring up in a very short time, and amongst these are often to be found some which deviate from the parent plant. I have recently had the opportunity of noting a very distinct hybrid of this kind. The gardener sowed some seed of *Acacia cultriformis*, which he took direct from the plant which was growing beneath another species called *A. pectolaris*.

Amongst the batch of seedlings several very distinct varieties appeared, showing in varied degrees the character of the two species. It is also remarkable that the seedlings assumed the character of the pollen plant as to the foliage, and in most instances were more or less variegated, as the one species has a silvery foliage and the other dark green.—*Riviera;—Gardener's Chronicle.*

Correspondence.

To the Editor.

LIBERIAN COFFEE; HOW TO INTRO-
DUCE TEA INTO UNITED STATES;
TEA IN GERMANY; FODDER;
RUBBER; FIBRES; MOSQUITO BLIGHT;
TEA PACKAGES AND LEAD.

London, E.C. 16th Feb. 1894.

SIR,—On looking over No. 7, Vol. XIII, January 1894, I would like with your permission to remark upon a few of the topics discussed therein, many of which are extremely interesting:—

On page 455, LIBERIAN COFFEE is referred to. It was found in Java that the Liberian Coffee carefully prepared, yielded a better product than the Coffee Arabica, known as the Java variety. This coffee should be planted very wide apart so as to make every allowance for it growing into a large tree, and the land between the rows of coffee plants can be most easily cultivated with beans, wheat or Indian corn, and crops regularly gathered. After a time, as the plants grow up into large trees, this same land can be utilized by cutting off the lower branches of the Liberian Coffee tree to 4th or 5th from the ground.

Page 459. Your Chicago correspondent fails to understand how they are to get TEA INTRODUCED INTO THE U.S.A. I would advise the authorities who interest themselves in such matters, in Ceylon to instruct their agent in America to get a list of the public institutions, at which ladies reside temporarily, either for education or for work, and send a small quantity of tea to each of these establishments; should there be "no tea-pot," as is often the case, then he should send one with the tea, to save them brewing it in the coffee pot.

Once the ladies take tea from Ceylon they are sure to continue it. I have many times been informed by American families visiting England, of the difficulty they have experienced in getting good Ceylon tea at a reasonable price.

Page 466, "TEA-TRADE IN GERMANY."—There is a certain class of tea sold in Hamburg, made from willow leaves, coloured and fired. It is frequently sold in London, but as the Customs authorities know that it is not tea, they will not allow it to come into this country, but the sale being made here, is forwarded to Hamburg and owing to there being steamship lines in all directions this so-called tea is regularly shipped to our Colonies and at present I do not see how this trade can be stopped. Further the tea sweepings from the warehouses in London, are now, as your readers are aware, turned into caffeine and before the Customs part with it, the whole is denatured so that it is quite impossible to be used for a beverage. The Germans, however, who wish to get over the fair traders, purchase the sweepings from one of the warehouses here, ship it in bond and they sift out the dirt and nails and mix the dust with low-class tea in Germany. By this means they escape paying the duty on the tea into Germany and of course buy it at an extremely low price compared with any tea which is sold in the English market. The whole details are known here and probably some means will shortly be found for stopping this small trade in very few hands which is not only discreditably but very injurious to the legitimate traders.

Page 467 "POLYGONUM SACHALINENSIS."—I feel confident in asserting that when this plant be-

comes more known and can be obtained in Bengal, it will be widely planted, not only as a fodder plant, but also for guiding the streams in their course and also for preventing overflowing and loss of soil.

Page 471 "RUBBER."—There is no article that comes to the London market which is so slaughtered as this. It will surprise many to know what a trifle exists between a profit and a loss and I will endeavour to describe the position to those interested. India-rubber and guttapercha come to the London market to the merchant who hands it over to the broker, and he has to exist upon his commission, he puts it up to auction and shows the samples for a day or so with the usual sale condition viz payment in 14 days; consequently the trade is in the hands of a few large dealers who purchase the rubber and pay for it in 14 days. In the large majority of cases the manufacturer has to go to these dealers and pay a large profit to them whereas if the manufacturer had time to examine the rubber and prepare his tests for each parcel, he could buy at a much higher price and the merchant would receive, as a result, a much larger share of profit, which now goes to the dealers. In Liverpool a rather better system prevails; because some of the manufacturers go to the auctions, examine the goods and arrange convenient terms of payment with the brokers.

Page 473.—"FIBRE PLANTS":—I believe that any one putting their money in these, with the view of treating the fibre and sending it to Europe will drop it. The mass of fibre now being offered here, has so crushed down the price that it is only a question of getting rid of the stocks on hand to save expenses. If there is any means of using the fibre locally, it is well to consider it.

While on this subject, it might be advantageous to Ceylon to grow the plant yielding the pulque that comes from Agave Americana which according to all accounts makes a very valuable beverage, and that Ceylon is especially suited to the growth of this cactus.

Page 481.—"MOSQUITO BLIGHT ON TEA":—There are many insects which affect plants and others which affect the human being. For instance to keep the mosquito down you must go to the water and if you take care that your ponds are well stocked with fish, they will devour the whole of the larvæ, and an estate may soon be free from these insects, if this is carefully attended to.

On some estates experiments of a very singular nature are being tried. Snakes were at one time plentiful; they were destroyed without regard to species, whether they were poisonous or non-poisonous; consequently the insects multiplied rapidly. I read a report sent to England a few weeks since, that said that while cutting weeds between one row of coffee plants they found 36 snakes; now all these snakes had to depend upon animal food which they found, and perhaps this hint can be turned to account by some of your readers.

Page 487.—"PACKAGES FOR FINE TEA especially fannings," if when the cases are made ready for the lead lining, some China paper with plenty of fibre in it, or what is known in this country as Manila paper, is cut into strips of about 4in. wide and stuck into the corner of the tea chest, with some carefully prepared paste, it will form not only a very strong joint but will prevent the tea leaking out; some of the houses are copying this Chinese plan and they are also pasting some sort of paper outside the chests at the angle. By this plan a lot of tea will be saved and at the same time no great change made in the arrangement for packing.

Page 492.—“LEAD IN THE TEA”: I am investigating this subject because I think the conclusions drawn by Tetley & Co. are not quite correct; but I will refer again to this matter later on.—Yours truly,
THOS. CHRISTY.

TEA LEAD IN TEA PACKAGES

LONDON, E.C. Feb. 22.

SIR,—I informed you that I would make inquiries respecting the lead being found in the tea chests. I find that it is not thought that any fraud has been committed in the bonded tea warehouses in London, but it is explained that pieces of lead are tacked into the inner linings of the boxes in Ceylon, with the object of equalizing tares, the boxes themselves not being uniform as to the thickness and description of the wood used in their construction.

If you can call attention to any further particulars I shall be glad to look into the matter. Naturally the packers of tea in Ceylon will be able to furnish information in reply to this charge.—Yours truly,
THOS. CHRISTY.

CACAO CULTIVATION AND RAINFALL.

- Wategama, Feb. 14.

DEAR SIR,—I enclose a table shewing the rainfall at half a-mile from the Wategama station for the last eight years, and other two tables of the percentages of cacao crops on two estates, gathered in each month for the corresponding period. The rainfall tables run from January 1st to December 31st; the crop percentages from July 1st to June 30th; August to January being considered the autumn, and February to July the spring, crops.

October, January and June are the most variable months, and one may reckon 5 to 5½ months from blossom to harvest.

1892-93 was the latest, and one of the shortest, crops. As in the old coffee days, the early crop is usually a bumper one.

Many useful deductions may be drawn from these facts and figures, and I hope they may prove of service to some of my fellow cacao planters.—I am, &c.,
CHAS. GIBBON.

“WHAT SCIENCE CAN DO FOR US IN THE TEA FACTORY.”

DEAR SIR,—When your contemporary, the editor of the “Independent,” writes on science we all accord him a respectful hearing, for he is an accepted authority on matters scientific, and his long experience has taught him the danger of hasty conclusions. He has supported you, sir, throughout in your insistence on the necessity for professional assistance and advice to planters in the field and in the factory. I did not write the sentence which that editor has taken for his text, but as it is much after my own way of thinking, I should like to criticise the critic who says your correspondent, presumably “an authority, appears to miss the object of analysis entirely.”

Your correspondent argues that, “as all the processes of the factory are conducted with a view to bring out the best flavour of the tea, the palate seems to be a better guide than chemical analysis.” Your contemporary contests this, and, following the expression of opinion just given, asserts: “the palate tests the result, but cannot discern at what stage of the process the flavor is gained or lost, or to what particular chemical change that essential quality is attributable,” “for,” he adds, “the whole process of manufacture from end to end is one continuous series of chemical changes &c., &c.” Now, before going further, let us suppose, for a moment, that all the leaf manufactured in Ceylon into tea, was grown and made under identically the same conditions as regards soil, climate, plucking, withering, rolling, oxidizing and firing &c. Given, then, the facilities for the due performance of all these functions everywhere alike, the study of the manufacture of tea would

be reduced to its simplest conditions and rules. Granted that from the moment the leaf is plucked "chemical changes" commence, no one would dream of troubling the chemist to interfere in the progress of the first "stage in the series of changes" until the leaf had lost a certain percentage of its weight, say, or had assumed a certain color and feel! Whether to go beyond that point, or to stop short of it, the experienced planter ought to know by this time, nor do I see what difference an analytical examination could detect in the composition of the leaf beyond the varying percentage of moisture. The chemist is not yet born with skill enough to say that within the margin the practical planter allows for this operation, his analyses would enable him to say "this result is better than that," or who could beat the palate if applied to test a dozen samples of tea made from as many heaps of leaf as variously withered, other conditions being the same. But is this first stage not very well understood already? or could science provide the necessary conditions to practise it to perfection where climate differs, room is insufficient and the one thing necessary to make all easy, "working capital," is nowhere? The next stage in the series is more complicated, *i.e.*, *rolling*.

Admitted that the planter knows when his leaf is "withered" (for though this "chemical change" is "progressive," it is only one change in the series) how should he roll? Is not the price realized in competition with a thousand teas all differently treated the final test? or should it not be? (though we all know, unfortunately, it is not); but we are imagining all tea made under identical conditions. After the tea, evenly withered, has lost a certain amount of weight representing loss of moisture and a given chemical change, it is rolled for so long and subject to a certain amount of pressure. Here another "chemical change" sets in; but let us suppose that no chemist could with existing machinery and appliances obviate the necessity for thus rolling and pressing the leaf until it sweats freely and shows a good commercial twist. Of all the many thousands of "rolls" done daily in Ceylon, probably no two are rolled identically alike, *nor ever could be*, and that's the point. Great approximation is of course effected, within the walls of the same factory only. We *must* gently break up the cells of the leaf and give it a twist, and as it is, we do not stop short or go beyond that, keeping the roll cool during the operation. Are we at fault here? If so, the very simplest laws of tea-making are not understood yet by anybody. The chemical change set up by the rolling is continued on the "fermenting" table, progressive from the time the roller begins to turn up to the point where the practiced eye and nose tell us when to check it by firing; but it is only one change, the second, in the series, and if its progress is even and continuous, like that of a growing child, all we have to do is with its accomplishment. Unless we are each and all prepared to employ professional chemists as tea makers we must have some margin and some outward and visible sign as our guide, and this I think we have and if we are in doubt a few trial heaps will enable the palate to decide upon the best. Besides this, science has already taught us, though common-sense would have done that, that to under-roll and under-ferment gives a coarse flavor, while over-rolling and over-fermenting gives a mawkish flavor, and sets up decomposition of the leaf. But we are told that the chemist, here, can render us the greatest assistance:—"Mr. Bamber, after some months' trying, has made important discoveries, by analysing the tea at different stages of the same

operation." Well, Mr. Bamber must indeed be a magician! It would take him, or any other chemist—not "some months" only—but a very long time indeed, to first find what to look for in his analyses, and what a few slight changes in the resulting formula really indicate; whereas the practiced tea-maker—(to which complexion even the chemist must come at last, to prove and demonstrate his discoveries, for it is the final test and determinator) would in less than "a few months," arrive at a satisfactory solution of the problem by merely *tasting* selections of the tea "made at different stages of the same operation."

This the editor of the "Independent" admits is carefully done by tea-makers, but he would have them also "know the difference in the chemical composition effected in the tea by the various processes." But this is quite a hopeless aspiration and let us hope as unnecessary as it is hopeless. Given a few broad rules and principles and care taking in the work, and that is all we can hope for, or reasonably expect "*in the factory*"; but if the chemist can discover new laws and new rules in his laboratory let him do so, but before he can be sure of their efficacy, he *must* submit them to the practical tea-maker and to the market for "proof."

But all tea is not made under identical conditions, but under innumerable, varying conditions too well-known to mention, though each factory may, for practical purposes, consider all others in the same case as itself. It must attend to its own peculiar circumstances without regard to others. Finally, though modern Chemistry is undoubtedly a marvellous and a magical science, it is not quite so magical as we are asked to believe. Before the chemist can be sure of his deductions *he must prove them*, and he can only do that by the palate of the tea-taster. TENTACLE.

CARRYING TEA LEAF LONG DISTANCES:—SILO SYSTEM.

Feb. 22nd.

DEAR SIR,—Some time ago I took up the subject of preserving fodder for cattle in the Silo. At the same time I was trying to find some good method of carrying tea leaf without injury, for long distances, and it occurred to me to try the Silo system for this purpose. I would define the principle of the Silo to be—"The expressing of air in the first place from the product to be preserved, and subsequently the exclusion of air." To insure the expressing of the air to a great extent, I compressed 3 maunds of tea leaf into a box measuring 22×20×19—the density of the leaf may be stated as 1 lb. of leaf to 34.8 cubic inches. The means adopted for compressing the leaf was that of the weight of two men who pressed down the leaf with their feet as it was thinly sprinkled into the box, and the box took two hours to fill. If the filling had been done hurriedly, it is probable that the leaf would have turned red.

Having compressed the leaf and by this compression having expressed the air, I placed a *false lid* on the leaf—*i.e.* a lid which would fit the inside of the box, and be able to sink into the box. On this lid I placed about 6 cwt. of lead. This pressure on the leaf was sufficient to insure that no fresh air could get into the leaf, and to express any gases formed. The result of this experiment was surprising. I left the leaf under pressure for seventeen hours, and it had contracted three inches. I opened the box and turned out

the leaf; the colour had changed to greenish yellow as if the leaf had been slightly steamed. *The stalks were flexible.* Seeing this I determined to roll the leaf at once, and put it straight into the rapid roller—I took care not to lose any juice—and dried off the moisture after colouring, and when the leaf was as dry as is usual with withered leaf, I rolled it again, and dried in a sirocco as usual. This tea was valued and reported as good as my ordinary tea. It will be seen that these 3 maunds of leaf only occupied a space of 22×19×20 from the time it was weighed till the time of rolling. And I am hopeful that my system may replace the present extensive and expensive appliances necessary for "withering."

For the carriage of "withered" leaf the above system will also insure success. The leaf cannot get heated or red;—the chest of 22×19×20 inches will hold about 240 to 280 pounds of "withered" leaf, and the leaf will stay uninjured for several hours.

To make the system practicable I have constructed a screw press, which will compress 3 maunds or so of leaf into the chest in a few minutes, by the power exerted by one man; and to keep constant pressure on the leaf, I have a chest which is fitted internally with coiled springs aggregating a pressure of six hundredweights. I shall be very interested to hear whether the above experiments have ever been tried, and to know whether any of your readers will give the system a fair trial.

"PRESS."

PROGRESS IN NORTH BORNEO.

Kandy, March 12.

DEAR SIR,—The following particulars just received from Mr. Henry Walker of British North Borneo may interest you and your readers:—

The Coffee Co. in which Messrs J. L. Shand and Herbert Anderson are interested is going ahead as they are satisfied with the progress made. They have a little difficulty in getting cocoa seed but that will soon be obviated as they are now having seed bearers of their own.

There can be no doubt for the future of coconut planting, for they have trees bearing 100 nuts. Mr. Walker believes there is a great opening for coconut planters in Borneo, and very fine land is available.

Mr. Walker will be very pleased to see Ceylon men with capital and promises to show them every attention.

The labour question is getting clearer and the value of the dollar is helping, being only worth 2-3d.

Tobacco reports are all good, and some crop is already in Sandakan for shipment.—Yours truly,

W. D. GIBBON,

Agent, British North Borneo Government.

A SILO FOR TEA LEAF; IMPROVED WITHERING ARRANGEMENTS.

DEAR SIR,—“Press”'s experience is very different from anything I have heard of, and if it be found that leaf brought into the factory wet, and packed into boxes as he suggests will produce as good tea as does the leaf properly withered, it will certainly be a valuable discovery.

He may be right, and his suggestion is worthy of a fair trial, but my experience is that when the leaf is *hard* packed into the sacks (all my leaf is transported to the factory in sacks) and has been carried from 3 to 5 miles, it feels hot and I have even known it changed to a bronze

or copper colour, whereas if lightly pressed into the sacks it is found in excellent order after 5 miles of a carriage on a cooly's head.

Any suggestion that will lessen the difficulties arising from insufficient withering accommodation, should receive encouragement. A correspondent of yours has recently been adding to his withering space by running his withering tats three inches apart instead of six inches, with the best results, and when compared with the advantages he has gained by the arrangement, at very little cost. Those who are pressed for withering accommodation should give the system a trial.—Yours truly,
INVENTION.

CEYLON TEA IN AMERICA AND CONFERENCES.

Hiralouvah, Haldnmmulla, March 13th.

DEAR "OBSERVER,"—I notice in your paper of 12th a most interesting statement, viz. that "In the afternoon Mr. Lipton and Mr. Duplock had a conference with Sir J. Muir and Mr. P. R. Buchanan" But you do not give us any details of this most important conference. But I fancy after settling the fate of nations, the conversation must have drifted round to tea; and I do hope that Messrs. Lipton and Duplock (as Ceylon planters) thoroughly explained to Messrs. Muir and Buchanan that the idea of Ceylon forming an alliance with India to push teas in America would not work. Let each country do its own work in friendly rivalry. It is very good of Mr. P. R. Buchanan to hold little informal meetings at Calcutta, and would no doubt help Calcutta. But I cannot help thinking that our own Planters' Association, with its many able members, is the body to discuss and arrange their matters, almost better than informal meetings of Calcutta agents and others.—Yours faithfully,
H. H. KIRBY.

ACME TEA CHESTS.

DEAR SIR,—For the information of tea planters and exporters we annex copy of a letter we have received from London regarding the above.—Yours truly,
MERCHANT.

We do not see that these packages should be any more successful than their predecessors which have proved failures. There is a strong prejudice against these packages in the trade. The small local dealers who are the ultimate recipients of tea, prefer the old lead-lined wood packages, because they are easy to open, and when emptied they can sell the old tea lead linings. These iron chests are very difficult to open as they nearly invariably, get jammed in transit, and they are useless when emptied. It is all very well for the makers to say that they will allow so much each for the packages when emptied, but they cost so much to send them to either Glasgow or London that they are not worth the carriage. Again, the saving in the cost, and the advantages which are supposed to exist, are largely mythical, and we are also informed that there is a galvanic action set up between the iron and tin if the package gets at all damp with sea water, which not only causes the rust to come through, but imparts a strange odour to the contents, and renders same almost useless.

ACME TEA CHESTS.

March 17.

DEAR SIR.—With reference to a letter appearing in last night's *Observer* signed "Merchant," I think it but fair to the Syndicate to say that we have tried close on 5,000 of these chests during the last 15 months and find that there is a

decided saving in favour of Acme tea chests and we have no complaint of any kind from the trade or any where else. MERCHANT NO. 2

[We thought in reading the report appended to "Merchant" 's letter that every possible and impossible drawback to the Acme chests was brought together. We have seen a testimonial today from an agent in a big way speaking on the Acme chests in very high terms:—

"The tea packed in the Acme chests has arrived in first-class condition and I am of opinion that tea so packed is received by the London dealers as readily as if the product were packed in wooden chests."

An advertisement for the benefit of "Merchant" appears in another column.—Ed. T.d.]

VARIOUS AGRICULTURAL NOTES.

COFFEE IN JAVA.—Messrs. James Cook & Co. learn from Java that the weather is less favourable; recent figures to hand estimate the Government crop at 310,650 piculs, and the Private at rather over 500,000 piculs.

THE CULTIVATION AND MANUFACTURE OF GANJA IN MADRAS by C. BENSON, Esq., M.R.A.C., Deputy Director, Agricultural Branch is the latest pamphlet to reach us from the Department of Land Records and Agriculture, Madras, Agricultural Branch.

PRICES OF HOME-GROWN TIMBER IN BEDFORDSHIRE.—Mr. A. D. Webster reports that the following prices were realised for home-grown timber of fair quality at the recent auction sale on the Woburn estate:—Oak, 1s. 6d per foot; Ash, 1s. 6½d.; Elm, 8½d.; Spanish Chestnut, 11d.; Poplar, 10½d.; Willow, 11d.; Maple, 11½d.; Larch, 1s. 1d.; Beech, 9d.; Lime, 10d.; Sundry poles and tops, 1s.—*Gardeners' Chronicle*.

COCONUT CULTIVATION AT VEDDUKADU.—The soil of Veddukadu seems to be well adapted for the cultivation of the coconut palm. Already hundreds of acres have been planted. In some parts the trees have already begun to bear. The nuts are larger than those of the Pachchilapaly estates. Applications have already been made to the G. A. for fresh Crown land. He has given directions to the local Surveyor to survey the land in allotments of 22 acres each. Cor., "Jaffna Catholic Guardian."

COCOA-STEALING.—There is not the slightest doubt that in the Matala and Panwila districts at least, the native cultivators are deterred to a considerable extent from planting cacao, by the special liability of the fruit to be stolen by thieves as mentioned by Mr. Westland at the Annual Meeting of the Planters' Association. In a letter Mr. Westland further endorses his statement; but in this respect as in regard to the employment of more watchers, we do not think there has been any flaw shown in the planters' case by any of their critics.

A NEW GREEN PIGMENT IN PLANTS.—Mr. D. Hooper, of the Laboratory, Ootacamund, writes as follows:—"In the issue of the *Gardeners' Chronicle* for July 22, notice is made of a discovery by professor Tschirch of a new green colouring matter in *Trichosanthes pubera*, which he has named trichosanthin. I should like to point out that the green colouring matter of the pulp of some of these plants was isolated by me in 1839, and the colouring principle of *Trichosanthes palmata* was especially investigated as spectroscopically by Mr. Michie Smith, of Madras, who read a paper on the subject before the Royal Society of Edinburgh in 1890. An account of these plants, their chemical composition, and a comparison of the spectrum of the colouring matter with that of chlorophyll, may be found in *Pharmacographia Indica*, vol. II, pp. 70-74. It will be seen that the term 'trichosanthin' was applied by me, not to the pigment, but to the bitter glucoside, the active principle of the plant."—*Gardeners' Chronicle*.

A HANDSOME NEW SPECIES OF BAMBOO has been discovered in Burma, and has been botanically named after its discoverer, Mr. J. W. Oiver, Conservator of Forests. Large quantities of the seed are being planted in Northern India.—*Western Star*.

REVIVAL OF CACAO CULTIVATION IN COLOMBIA SOUTH AMERICA.—Mr. Robert Thomson—whose name is familiar in connection with the Cinchona Enterprise in its early days in the East and also as a contributor to our *Tropical Agriculturist*—has been addressing (in Spanish!) the President of the Republic of Colombia, S. America, on the need of reviving and encouraging the cultivation of cacao within his State. Mr. Thomson gives a good deal of useful information, and having got a translation of the paper, we shall republish it in full in our T.A.—Meantime it remains to be seen if the Colombian authorities will lay to heart, and take action on, the advice tendered by Mr. Thomson.

JAMAICA'S NEW INDUSTRY: CEYLON BEATEN.—A great deal of interest and ceremony has attached to the inauguration of the West Indies Chemical Works, Limited, at Spanish Town, Jamaica. Never, perhaps—says the local *Gleaner*—has a new Jamaica industry been inaugurated under more auspicious circumstances. The foundation stone (or rather stake) was formally laid by Mrs. T. L. Harvey, wife of the Hon. T. L. Harvey, to whose energy and enterprize the Company owes its existence. Prior to the ceremony, Dr. Emile Bucher, founder and managing Director of the Company, gave a conversazione at the Hotel Rio Cobre, to which a large number of guests were invited. Dr. Bucher said: In future years when they saw all this waste land cleared, the noise of the factory and the smoking chimneys they would remember that day. There was one gentleman in that gathering who through his unflagging perseverance, his energy and his intellect, had brought that undertaking to a successful close. They all knew that he spoke of the Hon. Thomas Lloyd Harvey, Hon. T. L. Harvey said:—This is I believe, a personal undertaking; it must be considered the private enterprise of the gentleman I call Dr. Bucher and his friend Mr. Schweich. You know Dr. Bucher, you have seen him, but I am sorry Mr. Schweich is not here today, Mr. Schweich is a cultured gentleman, is a man of refined taste, is a man whose presence in Jamaica would add immensely to our society and to our business talent, but unfortunately for this community and unfortunately for this company, Mr. Schweich is absent from ill-health. Mr. Schweich will, however, act for the Company in the markets of Europe and will convince the sellers of the world that good extract can be made from Jamaica roots only, Dr. Bucher is not a financier; Dr. Bucher is a man who has taken up chemistry as a study. With Mr. Schweich, he carried on this business in the City of Manchester. He has come to this island not once, but three times, and I hope if we have not conquered him that he has conquered us. They examined the water, analyzed the air and burned red lights. I thought they were Obeahmen (laughter). Dr. Bucher satisfied himself that Spanish Town was central for the trade, satisfied himself that Europeans could live in it and thrive, and satisfied himself—best of all—that such an enterprise could be run by local labor and by Jamaicans. Mr. S. L. Sharp said that standing there and speaking in the name of many logwood growers and agriculturists he wished the new company a hearty success. It would not injure the trade, but would on the contrary increase it. This industry was one like many other good results of the late exhibition.

"ROOKETENNE ESTATE," near to Oodoowerre, comprising 812 acres, the property of Messrs. H. O. Hoseason and G. E. Osborne has been purchased by Mr. W. H. Hannan of Medacombrá, Watagoda for R7,000. As regards this property I know it beyond the shadow of a doubt that clearing of land—a part of it—is to be commenced forthwith and that the area under Tea is to be extended, Mr. and Mrs. Hannan have already booked their passage home, and till the return of the former from England and until further arrangements are made Mr. Hoseason will have the management of the estate and its extension. This place is between the 5th and 6th mile post on the road to Haputale and 12 miles from Bandarawella. There is also ample water power, hundreds of acres of land available and any amount of fuel. The Badulla Oya is on the Eastern side of the property.—*Cor.*, local "Independent."

INDIAN AND CEYLON TEAS—We do not at all approve of the tone of our friend Mr. Kirby's letter (page 698), although we know that his views are shared by a large number of his brother planters. We cannot at all see the wisdom of Ceylon refusing to co-operate with India, or rather to allow India to co-operate with Ceylon. Would Mr. Kirby have a special Ceylon Agent and native servants go round the States, followed, or preceded by a similar special Agent for Indian teas? The average American householders and dealers would certainly regard the visitors as rivals and would have their attention given to the difference between them and their teas, until they probably declared,—

"A plague o' both your houses ;
"We can't decide between you and will just go on with our old teas."—Whereas what both countries have to do is to force the Americans to realize the inferiority of the China's and Japan's they are drinking as compared with British-grown, honestly prepared teas whether from India or Ceylon. Does Mr. Kirby not realize that whatever benefits one country in America, is sure to benefit the other, because it lessens the pressure on the London tea market.

TEA PLANTING COMPANIES.—We call attention to the Reports of no less than four Plantation Companies, the annual meetings of which have been held. First we have the Yatiyantota Company, hitherto the premier Ceylon Company so far as dividends went, but which this year gives place to the Yataderiya with its 30 per cent dividend to shareholders. Still Yatiyantota is well to the front and save for the mischief caused by *helopeltis* and losses through Coast Advances, would have kept up its previous year's record. The return for this Company hitherto are as follows :—1888 dividend 22 p. c. ; 1889=25 ; 1890=25 ; 1891 40 ; 1892=30 ; 1893=25. The We-oja Company comes next as another Kelani Valley Company and the return for the past year is equal to 12 per cent dividend. Then we have the Glasgow Company with the fine soil and climate of the Agra-patanas, and the Dunkeld Company representing favourable conditions in Dikoya.—The one declares 12 and the other 10 per cent, but both Reports speak of young tea land yet to come into bearing. The Directors and Managers connected with these several Companies well deserve the thanks of the shareholders.

CEYLON TEA FOR AMERICA.—The paper on "Ceylon at the World's Columbian Exposition," in *Halligan's Illustrated World's Fair*, to which we alluded the other day, winds up with the following paragraph which we hope will be widely read and studied by Americans :—

The result of this careful attention to manufacture is an article that for purity and cleanliness and for a combination of strength with delicacy of flavor cannot be equaled. No deleterious substances are

fused into it to give it color like the teas of China and Japan, nor any extraneous essences to give it flavor ; it is directly treated on scientific principles by methods which conserve and retain in the leaf the maximum quantity of those virtuous properties which make it so wholesome a beverage. Space will not permit a dissertation on the good qualities of Ceylon tea which elaborate chemical analyses have indicated, but it may be observed here that it possesses the essential principle on which the dietic value of all teas depend—namely, theine—in a greater proportion than any other tea. It is, weight for weight, more economical than those of Japan and China which for the bulk of the teas imported into this country, and we have every hope from the ready manner in which it has been received by the public already, that it will prove to be the tea of the near future in this vast continent. If this hope is realized as it should be, and as the merit of the article deserves, the object of our visit here shall have been met and an unquestionably wholesome food product introduced into this country.

MR. E. V. CAREY IN CEYLON.—Mr. E. V. Carey, who returned here yesterday (13th) on a brief visit, speaks hopefully of the coffee enterprise in Selangor, where he now is, but says that it is a case of sheer hard work, and that he cannot leave his estate for any length of time. He has come up to Ceylon to meet Mrs. Carey, who is coming out in the P. & O. s. s. "Victoria," due in a fortnight's time, and he will return to the Straits by the P. & O. China boat that connects with the "Victoria." He says that his estate, New Amherst, Selangor, is a block of land of 1,000 acres in extent, of which 430 acres has been felled, while he has 250 acres opened in coffee, the oldest of which is 18 months. Mr. Gatehouse worked with him for a time ; but left Selangor some time ago, and he has another European assistant now and a conductor. His labour is chiefly Tamil, but Javanese are occasionally employed. Unlike Mr. Forsythe, who visited the Straits the other day, and on his return asserted that the Selangor Government "crimped" the planters' labourers by offering them higher pay, Mr. Carey speaks in the highest terms of the local Government. Mr. Carey has given up cricket, though Selangor possesses a club which stands second in importance in the Straits, and which alone, he says, could easily beat United Ceylon. He will stay with Mr. Talbot at the Serubs, Nuwara Eliya, until the "Victoria" arrives, and with that object went upcountry this morning (14th.)

THE CINCHONA MARKET.—In this morning's *Observer* (Mar. 19) we quoted figures from the *Chemist and Druggist* giving the export of cinchona from Java for the past five half years, July to December. The export for the period in 1893, is less than for the same six months of the previous year, but the news that has come of Java having shipped 900,000 lb. in Jan. this year alone shows the enormous reserves they must have, and it would simply be madness for any Ceylon planter to begin planting cinchona until more is learned from that colony. We are glad to be able to say that we have been promised a full report of the position in Java at an early date. One correction that we have to make on the paragraph which we took over from a contemporary on Saturday is with regard to the Java planters having brought the price down from 8s to 1s 3d per oz. This was done by the Ceylon planters ; at least the fall to 3s if not 2s was caused by the Ceylon exports. The Java planters have now the control of the market in their own hands, and with bark averaging 4½ per cent, neither India nor Ceylon can for a moment compete even if they had appreciable reserves which they have not. We must however wait for the full report which we have been promised before dealing further with the subject.

THE NEW PERADENYA ESTATE FACTORY.—The tea factory on this well-known estate, which was burnt down very recently, the machinery being all damaged, has been got ready for work again. The work was given to Messrs. Walker, Sons & Co., who have completed the re-fitting of the machinery in the very short time of fifty days. Messrs. Walker, Sons & Co. are to be congratulated on having such a competent staff of enginers and workmen. On the day of completion Mr. Bernard Stave, who is in charge of the fitters, hoisted a flag and gave the workmen a treat for the manner in which they had enabled him to complete the work so rapidly.—*Cor.*

THE COFFEE UP-COUNTRY.—Bogawantalawa, March 16:—Excellent blossoms all over Dikoya where there is any decent-looking coffee. Morar, Therasia, Killarney and Bogawanne are a sight to see, and the coffee looks so strong and well it reminds one of the old days. The weather for setting the blossom has been all that could be desired, and the lucky proprietors of coffee will certainly score decidedly this year; while the railway returns from Hatton to Colombo for coffee will in this coming season, October, 1894, to February, 1895, show, I should say, nearly ten times the amount of coffee carried to February 28th, 1894.—*Cor.*

ROYAL GARDENS, KEW. Bulletin of Miscellaneous Information for December 1893 has the following contents:—Root Disease of Sugar-cane, Peruvian Colonisation, Horticultural in Corwall, Botanical Station Dominica, St. Vincent Arrowroot, Coffee-leaf Disease in Central Africa (Preventive Measures), West African Botanic Stations, and Miscellaneous Notes. Bulletin of Miscellaneous information Appendix III.—1893. Contents:—List of Staffs in Botanical Departments at Home, and in India and the Colonies. Bulletin of Miscellaneous information for January has for contents:—Gumming of the Sugar-cane; Decades Kewensis, VII; West African Mahogany; Tuberosus Labiata; Veitch Collection; Diagnoses Africanæ, I; Miscellaneous Notes.

THE ALTON ESTATE FACTORY FIRE: FURTHER PARTICULARS.—A ton estate tea factory was seen by the tea maker to be in flames shortly after 9 p.m. on March 9th, and before the coolies arrived the whole of the two upper floors were in flames. All that could be saved were the estate check-rolls and books out of the office, as by that time the two upper floors of the old factory were blazing, and the smoke and heat prevented anyone's approaching. By midnight there was not a stick standing, the store and all its surroundings being completely destroyed. The tool store, which caught fire, was saved by the coolies with buckets. The hose being inside the factory it was impossible to get at it. Firing and all work had finished at 8 p.m., and no sign of fire was visible then. It is impossible to say how the fire commenced, but somehow fire got from the No. 1 sirocco chimney into the withering loft. The factory, machinery, and tea in the store was fully insured, but the inconvenience and loss during the next nine months will be very great.—*Cor.*

THE CINCHONA MARKET AND CEYLON.—In an interview with the representative of a contemporary Mr. C. Bohringer is reported to have said that in Java so much cinchona had been planted at the start that they could go on uprooting for a long time to come. The analysis was increasing, and, if they went on increasing the quantity as well, of course it would make a terrible difference from what things formerly were when Ceylon only supplied the market. The Java planting had had the effect of reducing the price of quinine from 8s to 1s 3d per oz., which was the price now; while it had been as low as 8½l. Of course the price would go higher if Java found out the way of not overstocking the market; but, speaking as a manufacturer, he personally didn't believe she had yet found out that way. It would suit him personally if Ceylon grew Cinchona again but he would not recommend it.

PATENTS: TEA MIXTURE.

16,267. September 10, 1892. Tea. H. Carus-Wilson, 22, Fenchurch Street, London. Consists in impregnating tea, after or during the ordinary processes of manufacture, with 1 to 2½ per cent its weight of a mixture of two parts of bicarbonate of soda and one part of phosphate of soda. A solution of this mixture is raised to boiling heat and sprayed upon the tea, which is then heated in a chamber to 130° F. for about half-an-hour, and afterwards dried in a tea-kiln at 120°-130° F., or in a rotary drying machine at 20°-30° lower. As an alternative process the dry leaf may be sprinkled with the mixed salts in the form of a powder, and then subjected to a hot-water spray.—*Patent Journal*, Jan. 17.

FIJI VANILLA.

Vanilla appears for the first time as an article of export from Fiji in the official statistics of that colony for 1892. In that year 112 lb. of a declared value of 120l left the island. The quality seems to have been excellent, and the fruit realised from 21s 6l to 22s 6l per lb in London. In the small island of Rodriguez, near Mauritius, vanilla growing is also tried. The plantations, it is said, are prospering.—*Chemist and Druggist.*

COFFEE CROPS IN SOUTHERN INDIA

promise well for next season, and all that is wanted now is timely rain to ensure success. On the whole, gardens have pruned out well; but on some estates there was less developed wood than was anticipated. We hear that large quantities of pouquette from Octoamund are being carted to the Ouchterlony Valley. Some of this is from very old pits and should be of rich manurial value.—*Nilgiri News.*

THE AMSTERDAM CINCHONA MARKET.

Amsterdam, Feb. 17.—The analyses of the Java cinchona bark to be offered at our sales on March 1st have been completed. The manufacturing bark contains 16 tons sulphate of quinine or 5.06 per cent on the average. About 1 ton contains about 1.2 per cent sulphate quinine; 15 tons, 2-3 per cent; 56 tons, 3-4 per cent; 79 tons, 4-5 per cent; 73 tons, 5-6 per cent; 61 tons, 6-7 per cent; 19 tons, 7-8 per cent; 5 tons, 8.9 per cent.—*Chemist and Druggist.*

BARK AND DRUG REPORT.

(From the *Chemist and Druggist.*)

London, Feb. 2.

CINCHONA.—A moderate quantity of Eastern and African barks was offered for sale on February 20th. There were seven catalogues, mostly small ones, totalling up as follows:—

	Packages	Packages
Ceylon cinchona ..	366 of which	247 were sold
East Indian cinchona ..	821 do	532 do
Java cinchona ..	95 do	96 do
African cinchona ..	182 do	182 do
South American ..	453 do	— do
	1918	1057 do

The Eastern barks were mostly of very high average quality; those from India were almost exclusively made up of good tone bright yellow and grey chips and shavings. A steady tone prevailed throughout the sales, but as some of the holders appear to be sanguine of obtaining more money by adopting a waiting policy, and therefore did not press their supplies for sale, a considerable proportion was bought in. The unit keeps firm at 24 to 25 per lb. for fair qualities.

A somewhat interesting feature of the sales was the offering of 335 bales of "soft Colombian" bark of 1893

import. This variety has not been shown at our auctions for some considerable time, and on this occasion all of it was bought in. It is said that, at the time of its importation, over 6s per lb. was refused for it.

Here follow the approximate quantities of bark purchased by the principal buyers:—

	Kilos.
Agents for the Mannheim and Amsterdam works	81,962
Messrs. Howards & Sons	48,289
Agents for the Brunswick works	37,747
Agents for the American and Italian works..	30,685
Agents for the Paris works	22,140
Agents for the Auerbach works	16,150
Agents for the Frankfort-on-the-Main and Stuttgart works	4,480
Sundry druggists	15,075
Total quantity of bark sold..	257,178
Bought in or withdrawn	165,378
Total quantity of bark offered ..	422,556

It should be well understood that the quantity of the bark purchased gives no indication of the amount of quinine in the bark actually secured by the buyer.

The prices secured for sound bark were:—

CYLON CINCHONA.—Original. Red varieties: Dull to fair dusty stem and branch chips 1½d to 1¾d; fair shavings 1½d to 1¾d; dusty root 1¾d to 1¾d per lb. Grey varieties, dull small stem chips 1½d per lb. Yellow varieties: medium to fair bright quilly stem and branch chips 2½d to 3½d; root 2½d per lb. Hybrid: ordinary, dull and weak stem and branch chips 1½d to 1¾d; good shavings 3d to 3½d per lb. Renewed. Red varieties:—Ordinary unill shavings 1d; fair stem chips 2½d per lb. Good grey quilly stem chips 3½d per lb. Yellow fair to good bright stem and branch chips 3½d to 4½d per lb. Hybrid dull chips 1½d; fair to good shavings 2½d to 3½d per lb.

EAST INDIAN CINCHONA.—Original. Red varieties:—Fair to good bright stem and branch chips 1½d to 2½d; root 2½d per lb. Grey varieties:—Sweepings 1d; small thin branch chips to good bright quilly chips 1½d to 4½d; good bright shavings 4½d per lb. Yellow varieties:—Small and dull branch chips 1½d to 2d; good bright ditto 2½d to 3d; thin twigs 1½d to 2½d; fair to good bright quilly chips 3½d to 4d; small to good bright speshavings 2d to 3½d; root 3½d to 3½d per lb. Renewed. Red varieties:—Dull to good bright stem and branch chips 1½d to 2½d; grey varieties:—ordinary small to good bright shavings and chips 2½d to 3½d per lb. Yellow varieties:—good bright shavings 4½d; medium to fine quilly chips 3½d to 5½d per lb.

JAVA CINCHONA.—Ninety-six packages Javanese Ledger bark realised 3½d to 4d per lb for crushed chips 2½d per lb for branch chips and 3½d per lb for root.

WEST AFRICAN CINCHONA.—One hundred and eighty-two bales from San Thome (succirubra character) brought 2d to 2½d per lb for fair to good bold quilly chips, and 3d per lb for fair rather thin quill.

SOUTH AMERICAN CINCHONA.—Several lots of old soft Colombian bark (3-5 bales) were all bought in at from 2d to 3d per lb. Besides ranged from 1½d to 1¾d per lb. For a parcel of 118 bales (½ cwt each) cultivated Bolivian Calisaya quill from Mollendo, fair quality, partly irregular a bid of 4d per lb was refused.

The exports of cinchona from Java during the second half of the year (July 1 to December 31) have been:—

	1893	1892	1891	1890	1889
Govt. plantation...	297,091	422,837	459,823	270,378	2,92,915
Private plantations..	3,085,007	3,481,417	4,693,747	3,831,381	2,321,745
Totals...	3,382,098	3,904,284	5,153,570	4,121,699	2,514,660

CINNAMON.—A sale of 100 bales (50 thirds and 50 fourths) at ¾d per lb., c. i. f. terms, February-April shipment took place last week.

COCAINE.—The convention price remains undisturbed, but there are rather more sellers in the second hand, and it is possible to purchase Hydrochlorate from such holders at 18s per oz., which is 1s below the Convention price.

QUININE.—No business was reported until Wednesday, when 10,000 oz were said to have changed hands at 11½d per oz, showing a decline of fully ¼d per oz. The market closes dull. The imports of cinchona bark and its alkaloids into the United States during the last two years were as follows:—

	1893	1892
Cinchona bark.....lb.	2,138,128	3,144,264
Quinine sulphate and other cinchona salts....., ..oz.	2,777,567	3,466,922

The following are the manufacturers' quotations.—Howards, bulk 1s 2d to 1s 3d; visls 1s 3d to 1s 4d. Whiffen, bulk 1s 1d; visls 1s 3d. Pelletier, visls 1s 5d to 1s 6d. Fabrica Lombarda, bulk 1s 1d; visls 1s 3d. All German brands in bulk 1s 1d per oz

(From Chemist and Druggist.)

London, March 1st.

CINCHONA.—Of South American barks only a few lots were offered today. Thirteen bales so-called flat Calisaya, bold bright pieces were bought in at 1s 8d per lb. (the owner asks 1s 7d per lb.), and 2 bales very damaged old Maracaibo were bought in at 8d per lb. For a parcel of 6 bales bold flat damaged very dark Calisaya from Hamburg, the high price of from 1s 5d to 1s 10d per lb was paid.

COCA-LEAVES.—Fair but broken and thin green Truxillo leaves were bought in at 1s to 1s 1d per lb.; but 2 bales rather ordinary sold at 9½d today.

CUBEBS.—Cultivated berries are arrived freely in Amsterdam and are being offered there at the equivalent of about 75s per cwt.; but no buyers can be found willing to pay this price. The demand here remains very slack, and at the public sale today 70 bags were all bought in, a bid of 45s for a lot of small dusty and slighty stalky berries, which are held at 50s, being rejected. Privately sales of good quality have been made at 50s.

VANILLA.—A rather heavy supply was disposed of today with good competition at from 6d to 1s 6d per lb. advance, the bold pods experiencing the greatest rise. Fine chocolate 7 to 8½ in. brought 16s to 18s, good ditto 5 to 7½ in. 8s 6d to 13s 6d, small crystallised chocolate 3 to 6 in. 5s 9d to 8s 3d; common brown and toxy down to 2s 9d per lb. A Seychelles report states the vanilla crop of last year was much above the average, but that it is feared, from the scanty flowering of the vines during the season of 1893, that the 1894 crop will not be worth consideration.

LONDON REPORTS ON TRAVANCORE PRODUCE.

(From Patry & Pateur, Limited, Report of the Colonial Markets for the Week ending February 21st, 1894.)

TRAVANCORE TEA.

In sale this week, with the exception of Arnakal, Aneimudi and Kuduwa Karnum estates, which were good, the other estates were only of medium quality. Prices realised were low, in sympathy with sales of Indian and Ceylon.

	Bro. Pek.	Pekoe.	Pek. Son.	Souchong.	Bro. Tea Dust.	Quantity.	Av. about.
Arnakal	1s 0½d	9½d	6½d	6d	...	77 chs.	8½d
Aneimudi	9½d	7½d	6½d	84 ½-ch.	7½d
Kuduwa Karnum	9d	7d, 6½d	5½d	228 chs.	7½d
Fairfield	10d	6½d	5½d	..	4½d	80 do	6½d

Total 794 packages, averaging 6½d. per lb.

THE TEA DEALERS ASSOCIATION ON SMALL BREAKS OF TEA.

It would seem as if the several bodies interested at home in the Tea Trade were hopelessly divided on the important matter of the best means of disposing of small breaks of tea. The Brokers submitted the method most favoured by them to the Ceylon Association, which declared against it; the Tea Committee of that body formulated its own propositions and sent them on to the Wholesale Tea Dealers' Association; and now we learn from our London Letter just received, that the Committee of the last-mentioned body wholly rejects the proposals both of the Ceylon Association and of the brokers! Nor has it when doing so, suggested even the shadow of an alternative course. Its letter says in effect, though not in actual words, that such things as small breaks of tea should be entirely unknown. It may be admitted that these stumbling-blocks in the way of facile disposal of our teas are very undesirable. We have, indeed, done all in our power to induce our planters to avoid them. We have pointed out to them how much against their interest it must be to send home small breaks, and yet even this powerful argument has failed to produce the required result. Such breaks continue week after week to make their appearance in the auction lists, and it must therefore be concluded, we fear, that our producers find them to be a necessary evil, one that the ordinary course of their operations forces upon them in spite of the conviction they must entertain that it is opposed to their financial interests to make shipments of the kind. We shall esteem it to be very unfortunate if, after all the efforts that have been made, no satisfactory course for the disposal of these breaks can be arranged between the three bodies to which we have above referred. It is true that the Wholesale Tea Dealers' Association Committee, when writing to our own representative Committee in London, intimates an intention to circulate among its subscribers, the several suggestions it had received. But if the Committee selected by the members to specially deal with such matters fail even to suggest a remedy, while condemning both of those laid before it, we fear this appeal must prove fruitless of result. From what this Committee has written it would seem that there must exist among buyers objections to the sales of these breaks being conducted in a separate room, though the nature of these objections has not been stated. The omission to do this must, we should say, prevent further present action by either the Ceylon Association in London or by the Brokers. Had the character of the objection taken to the two courses proposed been stated, it might have been possible, one would think, to have considered a further proposition tending to overcome them. The question is eminently one demanding discussion by the Planters' Association. It may well be asked whether the whole of our estate managers are unanimous in the belief that the practice giving rise to the difficulty is one that cannot be avoided? Does every estate, or every group of estates, feel bound to have small breaks sometimes? Are there no exceptions to be found to the rule? If the last question can be affirmatively answered, then it is certain that there may exist a remedy which has only to be known to be more widely followed. It may, of course, be that such a remedy has been found to be financially worse than the disease. We should, however, be glad

to know if this be the case. That lower prices are obtained for small, than for large breaks is so well-known that we need not again state facts to prove this. A certain amount of loss must therefore be foreseen by the manager of each estate forwarding parcels of the kind. It may be assumed then as a deduction therefrom, that the loss would not be incurred were it avoidable. To hold back until a sufficiency of tea had accumulated to form a break of ordinary size must, it would follow, also entail a loss. In which of these two cases is the loss the greater as a rule? Upon this hinges the action of our planters, and without fuller knowledge we cannot pretend to reply to the question we have put. But if the difference be not seriously against the holding-back principle, we would ask tea-planters to weigh in the balance the manifest difficulty created for the home trade by the present practice, and to change it whenever possible.

TEA AND SCANDAL.

Washington Irving evidently would have approved of my heading, for in his poem entitled 'Tea,' which is "earnestly recommended to the attention of all maidens of a certain age" there is this introduction of the time out of mind scandal associated with that beverage:—

In harmless chit chat an acquaintance they roast,
And serve up a friend as they serve up a toast;
Some gentle *four-pas*, or some female mistake
Is like sweetmeats delicious, or relished as cake.
A bit of broad scandal is like a dry crust
It would stick in the throat so they butter it first
With a little effectful good nature and cry—
"Nobly regret; the thing deeper than I."
Or young ladies nibble a good name in play,
As for past time they nibble a biscuit away;
While with ehrgs and surmises the toothless old dame
As she mumbles a crust she will mumble a name;
And as the fell sisters astonished the Scot
In predicting of Banquo's descendants the lot,
Making shadows of kings amid flashes of light
To appear in array, and to frown in his sight,
So they conjure up spectres all hideous in hue,
Which as shades of their neighbours are passed in review.

The wild statement of Percival, in his 'Account of Ceylon,' that Tea had been discovered native in the forests of the Island, is too well known for me to quote, but he also states at p. 366 that "Tea, coffee, tobacco, and the sugar-cane had already been cultivated to great advantage." He wrote in 1805, but at p. 117 of "The life and adventures of John Christopher Woolf in Ceylon," 1785, I find the following contrary statement:—"Tea and some other sorts of elegant aromatics are not to be found here. Some trials have been made to rear them, but without success."

Tea is called an aromatic because of its inherent aroma, but that the scent of Chinese Tea is not always that of *CHA* or *Thea Sinensis* is well known. The *Leisure Hour* for 1879 (p. 353) has a paragraph on Flowers for perfuming Tea. "In a Chinese Materia Medica some information is given respecting the flowers used in perfuming Tea. "The principal of these would appear to be those of *Gardenia radicans* (Oape Jasmine,) *Jasminum Sambac* (the Arabian Jasmine,) *Aglaia odorata* (an interesting Chinese plant named in honour of Aglaia, one of the Graces,) *Perstroemia japonica*, *Camellia Sasanqua* (Lady Banks' Camellia,) and *Olea fragrans* (the fragrant olive.) The flowers of the last named shrub are most highly esteemed for the purpose by the Chinese. Sometimes in this country an agreeable flavour is given to tea by putting a loaf of the sweet bay into the tea-pot before infusing the tea or a few leaves of the lemon-scented Verbena."

Alas! alas! how are the mighty fallen. Vicecount Hinchinbrook (E. G. H. Moutagu) wrote a 'Diary in India and Ceylon 1878-79.' He is in Dumbul, and on 18th November 1878, he says:—"I am initiated

into the mysteries of a coffee plantation * * * the crop is very good this year; an acre yields a ton of coffee; the expenses £15; the profit £100 *** I met two men owning an estate in this valley who had made £12,000 one year." A. M. FERGUSON.

CEYLON AND INDIAN TEAS IN AMERICA.

We call attention to the official report (see below) of the Calcutta "Tea" meeting, which has reached us. It includes a hurriedly-written letter of our own, addressed to Mr. P. R. Buchanan so far back as 26th January—before the return of the Ceylon Commissioner—and at a time when we were discussing the advantage of joint action in the *Observer*. It was not written with the expectation of being read on so important an occasion, though, of course, it conveyed to Mr. Buchanan, the impression left on our mind by the remarks made by planters on our editorials at the time. We have corrected some obvious misprints. On the whole, it will be seen the Calcutta meeting fully recognized the difficulties and jealousies attending joint action and therefore—if contrary to our anticipation in January—the Ceylon Planters' Association decide against the proposal recently formulated, we suppose we shall see (a thousand pities it should be so!) two Agents in place of one perambulating America,—Mr. Blechynden for Indian and Mr. Grinton for Ceylon teas. We feel sure that there will be cause, eventually, to regret such a course if it be adopted.

INDIAN TEA ASSOCIATION.

Proceedings of a Joint Meeting of the General Committee and of the Chicago Sub-Committee held on Friday, the 2nd March 1894.

PRESENT:—The Hon'ble J. N. Stuart, *Chairman*, H. S. Ashon Esq., H. C. Begg Esq., A. F. Bruce Esq., F. G. Stewart Esq., T. Traill Esq.—Members of the General Committee.

J. Davenport Esq., A. G. Watson Esq.—Members of the Chicago Sub-Committee.

Sir John Muir, *Bart.*, P. R. Buchanan, Esq., Allan Arthur Esq.—Present by invitation.

The CHAIRMAN said the meeting had been called to discuss with Sir John Muir and Mr. Buchanan the best means of carrying on future operations in America in the interests of Indian Tea. Mr. Blechynden after he had finished his work in connection with the Chicago Exhibition had been to New York and shown his exhibits at an Exhibition in that city, the expense connected with which had been rather more than was anticipated, and the results not altogether satisfactory. Mr. Blechynden was now on his way back to India in consequence of a suggestion made by the Indian Tea Districts' Association, London, who thought it was better that he should return and consult with the committee here before carrying on any further operations in America. The General Committee here had suggested that the London Committee should control and supervise any further efforts made in America as they were so much nearer to the scene of operations.

The Chairman then read an extract from a letter dated the 22nd December 1893 which had been received from Mr. Blechynden detailing his proposals for the further pushing of Indian Tea in the United States. The Chairman said that Messrs. Reid Murdoch & Co. had been appointed agent for the Western States and Messrs. Leggett & Co., agents for New York. Mr. Lipton with whom he had had an interview a few days previously, though he spoke of what Mr. Blechynden had done in terms of the highest praise, was inclined to deprecate the appointment of special agents for the sale of Indian tea, as he thought it kept other large traders away from

the article and he considered that dealers generally ought to be attracted to it. The following is the extract from Mr. Blechynden's letter referred to above:—[See page 688.—*Ed. T.A.*]

The CHAIRMAN then asked Mr. Buchanan if he would kindly give the meeting his views on what had been done in America in connection with Indian tea as he had had an opportunity of personally becoming acquainted with the efforts made.

Mr. BUCHANAN said that when he went to America in 1892 and talked to people about Indian tea the replies were very discouraging. Six months later, however, before the Chicago Exhibition was open the feeling was distinctly different and gradually more interest was shown. In August after the Exhibition had been opened it was freely admitted on all sides that it would be only a question of time as to when a general demand for Indian and Ceylon Tea began to set in. The American dealers were not keen about pushing the trade, but they were quite sure the demand would come, sooner or later, and the feeling generally had changed from one of opposition to one of friendliness. He was much pleased with the Pavilion and Exhibit of the Indian Tea Association. He thought Mr. Blechynden had done extremely well and deserved every credit for his work, as he had had to surmount very great difficulties. He was also very much pleased with the Ceylon Exhibit although he thought the Indian one was perhaps the better of the two. Mr. Grinton's methods were in some respects more suitable to the country and more appreciated by the Americans than Mr. Blechynden's. Before leaving Chicago he had seen Messrs. Reid Murdoch & Co., and they were of opinion that a good trade was sure to follow the Exhibition, but it must be pushed by assisting them to advertise and also by having natives of India to travel and attend at the different stores up and down the country. He thought this would be the best and cheapest method. He was strongly of opinion, however, that the Association should work with all the present distributors of tea and not give the preference to any particular firm. It would be a mistake to oppose the principal dealers in the States and a very serious competition to enter upon. He would suggest a concession in the shape of a commission to all large dealers in the States on all new business in Tea they were able to transact.

The CHAIRMAN referred to a proposal which had been mooted by the Editor of the *Indian Planters' Gazette* of holding tea auctions at different places in the States, but with regard to this he might say that it had been previously tried with the result that the tea was bought up cheaply and re-shipped to London.

SIR JOHN MUIR stated that Mr. Lipton had called upon his firm and he would ask Mr. Arthur to state what had passed.

Mr. ARTHUR said that Mr. Lipton described himself to them as the greatest advertiser of tea in America and he had no less than 400 wagons with his advertisements upon them, moving about through the States. One suggestion Mr. Lipton had made was that he should get a commission on every pound of tea he sold for India and Ceylon. The principal tea consuming States were New York, Ohio, and Pennsylvania. The Eastern States would be better supplied from India than from China and he would leave the Western States alone. Mr. Lipton thought that Mr. Blechynden had done excellent work but had made a mistake in placing himself in the hands of one large firm in Chicago and leaving nine others equally good, alone. Messrs. Reid Murdoch & Co., were, however, good dealers, but he thought inducements should be offered to all. The main question to consider was whether India should go hand in hand with Ceylon or work separately.

SIR JOHN MUIR said it was hardly worth while to discuss at the moment whether Indian or Ceylon tea should be pushed, he himself would rather push Indian tea, but the question should be considered as a whole as to which was the best way of raising prices in London, and pushing Indian and Ceylon Tea as against China and Japan. He agreed with Mr

Buchanan as to conciliating all the big distributors and he would be inclined to ask them to render statements of the business they had done during the last three years and then offer an allowance for every 1,000 lb. of Indian and Ceylon Tea sold in excess of the average, the commission only to be, of course, on the increased business.

Mr. ARTHUR said Mr. Lipton agreed with this plan.

Mr. BRUCE asked whether any good would result from having travelling lecturers on the merits of Indian and Ceylon Tea.

Mr. BUCHANAN said he thought not, but he approved of the idea of having natives of India to travel.

Sir JOHN MUIR said America was an enormous market and Canada was a fair one, and he thought they might look for a sale of twenty million lb. by energy and perseverance, and probably this would increase, and this would be a tremendous relief to the London market. The tea of course must be good tea.

Mr. WATSON asked where the funds were to come from for the enterprise proposed. He agreed that both Indian and Ceylon tea should be pushed but there were many proprietors and planters who would not subscribe to push Ceylon tea.

Mr. BUCHANAN thought an arrangement might be made by which both India and Ceylon might pay their respective commissions.

The CHAIRMAN agreed with Mr. Watson as to the jealousy existing between India and Ceylon and there were many planters who would not agree to work jointly.

Mr. ARTHUR thought one advantage of a joint organization would be that it would work cheaply.

Sir JOHN MUIR said that if it were possible to get a meeting of all interested in the trade the reasonableness of the proposals would soon carry conviction to their minds but as this was not practicable he would suggest a detailed report of the proceedings of the present meeting being circulated.

Mr. WATSON thought that the use of a term such as "British grown Tea" without referring to either Indian or Ceylon might solve the difficulty.

Mr. ARTHUR said that Mr. Lipton only wanted a special commission until the trade had been firmly established.

Sir JOHN MUIR suggested two years for the trial of the scheme.

The CHAIRMAN said the principal Companies were in London, and of course, they must be consulted. A reference had already been made to them in connection with further operations by Mr. Blechynden and the collection of new subscriptions.

Mr. ARTHUR suggested a strong recommendation in favor of the scheme going from this meeting to London.

Sir JOHN MUIR was so satisfied that the scheme was a good one that he was prepared to subscribe two annas per acre and half an anna per mound for all the gardens connected with his firm. The disposition in Ceylon generally was to work with India.

Mr. BUCHANAN read the following letter which he had received from the Editor of the *Ceylon Observer*:—

"*Ceylon Observer*" Office, Colombo, 26th Jan. 1894.
My Dear Mr. Buchanan,—I find that there is no chance of our Planters' Association taking the lead in asking co-operation from India, though there is a general acknowledgment and a strong under-current of feeling that the starting of a Ceylon Retail Store in Chicago was a blunder, and a determination, I think, to subsidise no new individual efforts for America, but rather to do general advertising.

I believe, however, that if a proposal came from Calcutta on the basis you mentioned, it would be accepted by the Ceylon Planters' Association. There is too, approval of Lipton as a tea advertiser and dealer in America, and, if he approved of joint action, I think it would carry weight. (He is on his way to Calcutta, I learn).

I think if you saw your way with Sir John Muir to sound the leaders in the Indian Tea Trade and Association, and got them to agree to one big Advertising Fund for America, and suggest or invite Ceylon to join with contributions in proportion to export, the

fund to be administered by a Joint Committee, that success would follow.

The danger is of India and Ceylon going on separately in a peddling way and creating suspicions of each other, in place of uniting forces on behalf of pure clean teas against the "faced," inferior Japan and China 80 millions. In the former case, it means a slow advance over many years; in the latter, a big and rapidly progressive gain.—Yours faithfully,

J. FERGUSON,

Sir JOHN MUIR saw no reason why, with a Joint Committee, India should not pay her own share of the Commission and Ceylon hers.

Mr. ARTHUR said that £50,000 would pay 1 per cent on ten million lb. of Tea.

Mr. DAVENPORT thought that when the consumption reached ten million lb. the subsidy might be stopped.

The CHAIRMAN thought that before any scheme of the kind could be taken up the opinions of Planters and Proprietors should be taken.

Sir JOHN MUIR said he was leaving India on the 5th and he would take an opportunity of meeting Proprietors in London and discussing the matter with them.

The CHAIRMAN said he thought the present meeting was agreed as to the advantages of union.

Mr. BEGG asked in the case of individual companies sending tea direct to large dealers in America whether the commission would have to be paid by the Companies or from the funds which it was proposed to raise.

The CHAIRMAN thought it certainly should be paid from the Special Fund.

Mr. WATSON thought that it should be borne in mind that funds would be required for other expenses besides commissions such as advertising, etc.

Sir JOHN MUIR, however, considered that Mr. Lipton and other agents should advertise themselves.

Mr. WATSON thought that a sum should be guaranteed for advertising purposes in case the sales did not reach a remunerative figure.

Mr. BUCHANAN also thought there ought to be a guarantee.

The CHAIRMAN said that, before the Association could be committed to any thing, they must find out what fund is they would be likely to obtain and he would propose to issue a circular to Agents and Planters soon after Mr. Blechynden's return. He thought they were all agreed as to the advisability of an effort of some kind and would do their best to collect funds.

Mr. WATSON thought that the management of the whole scheme should be vested in a Joint Committee in London representing both India and Ceylon.

Mr. BUCHANAN asked if he might inform the planters in Ceylon of the views expressed at the present meeting and this was agreed to.

Sir JOHN MUIR then thanked the Chairman for the manner in which he and Mr. Buchanan had been met and they would do their best when they arrived in London, to promote the object all had in view.

J. N. STUART, Chairman.

PLANTING NOTES FROM UVA.

Badulla, March 21.

We are having very extraordinary weather for March. The North-East monsoon has returned with renewed vigor and we have been having exceedingly heavy rain storms for the past week. 3.91 being the heaviest fall I have myself gauged. The rains have done a great deal of good to everything, but we have had enough now and I hope we may have a good spell of fine weather before the burst of the little monsoon.

Tea around Badulla is flushing extraordinarily well and the flushes have been very heavy. But around Passara it is hardly so far advanced. The bushes are full of bud and April will be the busiest month in factories Uva has seen yet.

Old coffee is still to the front too. The rains have brought out a very fine blossom indeed on a good coffee, at low and medium elevations. I have seen several fields lately really *white*, in the good old fashioned way. The present will be the best year coffee planters have had for some time. There is a great deal of spike still to come out.

Capital is at last coming into the district, witness the sale of the Tonacombe group to a Company. The wonder is it has not rushed in long ago. The capabilities of Uva in tea are at last being understood and I prophesy the Tonacombe Company will be by no means the last one floated in these districts. There are several rumours of other sales, but nothing definite is known yet.

The death of Mr. John Brown is very sad. There is no one who has been so intimately connected with Uva planting interests during the past twenty years as he has. He will be greatly missed and his place will be very hard to fill.

THE CALEDONIA (CEYLON) TEA PLANTATION, LTD.

We have further news by mail of this Company which has been formed in London with the object of acquiring two tea estates in Ceylon, viz.—Venture in Bogawantalawa and Sellegama in Matale West. These properties have been purchased by the Company for £16,900, the former comprising 427 acres of which 390 are cultivated with tea and the latter 1,030 acres of which 200 odd are in tea; both estates being fully equipped with bungalows, factories, machinery, &c. The capital of the Company is £30,000, divided into 30,000; shares of £1 each. The entire capital, we understand, has been issued—10,000 shares as fully paid up and the balance 20,000 with five shillings paid up thereon, thus leaving £15,000, uncallable liability; 150 debentures of £100 each have also been issued for £15,000, of which 130 are at six per cent for three or five years. Subscriptions at par have been invited.

The Directors of the Company are Sir Græme Elphinstone and Messrs. H. P. Haussen, James Ross and Alexander Ross.

The Company's offices are at Old Broad Street, London.

TEEN-WO-CHANG TEA.

We have received from the importers a very fine specimen of this product of the Ceylon tea fields. It consists of fanings or fine siftings from the best known gardens, and, so far as our experience of it enables us to judge, is not only delicious in flavour, soft to the palate, and of most remarkable strength, but exhibits all the qualities characteristic of the finest teas. The one point which needs to be impressed upon the purchaser is that this tea requires a strainer, as otherwise, the small size of the particles renders them liable to escape from the teapot. We notice that in the parcel submitted to us the importers supply the necessary apparatus for this purpose, free of charge, and, if we are not mistaken, the same arrangement is a fairly accurate measure of the quantity of tea needed to charge the domestic teapot.—*Family Doctor*.

THE SEYCHELLES AND THEIR RESOURCES.

[Mrs. Edwards with her husband will be remembered as a Madulsima resident when she was a contributor to our columns.—*Ed. T.A.*]

Edwards, Mrs., E. H.—Seychelles Archipelago. Pp. 20. Seychelles. 1893.

The Seychelles Archipelago consists of about thirty-three islands, one half of them uninhabited, the remainder being sandy, rocky excrescences, with little or no vegetation thereon, Mahe being the largest and most important of the group, being described

as between twenty and thirty miles in length and about seven miles across in the widest part. Although it is stated to possess a singularly steep and precipitous appearance as viewed from the harbour, Mrs. Edwards states that the luxuriant tropical vegetation, which descends to the water's edge, and its dark, forest-clad heights can but evoke an admiration little short of fascination in the minds of all true lovers of nature. Mrs. Edwards having resided in the islands for a considerable time, is enabled to contribute a considerable amount of information about this little known Colony. Regarding its trade Mrs. Edwards upholds that almost every tropical product would grow if cultivated, but vanilla planting has been the main industry of recent years. Cacao and coffee are grown in small quantities, and cloves are also an article of commerce. Mrs. Edwards has not become impressed with the energy of the Seychelles planters, for she states that, although cinnamon grows wild in profusion, and pepper and nutmegs might be produced to advantage, the average planter is not sufficiently enterprising to embark in new industries or to in any way deviate from the stereotyped paths of his forefathers. Fruits grow abundantly throughout the islands, but carriage and freight are so expensive that it does not pay to export them. The islands are stated to be English but in name, the language, manners, and customs being French; in fact, Mrs. Edwards says, English is taught in the Government-aided schools only as a subject. The various Government and private buildings are described, and the system of Government criticised. Although the work contains a good deal of controversial matter, which it is needless to refer to, it nevertheless gives a graphic description of those islands which were described by the late General Gordon as the "Garden of Eden."—*Journal R. C. Institute*.

JAMAICA COFFEE INDUSTRY.

In reference to this the "West Indian and Commercial Advertiser" has the following admirable remarks:—"Jamaica is an old coffee-producing country and some of its produce from the Blue Mountains ranks as nearly the best in the world. Of late years however, there has been little or no increase in the exports of Jamaica coffee."

Why is this so? We have been assured by a Blue Mountain planter that the difficulties in the way are roads and labour. There are yearly fluctuations in crops depending upon seasons and prices, but the general tendency lately, in spite of good prices, has been towards a smaller production of Jamaica coffee. At a first glance this may have been attributable to a gradual exhaustion of the present estates and to a want of suitable land for opening up new lands. It is true that some of the old estates are becoming less productive than formerly but there are still excellent tracts of land suitable for coffee cultivation in Jamaica, and these only require to be rendered accessible by railways and roads to support a considerable industry. It appears that not only are no new coffee plantations opened in suitable lands in Jamaica, but the labour that might be employed upon them is being attracted from the island for service on the coffee plantations of Guatemala.

Whatever may be said of the quality and fertility of the land suitable for coffee on the south side of the Blue Mountain range, it appears that there are far better prospects on the north side. We are informed by Mr. D. Morris, of the Royal Gardens, Kew, that in a lecture delivered before the Institute of Jamaica, on the 17th May, 1881, with the late Hon. Alan Kerr, Senior Puisne Judge, in the chair, he stated:—"With regard to amount of land still available in the island for coffee cultivation, reports from Manchester and St. Ann show that there are thousands of acres of good coffee lands at elevations between 2,000 and 2,500 feet in the Mile Gully Mountains, and on through Clarendon and St. Ann, which might be very advantageously brought under cultivation. In the Blue Mountain districts and on the southern slopes there

are not many tracts unopened, but on the northern slopes there are extensive areas finer and richer than any now cultivated lying in the upper portions of the valleys of the Rio Grande, Switand Spanish Rivers. These tracts are estimated at from 60,000 to 100,000 acres, and consist almost entirely of untouched virgin forest."

Whilst the coffee production in Jamaica is on the decline, we read that, in spite of the great difficulties experienced in Guatemala with regard to labour, it is noticed that the production of coffee has risen from 49 million pounds in 1888 to 75 million pounds in 1892. Of the latter quantity more than 8 million pounds, of the value of £322,000, have been received in the United Kingdom. These facts are of considerable importance to Jamaica, and Mr. Thiselton Dyer is of opinion that the Government of that island would do well at the present time to encourage in every possible way the development of so important an industry. Surely some of the spare capital of this country would be better employed in coffee growing in our Western colonies than in loans to South American Republics!—*Jamaica Post.*

CEYLON AND INDIAN TEA IN AMERICA.

The *Pioneer*—the leading Indian Journal—has an editorial on this subject from which we quote as follows:—

The Indian planter seem willing to bear their share and also to work in harmony with their Ceylon brethren, the great aim of both being to relieve the London market, which is at times gutted with tea causing a serious fall in prices. In opening out a new country there are always difficulties to be overcome in the matter of the local agencies to be employed in the sale and distribution of the goods introduced, and these have occurred in the case of America. To give one or even two firms a monopoly is to invite opposition from all the rest, and yet at the outset some particular house must be employed to ensure the trade being pushed. It is for the Indian and Ceylon Associations to decide by the light of experience how this difficulty can be best overcome, and we have no doubt they will find a way out of it. They also have to guard against inferior or spurious blends being sold, as the high reputation of Indian tea of purity and strength must be maintained at all costs. One plan which was put forward to secure large sales proved a complete failure. This was the institution of tea-auctions in various parts of the States. The cute traders of America soon saw a way to making large profits: they bought up the tea cheaply, and re-shipped it to the London market where it could be sold at a higher price. There seems no reason why Indian tea should not supplant the growth of China and Japan at least in the Eastern States; and the action now being taken, namely, co-operation between Indian, Ceylon and London proprietors, with a view to forming a Joint Committee to control future operations, should soon bear fruit. It may be noted that the exports of tea from India to America for the 11 months ending on February 25th were over 266,000lb. as compared with only 83,000 in the similar period of 1893 and 183,000lb in 1892. These figures are very small considering that Australia and New Zealand take over six million pounds a year.

SELANGOR AND IRELAND AND COFFEE.

It is proposed to plant Liberian coffee on a considerable scale at Klang in Selangor. But the planters who propose to begin work in the low-lying grounds fear that persons who may afterwards plant above them may so drain the upper land on to the lower land as to flood it. It is therefore urged that the Government shall adopt a drainage policy in that district similar to the drainage policy that exists in various agricultural counties in Ireland. That is to say, the Government is asked to undertake the drainage at the cost of the planters, dividing the cost fairly among all the persons who may plant

there, and seeing that the one planter does not suffer by the drainage from the land above him. It is understood that the Selangor Government would be favourable to such a proposal but that it is not approved at the Colonial Secretariat in Singapore. It is therefore intended that the matter shall be placed before H. E. Sir Charles Mitchell, with the intention of obtaining his decision as to whether such a land and drainage policy should be entered upon. It is said that various persons have proposed to embark considerable sums of money in Liberian coffee cultivation at Klang if the Government will adopt the proposed drainage scheme. It may be added that the gentleman who propounds the scheme is at once a planter and a Celt. As a pioneer and now successful planter, he brings a ripe Malayan experience. As a son of Ireland, he adds the true Milesian belief that the Government must help and that the land laws must be reformed.—*Straits Times.*

‘JOHN GAVIN, PLANTER AND MERCHANT.’

Referring to the extracts which were given in the *Ceylon Observer* from the Memoir published in this number, a correspondent writes:—

If John Gavin landed in Ceylon on July 4th, 1843, then his earliest coffee planting experience must have been gained on Galoya. When Mr. William Rudd gave over charge of the Galoya estate to "Bob Swan" (the brother of James Swan the proprietor) on August 8th, 1843, John Gavin went with the new Superintendent as his *Sinne Durai*, and drew a salary of £7 a month. He worked as Swan's assistant till September 1844, by which time his salary had risen to £8 6s 8d. He then left Galoya for Moorootie in Dolosbage, but he certainly did not have charge of Galoya any time in 1843 or 1844. Mr. Ellis succeeded him as assistant on Galoya, but did not remain long.

JOHORE.

On the 8th, the first of the Muhammadan Fast month, a copious fall of rain occurred after a long tack of dry weather such as we have not had for the past 17 years. Gambier and pepper, being the staple cultivated, were beginning to suffer.—*Cor.*

COFFEE DRINKING IN ENGLAND IN THE EIGHTEENTH CENTURY.—*Temple Bar* for March contains a paper on William Stulkeley, a Lincolnshire antiquary, in which we are told that among fifty other things he loved to illustrate the changes in social life:—

His notes on coffee-drinking would furnish some material for a new edition of Mr. Robinson's little volume on coffee-houses. Sir Christopher Wren and Robert Hooke, the professor of geometry, were "great drinkers of coffee. Dr. Gale drank 2 dishes twice a day. Mrs. Behen drank it much." These were great testimonies in its favour, but more conclusive still was the anecdote of the "Clergyman in Kent" who confessed to have taken it for forty years, without ill effects—an instance of the slowness of its application as a poison, which might rank with the still more celebrated case of Fontenelle. Dr. Barrow introduced this seductive drink to the notice of the dons at Cambridge. Stulkeley's own grandfather was "the encourager of the first coffee-house in Stamford." About 1698 "my mor. had her first set of the equipage. Chocolate drank before then." The introduction of snuff he attributes to Charles II., whom he also credits with the paternity of wigs. To ease this titillating dust "they first used a cocoa shell with a brass nozzle to drop a pinch out upon their hand from whence they snuffed it." Wigs were the curse to of his existence. At last, in January 1725, he resolved to leave them off and wear his own hair. He carried out his resolve, but it "ended in my leaving the town."

Correspondence.

To the Editor.

MR. GRIDLINTON AS AGENT FOR CEYLON
AND INDIAN TEA IN AMERICA.

Gammadua, Rattot, March 17th.

DEAR SIR,—In replying to an enquiry from the Editor of the "Times of Ceylon" my opinion on "how to capture the American market with our teas," the following is a copy of a letter addressed to the Editor, which you may have something to say regarding:—

I think the Indian planters show their good sense by coming forward and asking to be allowed to join us in this American Campaign. Had they not done so I don't think the Ceylon planters would have asked their help. Now they have come forward through their representative Sir John Muir the suggestion deserves the serious consideration of the Ceylon planters at their meeting next month in Nuwara Eliya. Hitherto I have held the opinion that Ceylon should try and capture this market without the aid of India, but with the export duty producing only £5,000, so little can be done, with that amount in the way of advertising, unless in the hands of one like Lipton, that Sir John Muir's proposal has in a way captured my vote on certain conditions. These are:—

1st. That Mr. Gridlinton's Bounty scheme be abandoned.

2nd. That Mr. Gridlinton be appointed if he will accept the post of Commissioner representing the Ceylon and Indian planters for spreading a knowledge of British-grown teas throughout America.

3rd. To enable him to do this he receive a salary of £2,500 a year for 3 years with £500 extra for a private secretary.

4th. That Mr. Gridlinton have full control of the expenditure of the balance of the money collected by the Ceylon Government from the Tea Export duty, and of the £7,000 per annum contributed by the Indian Associations. This amount being guaranteed by * * * gentlemen in India.

5th. That a Sub-Committee be appointed consisting of Ceylon and Indian planters or representatives of the latter resident in Ceylon, for receiving from the Ceylon Government and Indian Planters the funds to be forwarded to and in such sums as may be required by Mr. Gridlinton.

6th. That Mr. Gridlinton furnish the Sub-Committee with a monthly statement of the work accomplished.

7th. That these reports be laid before the Ceylon and Indian Planters' Associations.

If India and Ceylon planters agree to blending their interests in this way (and I see no reason why they should not) Mr. Gridlinton is the man if he will agree to act in the interest of British-grown teas.—Yours, &c., J. W.

CEYLON TEA IN AMERICA.

Dimbula, March 21.

DEAR SIR,—In your leader of the 19th inst., (see page 652) you state that the average Ceylon planter will have nothing to do with his brother planter in India, and can give no reason like Dr. Fell's proverbial pupil; this in reference to "tea pushing." Now answering for myself and those of my way of thinking there is a good and sufficient reason for not joining our planting friends of India. Our

teas are quite distinct and differ from the Indian,—so experts have always held,—and it stands to reason that this is, and always will be so, from the difference of soil and climate between the tea growers of India and Ceylon.

This being so, the necessity of keeping our name and teas separate—in "pushing" in new fields is obvious.

Much has been written on how to capture "America as a customer for our tea" but little has come of a really practical nature, and not a few absurd ideas are about:—ye, I would not go so far as one of your correspondents who propounded the idea that the gods were likely maddening us—preparatory to our destruction!

The "Bounty" Scheme is wrong on the face of it, unworkable. So of some others. The "Chicago Show" has been a great success as a Show, thanks to our Commissioner's great exertions, and the lumps of money spent. At the same time it would not be surprising, if the results may be all but—BARREN for want of being followed up.

It was but a show, and will soon be forgotten. Of the multitude who tasted our tea, probably few were in the tea trade, and the mass would but take a thirsty interest in the article, at the moment. With so many distracting surroundings, could it be otherwise?

It was lately laid before us by one of your best correspondents that the American trader has strict ideas on business, that part of his creed is, that "there is no d—d sentiment in business," so our unparalleled show of Sinhaless and other products may have had but small effect on his obdurate soul?

The idea of asking our Commissioner to go back to America again, even for Ceylon alone, is absurd. The next move should be hard business—without a show. Lime-lighted lectures and that sort of things won't catch the Yankee; he is a past master in the arts of "blarney" and "bunkum"

No our Commissioner has done his level best: let him be rewarded with a title for his great exertions, trouble him no more, but let him rest in peace with well-won honours.

What is to be done? Advertise—easy some; yes, but it is of no use, till you have stocks of the article on hand, or it would not be unlike a Costermonger bawling over an empty barrow.

I believe, with many others from what I have heard and experienced of America that our tea cannot be placed there but by means of the legitimate tea trader there. The trade must be induced to take us up. This would be best done by one of themselves in our employ. He should be an expert in teas of all sorts. A man with a good business connexion—just a good "drummer"—well supplied with samples of trial shipments of good serviceable teas—(not stuff unfit for human food, as was said to be the case with Ceylon tea condemned at Melbourne lately (?). This should have been traced and the wrongdoer publicly denounced)—not too fine teas but fair samples of what this country can supply.

Who is to furnish these trial shipments? Just yourselves, planters!

All paying estates can afford the trifling risk.

I have been engaged in sending tea to America for my employers, made and sorted to order. The results were fairly good for a beginning, and as things have gone it was a mistake not to have followed the opening up and continued the business. I refer to some years back. When a start is being made, then advertise and keep it up. Flood the places where you start with all the tea literature issued from the Ceylon Observer press. If you don't try this plan, "waken snakes" and expel "caru-

lean demons"—Let Brother Jonathan stick to his Japanese green muck, bad rotten coffee, "40 rod pumpkin whiskey," and other abominations!

There are thousands on thousands of people of British birth in America, who have tasted and used black tea, and who will find our teas an improvement on the dirty China stuff. A Committee of select business men here and another in London—a *sine qua non*—would deftly and well arrange the matter, were tea forthcoming.

Much might be done by individual effort, but UNION IS STRENGTH.

All traders of the "Cheap John" style ought to be avoided like "pisin." "They fecht only for their ain han"—"au' are at best but doofu' tae deal wi."

Nothing may be of an original nature in the above remarks, but at least I re-echo the idea of the average planter. Eh?—Yours faithfully,

SENEX.

VARIOUS AGRICULTURAL NOTES.

THE INDIAN GOVERNMENT QUININE-SALES.—Last year the Indian Government disposed of nearly a million and a half doses of quinine at the post-offices of the country.—*Chemist and Druggist*.

A WYNAAD CORRESPONDENT of the *I. P. G.*, says leaf disease is very prevalent in the district. The cinchona are being cut down on every estate, as all the disease of the coffee trees has been attributed to the cinchona.—*Nilgiri News*.

COFFEE.—The *Sourabaya Courant* gives particulars of a trade in coffee between Java and Japan. A couple of months ago, a firm at that port sent a few cwt. of the article as a trial shipment to Yokohama. In Japan, the coffee won high praise and fetched good prices. The result is that a demand has sprung up there for Java coffee.—*Madras Mail*.

ROYAL GARDENS, KEW: BULLETIN of Miscellaneous Information for March. Contents.—Sugar-Cane Disease in Old World. S minimal Variation in the Sugar-Cane. Improvement of Sugar-Cane by Chemical Selection of Seed-Canes. Guzerat Rape. Agriculture in British Honduras. Decades Kewensea. VIII. Artificial Production of Citric Acid. Miscellaneous Notes.

NICARAGUA RUBBER METHODS.—One method used by the rubber hunters is to scrape off the outer bark of the trees with a "machete," commencing 8 or 10 feet above and extending down to within 1 or 2 feet of the ground. Clay alone, or a vine and clay, is placed around the tree, inclined, so as to form a ridge about 2 inches high on the lower edge of the scraped or bark-removed part of the tree. The inclination of this guard is made sufficient to direct the rapidly-flowing milk or emulsion into the receivers at the foot of the tree.—*Trades Journal*.

ROAST COFFEE, as suggested by Mr. Elliot in a Madras contemporary, would, we think, be an excellent branch for a clever planter or enterprising firm to take up. Of course the bottling idea would have to be given up on the score of expense but doing the ground coffee up in half or one pound lead packets would surely be feasible and would, we are certain, command a huge success. How extremely difficult it is to secure a good cup of coffee anywhere in India or elsewhere, everyone knows. Indeed it is such a feat to roast the coffee one self, that even here in Ooty, in the heart of the coffee districts, abominable preparations of chicory and ground beans secure a great and increasing sale. Surely pure ground coffee selling at B1-4 per lb. would command as great a success in the open market as the packet teas do now.—*South of India Observer*.

TEA IN RUSSIA.—The Czar is said to be much interested in the proposal to cultivate tea in Russia. His Majesty has cordially seconded the attempt to cultivate the plant in the western limits of the Caucasus, where the temperature is stated to be much the same as that under which the plant grows in China. More than one consignment of shrubs has already arrived from China.—*L. and C. Express*.

WRITING OF NILGIRI TEA the Ooty correspondent of the *Planter* gives the following as the opinion of an old Assam man as the principal reasons which led to the gain and final loss of the old Nilgiri tea flavour, "At first Nilgiri tea was decidedly common, much as it is now, then early in 1871, Assam methods were introduced with great success, then after a few years, the old ignorant way was again resumed, with the present miserable low average that rules for Nilgiri teas. Now again Assam manufacture is being taken up, and generally speaking, with very great success. In a few years we shall probably see the Nilgiris once more famed for their unique bouquet. May it not be quite so evanescent as it was formerly! All the Blue Mountains can now boast of in the way of a distinctive flavour is 'burnt.'"—*Nilgiri News*.

THE MAGAZINE
OF
THE SCHOOL OF AGRICULTURE,
COLOMBO.

Added as a Supplement monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Magazine of the School of Agriculture* for April:—

Vol. V.]

APRIL, 1894.

[No. 10.]

SOURCES OF GAIN AND LOSS TO
THE SOIL.

It is of paramount importance to the cultivator of the soil that he should have a clear idea in his mind of the sources of gain and loss to the soil he cultivates, and

what ingredients of plant food are derived or lost through those sources, so that he may thereby be in a position to devise and adopt measures which may as far as possible enable him to help the soil to gain and not to lose the elements of fertility.

The sources of gain may be classified under various heads:—

1. There is the land itself which yields available plant food under the action of the natural weathering agents. These agents—the atmospheric, thermometric, chemical and animal agents—aid in the decomposition of rocks and minerals, and enable them to yield soluble plant food. Again the land itself is made to supply valuable substances under the influence of various artificial mechanical means generally spoken of as "tillage," as well as from the result of such operations as draining, liming, irrigation and the like.

2. The atmosphere is a source of plant food which mainly reaches the soil in conjunction with rain. By means of its moisture as rain and dew is also supplied to crops.

The atmosphere primarily consists of two gases, but intermixed with them are various other substances, such as carbonic acid gas, ammonia, the chlorides, sulphates and nitrates

of sodium, calcium, and ammonium, and certain solid impurities as dust and soot. The most important derivatives from the atmosphere are the compounds of nitrogen, the origin of which, however, cannot be conveniently considered here.

3. Another source of gain is the residue of plants and crops which finally yield nitrogen, potash and phosphoric acid.

4. There is a special source of nitrogen which has only of late years been recognised. This is the elaboration of nitrogen compounds from the free nitrogen of the atmosphere, by means of the bacterioids contained in the root tubercles of certain leguminous and other plants.

5. The application of manures (natural and artificial fertilizers) such as cattle manure, guano, chemical compounds, waste products and green manures, directly increase the fertility of the soil.

The sources of loss, on the other hand, are as far as can be ascertained:—

1. Evaporation of water from the soil, and transpiration of water vapour by the leaves of plants and trees.

2. Wash and drainage cause the loss of water and other ingredients which are carried away in suspension and solution. The chief and most serious loss by these means is, however, that of the nitrates, which owing to their solubility are easily carried off in solution. Ordinary soils, with a fair admixture of clay (which has a retentive power for these substances) do not suffer any appreciable loss of phosphoric acid and potash by means of drainage.

2. The removal in various ways of what is produced in the land is manifestly a source of loss to the soil, which has to be made good by the cultivator.

3. Lastly, neglect on the part of the cultivator to aid the action of the natural forces, or to employ artificial agencies which have an ameliorating influence will of course tend to impoverish the soil by withholding the means by which it may be enriched.

OCCASIONAL NOTES.

A maund of Jute seed, received from Calcutta, has been distributed among the agricultural instructors for experimental cultivation in their gardens.

The seeds of Ramle (*guizotia oleifera*) from the crop raised at the School is being kept for a second sowing. It is intended at the next seeding to supply instructors with small quantities for trial.

Ground-nuts suitable for planting are not easy to get in the Colombo markets. Locally procured seeds have been lately sown at the School, but their germination is unsatisfactory; it has therefore been decided to export fresh seed from India. Some years ago Mr. A. W. Jayawardene, late headmaster of the School, planted out a fairly large piece of land with the nut, and with excellent results. Of late we have had enquiries as to where seed nuts could be obtained.

The Government dairy was declared a free area (from the infection of cattle disease) on the 17th March, on which date it recommenced to supply milk.

Mr. W. A. de Silva, who has been studying Veterinary Science at the Bombay College, goes up for his final examination this month. Mr. de Silva has had a successful career at Bombay, and provided he satisfies his examiners, he will be back at the School in May next.

We heartily welcome back to the Island Mr. H. W. Green, through whose instrumentality the School of Agriculture was founded. Mr. Green is reported to have greatly benefited by his visit to England which his poor state of health necessitated.

ORIGINAL SOURCES OF COMBINED NITROGEN.

It is now generally accepted that plants are unable to utilize by means of their leaves the pure nitrogen gas which constitutes about 79 per cent of the atmosphere. At one time it was thought that plants were able to do so, and it was even said that certain Continental experiments went to prove this to be a fact; but later investigations have shown that plants cannot assimilate the free nitrogen of the atmosphere. The two main sources of nitrogen to the plant are the organic nitrogen in the soil, and the nitrogenous compounds that are washed into it from the atmosphere by rain (no account is here taken of the small quantities absorbed directly by plant or soil, chiefly as ammonia). The combined nitrogen from the two abovementioned sources are taken into plants by means of their roots, after having undergone nitrification,—that is, converted into nitrates—by the nitrifying germs present in the soil. The organic nitrogen in soils is of course traceable to the organic matter contained in them—from whatever source derived. The combined nitrogen in the atmosphere is on the other

hand traceable to two sources:—(1) To organic (vegetable or animal) matter, which liberates ammonia during decay and combustion (the ammonia which is given off being eventually oxidised in the atmosphere, into nitric acid); (2) to an original source of combined nitrogen, whereby the combined nitrogen is formed from its elements in the atmosphere. Warrington thus refers to this latter source: "The nitrogen, and oxygen of the atmosphere combine under the influence of electric discharges, nitrous acid being formed; this is converted into nitric acid by the action of ozone or peroxide of hydrogen. This formation of nitric acid in the atmosphere is the only original source of combined nitrogen on our globe, the existence of which has been placed beyond dispute." The extent to which combined nitrogen would be formed by this means is thus evidently dependent on the degree of electric disturbance in the atmosphere; and the recognition of this fact may account for the supplies of nitrogen which are secured by crops in tropical countries where electric disturbance is so common an experience. The statement made by Warrington that the formation of nitrogen compounds from their elements under the influence of electric discharges is the *only* original source of combined nitrogen would now have to be modified; for within the last few years, a new original source of combined nitrogen has been discovered, viz., that resulting from the action of the bacterioids in the root-tubercles of certain leguminous and other plants. There are thus two original sources of combined nitrogen. The first-mentioned depends on natural causes which are practically beyond human control; for though it may be possible to artificially create electric disturbance in the atmosphere, it is hardly practicable to adopt this means with a view to benefit crops on a prescribed area. But the formation of nitrogen compounds in the soil itself, through the agency of certain plants, is a possibility which it behoves the cultivator to take good note of and to endeavour to realize in his agricultural practice.

NOTES FROM THE NORTH.

15. The Jaffna cultivators do not believe in having all their eggs in one basket. The failure of the paddy crops cannot be an uncommon occurrence in a place where they have to depend for the water solely on pluvial irrigation which so often provides only a very scanty supply; and the people are too well aware of this fact to be remiss in growing a good stock of other food crops by way of providing against such a contingency. The fine grains such as "kurakkan" (*Eleusine corocana*), "Varagu" (*Panicum miliaceum*), "Thinai" (*Panicum italicum*), Shami (*Panicum miliare*) and various kinds of yams, roots, beans and pulses are freely grown; and a valuable addition to the food supply is afforded by the groves of plantain and banana trees which are grown in separate enclosures with perhaps one or two pumpkin creepers here and there.

16. The poorer classes of the rustic population of the North are a hard-working, healthy, robust and contented set. "Man wants but

little" seems to be their motto, and their paternal acres supply them with almost all they require in the shape of food. They relish the coarser kinds of field and garden products which their more-refined fellow countrymen in the town would look down upon as unfit for human consumption or would only take by way of variety.

17. Dead fences are very rarely, if ever, used in Jaffna. The advantages of live fences which are so common there are by no means to be undervalued. They are useful in different ways. Not only are the leaves sometimes used as manure, but they yield browse for feeding cattle and afford a certain amount of shade and shelter which come as a boon in a dry climate such as that of Jaffna. Again, the cost of effecting constant repairs which has invariably to be incurred in the case of dead fences is to a great extent dispensed with when the gardens are enclosed with live fences; and much annoyance, not to say loss, that would otherwise be caused by trespasses of cattle &c. is, moreover, saved.

18. The arboriculture of Jaffna deserves a word in these notes. There is, indeed, little or no spare land in the Peninsula where any attempt at afforestation can be made even on a small scale. The trees grown along the road side and in the public places are, however, worthy of notice; and the memory of Mr. Dyke, the first Government Agent of Jaffna, has been immortalized by the numerous trees he has planted, and his example has been followed up by his worthy successors. Besides the ordinary shade and ornamental trees, *Inga saman* and *Poinciana regia* (flamboyant), there are the valuable timber trees teak (*Tectona grandis*) and mahogany (*Swietenia mahogani*) which thrive luxuriantly in the market enclosures at Nellore, Chavakachcheri, Chunnakam, &c. Some satinwood trees (*Chloroxylon swietenia*) near the Kachcheri also seem to be doing well. The "sooriya" tree (*Thespesia populnea*) which yields a tough useful wood thrives well along the sea beach where few other trees would grow.

The margosa (*Azadirachta indica*) and the "illupei" or "meegaha" (*Bassia longifolia*) which are so common all over the North are very useful not merely on account of their timber, but more for the seeds from which valuable oil is obtained. It is interesting to watch the little urchins get up at daybreak and gather the margosa fruit, which has dropped on the ground over night. The fruit thus collected is washed, pulped, and the seed dried and stowed away for extracting the oil which is only used for the lamp and in medicine, its strong bitter taste precluding its use for culinary purposes. Unlike the margosa oil, however, that obtained from the illupei seed is greatly in request for the preparation of food, &c., besides being used for burning purposes.

19. As one travels along the central road through the Peninsula, he can see palmyrah trees mercilessly stripped of the sheath-ends of the old stalks. Many of the young palms have been done to death by this system of obtaining the fibre, the trunk being laid bare almost to the very summit of the crown. While the fibre trade is likely to be always a very profitable concern when discreetly carried on, there is

cause for serious apprehension that it will prove destructive to the useful palms and therefore suicidal to the industry when the gathering of fibre is done in this reckless manner, almost amounting to spoliation. The crown of a palm contains, so to speak, the very life blood of the tree, and the death of so many palmyrah palms of late has only too clearly shown how risky it is to divest it of its natural protection.

20. I must not bring these notes to a close without saying a word about paddy cultivation as I saw it at Aauradhapura when I made a short stay there some time back during a journey by the central road. I was agreeably surprised to see seedlings being planted out in the tract of field adjoining the Isuru-muni temple and under the tank called Tissa Wewa. Women chiefly took part in this work, their supple bodies enabling them to do it much more easily than the men who were employed in digging out the seedlings from the nursery by means of mamoties, and in doing other work deemed more congenial to them.

The Wannu with its vast acreages under large tanks affords immense scope for enterprising capitalists for paddy cultivation. I have heard that a large ancient tank at Kanukkeni in the Mullaitivu district will be soon restored by Government, and that when the restoration is completed there is every prospect of Mullaitivu becoming the granary of the North. What might not a good irrigation system coupled with improved cultivation effect in the raising of paddy!

E. T. HOOLE.

THE POONA FARM.

In the Poona Farm last year various fodder crops were grown with the object of showing their comparative outturn, cost of cultivation, and value of produce. This year the further steps have been taken (1) of practically testing their feeding value, and (2) of studying various leguminous crops to be grown in rotation with cereal fodder crops. To the fodder crop tested last year were added maize, oats, two local varieties of jowari (*sorghum vulgare*), viz., *nilva* and *shalu*, and a foreign variety, *imphi* (*S. saccharatum*). Oats and *imphi* were damaged by excessive rain. In point of merit, as adjudged by the amount of wastage in feeding, the crops are placed as follows:—1, guinea grass; 2, sunthia jowari; 3, shalu jowari; 4, nilva jowari. There was much wastage in Reana luxurians owing to its coarse fibrous stalks, and still more in maize. Lucerne showed its already marked liability to disease; even when grown on the ridge and furrow system, it was not safeguarded. Sulphate of copper in solution with lime, had no effect in checking the disease. It has been again proved that the partiality shown by local cultivators to this crop is due to its high price and large yield in favourable seasons. Incidentally a result which may prove itself important was secured. A badly-diseased patch of lucerne was interplanted with guinea grass. The lucerne recovered and grew well. This mixed crop corresponds somewhat to the rye grass and clover crop of England—a mixture, that is, of a cereal and leguminous fodder,

No fodder crop of the cereal order, except guinea grass, can be grown, in rotation, and general experience points to the necessity of growing leguminous crops in rotation. On a dairy farm it is, further, an object to secure for the rotation a crop which gives good fodder. The leguminous crops tried were, besides lucerne, already mentioned, *kulthi* (*Dolichos uniflorus*), *val* (*D. lablab*), *chavli* (*D. catiang*), vetches, and sainfoin. Little need be said as regards the last two, both failed; and less need be said as regards *Lathyrus sylvestris*, which was worse than a total failure, for it took up ground which might otherwise have been profitably utilized. The common peas of the locality were also tried unsuccessfully. The other pulses did well. *Val* and *chavli* in good deep soil thrived excellently, and though clearly better fodder than *kulthi*, the coarse stems of which are rejected by milch cattle, they will not grow on light soil as well as *kulthi*. *Kadwal* (or hot-weather irrigated *jowari* of several varieties) was not tried again, the trial of last year proving it inferior to *sundhia*. *Sundhia* is a variety of *jowari* unknown in the Deccan. It is a rain crop, but also thrives well as an irrigated hot weather crop, and though it will not out the local *kadwal*, it seems likely to prove a profitable introduction from Gujarat. Rye was tried in the hope of proving its utility as a source of charcoal for gunpowder, for which the straw is largely used in England. It grew fairly, but instead of sending up straight shoots tillered freely, forming a thick sward. This trial is sufficient to show that, in Poona at all events, it cannot be made useful for the manufacture of gunpowder.

In spite of famine rates for fodder in the early part of the year, the dairy herd on the Poona Farm yielded a very good profit, which would have been much larger had the farm been provided with a grazing area for dry cows and young stock in a locality where they could be fed with greater economy. A suitable area has been selected about six miles off, the possession of which is very desirable. An addition to the herd was made by the purchase of some well-selected Sind cows. They have proved to be docile and very good milkers, with a characteristic type and a breedy appearance. Last year it was noticed that the percentage of butter fat milk was greater in the hot weather than in other seasons. By giving green fodder throughout the year this difference has been greatly decreased. The new industry of dairying has continued to develop. The Bombay agent of the Dairy Supply Company has sold 47 more separators. A large dairy has been started at Hyderabad (Deccan). Some competition with the Dairy Supply Company by other similar companies has arisen. Separated milk now finds a ready demand. Cream separated from milk in Nadiad in Gujarat is largely taken by rail to Bombay to be made into butter, while the separated milk goes by rail in large quantities to Baroda and Ahmedabad. Butter made from Nadiad cream is sent from Bombay as far as Hyderabad. Incidentally an important success in keeping butter for a long period quite sound and fresh was secured. In April last a considerable quantity of butter

was salted with about 4 per cent of good table salt and was packed in earthen-ware jars fitted with close-fitting lids. The intention was to sell this butter to District Officers in the fair season, but in July a sudden demand arose for fresh butter. The salted butter, carefully washed to reduce the percentage of salt with the help of the butter-worker, was found to be perfectly good, and equal to butter freshly made. The number of private dairies has increased, and the Government dairy at Poona, far from acting as a hindrance to private enterprise, has taught a new industry which has already reached dimensions which were unanticipated.

THE AVAILABLE MINERAL PLANT FOOD IN SOILS.

Dr. Dyer's important paper on his researches into this subject, read before the Chemical Society, is being reviewed by Dr. Aikman in the *Scottish Farmer*. The following is the first notice:—

Dr. Dyer begins his paper by pointing out that, while the fact that a soil contains much less phosphoric acid, for example, than is contained in average soils, it is a probable indication that such a soil is in need of phosphatic manure; yet such an indication is not always to be relied on. In many cases the difference in the amount of phosphates contained by two soils is very slight, and yet the one is found by experience to benefit very much by the addition of phosphatic manure, while on the other application of such manure is fraught with little results. The inference, therefore, to be drawn from a consideration of the total amount of phosphoric acid or potash in a soil is seen to be too often practically valueless. Where the analysis of a soil is often found to be of great value, is in determining whether it is likely to be benefited by an application of lime, or whether it is in need of organic matter, &c.

As was pointed out last week, the need of some more discriminating analysis than that in which merely total amounts of ingredients are stated is obvious, if soil analysis is to be of any great service to the farmer. What is wanted is some process for estimating the relative proportions of the fertilising ingredients in a soil immediately available for the plant. It may be said frankly, at once, that an exact estimate of the amount of available mineral food in a soil will in all probability never be attained by chemical analytical processes. Nor does Dr. Dyer claim that his suggested test is an accurate estimate. Its merit consists in its giving a very fair though only a very approximate indication of the amount of available mineral food. Treatment of a soil by dilute acid solutions of the kind Dr. Dyer has experimented with can only, even at best, indicate the amount available at the time of testing; but as the present writer has pointed out in a work recently published [See "Manures and Manuring," by C. M. Aikman (Wm. Blackwood & Sons), p. 90], thanks to the numberless complicated reactions going on in the soil, this amount of available plant food, it is to be presumed, is constantly being added to.

One method of coming to some conclusion with regard to the soluble plant food in a soil is by analysing the drainage water. To give some idea of the very slight amount of matter in solution in drainage water, it may be mentioned that not more than from '04 to '05 per cent. is usually found in drainage water. Of this amount the most is organic matter. It is obvious that the amount of mineral food in drainage water falls far short of the actual available mineral food. We know well that when either soluble phosphoric acid or potash is added to the soil, they are retained in a very firm way by the soil particles, as is illustrated by the fact that when such soil is treated with water the phosphoric acid or potash is not washed out, as we should expect it to be. Considerations such as these point to the fact that probably much of the available mineral food in a soil is neither very soluble, nor, on the other hand, very insoluble. The point, therefore, to be aimed at, is to use some solvent which will dissolve this available mineral food, and not dissolve anything more than what is available. A weak acid solution is what is wanted, the only difficulty being its strength. This Dr. Dyer ascertained, as we mentioned last week, by carrying out an examination on the acidity of plant-roots. By transplanting this into an equivalent of citric acid, he found that this amounted to a 1 per cent. solution of citric acid.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

Class III. REPTILIA. Among the reptilians respiration is aerial, never by gills; the pulmonary and systemic circulations are always connected together, either within the heart itself, or in its immediate neighbourhood; the blood is cold; the skull has one condyle; the integumentary covering is in the form of scales or plates and never in the form of feathers.

The class includes four living orders and five extinct orders. The living orders are

1. Chelonia (Tortoises and turtles).
2. Ophidia (Snakes).
3. Lacertilia (Lizards).
4. Crocodilia (Crocodiles and alligators).

The Chelonians are conveniently divided into groups according as the limbs are adapted for swimming, for progression, or for an amphibious life. The aquatic forms are well known as turtles, distinguished by having the carapace depressed, and the limbs converted into oar-like flippers with which the animal swims. The two most important of the turtles are the edible turtle and the hawk's bill turtle. The former is much used as a delicacy, and the latter is of commercial value for the horny scales which cover the carapace, and which are largely employed for ornamental purposes under the name of "tortoise-shell." The land tortoises have a rounded and convex carapace with distinct toes furnished with short claws. The best known species is the *testudo græca* which is sometimes kept as a domestic pet.

The pond and river tortoises are furnished with webbed feet, and lead a semi-aquatic life.

The latter have the carapace covered with a leathery skin, without horny scales, and are often called "soft tortoises."

The order Ophidia includes most of the animals which would commonly be called snakes or serpents. They are generally distinguished as poisonous and non-poisonous. In the harmless snakes the teeth are solid and are arranged in rows in both jaws and on the palate. In the poisonous snakes, on the other hand, the upper jaws are usually destitute of the ordinary solid teeth, but carry a pair of long curved "poison-fangs." These fangs are pointed backwards when not in use, but they can be erected at will, by muscular action, the moment the animal wishes to bite. Each fang is hollow, and is perforated by a fine tube or canal opening by a distinct aperture at the point of the fang. The canal communicates with a gland placed under and behind the eye, which secretes the poison.

Of the members of the class Lacertilia, the house and garden lizards and the iguanas are very familiar. The lizards are distinguished from the crocodiles in not having their teeth implanted in distinct sockets, and by the fact that the skin develops horny scales, but never bony plates. The crocodilia include the crocodiles and alligators or kaimans. They are the largest of existing reptiles, and are dangerous and voracious creatures.

Class IV. AVES. In birds, respiration is aerial; the lungs are connected with air sacs scattered through various parts of the body, serving alike to reduce the specific gravity of the body and to assist in the aeration of the blood; the blood is warm; the integumentary covering is in the form of feathers; the forelimbs are converted into wings; the females are oviparous; and the skull has one condyle. The skeleton of the bird exhibits some points of peculiar interest. The breast bone in all birds which fly is furnished with a prominent ridge or keel to which are attached the muscles which move the wings: in birds which do not fly there is no keel upon the breast bone. The furculum, or "merry thought," is a V-shaped bone which keeps the wings at the proper distance from each other, and which is really composed of the united collar-bones or clavicles. The digits in the bird are reduced to a rudimentary thumb and two fingers. There are no teeth in birds and the jaws are sheathed in bone constituting the beak. The tongue is usually horny but sometimes fleshy as in parrots. The gullet is usually dilated in the lower part of the neck into a pouch called the "crop." From the crop the food passes into the "proventriculus" or true digesting stomach, which opens into a muscular cavity called the "gizzard" which finally leads to the intestines. The grinding action of the gizzard is assisted by the gravel and small pebbles which many birds are in the habit of swallowing. The form of the eyes is maintained by a circle of bony plates; in addition to the ordinary eyelids there is a third membranous lid (the *membrana nictitans*) placed on the inner side of the eye and which can be drawn over the front of the eye like a curtain.

The class aves is divided into the following seven living orders:—

1. *Natatores* or swimming birds.
2. *Grallatores* or wading "
3. *Cursores* or running "
4. *Rasores* or scratching "
5. *Scansores* or climbing "
6. *Insesores* or perching "
7. *Raptores* or birds of prey.

THE JUTE PLANT.

No less than six species of the genus (order Tiliaceæ) to which the plants that yield jute belong are found occurring in Ceylon, viz., *Corchorus capsularis*, *C. olitorius*, *C. uticafolius*, *C. fascicularis*, *C. tridens*, and *C. acutangulus*. *C. capsularis* and *C. corchoru* are the two species of this genus which are systematically cultivated for the production of jute fibre.

Soil.—Jute seems to be capable of cultivation on almost any kind of soil. It is least successful and least profitable, however, upon laterite and open gravelly soils, and most productive upon a loamy soil or rich clay and sand.

Climate.—A hot climate in which there is not too much actual rain, especially in the early part of the season, is the most advantageous; but exceptionally dry seasons are unfavourable.

Preparation of the Land.—Frequent ploughings or thorough digging up of the soil is necessary; all clods are then broken and pulverized, and finally the weeds are collected, dried and burnt.

Seed.—Under ordinary circumstances of cultivation a few plants from the growing crop are set apart for seed in a corner of the field, and the seeds from these are sown broadcast for the next crop. The sowing season, according to the nature and position of the soil, extends from the middle of March to the end of June.

Harvest.—The harvest of course depends upon the date of sowing, and commencing with earliest crop about the end of June extends to the beginning of October. The crop is considered to be in season whenever flowers appear and past season with fruits. The fibre of the plants that have not flowered is weaker and that from fruited plants is stronger than the fibre from flowering plants; but the stronger fibre of the fruited plants is coarse and without gloss.

The average crop per acre of fibre is a little over 15 maunds, but the field varies considerably, being as high as 30 to 36 and as low as 3, 6 or 9 maunds—depending on district and season. When the plants are fit, being then from 3 to 12 feet high, they are cut down close to the roots, when the tops are clipped off, and fifty or a hundred are tied together. Several of these bundles are placed in water with pressure above to cause them to sink. Sometimes the bundles are stacked for 2 or 3 days before immersion in water to give time for the decay of the leaves, but this is said to discolour the fibre. The period of immersion varies according to the kind of fibre, nature of water and condition of atmosphere from 2 to 25 days, but generally lasts from 8 to 10 days. It is most important that the immersion should not be overdone, and for this reason the jute bundles

must be examined daily and tried with the nail to see if the bark has begun to separate from the stem. If the proper time for removal be exceeded there is danger of the fibre rotting and becoming almost useless. When the proper time for removing the bundles arrives, the "retting" is completed generally by removing small portions of bark from the root end and stripping off the entire fibre. Washing is done by dashing the fibre on the water and drawing it forwards. Finally, the fibre is spread on the surface of the water and any blackened patches picked out by hand. Besides the gunny bags made from the fibrous part or bark, the stem of the plant is used for charcoal, for gunpowder, for fences, basket work and fuel.

C. olitorius requires longer steeping, generally a fortnight or three weeks for maceration. The fibre is used for bags, coarse cloth, cordage for agricultural purposes and for boats, and even for paper. The leaves and tender shoots of the plant are eaten.

GENERAL ITEMS.

The Director, Gardens and Forest Department, Straits Settlements, impresses on planters the importance of "turning down" in pepper cultivation. He recommends that when the pepper gets to the top of the post it should be bent down to the bottom and allowed to start again. Three times, he says, must this be done before the pepper is expected to yield heavily, otherwise it is skinny and wretched.

The better qualities of pepper were being sold in Mincing Lane last January for 2½d. and 2½d. This, it is said, is an extremely low price for black pepper of good quality, free from dust, but the market is reported as "depressed beyond former precedent by the very large stocks held in Europe, and by what appears to be an unlimited production in the Straits Settlements." In thus reporting Messrs. W. and D. Harvest remark that it is not very long since that pepper of this quality would have readily fetched in public sales from 5d. to 5½d. per lb.

The properties of ground-nut oil were discovered by a kind of accident in Europe. A large cargo of nuts had arrived at Bremen, and found no purchasers in their natural state, as good for luncheon or dessert; so the importers expressed the oil, and then found market enough. Our table oil is a good deal adulterated with the oil from the ground-nut.

More than thirty years ago the Governor of Gambia, West Africa, writing on the culture of the ground-nut in that Colony, urged the importance of the natives not confining their cultivation to this product alone. "The reflection," (that the nut may become a drug in the market) he says "is a very serious one to one who studies the interests of the colony, and difficult to remedy unless Providence in its mercy supplies some hitherto unknown or unappreciated article of commerce to supply the place of this little oleaginous nut, which has for the last twenty years brought all the blessings

of comfort, healthful occupation, industrious habits and civilization, in the place of wars, famine and slave trade of the interior.

Simmonds places *Penicillaria spicata* (kambu) at the head of the list of millets, being considerably more nutritious as compared with rice. Next in order of importance comes *sorghum vulgare* (Jowari), and at the bottom of the list comes *cleusine coracana* (kurakkan or ragee).

The following figures show how variable is the butter ratio in cows' milk:—

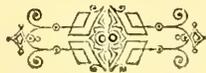

Cow. No.	Milk. lbs. oz.	Butter. lbs. oz.	Butter in oz. per lb.
1	49:13	1:11	.54
2	40:00	2:00	.80
3	32:80	2:40	1.10
4	32:30	2:80	1.17
5	28:40	3:20	1.17
6	36:14	1:10	.70

WATER-SOAKED WOOD.—The problem has puzzled many why two pieces of wood sawn from the same section of tree should possess very varied characteristics when used in different positions. For example, a gate post will be found to decay much faster if the butt end of the tree is uppermost than would be the case if the top were placed in this position. The reason is that the moisture of the atmosphere will permeate the pores of the wood much more rapidly the way the tree grows than it would if in the opposite direction. Microscopical examination proves that the pores invite the ascent of moisture, while they repel its descent. Take the familiar case of a wooden bucket. Many may have noticed that some of the staves appear to be entirely saturated, while others are apparently quite dry. This arises from the same cause; the dry staves are in the same position in which they grew, while the saturated ones are reversed.

The more a cultivator produces from a given area, the more prosperous will he be. The expenses will not (need not) increase in proportion to the yield. The added expense comes when you increase the area for a given yield. This is entirely true, but not realized by many. As the productiveness of their land has diminished, some have sought a remedy by buying more acres. An increased profit will not come that way. You may add acre to acre as long as you please, and get crops which fetch the

current price, but you will never join the moneyed class. Instead, concentrate labour and manure and get larger yields and grow other crops, and you should be on the road to success. There must be profit with good management if the latter system is adopted. Income and profit are two very different things, and you must make a good profit to join the moneyed class.

The discovery of a new fodder plant is evidently becoming quite the fashion. We have already had the *Lathyrus sylvestris*, tagasaste or tree lucerne, and quite lately the polygonum sachalinense. Here is another:—"Mr. J. F. Duthie, F.L.S., the Director of the Botanical Department, Northern India, is of opinion that during periods of drought in India when there is difficulty of providing fodder for cattle, the sea-side wormwood (*Artemisia maritima*, L.) which he says is to be found plentifully in the Western Himalayas, might be turned to account if introduced in various parts of the Indian Peninsula. Mr. Duthie finds that ponies feed upon this plant in the Himalayas "with relish," and he adds that "other species of *Artemisia* are mentioned as affording good fodder for sheep on the Punjab Himalayas." In localities where hardly any other vegetation exists, the wormwood will thrive and will thus prove invaluable as a fodder plant during periods of great drought and famine. The *Artemisia maritima* is described as a much-branched decumbent, or nearly-erect undershrub belonging to the *Compositae*, more or less covered with close white cotton. It is found in sandy and muddy wastes, generally near the sea, and occupies large tracts of country bordering on the Caspian and Black Seas. It extends round the Mediterranean to Western Europe. It is also found in Western Tibet in salt plains at elevations of about 9,000 to 14,000 feet. Professor A. H. Church, F.R.S., undertook an analysis of a bundle of dry leafy branches of the *Artemisia maritima* that was sent to the Kew Gardens by Mr. Duthie, and he says that although the herbage of wormwood is not so valuable a food for cattle as the ordinary mixed grasses, yet it is thrice as rich in albuminoids as the straw of European cereals, and to any animals not deterred from eating the plant by its somewhat sickly odour, it might prove, under special circumstances, such as those which obtain in barren tracts, of considerable value." [We have *Artemisia vulgaris*, the Sinhalese Wal-kolonda.]

“PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

GABRIEL AND MAURICE WORMS:

CAPITALISTS, PIONEER COFFEE (AND TEA) PLANTERS AND MERCHANTS IN CEYLON—1840-1865.

[For the following concinet and interesting biographical notice we are indebted to a relative of the Messrs. Worms who has also favoured us with the photographs from which the collotypes were printed. We have made considerable additions of our own, chiefly in notes, and an appendix, to this brief biography of two most enterprising pioneer colonists and good men whose departure from Ceylon left blanks, that, in some respect, have never been filled up.—ED. *Tropical Agriculturist.*]

GABRIEL Worms and Maurice Worms were the second and third sons of Benedict Worms of Frankfort-on-Maine, and Janette his wife, eldest sister of the Baron de Rothschild. Gabriel was born on the 2nd of April 1802, and Maurice on 20th July 1805. Their elder brother was the first Baron de Worms who died on 25th October 1882, and was the father of the present Baron de Worms of Milton Park, Surrey, and of Baron Henry de Worms, M.P., Parliamentary Secretary to the Board of Trade 1885-6, and Under-Secretary of State for the Colonies from 1886 to 1892. Maurice Worms was educated in Frankfort and came to England about 1827 and became a member of the London Stock Exchange, where he was very successful; but being extremely fond of travelling, life in London did not suit him. So in 1838 he made a long tour in the United States, Canada, Newfoundland, &c., returning in 1840. In February 1841 he set out for the East, and after visiting India, China, Singapore, Manilla, &c., he finally decided on settling in Ceylon and taking up coffee planting as an occupation. He accordingly bought a considerable

extent of forest land in Pussellawa* and other districts, and gradually established the celebrated Rothschild coffee estate, so well-known throughout the Island. It has been thought that this name was given to the property because the Rothschilds themselves were interested in it. This

* The story current in Ceylon planting circles was that Mr. M. Worms on visiting the Central Province took a great fancy to the forest-clad Pussellawa valley forming part of the "Black Forest" of that district. Learning that it had been allotted for a nominal sum (perhaps 5s. an acre) to Major Murray who was then in England, he wrote to his brother (Mr. Gabriel Worms) instructing him to call on the Major and, if possible, purchase the whole property of 1,200 acres. Mr. Gabriel Worms found Major Murray at his hotel, and at once asked him if he would sell Black Forest, Ceylon, and at what price? "For £5 an acre, paid down" was said to be the immediate reply of the Major who, to his astonishment, found his price at once accepted—so that, as the story runs, he always regretted he had not with equal boldness asked £10 per acre! Whether strictly correct or not, the story has its use in showing the reputation for promptitude in business which characterised the Messrs. Worms. Their names, of course, stood at the highest in the banking, mercantile and planting world in Ceylon, and every body in Colombo knew the merchant as 'everybody upcountry did the planter; but, on one occasion, a young mercantile assistant fresh to the Colony, asked the name of the gentleman who was giving a large order for corrugated iron roofing, &c.—"My name, sir, my name is *cash*," was the immediate reply!

is totally erroneous; it belonged solely to Maurice Worms and his brother Gabriel who came out and joined him in 1842. The name of "Rothschild" was given to the property at the express request of Messrs. Worms' uncles, the Baron Anselm von Rothschild of Frankfort, and Baron James de Rothschild of Paris.

Gabriel Worms was also educated in Frankfort and established himself in Paris in about 1825 as a partner of the celebrated Agents de Charge de la Ville, de Proulx & Co. The events of the Revolution of July 1830 having made a great impression upon him, he decided on coming to England and became a member of the London Stock Exchange about 1832, where he remained until 1842, when he joined his brother and became his partner in his coffee planting enterprise, and the two brothers established themselves as G. & M. B. Worms. Maurice resided at Pussellawa, managing the extensive plantations of coffee, etc.; while Gabriel had the Grandpass Mill where the coffee was prepared for shipment under his direction, and he also attended to the shipping and banking business of the Firm in Colombo. Gabriel was elected a member of the Legislative Council of Ceylon in 1847, but was unable to take his seat as the Jewish Disabilities had not been removed. The brothers were renowned for their hospitality, and had as their guests at various times all the European celebrities who visited Ceylon, amongst others the Duke of Brabant now king of the Belgians, the Crown Prince of Prussia, Earl Grosvenor now Duke of Westminster, the late Lord Derby, then Lord Stanley, and many others. It was Maurice Worms who first introduced the China tea plant into Ceylon; he brought cuttings from China and formed a small garden at Pussellawa in September 1841 (*vide* Sir J. Emerson Tennent's Ceylon, Vol. 2nd, Chap. 7). Messrs. G. & M. B. Worms had about 2,000 acres of coffee in cultivation and

their mark  was for more than a

quarter of a century a household word in Mingcing Lane. The enterprise was extremely successful; but old age creeping on, Messrs. G. & M. B. Worms decided on returning to Europe after a residence of four-and-twenty years in Ceylon. They disposed of their estates and returned home in August 1865 (*vide* "Ceylon Observer," 25th August 1865). Maurice unfortunately did not long survive his well-earned rest, as he died April 23rd, 1867, from liver complaint contracted in the Island. His brother Gabriel attained however a ripe old age and died in London 17th October 1881.

[We had the privilege of intimate acquaintance with Mr. Gabriel Worms from the date of our arrival

in the island, November 1861, until his departure in the latter part of 1865. His residence and office were opposite the *Observer* office, No 19, Baillie Street, and taking a great interest always in the current events of the day—especially in any mail or telegraphic news;—in the state of the roads up-country (often a serious matter for coffee transport in those days) and in railway progress, he generally paid us a visit in passing two or three times a day—or one of us ran across with the latest telegram or other special bit of news as received. We had the very highest esteem for the character of Mr. Worms—a thorough gentleman of the old school—and during the occasional visits of Mr. Maurice Worms from Pussellawa, it was very evident that a close attachment existed between the brothers. There was every day, a very early visit to pay to the Grandpass mills where some hundreds of native men, women and children found employment on very liberal terms, in the picking, drying and other careful preparation and packing of the coffee for shipment. Then, there was a daily walk round the Fort on business in respect of freight, insurance or banking, the private room of his friend, the Manager of the Oriental Bank (Mr. G. S. Duff), often seeing Mr. Worms. He did not care to push himself forward publicly, but Mr. Worms was ever ready to take his share in public movements. He was prominent in the Deputation to Sir Henry Ward about the need of Railway communication with the hill-country, and Mr. Worms pithily summed up their business in words that became famous throughout the colony,—“*We have come, sir, to be taxed.*” After Sir Henry Ward left, Mr. Worms had frequent occasion—as had most colonists—to find fault with Sir Charles MacCarthy's government, and especially with the cheese-paring policy of the Colonial Secretary, Mr. Wm. Charles Gibson, which led to some of the main roads in the planting districts getting shamefully neglected. Mr. Worms frequently supplied material to us for writing editorials on the subject—his closing remark after an interview frequently being:—“*Put it in the paper, sir,—put it in the paper;—don't mention my name, sir.*” Mr. Worms took a keen interest in the construction of the Railway to Kandy; but during his last year in the island, he (under an influence which need not be referred to here) lost faith in the successful working of the second section, the incline from the foot of the hill to Kandy—in other words he began to think a locomotive train would never pass round the top of Kadugannawa Pass. This led to a curious discussion in Baillie Street one day between Mr. Worms and Mr. (now Sir) Guildford Molesworth, the Chief Engineer,—Mr. Worms arguing that as the first section in the lowcountry of 34 miles from Colombo to Ambepusse was about to be opened, it should be so arranged that the bullock carts with coffee from the hills should be run on to specially constructed trucks and so carried to Colombo, where the cartmen had to replenish and see their friends, before returning to the interior! The Engineer did not see this, and so he was plainly told—he was only an Engineer and knew nothing about coffee! No one could speak in plain language

when roused than our good friend.* But his kindness of heart and liberality towards all charitable, philanthropic and even missionary agencies were proverbial. The Messrs. Worms were generous supporters of our Friend-in-Need Societies, and every agency in the country calculated to do the people good, while the widow and orphan were never turned empty away from their doors. Being conscientious Jews, Mr. Worms could not profess a direct interest in Christian Missions; but he never refused his £5 or £10 to a mission collector, giving as his ground openly and fairly: "Make honest men of them, sir"—referring to the need of Christian teaching among the natives. Both brothers took a great interest in the controversy which arose out of Bishop Colenso's attack on the Pentateuch, and we (of the *Observer* office) had to get out for them every answer published in England to the Bishop's work. Mr. G. Worms had a special question to put to us one day, as to Christians being as much affected as Jews, by the Bishop's attack; for "if the Pentateuch is discredited, it will affect your New Book (Testament) as much as the Old, will it not?" He was pleased with our prompt. "Certainly—we take the Bible as a whole."

No more liberal managers of property existed in Ceylon, and Rothschild was certainly the finest-looking and most liberally cultivated coffee plantation in the island, well set off too by its border of rose bushes round the boundaries and many of the principal paths. Both brothers were anxious that their other properties should be opened and planted with equal care: Condegalla on the Ramboda Pass was opened first for tea, a field planted from seed specially imported from China. It grew well; but the Chi-aman, who was also imported to prepare the produce, proved so incompetent, each lb. of tea prepared costing some £5, that Mr. M. Worms gave up the idea of tea planting, especially as coffee was proving so congenial and profitable. The field of tea-plants was, however, allowed to continue and afforded evidence that the Messrs. Worms were pioneers in this industry. They owned a large block of forest in Dimbula which was not opened until handed over to the Ceylon Company, Limited, when it became the extensive Maddecombra plantation. In Dikoya, again, they bought the 1,000 acres that became "Norwood" eventually, and here Mr. Worms finding that the land was actually in the Western Province (which had no repute for coffee),—to Sabaragamuwa boundary going so far round—got the Government of the day to alter the boundaries.

* Nothing put Mr. Gabriel Worms more readily out of temper than any display of meanness, or oppression of the poor. We well remember one occasion on which a reputedly well-to-do Sinhalese Chaplain—with a great craving for the amassing of money—approached Mr. Worms with the view of getting him to become landlord of a miserable set of huts in which Grandpass workpeople found refuge. "It would be so easy for Mr. Worms, as a large employer, to collect rents and even to increase them, which he (Mr. —) found it difficult to do." The reverend "Christian clergyman" got a lesson from the Jewish layman that day which was a splendid exposition of "doing to one's neighbour as he would be done by" and which he can scarcely have forgotten for the rest of his life.

In this way the planters of both the Dikoya and Maskeliya Districts have to thank the Messrs. Worms that they are included in the Central and not in the Sabaragamuwa Province.

The plantation Messrs. Worms took most interest in opening after Rothschild was what they called "Worms-Badulla" (afterwards Keenakelle plantation) on the Narangalla range. They employed an old Uva planter—George Morice—to do the preliminary work, paying him a liberal salary and grudging no expense to get good work done. On their first visit, however, both brothers were greatly disturbed at the miserly character of their Superintendent who lived on a tenth of his allowances and had besides no command of labour. Scarcity of coolies was the great want of the day, and Messrs. Worms began to think that for an out-of-the-way district, a "man of the country" who spoke the language thoroughly and understood the coolies, would be better as their Superintendent than a European. Accordingly on his return to Colombo, Mr. Worms came to our office with an advertisement which ran somewhat as follows:—

"WANTED"

For an extensive young Coffee Plantation in the Badulla District, a first-class experienced Superintendent with good testimonials and thorough knowledge of Tamil. Handsome salary allowed. *No European need apply.* Address W. care of *Observer Office.*

This intimation created quite a sensation throughout the Planting Districts; but the labour difficulty was given as the explanation, and Messrs. Worms soon got their man, in a Eurasian to whom they gave a salary certainly four times more than he had ever drawn. But this only served to turn the man's head and make him greedy for more after a dishonest fashion. Working so far from Colombo or Pussellawa—before the days of Visiting Agents—with no fear of inspection, and knowing that his repute depended on the number of coolies on the place, the "Superintendent" began entering a number of fictitious names in the Checkroll. This went on for some months, but at length suspicions were roused, a surprise visit by one of their trusted men arranged for, and the result was that within six months of the previous advertisement, Mr. Gabriel Worms one day appeared in our office storming about "dishonest black men—200 coolies in the checkroll 100 in the field—rogues, sir, put in an advertisement," and its terms were as follows:—

"WANTED"

For an extensive Coffee Plantation in Badulla, a first-class Superintendent of experience; highest testimonials required. Handsome salary provided. *None but Europeans need apply to W. care of Observer.*

So, this soon brought the right man to do justice to young Keenakelle which was handed over to the Company as a magnificent young coffee plantation just coming into bearing. The whole of the properties held by Messrs. Worms may be seen from the following list taken from our "Estates Directory"

of thirty years ago:—

COFFEE ESTATES.		
ESTATES.	PROPRIETORS.	TOTAL EXTENT OF PROPERTY IN ACRES.
Worms-Badulla (Kee-nakelle) ...	G. & M. B. Worms ...	994

		7,318 acres in

Total 12 properties

The "planted acreage" was not given at that period (this being compiled by us for the first time in 1869); but we may mention that the sale of these estates (some planted and others on y forest) together with certain town property, constituted probably the largest transfer of property ever effected in Ceylon at one time, the total amount which passed being no less than £157,000. Both brothers had in fact begun to feel after 24 years' residence in Ceylon that it would be better for them to return to Europe. Mr. Gabriel was still hale and hearty; but Maurice frequently suffered for want of change. Accordingly, their special financial adviser, Mr. Geo. Smytan Duff, arranged with the Directors of his Bank, the Oriental, for the formation of a Plantation Company to take over this grand series of Ceylon properties, and most properly it was dubbed "The Ceylon Company, Limited." Ceylon had a high reputation at the time as a plantation colony and the judicious Directors of the Bank very cleverly arranged to get rid at the same time, of a number of Sugar Estates in Mauritius, taking care, however not to call the Company, "The Ceylon and Mauritius Coy., Ltd." The consequence was that in certain circles, Ceylon bore the censure for losses due to Mauritius. For many long years, their Ceylon properties paid the Company very handsomely, while the reverse was the case with those in the Sugar Island;—but all this is apart from the Messrs. Worms. They were well satisfied with the sale of all their Ceylon properties for £157,000; "We have led useful contented lives"—said Mr. Gabriel, to us before leaving—"and our Ceylon investments have given 10 per cent interest and the capital back."

Very great regret was felt at the departure of the Messrs. Worms from Ceylon. How large a place they filled in the colony both in Colombo and the planting districts may be judged from what was written in Sir Emerson Tennent's "Ceylon" (already referred to) as follows:—

"At Pusilawa our home on many occasions was the hospitable bungalow of Mr. Worms and his brother, the proprietors of one of the finest plantations in the island. Their estate, which now (in the "fifties") consists, besides unfelled forest, of upwards of one thousand acres of coffee trees in full bearing, was commenced by themselves in 1811, when the new enterprise was still in its infancy. Their practical knowledge of planting was therefore acquired during its experimental stages; and no capitalists in the colony have contributed more to its advancement by judgment and moderation in times of excitement, and by firmness and perseverance in periods of difficulty. Hereafter, when the great project to which they have devoted their lives, shall have attained its full development, Ceylon, in the plenitude of commercial success, will remember with gratitude the names of men like these, who were the earliest pioneers of its prosperity.

"It is difficult to imagine a scene of greater natural grandeur than that in the midst of which their estates have been formed. The valley of Pusilawa* is overhung on its south-eastern side by a chain of wooded hills, the last of which, known as Moonera-galla, or the 'Peacock rock,' rises upwards of 4,000 feet above the level of the sea, and commands a prospect of indescribable beauty and magnificence; extending far and wide and embracing mountains, forests, rivers, cataracts, and plains. The plantations of the Messrs. Worms extend to the very crown of Moonera-galla, and the undulating sides of the hills, which fifteen years ago were concealed by the trees of the Black Forest, are now fenced with roses and covered in all directions with luxuriant coffee bushes.

"A plantation of coffee is at every season an object of beauty and interest. The leaves are bright and polished like those of a laurel, but of a much darker green; the flowers, of the purest white, grow in tufts along the top of the branches, and bloom so suddenly, that at morning the trees look as if snow had fallen on them in wreaths during the night. Their jasmine-like perfume is powerful enough to be oppressive, but they last only for a day, and the bunches of crimson berries which succeed, resemble cherries in their brilliancy and size. Within the pulp, concealed in a parchment-like sheath, lies the double seed, which by a variety of processes is freed from its integuments, and converted into coffee.

"On this fine estate an attempt has been made to grow tea: the plants thrive surprisingly, and when I saw them they were covered with bloom. But

* Pusilawa is said to mean the "valley of flowers." Another conjecture is, that the name is derived from the great climbing plant, the *pus-wuel* (Entada Pursetha), whose gigantic pods attain the astonishing length of five feet and upwards.

the experiment has hitherto been defeated by the impossibility of finding skilled labour to dry and manipulate the leaves. Should it ever be thought expedient to cultivate tea in addition to coffee in Ceylon, the adaptation of the soil and climate has thus been established, and it only remains to introduce artisans from China to conduct the subsequent processes.

"It will readily be inferred that if the life of a successful planter in these mountains be fraught with anxieties, it has also a share of compensating enjoyments. One can imagine the satisfaction with which he must contemplate the rich prospects that his own energies have created, peopling the solitudes with industry, and teaching the desert to blossom like the rose.

"Pusilawa and the surrounding valleys and forests have furnished large collections of objects, illustrative of the zoology of the island; but this is a source of enjoyment of which the successors of the present generation will be deprived by the felling of the forests and the destruction of the jungle, which now afford protection to multitudes of animals, birds, reptiles and insects. Their numbers are already declining in this particular spot; but still, such is their profusion in the forests and throughout the region surrounding the coffee estates, that opportunities exist for observing their instincts under most inviting circumstances, and even the apathetic become interested in watching their habits. These are so striking that they impress themselves on every sense, and stand out clear and illustrative in our recollections of the day and its progress. It is not alone that their crowded associations almost overpower the memory, it is not that they form at all times the incidents and life of the landscape—imparting vivacity to the foliage, and rendering the air harmonious with their motion and their music; but there is a degree of order in their arrangements, and almost of system in their times of appearing and retiring, that serves, when experience has rendered them familiar, to identify each period of the day with its accustomed visitants, and assigns to morning, noon, and twilight their peculiar symbols."

By attached estate and store employees, domestic servants, &c.—all of whom were handsomely remembered—the return home of the Messrs. Worms was much regretted. Here is a record of gifts made by them, and the farewell notice which appeared in the *Observer* of August 1865:—

"MESSRS. G. & M. B. WORMS.

We understand that Messrs Worms favoured the Colombo Friend-in-Need Society with the generous farewell contribution of £20 in aid of its funds; and a similar amount to the Colombo Ragged Schools under the care of the Rev. S. Nicholas."

"Speedily we shall have to say farewell to two men whose names, and the name of their great property, have been as household words in Ceylon for the past quarter of a century, wherever and whenever the coffee enterprise was discussed. We allude to the Messrs. Worms, owners of Rothschild Estate—

owners now no longer, for their interest in this splendid Estate and some 8,000 acres of land, cultivated and uncultivated, has now been transferred to the Ceylon Company (Limited). Cousins of the London Rothschilds—the Messrs. Worms were never stinted in means—their own ideas of Estate management were of the most liberal nature—and the thousand or so of acres of unbroken coffee which constitute the Estate of Rothschild, have always been models of high cultivation. To keep weeds out and put fertilizing manure, in, neither labour nor expense was ever spared; and amongst the coffee bushes which lately passed from the care of Mr. Worms to that of Mr. Corbet were many which at the age of twenty-five years are as vigorous and as fruitful, as they were in their hey-day youth of eight. The Black Forest which General Hodgson, and far younger men can remember an unbroken jungle, has long been felled, and the plantation and residence which occupy its place, have long been famed, the one for its beauty; and the other for its liberal hospitalities. Mr. Maurice Worms will be as much missed from Pussellawa, as Mr. Gabriel Worms will be from Colombo, where besides attending to his own large business, he always took an active, a shrewd and a useful part in the discussion of public affairs. He once occupied a seat in our Legislative Council, and we well recollect him as a Jew taking the oaths (with his head covered, as is the custom of his people,) and a seat in our Council, before the British Parliament had admitted his cousin Baron Rothschild or any other Jew to its ranks. The Home Government did not disallow the appointment on the ground of religion, but because only British-born subjects are eligible to seats in our Legislature. The Naturalization Bills which enabled the Messrs. Worms to hold land in the Colony, it was then found, did not give them the full status of British-born subjects. The Messrs. Worms, though Jews by race and religion, made no distinctions of religion or race in their large and generous charities. Besides hosts of necessitous individuals, the Friend-in-Need Society, the Ragged Schools, the Bible and Tract Societies, and the various Christian Missionary Societies will miss their contributions. To parties who have been long in their service, the Messrs. Worms have extended most generous treatment; and both in the circle of their more immediate acquaintances and amongst the general community, there will be a common feeling of loss and regret when the first steamer of September carries the well-known G. & M. B. Worms from the shores of Ceylon. Our personal regret is the greater from the feeling that, as one and another of the older residents quit the scene, we are fast qualifying for the position of 'the oldest inhabitant' or 'last man.' All honour and all enjoyment to those who, having done their work and done it well, seek well-earned repose, while we and others must still

"Learn to labour and to wait."

It only remains now to refer very briefly to the English life of the Messrs. Worms:—Mr. Maur-

Worms accustomed to an active, out-of-door life, felt he could not live in town, and he took a farm from Lord Leigh in Warwickshire; but he did not long survive in the treacherous English climate, dying in about 18 months after his arrival from Ceylon, aged 62 years. Mr. Gabriel Worms took up his residence in New Bond Street and there we visited him in 1869, and again in 1878, to find his interest as keen as ever in everything connected with Ceylon. But he had also established new interests and among other things he shewed us a cabinet with the reports and papers of nearly every Charitable and Philanthropic Institution in the Metropolis, and of which he was a liberal but judicious supporter. Many widows and orphans connected with Ceylon had also occasion to bless the generous heart of Mr. Gabriel Worms during the sixteen years that he survived his return to England. He passed away in his 80th year on the 17th October, 1881, widely regretted both in this island and in the Metropolis:

Peace to the memory of men of worth!

CEYLON TEAS IN 1893:

ANNUAL REPORTS OF MESSRS. WILSON SMITHETT & CO. AND MESSRS. GEO. WHITE & CO.*

We now fulfil our promise to republish both the above valuable Reports and great care has been taken to guard against any errors creeping in, in the reprinting. There is little occasion to draw attention to the salient features of the Reports, because both are admirably arranged and divided according to distinctive headings.

It will be observed that Messrs. Wilson, Smithett & Co. treat of the sales altogether last year of some 69 million lb. of tea against 65 million in 1892. It will be seen also that there is still the complaint about small breaks, Ceylon tea sales comparing unfavourably in this respect with those of India. It is surely time this was rectified, more especially as it is so clearly to the interests of the producers themselves not to send breaks of a size not likely to tempt full attention from buyers.—Turning to the Sales, at the head of the list for quantities we have the great Diagama, Galaha, K. A. W. and Mariawatte Factories which sent altogether for the four no less than 2,638,500 lb.—of which Diagama gave as much as 624,000 lb. at the really splendid average of 1.3d per lb. Of individual properties in Ceylon, it appears to us that the laird of Henfold is most to be envied with sales of 229,500 lb. of tea at an average of 1s 1d—one of the very few averages that show an improvement on 1892. The highest averages of all recorded for last year are those of St. Leonards with 1s 5½d for 40,500 lb., and Ormidale with 1s 4½d for 47,500 lb. We may extract here all the averages recorded from one shilling upwards:—

	lb.	Averaging.	
		l.	s. d.
St. Leonards	.. 40,500	1	5½
Ormidale	.. 47,500	1	4½
Dessford	.. 143,500	1	1½
Henfold	.. 229,500	1	1

* See Special Supplement given with Daily Observer and Tropical Agriculturist,—we much regret the delay in issuing both Reports: the alterations in the building of office are to blame.—Ed. T.A.

	lb.	Averaging.	
		l.	s. d.
Tomra-gong	.. 53,500	1	0½
Geat-fa	.. 182,500	1	0½
Norw od	.. 166,500	1	0½
Pedro	.. 42,500	1	0½
Kellebedde	.. 20,500	1	0½
Waverley	.. 415,500	1	0
Portswood	.. 77,500	1	0
Carabeek	.. 66,000	1	0
Hapootella	.. 40,000	1	0

We next come to the Districts—ranging from Dimbula with 12 million lb. of tea and an average of 10½d—thus taking the premier place over the Nuwara Eliya group and Bogawantalawa this year—down to Galle district with 327,000 lb. of tea and an average of 7½d or ¾d better than in 1892. The average for the island last year being 9d, the following are the districts above that rate in order of merit:—Dimbula, Nuwara-Eliya-Maturata-Udappasellawa, Bogawantalawa, Dikoya, Uva and Maskeliya while Hewaheta just reaches the average.

How the Home Consumption of our teas has risen is seen from figures which give

115 million lb. of China in 1883 against	only 36 do do do 1893; while
59 do India and Ceylon in 1883 contrast	with 172 do do do 1893.

Adding 50 per cent to the last-mentioned figures to reduce them to the "China" standard, we get a total consumption equal to 294 million lb. "China" in 1893 against only 203 million in 1883! An increase in consumption of 91 million lb. in ten years in the United Kingdom is, surely, satisfactory evidence of the effect of lower prices.

Meantime, that we have a great deal to do yet in fighting against "China" in foreign markets is shown by the re-exports of Ceylon and Indian teas being under 7½ million, while of "China, Java, &c.," no less than 36 million were sent out from the United Kingdom in 1893. This proves very clearly that we have much work before us on the Continent of Europe as well as on the American Continent.

Turning now to the Annual Report of Messrs. Geo. White & Co., we are met at the outset with the information that "a marked variation in quality" was noticeable in teas from the same estates in 1893, from Assam and Darjiling as well as from high estates in Ceylon. The fact that the long-established plantations in Assam, as well as those so noted for fine teas in Darjiling, shew variation in quality quite as much as high teas from Ceylon, is consolatory; because it shows that the chief factor must be the weather. It is striking, too, how the deliveries fell off in the Spring of 1893 in correspondence with the rise in price of the lower teas, while the demand recovered later on when prices fell. Java teas are spoken of as of a "very useful description" and as being shipped direct to Bombay. Ceylon common teas ought surely to oust Java from the Indian market, especially with the help of "Travancore."

The very full comparative table showing Imports and Consumption per head in the United Kingdom, given by Messrs. Geo. White & Co., is to our mind a very satisfactory one. It shows an increase from 4.56 lb. per head in 1875-6 to 5.45 lb. per head in 1892-3; and considering that in the first season of China 149 million lb. were imported against 25½ the total of British-grown; while in the last the proportions were 172½ million lb. of the stronger teas to 54½ China, the rise in the consumption of tea per head is really very remarkable and no doubt entirely due to the lower prices. The careful estimate prepared

by Messrs Geo. White & Co. for 1894-5, of the tea to reach the United Kingdom, will attract attention:—

India...	...	120	million lb.
Ceylon	...	80	do
Java...	...	4	do
China	...	41	do

245 million lb.

—against a consumption as we trust of not less than 210 million leaving 35 million lb. for export. In such a prospect, there is a good deal of encouragement, but we are all in the dark as to what China may do in the coming season. Meantime, there is no question that it would be well if India and Ceylon could take away some more of the re-export business from China. At present the quantity of China tea exported from London to the Continent of Europe, &c., is considerably in excess of that of British-grown teas.

As usual Messrs. Geo. White & Co., have excellent advice to give to planters in respect of "Manufacture," "Size of Breaks and Assortment," "Style of Packages," "Bulking," "Warehouse Charges," "Weighing," &c.—all of which, we have no doubt, will be duly taken into consideration.

COCONUT PALMS AND WEEVILS.

Puttalam, April 24.—The weather has been unbearably hot for some time, with little or no rain. Coconut plantations, new ones particularly, are suffering badly. The drought and the red weevil will convince planters before long that this District is not after all the best for coconuts. It is time that those who take an interest in coconut planting set themselves to devise a means of repelling the weevil. At a rough calculation forty out of a hundred trees die between the ages of three and twelve. This means an average loss of R120 for each acre before the trees planted come fairly into bearing.* I have heard of several remedies suggested for the beetle, but none appears to have proved effectual so far. I am informed that Mr. Wijeyesingha bores into the tree where it is attacked, scoops out the pith, beetles larvæ and all, and then fills up the gap with mud mixed with coal tar and kerosene oil. This mode of treatment must necessarily make a wreck of the tree, but it is followed by the Moorish planters. It remains to be seen what treatment Mr. Gane will adopt to save the trees he is planting at Ambalam.

It appears that there will be no salt manufacture this year, as the quantity collected during last year has filled up all the Government stores and is not likely to be disposed of just yet. Mr. Haughton is out on circuit.

A NEW FIBRE INDUSTRY.

[By TELEGRAM FROM OUR CORRESPONDENT.]

MACKAY, March 30.—About eighty residents and others assembled in Morthansens aerated water factory today to witness the process of the extraction of fibre from the leaves of the *Fourcroya gigantea*, the plant from which the Mauritius hemp of commerce is produced. A small Deane and Elwood machine was sent for the purpose, and being connected with steam power was set in motion and the large leaves of the *Fourcroya* fed to it, the result being the almost instantaneous removal of the vegetable matter, leaving beautiful bright hanks of white fibre, thus clearly demonstrating the ease with which this fibre can be separated without any process of steeping or the use of chemical agents. The exhibition was regarded as highly satisfactory, especially as the leaves treated were just fresh cut from a plant growing wild in a paddock belonging to Mr. H. B. Black.

It is stated that a company is in course of formation to work the industry locally, and that 150 shares have already been applied—*Queenlander*, April 7.

* Surely an exaggerated estimate.—Ed. T.A.

TEA CULTIVATION IN SOUTH CAROLINA.

The British Consul at Charleston, in a recent report to the Foreign Office, describes an interesting experiment in the cultivation of tea at a plantation near the town.

It seems that many attempts have been made to create a tea industry in the United States, and that repeated failure has not checked the ardour of those engaged in these experiments. The little patches, and in some instances, large gardens, which have resulted, have produced tea of fine flavour, although very generally devoid of that strength of infusion which appears to constitute a most desirable quality for many tea-drinkers. This failure in pungency is probably largely due to defective curing, and especially to inadequate rolling of the leaf, in consequence of which the qualities are not fully developed. The National Department of Agriculture began, about ten years ago, the first serious attempt to produce American tea on a scale sufficiently large to arrive at a decisive result; but a number of causes combined to lead to the total abandonment of the gardens, which had been established at great expense. The present experiment owes its existence to the belief that more careful cultivation and preparation, which might be the result of lengthened local observation, and the subsequent production of a higher class of teas might reverse the general opinion that, as an industry, the cultivation of tea in America must always prove a failure. During the summer of 1893 some of the plants were sufficiently advanced to warrant picking the leaf. The great majority had been raised from seed in 1889 and planted out that autumn; a limited number were a few months older. They belong to the Assam hybrid variety—the cross between the Assamese and Chinese sorts, and come from stock that had been thoroughly acclimatised by probably thirty years growth in America. The reports from experts as to the quality of the leaf have been of a very favourable character. The average production for the season was about 37½ lb. of cured tea per acre of the earlier "flushes," as the successive crops of young and tender leaves are called. "The results at Pinehurst are all the more gratifying as they were obtained on plants exhibiting great difference in form and luxuriance of growth and flushings; the seed from which they sprang had been brought from India long before the inauguration of the recent successful attempt to raise the grades of those teas by a judicious selection of seed and most careful cultivation. From the gardens now being established at Pinehurst, and in consequence of the great care bestowed on their composition, it is hoped to obtain much finer teas in the future,"—*O. Mail*.

INDIAN TEA COMPANIES.

EASTERN CACHAR TEA COMPANY.—Outturn was 5,363 maunds, and average realised 6-10 per lb. Total area under plant is 1,253 acres. The estimate for this year is 5,600 maunds for a total outlay of R1,69,148.

KHOBONY TEA COMPANY.—Outturn was 4,763 maunds, the bulk of which was shipped to London for sale. Estimate for this year is 5,000 maunds for an outlay of R1,76,000.

SHAKOMATO TEA COMPANY.—The crop of 2,873 was shipped to London and sales to date give an equivalent of 10-7½ net in Calcutta. The profit of the season is R56,841, and in adjustment in profit and loss account and deducting commissions, &c., a net R49,427 is seen. Two interims each of 5 have been paid, and a final of 5, in all 15 per cent, is to be given. To reserve R10,000 is to be transferred, making that account R30,000. It is intended this year to spend R94,344 and obtain 2,700 maunds.

LEISH RIVER TEA COMPANY.—Outturn was 4,190 maunds and average realised 5-7 per lb. After providing for dividend on season 1892 and the transfer of £2,000 to revenue fund, revenue account shows a credit balance of £1,356. A dividend of 7 per cent is proposed which will leave £306 to carry forward.

JETINGA VALLEY TEA COMPANY.—Outturn was 2,634 maunds of Tea and 609 maunds of seed. The former

fetched 7 per lb. Estimate for this year is 2,205 maunds tea and 600 maunds seed, at a total outlay of R73,235 including upkeep of certain unyielding tea and cost of extension. The Assam-Benzel Railway will run through the property but the line of route is not definitely settled—roughly 47 acres will be required.—*Pioneer.*

BANANA DISEASE.

For some two or three years past a disease has appeared among the various kinds of *Musas* (Bananas) cultivated in Trinidad. The disease is characterised by a diseased condition of the leaves, and by the fruit rotting before coming to maturity.

The kinds most affected are those known as the "Moko," or "Jumbi Plantain," and the "Jamaica Banana," otherwise known in Trinidad as the "Gros Michel," which is the kind most generally exported to the United States. I have several times examined diseased plants at various seasons, but so far am unable to point to any special cause for the appearance of disease, with certainty. In the specimens examined, it has been found that when first affected the plant shows signs of disease by the decay or shrivelling up of its leaves, and a general anemic or weak appearance and the base of the petiole of the leaf rots away and passes into a state of fermentation. The watery particles of the plant teem with amoeboid organisms and nematoid worms are present in large numbers, while a variety of forms of Bacteria are present in the fluids of both stem and leaf. These organisms also appear in the soil surrounding the roots, and also in the fruit when it decays. I have, however, been unable to show that the plant is attacked by parasitic fungi of any kind. So far as my observation goes the disease first attacks the growing parts of the plant and then induces decay downwards to the roots, the whole stem eventually rotting from the top downwards. I am careful not to assume that the presence of Bacteria, Amœba, or the Nematoid worms are the cause of the disease, although it is almost certain that, together with the extreme climatic conditions which have existed for the past two years, they have no little influence in promoting its spread and may be the original cause, but of this we have not as yet seen sufficient proof. As a tentative measure I would suggest the complete destruction of infected plants, and the removal of all that are healthy to well drained and fertile soil, as a means of inducing growth sufficiently strong to overcome parasitic attack. It is observed that the "Fig-sucrè," or small fruited Banana, enjoys the greatest immunity from attack; possibly on account of the harder character of the epidermis in this variety.

January, 1894.

J. H. H.

BLACK-PEPPER—(*PIPER NIGRUM*) IN TRINIDAD.

Consignments of "Black-pepper" plants, *Piper nigrum*, have been received at various times at this Establishment from the Royal Gardens, Kew, and have been grown and distributed to various applicants, amongst whom was Mr. W. C. Meaden of the Convict Depot, Chaguanas, who has paid much attention to the cultivation of economic plants. With Black-pepper, Mr. Meaden has been very successful, and he has now harvested probably the largest crop ever produced in the West Indies.* The sample is an excellent one, and, as prepared by him, leaves nothing to be desired, and is probably equal to the best kinds put upon the market. A portion has been sent to the Economic Museum of the Royal Gardens, Kew, from whence a report is shortly expected.

The propagation of Black-pepper is extremely simple, and plants can be obtained at the rate of one cent (half-penny) per plant. The cultivation

* 200 lb.

necessary to keep the plants in condition is performed with very little expenditure of labour, it being necessary only to place the plants at the base of such trees as the "*Bois Immortel*" (*Erythrina velutina* and *Erythrina umbrosa*) in well prepared holes, and train the young shoots for the first season to the tree. The after cultivation consists mainly in keeping the plants from getting out of reach of the short ladder, by means of which the crop is collected. The habit of the plant makes it a very suitable one for planting against the base of the trees used as shade on a Cacao plantation, which fact points to the probability of its being extensively utilized in such positions by Trinidad planters in the near future, especially now that it has been proved that it can be so successfully grown. Among our plants at the Gardens can be seen one which has produced a crop of 2 lb., harvested on January 16th, 1894, which is a similar position as it would be on a shade tree in a "Cacao" plantation.

The season for gathering in the crop in the East is from mid-December to mid-February, and it appears that the plant ripens its fruit at the same time of year in the West Indies. The fruit is picked when "full" but still green; when, however, "White-pepper" is required to be made, it has to be allowed to ripen on the vine. After a slight fermentation, the pericarp should be removed by washing, and the interior portion of the fruit then assumes the appearance which causes it to be known as "White-pepper." The present price of "Black-pepper" in the London market ranges from 2½d. to 4½d. per lb. The drying of the green berries should be performed as quickly as possible after picking or sorting, on mats or trays exposed to the sun, or where artificial dryers are available, these can be made use of with great economy. When systematic cultivation is adopted, (*i.e.*) if the pepper vine is made the sole object of cultivation, and not planted intermingled with other crops, much more attention can be paid to the cultivation than when it is planted with other things, and probably more profit would be realized than by mixed planting. The cost of planting and cultivating an acre in the East, up to the first bearing, is only £4, but it is probable that this cost would be far exceeded in Trinidad. The vines there are planted at five feet apart, and come into bearing about the third year from planting, the best crops being reaped at sixth or seventh year. In Malabar it is said that each vine gives an average of two pounds per year up to the fifteenth or twentieth year, but each supporting tree sustains some eight or twelve vines. It having been proved that Pepper, good in quantity and quality, can be grown in Trinidad, we have now to express the hope that our planters will be induced to take up the cultivation, even in a small way at first, especially as there is shown to be so little difficulty in initiating and maintaining it. Seeds of the tree* used in the East for support can be obtained, in their season, at the Gardens, and anyone requiring plants can, provided the order is sent in early, be supplied as before-mentioned, at the low rate of \$1 00 per one hundred, or one cent per plant. I may add that samples harvested by Mr. Meaden, may be seen at the Gardens.

9th January, 1894.

J. H. H.

PEERMAD PLANTERS are growling about the hail-storms which have done a good deal of damage to the open coffee blossom, Tea-men on the contrary are rejoicing, and the fine showery weather is bringing on the flush in grand style. A Wynaed correspondent writes:—"The season here has been most favourable for coffee and so, I fancy, very unfavourable for human beings, as I have seldom known so much sickness about. We are going in for a grand crop here, both of tea and coffee. Things are looking cheerful enough at last."—*South of India Observer.*

CEYLON MANUAL OF CHEMICAL ANALYSES.

A HANDBOOK OF ANALYSES CONNECTED WITH THE INDUSTRIES AND PUBLIC HEALTH OF CEYLON FOR PLANTERS, COMMERCIAL MEN, AGRICULTURAL STUDENTS, AND MEMBERS OF LOCAL BOARDS.

By M. COCHRAN, M.A., F.C.S.

(Continued from page 661.)

CHAPTER XI.

MILK.

COLOMBO MILK SUPPLY—COMPOSITION OF GENUINE COW'S MILK—EXAMPLES OF MILK SUPPLIED BY COLOMBO MILK-VENDORS—CONDENSED MILKS—COCONUT "MILK"—BUFFALO MILK—MILK OF THE GAMOOSE OR EGYPTIAN BUFFALO, AND OF THE HUNGARIAN BUFFALO—ELEPHANT'S MILK—MILK OF VARIOUS ANIMALS—BUTTER AND GHEE.

In Colombo cow milk is so generally adulterated with water by the vendors that it is only by the exercise of increasing vigilance that the householder can obtain a pure supply from day to day. Besides being adulterated with water, cow milk is also mixed with buffalo milk, and at times with coconut milk. The usual remedy for this state of things, viz., causing inspectors to take samples of the milk supply and forward them to the City Analyst for analysis as a basis on which to prosecute offenders has not been resorted to in Colombo. Government has, in consequence, been obliged to become its own provider of milk for its hospitals and asylums, while the interests of the general public still remain without safeguard.

The following is the composition of eight samples of Colombo cow milk believed to be genuine:—

Analyses of Colombo Genuine Cow Milk.

* See note on specific gravity in Appendix.

In parallel columns I give the average analyses of cow milk according to Dr. Hassall, based, he says, on all the reliable analyses he had met with (1876); also the average analyses according to Dr. Vieth of 11,389 samples of the milk examined in the laboratory of the Aylesbury Dairy Company during 1885; also the average of 13,196 samples examined in the laboratory of the same dairy in 1892 under Dr. Vieth's successor Mr. H. Droop Richmond; also the average analysis according to Dr. Bell, Principal of the Somerset House Laboratory of about 240 samples of milk from cows, in each case milked in the presence of a responsible person.

Average Composition of Cow Milk in England, and in Ceylon.

	General average according to Hassall.	Average of 11,389 samples. Vieth.	Average of 13,196 samples. H. D. Richmond.	Average of 240 samples. J. Bell.	Average of 8 samples. Colombo genuine cow milk.
Specific gravity	..	1.0322	1.0326	1.0297	1.0312
	per ct.	per cent	per cent	per cent	per cent

Solids not fat ..	9.33	9.13	8.80	9.01	9.15

* Not determined.

The average analysis of these eight samples of Colombo milk does not differ materially from the average composition of milk in England, more especially in the matter of total solids, non-fatty solids, and salts, which are the most important ingredients to take account of when judging of

the genuineness of a sample of milk. These average figures are important as giving the analyst a standard which enables him to certify that a given sample of milk is of average or good quality; but it is also important to know how far a milk may be below average quality, and yet be genuine, and therefore saleable.

In the State of New York it is required by law that milk offered for sale shall not contain more than 88 per cent of water, nor less than 12 per cent of milk solids, and 3 per cent of fat.

In Massachusetts the legal standards for milk are such that "in all cases of prosecution, if the milk shall be shown upon analysis to contain more than 87 per cent of water, or to contain less than 13 per cent of milk solids, it shall be deemed, for the purposes of this Act, to be adulterated."

In Paris milk is condemned, if on analysis, it is found to contain less than 2.70 per cent of fat; 4.50 per cent milk-sugar; 4.30 per cent caseine; albumen and ash; and 11.50 per cent of total solids.

In England the standards recognised by the Society of Public Analysts for pure milk have been:

Specific gravity	1.030	per cent.
Ash	...	70
Solids not fat	...	9.00
Fat	...	2.50
Total Solids	...	11.50
Water	...	88.50

The non-fatty solids in the above is now generally regarded as too high for a minimum figure, and milk is passed if it shows 8.5 per cent of non-fatty solids, provided other indications of added water are absent. This figure would probably not be too high for dairy milk in Colombo; but to meet the case of milk from individual cows it would probably be necessary to come as low as 8 per cent for non-fatty solids. All cow milk containing less than 9 per cent but not less than 8 per cent of non-fatty solids might be classed as milk of fair quality, and all cow milk containing 9 per cent and upwards of non-fatty milk solids might be classed as milk of good quality.

As a preliminary, however, to prudent legislation on the subject, a large number of samples of cow and of buffalo milk, which have been milked in presence of a responsible person, should be subjected to analysis.

The following are examples of what is supplied by Colombo milk vendors to their customers:—

	No. 1.	No. 2.	No. 3.	No. 4.
Specific gravity (Temp. 28 to 29° C.)	1.025	1.014	1.019	1.014
Fat	2.650	1.950	3.46	2.96
Sugar and Casein	6.58	4.130	5.83	3.17
Salts	.50	.39	.33	.33
Total Solids	9.73	6.47	9.62	6.46
Water	90.27	93.53	90.38	93.54
Solids not fat	100.00	100.00	100.00	100.00
	7.08	4.52	6.16	3.50

The following shews approximately the amount of adulteration indicated by the above analyses:—

No. 1 contains less than 80 per cent cow milk and more than 20 per cent added water.

No. 2 contains about 50 per cent cow milk and about 50 per cent added water.

No. 3 contains less than 70 per cent of a mixture of cow and buffalo milk and more than 30 per cent of water.

No. 4 contains less than 40 per cent of mixed cow and buffalo milk and fully 60 per cent of water.

The following are a few more analyses of Colombo milks:—

Sample of Milk supplied to the General Hospital in 1888.

Specific gravity	...	1.0265
Temp. 28.5° C.	...	per cent.
Fat	...	3.49
Sugar and Casein	...	5.41
Salts37
Water	...	90.73
Solids not fat	...	100.00
	...	5.68

From its composition the milk was evidently mainly buffalo milk, watered to a considerable extent.

Sample of Milk from Barracks.

Specific gravity	...	1.0188
Temp. 29° C.	...	per cent.
Fat	...	4.02
Sugar and Casein	...	5.52
Salts38
Water	...	90.08
Solids not fat	...	100.00
	...	5.9

This was also evidently buffalo milk with fully 30 per cent of added water.

The following was a sample of milk supplied to a Colombo hotel:—

Specific gravity	...	1.0213
Fat	...	5.59
Sugar and Casein	...	8.53
Salts47
Water	...	14.59
Solids not fat	...	85.41
	...	100.00
	...	9.00

Buffalo milk mainly if not wholly.

The following is the analysis of a sample of unsweetened condensed milk sold in Colombo. It is genuine:—

Total Solids	...	per cent.
Fat	...	(31.54)
Sugar	...	7.03
Ash	...	13.84
Albuminoids	...	1.87
Water	...	8.80
	...	68.46
	...	100.00

The following are additional analyses of condensed milks from *The Chemistry of Foods* by James Bell, Ph. D.

Description.	Percentage of			
	Water.	Fat.	Cane and milk sugar	Casein.
Swiss ...	26.70	9.76	51.02	10.20
English ...	27.07	8.30	50.79	11.84
Pure Swiss milk, condensed	61.40	11.37	13.37	11.48
Pure condensed Alpine milk ...	62.35	11.15	13.14	11.29
				Ash.
				2.32
				2.00
				2.38
				2.07

Analysis of Coconut Milk.

The following is an analysis of Coconut Milk, that is, milk made from the kernel of the coconut:—
Specific gravity at 84° F. .9944 Same after being much diluted

Oil or fat ...	36.78	8.94
Sugar and other constituents ...	7.60	1.85
Salts87	.21
Total solids ...	45.25	11.00
Water ..	54.78	89.00
	100.00	100.00
Solids not fat ...	8.47	2.06

Buffalo Milk.

The author despatched a servant to bring samples of pure buffalo milk with instructions to pay whatever price was asked; but to see the animals milked, and to make sure the samples were pure. Even under these circumstances the milkman's prejudice against beginning to milk into an empty vessel had evidently prevailed. Two of the samples had undoubtedly been watered to a large extent, and the purity of the third was at least doubtful.

The following were the analytical results:—
Analyses of Buffalo Milk sold as pure in Colombo.

	No. 1.	No. 2.	No. 3.
Specific gravity } Temp. 28 ° C.	1.0163	1.0174	1.0278
	percent	per cent	per cent
Fat ...	5.41	4.77	5.57
Sugar and Casein ...	3.45	5.09	7.14
Salts57	.27	.73
Total Solids ...	9.43	10.13	13.44
Water ...	90.57	89.87	86.56
	100.00	100.00	100.00
Solids not fat ...	4.02	5.36	7.87

No. 3 milk contains as large an amount of total solids in 100 parts as No. 1 milk does in 143 parts, and it would require 182 parts of No. 1 to equal in value No. 4, which last is undoubtedly a pure sample of Colombo buffalo milk. In a parallel column I give the analysis of Indian Buffalo milk by Dr. Barry, Government Analyst at Bombay.

Analyses of Genuine Buffalo Milk.

	No. 4. Colombo. (Single Sample.)	Indian. (Dr. BARRY.)
Temperature ..	26 ° C.	28.8 ° C.
Specific gravity ..	1.0275	1.031
	per cent	per cent
Fat ...	7.86	7.78
Sugar, Casein, &c. ...	8.50	..
Salts82	..
Total Solids ...	17.18	18.67
	82.82	81.33
Solids not fat ...	100.00	100.00
	9.32	10.89

With the above may be compared the composition of the milk of the Egyptian gamoose or buffalo (*Bos bubalus*) determined in the Khedivial laboratory at Cairo by A. Pappel and H. Droop Richmond, and also the composition of the milk of the Hungarian buffalo determined by F. Strohmmer.

Analyses of Egyptian and Hungarian Buffalo Milk.

	Egyptian. (PAPPEL & RICHMOND.)	Hungarian. (STROHMER.)
Specific gravity at 15.5 ° C.	1.0354	at 15 ° C 1.0319
	per cent	per cent.
Fat ...	5.56	9.02
Sugar ...	5.41	4.50
Casein ...	3.26	3.99
Albumen60	..
Nitrogenous bases09	..
Salts ...	1.03	.77
Total Solids ...	15.95	18.28
Water ...	84.05	81.72
	100.00	100.00
Solids not fat ...	10.39	9.26

Referring to the analysis of Hungarian buffalo milk J. Strohmmer says:—"The points in which buffalo milk differs from cow milk are the high percentage of fat and the musk-like smell." The higher percentage of fat and the whiter color are features which distinguish the milk of the Indian and Ceylon buffalo from the cow.

Elephant's Milk.

The following are interesting analyses of elephant's milk (by C. A. Doremus quoted by *Journal of Chemical Society*):—

Analyses of Elephant's Milk. (DOREMUS.)

	April 5th morning.	April 9th midday.	April 10th morning.
Fat ...	17.546	19.095	22.070
Sugar ...	14.236	7.267	7.392
Casein ...		3.694	3.212
Mineral matter651	.658	.629
Total solids ...	32.433	30.714	33.303
Water ...	67.567	69.286	67.687
Solids not fat ...	100.000	100.000	100.000
	14.887	11.619	10.233

The milk of the elephant is remarkable for the very high percentage of fat it contains; the milk of no other land animal appears even to approach it in this respect. The percentage of fat in the milk of the porpoise however is fully double as high as in that of the elephant, viz., 45.8 per cent. The casein in the milk of the porpoise also exceeds that in the milk of land animals. Elephant milk is richer in sugar than that of other animals.

The following table, exhibiting the composition of the milks of various animals, is from Dr. Battershall's work on Food Adulteration already referred to. The third on the list however is quoted from the Analyst, the analysis being by Mr. Droop Richmond:—

Analyses of Human Milk and the Milk of various Animals.	Specific gravity	Water.	Total Solids.	Fat.	Casein.	Sugar.	Mineral matter.	Analyses of Human Milk and the Milk of various Animals.

Butter and Ghee.

Milk is the only form of Ceylon dairy produce which the author has been called upon, officially to examine. Many of the European householders, who, in order to ensure a supply of pure milk, keep cows, have a daily supply of butter prepared at their bungalows. There is also a limited market for fresh butter, supplied from dairies on tea estates.

Adulteration of this locally-made butter is unknown. Butter is also imported in tins. This is of the usual mixed character, some qualities being pure, and others largely adulterated with foreign fats. The following shows the composition of English butter. The results are an average calculated from the analyses of good commercial butter, given in Thorpe's Dictionary of Applied Chemistry:—

Analyses of Butter.

	Water.	Salt.	Curd.	Butter Fat.	Sp. gr. of Butter Fat.
per cent	12.94	2.50	1.39	83.17	911.62

The specific gravity of butter fat is an important consideration in determining its purity. According to the authority already quoted it varies between the limits of 910.7 and 913.89 at 100° F. The specific gravity of ordinary animal fats, on the other hand, at 100 F. (37.7° C.) is considerably lower, varying from 902.83 to 903.07.

In India and Ceylon the natives do not make use of butter in its natural state, but of ghee or clarified butter. This is prepared by melting the butter in a vessel over a fire. The water and curd in this process sink to the bottom, while the butter fat remains on the top. The upper portion constitutes ghee of good quality. In India, according to the Encyclopædia Britannica, the lower portion is mixed with ground-nut oil, and sold as an inferior quality of ghee. Ghee or clarified butter is also prepared by heating butter for some time until the moisture is all evaporated. The melted butter is then strained through a cloth. Ghee is prepared either from the butter of the cow or of the buffalo, but that of the cow is preferred. Ghee, when properly prepared, can be kept for a long time without becoming rancid, which is without doubt one reason of its extensive use in tropical countries.

FODDER GRASSES FOR CATTLE.

A Bogawantalawa planter inquires:—
"Re fodder for cattle. Will you kindly let me know where I can obtain roots of *Bromus Schraderi* or *Paspalum* and whether the grass is likely to thrive at an elevation of 5,000 ft.?"

A competent authority replies:—
"I daresay Mr. A. J. Kellow of New Galtway would be glad to supply a few thousand plants of *Paspalum conjugatum*, or perhaps your correspondent could get seeds from Peradenya. The only persons I know at all likely to have seeds of the *Bromus Schraderi* is Messrs. William Bros. of Henaragoda, but I should recommend him to write to Messrs. Law, Somner & Co., Seedsmen, Melbourne, for seeds direct. This will insure them being fresh and good. Both will thrive at 5,000 feet elevation."

LEAVES DEVELOPED IN THE SUN AND IN THE SHADE.—Considerable differences are produced when leaves are developed in the shade instead of in the sun, other conditions, such as soil, moisture, &c., being the same. All the vital functions are carried on more energetically in those leaves which are produced in the sunlight. They transpire more abundantly than those produced in the shade, and contain relatively less water; but the circulation is more rapid, and they receive a larger quantity of nutritive substances. Besides these differences, leaves that are grown in the sun are thicker, and carry on a more active respiration, and since they contain a larger quantity of chlorophyll, their assimilation is also more active, and they fix a larger quantity of carbonaceous matter.—*Rev. Gen. de Bot.*, iv., p. 481.—*Gardeners' Chronicle.*

QUININE TO BE EXPORTED IN 1894!
EQUAL TO OVER 12 MILLION LB. AVERAGE CEYLON
BARK!

The annual statistical statement of the output of cinchona-bark in the island of Java, compiled under the auspices of the local Planters' Association, has just reached us (*Chemist and Druggist*) and is of even more than usual interest. As in former years, the present is the sixth annual issue of the statement, data are given both of the crop actually exported in the past, and of the estimated shipments during the present year. The information previously published by the Association has been, broadly speaking, so reliable that we are justified in placing reliance upon the approximate correctness of their forecast for the present year, which, we may say at once, is not altogether reassuring to holders of cinchona-bark and quinine. The figures given by the Association deal only with "manufacturing" barks, the "pharmaceutical" or druggists' cinchonas being left out of account altogether as of no influence upon the quinine-market. According to the Association, the ninety-two plantations now in active operation in Java exported in 1893 3,066,525 kilos of bark, representing an aggregate of 148,910 kilos of sulphate of quinine, or an average of 4.85 per cent. In 1894, should the unit remain near the lowest point it has touched and not average more than 3c, per half-kilo, or, say $\frac{3}{4}$ d, per lb., it is estimated that 2,574,600 kilos., averaging 5.28 per cent., or a total of 135,951 kilos., sulphate of quinine will be exported. These figures represent therefore, the irreducible minimum of what we have to expect as the Javan contribution to the world's quinine market. It would be nearly 10 per cent. less than that of 1893—that is to say, an insufficiently large reduction to cause any well-founded considerable upward movement in quinine. As the high average percentage of 5.28 against 4.85 in 1893 indicates, only the richest barks will be shipped from the island under such unfavourable market conditions. But since the statistics were compiled there has been a decided improvement in the cinchona position in Europe, and the unit is now nearer a penny than a half-penny per lb., and appears likely to remain so for some time to come. It is therefore probable that the Java shipments will be made upon another basis than that of a 3 cent unit. The compilers of the statistics, foreseeing this, have taken the precaution to give an estimate of the shipments in the event of a 5-cent per half-kilo, or say, $\frac{5}{4}$ d per lb. unit prevailing in the European market. In such a case, they think, 3,535,100 kilos. of bark, testing 4.83 per cent on an average, and representing 170,721 kilos. sulphate of quinine, or 15 per cent more than in 1893, may be expected. If any statement can contribute to depress the market once more to the seemingly hopeless despondency of last autumn, it must be the confession by the leading cinchona-planters' Association in the world, that the days of a reduced Javan output have not yet arrived. What is more, the Association, in the explanatory memorandum which accompanies their statistics, commit themselves to a remarkable statement, which, translated into English from its native Dutch, runs as follows:—

"Our figures show that the area under cinchona-cultivation in Java at the present moment is about 17,105 bouws (11,842 acres), of which about 1,022 are planted with *succirubra*, or bark for pharmaceutical purposes. Since 1890 about 2,492 bouws have been uprooted, but the new plantations laid out during the same period cover 3,512 bouws. Considering that the quality of the young plantations is so much better than that of the uprooted ones (which certainly were not among the richest), it may be predicted with certainty that for the next few years to come the Java crops will not decrease."

This is, indeed, a candid admission to make from the planters' side, and we do not wonder that, under the circumstances, there should have been considerable searchings of heart before the Association de-

ecided upon giving its statistics to the world. Several planters, in fact, refused to give information concerning their estates, on the ground that by doing so they would be playing into the hands of their opponents, the European quinine-makers. But the feeling that it would be better to face the situation boldly prevailed at the meeting of the Association on January 23, where the question was finally threshed out, and hence we are in a position to give the figures quoted above. That some of the largest and, to judge by the alkaloidal richness of their bark, most progressive Javan planters are not disposed to regard the situation as hopeless seems to be indicated by the fact that a few of them have increased the area of their plantations during the last three years by 50 to 100 per cent. It is the weaker ones that have gone to the wall, or are at present in process of extinction.

The gradual elimination of these weak elements from the competitive arena, the decline of Indian and South American competition, and the fact that Ceylon has finally thrown up the sponge, leave from seventy to ninety Javan planters in the position of potential dictators of the cinchona market. Can it be doubted that if there had been among them an organising genius of the stamp of a Rhodes, or of one of the bosses of the great American Trusts, we should long ago have seen a combination before which the quinine makers and consumers would have been powerless? The hour struck two years ago, but where is the man? We are no advocates of commercial combine, and we should be as sorry to see a ring of planters take their aces out of the consumer as to witness the same operation performed by a syndicate of quinine-manufacturers. We only record our surprise that such a splendid business-opportunity should have passed neglected.

CEYLON TEA IN AMERICA.

In *The American Grocer* of the 14th ult. a lengthy and illustrated article is devoted to Ceylon tea, and when the organ of the grocers gives so much space to the subject, we think that may be regarded as a very hopeful sign indeed. The illustrations consist of a geographical—astronomical sort of diagram showing the comparative consumption of tea in the U. S. and the United Kingdom, sketches of a Ceylon tea planters' buogalow (exterior and interior), coolies rolling the leaf by hand and the tea being examined. At the outset of the article statistics are given to show that the total supply of Ceylon tea in 1893, for the United States and Canada was 1,549,767 pounds. Fifteen years ago Ceylon exported 81,595 pounds or less than one-tenth the exports in 1893. Small as had been the imports into the United States, there has been more stir, talk and noise about Ceylon tea, than was ever made about Japan or China tea in the history of the plant in that country, waiving the instance of the Boston tea party. It was strange that in a country which in 1893 consumed 53,131,088 pounds, only about one per cent. came from Ceylon. It is added that the attempt to stimulate the use of Ceylon tea by discrediting China and Japan tea had failed. There was something in that method which antagonized the American's idea of fair play. Consumers there were wedded to coffee and beer, and although the importations of tea had doubled since 1870, the per capita consumption was less than it was in 1880 and subsequent years and only one-quarter pound more than in 1870. The use of coffee, however, had increased over 3 pounds per capita while beer had gone up from little over 6 gallons to over 16 gallons per capita. Undoubtedly one cause of the non-increase in the use of tea as a beverage was due to the poor average quality of the importations. Another cause is climatic. The American people did not take kindly to the tea leaf. The body and flavor

of Ceylon tea was radically different from that of China and Japan. It was, however, growing in flavor for blending purposes and were consumers as certain of getting such tea as was served at the Ceylon pavilion in Chicago, at various food exhibitions in the large cities, and at the California Mid-Winter Exposition, they believed the consumption of straight Ceylon tea would rapidly increase.

COCONUT PALM AND BEETLES.

A practical planter writes—"I am making an experiment with a view of saving some of my palms attacked by the weevil by taking the trees in hand early, before the grub has had time to do irreparable harm, digging out the larva and stopping the cavity with clay after applying a mixture of coal tar and kerosine oil. Results will be reported in due time."

THE TRADE OF FIJI IN 1893.

The import trade of Fiji for the year set against totals was as follows:—1885 £301,033, 1886 £230,629, 1887 £183,071, 1888 £183,222, 1889 £189,393, 1890 £206,757, 1891 £251,049, 1892 £253,536, 1893 £275,034. Its exports represented in 1885 £326,750, 1886 £283,496, 1887 £281,080, 1888 £376,978, 1889 £364,252, 1890 £364,533, 1891 £474,334, 1892 £434,791, 1893 £354,972.

It will thus be noticed that, although the business of last year was lower in amount to that of each of the two annual periods by which it was immediately preceded, it yet shows a material advance on all others with the exception of 1885 where the difference is comparatively immaterial.—*Fiji Times*.

SOUTH MYSORE PLANTERS' ASSOCIATION.

At the annual general meeting held in Belur on 22nd March 1894, there were present Messrs. Graham Anderson (President), H. F. Anderson, E. S. Broughton, B. Cayley, H. D. Chaldecott, H. P. Cobb, J. G. H. Crawford (Honorary Secretary), G. H. Eicke, W. Galiffe, J. G. Hamilton, J. A. Harris, P. Hunt, S. Hunt, L. Lake, Brooke Mockett, E. P. Playford, H. E. Townsend, and M. J. Woodbridge. Mr. Graham Anderson, in opening proceedings, congratulated the meeting on so satisfactory an attendance, and, having read a paper of introductory remarks, called upon the Honorary Secretary to read the Annual Report 1893-1894. This Report deals with:—Planters' Conference, Registration improvements, Coffee Stealing, Postal, Cattle Trespass, Cardamom Lands, Weights and Measures, Medical, Telegraph, Arrack Shops, Game Law, Railway Extension, Roads, Statistics, Accounts.

JAMAICA GINGER.

Hidden away in a little official Journal issued by the Jamaican Government, which is probably seen by few but botanists, there is some interesting information about one of the chief export articles of the island—ginger. The Jamaican Government has been somewhat troubled about the irregularity of the prices realised by this drug, and has set its tax-collectors to inquire why the average price of the rhizome from the Manchester parish should be 16s. 8d., and that of the Weatmoreland parish 60s. per cwt. The answers are generally that the want of care in the curing of the root is responsible for the low rates realised by much of the product. The green ginger, after scraping, should be kept from moisture, and daily exposed to the sun until it is perfectly hard; but these precautions are often neglected, the drug being dried while still immature, and put away damp into bags. Ratoon ginger is generally mildewed because it is harvested early in the season, when there is not yet enough constant sunshine available to enable the rhizome to be cured properly. The sharp, thin, narrow-bladed knives

used for scraping—or, rather, paring—and peeling the ginger are specially imported for that purpose, and are known as ginger-knives. When the rhizome has been scraped and peeled it is washed once or twice, and then dried on mats. In the Manchester district two varieties of ginger are grown—viz., yellow and blue—the former being the better grade. The name of "Ratoon" ginger, which often puzzles dealers in this country, is applied to the root produced from the same piece of the land after the first year's harvest has been garnered. These pieces of ginger (ratoons) left in the ground after the harvest, are again dug up, season after season, until their market value falls below 16s. per cwt. locally, when they are no longer remunerative. The use of lime-juice in washing ginger is condemned, as it is said invariably to cause mildew. An expert in ginger-culture describes the industry as a curse to the island, which should be abandoned—the sooner the better. Virgin soil is in constant demand for ginger-growing, but the exhausting effects of the crop on the soil, and the wholesale destruction of valuable timber in forest land (fire being the only agent for cleaning up), can only be realised by visiting growing districts and observing the dried-up streams, the clearance by fire of thousands of pounds' worth of timber, and the impoverished soil, which will only grow ferns afterwards. A howling wilderness marks the progress of ginger-culture in every direction, and 20l. worth of ginger is the outcome of ten times the value of other material destroyed.—*Chemist and Druggist*.

PLUMBAGO IN THE UNITED STATES.

From a pamphlet published by the Department of the Interior United States Geological Survey, on Gypsum, Fluorspar, and Graphite in 1892 by E. W. Parker, placed at our disposal by Mr. de Mell, jr., we quote as follows:—

GRAPHITE.

The production in 1892 was 1,398,363 pounds of refined graphite, valued at \$87,902, against 1,559,674 pounds, worth \$10,000, in 1891. Of the product in 1892, 1,298,363 pounds were from Ticonderoga, N. Y. The other 100,000 pounds was mined in Berks County, Pa.

Uses.—The higher grades of graphite are used in the manufacture of lead pencils and lubricants. The poorer qualities are used for crucibles, stove polish, foundry facing, and in the manufacture of paint for metallic surfaces.

SOURCES OF SUPPLY.—The graphite produced in the United States is by no means commensurate with the demand, and manufacturers are obliged to secure supplies elsewhere. The island of Ceylon furnishes the bulk of the world's supply of the mineral, and graphite mining is one of the most important industries of the island. Only the most primitive methods are employed in mining, but, nevertheless, the industry is a very profitable one. Germany also produces a considerable amount of graphite, the output of the empire in 1890 being 4,355 metric tons.

The production in the United States since 1880 has been as follows:

PRODUCTION OF GRAPHITE SINCE 1880.		
Years.	Quantity. Pounds.	Value. \$
1880	49,800
1881 ..	400,000	30,000
1882 ..	425,000	34,000
1883 ..	575,000	46,000
1884
1885 ..	327,883	26,231
1886 ..	415,525	33,212
1887 ..	416,000	34,000
1888 ..	400,000	33,000
1889	72,662
1890	77,500
1891 ..	1,559,674	110,000
1892 ..	1,398,363	87,902

IMPORTS.—The amount of graphite imported and entered for consumption including withdrawals from warehouses, in 1892, was 11,677 short tons, or

usually weighed) 233,540 hundredweight valued at \$667,775. In amount this did not equal the imports in 1890 when 255,955 hundred weight was imported but the value exceeded by more than \$70,000 the imports of any previous year. The following table shows the annual imports since 1867:

GRAPHITE IMPORTED INTO THE UNITED STATES from 1867 to 1892.

	Unmanufactured		Manufactured.	Total
	Quantity, cwt.	Value, \$		
June 30, 1867....	27,113	54,131	54,131

SUPPLEMENTARY OR AUXILIARY CULTIVATION FOR INDIGO, TEA AND COFFEE PLANTERS.

Owing to a variety of reasons, the production of shellac and cognate preparations has fallen off in recent years and it is a commodity of considerable value, for which there is a steady demand. The reason of the reduced production of Shellac is that the yield of Stick Lac, from which article it is manufactured has been very greatly curtailed of late years in the chief producing districts of this country, viz. the Central and Eastern Provinces, the Chhattisgarh plateau and the Chittia Negore territories. The result is a considerable and in all probability, a permanent enhancement in the price of Shellac, especially of the finer marks; and in this connection we would urge upon all our planting friends that a very profitable opening for a supplementary income is at their disposal. It is not our province to elaborate in detail on the reason for the short yield of Stick Lac, further than to say that the opening up of the Bengal-Nagpore Railway and the enormous clearings of jungle lands consequent thereon, coupled with the great tide of emigration of coolies from these jungly tracts to the tea districts for many years, are the chief causes of the reduced output of Stick Lac; for these jungles yielded it and these jungly coolies used to attend to the propagation and collection of the insect product.

What we would point out for the benefit of our planting friends—whether in Indigo, tea or coffee—is, that there is now a most beneficial and easily-worked undertaking available for them all, without any appreciable outlay of capital, an operation easily conducted, and one which from start to finish can be carried out without detriment to their ordinary operations. All work required for the propagation and collection of Stick Lac comes on at the planters' slack times, and the Labour they would have to detach from their current work is microscopic as compared with the results to be obtained, for the Lac insect is the great worker and the real producer of that commodity. In these days good Stick Lac is worth from \$40 to \$50 per pound, according to quality, and there is always a ready market for it and one good sized Koomum tree has been known to give 15 to 25 acres of Stick Lac annually.

As the plant which produces Urhur Dhal is a favourite with the Lac insect, Indigo planters might turn their attention to its production with advantage, for the period of growth of the Urhur plant is of quite sufficient duration to enable them to get off to get off a crop of Stick Lac each year, and the deposit of the insect and its operations do not in any way reduce the yield of Dhal from the plant. A small portion of each year's yield of Stick Lac would have to be retained for the propagation purposes of the following year's crop of Lac. There are waste lands in several Perguonahs where the Babool tree and the Peas exist in considerable numbers and over a considerable area, and on these the Lac insect thrives; and it would well repay Indigo planters to arrange for the production of Stick Lac upon all such as are in their respective neighbourhoods and in their control. For in these days of progress in chemical science and the attention that is being given to the production of a mordant that will supplant Indigo in the markets of the world, it is an advantage to look ahead a little and prepare for any great alteration that may take place, and Indigo planters are the most likely to be affected by any great changes or discoveries in chemistry.

Most tea and coffee plantations require a certain amount of shade, besides which, generally speaking, they have a substantial area of surplus lands and we wish to shew them how, by making an intelligent use of their shade requirements and their surplus lands, they are in a position to inaugurate a most profitable supplementary or auxiliary industry, and one which entails the detachment of very little labour from their ordinary occupations. There are certain wild trees such as the Koomum, the Blair, the bastard Teak, the Babool, and the Peas, on which the Lac insects thrive, and with the exception of the first mentioned they are all found in abundance in most jungle or waste tracts. The first mentioned description of tree is not so common, nor so generally found in jungle tracts, but the Stick Lac produced from it is the finest quality and goes to make the finest marks of orange Shellac. The Koomum is a large and very clean tree which gives a fair amount of shade. It is something like the Sisoo in size and appearance, is easily grown, is of rapid growth, and requires but little care when once planted, and the annual yield of Stick Lac from it is a moist one such as the tea and coffee plant loves, and where it is not indigenous and does not at present exist it would be a most profitable undertaking to plant it out for shade purposes, and in all waste or jungle lands. For the benefit of those of our planting friends who are not conversant with the subject, we may mention that Stick Lac and its resultant product is not a gum as it is usually or commercially called. It is the product of a minute insect, the *coccus ficus* and is composed of a material which the said insect builds up round its young for protection. The *coccus ficus* deposits its eggs on the finer twigs and leaves of the tree it affects, and an orange colored substance exudes from the insect with which it proceeds to cover its eggs—this incrustation is Stick Lac of commerce. This peculiar exudation is evidently intended as a protector of the eggs and the small maggot hatched therefrom; it probably also serves as food for the maggot in its first stage. The Lac is arranged neatly in cells slightly differing in form from honeycomb. The insect does all the work and the small branches and twigs encrusted with this substance are broken off by the collector when mature, or about twice a year; a small portion must be left in each tree from which the insect will escape and propagate and build up further supplies. Once introduced the only labour required for the production of Stick Lac is for the purposes of collection. To propagate on fresh or unused trees or shrubs, all that is needed is to take a few twigs, tear off the eggs or maggots of the insect at a period before it escapes from the cells of Lac built round it, and tie these on the unused or unimpregnated tree, and when the maggot escapes it will crawl along the fine twigs and commence its operations without

any further assistance. There are four kinds of Lac known to commerce—Stick Lac, Seed Lac, Shellac, and Button Lac—and it is optional with the producer to supply it in either form. Stick Lac is Lac in its natural state, the small twigs encrusted with this commodity being broken off twice a year. Seed Lac is the purer commodity when crushed and separated from the stick; this is done to lessen the expense of transport, as the wood to which the Lac is attached is useless and valueless. When fire is brought to bear on Seed Lac, this liquifies it, and it is then roughly made into small cakes, these are called Button Lac, and are exported to Europe and America in that form. Any planter could successfully prepare Button Lac with most profitable results. For the preparation and manufacture of fine Shellac much more elaborate arrangements are necessary. Roughly speaking, Seed Lac is placed in cloth bags and held over charcoal fires, pressure is brought to bear on it and the Lac melts and strains through the cloth bags in a very pure state, whilst in that state it is manipulated into sheets resembling panes of glass and that is the Shellac of commerce—only those planters who produced Lac on a large scale, or in combination, could profitably turn out Shellac. Formerly a dye was made from the insect, but this is valueless now—but the refuse at a Button Lac or Shellac factory is a very valuable manure and as a fertiliser it would benefit the planter. There is an everlasting market for Button Lac and Shellac. It is used by hatters for stiffening hats; it enters largely into the composition of sealing wax, it is a necessity in the preparation of submarine cables for telegraphic purposes, and whenever a new cable is laid down prices advance considerably. Varnish makers cannot prepare their various preparations without Lac, for it is one of the chief ingredients in all really good varnishes and it is used in all lacquer work. There is no other natural production which can enter into competition with it for the above purposes. Native manufacturers of Button Lac, as is their custom, tried the effects of adulteration with resin, but this was found to nullify the valuable properties contained in Lac and the result was very disastrous to the adulterators.—*Indian Planters' Gazette*.

TABLET TEA.

TABLET TEA, which, unlike brick tea, writes British Consul Brown, of Kiukiang, is made from the finest quality of dust, showing a marked increase in the 1892 movement. Two Russian firms are the only makers of brick tea in Kiukiang. One of them has at present the monopoly of the manufacture of the tablet tea, which is finding a market even outside Russia, in Germany and France. Last year's report spoke of it as "the best and most convenient form of tea that one can possibly imagine for travellers, backwoodsmen, or armies in the field." There would seem to be no reason, however, why whole-leaf tea should not be compressed into nearly the same compass by suitable machinery, much as some kinds of tobacco are treated, and in that case, the leaf being unbroken, one would expect the aroma to be better retained. By an arrangement of the mould the cake could possibly be divided into rations, and thus economy of space in the traveller's box, the army commissariat, and the man-of-war's store-room would be combined with simplicity in use. Samples of brick and of tablet tea are forwarded with the Consul's report for the inspection of anyone interested in the subject, and these are to be seen at the India Office. The manufacture is only carried on at Kiukiang during August, September, and October.—*Commerce*, March 21.

VARIOUS AGRICULTURAL NOTES.

HORN'S ANTITANNIC TEA INFUSER is a most useful patent. It consists of a little porcelain perforated bowl and a saucer to fit on its top. This bowl fits either breakfast or tea cup. The tea is put into this, and after three minutes' infusion in boiling water is removed, and the result is a cup of tea free from tannic acid.—*British Weekly*.

THE INDIAN TEA ASSOCIATION AND THE AMERICAN CAMPAIGN.—In another column we give part of the proceedings at a meeting of the Indian Tea Association showing the steps which that body are taking for the purpose of continuing the campaign in America. They have appointed a Tea Fund Committee to collect subscriptions and organize arrangements for the further introduction of Indian tea into the American and Canadian markets, and, following up what took place at the special meeting attended by Sir John Muir and Mr P. R. Buchanan, have passed a resolution in favour of combination with Ceylon.

Dr. GEORGE BENNETT.—We learn from *Nature*, of the death of our old correspondent, Dr. George Bennett, of Sydney. Dr Bennett was, we believe, the brother of the late J. J. Bennett, of the Botanical Department of the British Museum, and the contemporary and friend of the late Sir Richard Owen, and of the most distinguished men of the science of his time. He travelled in New South Wales and Ceylon, and a few years since revisited his old home, when his vigour of mind and body excited the attention of all who knew him. Dr Bennett was ninety years of age.—*Gardeners' Chronicle*.

LIGHT AND FLOWERS.—The action of light on flowers has always been a fascinating study, and many experiments have been made by which plants have been grown under glass of various colours. Amongst the latest researches in this direction are those of M. C. de Candolle. He exposed specimens of *Tropaeolum majus* and *Lobelia erinus* to the action of light, which had previously passed through a solution of cinchonine sulphate, and had thus been deprived of all rays except the ultra-violet rays. He found that these ultra-violet rays have the effect of greatly stimulating the formation of flowers, but that they are not essential to their development. Further particulars of these experiments may be found in the *Arch. Sci. Phys. et Nat.*, xxviii., p. 265.—*Ibid*.

WOOD PAVING.—Since the previous note on this subject was penned, the writer has observed a paragraph in the daily press, in which it was stated that sundry streets in Paris are being paved with Mahogany blocks! This is not the case, as the same woods are being used there as in London—Jarrah, the produce of *Eucalyptus rostrata*; and Karri, another member of the great genus *Eucalyptus*. The Jarrah has been most used with us, probably, but the Red Gum is coming to the front. Western Australia is the source whence the supplies are drawn, and the area now being extensively tapped exceeds, or at any rate equals that of Great Britain. The forests are not far distant from seaports, and the trade is being largely developed by our merchants and contractors. The results obtained in Australian towns are very satisfactory—doubtless the same record will be given here of the Australian hard-wood pavements.—*Ibid*.

GRAFTING.—Mr. J. T. Wright publishes in the *Botanical Gazette* for August, an account of his researches on the mode of union of cells in herbaceous grafting. This happens takes place in two ways, either by the compression of the cells of the scion and those of the stock, by which the two cells become welded together, or by the formation of meristematic tissue (callus) on the cut surfaces of one or of both plants. The broken walls of the injured cells are pushed into line by the growing tissue, and form a brown layer which everyone recognises on examining grafts by the microscope. The paper is of special interest, as showing the causes of failure or of success, and why graft hybridisation may probably occur in some cases, whilst the arrangement of the tissues would probably prevent it in others. In his experiments, Mr. Wright succeeded in obtaining union between, such unlikely subjects as *Tradescantia zebrina* on *Potato*, and *Geranium* on *Potato*. He does not tell us, however, how long the graft survived.—*Ibid*.

THE LATEST BOOK ON TEA.*

We now revert, as promised, to a fuller notice of this valuable addition to the literature of tea. Mr. Bamber's "Text Book" indeed covers the whole ground, as our readers may see from the full "title and contents" appended. Everyone, therefore, who wishes to know all about the tea plant from the earliest times should read this book. They will find within its pages much that is interesting, which cannot even be mentioned here, since in a necessarily short notice, it is impossible to do more than glance at what we may consider a few of the more salient lessons bearing upon our own circumstances and requirements in Ceylon. Of course, much of Mr. Bamber's experience in India would have to be greatly modified in Ceylon; for, while the scientific data and chemical facts accumulated will be found to hold good under all circumstances, yet in our island so many degrees nearer to the equator, climatic influences must compel many modifications in practice, as Mr. Bamber himself admits in the Preface already quoted by us. A great part of the contents, therefore, we shall pass over merely remarking that the lessons and experiments in Agricultural Chemistry recorded in the book as specially applicable to the cultivation of tea, though most valuable and interesting, are, after all, only such as must be repeated in Ceylon for local application; and that in Mr. M. Cochran, the Ceylon planter has the medium, whenever they choose to employ him, for ascertaining the nature of the soils in which their tea grows, the most suitable manures to apply, and the chemical value of such manures by analyses before purchase.

Before proceeding to that part of the Text Book, which, we think, will have most attraction for the Ceylon planter, we may notice one or two passages giving specially interesting facts concerning tea. On page 150, Mr. Bamber gives a list of the organic constituents of which the tea-leaf is composed. They consist of no less a number than fifteen; but of these, Mr. Bamber says, "the most important as affecting the quality and strength of tea are the essential oil, theine and tannin, the other constituents affecting it only according to their solubility in water." Concerning the essential oil Mr. Bamber says:—"Notwithstanding the small quantity usually present it is of great importance, owing to its powerful ethereal odour to which the flavour and aroma of tea is largely due. Tea loses its delicate aroma when not protected in air-tight cases, showing the necessity of immediate packing after manufacture." We make no comment upon this, leaving our readers to draw their own conclusions from their own experience. But Mr. Bamber does not fail to point that, "under the system of high firing so frequently adopted, a considerable loss of the chief flavouring constituent, the essential oil, results." That title of this "aroma" can ever reach the consumer in Europe must, however, be evident when we consider other facts we find scattered through the pages of this book. If the flavour and the aroma, due to the essential oil, can only be preserved by the tea being kept packed in air-tight cases, their retention becomes hopeless in face of the fact that once arrived at the Custom-house in London the contents of such cases are turned out and afterwards seldom properly repacked. The natural result is that absorption of moisture immediately commences, till we are told by Dr. Diver,

* A Text Book on the "Chemistry and Agriculture of Tea including the Growth and Manufacture," by M. Kelway Bamber, M.R.A.C., M.R.A.S. Eng., F.O.S., Member of the Society of Arts, London; Late Chemist to the Indian Tea Association, Calcutta.

in Appendix II., that "when tea comes hot from the firing operation it is without any water, but analysis of tea in Europe have been published giving as much as 16-17 per cent. of water, and 10 per cent is regarded there as the normal proportion! Thus it will be seen that every nine pounds of tea put up in Japan or China (of which tea he was writing in 1879) will on retailing in the United States or Europe, run to ten pounds, the tea containing the water, remaining dry to the touch." Tea passing direct from producer (or packer) to consumer ought therefore, to be superior in aroma; while another inference would seem to be that the moist climate of Colombo is but the ill-adapted for repacking or blending purposes?

That the essential oil is present in the green leaf, Mr. Bamber asserts against the opinion of some other chemists, "but," he says, "the quantity is considerably increased during the process of manufacture, provided the temperature employed at the different stages of firing be carefully regulated." This increase does not, he thinks, arise from any further chemical development; but is due rather to the "bursting of the interior cells of the leaf by the sudden expansion of the sap, during the first process of firing and its consequent liberation. Of the next chief constituent of the tea leaf, theine, we learn a good deal, much of which will doubtless surprise the Ceylon planter, as for instance when he is told (by Dr. Diver) that "the quantities of the theine have not been found to be at all in any direct relation to the recognized value or appreciation of tea." A table is given showing the quantity per cent of theine in 28 samples of Ceylon and Indian teas, varying in price from 7d to 3s a pound, the inference drawn being that "it is evident from data given, as compared with the prices mentioned, that the marketable value of tea is not to any great extent dependent on, or proportional to, the amount of theine it may contain, however important that constituent may be in other respects; neither can the 'strength' of tea, as that term is generally understood, be taken as proportionate to the amount of theine, which is evident from the results 26 ("weak tea 4.35 per cent."), and 27 ("strong tea 4.43 per cent.") in which the difference is very slight!"

Further we learn from Mr. Bamber himself that "the theine undergoes no change during the process of manufacture, there being the same amount when calculated on the dry matter of the leaf, both before and after manufacture." The discussion of this subject in the book is very interesting as it brings us into touch with the system under which tea is finally tested and valued. We are of those who believe that science can and will yet do much to help the planter both in the factory and the field; yet we cannot overlook the fact that tea experts, upon whose final judgment and report all tea stands or falls in the home market, depend solely upon the palate and the appearance of the liquor and infused leaf to the eye. Probably the most expert tea-taster and valuer has as little scientific knowledge as the ordinary planter, and would be equally at a loss to explain why one tea is more valuable than another in the terms of chemical science. In this connection Mr. Bamber admits that "the presence of slightly varying quantities of theine would not add to the strength or color of the liquor, and would not affect its commercial value to an appreciable extent." But he adds: "At the same time the tea with the higher percentage of theine would have a greater beneficial effect on the human system, only this fact is not regarded." When tea is infused for five minutes we are told that only "about 50

per cent of the total alkaloid present in the leaf is extracted, the other half remaining in the leaf together with the greater part of the tannin." Regarding tannin itself we learn that "a solution of tea when allowed to stand for some days, gradually loses its astringency owing to a portion of the tannic acid undergoing a chemical change from the absorption of oxygen. This change would go on in imperfectly dried leaf, and the mellowing of tea when kept for a long period is probably due to this, especially as is seen from analyses of Indian teas made in England, that the average percentage of tannic acid present is less than that found in freshly-made tea in this country." We, therefore, see that whereas the flavour and aroma due to the "essential oil suffer by exposure, tea is in other respects improved by the hygroscopic moisture it absorbs." Further on Mr. Bamber remarks:—"The tannin in tea is the chief cause of strength and pungency, *** but it is probable that the *fullness* of the tea apart from *pungency* is due to the mucilaginous constituents dissolved by the boiling water as well as to the tannin and other soluble matter." We notice here, as in many other places, that often where we long for more definite information, the scientist speaks in terms of doubt and uncertainty showing that much has yet to be learned by our teachers. This "other soluble matter" is chiefly "mucilage," to the presence of which we are told "the creaming of tea is apparently partly due." Finally, as regards the "theine," Mr. Bamber repeats in summing up the results of his analyses that "the total quantity present in the leaf and tea was 4.25 per cent showing that no loss of this constituent takes place during the various processes of manufacture"; but as regards "tannin," he says, on the contrary, "a large proportion is altered and its astringency destroyed during the oxidation and firing processes, without, however, reducing the total amount of soluble matter in the leaf. The quantity of soluble matter varies considerably throughout the season, depending largely on the kind of weather previous to, and at the time of, plucking."

We now come to the more practical part of the subject in the Seventh Chapter in which Mr. Bamber very wisely sums up the lessons suggested by his researches without re-intruding those scientific details to be found in the earlier Chapters.

The average planter recoils from the mere technicalities and tables of a dry, unfamiliar science, with whose symbols and terminology he is unacquainted. The scientific expert should endeavour to keep these for his own convenience, and to communicate the results he arrives at in the simplest language at his command. This, we apprehend, is what a community of practical men want, and must have, in order to arrest their attention; and this, it seems to us, Mr. Bamber has well kept in view in the chapter on "manufacture." In our notice of this part of Mr. Bamber's work we shall pass over the historical references and refer only to the useful hints and suggestions that may seem to be novel and of value to our planters, reminding our readers, at the same time, that there is scarcely a line without its interest and importance. Of course, "withering" occupies the first place, and we are not surprised to learn inasmuch as the chief object of withering is to "obtain the leaf in a suitable condition for rolling—this condition being attained when the leaf will take a good twist without being fractured—good tea can be made from almost any system, artificial or otherwise, provided the temperature employed is not too high,

or the process not too much prolonged." As there "is little chemical change in the leaf during the process of withering," it becomes more or less a mechanical process, already well understood and practised in our Ceylon factories. "The amount of moisture which should be allowed to evaporate varies considerably according to the *jat* of leaf, the time of year, and the weather, but about 33 per cent apparently yields the best results." "Rolling" comes next, and we are told that "certain chemical changes take place during this process being more pronounced when the temperature of the leaves is allowed to rise and the rolling long maintained."

Mechanically what takes place is "the breaking up of the cellular matter of the leaf in order to liberate the juices, and to give a twist or roll to the leaf, the tougher epidermis being merely bruised and twisted." The changes that take place during rolling, Mr. Bamber insists, "should be minimized as much as possible by keeping the leaf cool." These changes should take place during the "oxidation process" or, as commonly called, "Fermenting." This process, Mr. Bamber says, "is perhaps the most important in the whole manufacture, as both the good quality and appearance of tea depend largely on the process being properly carried out." He advocates a special room for this process, kept damp by sprinkling cold water over the floor, and the leaf itself, when too dry, should also be damped with clean cold water, and be protected from draughts by means of wet cloths placed over the heaps. Firing or drying, we are told, "should not be delayed for even a few minutes after the leaf has attained its proper colour, as it rapidly becomes darkened and the liquor and infused leaf will not be so satisfactory. The temperature of the drying machine should be about 280°, and in that it should remain only until it is half dry, when it can be allowed to cool and remain untouched for some time without harm. The air of the drier should itself be as dry as possible. For the second firing the temperature should not be quite so high as that of boiling water, or from 180° to 200°, so as not to drive off the essential oil usually lost at this time. But finally, in order to drive off *all* the moisture, the tea should be subjected to a temperature of about 212°, and the whole process of second firing should be slow, often occupying two hours to accomplish, in order to retain all the essential oil, and it is generally believed that exposing the leaf to a prolonged gentle heat develops more fully the peculiar aroma of good tea." The "final" firing takes place after sorting, during which process it has absorbed a considerable amount of moisture from the atmosphere. This, in the final firing at about 212°, is driven off, and the tea is then—after being allowed to cool down to a temperature a little above that of the surrounding atmosphere under dry clothes, and in the driest portion of the factory—packed in the usual air-tight, lead-lined boxes."

Thus far we have followed Mr. Bamber in the various processes involved in the manufacture of tea; and (although some interesting facts have been disclosed) we cannot conscientiously say that anything very strikingly new has been evolved in the proceeding. Nor has much been explained that was not well understood before. Still it is something gained to be assured on scientific authority that the various processes followed in our factories are right. Keeping the leaf cool during rolling has long been practised by our planters, and patentees of rollers have always made this a chief recommendation of their machines. To get an even "wither" vast sums have been spent on

spacious lofts and fans, and when our planters do not succeed in obtaining this it is more their misfortune than their fault.

In the matter of firing, perhaps, a good deal of improvement is possible. It is just possible that our planters habitually put their tea through this process too hurriedly and at too high a temperature; and the warning Mr. Bamber gives is well worth their best consideration. Another point we gather from a study of the book is that the Factory, instead of being one large open continuous house, should be divided off into several parts, only connected by doors with each other. Thus, the withering, rolling, fermenting, firing, sorting and packing should all be done in their own special rooms. For the rest it must be remembered that Mr. Bamber's experience and investigations into the various processes of manufacture extended only over "one season and in a single district," which, as he admits himself, "is not sufficiently large to enable him to speak confidently on every phase," and in our opinion it is quite inadequate to the requirements of the case. The book, however, is a valuable one, and should be a standard authority improving with each edition. But it is evident the scientific experts' work, especially for Ceylon—is still an open field waiting for the coming man.

A "FLORAL SPLENDOUR" AT PERADENIYA.

A RARE WEST AFRICAN CLIMBER.

CAMOENSIA MAXIMA.—Ever since Angolan Dr. Welwitsch made known this leguminous climber, with its "splendid bunches of pendulous milk-white flowers tinged with gold on the edge of the petals," botanists have been eager to witness this floral splendour. But they have had to wait in patience. Now we learn that the shy beauty has flowered in the Royal Botanic Garden, Ceylon, and no one will grudge Dr. Trimen his good luck in being the first to set eyes upon it. Here is Dr. Trimen's letter:—

"*Camoesia maxima*.—I do not remember to have seen any notice of the flowering of this tropical African climber in cultivation, and it may therefore be worth putting on record that two plants are now in blossom in these gardens. Both were received here in 1883, one from the Royal Gardens, Kew, the other from Mr. Bull's establishment. They were planted out against old trees, and have made fair growth, but showed no tendency toward flowering till this year. The flowers are fully as large as those shown in the plate accompanying the original description in *Trans. Linn. Soc.*, vol. xxv., only the petals in the fully-opened flowers are not erect, as there figured but (except the standard) wide-spreading and drooping. The drawing—which is a good example of the late Mr. Fitch's wonderful skill in vivifying a dried specimen—is otherwise very accurate, and correctly shows the erect flowers (erroneously described as "drooping") and the monadelphous bases of the staminal filaments (said to be "free" in the text) The stamens are always eleven in number, and about 6 inches long. When freshly expanded the petals are very beautiful, the standard over 7 inches long, the others over 6 inches, all of a delicate pure white thin tissue-like texture, with a narrow yellow fringe like gold lace, but their beauty does not last long, and they become flaccid and black ultimately, without falling off, which spoils the general effect of the inflorescence. Still it is a wonderful flower, and a rival to *Amherstia nobilis*, which is always in flower here. *Henry Trimen, Royal Botanic Gardens, Peradeniya, Ceylon, January 24, 1894*"

(From the "Gardeners' Chronicle," Feb. 24, 1894, p. 236.)

I send you the above cutting from the *Gardeners' Chronicle*. The beautiful plant referred to has many points of interest. It was discovered in 1855 by my old friend the late Dr. F. Welwitsch (who died in 1872 in London) during his very fruitful botanical explorations through Portuguese W. Tropical Africa extending from 1853 to 1860; the dense forests of the district of Golungo-alto being the locality. It was not however fully described till 1865 by the late Mr. Bentham in the *Linnæan Society's "Transactions"* from Dr. Welwitsch's notes and specimens.

To many inhabitants of Ceylon it will have a special interest from its discoverer (who was in the employ of the Government of Portugal) having dedicated it to the celebrated Portuguese poet, Luis Camoens, author of the great national epic, "Os Lusíadas," in which is described the voyage of Vasco de Gama (which indeed he himself accompanied as a soldier) at the end of the 15th century to these African coasts and southward to the Cape.

H. T.

Peradeniya, March 26th, 1894.

CEYLON PLANTING NEWS.

(Notes by Wanderer.)

March 27.

WEATHER again hot and dry. The good done by the late rains will not be of lasting effect, and our exports will not frighten dealers for some time to come. Some of our weather-wise men say that this long-continued dry weather will be followed by long-continued wet weather at end of N.-E. and commencement of S.-W. monsoons. In that case tea prices should look up.

EXCHANGE is certainly satisfactory. It may be the case that China's exchange is still 20 p.c. lower than ours, but I think Ceylon tea can stand that great handicap, at least its best teas can.

CEYLON TEA KIOSK.—What are the Directors about? Have they let Lipton away without having a try to deal with him? Is the concern doing so well under Whittall & Co.'s management that the Directors can smile at Lipton's little flirtation and his "two canoes"? The Sphinx of King Street, Kandy, will, I hope, be persuaded to give the shareholders a paragraph in his bold Roman hand.

The Hon. the PLANTING MEMBER is said to have taken his passage home. His constituents hope he will resign his appointment, and give them a chance of having Mr. Giles Walker to represent them. Mr. Kelly has attended to his duties, and represented the planters to the best of his ability, and they thank him; but they do not wish to be unrepresented in Council when so many important matters will be considered by our Legislative Councillors.

TEA COMMISSIONER TO AMERICA.—This question is being threshed out in your paper and the columns of your contemporaries. The general opinion seems to be that if Mr. Grimlinton is chosen by both India and Ceylon to represent both countries Ceylon men need not hesitate to share the expenses, if an Indian man is to be the representative, there is a pretty general opinion that there will be "wigs on the green."

THE PLANTERS' MEETING at Nuwara Eliya on the 14th proximo is likely to be well attended. There will be a lot of important matters to discuss, and there must be considerable divergency of opinion. The new Chairman will have his work cut out for him, and will, I have no doubt, show the stuff he is made of.

THE CACAO PLANTERS' DEPUTATION and the District Road Sub-Committee have also their work cut out for them. They will have to mind theirs and be ready to answer the questions of the Governor in no undecided manner. The Governor is a No. 1 man at plying a Deputation with his desires for

* See my memoir (with a portrait) in "Journal of Botany" for 1893.

information, and the interviewers often go out, feeling that they have been interviewed.

COCOA.—The news that the Guayaquil crop estimates are reduced will be somewhat comforting to the Ceylon grower, for really the present position of prices is too awful. If the cocoa land, lately planted, is worth anything, we will have a large increase in our Ceylon exports in two or three years.

DR. TRIMEN'S REPORT for 1893 is interesting reading. He gives the Borneo planter a leg-up in the matter of gambier, and he says a word of encouragement to the Liberian coffee planter in the New Ceylon.

FIRE INSURANCE OFFICES.—So the "Economic" is in liquidation or amalgamation, which does not offer much encouragement to the non-tariff style of doing business. In looking over some of the Tea Companies' accounts, one is rather struck with the small bonuses, the bonus-paying offices give to their clients.

COFFEE CULTIVATION IN JAVA.

From a reliable source it is reported that the newly-appointed inspector, Dr. Burck, who has made an investigation about the compulsory coffee cultivation in Java, does not consider the condition so gloomy as was generally presumed. In Central Java the prospects are not encouraging, and in many districts there the Government will have to give up the cultivation, as has been done already in the districts of Bantam and Japara. However, in Eastern Java, and especially in Probolinggo and Bezoekie, there is an abundance of magnificent ground suitable for the cultivation of coffee, and also in the Preanger districts the soil is certainly not exhausted. Dr. Burck seems to be a strong promoter of the system of granting an extra payment for the opening and maintenance of coffee lands, besides the price paid for produce delivered.—*Straits Budget*, March 20.

THE KWANTO TEA ASSOCIATION.

The Kwanto Tea Association—our readers will remember that the Kwanto, Kwansai, and Kiushu Associations have combined to form one great guild—is to have its central office in Yokohama, and will send agents abroad for the purpose of "extending the market for Japanese tea." From this we infer that the members of the Association have undertaken the pursuit of that *ignis fatuus*, direct export. We recommend them to pause. Every Japanese who has hitherto essayed that experiment did but serve to illustrate the familiar fable of the man that went out for wool and came home shorn. The tea trade, too, of all business, is least capable of being successfully exploited by amateurs. There is not the slightest chance for Japanese in such work unless they act in cooperation with foreigners. The time may come, probably will come, when they will be able to dispense with all extraneous aid, but for the present nothing of the kind is possible without heavy loss.—*Japan Weekly Mail*.

EAST AFRICAN COFFEE PLANTATIONS.

Favorable reports, says a London contemporary, have been received during the past year from all the plantations in German East Africa. The coffee plantations on the highlands in Usambara have been especially successful. The German East African Company report, with regard to their plantations at Derema and Nguelo, in the Hinterland of Tanga, that they now have 160,000 coffee trees in good condition, and soon hope to send samples to Europe. Experiments have also been made with tea, cocoa, and cardamoms. At Muoa, the most northerly inlet of the German coast, the East African Company have established a coconut palm plantation. On June 7th last a new Company, the Usambara Coffee Plantation Company, was formed in Berlin, and has already begun operations on suitable land beyond Tanga. Another undertak-

ing proposes to grow sugar in the Pangani valley, and establish factories for its manipulation, with a view to exporting it to Zanzibar and India. A former planter in Sumatra, Mr. John Schroder, has been taken into Government service as an expert to instruct the natives in the cultivation of profitable colonial products.—*American Grocer*.

MICA AND RUBBER.

The importance of the Mica industry is something that few people appreciate, especially to the extent to which it touches the rubber trade. Some twelve years ago it was almost wholly utilised by stove manufacturers for paneling the doors of stoves and furnaces. Of late years, however, the chief factor in its increasing demand has been its insulating properties. For armatures it is said to be superior to any substance known. The reasons for this are: its great hardness, which prevents its wearing a way under the action of the brushes; the ease with which its structure may be divided into very fine layers of uniform thickness, and its faculty for standing high temperatures without being affected at all. For insulating purposes a cement is made of finely pulverised Mica, compounded with rubber, and out with benzine, or it may be simply a dry dough of rubber and Mica which is moulded and vulcanised. Aside from this it is used for roofing purposes, and for waterproof and fireproof coverings, in which rubber, tar, canvas, and other materials are used in connection with it. The best Mica comes from Canada, in the vicinity of Quebec. In 1892, \$55,000 worth was imported to the United States, and it is said for 1893 over \$100,000 worth came this way. Considerable is mined in the United States, but the Canadian is rapidly driving it out of the field. It is said that a hot water valve, made of rubber and Mica, forms one of the most lasting compounds known.—*India Rubber Journal*.

COCONUT CRACKING OR SPLITTING MACHINE.

The splitting of coconuts has hitherto been done in the most primitive manner, the husk being burst open by short steel rods thrust into it, and the shell being afterwards cracked by a heavy hammer or weight. This old-fashioned and tedious method is now completely superseded by a new machine which is being manufactured and introduced by the Ceres Iron Works, Limited, of Kingston-on-Thames. By the use of this machine the nut with husk, as gathered from the tree, is simply dropped into the hopper, fixed above the revolving discs, which are kept continually in motion, and by their peculiar design draw down the nut, at the same time splitting it into three parts; the husk is then in a convenient form passed to the fibre mills, and the kernel is ready for removal for oil making. The machine will, it is claimed, do its work as quick as the hopper can be fed, so that a great saving of time is effected, removing the risk of the oil turning rancid from long exposure to the sun during the tedious operation of hand-splitting. These machines are made in two forms, one being arranged for fixing to the floor of factory, fitted with fast and loose pulleys for and driven, by steam, water, or cattle power, and the other being provided with travelling wheels and draw-handle for moving from place to place on the estate and working by hand power. The machines have been found by actual experience on coconut estates, to work most efficiently, one machine being sufficient for a factory accustomed to work up 8,000 to 10,000 nuts per day.—*Fiji Times*.

TEA IMPOSTURES.

Over in England, the land where the tea cup rivals the beer glass, it seems that tea has been discovered contaminated with lead; undoubtedly from

being wrapped in packets containing the metal. *Food and Sanitation*, London, says:—

"In the light of recent discoveries at Southampton that tea is adulterated with lead, it seems desirable that some attention should once more be given to this article. The Custom's examination, it was believed, had squelched tea adulteration, but such finds as those at Southampton may well cause grave uneasiness, and leads the public to ask if tea adulteration be really a thing of the past. Our inquiries go to prove that tea sophistication is very largely practised, despite the vigilance of those concerned with suppressing it. At least, two great proprietary packet tea firms, to our own knowledge, have no use in the patent tea restoring machine, which gives to damaged or "gone off" tea the appearance of first-class new tea. Whether the use of this recent invention explains the discovery of lead in tea at Southampton, or the process of "faking" is harmless, is a matter that ought to be inquired into, inasmuch as lead is a very dangerous poison, and its presence in so many samples may well cause grave public alarm. Popular as is "the cup that cheers, but does not inebriate," tea-drinking will quickly be shrunk from in horror if its devotees have to risk lead poisoning in their favorite beverage. Enough sins are alleged against tea without this of lead contamination."—*American Grocer*.

RUBBER IN THE CONGO FREE STATE.

According to the Brussels *Independence Belge*, the rubber industry of the Congo Free State has during the last few years grown to a marked extent. The development has been remarkable. The rubber is obtained in the usual way, by making incisions in the *Landolphia florida* vines, which are found in every part of the country, but which flourish most in the districts of Ubanga, Oulle, Mangalla and Kassai. The following table will show the quantities of rubber which the Congo Free State has produced and exported in the period between July 1st 1886, and July 1st 1893:—

	Kilograms.	Value.
		\$
In 1886 (July-December) ..	18,069	15,000
In 1887... ..	30,500	20,600
In 1888... ..	74,294	50,000
In 1889... ..	131,113	90,000
In 1890... ..	123,666	110,000
In 1891... ..	81,680	65,000
In 1892... ..	156,339	125,000
In 1893 (January-June) ...	116,301	90,000

—*Brodstreet's*.

TEA CURING BY ELECTRIC LIGHT.

Considering the extent to which the electric light has already replaced the old system of illumination by gas in manufactories and factories in England, on the Continent and in the great Western World generally, there can be little doubt that its adoption in India on a similarly large scale must only be a matter of time. It depends on the pushing energies of Electrical Engineers in the West, and the intelligent reciprocity of capitalists and speculators in the East, whether that time will be sooner or later, and that it will be rather sooner than later there are already evidences to show. In clubs, private mansions and some public places, in all of which it may be considered to a certain extent a luxury, the electric light has already found a very cordial welcome, notwithstanding that in such cases the whole cost of the machinery used in its production falls upon light alone. This being so, it is a matter of some surprise that in large factories, where some of the most expensive appliances required for an installation are all ready to hand without further cost, the electric light is not more largely used than it is at present. One of the first places where one would expect to see it in full possession would be the Tea Factory, yet here it is only just beginning to make

its manifold advantages over the dangerous kerosine known. In Southern India, at any rate, it may be said to have all its history before it; but not so in go-a-head little Ceylon. There Mr. Harcourt Skrine, of Osborne, Hatton, has fitted up his Factory with an installation of fifty lamps, on the advice of Mr. Robins, the electrical expert who is now putting up the plant for the Tramways in Madras, and news has just been received here of the complete success that has attended the innovation. The Factory is now illuminated with a steady and brilliant light such as was unknown when dependence had to be placed on kerosine oil, while the danger attendant on the use of oil lamps during the spreading of leaf on the Withering Tats has been completely removed. At Hatton it has been found, too, that with an adequate water-supply handy, accumulators are quite unnecessary, the light being taken direct from the Motor. In a properly equipped Tea Factory, it is explained, all the "rolling" of tea, the only process likely to make the speed of the shafting uneven, ought to be finished in the afternoon, leaving the firing of the Tea, for which light is required, and sometimes the spreading of the leaf on the Withering Tats to be completed between say 5 to 9 a.m. But even when "rolling" is going there is no reason why the light should be materially affected, as the speed of the main shaft could only vary from carelessness on the part of the coolies working the rollers. We have mentioned these details, which are the practical results of the introduction of the system into a large and well-managed Tea Factory, in the hope that they may be of service to some of our readers similarly situated, who may be contemplating the admirable step in which Ceylon has now set the fashion.—*M. Times*.

THE INDIAN ART OF ADULTERATION.

Much attention has been drawn of late years to the question of the adulteration of raw produce exported from this country. The state of affairs was exemplified not long ago in the case of the so-called "silk cotton," the product of the tree known to botanists as *Bombax Malabaricus*. A sudden demand for this article sprang up in Australia and Tasmania, and for a year the exports from this country were very considerable. The following season, however, the whole trade was diverted to the Straits, Java and Sumatra, and thus what looked like a promising new industry for India came to an untimely and regrettable end. The explanation offered at the time was that the second season's shipments were so heavily adulterated, that buyers would not look at them. In the Indian wheat trade the charge of adulteration has long been familiar. Dr. Voelcker has dealt with the question in regard to wheat at considerable length. One conclusion at which he arrives, on seemingly indisputable evidence, is that the primitive method of threshing which obtains in this country is not answerable for the heavy percentage of "dirt" in Indian wheat. On the other hand Dr. Voelcker lays the blame at the door of the European, or rather English buyers, who for various trade reasons insist on having "dirty" wheat. Dr. Voelcker asserts that by far the largest proportion of the "dirt" which is found mixed with Indian wheat is intentionally introduced by the various traders and middlemen between the cultivator and exporter. He quotes a case where he himself saw adulteration in process of being carried out.

It is certain that there is much intentional adulteration of all grain and raw produce. Dr. Voelcker mentions the habit of mixing the finer exotic growths of cotton which are grown in some parts of Bombay, with the short and less valuable indigenous cotton. We have recently heard complaints of the heavy adulteration of Godavery castor seed, before it reaches the hands of the exporter at Coonada, adulteration which has almost killed the trade though it has also resulted in for

tering a local oil manufacturing industry. Indeed the conditions under which agricultural products find their way to market offer every opportunity for adulteration, and in such a case opportunity is not lightly forgone. Railways are generally supposed to offer a fair guarantee against adulteration, though it was at a railway station that Dr. Voelcker witnessed the deliberate mixing of wheat with earth and foreign seeds. But railways are still few and far between. The grain consigned by the petty village merchant to the exporter has generally to spend days and nights in a country cart before ever it is put in the goods wagon. The cart man is always impetuous; in every village there is a "receiver," ready to buy and ask no questions. What wonder if the percentage of dirt increases fivefold in its passage from the threshing-floor to the ship's hold? In this Presidency we are fortunate in possessing some fine inland waterways. The Kistna and Godavery Canals have been an enormous boon to the trade of the Districts they serve. It is the more unfortunate therefore that the feeling is gaining ground that in goods transit over them are not safe. These canals are the property of Government and managed entirely by Government officials. It is worthy of consideration whether steps cannot be devised to keep the traffic on them free from such damaging imputations.

We noticed above how Dr. Voelcker absolves the ryot's method of threshing from blame in the matter of adulteration. In regard to wheat his experiments showed an average of only 1.32 per cent of impurity introduced on the threshing floor. Dismissing this therefore as the chief factor in adulteration he fell back on the hypothesis of intentional admixture effected by the various middlemen. He does not seem to have considered the various accidental dangers to which agricultural produce is subjected before it reaches the exporter's hands. We have very briefly indicated some dangers that occur on the road and the canal. There is another most fruitful source of contamination, in the granary. It is remarkable that Dr. Voelcker's attention does not seem to have been drawn to the native methods of storing agricultural produce. All the damage that the grain suffers on the threshing floor is but a bagatelle to the perils of the granary. An instructive little bulletin was issued in 1890 by the Madras Agricultural Department on "The Storage of Seed Grain in the Ouddaph and Karnool Districts." The cultivating classes, or at least the Reddies of those districts, are well known to be among the best husbandmen in this Presidency; and naturally they take more care of their seed grain than of that intended for home consumption or for sale. Seed grain in these districts, we are told in the bulletin, is kept either in bamboo baskets coated inside and out with cowdung; or in gunny bags or earthen pots; or in baskets lined with paddy straw. Whatever method of storage is used the grain is liable to damage either by insects or damp. But the bulk of the grain harvested, which is that intended to be used as food stuff, or for export, is nowhere treated with the care bestowed on the seed grain. "As a rule," says the bulletin above referred to, "the grain which has been stored in underground pits or in *garisalu* (overground bins) is not used for seed, as it is found to (*muggiponnu*) have become heated and been rendered unfit for that purpose. Grain is generally stored in these pits when it is desired to preserve it as a food stuff only."

The granaries used for storing the bulk of the ryot's grain are in general of the following descriptions. First there is the large room, or godown of mud walls and floor, or brick and mud walls and mud floor. Generally the floor is plastered with cowdung, and the roof is an open tiled or thatched one. In a godown of this description the grain is either heaped loosely on the floor, or is kept in bags. Another variety of the godown is the isolated granary built apart from the house, raised on stones or bricks or logs of wood above the ground level, with walls of mud, and conical thatched roof. A

very common receptacle, met within in most districts in the Presidency is a large bamboo basket, coated inside and out with cowdung. In this the grain is kept loose.—The last form of granary which we need mention here is the grain pit so common in some of the Northern Districts. This is a mere hole dug in the ground, usually on an elevated site, the sides and bottom of which are lined with paddy straw and the grain then poured in, in bulk. It would be hard to say which of these receptacles is the least suited to preserve the grain from deterioration. Each of them is liable to damp, whether of air or actual water, and it is only the thriftiest of ryots that will go to the trouble of taking his grain out and airing it periodically. To each of these granaries rats and insects obtain easy access. It is melancholy to see the dreadful havoc that has been wrought after the godown or grain pit has been closed for a couple of months, Mildew and weevils are the greatest devastators, and none of the precautions known to the ordinary cultivator—such as margosa leaves, gram pods, cowdung—suffice to keep these enemies out. And so, during the weeks or months the grain may be lying in the ryot's garner, to the modicum of dirt brought with it from the threshing floor there is now added a score of other impurities—dead insects; dust; scraps of household refuse; fragments of sticks, straw, bricks, chatties; mould; animal and insect excreta; the empty husks left by the weevils; and the miscellaneous dirt introduced by rats and squirrels.

We do not wish to be understood as implying that all this dirt accompanies the grain that is offered to buyers for foreign markets. The coarser and more obvious impurities are winnowed or cleaned out. Nor do we consider the mere adulteration of the grain the most serious consideration. The worst feature in this primitive method of storing grain is the very serious loss of food stuffs involved by it. Paddy and raggi enjoy a comparative immunity, but the loss of cholam and of all the different pulses is enormous. We have seen samples of cholam and horsegram taken from a grain godown wherein scarcely one grain in fifty had escaped the attacks of weevils. This implies an enormous annual loss of wealth. The Agricultural Departments of the different Provinces have for some years devoted a more or less spasmodic attention to the insect pests that attack the standing crops. We would commend to their notice the desirability of devising means to protect the gathered crops also.—*M. Mail.*

FACTS ABOUT BANANA MEAL.

A COMING INDUSTRY.

A Mr. Hartog, who went in the beginning of last year to Surinam (West Indies), is in possession of a method of preparing fine dry meal from bananas and plantains. The chemical analysis of both sorts of meal have proved that the chemical composition of different banana and plantain kinds is almost identical. The principal stuff the meal contains consists of 80 to 85 degs. of starch. This composition induced him to seek the adoption of the meal for purposes where other stuffs containing starch are employed, and he choose, in the first place, the fabrication of alcohol and glucose (grape sugar). As he did not dispose of very large quantities, he was forced to apply to laboratory experiments that were made at the Government Institute of Alcohols in Switzerland fixed at Berne. The gentlemen there made alcohol of the meal, and wrote as follows:—

"Il résulte de ce qui précède, qu'il vaut tout a fait la peine d'utiliser ces saines pour la fabrication d'alcool. La qualité de l'alcool de farine de bananes peut aussi être envisagée comme bonne." In the conversation about the object with those gentlemen, they gave their opinion that the value of the meal would at least be that of maize, the starch quantity of the meal being greater. The same opinion was given by some manufacturers of alcohol in Switzerland and Holland. As proof of how many stuffs

can be employed for alcohol manufacturing, it may be said that one not very large manufactory in Holland employs on an average 25,000 tons of maize a year. The same gentleman, in Berne, made experiments with glucose making, and said:—"Il est évident que la farine de bananes traitée de cette manière pourrait être encore utilisée pour la fabrication de glucose." The value of the meal for glucose would be more than one and-a-half times that of maize, for maize is not employed for that fabrication, but only "dearer sorts of stuffs," as potato and sago meal. A certificate for the employment of the meal for glucose manufacturing can only be given by employing at least a ton of the stuff, but there is very great probability it will also do for that purpose. In the following calculations he estimates the value of the meal on the basis of maize, that is at this time being delivered by ship in Europe at £5 to £5 10s. For manufacturing 1,000 tons per year of meal there would be needed an installation that would cost, delivered and fixed in the estate, £2,000 to £2,500. For a second 1,000 tons a similar installation would be needed, for it would be difficult to make large installations. For this reason it would also be profitable to make the manufactory on the estate itself, for using the bananas and plantains. The fabrication of 1,000 tons will be taken as a basis. Cost of reaping the fruit, preparing it, and making the meal delivered on ship if there is water in the neighbourhood, can be put at 18s to 20s per ton; for freight to Europe, 18s to 25s per ton. Thus the average cost for the meal delivered in Europe would be £2 per ton. He said the value would be at least that of maize, or £5 10s. So that there would rest per ton of meal £3 to £3 10s. So that for 1,000 tons an installation of £2,000 to £2,500 is wanted, and a quantity of bananas or plantains of about the double or the triple of the meal in average 2,500 tons, whilst the revenue would be £3,000 to £3,500. In the above given cyphers all exaggerations are avoided. So it is probable that the quantity of 1,000 tons can be surpassed, and cost of manufacturing can be reduced, whilst the price of the meal would increase if it will do for glucose manufacturing.

L. E. ASSER, C. E.

[We have examined specimens and samples—both of the banana spirit and banana flour—and are satisfied that there is a great future before this industry.—*Edinburgh Horticultural Times.*]

CLOSE PLANTING OF TEA.

A matter that is well deserving the attention of tea planters of the present day is, whether or not the orthodox 4 by 4 is not too close for bushes, whose roots after a few years become interlaced, and whose branches, when the pruning has been recovered from, approach so closely as to impede the free circulation of air, also confining the effective use of the hoe to the narrow strip of ground left between the rows, while the soil near the stem of the plant, the most important of all, is left undisturbed, or is simply scraped, for appearance sake. Overcrowding, it is well known, is at the bottom of most of the ills that human beings are subject to, by giving an impetus to the development of disease germs, and the same is equally true in agriculture. Those who are inclined to contend that wider planting, say 8 by 8, would diminish the yield, may be reminded that an experiment was carried out some years since in the Punjab with mustard, which instead of being sown broadcast was drilled in at two feet apart, reaping, when the plants were about the same height, a light hoeing, much the same as field turnips do in Europe. The result was highly gratifying, as the yield, over that of a field adjacent sown in the usual manner exceeded the latter by 50 per cent, and there is no doubt that the same method of treating tea would be as successful. Wide planting, moreover, would enable the pruner to lay the plants more open to the influence of light and air, thus going far towards exposing the insects, that now infest our gar-

dens, to the attacks of the numerous birds which prey upon them, but which the dense foliage that the present system engenders renders almost impossible—and anyone who has studied the subject must be well aware of the importance of encouraging our feathered allies. The exposure would also tend to the greater development of vegetation and permit of more opening out of the centre of the plant. Surely the setting aside of a couple of acres for determining this matter would not be too much for some large concern to undertake. One acre might remain as at present, while the other might have the intermediate plants removed and, though rather late in the season, the widened acre could still be subjected to the friser use of the knife. Of course the yield of each would have to be carefully weighed and, though from the lateness of the year, the first two months' flushes would no doubt preponderate in favor of the land planted as at present, no hasty decision should be jumped to, but the result of the whole season left to settle the question.—*Indian Planter's Gazette.*

TEA AND SCANDAL.

In 1665, Robert Lovell wrote a book, which he called "Pambotanologia, or A Compleat Herbal," and your readers may be interested to hear what he says concerning TEA, COCOA and COFFEE.

"*Thee.* PLACE.—It groweth in China, Japonia and Chia. TEMPERATURE. The time is not observed. NAME. *Herba Thee Chinensis.* *Tchia*, Japon. *Thee*, Tulpius. Tea is moderately hot and hindring. VIRTUE. The herb is most wholesome, preserving in perfect health until very old age; it makes the body active and lusty: it helpeth the stone, headache and heaviness thereof, lipptude, distillations and difficulty of breathing, weakness of the ventricle, pains of the bowels, lassitude; and prevents sleepiness, a draught of the decoction being taken, and canseth that, without trouble, whole nights may be spent in study without hurt to the body, by reason that it moderately heateth and bindeth the mouth of the stomach, and do restraineth those vapours which otherwise ascending would cause sleep. That of Japonia is the best, which the natives powder upon a marble stone and mix it with warm water, but those of China boil the plant with a little salt and sugar in some convenient liquor, which afterwards they drink warm."

"*Cacao* tree. *Cacao.* PLACE.—In the West Indies, in hot and shady places. TEMPERATURE. As soon as it is touched by the sun it withereth. NAME. *Cacavate*; the confection thereof *Chocolate*. KIND. As the common and broader. TEMPERATURE. The kernels of the fruit are of different parts: first they are very cold and dry, so should be restraining and obstructive: yet they so far participate of heat and moisture, that if they be well ground and mixed their restraining and obstructiveness will be corrected. VIRTUE. The confection of *chocchetto* being taken alone or relented in milk preserves health and impinguates; it helpeth digestion, consumption, and cough of the lungs, plague of the guts and other fluxes, the green sickness, jaundice, and all manner of inflammations and oppilations: it helpeth the morpew, cleanseth the teeth, and sweeteneth the breath; cures the stone and strangury, expels poisons and preserves from all infectious diseases. The Indians use it with pepper for drink, but it is better for hogs than men."

"*Coffee.* *Cophy.* PLACE.—It groweth upon little trees only in the deserts of Arabia. NAME. As for the variety of names authors have as yet wrote little. TEMPERATURE. Is of an exsiccant quality. VIRTUE. It drieth up the cruditie of the Stomach, comforteth the brain; it helpeth consumptions, lethargies, rickets, swoonings of women; it fortifieth the sight with its steam, and prevents dropsies, gouts, and the scurvy, together with the spleen and hypocondriacal winds: all which it doth without any destruction. Hereof may be made an electuary thus: Take of butter and sallot oil *p. aeq. m.*, and melt them with thrice so much

honey and powder of Turkish Coffee *q. s. Rums*: the quarter of a nutmeg taken, opens the body, and helps the stone and gout. The grains and berries called coffee are brought from Arabia and drunk generally throughout all the grand seignour's dominions, and about half a pint is to be drunk fasting an hour before, and not eating an hour before, and not eating an hour after, as hot as may be endured, it not fetching the skin off the mouth or raising blisters by its heat. The Turke drink it to help their cruditie, drinking water and eating much fruit, which cause it. This drink is cold and dry, and when hot neither heats nor inflames more than hot posset. It cleoeth the month of the stomach and helpeth digestion, and so may be taken at three of the clock in the afternoon, or four, as well as in the morning. It quickens the spirite and makes the heart lightesome. The steam helpeth sore eyes. It is good against a cough and cold, suppresseth fumes, and so helpeth the headache, stops defluxions, and prevents the cough of the lunge. It is better than any other drying drinke for old people and children having running humours, as the king's evil, &c. It prevents drowsiness, hindering sleep for three or four hours, taken after supper. It helps the stone, whitens the skin, and is not laxative or binding."

The *Revue des Sciences Naturelles Appliquees* for January containing an extract upon "The Agriculture of Diego Suarez (Madagascar)." The following bits may concern Ceylon:—"The French Colony of Diego Suarez enjoys a marvellous fertility of soil. . . . There is found wild in Mr. Ambre:—coffee: six different sorts, one of which seems exactly similar to the coffee of Harrar or Moka. The castor oil abounds also in the forests. . . . Cacao appears to prosper in the western vallies in the shade. Several planters from Mauritius, who came over to Diego Suarez to study the possibility of forming plantations of tea have declared that the lay of the land is perfectly suited to this cultivation, and that it seemed to them that Madagascar ought to rival Ceylon in ousting China tea."

An American, named Edward Francis Turner, has written two amusing books for public readings called 'T Leaves' and 'More T Leaves.' I extract three verses from an absurd song in the latter book:—

I will sing to you a most peculiar song,
Not particularly short, nor very long,
Of a place I've heard about,
Where they turn things inside out:
It's all true without a doubt.
Pom—pom—pom,

They mix cocoa with champagne and olive oil,
They put sherry in the kettle for to boil;
And for salad they use coke,
Interpersed with (plants) of oak,
Which are put in tea to soak.
Pom—pom—pom.

If you'd like yourself this country for to see,
Stop up late, and drink some extra strong Bohee:
They eat Beefsteak underdone,
With cucumber and Bath-bun,
And proceed to bed at one.
Pom—pom—pom.

In the Chinook Jargon of California, Coffee is *Kau-pa*: eat, *muck-a-muck*: drink, *muck-a-muck chuck* (i.e. eat water): egg, *le-sep* (French, *les œufs*): finger, *le doo* (Fr. *les doigts*): foot, *la-pea* (Fr. *le pied*): fin, *fish le-mah* (i.e. fish *la main*, hand of fish). But that word *le-mah*, for hand, puzzles me, as it looks suspiciously like the Malay word for 5, and the almost universal Oceanic word for hand, viz. *lima*. I don't doubt that *le-mah* came from *la main*, but did *lima* come from it too through *e-mah*? And what's the connection between *lima*, 5, and *limau*, a lemon or lime? I asked this before, but got no answer. Can Mr. Bell toll—I mean tell?
A. M. FERGUSON.

NEW CALEDONIA COFFEE.

Since the time (1870-75) when the exports of coffee from Ceylon averaged over 900,000 cwt. per annum—the bulk of which came to the United Kingdom, to be re-exported after a sufficient quantity had been retained for home use—numerous attempts, more less successful, have been made to fill up the gap occasioned in the general supply through the failure of the crop in the above-mentioned place of production; and coffee grown in countries hitherto unknown to the trade has been imported into London on a rather extensive scale. Still, it has not always been of the most desirable quality, and the dealers have often been seriously inconvenienced for want of a suitable selection of the article, especially during the latter part of the year, when the consumption is largest, and stocks usually consist of poor and indifferent qualities. To meet the ordinary requirements of consumers, great strides in the cultivation of coffee have been visible in Guatemala and other South and Central American States, and as supplies at their best have been inadequate to the needs of buyers, prices have generally ruled high. The stimulus thus given to the development of the resources of the coffee planter within the last twenty years has consequently been very powerful, with the result that entirely new descriptions have been raised in various parts of the world, making up in some measure for the deficiencies experienced in other quarters. Besides the importations from the Spanish West Indies which we have noticed in our market reports from time to time, there have also been shipments of coffee from Abyssinia; and only on the 3rd of the present month we drew attention in these columns to the satisfactory progress of the plantations in German East Africa, started by a Company bearing that name.

The latest and most interesting information concerning the cultivation of coffee, however, reaches us from New Caledonia, a small narrow island among the Hebrides in the South Pacific, lying to the east of Queensland and far to the north of New Zealand, where the soil and climate no doubt are admirably adapted for the raising of the plant. From what we learn in the matter, it appears that the late Mr. C. P. Laurie, who was a coffee planter in Ceylon thirty years ago, left that island in 1873, and settled in New Caledonia, where he commenced planting coffee as a private hobby; but it turned out to be so successful that, on his death, the son, Mr. A. A. Laurie, carried on the same pursuit as his father had done, only in a more resolute style. What had been a mere "hobby" soon grew into an important business, the number of trees increased considerably, and the bearing strength from 250,000 trees on the two estates, viz., "Thio" and "Canada," in 1893 was equal to 1,300 cwt. coffee. For 1894 (this year) the estimated yield from 300,000 trees is 1,600 cwt., and coffee of good quality only is grown there. We have been favoured with specimens and samples of this kind of coffee, which is not unlike Tellicherry, of East India plantation growth, of a palish, greenish hue, and in mincing-lane it would probably be worth about 90s per cwt. in bond. When roasted and ground it gives off a pleasant and agreeable aroma, and is well suited to the every-day wants of the trade. Of the quantity already produced, the greater portion has hitherto been sold in the Sydney and Adelaide markets, and it has likewise been supplied to the French Government in the execution of contracts in New Caledonia. None of this coffee has yet appeared on the London market, but there are proposals to introduce it here, and judging from the scarcity that exists, and the steady demand that prevails for useful qualities at most seasons of the year, it is pretty certain that the article as imported from New Caledonia would find a ready sale. Its introduction into this country may therefore be looked forward to with confidence by both importers and wholesale dealers: because of the remunerative prices that are likely to be obtained, and for the reason that clean, wholesale sorts of coffee, are the very grades that have for years past been most difficult to procure. It is on this account to be hoped that the new venture will become a great success.—*Grocer*, Feb. 24.

CARRYING TEA LEAF LONG DISTANCES.

We call attention to another letter (see page 759) from the Indian Tea Manager who has taken out a patent for something like the application of the "Silo" system to tea leaf, or as he prefers to call it, a "Leaf-press" Patent. Nothing in the criticism advanced by our several correspondents shakes his faith in his system—indeed seeing is believing with him, whereas he maintains no Ceylon planter has experimented under the actual conditions laid down in his first letter. The deductions of our local planting correspondents from their experience, in reference to hard-pressed baskets or bags of leaf, are not admitted for a moment as correct; because in none of them could the air be excluded. We trust, therefore, that one or other of our most experienced Managers who bring leaf from any distance will give a fair trial to the "Silo" system as once more sketched by "Press" in the letter we give. Mr. Jamieson on Mariawatte or Mr. Westland in North-East Matale may, perhaps, be in a position to make the necessary experiment with a tea-box in the way pointed out and to give their brother-planters and our readers the benefit of the result.

PROFESSOR POTTER ON CEYLON VEGETATION:

LECTURE AT THE NEWCASTLE MUSEUM.

On Saturday evening, the third of a series of six lectures under the auspices of the Natural History Society of Northumberland, Durham, and Newcastle-upon-Tyne, was delivered by Professor Potter, whose subject was "Tropical Vegetation in Ceylon."

The lecturer preaced his address by remarking that one of the signs of the latest development of biological science was the establishment of laboratories in various parts of the world; and referring especially to Botany, he instanced the Dutch Laboratory at Buitenzorg in Java, so celebrated for the important research work accomplished there. The need of an English tropical laboratory had been long felt by botanists in this country, and when in 1888 he was fortunate in being elected to a travelling scholarship at Cambridge to visit Ceylon for the purpose of botanical research, he was trusted with the selection and conveyance of the apparatus to found the first British Association laboratory in the Government Botanical Gardens, at Peradeniya. Professor Potter had thus an opportunity of studying to advantage the marvels of a tropical flora, and proposed to give that evening a brief account of some of the characteristic features of Singalese vegetation. Before proceeding further, he gave some description of the geographical situation and physical conditions of Ceylon, for it was these points which so largely influenced the character of a flora, and he referred to diagrams of the isothermals, and the distribution of rain on the earth's surface for the purpose of comparison with our own climate. From its situation the island enjoyed a continuous tropical climate. In shape it was somewhat like a pear, and might be described as a flat plane, a little above sea level, from the centre of which rose a group of hills, the highest (Pidurutallagalla) being 8,004 feet and the next (Adam's Peak) only a hundred feet less in height. Adam's Peak was a lofty, conical pinnacle tapering to a sharp point, the actual summit being a flat space of only a few square feet, upon which there was an impression about 6ft. 3in. long, which a fanciful imagination has ascribed to the impress of a human foot, it, according to tradition, being the spot where Buddha planted one foot when he stopped over from India. Not only the Buddhists, but

also the Mohammedans, regard the mountain as sacred, and pay frequent pilgrimages to its summit. The climatic conditions of the plain and the hills was next explained, and it was shown how there were all gradations of climate from the sea-coast to the summit of the hills, and suitable regions could thus be found for almost all species of cultivation. The rainfall was excessive, but not uniform throughout the year. There was a well-marked dry season (January, February, March) and a wet season, the greater part of the rain falling during the months of May, June, and July. The amount of rain, twice as much as in this country, coupled with the tropical heat produced in the wet season, a very damp, steamy atmosphere, such as one must experience to appreciate. Everything was damp, furniture, clothes, bedding, books, &c., even matches refused to strike unless specially dried, and the frequent attempts to get a light rubbed all the phosphorus off the box. The contrast with a climate like ours was very great. Not only was the period of active vegetation much longer (nine months), but the conditions of heat and moisture were much more favourable. The short period when vegetation suffered a temporary check was only three months, and this not from cold but from excessive heat. Several trees, it was interesting to note, shed their leaves as a protection against the heat and dryness, and not, as here, from cold. As soon as the short dry season was over the rain commenced and vegetation again burst forth with renewed vigour. Under conditions like this we could imagine the vegetation would be of the most luxuriant description, but it was almost impossible for anyone who had not visited a tropical forest to conceive of the wonderful prodigality of nature in such a region. The jungle presented a strange mixture of plants and large trees growing quite close together, with their stems embraced by numerous climbers, all so thickly matted that one had literally to hew a path through them. In many places the only footways were the tracks of elephants, who protected by their thick hide, could force a road through the thick walls of stems and lianas. Overhead was a dense mass of foliage, so thick that little light could penetrate, but even this enabled many shade-loving plants to live, some on the ground, others finding suitable localities in the tree stems and in the crevices of the bark. While, however, the general conditions were so favourable, plants had many adverse conditions to contend against and amidst such multiplicity of life the struggle for existence became fierce in its intensity. All plants were very dependent upon their surroundings, and the various forms, structures, and habits of plants were all modifications and adaptations to special external conditions. The absolute requirements upon which all plant life depended were heat, moisture and light and the unfavourable conditions in the Tropics were to be found in the excess of sunlight and rain, and also in the very high winds. The lecturer then went on to consider how the conditions of the Tropics influenced and reacted upon the tropical flora, moulding its character and principal features. He described the different members of the plants and the special functions each had to perform, giving numerous examples of the manner in which their development in any direction was an adaptation to the necessities of their existence. Illustrations were given of the huge buttress roots required to anchor the trees firmly to the ground, and prevent them being torn up during the violent storms of wind, and of the stalks of leaves tied in by an elaborate meshwork of interlacing fibres. Various means of protection of leaves from the sun and rain were shown, and many varieties of climbers with the hooks and tendrils they develop to assist them in reaching the light. Many beautiful forms of palms, coconut, cabbage, wine palm, &c., were displayed on the screen as well as some interesting views of the rice fields and tea and coffee plantations. The lecture throughout was profusely illustrated by lantern views, prepared by Mr. Potter himself.

A hearty vote of thanks was accorded to the lecturer.—*New York Journal.*

THE AMERICAN MARKET FOR BRITISH GROWN TEAS.

That Indian tea will obtain eventually a firm footing both in Canada and the States, we feel confident, but as it will be some years before present consumers will consent to give up an acquired taste, our teas for the American markets may chiefly be used for mixing, as for nigh twenty years they were so in the United Kingdom. Indian tea of the present day has, any unprejudiced and middle-aged planter or broker will admit, not the same flavour that it had between the eras of the famous sand tables and the siroccos. True, to deal with the produce of our present gardens by the old fashioned system of bamboo or even pukka dholes—how many are there left who recollect them?—would be a retrogression not to be thought of, but we see no reason why scented teas should not be turned out by the present drying apparatus, though such might entail the purchase of an extra contrivance to be devoted wholly and solely to the "pukka battying" of scented teas for blending with that part of the bulk destined for those who have been accustomed to them. Whether our planters will feel themselves justified in entering upon this innovation, must be left to their consideration, but if they wish to secure a market that has hitherto been supplied with a certain class of tea, they must "pander to the public taste" existing therein, or be content to undergo the same difficulties that were for many years encountered, ere Indian tea, pure and simple, established itself in the position it now holds in the United Kingdom. From the prices current published in the *American Grocer*, under date 17th January last, we find Indian quoted at 15 to 30 cents per pound, but presume the latter is fine kinds for mixing, and the low quotation for household purposes. If our surmise is correct, the lower price is exceeded in almost every instance by China scented varieties, the favourite apparently being Amy gunpowder and capers; it therefore seems tolerably certain that these have as firm hold at present, and it is unlikely that any great impression will be made unless some such concession, as we allude to above, is vouchsafed.

It must be confessed that with the planting extension, now being made, the dislocation of all trade, and general depression with the reverse of a promising market in Europe, we run considerable risk of overproduction, similar to the crisis in the cinchona industry in Ceylon, that led to the destruction of large quantities of bark by the planters there a few years back, and it is time that a conference should be held to consider the important subject as to whether we are not preparing goods ere we have established a certain market for their disposal. Certainly tea improves by keeping, but how long can it be held? Or will financiers consent to hold it until better times arrive? From private sources we learn that Mr. Hayter is doing well in Australia, in regard to pushing the Indian article, but the adverse trade conditions the colonies are passing through, are against too sanguine expectations of disposing of any very large quantity at present. Even there China has almost as firm a footing as in America. We have firm faith in the eventual prosperity of our tea industry, but write as we do in hope of awakening those engaged in it to pay more attention to the vital matter of supply and demand. Tea is just as subject to overproduction as any other public requirement, and the planter, like most of the rest of large employers of labour, cannot run his business short time, as his people must be paid whether their labour be remunerative or not.—*Indian Planters' Gazette*.

TEA SHARES.

Some interesting changes have taken place in the market for tea shares since we last considered the position. The season of 1892 produced such good results that in May of last year the prices of many shares rose to an abnormally high level and we

then pointed out that some reaction was probable. This proved to be the case, and in the latter part of 1893 tea shares withered and contracted, developments which were rather aided by the general situation of the market inducing sales. Tea itself commanded lower prices for a time which had the inevitable effect of stimulating the trade demand. As the greater part of the companies still have about one-third of the 1893 crops yet unrealised, and as prices are tending upwards—though as yet to an almost imperceptible degree—it seems to be not improbable that, when the whole results of 1893 come to be reckoned with, it may be found that they will pan out better than was anticipated although it cannot be expected that they will compare favourably with those of 1892.

A certain number of the better known shares have already benefited in price by the improvement in the prospect, notably Assams, which have risen from 24 to 29, Jorehauts from about 30 to 35, Lebongas from about 8½ to 10, while most of the preference shares have also increased their quotations. Others have not yet responded to the brighter prospects, and to these expectant eyes are being turned. For instance, Dooms ordinary shares now stand at about 13, against 15 of six months ago; Doom Doomas are 13 against 1½; Jokai shares, perhaps the best known of all, stand at 1½ instead of 1½. We are mentioning only the quoted shares, but many of the non-quoted shares are in much the same condition. It appears that there is a much less difficult market in tea shares than was formerly the case, partly owing to the publicity given to the subject, and partly owing to the growing interest with which investors are searching out suitable securities for their fattening money-bags. Dealings have been recently reported in such cut-of-the-way things as Assam Frontier debentures, Brahmapoora shares, Doom Dooma A and B, Jhanzies, and Scotch Assams.

It is worth noting that, while in 1892 certain districts yielded large crops and other districts but small crops, during the past season this has been almost reversed, the better yields in 1893 coming from those districts which returned the poorer results in 1892. Although it cannot be doubted that the silver and exchange questions have had a certain bearing upon the tea industry, there is now a growing belief in well-informed quarters that whichever way exchange may go in the near future, it will not seriously affect the position of the planting companies; even though it cannot be contended that a lower exchange, in the main, would not act for the benefit of the tea industry.—*Tanty Fair*.

PATIAGAMA CINCHONA COMPANY, LTD.

The twelfth annual report of this Company is as follows:—

Directors:—O. E. Symons, Esq. and W. Cross Buchanan, Esq. Agents and Shareholders:—Messrs. Bois, Brothers and Company.

The Directors herewith beg to submit their Twelfth Annual Report, and they regret that it is not so favourable as was hoped might be the case at the commencement of the season.

The estimate of tea for the past year was 70,000 lb.; but the actual crop has fallen short of this quantity being only 58,870 lb. which was sold in Colombo at an average rate of over 44 cents per lb.

On a reference to the annexed account it will be seen that the actual working of the year shews a small margin of Rs. 263-28. The Directors recommend that the total balance now at credit of Profit and Loss account, say Rs. 123-15, should be appropriated in reduction of suspense account, which represents the loss incurred in working the Estate previous to 1890 whilst the tea was coming into bearing; and they trust the Shareholders will approve of this recommendation.

The Shareholders have to appoint a Director in place of Mr. W. Cross Buchanan, whose term of office has expired; and it will also be necessary to appoint an Auditor for 1894.—By order,

BOIS, BROTHERS & Co., Agents and Secretaries.

"IBEAN"—OR BRITISH EAST AFRICA.

We have been favoured with a copy of the Handbook prepared in the Intelligence Division, War Office, 1893, of "British East Africa including Zanzibar, Uganda and the territory of the Imperial British East Africa Company." This seems a very comprehensive statement of territory; but the first thing to remember is that the region discussed in this Handbook, situated on each side of the equator and east of the Congo State including the great Lake country (Lakes Victoria, Albert and Albert Edward) has nothing to do with the region known as "British Central Africa" or that of "British South Africa." The former of these two lies to the South of German East Africa in the neighbourhood of Lakes Nyassa and Tanganyika; while British South Africa is definitely marked off by the great river Zambesi, all territory South of it being properly "South Africa." It is, of course, the ambition of Mr. Cecil Rhodes not only to extend British Government and civilisation right up to the Zambesi, but gradually to establish a bond of union between all the British African States, and as the first connecting link to run the telegraph wire (now in process of construction) right up the country until Capetown is able to communicate direct with Cairo as well as all intermediate stations. Again, while allowing the Germans a very large block of territory, South of Lake Victoria and Eastward of Tanganyika, the British have been careful to maintain their rights to a future line of waterway which by means of lakes and rivers may extend with very little interruption from South Africa to Egypt.

But leaving out of view all these grand projects and the vast development as well as latest resources appertaining to "South" and "Central" Africa, we would direct our readers' attention solely to "British East Africa" or "Ibea" as it has been happily termed, as treated of in the Handbook now before us. This work is accompanied by two valuable maps, in one of which we have the Southern—or explored—portion of the territory on a pretty considerable scale from the Coast up to the Lakes and the borders of the Congo State, while subsidiary sections are devoted to the islands of "Zanzibar and Pemba," to "Mombasa" island and ports with the routes starting inland, and a third to a skeleton map of North-east Africa showing the relation of this vast British territory with its estimated area of 700,000 square miles (equal to thirty "Ceylons") to the rest of the Continent northward to the Gulf of Aden and Red Sea. Most of this—the country of the Gallas and Somali—is marked as within the "Italian Sphere"; but on the coast immediately opposite Aden lies "a British Protectorate" covering the Somalis bordering the Gulf of Aden. North of this and of the region one day to be civilized and governed by Italians, comes Abyssinia—the habitat of the coffee plant, *Coffea Arabica*, a great deal of which is said to grow wild in the Gallas country and right up to the borders, if not within the territory of Ibea. On further reference to the outside regions, the "British Sphere" from "Ibea" proper is entered as running along the Nile—West of the Gallas and Abyssinia—for an indefinite distance; while to the West comes the great Congo State which, though nominally independent under the Belgian King, is practically under British influence.

The second Map accompanying the Handbook is one showing the projected route of the "Mombasa-Victoria Lake Railway" with the different "Surveyed Routes," as surveyed in 1892 by Capt. J. E. Macdonald, R.E., Capt. J. W. Pringle, R.E.,

Lieut. P. G. Twining, R.E., Lieut. H. A. Austin, R.E. and Sergt. F. H. Thomas, M.W.D., India. A long list of proposed stations with distances from Mombasa is shown, with the nature of the country adjacent to the railway, heights of mountains, situation of lakes, &c. The total length of the line is given at 657 miles, the distance from Mombasa of Victoria Station on the right bank of the river Nzira where it debouches into Berkeley Bay on the North-east coast of Lake Victoria Nyanza, in reality an inland sea situated 3,820 feet above sea-level. When, and how, this truly imperial line of railway will be made, it is at present impossible to say; but there is little reason to doubt that the next decade will witness its completion whether through a subsidy granted to the Chartered Company, or as a State line, the administration of "Ibea" being taken over by Lord Rosebery's Government.

There is a vast portion of "Ibea" which has yet to be explored, especially towards the North; but the great peculiarity of the country is the rapid rise from the East Coast until plateaux at an altitude of 3,000, and eventually 6,000 feet are reached in which the climate on each side of the equator approximates very much, by all accounts, to what we are accustomed in Ceylon, although the rainfall seems to be considerably less. Rising out of the plateaux, we find enormous detached mountain masses—notably Mount Kilimanjara (on the German borders) and 200 miles North, Mount Kenia, each over 18,000 feet. Farther North, there are mountain ranges running from 10,000 to 14,000 feet, while West of the Lake there are two or three detached mountains rising to a height almost equal to those already named. It would occupy too much space to enumerate the many rivers and minor lakes or to sketch other interesting physical features of the country. What will be more profitable for our readers—or for those of them who desire to become acquainted with "Ibea"—will be to run over the several districts or divisions of the country beginning with the islands of Zanzibar and Pemba next taking the coast of mainland; the explored region from the coast as far as Lake Victoria—with its several districts, some suitable for planting operations—Kittara or the region between the Great Lakes; and finally, the little known Northern region. We need not linger long over Zanzibar with its area of 640 square miles, population of 250,000, undulating hills rising to 440 feet, annual rainfall of about 60 inches and temperature very similar to that of Colombo ranging from 77° to 90° with a mean of 80 degrees, the hottest time being from January to March. Zanzibar has crops of its own in cloves (Pemba being a great clove garden), coconuts and vegetables; but its chief importance is as an entrepot for the products of "Ibea" brought down by caravans and across the strait in dhows. These include ivory, ebony, hides, rubber and minor articles, the total value being given at £1,300,000 in 1892. Of course, the import trade is correspondingly important, in Manchester goods, hardware, &c. We are enlightened in learning that a dozen steamers clear each week besides the visits of British and German men-of-war. The island of Pemba is 40 miles North of Zanzibar and covers 380 square miles, being surrounded by coral reefs. The clove tree is the most important product, the export being valued at £120,000 a year.

COAST DISTRICT—AND CENTRAL DISTRICTS

UP TO LAKE VICTORIA NYANZA.

The seaboard of "Ibea" extends for 400 miles facing the Indian Ocean from the mouth of the river

Umba, dividing British from German territory to that of the Juba, north of which comess the "Italian sphere." The Juba is navigable for 200 miles inland, running in a northerly direction parallel with the coast, but this country has not been much explored, nor indeed as far South as the river Tana, another navigable stream into the interior. South of the Tana on the coast and within easy reach of Zanzibar are three important ports—Mombasa, Lamu and Kasmaya—which possess good harbours capable of taking in ocean steamers, and on these ports converge the trade of the interior. Unlike nearly all the rest of tropical Africa, there is here no low malarial belt to be passed at great risk to health and life before reaching the highlands of the interior. In "Ibsa," immediately behind the sandstone or coral beaches, rise fertile lands, undulating hills and valleys watered by numerous streams and green with cultivation or open jungle. The products grown or collected include cloves, india-rubber, gum opal, orchella, oil seeds, Indian oorn, millet, rice and various kinds of timber. Mombasa is the headquarters of trade and administration, a leading representative of the Company here being an ex-Ceylon planter in Mr. J. R. W. Pigott, formerly of the Matals district. The population of the town of Mombasa is estimated at from 15,000 to 20,000, chiefly Swahilis, descendants of Arabs and African negroid races, Muhammadans and very much Arabs in physique, but speaking an African tongue, great traders and in fact the regular "tambyss" or pedlars of the country to its most remote villages. Mombasa is an exceedingly healthy town, and is in telegraphic communication with the rest of the world, the cable being landed here. A number of Bombay native merchants chiefly control the trade and hold the wealth of the place. There is a small railway at Mombasa, through the island-town—and a few miles on the mainland as if to form a start for the interior. There is no need to refer to the other coast towns, save to mention that several of them as well as Mombasa were trading stations of the Portuguese 300 years ago, and that coconut groves are frequent at different points on the coast.

Before passing into the interior, we may refer to the great number and variety of the native tribes inhabiting "Ibsa" between the sea and the Lake region. There may be said to be two great divisions or stocks represented by the negroid tribes of the *Bantu* family in the Southern division broken up into a dozen different tribes perhaps speaking as many dialects; and then North of these but often raiding and robbing them, the *Masai* belonging more to the negroid people of the Nile. Farther North and East are the *Galla* race supposed to be of Abyssinian descent and beyond them and very hostile to them are the *Somalis*, very different in appearance and religion, but closely allied in blood and speech. With the *Gallas* and *Somalis*, however, we shall have nothing to do in crossing from Mombasa to the Lakes.

The first division must be from Mombasa to Tsavo which is about 1,500 feet above sea level, and a distance of 146 miles by one route (which rises to 3,500 feet at one point) and 207 miles by another. The railway engineers surveyed three routes to Tsavo; but their adopted line reaches it in about 125 miles, the highest point being 1,700 feet. The country as far as Tsavo is generally uninteresting and unprofitable, except so far as cultivated by the Wa-Teita tribe with beans, Indian oorn, sugar-cane, &c. and they have fowls and goats. There is, however, one exception in what is called the "forest paradise" of Taveta, some 80 miles east of the great mountain Kiliman-

jaro, a great centre of trade routes, having abundance of supplies—it is described as follows:—

Taveta consists of a rectangular patch of forest some 7 miles long, lying at a height of 2,400 feet, and situated on the River Lumi, which is a narrow, deep stream flowing from the mountain southward into Lake Jipe. It contains some 10 square miles of cleared ground, surrounded by an outer fringe of impenetrable jungle, only traversed by four narrow tortuous approaches, which can be easily blocked and defended. The soil is highly fertile and produces every sort of grain and vegetable, so that Taveta is a most prosperous place, secure against attack from marauding neighbours, and rejoicing in an ample supply of food. Bananas, maize, beans, millet, yams, sweet potatoes, sugar cane and tobacco grow luxuriantly, and there are herds of small cattle, sheep and goats. It has, therefore, always been a great centre of caravan routes, which wait here to procure a stock of food for further journeys.

Taveta is inhabited by two distinct people, the *Waveta*, a mixed race of Bantu negroids, akin to the *Wateita* and the *Wakwafi*, a *Masai* people who have settled and taken to agriculture, and who speak a *Masai* dialect. The *Waveta* are friendly and peaceable, extraordinarily honest, and manly and pleasant in manners. They generally speak Swahili, owing to the constant presence of coast traders, but their own tongue is a Bantu dialect akin to that of their neighbours. In Teita and Ukambani they cultivate bananas, vegetables, maize, and sweet potatoes, and exchange them with traders for cloth and coast goods. The population is 6,000, scattered in beehive huts among the clearings in the forest. The government is that of the *Wazee* or Elders, supported by all the male population.

The next great division or stage for the traveller may be put down as from Tsavo to Machakos, a distance of 157 miles by the caravan route and between 140 and 150 by the projected railway. The country along the roadway rises rapidly and steadily until at 62 miles on from Tsavo it is 3,000 feet; at 124 miles it is 4,000 feet and at Machakos's 5,400 feet above sea-level. Several rivers are crossed and mountain peaks skirted, rising to 6,500 feet. Immediately after crossing the Teavo river, the district of Ukambani is entered, a mountainous well-watered region surrounded by great uninhabited plains and stretching along the river Uki for 150 miles. Respecting Ukambani and the country on to Machakos's we may quote from the Handbook as follows:—

It is through Ukambani that the route of all travellers to the interior lies, whether the start be made by Teita across the desert, or north from Mombasa and up the Sabaki valley, for both these routes meet at Tsavo on the threshold of the country: The stations in Ukambani are the following:—*Tsavo*, at a height of 1,600 feet on the river of that name near its junction with the Athi; *Kibwezi*, in the centre of Kikumbulu, 3,000 feet above the sea, the site of a flourishing Scotch mission; *Nzoi*, in Ulu, in the midst of a populated and cultivated district, under a noticeable peak of 6,100 feet high, falling precipitously to the west; *Machakos's*, a fortified and important depot situated at a height of 5,400 feet, at the north-western extremity of Ukambani on an elevated plateau surrounded by hills with well-cultivated slopes. Beyond Machakos are the treeless uninhabited grass plains of the upper Athi, at a height of 5,000 or 6,000 feet, reaching up to the boundary forest of Kikuyu, and affording little fuel, but furnished with water from the tributaries of the Athi. Like the plains to the south and west of Ukambani they are full of big game, and lions are always to be found.

Ukambani possesses a bracing and healthy climate, suitable for Europeans to work in at all seasons, the mean average temperature being 68°. The rains occur twice a year, the lesser in November and December, the greater in February and March. The soil is well watered and fertile, and about half the country is under cultivation. Sugar cane, tobacco, baricots,

simsim, cassava, sweet potatoes, millet and maize are grown, and cattle, sheep, and goats, are kept. All European cereals and fruits would probably thrive.

The country is divided into clans, each under a chief; of these the *Kilungu* are unfriendly both to Europeans and to their neighbours, the others are keen traders, alive to the benefits of European intercourse.

The Wakamba are a negroid people akin in race to their northern neighbours in Kikuyu, and, like them, speaking a Bantu dialect. They are a quiet industrious folk, well fitted to be workmen and porters for caravans, and in appearance are medium sized and muscular, with filed teeth, wearing no clothes but decorating their persons with brass wire and beads. The country is thickly populated, and the people live in beehive huts surrounded by thorn fences, and grouped in secluded clusters among the *shambas* or cultivated fields which cover the hillsides.

The government is in the hands of the Wazee or elders, who are at the head of each group of huts, and certain of these Wazee are head men of larger districts. One of the privileges of old age with men is a perfect right to be continually drunk. Nearly all the men and many of the old women are inveterate sunff-takers, tobacco being largely grown here for the purpose of making sunff, as is sugar cane for the purpose of making pombe, an intoxicating drink.

The Masai, who inhabit the plains lying south and west of Ukambani, are in the habit of raiding that country during the dry season, causing the Wakamba to retaliate by raids into Masailand. We would draw particular attention to the fact of a flourishing Scotch Mission being established at Kiburzi, in the centre of Dikumbulia, 3,000 feet above sea-level. We do not learn much of this Mission station save that the natives here are friendly, the stream of water beautifully clear, sport plentiful in giraffe zebra and hartbeest. Nothing is said of the missionaries establishing gardens or plantations of coffee after the fashion of their brethren of the Blantyre Mission; but apart from the probability of such being the case, Kiburzi $2\frac{1}{2}$ degrees from the equator, 3,000 feet above sea-level, if the soil is at all good, ought to be a paradise for coffee gardens. We read of the road for 12 miles on each side of Kiburzi (which will be 180 miles from the Coast by railway) being alternately through open country and dense forest or jungle and then of fields of Indian corn which must mean rich soil as also the heavy timber trees.

THE GLASGOW ESTATES CO., LTD.

An extraordinary general meeting of the shareholders of this Company has been called for Wednesday, April 25, for the purpose of considering, and if thought fit, of passing, the following special resolution, namely:—"That the capital of the Glasgow Estate Company, Limited, be increased from R200,000 to R325,000 by the creation of 250 new shares of R500 each." The object of the proposed increase is, we understand, to enable the Company to acquire Nithsdale estate, Agradatana, adjoining Glasgow estate and consisting of 212 acres, of which 209 are in tea.

QUALITY VS QUANTITY.

With reference to our frequent remarks regarding the necessity of making high-class teas, we read in the report of the Bisnanth Company that the manager has been ordered on no account to sacrifice quality for quantity. As these gardens turn out early 1,000,000 lb. annually, it is evident that large concerns recognise that the output of inferior teas must be restricted.—*Nilgiri News.*

GRANT OF LAND FOR COFFEE CULTIVATION.

The Government have sanctioned the grant of certain land in the Chamrajnagar Taluk, Mysore District, to Mr. R. H. Morris, for coffee cultivation, subject to certain conditions regarding the removal of the timber trees standing on the land.—*South of India Observer.*

FUEL FOR SIROCCOS.

Considering the difficulty experienced in many of our hill tea gardens in procuring fuel for tea-drying, we put it to the community, especially in places where coal is not available, (unless at almost prohibitive prices) whether it would not be advisable to institute systematic explorations to ascertain the amount of peat and suitable turf procurable from the ravines and gullies of the mountains where these are mostly to be found. We believe the only place where peat is made use of by Europeans is Ootacamund, but in certain parts of North Cachar, Sylhet and the Southern side of the Assam Valley, the structure of the country indicates the probability of these deposits being likely to be found. There are several places in Jaintia (in the plains) between the Harri and the Leobah where lignite crops out, where a find may reasonably be looked for, and though beyond the western stream there is an alteration in the geological contour, the ravines are well worth examining.—*Indian Planters' Gazette.*

TOBACCO CULTIVATION.

Though the showers of rain we had some time ago was not favourable for the grown up plants yet on the whole the crop, this year, is a good one. The cultivators are busily engaged in cutting and curing tobacco plants. The attracting of Jaffna merchants and traders and the high prices they offered for Trincomalee tobacco has given an inducement for an extensive cultivation of tobacco. At Nelaveli, in Kaddukalpattu Crown lands were purchased and turned into tobacco gardens. Some of the money-lenders here lay out their capital on tobacco cultivation finding that it pays better than other investments.—*Trincomalee Cor.*

CEYLON'S ROYAL BOTANIC GARDENS.

There are no Botanic Gardens all the world over better known than the Peradeniya Gardens; and Dr. Trimen's Annual Report invariably contains something or other of interest to those who know little of either botany or Ceylon. His remarks on the subject of cattle trespass will appeal to almost every sojourner in the East who takes any delight in horticulture or any form of cultivation. He writes that it is the immemorial custom of the country (he might have said of the East,) for every one to possess himself of a few miserable half wild and useless bullocks, regardless of whether or not he be able to afford to keep them. If he cannot do so he turns them out on the road or elsewhere and trusts to their picking up a living for themselves, which is probably at his neighbour's expense. These active little creatures wander widely and cannot easily be caught; they do damage not only in what they eat, but by breaking down and trampling. "I have fought against this nuisance for years, but without much effect, as the existing laws and public opinion appear to be against any really efficacious measures. I am advised that I must fence the grounds, but I find that in this community no ordinary live fence is any protection; anything that is not actually impenetrable is useless; as an indication of private property it possesses no force or significance." How very similar is Dr. Trimen's

experience to the experience of hundreds of others in the land of Ind. "Three acres and a cow" would not serve for a party cry amongst Oriental peasantry; a cow is all they require to whom the acres may belong is immaterial. "With the exception of *Helopeltis* the tea-plant is remarkably free from serious enemies." So writes Dr. Trimen and planters should rejoice to hear it. He advocates the use of the name *Helopeltis* in preference to "tea-bug" which though correct, is apt to mislead or "mosquito" which is absolutely incorrect. Like the blessed word Mesopotamia, there is something soothing in the term *Helopeltis* to the planter who sees his tea-bushes shrivelling up beneath the scourge. Dr. Trimen is of opinion that if a universal slaughter were undertaken, Ceylon could cope with the pest. As regards catching the insect there is little difficulty; the immature ones are wingless, and the mature ones fly only a short distance at a time. A good suggestion is the use of a small stick tipped with jak-milk or other glutinous substance, by which any insects may be picked quickly up a broad band of similar substance might be smeared round the base of the stems to catch any of the young ones that may have fallen to the ground and attempt to again crawl up to the leaves. The eggs are found not only on tea bushes but on cinchona and cacao and it is stated on some kinds of weeds, *Helopeltis* is said to be by no means restricted to low elevations, but as a pest on tea, states Dr. Trimen, there is no doubt that it is chiefly to be found below 3,000 ft. "At higher elevations it is more of a straggler; I have assurance of an attack at about 4,000 ft., but it was slight. There appears to be some good evidence that it is the inferior 'jats' of tea especially that suffer and that high-class plants, even when grown alongside the inferior, to a large extent escape." This has been observed also in Assam. Another experiment of interest undertaken at these gardens is with Indianrubber (*Hevea brasiliensis*). There was a large crop of seed last year which was distributed amongst planters, but Dr. Trimen is of opinion that the cultivation of this tree is more suited for Government than for private individuals. It is twelve years before a profitable return can be expected, but once in full bearing the trees are said in Brazil to continue to yield for a period of 75 to 100 years. The cultivation of nutmegs is, we learn from this Report, being extended greatly on the low-lying estates of Ceylon.—*M. Mail*.

COFFEE CULTURE IN BRAZIL.

The final and premature abolition of slavery in 1888, without any compensation to slave owners, caused less disturbance economically and socially than in any other country, perhaps, in the history of slave emancipation, and this fact speaks volumes for the natural resources of Brazil. It is true that this event has been, to some extent, discounted by the importation of free labour before that date, and though the "fazendeiros" received no compensation, they may be said to have received a certain equivalent in the shape of a State-aided immigration on a large scale, and of loans in aid of agriculture, while the coffee planter, from his preponderating influence in the Legislature, has proved the spoiled child of successive Ministers Finance, and has not been hampered by the onerous taxation of land customary in most old countries. At present, says Mr. Harford, the labour question is said to be approaching a solution in the State of S. Paulo, though there is ample room for genuine colonization. However, the loss caused by the scarcity of hands to pick the coffee berry in the Rio de Janeiro coffee zone alone was calculated at no less than 800,000 bags in 1892.—*Commerce*.

INDIAN TEA COMPANIES.

Shareholders in Indian Tea Companies will be glad to learn that the efforts made to popularise Indian tea in the United States are meeting with some measure of success. The export of Indian tea from Great Britain to the States amounted in 1892 to 600,216 lb. but last year the total rose to \$18,356 lb. The consumption of tea generally has been steadily increasing in America of late years. In 1868, the total consumption was only 35,625,000 lb. but in 1892 it exceeded 89 million lb. A very small percentage of the last-named total consisted, as it appears, of Indian tea. But the taste is evidently developing, and we know from the experience of this country how rapidly the liking for Ceylon and India teas spreads when once it becomes familiar to the tea-drinking community. The United States offer a splendid and almost inexhaustible market to the Indian Tea Companies, and no effort should be spared in cultivating it.—*Financial Times*.

INDIA AND CEYLON TEA.

The forecast of the future of the tea market which we made on February 6th has been justified by events. The consumption of Indian and Ceylon tea since January 1st is 8,500,000 lb. heavier than last year, while the crop from India has closed 6,000,000 lb or 7,000,000 lb. short of the estimate. In consequence, an advance of 2d to 3rd has occurred in the finer teas, and the quotation for "type" on the terminal market has risen 3½d. Much interest is felt in the forthcoming Budget, owing to the rumours of a free breakfast table; and it is generally admitted that it would be a good thing for the trade if the duty were taken off, as the restrictions and expense of working in the bonded warehouses would be avoided. The first effect of such a measure would probably be shown in a large increase of Indian and Ceylon tea exported from London through the medium of the blender.—*Financial News*.

PICKINGS WITH AN APPLICATION.

In an exhaustive paper on the classification and distribution of Earthworms by Frank E. Beddard, M.A., F.R.S.E., F.Z.S. Professor and Davis lecturer to the Zoological Society of London, and lecturer on Biology at Grey's Hospital. (published in the "Journal of the Royal Physical Society of Edinburgh") the following are given, under the "Oriental region," as occurring in Ceylon: *Pericheta coerulescens*, P. Houletti, P. Ceylonica *Deodrilus Jacksoni*. The following insufficiently known species are also given as from Ceylon: *Pericheta leucocycla*, P. Viridis, P. bryachycycla, and P. Cingalata.

The name orange is derived from the latin *aurum*, gold, owing to the gold colour of the ordinary ripe fruits. The orange is said to have originally been a small bitter berry not larger than a cherry, and very seedy. In Hindustan it has been cultivated from a very remote period, and was taken from that country to Arabia and Persia in the eighth or ninth centuries. It is said to have received little or no attention from cultivators of fruits in any of the countries last named prior to the tenth century, there being a tradition that it was a cursed fruit sent by Mahomet to destroy the unfaithful. In the 10th and 11th centuries the cultivators of Oman and Syria began the cultivation of the tree in earnest, the fruit going under the name of "bigarada." By the end of the 12th century the crusaders brought it with them on their return from Jerusalem. It was well-known but not extensively cultivated in Italy, Spain, and France before the middle of the 16th century, 400 years after its introduction into the first named country, the

reason being a survival with an addition, of the old Mohomedan tradition, viz., that the use of the fruit would cause the partaker to enroll himself with the legions of Islam whether he desired or no. The Spaniard finally attempted and succeeded in cultivating it in their West Indian colonies, and from there it found its way to Florida, Central America, Mexico, and California, always improving in size and flavour until it became one of the most perfect of fruit.

The Australian Commercial Commissioners, in an interview with H. E. the Governor of Madras, are reported to have mentioned "the success which their mission had met with in Ceylon, and said that they had come to Madras hoping to meet with the same success." Mr. Rowe is reported to have given the experience he had gained in Colombo, as regards frozen meats thus:—"The meat supply for the army there is admittedly very inferior, and the military authorities were prepared to give Australian frozen meat a trial if it could be obtained at the same price which the same meat realized in England, namely, from 4d to 4½d per lb. These prices, however, at the present freights would scarcely pay the Australian exporter. If the Government of Ceylon were prepared to advance a ½d on the lb. more, one at least of the large exporters of frozen meat was prepared to undertake a contract, and to commence supplying meat within two months of the date of signing the contract."

In Madras, however, the Commissioners do not seem to have much success. With regard to the frozen meat business, Lord Wellock stated that he had gone fully into this subject in conjunction with his Military Secretary and had come to the conclusion that the supply of frozen meat in India on anything like a satisfactory scale, remunerative to the consumer and exporter alike, was impracticable. With regard to compressed feeders, the Assistant Adjutant-General stated that the military authorities were very well satisfied with their present fodder supply. His Excellency the Governor remarked with regard to the wines that he did not see what market there would be in a country where the chief beverage was whisky and soda. He said that the general opinion was that there was much less wine drinking in India among Europeans now than was formerly the case. The only consolation the Commissioners seem to have received is the assurance that the Governor would be glad to receive some samples of their products and test them and give his private opinion on their merits, but beyond that he could do nothing further as matters of this kind were best left to private enterprise.

Says the *Rural Californian*, referring to dried fruit:—"The trade in dried figs, prunes and raisins is nearly altogether in the hands of France, Italy, Spain, and the Orient. The annual consumption of these is enormous; as staple articles they are found in the most humble village store. But with these and dried apples the acquaintance ends. Peaches and apricots are almost unknown; what has come in has been mainly from the River Murray Colonies in Australia. A recent shipment of these dried apricots sold in the London markets freely at 98 shillings per 100 lb. that is, over 20 per cent per lb. wholesale.

Mr. Chardonnat is credited with having invented a process of manufacturing artificial silk from wool-pulp. This process is as follows: The pulp is dried and is then treated for transformation in the ordinary way into collodion. That done, the viscous fluid is placed in a vessel of peculiar construction, fitted at the bottom with a filter. Compressed air is forced into it by means of an air-pump, which drives the collodion through the filter into a horizontal tube fitted with a very large number of coaks. Each of these coaks has a spout made of glass, which is pierced with a minute hole, no larger than the diameter of a silkworm's thread. Through these holes the fluid is forced in long fine fibres, six of which are twisted together to make one thread for

wearing. Before it is wound off, the thread is steeped in water and hardened (the water taking out all the ether and alcohol which were in the collodion), after which it has all the strength and glossy brilliancy of the best natural silk. Mr. Chardonnat has opened a manufactory at Besancon, to prepare silk and carry on the business.

TEA AND SCANDAL.

In 1746, John Andree in a book entitled "Cases of Epilepsy, &c." describes one of palsy and convulsions from eating of tea. He tells how "a girl of about twelve years of age was taken last year with loss of appetite, grew pale and languid, and soon after the left side of her face became paralytic, and her speech began to falter, her arms and legs not all affected. She had no colic pains, which I first inquired after, thinking it might be owing to the *effluvia* from lead (which exert their pernicious effects chiefly at first in that manner), she being a Glacier's daughter; but found that she had made free with her mother's cannisters, and privately eat tea, for about 6 or 7 weeks last past. As she was pale and languid, I ordered no bleeding, but a blister to her neck, &c. As this case partakes of the nature of the *Chorea Sancti Viti* it belongs properly enough to this collection, though my chief view of inserting it, is to show the pernicious effects of the intemperate use of tea. *Schroder*, who is very sanguine in his commendation of this vegetable, praises its virtues for all manner of rheums, catharrhs, indigestion, weakness of the reins, joints and gout. And sums up all with saying that it is an augments of human strength, and preserves from all infections of the air, to which purpose divers Ambassadors residing in China used it in his time in the morning.

"As a dilute and detergent it may properly enough be used in some cases he mentions, but we know from longer experience that as it rarifies and dissipates the finer juices which should serve to actuate the nerves, it brings on Tremors, Vertigos, Watchings and all manner of hypochondriac, hysteric, and paralytic disorders, and therefore is by no means to be looked upon as a preserver of human strength. And I am persuaded that the frequent use of this plant is the chief cause, next to private dram drinking, which I am afraid is too much practised, of the various nervous complain's, that are so common among the fair sex.

"Before this child took to eating the tea, she was healthy, brisk and active: her paralytic disorder can therefore be attributed to no other cause. And as the smaller branches of nerves were already affected, it is reasonable to suppose that by the continued excess in tea, the Origin, which on account of its stronger texture remained hitherto unmolested, would in process of time have also suffered, the consequence of which must have been a total relaxation, and destruction of the animal frame. On the contrary it appears that when this abuse was laid aside, and proper medicines applied, she was soon restored to her former state of health."

Do you know what *Amblyopia* means? It comes from the Greek *amblyos*, dim, and *ops*, eye: so means "dim sight." The *Lancet* of 1887 describes a case of "Tea Amblyopia" thus:—"We read in a contemporary that M. Molchanoff, a Russian, who is reported to be the wealthiest tea merchant in the world; has arrived at Paris from Hankoy, with the intention of placing himself under the treatment of Doctor Charcot and an experienced French ophthalmic surgeon. The great tea magnate is suffering from *amblyopia*, which it is said is the result of the prolonged practise of tea-tasting. It is not unlikely that tea taken in excess might produce *amblyopia* similar in character to those toxic amauroses which result from the abuse of alcohol, tobacco, opium and quinine. But we are not aware that this form of *amblyopia* has been particularly described. *Wecker* does not mention it in the last volume of his large work just completed, and it is not mentioned in the *Real Encyclopedie*, or in

the *Graefe Saemisch Handbuch*. Tea is hardly indulged in this country to a sufficient extent to produce any marked effects upon the nervous system. But it is undoubtedly a sedative, and acts powerfully upon the heart."

Do you feel bad after that? Then take the following, prescribed by F. W. Pavy in 'Food and Dietetics';—"Lemon Peel Tea. Pare the rind thinly from a lemon, which has been previously rubbed with half an ounce of lump sugar. Put the peelings and the sugar into a jug, and pour over them a quart of boiling water. When cold, decant the liquid, and add one table-spoonful of lemon juice." [Then drink till finished! A. M. F.]

Alas! a Scotchman, and of the name of Robert Ferguson, (the double s accounts for it), wrote some poems: among them one on 'Tea': and although he begins well he ends miserably—for he more than yawns with faint praise over 'Celestial Tea.' I leave you to judge for yourselves from the following quotation:—

Ye maidens modest! On whose sullen brows
Hath weaving chastity her wrinkles call'd.
Who constant labour o'er consumptive oil,
At midnight knell, to wash sleep's nightly balm
From closing eyelids, with the grateful drops
Of tea's bless'd juices: list the obsequious lays,
That come not, with Parnassian honours crown'd,
To dwell in murmurs o'er your sleepy sense:
But, fresh from Orient blown, to chafe far off
Your lethargy. * * *

For many a dame, in chamber sadly pent,
Hath this reviving liquor call'd to life. * * *

But Venus, goddess of the eternal smile,
Knowing that stormy brows but ill become
Fair patterns of her beauty, hath ordain'd
Celestial tea; a fountain that can cure
The ills of passion, and can free from frowns,
And sobs and sighs, the disappointed fair.

To her ye fair! in adoration bow,
Whether at blushing morn, or dewy eve,
Her smoking cordials greet your fragrant board,
With Hyson, or Bohea, or Congo crown'd. * * *

Mark well the fair! Observe their modest eye,
With all the innocence of beauty bless'd.
Could slander o'er that tongue its power retain,
Whose breath is music?—Ah, fallacious thought!
The surface is ambrosias' mingled sweets;
But all below is death. At tea-board met
Attend their prattling tongues: they scoff, they rail
Unbounded. * * *

O Gold! thy luring lustre first prevail'd
On man to tempt the fretful winds and waves,
And hunt new fancies. Still thy glaring form
Bids commerce thrive, and o'er the Indian waves,
O'er stemming danger draw the laboring keel
From China's coast to Britain's colder clime,
Fraught with the fruits and herbage of her vales.
In them whatever vegetable springs,
How loathsome and corrupted, triumphs here,
The bane of life, of health the sure decay:
Yet, yet we swallow and extol the draught,
Though nervous ails should spring, and vaporish
Our senses and our appetites destroy. [qualms]

Look round, ye sippers of the poison'd cup
From foreign plant distill'd! No more repine,
That nature, sparing of her sacred sweets,
Hath doom'd you in a wilderness to dwell;
While round Britannia's streams she kindly rears
Green sage and wild thyme.—These were, sure,
As plants of Britain, to regale her sons [decreed,
With native moisture, more refreshing sweet,
And more profuse of health and vigor's balm,
Than all the stems that India can boast."

Beginning to feel somewhat discouraged myself by the above dismal effects of tea, I took up "The Golden Butterfly," by Besant and Rice, to restore cheerfulness: but at the very outset I am again crushed. Phyllis, the heroine, takes an unearthly early walk in London, and wanders by mistake into

a tavern. The pot boy asks her to give "it" a name, and she says "Thank you very much. I should like to have a cup of tea, if I could take it outside." He shook his head, a gesture of disappointment. "It can't be had here. Tea!" as if he had thought better things of so much beauty—"Tea! Swipes! After all, miss, it's your way, and no doubt you don't know no better. There's a early cauffy-onse a little way up the street. You must find it for yourself, because the dawg he don't know it: knows nothin' about tea, that dwag. You go out, miss, and Cæsar he'll go too."

And it's time I went too, or I shall hear something from the Editor about "Aut Cæsar, aut Nihil." A. M. FERGUSON.

COFFEE IN SOUTH INDIA.

The *Peermaad Coffee Spike* was just saved by the heavy showers of the last week. A few more days of drought, which had been very severe indeed, and the fine spike would have been ruined.

The *Shevaroy* blossom is rejoicing the hearts of coffee planters. The coming crop, as your Yercout correspondent remarks elsewhere, will be a very good one on most estates, especially out at Nagaloro where proprietors are going ahead in hopes of a bumper crop.

The *Spike in Coorg* is coming on gradually from latest advices, evidently it is to be a bumper crop all round. Yet the rain—in some places they have had over 3 inches—is just a little too plentiful for unmixed joy. Forward estates are a bit funky as to the next move, in fact here and there the "black spot" shows up ominously.—*South India Observer*.

VARIOUS AGRICULTURAL NOTES.

The cacao crop of Ecuador for 1893 is said to be the best on record, aggregating 401,654 quintals as against 334,625 quintals in 1892. The heaviest previous crop was in 1886, which was 17,000 quintals less than last year's yield. The quality in 1893 has also been good.—*American Grocer*.

COFFEE IN S. INDIA.—From all sides we hear Coffee planters are in high spirits, and the promise of 1894 being a bumper season seems general. Not only coffee, but the whole agricultural interest throughout India seems to have the prospect of a good year which should naturally relieve the burden of a diminishing rupee.—*Nilgiri News*.

ROYAL GARDENS, KEW, BULLETIN OF MISCELLANEOUS INFORMATION for March has the following contents:—Sugar-cane Disease in Old World. Seminal Variation in the Sugar-Cane. Improvement of Sugar-Cane by Chemical Selection of Seed Cane. Guzerat Raps. Agriculture in British Honduras. Decades Kewenses, VIII. Artificial Production of Citric Acid. Miscellaneous Notes.

AUSTRALIAN COMPRESSED FORAGE IN CEYLON.—Compressed forage is a line which is perfectly new to Ceylon and the East, writes our special correspondent with the Victorian Trade Commissioners at Colombo, and has attracted as much attention as all the other products together. The line has "caught on" firmly as the order forwarded this week can testify. But these first orders are only trial ones, as prejudice is difficult to overcome in the horse world as well as amongst mankind. There is no Customs duty upon this compressed forage; therefore, if the Australian patentees include their royalty in a moderate charge for pressing, if none but the best material is used in the manufacture, and if shipping and other charges are reduced so as to allow the commodity to obtain a firm foothold in foreign markets, there is an absolute certainty of an excellent trade being done not only in this Island, but throughout the East.—*Australasian*.

CEYLON AND INDIAN TEA IN AMERICA.
THE CAMPAIGN TO OUST "CHINA'S"
AND "JAPAN'S."

HOW THE CASE STANDS NOW?

Travelling up and down country and during an absence of nearly a fortnight from Colombo, we have heard a great deal about the proposed "Tea Campaign in America," and we had the advantage of being present with two gentlemen who know a good deal about business in America, Mr. P. R. Buchanan and Mr. J. G. Wardrop, Manager of the Colombo Commercial Co., Ltd., and a prominent member of the Chamber of Commerce, when the whole subject was very fully threshed out. We have also had the advantage of listening to the opinions of a considerable number of planters, though, in view of the approaching meeting and the uncertainty attending the result, it will be best to mention no names nor indeed to particularize as to the views expressed.

We should, indeed, be very much astonished if a "do-nothing" policy were adopted by the Planters' Association. We cannot, for a moment, believe that a vote can be carried to put a stop at this time to the "Tea Customs' Cess" as well as to the voluntary "Tea Fund." Maintain the former and wind up the latter is, so far as we know, the prevailing opinion and we trust Saturday's meeting will yield a corresponding result. Last mail brought to Ceylon an Estimate from a well-informed quarter, showing that 245 million lb. of Indian, Ceylon, China and Java teas are expected to be imported into the United Kingdom during the current year; and the question is very properly asked, how is this to be taken off? Without help from outside countries—and especially America—the result would certainly be very serious for Ceylon and Indian planters and increasingly so year by year to follow. There is another point: we are all aware that, however much we may preach the danger of "over-production," a large number of proprietors both here and in India, are still adding clearings, large or small as the case may be, to their tea plantations. Now, in the face of the statistical facts of Tea Production and Consumption, this policy of the gradual extension of cultivation would be quite unjustifiable, unless the proprietors are prepared to support the campaign to get our teas introduced into new countries. It is only by both Ceylon and India entering heartily (whether unitedly or separately) on this American Tea Campaign to drive out "China's and Japan's" that their increasing cultivation and crops can at all be justified, and we can conceive of no clearer or more imperative duty before producers at this time than to do all in their power to capture America for Ceylon and Indian teas.

In this light we are glad to understand that the Chamber of Commerce is by no means to be taken as opposing an American Campaign through the agency of the Tea Cess, provided a really sound, business-like

proposal can be formulated. This is Mr. Wardrop's opinion and notwithstanding the utterances of the Chairman, he is borne out by the motion actually carried in favour of a joint Committee of the Association and Chamber to consider such proposal. One important fact in this connection seems to have been overlooked, namely, that it is much more the place of the Planters', than of the Mercantile, representative body, to take action towards securing the continuance of the Tea Cess. It was at the instance of the planters that the Cess was originally imposed and it is certainly for the Association (rather than the Chamber) now to ask the Government to be good enough to continue to collect the Cess after the Chicago expenditure is fully met, and to hand the proceeds over, monthly or quarterly, to the Committee of the Planters' Association as the natural trustees for the tea producers of the country—the same to be expended in introducing our tea into America (jointly with the Indian Fund?) or generally into new countries. That, we take it, is the first duty imposed upon Saturday's meeting. It is, indeed, embodied in a motion carried at the Dikoya Planters' Association, and we cannot see any possible opening for objection on the part of Government, or of the merchants, if the Planters' Association resolve on such a course of procedure.

We have next to consider the much more difficult and controverted question of how to go to work in America, in order to get our teas far more rapidly into demand than would be the case if everything at this crisis were left to private enterprise. First of all, anything like interference with retailers, or the opening of special Ceylon or Indian Tea Stores is now generally condemned. We have not the slightest doubt—notwithstanding the sneers of "Old Colonist" among others—that the pioneering work of Messrs. MacCombie Murray, Pineo, Arthur, Elwood May and others, is bearing much good fruit in the present day and that there is a steady demand for a certain quantity of our teas in the Eastern States which is almost solely due to the labours and advertisements of these gentlemen. Not one rupee of Ceylon money spent over them has, in our opinion, been wasted. [A curious, interesting and important fact brought out by Mr. P. R. Buchanan is that British-grown teas (whether Indian or Ceylon) are almost universally spoken of as "Ceylons" by dealers throughout the States. One scarcely ever hears of the term "Indians."] Still, the stage at which we have now arrived is emphatically one for dealing with, and through, the Wholesale Dealer.

There is then another point which has gradually been brought out and which we believe has influenced the members of the Chamber, as it has a number of thinking men upcountry, and that is, that the work now to be done in America must be through the agency of experts. Following on the group of pioneer tea store-keepers and advertisers, came the greatest retail shop and advertise-

ment of all, namely the Chicago Exhibition and to what Ceylon and India have done there, we need not particularly refer beyond repeating that in this island, there is but one opinion of the admirable way in which the Hon. J. J. Grinlinton discharged to the full, the function and commission entrusted to him. He deserves every word of praise allotted, both officially and unofficially: for the latter he has won the high opinion of his fellow-colonists and of the intelligent natives and this he will deem a great reward. Officially, the acknowledgment of his meritorious work has yet to come and we have said it ought to be "*K.C.M.G.*" to correspond with that of the New South Wales' Commissioner; while others hold it will be "*C.M.G.*" But be that as it may, what has now to be said is that Mr. Grinlinton's duty and function closed with the Exhibition, and that it ought not to be re-opened. We have all along felt that those who were pushing Mr. Grinlinton's name to the front, as the man to go back to America as the *business* agent of the planters were doing him no kindness, but a distinct disservice. For one thing, it would be a clear coming down for the Exhibition Commissioner; he would have no official appointment or status; he would be expected to work in a way which no Colonist of his years or standing, let alone his training, should be expected to do; he would have to convince wholesale dealers and American tea experts of the advantages of Ceylon (and Indian) teas over "China's" and "Japan's" as if he had been all his life in the trade; and the work is one which should engage the close, unremitting attention of whomsoever is appointed for at least three, if not five, years to produce adequate results. We feel sure if these and other facts are taken into consideration, it will be understood that to call on our Commissioner to risk the high reputation he has secured, by a work, *finished* and complete in itself, would be the reverse of what is fitting and right, and opposed to the conditions under which the new Campaign must be undertaken.

These conditions point to the engagement of a first-class London Tea Broker—an expert who can be thoroughly trusted to enter *con amore* on his work among American wholesale dealers and tea experts,—as the right man now to carry on the Campaign throughout North America against China and Japan, and in favour of Ceylon and Indian teas. Such a man can no doubt be selected (by advertisement or a Committee) from Mincing Lane. As a Broker, he will have been all his life trained to consider the interests of producers on the one side and of the wholesale dealers on the other. He will have his instructions and will be expected to follow them; but his one great mission and object will be to demonstrate the inferiority of "China's" and "Japan's" and the good reasons for each dealer taking up with the better teas, lest his rivals in the trade cut in before him. The representative will have an "entertainment" allowance and will doubtless, know how to work this branch. Moreover, he must as a high-class, highly-paid agent be fully

trusted, and will therefore be empowered to advise and draw on the Committee in charge of the Indian-Ceylon Fund, in order to *advertise* or to pay commission or bounty, as he may deem advisable after testing the market, sounding the wholesale dealers, and otherwise deciding on the best course to pursue. The Broker-Agent will know well that his mission will be judged by results and his training must lead him to prefer the building up of a good solid, rather than a flashy business. As to his impartiality between India and Ceylon, we cannot conceive of any Agent who could be more so. In London he has been accustomed to deal with both teas: he is intimately acquainted with their qualities: his province is not to think of where a tea grows, but of the kind of tea to suit his customer. He will spread before the wholesale dealer and his expert, a fairly representative assortment of Indian and Ceylon teas and will call on him to test and select what suits him best. But we may say that here Ceylon, while profiting by the larger "fund" which united action would ensure, is likely to score very decidedly in the selection of suitable teas, and for the same reason as brought Ceylon so rapidly to the front in the United Kingdom and Australasia as the superseder of China tea, namely that it is milder and comes nearer the superseded tea, than average "Indian's." Indian planters would eventually benefit by "Ceylons" forming stepping-stones to their stronger teas, suitable for blends—and, at once, the benefit would be in the slackening of competition in Mincing Lane, by so much "Ceylons" as were added to the existing American consumption. It has been said that if Ceylon has a Broker or other Tea Expert or representative all to herself, to push her own tea only, and ignore India, there may come a special demand for "Ceylon's" in America with a distinct advantage in price, apart from the lessening competition in London. In other words, Ceylon would do better to act alone. But against this, is to be put the more limited fund available to the Agent, and the very real risk of rivalry and competition with two men pushing "Indians" and "Ceylons" and the dealers playing the one off against the other and in some cases, saying "Don't bother us—a plague o' both your houses." This result, we say, is more likely to arise from India and Ceylon working separately through two independent Agents, each intent on making the better show for his principals. A middle course is for both countries to unite with one Fund and a Joint Committee to select two representatives—a tea selling expert and a tea producer—to work together, so that the one could tell the dealers all about how the tea is grown and made, and the other how it compares in the cup, &c. with China's and Japan's. In our opinion, Ceylon has everything to gain from joint action. We should be most foolish to refuse such an "ally" as the Indian Tea Fund for America, promises to be, and still more to court rivalry, or competing agents, where

joint action is practicable. It has been said,—"Why should not the representatives of India and Ceylon work amicably, even if paid and appointed separately?" Well, is it in correspondence with trade instincts or human nature? One Agent is appointed to push "Ceylon" teas by hook or by crook; the other to do the same for "Indians." Would the one not be jealous of the other making a greater show? Would he not be in a very different position to a Broker-representative whose one object would be to give the wholesale dealers the very largest choice of samples of pure teas—from the weakest Ceylon to the strongest Assam—for them to choose from? We have looked at the matter from every point of view, and we still adhere most strongly to the wisdom of joint action, and to the balance of advantage from following such a course being distinctly on the side of Ceylon. Nevertheless, if the planters decide otherwise—or rather if the Joint-Committee to be appointed to consider the course of procedure, so decide—we are free to confess that the Campaign can be fought and with the prospect of successful results—though not, in our opinion, such speedy and satisfactory results.

For, if a joint campaign is started having for its one object to supersede China and Japan teas in America,—if there is "a long pull, a strong pull, and a pull all together,"—we believe that a great and important change might be expected in a very short time. We are not afraid to say that if a start were made this year, 1896 might see the 20 to 30 million lb. of Ceylon and Indian tea taken off in America, with the prospect of an increase year by year in leaps and bounds. Let the despondent among our planters and merchants know that *such a revolution in the American tea trade has already taken place.* Talking with one of the largest dealers in America, who had been won over to take a favourable view of the new teas, Mr. Buchanan said:—"I suppose in any case, the increased demand for Ceylon and Indian teas in America must be very gradual over a long series of years."—"Not so"—was the reply—"if once they begin to be dealt with by the trade generally; and for these reasons, (1) you have a good article, and (2) Japan teas have been steadily deteriorating for years. Now I (said the speaker) have been long enough (over thirty years) in the tea trade, to remember when America drunk no Japan's; but within two years of the taste being approved, Japan's became all the rage in the United States." Clearly this dealer implied that if the Advertising Campaign of Ceylon and Indian teas—for whether it be by Agent or Bounty or anything else, still it means advertising—is pursued vigorously, even he might see in a very few years, another big revolution in the American taste, and the good, sound, superior Ceylon and Indian teas become all the fashion. So mote it be.

It is impossible to think of the special intelligence of the American people and not to feel sure that when they know that the experts of their own and every other country admit the great superiority of Ceylon and Indian teas, they should not begin to discard the inferior article.

We had written so far, when the letter of the Chairman of the Association enclosing the succinct business-like and feasible scheme of Mr. P. R. Buchanan, reached us. We need not comment

upon it: where it differs from what is urged above, it will be for those concerned to say, where the advantage lies. Meantime, so soon as the Government consent to continue the Cess, and a joint-Committee is appointed, the latter might well call on all and sundry to follow Mr. Buchanan's example, and send in schemes in an equally brief clear form to be taken into consideration before a final decision is arrived at.

THE POSITION OF INDIAN, CEYLON, AND JAVA TEA.

Messrs. Geo. White & Co., in their annual Indian, Ceylon, and Java tea report of March 19, 1894 say: Notwithstanding that the total yield from all quarters will probably be less than at one time anticipated, supplies generally appear likely to be sufficient for ordinary requirements.

One of the chief features noticeable, both in some of the teas from India, especially from Assam and Darjeeling, and also in most from the high districts of Ceylon, was the marked variation in the quality received from the same estates. In many instances a fine invoice was followed by one much inferior, and again succeeded by another good one, and so on throughout, causing prices to fluctuate considerably. Consequently regular buyers of well-known marks often experienced much difficulty in determining their course of action as regards purchasing. From this it would seem that the weather in many of the tea districts was more changeable than ordinary.

Although the home consumption shows an increase of nearly 1,000,000 lb. this is disappointing, but may be accounted for by the high prices current for common descriptions during the first half of the year. Exports of China from London exhibit a marked decrease, probably due to larger direct shipments to the Continent. It is therefore necessary in estimating our wants for the coming season that this gradual changing of the situation should be kept in view. At present crop estimates from India have not been received, and must when they do arrive be considered only approximate, as nearly everything depends, both in India and Ceylon, upon the weather during manufacture. The following, however, appear to be the quantities that will most likely be sent from the different countries to meet our requirements, viz:—

	lb.
India may be expected to furnish	120,000,000
Ceylon do do ...	80,000,000
Java do do ...	4,000,000
China do do ...	41,000,000
	<hr/>
	lb. 245,000,000

PROSPECTS.

Should these figures prove correct, it is evident there will be a larger quantity of British-grown tea to deal with than last season. Young bushes from the areas planted out three or four years since will now come into bearing, and it is a question whether the outlook for some time is sufficiently good to induce estate owners to make further extensions. The present rate of home consumption appears hardly enough to absorb these increasing supplies, as owing to their superior strength they go further in domestic use than a similar weight of China Congou. Consequently the importance of continuing to push them in other countries claims the attention of everyone interested in the development of the industry. Trade with the Continent is steadily growing, while the efforts made at the Chicago Exhibition will probably have a far-reaching influence in the United States. Considering that the world's consumption of tea, not including the amount used locally in China, is from 450 to 470 million lbs., of which India and Ceylon do not at present furnish one-half, there must be ample room for expansion if the produce of China and Japan can be still further displaced in the countries where they are at present chiefly taken. This

has already occurred in some quarters, as seen by the shipments to the Australian Colonies and the Persian Gulf;

MANUFACTURE.

As regards the make of the leaf in Ceylon, it would appear that this process has on the whole received considerable attention, though when flushes were heavy in November and December, from some districts the appearance was brown and mixed, which might be partly attributable to want of withering space at the factories. Similar causes no doubt contributed to the difficulty of turning out fine descriptions; hence the large proportion with thin, pointless infusions. It is to be hoped that the weather will enable planters to send teas with more strength and flavour, so that these growths may not fall in the estimation of the public. With the larger output looked for, it should be worth while to secure quality, even though by so doing the quantity of common is lessened.

BULKING, &c.—More factory-bulked tea has been received, especially from Ceylon, and as a rule the appearance has been found sufficiently regular to obviate the need of incurring extra expense in bulking here.

ANALYSIS OF CROP.

CEYLON.—Arrivals since July 1 have not shown so much fluctuation in quality as in the previous year, though circumstances evidently only admitted of the manufacture of an ordinary crop. Low-lying districts will probably give a fairly good result, but those at a higher level appear to have had unusual obstacles to contend with, and so have been unable to send the choice full-flavoured kinds looked for from those quarters.

From July 1 last about 74,000 packages have been disposed of here in excess of the same period of 1892-93.—*H. and C. Mail.*

ALUTKELLE GOLDEN TIPS.

The box of Alutkelle estate Golden tips which was offered R1 at the last tea sale was again put up by Messrs. Somerville & Co. and was bought by them at the rate of R2 per lb. The box weighs 7 lb.

NOTES ON PRODUCE AND FINANCE.

TEA AND SILVER.—This is perhaps the quietest season of the year with those interested in the tea industry at home, as the feeling is one of expectation rather than activity. In about a month the tea companies will begin to issue their reports, and until these important documents are made public there is little to occasion much interest. The great currency question which agitates other commercial circles trading in the East is felt much less acutely by tea proprietors, who for the most part are not adversely affected, or at least do not feel the effect of the depreciated rupee in the same degree as Indian and Ceylon traders generally. Indeed, the uniform steadiness of tea shares and the prospects of tea companies generally are in marked contrast to the general disturbance and depression to be found elsewhere. The outlook generally for the tea industry is anything but unsatisfactory, although, owing to exceptional circumstances, there may be a few cases where the silver question is prejudicial to uniform prosperity. There may be apprehension as to the future if the decline in silver continues, but on the whole that which has troubled the mind of the exporter is accepted up to now by the importer of produce with a certain degree of equanimity.

LAST WEEK'S TEA MARKET.—The market for all grades of Indian tea, says the *Produce Market Review*, is stronger, but the advance is most marked in the finest kinds, which continue in comparative limited supply. The commoner descriptions have risen from ½d to ¾d

with every appearance of increased firmness later on. In medium kinds the advance has been greater, and the demands shows distinct improvement, notwithstanding the near approach of Easter. With an increasing consumption, and a strong statistical position, it will not be surprising if a further general advance in the prices of Indian tea is established during the next few weeks. The public sales of Ceylon teas have again been small and a brisk business has been done in all descriptions, the tendency generally being distinctly firmer while in many cases advanced rates were paid. With small supplies coming forward during the next few weeks and the strong statistical position of Indian teas, this improvement is likely to last, and as prices are still very moderate, an increase in the demand from the retail trade may be expected. The proportion of fine growths continues very small and any teas of good quality realised full prices.—*H. and C. Mail*, March 23.

INDIAN TEA DISTRICTS.

Darjeeling, Terai, and the Dooras are suffering from want of rain, and what with wells running dry and no water in the streams, matters are becoming serious. There have been heavy hailstorms in Sylhet and some gardens have been so severely cut up, that the damage has had to be specially reported on.—*Nilgiri News.*

INJURIOUS INSECTS.

For the seventeenth year in succession Miss Ormerod has issued her report, on this occasion showing the nature of the principal insect-attacks during the year 1893. The prolonged drought was in many cases unfavourable to plant-growth, whilst it was propitious to some insects, such as the Gout fly (*Chlorops taeniosus*). For eel-worm an application of 6,000 lb. per acre of carbolic acid mixed with twenty times its bulk of water, is recommended, but for greenhouses no hope is entertained of getting rid of all the pests.—*Gardeners' Chronicle.*

BRITISH GUIANA.

British Guiana is justly entitled to plume itself upon its exceptional prosperity. When Trolope visited it he was struck with the evidences of its well being, at a time when most of the West Indian Islands were depressed; and since then the sugar-planters have continued to do well and the gold mines, first worked in 1856, are already producing at the rate of half a million a year. This does not quite justify an official surmise that "the goldfields of British Guiana will equal, if not surpass, those of California and Anstralia"; but it accounts for labour on the plantations being scarce. Still it is hardly fair of local patriots to invite Europeans to emigrate to this prosperous settlement. The Blue Book we have just quoted honestly describes British Guiana as a "great lone land, whose forests are as pathless and gloomy as those of darkest Africa, whose soil teems with gold and natural riches but where the climate is treacherous to the stranger and where the seeker after wealth is as likely to find a grave as a fortune."—*Westminster Budget.*

TEA IN THE WYNAAD is decidedly looking up. Mr. Romilly's 130 acres which he planted up last June on his estate at Maypadi is looking remarkably well, and up to date he has only sustained about 4 per cent of failures. He intends planting up another 170 acres of tea this year: the elevation of his estate is, we may mention some 2,000 to 3,000 feet, this means huge yields.—*Indian Planters' Gazette.*

BRITISH CENTRAL AFRICA:

AN OFFICIAL NEWSPAPER STARTED: NEWS OF
OLD FRIENDS.

Just as we are in the midst of writing about "British East Africa" from Mombasa up to Uganda, there arrives very interesting intelligence from the other great British-African sub-tropical division in the shape of a letter from Mr. Alex. Whyte, formerly of Kandy and Nuwara Eliya, and copies of "The British Central Africa Gazette"—the first newspaper, we suppose, published in Africa between Natal—or say The Transvaal—and Egypt. Mr. Whyte writes from Zomba under date 8th Feb.—so that his letter has taken nearly two months *en route*—as follows:—

"I send you copy of our new paper; *The British Central Africa Gazette* and copies of it will be posted to you regularly in future. In return, Commissioner Johnston will feel much obliged if you will post us the weekly *Observer*.

"I should have written to you long ere this and repeatedly if I had had time, but my duties here, as you may imagine, in a new country have been very numerous and absolutely no time has been left for outside correspondence, I think, however, that I can guarantee that the new paper will keep you well posted up on what goes on here. We have had trying times of it here lately with the slave raiders and traders, but as you will see by the papers they got a thorough thrashing on the lake from Mr. Johnston and his handful of Sikhs the other day.

"You will see the Central African Telegraph is going ahead, and there is now a scheme on hand to connect the Zimberri with Lake Nyasa by means of a railway, and which I have no doubt will be carried out ere long. I have now been out here three years and I go home on leave soon. I have kept my health well on these uplands of the Shire Highlands, but even they cannot be called healthy for Europeans. However as the ground is cleared and estates opened up, I have no doubt that it will improve and that there is a bright prospect for the country in the not very distant future. I felt much the news of the death of my nephew, Jas. Brodie of Colombo, by last mail. We were all very fond of James and I always looked on him as an exceptionally fine character."

The number of the new "Gazette" before us is a very interesting one indeed, giving us 8 pages of about the size of the *Overland Observer* of closely printed matter. It opens with an official notice from Commissioner Johnston that the paper is to be the official *Gazette* for "British Central Africa," but is to be conducted independently of the Administration. Next we have a report on the Telegraph Road between Tshikwawa and Tete, a distance of 90 miles, giving a full description of route and signed by Messrs. J. O. Bowhill, S. Argyle Gillmore and G. C. L. Ray. On the 2nd page we have Mr. Thistleton-Dyer's information about coffee disease already noticed by us and published in full detail in the *Tropical Agriculturist*, and further on, come the Queen's Regulations for preventing the introduction of coffee disease into Central Africa, as drawn up by the Commissioner and very stringent they are about permission being required to introduce seeds, living or dried plants from Asia or dependencies, Natal, Mauritius or Zanzibar. Certainly all the coffee planted in Central or East Africa should be from the indigenous plants—coffee grows wild in the Uganda forests and no doubt in other accessible parts as well as in

Abyssinia. We have also a further great variety of Queen's Regulations dealing with the Registration of Titles to Land after a very simple and economical fashion; giving a list of Import Duties (generally 5 per cent *ad valorem*, but a good deal free, machinery, &c.; 10 per cent on guns, gunpowder, &c.: alcohol under special restrictions.—In respect of Export Duties, we have 6d per lb. on ivory up to tusks weighing 15 lb., 9d per lb. above that; 1d per lb. on rhinoceros horns and hippopotamus teeth; 1s an oz. on gold. A list of 15 Customs houses and ports of Entry and Exit representing the different districts is given. Then we have Licenses to carry firearms £1; to kill big game £25; to trade £10—all per annum; besides licenses in respect of importing and selling alcohol. A Postal Notice and Report of "E. E. Harry," P.M.G. is very interesting. Nothing can show us better how civilisation is advancing in Central Africa than the following table and extract:—

POSTAL SERVICE IN BRITISH CENTRAL AFRICA
FOR ONE MONTH.

(October 20th to November 20th, 1893.)

From a "ways and means" point of view the position of the British South Africa Company's British Central Africa Postal Service is a unique and difficult one. Incoming mails are only conveyed so far as the Tshinde mouth of the Zambezie at the expense of the country of origin, and the cost of carrying them up river to the nearest point of British Central Africa territory—some two hundred and forty miles distant—has to be borne by the British Central Africa Post Office. This, taken in conjunction with the fact that the English newspaper mails for Nyasa and Tanganyika alone are, as a rule, three times as heavy as the whole of the homeward newspaper despatches made up at Tshinde, will tend to prove that, for at least a few years to come, very little profit can be made out of the Department which I have the honour to represent.

A Revenue Abstract for the Ruo Division shows that the revenue has increased from £144 in 1891 and £1,780 in 1892 to £4,708 in 1893! The native population in the several divisions is also rapidly increasing through immigration and settlement—the result of good Government, of course. Who can estimate the benefit conferred on the many poor native tribes that hitherto could

never call property or lives their own from one month to another. In Ruu the increase has been from 8,000 at beginning of 1892 to 13,000 by end of 1893; in Lower Shire from 3,000 in August 1892 to 8,660 in December 1893 which population paid £427 during 1893 for hut taxes at 3s a hut on 2,890 huts. Further we read:—

In the Blantyre, Zomba, West Shire, Upper Shire, and South Nyasa districts the resident native population has largely increased during the year 1893. In the Mlanje district the population has slightly diminished owing to the expulsion of Mtanda and his Yaos, but has increased locally round Fort Lister and on the western face of the mountain. Next we have an eulogistic notice of the late Mr. A. L. Bruce, an Edinburgh merchant, son-in-law of Livingstone, who subscribed largely to every scheme for benefitting East and Central Africa. Then follows an affecting obituary notice for the young settlement:—

Another death, equally sudden and unexpected has saddened our scattered community. Mr. Alfred E. Peile, the Collector of the Lower Shire District, died at Ntumbi, near Port Herald, on January 19th from a gun accident. He was standing on the gunwale of his boat, waiting to get a shot at a bird. He held his loaded shot gun pointing upwards and the stock resting on the gunwale. The boat gave a sudden lurch Mr. Peile fell backwards, the gun went off, and both charges entered his abdomen. The unfortunate man did not at first believe himself very severely wounded, and sent a message to the African Lakes Company's agent to the effect that he was going down to Tshinde in a boat to see a surgeon. He died, however, ten minutes after the wound was inflicted.

Mr. Peile was one of the most valued servants of the Administration. He was appointed assistant collector in the Lower Shire District in August, 1892, and in the spring of 1893 was promoted to be Collector. During his occupancy of this post the native population has increased by immigration from three thousand souls to nearly nine thousand. Port Herald has been laid out as a township, and Europeans and Banians have settled there. Mr. Peile was engaged up to the time of his death on an elaborate survey of the Lower Shire District. He will be missed not only by his many English friends, but by the natives with whom he was a great favourite. At the time of his death his age was twenty-eight.

And further:—

We also announce with much regret the death of M. Jacques Bianchi, a French subject, and a well-known trader and transport agent in British Central Africa. Mr. Bianchi was sailing up the Zambezi in a large boat, when a puff of wind capsized her, and Mr. Bianchi was unfortunately drowned, becoming entangled, in some way, with the gear of the capsized boat.

We have next interesting extracts from Reports by Mr. Richard Crawshaw (Magistrate and Collector for the North Nyasa district) on the interesting Nyika country, which is the lofty plateau lying between the N.-W. coast of Lake Nyasa and the Great Luangwa River. We must make a few quotations:—

Our route into Angoniland lay through some of the finest country I have seen in Africa; indeed, I cannot recollect having seen anything like it either in the Shire Highlands or on the Nyasa-Tanganika Plateau. Leaving Lake Nyasa at Tshombe (Mount Waller), where I secured some specimens of coal, we climbed the Nyika Plateau in a westerly direction, and travelled through Nyika, Henga, (depopulated some 16 years ago by the Angoni), and Tumbuka in part; skirting the eastern limit of another depopulated district Nkamaoga, and following up the Linyina, Kasitu, and Luanyangwa rivers for about two and a half days' journey. The Linyina and Kasitu

are curious rivers, of fair width, but very shallow with beds of pure soft sand, as a rule, very high banks, The Nyika plateau is magnificent country, and is sparsely peopled by Anyika (otherwise called Apoka) who live on tiny ledges out into the slopes of the mountains, and occasionally in caves, and who cultivate almost exclusively peas of fine size, which grow vigorously through the entire dry season.

The climate of these Nyika Mountains is almost European, and quite Natalian. On Kantorongondo, below Tshidiyu's, the temperature at sunrise registered less than 36° (the lowest my Capetown purchased thermometer would register), and, at noon in the shade, with the sun shining brightly, 71°. The soil is generally bright red loam and very moist. There are any number of streams, large and small, in the beds of which are Tree Ferns, wild bananas, and monster trees with their limbs hoary with long grey lichen. The more I see of Nyika the more I am charmed by its high healthy country, and bracing air. It is in the mean higher than I had expected. For a day we rarely descended below six thousand five hundred feet, often going for miles well over seven thousand feet. The highest point registered on our route was seven thousand seven hundred and ninety feet, and at that altitude there was a perfect travelling over level ground covered by short, crisp grass, no more than ankle-high.

It is impossible to ignore paths altogether on the tops and sides of the mountains, so level is the land and so short the grass; but not so in the valleys intervening, where there are vast and dense forests and tangled undergrowth of extraordinary luxuriance, and where often the ground resembles what is termed in Ireland "Red Bog."

Water I found everywhere abundant and good and so cold that a prolonged draught gave one a pain between the eyes—after the manner of ice if eaten quickly. This last time I made a small but unique collection of butterflies, taken almost without exception at altitudes well over seven thousand feet.

Flowers I again collected in a small and unscientific way; and I have, too, a branch of a kind of dwarf *Lawsonia*, [the "henna" of the East.—Ed.] which I found growing plentifully on the exposed peaks from six thousand five hundred feet upwards. This tree the Anyika know by the name of "Masta;" it does not grow, apparently, higher than some ten or twelve feet, and has a most pleasing smell.

Game, both feathered and furred, is woefully conspicuous by its absence, in Eastern Nyika at any rate. Altogether I only saw three antelopes, all small, and one very similar to the Natal *Oribi*. Hares are plentiful, but, strange to say, there are no guinea-fowl, though there are numbers of Francolin (three species), and Quail. These latter are often caught by the natives in "running noose," traps with which the paths are plentifully beset.

We have next Regulations dealing with the Engagement of Native Labour within the 12 districts into which the "B. C. African Protectorate is divided." These Regulations seem very wise and moderate, engagements as a rule being for a year. We then come on the 7th page to perhaps the most interesting part of this unique newspaper, namely "Notes on Natural History by Mr. Alex. Whyte and others." Mr. Whyte is the head of the "Science and Forestry Departments" and among those who assist him is at least one other old Ceylon resident in Mr. T. H. Lloyd. We can only make short extracts from Mr. Whyte's paragraphs:—

A remarkable monkey has recently arrived at Zomba from Tanganika. There is some probability of this creature turning out to be a new species, or even genus. It has a remarkable superficial resemblance to the Black Ape of the Island of Celebes. It may, after all, be only a variety of the *Cercopithecus pluto*, though as a matter of fact, it seems to combine in itself characteristic of the baboons, the mangabeyes,

the *Colobi*, and the curious Guereza monkey of Abyssinia. Its colour is coal black, except on the shoulders, where the mane of long hair of a reddish black colour; still at a first glance it strikes one as being an absolutely black monkey.

A curious and interesting discovery was made on the Upper Shire some while ago by Mr. F. J. Whicker. He found that in a small patch of country (a piece of "bush" near Liwonde's) there was a colony of love birds (*Agapornis*). These tiny little parrots would seem to be a different species to that found in West Africa. They are chiefly characterised when mature by a greater extent of bright flame colour over the whole face and upper part of the breast, while the end of the mandible is a deep crimson. The most curious point about these birds is the fact that, in spite of all our researches, they have been met with in no other part of British Central Africa. Their distribution seems to be confined to a small patch of woodland on the west bank of the Upper shire.

A few weeks ago the handsome new aviaries at Zomba were completed. This building consists of eight large compartments, two of which are made specially strong to hold beasts of prey. Two separate streams of water from the Mlungusi river course through the aviaries, and in places widen out into shallow pools for the water birds. Among the more interesting creatures at present in the collection may be mentioned, in addition to the black monkey and the love birds, a remarkably handsome crested eagle, presented by Mr. T. M. Hastings, and obtained from Tahiradzulu. This bird is rather strikingly coloured with glossy, brownish black and white, the long legs from the thigh to the foot being snowy white, and heavily plumed. There are also some gandy plantain-eaters (*Gallirex*) who are quite as amusing as, and much more lively, than parrots. Two young birds of this species were recently purchased from a native. They had been brought straight from the nest. [According to the natives, the *Gallirex* or plantain-eater only hatches two young at a time.]

Mr. F. J. Whicker, on the 20th January, shot a large male leopard on Liwende Island, close to the "boma" of the fort. He had swum the small strait of sluggish river which separates the island from the west bank of the Shire, and was discovered in a field of maize. He was surrounded by native beaters, two of whom he severely scratched before Mr. Whicker gave him his *coup de grace*.

And here comes a paragraph which reminds us of how elephants in olden days used to delay the tappal in Ceylon:—

There has been another incursion of lions on to the slopes of Zomba mountain. Their presence has been reported from several villages not far from the Residency, and in the middle of January they actually interrupted the passage of Her Majesty's mails on their way up from Mpimbi to Zomba, so scaring the two mail carriers that they climbed up with the mail bags into trees and remained there for some hours until the lions decided to walk in another direction.

Further, here is very practical information for future planters:—

Mr. Whyte desires to draw attention to the facility with which bush buck, when caught young, can be tamed. There are at present a couple, male and female, at Zomba which are a good deal tamer than the domestic goats. They roam about freely over the grounds during the day time, and are shut up at night for fear of leopard. There are also one or two charming little antelopes of the *Cephalophus* genus. The meat of the bush buck is the best meat to be obtained in Tropical Africa. It is superior in taste, juiciness and tenderness to any beef but the best English, and is preferable to mutton and goat.

It is gratifying to note how many have been our discoveries in both the fauna and flora of British Central Africa. Mr. Richard Orwashay recently sent to the British Museum, through the Commissioner, a collection of fresh water mollusca from Lake Mweru. It has since been announced by Mr. Edgar Smith, of

the Zoological Society, that almost the whole of these shells are new to science.

It is interesting to observe the effect which transplantation into the Shire Highlands has on plants introduced from other parts of the world. Some trees and flowers which would seem most suited to this soil and climate do not answer at all. Others, again, find in the Shire Highlands a new home where they thrive to a marked extent. The potato family (*Solanaceae*) is an instance of plants which thoroughly appreciate the climate of the Highlands of Central Africa. Tomatoes and tree tomatoes, all forms of tobacco, the Cape gooseberry and the potato flourish amazingly. The potatoes introduced into the Zomba gardens from England seeded, and the seed thereof has produced a remarkably fine tuber, which Mr. Whyte intends to style the "Zomba Wonder," and which he hopes may become a permanent variety. The *Petunia* (which is a member of the *Solanaceae* family) seeds rarely and with difficulty in England. At Zomba it produces seed in abundance, and may be considered to have definitely established itself in consequence.

Mr. T. H. Lloyd has been endeavouring to introduce the cultivation of the Deli tobacco of Sumatra. Unfortunately much of the seed which reached him from the Malay Archipelago had been spoilt on the voyage, and none of it came up in the Residency gardens, but Mr. Buchanan, on the neighbouring Mlungusi estate, has been more lucky and has succeeded in rearing a few plants.

Roses take to this climate very kindly, and bloom nearly all through the year. The strawberry again is a great success. Strawberries planted at Zomba in 1892 commenced to fruit in June 1893, and continued supplying fruit until the middle of December. Apples, however, are almost a failure; the vine appears to be a disappointment, and peaches, apricots, and all stone fruit also. The young orange trees at Zomba have borne for the first time this present rainy season, and appear to be thriving. A fig tree also which had languished during several years has suddenly taken heart of grace and produced an extraordinary crop of figs. Nearly all European vegetables, except celery, give excellent results. The climate is a little too damp for melons, although cucumbers are very successful. In many respects the grounds of the Residency at Zomba afford a curious spectacle as a meeting place of tropical, sub-tropical, and temperate products. Here at one time were to be seen fields of oats growing alongside banana plantations, wheat next to brakes of pine apples, and gorse trailing at the foot of India-rubber trees coming from the most tropical parts of Asia.

A useful lawn grass known as the Dub grass in Ceylon was accidentally introduced some years ago, by Messrs. Buchanan Brothers. It began to take a firm hold of the cleared land round houses at Mlungusi. Mr. Whyte introduced into the Residency grounds, where it has become quite a feature. It rapidly covers large tracts of land, and excludes the never-to-be-sufficiently-exercised coarse rank grass of the country. This season these lawns have produced a large crop of seed, and Mr. Whyte will be happy to dispense the seed in small packets, as far as he is able, to those who wish to introduce this grass on to their estates.

Next, we have under the head of "Local News" on the last page, paragraphs about the good work being done by Capt. Edwards and Lient. Manning and his Sikhs, as well as by Collectors and Magistrates, in putting a stop to the Slave Trade and its untold miseries. In this they are cordially supported by Baron von Eltz, acting Imperial German Commissioner for Nyassaland. The Baron had indeed seized one caravan and released 211 captives taken by the Arab raiders. No words can describe the benefit to the country and people of peaceful settled Government and it is touching to read how chiefs and

people in some cases help to build the Forts intended to command certain routes taken by the Arab slave-dealers whom they detest. But the works done by the British in putting down tribal and intertribal wars among the natives of Africa is beyond praise—one of the most valuable ever undertaken in the name of civilisation and progress. For planters, we have useful information in returns of rainfall for two districts in the Shire Highlands as follows:—

Mr. Hyde Wyatt of Namitembo has supplied us with the following record of the rainfall for the years 1892 and 1893 on the south western part of Zomba Mountain.

Rainfall, Somba South West, for 1893.

Month.	Inches.	Number of Days Rain.	
		1893.	1892.
January ...	9.55	23	no record
February ...	8.22	19	8
March ...	5.16	11	15
April ...	1.96	11	11
May05	1	3
June15	1	2
July ...	1.17	6	4

September32	1	1
October80	2	3
November ...	2.30	1	10
December ...	11.38	13	15
	41.06	91	72

Supposing we take 23 days' rain for January 1893 we have 95 days' rain against 91 days in 1893. It is curious to note only a difference of 1 day's fall in the two years during the months of July-October inclusive but .44 of an inch more rain was registered in 1893 than in 1892. The heaviest falls were February 10th 4.50 and December 24th 3.00 in 1892. November 10th 2.30, and Dec. 11th 2.75 in 1893. The planting season commenced in 1892 on November 19th and in 1893 on December 23rd.

Mr. Bell, the Collector for the Mlanje District, has measured the rainfall on the western flank of Mlanje mountain during the year 1893. He finds that there was a total rainfall of 64.25 inches that rain fell on 134 days of the 365, and was distributed as follows through the 12 months.

Rain fell on			Rain fell on		
1893.	Days.	Rainfall Inches.	1893.	Days.	Rainfall Inches.

164 64.25

Finally to show that Commissioner and Consul-General Johnston, C.A., is at the head of an important service, we need merely quote the "Official Gazette":—

Commissioner's Office, Zomba, Jan. 1st, 1894.

BRISH CENTRAL AFRICA ADMINISTRATION.

H. Croad has been appointed to be Assistant Collector in the Mlanje District.

H. Crawford Angus has been appointed to be an Assistant Collector in the West Shire District. Feb. 1st.

De Symons M. G. Honey has been promoted to be Assistant Collector in the Blantyre District.

Mr George Galt, Assistant Collector at Blantyre has been transferred to the Lower Shire District to act as Collector.

Mr. Chalmers Duff has been appointed to be an Assistant Collector in the Upper Shire District.

PLANTS ON THE PHILIPPINE ISLANDS.

We extract the following notes on the flora and products of the Philippine Islands from a report recently furnished to the Foreign Office by Mr. Consul Stigand, dated Manila, July 21, 1893:— "The flora of the Islands would require a long chapter for proper treatment. There is a great absence of flowering plants, and those which do flower have, as a rule, very small flowers, and the absence of odorous blossoms is as remarkable as the absence of singing-birds. Flowering Orchids are abundant, both in variety and quantity in the forests, but in the towns a fair-sized plant of an ordinary species cannot be procured under 1 dollar, or about 3s. By the roadsides near Manila the principal trees to be seen are the tall and graceful Betel-nut Palm, Bamboo, Bananas, and other tropical trees and plants. Vegetables—Beans and Peas, for example—are grown here by covering them up from the sun with trellis-work covered with Bauana and other leaves; but most of the vegetables are brought from Hongkong. There is hardly any eatable fruit but Mangoes and Pine-apples, the latter growing as commonly as weeds. The Sugar-cane, Coffee-plant, Ataca or Hemp (*Musa textilis*), Tobacco, Maize, and Rice, are the plants chiefly cultivated. As for the woods of the country, their nomenclature forms an immense list; and the better kinds of woods are too little known. Some of these woods are excellently suited for furniture, especially the "Narra" wood, which has the look of Mahogany, but is not so close in grain, while having a lighter colour."

The only outside market for Philippine woods is China, where large quantities are shipped annually, and the hard woods of good length find great acceptance in that market for the building of temples. A wood known as "Camagon," a sort of ebony, is a good wood for ornamental work, but it is defective, owing to the white streaks that run through it. A sort of Boxwood, or *Lignum-vitæ*, grows in the country, but not in sufficient quantity to be of marketable value. None of the Philippine woods have had a fair trial in the home market.

Referring to gutta-percha, a good business, it is said, was done in this article for a few years, but owing to a system of adulteration carried on by the Chinese, the trade has been entirely killed, and scarcely any business has been done for two years.—*Gardeners' Chronicle*.

TEA IN TRAVANCORE.

Baron Rosenberg of Travancore, despite his great belief in cinchona, has come back from Ceylon full of tea and means to go in largely for the fragrant herb on his Travancore estates. —*South of India Observer*.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed during week ending 17th March 1894:—

DECORATING MACHINES.—No. 88 of 1894.—Alfred Deudonne Estienne, Chief Engineer of the Messageries Maritimes for improvements in machines for decorating ramie and other plants.

COCONUT-SCRAPER.—No. 339 of 1893.—David Isaacs, Assistant in the firm of Messrs. W. Whelan, Coen & Co. of Hubli, Southern Mahratta Country, British India, for a new or improved coconut-scraper. (Filed 8th March 1894.)

Week ending 24th March.

PLANTING MACHINE.—No. 92 of 1894.—K. Kaparam, Meehiniet to H. H. the Maharaja of Mysore, Nazarabad, Mysore, for planting purposes, by name "Rapana."

INDIA-POST REPLY COVER.—No. 93 of 1894.—Thomas Stephenson Weir, Health Officer, Bombay, and George Walsbe, Retired Warrant Officer, Grand Road, Bombay for an India-Post Reply cover.

TEA-SIFTING, &c.—No. 94 of 1894.—George Murray Collom, Engineer and Tea Planter, care of W. G. Forbes Mint Buildings, Calcutta, for an improved sifting and sorting machine for tea or grains, &c.—*Indian Engineer*.

Correspondence.

To the Editor.

CARRYING TEA LEAF LONG DISTANCES.

Northern India, March.

SIR,—The above forms a better heading than that adopted by me in my first letter. I used the term "Silo System," &c. in order to attract instant attention to the essential principle of my system, which is that the exclusion of air by the application of pressure prevents fermentation. Your quotation from Mr. Bamber's new book does not apply to my system, because the leaf under pressure does not become red, if it has been compressed sufficiently and if air is excluded.

I have to thank the "experienced Ceylon manager" for his reply to my letter, but I think that he has not quite realized the principle on which I propose to work. Of course, the simplest way of testing my assertions would have been to try them practically as detailed in your issue of March 19th. All that is required is a well-fitted tea-chest (of well-seasoned wood which will not give any woody smell) of any dimensions, and the labour of two men to trample in the leaf slowly and evenly—so slowly that the two men will be employed for two hours before the 3 maunds of leaf will be pressed into the box. Note carefully the required density 34.8 cubic inches to 1 pound of leaf from this it will be easy to determine the amount of leaf; to be put into the box the dimensions of which are known.

The weight of (lead, stones) pressure to be put in the false lid should be from $1\frac{1}{2}$ to $1\frac{3}{4}$ pounds per square inch of surface of the false lid. With these simple appliances the "Silo" system can be tried: a box, two coolies a few heavy weights. Care must be taken that the weights do not get supported by the sides of the box. I can assure your correspondent that it is possible to compress 240 lb. of fresh tea leaf into "an ordinary tea chest" without expressing any juice, and that heating and fermentation will not take place. He has quoted instances where leaf "hard pressed into a basket has been spoilt but he must see that this is the most favourable condition for active fermentation, i.e., conditions of moderate pressure to start the heating and the admission of fresh air to carry on the combustion. I propose to pack the leaf so tightly that the air is expressed and no rapid heating can take place, and after that to prevent fresh air from getting at the leaf. Mr. Bamber in one of his circulars states that rolled tea leaf deprived of air remained absolutely unchanged in colour after 24 hours; also that it remained almost unchanged with a limited supply of air. To begin with I only want your readers to allow that there is some possibility of success in the system I have brought to notice. PRESS.

P. S.—The bruised condition of the leaf after being compressed is not to be taken into consideration because whether fresh or withered leaf, has been pressed, it must be put into the rolling machine as soon as it is taken out of the pressure chest. There must not be a delay of even half an hour, as if there is any delay, the exposure to the air will turn the leaf red, and of fresh leaf the stalks will again become brittle. Once in the chest the leaf will remain there under constant pressure until it is put into the rolling machine. Withered leaf can be manufactured as usual, but unwithered leaf will require different treatment because the moisture has to be got rid of after instead of before rolling. PRESS.

A PLANTING QUERY: TEA ROOTS AND SOILS.

DEAR SIR,—It will be interesting to read what answer your "Scientific Referee" will give to "An Old Coffee Stamp's" question: "Do the deep roots in very dry weather abnormally draw upon reserves of mineral salts"? This question presupposes the probability that in ordinary rainy weather such roots are inactive in consequence of the sufficiency of the supply of "mineral salts" nearer the surface. The roots of plants can absorb or feed on nothing that is not soluble and in a state of solution, and when all moisture is absent from near the surface, it is only reasonable to suppose that greater activity is induced in the deeper regions. It is possible that the principal function of deep roots is that of searching for water, while they gratefully accept any chance mineral food that may come in their way in the course of such explorations. If the long whippy feelers that are thus sent out are examined they will be found to be of very varying length, going round and smooth through barren regions, but developing bunches of tender rootlets wherever they come across bits of good feeding, and these bunches are large, or small in proportion to the richness of the finds thus made. Now this is what "An Old Coffee Stamp" supposes our tea-roots have been doing lately, during the dry weather, resulting in improved "flavour" rather than "strength" and that he shall suffer for it when the rains set in and the surface roots again become the sole feeders. I think much of this is pure fancy, beyond the very possible supposition that greater activity is developed in the functions of the deep roots during very dry weather. But according to the reports from nearly every district (except a few places in very low districts) the flush everywhere has been very abundant through all the drought. This could scarcely be in consequence of the deep roots suddenly and almost universally finding new pastures. If it were so, it would by no means be a bad sign, but go far to prove that vast reserves of plant food exist where he had expected to find it. So long as plants get "enough," I suppose the plethora of a supply near the stem would render unnecessary, and mechanically choke out, later-arriving supplies from a distance, which supplies, however, are always there to be drawn upon when wanted,—if, indeed, the dry weather flushes go to prove their existence at all? Soil that seems perfectly dry and burnt up, still contains the water of crystallization, and the roots of plants have the mysterious power of extracting this. Dry as the weather has been, I do not think it has been so dry as to justify either your correspondent's inferences, or his fears.

Then, why should "mineral salts" give "flavour" rather than "strength"? Purely "flavour" is due to the "organic"—not the inorganic (mineral)—constituents, as you, sir, recently showed in your Review of Bamber's New Text Book on tea.

The aroma of tea is due to the volatile essential oil, which when obtained pure, and exposed—"gradually diffuses into the atmosphere." Beyond this science is still at fault as to what it is which gives body and strength to tea. "Tannin imparts to it pungency and strength," says Bamber, and it is probable that the fulness of tea, apart from pungency, is due to the Mucilaginous Constituents dissolved by the boiling water, as well as to the tannin and other soluble matter." And that's all science seems to know about it. But all this has reference to such constituents only as are obtained by the plant either from the atmosphere or the surface soil. The "mineral salts," phosphate of lime, potash, sulphur, iron, &c., go

chiefly to form the tissue of plants, and are quite as essential to plants as the organic constituents but they have little to do with either "flavor" or "strength," except, perhaps, indirectly, by inducing a vigorous growth necessitating equally abundant concomitants." Without a sufficient supply of potash and phosphoric-acid tea will not yield leaf, and, Bamber says, "it is to the replacing of these constituents that the attention of the grower should be directed, unless stores are developed from the sub-soil." But "sub-soil" in Upper Assam and in Ceylon are two very different things. Here we speak of "surface soil" for very good and sufficient reasons, but there, we are told "the soil is alluvial without a pebble to the depth of some 30 feet." Such soil has no need for manure for centuries, for the tap-roots develop abundant supplies twelve to fifteen feet down. But it is possible, and, indeed, very probable, that in Ceylon our tap-roots do forage after and very often find new supplies, which explains "Why old coffee plantations make admirable tea gardens."

The above deductions may be upset by your "Scientific Referee," but being fond of speculations like your correspondent whose query I am noticing, they go for what they are worth.

A YOUNG TEA PLANT.

GUM TREE TIMBER AND TEA FIRING.

Colombo, April 8.

DEAR SIR,—Could you kindly inform me if you have found the wood of any of the Eucalypti species, in any way detrimental to tea, when used for firing. My own experience is that it gives the tea a minty disagreeable flavour, which is certainly not conducive to its quality and that one day's make like this, is enough to spoil a month's break.—Yours faithfully,

QUONDAM AGRICOLA.

No. II.

[On the above, we have the following opinion from a planter of experience:—]

DEAR SIR,—I have for some time used blue gum (Eucalyptus Globulus) solely for tea firing in Jackson's Britannia and Venetian dryers and have never found the teas tainted in the slightest degree.

E. Globulus is more likely, I should say, to cause a disagreeable flavour than any of the other gums. So my opinion is "Given a good dryer you may use this or cowdung, or anything else, more, or less odoriferous, as you like."—Yours

SOEPTIO.

THE AMERICAN CAMPAIGN.

Dimbula, April 10.

SIR,—I have read most carefully what has been written upon this subject, and as practically no public scheme has been brought forward to meet the situation, and although many may be upon the 14th, yet I shall be obliged if you will republish my letter of November 16th, 1893, to your paper as so few to whom I have spoken appear to understand it. I would urge its main principle is that *if no tea is taken there will be no expense* and the benefit to us and to those who assist us will be relative and proportionate to the cost, and that whereas we now import only 1,688,573 lb into America, my scheme provides for five millions; and when this is attained, halve the subsidy per 1,000 lb. and we can introduce ten millions.

The Chamber of Commerce has passed its opinion upon our Commissioner's scheme which is simply condemnatory, yet has substituted nothing

in its stead. The figures this institution has given us of Ceylon tea introduced to America (I have removed those relating to Canada) are:—

1891	..	lbs. 1,037,894
1892	..	" 1,519,967
1893	..	" 1,688,573

We have spent upwards of £20,000 on the Expedition, and yet the Chamber indicates no great desire to derive the full benefit of this by a continuation of our most strenuous efforts! Are these figures so encouraging that we should now stop? Should we leave it to private enterprise? Have we pressed enough to rest content?

A writer over the signature "E. S. G." would have us do nothing; activity, energy and push have brought upon us all our misfortunes, he tells us. Surely there is something wrong here; to me such is a new doctrine—

"That the earth should stand and gaze like Joshua's moon in Ajalon!"

If America is to be won, I would say for once leave Canada alone for the present, as far as special effort goes; concentrate upon America; let that be the "gold" of our target, believing as I do that the United States means ultimately the whole of the Continent. Neither will any attempt, at all likely to succeed, bear much division of means. Let us do as all great generals have done, concentrate our forces, remembering that the old and established means of aggression, even if assured, are more worthy of support than the new. So, if we have to pay those who already import our teas, we are supporting a far more certain source of development than in supporting these we hope some day will begin. All systems independent of the existing trade so far have failed. If we want to carry America we must vigorously assist those who have found out how to do it; any other course would make them our opponents.

WM. FORBES LAURIE.

[The pith of Mr. Laurie's letter referred to above, is contained in the following extracts:—

"Let us adhere steadily to the export duty and use the result as a means of pushing Ceylon teas."* Simply speaking, my plan would be for the Planters' Association of Ceylon to offer 4 per cent *ad valorem* premium on all bona fide shipments of Ceylon tea to America from either London or Ceylon; or what would be about the same thing and more simple, pay the shippers at the rate of £1 sterling per 1,000 lb. of tea on all manifests of tea so shipped. This would provide for introducing 5,000,000 lb. into America yearly, and when that quantity was exceeded the shippers would be satisfied with a lower rate upon larger transactions.**

"If 4 per cent does nothing else it can be beneficially used for advertising by those into whose hands we place it; far better than we could do to ourselves, and, as far as we are concerned *no shipments no payments* by us. The introduction of 5,000,000 lb. of Ceylon tea to begin with annually into America will be cheaply purchased by so small a sacrifice, if we can only arrange with men like Lipton to open the campaign; and what is $\frac{1}{2}$ cent per lb. on 80,000 lb. of tea (the average yield of an ordinary estate) but £100, about £310 sterling annually."—Ed. T.A.]

THE TEA CAMPAIGN IN AMERICA: CO-OPERATION BETWEEN INDIA AND CEYLON.

Belugas, Madulkele, April 10th.

SIR,—I enclose for publication a letter received by me from Mr. P. B. Buchanan this morning. I have not asked Mr. Buchanan's leave to publish the letter, but take the responsibility on myself, in

view of the fact that it seems very desirable that members of the Association should be made aware of Mr. Buchanan's views before they come to the meeting at Nuwara Eliya.

I have only to add that Mr. Buchanan does not profess to exhibit to us a perfect scheme in full detail, but merely a rough draft.—I am, &c.,

A MELVILLE WHITE.

MY DEAR MELVILLE WHITE,—I thank you for your note of 4th instant, and I am very much obliged to you for asking me to attend the meeting of the Planters' Association on 14th instant.

I assure you I appreciate the compliment you have paid me most heartily, and in other circumstances I would have gladly availed myself of the opportunity of hearing the views of the Association in regard to questions of much importance and of great interest to us all. As you are aware, I have arranged to sail on the 12th, and I have a great deal of business awaiting me in England, business of such a nature that I would not feel justified in putting off unless it was clear I could accomplish some real practical good by doing so. I cannot gather from your note that this is likely to be the case, so I am compelled to decline an invitation which, personally, I should have had pleasure in accepting.

I enclose a rough draft of suggestions as to the working of a joint scheme. This, I think I promised to do. You will see by it that I incline to give full power to our representatives as to the method and detail of working. It is generally best, is it not to trust the men on the spot? I would empower them to give a bounty or commission to wholesale distributors if they thought it would help them to attain our object.

As to co-operation with India, I have seen no reason as yet for declining allies, though I have read a good many letters objecting to the proposal. For my part I feel bound to say, whether I feel strong or weak, I am always glad of an honourable ally. In the face of the difficulties we have to encounter in America, the union of the tea-growers of India and Ceylon seems to me a wiser course than that they should work separately.

With these who advocate a policy of "do nothing" I have no sympathy. Its adoption would seem to me to stultify all past action.

Whatever decision you come to, I feel confident the planters of Ceylon will not relax their efforts to gain new markets.

May I venture an opinion that it would be suicidal on the part of either India or Ceylon to take any course in the States or Canada which would be in the slightest degree antagonistic to the large wholesale distributors. They are the men who can help us if they see we are willing to help them.

I can only thank you again for your invitation, and I can assure you that if there is anything I can do to promote the interests of Ceylon tea for the Planters' Association at any time I shall only be too happy to do so.—I am, &c.,

PAT. R. BUCHANAN.

Warwick, Ambawala, April 8th, 1894.

1. That the tea planters of India and Ceylon, through the Indian Tea Association and the Planters' Association of Ceylon, establish a joint fund for the purpose of assisting the Wholesale Tea Dealers in the United States of America and in the Dominion of Canada in advertising and otherwise encouraging the use of Indian and Ceylon teas in those countries.

2. That the respective contributions to the fund for 1894 be regulated by the total exports of tea from India and Ceylon during 1893; the amount payable by each country being proportional to the quantity of tea exported from it.

3. That a representative be appointed by each country to work together in the United States and Canada for the purpose specified in clause 1 and in carrying this out they shall not favor the produce of one

country or one district over another but they shall recommend Indian and Ceylon teas generally as superior to Obina and Japan, leaving the dealers to make their own particular selections.

4. That the representatives shall have power to jointly administer the funds from time to time entrusted to them by the Indian and Ceylon Associations in paying the regular expenses connected with their work, and in the payment of commission to distributors, or in any other manner that may appear to them most likely to attain the object of the two Associations, always provided that such expenditure shall in no wise clash with the interests, but shall be directly to the benefit of the wholesale tea traders of America and Canada. The representatives shall in no case favor one distributor over another, but shall be ready to extend the same facilities and advantages to all engaged in the wholesale trade.

5. A troop of native servants shall be placed at the disposal of the representatives to be lent to the various distributors or their constituents for the purpose of advertisement.

6. That each representative shall be paid out of the fund a salary of £1,200 sterling per annum, to include travelling expenses, and in addition they shall have a joint allowance for entertaining, not exceeding £600 per annum.

7. That taking into consideration the difficulty of direct personal communication between the Committee of the Indian and Ceylon Associations, and likewise remembering the length of time occupied in communicating on matters of detail between America and the East, the two Associations shall elect a Committee of six (each Association nominating three members) to act as their agents in London, such Committee to meet in London and to be called the "Joint Committee of the agency for the tea planters of India and Ceylon."

8. The duties of such Joint Committee shall be to correspond with, and give effect to, the views of the Indian and Ceylon Associations, and to advise the representatives on all matters the latter may place before them, also to settle any differences that may arise between the representatives as to the methods to be adopted by them. All decisions of the Joint Committee shall be final on all subjects referred to them by the representatives, provided such decision is unanimous, and that the question does not involve extra or special expenditure not previously contemplated by the Associations.

9. The representatives shall send joint weekly reports of their work, and quarterly accounts of their expenditure to the Secretaries of the Indian Tea Association and the Planters' Association of Ceylon, and copies of such reports and accounts shall also be sent to the Joint Committee in London.

10. The Indian Tea Association and the Planters' Association of Ceylon shall jointly sanction all general expenditure, and funds to meet the same shall be paid by them proportionately to the Joint Committee in London, on whom, as money is required, the representatives shall jointly draw.

In the event of any difference of opinion arising between the Indian and Ceylon Associations, the question shall be referred to the Joint Committee in London, and should the Joint Committee fail to come to a decision, the point shall be referred to an umpire to be nominated by the Joint Committee beforehand, whose decision shall be binding on both parties.

N.B.—For some reasons one representative might be better than two, but it might be difficult for both parties to agree as to the most suitable man. If two representatives are agreed upon it might perhaps be best that one should be interested in tea-growing and the other a London Broker.

TEA IN AMERICA: MR. GRINLINTON'S SCHEME.

Sir,—I enclose a letter received this morning from the Hon. Mr. Grinlinton in reply to a request of mine that he would be good enough to clear up a point of detail in his scheme, which had apparently been overlooked. It seems desirable that this should be published, so that those attending the P. A. Meeting may have the information beforehand.—I am, &c,

A MELVILLE WHITE.

Relugas, Madulkele, April 11th, 1894.

Colombo, April 10th, 1894

A Melville White, Esq., Chairman Planters' Association, Kandy.

Dear Sir,—With reference to the fourth paragraph of my letter of the 2nd inst. to the Secretary of the Chamber of Commerce, and to your request of April 9th, I have the honor to state that the system which I propose, to enable the "bounty" to be traced to the importers of tea in America is a simple one and easy to work. This I have had the pleasure of hearing from one of the most practical business men I have met with.

It is, that each exporter who earns and receives a bounty under the scheme I have ventured to propound—vide my letters to the Chamber of Commerce of February 27th and April 2nd, and my explanatory memorandum to the same body dated March 15th—should be required to produce a certificate from the importer or storekeeper to whom the tea has been delivered in the United States or in Canada that he has received a given sum being the bounty paid by the Planters' Association in Ceylon for such and such shipments of tea, in aid of advertising and placing the tea in a prominent manner before the public in the localities where the teas are sold.

A form of certificate (approved by the Planters' Association and printed) should be issued to each exporter who desired to claim the bounty, with blanks to be filled in, showing the

Date

Port of shipment and destination

Ship by which the shipment was made

The marks of grades of tea

The nett quantity of each grade

And the total.

The certificate referred to above being at the end of the return.

Thus, at all times, the certificate should be easily identified with the bill of lading and invoice, so that the teas shipped under the bounty system may be easily traced to their destinations in the United States and in Canada. Such certificates will go far to prevent the importation of inferior or bad teas.

Any person representing the Planters' Association in America could more easily trace teas imported under such safe guards than under existing arrangements.

I am not aware of any essential leading points having been omitted in the papers I have submitted, and which are enumerated above; but if there should be anything except mere details which must always be liable to change as circumstances occur and experience is gained, I shall be happy to reply to any question that may be put to me.—I am, sir, your obedient servant,

J. J. GRINLINTON,

Special Commissioner for Ceylon World's Columbian Exposition.

P. S.—Herewith a cutting from a local paper in which will be found the letters and memorandum to the Chamber of Commerce referred to herein, as also a report of the Chamber of Commerce meeting.

COMPARATIVE TEA PRICES—WITH REFLECTIONS ON THE COURSE OF MARKETS AND OF TEA MAKING.

(By an Indian Tea Planter.)

(Page 599 of *Tropical Agriculturist*, March 1894.)

DEAR SIR,—“One of them” gives a list of comparative averages. I have an idea that a more

complete analysis would still further “open eyes.” I am interested in the production of low-class teas; many of my brethren are in the same boat. I want to find a good market for my low-class teas; I admit that they are shabby but they are “mine own” and I want to do well for them. So I want to see (without the trouble of working it all out myself) the comparative result of selling low teas in London and in our local markets. I did see a report this year that at a certain sale “very little was sold below 6d.” I think we could say of our local markets (Colombo and Calcutta), very little goes for more than 6d. I am convinced that low teas sold better in London than locally, because I got the same prices locally as in 1892 but dust, fanings, and various got about 1d to 2nd more (in London) than in 1892.

You will remember “Bitter Cry” and the 30 or 40 letters about him. Has it yet occurred to him that in 1893 the planters made superb low class tea? It was as much as 2d better at times, but their good tea was very poor, 2d or so poorer. And perhaps we could tell him that the humidity of 1893 was favourable to the low-class bushes, but it simply ruined the pekoe bushes, and that we all contemplate putting glass shades over these next time a wet year comes, and then we will let him have tons of 2-shilling tea and he shall be happy.

On page 636 of the same number of the *Tropical Agriculturist*, I see that the Indian Engineer goes for “Humidity” which villainously cut off “60 per cent of the prices of the tea.” In 1892 “Humidity” (even in the rains) was not “up to” such vile tricks; it behaved itself admirably. I wish we had a “Market Expert,” one who would honestly tell us why prices rise and fall. Would it be beyond his power to find out how much tea will be taken at 2s and upwards, at 1s and upwards, at 6d and over. Now supposing that 1,000 tons of tea are wanted at a price over 1 shilling and the planters produce 1,500 tons of that tea, then the surplus 500 tons goes into class “6d and upwards” and it goes on shoving until my low tea which might have got 6d falls down to the “5d line” or even lower.

The local markets (now including Bombay for Persia) have to be fed. I wish they would feed on shilling teas and let my poor stuff alone. Can anyone tell us whether there will be a limited demand for teas costing 5d in London? Is it likely that any big break of tea will go begging and asking to be taken at 3d or 4d as they did in local markets in 1893? “One of them” scents a mystery; he suspects an enemy. If there is an enemy he has a camp—let us find out and engage an expert out of that camp. Could we find out how many more million people would buy tea if they could get it at 10d. Then start a Planters' Protection Society which would give 5d exactly for any tea for which that price had been refused in any market. Could we get an expert to tell us of the tendency of the “market” towards certain styles of tea? I remember (I think correctly) that about 1875, of the Indian Districts, Cachar and Sylhet led the market; then came Darjiling; then other small districts and last of all Assam. Since then all has been changed. Assam leads the world; Cachar and Sylhet are very low; small districts nowhere. Any planter can change his style of manufacture if he only knew what is wanted. The market wants a strong thick tea for mixing with low poor China: let them say so, they shall get it; but suppose they want a thin flavoured tea and take it wherever they can get it and keep quiet, then the planter who makes thick strong tea is told that it is coarse and

paid poorly. Tea is like society; at first it was "a party," few and select. Brokers called it all sorts of sweet names, Miss Pekce was mild, full and flavoury—even Congou was admitted as having "body" &c., &c. Later on it became a crowd, and strong language had to be hunted up to keep it in bounds. Nowadays it has become a mob and the police have to be called in to suppress it; and the Brokers fly round and will soon have to appeal to foreign languages for terms to induce producers to give up their pounds for tuppence.

Once upon a time red leaf (real good honest scarlet) used to fetch only 8 annas. It was made from only the 6th to 10th leaf of the flush, and the planters in my country "thought" and one of them got an iron pan in which he boiled still older tea leaves, and he thus made a sort of tea-ink (Tannin and Iron) and he sopped up this ink into his red leaf, and he got 10 annas for it. Now Mr. "Bitter Cry" will tell you that we never see the "teas of old." I would like to send him a hundred chests of that good, old, ink-faced, double-dried, red leaf and ask him 10 annas a pound for it.

Just one thing more. Can you find out that man who bought tea in the local market and got sacrificed over it? Let us find out how much he lost and pay the amount to him in rupees (so as to keep him in India) and then ask him to say no more about it. He is always shoved at "Any one of them" who wants to know, you know? And I want to know how much he lost on the tea for which he paid 2 annas 6 pie.

1874.

P. S.—Could anyone make up a table showing in pence at a penny rise, from lowest to biggest, prices obtained in London in 1893, the number of pounds sold at each price; and do the same for 1883, and for 1876. Perhaps we shall see that a greater weight of tea sold at 2s 6d, in 1893 than in 1876 and I believe that we shall see that the higher prices are paid for a steady weight of tea and consequently that if too much of that quality of tea is sent, it has to go into the "penny" below. And it will be discovered that the lowest price of all includes a great part of the increased output year by year.—1874.

VARIOUS AGRICULTURAL NOTES.

LIBERIAN COFFEE cultivated with cacao and coconut palms is doing well in the Kurunegala district; on Arampolla estate of Messrs. Harper and Davidson a crop equal to between 2 and 3 cwt. per acre has set, though the coffee is not above 3 to 4 years old.

EXTENSION OF TEA PLANTING IN ASSAM.—The demand for tea land is, we notice, increasing, and those prospecting for grants are abandoning the old system of delving deep among the backwoods being satisfied with poorer soil but greater proximity to communications and supply centres. The Habigune sub-division in S. W. Sylhet is attracting attention, and, as the Chittagong-Assam Railway line will run through it the advantages are obvious, while, at the same time high cultivation by means of manures that can be brought by rail almost direct to the gardens at small cost should secure as luxuriant a growth as would be attained upon the virgin soil in remotely situated forests. So long as the sites selected are confined to localities near the hills so as to secure the rainfall success should be pretty well assured, but we trust intending planters will not be tempted to venture too far out into the more arid plains proper, however promising drainable heel lands may be, for, though surface irrigation will stimulate growth by capillary attraction, the leaf, unless itself well drenched, will not prove flaccid enough to ensure good outturn.—*Indian Planters' Gazette.*

PAPAW MILK.—The "Ophir" which left recently for London took away one case containing 50 lb papaw milk.—Local "Examiner."

TEA IN AMERICA.—Our morning contemporary writes of the "bounty" scheme as essentially an American idea. Now he is surely aware of what we announced in January last that Mr. P. R. Buchanan made three special visits to the United States to learn how best to introduce British-grown teas there, and that it was only on the third occasion that he got listened to by the wholesale dealers, and that they then—the largest importers in New York and Chicago—deliberately told him,—“what you have to do is to advertise your teas to create a demand and send over a batch of native servants to be utilised in different outlying towns as we direct.” This, it will be seen, is the policy just adopted by the Indian Tea Association.

THE PALLEGAMA LAND GRANT ASSOCIATION.—We hear that this Company has already made a commencement with the work of opening up a portion of the large block of land it has acquired. This year no less than 200 acres are to be opened and planted with coconuts, cocoa being planted between the rows at the same time. The land is believed to be well suited for both these products, coconut trees growing in the adjacent villages very well. Liberian coffee is also to be tried on a fairly large scale, and, should experiments in this direction prove successful, no doubt many others will apply for land, of which there is a great abundance in the vicinity. At present Mr. Gordon Reeves is looking after the work; but a resident superintendent is being secured, when the work will be vigorously taken in hand. A force of about 150 Sinhalese coolies is already at work, and they are certain to benefit more rapidly than anyone else from the employment of English capital and energy in proximity to their homes.

BEIRA RUBBER.—The India-rubber tree (*Ficus elastica*), says Mr. J. D. Ellis (recently returned from a trip up the East Coast of Africa), grows luxuriantly in these parts and is well-known to the natives who tap it and as the sap exudes or bleeds (very similar to the milk of the Euphorbia in these parts) they by the aid of a little piece of stick roll it round and round until about as thick as one's finger when they repeat the process with another piece of stick until the tree is exhausted. In this form they sell the India-rubber to the traders, who eagerly purchase it; in fact it is one of the few articles of export from Beira. A very fine tree, bearing a leaf very like the walnut, provides excellent shade and is very attractive; it also produces a bean, but the seeds are very small. I secured a number of these also.—*India Rubber Journal.*

THE COMPULSORY CULTIVATION OF COFFEE IN JAVA.—From a reliable source it is reported that the newly-appointed inspector, Dr. Burck, who has made an investigation about the compulsory coffee cultivation in Java, does not consider the condition so gloomy as was generally presumed. In Central Java the prospects are not encouraging, and in many districts there the Government will have to give up the cultivation, as has been done already in the districts of Bantam and Japara. However, in Eastern Java, and especially in Probolinggo and Besokeie, there is an abundance of magnificent ground suitable for the cultivation of coffee, and also in the Preanger districts the soil is certainly not exhausted. Dr. Burck seems to be a strong promoter of the system of granting an extra payment for the opening and maintenance of coffee lands, besides the price paid for produce delivered.—*Madras Mail.*

INDIAN TEA IN AMERICA,

If the following telegram, which we find this afternoon in the *Times of India*, prove correct, it will show that the Indian Tea Association have forestalled the decision of the Ceylon Planters' Association on the point of united action in America. Our neighbours have resolved, apparently, to act independently. We suppose that the Calcutta Committee finding no response to their proposal before Sir John Muir left Ceylon, nor any favourable advice from Mr. Buchanan, decided to go ahead on their own account. Here at any rate is the announcement:—

THE INDIAN TEA TRADE.—Calcutta, April 9.—The *Englishman* states that the Indian Tea Association has decided to send Mr. Blechynden to America for two years to represent the interests of the Indian tea trade. He will work in conjunction with the local trading firms and through the ordinary trade channels. Unlike Ceylon, the Indian tea trade does not purpose to push the trade independently, but will offer certain encouragement in the shape of advertising charges to Mr. Lipton, Messrs. Reid, Murdoch and Co., and other firms, which have practical control of American sales.

The Canadian tariff reform is viewed as distinctly favourable to the Indian trade. The new import is intended to check the import into Canada of teas rejected at American ports as unfit for food. The rejections at New York last month were on such a scale as to attract public attention. The telegram is otherwise interesting as showing the belief of the Indian Tea Association in advertising through the large American wholesale houses. It is also worthy of note what is said about the new Canadian Tariff and the rejection of teas at New York. We should have telegraphed the substance of the *Englishman's* information to the Chairman, Planters' Association, Nuwara Eliya, as soon as it came into our hands, save for some doubt as to its authority and full authenticity. At present the information seems to be published by the *Englishman* on its own authority or that of Mr. Blechynden?

CEYLONS IN AMERICA.

Mr. Buchanan writes under date (April 14):—"A gentleman I met this morning seems to think that because I told you that 'as often as not the generic term of 'Ceylons' was given to Indian and Ceylon teas in the States indiscriminately,' therefore dealers there do not know the difference between the produce of the two countries. This, of course, is absurd: dealers know perfectly well the qualities of both and which to ask for to suit their requirements.

"In old days the London trade spoke of all 'Indians' as 'Assams'; but all the same they knew the difference in value and quality between the produce of Cachar, Sylhet or Assam, though in common trade parlance they used the term 'Assams' for them all.

"I hope you will urge people who criticise the suggestions of others to make some suggestions themselves. In this way we shall arrive at a sound conclusion?"

As we said the Joint-Committee, if appointed, ought to call for suggestions up to a certain date, which could be taken into consideration along with the published schemes.

INDIAN TEA ASSOCIATION:
THE AMERICAN CAMPAIGN.

We have received a copy of the proceedings of a Special General Meeting of Members of the Association held on Tuesday, the 20th March, at the rooms of the Begal Chamber of Commerce, to receive Mr.

R. Blechynden on his return from Chicago. The Hon. J. N. Stuart, Chairman, presided.

Mr. Blechynden read extracts from his report, which stated amongst other things.

Purchasers of tea were always invited to back their orders through their own grocers; and such orders, with information as to where the teas could be procured and their prices, were sent direct to the grocer. This was the means of distributing the tea directly into the regular trade channels, and thus creating an immediate supply to meet any demand that was created. A list of the grocers stocking the tea was then prepared and this was not only hung in conspicuous places in the Pavilion, but thousands of copies were distributed in the sample boxes of tea given away.

The terms made with Messrs. Reid, Murdoch & Co., of Chicago, are described in the report. Briefly, they are that the trade marks advertised, became the property of that firm, and they paid for the due copy-righting of them. The firm was supplied with a certain quantity of tea, and it was agreed that their further requirements for teas of the two standard only should be met on the basis of four month's credit at market rates. The firm for their part were to push the tea through their numerous travellers, and in other ways. The net result has been that up to the close of the Exhibition over 1,500 grocers had stocked Indian Teas through Messrs. Reid, Murdoch & Co., the total expenditure advised to the Association being the interest on the price of the tea supplied, apart from the expenses of the Chicago Exhibition. There is no further risk, involved.

AN AGENCY IN NEW YORK.

At the close of the Chicago Exhibition, Mr. Blechynden attended a small Exhibition at New York, retaining for the purpose four khitmutgars. The object in attending this "show" was at first, as one of the most influential New York wholesale grocers agreed to accept the agency of the Association, though they, as well as others, had steadfastly refused to do this before. The terms made with this firm are even more simple than those with Messrs. Reid, Murdoch & Co., and are that on the Association advertising a given brand of Indian Teas, the firm will undertake to put up packets in a suitable manner, and to supply any grocer at a given price. The Association undertake no responsibility and are at no separate charge beyond that of advertising in the matter.

The CHAIRMAN said they were indebted to Mr. Blechynden for the remarks which he had made regarding his operations. He moved that:—The Indian Tea Association places on record its cordial appreciation of the services rendered to the Indian Tea Industry by Mr. Blechynden, the delegate of the Association at the Exhibition at Chicago, and desires to convey to him their thanks for the manner in which he has brought Indian Tea before the American public, and for the tact and skill displayed by him in surmounting the many difficulties attendant upon his important task.

The resolution was seconded by Mr. A. G. Watson and carried unanimously.

CONTINUING THE CAMPAIGN.

The Chairman then said there were two resolutions which he would like to put to them while they were on the subject. It was very evident that having once started the campaign with America it would be a waste of money if they did not take advantage of the position gained. He then proposed:—

That a Sub-Committee of the Indian Tea Association be formed to be called the "Indian Tea Fund Committee," to collect subscriptions and organise arrangements for the further introduction of Indian Tea into the American and Canadian markets, and that the following gentlemen be asked to form the Committee:—

Hon'ble J. N. Stuart, Chairman; Mr. C. Lawrie Johnstone, Mr. D. A. Sibthorp, Mr. G. G. Anderson, Mr. A. K. Muir, Mr. A. F. Bruce, Mr. D. A. Campbell, and Mr. W. T. Carter.

It was not proposed to fetter them, but to give them full powers to do the best they could to work out the scheme and to do their best for the Indian Tea Industry.

Mr. H. C. Begg seconded this resolution.

The Chairman asked whether any of the gentlemen present had any remarks to offer. There being no response the resolution was put to the meeting and passed.

COMBINING WITH CEYLON.

The Chairman then said that a special meeting had been held at which Sir J. Muir and Mr. Buchanan were present. Copies of the proceedings had been printed and circulated and the object of the meeting was to consider a proposal of Sir John Muir to combine with Ceylon for the purpose of more effectually securing the American and Canadian markets. Though no definite resolution was put to that meeting it was agreed that Mr. Buchanan, who was going to Ceylon, should inform the planters there of the views expressed at the meeting, and he believed that that gentleman and Sir John Muir, who was also visiting Ceylon, were doing so. It was necessary, however, that some definite steps should be taken, and though he did not wish that they should commit themselves to any positive scheme in connection with this proposal, he thought it would be as well if they expressed an opinion in the form of a resolution in general terms. He would therefore propose:—

"That this meeting of the Indian Tea Association is of opinion that it is in the interests of both Indian and Ceylon planters that those interested in the Tea Trade of both countries should combine in endeavouring to introduce the British-grown tea into America and Canada and invite the co-operation of all concerned with the Tea Industry in promoting such a combination."

How far the scheme would be worked remained to be seen. Practically it was a question of British-grown teas against China and Japan. Where Ceylon gets a footing we shall get a footing and the opinion seemed to be that it did not matter whether Ceylon or India was first.

The resolution was seconded by Mr. C. LAWRIE JOHNSTONE.

The Chairman asked whether any gentleman had anything to say on the subject.

There being no response, on a show of hands the resolution was declared to be carried unanimously.

With a vote of thanks to the Chair, proposed by Mr. A. G. WATSON, the meeting separated.

TEA IN TRAVANCORE.

We (*Madras Mail*) are glad to learn from figures that have been kindly placed at our disposal by Mr. H. M. Knight, President of the Travancore Planters' Association, that the tea industry in those districts is making steady progress. The total yield of Travancore tea for 1893 was 2,386,800 lb., divided as follows; Peermada 1,033,000 lb.; Central District 1,020,000 lb.; Ashambo 237,000 lb.; Kannan Devan 96,800 lb. Travancore has not yet reached here three millions lb. of tea, but she is rapidly advancing that way. No mention is made of the favourableness or otherwise of last season for the cultivation of tea so we may take it that 1893 was on the whole a fair average year, and estates gave neither an exceptionally large nor an exceptionally small yield. In another column we publish a summary of Travancore tea sold at public auction in London during 1893. It will be noticed that the total shows a discrepancy of, say, 400,000 lb., as compared with the total yield, which is due to the fact that the tea from some estates is disposed of otherwise than by public auction in the Mincing Lane Sales-room. The average price of Travancore tea, it will be seen, varied from 6d to over 8½ per lb; Seafield Estate with 59,850 lb. obtained the highest average, over 8½d, though Venturo Estate with a yield of 188,200 lb. and an average price of 8d appears to be the most satisfactory. No very definite conclusions can be drawn from these figures since

the acreage in bearing is not given,* but they bear on the face of them evidence that the tea industry in Travancore is flourishing. During the year 1893 and previous to it Travancore planters endeavoured to come to some arrangement with Ceylon for their tea to be imported free from duty, but without success. As we mentioned the other day Ceylon levies an import duty of four annas per lb. on tea which means, in the case of tea realising 8d, a duty of over 55 per cent. And what are Travancore's 2½ millions compared with Ceylon's 80 millions? Hardly a drop in the ocean in so far as the world's consumption is concerned. We still hope that Ceylon may see her way to allow Travancore teas to be imported into Co'ombo free of duty. It cannot possibly do the Island any harm but rather should help to stimulate its trade.

PLANTING IN BRITISH CENTRAL AFRICA:

(By an ex-Ceylon Planter.)

It did my heart good when in Blantyre in July last to see the

COFFEE CROPS

cherry ripe (gladdening the heart of an old planter) without the withering and drying-up of half the crop at the end of the branches as of days of old, the result of coffee leaf-disease in Ceylon. Coffee three years old has this year given 5 cwt. per acre and looks none the worse. Our blossoming season just ended has been very favourable—two good large blossoms—and some sprinklings which always help have set well. We have Orange coffee here which I never remember seeing in Ceylon and which looks as if it will stand leaf-disease. It is dark brown in flower and leaf, but the berries are the same as Arabica.

OUR RAINY SEASON

has begun and the order of the day on estates is supplying and planting—an awful lot of vacancies occur (owing to having to plant three to six months' seedlings instead of nine to 12 months' plants) from grub, crickets, locusts and other enemies. I have seen as much as 50 to 60 per cent on some fields. One cause of failures is bad seed obtained from diseased trees, black beans, black rot, as it is commonly called which is very prevalent in Blantyre, due, I presume, to the stiff clayey subsoil they have; for none has appeared here amongst our maiden crop coffee although from diseased seed, the only obtainable in Nyassaland. No one can import coffee seed as it is prohibited. It strikes me we shall get an equally bad disease if we go on extending from the mother tree brought from Kew some 13 years ago although soil and climate, which varies a great deal in this part of Africa, have much to do with quality and quantity of Coffee Arabica, the same as your wet and dry high and low districts.

I was really sorry to see the way

COFFEE IS CURED

by African planters, half of their crop being chewed up, bruised, chipped and passing through with the pulp. Wasting of labour in stores (if those buildings can be called stores) is distressing to a Ceylon trained planter, to look at 20 to 40 boxes per day of cherry requiring as many hands to cure, where 4 or 6 good men would suffice. I jumped into a cistern and washed out a lot of coffee for a planter in a few minutes which would probably, as he said, take all day to clean.

*The latest figures for acreage are those given in the "Ceylon Handbook and Directory" up to 1892 and they show tea of two years and over to equal 6,895 acres in the four divisions of Travancore. This would give an average of a little over 300 lb. per acre; but Peermada division with 2,600 acres over two years gives an average of 400 lb. which is very good. The Central and other divisions do not give so good a result.—ED. T.A.

ROADS

are being opened out throughout the country Blantyre has already been connected with Zomba and Mlangi right to the frontier, Fort Anderson on the Ruo, comprising about 100 miles. There is also in course of construction a road to connect Zomba and Mlangi. Also Tshilonio, the steamer Shire River, Ruo terminus and Mlangi, which will be carried through in course of time to Lake Nyassa so that anybody landing from the river steamers, if they bring a horse and trap with them, can drive right up to the Shire Highlands and visit all the important European Settlements where civilization has advanced with amazing rapidity during the past eight years. English vegetables thrive. Wheat, oats, horses and cattle do about as well as they do at home. I measured a turnip 23 inches in circumference, and grew a crop of wheat (planted in August and reaped in November) well filled, equal to 40-fold, which speak volumes for our climate. Men with pluck and energy are wanted to open up this country—men who are not afraid of a touch of hill country fever and prepared for pioneering work with some capital and any amount of pluck.

LABOUR

is cheap I may say, the cheapest in the world, a few shillings per month per man, and abundant to the bargain. If distant fields are tapped natives come over 100 miles to seek work. Now they are sure they won't be kidnapped by slavers on the way as in days of yore. Land is abundant: one can travel 20 to 40 miles through forest and grass country without a single village—the home of the lion, rhinoceros, hippopotamus and any number of buck. I hope at no very distant date to see

STRETCHES OF COFFEE

like Dimbula and Dikoya in the days when coffee was king. I well remember in April 1873 how impressed I was with the undulating green fields, some 20 miles from the Gap to the Agras, of coffee with hardly a spot where I could see the ground and not a stick of forest to be seen except on the sides of the Great Western and other surrounding hill ranges. My S. D. days in Dimbula will always be looked back to with pleasure.

Although I had a stout P.D. as far as work went, in Ryan, who has gone over to the majority, he always allowed his S.D. to take part in any amusement, such as a game at cricket at Radella, the levee on the patana, and ball at Middleton store, breakfast to McLeod at Talawakele. Sir William Gregory did get a hearty welcome and no mistake on his first visit to Dimbula. Leaf-disease was known then, but laughed at by our P.D.'s, who were in great glee at coffee making 100s per cwt. Stoddart and Fyers

SURVEYING A RAILWAY

although only a preliminary trace through the Walaha Valley, and bones and castor cake at R8 per ton. Such a change in 1888, when creeping along the Great Western by train, hardly able to depict the different estates, some partly in tea, and some abandoned altogether. Now, however, going to beat the world with tea both in quality and yield.

VIRGIN FOREST

such as Stanley describes in the Congo Free State is very rarely to be met with in this part of the country, for it has evidently at one time or another supported a teeming population, bearing traces of villages (with broken earthenware pots in heaps), terraces raised for cultivating Indian corn, long irregular beds for sweet potatoes and the best and most indisputable evidence of all is the patch of forest graveyards in some places an acre or two in extent, with a heap of pots of very ancient pattern, rude in the extreme, not a bit like the present design, over each hollow in the ground indicating the resting place of some villager of bygone days. The inhabitants of the country at present keep their burying-places sacred, bury the deceased's belongings with the body, dig a hole like a bullet hole in the bottom of his chatties and place them over the grave, build a small four feet circular thatched beehive-like hut over the head, which is kept in repair by parents

and relations. None of those are to be seen, however, in the old graveyards as they have not been used within the memory of the present generation. I am curious to know the age of those graveyards, but would not like to disturb any grave as the people are very superstitious. At all events, there are trees 150 feet high and 20 feet in circumference of hard timber, slow growers doubtless, over 2,000 years old.

The country is

ONE HUGE GRASS FIELD,

but looks like broken forest from a distance. There is no undergrowth like virgin forest. The grass is burned off once a year and until it grows again after the rainy season sets in, one can walk under shade of the trees regardless of path almost from one end of Nyassaland to the other. Cattle seem to eat all our grasses (about 10 varieties). They grow in about 6 months to 6 to 8 feet high, die down and dry up during the winter month. The country reminds me a good deal of some park-like forests I have seen about Polonnaruwa in Tsamkadawa, North Central Province, Ceylon; the only difference is long grass instead of sport. What a magnificent grazing ground but no cattle within a hundred miles of us the lake shores of Nyassa, except a few kept by one or two planters.

I hear

THE TELEGRAPH LINE

is being rapidly laid down from the Tita on the Zambezi to Zomba, our site of Government, and the section south of the Zambezi to Fort Salisbury is also progressing rapidly, so we shall soon be in touch with the old country. It takes a letter from two to three months to reach here. There is room for improvement in our postal service, the delay is principally between here and the coast rivers drying up and one thing or another. We have had wars and rumours of wars of late, but as there are as many rumours as to the true cause of them, the least said about them the better. All is quiet again now; however, a lasting peace promises to exist.

THE BALATA INDUSTRY AT PARAMARIBO.—Under the name of balata, a substance similar in many respects to gutta-percha, but furnished by *Mimosa globosa*, has been from time to time brought to notice in this country in the course of the last thirty-four years, for it was in 1859 that it made its first appearance in London. In 1862, however, during the International Exhibition, some samples of the raw product were shown from British Guiana, and attempts were made to utilise it either as a substitute for, or in combination with, gutta-percha. The result was that a demand sprung up for it, and some 20,000 lb. were imported in 1865. During the next ten years the demand continued to decrease, reviving again in 1877, and after that fluctuating considerably till about three years ago, when but a very small quantity found its way to the British market. The advantages claimed at first for balata was its greater ductility and tenacity than gutta-percha. But time has proved that, like gutta-percha, balata becomes brittle and cracks when exposed to the air, and that it has no advantages over the longer-known substance. As an illustration of the continued fluctuation of this product, we quote the following extract from a Report by the British Consul on the Trade and Commerce of Paramaribo for 1892:—"Although," says the Consul, "the balata exploitation has made a steady progress, the general results are not favourable, owing to the price of the article having gone down remarkably in the course of the year. Unless an improvement in the price of the article takes place, very little will be done during the next year in the exportation of it, which will be a terrible blow to the district in general. It is expected that an ordinance will soon come into force regulating this industry, and by which ordinance it shall be enacted that the grant-holder has to pay yearly a certain sum per acre of land."—*Gardeners' Chronicle*.

MR. ERNEST HART ON TEA.

There are few more striking or influential personalities in the Medical and Editorial world of London, than Mr. Ernest Hart. As Editor of the *British Medical Journal* he wields an immense influence, and as a lecturer on Sanitary, Dietetic and even Social subjects he and Mrs. Hart are very frequently before the intellectual and philanthropic world of the metropolis. The Warden of Toynbee Hall and ex-Whitechapel Vicar, the Rev. S. A. Barnett and Mr. Hart are brothers-in-law, and both were in Colombo, it will be remembered, three years ago, Mr. Barnett spending some time in the island, while Mr. Hart merely called in on his way to Japan. Still, the opportunity was not lost for interesting him in Ceylon and British-grown teas as well as in his favourite "Japan's"; and afterwards during our trip to England, we paid a special visit to the very busy *Medical Journal* office in the Strand and afforded information and left papers calculated to correct the erroneous notions promulgated by so great an authority as Sir Andrew Clarke in reference to the tannin in Indian and Ceylon teas. We do not know how far Mr. Hart may have been influenced by such information; but we have been much interested in an Address he lately gave in his capacity as Chairman of the Council of the National Health Society, on Tea, Coffee, Cocoa and allied beverages. We reproduce this address in full on page 772 from the *British Medical Journal* and think it will repay a careful perusal. There are a few rather puzzling statements and others with which we cannot quite agree; and English reviewers of the lecture are as much perplexed as we are at some of Mr. Hart's authoritative utterances. "It has long been the profound conviction of the human race," says our reviewer, "that when tea has been allowed to draw for more than three or four minutes, it becomes full of tannin and so plays havoc with the coats of the stomach and the nerves. And now comes Mr. Ernest Hart telling us that there is just as much tannin in three minutes' tea as there is in twenty minutes' tea, and that, in any case the tannin is not particularly injurious. It is, however, within the experience of most people that if you drink twenty minutes' tea just before dinner, your appetite becomes a figment of the imagination; and that if you drink the same beverage just before going to bed sleep recedes before you as the shores of Italy before Æneas. To the average drinker of tea it matters little whether its particular poison is called tannin or theine. By any name it is equally noxious, and it can only be avoided by a fresh brew." In this, it is impossible not to agree; anything in excess of a five-minutes' infusion in the case of average Ceylon tea makes a great difference in the quality and taste of the brew. The "warm compliment" which Mr. Hart pays to the Ceylon teas is of much practical value, and will, we have no doubt, entirely counteract any effects left by Sir Andrew Clarke's blundering depreciation. We do not, however, quite understand how Mr. Hart can speak so favourably of Japan teas, as a whole. He says:—"The only true natural green tea produced in quantity by any country now, is the green tea of Japan as drunk by the natives and consumed in America." Now in travelling through Japan and thence to San Francisco in 1881, we had the assurance of large American buyers that scarcely a lb. of "green tea" sent from Japan to America escaped artificial facing with Prussian blue and other deleterious substances; while on the other hand we have always heard the natural green teas, the

Olongs of Formosa spoken of as the very finest used in America. In denouncing the European taste for "strong, bitter, fermented" teas, Mr. Hart almost takes away from the compliment paid a little before to Indian and Ceylon teas. However, he specially alludes to the "Ceylons" as containing less tannin, than the "Indians" though quite as much theine. Then again, the comparison Mr. Hart institutes between coffee as ordinarily sold and tea is to the immense advantage of the latter. Mr. Hart's lecture—or the popular parts of it—should be placarded all over America; and also (after translation) over the Continent of Europe. The Editor of the *British Medical Journal* has a reputation from Moscow or St. Petersburg to San Francisco or Japan. We only wish he could spare a few months of his busy life to pay a winter's visit to Ceylon and see, among other things, everything connected with the preparation of our teas grown at various altitudes in the island. Meantime, the Committee of the Ceylon Tea Fund should make a point of sending Mr. Hart—as "Chairman of the Council of the National Health Society" as well as Editor of the *British Medical Journal*—a special case of the very finest Ceylon Orange or rather "Broken Pekoe," to show him, among other things that he can safely recommend Ceylon "Broken Pekoes" and even some of our finer "Pekoes," as cordially as the "Orange Pekoes," to such of his friends or readers as require a delicate-flavoured, mild and yet satisfying tea. We feel sure the compliment would be appreciated and we think it has been earned by all that is said for Ceylon teas in the important and valuable address under notice.

INDIAN TEA FOR THE UNITED STATES.

The *Englishman* announces that the Indian tea Association has decided upon a plan of action for the American campaign. Mr. Blechynden will be intrusted with the further operations in the United States. His engagement will be for a period of two years, with the prospect of an indefinite extension in the event of the success of the scheme being realised. According to our contemporary, India's plan is totally different from Ceylon's. Mr. Blechynden will work hand in hand with "the trade" in America, and all his efforts will be directed to the advertising of Indian tea in the widest sense of the term. Not only will Indian tea be advertised extensively in the American press, but full advantage will be taken of the local Exhibitions and "State Fairs" which are so frequently held in America. The local Exhibition of "Food Shows," organised by the grocers, are valuable means of bringing trade products to the notice of those whom it is most desirable to reach. Mr. Blechynden will take with him four smart khitmatgars, whose services will be valuable in connection with what are known in the States as "Demonstrations." The object of these Demonstrations is to bring any article of trade directly and forcibly to the notice of the public. In connection with tea, a particular city will be selected, and the four Natives, attractively dressed, will be placed in one of the principal shops or stores. They will remain there until the interest of the public is roused, when they will be removed to another store in a different part of the city. There after store will thus be visited, and when one city has been "worked" a move will be made to some other centre. Mr. Blechynden's aim is, in fact, to work through the "middleman," while Ceylon favours the idea of

cultivating direct trade as far as possible. The comparative merits of the two schemes can only be properly understood after both have been fully tried. There can, we think, be no doubt that the Indian plan should yield *quicker* results, but it is far from certain that Ceylon will not get ahead in the long run, if she has the necessary "staying" power as well as continued energy and "push." The scheme adopted by the Indian Association practically amounts to the establishment in the United States of an unpaid agency wholly devoted to the furtherance of Indian interests. An appeal is now being made for funds to enable the Association to carry out its project; and it is expected that Mr. Blechynden will leave Calcutta for New York by the end of this month.

"UNION FOR ADVANCING THE SUCCESS OF QUININE CULTIVATION."

Such is the name of a Society recently founded in Amsterdam. In return for a yearly contribution of 10 florins, it undertakes to issue quarterly papers with recent information that shall be helpful not only to the planters, but also to the European purchasers or consumers of cinchona bark and quinine.

The prime object of the Society is to further the Quinine (Bark) Cultivation in Netherlands East-India.

VALUE OF TEA PLANTATIONS.

It is a curious fact that notwithstanding the fall in prices of Ceylon tea and the drop in exchange which the last ten years have shown, the *sterling* value of tea plantations seems to be as high as, if not higher than ever before. A *Dimbula* planting correspondent to a contemporary offers the following comparison:—

Supp s: that in 1855 "A" being anxious to invest in tea property had an estate valued, and bought, say, 200 acres yielding 400 lb. per acre; London average 1. 3d per lb.

Value of crop, 80,000 lb. Tea	£	s	d
Cost of producing 80,000 lb.		516	13 4
Tea at 5.62d equivalent of 30c.	£1873	6	8
The freight and London charges 10 per cent on sale value	516	13 4	2390 0 0
	Profit.	£2776	13 4

at 7 years' purchase £19,436 13 4, at exchange of 1s 6½d equal to R248,719.

In 1893 "A" being desirous of selling, the property would be valued, 200 acres yielding 400 lb. per acre. London average 9d.

Value of produce 80,000 lb.	£	s	d
Cost of producing 80,000 lb.		3000	0 0
at 4.5d equivalent of 30c.	£1500	0	0
Freight and London charges 10 per cent on sale value	300	0 0	1800 0 0
	Profit	£1200	0 0

Seven years' purchase at exchange of 1s 3d R134,400.

For how long can this go on? Talk about the shrinkage of bank capital employed in the East, it surely cannot beat the above! Comparics and individuals with "reservec funds" laid by are to be congratulated.

But, we suppose it is a fact that neither Nithdale nor Holbrook estate would have sold for £9,000 sterling or over, in 1855, as they did the other day? This is due no doubt, in a great extent, to

the increased confidence felt in tea cultivation especially in the higher districts of Ceylon and to the prospect of still more economical as well as improved means of working plantations and making tea.

TEA AND SCANDAL.

I have picked up a curious little book called "A Natural History; containing Many not Common Observations: Extracted out of the Best Modern Writers," by Sir Thomas Pope Blount, Baronet, 1693: and I purpose, with your approval, giving you some extracts from it. I begin with his "Observations concerning Thee, or Tea."

Thee is a shrub growing in most parts of China and Japan: it arises generally to the height and bigness of our Garden-Rose and Currant-Trees; the Roots are Fibrous, and spread into many little Filaments, near the surface of the Earth; the Flowers are like those of *Rosa Sylvestris*: the seeds round, and black: which being sow'd come to perfection in three years time, and then yield yearly a crop; but these are little valued; the great and only Virtue of this Plant being supposed to consist only in the Leaves: of which there are five sorts both as to bigness and value; for the largest at bottom are sold for about one Penny-half-Penny the Pound; but the smallest at the top for Fifty, may sometimes one Hundred and Fifty Crowns the Pound. *Joh. Nich. Pecklin. De potus Thea.*

This Plant (saith the learned *Pecklin*) abounds with a brisk Volatile Salt, which judges very agreeable to our Northern Constitutions, whose Blood is naturally very heavy, and sluggish; it carries also with it a fine thinner sort of Oyl; but so admirably well temper'd, that as this hinders the Spirit from Evaporating, so that corrects the Inflammability of this; from whence results the very agreeable bitter Astrigent; All which together, as they rectifie the Ferment of the Blood, and at the same time strengthen, and confirm the tone of the Parts, contribute so much to the assisting of Nature in her Operations, as to prevent, if not to cure, most Chronical Distempers.

Because the discreet choice of a proper Vehicle for this great Panacea, may be very material, the learned Author therefore thinks good to show his dislike of Milk, in that it very much obstructs its more lively and quicker Parts: as always leaving behind it much acidity, which how prejudicial to Hypochondriacal Persons, is sufficiently obvious. He dislikes the Custom they use in Japan, of drinking the Leaves powder'd, supposing that it may dry the Body too much. In short, he concludes warm Water to be the most Natural and effectual Vehicle, as being pure, and void of all Saline or other ways pernicious Particles, and being more ready to be impregnated with the Virtue hereof; which when Armed with this powerful vegetable, Nature easily admits into its obscure Channels, and dark Recesses.

He approves well enough of the use of Sugar; as it serves not only to qualifie the bitter Taste, by its Sweetness, which at the same time is corrected by the Heat; but as being good also for the Kidnies, and Lungs. He thinks the difference of Constitutions too great to be insisted on, and therefore only says this, viz, That those of a dryer Habit may take it more diluted, because their Salts may more easily be carried off: And for the Moisture and Hydropical Temper, He supposes this Water, if more strongly impregnated may make way for the Evacuation to the other.

As to the Times of taking it, *He says*, the more empty the Stomach, the passage will be the more easy, and therefore in such the more effectual: He conceives the use of it after Meals because the Volatile part flies off, before the Meat is any ways digested: after which the Concoction is with difficulty performed: because the Ferment, as well as the Volatility of the Chyle, is suppressed by the Astrigent Quality; which in those circumstances oft proves a thing of very pernicious consequence.

To conclude our Author, notwithstanding all his *Encomiums* of this *Ecotick*, can be content to think, we might receive as much benefit from some Plants of our own Growth: were People industrious to search after them: such as *Veronica Lingna Cervina Marrubium*, *Hepatica Cichoreum*, and some others which he names.

The Physicians of *Tunquin* in *India* do mightily admire the Herb TEA, which comes from *China* and *Japan*; which latter country produces the best. It is brought to them in Tin Pots close stopped to keep out the Air.

When they would use it they boil a Quantity of Water according to the proportion they intend to use, and when the water seeths, they throw a small Quantity into it, allowing as much as they can nip between their Thumb and Forefinger to a glass. This they prescribe to be drunk as hot as they endure it as being an excellent Remedy against the Headache, for the gravel, and for those that are subject to the Gripping of the Guts; but then they order a little Ginger to be put into the Water when it boils. At *Goa*, *Batavia*, and in all the *Indian* Factories, there are none of the *Europeans*, who do not spend above four or five Leaves a day: and they are careful to preserve the boild Leaf for an evening salad, with sugar, Vinegar, and Oyl. That is accounted the best TEA, which colours the water greenest; but that which makes the water look red, is little valued. In *Japan*, the King and great Lords, who drink tea, drink only the Flower, which is much more wholesome, and of a taste much more pleasing. But the price is much different for one of our ordinary Beer Glasses is there worth a *French* Crown. *Tavernier, of the Kingdom of Tunquin* cap. x.

In *Japan* there is a Plant called *Tsia*, it is a kind of The or Tea; but the Plant is much more delicate and more highly esteemed than that of. The Persons of Quality keep it very carefully in Earthen pots well stopp'd, that it may not take Wind but the *Japaneses* prepare it quite otherwise than is done in *Europe*. For instead of infusing it into warm Water, they beat it as small as Powder, and take of it as much as will lye on the point of a knife, and put it into a Dish of *Porcelane* or *Earth*, full of seething Water, in which they stir it till the Water to all green and then drink it as hot as they can endure it. It is excellent good after a Debanch, if being certain there is not anything that allays the Vapours, and Settles the Stomach better than this Herb does. The pots they make use of about this Kind of Drink are the most precious of any of their Household-stuff, in as much as it is kuowo, that there have been *Tsiapots*, which had cost between six and seven Thousand Pounds *Sterling*. *Mandelslo's Trav. into the Indies*, p. 156.

The *Persians*, *Indians*, *Chineses*, and *Japaneses*, assign to Tea such extraordinary Qualities that imagining it alone able to keep a man in constant Health, they are sure to treat such as come to visit them; with this Drink, at all Hours. The Quality it is (by experience) found to have, is, that it is a-triugent, and that it consumes superfluous Humours, which incommode the Brain, and provoke Drowiness.—*Olearius's Ambassadors Trav. into Musc. Pers. and Tartar*, p. 241.

The *Dutch* are said to transport the Dried Leaves of sage into *China*, and under the name of *European* TEA, to harter it with the *Chineses* for their tea.

"In the Island *Cimbun* there grows a Tree, whose Leaves fallen upon the Ground, do move and creep. It hath Leaves like the *Mulberry* Tree. They have on both sides that which looks like two little feet; pressed they yield no Liquor. If you touch them they fly from you. One of them kept eight days in a Dish, liv'd and moved as oft as one touch'd it."—*Jul. Scaliger, Exercit*, 112. A. M. FERGUSON.

PLANTING IN SOUTH TRAVANCORE.

Tea is only making very slow progress there, and attention seems to be equally divided between that product and *Liberian* coffee. There is

some doubt as to which will pay the best here, tea with its splendid yields of 10 to 15 mounds per acre, or the hardy *Liberian* with its ruddy gold-winning crops. Personally I should prefer the tea, but then I am a tea-man and have never gone in for coffee. As most of the men in South Travancore are old coffee-planters, they naturally prefer *Liberian*, which seems to be almost free from leaf-disease, while what *Arabica* there is still left is dragging out a most miserable life. Strange to say there are still some who look askance at *Liberian*, though the elevation here suits it famously; it grows very rapidly and bears crops almost as quickly as *Arabica*. The newer jats has two peculiarities, however, which old fogies don't like, one is its habit of blossoming and ripening all the year round—much as *Arabica* does on the high elevation Nilgiri estates; and another disadvantage it possesses is that it requires special pulpers, as the cherry is so fearfully hard that the ordinary kind are no good whatever. For all that, *Liberian* is the coffee of the future, unless *Brooke-Mockett's* new *Mysore Hybrid*, with its 3 to 4 tons an acre crops, will turn out a success—and where poor *Arabica* once stood are large tracts of abandoned land given over to Mother Nature to cover up and fertilize until wanted again.

The tea mostly planted up here is chiefly a medium Hybrid, which seems perhaps scarcely the most suitable jat to plant as the elevation generally only varies from about 1,000 to 1,500 feet. Judging from the healthy appearance and rapid growth of a small piece of fine young Manipuri plants, it is, I think, very strange that more of this kind is not planted. But then I am an enthusiast for Manipuri Indigenious, and believe it at it can't be beat.—*S. of India Observer*.

HAMBURG vs. AMSTERDAM AS A CINCHONA MARKET.

The Hamburg merchants are a very energetic community, but occasionally their zeal outruns their discretion, and they expose themselves to an unpleasant snob, such as is administered in this week's *Indische Mercur* to a Hamburg wholesale drugs house by an Amsterdam cinchona-broker. The Hamburg firm, it appears, have been circularising the Java planters, pointing out to them the advantage which, they alleged, Hamburg possesses over Amsterdam as a port to which to consign the Java cinchona-bark. The chief buyers of the article, the Hamburgers say, are in Germany, and Hamburg already possesses an old-established reputation as a bark-market inasmuch as South American barks have been consigned there for years. The Amsterdam broker, in his rejoinder, shows that, as a central market for buyers from Germany, France, the United States, and England, Amsterdam is very much better situated than Hamburg, that the carriage of goods from the Dutch ports by canal and river is very much below the cost of transport from Hamburg to the factories, that bills upon Holland are far more advantageously negotiable in Java than paper on Hamburg would be, and that the freight-rate from Java to Holland is lower. He then carries the war into the enemy's camp by quoting a letter from a German quinine-manufacturer, who writes "that he would much prefer Amsterdam to Hamburg as a bark-market especially because cinchona is much better sampled and warehoused in Amsterdam than has ever been the case in Hamburg, and because buyers in the Dutch market are certain to receive exactly what they are shown—a guarantee which is altogether wanting in the case of Hamburg." The Amsterdam broker concludes by observing that it speaks very little for the capacity of the Hamburg cinchona-dealers that they propose to call in the aid of an experienced London broker to do their sampling; that so far as South American bark is concerned, the owners in Hamburg always re-ship their consignments to London because they sell to better advantage there; and that South American bills are negotiable in London at quite 2 per cent above the Hamburg parity. —*Chemist and Druggist*.

BAMBOO OF THE ORIENT.

The Orient is wreathed with bamboo. A considerable proportion of the houses in the East are built of bamboo, and at one season of the year many thousands of natives are fed on bamboo. There is nothing else I should find so impossible to wipe from my memorized picture of the East as bamboo. It is the one characteristic common to all the East. Indigo, rice, opium, tea, coffee, cochineal, gems, spices—they all mean the East, but not one of them means the entire East. Bamboo is symbolic of all the East. It lifts its graceful foathery heads among the coconut trees and cinnamon trees of Ceylon, it touches with rare beauty every few yards of the Chinese landscape. It breaks up into lovely bits the fields of India. It grows at the base of the Himalayas. It softens again the soft, fair face of Japan. It thrives in Singapore, it runs riot in Penang. And wonderfully deft are the various natives in their use of the bamboo. The Chinamen excel in its manipulation. I have come home after a sojourn in the East of some years, with an idea that the Chinamen excel in almost everything mechanical in which they have an entirely fair chance. There are few things a Chinaman cannot make out of bamboo; houses, boxes and baskets, furniture, palanquins, rickshaws, hats, shields, carriages, scaffolding, fences, mats, portieres—these are a few of its simplest uses.

There is nothing else in the vegetable kingdom at once so pliable and strong as bamboo. The fingers of Chinese children weave it. The hands of Indian women pluck it. Yet from it is made scaffolding, upon which stand a multitude of Chinese workmen. Once, in Hongkong, I saw the Chinese prepare for their "Soul Festival." The "Soul Festival" is a unique expression of the artistic yearnings of this peculiar people. It occurs once in every four years. A temporary house is built of bamboo. It is lined with shelves of bamboo; on those shelves are placed pictures, vases, flowers—in brief, anything and everything that marks Chinese progress in the fine arts. The "Soul Festival" is the Chinese World's Fair. But a World's Fair from which all the world is rigorously excluded except China. There was a great deal about the "Soul Festival" I saw that was incomprehensible to me. And a Chinese mystery is apt to remain a Chinese mystery to the most inquiring European. They are not prone to explain themselves to us. One thing, however, was clear to me at the "Soul Festival." That one thing was the preponderance of bamboo. Not only was bamboo an important ingredient of the building and of half the semi-useful articles displayed, but it was in evidence on the majority of the pottery and in many of the pictures. It was the saving grace of the most hideous carvings. It gave the utmost touch of beauty to the finest ivories.

Bamboo is as light as it is strong. That makes it invaluable for receptacles that must be carried. I used often to stop in the streets of Shanghai to buy Chinese sweetmeats from a "chow-chow seller" who had a portable booth or cabinet. I wondered at the ease with which he carried it, until one day I lifted it myself. It was inexpressibly light. It was made of bamboo. The minor Chinese bridges are made of bamboo. Very quaint and effective they are. I went to a Chinese court of justice. The judges sat upon bamboo chairs, about a bamboo table. The doors of a Chinese prison are barred with bamboo lattice-work. The shields of the Chinese soldiers are made of bamboo. Of bamboo are made the flutes of the Chinese musicians. The Chinese poulterer carries across his shoulder a straight bamboo rod and on it are hung his feathery wares. The captive song birds of China chirp their sad music behind the bars of bamboo cages. The Chinese woman, who toddles from her window to see your strange, pale European face, leans over a bamboo balcony.

In Bengal I have seen women carrying bundles of bamboo three times their own height and quite their own circumference. They cut it, the women of the coolie class (hard-working class), and carry it for miles on their heads. They have a little band of rags between their skulls and their tremendous burdens. They bring

the bamboo to the nearest village and sell it to some bamboo shop.

But it is the picturesque aspect of the growing bamboo that I would emphasize. Except in Japan, almost all the beauties of the East are positive—aggressive in color and in line. Bamboo is soft of hue, graceful, indefinite of outline. It softens and modifies many a mile of Indian scenery which without it would be crude. I remember with genuine gratitude one glorious clump of bamboo in Jubbulpore. It was so delicate in tint and shape that it toned to tender half colors the rough dyes of the garments of the natives who clustered about it. I always made a point of including it in my afternoon drive, and many a starlit night I walked some distance to see it outlined, like wonderful ray-green lace, against the opalescent sky.—*Pall Mall Budget.*

PEARLS—PEARL SHELLS—OYSTERS—BECHE-DE-MER—FISHERIES ON THE GREAT BARRIER REEF OF AUSTRALIA.

The most valuable industry or the Great Reef is the pearl-shell fishing. Pearls, be it remarked, are only an incident in the pursuit of the mother-of-pearl. Torres Straits is the fishing-ground, and the best pearl-shell known is raised from off the New Guinea coast, at the depth of twenty fathoms. The average value for the last five years of the exported pearl-shell is stated at £69,000. The search for the shell is conducted in luggers of ten tons and upward, which are manned by the diver, the tender (who manages the life-lines and breathing apparatus), and four pumping-hands. The wages are good, but the work hard. The diver gets £3 for a hundred pairs of shell; and if the yield is six hundred pairs a month, he may earn £200 a year. The price obtained by the shelling-stations is £90 a ton. These are average prices, for the take varies, and the price of the best shell is more than double the average. Pearl-shell is obtained also from Western Australia, Bombay, Egypt, Zanzibar, Linga, and Manila—the best of which, twenty years ago, before the discovery of the Torres Straits' wealth of shell, sold for £400 a ton—Perang, Macassar, Shark's Bay, Ceylon, and Polynesia generally. It is the "black-lipped" or "Tabiti Black" which produces the best pearls.

The oyster and beche-de-mer fisheries together average about £30,000 a year, two-thirds of this value being from the beche-de-mer. The headquarters of the oyster-fishery are Moreton and Wide Bays, quite at the southern end of the Great Reef; but all the varieties exist in the tropical waters, and their true habitats are the coral-islets of the Great Reef. Oysters are cultivated on various surfaces, fascines, split-palings coated with cement, cemented tiles, &c.; but the "split-paling" contrivance is the most convenient and successful. As yet it has not been found necessary, such is the fecundity of the Queen-land oyster, the ordinary commercial variety *Ostrea glomerata*, to dredge for the embryo, as is done in European waters. A remarkable feature of oyster-life is a mangrove bank of oysters, where the molluscs cling to the roots of the red and white mangrove. Oyster-cultivation seems a remunerative and by no means laborious occupation, and a healthy one too.

The beche-de-mer belongs to a group called the Holothuridae, of the class Echinodermata, which includes all varieties of "star-fish" and spine-bearing sea-urchins—the "seaslugs" and "sea-mouse" of our coasts. The French name is derived from the "bicho-do-mar" of the Portuguese navigators. The Chinese, those eaters of expensive soups—witness their "bird's-nest soup"—have for ages eaten them. They are caught at low-tide by wading. The fish vary from eighteen inches to three or four feet, but when boiled and dried they shrink to a few inches. The value of the dried fish is about that of the pearl-shell. The fish-supply of the Great Barrier Region is varied, and contains some excellent eating-fish. The size of a 30 lb. mackerel alone is enough to make one's mouth water; and this, the horse-mackerel or king-fish, if boiled like a salmon, makes a capital table-fish. The

rest of the mackerel family, the herrings, the cods, and the salmon, are not well represented. The Australian whiting, which is not the same as ours, is a useful and important fish. The flat-heads are fairly abundant, as are the sea-pikes; and the genus *Belone*, allied to our "green-bone," is represented by a good fish, the Fitzroy gar-pike; but the best-known Queensland fishes are the grey mullet, the sea-mullet being the most valuable species, this fish reaching ten or twelve pounds. Smelts, anchovies, and other fish are known, particularly the shovel-nosed skate, which may attain a hundred pounds. Some beautiful colours are seen among the non-edible families. With these brilliant-hued fishes, set forth in their glory together with the coral-animals in some chromo-plates, reluctantly leave the Great Barrier Reef.

Mr. Saville-Kent's quarto volume is a handsome one, worthy of its subject, and it is enriched by photographs of the typical scenery of the Great Reef, the fishes, and coloured plates of the more striking animals and fishes. It is chiefly descriptive, but an area so vast could hardly be treated in any other manner; and information of the most varied and interesting character is provided hand-in-hand with the more æsthetic details. It deserves to be studied, for the Great Reef is unique,—one of the most strange and yet beautiful features of the Southern hemisphere; and, moreover, it belongs to the British Empire.—*London Spectator*.

THE KELANI VALLEY TEA ASSOCIATION (LTD).

DIRECTORS :—George W. Paine, Cotswold Lodge, Upper Nurwood (Chairman); Donald Andrew (of Messrs. Andrew and Co.), Calicut, 16, Philpot Lane, E.C.; Leopold F. Davies (of Messrs. Gow, Wilson and Stanton), 13, Road Lane, E.C.; Dudley A. C. Scott, 45, Eaton Square, S. W. Managing Director: Robert Porter, Midlothian Estate, C ylon.

The following is from the report of the board of directors to be presented to the shareholders at their Eighth Annual Ordinary Meeting, to be held at the offices of the Company, on April 9th, 1894, at 2.30 p.m.

The directors have pleasure in submitting to the shareholders the report and accounts of the company for the past season. In their last report the directors intimated that they had acquired Weraagalla Estate, but that it was not their intention then to create fresh capital. Shortly afterwards, however, they were able under Mr. Porter's advice to negotiate for the purchase on advantageous terms of the adjoining estate of Paruwella from the executors of the late proprietor. The price paid for this property was £5,250, and it was taken over by the company as from July 1st last.

In view of these extensions, the Board thought it desirable that the capital of the company should be increased, and an Extraordinary General Meeting was held on June 26th last, when resolutions were carried increasing the nominal capital to £50,000, which were duly confirmed at a subsequent Extraordinary Meeting held on July 13th following. Of the fresh capital thus authorised 1,000 shares were offered pro rata to existing shareholders at £1 premium per share, and 816 shares were taken up, leaving 184 shares, to be subsequently dealt with by the Board. For these, tenders have recently been invited at a minimum of £2 premium per share, and all have now been allotted. The premiums received on the 816 shares have as usual been placed to reserve account, which with a small profit on realisation of Consols, now amounts to £1,839 2s 9d., and the further premiums on 184 shares will be similarly dealt with. The season just closed has been an adverse one for the Tea Industry in Ceylon. The island was visited by a severe and abnormal drought, which told most severely on the lowcountry estates, and the crops secured were consequently considerably short of estimates. The prices for tea were not so good as in the previous year, but the average obtained for the company's teas compares favourably with that realised for the produce of other gardens in the same

district. The factories and machinery are in efficient order, but the directors think it wise to continue the policy of writing down their cost, and 10 per cent amounting to £590 1s 4d., has accordingly again been written off for depreciation. The company's net profits for the year, after debiting the above, amount to £1,486 8s., which with £884 19s 5d., brought forward from last accounts, gives £2,371 7s 5d., to be now dealt with, and this it is proposed to appropriate as follows:—

Amount as above ..	£2371 7 5
Interim dividend of 5 per cent paid in September, ascribed ..	£563 5 0
It is now proposed to pay a final dividend of 10 per cent (free of Income Tax), making 15 per cent for the year ..	1289 14 0
	1852 19 0

Leaving a balance to carry forward of £518 8 5

In accordance with the Articles of Association Mr G W Paine retires from the board, and being eligible offers himself for re-election.

Mr. J B Lauric also offers himself for re-election as auditor.—*H. and C. Mail*.

NOTES ON PRODUCE AND FINANCE.

NEW IDEAS ABOUT TEA DRINKING.—It is quite time that in the place of mere bald strictures upon tea drinking, our medical and scientific authorities should endeavour to assist tea planters and the public generally by giving a few details on the subject. It is useless to expect that the public will give up tea simply because some eminent medical authority rails at the tea drinking habit, and utters some commonplace remarks about tannin. The public like tea, and they wish to drink it under the most favourable conditions as regards its brew. In fact, everyone wishes to receive instruction upon the art and economy of tea growing and tea drinking, and here, just in the nick of time, we have Mr. Ernest Hart coming to the rescue.

TABLET TEA.—According to Consul Brown, of Kiukiang, tablet tea, which, unlike brick tea, is made from the finest quality of dust, shows a marked increase in the 1892 movement. Two Russian firms are the only makers of brick tea in Kiukiang. One of them has at present the monopoly of the manufacture of the tablet tea, which is finding a market even outside Russia—in Germany and France. Last year's report spoke of it as "the best and most convenient form of tea that one can possibly imagine for travellers, backwoodsman, or armistees in the fields." There would seem to be no reason however, why whole leaf tea should not be compressed into nearly the same compass by suitable machinery, much as some kinds of tobacco are treated, and in that case, the leaf being unbroken, one would expect the aroma to be better retained. By an arrangement of the mould the cake could possibly be divided into rations, and thus economy of space in the traveller's box, the army commissariat, and the man-of-war's store room would be combined with simplicity in use. Samples of brick and of tablet tea are forwarded with the Consul's report for the inspection of anyone interested in the subject, and these are to be seen at the India Office. The manufacture is only carried on at Kiukiang during August, September, and October.

LAST WEEK'S TEA SALES.—Only one public sale of Indian tea has been held this week, says the *Produce Markets Review*, and as there were many closing invoices from the most important gardens competition was active. As the quantity to be imported to close the season will be small compared with the same period last year, it is probable that the stock at the end of this month will be below that of the preceding year.

This being the case the market is likely to remain very strong, for although the trade demand has been much less animated during the past three weeks than previously, prices have steadily risen, with increasing deliveries, which is a proof that dealers are mainly clearing from their earlier purchases. It is, therefore, natural to infer that stocks must sooner or later be replenished, but even in this case any further material forcing-up of prices would be unfortunate, as it would certainly check the consumption. There is no change in the position of Ceylon teas, the market remaining steady with a good demand. The supplies will no doubt continue for a time on a moderate scale, owing to the smaller exports from Colombo, and consequently an increased firmness may be expected after Easter, when an improvement in the inquiry may be looked for.—*H and C Mail*, March 30.

TEA, COFFEE, AND COCOA.

On Wednesday Mr. Ernest Hart, Chairman of the Council of the National Health Society, delivered an address on this subject at the rooms of the Society, 53, Berners Street, in which he aimed at dispelling many common errors, and discussing the matter in hand practically as well as from the scientific point of view. The lecturer began by referring to the overwhelming argument in favour of these beverages deducible from the principle *quod ubique, quod ab omnibus*. A universal, discriminating, and all powerful instinct had led first all the nations of the East and the South to use as their beverage, and subsequently all the Western nations, to adopt from their beverages derived from tea, coffee, Paraguay tea, cocoa, Guarana chocolate, or the kola nut. These were all extremely different in their flavour, and altogether different in their sources of origin. The tea was the dried leaf of a camellia; coffee and dried root of a species of cinchona; the Paraguay tea, drunk by millions of people in Southern America, was derived from the leaves of a holly; guarana from the seed of paullinia; kola from the nut of sterculia. Modern chemical processes had succeeded in discovering that the whole of these beverages were characterised, however different in flavour or source, by the presence of a single and practically identical alkaloid or active principle known as theine or caffeine. Taking tea and coffee as the two typical beverages of the kind prevalent throughout the East and in Western Europe, Mr. Ernest Hart proceeded to discuss what were the important matters known or unknown about them and to compare the methods of preparation and of infusion which prevailed in the West and in the East. Describing in comparative detail the processes of plucking and preparing China tea and the teas of India and Ceylon, he pointed out that however different in detail, they were essentially alike in principle. After plucking from the shrub the leaf was subjected to the softening and wrinkling process known as withering; the leaves were then in India, China and Ceylon, fermented in a wet mass, rolled and crushed under the heavy pressure, re-roasted and packed for the market. In Japan the practice differed especially for teas intended for home consumption. The leaf was moistened by steam roasted at a very mild heat or basket fire, rolled and for the purposes of the finest tea reduced to powder which was the most highly esteemed and the only kind of tea used in the tea ceremonies of Japan. It will be observed that the essential point in all these modes of preparation is the *softening* of the tea leaf and the *crushing* is so as to set free within the substance of the leaf the theine and essential oils which it contains so as to render them more easily diffused when infused in hot water as a beverage. In all cases the leaf most highly valued was the small top leaf of the twig and the bud. There was no reason whatever, however, to believe that this was either finer in quality, richer in content or intrinsically better in flavour than the leaves next in succession, but being more tender and softer in structure it yielded more completely to the crushing process and gave better and more flavoured liquor.

Setting aside for the moment the various obscure and untrustworthy varieties of preparation and selection of China teas, as to which there was much mystery and some misrepresentation and dealing only with Indian, Ceylon and Japan teas where everything was open and above board, Mr. Hart pointed out that the common and prevalent impression that the trades names Orange Pekoe, Pekoe, Souchoong, Congou, represented different products having some generic distinction, was altogether unfounded and contrary to the fact. They were all the same in respect of origin; they were picked at the same time from the same plant and from the same bush. The bud and the top leaf constituted Orange Pekoe, the two or three larger leaves growing on the same twig a little lower down were Souchoong, and below that the leaves became Congou, a name, however, not much recognised either in Indian or Ceylon teas.

After describing the mode of growth and of selection of the leaf, the lecturer paid a warm compliment to the Ceylon teas and the Indian teas, pointing out, however, that the great favour with which Ceylon teas were now regarded was no doubt due to the fact that, while equally rich in theine, they had a less proportion of tannin than the Indian teas. In 1880 the total export of tea from Ceylon was under 120,000 lb.; this year it had reached 6,000,000 lb. The housewife, in selecting a fine tea, should not be guided by any trade name, but should obtain orange pekoe of whatever growth, whether from Ceylon, Assam, or Darjeeling, and should then determine by pouring a little boiling water over the leaves, and examining them that the leaf was a whole leaf and not cut into small pieces from the larger leaf, as was commonly the practice. The larger the leaf the weaker the infusion and the less the value. Green tea from China was for the most part tea fermented and made bitter like black tea, and then faced with Prussian blue or indigo to simulate green tea. Nearly all the Indian and Ceylon teas were also fermented and were all black teas.

The only true natural green tea produced in quantity by any country now was the green tea of Japan as drunk by the natives and largely consumed in America. This tea was neither so bitter nor so strong as to require to be doctored with an albuminous fluid such as milk to make it drinkable, or with sugar to further hide its bitterness. It needed to be infused only for a short time, never more than five minutes, and the water used should be just off the boiling point, so as not to dissipate the delicate aroma of the tea. Japanese "green," or unfermented and un-faced tea, so drunk was, in the lecturer's opinion, the very perfection of the beverage. Our European tastes, however, had so long been vitiated by the habit of drinking the strong, bitter, fermented tea, that he had no great anticipation that any but the more delicate and cultivated palate would appreciate and habitually prefer this exquisitely aromatic and harmless beverage, which was the staple drink of the Far East. He showed the mode of preparing tea after the fashion of the Japanese from a series of specimens, some of his own importation, and some procured from a Japanese resident in London.

Referring then to the question of tannin in tea, Mr. Hart gave the result of a series of experiment, which threw much doubt upon the current views on the subject. It was supposed generally that letting the hot water stand upon the leaves more than fifteen minutes extracted a considerable additional amount of tannin from the tea, and was very deleterious. This was hardly the fact. After fifteen minutes very little more tannin could be extracted from the tea by the ordinary methods of infusion. What came over was an unpleasant disagreeably flavoured bitter extractive, which had lost all delicacy of flavour, and was unpleasant to the palate, but it did not contain the excess of tannin popularly attributed to it. Tannin was so highly soluble that it was dissolved in the water from the very first instant of contact, and the three minutes' infusion of pale tea contained a very large proportion of tannin. He

agreed with Sir William Roberts in believing that the alleged ill-effects of the tannin in the tea were probably very much exaggerated, and that the ill-effect of drinking too much tea and too strong tea were due to the tannin and volatile extractives of the tea, and not to the tannin. It was quite a fallacy to suppose, although he often saw it stated, that common teas contained more tannin than the choicer varieties. In many cases the opposite was the fact. Varieties of tea, however, such as the "digestive" tea, might be had in which the tannin of the tea was so altered by electrical treatment that it did not precipitate gelatine, and interfered but little with the digestion of starch; of these Mr. Hart showed specimens which he considered deserving of notice.

The most essential point of all for making good tea of the finest quality, and with the least waste, was the thorough crushing of the leaf, and its subdivision in such a manner that the largest possible surface was rapidly exposed to the boiling water in infusing it. Hence the traditional preference by the Japanese who in this matter had shown their customary intelligence and refinement of taste, for their carefully prepared and selected "teapowder," which produced the finest tea in the world. Hence, too, probably, the superiority of the thoroughly crushed tea bricks of the best quality formerly sent from China to Russia. This matter had been greatly overlooked in the West but undoubtedly it was the key to any further progress in the art and economies of tea drinking. The difficulties and disadvantages of tea powder obtainable in Europe at present were its liability to adulteration, its uncertain mixture, and the discomforts attending its use. Some months ago he had sent him a series of Tea Tablets made by the compression into the tablet form of carefully selected and finely ground teas of Japan, India, and Ceylon, some of them already sweetened. During his recent travels he had used these largely and with excellent results. Investigating the matter accurately he found that weight for weight the finest teas in small compressed tablets gave results at least three times better than the same tea in leaf. These tablets were a scientific application of the experience of the great tea using nations of the East. Their extreme portability, the automatic and accurate measurement of quantity which they facilitated, and the saving of fully 50 per cent. in cost, together with the readiness with which a cup of tea might be prepared from them in a few seconds, were advantages which he thought were likely to be highly appreciated by others as they had been by himself.

Specimens were shown of these and of the beverage prepared from them. Passing to coffee, for which he had left himself little time, Mr. Hart said that coffee as in France has justly lost its reputation, and was commonly hardly drinkable by reason of its large admixture with chicory, which cheated the eye but defrauded the system of the needful and necessary alkaloid. Chicory was worth 2s. a pound, and good coffee 1s. 6s., or 1s. 8d. There was only one secret in making coffee, and that was the berry should be good in quality, freshly roasted, freshly ground, and that not less than an ounce should be used for every pint of coffee, better two ounces. Weak coffee was an abomination, but it was what was almost universally drunk in this country. Strong coffee would cost not less than 1d. a cup without sugar or milk, and the only permissible dilution was with milk, not water; a pint of watery coffee, thickened and darkened with chicory and burnt sugar, and coloured with milk could be produced at 2d a pint, and this was what was ordinarily drunk by the working classes. It was not a very agreeable and not a really restorative fluid. No wonder the use of coffee among the working classes was declining rather than advancing. Good tea could be sold for a fourth of the price of good coffee, hence the universal preference for it among the working classes and in the ordinary British household, a preference which was quite natural and justifiable. After discussing cocoa and chocolate, the lecturer concluded that only cocoa essences which were free

from heavy admixtures of starch and sugar should be drunk; and he showed specimens of chocolate which were notable and much to be commended, in that they were also wholly free from added sugar or starch, and which he hoped would be largely introduced into commerce for the sake of the gouty and rheumatic, the diabetic and the obese, to whom a superfluity of starch and sugar was highly objectionable.—*British Medical Journal.*

CINCHONA EXPORTS FROM JAVA.

From a reliable quarter we have received the following figures:—

Exports from Java in February 1894.
Private lb. 412,120. Government lb. 46,543. Total 458,663 lb.

Exports from Java from 1st July 1893 to 28th February 1894:—

	Private. lb.	Government. lb.
1894...	4,366,426	367,382
1893...	4,695,397	478,714
1892...	5,463,815	493,184
1891...	4,838,965	404,645
1890..	3,012,630	394,780

A DUTCH CINCHONA ASSOCIATION.

An "association for the promotion of the interests of cinchona cultivation" has been established in Holland. The object of the association is to promote the interests of the cinchona industry in the Dutch East Indies. It is proposed to carry out this object chiefly by collecting facts relating to the industry, giving lectures on the subject and publishing literature concerning it. Members are admitted upon payment of an annual contribution of 10 florins (16s. 8d.) The management of the association is vested in a council of from three to seven members, who must have their domicile in Holland and who must be connected with the Dutch Indian cinchona industry, either as plantation owners or as directors of companies. It is proposed to hold quarterly meetings of members of the association in Amsterdam.—*Chemist and Druggist.*

HOW TO GET RID OF ILLUK GRASS.

An old planter writes:—"Illuk is a nasty weed to eradicate. The most effectual way with a small acreage is to dig over the whole surface to a depth of 18 inches, carefully removing all the roots and having them burnt. I did this once in Badulla to about 7 acres of Illuk and Bracken, and it was most successful, and the growth of the coffee after it was wonderful. There is another way which might be tried in the wet weather. Let coolies be armed with pieces of gunnybag to defend their hands, and then begin from one end and pull up each stem of the grass. Once a week, or every ten days after this, let this be repeated with each fresh growth, for say two months. The roots, being deprived of food and air through the leaves (lungs), the reserve nourishment laid up in the roots is exhausted in raising fresh shoots, will rot in the ground and the nuisance will cease."

CEYLON TEA IN NEW ZEALAND.

GOOD ADVICE TO PLANTERS.

Messrs. Ninian Hyslop & Co., of Christchurch, New Zealand, write to ask us to add their firm to the list of those who sell pure Ceylon Teas given in our *Overland and Tropical Agriculturist*, and they add:—"We have had printed and circulated 20,000 of the enclosed circulars re-Ceylon Teas [the circular compiled and printed by us.—Ed. T.A.] and we think the Ceylon Tea Association ought to make us a grant of 1,000 or 2,000 lb. of tea as we have advertised and pushed tea hard during the last 5 or 6 years. Our Mr. Ninian Hyslop had the pleasure of meeting

your late senior along with Mr. Gammie of the Government Cinchona Plantation at Darjeeling. Mr. Hyslop was then in charge of the Iesta Valley Tea Plantation, but he has been pushing Teas in New Zealand for the last 10 years. Ceylon teas are not being kept up to the mark; they are not so good as they were a few years ago. This is to be regretted and it is bound to hurt the sale and curtail the demand for Ceylon Teas. Planters ought and must keep up the quality in order to retain the good name Ceylon teas have acquired in the past."

VARIOUS AGRICULTURAL NOTES.

TRAVANCORE TEA.—We have seen a Colombo expert's report on some of the tea which is shut out from the Colombo market which, with the accompanying valuations, should make many a Ceylon proprietor's mouth water! Travancore planters are evidently bent on turning out better teas.

THE KELANI VALLEY TEA ASSOCIATION.—The shareholders in this Company have certainly to be congratulated that, notwithstanding a bad year, their Directors are able to declare the usual dividend of 15 per cent. The first quarter of this year has also been a poor one in the Valley; but at present all is favourable.

THE WANNARAJAH COMPANY SHAREHOLDERS.—are very lucky in the prospect of an unexpectedly good coffee crop: the experienced Manager thinks there may be as many as 2,000 bushels gathered of what may be called the "precious berry"—a very handsome windfall. The tea is coming on well too; but the shareholders will be sorry at the prospect of losing the services of their Manager, Mr. W. Taylor, as he is likely to be going home in June for an indefinite period.

CEYLON TEA AT THE CHICAGO EXHIBITION.—We have got into the habit in Ceylon of speaking loosely (and largely) about the £30,000 this Colony has spent to advertise her tea at Chicago against £7,500 on the part of Indian planters. But it will be seen now that the net expenditure by the Ceylon planters for their tea is about £10,000; another £10,000 being spent from the General Revenue on behalf of other Products and Industries of the Colony generally.

IMPROVEMENTS IN TEA MAKING. An experienced planter writes:—

"I am interested in Bamber's book on tea. I would not be surprised though the old China system of 'steaming' green leaf before rolling instead of dry withering may not be taken up some time." But is not this very much what our Chota Nagpore correspondent advocates in his "Silo" system, the keeping of the juices in the leaf? We are glad to say that a careful trial of the "Silo" system is to be given by a shrewd Ceylon planter and the result reported to us.

IMPROVED TEA-MAKING AND BETTER PRICES.—

We call attention to the letter signed "1874" which is from an Indian tea planter of 20 years experience and who, in writing to us from Northern India, affords a good many reflections as well as suggestions of interest to his brother planters. It is quite clear that we are entering on a period of discussion and experiment in reference to improvements in tea-making, and we expect the next decade will witness a considerable change in this department, as well, perhaps, as in certain branches of cultivation. Hitherto our engineers have been busy solving, for the planter, the problem of coping with large and increasing quantities of "leaf." This has now been disposed of, and we may henceforward expect their aid, as well as that of others interested, in experimenting towards "improved tea-making."

THE COCOA CROP OF PARAMARIBO, in the Netherlands, Guiana last year, was a remarkable one being more than the total output of the previous two years, and exceeding the production of any other one year within the last decade.

BUG ON COFFEE is being attacked on one of the estates near Coonor by spraying insecticides on the bushes. The machine used is one of Vermorel's Eclair knapsack spraying pumps, in very great favour on the Continent and at home for use in orchards. We trust soon to be able to give results.—*South of India Observer.*

CORROSIVE FUNGICIDES.—The *English Mechanic* reports that the use of poisonous or corrosive salts as fungicides or insect destroyers on plants is found to be almost as bad as the disease in some instances where the application has been made in a rather careless manner. Sulphate of copper should be applied only in weak solution to the foliage and then, when mixed with lime. In various parts—this country, America and India—potatoes have been practically destroyed by the strong remedy and in the reports of the State Agricultural College, Michigan, it is reported that the poisons used in spraying such as the salts of copper and of arsenic, were found in the fruits—in small quantities only of course. Dr. Kedzie, who made the analyses at the Michigan College, considers that the quantity of poison used is much in excess of the amount needed to act as a fungicide and poisonous salt should not be used at all when the fruit is ripening.

TOBACCO CULTIVATION IN INDIA.—Attempting the cultivation and curing of tobacco for the first time last season, the authorities of the Sibpur Experimental Farm sowed in addition to some ordinary country varieties the seed of several finer foreign kinds—Havana, Virginian and Kentucky. The seed of the last two varieties failed to germinate. The Havana and the country varieties came up well, and were plentifully manured with saltpetre and sulphate of potash, both of which supply potash, an ingredient in which Indian tobacco is said to be deficient, and which is required in larger proportion to make it burn well. All of them gave a good return, and though they had not been tested when the report of the experiment was made, the country varieties were expected to show an improvement in quality. The Havana appeared to be mild and sweet in flavour, and was to be made up into cigars, and sent out to be apprised by competent authority.—*Pioneer.*

LIPTON AND TEA.—Correspondents deal very freely with Mr. Lipton's name, business and reputation in our columns, one who sends the letter from London protesting against his having the Tea Kiosk, writes to us separately:—

"Though it may sound paradoxical, nothing has done more harm to the interests of Ceylon planters in England than the Liptonian boom, at the same time no man can do more good to them in America if he (Lipton) can develop the taste for cheap black teas, Ceylon, Indian or Java it matters not what. The Yankees won't drink good tea to any extent; if they can be got to take to black teas they will have them of the lower kinds and that is what we want to get rid of here. I know several of the best friends Ceylon tea has had in England who have been struggling to keep up quality buying tea at 1s. in bond and selling at 1s. 10d. which after paying rent, wages, duty, packing and carriage leaves but little profit but who have been nearly crushed out by the great advertiser."

But is our correspondent aware, we would ask, of the great need for improvement in the Colombo 'Tea Kiosk' and of the fact that 'Lipton' is willing to submit for test, the teas he will sell here—all "pure Ceylons."

Correspondence.

To the Editor.

TEA LEAF PRESSING: THE SILO SYSTEM.

Northern India, April 13.

DEAR SIR,—My salaams to Messrs. A.B.C. who confabbed on the railway on March 15th, and go out at Talawakele. I am thankful to Mr. A. for starting the discussion—although he calls me “a man.”—Now any one can be “a man,” but few are planters and ever still “Tea Planters.” In this matter I want to be recognized as a “Tea Planter.” Mr. B. is evidently the conservative element, he will come in by and by when all is proved sufficiently, and I trust that his manure heap will not grow too large. It is possible that Mr. C. will get somebody to try the new thing. I wanted at one time to get it taken up by our Association and have it tested by their expert; but I suppose that the danger of benefiting a private individual is a sufficient bar to any public endeavour. Bide a weel some one will get those chestnuts out of the fire. Mr. C. put all in a nutshell: it would save a lot of expense, bother, danger, and time? I have set the nuts roasting, and I am not going to burn myself in getting them out. They ought to be awfully good I assure you; they will save heartburn, indigestion, Doctor's bills. Do have a try. And as Mr. C. says you can try only a small quantity—say you try 3 maunds of leaf and you happen to be one who gets 4d average, your risk is losing 60 lb of tea at 4d=240 pence, £1 sterling. No, not so much, you will see if you fail moderately get 2d per pound, so you would lose half-a-sovereign. If your tea sells at better prices than 4d you risk losing £2 or so. Times are bad, Horatio, and here is a new philosophy going begging for £2 or so.

I admit that you may fail (I am supposing that I am on that railway getting on rapidly to Talawakele). I showed the plan to a neighbour; he was delighted, going to try it at once. I went to his place a few days later. I found about a foot of burnt leaf all over the floor, a tea-box with seams half-an-inch open, the lid of the box bigger than the top of the box and a chest of tea lead weighing 2 cwt.

The man (I say *man* now, not planter) had jammed 2 maunds of leaf into a leaky box, and put the tea lead on to hold it down in case it wanted to swell and burst, and he had taken out the leaf to get cool and he thought that he had carried out my instructions near enough, and I think that he would have gone on cursing me, had I not fortunately turned up at the proper moment. [I now imagine a dead silence and a long sigh as Tala, &c., &c. is heard from the platform, and as the train starts (I am going on to the asylum farther on) I hear, “Glad that chap is going on!” I suppose that the late Mons. Vaillant, when he wanted to change the aspect of the Chamber of Deputies, asked his friends to undertake the job. I don't want *all* the glory, says he. But he had to work alone at last. And so he got into the illustrated papers. My idea is “to regenerate the manufacture of tea.” Kindly take the bomb—hold it so! let it fall just there. Please don't compel me to do all the work and take all the glory. PRESS.

CEYLON TEA IN RUSSIA.

We have received for publication from the Secretary of the Standing Committee of the Tea

Fund the following correspondence from Mr. Rogivue to Mr. Giles Walker:—

MR. ROGIVUE'S REPORT.

MY DEAR WALKER,—I duly received your kind letter of December 20th last and thank you very sincerely for same, also for what you have done for me in bringing the committee of the Tea Fund to vote me a further grant of 5,000 pounds Ceylon tea for advertising purposes.

I have received from the Secretary to the Planters' Association the official notification of the minutes and resolution passed thereon by the Standing Committee of the Ceylon Tea Fund, but up to this time I have not heard from the Ceylon Tea Company, Limited, that the shipment of this tea has been effected; no doubt, I shall however, have this advised before long.

I am exceedingly sorry that some of my previous remarks have been found offensive to the members of the Tea Fund Committee; they were not meant with such an intention, and, although I feel that I had some right to complain, I do apologise for them, and it remains me to thank your committee for what they have done and for the further support they promise to give me as far as the funds they have will permit.

As regards a “Company,” it is perhaps too early to think of starting one just at present; but later on, when Ceylon tea has made further progress in Russia, the task will be easier, and I have no doubt that some Ceylon men will then find their interest by supporting such a concern and taking shares in a Company which could eventually be floated in London.

With reference to “consignments”, I herewith beg to hand you 5 pro forma account sales of teas which I bought in London at different periods during the last year and sold here in packets, from which you will observe that the *good* and *medium* standards A B C D give very fair returns and compare favourably with London prices, whilst the *lower* sorts (Pekoe Souchong) of standard A B are mostly sold at a loss. The higher and medium grades of tea (good, well-made, nicely twisted, tippy, of a fine blackish colour, strong and fine flavoured in cup, Broken Pekoes and Pekoes) are therefore preferable for this market and will leave good profits, and I must remark that my best selling numbers are the No. 5, 6, and 7 at R2, R1-80, and R1-60 respectively. I also send you by this same post, registered parcels the five standard samples referring to abovementioned accounts, and I trust you will be able to induce some of your friends to send me trial consignments of their teas. Remittances of proceeds could be made in sterling by cheques on London Banks *ad libitum* to the planters themselves in Ceylon as to their agents in London.

Shipments *direct* from Colombo to Odessa would be preferable, and it possible, *with through bills of lading to Moscow* made out to order of which one copy should be sent to Mr. Alexander Pappé, Odessa, who will do the needful there for forwarding in transit to Moscow, and another copy to me—Marine Insurance to be covered in Colombo all the way to Moscow.

Strong cases should be selected for packing; Russians taking very little care of the goods, and the transit from Odessa to Moscow being very heavy.

Since my last letter to you of Oct. 29th, 1893, Ceylon tea has made further decided progress, the more so that now and besides R. S. Popoff, other large tea firms are advertising it for sale *pure*, and I hear from London that shipments of Ceylon tea (from London to Russia) are gaining importance. You must have noticed in Messrs. Gow, Wilson & Stanton's London circular (tea

report) of January 12th, 1894, the following remarks:—"The Russian trade in Ceylon tea shows encouraging expansion, much of the export to Germany being for Russia."

I moreover notice with pleasure that the direct export from Ceylon to Russia, which in 1892 was 4000 lb. of tea, has been in 1893—53,272 lb.

I enclose my last brochure on Ceylon tea, and remain, with my best compliments.—I am, &c.,
M. ROGIVUE.

Moscow, Feb. 1st-13th, 1894.

MY DEAR WALKER,—Confirming my letter of the 1st-13th inst., I must again write a few lines to inform you that, after new inquiries made regarding the transport from Olessa to Moscow, I find this route would be too long and too expensive, rendering thus shipments via Odessa very disadvantageous. I have ascertained that Hamburg is a much cheaper place, for transshipments than London, and would therefore recommend for eventual tea shipments to ship per German steamers to Hamburg, with bill of lading made out to order, of which one copy should be addressed to me and another one to Messrs. *Ellan & Co.*, Hamburg, who will do the needful for re-forwarding to Moscow.

I forgot to tell you that particulars of weights (with gross, tare and net weight of each chest) which is required by the Customs authorities, must be sent along with the invoices.—I am, &c.,

M. ROGIVUE.

COFFEE IN MEXICO.

A private letter received in the city of Mexico from the United States Consul at Vera Cruz states that the shipments of coffee from that port during the last two months were the heaviest ever known. During the months of January and February this year over \$4,000,000 (Mexican) worth of coffee was shipped from Vera Cruz to the United States.—*Financial News.*

INDIAN PATENTS.

CALCUTTA, 5th April 1894.

Specifications of the undermentioned inventions have been filed under the provisions of Act V. of 1888:—

Drying Tea Leaves, &c.—No. 30 of 1890: William Jackson of Thorn Grove, Mannofield, Aberdeen, North Britain, Gentleman, for improvements in apparatus for drying tea leaves, coffee, grain or other produce. (From 26th May 1894 to 25th May 1895.)

Withering Machines.—No. 31 of 1890: William Jackson of Thorn Grove, Mannofield, Aberdeen, North Britain, Gentleman, for improvements in apparatus for subjecting substances to the action of air, more especially intended for use in withering machines or wilting tea leaves, but applicable also to drying coffee, grain and other produce. (From 4th June 1894 to 3rd June 1895).—*Indian Engineer.*

THE DELGOLLA ESTATE COMPANY.

Minutes of proceedings at the ordinary general meeting of shareholders of the Delgolla Estate Company, Ltd., held at the Registered Office of the Company, 24, Colombo Road, Kandy, on Saturday, 21st April 1894, at 11 a.m.

Present.—Messrs. W. D. Gibbon (in the chair) E. S. Fox, Buxton Laurie, W. H. Bailey, W. Forbes Lanris, Gordon Pyper, A. E. Wright, represented by attorney; and F. M. Laurie and J. Munton, Secretary.

Read notice calling the meeting.

Read and confirmed proceedings of meeting of 11th April 1893.

Report and balance-sheet taken as read.

The CHAIRMAN in reference to the Directors' Report submitted to the shareholders made a few remarks, informing the meeting that he had just been over the estates and had in fact been there the day before, and had every reason to congratulate the shareholders upon the evidence of progress and improvement, and the possession of a first-class property, and if the prices of cocoa were only somewhat better they would show very excellent results now, and still better hereafter—that, in fact the crops, as regards quantity were, if anything this last year, better than the average over the island. It was true Isabel had been a little disappointing, it had given a large crop the previous year and perhaps naturally needed a little assistance, and that had been given it in the way of manuring. The supplying and shading here had not been so far advanced, and not at present, quite so successful as at Delgolla, but no efforts had been relaxed, and good results must follow. Cocoanuts at Delgolla had been rather disappointing that was to say, only, as regarded crop, dry weather affecting the blossom and yield, and unfortunately very little better could be expected in the coming year—because the blossoms in the district generally were less good than usual owing to dry weather, and such blossom as followed the recent rains could not mature within the season. He had seen in the local papers a report from some part of Jaffna which stated 50 per cent of the blossom had failed. Applications for nuts for seed purposes had been made to a pretty large extent, showing the estimation held of the fine bearing trees on the Company's properties.

Coming to the consideration of the dividend he thought he might say that last year they originally advised 8 per cent being declared; but that, some excess in sales of produce over the valuation, induced the shareholders to consider an additional 1 per cent could be taken and 9 per cent was therefore declared. Perhaps it might have been better to have adhered to the lower figure, but at all events he urged them strongly not to declare more than the proposed 5 per cent this time and leave the balance as proposed to be carried forward. It should be remembered that the estate was bought with other ideas than the immediate return of large dividends; but as a safe and sound investment with excellent prospects from what he might call the reservations of young areas coming gradually into bearing. One of the shareholders who, he regretted to say, was not able to be present had written regarding the writing off for buildings, but in the meantime there was nothing to write off. Some works such as the conducting of water to the stores had gone to ordinary expenditure—while as for reserves it appeared to him that in such works as manuring they were in effect, building up for themselves a very substantial reserve; and if in such matters the directors could be charged with meanness, they had on the other hand one of the shareholders suggesting that part of the expenditure on manure might fairly be drafted to account of permanent improvements as he found the manuring expenditure so treated would have given them 1 per cent extra dividend. If fault could possibly be found on the one hand, then credit should be given on the other. Anyhow they had his assurance that they had an estate that had very much and substantially increased in value since it was taken over. It was not proposed to open

more land at Delgolla this season than the 60 referred to in the report (not 70)—that was to say the best selected of the land under coconuts, of the joint cultivation of which with cacao they had ample proof of success in an adjoining district. At Isabel it was proposed to increase the area of the estate somewhat, probably by 50 acres. He thought it would be very inadvisable to increase the dividend but rather to carry the balance on as proposed. The serious fall in the prices of cocoa was alone to blame for the smallness of the dividend which could neither have been anticipated nor prevented.

Mr. W. FORBES LAURIE moved the adoption of the Report, and in doing so said it would be well to bear in mind that a large proportion of the products had yet to come into bearing. For instance there could not be more than 40 acres coconuts in full bearing, so fully 350 acres have yet to come in. He considered about 45 acres would in future come into bearing yearly; this year 15 acres of cocoa gave its first appreciable crop and next year it would give more. There were 25 acres of Liberian coffee planted up with coconuts which bear first in the coming season and 30 acres in the following, &c. Thus it was hardly necessary to write off particular amounts against wear and tear when every year something extra was coming into bearing and the continual progress in this manner showed an improved value virtually as good as a sum paid off, and in other words, it seemed to him that a portion of the capital being thus temporarily unremitting must dilute the profit paid to shareholders, and a reserve was thus effected. Personally he had considerable interest in the Company and intended to have more, for he had not sold a share in the Company since its foundation, but was acquiring more as he had only recently again gone over the estate and felt that the permanent value of the property was pretty well assured.

Mr. GORDON PYPER seconded the adoption of the Report, which was carried.

STATEMENT OF ACCOUNTS AND BALANCE SHEET APPROVED AND PASSED.

Mr. PYPER proposed and Mr. W. H. BAILEY seconded and the motion was carried *nem con.*

Proposed by Mr. A. E. WRIGHT, attorney by W. D. GIBBON, and seconded by W. Forbes Laurie that dividend be declared at rate of 5 per cent and carried.

ELECTION OF DIRECTORS.

Mr. GORDON PYPER proposed and W. F. LAURIE seconded that Messrs. Fox and Buxton Laurie be eligible be re-elected.—Carried.

AUDITOR.

Mr. BUXTON LAURIE proposed and Mr. Gordon PYPER seconded the election of Mr. Guthrie, on same fee as before.

DATE OF GENERAL MEETING.

Proposed by Mr. BUXTON LAURIE and seconded by Mr. W. H. BAILEY that the ordinary general meeting should take place annually on or about 21st April.

SPECIAL RESOLUTION ON ELECTION OF DIRECTORS.

Moved from the Chair that clause No. 79 of the Articles of Association be so altered as to admit of only one Director retiring annually instead of 2 and carried *men con.*

USE OF SEAL.

Moved from the Chair and carried that no alteration should be effected.

The meeting closed with a vote of thanks to the Chairman.

The following is a copy of the Report which was submitted at the meeting:—

Your Directors beg to submit the annexed Balance Sheet and Profit and Loss Account for the season ending 28th February 1894, which have been duly audited.

The sum at credit of profit and loss account shows that a balance amount of R13,294-09 remains to be disposed of, and your Directors propose to pay a dividend of 5 per cent on the capital of R204,000 leaving a balance of R3,094-09 to be carried forward.

The Directors consider it is advisable to carry forward so large a balance as the produce is not as yet wholly realized. It is a matter for regret that the low prices ruling for cocoa has prevented the possibility of a dividend being secured equal to that of last year. The yield of the estates is not at fault, but the unexpected and heavy fall in the prices of the principal product grown on the estates, for Delgolla estate gave in the twelve months 412 cwt. cocoa against 335 cwt. of the 14 months including in the previous season's accounts.

Cocoa.—The estimate for the season upon Delgolla was 400 cwt. and realized 412 cwt. Isabel estimate was 200 cwt. and 155 cwt. were secured. The estates have passed through a rather dry north-east monsoon, and it is difficult to conclude with absolute certainty what the spring crop may be, but the Reports from the Visiting Agent and Superintendent show that the trees are in good heart, and everything in favour of a fair crop for the coming season. The Directors are alive to the advantages of manuring, and a considerable area has been so dealt with.

LIBERIAN COFFEE.—The crop fell somewhat short of the estimate, 58½ cwt. secured against estimated crop of 70 cwt.; this deficiency the manager accounts for by the continuance of dry weather retarding the ripening of crop prior to or before close of financial year.

COCONUTS.—The number of nuts gathered was 74,194 against an estimated 105,000. This has been disappointing, but the comparative failure of the blossoms, owing to dry weather, was not confined to this locality, and the prices were a little better in consequence, and to a certain extent compensate for the deficiency.

CLEARINGS.—The 60 acres reported as having been felled last year has proved a very successful clearing, planted with cocoa, Liberian coffee and coconuts, and the growth of the shade here has been remarkably good.

Out of an area of about 120 acres of coconuts, about 70 acres were reported by the Visiting Agent and Manager to be well adapted for cocoa cultivation, and it has been decided to plant it up with cocoa, and keep it thoroughly weeded, serving the double object of increasing the extent of cocoa, and quickening the growth of the coconuts.

ISABEL ESTATE.—A small block of Crown land 11 acres, in the vicinity of this estate has been purchased from Government and has now to be added to capital; adjoining pieces will probably be required.

CAPITAL.—To provide for extension and other requirements, the Directors find it desirable to call up the remaining capital.

The following Directors retire in accordance with the Articles of Association:—Messrs. E. S. FOX and Buxton Laurie, but being eligible offer themselves for re-election.

It rests with the meeting to elect an Auditor for the current year. By order of the Board. (Sgd.) J. MUNTON, Secretary.

THE AMSTERDAM CINCHONA- AUCTIONS.

Our Amsterdam correspondent writing on March 29th last, says:—"The analyses for the Java cinchona to be offered at auction here on April 5th have been completed. The manufacturing bark contains 23 tons sulphate of quinine, or 5.12 per cent on the average. About 23 tons contain 2.3 per cent sulphate of quinine; 94 tons, 3.4 per cent; 118 tons, 4.5 per cent; 96 tons, 5.6 per cent; 64 tons, 6.7 per cent; 50 tons, 7.8 per cent; 6 tons, 8.9 per cent. No analyses have been made of a few lots damaged by water." The periodical auctions (our correspondent telegraphs) were held today—Thursday—4,345 packages finding buyers at an average unit 4½ cents per half-kilo, or say about 4.5th d per lb., showing a very steady market. Manufacturing bark in whole and broken quill realised from 9 to 44 cents (=12d to 8d per lb.), ditto root from 11d to 33 cents (=21 to 5½d per lb.), and druggist's bark from 14½ to 57½

cents (=2½d to 10½d per lb.) The principal buyers were the Burnswick, Auerbach, Mannheim and Amsterdam Quinine Works, Mr. Gustav Briegleb, the Frankfort factory, and Messrs. Matthes and Bormeester. Of 23½ tons of quinine in the bark, 20 tons were sold.—*Chemist and Druggist*, April 7.

PRODUCE (TEA, COFFEE, &c.) COMPANIES.

LONDON, April 13.

April is the month in which the larger proportion of the

COMPANIES

connected with Ceylon and having offices here issue their annual reports. Three of these, those of the Eastern Produce and Estates Company, of the Haputale Company, and of the Madulsima Coffee and Cinchona Company, are forwarded to you with this letter. That of the Mahausa Tea Company, although issued, was refused to me on the ground that the directors did not wish the full details of it published. I was, however, obliged with certain leading points of information respecting it. The capital is £18,000, and the dividend declared for the year 8 per cent. There has been placed to reserve £877 10s 2d, whilst £158 17s 9d has been carried forward to the next account. The Eastern Produce and Estates Company made a profit of £30,409 18s 3d, and after paying interest on debentures, £20,045 16s 3d remain available. A dividend of only 3 per cent can, in accordance with the Articles of Association, be paid pending the reduction of the debenture debt below £50,000. This dividend absorbs £8,974 1s 0d. £11,034 2s 3d is applied to paying off debentures. This account is now reduced to £170,880, and the date for paying off this amount has been extended from the original term of seven years for a further term of three years. The Company has 9,750 acres under tea. The crop for 1893 was 2,638,000 lb. which sold at an average of 8½d per lb. The total average of the Company's estates is 17,273 acres which include 92 acres under coffee, 426 under cocoa, and 281 cardamoms and sundries.

The Haputale Company's report states that the gross profit for the year was £4,720 2s 5d, of which £3,701 6s 0d is available for dividend. This is proposed on the preference shares at the rate of six per cent, less income tax. It will absorb £3,462 16s 2d, leaving £238 9s 10d to be carried forward. The report informs me that the season had been favourable for coffee, and that this crop had been over 1,500 cwt. reaching a gross average price of 105s 3d per cwt. againsts £107s 6d in the year previous. The estimate had been for 1,200 cwt. only, and that figure is adopted for the current year. Tea had yielded £2,737 against £1752 in 1892 and £1065 in 1891. It is announced that the Colombo Agency had been accepted by Messrs. Cumberbatch & Co.

The Madulsima Coffee and Cinchona Company only made a profit of £541 4s 0d. A dividend of three per cent on the preference shares, less income tax, is recommended. £294 2s 7d will be carried forward. Only slightly over 100 cwt. of coffee was obtained, and it is found the product cannot in future be looked to as a source of much profit. Tea yielded £5416 against £4123 in 1892, and £2600 in 1891. The total average under tea is now 1300 acres. The total debentures issued amount to £10,050. The report received on the estates from Mr. Naftal is considered satisfactory. On the death of Mr. A. T. Karlake the agency of the Company in Ceylon has been undertaken by Messrs. Cumberbatch & Co.—London Cor.

VEGETABLE PRODUCTS IN CHINA.

Some curiosities of the rise and fall of certain commercial vegetable products may be gathered from a report on the trade of Pakhoi for the year 1892. In some remarks on the export of essential oils the most noticeable developments are said to have been made in Star Anise and Cassia, the former from *Illicium verum* and the latter from *Cinnamomum cassia*. The advance in the value of Anise oil was from £15,185 in 1891 to £35,579 in 1892, and in Cassia oil from £13,074 in 1891 to £11,408 in 1892. Chinese traders, who alone have any knowledge of the trade in Star Anise and essential oil, assert that this extraordinary increase is due solely to increased production, and further state that every alternate year there is a large increase in the trade. This latter statement, however, is only partially verified by the customs returns for past years in the case of Star Anise, and not all in the case of essential oils. The Consul gives it as his opinion that the increase, in part at any rate, is to be accounted for by a change of route—that whereas in past years these goods have been sent in native boats to Macao by the West River, last year, possibly owing to increased taxation by the route, the trade has been diverted to Pakhoi. The essential oils of Anise and Cassia are mainly destined for export to Europe, where the demand, stimulated no doubt by the heavy fall in silver, has greatly increased. Enquiries have been made by European firms with a view to purchasing the oils in Pakhoi, but the trade is entirely in the hands of the Macao merchants established at Pakhoi, who prefer to send them to Macao before sale to foreigners and shipment to Europe, and it seems improbable that they will ever be purchased at profitable rates or indeed at all in Pakhoi. Ground-nut cake has also advanced considerably. This commodity is the refuse of the ground-nuts (*Arachis hypogæa*), after the oil has been extracted, and it is pressed into cakes and used chiefly as a fertiliser in China, for which purpose it is said to be admirably suited, and it is interesting to note that enquiries have been made from Europe with a view to its introduction for the same purpose. Its cost if purchased in Pakhoi, according to the value as stated in the customs returns, would be about £3 12s. per ton, with which freight, &c., to Europe would make its cost considerable.—*Gardeners' Chronicle*.

TEA COMPANIES' MEETINGS.

THE KELANI VALLEY TEA ASSOCIATION, LIMITED.

The eighth annual meeting of the Kelani Valley Tea Association, Limited, was held on the 9th inst., at the offices of the company, 16, Philip Lane, to receive the annual report of the board of directors.

Notice of meeting having been read by the Secretary, and the report and accounts having been taken as read,

The Chairman, Mr. G. W. Palpe, before submitting the usual resolutions to the meeting, offered a few remarks on the position of the company, going over the accounts in detail, and remarked that he trusted the shareholders would find all satisfactory. He begged to remind the shareholders that the company had still the sum of £1,285 to issue in debentures at 5 per cent., and he also intimated that a call of £1 per share on the last issue of 1,000 shares would probably be made in about a month's time. He also stated that the purchase of Weraagalla and Parusella estates has now been duly completed, and the balance of the shares allotted, and the further premiums received would be duly placed, as usual, to reserve fund. Deficiency in crop was due partly to the dry season, and partly to helopeltis, which is very destructive to the young leaves, but the company's manager had taken energetic measures to keep down the latter pest by setting coolies to catch the flies, and they had now nearly been got rid of.

SYSTEMS OF CULTIVATION.

IN continuation of our remarks on this subject, we would next notice the bare-fallow system, according to which no crop is grown for a certain period, the land being allowed to lie fallow, and the interval taken advantage of to thoroughly clean it, turn up the soil and allow it to mellow down. Owing to the rapid propagation of weeds in this country there can hardly be said to be any real bare-fallow possible, unless the land be kept constantly weeded.

In the green-fallow system, a green crop is substituted for a bare-fallow. The advantages of this over the bare-fallow system are that there is less loss of combined nitrogen through washing by rain,—the roots of the fallow crop being present to utilize it,—and that a crop is secured which can either be fed off to cattle or used as green manure. In the ordinary process of fallowing among paddy cultivators a natural crop fallow takes place, and the resulting growth of grass would seem to be much valued by them as pasturage for their cattle.

What is known as Prout's system consists of selling all the crops off the land cultivated, without making any manure from them. No livestock for fattening or breeding would thus be kept, the manures used being all imported into the land. For the adoption of this system special conveniences are positively necessary; for instance, there must be easy access to a ready market for the produce.

In the livestock system the business of the occupier of the land is confined to the keeping of livestock, and the cultivation of grass and making of hay for the upkeep of his animals. Artificial

foods are all bought, the only natural food being hay and grass. The manure from the stock is returned to the land if the cattle are not kept out. In dairy farming and sheep farming this system is generally followed.

By the irrigation system, water, liquid manure or town sewage is used in the cultivation of the crops. The system is applicable to the case of grass farms, market gardening and even fruit culture, but seldom in the case of cereals, though irrigation water may be said to be indispensable in the case of paddy cultivation.

The systems that have been enumerated and briefly touched upon are :—(1) Jethro Tull's system, (2) the Lois Weedon system, (3) bare-fallow system, (4) crop-fallow system, (5) Prout's system, (6) the livestock system, and (7) the irrigation system. Though some of these are adopted as distinct modes of cultivation, it is more common, however, to find modifications and combinations of them. For instance, the cultivation of cereal crops is frequently carried on together with the keeping of livestock. The intelligent cultivator will adopt one or other of these systems according to their suitability to his circumstances, and if necessary modify and combine them as he thinks best.

OCCASIONAL NOTES.

Those who have cultivated vegetables will know how great a pest is the common ant. Ants are often found swarming in colonies in the beds and even nipping off the tender shoots of plants. After repeated endeavours to destroy the pest by means of lime, bluestone, arsenic and Paris green, it was found that the spraying on of kerosine emulsion completely routed them after the second or third application. The emulsion (which did no damage to the growing plants) was made up as follows:—1 pint of soft soap or $\frac{1}{2}$ lb. of hard soap in 2 quarts of hot water, with 1 pint of kerosine. Mix thoroughly while the mixture is still hot until a perfect emulsion is

formed. For use dilute with 15 parts of water. The spraying was done by means of the "Eclair" knapsack spraying machine.

Some time ago we referred to the *Singhara* or *water chestnut*, as yielding in its curious buffalo-head-like fruit a farinaceous food. The plant is known by the Sinhalese name of *Ikiliya*, and is found in some of the tanks in the neighbourhood of Anuradhapura. In India, it is commonly grown in Guzerat, and is said to be the only food for at least 30,000 people for 5 months in the year in Cashmere. The following is an analysis of the edible portion of the fruit, as made out by Mr. Hooper, the Madras Government Quinologist:—

Fat	0.97
Sugar and Gum	14.36
Albuminous matter	8.41
Starch	63.84
Cellulose	3.60
Ash	4.66
Water	4.16

Total. 100.00

The nutrient ratio, or the ratio between the albuminous matter and the starchy materials is 1: 9. 5, which is very similar to that of cleaned rice having a nutrient ratio of 1: 10. 8.

LACTIC FERMENTS.

The *Melbourne Leader* has an interesting report on the experiments that have been carried out in connection with lactic ferments, and the important influence which the success of these experiments is likely to produce on the manufacture of butter. The experiments consist in sterilising cream and afterwards adding to it the particular bacillus (which has now been isolated) that produces the proper butter aroma, when used as a pure culture to ripen cream. Samples of a pure culture of the ferment having been secured from the Continent by Mr. David Wilson, that gentleman in conjunction with Mr. Pearson, the Government Analytical Chemist, succeeded in proving as the result of the experiments referred to, that butter produced from cream first sterilised and afterwards treated with the ferment was far superior to the best samples produced in the ordinary way. A description of the manner in which this superior butter is made mentions that the cream was raised to a temperature of 200 degrees, and rapidly cooled down to 40 degrees when the lactic ferment cultivated from the continental samples was added; the cream was churned some 24 hours later. The butter produced from this levured cream was pronounced to be worth 4d. more in the London market than first-class butter produced in the ordinary way. It is described as having possessed a perfect aroma, and the beautiful flavour found only in the highest class butter. The introduction of the cultivated ferment to the sterilised cream is, moreover, said to have a more beneficial effect on the keeping qualities of the butter, and among other instances in proof of this, the following is given:—A portion of the same churning of butter as that under notice was sent to Colombo, and, owing to some mistake, instead of being taken to a cool store, it

was placed in an open shed, where it remained in the sweltering heat for 17 days. At the end of that time it was examined, and then found to be good and sweet.

It is a common practice in dairies to allow cream to ripen for a certain period (according to temperature) before churning, since the cream churns more easily, and a large amount of butter is obtained than, without ripening, while the proper flavour or aroma is secured. During this process of ripening the various bacteria contained in cream multiply rapidly; and among them the lactic acid organisms which produce the souring of cream are prominent. It was a Swedish chemist, named Storch, who succeeded in isolating from cream a single bacillus, which, when used as a pure culture, produced the butter aroma; and shortly after Weigmann succeeded in obtaining cultures of an organism which produced a normal ripening of cream and the proper aroma in butter.

The value of using such a ferment, if it can be supplied, in a practical manner, is quite apparent, and we may expect, as the report under notice points out, that improvements will be introduced into butter-making similar to those which have been effected in brewing by means of the study of the yeasts. The following passage helps to explain why the new mode of fermentation should give better results than the old:—A sample of cream contains a large variety of bacteria, but the ordinary butter-maker has no means of obtaining a proper control over them. During the ripening process of the cream there will ensue a conflict of the different organisms with each other, and the result will be influenced by temperature, variety of species, quality of the cream, length of time of ripening, as well as the advantage which certain species of organisms may get from an earlier start. In such a conflict it will be a matter of accident if the proper species succeeds in growing with sufficient rapidity to produce its own effect on the cream unhindered by the others. To prevent a conflict of this kind, and by sterilising the cream and then adding the cultivated organisms to give them a start of all other kinds, thus insuring the production of butter possessing superior merit, is the object which the scientist has now in view, and experiments go to show that a large measure of success has been attained.

Until, however, the matter is taken beyond the confines of the laboratory and firmly established in the factory, it can scarcely be said to have advanced much beyond the experimental stage, but this much may be said—that almost every experiment that has been conducted has shown the certainty with which a pure culture of the right kind of bacteria will ensure the production of a superior butter with the most approved flavour and aroma.

INDIAN JOTTINGS.

Cattle from the Bombay Presidency seem to be in demand in foreign parts for stud purposes. Just now three fine bulls of the *gir* breed have been brought down to be sent to Jamaica. The importers evidently do not mind the cost, as in addition to two cattle men, a student of the Bombay Veterinary College is likely to travel in charge of the animals. Even with very liberal

inducements, the difficulty at present is to get a student to undertake the charge, as the College examination is so close at hand that no one cares to miss it, and there is every likelihood that the animals will be left here till May. The gir-bulls have a fine short head with a broad forehead, a pair of horns that incline backwards and large pendant ears. They have a large and well-developed hump, deep chest and well-proportioned legs, and are known as very good draught animals; the cows on the other hand being considered excellent milkers.

It is not generally known that animals which suffer from rinderpest once enjoy immunity from the disease ever afterwards. There are some who believe that this immunity extends only for six or seven years. The fact however is of great importance as regards the value of animals which have once suffered from the disease; and such animals ought to be worth more after recovery from an attack of rinderpest than before. As there are not many authentic records on the subject, it would be well to take note of the animals which have recovered from the disease and the year in which they suffered from the plague.

The immense quantities of hay, or rather dry grass, brought to Bombay from the outlying districts reminds one that much may be done in the matter of hay-making in Ceylon. There we have to depend chiefly upon paddy straw, which is at the best not a very nutritive food. In this city, where so many horses and working bullocks are kept, it would almost be a matter of impossibility to meet a hundredth part of their wants even if owners used rice straw. As for green grass, even several hundreds of acres of Guinea or Mauritius grass, (the last of which by the way is not grown here), will not supply the demand, and but for the provision made by dry grass it would be a matter of impossibility to maintain the large number of draught animals in any of the big towns. The grass from which hay is made grows in the jungles and waste lands in the country and attains a height of about two to three feet on an average. A month or so after the rains the grass cutters mow it and leave it on the ground to dry, after which it is made into bundles and disposed of. There are many species of wild grass, but the common kinds appear to consist mostly of *andropogons* quite similar to the *andropogon* grass* of which a specimen was grown at the School from seed obtained from Delft. There is, I believe, no lack of wild grass in the vicinity of Ceylon forests where a little more attention might be paid to it. One of the great drawbacks as regards cattle breeding in Ceylon is undoubtedly to be attributed to the insufficiency of fodder. There are two species of wild *andropogons* which are put to some use here. One is the well-known kus-kus grass, *andropogon muricatus*, the Scendara of the Sinhalese, which possesses fragrant roots, and is used in making tatties and hand punkhas, and for extracting a perfume. It is a common sight to see mats made of kus-kus roots hung up in verandahs and kept moistened in order to lower the temperature of dwellings.

* *A. Schœnanthus* var. *Versicolor*.

The other useful species of *andropogon* is of more wide economic interest and grows wild in Central India and Punjab. It is known as rusa grass or sweet calamus, *andropogon calamus aromaticus*, and resembles greatly our own Penzance, or the citronella grass. The oil obtained from the leaves of the grass fetches a good price in England, and is sold as grass oil or oil of rose-scented geranium. In the vernacular the oil goes under the name of *rosnætel*.

Sometime back there was a discussion as to the advisability of trying well irrigation in Ceylon. The more one sees of Indian cultivation, the more will he be convinced of the feasibility of this system. In some places the wells from which water is obtained for irrigating the land are very deep and must have cost much money and labour, but the cultivator does not consider any money spent on a well as wasted; on the other hand he will spend his last penny in getting a well excavated, and when he has succeeded will consider it to be a real treasure. The methods of water lifting have already been explained in the columns of the Magazine. The single mhoote, the double mhoote, the lever lift, the Persian wheel, are all in use here. The system of land tenure in some of the Native States encourages the excavation of wells and the improvement of the lands generally. In some States all the land belongs to the Rajah and the cultivators pay a land tax. If a cultivator excavate and build a well in any area he is cultivating, such land comes to be held on a permanent lease by him. In this way in some of the Native States almost every holder of land has got a well for irrigating his crops. These wells in Central India cost as much as R250 or R300 each

BOMBAY.

HOW TO MAKE GOOD DRY GRASS OR HAY.

The following is a Memorandum issued by the Superintendent of the Horse Breeding Department, Meerut, for making good dry grass or hay:—

Cut when green and in flower, tie up in bundles of about 8 to 10 lb. weight, and place three of such bundles on their broad ends leaning against each other. By this arrangement the grass will not become damaged by rain, and the central grass of each bundle will ferment and acquire more nutritious properties from containing saccharine and starchy matter.

When the bundles are sufficiently dry they may be stacked. Dry grass thus prepared will be found very nutritious and sweet, and animals will eat it readily. It is nearly as good as fair hay made in England. Proper haymaking requires much practical experience.

If the weather is hot and the sun powerful, grass will be dry enough as a rule, in 2 or 3 days, and can be then stacked but it should be stacked in small ricks, in case of any heating taking place, for if grass be stacked when too green or wet, it will surely heat too much, go beyond the fermenting process of making sugary matter &c. and may take fire.

A little heating makes the grass sugary and gives a very sweet odour, the odour of hay

THE PRODUCTS OF THE GRAPE VINE AND THEIR USES.

Grapes.—The vine is generally cultivated for the sake of its agreeable sub-acid fruit, the chief acid in which is the tartaric—the same as is present in the tamarind. Grapes exert a cooling and refreshing influence upon the blood, and, like many other fruits, have a beneficial effect upon the stomach and the liver. The late Mr. A. M. Ferguson once wrote as follows about the use of grapes in the dessert:—"For those diseases of the digestive functions to which dwellers in our hot, moist climate are especially liable, 'the grape cure' is frequently prescribed. A full supply of grapes at meals might act as a preventive of the disease indicated by sore mouth." The following is the percentage composition of the ripe grape as given by Dr. Edward Smith:—

Soluble Parts.

Grape Sugar ..	13.80
Tartaric and Malic Acids ..	1.12
Nitrogenous matter ..	.80
Gum, Fat, &c. ..	.50
Salts ..	.36
Water ..	79.80

Insoluble Parts.

Skin, Stones, &c. ..	2.60
Pectose ..	.90
Mineral matter ..	.12

100.00

Before they are ripe grapes are extremely harsh and sour to the taste, and by expression furnish a liquor known as verjuice and formerly used as the juice of lemons. Among other substances, verjuice contains malic acid and bitartrate of potash.

A vinegar is obtained, though rarely, from grapes. It is variously used as a condiment, for extracting the virtues of other medicines, and for counteracting the effects of vegetable poisons. It is said that an excellent vinegar can also be made from the loppings and prunings of the vine.

The bitartrate of potash or cream of tartar which is deposited during the fermentation of wine is used as an aperient.

Raisins.—As the grape is being dried, the quantity of sugar in it increases, while that of malic acid diminishes. Raisins are, therefore, more saccharine, but less cooling and refreshing than grapes. There are many sorts of raisins. The "muscatels" which are highly prized for dessert are left to dry in the sun hanging on the vine itself and are hence called sun raisins. The leaves around being first cut off, the bunches are left undisturbed until the grapes are sufficiently dried and converted into raisins. These are the largest and sweetest raisins in the market and sell at high prices. The "Sultanas" are the smallest which are sold under the name of raisins and are of a peculiarly fine flavour. The former grow in Southern Europe and the latter in Turkey. It is thought that the quality and appearance of ordinary raisins can be improved by dipping them in lye before being dried. Currants are prepared from a small, seedless variety of grapes. They are less juicy and contain a less proportion of sugar than the muscatels. The chief use of raisins and currants is in the pre-

paration of puddings, but wine is also sometimes obtained from them.

Wine.—Must is the unfermented grape juice. Wine is the juice of the grape altered by fermentation. The quality of wine depends principally on the proportion of sugar contained in the must, and the manner of its fermentation. When the quantity of sugar is sufficient and the fermentation complete, the wine is perfect in quality. If the quantity of saccharine matter be too large, the fermentation is slow and consequently part remains undecomposed imparting a sweet and luscious taste to the wine. On the other hand if there is too little sugar in the must, the wine is thin and weak. Ceylon-grown grapes are sometimes found deficient in saccharine matter. Father Assauw, writing from Wahakotte, says:—"I tried to make wine out of grapes grown here, but I had to add from 3 to 4 oz. of sugar to each bottle before I could have got anything like wine." If the skin of the grape is removed from the must before the fermentation sets in, the wine has little or no colour and is called white wine. If, on the contrary, the skin is allowed to remain in the juice while the fermentation is going on, the alcohol dissolves the colouring matter of the skin, and the wine assumes a red colour. Some of the red wines, such as Port, contain tannic acid derived from the skin.

Oil from the Seeds.—A useful oil is extracted from the grape stones in some places. In order to separate the seeds from the husks and other refuse matter, the mash is put into a bucket with some water and worked about with the hands until the seeds sink to the bottom. They are then removed and dried in the sun as soon as possible. When a sufficient quantity is collected, the whole is ground in an oil mill. The oil which is then cold drawn is scarcely distinguishable from common olive oil. The oil cake that is left in the mill as residue, when scalded in a little hot-water, yields a fresh portion of oil, which though inferior to the cold-drawn oil first obtained, burns excellently well in a lamp, giving out no unpleasant odour and very little smoke.

E. T. HOOLE.

DAIRY PICKINGS.

Milk, as is well-known, after being taken from the cow, placed in vessels, and left undisturbed at the ordinary temperature, becomes sour, loses its liquid character, and is ultimately converted into a gelatinous mass. If this mass be broken up by raising the temperature it will separate into curd, which is casein and fat, and a bright liquid whey. This change of souring and coagulation, says Professor M'Connell, a well-known English authority, is caused by the action of a living ferment or micro-organism called the lactic ferment, which enters the milk from the atmosphere after the milk has been taken from the cow. The rapidity with which the ferment acts depends on the temperature of the milk. It acts very quickly at the temperature at which milk leaves the cow—90° Fahr., the maximum rapidity being attained at 100° Fahr. At 114° the action ceases altogether, the heat being too great for the ferment. On the other hand, the ferment

acts slowly when the milk is cooled down to about 60°; at 55° it acts still more slowly; and at 50° no action has been observed. This circumstance explains the fact that milk is most difficult to "keep" (*i.e.*, it turns sour most readily) in warm countries and warm summer weather, and keeps unchanged far longer in the cool winter time. Other ferments besides the lactic ferment enter milk from the air, causing special changes.

Milk may be preserved for any length of time unchanged by the use of certain chemical agents which are added to it—such are boracic acid, bicarbonate of soda, carbonate of soda, and salicylic acid. All these are more or less inefficient, and some of them are objectionable in that they give their own taste or smell to the milk. Sir H. Thomson says that 8 gr. or 10 gr. of these agents per pint of milk will keep it sweet for three or four days, twice the quantity being required for cream. The preservatives are perhaps not injurious if one pint of the milk containing them be drunk daily, but are likely to be hurtful to young children taking it.

The best temperature for churning cream is 56° Fahr. The butter should come in twenty minutes. If the temperature is above or below the proper point use means to bring it to the right degree. If too cold put boiling water into a long tin tube, and stir the cream until it is warm enough. In summer it is not possible to get water cold enough or ice to cool the cream down, but it can be put into a bag in a draughty place, and this will in time bring it down; or the churn or other vessel can be wrapped round with a wet bandage, and be put out where the wind can blow upon it; keep the cloth wet. Water put out in dinner plates in a draughty place will become very cool in a short time, and this cold water may be put into the tin tube to stir the cream until it is cooled somewhat.

Milk should be cooled quickly after it is taken from the cow. It will keep much longer, and any bad flavours in the milk will be modified. Cooling is now done quickly by means of refrigerators.

Lucerne should be cut some hours before being fed to cows. If they are allowed to graze upon the field their milk will have a bad smell and taste, but if the lucerne is allowed to wilt a little first there will be neither smell nor taste imparted to the milk.

The following recipe for cooling water for dairy purposes in summer time is given by Mr. McCormick, the expert in charge of the Tasmanian travelling dairy:—Take 8 lb. nitrate of ammonia and 4 lb. chloride of ammonia, both finely powdered; mix well together and use 5 lb. of the mixture to every gallon of water. This quantity will be found sufficient to reduce water at a temperature of 90° F. to freezing point (32° F.) in a few seconds. In order to regain the salts after using, evaporate the water over a slow fire in an iron vessel. The salts should then be laid on a plank and allowed to thoroughly dry in the sun. Be careful not to boil the mixture, because a portion of the salts will thereby be lost. Never allow the ammonia to come in contact with butter or cream, but stand the vessel containing these articles in the mixture, so that they may be entirely surrounded by it.

Milk tainted with "native cress," or with cabbage, or other plants eaten by the cow can be partly restored by cooling rapidly, then heating to 150° F., and again rapidly cooling it. If not cooled and heated in this way, but put into pans and set for cream, the cream will rise, and with it the oily globules which give rise to the offensive odours and flavours, so that the skim milk will be nearly free, and the cream will have nearly all of the flavour and odour. By separating the cream from the new milk at once the cream will only have its own percentage of bad qualities, and most of this can be driven off by cooling and then heating to 150° F., because the odours, &c., are volatile oils which are vapourised upon the application of sufficient heat.

A pint of milk should weigh 1:25½ lb., as near as can be; a gallon weighs 10 lbs. and a very small fraction. Dairy factories often weigh in 10¼ lb. of milk for a gallon. Where the whole of the suppliers are shareholders this is quite fair.

POONACS.

Mr. Hooper, the Madras Government Quinologist, makes the following remarks on poonac, which he has been examining with a view to their utilization as manures:—

Castor Poonac.—This is obtained from the seeds of the well-known castor-oil plant. The cake contains from 5 to 7.5 per cent of nitrogen and 7 to 12 per cent of mineral matter. This is one of the richest poonacs.

Ground-nut Poonac.—This is prepared from the seeds of *Arachis hypogæa*, which is cultivated so largely in the districts bordering on the Coromandel Coast. It contains from 5 to 7 per cent of nitrogen, and 9 to 12 per cent of mineral matter. The cake from the decorticated seed is about one-tenth richer in albuminous substances than that from the undecorticated.

Min or margosa poonac is made from the seeds of the min tree (*Melia azadirachta*) and is characterized by its asafœtida-like smell and its bitter taste. The nitrogen ranges from 4 to 5.5 per cent, and the ash is rich in phosphates. The cake usually retains a large quantity of oil, sometimes as much as 20 per cent.

Hongay Poonac.—Hongay is the Canarese name for *Pongamia glabra* [The Sinhalese *Magul-karunda*.—Ed.] The cake, which is very bitter, contains from 4 to 5 per cent of nitrogen, and 4 to 6 per cent of ash.

Coconut Poonac is one of the products of the coconut palm on the western coast. When fresh it is eaten as food by the lower classes, but it soon decomposes and is fit for nothing else than a manure. [In Ceylon it is commonly used as cattle-food, especially for working bullocks.] It does not afford more than 3 to 4 per cent of nitrogen, and only a small proportion of ash.

Moura Poonac is prepared from the seeds of *Bassia longifolia*, a tree known by the Tamil name *illupu* [And the Sinhalese *mi*.—Ed.] The cake contains a large quantity of saccharine matter, but is rendered nauseous on account of a bitter principle being present. It yields from 2 to 3 per cent of nitrogen.

RICE.*

Few people realize the important part rice plays in the economic history of the world, and that probably there does not exist any other product of the soil which forms the staple food of as great a number of human beings, computed as three-fourths of the human race. Rice is supposed to be of Asiatic origin, but it is found growing wild in several parts of the world, notably in Central America, Africa, and even Queensland. To India, however, belongs the credit of first utilizing it as a food, and by the cultivation of centuries altering the wild product to what it now is. The rice plant is to be found growing between the 45th parallel north, and the 30th parallel south. When it is mentioned that besides being extensively grown in India and the East generally, it is also found cultivated in the south of Italy, Spain, Portugal, the West Indies, Central America, the United States and Australasia, it will be readily seen that the plant thrives under varying conditions of climate and soil. Rice analysed contains: starch, 86.9; gluten, 7.5; fatty matter, .7; sugar and gum, .5; epidermis, 3.5; ash, .9. The general composition of rice from another analysis shows: water, 13.7; flesh-forming substances, 6.5; non-nitrogenous substances, 79.4; ash, .4. Cooked rice is said to give up 88 per cent of its bulk as nutriment.

The advice given on the subject of seed is good:—Too much attention cannot be paid to selection of seed; only good seed from vigorous plants should be selected. Age has to be considered as well in selecting seed. Both new and old seeds have to be avoided. Seed about 12 months old is reckoned the best. New seed will come up soon, and grow rapidly, but will give a very light crop; old seed will either not germinate or give a very straggly crop and weak plants. Good seed not only gives an increased yield per acre, but also produces a hardier plant—one less liable to parasitic and other diseases. Another matter not to be lost sight of in selecting seed is to see that it is pure, of one variety only, not mixed, otherwise an unsatisfactory crop is the result. Special mention is made of the variety known as Patna rice as a good kind for sowing on the ordinary swampy land.

Then as regards cultivation, we are reminded that the roots of the rice plant are very delicate, and hence good tilth is absolutely necessary to enable the tender rootlets to push their way down. According to the Indian methods of culture 6 inches is given as the lowest depth of tilth, and under this is a hard pad; hence the roots become shortened and travel laterally in search of food, and where no water is provided the plant does not survive. "It is certain," we are assured, and we do not doubt it, "that varieties of paddy imported from Bengal, and treated to scientific farming would develop good root growth, and in course of time, with careful seed selection, a variety could be produced which would really be a dry land crop—that is, entirely independent of added moisture,—and one not likely to fail with moderate drought, as, having longer roots, and good tilth being provided, the plant would receive nourish-

ment from the subsoil, which in the driest of seasons has a sufficiency of moisture if get-at-able by the plant." Instances are mentioned of certain varieties of rice grown in the Bankura district in India, as well as in Burmah, which require much less water than the ordinary kinds, while a variety grown on the Garo Hills in Assam and in Madagascar is practically a dry land crop. The idea of attempting to convert the aquatic rice plant into a dry land crop may be practicable, and the result will no doubt do away with much of the risk of failure from insufficiency of water, but it is generally believed that the extra dry varieties of "upland rice" are not quite so nourishing as the swamp or wet rice, nor so palatable. The advantages of deep cultivation (except in exceptional cases) and finer tilth are undeniable, and if they be aimed at, and seed for sowing be carefully selected, the risks of rice or paddy cultivation would be minimised, and more uniform and better results insured. We hope to conclude our notice of this paper on rice in our next issue.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

The first mentioned of the different orders of birds, viz., *Natatores* or swimming birds, are more or less adapted for an aquatic life, the body being boat-shaped, the legs short and placed behind the point of equilibrium of the body so as to act as oars. The toes are more or less completely webbed. Owing to the fact of their being exposed to great variations of temperature, the *Natatores* are furnished with particularly dense plumage which is kept well-oiled so as to be waterproof.* Among the swimming birds occur ducks, geese, swans, penguins, gulls and petrels. The first three form a well-marked group (ducks and geese being common domestic birds) distinguished by having the bill flattened, and covered by a soft skin, and its edges furnished with a series of plates, which form a kind of strainer, by means of which these birds sift the mud in which they seek their food. The foot in this group is webbed, but the hinder toe is free. Penguins are the chief among the sea-fowl whose excrement forms the well-known fertilizer, guano.

The *Grallatores* or wading birds mostly spend their time in shallow water, feeding upon small fish, shell-fish, worms and insects. Many, however, live chiefly upon dry land, and are more or less exclusively vegetable feeders. They are distinguished by the great length of their legs. The foot has three toes in front and one behind, but the toes are never completely webbed. The wings are short and the power of flight considerable, but the tail is short, and its function as a rudder is chiefly transferred to the long legs which are stretched out behind in flight. The bill is almost always of considerable length, and usually more or less pointed. Among the more important wading birds may be mentioned the water-hens, herons, egrets, bitterns, the stork and adjutant,

*A special oil-secreting gland is provided by nature and placed in the posterior part of the body. It is a common sight to see ducks oiling their plumage by means of their beaks.

* Rice growing and its preparation for the market. A bulletin issued by the Department of Agriculture, Brisbane.

the long-billed snipe, sand-piper, cranes, and plover.

The *Cursores* or runners are characterised by the rudimentary condition of the wings which are useless as organs of flight, and by the compensating length and strength of the legs. The bones have few air cells and the ridge or keel to which the muscles of flight are attached in flying birds, is absent. The hinder toe of the leg is wanting in all but the apteryx, in which it is rudimentary. The front toes are either two or three in number, and are furnished with strong blunt claws. Among the runners are the ostrich, cassowary and emu.

The *Rasores* or scratching birds—or as they are often called the gallinaceous birds—are characterised by having the upper mandible of the bill convex, and having a membranous space at its base in which the nostrils are pierced. The nostrils are protected by a cartilagenous scale. The feet have four toes each, three in front and a short hind toe; and in typical forms the toes are provided with strong blunt claws suitable for scratching. The feet of the pigeons, however, are generally adapted for perching. The rasorial birds are divided into two well-marked groups. In the first of these are the fowls, pheasants, grouse, guinea-fowl, turkey, pea fowl and other allied birds. In the second division are the pigeons and doves, distinguished by the fact that the feet are slender, and adapted for perching while the voice is of a gentle, soft, and melancholy character. The fowls and game birds, on the other hand, are mostly terrestrial in their habits, and have strong feet with claws not suited for perching on trees, while their voice is of a harsh, dissonant nature, and their flight comparatively feeble. Fowls, turkeys, guinea-fowl, pigeons and doves are all more or less domestic animals, though only fowls and turkeys of this group, together with ducks (and sometimes geese) are found in the ordinary poultry-yard.

STERILIZED MILK.

At the request of the Secretary of Agriculture, the chief of the Bureau of Animal Industry, California, has furnished the following simple directions for the sterilization of milk:—

"The sterilization of milk for children, now quite extensively practised in order to destroy the injurious germs which it may contain, can be satisfactorily accomplished with very simple apparatus. The vessel containing the milk, which may be the bottle from which it is to be used or any other suitable vessel, is placed inside of a larger vessel of metal, which contains the water. If a bottle, it is plugged with absorbent cotton, if this is at hand, or in its absence other clean cotton will answer. A small fruit jar, loosely covered, may be used instead of a bottle. The requirements are simply that the interior vessel shall be raised about half an inch above the bottom of the other, and that the water shall reach nearly or quite as high as the milk. The apparatus is then heated on a range or stove until the water reaches a temperature of 155 degrees Fahrenheit, when it is removed from the heat and kept tightly covered for half an hour. The milk bottles are then taken out and kept in a cool

place. The milk may be used any time within 24 hours. A temperature of 150 degrees maintained for half an hour is sufficient to destroy any germs likely to be present in the milk, and it is found in practice that raising the temperature to 155 degrees and then allowing it to stand in the heated water for half an hour insures the proper temperature for the required time. The temperature should not be raised above 155 degrees, otherwise the taste and quality of the milk will be impaired.

"The simplest plan is to take a tin pail and invert a perforated tin pie-plate in the bottom, or have made for it a removable false bottom perforated with holes and having legs half an inch high, to allow circulation of the water. The milk bottle is set on this false bottom, and sufficient water is put into the pail to reach the level of the surface of the milk in the bottle. A hole may be punched in the cover of the pail, a cork inserted, and a chemical thermometer put through the cork, so that the bulb dips into the water. The temperature can thus be watched without removing the cover. If preferred an ordinary dairy thermometer may be used and the temperature tested from time to time by removing the lid. This is very easily arranged, and is just as satisfactory as the patented apparatus sold for the same purpose."

GENERAL ITEMS.

In a memorandum on experiments with pulses by Mr. Valder of the Department of Agriculture, New South Wales, the following reference is made to pigeon pea (*Cajanus indicus* or Dhall plant):—"As a forage plant it should prove of value, especially in rotation with other fodder crops such as maize, sorghum, etc. Six months after sowing the yield of green fodder (in a climate which is considered rather too cold for it) was at the rate of 12 tons per acre. I cut a quantity and gave it to horses and cattle, and found that they ate it with great relish."

The experiment with *Lathyrus sylvestris* would seem to have yielded as unsatisfactory results in New South Wales as in other Colonies and in India. We are told that at the end of nine months the plants were not more than 6 to 10 inches high. "Of the fifty-four pulses sown this one was by far the slowest grower and at the end of nine months produced about half a ton of green plant per acre from reports received by the Department it has certainly failed in giving a good yield or withstanding the heat, and in many instances has died out." Our experience at the School was quite similar to this.

Craspedia pleiocephala a rather ornamental plant of the order composite, with yellow flower heads, is said to furnish an admirable substitute for feathers or kapok for filling beds, pillows, or cushions. The material is got from the mature flowers.

Mr. Maiden, the consulting botanist of the N. S. W. Department of Agriculture makes the following remarks regarding *Hibiscus tiliaceus* (our Belipatta, so common as a hedge plant):—"Of all the species of hibiscus, *H. tiliaceus*, has

received the most attention as a fibre plant. The fibre was used by the aborigines for nets and fishing lines. Some fibre produced in this colony was pronounced by the Jurors of the London International Exhibition of 1862 to be only fit for paper making. It must have been crudely prepared, as the tree produces a good fibre in many parts of the world. Three or four years ago the Department of Agriculture of Queensland sent to London some fibre for report. The fibre 'was roughly prepared by boiling, in soda-lye, and rubbing with an old sack.' The report was 'good colour, moderately soft, but of no great strength, and fit only for jute purposes. It would, however, probably sell in large quantities, and we would estimate the value today at £12 to £14 per ton in London.'

"But," continues Mr. Maiden, "I am afraid there is no possible future for hibiscus fibre in the world's markets; the utmost we can expect is to satisfy a small local demand. India is the home of the hibiscus. The products of different species are not always kept separate for trade purposes, but the principal hemp-yielding hibiscuses are *H. cannabinus*, which yields Bombay hemp, Ambari hemp, and Decani hemp, and *H. subdariffa* which yields the Rozelle. There are other species used as fibre plants. I note certain figures in regard to Bombay hemp. From official records it is stated that the area under cultivation in the Bombay Presidency was in 1885-6, 53,488 acres; in 1886-7, 87,957 acres; and in 1887-8, 715,88 acres. This refers to one species, to one presidency, where labour of the cheapest kind, well accustomed to this sort of work is employed.

A sample of the young bark of *Cassia auriculata* (Sinhalese, *ranawara*) was found to contain about 11.9 per cent of tannin; bark from the thicker branches contained as much as 20.1 per cent. It is evident from this that in the analysis of vegetable economic products great importance is to be attached to maturity of the sample and the condition under which it has been collected and preserved, as a slight difference in the age of the sample, or the presence of impurities will make an analysis of that sample of little value.

* * *

To prevent articles of iron or steel from rusting, immerse or wash them, for a few moments, with a solution of carbonate of potash or soda.

* * *

Kerosine emulsion has been found efficacious in ridding animals of ticks.

The native country of *Coleus tuberosus* (Sin. *imala*) is somewhat doubtful. Besides Ceylon, it is cultivated in Java, Amboina, and other islands of the Malay Archipelago. Rumphius, in his account of the plant, mentions it having been

recently introduced into Amboina from Java and Baly, and further suggests that it probably came into the islands from the Malay Peninsula. On the other hand he tells us that the common name employed among the Portuguese for the plant is *gotte kelingan* or *gotte kelin*, probably because it was much cultivated on the Coromandel Coast, the inhabitants of which were known as *Kelin* or *Quellin*.

Coleus barbatus, another species found in Ceylon, is said to be cultivated in the Deccan for the sake of its fleshy roots which are pickled by the natives.

Mr. D. A. Chinniah read an interesting paper on "Cattle" at the Agricultural Improvement Society; the following are a few selections from it:—Feeding should neither follow nor be followed immediately by exercise. A large meal given when there is nothing in the stomach is apt to produce indigestion. The administration of food or medicine in a liquid form should be carefully done, as much harm may follow from careless drenching. If any attempt be made by the animal to cough, the head should be immediately let down. Owing to the fact that village-cattle are allowed to roam about at their will, the owners of the animals lose the manure which could otherwise be collected if the animals were confined within certain areas. This manure may go to enrich his cultivated lands and so enable him to secure better crops, or it may even be turned into money. Where litter is used for bedding, care should be taken that it is well dried before using. Damp litter may be the cause of ailments that develop serious results afterwards.

According to the *Melbourne Argus*, the firm of Messrs. Clarke & Co., of Elsternwick, Victoria, have succeeded in devising a very useful and, at the same time, inexpensive calf-feeder. The feeder consists of a tube about 15 inches long, at one end of which is fixed a strainer, while to the other end, which is bent, is attached an india-rubber teat. In using the feeder it is only necessary to place the bucket of milk on one side of a fence, and drop the strainer-fitted end into the milk, while the teat end is passed through a hole in a fence, and given to the calf, which may then be left to suck away at pleasure. There is a shield fixed to prevent the calf pulling the tube through a fence, and of course there is no possibility of the bucket being upset. Under this arrangement the calf feeds in a natural manner, inasmuch as the use of the teat excites salivation, whereas in drinking from a bucket, in the usual way, the calf gulps down a quantity of milk which it cannot readily digest. It is reported that several well-known farmers have adopted the feeder after satisfying themselves of its utility.

COLOMBO, JUNE 1ST, 1894.

No. 12.

“PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

WILLIAM RUDD, SENIOR:

PLANTING PIONEER; AND FOR MANY YEARS THE OLDEST OF CEYLON PLANTERS.

[Failing in our attempt to get a photograph or other portrait of Mr. George Bird, the very first Planter in Ceylon, it is some satisfaction to be able to present that of Mr. Rudd who began life as Mr. Bird's assistant. The biographical notice of Mr. Rudd is written by a relative, with a few additions and alterations.—ED.]

INTRODUCTORY.—The career of a Planting Pioneer like Mr. Wm. Rudd, whose first connection with coffee dates back into the early “thirties” or sixty years ago, could not fail to be of special interest, if the story could be related by one who had access to the records, notes, &c., that Mr. Rudd left behind him. The writer has had no such advantage, so that the sketch here presented of the vicissitudes of the forty-five years of Wm. Rudd's life in Ceylon is necessarily imperfect: but it is believed to be correct as far as it goes, and it will be found to afford a striking illus-

tration of the capricious moods of Dame Fortune. The colotype likeness has been engraved from a photograph taken by Messrs. W. L. H. Skeen & Co., Colombo, about twelve months before Mr. William Rudd finally left Ceylon for England. The correctness of the portrait will be at once recognized by those who remember him.

EARLY LIFE.—William Rudd was born in London on June 6th, 1812. His parents were of the county of Norfolk, and it was his misfortune to be left an orphan almost in his infancy. He was the younger of two brothers, of whom the elder John, many years older than the subject of this sketch, died at the age of 21. Of Wm. Rudd's early life much is not known. After receiving a very rudimentary

education, he was apprenticed in his youth at Maudslay's Factory and Iron Foundry where he received a thorough training as a mechanical engineer and fitter, and gained a practical knowledge of a branch of work, which, in after years, proved of the greatest utility to him as a colonist. He was at work in this factory when the Greeks were being aided by England to gain their independence (1827) and Maudslay's with many other factories had a busy time in the preparation of war material. In 1830 after the expiry of his indentures, he met his uncle, Mr. Henry Rudd, Seur., who had just returned to England after an absence of 20 years in Ceylon. He had been commissioned to obtain and bring out two stationary steam-engines for the Ceylon Government—one being intended for pumping water in Jaffna, and the other required for oil-mills in Colombo. Having been persuaded to try his fortune in Ceylon, Wm. Rudd left England with his uncle in the month of July 1831, and after a tedious voyage of six months round the Cape, landed in Ceylon on January 14th, 1832. Amongst their fellow-passengers on the voyage out, were old Mr. French Gray, and the mother of the late Mr. Marcus Vanderstraaten, Station Superintendent of Kandy.

IN GOVERNMENT SERVICE.—After working for a short time with his uncle, who had a Carriage Building Establishment* in the Pettah, Wm. Rudd was employed by the Government. He put up the steam-engine, which had been imported for use in Colombo, and subsequently had charge of a division of pioneers. He did not, however, remain long in the Public Works Department of the island, as he fell out with an official who wanted vouchers signed for a larger amount than was actually paid. It is devoutly to be hoped that this variety of official is now extinct. After leaving the service of Government, Wm. Rudd got charge of a Coconut-oil Mill belonging to Messrs. Ackland & Boyd, and it was by reason of his connection with this Planting Firm that he afterwards turned his attention to coffee planting—an enterprise at that time (1834) in its infancy in Ceylon. The commencement of his PLANTING LIFE being so nearly coincident with the start of the enterprise it may be interesting here to refer to the first planter—George Bird—the brother of Colonel Bird who was the Military Commandant at Kandy in the year 1823. Geo. Bird, who in his time had been a Cavalry officer, was a personal friend of the Governor, Sir Edward Barnes. He had opened and planted with coffee the Sinnepittia estate near Gampola, as far

*The building, an upstairs house overlooking the Pettah Burial Ground, still stands.

back as the year 1824; and about the same time Gangarooka, on the banks of the river near Kandy, was opened for the Governor, with Mr. W. S. Northway as Superintendent. The name of "Raja Totam" or Governor's estate, clings to this property to this day. Sinnapittia was not a success as far as coffee was concerned, possibly owing to the fact that Geo. Bird had no previous experience to help him. He was however a man of vast energy, great physical strength and indomitable pluck, and was not easily turned from his purpose. It may be as well here to quote from Mr. William Rudd's contribution to the *Colombo Observer* in July 1867:—

"Recollections of the early days of Coffee Planting by Wm. Rudd—the first Sinne Durai in Ceylon.—In December 1832 Mr. George Bird went to Kondesallie, in the valley of Doombera, to inspect the land in that neighbourhood to determine its eligibility for the cultivation of coffee and after a short time he applied to Government for a grant of the lands now known as the Kondesallie Coffee Estate. Land was then given away by Government on condition that the applicant should cultivate one-tenth of what he applied for, and this was the last land granted on those conditions, for very soon after, there arrived orders from England that no more land should be given away, and that in future all lands should be sold by public auction, at the upset price of five shillings per acre. Mr. Bird was put in possession of his land, and having made arrangements with a Mercantile House in Colombo, it was agreed that 300 acres should be at once put under cultivation under the superintendence of Mr. Bird.

"In 1834 Mr. Wm. Rudd joined Mr. George Bird as assistant, and during this and a part of the next year they planted to the extent of three hundred acres, while a house for the Superintendent was in progress and nearly completed. But the natives were extremely troublesome, driving their cattle into the cleared and planted lands, and thereby causing much trouble and loss. Tying up was illegal and no cattle trespass law existed in those days. The consequence was the cattle were driven out from the coffee fields to the grass lands, but only to be driven back as soon as an opportunity offered. This state of things could not continue and as a last resource the cattle (both black cattle and buffaloes) were shot. This engendered much ill-feeling between the Superintendent and the natives, and at last ended in serious consequences, for no sooner was the new house finished than the natives set it on fire, and it was quite destroyed. The Government offered £100 reward for the conviction of the offender, but he was never discovered. However, this offence had the effect of hastening the Government on with a Cattle Trespass Regulation, which when passed was considered satisfactory by all parties, and it is the same with little alteration that exists to this day."

About this time the Rajawella, Pallekellie and Degalla estates, in the Dumbara Valley were commenced and several new hands arrived from England. Wm. Rudd was later on joined by Charles Pitts and then by John Capper who was the oldest of the three. George Bird was their Peria Durai, and as an instance of his capacity for hard work, it may here be noted that he would think nothing of walking down from Peradeniya (where he had a house) to Kondesallie in time for morning parade. There were very few works on coffee planting at that date; but a translation of the excellent pamphlet by Laborie, the Frenchman, was in the young planter's possession and from it Wm. Rudd obtained many a wrinkle. Being a practical engineer and fitter he was able to build his first coffee-pulper himself. In after years he built several others. Wm. Rudd and Charles Pitts jointly bought a piece of land somewhat farther down the river than Kondesallie, and called it "Ballywhindle." It proved a failure for coffee. He also opened other land at Haragam in partnership with his uncle, Mr. Henry Rudd, who eventually took over the land and placed his eldest son, Henry, in charge, who, while here, contracted malarious fever which never afterwards left him altogether.

Although life at Kondesallie was rough and isolated for the young planters, there was also a bright side. Temptations were few, and game of all kinds was plentiful and close at hand. The romantic interest that attached to the novelty of the life, with the bright prospect which shone before them in the future, doubtless sustained and cheered the pioneers. In 1838, Messrs. Ackland & Boyd, who had the agency of most of the blocks of land then being opened as Coffee Estates, sent Wm. Rudd to the Balangoda district where he commenced work on St. Clements or Bombuwé, his earliest connection with this estate, of which any record is available, being in the month of May 1838, when he was drawing a salary of £8 6s 8d.

MARRIAGE.—In December of this same year he married Miss Otelie Prins, the daughter of one of the old Dutch residents who had elected to remain in Ceylon when so many of his relatives left for Batavia. Prins had by studying the English language qualified himself for the post of "King's Advocate Fiscal," which position he occupied in the early years of the British occupation of Ceylon. From January 1839 Wm. Rudd's salary was raised to £12 10s per month, and he settled down to a some-

what rough and isolated life in the wilds of Balangoda. Living was cheap enough as compared with modern times. Three half-pence (one fanam) would purchase two dozen eggs, and a full-grown fowl rarely cost more than threepence! Straw, for thatching purposes or for feeding cattle, could be purchased at the rate of 2,000 bundles for ten shillings. William Rudd was now an authority on the suitability of land for coffee. He had also gained a considerable topographical knowledge of the Kandyan country, and largely owing to his wife's kindly manner and treatment of the natives, he was on good terms with many of the Ratemahatmayas and other Kandyan headmen, people of considerable local importance at that time.

In 1840 Messrs. Ackland & Boyd thought that Wm. Rudd's experience and services could be better utilized in the Kandy District where the "wild rush" into coffee, of which Sir Emerson Tennent has given such a powerful description, had commenced. He says in an oft-quoted passage,—

"The Governor, and the Council, the Military, the Judges, the Clergy, and one half of the Civil Servants penetrated the hills and became purchasers of Crown lands. * * * The rush for land was only paralleled by the movement towards the mines of California and Australia."

In accordance with instructions received from Messrs. Ackland & Boyd, Bombuwé was given over to the management of Mr. A. Stephens at the end of April, 1840, and Wm. Rudd left the District, travelling to Kandy *via* Nuwara Eliya and seeing as much as possible of the hill country. Bombuwé was ultimately abandoned in the bad year 1848 with 12 cwt. per acre ripening on the trees.

On his arrival in Kandy, William Rudd was engaged by Messrs. Ackland & Boyd to open some land which had just been purchased by Jas. Swan on the Hantane range. This was the Galoya Estate, which takes its name from the large stream passing through it.

As there was no kind of suitable accommodation near his new charge, the Superintendent was allowed the sum of £2 5s a month as rent of a house in Kandy for his wife's occupation, and this amount was duly charged to the estate until a bungalow was built and ready for occupation in May 1841. [His eldest son was born in this year.] Work on Galoya was soon going on in full swing, with Mr. Dowdall as assistant. Nurseries of coffee were laid down and the first clearing of about 100 acres was planted during the South-West mon-

soon of 1841. A large nursery was made a little below where the Uplands Bungalow now stands, for at that time the 236 acres forming the Uplands Estate was a portion of Galoya and were considered too wet and cold for coffee!

The adjoining estate, Wattedodde (now called Haloya), was also opened by Wm. Rudd about this time, and while planting these estates there were several assistants working under him at different times. Dowdall was with him for a few months, then McGowan, Harding, Wright, Ondatjee, Capper, Webster, and Dunn who was subsequently a Cinnamon planter at Kadirane.

Galoya gave its first sprinkling of cherries, or maiden crop, in 1842 and the Superintendent was very anxious to have a fine sample of parchment to show. Having occasion to visit Amblamana, on the other side of the range, he rode off one morning after giving his assistant instructions to have some coffee put out to dry. On returning in the evening, during a heavy North-East shower, he found the coffee beans being washed off the barbacue. The Sinne Durai's explanation was:—"You did not tell me to take the coffee in, you only said to put it out." William Rudd often said that want of thought did more harm than the want of knowledge, and here was certainly an apt illustration of his favourite aphorism. The hero of this little episode was promptly sent back to Messrs. Ackland & Boyd who placed him under a stern master and he lived to become one of the hardest working planters in Ceylon. On Galoya there was a very large mixed labor force of over 200 Malabars and Sinhalese, some of the latter coming from Kadirane, Bentota and even Ambalangoda. The rate of pay was 7 pence per day and there was a general strike when the rate was reduced to sixpence, but the reduction was maintained in the face of all difficulties and work was soon going on smoothly again. In 1842, however, rumours of a rebellion caused a panic amongst the lowcountry Sinhalese who kept away for a considerable time.

The bungalow erected on the Galoya Estate was of a somewhat uncommon plan—the house being a perfect square, as affording the greatest amount of accommodation within a given area.

The site of this first bungalow (which has long since disappeared) was near the store and could be distinguished by some Sissoo trees* which had been planted about it. These were obtained from seed sent to Ceylon by the Agricultural Society of India. If these trees have not been destroyed, they should, after half a

century of growth, yield magnificent timber for fancy articles of furniture. The wood of the Sissú tree is of a dark brown colour mottled with yellow.

A note of some little interest is found under date of June 22nd, 1842, when Mr. Swan accompanied by Mr. Anstruther (the Colonial Secretary, and Mrs. Anstruther) visited the estate—"The first lady visitor to Galoya."

William Rudd had been drawing £400 per annum for the two estates, Wattedodda and Galoya, and resigned on intimation from Messrs. Ackland & Boyd that the salary was to be reduced to £250. At the end of July the proprietor's brother, Robert Dalgleish Swan, took over charge. He was at one time the owner of the Handrookande Estate which gave one year 17 cwt. per acre picked and despatched besides what was lost! The new Manager's assistant was John Gavin, a recent arrival, who was subsequently known as "Honest John," and whose portrait and memoir appeared in the April issue of this periodical.

Mr. Jeffery and Edward Francis, (generally known to his friends as "Pickwick") jointly owned the Hindoogalle estate. From them Wm. Rudd purchased the place. When originally formed into an Estate it was almost all chena land, but the new purchaser must have been well acquainted with the land as it was next to Galoya.

At this time, old Mr. Robb was living on Hindoogalle. He had come out from Scotland under an indenture to Mr. Jeffery, and Mr. Rudd having taken over the indenture by mutual agreement, Mr. Robb continued on Hindoogalle.

PROSPERITY.—On Hindoogalle Wm. Rudd prospered for some years. He bought other properties, some by himself, and others in partnership; some were profitably resold, and at one time his income from interest of money alone amounted to £2,000 a year. He had charge of the Kent and Ambokke estates in Matale in addition to others, and with his wife and family, there being now three children (1846), he lived on Hindoogalle in comfort and happiness.

The contrast was great between those days of comparative affluence, and the time when as a younger man just freed from his indentures, he started for Ceylon, being indebted to his uncle for the amount of his passage money, which he early in life repaid out of his earnings.

* *Dalbergia sissoo*.

ADVERSITY.—But this happy state of affairs did not long continue. In England the equalizing of the coffee duties in accordance with the new doctrine of Free Trade deprived Ceylon coffee of the advantageous position it had held for about twelve years. The result was so disastrous to those who had expended large sums in Ceylon that it was no wonder there was a strong feeling that the new legislation was a breach of faith with that portion of the public who had sunk £5,000,000 in the coffee enterprise, relying on the Protection afforded by the differential duties. Money was so scarce that everything came to a standstill.

Those whose properties were mortgaged were sold up, in many cases the estates going for 25 per cent of the amount they were mortgaged for, and in others they were sold for a few pounds.

Plantation coffee was sold in London for a trifle and locally parchment went as low as 3 shillings per bushel.

Wm. Rudd suffered with the rest. He assigned his estates and paid twenty shillings in the pound and it was always a source of proud satisfaction to him that he had avoided the Bankruptcy Court. There is no doubt that in many instances he threw away his property in land to satisfy clamorous creditors. Winding-up his big estate and meeting all claims in full was a long and wearisome process, and eventually left him very badly off. Being in Colombo when the news of the so-called local "Rebellion" reached him, he had not even the means to get back upcountry where his wife and children were, at Hindoogalle. He walked from Colombo to the estate (over 70 miles, the place being 9 miles from Kandy on the Deltota road) in 24 hours with his gun on his shoulder, and followed by a lowcountry Sinhalese servant, who pluckily kept up with his master, but died a few days after from the effects of the journey. During the Rebellion Wm. Rudd received a bullet wound from a rebel; but beyond leaving a deep scar for life, he suffered no inconvenience. A grey Pegu pony was also fired at and wounded, but lived through it all and worked for many years after.

Hindoogalle was bought by Henry Rudd, Scnr., for £600. In 1851, he gifted the property to Wm. Rudd's children and appointed the father Trustee. In the meantime the estate had been abandoned and Wm. Rudd with his family resided at Ambokke in the Matale District.

He returned to Hindoogalle in 1852 and again commenced to work up the old coffee land. He leased Galoya from Messrs Swan and Keir, the terms being that he was to

give them one-fourth of the crop. The place, of course, had been almost abandoned during the bad times. After Robert Swan left, it had H. Ackland, Stephen Darley, and Tom Dixon in succession as Superintendents.

Hindoogalle during this time was brought into a very high state of cultivation, chiefly by means of pig manure, a very large number of pigs being kept on the estate and fed during a portion of the year on boiled jak fruits. This fruit was very plentiful as there had been 5,000 jak trees planted on the estate when it was first opened.

In 1856 being driven to Colombo by ill-health and a stay there being needed for thorough recovery, Wm. Rudd took temporary charge of the St. Sebastian Mills for Messrs. Ackland & Boyd. In February 1857 he was severely tried by the loss of his wife. She left him with a family of 7 children, the eldest of whom was about 16 and the youngest about 3 years of age. In 1858 the substantial bungalow that now stands on Hindoogalle was completed and this year he also purchased the Pettiagalla and Bombuwé estate in Balangoda, which had been abandoned for the last ten years. In 1858 with a view to enabling himself to take a trip to England he leased the Hindoogalle estate to Mr. Sam Thwaites for £1,000 a year, but the lease had to be cancelled. In 1860 after an absence of nearly thirty years he returned to England. While there he married Miss Berry of Huddersfield, Yorkshire, and returned to Ceylon in July 1861. Soon after their return his wife purchased 236 acres of the upper or North-West portion of Galoya from Mr. Lee Viner for £1,000 and this was called "Uplands." Felling was commenced almost immediately and about 60 acres were planted in 1862. In 1864 Messrs. H. C. Bird & Son, who had a heavy claim against Wm. Rudd and a mortgage over Hindoogalle, wished the account closed, with the result that the property passed into the possession of Mr. Price for £4,300. Wm. Rudd now retired to Uplands and began to make a home again. The bungalow he built here is a most substantial structure with stone walls. His wife had become a confirmed invalid, she lingered on till January 1866 and died at Maligakanda. A curious experience may here be related illustrative of the danger of delay, in matters where title deeds are concerned. In 1868 the Mercantile Bank gave instructions to Mr. Geo. Fernando, Auctioneer of Kandy, to sell a block of 188 acres of land in Matnura, of which the Bank had the deeds. The land was knocked down to the bid of Wm. Rudd for about £72, and the deeds with the auctioneer's receipt,

and instructions about the transfer were handed over to a Colombo notary in large practice. Through some lapse or other the matter was left uncompleted, the Notary died, and when his papers were looked through the deeds were found and returned to the Bank. The management of the Bank in the meantime had changed hands and the land was again privately sold! This land is now the Woodcote Estate. This was not the only instance of the kind. In 1847 Wm. Rudd bought and paid for 300 acres of land in Kitoogalle from J. C. Albrecht, but probably owing to the troubles which followed soon after, he never interested himself any further in the purchase.

MORE TROUBLE.—Expenses attendant on the education of some of his children in England were a severe drain on his resources and to add to this a trustee who held Railway and Bank shares in trust for his wife in the North of England failed, and by some one's fraud several thousands of pounds' worth of stock were lost to the lawful owner. Wm. Rudd now bought that large tract of land known as the Morankande and Udahena estates (1869); but the failure of a local firm to help him to meet (according to arrangement) the instalments as they fell due, resulted in the loss of both these properties. In 1870 the Uplands estate was sold, and bought by the mortgagee, Mr. A. H. Fryer for £3,500, and thus after forty years' hard work the pioneer planter was homeless and almost penniless.

However, by the aid of his cousins, the Messrs. Rudd Bros. he now purchased the Coldstream estate, in Ambagamuwa, from Messrs. John Whyte and Wm. Bissett for £6,500. Just about this time there was a boom in the value of coffee land, and the bargain was hardly concluded when it was considered very lucky for the purchaser, although there was a time when nothing would have induced Wm. Rudd to venture into Ambagamuwa in search of coffee prosperity.

In June 1873 Wm. Rudd married his third wife, Miss Adelaide Smith, from Lancashire. He sold to his son, Mr. Ralph Rudd, that portion of Coldstream north of the river for £5,500. This was distinguished by the name of Ivanhoe. For some time he continued to work

Coldstream, but his health was now very indifferent.

THE END.—His wife having preceded him by some months, he finally left Ceylon on the 6th of June 1876, his 65th birthday, and on his arrival in England he took up his residence near Exeter. Here on the 29th March 1877 he died, leaving in England his widow and daughter. Just previous to his death he had sold all his interests in Ceylon to his son, Mr. R. P. Rudd.

Wm. Rudd was a man of broad views, somewhat reserved and stern, and of great mental and physical vigour. In his early days in Ceylon, he endeavoured as far as time and circumstances would permit him, to remedy the defects of his education and as soon as he was able to afford it, he constantly supported a free Press and later on when his superior knowledge of the Central Province carried weight, he frequently wrote for the press.

Of his children who at present survive him, Mr. John Rudd is the Superintendent of Police S. P., Mr. Ralph Rudd, who purchased Coldstream and Ivanhoe and other places, but who could not tide over the depression of short crops and leaf disease of the early "eighties," left Ceylon 12 years ago for Victoria with his younger sister, and they are now in Melbourne, where he holds the post of chief clerk to the Melbourne Harbour Trust. The youngest son, Mr. Benjamin Rudd, is the Manager of the Kiri-metiana coconut plantation in the Chilaw District, the property of Mr. Frederick Schrader.

It will be seen from the foregoing that Mr. Wm. Rudd, beginning his planting career as an assistant to Mr. Geo. Bird, in 1834, continued for 42 years in active work as a coffee planter, during which time his career was marked by all the vicissitudes of fortune which distinguished the enterprise itself; but all through, Mr. Rudd won himself the reputation of being an honest, industrious and upright Englishman—a good intelligent planter—the friend of many and the enemy of none.

Mr. Rudd had his spice of humour and could tell a good story as well as act the hero in one: his brief but expressive report on a shuck coffee estate has often been quoted:—"All whips and walking-sticks!"

TEA GROWING IN THE UNITED STATES.

Consul E. H. Rawson-Walker has forwarded a report to the Foreign Office on his Experimental Tea Farm at Summerville, a suburb some twenty miles distant from Charleston, which owing to the climatic conditions of that part of the State of South Carolina, gives promise that great success will attend the cultivation of the plant in question. It appears that Dr. Shepard started experimental tea gardens at Summerville, South Carolina, which have been carried on very successfully, and from a report he has made to the Agricultural Department at Washington, Mr. Rawson-Walker makes the following extracts:—

From this report it would appear that the first tea plant in this section of the United States was planted by the French botanist, Michaux, 1804, at Middleton Barony, on the Ashley River, distant some 15 miles from Charleston. With it was planted out the first representative of its cousin, the *Camsia Japonica*. Dr. Shepard states that he saw the former tree a few years ago, and that it had grown into a small tree, about 15 feet in height, while of the latter there were many specimens fully twice as tall.

The publications of the United States Patent Office and the United States Department of Agriculture record the results of many subsequent attempts to inaugurate an American tea industry. It would appear that repeated failure has not checked the ardour of those engaged in these experiments. The little patches, and, in some instances, large gardens, which have resulted from these attempts, have produced tea of fine flavour, although very generally devoid of that strength of infusion which appears to constitute a most desirable quality for many tea-drinkers. It may be presumed however, that this failure in pungency was largely due to defective curing, and especially to inadequate rolling of the leaf in consequence of which the cup qualities were not fully developed. So far as is generally known, it remains for the National Department of Agriculture to begin, about ten years ago, the first serious attempt to produce American commercial tea on a scale sufficiently large to arrive at a decisive result. Various causes contributed to the total abandonment by the Government of the gardens which it had established at great expense on a plantation called Newington about a mile distant from Pinehurst Farm, which also constituted a part of the same large estate.

The present experiment owes its undertaking to the belief that the previous trials to produce tea in the United States were arrested before reaching definite conclusions—that more careful cultivation and preparation, which might be the result of a lengthened local observation, and the subsequent production of a higher class of teas might reverse the generally entertained opinion that, as an industry, the cultivation of tea in this country must always prove a failure; and that, if successful, this new field for agricultural enterprise would furnish a wide and comparatively easy out-door employment for many who are unequal to those rougher operations, whose accomplishment under a summer's sun can be borne but by few in this climate.

It needed only the announcement of the revival of tea experiments in this country to excite the liveliest interest and assistance for the undertaking. The United States Department of Agriculture has generously borne a considerable part of the expenditure for procuring consignments of tea seed from Asia. The Department of State has kindly issued orders to its Consuls at the tea ports to obtain these samples, and the foreign representatives of the United States Government have spared no efforts to secure the best quality of seed.

QUALITY OF TEA PRODUCED AT PINEHURST FARM.

During the past summer of 1893 some of the Pinehurst plants were sufficiently advanced to warrant picking the leaf. The great majority of them had been raised from seed in 1889 and planted out that autumn; a limited number were a few months older. They belong to the Assam hybrid variety, *i.e.*, the cross between the Assamese and Chinese sorts, and

come from stock that had been thoroughly acclimatised by probably 30 years' growth in this country. The plants had been systematically "topped" with garden shears, and afterwards carefully pruned with a knife during the winter of 1891-92, and throughout their growth had been carefully cultivated and generously manured—they covered small areas on various soils, *viz.*, under-drained pond and high swamp, the slope of a clay-hill, and a flat, sandy pineland. So free had been the artificial enrichment of all these plants that no material difference in the quality or quantity of yield were observed. It was designed to test by these first experiments whether commercial tea could be raised at all. The results for picking and curing such leaf as appeared to be suitable for manufacture, and might be spared without impairing the subsequent luxuriant development of the plants, are given in a report by the United States Secretary of Agriculture, dated November, 1892, as follows:—I wish to say that we are much pleased with the samples. A sample was sent to a travelling agent of a large tea firm in Detroit for his judgment, advising him as to where the tea was produced. He took the tea to his store, and without giving them any information with regard to the same, it was tested by two of the leading members of the firm, each making a separate test—they pronounced it very excellent English breakfast tea, and as I recollect claimed that it was better than any breakfast tea they had in the store or at least equally good, and when the information was given them as to the place of production, they were very much surprised and wished to know if any considerable amount could be purchased.

Mr. Gilbert Gil, of Martin, Gilbert & Co., Baltimore, Maryland, also pronounced it equal to the best high grade English breakfast tea, and superior to many grades that come from Indis and China.

YIELD OF TEA.

The Pinehurst plants were set out at a greater distance than is the practice in the East, with the object of substituting cultivators and ploughs drawn by mules for hand labour and the spade. After making due allowance for this difference and for average vacancies (where plants have died), and thus estimating the production by the same number of plants, we find the average of the Pinehurst gardens for the past season to have reached about 37½ lbs. of cured tea per acre of the earlier "flushes," purposely very little was picked of the midsummer ones, we were careful to confine the pickings to the smallest leaf and in the autumn we had at least one abundant flush that was permitted to remain on the bushes—in other words, the standard production as laid down by Colonel Money, the expert in tea planting, might readily have been attained. Indeed, in view of subsequent events, it would have been better to have picked the late (October) flush, as probably thereby we might have prevented the florescence of the plants with all its attendant drain on the resources, and subsequent entailed cost of picking off the incipient seed, in order to prevent the yet further exhaustion of the bushes by its full development through the next season. But we will assume that the Indian grower exercises as much care with his own gardens, and we will rest our case on the actual figures submitted. The results at Pinehurst are all the more gratifying, as they were obtained on plants exhibiting great difference in form and luxuriance of growth and flushing—the seed from which they sprang had been brought from India long before the inauguration of the recent successful attempt to raise the grades of those teas by a judicious selection of seed, and most careful cultivation. From the gardens now being established at Pinehurst, and in consequence of the great care bestowed on their composition, it is hoped to obtain much finer teas in the future.—*L. and C. Express*, April 20.

BANANA FLOUR.

As British Central Africa is emphatically a land of the Banana or at any rate of the variety called the plainain, the following extract from Mr. Stanley's

book "Darkest Africa" may be useful as drawing attention to an important and valuable source of food supply hitherto neglected in this part of Africa. The Banana that Mr. Stanley here refers to, is what we call the plantain, the long and large variety of the cultivated *Musa*, not the short and very sweet kind ordinarily known as the banana:—

"For the first time we discovered that the Awamba, whose territory we were now in, understood the art of drying bananas over wooden gratings, for the purpose of making flour. We had often wondered, during our life in the forest region, that natives did not appear to have discovered what invaluable, nourishing, and easily digestible food they possessed by the plantain and banana. All banana lands—Cuba, Brazil, West Indies—seem to me to have been specially remiss on this point. If only the virtues of the flour were publicly known, it is not to be doubted but it would be largely consumed in Europe. For infants, persons of delicate digestion, dyspeptics, and those suffering from temporary derangements of the stomach, the flour, properly prepared, would be of universal demand. During my two attacks of gastritis, a light gruel of this mixed with milk, was the only matter that could be digested."—*Central Africa Gazette*.

SOME INDIAN TEA COMPANIES' ESTIMATES FOR 1894.

KETTELA TEA COMPANY.—Outturn was 1,650 maunds and the average obtained was close on 9 annas net. A net gain of R10,044 was made. After adjustment a balance of R8,624 remains at credit of profit and loss. A dividend of 5 per cent is recommended which will leave R1,124 to carry forward. Estimate for the current year is 1,700 maunds of fine tea for a total outlay of R59,500.

HOPETOWN TEA COMPANY.—Outturn was 657 maunds and average realised 9 annas a lb. Revenue account is R4,782 to the good and after adjustment in profit and loss account R3,559 is available. A dividend of 3 per cent is proposed which will leave R559 to carry forward. The estimate for the current season is 650 maunds for a total outlay of R24,500.

KORNAFULI TEA ASSOCIATION.—Outturn was 4,407 maunds. All route invoices were sold in Calcutta and London fetching about same averages in both markets—6.4 net per lb. Result of working is a gain of R3,610. Profit and loss account is R5,833 at credit which will be carried forward. Estimate for this year is 4,475 maunds for a total outlay of R1,48,000 which includes cost of putting out 30 acres of new tea.

IRINGMARA TEA COMPANY.—Outturn was 1,820 maunds and average realised 5.8 per lb. Revenue account is R1,446 to the good. By issue of 6 per cent preference shares for R40,000, funds are provided for extensions now going on. Profit and loss account is R2,862 at credit. Estimate for current year is 2,100 maunds at a garden cost of R47,634 exclusive of Calcutta charges, which are not expected to exceed 1½ anna per lb.

KUNLAI TEA ASSOCIATION.—Outturn was 2,154 maunds and average realised 5.5 per lb. Revenue account is R3,721 to the good. In adjustment profit and loss accounts is R4,517 at credit. A dividend of 21 per cent is proposed. The estimate for current year is 2,500 maunds for a total outlay of R54,632.

SINGOLO TEA COMPANY had a record year for outturn, having obtained 9,176 maunds for which 9.6 per lb. was realised. There was also an income of R19,216 from tea seed. Revenue accounts is R1,27,369 to the good and profit and loss is R1,31,282 at credit. The proposed dividend of 10 per cent will absorb R1,20,000. Estimate for current season is 10,300 maunds for a total outlay of R3,60,000. It is also expected to obtain 400 maunds of tea seed and realise R50 per maund.

CUTLACHERA TEA COMPANY.—Outturn was 2,117 maunds and realise in London the equivalent of 5 annas a lb. The season's working shows a profit of R1,384 which is carried to profit and loss account. Estimate for the current year is 2,200 maunds for a total outlay of R52,368.

MANABARRIE TEA COMPANY.—Outturn was 3,901 maunds and average realised was 5.6 per lb. The years' working resulted in a profit of R11,869. The balance from last account and R3,360 realised more than estimated on the 1892 crop, bring up the sum at credit of profit and loss to R21,279. A proposed dividend of 7 per cent will absorb R14,000. In current year it is estimated to spend R88,497 and obtain 3,900 maunds of finer plucked tea than heretofore.

ELLENBARRIE TEA COMPANY.—Outturn was 3,439 maunds and average realised 5.11 per lb. Net income was R18,966. An interim dividend of 5 per cent was paid and a final of 7 is proposed, which will leave R6,730 to carry forward. Estimate for this year is 3,250 maunds for a total expenditure of R81,930.—*Pioneer*.

COCA-GROWING IN NEW YORK.

A fine specimen of the true *Truxill's* coca is reported to be in full bloom in the green houses of Pitcher & Manda, at Short Hills, N. J., near New York City. The flower is attracting the attention of the medical botanists, and Dr. H. H. Rusby, of the New York College of Pharmacy, is quoted as saying that though not yet ready to concede it to be a distinct species, he is rather more inclined to that theory after observing this plant in bloom.—*Chemist and Druggist*.

A USEFUL PLANT.

Do any of our readers know a plant called "*Adhatoda Vasica*?" A decoction makes a good insecticide and fungicide—and is well known in Bengal as a medicine for coughs. Writing to a contemporary a correspondent says, that the crushed leaves rubbed over the hands and face, entirely drives off mosquitoes—which is a tip worth knowing. Mr. Bamber says the plant is largely used on the Bombay side by natives for killing insects in the soil by merely throwing the leaves about before irrigation. It is described by Major Drury in his "Useful Plants of India," as known in English, as the "Malabar Nut" and in Tamil as "Adatoday" and is common in the Peninsula. It is a shrub 8 to 10 feet high, and leaves opposite, lanceolate, flowers on short spikes terminal.—*Nilgiri News*.

INDIAN PATENTS.

Calcutta, April 19.

Applications in respect of the undermentioned inventions have been filed during the week ending 14th April 1894.

Mosquito Blight.—No. 125 of 1894.—Charles Graham Hannay, of R'mai Tea Estate in the district of Lakhimpur Assam, Tea Planter, for the prevention and cure of "Mosquito Blight."—*Indian Engineer*.

A GOOD ADVERTISEMENT!

A planter sends us the following cutting from a home paper:—

"I think invalids prohibited from tea-drinking generally might venture without risk upon a cup of Teen Wo Chang's Ceylon Pekos Fannings, a tea which differs from the ordinary samples, inasmuch as it is composed of the siftings—which blend, devoid of any roughness in taste, is mild yet full of flavour. Although so fine, the tea will not come through into the cup if a strainer—such as is provided by the importer, Teen Wo Chang, of 36 and 37, Mincing-lane, E. C., in each sample tin—be used. For eighteen-pence a tin of 1 lb. of tea will be sent free, including strainer."

CEYLON MANUAL OF CHEMICAL ANALYSES.

A HANDBOOK OF ANALYSES CONNECTED WITH THE INDUSTRIES AND PUBLIC HEALTH OF CEYLON FOR PLANTERS, COMMERCIAL MEN, AGRICULTURAL STUDENTS, AND MEMBERS OF LOCAL BOARDS.

By M. COCHRAN, M.A., F.C.S.

(Continued from page 730.)

CHAPTER XII.

SUGAR, HONEY, SPIRITUOUS AND MALT LIQUORS, WINES.

SUGAR—UNREFINED SUGAR—COMMERCIAL SUGARS—HONEY—TABLE OF ANALYSES OF HONEY—STRENGTH OF SPIRITUOUS LIQUORS—WHISKY—RUM—BRANDY—GIN—ARRACK—MALT LIQUORS—UTAKAMAND BEER—TABLE OF ANALYSES OF MALT LIQUORS—TABLE OF ANALYSES OF WINES.

Sugar.

Sugar is prepared in Ceylon at Baddegama from the juice of the sugarcane, *saccharum officinarum*; but I have not seen any analyses of the locally-prepared article.

The following is an analysis I made for the Ceylon Customs of a good sample of unrefined sugar, imported to Ceylon:—

Analysis of Unrefined Sugar, imported to Ceylon.

				per cent.
Moisture	2.60
Sucrose	94.80
Glucose	2.00
Insoluble matter12
Ash16
Undetermined32
				100.00

I add a table shewing the composition of the chief sugars of commerce:—

TABLE OF ANALYSES OF COMMERCIAL SUGARS.

(From Allen's Commercial Organic Analysis.)

Description of Sugar.	Sucrose.	Glucose.	Insoluble matter.	Ash.	Water.	Organic matter not sugar.	Authority.
RAW CANE SUGARS.

Treacle	32.5	37.2	3.5	23.4	3.5	do
BEEET ROOT :						
Molasses, average	55.	trace	12.	20.	13.	J. H. Tucker.

Honey.

The ordinary honey of commerce is a saccharine substance collected by the bee (*Apis mellifica*). In Ceylon, according to Tennent, "Bees of several species and genera, some divested of stings, and some in size scarcely exceeding a house-fly, deposit their honey in hollow trees, or suspend their combs from a branch. A gentleman, connected with the department of the Surveyor-General, writes to me, that he measured a honey comb, which he found fastened to the overhanging branch of a small tree in the forest near Adam's Peak, and found it nine links of his chain or about 6 feet in length, and a foot in breadth, where it was attached to the branch, but tapering towards the other extremity. It was a single comb with a layer

"of cells on either side, but so weighty that the branch broke with the strain."

I have not seen any analysis of Ceylon honey, but Allen has collated analyses of commercial honeys by Brown, Sieben, Hehner, Bell and Hassall which I reproduce :—

Analyses of Honey.

	J. C. Brown.	E. Sieben.	O. Hehner.	J. Bell.	A. H. Hassall.
	per cent.				
Dextrose	31.77 to 42.02	22.23 to 44.71

Strength of Spirituous Liquors.

By the sale of Food Amendment Act 1877, the following were fixed as the lowest limits of alcoholic strength at which spirits could be sold:—

Whisky }
Rum } 25 per cent under proof.
Brandy }

Twenty-five per cent under proof is also the lowest legal strength for the sale of arrack in Ceylon. For gin the lowest limit is 35 per cent under proof.

Whisky.

The fermented infusion of barley, wheat, corn or other grains yields, by distillation, a spirit called whisky. Such spirit may vary in strength from 25 per cent under proof to 58 per cent over proof, or may contain from about 43 to 90 per cent of alcohol by volume. The term whisky in a more restricted sense is applied to this spirit when the strength is about proof or a little over. It should contain about 50 per cent by weight, or 58 per cent by volume of alcohol, which corresponds to about 1.6 per cent over proof.

Rum.

The strength of commercial rum varies from the legal limit of 25 per cent under proof to 35 per cent over proof. It should contain from about 50 to 70 per cent by weight, or 58 to 77 per cent by volume of alcohol.

Brandy.

The fermented juice of the grape yields, by distillation, the spirituous liquor called brandy. The best brandy comes from France, and inferior qualities from Portugal, Spain, Italy. As received from the vine farmers, brandy is of a strength 20 per cent over proof. The strength at which it is sold varies, but usually it is about 10 per cent under proof. It is rarely met with in the market over proof strength. The amount of alcohol present varies from 45 to 55 per cent by volume. According to Battershall the strength may even reach 60 per cent by volume.

Gin.

The strength of gin should be from 35 per cent under proof to 9 per cent under proof, or should contain from 37 per cent to 52 per cent by volume of alcohol.

Arrack.

The name arrack has been given not only to the spirit distilled from toddy, the fermented sap of the coco palm, but also to the spirit manufactured from molasses, rice and toddy, which might be more appropriately termed rum. The strength varies from 25 per cent under proof to a little over proof.

Malt Liquors.

There is a branch of the Murree Brewery Company, Limited, at Nuwara Eliya; but I have not seen any analyses of the malt beverages brewed there; the following, however, are analyses of the beer brewed by the same Company at Utakamand, by Dr. T. H. Ross, B.S.C., acting Chemical Examiner, Madras, and dated 29th January 1892:—

Analyses of Utakamand Beer.

Number of Sample.	II. F.	III. P.
Original gravity	1059.82	1060.3
Specific gravity	1012.14	1012.37
Extract gravity	1021.02	1021.02
Absolute alcohol by volume per cent	6.48	6.55
Acidity as acetic acid per cent0867	.0765

I add a table shewing the analyses of malt liquors brewed in various other countries as England, Scotland, Germany and America. I also give a table of analyses of wines by various authorities, both tables being from Dr. Battershall's work "Food Adulteration":—

Table of Analyses of Beers collected from Analyses of various Chemists by Dr. Battershall.

	Specific gravity.	Carbonic acid.	Alcohol by weight.	Extract.	Albuminoids.	Sugar.	Dextrine	Acid.	Ash.	Phosphoric acid.
	per cent.	per cent.	per cent.	per cent.	per cent.	per cent.	per cent.	per cent.	per cent.	per cent.

CASSAVA MEAL AND TAPIOCA.

Next to rice and sago, there are but few food products of a similar character that have such an extensive use as tapioca. And notwithstanding the enormous quantities that are produced, and the cheap rate at which it is sold in the English market, but little is generally known as to its origin and preparation.

Two distinct plants, though closely botanically allied, furnish tapioca; they are *Manihot utilissima*, Pohl. known as bitter cassava, and *Manihot apii*, Pohl. the sweet cassava. The plants are natives of Brazil, where they are extensively cultivated, the bitter cassava especially, for the sake of the starch which is contained in the freshly tuberous root, and which forms commercial tapioca. It is also largely grown in West tropical Africa, as well as in the Straits Settlements. It is a half shrubby perennial, with large leaves deeply divided into from three to seven segments. The tuberous root often grows to a very large size, weighing many pounds, and containing a poisonous milky juice. The plant is known under a great number of varieties, differing in the colour of the stems and the division of the leaves. The roots of the bitter kind are said not to become soft by boiling or roasting, while

those of the sweet cassava, though very tough in the centre, become soft by the application of heat; so that after being roasted or boiled, they are eaten in a similar manner to potatoes.

Besides tapioca, the cassava root furnishes several other valuable food products, as cassava meal and cassareep. In one of the monthly numbers of the *Bulletin of the Botanical Department of Jamaica*; these products and their uses are thus referred to. Cassava meal is prepared from both the sweet and bitter sorts, the root is grated, by which the cells containing the juice and starch grains are broken up, the grated material is placed under pressure, sometimes with water pouring through it. The pressure squeezes out all the juice, while a certain portion of the starch grains passes over with the liquor. The substance left under pressure consists chiefly of the cell walls broken up, but also of some starch grains. This is cassava meal, which is dried on hot plates, and made into cassava cakes. The liquor which passes away under pressure being the pure juice only, or the juice mixed with water, which is allowed to stand for some time, when the starch settles to the bottom, and the liquor is poured off. The starch grains, as seen under a microscope, are mullar shaped. This is cassava starch proper, as distinguished from cassava meal. Tapioca is prepared by heating moistened cassava starch on hot plates. This process alters the grains, which swell up, many bursting, and thus they agglomerate in small irregular masses.

Cassareep is the juice of the bitter cassava root, concentrated by heat, which also dissipates the volatile poisonous principle. The same is further flavoured with aromatics. Boiled with peppers, and fish or meat, it forms the West Indian "pepper-pot."

Cassareep is an article of import into England. It is a thick, black, treacly-looking substance, and forms a component part of most table sauces.

The following details for preparing cassareep, tapioca, and cassava cakes may be found useful:—"Grate the cassava and squeeze out the juice, which is to be put aside for about three days; add one part of fine salt to every twelve quarts, and then boil down, until it becomes like syrup. If it is intended for long keeping, it must be boiled thick. Put aside in jars till required for bottling."

To prepare tapioca, "grate the cassava, wash it, by putting in a cloth, and pouring clean water on it till settled, and the water at the top is quite clear. Decant the water, leaving the starch at the bottom; wash again with clean water, allow it to settle, and pour off the water. Take up the starch in lumps and put it to quail a little in the sun; then mash it up fine and sieve it. Put a large baking iron on the fire, and bake it in cakes, not too thick. The iron should not be too hot, as the cakes must not be baked brown. Then dry well in the sun, and beat in a mortar, coarse, or fine, as required. If sieved, it will give two qualities, fine and coarse."

For making cassava cakes, the cassava should be grated, and well squeezed, but not washed. After squeezing, let the lumps dry very slightly in the sun. Beat on a mortar and sieve. Bake on the iron, thin or thick, according as the cakes are required. —*Journal of the Society of Arts.*

TEA IN THE AUSTRALIAN BUSH.—This is how Mr. Inglis describes tea as provided for Australian bushmen—shepherds, cattle-keepers, &c., &c. :—

The national beverage, tea, was supplied abundantly, but chips, planks, sticks, faggots, stakes, barge poles, any word of similar import would better describe it, than the word leaves. An infusion of a crow's nest, would give a fair imitation of it.

The proverbial expression for such tea is "posts and rails." As yet our Indian and Ceylon teas are scarcely known in the bush. We have only got the trade for 12 million lb. British-grown tea against 18 million China stuff, taking all Australasia into account.

* These figures denote the weight in grammes of the ingredients in 100 c.c. of the time; otherwise, percentages are expressed.

RECENT INVESTIGATIONS AND IDEAS
ON THE FIXATION OF NITROGEN
BY PLANTS.

Three totally different, though convergent, scientific controversies have arisen during the latter half of the present century concerning the *role* played in nature by nitrogen, as met with in the air, rain, and soil, free or combined, in connection with the ordinary plants of agriculture and forestry; and quite apart from their real relations to one another, these three controversies have at times been somewhat confused in their issues.

One of these controversies turned on the question of the transformations of combined nitrogen, as met with in the forms of ammonia, nitrites, and nitrates, and as organic compounds of nitrogen resulting from the decomposition of the remains of living beings—plants and animals—in the soil. The outcome has been the proof that oxidations and de-oxidations of these compounds are intimately bound up with the physiological activities of living organisms; especially bacteria, in the soil; the investigations of Gütay and Aberson, and Wicogradsky's brilliant researches especially, have brought what had long been regarded as purely chemical problems into the domain of biology. "Nitrification" and "de-nitrification," to use the current terms, are phenomena incorporated with those of fermentation, respiration, &c., and therefore involve biological science for their elucidation.

Another of these controversies turned on the question whether the free nitrogen which forms so large a proportion of that huge gaseous ocean, the atmosphere, can be again directly employed by green leaves, and built up as combined nitrogen in plants; or whether, once having been disengaged from organic and other compounds, and passed into the air as gaseous nitrogen, it is for ever lost, except in so far as electric discharges and other energetic physical and chemical processes force this relatively inert element into combinations, which the rain then brings down as inorganic salts, and so help to restore the balance of nitrogenous substances in the soil.

This controversy, a long and involved one, started and for some time continued as a peculiarly chemical question, has passed through various phases and branched out into several subsidiary controversies, if we may so term them.

Thus the alleged "fixation" in the soil, especially investigated by B. Thelot and Andre, became a scientific question apparently on definite lines of its own, and (so far as any such question can be independent) independent of the question whether ordinary green-leaved plants, such as peas, lucerne, wheat, &c. can assimilate the free nitrogen of the atmosphere by processes more or less comparable to those by which they are known to assimilate the carbon they wrench from the carbon-dioxide of that gaseous environment.

The latter question, again, became a divided one, chiefly owing to assertions that green leaves could directly assimilate the ammonia, if not the free nitrogen, of the air, and some time was occupied in arriving at the conclusion that ordinary green plants do not directly assimilate or fix either the gaseous ammonia or the free nitrogen of the atmosphere. This conclusion, in opposition to that arrived at by Ville, was regarded as so thoroughly established by the experiments of Bausungult and of Lawes, Gilbert, and Pugh, that it has been definitely accepted and taught for many years—and rightly so, from the evidence to hand.

The third of the three controversies referred to at the outset, is the more recent one concerned with the question whether certain of the higher green-leaved plants, particularly those known as leguminous plants (such as peas, beans, clovers, vetches, lupines, robinia &c.), when living as they normally do in symbiotic association with certain micrococci and essentially parasitic fungoid organisms which invade their roots, are differently placed from other green plants as regards the power of "fixing" and assimilating, the free nitrogen of the atmosphere.

The present position of opinions on this last and most remarkable controversy is the subject of this article, so far as it can be done justice to in the short space at disposal.

It is now well known that leguminous plants are normally found to have certain nodosities or swellings on their roots, and that these swellings are caused by the activity of certain minute organisms which, as the writer of this article first proved, invade the roots from outside, after the manner of a parasitic fungus. The controversy as to the exact nature of these organisms—bacteria, according to Prazmowski, Beyerinck, and others, degraded allies of the *Ustilaginæ*, or some lower fungus, according to my observations, and the confirmatory evidence of Laurent—in no way affects the truth that these organisms do not kill the plants attacked, or even make them diseased, but incite them to more active life for a time. The evidence on which these organisms (termed "bacteroids") have been taken to be bacteria—their growth in gelatine tubes staining, and their minute size—is equally in favour of their being lower fungi, and is not sufficiently conclusive. Eventually the nutritious contents of these nodules, with the symbiotic "bacteroids," are absorbed, in whole or in part, by the leguminous plant, and their rich stores of nitrogenous material assimilated by the latter.

The experiments of Hellriegel and Wilfarth, of Lawes and Gilbert, and of others and myself, placed it beyond reasonable doubt that, taking the leguminous plants and its symbiotic organisms together with the pot of soil in which it is grown as a closed system, this system contains more nitrogen at the end of several weeks than can be accounted for by the nitrogen in the soil and the sand at the commencement of the experiment; and this was true in cases where careful precautions were taken to prevent the addition of any nitrogen further than the free nitrogen of the air. The only legitimate conclusion was that somewhere, and somehow, the system fixes free nitrogen from the air.

This matter has been since carried further, however, by Laurent and Schloësing, who, by growing various plants in an air-tight apparatus under such perfect control that they could analyse the quantity of nitrogen both in the plant and soil, and in the purified air, showed that the gain of nitrogen in the former during the progress of the experiments, is balanced by a corresponding loss in the latter. They further showed that only two kinds of plants could thus "fix" the nitrogen of the air. These are leguminous plants, and certain lower algae (perhaps mixed with bacteria) or allied forms. This fixation only occurs under certain definite conditions, moreover. The leguminous plants must be infected with the symbiotic "bacteroids," and the algae must be exposed freely to the air and light in the apparatus: even a thin layer of the sterilised sand employed sufficed to stop the action of the algae.

Laurent and Schloësing found no fixation in the case of artichoke, oats, tobacco, mustard cress, or any other plants experimented with; and their experiments, taken as crowning the edifice of evidence accumulated by them and numerous other observers, have been fairly regarded as proving that leguminous plants, at any rate, and perhaps certain lower algae, do somehow "fix" the free nitrogen of the atmosphere and assimilate it.

Koch and Kossowitsch have recently claimed to confirm the above results of Laurent and Schloësing with algae, and it should be mentioned that Frank had previously stated that such fixation by lower cryptogams occurs. Unfortunately we are as yet uninformed what species of algae are exactly concerned here, and no one has cultivated them pure and confirmed the results.

It will be noticed that, so far, all that is established is that the infected leguminous plants, and the algae of sorts, *plus* the known soil (usually sterilised sand to which known additions are made), somewhere and somehow gain in nitrogen at the expense of the free nitrogen of the atmosphere.

Now come the other aspects of the controversy, which raging chiefly around the question as to exactly where and how this gaseous nitrogen is fixed.

Obviously several possibilities could be suggested.

(1) The gaseous nitrogen could be conceived as directly fixed by the plant which gains in nitrogen—as absorbed by the protoplasm of the living cells exposed to the air—e.g., the cells of the leaves of the leguminous plant, or those of the algae on the surface of the soil. This view is actively maintained by Frank and a few supporters, who go as far as is possible in this direction, and really again raise the old question which originated with De Saussure, and was rightly regarded as refuted by Boussingault and Lawes and Gilbert.

(2) The gaseous nitrogen could be conceived to be fixed in the soil by means of bacteria or lower algae (we have seen these are left indefinite), and, when it has been converted into nitrogenous compounds of some kind in the soil, eventually absorbed by the roots of the leguminous or other higher green plant in the ordinary course of events. The principal champion of this view is Berthelot, who claims to have proved that certain soil-bacteria, and also the organisms of the leguminous root-nodules, have the power of fixing the free nitrogen of the air, and so enriching the soil in nitrogenous compounds. In this connection, of course, the whole question of nitrification and de-nitrification in the soil will no doubt be involved with the question of the fixation of free nitrogen from the atmosphere.

(3) The fixation of the atmospheric nitrogen could be conceived of as a powerful act of the machinery of the leguminous plant, urged to the necessary expenditure of energy by the stimulating action of the symbiotic organism in its roots. This view, held especially by Hellriegel, Prazmowski, and others, is also shared by Frank, who believes that it is only in their being thus stimulated to greater activity that the leguminosae differ from many other plants, which, he says, also fix the atmospheric nitrogen directly, but to so much less an extent that the experimental proof of their power to do it is far more difficult.

(4) Another possible view is that the root-organisms act merely as accumulators of nitrogenous material, which has been derived from atmospheric nitrogen fixed and combined in the soil, by physical or chemical processes, or in the open ground by the action of soil-organisms; and the leguminous plant benefits by devouring (if we may employ this word) the bacteroids eventually, and profiting by their stores of nitrogenous material.

Let us now take these four possibilities in order, and examine them a little more in detail.

The first view rests almost entirely on the statements of Frank, of Berlin, who brings forward a number of experiments which in his opinion show that many higher plants, in addition to the leguminosae, are capable of directly assimilating the free nitrogen of the atmosphere. For instance, Frank gives results showing that oats, buckwheat, spurrey, turnips, mustard, potatoes and Norway maple are all capable of fixing atmospheric nitrogen.

Most of Frank's experiments were made in the open air, the pots of plants being simply sheltered from rain; but in some cases, he affirms that he got positive increase of nitrogen with mustard-plants under bell-jars, properly shut off from the outer air, and through which purified air was drawn.

Apart from these latter, and in spite of Frank's assertion that the quantities of combined nitrogen in the air are so immeasurably small that they may be neglected, it seems fair to object that, in the present state of science, we cannot trust experiments in the open air to decide such a point; while, with regard to the experiments with mustard, it must not be forgotten that not only the old results of Boussingault and Lawes and Gilbert are entirely and emphatically opposed to them, but the exceedingly careful recent experiments of Schloesing and Laurent, made with all modern appliances and methods, showed the contrary—no signs of fixation of nitrogen could be obtained in oats, tobacco, cress, mustard,

cabbage, spurrey, and potato, the very plants Frank used.

Frank replies that completely normal plants cannot be grown under such closely covered glass vessels as these experimenters use, but he accepts their positive results in all cases. Frank's contention is that the plants must be very vigorous, and near its maturing point, before it has power to economically seize and "fix" the atmospheric nitrogen; but (without denying that it is possible that the utmost vigor may not be as yet attainable under the conditions necessary for culture in closed glass receptacles of limited capacity) it is impossible to overlook the danger that in experiments in the open air, the time which must necessarily elapse before Frank's critical period of maturity on the part of the plant is reached, is long enough for all sorts of disturbing influences to come in, especially if any kind of "fixation" in the soil, such as Berthelot asserts, really occurs; the root-hairs would take up, and the plant absorb, nitrogenous bodies as fast as they were formed in the soil around them, while there would be ample time for the development of many generations of micro-organisms in the medium.

In view of the tenacity with which the belief in a direct absorption of atmospheric nitrogen is cherished by many foresters and agriculturists, it seems imperative that critical experiments should be persevered in; as matters stand, we cannot accept Frank's position as proved, or even as rendered probable.

The possibility mentioned above as an explanation of the danger of accepting Frank's results would be rendered a certainty if the recent researches of Laurent and Schloesing, Koch and Kossowitsch, and Berthelot, in part supporting earlier statements by Frank himself, turn out to have been properly interpreted.

Laurent and Schloesing—and their results are confirmed by Koch and Kossowitsch—declare that sterilised sand, devoid of nitrogenous material, when covered with a growth of certain green and blue-green algae, probably mixed, however, really does "fix" the atmospheric nitrogen, and gains in nitrogenous compounds, but only if the algal growth is freely exposed to the atmosphere in the closed chambers employed. These statements confirm earlier, but less definite, experimental results by Frank; and the latter has recently expressly stated that certain fungi—e.g., *Penicillium cladosporeoides*—can flourish in a medium to which no nitrogen but that of the atmosphere has access.

Berthelot goes further, and claims to have established that several species of soil-bacteria and fungi, including the fungoid organism of the leguminous tubercles cultivated separately, can "fix" free nitrogen; and if the analyses of the small quantities of materials in his flasks survive the criticism of the chemists, it seems difficult to refuse credence to the views he puts forward; but, as in most of these cases, it is the enormous difficulties of analyses which lie at the root of the matter.

Moreover, different observers differ considerably on this question. Beyerinck, while regarding it as probable that the nodule-organisms "fix" atmospheric nitrogen, admits that he does not prove it; and in Laurent's special investigation into this question, he left it also uncertain; while Immendorf failed to satisfy himself that these organisms can flourish without organic compounds of nitrogen; and Frank insists that they do not thrive at all without organic nitrogenous food-materials. Moreover, it must not be overlooked that other observers, e.g., Gautier and Drouin, have given evidence pointing to possible phenomena of "fixation" of nitrogen by compounds of iron and other substances clinging to particles of the sand employed, which may interfere with the accuracy of conclusions drawn from experiments where sterilised soil in the open air is concerned.

When we reflect how very minute these organisms are, and what excessively small quantities of nitrogen they need for their life-purposes, we cannot be surprised at the difficulties met with in these investigations. But, however far from proved we may

regard the question of fixation of free nitrogen by soil organisms, it is perfectly clear that here is a most pressing question for further experimental research, and agricultural and forest practice are alike keenly interested in having the question definitely answered.

The third possible view—that the leguminosæ are able to force free nitrogen into combination with other elements, owing to the energetic action of their protoplasmic machinery stimulated by the symbiotic fungoid organism—deserves more consideration than may at first sight appear, especially to those who are not familiarised with the remarkable phenomena of symbiosis generally.

In the first place, the fact that leguminous plants amply provided with the root-nodules do "fix" the atmospheric nitrogen under conditions in which the same plants devoid of the nodules fail to increase their supplies of nitrogen, is far better established than any of the other cases discussed, and must now be accepted as proved by the experiments of Frank, Hellriegel, myself, Lawes and Gilbert, and especially by the recent splendid investigations of Laurent and Schlessing.

It is true that Frank says the symbiosis is not absolutely necessary for the fixation to proceed, but even he declares that the leguminosæ are stimulated to greater powers of nitrogen-fixation by the nodule-organisms.

A curious and significant confirmation of the symbiosis theory comes from the experiments of Nobbe, Schmid, Hillner, and Hotter, who find that *Elaeagnus* plants, the root of which develop nodules due to the invasion of a fungus totally different from the one causing the leguminous nodules, also "fix" and assimilate the free nitrogen of the atmosphere, as shown by their growing and flourishing much better and more rapidly than *Elaeagnus* plants side by side with them, but not infected with the root organism. It will be interesting to see if further research shows similar results with any of the physiologically similar root outgrowths, due to very different fungi, met with in *Taxodium*, *Podocarpus*, *Alnus*, *Juncus*, and many other plants including some vascular Cryptogams.

Now comes the question, in what part of the leguminous plant does the actual "fixation" of the free nitrogen occur? Frank stands practically alone in claiming the leaves to be the organs concerned. Nearly all other observers regard the roots as the region, and the nodules themselves as the actual seat of fixation.

Kossowitsch has even attempted the heroic task of deciding between leaves and roots, by enclosing the former or the latter respectively in airtight receptacles, shut off from the non-enclosed parts, in which gases devoid of nitrogen were circulated. He could not always keep the apparatus perfectly gas-tight, however, and this and other failures met with in these exceedingly difficult experiments, undoubtedly weakens the force of his conclusions that it is in the roots and not in the leaves that the process occurs, though it does look as if the balance of evidence obtained fairly support his conclusion so far as it goes.

There are facts, however, to be gathered from the microscopic analyses of the root-nodules, as furnished by myself and others, which have been in great part overlooked in the discussions on this subject, and which, although not conclusive, seem to support the view that the seat of fixation may be in the nodules themselves. For instance, the nodules are supplied with a regular system of conducting vascular bundles, communicating with those of the roots; then their cells, during the period of incubation of the symbiotic organism, are abundantly supplied with starch; further, the cells in which the fungoid organism is vigorously flourishing are evidently exceedingly active, as may be deduced from their large size, brilliant nuclei, protoplasm, and sap-vacuole, all of which show signs of intense metabolic activity, lasting for considerable periods. The fact that the sap expressed from these active tissues is alkaline, has been interpreted as in accordance with Löw's suggestion that the living protoplasm, in

presence of an alkali and free nitrogen, can build up ammonium nitrite, or some similar body. Be this as it may, there can be no question as regards the infected nodule-cells being centres where intense physiological activity is going on; and it seems impossible to avoid the conclusion that the vascular supplies from the roots into the nodules bring to these cells water in which various salts, carbohydrates, &c. are dissolved, and carry off from them the soluble products of metabolism.

Presumably these products of metabolism include nitrogenous bodies.

In the ordinary course of events, theory teaches that these nitrogenous bodies—*e.g.*, amides, produced by simpler compounds—are built up by the machinery of the ordinary living cell-protoplasm from carbohydrates and nitrate, the energy necessary for the metabolism being derived chiefly (if not entirely) by the oxidation of part of the carbohydrates supplied.

This constructive metabolic work of the protoplasm is an act which we cannot explain in detail. We can only dimly perceive that it must be due to some remarkable power the protoplasm possesses—and in virtue of which it is an illimitable machine much more economical in its actions than any apparatus we can construct—of so packing the atoms and molecules of the nitrate, carbohydrate, water, &c. with which it works, that they are enabled to undergo movements into which we cannot as yet force them in the laboratory.

The whole matter seems to depend on some particular mode of presentation of the atoms and molecules concerned; and we can see no further than that this can be done in the living cell, because the protoplasm is a suitable engine for thus bringing the combining elements into the necessary positions in space.

Now, if this is so, there seems no exclusion of the possibility, at any rate, that the cell-machinery may be so stimulated into greater activity that it can even force the notoriously inert nitrogen molecules, properly presented, into combinations with other molecules, resulting in the production of nitrites, amides, or similar bodies in ascending order.

The whole matter no doubt revolves itself into some such question of a properly adopted engine sufficiently supplied with energy. The matter seems capable of explanation, in some degree, if we remember that carbohydrates and oxygen are present in abundance; the real difficulty is with the machinery, for we cannot as yet picture the exact construction or working of such an engine, as physiologists nevertheless impels us to suppose the cell-protoplasm must be.

It may be remarked, by the way, that the likeness of the living protoplasm to an engine, in the sense implied, may hold good whether the former is an "emulsion," in the sense of the defenders of that hypothesis, or a "structure," in the sense of those who refuse the emulsion hypothesis.

The fourth of the possible views as to the means by which free nitrogen becomes available to the leguminous plant, however, reminds us that, although the evidence points to the stimulated leguminous plant as the best established example of one capable of doing this work, there are other possibilities.

Berthelot's recent instance that certain soil-bacteria can fix free nitrogen, taken with Frank's, Laurent and Schlessing's and Koch and Kossowitsch's experiments, make it impossible to deny that the above hypothesis as to the powers of the protoplasmic machinery may apply to the cells of some lower organisms, without symbiosis coming into play at all. The remarkable facts brought to light regarding sulphur-bacteria and iron-bacteria by Winogradsky, and the still more unexpected results this observer obtained with nitrifying organisms, show that the machinery of the cell can avail itself of sources of energy undreamt of by earlier observers. If, by the oxidation of sulphur or sulphuretted hydrogen, or of lower iron-compounds, or of ammonia, certain of these organisms can obtain the energy necessary to act going machinery capable of so presenting other molecules of the elements they take up to one another that organic compounds result, it is by no means inconceivable that, at the cost of

carbon-compounds which they oxidise powerfully, the necessary energy can be obtained to force even free nitrogen into combinations.

It is equally conceivable that in the case of the leguminosæ, the symbiotic organism is really more of a parasite (it is necessarily a parasite in some degree) than is assumed in the third view, and that, at the expense of the carbo-hydrates so richly furnished to it by the host plant, the fungoid organism alone supplies the machinery for forcing the nitrogen into combination, and that when it has stored up relatively large quantities, owing to its activity in the incubators—the root-nodules—provided for it by its host-plant, and is diminishing in resisting power, the latter at length turns round and absorbs the stores.

The chief objection to this view is that the gains in total nitrogen seems to be greater than would be thus explained, unless the organisms in the soil outside the roots are also fixing free nitrogen.

Such then, put too shortly as regards the numerous experimental facts, are some of the chief ideas agitating the scientific world on this question, a question which, be it emphatically stated, promises to be of more importance to agriculture in the future than any legislation as to prices, &c. that we can conceive; for if it turns out that the acquisition of free nitrogen by the land, or what amounts to the same thing, the plants growing on it, can be economically promoted, the farmer and forester may have the control of sources of real wealth not yet dreamt of. Unquestionably there is an enormous amount of careful and very difficult experimental work to be done before we arrive at the solution of the various vital questions raised; but the astounding results obtained during the last decade by a few earnest workers promise brilliant results in the future.

—*Nature*.

H. MARSHALL WARD.

CACAO BEETLE.

Several young trees, recently pruned, were a short time since attacked very severely at several points by the larvæ of a beetle, especially near where the cuts had been made. As soon as they were discovered, I had them searched out from beneath the bark, where they had eaten a winding channel about the depth of one-eighth of an inch to some three or four inches in length. We had not suspected the presence of these beetles in the Garden until the larvæ were discovered attacking the trees, or we should have used the mixture recommended at page 20 of my work on "Cacao" for application to wounds. This was afterwards applied to the wounds made by the knife when cutting out the larvæ, and has been quite successful in rapidly healing them up, as well as preventing a successive attempt of the beetle to lay its eggs again at the seat of injury. Trees afterwards pruned had a coating of the composition placed on the surface of each cut, and no attack of beetle followed. It would appear, therefore, that the beetle readily avails itself of the injury done by pruning and lays its eggs, in the cavity formed by the drying of the bark at the edge of a wound, but if the wound is covered with a composition similar or identical with that recommended, there need be little fear that the beetle will attack the trees at pruning time. It is both possible and probable that these beetles are able to pierce the skin or bark of a tree for the purpose of laying eggs; but the known habits of the animal point to the fact that it prefers an accidental crevice for the purpose rather than perform the work of preparing one by its own exertions. It appears to be clear, therefore, that the application of a suitable dressing to all wounds, is one which the planter in his own interest should always adopt, especially where it is known that the beetle is present in some numbers. As we had only the larvæ, and did not wish to allow it to mature for the sake of young trees (which were being grown for an experiment), we could not determine the name of our animal, but in appearance the larvæ resembled the form known as common to the Longicorn class of beetle which have long

been known as enemies of the plant. The dressing used is simply Coal Tar mixed with Yellow Clay to the consistency of a thick paint. This should be applied with a paint brush to all wounds on branches or stem while still fresh.

SISAL HEMP.

Some four years ago plants of *Agave sisalana*, var. *sisalana*, were introduced to this Colony from Florida, and the major portion of these were distributed to planters. The plants have grown well and have proved that our climate is quite capable of producing a fine class of fibre. A specimen manufactured from plants grown at the Gardens was sent to the Chicago Exhibition where it received an award, after an examination by Mr. Dodge, the "Fibre Expert," attached to the United States Department of Agriculture.

The plant proves itself to be superior to anything of the kind hitherto cultivated for the purpose of manufacturing a fine class of vegetable fibre, and if found profitable, might be readily cultivated in the various districts of this Island. Although only four years old the plants are now giving leaves, and consequently fibre, over six feet in length, specimens of which can be seen at the Gardens at any time, or at the convict Depot, where, on the poorest description of soil, it has succeeded beyond expectation. An easy means of decorticating this plant and producing clean fibre is as follows: Procure two strong hardwood sticks about one inch in diameter, and two feet in length, and make them perfectly round. Bore into a tree or post at a convenient height to the worker, two holes, close together, to receive the ends of these sticks, and the apparatus is complete. The Operator commences by dividing the leaves to be operated upon into strips from the centre of the leaf to the point. These strips he places successively one at a time between the two sticks, holding the unsplit or upper portion of leaf in the right hand, grasping the two sticks with his left and drawing the leaf with the right hand, the epidermis and cellular matter is removed and the clean fibre only is left. When the half of the leaf is finished, the fibre is tied up in a loose knot to be taken in the right hand, and the lower portion of the leaf is treated in the same way as the upper. The knot is then untied, the fibre washed in water to remove the gum (which would otherwise discolour it) and then hung up to dry. In this way a workman who is "smart" will make 6 to 8 lb. of dry fibre per day with less waste than with some of the highly-recommended machines.

In Nicaragua "The Sisal" is grown at nearly every door, and all the rope and hammocks of the country are manufactured from the fibre derived from its leaves. The leaves are cut a few at a time from below upwards until the plant reaches six or eight feet of clean stem. Fibre-making to the Nicaraguan, seems to be more of a recreation than a toil, whole families—men, women and children—assisting in the operation.

I have given the particulars of the process to Mr. Meaden of the Convict Depot, and I doubt not that in his hands it will have as fair a trial as it has already had at the Gardens from which I am able to strongly recommend the process as simple, effective, and much more economical than many of the machines costing £40 or £50 each. Of course it is not recommended that such a method would be practicable except for home use.

J. H. H.

INDIA-RUBBER is said by a German technical paper to be coming into favour in the Fatherland as a covering for house floors and stairways, in place of carpets and floorcloths. A coat of beton is applied to the floor, and the rubber, cut into pieces one metre square, is laid upon it. The edges are united by caoutchouc cement, and thereafter form one continuous piece.—*India Rubber Journal*, May 8.

COFFEE LEAF DISEASE IN COSTA RICA.

The cultivation of coffee bids fair to come to an end, if not all over the world, at least in all those countries whose chief staple it has hitherto been. Ceylon was almost the first of these to succumb, Java followed and Brazil was only able to exist so long by the vastness of its reserves. In Costa Rica the diseased foliage of the coffee plant is now assuming the acute stage, and it remains to be seen whether science—having the experience of Ceylon and other countries as a guide—will be able to check and arrest the spread of the disease. So far, the able scientist, "Adolpho Tonduz," appointed thus early in the appearance there of the attack by the Costa Rica Government, is of opinion that "fire" only can arrest the spread of the contagion. He says in his preliminary report: "it would be imperative to take energetic measures to prevent its propagation, destroying by fire the first centre of infection, as the only method of getting rid of the millions of spores, which, endowed with a wonderful vitality, only need a favourable opportunity to germinate and propagate themselves." This was our case in Ceylon, and it may have been that had those central parts of Madulsima where it first appeared, been ruthlessly fired and destroyed, the disaster which overtook us might have been averted, or at least long delayed; but who can tell? Mr. Donald Reid did, indeed, keep a force of coolies collecting and burning the affected leaves, but a more wholesale application of the devouring element was essential, had the rest of Ceylon been alive to its danger. The fungus attacking the Costa Rica coffee is pronounced by Mr. Tonduz to be not *Hemileia vastatrix*; and—so far as science is concerned—it is as well to note the distinction; but inasmuch as its life-history is pretty much the same and is followed by the same dire effects, it can only be a variation in the type. "Its spores are carried by the wind till alighting on the healthy leaves, it penetrates into the interior by the stomata, and produces filaments which spread among the cells. Exteriorly a light brown spot is noticeable, but the fungus continues to spread, and soon there appear, on the interior surface, certain filaments whose apex bears the reproducing organs." For a full translation especially made from the Spanish by Mr. A. M. Ferguson for the *Tropical Agriculturist* of this valuable report, see next column.

In speaking of *Hemileia vastatrix*, Professor Tonduz says: "it caused in 10 years a loss of 12 to 15 million pounds sterling to the producers of coffee in the island of Ceylon. But notice that I mention it as the unique example of a parasitical fungus, and that, happily it cannot be compared to the fungus which attacks our coffee here." So much the better for Costa Rica. But the producer will not quarrel with the scientist on this point, if only the impending danger is fully recognised in good time. Professor Tonduz says: "the sick plants appear as vigorous as their unscathed neighbours," but so did the affected trees in Ceylon appear for the first and second years. "But," he goes on to say, "on examining them more nearly I found the ground covered with fallen leaves whose surface was spotted with greyish spots. A great number of cherries also spotted, lay on the ground." This also agrees with our experience in Ceylon; and, therefore, it is we fear that coffee in Costa Rica is doomed by the attack of a fungus even if it be not our own *Hemileia vastatrix*. Speaking of the planter, Prof. Tonduz says: "In all countries and at all times the planter has never had much faith in the investigations of botanists, and especi-

ally of cryptogamists. The rustic needs a powerful stirring up of his intellect to cause him to comprehend that in the immense family of the fungi the number of the minute ones is greater than that of the larger kinds, that the harmful surpasses the innocuous, &c. One old planter told me that the disease had always existed in the country." We will close our notice of a Report which will repay perusal in full, with the foregoing quotation as it seems to have a practical bearing upon ourselves, at this time, when we find "leading planters" opposing the appointment of an Entomologist for Ceylon.

COFFEE LEAF DISEASE IN COSTA RICA.

[Translated by A. M. FERGUSON for the "Tropical Agriculturist."]

National Physico-Geographical Institute.

BOTANICAL SECTION.

Information regarding the Coffee Disease; by Adolfo Tonduz, Chief of the Botanical Section of the National Physico-Geographical Institute 1893. San José de Costa Rica, Central America, Government Press.

To the Minister of Public Instruction.

SIR,—In your letter No. 34 of 31st August last, you did me the honour to ask me for some detailed information regarding a disease from which the Coffee-shrubs of Costa Rica are suffering this year. Having just returned from a botanical exploration of the valley of Tuis, I occupied myself with the subject without more delay, and examined with the greatest care the two enclosed leaves which accompanied your note. The preliminary essay, which I have submitted to your honor's illustrious consideration divides itself into two parts: the first refers to my own observations and the conclusions which are derived therefrom: the second is a resumé of what I have been able to gather from other sources relative to the diseases of Coffee in general.

I.

From the commencement of my investigations, I recognised the absolute necessity of studying the disease in the very locality of its development. With this object I visited a great number of Coffee estates of different ages, varieties and exposures, in all the environs of San José. The disease was generally prevalent, but almost always in an isolated or sporadic condition, without ever affecting the adjoining bulk of the estate. Neither did I meet with withered or much injured Coffee bushes whose morbid condition could be attributed to the disease.

I noted that, in the majority of cases, the bushes most virulently affected were those which were situated in dense shade, under large trees of *poro aguacate*, *cuajiniquil* or of very umbrageous plantains. Likewise the plantations made on the shady borders of water-courses appeared to me specially affected.

The disease presented itself under the following aspect:—In reality, the sick bushes were found isolated, as having just been affected, or, at the most, in groups of twos or threes. Near the station of the "Iron Cartwheel" only did I [see a Coffee estate in which whole lines were affected. The sick plants appeared as vigorous as their unscathed neighbours, and the majority were in fruit in spite of it. But, on examining them more nearly, I found the ground covered with fallen leaves, whose surface was sprinkled with greyish spots. A great number of cherries, spotted, also lay on the ground. The diseased stem hardly shows any healthy leaves, except such as are at the top, in which nevertheless the plague is not with at the period of their development. The new branches, whose thickness varied between that of a feather and that of a pencil were also spotted with the same blackish-grey coloured signs and had already lost part of their leaves and fruit.

I pulled up several sick bushes with the view of minutely examining their roots. All, from the largest to the smallest rootlets, proved healthy and without a trace of any alteration.

Consequently, the disease is located in the overgrown parts of the Coffee-tree and principally in its leaves.

Such are, in a few words, the results of a microscopical examination of hundreds of infected stems. The spots on the leaves vary in number, shape, size and colour. Some leaves showed only two or three spots, others were literally covered with them. The spots generally take a circular or oval shape, semi-circular or semi-oval when they encounter the margin of the leaf: in rare instances they possess an irregular contour. Their dimensions vary from scarcely the tittle of a millimetre to eight or nine millimetres in diameter. The colour changes from brown to gray and white, and these shades correspond to the difference in the age of the disease. The distribution of the spots in each leaf is irregular: all the parts of the lamina were equally infected.

The spotted branches are the sprouts of the year: the spots are met with in the internodes as well as in the junction of the leaves.

The infected berries are at times isolated, at other times numbering two or three on each bunch. As the peduncle is almost always diseased, it is easily understood that an affected cherry quickly falls.

The microscopic examination of the spots, whether of the branches, of the leaves, or of the cherries, demonstrates that all depend upon one and the same disease. For greater clearness, I take as the object for examination a spotted leaf, with the naked eye, or better with a good lens, in the two faces of a spot circular concentric spaces are to be noted, for the most part with a wonderful regularity at a distance of one millimetre. Moreover, and this is the chief point in the diagnosis of this disease—there are to be seen in the two, though more generally in the upper, superficies of the spotted leaf, thin, white and erect threads of one to four millimetres long, and terminating in a cupola of a yellow olive colour. The spots on the branches and on the cherries also show these same germ-bearing threads.

The disease, then, appears to owe its origin to a parasitic fungus, of a contagious and epidemic nature.

All the pathological characteristics, then, noted above, are of easy explanation by the morphology which I know of these little destroyers of so many other vegetables.

The spore (seed) of the fungus, whether carried by the wind, by the rain, or by whatever other means, and deposited on the surface of a healthy leaf, or on other parts of the plant liable to be infected, penetrates into the interior by the stomata and produces filaments which spread among the cells of the parenchyma. This is the first phase of its development, and of the proto-mycelium and of the mycelium. Exteriorly only a light brown spot is noticeable, the result of the first disintegration of the parenchyma. But the fungus continues to spread, and soon there appear on the exterior surface certain filaments (*hyphæ*), whose apex bears the reproductive organs (*conidia*). Then the fungus has run through the various periods of its life and perishes, after having scattered a prodigious number of spores. In the leaves the spots become transparent: the tissues invaded by the parasite die and disappear leaving a hollow in the lamina.

It is necessary to make a short digression here: In the investigation of the cryptogamic diseases that attack cultivated plants, it is most important to ascertain whether the fungus is the cause or the consequence of the disease, or as we say, whether it is parasitical or epiphytal. The following examples will explain the difference that exists between the two groups. For a long time past higher fungi belonging especially to the genera *Agaricus* and *Polyporus* have been observed on the trunks of the Coffee-trees. These fungi live upon the detritus of the bark of the old stems and of the lichens and mosses which clothe them; but they possess their

own and independent life, and the Coffee-tree only serves them as a *substratum*, for support. Such funguses are epiphytal, and cause no internal disorders in the Coffee-tree. On the other hand, there exists, in some regions of Tropical Asia, a microscopic fungus, which produces in the leaves of the Coffee yellow spots, which spread in concentric rings and end up by hastening the fall of the leaf. This organism is the *Hemileia vastatrix*, and has caused in 10 years a loss of 12 to 15 million pounds sterling to the producers of Coffee in the island of Ceylon. This fungus then affects disastrously the existence of its supporter, the Coffee, and causes its destruction: it is a parasite. Notice that I mention it as the unique example of a parasitical fungus, and that, happily, it cannot be compared to the fungus which attacks our Coffee-tree, and of which this communication specially treats.

On weighing that sentence, it is not enough now-a-days to assert that such and such a fungus is parasitical, simply because of its mode of living and of the injuries it causes: the scientific proof is needful.

This can only be established by means of sowing the spores of the fungus upon a healthy leaf of a Coffee-tree, itself also completely healthy. I undertook this delicate experiment, inoculating the disease, with which we are occupied, upon a robust shrub of Coffee, cultivated in the garden of the Government Observatory. At the time of writing these lines, I have nevertheless not been able to verify the results: but directly the characteristic spots appear upon the infected parts, we can hold ourselves convinced of the favourable termination of the experiment, and for that matter of the parasitical nature of the fungus.

This experiment will also have another advantage that must not be despised, and that is, to convince the practical man of the true cause of the devastation. In all countries and at all times the planter has never had much faith in the investigations of botanists and especially of cryptogamists. The rustic needs a powerful stirring up of his intellect to cause him to comprehend that, in the immense family of Fungi, the number of minute ones is greater than that of the large kinds, that the harmful surpass the innocuous, and that amongst these destructive parasites some attack even our poor humanity. All these ideas are with difficulty explained to the masses, and consequently it is absolutely necessary always to proceed with due caution. It so happened, in the course of my investigations, I had an opportunity of talking with an old planter, who assured me that this disease had always existed in the country. In that case, Mr. Minister, we can repeat the old saying *Nihil sub sole novum* (nothing new under the sun), and console ourselves. But I hasten to say that in the same Coffee-trees, I met with disturbances other than that whose study you have commissioned me with, that these display certain marks of antiquity, and that they could easily be confounded with the latter. Thus, the other disease revealed itself by blackish spots in the leaves, whose superficies attained to 1 to 2 square centimetres. Between the epidermis and the parenchyma of such leaves, I discovered a caterpillar and a deposit that gives its colour to the spot. This disease is rarer, and I have not found a single Coffee-tree seriously damaged by it. Other leaves were covered with a light ferruginous film, especially along the length of the nerves. In others again, the cuticle was clothed with a grayish deposit that also attacked the cherry. I was not able to discover the cause of these alterations. I also verified in the Coffee-trees the presence of numerous insects, without being able to decide whether it was accidental or whether they were true enemies of the bean. The most frequent amongst them are the *Acarides*, the *Aphides*, and the ants. Finally, I have very often seen leaves whose limb appeared partially burnt. It might well happen that drops of water should, under a fierce sun, act as burning-glasses and produce the above-

mentioned blisters, but this accident must be of very rare occurrence.

Only as a reminder would I here mention the epiphytal plants, such as the *Peperomia*, the ferns, the mosses and the lichens which are commonly met with on the stems of the Coffee-trees without occasioning any injury.

The woody parasites of the family of *Loranthaceae* have seemed to me very exceptional on the Coffee-tree and the damage they caused of no consideration.

Turning now to the fungus, which I suppose to be the cause of the chief Coffee-disease in Costa Rica, I confess that my microscopical investigations have had to be most superficial. I saw at a glance that with the scanty resources at my command, the identification of the parasite would be altogether impossible. Consequently, I deemed it preferable to make numerous preparations of the infected branches, leaves and berries, with the object of sending them to specialists in phytopathologia, to whom the diseases of the Coffee-tree would be familiar. On the other hand it has been perfectly impossible for me to ascertain whether there existed in botanical literature documents which treated specially on this subject, and, if I had gone on with the micrographic study which I had undertaken, it would have been to have risked doing, superficially and badly, a work which, perhaps, had been completed with dispatch and perfection in some other country.

With such an idea, I abstain altogether from any attempt at a systematic identification of the said fungus, and moreover I make once for all express reservations concerning a possible case of *Heterocelia*.

I do not possess any precise dates referring to the appearance of this disease in Costa Rica, and yet I fear that its invasion is recent, and that the planters confound it with others more ancient and less destructive. Now-a-days and in consequence of the considerable increase in commercial relations between the various countries, the propagation of diseases of all sorts is more than ever to be feared. And, in a climate like that of Costa Rica, cryptogamic epidemics are immediately invested with a character of exceptional gravity, for they meet with a medium excessively favourable to their development: the alternations of intense heat and torrential rains appear as though ordained for the very purpose. It is also necessary not to forget that the Coffee is here an acclimatised plant, debilitated by high cultivation and offering to infectious agencies a resistance much weaker than one living in its own country and in a wild state.

In case the Coffee disease should end in causing great injury to Costa Rica—an event we cannot yet foresee—it would be imperative to take energetic measures to prevent its propagation, destroying by fire the first centres of infection. This is the only method of getting rid of the millions of spores, which, endowed with a wonderful vitality, only need a favourable opportunity to germinate and propagate themselves.

Yes: unfortunately these prophylactic means might be illusory; I should then take to curative measures.

Henceforth I consider myself to be in a position to be certain that, if the disease is located in the leaves and branches, I could combat it at the very outset, by applying the processes which modern science has popularized in the analogous cases of other cultivated plants.

I now interrupt these few notes on my own observations, Mr. Minister, soliciting your kind authority to follow out this examination only barely outlined here. I should wish, in the first instance, to be placed in communication with some specialists with the object of elucidating the classification of this fungus and of acquainting myself with all that has hitherto been done in relation to the diseases of Coffee. It would be absolutely necessary also that the botanical library of our Institute should be enriched with the principal works treating of the natural and pathological history of the Coffee-tree. Finally, it is evident that in order to make a general study of the disease in the country,

it would be necessary to take journeys through the entire zone of the cultivation of the shrub, and also to be possessed of sufficient leisure. Under these conditions alone could I prepare the detailed information which you required of me, and the plan of which I submit beforehand for your illustrious approval.

I. The History and Etiology of the Coffee-disease in Costa Rica.

II. Causes of the Disease. The Fungus parasite. Its classification, description, cultivation and development.

III. Seat of the disease. Branches, leaves, fruit. Nature of the alterations produced.

IV. Propagation of the disease. Resistance of the Coffee-plants according to their variety, age, exposure, the soil and climate.

V. Importance of the injuries caused by the disease.

VI. Measures preventive and curative. 1. Preventive. Destruction of the contagious organisms. 2. Curative. Employment of Sulphur, lime, &c.

VII. Bibliographical investigations, especially in the publications of the countries producing Coffee.

II.

The only work that I was able to obtain in San José relative to the diseases of Coffee, and which I attentively read through was the following:—*Doctor Emilio Göldi. Report upon the Disease of the Coffee-tree in the Province of Rio de Janeiro. 1887. (Relatorio sobre a molestia do cafeeiro na provincia do Rio de Janeiro.)*

Doctor Göldi, a Swiss savant, devoted himself for 14 months to the study of the Coffee disease in Brazil at the recommendation and under the auspices of the Minister of Agriculture. On undertaking this difficult work, he asked for and obtained the assistance of 12 foreign botanists, all eminent specialists, and of 5 zoologists equally noted. Some Brazilian scientists also united in these labours, whose joint product is a work of profound learning.

In it is described with the greatest minuteness the terrible Coffee-disease which caused enormous losses in Brazil. In 20 years the contagion spread over a territory of 3,000 kilometres or say 300,000 square hectares, and until 1887, the Government only attempted a few timid prophylactic measures. From that date we lack details concerning the result of the struggle engaged in.

The propagation of the disease in the plantations is circular, and the bushes attacked are disposed in islets, which remind one of the phylloxera patches. In the infected zones, the sickly or withered stocks had almost entirely lost their leaves, the branches were dried up, and the spark of life that remained in the plant only showed itself by some abortive sprouts that sprang from the bottom of the stem.

This plague assumed an aspect called *explosive*, in which 8 to 15 days were enough to wither up the bush. In this case, the leaves were found scorched as though suffering from the action of a violent fire that had been lighted in its neighbourhood.

The ordinary symptoms of the disease are the following: the leaves lose their horizontal position and turn to the right or left, their edges curl up in an abnormal manner, the characteristic glossiness of the lamina disappears, and is replaced by a yellowish colour, and they do not take long to fall off. But the real seat of the disease lies in the roots, covered with warts, which are due to a thread-like grub. The formation of the warts, easily distinguished by the naked eye, begins the moment the disease plainly declares itself, and continues till the death of the Coffee-tree.

Doctor Göldi makes known the thread-worm under the name of *Meloidogyne erigua*, and in several pages of his splendid report deals with its biology in a masterly way.

The same naturalist discovered in the roots of the sickly plants the mycelia of fungi whose ordinary

*A hectaro equals 11,960.33 Eng. sq. yds.—A.M.F.

abode is between the bark and the woody fibre of the said roots. They are black filaments that generally run down the roots lengthwise and by turns envelop it completely or partially. This fungus appears to be the inseparable companion of the thread-worm, but, according to Doctor Göldi, its performance is only subordinate: at the most it acts as the *aide-de-camp* of the destructive grub. It has not been possible to classify it with certainty, but it is supposed that it belongs to the numerous family of the *Pirenomicetes*.

In the infected Coffee-plantations, says Mr. Göldi, "are to be seen a prodigious number of spotted leaves." Each spot consists of a gray or blackish dot whose diameter varies according to the age. This centre is seen to be encompassed by a yellow aureole. These spots appear principally at the point or on the margins of the leaves, and invade the tender branches as well. The fungus to which they are due belongs to the family of the *Ramularia*. But Mr. Göldi agrees that in no way can the Coffee-disease of Brazil be ascribed to the *Ramularia*. Speaking of the fruit, he says that he has hardly found in it fungi of the second or third rank, which could be considered as accidental guests.

Considering the lack of types of comparison, and referring solely to the descriptions, it appears certain that the *Ramularia* is not the fungus which attacks our Coffee-trees. But the perusal of Göldi's report gives us the impression that, although less dangerous than the thread-worm, it nevertheless does not abstain from working havoc amongst the Brazilian plantations, and that it has been considered too superficially. Had I been at the seat of its outbreak, I would not have been bold enough to have shared the optimism of the author relative to this plague.

Dr. Göldi however, quotes three different fungi which he met with in the Coffee-shrubs during the course of his investigations, but considers them to be altogether harmless.

(To be concluded.)

PICKINGS WITH A LOCAL APPLICATION.

A writer to the *Sugar Journal and Tropical Cultivator* writes enthusiastically of the prospects of COCONUT CULTIVATION in the Southern Continent:—

"For some time past," he says, "the Government has been planting the islands off the coast with coconut trees. Many of these are four years old and will bear in a couple of years; the others are coming on well. Probably all of them will be fit to yield their returns to the man who farms them within the next three or four years. There are in all some 4,000 trees now planted, the largest number being on M Island with 1,500, and M Island (Brampton) 550. When the 4,000 trees are in full bearing it is a moderate estimate to suppose that each will produce an annual crop of 100 nuts. Every nut should produce half-a-pound of copra, or about 90 tons from the lot. Copra will realise not less than £12 per ton f.o.b. on the ships taking away the cargo. The farmer would therefore get an annual return of £1,000 to pay rent to the Government and the cost of getting the copra. But this will not by any means exhaust the products to be obtained. The fibre has a very distinct market value, while the pulp or dust of the coconut is daily becoming more used, for packing fruit, as a slug destroyer in gardens, and in many other ways, the whole of which are by no means generally known. I feel convinced that not only is there a good opening for the industry in the way I have stated, but that it will be found so remunerative that others will follow it up. Not only the islands off the coast but the whole length of our coast line north of Rockhampton could contribute to the industry. It is frequently argued that we could not compete with the cheap labor of the South Sea and Africa and other places, but it must not be forgotten that we should also be competing with the most primitive of methods, most idle of cultivators, and with the most risky, and consequently, costly of enter-

prises. With scientific appliances, with small risks, and with the indomitable industry and perseverance of the Anglo-Baxon race, there is not reason that we should not only successfully compete with Africans and Polynesians, but also establish a new branch of industry which if it does not supersede any of those industries already in vogue, at any rate show that we are not so foolish as to neglect one of nature's best gifts."

It is stated that an invention of two Japanese scientists for the production of fine thread from the fibre of NETTLE HEMP is attracting much attention in Mexico, in view of the fact that this plant grows abundantly in different parts of that country. It is claimed that the new thread is likely to supersede to a great extent, the finest thread made from silk. The nettle hemp, we are told, produces a thread three or four times as one made out of silk, and it is quite equal to the silk in point of lustre. Some of the Mexican planters and manufacturers have interested themselves in the invention, and are preparing to put it into practical operation.

COMPRESSED FORAGE (says the *Queenslander* from Victoria has "caught on" in Ceylon, and some orders have been received on the strength of the samples lately exhibited by the Victorian trade commissioners at Colombo. These orders are only trial ones, but if attention is paid to the material used there is no reason why a remunerative trade should not be developed. There is no customs duty on the compressed fodder in Ceylon. The process of compressing is the subject of a patent, but in view of the cheap and abundant fodder that is unsaleable in Queensland in good seasons we may expect that this colony will in the near future share in this business.

The same paper, referring to GROUND-NUTS, mentions that a learned professor advocates the advantages of peanuts as human food. He recommends that the nuts should be first roasted and then made into porridge or soup. Hundreds of tons of peanuts are consumed annually in the United States either raw, roasted, or in the form of "candy"; in fact, eating peanuts may be described as the principal recreative exercise of the American people. The west coast of Africa produces an enormous crop of peanuts, Marseilles alone using 10,000,000 bushels a year, while many other millions of bushels go to London, Berlin, and other markets. This product is largely used in the manufacture of imitation chocolate and of peanut oil. Very large quantities are ground in India and Brazil, but find principally a home market. The nut flourishes in Queensland, but has not yet been turned to commercial use, although a fair quantity finds sale in the fruit shops for consumption chiefly by children.

TEA AND SCANDAL.

REFLECTIONS ON A TEA-TABLE.

Know ye the land where the hot toast and muffin
Are emblems of deeds that are done in their spheres;
Where scandalous stories and hints about muffin
Now melt into whispers, now rise into sneers?
Know ye the land where the liquids and cake
Their circumlocutions consecutive make;
Where Pompey's strong arms are oppressed with Pekoe,
And the air waxes faint with the scent of the sloe?
Where malice produces its bitterest fruit,
And the voice of detraction can never be mute;
Where the tints of the story, the shades of the lie,
In number tho' varied, in falsehood may vie,
And the venom of scandal is deepest in dye;
Where virgins of fifty strange ringlets entwine,
In the fond mis-conception of looking divine?
'Tis the land of the teapot, the realm of the tray,
Can we smile when we know what their votaries say?
Oh! false as the curls of the ancientest belle,
Are the hearts which they bear, and the tales which
they tell.—*Punch*, December 1846.

"The tables of the ancient gentry of this nation were covered thrice a day with hot roasted-beef; and

I am credibly informed by an antiquary who has searched the registers in which the bills of fare of the court are recorded, that instead of tea and bread and butter, which have prevailed of late years, the maids of honour in Queen Elizabeth's time were allowed three rumps of beef for their breakfast."—*The Tatler*, March 21st, 1709.

Why do you treat chairs very spitefully in Ceylon?—Because you have them caned, simply because they cannot bear you.

Why should you never tell a man to take a back seat?—Because if you do, he may take affront (a front.)

What is the most warlike nation?—Vaccination, because it's always in arms.

ADVENTURES OF A HALF-CHEST OF TEA.—A Liverpool merchant recently sent 3 half-chests to a suburban customer by carrier. On the tea being delivered it was discovered that one of the packages had undergone a process of transformation. It had been relieved of about half its contents, and the purchaser states that the following articles had been substituted. Three old canisters, a tin dish, a teapot, oyster-knife, a rusty gimlet, and an old rag! (*Food*, Sept. 1884, p. 31.)

TEA-OIL.—A little to the west of Pu-ki I came upon the borders of the tea districts. Here, as well as elsewhere in Hunan, a good deal of the tea oil is made. The plants from which the seeds are obtained be grown about 8 or 9 feet high, and are more straggling than the tea-shrubs. The leaves of this tree cannot be used for making tea. The tree has been named *Camellia Oleifera*, but in Simonds's work on *Tropical Agriculture*, it is stated that Tea-oil is obtained from the seeds of *Thea Viridis* and in many parts of Hunan the natives assert that the plant was the same as the Tea-plant, but cultivated differently. If the species are distinct, they are very closely allied. (*Journeys in the interior of China*, by G. James Morrison, C. E. Proceed, R. G. S. Vol. ii. 1880 p. 158.)

THE COMING CHINA TEA SEASON.

We are constantly being told that in the greater strength of Ceylon and Indian teas in comparison with those of China growth, which means, in most cases, a greater preponderance of tannin, lies one of the chief reasons leading to the increased consumption of the former qualities, and the steady downward march of the China import to this country. No doubt it is a considerable element with the poorer classes, whose digestions are not of a delicate order. But the reason whatsoever, the fact is, that, according to an estimate of Messrs. Geo. White & Co., the total requirements of all sorts for the approaching season are put at 245 million of lb., of which China is to furnish only some 41 millions of lb., including the export demand for the Continent, which, however, takes more and more of its China Tea direct each year, and without the intermediary of London. It is quite evident, therefore, but China must fight hard if she wants to retain a fair place in the competition in this country, and it must be China and the Chinese who should do the most in the matter. The foreign Cha-sez and the merchant may be trusted to aid in his way, but he cannot meet the competition unless he is aided—or, rather, unless the handicap now placed on the export of tea by the Chinese Government is lightened. China has now as excellent a chance of regaining some of her lost ground as she is likely to ever get, for, with a monopoly valued rupee in India and Ceylon, she has a bonus over her rivals, that she should be thankful has been handed to her. Taking freight and charges from the various ports as being equal, China has a bonus in exchange equal to about 30 per cent.; or, in other words, with silver at its present price, she can ship nearly 23 lb. of tea to a little over 17 lb. of her rivals, taking the cost of tea in each case as being the same at port of shipment. But she must

be prepared to reduce some of the onerous inland taxes and duty which on the average, amount to fully 30 per cent of the value of the tea purchased. Whilst these exactions are maintained the profit on growing tea must continue so small as to leave no margin for improvement in culture or curing. It used to be pointed out that all the China tea we rejected was taken by Russia, the net result being that the total export from China to all foreign countries was maintained, but most Russian buyers have since left Foochow, owing to a deterioration in manufacture, and the same may occur at Hankow, whilst the efforts be't made by Ceylon to create a trade with Russia mu not be despised. With some easement of the heavy duties, China should have a splendid chance of proving she can still give us those "well-flavoured and wholesome teas" she was noted for. In common with all silver-standard countries which grow in competition with those on a gold-standard, she is honoured in her exports, and has an opportunity if she will only recognise and profit by it. As we stated in our commercial article last week, there is a good opening for the China article if the native teaemen can be prevailed to once more send to market improved quality.—*L. and C. Express*.

CEYLON TEA IN THE TRANSVAAL.

We published yesterday a letter from a resident in this division of South Africa and today's post brings us another letter this time from Mr. O. Mac Lure, whose firm is established in Johannesburg, for the sale of Ceylon tea. We have added their name to the list of sellers of "pure Ceylon Tea" all over the world, and we quote from the letter as follows:—

"About two years ago I called at your office when I was in Colombo, and mentioned that I purposed starting a Ceylon tea business in this part of the world. You will see from above heading that the business is in full swing, and I am pleased to say showing signs of very considerable development. Pure Ceylon tea has only recently, comparatively speaking, got into the market here, but it has, as at home, rapidly established itself in public favour. I may say that my firm has materially assisted in creating the taste for Ceylon tea by opening rooms called the 'Ceylon Tea Rooms,' a photo of which I herewith send to you. This photo is taken from a drawing of mine, and gives a fair idea of the design of the rooms. They are well patronised by the Johannesburg public, and as we have a very liberal supply of the London illustrated papers, etc. it has become quite a resort for the reading portion of the community. "Business, generally speaking, has been undoubtedly bad for some time back, owing principally to the depression in the share market, and this, too, in spite of the steadily increasing output of gold, which will probably this month be considerably over 150,000 oz. What is wanted in this country is industrial development otherwise than in gold mining. The agricultural resources of the country are undeniably great, although the periodical scarcity of water, and the vexed labour question, would probably operate seriously against any farming or planting enterprise. The mineral wealth of this country must be enormous and there is undoubtedly a great future before it."

COORG COFFEE PROSPECTS.

The Honorary Secretary of the Coorg Planters' Association writes to us:—"With regard to crop prospects in Coorg, though I have been away for some little time, and therefore cannot speak from personal experience. I am given to understand that the blossom has set well and that the crop, generally speaking is likely to be a good one. Coffee is, here also, looking very healthy, and making plenty of good new wood."—*South of India Observer*.

MR. R. S. FRASER ON NEW AND OLD PRODUCTS.

This gentleman whose name is so well-known as Managing Proprietor of the fine plantations of Kandenuwara and Wariapolla in Matale East, has just spent some four months in Ceylon. During that period, Mr. and Mrs. Fraser have travelled a good deal over the island, visiting Trincomales and the East Coast, and a number of the Planting Districts. Mr. Fraser, it will be remembered, was a pioneer in cacao cultivation. Like the late Mr. Tytler, he visited Trinidad and published a little Manual as the result of his visit. Mr. Fraser is a little afraid now that the planting of cacao in Ceylon is being overdone in the sense of plants being put out in soil, in some cases, too poor to carry them. The prices for this product have also not been encouraging of late. On Wariapolla, there is still Coffee *Arabica* as well as *Liberica* and from the former, grown under shade, a crop of 1,000 bushels has been got with almost no expense. Mr. Fraser believes that our old staple would still pay to cultivate if there were suitable soil, and under shade. He is also cultivating Para rubber, and tea is doing fairly well on both plantations. It will thus be seen that these fine old Matale estates are well to the front in both new and old products and we say, long may they flourish; and may we often see Mr. and Mrs. Fraser back on visits to an island where they are so generally esteemed and with which their family have so long been connected.

The Superintendent of Wariapola Mr. L. B. Dickenson, after many years faithful service, goes home on leave by the same steamer and it is a coincidence that Mr. Hugh Fraser of Bandarapola who used to manage both Kandenuwara and Wariapola, also travels Westward by the "Ohnan." We hope all will have a pleasant passage and an enjoyable time in the old country.

TRAVANCORE TEA.

The following is a summary of Travancore tea sold at Public auction in London between January 1st and December 31st, 1893; quantity in lb and average prices realized. The figures have been taken from Messrs. Gow, Wilson and Stanton's weekly reports and may be considered substantially correct.

OVER 50,000 lb.		lb.	av. price.
Seafield	...	59,850	8'84d
Bon Ami	...	165,500	8'77d

Total 1,950,500 lb.					

INSECT ENEMIES: INDIAN MUSEUM NOTES.

We have received a copy of No. 3 of Volume III. which contains: A new Coccid from Ceylon, by G. B. Buckton, F.R.S.; A new Species of Fulgorida, by M. Letbierry; A new enemy of the Custard Apple, translation by F. Moore; Notes on Indian Aphidæ; by G. B. Buckton, F.R.S.; and Miscellaneous Notes from the Entomological Section, by E. C. Cotes. Mr. Buckton gives a minute description of the cocoon explaining at the outset that in March 1893 he received from Ceylon a consignment of twigs and leaves of *Crossandra* which were incrustated by a white semi-flocculent matter, which proved to be the exudation of a species of *Orthesia*, apparently undescribed. Unfortunately the specimens arrived in a bad condition from the effects of mildew, which rendered the examination less complete than could be wished. Amongst the miscellaneous notes are several dealing with teak defoliators and the Travancore teak-borer; the identification of the mosquito, a hesperid caterpillar injuring paddy, the orange tree defoliator, and the preservation of hooks from insects.

RECENT RUBBER RESEARCH.

Either on account of the panic news that has been spread abroad as to an alleged probable failure of the Rubber and Gutta-percha supply or from some other causes, it is certain that Rubber, Gutta-percha, Balata, &c. have recently come very much to the front. As for the last named product, Balata, it is simply "all over the shop" at the present time. Mr. Smith Delacour has been reporting to the Foreign Office on the Balata of Surinam—its most valuable product. Of this report, we shall have more to say hereafter, but several of our contemporaries have taken the report as a text for homilies on the failure of rubber, &c., and the blessed advent of Balata as a saviour to the insulating and allied industries.—*India Rubber Journal*.

COFFEE IN PERAK.

A gentleman largely interested in planting who has just returned from a visit to the Straits gives a very hopeful account of coffee in Perak. He states that both Arabian and Liberian coffee, are looking remarkably well and giving good promise. He inspected the two estates held by Europeans there and he found no trace whatever of bug, while there were only the very slightest signs of disease and that on the Liberian leaves. As to which elevation was the better for either kind of coffee was as yet an undetermined question, but the fact remains that at present Arabica was grown on the higher and Liberian on the lower slopes, and there was plenty of good land for extension. There were about 150 acres in bearing on each of the two European estates—there were numerous small native gardens of Liberian—and perhaps about the same extent opened up, and he believed that each estate could bring about 1,000 acres under cultivation. Capitalists, he was of opinion, would find very good investment for their money in Perak.

THE CULTIVATION OF VANILLA IN TAHITI.

The cultivation of vanilla has been carried on in the Island of Tahiti for several years, but is limited to a few districts only, that of Papara supplying more than half of the quantity sent into the market. Consul Hawes, of Tahiti, says that the native method of culture is, as a rule, simply to plant the cuttings of the vine under the shade of trees, and then to leave them to grow and twine round supports as best they can. Occasionally attention is paid to keep the vines trained round the trees, and to prevent them from attaining a greater height than nine feet, so that during the inoculating season the flowers may be reached without difficulty. Shade is absolutely necessary during the growth of the vanilla vine to ensure a successful crop of beans. About one year from the time of planting the vine commences to flower, and the inoculation which then takes place must be carefully attended to; this is generally carried out by women and children, whose light hands are best suited for this delicate operation. In from six to nine months from the time of inoculation the bean will be ripe for picking and curing. The native method of curing is to keep the beans alternately indoors rolled in cloth and out of doors during the day spread on mats exposed to the sun for periods of three or four days at a time until they are dried and ready for the market. The disadvantage of drying on mats in the open, of having beans frequently wetted and deteriorated in value by sudden showers before there is time to get them under cover, has made itself apparent to many native planters, who now dry their vanilla in boxes with glass covers. They are usually filled three-quarters full, the beans being placed on a blanket in the bottom of each box, and covered with a double thickness of blanket at the top. The glass lids are then put on, and the boxes exposed to the sun for about fifteen days, when the beans are generally found to be sufficiently sweated to admit of their removal to the drying house. This building is constructed throughout of corrugated iron, and contains three tiers of wire shelves. The beans are laid on the top tier first, then they are moved to the second and third in succession as they gradually dry, and remain on the latter until they are perfectly dry and fit for the market. Consul Hawes says that Tahiti vanilla is inferior to that of Mexico, Bourbon, and Mauritius, and this drawback is not improved by the careless manner in which the natives and even Europeans dry and tie the bundles of beans for export. The export trade in this article has increased considerably during the last ten years, the United States being the principal market, although small quantities are sent from time to time to France and England. The total quantity of vanilla exported in 1883 from Tahiti amounted to 276 lb.; in 1890 it amounted to 15,822 lb., and this quantity increased in 1893 to 25,560 lb., valued at £4,418.—*Journal of the Society of Arts.*

MOTIVE POWER FOR TEA ESTATES.

We think that the information placed at the disposal of our London Correspondent by the manufacturers of several descriptions of motors may prove of material service to our planters. For it cannot be denied that every day increases the general anxiety respecting what will have to be done when our present very limited supplies of wood fuel for estate engines becomes altogether exhausted. Of course, such estates as lie contiguous to the lowcountry forests need not for a long time to come give consideration to this matter. It is quite different, however, with respect to those situated nearer to the centre of our great planting enterprise. These have already felt the pinch for years, and the superintendents of many of these have for some time past had to rely almost entirely on coal, an imported fuel always very costly, and likely, we fear, in this age of strikes and increasing wages, to become more so. Already we have heard that, on some estates so circum-

stanced, the coal received has cost upwards of £4 per ton. It will be manifest that under such conditions reliable information as to alternative sources of power must be acceptable. It is fortunate that in a very large number of cases water-power is available as the motor for estates. We believe Mr. Rutherford, when recently here, discussed with some of his fellow-planters a scheme for establishing central sources whence this power might be widely distributed by electrical transmission. This idea, we have been told, he has however felt compelled to abandon, and although not fully informed as to the grounds of this compulsion, we can imagine it to be the costly nature of the long leads that would be required and the liability to theft of the copper—always valuable and of ready sale—of which such leads would be composed. It seems likely on all accounts that estate proprietors must be left to provide their own power in all cases. It cannot, we should say, be long before either the steam engines or their boilers on most of our estates will require renewal. Probably fifteen, or at the outside twenty, years may be regarded as the utmost limit of safe working for the latter, and the engines themselves, under the conditions upon which they are worked upon estates, can hardly have a much longer life, or must at least need extensive and costly renewals. A large proportion of our tea factories have now been worked almost up to that limit, and we should imagine that the necessity for fresh outlay on motive power is now seriously engaging the attention of many superintendents. In view of the increasing difficulty of obtaining fuel, it is more than likely that the minds of many of these are being exercised in the direction of some alternative to steam-power. Already we know that some of the large proprietors are discarding their former agent and are erecting turbines whenever it may be practicable to do so. The Eastern Produce and Estates Company has, we believe, been foremost in this work; and has already largely superseded by it the steam engines that have up till now served its purposes. Many more, we believe, among our estate proprietors would be glad to follow this example did natural conditions admit of their doing so. Failing these, they must of necessity either determine on a replacement of worn-out machinery ere long, or they must seek for an alternative demanding at less amount of, or less costly, fuel than what they now have to use. The details afforded by our London Letter under these circumstances, we are sure, will prove a useful guide to many. The advantage, taking the conditions all round, appears to our correspondent to rest with the Priestman's oil-engine. He discusses with this, however, the gas-producing plant and gas-engines of the well-known Birmingham firm of engine-makers, the Messrs. Tangye. These last appear to him to have some advantages not possessed by the oil-engines first mentioned. But on the whole he would give the preference to the special forms of oil-engine manufactured by Messrs. Priestman Brothers. He tells us that one of these last-mentioned engines was some time back sent out to Ceylon through the agency of Messrs. Walker, and that none but favourable accounts have been received of its working. Indeed these accounts have been so satisfactory that a second engine of the same type, but of increased power, 13 H.P. has now been despatched, and probably the owners of both these engines would favour us with their experiences with them. The objection long entertained by our correspondent against oil-engines, namely that the smell of the oil might taint the tea, appears to have been removed by his

inspection of one of these engines in motion, as also has been the further fear of their liability to foul. Although both these objections are largely present in the case of most oil engines, Messrs. Priestman's improvements seem to have wholly overcome them.

TAKING UP LAND IN SELANGOR.

Sir,—I notice in the *Singapore Free Press*, of the 5th instant, under the heading "Taking up land in Selangor," a letter of Mr. G. A. Talbot, of Nuwara Eliya, dated March 24th, reprinted from the "Times of Ceylon" in which he states "with regard to timber being a Government monopoly, the timber belongs to the occupier solely and absolutely, the Government not even having the right to cut the planter's timber for its own requirements. There have been many instances of prosecutions ending in favour of the planter in this connection."

The following is an extract from a recent decision of the chief magistrate of Selangor in a case in which I sued two Chinamen for damages done to land, part of a coffee estate, in respect of which I hold a permit from the Government. The defendants started mining on the land in question, and cut down trees and other jungle produce, and brought within their operations an area of 10 or 15 acres:—

The question, then, is whether the plaintiff's permit enables him to maintain an action against the defendants for the damage done by them. The important conditions of the permit are that the plaintiff is to have the right, for five years subsequent to its issue, to occupy for the purposes of coffee-planting any of the land in the area specified in it except such land as may be found to be held under other titles, and that if and when within the five years he cultivates one quarter of the whole area included in the permit, the Government will give him a grant of the whole subject to conditions, and there are further two clauses which both expressly provide that, until this grant is executed, the permit-holder shall have no right over the land which he does not occupy for the purposes of coffee-planting, except the right of so occupying it. The plaintiff has argued that he has the same rights over the unoccupied land as he would have under the anticipated grant, but I am unable to agree with him.

This land, then which the defendants have been working has not been occupied by the plaintiff for coffee-planting purposes, and he has no rights over it except the right of so occupying it within the remainder of the five years' term. *The timber and other natural products upon it are not his*, but he may maintain his right to occupy it, and therefore his right to have it left in a condition fit to occupy for coffee-planting, against anyone who has not a good title of his own.

This decision appears to me to be very directly opposed to Mr. Talbot's statement.—Yours &c.

F. A. TOYNBEE.

[NOTE BY ED.—What has Mr. Talbot to say to this?—Local "Times."

A JAMAICA PERFUMERY INDUSTRY.

The perfumery trade is a large and growing one. There will always be a demand for scents, perfumed soaps, and cosmetics, and the means of supplying the demand must expand in proportion. Within recent years this necessity has led to the production of an imitation article, the result of chemical manipulation. These crystal scents, as they are called, are largely manufactured in Germany and are being bought in the absence of the pure material. Many trade lists of "floral products" are simply catalogues of cheap imitations. They are not by any means so

pleasant or so harmless as the genuine article, and one who habitually uses the latter can tell at once the difference. A comparison can be drawn between any natural scent and its artificial prototype always to the disadvantage of the chemical product with its reminiscences of the mineral basis. The public in this instance prefer the real to the artificial. If the pure article were placed on the market in sufficient quantities to fix their taste the crystal scents would soon find themselves boycotted. There is thus an opening for the production of the legitimate article which might be taken advantage of by many of the colonies to supply the wants of the United Kingdom. We think the suggestion is worthy the consideration of our small capitalists or cultivators whose means are not fully employed or invested and who are desirous of adding to their ordinary sources of income.

Jamaica could produce perfumes both of an ordinary and special character in abundance. The conditions of cultivation are exceptionally favourable and the establishment of a flower farm would, we believe, be a profitable undertaking. Col. Talbot, we understand, demonstrated the fact that flower-farming in Jamaica was feasible but we are unaware of the results of his efforts in the direction of starting an industry. The enterprise might very well form an adjunct to some of our larger Poor-houses. In the neighbourhood of Grasse in France there are hundreds of acres where the old, the ailing, and the children, earn a livelihood by picking roses for the scent market. The only obstacle in the way of embarking on the industry is the preliminary expense. To make perfume from flowers requires a somewhat costly plant. But admitting that difficultly, any one with a fair capital could easily start a farm and confidently, calculate on a handsome return for his capital and labour. In India a flower grower started in 1890 in the industry and is now doing a prosperous business and employing over ninety hands. If this result can be achieved in the East, it ought to be duplicated in the West Indies.

Flower farming in Europe for perfumery purposes is engaged in almost exclusively at Vau, France, it is here that the jasmine, tuberose, cassia, rose, and violet, grow to great perfection and where the subsequent processes of manufacture are commercially worked. Of orange blossoms alone as many as 1,900 tons are used annually, and nearly 1,000 tons of roses. In the Grasse district and byer is always ready to purchase as small a quantity as a kilo of roses from the small proprietor. This fact furnishes a hint upon which we might improve. A central factory system might be organised. The plant-holder would buy the modest crops from the settlers and others, in addition to being a farmer himself, and utilise them for the various purposes of the scent market. An entire family could engage in flower growing, or the farm might be the special care of one member while the remainder are otherwise occupied. There are many odoriferous and other vegetable substances in the colony which the floral chemist might find a profitable use for, and the culture of which might add to the resources of the people. Such minor products should not be overlooked in the cultivation of more familiar articles. It should be kept in mind that the agricultural possibilities of the country are not exhausted. It has always been an article of our faith that there is potential wealth lying in the soil as yet undreamt of. We do not think it is an exaggerated belief. The desiderata required to realize that wealth are, an insight into the capabilities of the soil; enterprise, patience, and a moderate capital. With these a man ought to be able both to enrich himself and to contribute to the prosperous development of the country.—*Gleaner Packet*.

SANDALWOOD OIL.—Mr. Petrie Hay, of Hunsur, has been regranted the exclusive right to manufacture sandalwood oil within the Mysore State for a further period of 10 years.—*Pioneer*.

"IBEA"—OR IMPERIAL BRITISH EAST AFRICA No. III.

How strange it must appear to the present generation of young planters in Ceylon, to be reminded that twenty-five years ago a great part of Dimbula and Dikoya and all Maskeliya were not only without a road or a bridge, but were under dense and almost pathless forest. It would sound mythical in the ear of the "creeper" of today to be told of surveyors and pioneer planters in this "Wilderness of the Psak," who, for weeks, lived on no better fare than their coolies' rice and salt-fish curry while their usual supplies were stopped on the other side of flooded rivers. When there was no railway in the land, or none nearer than Kandy or Gampola, and the cart road extended no higher up than Ginigathena Gap, to carry supplies into the heart of Dikoya or Maskeliya, was no joke. Of the many narrow escapes of the "young bloods" of those early days in crossing flooded streams, and of actual drownings in some sad cases, many stories might be told. How "Pedigree Banner" lost his pedigree in the dangerous Dikoya river, and how another planter pioneer only saved himself (Irish-like) by "taking off his boots while under water"—at a time when one if not two companions were drowned,—are old stories of the district; while similar experiences could be narrated of both Maskeliya and Dimbula.

Now, all this has been brought back to our recollection in reading of the Central region of "Ibea" and especially of the Ukumbani and Kikuyu divisions to which we are now approaching. In rising from 3,000 feet at Kibwezi to 5,600 feet in Kikuyu Forest, we read of dense forests and of stream often in flood in their descents through districts 4,000 to 5,000 feet above sea-level from what may be described as the Nuwara Eliya and Horton Plains above. All this is just what the energetic pioneers between Great Western and Adam's Peak rejoiced over in their day. Broad-breasted hill sides, pathless woods, rivers and waterfalls and then the open grassy patanas—all seem repeated in this part of Africa on a grand scale. We do not read of coffee growing wild in these "Ibsan" jungles, but it is certainly found in some of the forests not far to the North, stretching away towards Abyssinia. We remember reading many years ago of an Embassy which passed in this early part of the century from Bombay to the Court of Abyssinia. Landing somewhere in the Gulf of Aden on the African coast, a journey was made inland, which after a time, led the party through a grove of wild coffee, the cherries hanging in clusters from trees that were allowed to grow at their own sweet will. We only mention this in passing to show that the home of the coffee plant is not far off "Ibsa." But the men who are to subdue the forest, do justice to the labour available, and endure the many privations which are ever the lot of pioneers, must be as plucky as were the young men who mainly opened Dimbula, Dikoya and Maskeliya in the "sixties" and early "seventies." Let no Ceylon planter of the present day, too, dream of East Africa, unless he has learned all the mysteries of coffee culture, pulping, drying and preparation generally. Equally should he be a qualified cacao planter, and be up to a good few of the Ceylon "wrinkles" about India-rubber, and about coconuts and other palms. Of course he can learn a great deal from the locally-published Manuals; but this is not quite enough of itself without some practical experience.

In our second paper on "Ibea," we arrived at Kibwezi where there is a Scottish Mission station. Fifteen miles farther on we come to the "Makindo" or Palm river and still another 8 miles to the "Kiboko" or Hippopotamus river where there is much game in hartbeeste, zebra and small antelope, while the natives are friendly. But the two branches of the Kiboko when in flood are difficult to cross. Twenty miles onward at the Wakufukoa or salt river, "numbersless herds of game" are always met. One warning given is that "the bsechives should be avoided as much as possible as the bees attack a caravan on any provocation." We are now near Kilungu 4,000 feet above sea-level with peaks rising to 6,400 feet; but the road is still upwards, the natives fairly numerous in the open parts, and the country well-cultivated. At Machako's post, an elevated plateau surrounded on three sides by hills, the slopes of which are highly cultivated, we are 5,400 feet above sea-level and 350 miles from the Coast at Mombasa. Now it is to this point—or close by at Kikuyu—that the first grand section of Railway is projected (on its way to Uganda) and having thus afforded an idea of what travelling at present means in these regions, we are able turning aside from the "Handbook," to give the very latest information of this important region which we find in an official Report published in the London *Times* only received by the mail on Tuesday. It is as follows, only promising that Ukumbani, Kikuyu and Machakos refer very much to the same district:—

EAST AFRICAN DEVELOPMENT.

AN INTERESTING REPORT FROM UKUMBANI.

The British East Africa Company have received from their agent at Machakos an interesting report upon the present condition of Ukumbani, a district about midway between the coast and Uganda, and not far removed from Kikuyu, the point to which the pioneer expedition of the Freehold Colony is directing its intended investigation.

The report, after describing a satisfactory and growing readiness on the part of the Wakamba, who inhabit the district, to accept occupation, and detailing the rates of labour, gives the following account of a meeting held by the elders of the district:—

"On December 4th last all the elders of the Machakos Hill, Manyani, Iveti, Nzibus, Kasinga, Mututuni, Quambodi and Engoleui assembled here and held a long shauri. This shauri, as I have before mentioned, was convened by themselves after asking my permission to be allowed to meet here. The substance of what they said is as follows:—

"That we, the Wazee of the district, recognize the benefits we are deriving from the company (Mzungu) here; our young men have learnt to work and earn mail, our country is peaceful, Masal do not raid us and our people live at peace with one another, our cattle can graze in security &c. All matters brought to the Europeans for settlement have always received a fair hearing, and the Mzungu knows the Wakamba and their ways, so we have every confidence in bringing our complaints &c. and troubles to the station for settlement.

"We tell you all this so that the company may know that we are glad they come to live amongst us; our country is theirs and ours, and half the food is theirs."

"This is a summary of what they came in to say, and this sentiment was backed up by a further offering of 40½ loads of flour, which makes, with the previous contributions, a total of over 20,000 lb. of flour contributed to the station in 12 months."

In describing the commercial and agricultural value of the country, the report proceeds to state that the district is extremely fertile and rich in agriculture and cattle. The population is estimated at about 1,000,000 souls, all extremely industrious. The following crops grow freely:—Tree beans, kidney beans, maize, millet and two kinds of small grain, cassava, manioc, sugarcane, sweet potatoes, bananas and pumpkins. Tobacco

and yams are also grown, but not in large quantities. Several of these products give two crops a year. Cattle, sheep and goats thrive extremely well and the milk is wonderfully rich. Honey is also collected and consumed.

With regard to temperature and rainfall the country is described as peculiarly suitable to European agriculturists. The climate is more like Southern Europe than Central Africa. The highest thermometer reading given between June and January is 80½, registered in the month of October. The division of the seasons is as follows:—From about the end of October to the end of January, small rains. From beginning of February to about middle of March, a short dry season with few showers. From middle of March to about beginning of May, heavy rains. To end of May, occasional showers. From June to October dry season, with a very few local showers of light rain. The hottest part of the year is from October to March. These seasons affect mostly higher Umambani and Kikuyu.

From the commercial point of view it is noticed that the demand for trade goods increases steadily. Eighteen months ago the demand was almost exclusively for beads and brass wire. Now 50 per cent of the demand is for the cloth, and whereas 18 months ago not 5 per cent of the population wore cloth, now it is observable that the general custom is to be dressed in cloth. A flourishing trade is confidently expected as soon a transport to the coast is made cheap.

The establishment of the authority of the company in Ukambani has already practically extinguished the slave trade in Masai and Kikuyu captives which used to exist with the Arabs and Swahili dealers. The following paragraph of the report explains the position:—

“The Wakamba living very close to the Kapti Masai used to be continually raided by the Masai, and many men, women and children were killed. The Masai do not take prisoners. In retaliation the Wakamba raid Masai kraals and take whatever they can get, including women and children. With the Wakamba, women and children prisoners are looked upon as being too useful and valuable to be killed; firstly, they are useful for sbamba work, wood outling &c.; and secondly they used to be looked upon as articles of barter with the Swahilis, and according to all the information I can obtain from the natives, it is evident that before the company's authority was established here there must have been a pretty large trade in Masai and Kikuyu captives between the Swahilis and the Wakamba; but as I have said before, the trade now in comparison with the past can almost be said to be non-existent.

“During our residence here the Masai raids have become very rare. What Masai prisoners are taken by local Wakamba in their raids are at our request brought into the station here, and during my residence I have received from the Wakamba elders and returned nearly all to their own people by some means or other, the following people. All or nearly all would, in the absence of a European, have undoubtedly been sold to Swahili traders:—44 Masai women (11 with babies); 20 Masai children (the above babies not counted with this); 14 Kikuyu women; making a total of 89 souls. Anyone looking well into this question must readily see what would result if our influence is withdrawn. The insignificance of the slave trade here at present is not due to the Swahili or the Wakamba; the company's occupation and influence with the natives is the sole factor in this good result. In my opinion, once we withdrew from here (if withdrawal is possible) a brisk slave trade would once more revive. The best Arab or Swahili in the world cannot, as you know, resist this, to them, infatuation of slave-trading. Where there were slaves to be had there would the Arab and Swahili wend their way. Without European power and influence in the interior, what is to prevent Arabs and Swahilis from coming up, buying, and capturing slaves and placing them on their coast and inland shambas. A demand for slaves here would soon create a supply. Our influence here has stopped both the supply and the demand.”

The report contains some description of the handicrafts to the Wakamba, who work in iron and brass and have hitherto used tanned leather and a rough material made from aloë fibre for clothes and domestic purposes. The only agricultural implements in use are, however, made from hard wood. The relations of Wakamba with the neighboring tribes are also entered into at some length. The Wakamba themselves are described as the predominating tribe. The day of the Wa Galla to the north appears to have gone by. The Wa-kikuyu are described as half and half Masai and Wakamba, without the good qualities of either. The Masai, who have always been the deadly foes of the Wakamba, are the Ishmaelite of East Central Africa: They are nothing else than a well-organized and trained band of wholesale robbers. Their hand is against every other tribe, and in their self-defence, every other tribe is against them. Nevertheless they are said to be straightforward, likeable, and on the whole disposed to be friendly with the European. Their great faults are their pillaging propensities and their “utter disdain of all manual labour.” With regard to them the report continues:—

“The wave of civilization as it advances in East Africa must, of course, severely affect, and eventually cripple, the Masai, and a new sphere must be found for their energies. As these civilizing influences continue and go forward the Masai will have to accept the inevitable; as he finds all the cattle countries gradually closed against him he must either come to terms or starve. If he comes to terms he must perforce accept the obligations imposed upon him by civilization—i.e., to learn to live by other means than by pillaging and murder, and to learn to turn his hand to honest work; it can only be absolute necessity or force that would bring the Elmoran to this way of living, but when he has arrived at this stage we shall have got a long way on the road towards civilizing East Central Africa.”

Finally it concludes:—“The Wakamba are, I should say, superior in numbers to the whole of their immediate neighbours, and with a firm Government established in their midst they would quickly become the dominating nation in this part of the country.

“JOHN AINSWORTH, Commanding District.”

THE PANAWAL TEA COMPANY, LIMITED.

EXTRACT FROM REPORT OF THE DIRECTORS.

The net amount at credit of profit and loss account, after providing for general expenses, Directors' and Auditors' fees £1,649 12s 4d.

An interim dividend was paid on the preference shares on 31st December 1893, at the rate of 7 per cent per annum, from the dates of payment of the various instalments to 31st December 1893 £211 10s 7d.

It is now proposed to pay the balance—viz., from 1st April 1893, to the various dates of such payments, which will require £50 19s 5d.

It is proposed to write off the cost of new land extensions, machinery, &c., completed during the year, viz., from 1st January 1893 to 31st December 1893 (in terms of the contracts for purchase), at a cost of £297 8s 6d.

Also the preliminary and other expenses connected with the formation of the Company, requiring £298 4s 1d.

It is proposed to pay a dividend on the ordinary shares at the rate 6 per cent per annum from 1st April 1893 to 31st December 1893 (free of income tax), which will absorb £765 0s 0d.

Leaving to be carried forward to next year a balance of £26 9s 9d.—£1,649 12s 4d.

The Directors have pleasure in recommending the distribution of a dividend at the rate of six per cent per annum on the Ordinary Shares of the Company from 1st April, 1893, the date the working of the Estates was taken over by the Company, to 31st December, 1893. Owing to the prolonged drought, &c., the yield of tea in the nine months' working fell short of the estimate by 12,552 lb. It is proposed to write off the cost of new land, extensions, machinery,

&c., in £297 8s 6d, thereby reducing the cost of the Estate to £20,000, and the whole of the preliminary and other expenses in connection with the formation of the Company in £298 4s 1d. The advances to coolies and the balance in the hands of the Company's Manager in Ceylon are written down to 1s 13d per rupee, thus leaving the entire working capital of the Company intact.

The acreage of the Company's properties on 31st December last was—

Tea in bearing	439
Do. not in bearing	97
New clearings and nurseries...	38
Jungle	364½
			938½ acres.

The Directors have since been able to obtain some 129 acres of Forest land at a cost of £2,123, which purchase they trust will prove advantageous to the Company.

The Ceylon Manager reports the estates in good order. With a favourable season, the crop for 1894 is estimated at 240,000 lb.

The Directors deeply regret to report that their late esteemed Manager, Mr. Graham Hogg, has been obliged to relinquish his post through ill-health, and return to this country; they have appointed Mr. Alexander Mansfield Forbes, Manager, in his place.

CEYLON TEA PLANTATIONS CO., LIMITED.

The Directors have the pleasure to submit the General Balance Sheet and Profit and Loss Account for the year ending 30th Dec. 1893, duly audited.

The net amount at credit of Profit and Loss Account, including Balance brought forward at 31st Dec. 1892, and after providing for general expenses, Directors' fees, income tax, &c., is £44,481 5s 3d.

An interim dividend of 7 per cent. on the ordinary shares was paid 27th October 1893, amounting to £11,182 2s 3d.

It is proposed to pay a final dividend of 8 per cent. on the ordinary shares (making 15 per cent. in all, free of income tax) which will absorb £13,890 8s.

Dividends on the 7 per cent. preference shares were paid for 1893, in full amounting to £5,413 6s 2d.

It is proposed to add to Reserve Fund £10,000.

It is proposed to write off for depreciation on buildings and machinery £2,500.

And to carry forward to next year a balance of £1,995 8s 10d.

The Directors have again to report a successful year's working, and to declare for the seventh consecutive year a dividend on the Ordinary Shares of fifteen per cent. per annum.

It is proposed to write off for depreciation the sum of £4,981 6s 11d derived from "Premiums" on the issue of 1,584 Ordinary Shares and 764 Preference Shares, and also a further sum of £2,500 taken from profits. With the £10,000, now proposed to be added, the Reserve Fund will stand at £35,000, and of this amount the Directors have invested the sum of £12,562 13s 8d in Consols and other Securities.

The year under review was a favourable one for the production of Tea on the Company's Estates, the average yield of 419 lb. per acre being the highest yet reached. Taking into consideration the fall in the price of tea, the profit earned is sufficient evidence that the Company's affairs in Ceylon have been well and economically managed.

The following statement shows the acreage of tea in bearing; the yield per acre; the rate of exchange,

and the price per lb. realised for the Company's Tea Crops, annually, since 1887:—

Year.	Acreage in bearing.	Yield per acre in lb.	Rate of Exchange.	Sale price of Tea. d.
1887	1251	403	1.5 14-32nd	13.0d
88	1405	394	1.4 28-32nd	10.5
89	2773	338	1.4 28-32nd	11.0
90	3947	387	1.6 24-32nd	11.0
91	5168	414	1.5 19-32nd	9.27
92	6584	376	1.3 20-32nd	9.38
93	7167	419	1.3 8-32nd	8.85

The following is the acreage of the estates:—

	Acres.
Tea in bearing	...
Tea not in bearing	...
Timber clearing, reserve forest and waste	...
10,499	

The tea crop for the year was as under:—

Estate	Tea. lb.	Bought leaf lb.	Tea Manu- factured for others. lb.	Total. lb.
	3,009,055	539,615	1,418,258	4,966,928

The Chairman visited all the Estates in the months of December and January last, and is thoroughly satisfied with the condition of the properties and the management of the Company's interests. The Board have again great pleasure in acknowledging their appreciation of the services of the staff both in Ceylon and London.

THE EASTERN PRODUCE AND ESTATES CO., LIMITED.

Extracts from report to be presented on the 26th April 1894:—

The directors herewith submit report and balance sheet for the year ending 31st Dec., 1893. The profit for the year (including £12 2s 5d balance from last account, after payment of Debentures for £1,310) amounts to £30,409 18s 3d, from which, after providing for interest on debentures, there remains a balance of £20,045 16s 3d, which it is proposed to appropriate as follows, viz:—

Dividend on preferred shares	...	£37 13 0
Payment of debentures...	...	3,000 0 0
Dividend at the rate of 3 per cent per annum for the year 1893, on the Ordinary Share Capital, being the full rate permissible by the Articles of Association, pending reduction of the Debentures below £50,000	...	8,974 1 0
Balance to be applied in further redemption of Debentures	...	8,034 2 3
		£20,045 16 3

The debentures of the Company, which have been reduced as shown in the annexed accounts to £170,880, being originally issued for seven years, would in the ordinary course have matured for payment at 31st Dec. next. The directors, however, have the satisfaction to inform the shareholders that they have succeeded in renewing the amount for a further period of three years.

As shown in the accompanying schedule, the extent of the Company's property now under tea amounts to 9,750 acres, of which 8,740 are over four years old. The crop in 1893 was 2,638,000 lb., being in excess of the estimate, and the average gross sale price was 8½d per lb. The crop of 1894 is estimated at 2,800,000 lb.

SCHEDULE OF THE COMPANY'S ESTATES AT 31ST DEC., 1893.

Arapolakaunde, Aageriya and Bulatwatte, Colombo, Condegalla, Dandukelawa, Doombazastalawa, Dromoland, Hope, Iugrugalla and Berrewella, Kirrimottia,

Koladeniya, Kolapatna and Gongalla, Kumaradola (and land adjoining), Labookellie, Meddecoombra, Norwood, Rothschild, Sogama, Vellai Oya and Wevakkelle.			
			Acre.
Under Tea	9,750
Under Coffee	92
Under Cocoa	426
Under Cardamoms and Sundries	281
Under Forest Grass and uncultivated Land	6,724
Total ...			17,273

THE NEW INDIAN TEA CROP.

We have been favoured by the Indian Tea Association with the following estimate of the crop of the coming season—

ORIGINAL ESTIMATE OF CROP OF 1894.
lb.

Assam	52,176,369
Cachar	18,481,640
Sylhet	21,246,620
Darjeeling	8,016,480
Terai	3,416,300
Dooars	17,155,680
Chittagong	995,200
Chota-Nagpore	280,000
Dehra Dun, Kumaon and Kangra	...	4,500,000
Private and Native Gardens	4,000,000

130,268,289

Being 4,946,815 lb. over the actual outturn of the crop of 1893. Estimating shipments to the Colonies and other Ports with local consumption at 12½ millions, there will remain about 117½ million lb. for export to great Britain.—*William Moran & Co.'s Report*, April 25.

NEWS FROM FIJI.

Mr. A. J. Stephen—so well-known in Dolosbage and elsewhere—favours us with the following notes from far Fiji:—

Some 200 to 300 Japanese are expected next month as labourers on sugar estates. It is to be hoped they will turn out well and not increase wages which are too high already in Fiji. With Japs, coolies, Polynesians and Fijians we shall have a fine mixture, and a man to work them will have to be a linguist as well as a planter.

The fruit industry is not quite so flourishing as formerly. Prices are not so good and freight still too high. Queensland is a great rival to our bananas.

The Vancouver line steamers now call monthly at our capital, Suva, and we hope in time to find a market in Canada for some of our fruit and other products.

A lot of tobacco of good quality will be planted this year in Vite Levu and Vauna Levu. The crop grown last year in the former island has, from all accounts, turned out well, reports on it satisfactory and prices offered remunerative as will lead to extended cultivation. It is to be sincerely hoped tobacco will prove to be successful, as we sadly want some product to set this colony going ahead, and there is one great thing in favour of tobacco—it can be grown and cured between the hurricane months.

The death of your senior struck me with a painful blow. I liked and admired him very much. He was so sterling and honest in all he said and did.

The reputation of the *C.O.*, *T.A.* and other papers issued from your office will, I feel convinced, not suffer, but increase under your management.

ROYAL GARDENS, KEW.

Bulletin for April has for contents:—West Indian Lime, Jaffa Orange, West African Cinchona Bark, Diagnoses Africanæ, III, The Coffee-leaf Miner, Miscellaneous.

CINCHONA BARK STATISTICS.

A compilation under this heading, by Messrs. C. M. & C. Woodhouse, of Mincing Lane, dated April 1894, is of very great interest. We first read that the tables are compiled as far as possible from official sources and show the statistical position of cinchona bark and quinine as completely as can be. As regards the Supplies (Table I), the exports from Ceylon, East India and Java are estimated to contain:—

1893 ..	8,441,000	ozs. Sulphate of Quinine
1892 ..	8,706,000	" "
1891 ..	8,913,000	" "
1890 ..	8,637,000	" "

This does not show any expansion of trade, or increased demand for quinine. Far from it. A second table shows clearly a great shrinkage in the quinine trade during 1893, which is probably chiefly due to a combination on the part of the principal manufacturers of quinine in Germany. Messrs. Woodhouse also allude to the great excess of imports over exports of bark in Holland, amounting in the four years to over 10,000,000 lb.: and as the stocks of bark in Amsterdam in first hands only account for about a quarter of this amount, it would be interesting to know what has become of the remainder. We append the first table which is of most interest to cinchona planters:—

SUPPLIES OF BARK.

Exports from Ceylon, British India and Java, 31st January to 31st December:—

	Ceylon	British		Java	Total
		E. I.	English		
		lb.	lb.		lb.
1893 ..	3,571,325	2,747,284	8,187,900	14,506,509	
1892 ..	6,793,320	2,456,024	7,191,300	16,440,644	
1891 ..	5,679,339	3,123,934	8,699,500	17,502,773	
1890 ..	8,728,836	2,294,379	7,291,200	18,314,415	
1889 ..	9,325,728	2,406,908	5,323,300	17,055,936	
1888 ..	12,482,817	2,297,305	4,306,656	19,086,778	

The arrivals in London of South American barks were estimated by Messrs. Widenmann, Broicher & Co.;—

	Calisaya.	Other		Total.
		South American.	Pkgs.	
	Pkgs.	Pkgs.	Pkgs.	
1893 ..	4,719	—	4,719	
1892 ..	6,661	—	6,661	
1891 ..	7,076	252	7,328	
1890 ..	5,574	80	5,654	
1889 ..	9,552	455	10,007	

The number of packages of African bark offered at auction in London have been:—

	Pkgs.		Pkgs.
1893 ..	1,994	1891 ..	724
1892 ..	4,309	1890 ..	221

COCONUT BEETLES: BLACK AND RED— AND THEIR DESTRUCTIVENESS.

OTHER ENEMIES OF THE COCONUT AND CACAO TREE, AND PLANS FOR PREVENTION.

We call attention to the letter of our correspondent Mr. E. N. Heanly and to his ingenious suggestion for the clothing of coconut palms as well as cacao trees with "hoops" of mica-sheets as a protection against beetles and rats in the former case, and of squirrels in the latter. Before discussing how far adequate protection would thus be afforded, and in the case of rats and squirrels it would probably be complete, the practical planter would want to know from Mr. Heanly an approximate estimate of cost. Apart from the labour of applying the mica, would not the mere first cost of the plates or sheets of that article,

no matter how thin, or how near at hand to the plantation, put any practical test entirely out of the question when it came to be a case of shielding some 70 to 80 coconut palms, or 300 cacao trees, per acre? We fear that even for the garden or compound of a bungalow with but a few dozen of trees that might require protection from enemies of the type alluded to, "the game would not be worth the candle" in the application of mica sheaths as a protecting band; although the experiment in the case of one or two palms troubled with rats and squirrels would be interesting. It would be interesting, for instance, to contract the crop of nuts from a palm so shielded, with that from its unprotected neighbour. Care would have to be taken however to select trees sufficiently apart; for, squirrels, and we suspect rats, having got up one tree, generally do not require to descend in order to get at the young nuts of another, but spring across where the branches touch or come within easy distance.

There can be no doubt of the destruction wrought by both squirrels and rats to the fruit of the coconut palm in its incipient stage, and we suppose in the case of rats, even to nuts of larger growth. Where trees return fair crops notwithstanding, perhaps the owners regard these little feeders as of some service in preventing the palm from trying to bring too many nuts to full maturity at one time? In the case of cacao, we know squirrels sometimes do immense mischief as the late Mr. Tytler found when he first, in Ceylon, commenced the industry on a considerable scale in the Dumbara Valley. But mica shields for every tree is out of the question for cost, as compared with setting watchers to shoot the depredators.

Turning now, however, to the more serious enemies of the coconut palm in beetles. Mr. Hoanly is under a mistake in supposing these require to crawl up the stem. The big black "Kurumeniya" flies freely about, especially at night, —it often gets into Colombo bungalows attracted by the lamps, and makes a great humming noise as it goes striking against the walls—and its favorite mode is to alight on the top and work its way if possible into the pith of the tree. If there is any open or weak place, we suppose, it at once finds lodgment and begins to burrow and feed on the young leaves or on the "cabbage." Of course, both in the case of this beetle and its more serious red compeer (the "Kandapanuwa" of the Sinhalese), young palms are specially affected, their tender growth and liability to injury making them often ready victims. Expert coolies quickly discover where the black beetle is at work and armed with a slender iron wire with a hook at the end, quickly pull him out. In the case of the red beetle, a mica shield—if it were peculiarly feasible—would be more effective; because they aim chiefly at the side of the palm, on some wounded or injured spot, and quickly burrow into the tree. A frequent means of giving them a chance of lodgment is the breaking off branches from young palms—branches or arms which seem superfluous and in the way; but which as Mr. Jacob De Mel (one of the most intelligent and enterprising of Sinhalese landed proprietors) assured us only yesterday, should never be broken off and in accordance with that view he has issued strict orders for all his coconut palms.

Now, we had read a great deal about the destruction wrought by beetles among young palms; and in compiling our Manual "All about the Coconut Palm" it was our special duty to do so. But coming face to face with the reality in this as in so many other cases, is worth far more than a pro-

longed course of reading. We had no proper idea of what harm can be done until our visit of the other day to the Deduru-oya region. The harm arises from not keeping young clearings consistently clean from the outset, taking care above all things to prevent jungle growth between the young palms, and to burn or get rid of all decaying timber. If this is done, there is no breeding place available for the beetles. We have learned our lesson at some considerable expense and take no small share of blame for ignorant unintentional neglect in one case for which we are indirectly responsible. This is not likely to recur; but here as in the case of thistle-infested districts in Tasmania or white-weed on our coffee plantations, the proprietor who scrupulously does his duty by his own clearing, is liable to suffer nearly as much from the neglect of his neighbour. The beetles once bred in an adjacent plantation make no scruple in their nightly flights about crossing boundaries and attacking palms on the clean estate. This evil has been realized in the new Deduru-oya and Rajakadaluwa district, and Mr. De Mel—who is one of the largest proprietors there—is very strong on the point that something should be done to remedy the evil. In Australia, a "Thistle Prevention Act" was passed under almost parallel circumstances, and in coffee plantation days, more than once, an ordinance to empower a neighbouring proprietor to clear up a white-weed-covered field with power to recover the cost as a first charge, was talked of. Mr. W. H. Wright of Mirigama—who is *facile princeps*, the most advanced and enterprising practical coconut planter at present at work in Ceylon—does not wait for the Government or public opinion to help him. He has opened one of the finest coconut plantations in the island, and devoted the utmost care to the cultivation and development of his palms. But he is surrounded by native gardens which are too often entirely neglected, and so prove a nursery for beetles. What does Mr. Wright do? He requests permission to examine all the surrounding palms, and he pays 50 cents a tree for leave to kill and burn utterly every one infested with beetles past remedy! He thereby, to some extent protects himself; but while this course is necessary in the case of small village gardens, it ought not to be so, between proprietors of considerable clearings. Self-interest in such cases ought clearly to point the way and to induce each proprietor or lessee to clear up his land, burn all decaying timber or rubbish, to examine his trees and to deal promptly with those affected, for his own personal advantage as well as *pro bono publico*. We trust this course will be universally followed the new Coconut District beyond the Deduruoya.

TEA IN SOUTH INDIA.

Considerable attention is being attracted to tea in Travancore, where all conditions point to suitability either in soil, climate or rainfall. The favorite sites, and from which the largest yields are obtainable, are situated between 1,000 and 1,500 feet above sea level, which, allowing for difference of latitude, assimilates to the Assam gardens above Tezpur. Manipoorie indigenous is much sought after and recommended for the place as better able to accommodate itself to the climate than the usual hybridised varieties; that the yield of the gardens is said to be far in excess of that of the Nilgiris, amounting to from 800 lb. to 1,200 lb. per acre as against 200 lb. to 400 lb. in the mountains. The average prices being much upon a par. Considerable as the elevation of the Travancore gardens is, the planters complain of the intrusion of elephants,

mostly at night time, when the plantations are at the mercy of these troublesome beasts.—*Indian Planter's Gazette.*

THE KANGRA VALLEY AND TEA.

Kangra, April 17.

The tea season in the Kangra Valley is now in full swing, and all the planters are busy with manufacture. Heavy winter rains, followed by genial spring weather, have brought on a rush of leaf, and prospects at present point to a bumper crop for quantity and quality. There have been some changes in the management of the two largest concerns in the district, the Holt and Hassan Tea Companies. Mr. Compton, a former Manager of Holt, has returned from England after an absence of six years, to superintend the two concerns, and thus these plantations—rivals of nearly forty years' standing—find themselves now for the first time facing the tea market arm in arm, instead of each trying to get a bulge on the other. Our local society has been further augmented by the arrival of two young gentlemen from England—we do not call the budding planters Kangra creepers in this district, whatever they may do in Ceylon—and the European community within ten miles of Palampur town numbers not less than twenty souls.

Civilisation in the shape of tea manufacturing machinery has made wonderful strides in the Kangra district during the last few years and some of our local factories would surprise those whose memories travel back to the old days of manual and pedal manufacture—for the foot was often used to accelerate the weary process of rolling the leaf. *Nous avons change cela*, and the visitor invited to inspect any of our factories now will find us quite up to date. The larger factories are each fitted with a couple of engines and boilers, driving two or three rolling machines, and as many sifting, equalising and firing machines, whilst the eye and ear are bewildered with the motion and buzz of shafting and belting and the speculative mind is surprised to find how accustomed the native seems to it all. God bless him, and so he ought to be, for he is a gentleman at large in comparison to what he was. In the old days of hand manufacture three coolies were allowed to each hundred pounds of leaf (say 25 lb. tea.) Thus with a daily gathering of 10,000 lb leaf 300 men were required in the factory. Now our machinery performs the same work—and infinitely better too—with the assistance of only thirty or forty hands, whose duties simply consist of shifting the leaf from one machine to another during the process of manufacture. And as each operation is begun or ended, the engine's steam whistle shrieks out defiance, or bellows forth a paean of joy, which Himalayan kiock and khud re-echo back whilst those who have not yet got machinery protest against our making night and day unlovely with such hideous and irritating noises.—*Pioneer.*

DURBAN (NATAL) BOTANIC SOCIETY.

TIMBER TREES AND FODDER GRASSES.

We have received a copy of the Report on the Natal Botanic Garden for the year 1893, by the curator Mr. J. Medley Wood, A.L.S., Corresponding Member of the Pharmaceutical Society of Great Britain. In presenting his report which is his twelfth, Mr. Wood says that the past season has been one especially favourable to the growth of plants, and that the condition of the trees and shrubs in the Gardens is all that could be desired. The rainfall for the year has been quite an abnormal one, amounting to 71.27 inches, which is 31.54 inches above the average of the last twenty years, the heaviest fall during that time being in 1874, when it reached to 55.06 inches. On the night of September 28th they were visited by a heavy hurricane, which caused considerable damage in the neighbourhood, but the Gardens being somewhat sheltered by the Berca hill, they escaped

with but little loss. A tree of *Eucalia natalensis* near the main walk came down, and in its fall took off the complete head of leaves of their finest specimen of *Cocos plumosa*, and also destroyed a light iron archway covered with climbers near the out-door Fernery; the palm, however, was slowly recovering, though its beauty was gone for the present. A large *Acacia* tree also came down, and in its fall destroyed their only specimen of *Ictona grandis*. Several *Eucalypti*, a *Loxostylis* and a few other trees and shrubs were more or less damaged. Details are then given regarding various works connected with the upkeep of the gardens; and lists are next given of those from whom seeds and plants and publications were received during the year, and of plants that have flowered or fruited for the first time in the Gardens. Of a few of these plants special mention is made including the following:—*Dammara australis*, "Kauri Pine."—This tree, which has been for many years in the Gardens has this season for the first time borne cones, from which a few seeds have been obtained for planting. It appears to thrive in the coast districts, and we shall now, I hope, be able to give it a trial in the uplands. The wood is valuable, and the tree yields the gum known as "Dammar." *Polygonum sachalinense*. A root of which had been received by the kindness of Mr. R. Jameson, from which they had now two plants, both growing vigorously. Its rate of growth has been measured in late spring or early summer to be 3½ inches per shoot per day, and, as one friend said, 'You may almost stand and watch it grow.' It has of late been brought into more prominent notice in the National Society of Agriculture of France. They specially commend it as a forage plant, and although it loves the vicinity of water it proves to be a good grower in a droughty season like the present. This is a most commendable property. Experiments are said to have given results highly satisfactory. The green yield is said to have been 44 lb. to 88 lb per square yard, or 95 to 190 tons per acre. Bees are very fond of the flowers, and cattle extremely fond of the foliage. Doubtless, more will be heard of the plant ere long. It does not yield seed, and therefore has to be planted by pieces of root, every short piece of which will make a plant and grow strongly the first year. The new shoots or sprouts in spring are stouter than the thickest asparagus, and much resemble that vegetable; indeed the shoots have been used in a similar way to asparagus. "In well kept gardens it should be planted judiciously or owners may have to speak bitterly of it, as Mr. Joseph Buckton does who aptly describes it as 'original sin.' Notwithstanding the tropical appearance of the plant, it is capable of enduring our worst and coldest winters, and once it gets possession of good light soil, it grows amazingly, and indeed in the worst soil in which vegetation can live at all, it thrives in a degree beyond comparison with most vegetation."

Sand Stay Plants.—In May last, says the reporter, I received a letter from the Secretary to the Harbour Board, asking for information as to certain plants used in Australia for fixing drift sands, and enclosing a specimen of one of them, which however, not being in flower or fruit could not be identified here. I therefore forwarded it to Baron F. v. Mueller in a separate envelope, together with the information I had received about it asking him for his kind assistance in the matter, and in September I received from him a closed case containing plants and also a letter, from which the following is an extract:—

"This day, dear Mr. Wood, I despatched to you a case containing plants of *Psamma arenaria*, the 'Marram' grass, for your sand coasts as you may not yet have this the best of all sand-staying grasses. Your letter indicated a sample of plant of similar utility from West Australia but no specimen was in the envelope. But I am quite sure, whatever it was it could not compare with the *Psamma*, nor the *Elymus arenaria*. Both were introduced by me, and the plants of *Psamma* now forwarded were reared on the sand dunes of Port Fairy by Mr. Amory, the

Superintendent. * * * * Into the box I put also some roots of *Spinifex hirsutus*, as this species and the few other congeners are not natives of any portion of Africa and all help to bind coast sands. Into the same box I put roots of *Panicum spectabile*, here called the 'Wonder grass,' for pasture.

On arrival of this case however, only one species of these plants were living, and as they were not labelled I can only as yet conjecture which it is. I think, however that it will prove to be the *Spinifex*. Several plants of it are growing, and will be planted in the sandy soil of the lower portion of the Gardens, and we shall propagate them as quickly as possible. Another attempt will therefore have to be made to introduce the "Marram grass," *Psamma arenaria*.

Appended to the report is an abstract of meteorological observations for 1893, taken at Natal Observatory, Durban; a statement of the receipts and expenditure, showing a balance in the Natal Bank of £217 16 7, a report on "Field Experiments with Sugar Cane"; and a report on the Colonial herbarium.

TEA AND SCANDAL.

THE BALLAD OF SIR T. TEA-LEAF.

It was three gallant Chinamen,
With long tail and pig eye,
And they have sworn a solemn oath
Sir T. Tea-leaf must die,
And they have taken and flung him down
Upon an iron bed,
And underneath with cruel hand
Have heaped the ashes red,
They've spread him out and press'd him down,
And turn'd him o'er and o'er;
They've dried him up, until he curl'd,
And writhed in suffering sore,
In vain he twist'd and he turn'd,
In vain he cried for grace;
They kept him so and scorched him till
He grew black in the face,
But finding he was still alive,
Their malice waxed more keen;
They dosed him first with Prussian blue
Till his poor face turn'd green,
What sparks of life might still remain
Determin'd to fredo,
They gave him next a bitter draught
Of gum and catechu,
And on his death his name they chang'd,
Lest men their crime should know,
And when men ask'd "who's that lies there?"
They answer'd "Young Pekoe."
Whereas his name and family,
It really was Sonchong,
Kekelat to the old Congous,
A race both rough and strong,
Lest men should recognise his dust,
To dust when pass'd away,
His calcined bones they kneaded up
With lumps of China clay,
Their pois'ned victim then they wrapped
In lead, with well-feign'd grief,
And wrote the epitaph outside,
"Here lies Sir T. Tea-leaf."
And though their grief was all a sham,
The epitaph was true,
For 'here' it said a 'Tea-leaf lies,'
And 'lio' such Tea-leaves do.
Now Tea-leaf's name's in repute
In lands beyond sea,
Where maiden ladies love him much
Under the name Green-tea,
Ah! little dream these ancient maids
Of Chinamah's vile craft,
Nor think while chattering o'er their cups,
'Their's poison in the draught.
And little know they of the fate
Poor Tea-leaf had to meet,
Or in their tea-pots they would weep
Tears bitter as their tea;
Till with the water of their wo
Even the first brew was spoiled,
And the presiding maid would be
Obliged to draw it mild,
Then to poor Tea-leaf drop a tear,
By poison doom'd to fall,
And when there's green-tea in the spot,
May I not drink—that's all.—*Punch*, Nov. 29th, 1871

"TEA, I consider a very palatable and harmless drink, and a most useful restorative when a person

is fatigued. This is due to a substance called *theine* which it contains. There are very few people who cannot take Tea with benefit (when taken in moderation) to the digestive system. Of course the abuse of Tea (like the abuse of any other food or drink) brings on many diseases, more especially those of a nervous order; also flatulency, palpitation of the heart, constipation, &c. These latter complaints are caused by its being improperly made, the tannin being consumed with the infusion.

Tons upon tons of the Tea which is imported into this country are absolutely thrown away and the virtue destroyed by housewives not attending to the making of it. Why should people when entertaining you at afternoon tea, give you a cup of black, bitter stuff, which, if you drink, will most surely make you feel ill? or again, why should the pleasure of the breakfast table be entirely spoiled by the presence of this black liquid? People will persist in keeping the hot water on the leaves and adding to it, instead of pouring on the leaves boiling water sufficient for the table, and after it has stood for between 3 and 5 minutes (according to whether China or Indian Tea, is used) pouring the infusion into another hot teapot leaving the leaves in the first teapot. A second lot of water should never be added to the leaves, they are finished with, and only contain the baneful *tannin*, and are of use only when the carpet requires sweeping. The method is so simple that it is unintelligible to me why it cannot always be made properly, and thus instead of causing it to produce injurious effects on the drinkers make it a drink which would bring comfort and joy to the tired and wearied. The water should be *soft* (if *hard*, a little carbonate of soda thrown in will remedy it), and allowed to boil, and as I have already stated, the quantity of water required should be poured on *at one time*. The great drawback to tea is its constant adulteration with all kinds of things, and the frequent substitution of leaves, such as sloe, hawthorn or beech leaves in the place of the pure leaves. This substitution can, however, be easily detected. "The pure Tea-leaf when unfolded has its whole length like the edge of a saw (serrated). The veins run out from the tendrils. The leaves are odourless when freshly gathered, the taste and aroma being developed during drying. The colour in Tea is often produced by the use of Prussian blue, indigo, and burnt gypsum."

COFFEE.—The remarks just previously made byme as to the making of Tea apply with equal force to coffee, for the greater proportion used in this country is literally wasted through being improperly made. I know no method better than to take 4 table-spoonfuls of freshly ground coffee, place it in a clean muslin bag, and throw it into a pint of hot water just upon the boiling point, and then let it boil for a minute or so.* Coffee is a pleasant beverage for people with whom it agrees, but there are a great number of people who cannot drink it without its causing palpitation of the heart, indigestion and biliousness, and these should carefully avoid it. It is a stimulant, and increases the action of the pulse, and relieves the sensation of hunger and fatigue, and cures headache in those with whom it agrees. The beneficial ingredient in it is *caffeine*. Coffee is a much milder beverage than Tea. Dr. Pavy says it was used in Abyssinia as far back as A.D. 875.

COCOA.—I shall now conclude this article on non-alcoholic drinks by dealing shortly with cocoa, which is a drink and food combined. It is extremely nourishing but unfortunately agrees with very few people, the oil it contains being too rich for weak stomachs. When the stomach is able to assimilate this oil, it is a food of very great value, particularly for the growing child and people who are suffering from debility, either the result of some fever or due to consumption. A cup of hot cocoa taken before going for a long walk or retiring to rest, is of very great benefit and sustenance. Cocoa is also the subject of adulteration, and we find it mixed with starch, sugar, and fat:

* We should make an infusion of tea, but a decoction of coffee.

naceous substances, which are very often the causes of heat, acidity, &c. To insure its purity I should advise the reader to buy the nibs, and grind them when required.

Some of the manufactured article is very carefully prepared only from selected nibs, and can be used with perfect confidence as to its purity.

(*Digestion and Diet rationally discussed.* By Tho. Dutton, M.D., Univ. Durham, London, 1892 p. 102-6.)

TEA, SWEET TEA.

'Midst mansions or cottages, where'er we may be,
Be it ever so feeble, there's nothing like tea.
A balm that restores seems to perfume the air,
Which, seek through all comforts, is not met elsewhere.

Tea, tea, sweet, sweet tea
There's nothing like tea
There's nothing like tea.

Forbidden my tea all else tempts me in vain,
Oh give me my Chinese infusion again.
The urn singing gladly, responds to my call,
And brings back the soothing draught, cheering to all.
Tea, tea, sweet, sweet tea
There's nothing like tea
There's nothing like tea.

—*Edna.*

A. M. FERGUSON.

PLANTING AND PRODUCE.

AN OLD STORY.—We have often pointed out the inquiry inflot on the tea industry owing to the stupidity with which ignorant consumers set about the task of brewing tea, and the recklessness with which they drink it at odd times after the leaves have been stewed for hours. While we have deplored the injury to the industry, we have felt sorry for the depraved tastes of the consumer. The injury to the trade is caused by the opportunity this abuse of the tea drinking habit affords to dietetic experts, so called, for attacking tea. Instead of pointing out that tea drinking under reasonable conditions is not harmful but beneficial, and that, like other goods, the tea leaf was never intended to be abused, these dietetic reformers rail at the habit as if it were a vice, and talk of tea as though it were opium.

TEA DRINKING IN WALES.—Attacks on tea-drinking come from unexpected quarters. For instance, Miss Winifred A. Ellis, of Gynlisa, Merionethshire, and sister of Mr. T. E. Ellis, M. P., first Ministerial Whip, has been giving evidence at Corris, Merionethshire, during the past week, before the Departmental Committee appointed by the Home Secretary to enquire into the working of the underground slate quarries at Merioneth. Miss Ellis said she had been giving lectures on plain cookery at four centres in Merionethshire. Incessant tea drinking, she said, was undoubtedly becoming a real calamity to the physique of men and women. The neglect of porridge, oatmeal cake, "bera llath," "oawl," and "shot," in favour of tea three or four times a day is, the witness continued, to destroy the stamina to induce indigestion and dyspepsia, and to bring about enfeeblement of body and mind. Tea has such a charm for some people that they are sensitive about putting away the cups and saucers when they are not actually in use. Tea often serves as breakfast, dinner, and supper, the only accompaniment being bread and butter, and sometimes tinned meat. This was insufficient for a hard-working man or woman. "I regret," Miss Lewis said, "that as a rule the women at any rate prefer pancakes swimming in butter, with tea, to a good dinner. Miss Ellis makes the attack on tea drinking, so far as we know, without any statistical facts in support of her statement; but allowing that all she says is borne out by the real facts, to talk of tea drinking as a "real calamity" is strong language even from a lady lecturer on plain cooking. If these unfortunate people were told how to make it and when to drink tea the evil would be remedied. As evidence of the effect of statements of this kind, an evening paper quoting Miss Ellis's speech asks how soon will tea have to

be added to the "drinks" which temperance reformers place on their list of things to be avoided adding that a strong case against tea is presented in the curious and interesting evidence. This is how "strong cases" are built up.—*H. and C. Mail*, April 13.

FIRE-PROOF TEA FACTORIES.

Our Ceylon friends have been discussing the very important matter of having all factory buildings constructed of fireproof material, and Assam proprietors could testify to the advantages of this. The prime causes that caused the N. Eastern planters to adopt kutcha in lieu of pucca, buildings were first the danger from earthquakes as experienced on the memorable afternoon of the 10th January 1869, and that, when gardens were being planted solely for speculation, it was not deemed necessary to go to any great expense for housing either the managers or coolies; in fact, a good deal of the mortality and invaliding in the early days of planting was undoubtedly due to the wretched hovels considered fit for habitation by the projectors of Companies, for their employes. Things have altered since then and as Ceylon is not exposed to the same violent seismic disturbances as Northern India, we are strongly of opinion that substantial buildings should form the rule; thus getting rid of the interminable expenses of annual renewals and repairs.—*Indian Planters' Gazette.*

A NEW TEA ROLLER.

The *Patent Journal* of the 4th ult. has a drawing and short explanatory notice of a new tea rolling machine by that indefatigable inventor, the late Mr. John Brown. The patent relates to machines in which a box containing the tea and an under rolling surface receive a circular translating movement from crank-shafts; and it consists in adding an upper plate or lid, carried by a shaft and counterbalanced by a lever and weight. The shaft is driven by an extension of one shaft and another shaft through bevels which drive the lid in the same direction as the tea, but at a greater speed. One of the bevels may be loose, so that when the sliding clutch is out of gear the lid may be driven merely by friction with the tea.

INDIAN TEA: THE ENSUING SEASON.

Despite the drought and subsequent storms in the early spring, the tea season may be said to have commenced under fairly promising auspices, in so far as the prospects on the gardens are concerned; and if fine plucking is more generally adopted it may be possible to curtail the out-turn so as to maintain some equilibrium between the demand and supply which would mean better value. It would be far better to turn out nothing below moderately good pekoe souchong; (we write quite as much in Ceylon's as in India's interests) and were this adopted we believe the rise that would result from diminished supplies, would more than compensate for the greater weight in the bulk of the year's out-turn. But in order to accomplish this, co-operation must be thoroughly and loyally observed, or the tea industry at the close of what may be called an extremely critical season, will be very likely to prove the truth of the adage about "a house divided against itself." The gist of our advices from England, America and the Colonies all tend to shew that the trade are reckoning upon increased supplies, or in Stock Exchange parlance, operating for a fall and unless measures are at once taken to frustrate this many estates will close the year with losses that will land them on the brink of insolvency. Many devices no doubt will be resorted to in order to tempt the planters into increasing their out-turn should restriction be agreed upon, but it will be the duty of the Tea Association in London to keep the community constantly informed of these trade manipulations. *Indian Planters' Gazette.*

THE FIXATION OF NITROGEN BY PLANTS.

English, American and German chemists and biologists are now scientifically investigating an important fact in plant life and culture which may, and probably will, soon be "fraught with consequences the full significance of which," says the *London Times*, "is hardly yet grasped, and the economical application of which belongs to the future." Also our old friend Mr. "H. Marshall Ward," writing simultaneously and independently on the same subject in *Nature*, concludes an able review of the present position of the enquiry in these remarkable words: "Such, then, are some of the chief ideas, &c., &c." This full and weighty article is reproduced at length on page 802 of this issue; but here we can only direct the attention of our readers to what they will see is likely to end in a new departure in economical agriculture, whether the plant cultivated be wheat or tea, or any other staple. The value of the rotation of crops, already too long practised by tillers of the soil all over the world—one crop being grown as the best fertilizer of the one to follow—proves that the practical observation of the cultivator long forerun the explanations of modern science, which necessarily moves slowly to its conclusions in face of the stupendous difficulties of proving its hypotheses as without positive proof, science lags in doubt. But new discoveries daily put new powers into scientific hands, which scientists do not fail to employ, and the light of recent discoveries in bacteriology is at once turned upon previously known but little understood phenomena, and, lo! a new truth is unveiled in the secrets of nature, and man is the gainer. At present much has yet to be done in the way of experiment, ideas exchanged, and differences of opinion reconciled, before a new law can be definitely established; but the scientists already know for certain that they are on the right track. And it may yet be discovered, in the very near future, that tea and other plants, either by association in growth with other kinds, or by some system of inoculation of roots or leaves, may be led to absorb their nitrogenous food direct from the ocean of the atmosphere, as they do their carbon, and thus the application of corresponding manures to the soil be forever superseded. This possibility (the most important of all) turns on the fact that the roots of certain leguminous plants "are invaded by a microscopic and essentially parasitic organism" possessing the power of "fixing and assimilating the free nitrogen of the atmosphere," resulting in "nodosities or swellings on their roots." And Mr. Marshall Ward thus sums up the possibilities to economic agriculture this discovery may bring about: "At the expense of carbohydrates so richly furnished to it by the host plant, the fungoid organism alone supplies the machinery for forcing the nitrogen into combination, and then, when it has stored up relatively large quantities, owing to its activity in the incubators—the root nodules—provided for it by its host plant,—and is diminishing in resisting power—the latter at length turns round and absorbs the stores!"

COCONUT CULTIVATION IN THE NORTH-WEST OF CEYLON:

THE PALM-GROWING COUNTRY BETWEEN OHILAW AND PUTTALAM: NO. I.

We have just returned from a visit to the district beyond the Deduru-oya, North of Chilaw, Ceylon, and feel more impressed than ever before with the

importance of the planting industry, fast developing over many miles along both sides of the main road to Puttalam. This makes our fourth visit within seven years, and each time we have had occasion to be more and more struck with the fitness of the soil and climate for coconut palms. Our last visit took place so far back as December 1890, so that the change witnessed on the present occasion in over three years' growth on planted fields was, of course, very marked. It is no new story to speak of successful palm cultivation along the coast North of Colombo: the Negombo district has long been regarded as 'good'; the Maravilla division of Ohilaw as 'better'; and the Madampe-Ohilaw section as 'best'; of the three, it would be a difficult matter to beat Madampe in the luxuriant growth of its palms and the early age at which the trees there come into bearing. Such shrewdly successful native capitalists as Messrs. De Mel, De Soyza and Jeronis Peris have long ago proved to their own satisfaction the advantage of investments in Madampe; but we believe, we shall have the support of some of these gentlemen, at least, in saying that where the land is well-selected, carefully planted and attended to, plantations north of the Deduru-oya are likely to beat even those of Madampe. Messrs. De Mel have proved their faith in the region we speak of, by investing and planting very freely. Their young plantation about six miles North of Chilaw is most promising in its growth, and it was this promise doubtless that led them very lately to purchase another block of land still farther north (though within Mr. Noyes' Ohilaw district) notwithstanding that keen competition raised the price to R100 an acre at which the Assistant Agent knocked it down to Mr. De Mel. Since then several other investments have been made by Ceylonese, and one by the Messrs. Sten who are opening forthwith. And no wonder, if the appearance of the young palms on the existing plantations is to be taken as a guide. Unfortunately, the pioneer plantation—opened by the late Mr. G. D. Miller—has fallen on evil days, though the native lessee will, we hope, begin to do justice in clearing jungle growth from this fine property. The adjacent estate, which also got neglected about the same time, is being rapidly put in order; but the wonderful thing in both cases is, how the palms have grown even where beset with a crowd of rivals for the advantage of both soil and light. In fields taken care of all along, as on the fine property of Polgaswella, and on that of Messrs. de Mel, there has been the fullest response. But our tests were applied on fields which had suffered temporary neglect and yet trees with a circumference of 6 feet (24 inches diameter) were measured under five years old, and quite a thousand of such palms in 160 acres were blossoming, or in bearing, some with big nuts, at the same early age. The fear may naturally be expressed—as we did not fail to express it to the experienced Coconut planter who accompanied us—whether coconut palms coming into bearing at so early an age, was a good sign; but in the face of such growth of stem, our companion had nothing but satisfaction in contemplating the first fruits. There is, moreover, the fact that the most flourishing Madampe plantations came into bearing at a very early age, and have gone on prospering.

Of course, it is not to be supposed that there are no drawbacks: both beetle enemies of the coconut, the big black one and the much more deadly smaller red one, find a splendid field for their depredations, especially while neglect of decaying timber and jungle growth has given the beetles admirable breeding scope. We saw beetle-

hunters bringing in 20 to 30 "Kuruminiyas" and several of the red "Kandapanuwas" as the result of a morning's hunt; while it was truly mournful to see the effect of the latter's attack on some of the largest palms, through burrowing in their side and the larvæ penetrating to the vital core of the palm. At the same time, the ingenuity with which, under experienced direction, a sharp cooly was engaged in the attempt to save some of the trees so attacked, was very interesting to watch. There is another great drawback, in the fact that this region alongside or North of the Deduru-oya—so favourable to the growth of the coconut, in the mixture of sandy-alluvial-brackish soil if we may so term it—is by no means congenial to human beings, at any rate during several months of the year. No doubt amelioration may be anticipated here, as has been the case in the Maha-oya Valley, as clearings extend, and more care is taken about residences, cooly lines and the water supply. The benefit already conferred on the villagers by the money of the planters distributed amongst them for felling, clearing and other work, is very considerable, and we look for extended operations until all the way from Chilaw to Puttalam and for a good many miles off the road, there is one continuous scene of cultivation with the palm which already so especially distinguishes and benefits Ceylon.

THE LAND OF COCONUTS AND TOBACCO. THREE DAYS IN THE NORTH-WEST: NO. II.

When we say three days, we mean one day getting to Chilaw; the next day inspecting beyond the Deduru-oya; and the third day returning to Colombo. Still, the greater part of the travelling was done in the North-West Province. Now of all our provinces, this is scarcely the one to be associated with "prosperity" and yet in this respect, the Acting Government Agent (Mr. King) whom we met with the District Assistant (Mr. Noyes) at Chilaw, may challenge any native district in Ceylon in competition with the Marawila division of Chilaw; while in regard to "revenue" where have the Government such a deposit of wealth as in the Salt Depot at Puttalam!

It is the correct thing to speak of

THE DRIVE TO NEGOMBO

as through one long avenue of palms; but there are considerable intervals, and after leaving the river, the road being rather narrow, we were most conscious of continuous rows of plantain shrubs, whose great flapping leaves met almost across or above the coach. The temptation to cultivate plantains as well as other fruit, for the supply of the ready Colombo market must be very great in the neighbourhood of the Municipality. Our impression is that after a few miles out on the Negombo road, native coconut gardens are far more regularly planted and better looked after than they are along the roadside south of Colombo. How great a blessing to the owners of the latter if an "Agricultural Headman" had the power to go over all native palm and fruit-gardens in order practically, to prevent the overcrowding of palms or other fruit trees. Villagers too often think that the more plants and trees they cram into a tiny plot of soil, the better off they are, the consequence being that there are many square miles of good occupied land in the lowcountry not giving half or one-fourth the quantity of food or other produce it would yield under a system of proper cultivation.

The road is in good order along our Negombo-Chilaw route; we notice the many admirable cross and branch roads; the neat little Jayella resthouse, nestling by its sluggish stream, and by and bye the first of the regular cinnamon plantations—once so famous, now so low in the scale of profit yielders—attract attention. The nearer we get to Negombo, the better the cultivation and growth,

and the more frequent the signs of a well-to-do people.

NEGOMBO

itself is a wonderfully busy town; such crowded bazaars; such a multiplying of boutiques since we were last there, and sure signs of prosperity, two great new Roman Catholic churches—or cathedrals—rising up within very short distance of each other!

We have sometimes speculated as to whether Palm branches and leaves are as freely used in Ceylon as in Italy and elsewhere by Roman Catholic communities on Palm Sunday? The Date Palm is so utilised in Italy and in parts too far North for it ever to bear fruit, this palm is cultivated because of its leaves and branches in which a regular trade takes place, for ceremonial uses. Farther North in Europe the leaves and branches of other trees (for the nonce, called palms) are used, specially those of the willow. This is noticed by Dr. Seeman in his interesting "History of the Palms," and he quotes the charming lines from Goethe:—

"In Rome upon Palm Sunday,
They bear true palms;
The cardinals bow reverently,
And sing old psalms:
Elsewhere, those psalms are sung
Mid olive branches:
The holy branch supplies their place
Among the avalanches:
More northern climes must be content
With the sad willow."

From Negombo northwards to the Toppur village (with a crowded bazaar scarcely inferior to that of the district capital) we have a dense population. The very neat as well as strong Toppur iron bridge (across the Maha-oya) was made in the Government Factory and a trip over it always make us regret that it should be so narrow: no two vehicles can pass each other on it; while two or three feet more in width would have made all the difference.

We are now in the

NORTH-WESTERN PROVINCE,

and at first the change does not strike one as much for the better; but later on as we pass into the fertile Marawila district, with its deep chocolate-coloured soil, its grand avenues of palms with such loads of nuts as are seldom seen anywhere else, we note a difference. Hence, right on to Chilaw we are in a land of plenty, so far as the traveller can judge. The people all look sleek and prosperous; their gardens well taken care of and properly planted. We cannot speak of the large plantations which lie off the road including some highly spoken of belonging to Messrs. Schrader, De Soysa and others before we get to the entrance to Horekele. The late Mr. De Soysa has left his name in the Marawila district by the erection of the very neat-looking and useful Hospital: Marawila resthouse seems a quiet little place, standing back from the road and seldom used, perhaps, save by the Chilaw Magistrate when he holds Circuit Court there. On our way back, we had the opportunity in a garden near the road of seeing a veritable curiosity in a coconut palm with four distinct heads, all bearing fruit. At Mount Lavinia there can be seen one with two arms bearing nuts; but the Marawila one is doubly curious to specially photograph the result sent to Kew. The coconut gardens here are very valuable; some of 15 to 20 acres were pointed out as for sale—upset price R800 per acre!

MADAMPE.

As we pass Horekele and approach Madampe we come on further properties of the Messrs. De Soysa, De Mel and Jeronis Peris.

From Madampe,

ALL THE WAY TO CHILAW,

the cultivation becomes more diversified, and stray specimens of the Palmyra indicate our entrance into a

drier zone * and also that we are drawing near to the Tamil division of the island? But so far as race is concerned, we have been noticing a remarkable change in the features of most of the people ever since we crossed the Maha-oya. Is there not a tradition of a Tamil settlement in one of the Sinhalese Korales—but that was, if we remember rightly in Alutkuru Korale North, while even in Pitigal Korale South, we are arrested by what seems to us a

BLENDING OF TAMIL AND SINHALESE FEATURES, the forehead and eyes seem especially of the Tamil order, and some of the women remind us of the peasant class on the East Coast of Italy, between Brindisi and Ancona. There is a more animated, piquant expression in such cases than is seen in South Ceylon.

Which is the more attractive in appearance the Coconut or

PALMYRA PALM?

Possibly, it is because of the greater novelty that we are specially attracted by the latter. With its well-developed, erect stem and compact as well as ornate head, the Palmyra more than the Coconut seems to us to justify Miss Jewsbury's line,

A column and its crown a star!

We never see a Palmyra that we are not reminded of a venerable and learned Botanist, Dr. Prior (a great friend of the late Sir J. F. Dickson) next to whom we had the honour of sitting at a Linnæan Society's dinner. The conversation ran on palms: he had been in the West, but never in the East Indies. We mentioned the Palmyra; Dr. Prior seemed puzzled—he could not recall the name—"Do you happen to remember the scientific name?" he said. Fortunately we happened to do so and as "*Borassus flabelliformis*" was rolled out, the old gentleman's eye brightened—"Oh, I know perfectly what you mean now."—It is a great pity the Palmyra takes so much longer than the Coconut to mature; there are many thousands of acres in the drier parts of the island that ought to be covered with this most useful palm. The late Rev. J. Kilmer, when head of the Wesleyan Mission in the North,—during the early "sixties"—had a splendid idea, which however, he tried in vain to get the Rajah, Mr. Dyke to take up. It was that every traveller down the North road should pay toll by having to carry with him a certain number of Palmyra nuts—they are comparatively small—to be planted alongside the road and marked by stakes, so that others would follow on, the result in time being one long avenue of Palmyras from Elephant Pass to Annadhapura. The idea was by no means chimerical or impracticable; the palmyra seed is very hardy and will hold its own when once it germinates and takes root even in the midst of jungle and that it readily takes root on its own account may be seen by the following experience. Along a good deal of the two miles of road between Chilaw town and the Deduru-oya we observed what seemed to us a fairly regular series of young Palmyras growing in the reserve on each side of the macadamised portion. We were giving the Assistant Agent credit for planting an avenue, perhaps with prison labour, as an improvement on the avenues of young rain-trees (*Pithecolobium saman*) sadly in need of lopping, which overshadow some of the Chilaw streets. But Mr. Noyes speedily disabused us of this idea, any palmyras growing as we described, were self-sown—a most encouraging fact as showing the suitability of climate and soil and the hardy character of the palm. An avenue all the way from Madampe to Puttalam might readily be started in the midst of the road

* Here too the stately leafy Tamarind and the useful Margoa tree as well as more than one species of *Ficus* become common. The country is a splendid one for fruit trees: mango trees are numerous and loaded with fruit, North of Negombo; while from North of the Deduruoya, great supplies of plantains are carried even to the Colombo market, and this region has just the climate and soil in which oranges and limes could be freely produced.

reserve at the merest trifle of expenditure and far enough to the side not to act as a shade for the macadamised thoroughfare, such as practical Road Officers detest.

We were just too late to see on the fields before harvesting, one of the finest

CROPS OF TOBACCO

that the Chilaw townsmen have ever harvested. The profit is said to average at the rate of Rs. 1,000 an acre—and there is no excise! How thoroughly the Revenue Officers of experience must feel that in place of dropping the immemorial paddy rent (save in granting liberal exemptions to meet hard cases) the principle of such

LAND REVENUE

should be gradually but surely extended, until as in India, it embraced all crops and superseded other unscientific forms of revenue collection. It will come by-and-by of course; but how the rash, imprudent action of 1892 will be blessed in that day! "After a good tobacco crop, comes a crop of litigation," we found to be the proctor's experience and saying in Chilaw: that is money abounds and quarrels are revived! All round the little town and in nearly every garden, compound or backyard—in every waste field,—nay up to the very steps of the great entrance to the Roman Catholic Church,

TOBACCO

has this year been cultivated. Chilaw looked like one great cabbage garden as we saw it; for, while the long top leaves of the tobacco plants are taken off, the stalks and lower leaves are left as they stood and we found them with quite a verdant appearance. The oadjan drying sheds for the harvested crop were also all over the place, and men and women, chiefly Tamils—were busy handling and drying their bundles of leaves. The wholesome flavour pervaded nearly every street or lane. It must have a good sanitary effect in two ways: first, in the care with which the scavenging and refuse of the place are used up for manorial purposes; and secondly in the powerfully odoriferous leaves (while drying) driving away insect pests including possibly mosquitoes.

Our coast journey terminated at Chilaw: thence to the heart of the new coconut district, four to six miles North of the Deduruoya, we had to manage as best we could. There was nothing to hire apparently in Chilaw. Fortunately, Mudaliyar Samarakoon was able kindly to place his spring-cart at the disposal of the experienced Manager of Gollnapokna (coconut and cinnamon plantation in the Negombo district) and ourselves. The ferry is, of course, at present the great obstacle, but in another year of 18 months, the new

IRON-BRIDGES

may be expected to be available. Four out of 16 piers are in their places, and Mr. Simmons (who has succeeded Mr. Gregson) after one experience of the fever, has learned the advantage of sleeping two miles off in Chilaw town, while engaged all day on the river.

THE NEW COCONUT DISTRICT.

We have already described very fully, in our editorials, the character of the Deduruoya—or Rajakadalawa—Coconut District. The section of plantations we visited has a varied and thoroughly representative proprietorship—Sinhalese, Moormen, Chetties, as well as Europeans of different nationalities have their clearings close together and haying land and planting is likely to go on until from the Deduruoya all the way to Puttalam for 30 miles, here will be a continuous line of coconut palm plantations. A great part of the district must be the bed of an old lagoon or backwater filled with sand from the sea and alluvial debris brought from the hills. In digging for wells, brackish water is encountered and also smooth pebbles as if from a river bed. A good deal of ebony and other good timber was found in the jungle; but the predominating tree is that which bears the wood-apple—*Feronia elephantum*—the favourite fruit of the elephant. The native name "Rajakadalawa" would

seem to indicate a royal residence in the village in ancient times, perhaps for hunting or kraal purposes?

Every one with whom we spoke on the subject realized the immense advantage

RAILWAY COMMUNICATION

with Colombo would be to the Ohilaw and Puttalam districts. No possible system of canal boats or even steamers can give such regular and easy transport; while if, at the same time, direct communication by rail with India were established, the advantage would be doubled. There is an immense local passenger as well as goods traffic ready to be thrown on the railway, whenever it comes. With the Government Agent, Mr. King, we did not talk on this subject. He, no doubt, regards with favour Extension Northward from Kurunegala; but when and where are passengers and traffic to be reached on that route?

TEA PLANTING: INDIA VS. CEYLON.

We can do no more than direct attention to the very long letter of "European Employee" on page 833. He makes some points in his comparisons; but he overlooks a variety of circumstances which tell against his rather extreme views. For instance, Indian tea districts are very different in extent to what we call a "district" in Ceylon. A District Inspector in India might possibly have to travel over more ground in actual mileage,—although within one large so-called district,—than a "Visiting Agent" in Ceylon. Besides we have always regarded as one of the advantages of the latter that he brought in new "wrinkles" from other districts, and enabled comparisons to be made between the working of plantations far separated in situation, and yet under very much the same conditions. Indian Tea Companies have all their properties as a rule in one large district. What is said about training "creepers" as engineers and only sending them out as required, is more to the point. But then Ceylon is not isolated like Assam, but is an island and a great centre of the Eastern World and a great school for tropical cultivators.

RUBBER CULTIVATION: IN THE FAR EAST AND WEST— CEYLON LEADING THE WAY IN EXPERIMENTAL CULTIVATION.

The Editor of *The India Rubber World*—an important periodical published in New York—takes a special interest in the cultivation of rubber-yielding trees, and in an editorial note on a communication from "Professor Henry Trimén" he says:—

The experiments in rubber-culture in Ceylon must be regarded as the most important yet made outside the natural habitat of the trees here discussed, and upon the results there attained must rest to a large degree, the question of the further development of this industry except, as Mr. DeKalb suggests, in the countries where rubber-producing plants flourish naturally. The Ceylon experiments cannot be said, however to have been completed.

The Editor pays a high compliment to our *Tropical Agriculturist*:—

One of the most interesting exchanges received at this office is *The Tropical Agriculturist*, published at Colombo, Ceylon, devoted to information regarding products which in America are scarcely regarded as pertaining to agriculture, prominent among them being tea, coffee, cocoa, sugar, cinchona, rubber, and

palms. The publishers of the *Agriculturist* long have been personally interested in the development of the planting enterprise in Ceylon and from the beginning they have regarded rubber as one of the products which might be cultivated with success in that colony. They have appreciated, however the fact that under any circumstances a number of years would be necessary for making any satisfactory test, for the reason that rubber-trees cannot be tapped before they have reached some degree of maturity.

A correspondent (interested in the Para trade doubtless) does not offer much encouragement to rubber cultivation:—

A BRAZILIAN VIEW OF RUBBER-CULTURE.

To the Editor of the *India Rubber World*. The arguments published in favour of rubber tree culture are very plausible, but many seem unaware of the fact that even the oldest rubber-forests are constantly renewing themselves. Worn-out trees are substituted naturally by new ones. A proof of this is the constantly increasing supply of rubber from the state of Pará alone, from the same districts. New trees in a few years begin to yield rubber, and, when carefully taken care of, as in the state of Pará, grow wonderfully, yielding year by year more rubber. There is about as much probability of rubber giving out in the Amazon valley as there is of coals doing so in England. Consequently, there is no need of cultivating what nature yields so spontaneously, as was similarly remarked by a gentleman writing on the subject in the last number of *The India Rubber World*. Better let well enough alone.—M. F. SESELBERG.

Pará, Brazil, February 12th 1891.

But another authority writes very differently:—
"In spite of frequent discoveries of new reserves, which temporarily sustained the usual volume shipped to market, it is apparent to any one who has gone beyond the port cities into the wildernesses of South America and Central America that the rubber-trees are being destroyed at an alarming rate, and that the world will feel the shortage before many years have passed,—in fact before rubber orchards planted now will come into service. To see river after river, once occupied by hundreds of rubber-cutters, once having frequent trading-posts along their banks, but now abandoned, tells the tale of exhaustion of the rubber-forests in no unmistakable manner. Each year's delay in establishing orchards is endangering the future of this industry, and inviting hardship for the governments and people of these rubber-producing countries, and the state which offers the earliest and most liberal inducements to rubber cultivation will witness the most rapid increase of colonization in those regions which are today little more than a howling wilderness, and will enjoy an immensely larger measure of prosperity in the future.

"It is interesting to note that Honduras has recently taken this matter in hand, and has attempted to stimulate rubber-growing by offering a cash bounty of ten cents per tree to all farmers who shall set out 2,000 trees. This will doubtless produce good results to some extent, but it offers no incentive to careful cultivation, and protection of the health of the trees, —to that good husbandry, in short, which is lacking to such a serious degree in Spanish America, and particularly in those regions where the inhabitants have come to depend largely upon the uncultivated produce of the earth. If the rubber-exporting countries of Latin America would offer a bounty upon all rubber extracted from cultivated orchards, the increase of dutiable importations as a result of any exportations of cultivated rubber not only would repay the bounty, but would more than indemnify the government for the loss of revenue from the export duties on that amount of rubber. It would not decrease the amounts obtained from the wild trees, but would add just so much wealth to the nation, which does not exist today, and would insure a continuous production of the precious gum, thus giving rise to a steadily-growing commerce that would provide a revenue which could be depended upon from year to year."

SMALL BREAKS OF TEA.

The information given in our London Letter (see page 828) evidences that there is thorough discontent at home with the existing system of dealing with small breaks; and, the statistics afforded, materially strengthen the probable good result of the proposal, emanating from the brokers,—a proposal however, that was rejected both by the Tea Committee of the Ceylon Association in London and by the Wholesale Tea Dealers' Association. A member of the tea broking community, Mr. Long, writing on the subject of the difficulty and of the methods recommended for its removal, has analysed the effect the brokers' proposals would have had upon the sales effected on a particular day at the Mincing Lane sale rooms. When we formerly commented upon the suggestion of the brokers that a re-classification of what constitutes a small break might go far to redress present causes for complaint, we remarked that we could not see any other effect from it than an increase of the difficulty. We confess, however, that Mr. Long's figures as given by our London Correspondent have materially modified the impression we then stated. It appears that the proposal of the brokers is that 18 chests, or 24 half-chests, or 40 boxes, or less, should for the future be held to come under the heading in the sale lists of small breaks, and that all such breaks should be offered for sale on a Thursday. Now buyers attend mainly the Tuesday sales. Consequently the lists of these auctions are always full. The attendance on Thursday is always small, little beyond the small breaks being in the list to attract buyers. The argument of the brokers is:—"Increase the quantity to be dealt with on the Thursday, and the buyers will attend that day's sales." Therefore it is that they propose to widen the classification of the small breaks and to relegate them to Thursday's auction. Mr. Long, taking the sales of the 10th April as a datum, points out that there were 762 large breaks and 281 small breaks up for sale on that day, a total of 1,043 lots. The sale was therefore overcrowded. Now if the wider classification suggested had received adoption, there would have been but 568 large breaks and 475 small ones to be dealt with; and the amount of the small breaks, if postponed till Thursday's sales, would have been sufficiently large to have attracted a good attendance of purchasers. There is one reason always advanced why Thursday's sales are disliked by the London agents. Their constituents in Ceylon desire to receive account sales by the Friday's mail, and some difficulty is felt in obtaining the "prompt" in time to enable this to be done. But Mr. Long and Mr. Alec Roberts both assured our Correspondent that any difficulty as to this, need not exist if both buyers and brokers do their best to expedite matters. Their willingness being assumed, the proposal of the brokers seems to have a commonsense basis. As matters at present stand, none of the London agents like to have their lots put up on the Thursday, as these are foredoomed in such an event to meet with lessened competition. Meanwhile the Wholesale Tea Dealers Association has made no sign of stirring. Apparently it is thought at home that this want of interest is due to the fact that its members buy cheaper at the Thursday sales than at these of Tuesday. If the bulks offering on both days were more equalised, as they would be under the brokers' proposition, they would sacrifice this advantage. It is certain, however, that a remedy must be somehow found, and perhaps it will be better to take steps without further consultation

of the Buying Trade? Is this, in fact, not a practical matter upon which the Ceylon Planters' Association and Chamber of Commerce should take action?

OPENING OF THE NEW CHINA TEA SEASON:

LAST SEASON'S EXPORTS; AND IMPORTANT NEWS ABOUT TEA BEING UPROOTED IN CERTAIN DISTRICTS.

In the *Hongkong Weekly Press* of 26th April we find the first market report for new season's tea: it only refers to small parcels from Canton so far; but no doubt the rush will speedily commence. Meantime we quote as follows:—

CANTON, April 21.—During the last month about 4,700 boxes have changed hands, making the total to date 5,700 boxes, all of which have gone forward. Prices range from Tls. 15 to 17 per picul, laying down at 5½d to 6½d per lb. which compare favourably with last year's opening rates. Although the Teas show a falling off in appearance, the liquors are good, and the quality, on the whole, may be described as being equal to last season's early shipments. A moderate quantity of ½-chests have been taken for the Colonies, but the demand from that quarter is not equal to that of previous years. Considerable contracts for common old-leaf Teas have been placed for the Continent, but as yet no shipments have gone forward.

In the same journal we find the final figures for the past season to the different countries which we may as well put on record:—

EXPORT OF TEA FROM CHINA TO GREAT BRITAIN.			
	1893-94.	1892-93.	
	lb.	lb.	
Canton and Macao	8,178,734	9,767,927	...
Foochow	21,336,687	15,165,743	...
Hankow and Shanghai	25,514,030	30,125,338	...
Total to date	55,029,415	55,059,008	

EXPORT OF TEA FROM CHINA TO UNITED STATES AND CANADA.			
	1893-94.	1892-93.	
	lb.	lb.	
Canton	1,356,153	3,225,358	...
Amoy	21,291,281	17,545,672	...
Foochow	6,392,610	5,183,323	...
Shanghai	24,176,826	23,162,255	...
Total	53,216,869	49,116,608	

EXPORT OF TEA FROM CHINA TO ODESSA.			
	1893-94.	1892-93.	
	lb.	lb.	
Hankow and Shanghai	22,057,162	15,577,999	...

EXPORT OF TEA FROM JAPAN TO UNITED STATES AND CANADA.			
	1893-94.	1892-93.	
	lb.	lb.	
Yokohama	28,623,687	23,488,881	...
Kobe	17,213,605	19,295,629	...
Total to date	45,837,292	47,784,510	

It will be observed that to the United Kingdom, there has been a slight decrease; to Russia, through Odessa, an increase of 6½ million lb. apart from the quantity sent overland as well as through other ports than Odessa. To America, there was a comparative increase of over 4 million of China tea, but a falling-off of nearly 2 million lb. of Japan tea. The grand total of the exports as above given, becomes:—

	1893-4	1892-3
Export of China and Japan tea to U. K. America and	lb.	lb.
Odessa	176,140,738	167,533,125
Increase lb.:	8,607,613.	

We shall now be on the *qui vive* to learn what the present season is to bring forth and we may expect our Special Telegrams of shipments to be renewed very shortly.

Meantime we have some important news through the medium of a Church Mission Medical Missionary, Dr. Rigg, who has just passed through Colombo on his way home. Dr. Rigg in the Fuhkien district, has been on the borders of a large tea-growing district and he distinctly reports that he has seen very considerable areas of tea within the past few years uprooted and the ground utilised for other cultivation, chiefly cereals and vegetables. How far this process has gone on throughout the China tea districts generally—covering as they do so wide an area and in different provinces—it will be hard to say; but it is something to have authentic intelligence from an eye-witness, as to the actual fact of tea being supplanted by other cultivation in any one district of China.

BREAKS OF TEA.

April 20.

Fresh agitation is taking place with regard to THE SMALL BREAKS OF TEA QUESTION.

Finding that Mr. Roberts, of the Colombo Commercial and other Ceylon Companies, had been to see Mr. Leake on the subject, an early call was made by me on that gentleman. At his office I met Mr. Long of Messrs. F. S. Leng & Co., Brokers, of 10 and 11 Mincing Lane, and was introduced to him as a gentleman then calling on Mr. Roberts relative to the very matter respecting which an interview had been sought by me. Mr. Long said that all the brokers felt the position with reference to these small breaks were becoming every day more intolerable, that they, the brokers had months back submitted propositions by them on the subject to the Ceylon Association but had received no reply. When it was told Mr. Long by me that the Tea Committee of that Association had considered and rejected those propositions and that it had communicated fruitlessly with the Wholesale Tea Dealers Association, he expressed the greatest surprise, for, he said:—"We have never received any reply to our original letter." Mr. Roberts said they as agents did not know how to act in the matter, for the fact that better prices were obtained at the Tuesday sales as compared with those of Thursday, made all their clients demand that their teas should be included in the lists of the first-mentioned day. Mr. Long said that the brokers' proposition was that the definition of a small break should be extended to 18 chests, or 24 half-chests, or 40 Boxes, and that the sale of such breaks should be exclusively confined to Thursdays. "Let me," he went on, "show you what the effect of this would have been on the sales of April 10th, a Tuesday. There were offered, or rather included in the auction list for that day, 762 large breaks and 281 small breaks, a total to be dealt with of 1,043 breaks. As a matter of course the auction was overcrowded and small prices resulted. Now had our proposition been adopted the sale would have consisted of 568 large breaks and 475 small ones. It is complained that Thursday's sales offer so little that it is not worth the while of the trade to attend them. It gets all it wants at the large Tuesday sales. But if the 475 small breaks were included in the Thursday list, the bulk of these would have sufficed to attract the trade, fair competition would have been secured, and the glut of Tuesday would have been relieved. We feel

sure this course is the only one practicable. As for the proposal you tell me of by the Tea Committee of the Association, of which I now hear for the first time, that small breaks should be sold on Tuesday but in a separate room, I feel sure the trade will never consent to it. It would necessitate its having the attendance of two buyers instead of one, the sales proceeding simultaneously. The purchasing firms will never consent to their incurring of this expense. And, indeed, it is to be feared that the purchasing trade are far from anxious that a way out of our difficulty should be found. At present the system enables them to pick up bargain at the Thursday sales when some of the small breaks may suit their convenience or requirements. No, this matter cannot be settled by the Tea Dealers' Association. It will do nothing to help us. The Ceylon Association and the brokers must agree on some course or other, and having done so the trade will ere long be forced to follow it whatever it is. You say that there are difficulties raised in settling Thursday's accounts for promptness as to dispatch them by the Friday's mail. As a broker I can assure you that this difficulty need not exist. Where it does, it is due only to want of proper exertion in the broker's office, and if the staff of some of these is not large enough, why they must increase it." Mr. Robert fully concurred with Mr. Long as to the necessity for some early revision of present arrangements, and said these now give rise to immense inconvenience and financial loss. We could none of us understand how it was that that the brokers had received no intimation of the resolution of the Tea Committee of the Ceylon Association, for it is known to me, on Mr. Leake's assurance, that the information was sent to them, and I believe that when Mr. Leake received the reply of the Wholesale Tea Dealers' Association he communicated this also to the brokers. Now that the facts are known, probably more harmonious action will soon be assured.—*London Cor.*

COLONIAL FRUIT.

Reports as to the paying character of the crop of fruit principally Apples, sent from the Antipodes last year were in the main favourable to the prospects of the various fruitgrowers' associations, and the first arrivals of the fruit ships carrying the harvest of 1894 are now upon us, one of the P. & O. steamers having we believe, already delivered its cargo. The steamers of that company to follow are the "Britannia" due April 21; "Massilia" May 9th; "Australia" May 23rd; "Ballarat" June 6th; "Victoria" June 21st; and another on July 10. The steamers of the Orient line due to call at Hobart are, we believe the "Ophir" "Orizaba," "Oroya," and "Orient."—But the information is not quite definite; at any rate a weekly steamer may be reckoned upon during the season—the Orient and Peninsular and Oriental ships alternately. Just before going to press, the Tasmanian Agent-General sent us a notification to the effect that "The shipments of Tasmanian Apples to this country this season will be about 100,000 cases; the first shipment is by the steamship "Britannia" due about the 21st inst. and will consist of 9,100 cases all picked fruit.—*Gardeners' Chronicle.*

AN ELECTRIC PLOUGH.—The firm Siemens & Halske is experimenting practically with an electric plough on the estate of Biesdorf, the property of Mr. Arnold von Siemens. A great success is looked for with the electric plough in Java, where large tracts of lands lie fallow in consequence of the destruction of draught animals by the cattle plague.

A STAFF OF ENTOMOLOGISTS WANTED FOR INDIA.

Sir Arthur Havelock and his advisers can scarcely hesitate to grant the Tea and Coconut cultivators in Ceylon, the advantage of one Entomologist, when he reads the following important paper showing that a "Staff of Entomologists" is bespoken for the benefit of Agriculture in India. We trust there will be no hesitation, therefore, in acceding to the request of the Planters' Association—a request really made in the interests of Agriculture throughout the island. The following official correspondence is deserving of careful perusal by all planters as well as by the Government:—

PREVENTION OF INSECT RAVAGES IN INDIA—OFFICIAL CORRESPONDENCE.

TO SIR E. C. BUCK, Kt. C. S. I., Secretary to the Government of India, Revenue and Agricultural Department.

Calcutta, 2nd April, 1894.

SIR,—I have the honour to forward for the consideration and orders for the Government of India, 20 copies of a Memorandum on the Mitigation and Prevention of Insect Ravages in India prepared by the Hon. J. Buckingham, C. I. E., of Amgoorie.

2. The General Committee can add but little to the suggestions contained in the Memorandum, which they consider a most valuable document in every way, but they desire to impress in the strongest manner possible upon Government the great importance of having a strong staff of entomological officers, for the organization of which a scheme which appears of a practical nature is suggested by Mr. Buckingham in his Memorandum, and the Committee trust this will have the careful attention of Government.

3. There can be no doubt from the facts detailed in the Memorandum that this country is very far behind the rest of the civilized world in this important branch of science.—I have the honor to be, sir, your most obedient servant, (Signed) S. E. J. CLARKE,

Secretary.

MEMORANDUM by the Hon. J. Buckingham, C. I. E., on the Mitigation and Prevention of Insect Ravages in India, submitted to the Indian Tea Association for transmission to the Government of India, Department of Revenue and Agriculture.

1. The Indian Tea Association has recently subscribed Rs750 supplemented by Rs250 from the Assam Government, and Rs250 from the Government of Bengal, towards certain prizes for the encouragement of the study of the insects which attack the tea plant in India. It is hoped that these prizes will have a beneficial effect in the direction of adding to what is known upon the subject, but they are only a first step towards placing this important matter upon a proper footing. The question affects not only the tea industry but also every agricultural and forest crop that is grown in India, and it requires to be dealt with far more comprehensively than is within the power of any single Association. The tea plant is known to be attacked by more than thirty distinct species of insects each with a complicated life history of its own, and each liable to do more or less considerable damage by itself. To take a single example, the fact that mosquito blight frequently stops production over a large portion of a garden for months at a time, is sufficient indication of the serious nature of an evil which too often turns what would otherwise have been profit into actual loss, and it is well known that red spider, green fly blight, and other insects, though less generally prevalent, are sometimes almost equally destructive over more restricted areas.

2. The case with other crops is very much the same. Sir Edward Buck has recently estimated the loss occasioned in India by the wheat weevil, which is only one of a number of insects which attack wheat, at five millions of rupees annually. Sorghum, which forms the staple food of a large portion of the population, has been estimated by another

authority to suffer on an average annually from insects, to the extent of one per cent. of the total yield. In its early growth, cut worms often injure paddy to the extent of making it necessary to replant whole fields at a time. At a later stage supposing it escapes the rice *Hispa*, and the numerous grasshoppers which also attack it, paddy is in danger from the rice-sapper, which is said sometimes to render the crop over large areas hardly worth the cutting. A tenth of the maize crop around Amritsar is said to have been destroyed by the stalk borer in 1890, and this is merely an example of the extent to which this crop is liable to be attacked. A quarter of the whole sugarcane crop of a neighbourhood is no uncommon proportion to suffer; indeed not so very many years since the cultivation of a specially profitable variety of sugarcane is said to have been practically driven out of several districts in Bengal owing to the attack of one particular insect, the sugarcane borer. Jute fields are often completely stripped by caterpillars. A teak forest in Burma has been described as attacked by an insect which does as much damage as a forest fire, while it is notorious how large was the part played by green bug and stem beetles in the almost annihilation of the coffee industry of Ceylon and in the prologued decadence of that of southern India. Agave, indigo, groundnuts, oilseeds, opium, and almost every other form of agricultural and forest growth suffer from insects to an extent which seriously affects their cultivation. Indeed it is not too much to say that hardly a year passes without a very appreciable portion of the labor of planters, cultivators and forest officers alike, being simply thrown away owing to the attack of some or other of the hosts of the destructive insects which thrive and multiply in India.

3. In so vast a country depending as it does for its material welfare almost entirely upon agriculture, the total loss occasioned by insects is simply appalling to contemplate. In the United States which, when taken collectively, are to some extent comparable with India in area, the damage due to insects has been calculated as amounting to an average of more than three hundred millions of dollars annually, and figures approaching these in magnitude would have to be employed to represent anything like the true state of the case in India.

4. In the United States, as also in Canada and parts of Australia, this matter has been seriously taken up by the Government, with the result of the introduction of new methods of treatment which in some cases have already effected an enormous saving. It is sufficient to refer to the numerous insecticides, both liquid and gaseous, and the apparatus for applying them, designed to meet the various requirements of different crops and different species of insects, which are now widely employed with the best results, both by the agriculturists and fruit-growers in all parts of America, also to the general adoption of the system of late sowing against Hessian fly, the feeding off the first crop clover early enough to catch the clover seed midge before it is sufficiently matured to leave the heads and hide itself in the ground, the adoption of the band system against canker worm, and the introduction of the Australian *Vedalia* beetles which have proved so beneficial in California against the destructive fluted scale insect.

5. It is true that most of the methods of insecticide treatment, though very promising for adaptation to the requirements of such valuable crops as tea and coffee, which are cultivated under European supervision, are too costly to be likely to be applicable to the imperfect methods of agriculture which exist amongst Indian villagers. This is not the case however with such systems as that adopted against the clover seed midge, which depends solely upon improved knowledge of the habits of the insect. Still less does it apply to the importation of the *Vedalia* beetle, for this benefit has been conferred upon the United States almost entirely independently of any action upon the part of the cultivators.

6. It would of course be out of the question to suppose that any action, which could possibly be taken

at the present time in India, would result in the discovery of a remedy for every destructive insect at a cost which would make its adoption practicable. But it is not too much to hope that careful investigations of the life histories and habits of the various insect blights, conducted by specialists fully acquainted with local requirements and able to compare the experience of other parts of the world, where very similar insects are often being successfully combated already, would result in many cases in improved methods of fighting the evil.

7. In the United States, besides entomological advisers attached to individual States, a strong section of entomology is kept up as a branch of the Agricultural Department of the Central Government. Attached to the entomological section are some fourteen trained entomologists who visit all parts of the country in order to study and report upon destructive insects. The great importance of collecting information personally upon the spot is so fully recognised that the travels of the investigators are not confined to the limits of the United States, but representatives are even occasionally despatched to far distant parts of the world. For instance deputations have been sent to Brazil to study the insects common to North and South America, to Australia to make the investigations which resulted in the importation of *Pedalia* beetle, to Europe to confer with other entomologists upon the joint interests of the Science, and so on. That the results obtained have been commensurate with the expenditure involved seems to be admitted upon all sides. In one of his Annual Reports, the Commissioner of Agriculture writes—

"The importance of the study of economic entomology becomes every year more and more apparent. Scarcely an Agricultural or Horticultural Meeting takes place but that the subject of injurious insects and the best means of counteracting their ravages, occupy a large share of attention. The losses occasioned by destructive insects to the farmers of the country aggregate an enormous sum, and there are few directions in which the Department can do more good than in researches, having for their object the prevention of a portion of these immense losses.

8. In India all that has yet been done has been to empower one of the officers of the Indian Museum in Calcutta to report upon insects that are submitted by planters, officials and others and to publish the results. In this way a considerable amount of information has been collected and the nature of a large number of the more destructive species of blights has been ascertained. Beyond this however, little has been possible, for to expect practical advice from an investigator who is tied to a Museum and is consequently unable even to see for himself the fields where the insects are at work is like demanding medical treatment of the doctor of a Turkish bazaar, who is only permitted to see the tips of his patient's fingers thrust from behind a curtain.

9. What is wanted for entomology is very much what has already been created in the case of chemistry *viz.*, a specialist himself free to move about the country and supported by laboratory assistants in some fixed place. To render the work of practical value, it is essential that it should be carried on continuously from year to year, so that the observations made in one season may be supplemented and verified by those made in the next, and that a record may be kept up of the increase or decrease of particular blights so that the planting and agricultural community may be warned in time of impending danger. It is a *sine qua non* also that the investigator should himself be in personal touch with agriculturists in all parts of India and that he should look, not to a purely scientific institution like a museum for his instructions but to that section of the Government which concerns itself with practical agriculture. No doubt it is necessary to have collections of insects and a considerable library of entomological works for reference, but it is absurd to suppose that an entomologist should be tied to these; and to saddle as is now done the whole work upon a museum which is primarily engaged in making collections of zoological and mor-

phological specimens, and which looks to the elaborate exhibition and cataloguing of these treasures as its chief end and object must obviously be fatal to practical results so far as agriculture is concerned.

10. In the United States the scientist who is at the head of the entomological section of the Agricultural Department of the Central Government, is also honorary curator of the department of insects in the United States' National Museum at Washington, and amongst his assistants, one man is especially detailed to attend to the collections. In every thing else the entomologists directly belong to the Agricultural Department, their reports being made to the Commissioner of Agriculture, and they work in concert with the other scientific branches under the general direction of the Commissioner of Agriculture.

The same system is perfectly practicable in India, under the Revenue and Agricultural Department, and ought undoubtedly to be adopted.

11. The question of expense is by no means a difficult one. Already a permanent annual grant of five thousand rupees is made by the Government to the Indian Museum for the express purpose of Economic Entomology and this amount is supplemented by an annual contribution from the Forest Department for a series of lectures delivered in the Imperial Forest School at Dehra by the officer in charge of Museum entomology. If, therefore, the Indian Museum were relieved altogether of the work and with it of the necessity of paying a special member of its staff for the purpose, all that would be necessary would be to increase the amount devoted to the subject sufficiently to maintain a somewhat stronger staff and to defray the cost of travelling expenses. This additional expenditure could probably be met without any further call whatever upon the straitened finances of the Central Government, partly by contributions from Local Governments, and partly by grants from the budgets of the Provincial Directors of Land Records and Agriculture, who would no doubt gladly take advantage of the entomological assistance that would by this means be rendered available, in order to obtain reports upon the insect blights incidental to the principal crops in the various provinces for which they are responsible. J. BUCKINGHAM.

Amgcorie, 9th March 1894.

MANURING EXPERIMENTS.

The complete chemical manure in the Warrimser experiments was a mixture of sulphate of ammonia, superphosphate, and kainit. It was applied on the plots which yielded the greatest crops at the rate of 12 owt. per acre, and gave better results than 32 tons of farmyard manure. The proportions of the mixture of the three manures are not stated, but the mixture contained 5.37 per cent of nitrogen, 4.2 per cent of phosphoric acid, and 4 per cent of potash. But when the sulphate of ammonia was omitted, the yield was no greater than on the unmanured land, and this was the case also in the preceding season. Trials were made with different quantities of manure, winter and spring planting, close and wide planting, different varieties of potatoes, cut and uncut seed tubers, deep and shallow cultivation, and spraying with Bordeaux mixture.—*Indian Agriculturist.*

COFFEE PROSPECTS IN UVA.—We learn from Mr. T. J. E. Johnson that native coffee between Badulla and Haputale is looking better than he has seen it for many years back, and coffee that has already given a small Spring crop on the Naraagalla range, is looking quite healthy and fit for an autumn crop—already three blossoms having set. This, we need scarcely say, is an unusual experience of late years. Altogether we trust that coffee in Uva is going to add appreciably to our exports of the old staple this year. As for tea, the report everywhere in Uva seems to be most satisfactory.

Correspondence.

To the Editor.

THE PRODUCTION OF CAMEL.

Georgetown, British Guiana, April 3rd 1894.

SIR,—Herewith I have the honour to forward a copy of a resolution of the Royal Agricultural and Commercial Society of British Guiana, referring to a Premium for improvements in the preparation of Caramel for colouring rum which the Society will be glad if you will notice in your magazine.—I have the honour to be sir, your obedient servant,
 THOMAS DALY,
 Honorary Secretary.

ROYAL AGRICULTURAL AND COMMERCIAL SOCIETY.
 Georgetown, British Guiana, March 1894.

At a meeting of the above Society, held on Thursday, March 8th, 1894, the following resolution was adopted:—

"That the sum of two hundred dollars be paid from the funds of the Society, on the award of its Agricultural Committee, to such person or persons as shall by the 30th of September next, inform this Society of some improved way of producing Caramel,—combined with its economical manufacture, for colouring rum for market and producing the least degree of obscurity."

In accordance with the above resolution the undersigned invites communications, to be addressed to him not later than the 30th of September next.—
 THOMAS DALY, Honorary Secretary.

[CAMEL.—Burnt sugar; a black, porous substance obtained by heating sugar. It is soluble in water, forming a dark brown solution, and is used to color spirits, gravies, etc.—Ed. T.A.]

TEA MAKING AND HIGH PRICES.

LONDON, April 11th, 1894.

DEAR SIR,—The letter on the above, written by the London Correspondent of the "Ceylon Times" and copied into the *Tropical Agriculturist*, page 691, has interested me very much, because it lays special stress upon the fact that the successful manufacture of tea depends largely upon the careful observation of chemical principles.

Until it is recognized that the manufacture should be carried on with certain definite objects in each stage, and that each process of the manufacture should be regulated upon some scientific basis, it will be quite useless to expect uniform and satisfactory returns.

With a variation of climate and soil, there will naturally be a variation in the quality and strength of the tea made.

But in what respects does the tea differ, and how far is the difference due to the soil, and how far to the climate; or still more how far is the difference due to the mode of manufacture?

These are the points which I have put forward from time to time in your paper, with a view of exciting the interest and support of your Planters' Association.

The manufacture of tea involves chemical, physical and mechanical principles and, as the writer to your contemporary, truly remarks, though no one supposes that the Chinese tea makers have any special scientific training, they are nevertheless following, though perhaps of late years in an imperfect manner, the rules impressed by ages of past experience.

The climate and soil of Ceylon doubtless vary considerably from those of China and it therefore by no means follows that an experienced Chinaman would make the best Ceylon tea-maker, but his previous training would probably soon direct him how far to modify his process of manufacture.

It is therefore a matter of regret, and possibly of distinct pecuniary loss to the Ceylon tea enterprise, that, up to the present time, the Planters' Association have not considered it desirable to promote scientific investigation into the principles of tea manufacture.

As was pointed out in my Report upon the Tea Analyses made last year in London, the market price of the samples examined, varied according to the amount of the soluble ash contained, and the results certainly suggested further research as being likely to yield useful as well interesting results.

It is probably only a question of time; and very likely a large Tea Company will first lead the way in scientific research and attach an experienced Chemist to the Factory staff, who, if a good man, would soon be found most useful, for instance in reporting on the quality of the green leaf delivered from different estates.

In saying this I feel sure I am not simply expressing an opinion, but predicting a fact.—Yours faithfully,
 JOHN HUGHES.

LIBERIAN COFFEE IN MATALE

Kandy, April 27.

DEAR SIR,—I send a Liberian coffee cherry picked at *Wiharagana Estate Matale*, and which, I think, is a very remarkable specimen. It is a double-triplet and contains 6 beans and the cherry is nearly 1½ inch long.

I send it to you as you have always shown much interest in Liberian coffee, and I cannot recollect ever having seen or heard of such an abortion.

It may be useful as the big gooseberry, if your "illy season" is on,
 J. M.

THE RAVAGES OF BEETLES ON COCONUT TREES.

Haldummulla, April 27th.

DEAR SIR,—A letter from Puttalam on page 725, complains of ravages committed by the beetles on coconut trees. If these insects crawl up the stem, I fancy we can master them; and the same will apply to rats. The latter I believe cause a lot of mischief when the trees are young. My remedy is to hoop the tree with thin sheets of "Mica" say from 4 to 6 inches in width: one such band would be a sufficient preventative if attached to every tree. "Mica" is impervious to heat, cold, rain or drought; neither can any living thing crawl over its polished surface. I would wish to mention that although I could not guarantee success, I will be glad to send your correspondent a small quantity of Mica bands for trial if he will kindly write me. I would also suggest the same remedy to prevent squirrels attacking cocoa pods.—Yours truly,

EDGAR HEANLY.

ENCOURAGEMENT OF NATIVE LABOUR.

Nuwara Eliya, April 28th.

SIR,—Allow me to suggest to Government to call upon the Mudaliyars and Ratemabatmayas to keep a register of people in their Korales, who are willing to go and work as labourers on estates.

The Government should publish in the *Gazette*, monthly or quarterly, for the information of the planters, the number of such people in each Korale. This would enable the planter to get his labor supply from the island itself.

If the unemployed, specially in the villages of the maritime district, could be got to work on the estates, there would be less crime and it would do much good to the country.

The Government should obtain from the different Planters' Associations the rates of coolies' wages in each planting district and this information should be made known in the villages.—I am, &c.,
SPECTATOR.

PRIESTMAN'S OIL-ENGINES: INTERESTING INFORMATION.

Hatton, Ceylon, 28th April.

DEAR SIR,—Our attention has been called to your leader (see page 813) *re* Priestman's Oil Engines.

You ask in your leader for information regard ing these engines. We being the sole agents in the island are pleased to be able to hand you the latest information we have on the subject, and enclose same for your perusal.

You will see by the circulars that Priestman's Oil-Engine is steadily gaining ground and there is no doubt that a better oil-engine cannot be procured up to date. As regards Ceylon, we believe that gas engines out of Colombo are of no good, in fact the only one we have heard of upcountry has been superseded by a steam-engine.

There are at present 4 oil-engines in the island used for tea manufacture. Mr. Egan of Fernlands has worked one regularly and we are sure he will be glad to give you any information as to the working of same. Mr. Buxton Laurie has had one at Claverton for some years supplied to Mr. Skrine by ourselves. This one is worked during the dry season when there is no water. We have an 11 H. P. Engine here which we keep as a stand-by and use as an auxiliary.

The above are all old-type engines; great improvements have been made since they came out. Mr. Roberts of Dartry imported one which we are about to erect. The iniquitous oil tax has damped the ardour of many who might have gone in for this type of engine, but when oil tanks are erected all over the island and oil can be brought in bulk, when also firewood becomes more expensive there will very likely be a much greater demand than at present.

We will be very pleased to give you any further information and will be glad to answer any questions any of your readers may ask on the subject.—We are, dear sir, yours faithfully,

BROWN & Co., LIMITED, JOHN GRIEVE,
Manager.

AN INDIAN PLANTER ON THE TRADE'S TREATMENT OF INDIAN AND CEYLON TEA.

DEAR SIR,—March 19th Report by Messrs. Geo. White & Co., on Ceylon tea (Supplement to the May issue of the *Tropical Agriculturist*) under heading of Manufacture, I see:—"It is hoped that the weather will enable planters to send teas with more strength and flavour, so that these growths may not fall in the estimation of the public." What "public" is referred to, and have they (or it) a chance of forming any "estimate" of your growths whether good, bad, or indifferent.

One might be led to imagine the public in search of such and such a growth? "Please let me have a pound of Ceylon 9s tea." "Kooobparwarawatte pekoe." "That is scarce sir, now, guinea a pound sir!" Yes sir! good day sir! We must "campaign" America and Canada and Australia why not "Home" first of all? Why not ask *Tic Dits* to get up a prize competition?—each subscriber to send in a report as to whether he or she prefers Indian or Chinese tea, and to guess the number of people who prefer China 1st prize—2nd prize for nearest guess to the number of people who don't know that tea is grown in India; and 3rd prize nearest number of those who declare solemnly that they know the difference between tea and coffee without being told. "The Missionaries want to oust their enemy from foreign parts leaving him fairly well in possession at home, and Indian tea apparently is adopting the same line. Do Messrs. Geo. White really want tea that will be appreciated by the public or by the leaders of the public. Is it good drinking tea that they honestly ask for, or is it tea which will bolster up the China trade at home? A good priced "market" tea will make your teeth curl—is that the tea that the public hawker for and appreciate? There is a "bitter cry" for that tea; but there would be a worse cry if none of it was sent and China tea had to be sold alone. Can China keep its hold on the market without the support of strong undrinkable Indian tea. Can they put down tea in London at a profit, as good as cheap as our low-class Indian and Ceylon tea? I know that in parts of Ireland medium Sylhet teas are very much liked and paid for readily at 1s 6d per pound and this leaves the dealer a good profit. The weakest must go to the wall. If we can oust China from Home and everywhere the weakest will have a few years more run then must the wall be approached again!
PRESS.

AN INDIAN PLANTER ON THE PROSPECTS BEFORE THE A PLANTERS.

May 2nd, 1894.

DEAR SIR,—Every man has his infallible test of a "good leader." No man will listen for long to any one whose opinion does not in the main agree with his own. We tea planters have now come to a stage where we find that our old leaders are not with us and we want a "Prophet"—one to tell us of good days to come and how to hasten them. Going back to my proposition (with which I began) I now proclaim a "Prophet" and his name is "Siward" and he wrote in the *Indian Planters' Gazette* of April 14th, 1894. Let me for the sake of brevity enunciate what is to me the cream of his words:—

1. New markets for Indian Tea.
2. Indian and Ceylon tea did not gain a footing in England or Australia through the aid of any big self-advertising retailer.
3. Keen enough to seize the introduction through the auction room of Indian and Ceylon teas.
4. This is done not by one grocer, but by thousands and tens of thousands of travellers and agents through innumerable channels, and the money spent must be as the Ganges to a bottle of soda-water as compared with any money the Indian Tea Association can ever spend in advertising.
5. But there are varied tastes in tea and it is no good rushing all sorts and conditions of tea into the market. There are men who know what the Americans will take and what they won't take.
6. Choosing the right sorts and having the right sorts made in the gardens.

7. Every year, every month and week since tea was grown, fresh advice and fresh experience have been gained as to what sells best.

8. But tastes vary and changes come over fashions inexplicably, and the near future may see London Brokers crying out for flavor and delicacy.

9. While the London warehouses were "chock-a-block" with low China teas, Indian teas were wanted with strength and astringency to mix with them, but this may not be so when low China teas are no longer in supply.

10. But I have seen samples made in India quite equal to China tea, but then it was made with a view to delicacy and flavor, not to astringency and strength.

11. Make such tea and millions of pounds will go at 50 per cent higher rates than rule for strong teas, into Russia and America.

12. Let us ignore small measures, small men and small things in conjunction with such a big trade as the Indian Tea industry, and so big a country as America.

* * *
Now then to work—the ideas are not new to me, but I have not seen them openly advocated. Did not some one in your own pages sneer at the thought of consulting American tastes? A few words on each of the numbered quotations:—

1st. See No. 4, No. 5, No. 6, No. 10 and No. 11 as applied to "new markets" not only for America and Russia, but for the Continent and for the great numbers in England who will not take our strong tea.

No. 12 comes into each and all of the points under discussion. Let us ignore everything but our own interests as Planters. Our own interests run with the likes and dislikes of our customers. Let no small men or things come between us.

2. India has not advertized much, Ceylon has done more—her small retailers have advertized; but they have gone the way of the trade and they have joined hands with China and other rivals. Dont blame them, they are justified in getting rich; they owe you nothing; they are not your servants; but don't depend on them, don't subsidise them. Here repeat No. 12—let it be the refrain to the song.

No. 3. See No. 7—emphasise the last two words. See No. 9, note the word "to mix with them." What advice have we had from the auction room—ask Philpot!

No. 4. Points out the "grocer." Here is our ally, our agent: ask his opinion, raise him if possible in the line of go-between, let him make more profit. Give him shilling tea which his customers will buy more of than their present shilling China tea, and the grocer will be our friend. Let us embark our boat on the "Ganges"—leave the soda water to the small men.

No. 5. Very true; please introduce us to the men who know what the Americans will take. We now run the old danger, that we shall supply tea which will improve the American China tea. So that we shall not oust, but we shall establish our rival in the "New Market."

No. 6. Nothing easier when we know what are the right sorts—"What is good Tea."

No. 7. Ho! Ho!!! What sells best; "Buyers to sell"; "Made to share." No! they are made to sell one shilling a dozen—every year every day, we have attained such perfection that we get a shilling a gross. By all that is good and true let us forget the experience gained. Here repeat No. 12.

No. 9. Let me change the words into "But this may not be so when Indian teas are no longer undrinkable."

No. 10. Of course we all know that—why make samples; why not here repeat No. 12.

No. 11. I wou'd make you our prophet for these words and I would add to "Russia and America" the whole world.

No. 12. Kindly have this printed in gold and colours and many pleasing flourishes as a text and send one copy to each of those interested. Substitute "The World" for "America."

There is time to retrace our steps, there are good times before us or the big men would not be joining our ranks. Hold on like grim death to every tea bush you own.

1874.

TEA PLANTING IN INDIA AND CEYLON: WHERE INDIA IS AHEAD OF CEYLON.

May 3.

DEAR SIR,—There are many matters connected with the tea industry about which the Planters of India and Ceylon might well exchange ideas, with mutual advantage, and I purpose writing on two of them in this letter where India is ahead of Ceylon.

1st. With regard to the system of European Supervision.

2nd. With regard to the Management of Machinery and Construction of Buildings.

First, then with regard to Supervision. We have in Ceylon an ubiquitous individual rushing about "like a bull at a gate," or flitting over large areas of tea (sometimes two or three estates in one day), finishing up with a long-winded and frequently diplomatically written Report to the Proprietor, who too often cannot make head or tail of it, except that it is a series of sentences in well-thought-out English, which might be read to mean several things. This gentleman is called a "Visiting Agent." What are his qualifications? I fear the answer to this in too many cases is that "kissing goes by favour" or rather has gone by favour. How many among the Visiting Agents of Ceylon estates today have had practical knowledge of tea estate management? or could take up a billet on a property and do the detailed work, as well as the Managers they visit? And even if the Visiting Agent was a man who had gone through all the practical work in one district, he would indeed need to be a veritable genius, to advise men in other districts, with entirely different climatic and other conditions on their work, as these men bring the accumulated experience of years of patient labour and investigation to bear on it with the result that in many, very many cases, they could and "do teach their visiting agent all he knows."

Looking over the past planting history of the island, we can recall the names of many a Visiting Agent like R. B. Tytler and Sandy Brown, whose advice was welcome, and whose intimate knowledge of what they reported on contrasted strangely with some of their latter days followers.

When we find a "Creeper" one month, blossom forth into a full-fledged Visiting Agent the next, and visit the man (of many years standing) with whom he had been creeping! When we find the tea from the property on which a Visiting Agent is resident, fetching the lowest or nearly the lowest prices of the district, in which it is situated and when we find that man paid for "visiting and inspecting" estates manage to interpret this into rushing over 200, 300 and sometimes 400 acres

in a morning; for which they are paid good fees, I think it about time for Proprietors to give heed to the Indian system of District Superintendents, as infinitely more efficient and calculated to produce much better results so far as the proprietor's pocket is concerned. The District Superintendent in India is a planter of great experience in his district. He takes the place of the Ceylon Visiting Agent and by his intimate knowledge of the work in that district, is of immense help to the Managers he advises and as the gardens he supervises are all near his headquarters, "very little of his time is wasted on the road" and when any Manager is in doubt or difficulty, he can get the advice or assistance he requires at once. There can be no comparison in the inevitable results of the two systems.

Take Rakwana for instance as a good example of waste of time in this matter.

About half-a-dozen different V. A.'s used to go to this district, mostly visiting one or two estates; time—going 2 days, coming 2 days, say 6 visiting agents, 4 times a year = "96 days on the road," when one good District Superintendent would have saved all this time, and done the work more efficiently.

Then as to Superintendents in India the men are paid to recompense them for hard work in a tropical climate; in Ceylon they seem in many cases to be paid to exist, and it is a notorious fact that while Ceylon is producing heavy profits for the benefit of its proprietors, large numbers of Managers are so badly paid, that they have no chance of taking a trip home to recruit their health, the salary only being sufficient to live on. In the name of all that is just and honest the Superintendent by whose energy and care the fortune of the Proprietor is being amassed, is surely entitled to a percentage on the profits, which are very large in many cases.

When profits a few years ago went down till they reached the vanishing point, the Managers of Ceylon estates allowed their salaries to be cut down ruthlessly, and indeed I could point out instances where Superintendents in their sympathy for the straitened circumstances of the Proprietors, of the gardens they managed, "reduced their own salaries;" and so far as I can learn, such kindness has been badly requited.

No doubt the fact that many gardens are managed through Colombo Agents now-a-days, and the Superintendents are unknown to the Proprietors, unless it be as working machines partly accounts for this, but give me back the days of old, when the kindly Proprietor used personally to acknowledge his obligations to his Manager, and the Christmas cheque or present of stores was common. If we can't get this, let us have the "mechanical equivalent" (although I trow a little "personal" interest in the Manager, would well repay itself) by which I mean a division of profits, say 5 per cent or more to the employees and it will give them something to look forward to, in old age other than being a burden to their relatives which is certainly the destiny of many Managers now in the Island unless some means are adopted for improving their prospects. We come now to that class known as "Creepers." Of all the frauds perpetrated on a community whose ranks are already far overstocked with labour, the introduction of the Creeper is the greatest. If the facts were clearly stated at home—(1) that in the island there are numbers of men out of billets, and in temporary ones who will thankfully accept any pay almost; (2) that the climate in many parts of the island at least, is far from healthy; (3)

that that wonderful elephant shooting and other sport we have all heard about are only for the wealthy and are not participated in by one in twenty planters as they have neither the time nor means to indulge in them; (4) that for each billet going of Rs.1,000 and upwards there are often more than 100 applicants; (5) that the average planter of 10 years' service is not drawing Rs.500 or say £200 a year stg., and lastly that a number of Creepers when they have seen the actual state of affairs have left the country and their premiums behind them in the hands of their teachers greatly to the discredit of the latter in my opinion. I say if these facts were known we would see a wholesome reduction in the arrivals of those unfortunate young fellows whose future is pitiable. From the social point of view I strongly object to have this country filled with useless ne'er-do-wells of the class of Mr. Sinclair who now is (or was) doing hard labour in Australia, or Gordon in Madras recently convicted of forgery, now in jail even if my neighbour Jones imagines he has a divine right by misrepresentations, to make a handsome income out of them, by charging them first an exorbitant premium, and then equally exorbitant boarding fees, for badly cooked food. No, sir! Ceylon is taking to a species of babyfarming of the worst type, and parents desirous of getting rid of utterly bad grown up babies, launch them on the Ceylon community, (which so far has not resented it) by paying one of the Babyfarmers £100 to £250 to take them over.

N. B.—Some of those babyfarmers have added substantially to their incomes by carefully playing nap, poker and a few equally innocent games with their "creepers," (parents take note.) In my remarks on creepers I want it to be clearly understood that it is the class of useless "giraffe necked chappies" who are brought here in most cases by false pretences, that I object. Thank God, there are a lot of fine young fellows coming to Ceylon from time to time, who will make the future bone and sinew of our planting community "and who are being discredited by the ne'er-do-wells imported along side of them."

In India the Proprietor as a rule sends out the young fellow under agreement, and pays him sufficient to cover his food and clothes at once, generally Rs.2,000 to begin with, hoping after he becomes efficient to get good returns for his money from the well paid services of the youth. In Ceylon, Creepers are as a rule imported under false pretences after paying a heavy premium, and the object of the importer is to get rid of him as soon as he can to make room for another "premium" with an equally unfortunate youth attached to it. Which is the better system think you?—the Ceylon or Indian?

We now come to the question of machinery and buildings in Ceylon as compared with India. In Ceylon in addition to the many ordinary duties of the Superintendent he is expected to be Architect, Builder and Engineer, all rolled into one with the result that unless he has had previous training, the buildings cost far more than is necessary, and are built either copies of other buildings near, or often of a type quite unsuitable for the work; and still more frequently with bad material in them especially bad sorts of timber and before many years are over Proprietors in Ceylon will learn their mistake practically by expensive renewals, in their buildings that would not have occurred if they had employed a competent Engineer to supervise the work. I recently saw the end of a 5-year old store: weather-boards, &c. falling down bodily all rotten, made of Malabodds, Etheheraliya

and other bad timbers; and another 3 storied building with $\frac{1}{2}$ brick walls which were really supported by the window frames in a state of semi-collapse, as the window frames had been eaten up by white ants, being made of rubbishy timber; and instances of this kind could be multiplied all over the country, where Proprietors will suffer heavily in the long run although at first no doubt a few rupees were saved.

With machinery matters are even worse and engines, and rollers, sifters, and fans, can be heard all over the country knocking themselves to pieces, through want of little trained attention to the bearing surfaces. Heated bearings are common, and thousands of gallons of oil are needlessly wasted in lubricating the machinery in factories; (often too, oil of the most unsuitable kind). Priming in boilers under the circumstances must be common, and I will be very surprised if we do not hear of boiler explosions over the country with fatal results before long, as the machines get older and weaker.

On a well-known estate not long ago, with an engine below the power of the work required, the energetic Superintendent used to hang a 56 lb. weight on the safety-valve to increase its power!!! And it was a perfect miracle that the Engine Driver was not blown into eternity and this went on for over one year.

Another case that came to my notice was that of a boiler, where on inspection the whole of the fire bars of the back were melted into a solid mass; and of course it did not work efficiently; and quite recently I heard of two down-draft Siroccoos, with all their trays and tea, being converted into furnaces, and the whole of the trays and tea being burnt to cinders, all through want of ordinary knowledge and attention. But how can we expect otherwise when sets of expensive machinery, costing from R60 to R100 per acre, for the area of tea in bearing are placed in the hands of Superintendents who have had no previous training whatever, and have numerous other duties to perform and who are too often assisted by a Tamil cooly only (of profound ignorance on 37 cents a day) in the supervision of this valuable machinery.

You cannot expect local Engineers to complain when every worn-out (I should say torn-out) bearing, or break-down means handsome profits in repairing. Mean and ignorant parsimony is at the bottom of it all. In India each concern of considerable size has its own European Engineer who attends to the erection of the buildings and machinery and the proper-working of the latter. If one estate alone cannot afford it, two, three or six estates support one man, between them; and the Superintendent knows his machinery is being properly looked after while he devotes his time to legitimate estate work. Add to this the fact that some Indian Firms send their assistants to get a proper knowledge of machinery at Gainsboro' or some other Engineering centre, before they start for India and we see how far ahead of us our Indian neighbours are in this matter.

I commend these remarks to the unbiassed attention of proprietors of Ceylon estates. Pay your men well, and they will work for you well! And put men over them to report to you who know practically what they are writing about, and how to advise those under them. Do not allow creepers on your property, unless you are certain they are likely to be useful in the future to you, and the community at large; and in any case do not be party (by doing it, or allowing your Managers to do it) to extracting extravagant premiums, from youths about to start in life, by any false pretences

See that your machinery and buildings are properly looked after by men of professional knowledge. "A stitch in time" often saves the whole machine, and if we endanger the life of the employees by want of proper supervision, rest assured it will result in some frightful accidents before long, and Government forced supervision, as they have in England, which will be found ten times more irksome than was the forced Medical Inspection of our labourers.—Yours obediently,

EUROPEAN EMPLOYER.

WHAT CONSTITUTES GOOD TEA.

DEAR SIR,—In your last issue, on page 774, you were good enough to call attention to my letter and you did so under the heading of "Improved Tea-making and Better Prices." You invite wide discussion under this heading, and naturally it should form the banner and war cry of all tea planters, of all tea proprietors—of all concerned.

But as a small beginning let us know what is "good tea." Invite definition of the term "good tea." There is no use in discussion unless all start from one defined and fixed point.

In yours of 17th April you have commented on and favoured us with a lecture by Mr. Ernest Hart, and seeing that he so clearly expresses his liking for "Japanese 'green' or unfermented and unfaced tea," you still advocate that he should be presented with some finest Ceylon broken pekoe. He may be brought to change his opinion, but is it really better that he should do so, than that the Ceylon planter should try and humour him and send him some tea as good or better and of the same sort as his favourite Japanese tea. But that is not my point. Mr. Hart gives you clearly his definition of good tea, and as he is a leader of medical opinion, he will have the doctors on his side, and their patients no doubt in great numbers, altogether a most important class. Shall we then start with Mr. Hart's definition of "good tea?" It is no use asking the planters themselves—they are trained to consume tea that would tan the hide of a bullock—and those few who have to buy their own tea don't buy best Broken Pekoe.

Let us ask "Philpot"—he of the Bitter Cry (and by the same token his cry was for more bitter tea). I expect that rasp, strength, body, fullness, would predominate in his definition. Whatever it is let it go on the list. Is there anyone else whose opinion should be asked?

A planter sent some tea to his mother who was profuse in her thanks, but she had to confess that it was too strong and that it was simply delicious when mixed with her usual China tea. Is her opinion worth putting on the list, as follows? "Good Indian tea is one which is delicious when mixed with China Tea."

Thinking of authorities whose definition of "good tea" will be of value, I can hit on none better than "Lipton;" he knows what good tea is. He sells tons of it, none higher than 1s 7d. Evidently he has discovered what is "good tea;" perhaps the verdict may be "a tea which you buy for 6d and sell for eighteen pence" (this would be a penny short of the best but still near enough). It is wrong, however, of me to try and anticipate a "verdict." But seriously, will he tell us what sort of tea is best liked?

Tea planters long ago used to send home for samples of "Horoiman's" best tea and they couldn't tell it from their own fannings and red

leaf, and could make no attempt for very shame to imitate it. And yet "Horniman" sold a good deal of tea. "Cooper-Cooper" had a huge tea shoot as their advertisement with great flowers on it—a "Bany" shoot with no tip. And I used to think that good tea was only made of the flowers (no branches or roots you know). Kindly look back to page 48, July 1st, 1893, of the *Tropical Agriculturist*, and letter No. 18 signed D.:—"It was candidly admitted to me in the Lane, when I was last in England, that ordinary Ceylon pekoe sou-chong was 50 per cent better for drinking purposes than ordinary China congou and that the only advantage the latter had was in its appearance."

When we have a fair consensus of opinion, we can take the majority—that of the greatest number of those who drink our tea—and when we know what "good tea" is we can make "improved tea." Good green tea used to be made in India; why has it been dropped so entirely? Do you think the London buyers will be bothered to buy tea to please the customers of the grocers who are removed, say, three places from themselves in the deal. "If they want green tea let 'em go to Japan or Hongkong; these Indian chaps can make good strong mixing tea."

The Continent, I hear, is refusing our strong tea, and yet have we had a single word of warning? Has the market found out what is wanted on the Continent and advised us to try and make some tea to suit that taste? And if this is a fact and we are losing, the Continental Market is not the "Market," a traitor to the hand which has made it, and fed it and keeps it alive. Are we to be monopolized for mixing? "Ach! dat ish too bitter," said a German gentleman when offered a cup of weak tea say about half the strength of Assam 1s 6d tea, and he insisted in reducing the strength half again with hot water. And yet we have to strive to improve even Assam tea for him.

Would it be heresy to say that people drink tea not for the taste but for the properties contained in the tea; and, alas, if we find out that the necessary "properties" consist of strength and body, then indeed we are at the end of our tether, for have we not come to the 3rd leaf as the limit of plucking? Shall we have to drop the second leaf in time and only pluck buds?

1874.

COCONUT PLANTING—AND THE DESTRUCTIVENESS OF BEETLES:

LEGISLATION NEEDED.

May 7.

DEAR SIR,—I am glad you have called prominent attention to the mischief done by coconut beetles (see page 818). If their destructiveness in the Chilaw and Puttalam districts is anything like that represented—40 trees I think it was etated out of every 120 planted—it is certainly time the Government intervened with legislation to stamp out the beetle pest, or at least to arrest their spread. The coconut industry is a great deal more to the people of the country than tea is to the European Colonist, or than even coffee, with its far-reaching influence and benefits, ever was. And for this reason. The nut is more than an article of commerce to them. It is their food in a variety of ways; it gives them light, and the product of the tree is to them shelter and many things beside. We need not be alarmists while we recognise and press obvious facts on the attention of the Government. It would be absurd

exaggeration to say that the industry is in danger; but under easily conceived circumstances it may rapidly be endangered, and in the meanwhile work serious, if not irreparable, loss. Happily, the pests are insects, and not, as in the case of coffee, fungal, and can therefore be more easily attacked and overcome. It may be true that as long as there is a coconut plant to attack, beetles and weevils will thrive; but they can thrive only if allowed to live, and their extermination is possible; while that of "hemelleia vastatrix" was soon proved to be impracticable. Still, the operations of the enemies of the coconut have their chief danger in their obscurity, while the fecundity of the insects is something marvellous. The danger is that the insects may, through neglect, spread from tree to tree, from field to field, and from estate to estate until whole districts become involved; and that this is no fanciful picture or contingency is proved by the sad experience in British Honduras where the injury done to coconut plantations threatened the prosperity of the whole colony. There 30, 40 and even 50 per cent were attacked and lost, and as the attacks were not confined to plants, but extended to bearing trees, the loss was most severely felt. The first step should then be to bring home the dangers of neglect to the minds of proprietors, large and small, and then to compel them to apply the needful remedies by more immediate penalties than the gradual loss of their profits and their plantations. In this district, I suppose I don't lose half-a-dozen plants a year from several thousands I have over 250 acres; but my experience within the last 12 months of the manner of the loss, through close observation, has convinced me that the danger is a real one; and that without careful and thorough extermination of insects and grubs all plants are liable to attack.

Let me explain. There is an idea that the plants attacked are those which have just come into bearing, or those about to blossom. That is a mistake. The plant is often attacked when much younger, and the mischief becomes apparent just when hopes of returns begin to be entertained. I became alive to the real danger which beetles and especially weevils threaten, after examination of the remains of a plant which an experienced kangany had destroyed as usual and as I thought effectually when I saw the heap of cinders and ashes. I had the curiosity to take up a petiole or leaf-stalk which the fire had not consumed, and which had a hole at its thickest end. I had it ripped. The larva which it had accommodated was shrunken and dead, but as the stalk was ripped farther on, a network of hollows was discovered, each with a cocoon of fibre in which was a live grub of diminishing size as you went further from the thick end of the petiole which half-encircled the stem. This brought to light two facts—that the fire cannot reach the grubs set in the deeper parts of the tree attacked, and that the damage is not confined to the heart of the tree. Search should be made for the enemy in every leaf stalk as well, and also in every convolution of the heart and head. In a word the tree and its leaves must be thoroughly dissected before burning, or you will leave behind your enemy to develop in a few days into a full-winged insect to carry its destructive mission into the next plant available.

Another point is that it is not the diseased plant which is attacked, as is generally the case with plants and their enemies. My experience is that the stoutest and the healthiest are the chief victims. Mr. De Mel is quite right to warn planters

against stripping the tree of leaves and exposing the tender bark. It is a most mischievous operation and invites to attack; but you will find these are not the principal sufferers. I have had plants attacked enveloped in a mass of leaf stalk and their almost impervious matted fibre. Whether oviposition was first at the root of the leaf-stalk or in a crack in the stem it is difficult to say. The absence of a stem in one case suggested the former; while the evil in another began in a crack in a stem of splendid girth. *Quare*, may not the fat bulky stems which are the outcome of the free rich soil in the Chilaw district explain the spread of the enemy? They crack readily, and at once afford him lodgment and succulent food!

Of course, you know the Kuruminiya or black beetle is not considered fatal to a tree. I have heard it even spoken of as a blessing in that it gives the tree a shock by its excavations and hastens fruit bearing, before its departure for another feeding ground. The natives say that it prepares the way for the Kandapanuwa, or red weevil, which has a most formidable pointed snout, and that the latter takes possession of the hollows vacated by its black friend. But I have known them work together, as I have discovered them in the same host, and their larvæ too are different—those of the beetle being white and cylindrical like the ordinary dunghill grub, while those of the weevil are, I believe, the yellowish baggy fellows which taper towards the ends. The scientist might find abundant material for investigation in the life history and habits of the Enemies of the Coconut Tree and his aid cannot but be helpful in carrying war into their camp; but you have done well as a preliminary to sound a note of alarm. It must be followed up, as only active determined measures can check the plague.—Yours truly,

PROPRIETOR.

MICA SHEETS AS PROTECTION FOR PALM AND CACAO TREES.

HALDUMULLA, May 8th.

DEAR SIR,—Many thanks for so kindly noticing my letter *re* "Mica" (see page 831). I fear you take rather a doubtful view of my remedy regarding the enemies of coconut trees; I candidly admit as regards beetles "mica" would prove futile. Referring to squirrels and rats I think it would prove successful. I post herewith one pound of mica sheets 6 inches in length by 3 to 4 inches in breadth. This quantity, I think, would be sufficient for say 18 trees and would cost about R1 12s delivered in Colombo. The mica should be fixed on the tree with tin-tacks. To illustrate my meaning more clearly we will suppose the girth of a tree 4 ft from the ground measures 3 ft and the mica is fixed there, allowing say 6 pieces for each tree which would cost about 7 cts.

The cacao tree would not require more than two pieces of mica, and would cost about 3 cts. but in no case must a band be fixed near the ground as rats and squirrels invariably take a jump—more especially when frightened. It is true that squirrels often live in cacao trees leaping from one tree to another in search of ripe pods, but surely it would pay to put on a large force of coolies for one day driving away the animals, and fixing the mica on the trees. Once rid of these pests I do not think they could return. As regards shooting squirrels being cheaper I doubt it; but of course a trial would prove.—Yours truly,

EDGAR HEANLY.

TEA PLANTING IN INDIA AND CEYLON.

May 11.

DEAR SIR,—My attention has only today been drawn to a letter appearing in the *Ceylon Observer* of 7th inst. signed "European Employee," (see page 833), in which he draws comparisons betwixt India and Ceylon in the matter of management of tea properties.

With a good deal of what he writes I quite concur, but I cannot help thinking that he has an ulterior motive in starting such a discussion. That, in fact, he has an eye to a probable District Superintendentship, or, at least, to an appointment as examiner of engines, boilers, &c., attached to tea factories. His remarks on the so-called "Visiting Agent" are very much to the point, but I submit that they are in a great measure applicable to his so-called District Superintendent.

I have always maintained that it is—or ought to be—highly satisfactory to both the Proprietor and the Superintendent that a report on the estate should be given once or twice a year by an Agent appointed by the Proprietor, but I have equally always maintained that the duty of a Visiting Agent should cease. I quite appreciate the fact that a District Superintendent's services might, and would, be very useful in cases where "creepers," after a few months' experience, were "shunted" on to a garden to manage or mismanage, on a salary barely enough to pay for an honest dish of curry and rice whilst the said District Superintendent draws a handsome salary; but otherwise I should prefer to leave my garden in full charge of one responsible, experienced man on the general plea that "too many cooks," &c.

As I have hinted above, I do not quite grasp what "European Employee" is driving at, but it seems quite evident that he has a *great* antipathy to the modern "creeper"! So have I—a *very strong antipathy*—so much so that I have, on three occasions, absolutely refused to be burdened with them, although I had the opportunity of pocketing £500 sterling had I taken them under my care. I am glad to find that "E. E." and I agree on this question.

The question "E. E." raises with regard to the management of machinery and construction of buildings is a large one; and it is truly wonderful how the average planter adapts himself to be almost "a jack of all trades." Presumably he "E. E." is a very competent man, but his tone is too sneering altogether, and detracts from his otherwise very sensible letter. He writes in too sweeping condemnation of our ordinary factory which, in very many cases, is the old coffee store converted into present requirements, and as regards machinery, &c., well, we have not yet been treated to an account of the *first* boiler explosion. Let us hope that "E. E." always has his safety valves in proper working order, and that he may never find it necessary to hang a 56 lb. weight on the lever, to increase the power of his engine.

I really think that his remarks *re* creepers should be given prominence to in the English papers as a warning to parents and guardians who contemplate sending out fresh drafts of "giraffe-necked chappies."—Yours truly,
D. L.

BANDARAPOLA CEYLON COMPANY LIMITED.

Extracts from report for meeting on the 25th
April 1894.

The Directors have now the pleasure to submit to the Shareholders the Accounts and Balance Sheet representing the working of the Company's Estates, for the year ending 31st December, 1893, the Properties having been taken over from 1st January, 1893.

Of the Capital authorised, viz., £50,000 in 500 Shares of £10 each, there has been issued—
 650 fully paid Vendor's Shares .. £6,500
 1,800 Shares, £3 paid 5,400

£11,900

and the remaining 50 fully paid Vendor's Shares, as named in the Prospectus of the Company, will be issued to the Vendor when the transfer of the Muendeniya portion of the property has been duly made to the Company.

Mr. Hugh Fraser, the Managing Director, is now in Ceylon, and as he has exerted every effort to have the transfer duly completed, the Directors hope shortly to learn that this portion of his mission has been brought to a satisfactory issue. Pending the completion of the transfer of Muendeniya, the Directors as arranged with Mr. Fraser have withheld £1,500 as representing the purchase price, viz. £500 fully paid Shares, £500 Debentures, £500 Cash, and these amounts will be dealt with when the necessary transfer has been duly executed.

The Company's acreage as shown in the December Estate Report consisted of the following:—

Tea in full bearing 310 acres, Tea planted in 1890 3 acres, in '91 12 acres, in '92 32 acres, and in '93 99 acres.	Acres
Total in Tea	456
Cocoa	37
Grass	6
	—
Total cultivated....	499
Forest	925
	—
Total	1,424

Mr. Fraser arrived at Bandarapola on the 10th December, 1893, and the following is an extract from his letter addressed to the Company on the 12th of that month: "Since my arrival I have occupied all the time available in inspecting the Tea Fields, Factory, &c., here, as well as the young tea, and cocoa clearings and the tea clearings on Muendeniya, and I have much pleasure in saying that I am greatly pleased with the vigorous appearance of the old tea which I have never seen present a greener appearance or shew a better cover, while the young clearings are promising in every respect. The cocoa is growing most satisfactorily, and its extension deserves every encouragement."

The estimated crop of tea for 1893 was 200,000 lb. and the Directors regret that owing to the unprecedentedly small rainfall, viz., 58.83 inches against 105.05 in 1891, and 83.08 in 1892, the crop secured only amounted to 175,107 lb. or a shortfall of 24,893 lb.; a deficiency which renders the accounts, as presented, not so satisfactory as the Directors had anticipated. The Shareholders will learn with regret that Mr. John Anderson, the Chairman of the Company, has found it necessary to resign his seat at the Board.

The Company's net profits for the year amount to £803 8s 1d, and this it is proposed to appropriate as follows:—

Amount as per Balance Sheet ..	£803 8 1
Interim Dividend at 3 per cent paid in September, absorbed	£357 0 0
It is proposed to pay a final Dividend of 3 per cent. (free of Income Tax), making 6 per cent. for the year	357 0 0
	714 0 0
	£89 8 1

QUANTITY AT THE EXPENSE OF QUALITY: INDIAN TEA.

Referring to the Indian tea crop for 1893-94, the *Grocer* says:—In the present season it seems to have been the aim of planters to produce "quantity" at the expense of "quality," and it is notorious that the difference in the character of the trees forwarded from the

same estates in Assam and Darjeeling has been very marked, month after month. Fine and inferior invoices have alternately succeeded each other from the same gardens, often creating much difficulty and confusion among the wholesale dealers in selecting the favourite marks on which they could rely for uniform strength and flavour, and leading to wide and almost ruinous fluctuations in value. It was not until last autumn that the London market began to steady itself, when it was ascertained beyond a doubt that the proportion of fine and finest teas in the above huge crop was very small, and every time they were competed for a fresh advance was established; but this did not always imply higher prices, only relatively better rates than had been previously obtainable, and the average quotations that have been realised at public sale in 1893-94 have been 2d per lb. under those in 1892-93. What there have been deficient supplies of choice and carefully prepared teas, there has, on the contrary, been an extraordinary abundance of low and common grades, portions of which have been so poor and trashy that at times hardly and buyers could be found to take them, and they had to be either put back out of sight or be sacrificed at unheard of cheap rates. This and weak liquoring qualities have invariably been at a discount, and where large parcels have been placed simultaneously on offer the greatest difficulty in disposing of them has been experienced. It rests with the growers of tea in India, therefore, to bestow more care upon the cultivation of the plant there, and give special attention to the preparation of their tea for the British market, which requires and must have a full-flavoured and pungent kind of liquor in the cup, and not a faint steamy decoction that is undrinkable without it is blended with a class of tea that is brisk on the palate, rich in colour, creamy or rare in fragrance. By a constant adherence to these rules, consumption is stimulated, and the finer the tea come here, the more active is the demand and the stiffer the price. As one of the satisfactory results of an abnormally big crop this season, the deliveries of Indian teas at the port of London have been exceptionally heavy, and for the last nine months they have amounted to 87,193,600 lb., in comparison with 81,729,000 lb. in the same period of 1892-93, and 82,673,000 lb. in 1891-2. The landings have also been excessive, reaching in the first three-quarters of the season 111,705,500 lb. instead of 105,006,000 lb. and 106,300,000 lb. in the two former ones; and the stock remaining on hand on the 31st ult. was of good dimensions—viz. 47,912,600 lb. against 46,276,500 lb. last year, and 45,089,308 lb. in 1892.

A NEW PROCESS OF MAKING QUININE.

About a fortnight ago the following peculiar-worded advertisement appeared in a London trade-list:—

Advertiser who has discovered a New Process, which has been thoroughly tested, for the production of Sulphate of Quinine at one-third ordinary cost, needs £500 to work same. Enormous profits certain. Strictest investigation courted.

Then followed the name of the alleged inventor and an address in Hampshire. As we were anxious to find out what new revolution the advertiser proposed to carry out in the quinine trade, we wrote to the address given, offering him, provided he could establish a *prima-facie* case of the genuineness of his invention, the gratuitous advertisement of an interview in our editorial columns, as the best means by which to obtain the funds of which he stood in need. Our letter was returned today officially marked "not known" Unless, therefore, the "inventor," who appears to have been just a bird of passage in the Hampshire village he named in his advertisement, had already found the needed financier and departed before our letter arrived, it is not likely that much more will be heard of the matter.—*Chemist and Druggist*, April 28.

JUTE CULTIVATION IN CEYLON.

We have just seen a very excellent sample of jute fibre in the hands of the Director of Public Instruction, which has been prepared from plants grown at the Agricultural School raised from seeds got from Calcutta. At the Peradeniya Gardens, a similar experiment was a failure; but here in Colombo the plants grow and mature from seeds in *six weeks*, against three months, the time usually required in Bengal. The fibre sample, so far as we can judge, is very strong and in every way superior; but we fear the state of the Fibre market in Europe does not offer much encouragement to an extension of the cultivation of jute. When in Dundee in 1884, we did all we could to stir up the Jute Mill "Princes" there, to form a Limited Company for the cultivation of Fibre-yielding plants in Ceylon. It was then a very small day with our "tea," and new products and new enterprises were required to revive the Colony. Here is one paragraph from a long letter of ours which appeared in the *Dundee Advertiser* in July 1884:—

Turning to *Fibres*, I can only report an experimental stage with Ceylon, although the resources of the island in indigenous or introduced fibrous plants—palms, bamboos, nettles, a'oes, plantains, &c., suitable for cordage spinning, papers, &c.—is very great. Of course I except the trade in coconut and other well-known palm fibres which has been growing for a good many years. But latterly experimental shipments have been made of aloe, Manilla, plantain and pineapple fibres. Jute, rhea, or China grass, New Zealand flax, and other grow freely in the Botanic Gardens and indeed jute and rhea are found in many parts of the island. In the low country of Ceylon there are hundreds of thousands of acres of fine land available for fibre cultivation, and a vast population of Sinhalese villagers, who as soon as they found a demand set in from European traders or planters, would speedily cultivate fibrous plants, for which they could get a return, as they now do for their coir or coconut fibre.

We failed, however, to move the Dundee merchants; or the reason that even ten years ago, there was no doubt of the supply of jute being ample and cheap enough. What the manufacturers there and in Bradford specially desired at our hands, was a new fibre—something between jute and silk—and they assured us that if this were forthcoming from Ceylon, a great industry would speedily arise. "There were fortunes in it!" The difficulty was to find the desired fibre of a silky character that could be continuously supplied in large quantities at a price not much in excess of that paid for jute. Failing to get what they wanted, the Bradford and Dundee makers of cloth began selecting the very finest of the jute to *mix* with silk and we know how far that trade has been carried.

Meantime, if as we fear, it should be found that there is no special encouragement in the European demand for jute, for us to start in Ceylon an industry supplementing or rivalling that of Bengal, there is nevertheless one direction in which there is ample room for a local industry. We refer to the very considerable import, year by year, from Calcutta for local use of "Gunnies, Twine nets, brushes, jute." We have repeatedly in reviewing our Customs accounts, pointed out that some R250,000 to R400,000 a year might be saved to Ceylon if steps were taken to meet this local demand on the spot. It is, of course, also a question whether with the very cheap labour in some parts of the Southern Province, a jute-growing industry might not profitably compete in a small way with that of Bengal. At any rate there can be no question of the interest attaching

to Mr. Driberg's experiment and to the resulting sample of jute which we have seen in Mr. Cull's hands.

THE REASON WHY CINCHONA BARK IS NOT MORE LIVELY.

We have had specially supplied to us the following information from the very latest Report of the well-known firm, Messrs. Gehe and Co., Dresden:—

Quantity of Quinine in Bark sold in		
	1893.	1892.
	Kilograms.	Kilograms.
London..	100,001	128,702
Amsterdam	138,763	120,509
Total: kilos	238,764	249,211
Offered in Amsterdam:		
	1893.	1892.
	Kilos.	Kilos.
Quinine in bark	217,992	168,918

79,229 kilos of quinine were not therefore sold or in other words the offerings surpassed the demand by 78,229 kilos quinine or by 28 per cent.

The Stock in Amsterdam on 1st January last, is given as follows:—

	1894.	1893.	1892.
	(Packages of 100 kilos or 225 lb. each.)		
	14,184	11,268	5,279

All this explains why bark is not more lively; but a change is expected before the end of the year, through a more active demand for quinine setting in.

ELECTRICAL MOTORS.

The question of electrical machines as "motors" has scarcely yet become one of much interest in Ceylon, and probably—unless it be for a tramway in Colombo—or here and there a "dynamo" worked from some convenient waterfall, no great interest will be evinced until some discovery is made in the direction so many are now looking. We are all fond of imagining what wonderful things will be accomplished some day, when, instead of having to generate the electricity before we can use it, as at present, we shall be able to tap it from its natural sources and stores, and apply it directly to the work we desire it to perform! That will be the first step towards a transformation scene such as the world has never yet known, and compared to which the wonders and progress made by steam were a mere step in the dark. Many novelists, and notably those of America, have tried to forecast such a time, but the reality will be very different and far transcend their imaginings. All these wonders will become familiar facts when once we succeed in turning electricity "from a mere transformer of energy into a source of energy." In these few words are wrapped up the whole problem. To a good many slow-minded people "working anything by electricity" already means the accomplishment of this as yet undiscovered problem. So it is as well to be reminded, from time to time, that the energy, or power, derived as yet, from any electric motor whatever, is only a "go-between" the original source of the power and the work done by it; and that this is accomplished only at the expense of much leakage, through friction, on the way. The Niagara Turbines will transmit only a little more than one-third the Falls' energy into the workshops connected with them; and yet a turbine driven by a natural fall of water is at present the most

efficient and cheapest "source" of energy we have. A vast amount of energy is stored up in coal; but of this at present we are able in the steam engine to extract only one-eighth for work done. Coal is in fact one of the stores of electric energy, from which we may some day find a way to extract the full power for use as we may want it. Given a "battery" into which coal can be put in such a way as to cause it to give up the whole of its energy on the spot, and we should have batteries of all sizes everywhere, driving our snips and our trains, turning our machines and lighting all our streets and houses. But that time is not come yet. When it does, a tea-house manager will say to Mutu Samy:—"Drop a lump of coal into battery A"—being all he will want to roll a thousand pound of leaf; or, "put a pinch or two of coal-dust into battery B," and this will light up his factory by night as if it were day!

These reflections are the result of reading an article in *Nature*, by E. P. Bamber, on "Electric Traction." In case this is ever to become a practical question in Colombo, it may be well to state that as regards motors for the cars, there exist at present six different systems, viz:—1. Using the rails on which the cars travel as conductors. 2. Having a special rail as conductor, either beside or between the rails on which the car travels. 3. Using under-ground conductors with an open conduit or slot in the road. 4. Having an insulated underground conductor. 5. Overhead conductors. 6. Storage Batteries. All these systems are in practical application,—“overhead conductors” taking the lead so far; but secondary or storage batteries, on account of their simplicity and immediate applicability are specially suitable for use on existing tramways, the objection to them being their weight and the necessity of renewing them from time to time. There exists, however a special difficulty in making these batteries at the same time light and durable, and the weight of each is so much extra weight to be carried by the car. Still, it would seem that “present conditions” are entirely in favour of light tramway cars so driven, following one another in frequent succession, and travelling at a moderate speed. This is the conclusion arrived at. But what we have to bear in mind is that electrical machines, under “present conditions,” can rarely be used with advantage and economy, and that the greatest economical difficulties are encountered with traction motors. A turbine directly applied transmits 6 or six-tenths of the energy of the head of water, to its work. An intervening electrical machine would cause a loss of nearly half of this energy, and when other prime movers are used the loss is still greater.

ENEMIES OF THE COCONUT PALM:

WANTED:—"LEGISLATION"; AS WELL AS AN "ENTOMOLOGIST."

If there remain any doubt on the part of the Government, as to the special importance of securing the services of an Entomologist at this time, we think the letter of "Proprietor" on page 836 ought to dispel it. When we find that not only is the great Tea Industry in need of such services; but that the still greater and in some respects more important Palm culture of the island, stands specially infested with insect enemies, we trust there will be no hesitation in appointing a Scientist to help both natives and

colonists at this juncture. The question may be asked, indeed, as to whether the services of Miss Ormerod herself could not be secured for a year or two from the Royal Agricultural Society of England. She must have pretty well exhausted her English field of inquiry, and if her employers offered no objection, we feel sure that a trip to and limited stay in, Ceylon, would not be at all unacceptable to this accomplished Entomologist. From the letter before us, as well as from somewhat contradictory reports which we find in our Manual and files, we can see that there are many points about the life-history and ravages of our coconut beetles that are by no means satisfactorily settled. "Proprietor" speaks of the enormous percentage of loss of 40 out of every 120 trees of certain ages, experienced in the Puttalam district. We cannot help thinking this statement, made in our columns by a native correspondent must be an exaggeration, unless the case be one of a specially neglected garden? We spoke of beetle-catchers bringing in as many as 40 "Kurumeniya" beetles and a few of the "Kandapanuwa," daily in the Deduru-oya district; and certainly the destruction in that region has been heavy enough in some parts, though by no means we trust so high as 33 per cent of the growing palms. Still, the loss is very severe and warrants both inquiry and action.

Our correspondent speaks of the need of "legislation," and we are most ready to back up his opinion and to support any movement in this direction; for, we think the time has fully come when the villagers—and for that matter, the larger proprietors too—should be compelled by law to deal promptly and thoroughly with their affected palms, so as not to allow them to become breeding-places for a multitude of beetles which eventually fly over the land, far and near, and attack the palms of their more active and conscientious neighbours. We do not think there would be much difficulty at this time of day, in getting the owners of coconut gardens and estates, to understand the necessity and importance of official interference. But as a matter of right procedure and as affording the fullest justification for the Government, it would be well perhaps for the Executive, first, to be placed in possession of a Report on the question from their duly-appointed Entomologist—whether Miss Ormerod or some one else. It should not take a Scientist very long to arrive at the conclusion that the case presented, was one for legislative and executive interference even though also for further careful scientific investigation. The first step therefore is to secure the appointment for a certain term, of an Entomologist as moved for by Mr. W. D. Gibbon and carried at the annual meeting of the Planters' Association—such appointment to be in the interests of the Agriculture of the island; but more especially in those of Tea and Coconuts.

In this connection we would call attention to a further interesting letter from Mr. E. N. Healy (see page 837) on the application of mica-sheathing to palms and cacao trees as a guard against the depredations of rats and squirrels. Who will give a trial to the proposal? We have received a packet of mica sheets which certainly are wonderfully cheap and should be easily applied, and which are at the disposal of anyone who will experiment and report to us.

CEYLON TEA PLANTING COMPANIES.

Our columns contain quite a number of Annual Reports from the Directors of Ceylon Tea Planting Companies and the Proceedings at

the Annual Meetings of several. Among the latter will be found a summary of the Chairman's address at the Ceylon Tea Plantations Company meeting, and nothing could be more brilliant from a financial point of view, than the figures indicative of advancing importance and prosperity which Mr. H. K. Rutherford was able to lay before his shareholders. The growth of the capital and operations and profits of this, the premier Ceylon Tea Company, is little less than marvellous. Long may its prosperity and its 15 per cent. continue, through the careful work of its splendid staff of officers and Superintendents in Ceylon and the shrewd, judicious management in the London office presided over by Mr. Rutherford.

Next we have the Bandarpolla Meeting, the chief feature of which was the special sympathy shown with Mr. John Anderson under his misfortune and the unexpectedly good news that so strong a public man—and one now so deeply interested in Ceylon—as Sir George Pilkington of Southport and Haputale, has agreed to join the Board of this Company. This is good news for the shareholders in our opinion.

There is nothing noteworthy in the proceedings at the meetings of the Panawal and Eastern Produce Companies, although in both cases, the prospects seem satisfactory if not brilliant.

The Report of the Standard Tea Co., which comes to us by this mail, affords good reading, were it only for the record of coffee in Udapussellawa still making so good a show. The Directors are prudent in not giving beyond 10 per cent for the year in a dividend, and carrying a considerable sum to reserve. On the paragraph in the Report referring to the comparison between the Udapussellawa tea-leaf sold on the spot before the St. Leonards' factory was constructed and the balance made in the factory and shipped to London, one who knows offers the following comment—

Obviously this comparison is made without taking into account cost of making the Ceylon-sold tea. With this in account the comparative figures would be probably:—Two-thirds Uda Pusselawa crop sold in Ceylon realised £3,400. One-third Uda Pusselawa crop shipped to London realised £4,000. Even with this correction the difference is markedly in favor of the factory.

Meantime we congratulate the Directors and shareholders of the Standard Co. on the very promising position and prospects of their affairs.

Next we turn to the GREAT WESTERN TEA COMPANY, the Annual Meeting of which was held in Colombo. While a dividend of 11 per cent. has been declared, it will be observed that the earnings equalled 14.83 per cent for the first year's working, although some 150 acres are not yet in full bearing. When we recall the age of Scalpa and Louisa as coffee estates, now forming the bulk of Great Western in tea, this result is very striking; for the places must have been opened originally over 50 years ago. Of course, such results in tea could not have been obtained off old land like this, save for liberal cultivation and manuring, and it is evident that when grass is plentiful, cattle establishments for manuring are the right thing. On the Great Western Group, there has also been a great deal of timber-tree planting, all very thriving and not only improving the appearance of the place; but ready to afford very valuable shelter to the tea in the exposed parts during the severe monsoon weather. The tea at present is looking exceedingly well. For the good management in the past with the means for liberal cultivation and shelter, thanks are specially due to the Manager, Mr. Mackie, and general regret will be felt that he was not at the meeting to have this tendered to him in person.

REVIEW.

"BAKER AND COOK" AND "FLOWERS AND GARDENS"—IN INDIA AND CEYLON.*

Such are the titles of two handy little Manuals for Anglo-Indian and Ceylon residents, just published in India, the latter being a second edition and the authoress being Mrs. R. Temple-Wright who has been long resident in different parts of the Continent. They are books which every house-keeper must delight in, and, once having begun to study them, would find it hard to lay them down. The hints and directions are so pithy and practical—tell one so many things that one wants to know for certain, in order to speak with authority to the cook or gardener—that one wishes always to have the books at hand. "BAKER AND COOK," like its predecessor "Flowers and Gardens," was written, we understand, in answer to many inquiries and the key-note of its composition is to be found in the words of Sir Henry Holland, a most distinguished Physician, who had vast and varied experience in dinners and dining. In his "Recollections of Past Life" he says:—"Refinements in food and furniture may err from excess, but their salutary influence is not to be disregarded. Every man is moulded more or less by his daily surroundings; and the vulgar eye becomes insensibly refined by the fairer forms and colours brought before it."

So, from the baking of bread to the last detail in the preparation and serving of fresh and wholesome food, the authoress has aimed at a simple reficement within the scope of every housekeeper. The books do not profess to be more than a sort of primer in flower-gardening and in culinary education, and frequent reference is made to books giving more elaborate recipes in various directions; but the books contain the necessary A.B.C. of Cookery and Gardening, and with them the novice may steer safely in the mysteries of housekeeping in the East.

With the rupee difficulty ever before them, house-keepers must welcome hints that may enable them better to utilize home-grown rather than imported foods, and Mrs. Temple-Wright tells us in her preface that she hopes these notes "will enable hostesses to make the best use of the cheaper and far more wholesome fresh food obtainable in the country, without having to fall back on the more expensive European tinned provisions." She has also gone fully into the subject of bread-making and yeast. Over twenty pages are devoted to this subject and elaborate explanations are given under such heads as the following:—The Bakehouse, Bread Clubs, The Oven, Heating the Oven Small Ovens; Home Baking; Mill for Grinding Meal; Wheat for Whole Meal; Atta; Flour; Kiln-Dried Flour; Testing Flour; Articles for Bakehouse Use; Moulds for Bread; Yeast-making—4 receipts; Bread-making; Baking Powder; Cottage Loaves, &c., and Breads and Buns of many descriptions. After this come a number of good receipts for cakes, biscuits, icing, &c.; and the authoress closes this branch of her subject as follows:—

You will find intense pleasure in attempting and effecting the Bread-making, etc., described in the foregoing paragraphs; the scent of the yeast, the sight of the lovely bread, fresh out of the oven, will inspire

* Baker and Cook, a Domestic Manual for India by Mrs. R. Temple-Wright. Flowers and Gardens in India, a Manual for Beginners, by Mrs. R. Temple-Wright. Second edition 1893, *Sic vos non vobis*.

you with zeal in all your efforts. The simplest philosophy of experience will show you the great necessity of this kind of work in Indian stations; the philanthropy innate in every wife, mother, and friend will lead you to love it, for you know our motto is—*sic vos non vobis*.

The remarks on the Kitchen, Kitchen Utensils, and Pantry are all worth studying, especially for those starting a home. Then follow recipes and instructions under the following heads:—Antepasto; Potage; Poisson; Relevé; Entrées; Le Rô; Entremets; Savoureux; Entremets Sucrés; Hors D'œuvres; Odds and Ends; and Hints.

The Hints embrace all manner of subjects, such as fattening poultry, mutton clubs, rabbit-keeping, testing milk, tea making, how to select meats and to clean rusty knives. But, buy the book and you will save many a rupee by knowing what to do and how to do it. The table of Contents is as follows:—

	Bread, Flour, Yeast, Oats...	1-47
	Indian Cooks and Cookery ..	48-57
DINNER	The Relish...	58-61
	The Soup ..	62-70
	The Fish ..	71-82
	The Joint ..	83-92
	The Side-dish ..	93-102
	The Roast ..	103-108
	The Vegetable ..	109-125
	The Sweet ..	126-142
	The Savoury ..	143-148
	The Sauce ..	149-158
	Odds and Ends, Curry and Rice, etc.	159-185
	Hints: Coffee Table Linen, Dairy, Poultry, Mutton Clubs ..	186-225
	English and French Names of Estates ..	i-iv
	Table of Measures of Liquids ..	v
	Index ..	vi-xiv

"FLOWERS AND GARDENS," which was published first, is the most practical and easily followed brochure we have met with of its kind and it makes one wish to set to work at once at improving the garden, and shows one how and where to begin to lay out the ground, make the lawn, the rosaries, take and start outtings, fit up seed-boxes and watering cans. Then follow many natty directions as to improvising garden stands, trays and hanging baskets. The work contains descriptions of some eighty ornamental or useful plants, and after naming the plant and describing its appearance, the authoress gives full directions as to how the plant should be cultivated, where planted and how treated. The directions for the cultivation and handling of ferns are very full. Each plant named has half-a-page or more to itself. Take for example what is said of *Phlox Drummondii*:—

"The indispensable ornament of an Indian garden," is what Firminger rightly calls this dear little annual. It grows low, so must be put in front of annuals that grow higher. Get some packets of mixed seed, and if you want a variety for table decoration, send for a packet of dark red and one of pink. Sow in October in separate boxes. When the plants are two or three inches high, take them up and plant the mixed colours in beds and borders, and the red and pink in patches by themselves (for outtings) and in flat boxes of your rustic stands; also in small pots for your verandahs and porch,—a good many, so as to admit of their being changed from time to time. Phlox, like petunia, will sow itself, but you must save seed the first year, because the flowers of those that come up self-sown are not so good.

In one of my gardens I had an oblong plot at the back of the house, which I grassed over and planted with a small rosary, each rose bush at a distance of six feet from the other. This grass-plot rosary had a 9-inch border of red alteranthera, against the

inner side of which was a 9 inch border of mixed phlox. This plot, from January to May was a sight pleasant indeed to the eye. It was watered by the hand, and the grass-cutters kept the grass clipped low (see "Hints.")

The last thirty pages of the book are devoted to hints of all sorts in connection with plants, where to place them, rustic supports, how to get rid of insects, to bronze or colour grasses, to keep flowers fresh and to pack them for travelling. Whoever wishes to understand the management of his own garden should study this little book.

INDIAN TEA ASSOCIATION.

ANNUAL GENERAL MEETING.

The annual general meeting of the Indian Tea Association was held in the Committee Room of the Royal Exchange recently, the Hon. Mr. J. W. Stuart presiding. The meeting was well attended, and several matters of importance to all concerned in the tea industry in this country and Ceylon were considered.

The CHAIRMAN in opening the proceedings said:— [We quote the portion of the Chairman's address of local interest.—*Ed. T.A.*]

The most important subject dealt with this year is the Exhibition of Indian tea at Chicago. I am glad we are able to publish with our report, the report of Mr. Blechynden, together with a photograph of the Indian Pavilion; this Association has already expressed its appreciation of the services rendered by Mr. Blechynden.

Mr. Blechynden's report gives full details of the difficulties overcome, and the work he was able to accomplish; the good sense shown by him in his policy towards the wholesale trade in America is one of the most striking features of his work; with the expenditure of less than one-third of that of Ceylon he has, I venture to think, done as much work of a permanent nature as was accomplished by the Ceylon Commissioner, for the system adopted by Mr. Blechynden has resulted in 1,500 grocers throughout the States handling our tea, who are consequently more likely to take an interest in them than if left to discover their virtues by themselves.

It is needless to say that having spent £7,000 on the Chicago Exhibition, it is absolutely necessary, if the money is not to be thrown away, that efforts must be continued to follow up the advantage so far gained, and it has been resolved to send Mr. Blechynden back to America to carry out the plans he has sketched out in his report, by which the interest of the consumers and grocers shall be stirred to make trial of Indian tea throughout the States. The figures of shipments of Indian teas to the U. S. A. and Canada for last year amounted to 2,137,600 lb. against 1,482,311 lb., in 1892, an increase of 50 per cent. which is without doubt largely due to our exhibit at the Chicago World's fair.

The expenditure required to carry out Mr. Blechynden's scheme is estimated at £36,000 per annum; in order to advertise and carry out other proposed means of pushing the sale of tea, we ought to have on hand £75,000 a small sum compared with the advantages to be gained. I appeal therefore to all tea proprietors whether belonging to this Association or not to give the subscription asked which is 2 annas per acre of cultivation and $\frac{1}{2}$ an anna per md. of tea and if all will give that sum will easily be obtained. I make this appeal for their own benefit as unless new markets are opened even the present low prices in London cannot be maintained. When you think that the Ceylon planters tax themselves by a special export toll besides subscribing largely to the Tea Fund, you must admit that India is far behind them in pushing its own interests.

A proposal was made by Sir John Muir a short time ago that India and Ceylon should combine for the purpose of introducing British-grown teas into America; Sir John Muir being interested in both

Indian and Ceylon teas was in a position suitably to make this suggestion; this Association after considering his proposals, quite agreed that, if possible to be arranged, such a combination was desirable. Accordingly Sir John Muir communicated our resolution to the Ceylon Planters' Association, who, on the 14th April, passed a resolution.

I have read the discussion which took place on that occasion, and I was glad to notice the cordial and friendly feelings displayed by the speakers towards their fellow-planters and our Association in India; like most of us, they appeared to agree with the theory of combination between India and Ceylon, but the practical difficulties were so great, that they decided that while working in harmony we should each be independent. For myself I feel sure this is the best plan, and your Committee has decided to carry it out, and has instructed our representative to work in harmony with the Ceylon Agent.

A Sub-Committee, called the Indian Tea Fund Committee, has been appointed to collect subscriptions and carry on the works well begun in conjunction with a special London Committee, feeling from what we had heard from Ceylon, that the proposed combination was not likely to go through the Sub-Committee drew up their plans, but waited until the Ceylon decision was known, before definitely proceeding; accordingly on the 10th April, after receipt of a telegram from Ceylon notifying the passing of the resolution they appointed Mr. Blechynden to proceed to America, and he has left this week, together with his attendant kbitmaghars. I wish to draw attention to these dates as some of the Ceylon newspapers, learning of our proposed arrangements, were inclined to think we were forestalling them by our arrangements which was not the case. Time enough however has been lost, and we feel that we are losing much by delay. I have every confidence that Mr. Blechynden will not let the grass grow under his feet and that it will not be his fault if Indian tea does not make strides towards the favour of the American public.

Another matter of great importance to the tea industry which has occurred during the year is the publication of Mr. Bamber's book on the Chemistry and Agriculture of tea. It is not a book perhaps, which all of us will read right through in our lighter moods, but as a text book, which brings all, that is known about tea, up to date, and explains the chemical changes which takes place in manufacture, it will, I hope, prove a useful addition to the library of every planter, and stir up an interest in the scientific development of the tea plant, which will lead to improvements in its treatment in the future.

The question of insect blights is shortly entered into by Mr. Bamber; but time did not admit of his going more fully into the subject. Our good friend the Hon. J. Buckingham has written a memorandum on the subject which you have doubtless all seen, in which he points out most forcibly how little Government is doing in the matter of entomological research, compared with America and other countries. His paper has been submitted by your Committee to the Government of India with a strong recommendation to adopt the scheme proposed by Mr. Buckingham; a reply has just been received from Government that the suggestions will receive the careful attention of the Government of India in connection with the proposals of the Agricultural Conference of October last."

The past season has been a singularly bad one both as regards quality of crop and the profits derived. The quantity of tea produced verified our estimates, almost to a lb., for we estimated originally for a total crop of 125,549,000 lb., and the actual reached 125,321,000 lb. After a bad season like the last, we naturally hope to see a better one this year, and if energy, fair dealing and unity of purpose can accomplish success, we may with good reason look for it.—*Englishman*.

CEYLON SEASON REPORTS.

From the abstract of season reports for the quarter ended March 31st last, published in the

Government Gazette we notice that the crops and prospects were good in all parts of the island, except in Udunuwara, Tumpane, Matale and Udahewaheta districts of the Central Province and Kurunegala and Puttalam districts of the North-Western Province and Galboda and Kinigoda Korales of the Kegalla district in the Province of Sabaragamuwa. The price of paddy during the quarter ranged from R1 to R2.40 per bushel, the former in the Yatinuwara and Harispattu of the Central Province and the latter in Mullaitivu in the Northern Province; while dry grain fetched 50 cents per bushel for amu to R4.50 for green peas.

THE PALLEGAMA GRANT ASSOCIATION OF CEYLON, LIMITED.

The Memorandum and Articles of Association of this Company are published in the *Gazette* setting forth that its objects are to purchase or otherwise acquire the leasehold interest of Messrs. Evelyn Gordon Reeves, Edward Rosling, Dalziel Ross Buchanan, and Gordon Frazer in a certain area of land, situate in the District of East Matale, in the Central Province of Ceylon, containing in extent 5,014 acres and 31 poles or thereabouts, under a certain lease dated 20th August, 1891 granted by the Crown to William Gow and the said Evelyn Gordon Reeves; to purchase tea leaf, coconut, copperah, indiarubber, and (or) other raw products for manufacture, manipulation, or sale; and to manufacture tea leaf, copperah, oil, poonac, coir fibre, yarn, rope, spirit from toddy drawn from coconut trees or from the water of the nut, desiccated coconut, compost manure, and other raw products. The nominal capital of the Company is R200,000, divided into 2,000 shares of R100 each with power to increase or reduce the capital. The subscribers are Messrs. Edward Rosling, Dessford, Nanuoya; D. R. Buchanan, A. Schulze, H. Creasy, and Gordon Frazer; Colombo; E. Gordon Reeves, and Arthur H. Thomas, Madulkele.

PLANTING PROGRESS IN FIJI: TEA, COCONUTS, BANANAS, &c.

The Chairman of the Levuka Chamber of Commerce had not a very brilliant review to make at the annual meeting held on 20th March, a report of which has just come to hand. He began by saying:—

I am sorry to say that my task is a comparatively easy one, as many products which used to be some of the principal exports have almost disappeared from the export list. I refer principally to peanuts, maize, coffee, tea, island cotton and kidney cotton. This latter produce is now only grown by the Government as taxes, and at present prices, it would not pay any planter to embark in this industry. The products noticed are Peanuts, Bananas, Sugar, Tea, Vanilla, Coffee and Coconuts, and as the statement is concise as well as interesting, we copy it nearly all:—

PEANUTS.—There is only a limited demand for this in the colonies, and as prices ranged very high some years ago a great many planters were tempted to grow peanuts with the natural consequence that the market was flooded and thousands of bags were lying in the colonies, absolutely unsaleable.

BANANAS.—Owing to the disease of the plants near Suva, and even Navua, this industry has fallen off very much in the last two years; the result being that one of the fortuitously steamers from Sydney has ceased running—it is to be hoped for a short time only—until our banana plantations are opened up. I have been informed that the banana disease in the

district of Tailevu has almost disappeared, and if this is the case it is the attention of the Levuka merchants to revive this industry. But everything depends upon the local steamship companies, as it is a question whether the steamers can be induced to call at these places. Beside Tailevu, there are the districts of Savu Savu and Wainunu, where the disease is not very prevalent.

SUGAR.—As regards this industry, we have had a full report from the Chairman of the Sava Chamber of Commerce, and little is left for me to say in this matter, except that the very extensive operations of the Colonial Sugar Company at Labasa and Ba are of very great importance to Levuka.

TEA.—This is an important industry, and although the exports hitherto have been small and I believe not very successful, it is to be hoped that the plantations, Alpha Tea Estate and Masusa Estate would be kept going. The Masusa Tea Estate I hear is likely to be closed unless some satisfactory arrangements are concluded. This concerns the Levuka merchants very closely. An attempt was made to form a syndicate to take over this estate, but it fell through. I still hope that the merchants and others of Levuka will be able to come to some arrangement with the present energetic manager, Mr. Barrett to continue the working of the estate. The local consumption of Tea is entirely derived from the Alpha and Masusa Tea Estates, only a very small quantity of some China and Indian Teas being imported.

VANILLA.—Is being tried on a small scale by several planters, and it has been proved that a most excellent article can be produced here.

COFRA.—I now come to the export of copra, which affects the trade of Levuka more directly than any other export, and I have taken the trouble to go into this subject more minutely. The total exports for 1893 as far as I am able to collect statistics amounted to 6,300 tons. In this amount I may state is included the shipment per "Augusta" 1,100 tons which barque left here early in January, although the whole of the cargo was virtually on board by December 31st, 1893, except a few tons.

Owing to the hurricane in December 1892, I estimate that Fiji lost fully 1,000 tons of copra. If we therefore escape the hurricane this year there is no reason to doubt why the colony should not produce 8,000 tons, as you must remember that the increase of copra is going on from year to year, as most of the plantations have not recovered from the injury sustained during the gales, 1886 and 1887. Besides this a great many plantations are not in proper bearing as yet, and if not disturbed by natural causes I look forward to a production of 10,000 tons within a few years. While on this subject I cannot help expressing an opinion that the produce of copra could be increased, probably by one-fourth of the whole export, if the Government would take the matter in hand. There has been some attempt made by planting trees in certain districts, which, of course, is a step in the right direction, but I would propose to cut down the superfluous trees, by which means I maintain the increase in copra could be augmented within probably two or three years. This may seem at first somewhat paradoxical but the fact is that on the Windward Island, more especially at Lakeba, there are thousands of trees which never bear and keep others from bearing.

The trees have grown up spontaneously for years as the nuts drop, and the consequence is that groves of coconut trees can be found where the trees are not more than five or six feet apart, and as it is a recognised fact that trees should be at least 30 feet apart, it requires not much argument to prove my contention. In these groves I refer to, there are of course here and there some trees which bear; these trees having managed to outgrow the others and thus have come to spread their leaves. I have seen thousands of trees 30 or 40 feet high without a nut on them, and this on islands which are supposed to be peculiarly adapted to the growth of the coconuts. Any one can witness the same thing even here on Ovalau on a small scale. I am of course aware that the Fijians, especially the

elder ones, have a superstitious aversion to cut down and finish trees under any circumstances; therefore the thinning out of trees can only be done by a certain amount of Government authority, but it requires a practical man to supervise the cutting down of trees. It is a well-known fact that planters, who planted their coconuts in early years 18 and 20 feet apart, found it necessary to cut down a number of trees in order to give the remaining trees a proper amount of light and room to spread their leaves. If this is so how much more necessary is it to do the same in those islands where the trees have grown up anyhow without any supervision of planting. In proposing that Government should take steps to thin out coconut palms to stand 30 feet apart, the Mercantile Chairman is making the same proposal as we have urged in Ceylon very frequently and we trust to see it acted on here before long.

DRUG REPORT.

(From Chemist and Druggist.)

London, April 19.

CINCHONA.—At the cinchona-auctions on Tuesday a very moderate supply was offered. It was made up as follows:—

Ceylon cinchona ...	317 of which	224 were sold
East Indian cinchona...	782 do	478 do
Java cinchona ...	70 do	70 do
South American cinchona	73 do	73 do
	1222 do	840 do

The sales passed off very quietly, without any quotable change in price on the last auctions. The bulk of the bark offered consisted of fair East Indian Officials, but a considerable portion was bought in. The unit remains as nearly as possible 7d per lb.

The following figures represent the quantities purchased by the principal buyers:—

Agents for the Mannheim and Amsterdam works	69,598
Agents for the Brunswick works ..	50,864
Agents for the American and Italian works..	35,898
Messrs. Howards & Sons ..	28,270
Agents for the Auerbach-factory ..	16,520
Agents for the Frankfurt-on-the-Main and Stuttgart works ..	9,900
Druggists and other s.....	16,800
Total quantity of bark sold..	227,760
Bought in or withdrawn ..	107,398

Total quantity offered .. 335,158

It should be remembered that the proportion of bark bought by a buyer is no indication of the percentage of the total amount of quinine in the sales represented by his purchases.

The following prices were paid for sound bark:—
CEYLON CINCHONA.—Original: Ordinary woody to fair bright quilly red branch and stem chips and shavings 1½d to 1¾d; low ditto 1½; yellow stem chips 3½d per lb. Hybrid chips 1½d per lb. Renewed: Ordinary to fair red stem and branch chips and shavings 1d to 1½d per lb. Hybrid stem chips 2d per lb.

JAVA CINCHONA.—Yellow branch, rather dusty 3d to 3½d per lb.

SOUTH AMERICAN CINCHONA.—Seventy-three bales cultivated Bolivian Calisaya quill realised from 4d per lb. for dull broken to 5½d per lb. for fair, partly thin quill.

COCAINE.—After a couple of months' quietness, the price of cocaine hydrochlorate was suddenly reduced on Wednesday to 18s per oz. for 100-oz. parcels, 18s 3d for lots of from 25 to 100-oz., and 18s 6d per oz. for smaller quantities. The reduction, which is at the rate of 1s per oz., applies to all the "competing brands."

QUININE.—The market has been very dull, 1½d per oz. remaining the asking-price for second-hand German bulk on the spot. The last business done for delivery was at the rate of 1½d per oz. for July. The manufacturers' prices are now as follows:—Howards bulk 1s 2d to 1s 3d; vials 1s 2d to 1s 4d per oz.; Whiffen bulk 1s 1d; vials 1s 3d per oz.; Pelletier, vials 1s 5d to 1s 5½d per oz.; Fabbria Lombarda, vials 1s 3d; bulk 1s 1d per oz. All German brands in bulk 1s 1d per oz.

INDIAN PATENTS.

Specifications of the undermentioned invention have been filed, under the provisions of Act V of 1888:—

EXTRACTING FIBRE.—No. 101 of 1893.—Albert Angelo Lacey, of 116, Ripon Street, Calcutta, for extracting fibre from the agave or aloe, pineapple, and other fibrous plants. (Filed 4th April 1894.)—*Indian Engineer.*

TEA AND SCANDAL.

The following amusing skit on the Poets may be known to some old Cantabs in Ceylon, but as I am sure it will be as new to most of your readers as it was to me, I give it *in extenso*, all but Cowper's which unfortunately is omitted:—

THE POETS AT TEA.

(Such is the title of a series of short clever parodies which appeared in the *Cambridge Fortnightly*, February 7th, 1888.)

MACAULAY, who made it:—
 Pour, varlet, pour the water
 The water steaming hot:
 A spoonful for each man of us,
 Another for the pot!
 We shall not drink from amber,
 No Capua slave shall mix
 For us the snows of Athos,
 With Port at thirty-six
 Whiter than snow of crystals
 Grown sweet 'neath tropic fires,
 More rich the herb of Chiu's field,
 The pasture-lands more fragrance yield,
 For ever let Britannia wield
 The Tea-pot of her sires!

TENNYSON, who took it hot:—
 I think that I am drawing to an end,
 For on a sudden came a gasp of breath,
 And stretching of the hands and blinded eyes,
 And a great darkness falling on my soul.
 Oh, Hallelujah—huddly pass the milk.

SWINBURNE, who let it get cold:—
 As the sin, that is sweet in the sinning,
 Is foul in the cool thereof,
 As the heat of the summer's beginning
 Is past in the winter of love,
 O purity, painful and pleading!
 O coldness ineffably grey!
 Oh hear us, our haodmaid unheeding,
 And take it away!

BROWNING, who treated it allegorically:—
 Tut! bah! we take as another case—
 Pass the pills on the pills on the window-sill;
 notice the capsule.
 (A sick man' fancy, no doubt, but I place
 Reliance on trade-marks, sir)—so, perhaps you'll
 Excuse the digression—this cup which I hold
 Light poised—bah! it's spilt in the bed—well,
 let's on go

Held Bohea and sugar, sir; if you were told
 The sugar was salt, would the Bohea be Congo?
 (COWPER, who thoroughly enjoyed it:—omitted.)

WORDSWORTH, who gave it away:—
 Come, little cottage-girl, you seem
 To want my cup of tea,
 And will you take a little cream,
 Now tell the truth to me.
 She had a rustic woodland grin,
 Her cheek was soft as silk,
 As she replied, "Sir, please put in
 A little drop of milk."
 Why, what put milk into your head?
 "This cream my cows supply,"
 And five times to the chill I said:
 "Why, pig-head, tell me why?"
 "You call me pig-head," she replied;
 "My proper name is Ruth,
 I called that milk," she blushed with pride,
 "You bade me speak the truth."

POE, who got excited over it:—
 Here's a mellow cup of Tea! golden Tea!
 What a world of rapturous thought its fragrance
 brings to me.
 Oh, from out the silver coils
 How it wells!
 How it swells!
 Keeping tune, tune, tune, tune
 To the tintinabulation of the spoon.
 And the kettle on the fire
 Boils its spout off with desire,
 With a desperate desire
 And a crystalline endeavour,
 Now, now to sit or never
 Oh the top of the pale-faced moon,
 But he always came home to tea, tea, tea, tea,
 tea, tea.
 Tea to the n—1th.

ROSETTI, who took six cups of it:—
 The lilies lie in my lady's bower,
 (Oh, weary mother, drive the cows to roost!
 They faintly droop for a little hour;
 My lady's head droops like a flower.
 She took a porcelain in her hand,
 (Oh, weary mother, drive the cows to roost!
 She poured; I drank at her command,
 Drank deep, & now—you understand!
 (Oh, weary mother, drive the cows to roost!

BURNS, who liked it adulterated:—
 Weel, gin ye speir, I'm no inclined,
 Whusky or tay,—to state my miud
 For aoe or ither:
 For gin I tak the first, I'm fou:
 And gin the next, I'm dull as you:
 Mix a' thegither.

WALT WHITMAN, who didn't stay more than a minute:—
 One cup for my self-hood,
 Many for you. Alloos, camerados, we will drink
 together.
 O hand to hand! That tea-spoon, please when
 you've done with it.
 What butter-coloured hair you've got; I don't
 want to be personal.
 All right, then, you needn't. You're a stale
 cadaver.
 Eighteen-pence if the bottles are returned.
 Alloos, from a' bat-eyed formulés.
 B. E. O. P.

The rabid feeling existing at the time of the War of Independence in America, is well shown in the annexed extract from the *Pennsylvania and Weekly Journal* of February 8th; 1775.—"Boston January 23rd.—Last Wednesday evening about 60 lb. of Tea was burnt on the parade at Portsmouth. It belonged to a person who brought it from Salem, who was so convinced of his error in exposing that condemned commodity to sale, that he set fire to it himself in the presence of a great number of people.

We hear from Newbury that some time last week it was discovered that three or four chests of Tea had lately been smuggled into that place and sold to different persons, but as soon as it was known to the Committee they applied to the person who disposed of it (it being impossible to come at the Tea, and obliged him to give up the profits arising from the sale thereof, amounting to about £50 L. M. for the benefit of the poor."

This also is part of a long poem in the 28th June number of the same paper:—

Whereas the rebels hereabout,
 Are stubborn still, and still hold out,
 Refusing yet to drink their Tea,
 In spite of Parliament and me:
 Thus graciously the war I wage,
 As witnesseth my hand—Tom Gage.
 A. M. FERGUSON.

PICKINGS WITH A LOCAL APPLICATION

The *Agricultural Gazette of New South Wales* remarks as follows regarding Coffee leaves as a Beverage:—
 A decoction made from the leaves of the coffee shrub has long been used in the Eastern Archipelago, and has more recently been introduced to the coolies in Southern India. A few years since it attracted considerable notice, and was recommended as a new article of import, to become a cheap substitute for tea. There seems to be no doubt that coffee leaves contain caffeine in sufficient abundance to make a valuable beverage, but the presence of an unpleasant sunna-like odour would militate greatly against its popularity. As regards price, it is said that coffee leaves could be prepared (like tea) and shipped at 2d per lb. as against teas at 6d to 10d. There exists, however, the difficulty that depriving the tree of its foliage damages the crop of berries and injures the tree itself. On berry-producing trees, therefore, only the leaves obtained in the ordinary pruning operations would be available, and these would seem to yield so small a supply as not to be worth the cost of collection. Growing the shrubs for leaf alone would be a very questionable undertaking, but there appears to be no valid reason why, in the event of the berry crop failing, a portion, at least, of the leaves might not be gathered and prepared, if any means can be found of removing the objectionable odour. It has been urged that the product would be chiefly used to adulterate tea, but even supposing that such an adulterant could escape ready detection, the charge is not a very serious one.

Referring to the success of the BROAD TIRE ORDINANCE in Placer county, the *Sacramento Record Union* says:—"The waggon rolled over the road should be a road maker, not a road destroyer. It ought to conserve hauling the heavier than the lighter load. The broad tire does this. In France are found the best roads in Europe, and over them roll only wheels of the broadest tires. It is the law there that the load shall be distributed over the largest possible surface consistent with the weight carried, the power exerted and the needs of the people to wheel loads to market. The tires of the French market waggon are all the way from 3 to 10 inches in width. The greater number are from 4 to 6 inches. There, too, the hind and forward wheels do not track. Each pair of wheels tracks alone, and thus the combined width of the four tires serves the purpose of a road roller to keep the roof of the road smooth, compact and free from cut outs, or what are generally known as chuck holes." In Ontario the Department of Agriculture advises that for waggons without springs the tire should never be less than 2½ inches in width for a load of from 500 lb. to 1000 lb. per wheel. For loads of from 2000 lb. to 3000 lb. per wheel the tire should have a diameter of not less than 6 inches. It is understood that this recommendation will be adopted.

How very seldom it happens—says the *Melbourne Leader*—that farmers or orchardists study the LIFE HISTORY OF THE INSECT OR FUNGOID PESTS which annually work such an enormous amount of destruction. The work is almost invariably relegated to the scientist: yet it is on the farm or in the orchard that the most reliable information can be obtained. The cultivator who exerts himself to study the diseases that may be attacking his crops, trees or vines occupies a position analogous to that of the physician in a hospital who has his patients always under his eye, and is therefore in a position to note every change that takes place and watch the effect of the remedies given. Scientific men engaged in studying insect or fungoid pests must necessarily do a large portion of their work in the laboratory, and therefore have not the same opportunities for closely studying the various diseases of farm crops or following them through their different stages. If the farmer could be induced to study the history of each special pest which may be common on his particular farm, a great deal of valuable information would in time be gained that might be of great assistance to the scientist in devising a remedy. The microscope opens up a most fascinating field for research for all who have learned to use it, and it is extremely desirable that it should be found on the majority of farms. Agricultural societies have a partiality for giving cups and medals that are useless, and not always ornamental, as prizes for exhibit at their shows. Far more benefit to the community would result if a good working microscope and a text book of agricultural microscopy were given in lieu of articles which no one particularly cares about or values highly. Microscopes are now obtainable at a moderate price, and if they were more generally made use of they would become the means of disseminating a vast amount of knowledge, and would place at the disposal of the scientist a great deal of information which he has now some difficulty in obtaining. Given a microscope and the means of learning how to intelligently use it, and the young farmer would be able to enter upon a highly interesting and important field of research, and many of the problems which now puzzle the pathologist would, in all probability, have light shed upon them. We feel sure that the younger generation of farmers would eagerly avail themselves of an opportunity to become acquainted with the use of the microscope. We commend the suggestion to agricultural show committees and the donors of special prizes for shows.

A good deal has been said about the healthful-

ness of LEMONS. The latest advice how to use them, so that they will do the most good, is as follows:—Most people know the benefit of lemonade before breakfast, but few know that it is more than doubled by taking more at night also. The way to get the better of the bilious system, without the use of medicines, is to take the juice of one, two, or three lemons, as appetite craves, in as much water as makes it pleasant to drink, without sugar, before going to bed. In the morning on rising, at least half an hour before breakfast, take the juice of one lemon in a tumbler of water. This will clear the system of bile with efficiency, without any of the weakening effects of drugs. People should not irritate the stomach by eating lemons, however, as the powerful acid of the juice, which is always most corrosive, invariably produces inflammation after a while, but properly diluted, so that it does not burn or draw the throat, it does its medical work without harm, and when the stomach is clear of food, has abundant opportunity to work over the system thoroughly, says a medical authority.

Had it not been for an accident of fashion the gentler sex would be striding their horses still, and that the sidesaddle is not an invention due to the modesty of advance civilization. It appears that one Anna of Bohemia, eldest daughter of a German Emperor and wife of an English King, introduced the custom, not from delicate repulsion to the old method, but simply because she was afflicted with some sort of deformity that rendered it impossible for her to ride upon the saddle in common use. In those days it was imperative that a woman should ride, accordingly, the first sidesaddle was invented. Royalty had then, as now, snobbish followers, ever on the alert to adopt fashions honoured by its patronage, and in a few months every woman of position in England possessed a sidesaddle, and the custom was established.

M. Girard in his notes on ARABIAN COFFEE, in the *Queenslander*, writes thus regarding the analysis of the bean:—

Coffee berries contain water, cellular, and organic matter, 93.31; mineral salts 6.69. The mineral salts comprise potash and soda from 35 to 40 per cent phosphoric acid from 12 to 18 per cent, silica from 15 to 20 per cent, magnesia from 9 to 13 per cent, lime from 3 to 5 per cent, oxide of iron and manganese, carbonic acid and chlorhydric acid, in smaller proportions. Taking the average crop to be 500 lb of coffee beans per acre, the loss in alkaline salts sustained by one acre of soil after every crop will be—potash and soda, about 180 lb phosphoric about 58 lb; and lime about 20 lb, which would have to be returned in the shape of artificial manures containing the said ingredients in maximum quantities and the others in smaller quantities.

IVORY AND BONE.—I fancy I could tell one from the other on inspection; or at least when sight was better I could do so. But I have not had experience of ivory which has been in a grave. Ivory is homogeneous, and is non-porous. Bone, on the other hand, is always porous. Each, however, contains phosphate of lime, so boiling would not be a test. If "Antiquary" were to get a bone which can recognise as the part of the leg of an animal, and which has been exposed to the weather, he will see what I mean by its being porous. Again, if he subjects a bone to red heat in a muffle furnace, he will get a skeleton (so to speak) of the bone composed of phosphate of lime, and very beautiful they are. But I believe that a piece of ivory similarly treated would only fall to powder of phosphate of lime, and be amorphous or without shape. A bone with water heated in a digester so as to get a greater heat than boiling point of water 212° Fhr., leaves a beautiful skeleton of bone, Ivory so treated does not, nor fish bones.—*English Mechanic*.

Correspondence.

To the Editor.

COCONUT CULTIVATION IN CEYLON;
AND HOW TO DEAL WITH DEADLY
RED (KANDAPANUWA) BEETLE.

(By the Oldest Planter left to us.)

DEAR SIR,—Having recorded my experience in Coconut Cultivation in the columns of the *Tropical Agriculturist*, as I acquired it during upwards of 30 years, I intended to keep silence on that subject in the future, and would not have troubled you now, but for the reports you have lately published about the ravages of the Kandapanuwa in the Chilaw district which display almost incredible ignorance on the part of those in charge of estates on this part of their duty. I therefore once more take up my pen to restate what I know regarding this pest, which can best be done by stating how I learned to deal with the Kandapanuwa.

It is now nearly forty years since I took up my first charge of a coconut field. The weevil had been quite as destructive then as it now appears to be in the new district, and great efforts had been made to combat it with the result of increasing rather than diminishing its ravages. The system was to send a couple of coolies carted in hand to search for the trees in which the grub was at work. This was done by hacking off leaves, in which process wounds were made in the rind, and the stems were opened to the weather while too tender to stand it without cracking. When the presence of the grub in a tree was clearly ascertained, they set to work with chisel and mallet to dig them out and they were never at a loss for a job.

In my ignorance which was at the first quite as profound as that of any modern Deduru Oya planter, I carried out the established system for some time; but, finding things getting worse instead of better, I began to have doubts about its being the right thing. I then began to study the subject for myself and observe facts. I found that adjoining native gardens of the same age, but that had been left to grow up in jungle, had not lost a plant from this cause. I next satisfied myself that the weevil's means of attack was unequal to the task of penetrating the ripened rind of a coconut stem. I found digging out the grubs an utter failure, every tree so treated perished except such as had become already too hard, for further operations had in fact ceased to be suitable food. On those facts I acted, I stopped the carting work, I stopped digging out, and confined operations to chopping up the affected trees and destroying every visible grub they contained, as well as the mature insects which were almost as numerous as the grubs. At first the chopped up stems were left on the ground, but in a few days I found them full of young grubs. After this they were treated with fire, but even that did not deter the insect from using them for a breeding ground, so after scathing them with fire, they were buried under three feet of earth. From the time that the old method was stopped, the loss gradually diminished, and in three months ceased altogether.

As the red weevil cannot penetrate the ripened rind of the coconut tree, it can only effect an entrance by a natural defect, an accidental wound on injudicious interference on the part of the planter, with the natural development of the tree by way of helping it on. To guard against such fractures of the rind, we must begin at the beginning by digging holes three feet deep and placing the plant, so that the crown of the root shall not be less than two feet below the surface. Shallow planting—in good soil, especially—forces the stem into a bulbous form at the base; this abnormal expansion splits the succulent leaf stems at the base, and those leaves afford sufficient food for the grub, till it is strong enough to eat through the fibrous rind of the main stem. Then the plant having no space under ground to throw out roots proceeds to form them above ground, thus causing a series of cracks, in the hard rind all round on the surface; of which the ever-watchful weevil at once avails itself, to deposit its eggs. Nothing of this kind occurs, when the plant has sufficient length of stem underground to produce all the roots it requires, accidental wounds of the stem are then rare; but the system of trimming the trees, is the most dangerous proceeding of all. The imbrication of embracing leaves, that naturally cling most tenaciously to the stem, in the earlier stages of growth, till they rot and drop off piecemeal, protect not only the stem, but the younger leaves, till they are sufficiently hardened to stand the weather and defy the enemy. This arrangement should on no account be interfered with.

No skill and watchfulness can avert the loss of an occasional tree, if there are any weevils in the vicinity; but not an hour should be lost in dealing with the tree in which they have effected a lodgement, so that not a single perfect insect may emerge. A war of extermination is the only way to security; and if every proprietor in the affected district join heart and hand in the campaign, the enemy will be cleared out in six months.

That a neglected jungle-grown coconut field is a breeding ground for the weevil is a mistake;—so long as they have a cleared field to operate on, they never go into the jungle. I do not recollect a case of an attack on a tree surrounded by jungle.

An Entomologist by all means; but that will take time, and immense further damage may be done in the meantime, even if he or she should show any less drastic method of combating the enemy than the destruction of every tree successfully attacked by the insect. No objection to a law on this, when the lawgivers have a perfect knowledge of the subject, when they certainly know the cause and the remedy. We have the example of the Straits Settlements in this very matter. They there made a law imposing heavy penalties on dunghills as the breeding ground of the Kurumenia that only deals with the leaves, and left out of the measure any notice of the more deadly enemy, whose successful invasion of the tree is a death sentence.

It is not a fact that the Kurumenia in any way facilitates the operations of the Kandapanuwa; the former feeds on the tender undeveloped leaves at the summit of the tree, the latter on the substance of the stem, and there is a space of several feet between their respective fields of action, a sort of neutral ground towards which the one works downwards and the other upwards.

I am slow to believe that the weevil gets into bearing trees I have never seen it except where unwarrantable liberties have been taken with the leaves.

W. B. L.

IMPROVEMENT IN TEA MAKING BY AN INDIAN TEA PLANTER.

DEAR SIR,—Mr. John Hughes is of the opinion (see page 831) that “the successful manufacture of tea depends largely on the careful observation of chemical principles;” and that “the market price of the samples examined varied according to the amount of soluble ash contained.” He recommends the services of the Chemical expert.

Is the book by Mr. Kelway Bamber to be considered useless? No doubt if his research and report, now in the hands of all, is of value, we shall see the quality of tea generally and rapidly “improved.” Consequently we ought to see higher prices.

It is evident that both Mr. Bamber and Mr. Hughes point out the way to make, or to find out how to make, tea which will fetch a better “market price.”

Assam wants no teaching; it has found out the tea to suit the market, but every other district has failed. Why not let Assam go on its way and suit the market and let the other districts try and find out other customers than the London market. Can it be said that the tea we send (generally a poor attempt at Assam tea), suits the consumer. If this was really the case the price of Assam best tea would be double its present range and the rest would be much lower even than at present. If Assam endeavoured only to make tea for the consumer, it would probably still lead the way, and should the whole planting community also endeavour *only* to suit the consumer, very much more of our tea would be used. To do this we must find out what the consumer wants. In the same issue see “Tea Drinking in Wales.” We could supply the miners referred to with tea which they could drink five times a day without doing them any injury—how can we do this when our endeavour is to keep in all the tannin so as to make strong astringent tea?

I may be wrong and quote from memory, but I have read that the Chinese *never* drink plain water, they invariably drink tea (*i.e.* boiled water made palatable by a weak infusion of Theine) and I hear that there is no cholera in China. Those miners in Wales are right, there is nothing like tea. It is a bulky drink, has been boiled, and sustains them to a great extent. Have we ever made an attempt to make “miner’s tea?” Naturally he does not want the delicate aroma sought after in higher circles at 5 o’clock daily. The Australian used to make his tea in a pail—no expert wanted to find out how to make *that* tea. Have we ever tried? We make the tea that is wanted by these men in spite of ourselves, but only because we *fail* in making the “market” tea. I think that anyone can make tea which will be taken readily by the bulk of tea drinkers; but in times to come the expert will be employed to make teas running up to five and eight shillings a pound. Just as in wines the bulk is made by rule of thumb; the choice brands by great care and chemical knowledge. If we try to make tea for drinking, we shall succeed, and probably (as in China) tea will become the universal drink, and help the temperance people. If tea is *bad* the Chinese ought to have been killed out by now. Are they injured? Listen to complaints and follow advice, but try and get both from the people who drink your tea. Undoubtedly, as in China, some districts—and of these some particular plantations—are capable of making better tea (whether for the market or for

the consumer) than the other districts or plantations. The chemical expert will be able to discover this if it is not already known; but it is absurd to suppose that the chemical expert will be able to show all of us how to make the teas which at present hold the highest value in the market. All that sort of thing has been threshed out by the wine growers. Everyone does not try to make the best champagne, but still the bulk manage to make a product which is appreciated by their consumers. Leaving out the £25 per pound Ceylon tea, do we get higher prices than China for our teas? If we do not then it proves that China makes tea which is better appreciated by the consumer than our tea. Then comes the question. Is it easier and better to find out what the consumer wants, or to force him to adopt his taste to what we are accustomed to produce? Is it easier to change our style of manufacture than the habit and taste of the consumer? Let us settle all this before you get a better man than Mr. Bamber. 1874.

[Is it not the business of the blender to edit the taste of different classes and districts in the old country?—ED. T.A.]

TEA MAKING AND “DRY” Vs. “WET”

FUEL: A QUERY?

Dehiowita, 25th May.

SIR,—At pages 231 and 233 in Mr. M. K. Bamber’s book on Tea, the author advocates the use of *dry* fuel, because air heated by dry fuel is drier than if heated by wet fuel.

Of course every one knows the advantage of dry fuel from an economical point of view. What I want to know is, that if, in any of our ordinary tea drying machines—desiccator, sirocco, victoria, &c.—when the thermometer is registering say 100 deg. will that 100 deg. represent a *drier* drying agent when it has been created by dry fuel than when created by wet fuel? To my lay mind it seems as if air drawn from the surrounding atmosphere and passed through tubes, &c. acted on by heat from either dry or wet fuel will represent the same drying power; of course given the thermometer registers the same.

I am quite aware it will take more wet fuel to give the same result as dry, just as it will take more to heat damp air than dry.

Will you or any of your readers kindly enlighten

IGNORAMUS?

TEA IN RUSSIA.—The Russian Government may develop successfully one or two experiment plantations on the Caucasus where a beginning has already been made on a small scale; but we have no faith in this being followed by private enterprise or that an industry of any importance can arise. With tea so cheap as it is now, the Russian people as well as Russian Government, will soon find that the truly economical as well as wise course, is to import. When M. Popoff and his staff visited Abbotsford plantation some years ago, the veteran Russian tea buyer was very inquisitive on all points touching cultivation and preparation, and there was no hesitation in supplying him with the fullest information. He got a set of our Manuals, to present to the Russian Government; but he quite admitted then that with tea travelling down in price year by year, there was not much encouragement to grow tea out of India, Ceylon and China,

* Mr. Hughes had not seen this book when he wrote.—ED. T.A.

CEYLON PLANTERS AS PIONEERS IN NEW LANDS:

CAPITAL LEAVING CEYLON.

It is the manifest destiny of this central island-colony—the best school in the world for tropical agriculturists—to see its planters go forth to try their fortune in other lands. North Borneo or “New Ceylon,” the Straits Settlements planting districts and Travancore district in Southern India owe their very origin and rise into importance to Ceylon; and what has been done there, is likely to be effected perhaps with greater success in other lands. We hear that at present, there is a very appreciable outflow of planting capital from Ceylon. The object is to invest it in coffee and coconut land. For the former, we fear the Ceylon Government cannot offer any very tempting area; but for coconuts, it is not right that such Ceylon capitalists as we have, should be forced to lock to the Straits Settlements or Eastern Archipelago. There must be a good deal more of Crown land in the Chilaw and Puttalam districts well worth planting with the palm, which ought at once to be offered for sale in order, if possible, to attract and retain surplus money in the island.

But we have today to refer to a great Coffee enterprise started and fostered mainly under Ceylon auspices and that not on British territory, but in Netherlands India. How Mr. D. Fairweather in the first instance came to fix on the East rn division of Java as the best place in which to invest for coffee planting, involves one of the most romantic stories of travel and exploration ever told of a Ceylon planter. Mr Fairweather started from Ceylon in 1891 to visit and explore “Ibea” (of which we have recently been writing so freely). He made his way via Aden and Zanzibar to Mombasa, secured the good offices of Mr. Commissioner Berkeley and his Deputy Mr. J. R. W. Pigott (formerly of Matale); organized a caravan and penetrated—all by himself so far as Europeans are concerned,—as far as Uganda and the great inland sea Victoria Nyanza. He had Stanley’s “boy” Salley with him, and travelled into the heart of Africa and back in safety at a cost of £600 without finding any warrant to take up planting land in the then unsettled state of the country and backward state of transport. He saw coffee growing or running wild in some parts; tobacco growing or running wild in some parts; tobacco of fine growth being trampled under feet near numerous native villages; wide areas under bananas; splendid timbered country and elevated forest land and when the Railway and good Government arrive—as they are now bound to do speedily—Mr. Fairweather has no doubt of a splendid planting future for a large portion of Ibea. The marvel is that our enterprising Ceylon pioneer passed through unscathed: the fever developed after he returned to Zanzibar—where he lay stricken for many weeks; but he recovered to travel over Mauritius and a great part of Madagascar and then in despair of getting away otherwise, he became a passenger in a sugar barque to New Zealand, and thence finding his way through the Australian Colonies, he at length came to Java.

All this is no doubt an old story to many Ceylon readers; but it may well bear recapitulation at this time. Indeed, it is an experience that stands out prominently in our planting annals of its kind: and we may well be proud of the planter who spends 18 months, many hundreds of £’s, and risks his life in order to find the best region in which to invest for *Coffea Arabica*: How, at length, the Messrs. Fairweather with Mr. J. H. Starey and a Java Firm secured 3,000 acres of fine land in East

Java and how now there are 600 acres under cultivation with splendid coffee which at a year old is almost a man’s height, are results which can only be mentioned today. Mr. J. H. Starey has just returned from a visit to this Glen Falloch plantation and property, and we understand he is most thoroughly satisfied with the appearance and prospects. Mr. Turing Mackenzie, whom many friends will remember in Ceylon, is the chief manager, and he has Assistants both English and Dutch. Mr. Starey has kindly promised to grant an interview to our reporter so soon as the hurry of the mail is over, from which we have no doubt many interesting particulars will be gleaned. We were led to believe that labour would be a difficulty, but Mr. Fairweather assures us that so far this is not the case, for although the wages at 60 cents of a guilder (gold standard) is about double the rate in Ceylon, yet the work is well done and profitable. The plantation is situated about 40 miles from the port of shipment; and there is no dread of taxation, seeing that the only material levy by the Dutch Government will be 2 per cent on the value of the produce, a very moderate tax.

Are we to rejoice over, or regret such planting development in other regions by Ceylon men and to some extent Ceylon capital? Our feelings are no doubt a little mixed; but we cannot but rejoice in every sign of true enterprise, extended industry and of the subjugation of jungles to the wants of man. For the Ceylon Government, there is a striking lesson in the circumstance that Java as well as the Straits are drawing on Ceylon. Our authorities undoubtedly went waking up. They should put waste Crown land fit for coconuts freely into the market and they ought to rejoice in the fact of private enterprise being ready to connect Colombo by railway along our North-west Coast with India. A Railway through the Chilaw and Puttalam districts would speedily lead to the development of a vast additional area under the coconut and palmyra palms.

ENTOMOLOGY AS EMPLOYMENT FOR WOMEN.

Women and children have a special aptitude for entomological inquiries. They have the curiosity, the patience, the eyesight, and the memory for the purpose. Anywhere one woman in ten, and one child in ten, with fair opportunity and encouragement, will acquire a very large mastery of the insect world. Even as it is, without any encouragement, a village lad will often surprise the parson, and his own employer too, by his familiarity with the numerous creatures coming daily across his path or his field of vision. Whether it will ever be found practicable to substitute economic entomology for the long division sums now used to tie village lads to the desk the whole summer afternoon depends on the period to elapse before common sense resumes its old place in education. But nothing would be easier, if only teachers can be found with the requisite observation and industry.—*London Times*.

PROSPECTS IN NORTH BORNEO.

We are glad to hear that accounts from North Borneo are altogether more cheering. Tobacco prospects are improving and the low exchange is greatly in favour of planters. The cable just laid connecting Labuan with Singapore and by and bye with China will be a great benefit to the country, as a small branch cable connects Labuan with Borneo, and it is intended to carry on a land line to Sandakan.

CEYLON TEA PLANTATIONS CO., LTD.

The ordinary general meeting of the Ceylon Tea Plantations Company, Limited, was held yesterday at Winchester House, Old Broad Street, E.C.—Mr. H. K. Rutherford presided, and in moving the adoption of the report, said although the depression of trade had undoubtedly had a lowering effect on the price of their produce, they were able to present a statement of their affairs showing results superior to those of any previous year in the Company's history. As they had now been in existence seven years, he proposed to compare the early beginnings of the Company with its present position. The original paid-up capital was £75,000 and it was now £248,460. They started with 1,593 acres of cultivated land, standing them in some £38 per acre, and they now had 8,318 acres under tea, at £29 per acre. Their first crop from all sources, was 598,779 lb. of tea, and last year it was eight times that amount, or 4,966,928 lb. The first year's profits were £13,257 and in the year under review they were £44,481. They had paid dividends amounting to £144,073, had written off depreciation £20,445, set aside as reserve from surplus profit £35,000, and carried forward to next year £1,995, making in all a total profit on the seven years working of £201,514. The tea had been produced during the year at a reduced expenditure of £12,614. That was one of the most gratifying features in the accounts as it showed the lowest point had not been touched in the cost of production in previous years. The proceeds from all sources amounted to £127,240, being £1,920 over those of the previous year and the net profits were £44,481, or £6,121 in excess of 1892. That profit represented 23 per cent. on their ordinary share capital, after allowing for 7 per cent. on the preference shares. The board proposed to declare a final dividend of 8 per cent. on the ordinary shares, making 15 per cent. for the year.—Mr. H. Tod seconded the motion, which was agreed to. (See also page 851.)

COFFEE AND TEA IN THE NILGIRIS.

The Chairman of the Nilgiri Planters' Association at the annual meeting on May 16th, reported:—

"The season, as regards coffee has been a somewhat unsatisfactory one, unseasonable early rains being the chief cause of failure. For tea the season has been a fairly good one."

Mr. Hodgson read a report of the interview of the deputation of the Planters' Association with H. E. the Governor; and we quote as follows:—

"Compulsory Registration of Maistries was promised careful consideration. I may say here that in addition to defining the maistry as a man who receives 50/- to supply labor, we also stipulated that the introduction of registration should, if brought into law, be introduced simultaneously in *all planting districts*; this of course for our mutual protection.

"A Definition of the word advance, meaning advances to coolies after they arrive on the estate was proposed by a member of Government but was made without prejudice. I think this definition will meet our requirements under this head, as it will protect us with coolies who take advances on the Estate, by making such advances distinct from advances of wages, which latter would not come under the Act, and are only recoverable in a Civil Court."

LEMONGRASS AS TEA.

Although in different countries the leaves of various plants have, to some extent, served the purposes of tea, their use never became popular; even in India the poor classes sometimes infuse the leaves of the lemongrass (*Andropogon*), and use it as tea. A new plant has recently been introduced as a tea substitute. In the islands of Mauritius and Reunion the leaves of the orchid

Angræcum fragrans were dried and used as tea by the natives and from time to time came to the notice of travellers and others, who have testified to the fine flavour of the tea so made.—*Invention*, April 21.

THE DUTY ON COFFEE.

A correspondent who signs himself "Not a Tee-totaler," writes to us suggesting that the duty on coffee should be removed, in order that the temptation to adulterate that fragrant beverage with chicory may be diminished. Seeing that the revenue derived from coffee is decreasing so rapidly that it can hardly be long before it will cease to be worth collecting, the suggestion may certainly be commended to the serious consideration of the Chancellor of the Exchequer. There are thousands of people who declare that coffee is all the better for an admixture of the root so often found with it, but nearly all of them are grocers. The community at large knows better, and those who have tried both beverages are aware that the coffee which makes men feel better and more contented with their lot in life is the unadulterated coffee. If Sir William Harcourt can do anything to bring such coffee within reach of the very poorest, the very poorest will take a more radiant view of life and be thankful to him without reference to their political opinion.—*Daily Graphic*, April 21.

CEYLON TEA AND SMALL BREAKS.

Messrs. "I. A. Rucker & Bencraft" in their Weekly Tea Circular, thus refer to this subject:—

There is some discussion taking place about the best means of relieving the trade from the pressure caused by the simultaneous issue of catalogues for 25,000 packages for one day's sale. Attention has been called to the inconvenience of selling small breaks after a long and wearying sale of large breaks, and proposals are mooted for raising the limits in the direction taken by the Indian Tea Importers, who have agreed to 20 chests, 30 half-chests and 50 boxes. It is felt that Ceylon can scarcely go as far as that, but 18 chests, 24 half-chests and 30 boxes might advantageously be made the limits for the present. As it is obviously the interest of the seller to study the convenience of the buyer, the ideal plan would of course be for the Ceylon Planters' Association and Ceylon Tea Importers to instruct their brokers when printing their catalogues on Wednesdays, to issue two catalogues divided as fairly as possible between the Tuesday and Thursday of the following week. When there is a large quantity in one week, this would amount to 12,000 packages, let us say on each day, a broker printing 4,000 packages, would sell 2,000 on Tuesday and 2,000 on Thursday. The dealers would have ample time to value the samples, and the sales would be over, small breaks and all, in three hours on each day instead of six on one day. It is objected to this arrangement that certain planters would never agree to it, and that account sales of the Thursday's sale could not be made up and rendered in time for Friday's mail. One or two alternative schemes is that small break sales should commence at 2 p.m. in other room, while the Tuesday's sale of large breaks is going on. But it is obviously possible that if the sale was heavy, the small breaks might be sold before the large breaks, and every one knows how much better a small break sells, if the prices of the preceding large breaks have stamped the invoice as "fine" or "finest." The third proposal is to sell the large breaks on Tuesday and the small breaks on Thursday. If the size of the small breaks is raised this would have much the same result as the first plan, as far as account sales went, but it would have the corresponding advantage of dividing the sale more evenly. It is evident that something must be done to prevent what may be called the "physical" decline of the market

caused by the strain on the tea-tasters. In a naturally strong position, tea might be expected to go easier when catalogues were issued for 25,000 in one week, even if divided between two days, but the market would not be knocked down 1d to 2d per lb. owing to the physical impossibility of carefully valuing 1,000 samples for one day.

THE CEYLON TEA PLANTATIONS COMPANY.

The usual annual meeting of this Company was held at Winchester House, on April 12th, when the following shareholders were present.—Mr. H. K. Rutherford (Chairman), Messrs. D. Reil and H. Tod (Directors), and Messrs. J. Dudin, W. H. Whitefield, Jesse Moir, W. G. Freeman, George White, S. Johnson E. Tje, W. Johnstone, George Seton, C. J. Scott, J. Moir, E. T. Davies, A. G. Stanton, J. L. Shand, and H. Anderson.

The SECRETARY having read the notice convening the meeting.

THE CHAIRMAN'S SPEECH.

The CHAIRMAN said.—As the report and accounts have been in your hands for some days, I presume, as usual, you will accept them as read. I notice it is customary at these times for the chairmen of companies, in addressing the shareholders, to make some reference to the depression of trades having more or less curtailed profits for the past year. Although this depression has undoubtedly had a lowering effect on the price of our produce, we are, notwithstanding, able to present to you a statement of your affairs shewing results superior to those of any previous year in the Company's history. As we have now been in existence seven years, it may not be uninteresting to compare the early beginnings of the Company with its present position. The original paid up capital was £75,000, and it is now £248,460. We started with 1,593 acres of cultivated land standing us in some £38 per acre, and we now have 8,318 acres under tea at £29 per acre. Our first crop from all sources was 598,779 lb of tea, and last year it was eight times this amount, or 4,966,928 lb. The first year's profits were £13,257, and in the year under review they are £44,481.

We have paid dividends amounting to ..	144,073	13	9
Have written off for depreciation ..	20,445	8	1
Set aside as a Reserve from Surplus			
Profits	35,000	0	0
And carry forward to next year ..	1,995	8	10

Making in all a total profit in the 7			
years of	£201,514	10	8

A CREDITABLE RECORD.

This, I submit is a very creditable record and one which I am sure must be as gratifying to shareholders as it is to those who have to deal with the management of your affairs. Before referring to my visit to Ceylon it will perhaps be more convenient to make some remarks in elucidation of the various items in our balance sheet and profit and loss account. Our shares issue, you will note, has been increased by the addition of £20,240 to the ordinary share capital and £7,640 increase on the preference shares, and this extra capital, you will remember, was called for in order to purchase Glenlyon and Star's estates. The total issue now stands at £248,460, and against this you will see we have property to the value of £285,470 or £37,000 in excess of our issued share capital. When you consider the high-class nature of our property generally, and the value of such lands at the present time in Ceylon as evidenced by recent sales, and the flotation of new tea companies, I think it cannot but be admitted that we have placed this company in an exceedingly strong position when our cultivated lands now stand at £29 per acre and other lands at £3 15s—after allowing for the reserve of £35,000. This reserve fund last year was made up to £25,000, and, it will be observed, half this amount has been invested in first-class securities, and, as we think it right you should know what these investments are, I will enumerate them:—

£2,500 — 2½ per cent Consols			
2,500 — 2½ per cent Metropolitan Stock			
300 — 3½ per cent Glasgow Irredeemable Stock			
2,500 — 3 per cent Mauritius Inscribed Guaranteed			
1,000 — 3 per cent Canada Stock			[Stock
1,000 — 4 per cent Victoria Inscribed Stock			
1,000 — 3½ per cent New Zealand Inscribed Stock			
1,000 — 3½ per cent New South Wales Inscribed Stock			
1,000 — 3½ per cent Cape of Good Hope Do.			

It is the intention of your Directors to place the full amount of £25,000 in a similar class of investments, and we trust this money will not be distributed for any purpose save that of equalizing dividends. It is proposed by your Board to add £10,000 to this reserve, and I shall now refer to how we have begun to utilize some of the surplus profits. I think you will agree with me in considering that it is highly desirable that these funds should not participate in the risks incidental to tea cultivation, but that we should fortify ourselves against the possibility of bad years in the future by growing products other than tea.

COCONUT CULTIVATION.

While in Ceylon I discussed very fully with Mr. Talbot the proposals he had made to the Board for the cultivation of coconuts as a reserve product. After mature consideration, and the inspection of several blocks of land by our manager, assisted by the well-known expert, Mr. Jarline, he selected and purchased for us 803 acres of land lying between Mirigama and Kurunegala of which 175 acres are already planted with coconuts. There are some here, connected with the Colony, who do not require to be told anything as to the stability of this product and of its safe character as an investment; but to those who do not know Ceylon I may briefly say it may be termed the consols of tropical agriculture. The security consists in the fact that coconut trees go on bearing for over 100 years, that the cultivation is a cheap one, involving but little outlay after planting up; that the demand for the product of the trees is steadily increasing, and further that well-planted and cultivated coconut estates at the present time give returns quite equal to those derived from tea cultivation. European enterprise has not hitherto, however, found it congenial to embark on any large extent in the cultivation of this staple product of the Island, from the fact that eight to nine years elapse before any appreciable return can be looked for from the capital invested. With coconuts as the basis of our cultivation we intend also, where the land is suitable, to grow Liberian coffee and cocoa, from which we hope to obtain fair returns before the coconut trees come into bearing. With encouraging prospects for a continuance of good dividends from our tea properties, and a substantial reserve in securities to fall back upon in case of necessity to equalize dividends, I think we are amply justified in investing in the cultivation of this product. The policy we have decided to pursue in this matter we consider an eminently safe one in the interests of the shareholders and to the continued stability of the company. Turning to the profit and loss account, it will not, I think, have escaped your notice that, although we have turned out 300,229 lb. more tea than in the previous year, we have done so at a reduced expenditure in Ceylon of no less than £4,614 6s 9d.

COST OF PRODUCTION.

This to my mind is one of the most gratifying and satisfactory features in the accounts, as it shows that the lowest point had not been touched in the cost of production in previous years, and is evidence, when taken in conjunction with the profits earned, that we have in our Ceylon manager and the estate superintendents men who, while economizing in every particular of expenditure, do not sacrifice efficiency in order to secure cheapness of production. The proceeds from all sources amount to £127,240, being £1,920 over

those of the previous year, and the net profits are £44,481, or £6,121 in excess of 1892. This profit represents 23 per cent. on our Ordinary Share Capital, after allowing for 7 per cent. on the Preference Shares, and is equivalent to a return of £6 4s per acre. You will observe from the report that we have 1,151 acres of young tea from which at present we get no return. This acreage is equivalent to an increase of 16 per cent. on our present area in bearing; so that, were our profits to continue at £6 4s per acre, we would earn 25 per cent. for the Ordinary Share Capital.

THE FUTURE.

The future, however, depends on many things, the two most important factors being the exchange question and the price of tea. Of these I can tell you nothing, as they are practically beyond control. Should, however, either or both of them assume an adverse form it is not, I think, likely that they could be more than temporarily injurious to the Ceylon tea enterprise. As regards the other material agents which influence our profits, namely the condition of our estates and their management, I am, from my recent visit to Ceylon, in a position to say something. As this Company owns 21 estates which vary with each other in a more or less degree as regards elevation, soil, climate and class of plant—all of which contribute in affecting the quality of tea, and as they also differ as to their natural advantages for cheap production it would scarcely be possible, even if it were desirable, for me in the brief time at my disposal to detail the condition of each of these properties separately to you. I will therefore, content myself by saying that I found our estates being most carefully cultivated, and factories and machinery maintained in excellent condition and repair, and the superintendents taking a keen and intelligent interest in every detail affecting the welfare of the property and the manufacture of tea. The tea bushes on our estates were looking better and more vigorous than when I handed over charge to our present manager in 1889, and give every indication of being able to yield good crops for many years to come. Our oldest tea is now 16 years from planting, and instead of shewing signs of deterioration (as has been alleged in some quarters of Ceylon tea generally), I am in a position to say that no acreage under tea that I saw while in Ceylon, of which I had previous knowledge, shewed any signs of deterioration, but on the contrary the condition and appearance of the bush generally throughout the Island had greatly improved. I may say that I have returned from my visit more than ever convinced not only of the sound nature of the tea enterprise generally, but more particularly of the eminently good position of the Ceylon Tea Plantations Company in its relation to that enterprise. Since the close of the year we have been unfortunate in having our Alton Factory totally destroyed by fire, but I am glad to say we are covered by Insurance. During the reconstruction of the buildings the tea will be manufactured on some of our neighbours' gardens, and any loss we are likely to suffer will, we estimate, be small. And now gentlemen, with regard to the current year. We do not know what is before us; but I may tell you that in the first quarter of the year we have manufactured 68,000 lb more tea than we did for the same period last year, and the prices realised are about the same.

THE CEYLON STAFF: A FINE SELECTION.

I would say one word on behalf of our Ceylon staff. On my visit I had an opportunity of meeting all our superintendents and assistants, and it gives me great pleasure indeed at this meeting to be able to say that I consider we could not have a better selection of men than those who carry out our work for us under the able management of their chief, Mr. Talbot. I shall be very pleased to answer any questions shareholders may desire to put with regard to the Company's affairs as far as I am able. Meantime I have now to move:—"That the report of the directors and statement of accounts as submitted be received and adopted, and that a final dividend of

8 per cent. on the ordinary shares (making 15 per cent. in all free of income tax) be declared, payable on and after the 30th inst."

The resolution, having been seconded by Mr. Tou, was duly carried.

The re-election of Mr. D. Reid as a director was then carried, as was the re-appointment of the Auditors, and a vote of thanks to the Ceylon Staff having been put and carried by Mr. J. L. Shand, for their efficient service during the past year, the proceedings were brought to a close by an unanimous vote of thanks to the Chairman.—Local "Times."

THE ACME PACKAGE COMPANY, LIMITED.

CAPITAL £75,000 IN £5 SHARES.

The prospectus is issued of Acme Package Company, Limited. This company is instituted for the purpose of acquiring the rights of a comparatively small syndicate which has been worked in Glasgow during several years. Its primary object was to provide metal packages for the carriage of tea from India, Ceylon, China and other tea producing countries. Hitherto it has been the practice to export tea grown in these regions lead-lined boxes of native manufacture, good enough in their way, but not sufficiently strong to obviate leakage, which often led to considerable loss. The new invention completely annuls, it is said, such mischances. Instead of the wooden box with lead lining, which has been used ever since tea was imported into this country more than two-and-a-half centuries ago, a package of thin steel is provided which not only gives greater security and consequent freedom from loss of weight, but has also the additional advantage of saving freight and inland carriage. A board of thoroughly practical men, several of them already users of the packages, and who have tested them in actual work, has been formed. Some of the largest tea producers have taken up the scheme, which it is claimed will effect a revolution in the transport of tea from the growing districts in the East to this country.—*City Leader.*

THE AMSTERDAM CINCHONA MARKET.

Our Amsterdam correspondent writes, under date of April 19th, that the cinchona-sales to be held in Amsterdam on May 10th will consist of 807 cases and 3810 bales, or about 344 tons divided as follows:—From Government plantations 60 cases and 237 bales, about 29 tons; from private plantations 247 cases and 3564 bales, about 315 tons. This quantity contains of Druggist's bark—Succirubra, quills 105 bales, 200 cases; broken quills and chips 205 bales, 71 cases, root 3 bales. Officialis, quills 36 cases. Of Manufacturing bark—Ledgeriana, quills 56 bales, broken quills and chips 2812 bales, root 444 bales. Hybrid, broken quills and chips 164 bales, root 44 bales. Officialis, broken quills and chips 5 bales. *Chemist and Druggist.*

Our Amsterdam correspondent telegraphs this afternoon:—At our auctions today 3423 packages of Java cinchona sold at an average unit of 4.30 cents per half-kilos (equal to 4.5ths d. per lb.) or 3 per cent below the previous auction price. Manufacturing barks in quills and chips realised from 6½ to 45½ cents (equal to 1½ to 8½d); ditto root from 9½ to 35½ cents (equal to 1½ to 6½d); druggists' bark in quills, entire and broken from 5 to 43 cents (equal to ½ to 7½d); and ditto root from ¾ to 8½ cents (equal to ½ to 1½d). The principal buyers were the Brunswick, Mannheim, and Amsterdam and Aterbach factories, and Mr. Gustav Brielegel of Amsterdam. The total quantity of sulphate of quinine represented by the bark offered was 15,589 kilos, of which 14,156 kilos were sold.—*Chemist and Druggist*, May 10.

DRUG REPORT.

(From Chemist and Druggist.)

London, May 3rd.

CINCHONA.—At Tuesday's cinchona-auctions eight catalogues were presented. They comprised of—

	Packages	Packages	— were sold
Ceylon cinchona ..	16 of which		
East Indian cinchona ..	1483	1203	"
West African cinchona ..	510	444	"
Cuprea bark ..	403	107	"
	2418	1754	

The most important feature of the auctions was the fact that, for the first time, the supplies from Ceylon were practically nil, only 16 packages (all yellow bark) from that island being offered, and not a single one sold. The East Indian cinchona embraced some very nice parcels, chiefly of grey bark. This supply included 274 bales (about 14 tons) of Neigherry crown bark, in chips and quills, which realised fair prices. This bark was now offered for the second time, the previous occasion having been about a year ago, when prices equivalent to about 3d per unit were offered for it. In this instance, therefore, the owner has profited by having kept his goods for a twelvemonth. The tone at the auctions was rather dull, and more than one-third of the cinchona offered was bought in. There is no quotable alteration in price, but the average unit value is probably nearer 3d than 3d per lb.

The following are the approximate quantities purchased by the principal buyers:—

	Lb.
Messrs. Howarla & Sons ..	68,699
Agents for the Brunswick factory ..	66,093
Agents for the Auerbach factory ..	48,640
Agents for the Paris factory ..	40,365
Agents for the Mannheim and Amsterdam works ..	37,154
Agents for the American and Italian works ..	23,492
Agents for the Frackfort-on-the-Main and Stuttgart works ..	14,200
Various druggists ..	47,967

Total quantity of bark sold .. 345,536
Bought in or withdrawn .. 125,369

Total quantity offered .. 471,955

It should be remembered that the proportion of bark secured by a buyer is no indication of the percentage of the total amount of quinine in the sales represented by his purchase.

COCA.—Coca-leaves are now specifically mentioned among the articles exported from Java. The shipments from the island from July 1st, 1883 to February 28, 1894 were 96 cases.

CUBES.—The following figures represent the exports of cubes from Java in the eight-month periods between July 1st and February 28th of the following years:—
1883-4 1892-3 1891-2 1890-1 1889-90
Piculs .. 3 1,937 1,172 6.4 539

QUININE.—Hardly any business is reported this week. The market is dull, and it would probably be possible to buy second-hand German at 11d per oz. It is said that 11d per oz. has been accepted for a small quantity.

VARIOUS AGRICULTURAL NOTES.

AN INSECT PEST.—The short grass in Kulu last summer and autumn has been fully accounted for by the appearance recently of large swarms of a species of *Tipula*, or crane fly, "daddy-long-legs." The "wire worms," as the larvae are called, feed upon the roots of grasses, and when they abound to such an extent as the numbers of the perfect insects show that they must have done last year, they do immense damage to grass and all other roots.—*Indian Engineer.*

HEAVY HAIL.—A Yercaud correspondent writes:—"A hailstorm of unusual severity raged here for nearly two hours yesterday evening; over three inches of rain fell and the ground as well as walls, roofs, etc., looked exactly as if covered with snow. The hailstones were as large as pigeons' eggs and were lying still unmelting this morning. A native child who was exposed to them was killed, and a hailstorm of such severity has never been witnessed here. The roads and lanes are so thickly strewn with fallen leaves as to form a perfect carpet and trees and shrubs everywhere look out and beaten to pieces as after a cyclone on the coast."
—*M. Mail.*

THE COMING COFFEE CROP.—One who has recently been through Dimbula and Dikoya writes:—"The coffee is going to give a nice little crop—a welcome addition to many a planter, and company, too, for that matter. A good deal of the blossom did not set, but that was to be expected. It is a really pleasant sight to see rows of strong healthy berries on the trees. In Dimbula and the Agras particularly the trees seem to be carrying their crop well, and those who have kept any coffee are reaping their reward this year. I hope it will all mature."

THE DIMINISHING SHELLAC SUPPLY.—The *Indian Planters' Gazette* asserts that the production of shellac and other preparations of its kind has fallen off in recent years on account of the diminished supply of sticklac (from which shellac is manufactured) in the chief producing districts of India—viz., the Central and Eastern Provinces, the Chattisgarh plateau, and the Chutia Nagpore territories. The result is a considerable and, in all probability, a permanent enhancement in the price of shellac, especially of the finer marks. The opening-up of the Bengal Nagpore Railway and the enormous clearings of jungle lands consequent thereon, coupled with the emigration of coolies from the jungle tracts to the tea districts, are the chief causes of the reduced out-turn of sticklac.—*Chemist and Druggist.*

THE MAGAZINE

OF

THE SCHOOL OF AGRICULTURE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Magazine of the School of Agriculture* for June:—

Vol. V.]

JUNE, 1894.

[No. 12.

COMBATING DROUGHT.

It is known to most cultivators of land that one of the objects of fine tilth is to promote capillary action, by which moisture is supplied to the surface of the soil. But there is another important point which has to be borne in mind, and that is, that if all the capillary tubes are open to the surface, evaporation can proceed from them so freely that the underground store of moisture may be insufficient to supply the continuous demand. Hence, again, it is desirable to keep the surface soil, by frequent stirring, in such a state that the capillary tubes are broken or interrupted a little below the surface. In this case the mere superficial covering of earth acts as a soil mulch; and, like a layer of leaves or grass or cattle manure, it protects the moisture beneath. Hence an occasional slight stirring of the superficial soil serves to conserve rather than to dissipate the underlying moisture. These points should be seriously considered by cultivators in the tropics, where the practice of surface stirring will be found to be of the greatest service especially in droughty seasons.

The following extract from an article in the *Florida Agriculturist* on the subject of "beating drought" helps to illustrate the foregoing remarks:—

Not only in the "arid west," but in many portions of the old world, farmers, urged by necessity, have learned to make crops almost without rain during the growing season. This is done by selecting crops, and adopting a method of cultivation suited to the climatic peculiarities. In most arid, and in all sub-arid regions, there are, at some time during the year—usually in

winter—heavy downpours of rain. The methods of cultivation are directed to the preservation of this water for the use of crops during the future growing season, and this is successfully accomplished where the soil is not of such a structure as causes the water falling upon it to continue to descend and flow away in a pervious substratum. The system of cultivation is directed solely to the object of preventing the water from reaching the surface and being evaporated by the heat of the sun. It has been demonstrated that water in the soil rises to the surface by capillary attraction, and is evaporated and passes off in the form of invisible vapor. It has also been found that by the frequent and thorough pulverization of the surface soil to a depth of two or three inches, the capillary tubes are destroyed, the water does not rise to the surface, and is not evaporated. In parts of Southern California this method is practised so successfully that large crops of fruit, and even grain and corn are raised without a drop of rain during the growing season. Of course, no other growth must be permitted, for grass and weeds would consume the very moisture that should be preserved.

OCCASIONAL NOTES.

The experiment in Jute cultivation at the School has been fairly successful. The plants grew to 4½ and 5 feet within 6 weeks after sowing, and at the end of that time came into flower. The fibre which was extracted would seem to be of good quality, but on this point the opinion of an expert is necessary. We have not yet heard the results of experiments made in other parts of the Island to which parcels of seed were despatched. In Haputale, however, where the climate and elevation are manifestly unsuitable, the experiment resulted in total failure. It is, of course, absurd to think of Ceylon competing with India in exporting Jute fibre, but the Island may perhaps be able to supply part of its own demand for the fibre and its products.

Mr. W. A. de Silva arrived in Colombo on the 25th ultimo, after having completed his course at the Bombay Veterinary College with great credit to himself. We welcome back Mr. de Silva, and trust he will have a successful career in the Island, where there is ample opportunity of making himself eminently useful.

Thirty head of Sind cows arrived by the S. S. "Melpomene" in charge of Mr. W. A. de Silva. The animals are a well-selected lot, and will help to make the Government Dairy herd without exception the most valuable collection in the Island.

The sale of stock, drafted from the Dairy herd last month, was most satisfactory. The animals were eagerly sought after and realized excellent prices. The dissemination of the Sind calves throughout the Island should help to raise up a better class of cattle.

The following is a statement of the results of the sale:—

CALVES.					
No.	Sex.	Age. Mos.	Breed.	Purchasers.	Price. R.

7	Mr. Rodrigo	18

The total amount realized was R979'00; the average price of the Sind calves was R64.

FODDER SUPPLY.

Apropos of the remarks made by our correspondent, W. A. D. S., on the subject of a fodder supply for cattle in the Island, Mr. N. N. Banerjee, of the Bengal Agricultural Department, suggests that during the settlement now in progress in the district, large tracts may be set aside for fodder and pasture reserves, so that the practise that has converted grazing into arable land may not continue, as it must inevitably do otherwise. In order that no undue proportion of waste land may be brought under cultivation, the Government he says, might reserve it, gradually converting thorny bushwood or bare rock and stone into tracts covered with vegetation edible by cattle. Under this systematic artificial care and treatment, Mr. Banerjee thinks

that the ultimate financial results may cover the initial expenditure incurred in acquiring and protecting the land. In the face of fodder scarcity he considers it desirable that an effort should be made to improve forest lands by cutting down useless bushwood and planting useful trees, such as teak &c. By clearing away the jungle and converting it into extensive pasture ground much could be done in the way of securing a perennial supply of fodder sufficient for agricultural and other cattle. By adopting such a course it is thought that much more would be done towards the improvement of cattle than any system of cross-breeding. The improvement of cattle will generally be followed by superior cultivation and a larger outturn of crops, necessarily leading to material improvement in the condition of the peasantry.

These suggestions have much to commend them, but their practicability will have to be carefully considered and discussed. No one can have any cause for complaint if the Government, without entailing any loss adopts measures for improving the live-stock of the country and thereby the condition of the Native cultivator. By the co-operation of forest officers with agricultural instructors, there should not be much difficulty in carrying out the idea of extending the area of land suitable for pasture and the production of fodder, into practise. It will, however, first have to be ascertained whether the plan is feasible from a Government point of view before the practical details in connection with the supervision and control of such lands, and the terms in which the fodder or pasture is to be made available to cattle owners, are considered. One thing, however, is certain, that by providing pasture and fodder (either in a green state or in the form of dry grass or hay) the condition of live-stock as well as their owners—taking for granted that the latter will not neglect their opportunities—will be vastly improved, and such improvement will not be without its indirect benefit to Government itself.

RICE.

(Continued.)

There are three methods of sowing: (1) Broadcasting, (2) in drills, (3) transplanting from a nursery. Of the three systems the last is by far the best, as it insures a greater regularity in the crop, a great saving of seed, and what is of infinite importance, superiority in weight and fulness of grain, hence increased nutritive qualities. In broadcasting 60 lbs. of seed is said to be plenty; in drill-sowing, 12 inches or more apart, 40 lbs. is stated to be ample. If sowing is to be done by means of transplanting, it will be necessary first to prepare a nursery, the area of which, to plant an acre from should, we are told, be 30 ft. square, or 2 or 3 such beds 10 feet or 12 feet square may be made near the field to be planted. If only a quarter of an acre is to be planted, then a bed 19 ft. square or 3 beds 6 ft. square will be sufficient. The amount of seed required for a nursery to plant one acre is mentioned to be about 8 lbs., and for a quarter of an acre 2 lbs. It is advised that seed for sowing should be steeped in water for 12 hours to assist germination. In making a nursery it

is always best to use a little extra seed, and select the best plants for transplanting. The nursery will be ready for transplanting in 3 weeks. Care should be taken to have the nursery plants ready for transplanting at a time when the operation can be most advantageously performed, particularly when there is sufficient rain for the purpose. But on no account should the transplanting be delayed longer than a week more, for provided the field is in good tilth, it is better to put the plants out when 3 or 4 weeks old than to wait 5 or 6 weeks for rain. The plants are simply pulled up by the hand, tied in bundles, and carried to the field, where they are dibbled in, putting 2 or 3 plants in each of the holes, which are about 6 to 9 inches apart. Three men should plant an acre in a day. In transplanting it is often the custom to crop the tops as well as the roots of the seedlings, when pulled from the nursery, before planting them out, the reason being that it not only makes the plant hardier, but prevents their falling down and the remaining leaves withering, as growth begins at once. This system has a good deal to recommend it, and is advocated.

In discussing the subject of irrigation by wells, the following reference is made to the capacity of the appliance known as the "Piccolta"—the common form of water lift in Eastern countries; water raised 16 feet; contents of bucket = 45 cubic feet; number of discharges per minute, 3; discharge per hour, 81 cubic feet; actual discharge per hour 72.9 cubic feet, or 45.4 gallons per hour. Machinery can now be obtained for thrashing, to separate the grain from the straw and stalks; hulling, to remove the outer skin or husk; separating or cleaning the rice of thrash or any unhulled grain; and finally polishing, to remove the inner cuticle and thus complete the process of rice cleaning for the market. The machinery for the above operations can either be had in sets or separately for hand, animal or steam power. A complete set for hand-power, with a capacity of from 300 to 500 lbs. per day, will cost £53 2s. 6d. in New York; a set for animal-power of the same capacity £87 10s.; while a set for steam-power, including engine and boiler, with a capacity of 600 to 1000 lbs. per day, £225. The best known manufacturer of rice cleaning machinery are the Geo. L. Squier Manufacturing Co. of Buffalo, New York, their machinery being most extensively used, and giving universal satisfaction. A huller, which is capable of producing as finished an article, polished and all, as comes out of the modern rice mills, costs only £16 13s. 6d.

Messrs. Geo. Squier & Co. supply hand rice hullers with a capacity of 200 lbs. in 12 hours, for £10 8s. 4d. in America. The machine is simple in construction and durable. The Engelburg Huller Co. of Syracuse, U. S. A., keep a combined huller and polisher with a capacity of 75 to 150 bushels in 10 hours, costing £100; while a complete modern rice mill, automatic in action, and costing £1,230, can put through 13,000 lbs. or 300 bushels of paddy per day. The initial cost of the more expensive machines, taking into consideration the work they perform, is not excessive, but their prices place them beyond the reach of small growers. Co-operation of rice growers is the only means of solving this difficulty. The primitive methods in vogue in

India for cleaning rice for the market are both slow and tedious, but in the absence of winnowing and husking machinery they are the only possible makeshifts available. Paddy loses one-third weight by husking; three bushels of paddy when husked producing 2 bushels of rice. A bushel of paddy equals from 40 to 45 lbs. and a bushel of clean polished rice 60 to 65 lbs. dependent on the size of the grain.

As regards the question of "will it pay?" the following concluding remarks on the subject of the rice industry in connection with Queensland, are interesting:—"Under favourable circumstances one acre under rice will produce from 50 to 90 bushels of grain per acre. Quite recently on the Clarence River, N.S.W., a crop gave 67 bushels of grain per acre. In the Cairns district the average rice yield per acre is estimated at 2 tons. Taking 2 tons or 74 bushels as a basis for calculation, we find that paddy being worth to the grower, say, £9 5s. per ton or 5s. per bushel (the price varies between £8 and £10) 2 tons per acre will realize £18 10s., and this multiplied by 2 crops gives £37. The straw should realize from £2 to £3 10s. per ton for fodder, and taking the yield at 5 tons per acre, will realize another £10 per acre, or in all, £57 per acre for two crops.

The cost of putting the land under crop will be amply met if set down at £9 per acre. Profit per acre, say, £18 10s., at which price it cannot but be admitted that rice growing will pay.

Rice milling is also said to be a remunerative enterprise. Taking rice at the present market value, viz., £23 per ton, to produce which 3 tons of paddy would have to be milled, we find 3 tons of paddy at £9 5s. equals £27 15s., producing 2 tons rice at £23 equals £46; difference, £18 5s., or equivalent to £6 1s. 8d. per ton of paddy, from which deduct the cost of milling, amply met by, including all charges, £2 per ton. Net profit, £4 1s. 8d. per ton. Further, rice chaff has a commercial value, and is commanding a good price in Europe to-day. It is used extensively for packing glass, canned goods, and like packages, for which purpose it cannot be equalled. This chaff realises in the German market something like from £3 to £4 per ton."

CALATROPIS GIGANTEA.

This is a shrub of two varieties, the only difference between them consisting in the colour of their flowers. It is commonly to be found in waste ground among rubbish, ruin, and such like places. But the plant has gained much prominence from the many and important uses to which it may be applied. An acrid, milky juice flows from every part of the shrub when wounded, and this the natives use medicinally in different ways, besides prescribing preparations of the plant itself in epilepsy, paralysis, bites of poisonous animals, as a vermifuge, etc. In almost all cutaneous affections it is frequently employed, but its virtues have been largely tried in the cure of leprosy. The root, bark, and inspissated juice are used as powerful alteratives and purgatives. The activity of this drug is said to be owing to a principle called Mudarine, discovered by Dr. Duncan, of Edinburgh, who found the juice to possess the

singular property of congealing by heat and becoming fluid again on exposure to cold. Mudarine is obtained from the tincture of Mudar, the powdered root being macerated and steeped in cold rectified spirit. After recovering the spirit by distillation the solution is allowed to cool. A granular resin is then deposited, which is allowed to dry in order that it may concrete. If water be then applied the coloured solution from which the resin was deposited dissolves, and the resin remains. This solution is called Mudarine. In taste it is very bitter, soluble in alcohol and cold water, but insoluble in sulphuric ether or olive oil. By experiments made by Dr. G. Playfair the milky juice was found to be a very efficacious medicine in leprosy, dropsy, rheumatism, and in hectic and intermittent fevers. By the Hindoos it is employed in typhus fever and syphilitic complaints with such success as to have earned the title of vegetable mercury. Dr. Duncan held that it agreed in every respect with Ipecacuanha, and that from the facility of procuring it, it might eventually supersede the latter medicine. The pulverised root made into an ointment is a very efficacious remedy for old ulcers. The milky juice mixed with common salt is administered in cases of toothache, and the juice of the young buds in ear-ache. The leaves beaten up with pepper are given internally in cases of snake-bites, and boiled in oil they are rubbed over the body in scabies. Besides its medicinal uses the plant and its productions are utilised in various other ways. The root is used in the manufacture of gunpowder charcoal. In a powdered form it is used to adulterate safflower. The silky floss which surrounds the seeds has been woven into shawls and handkerchiefs, and even made into paper.

But the chief value of this plant consists in the fine, strong fibres in which it abounds. To procure them the straightest branches are cut and exposed to the air for at least twenty-four hours; on the second and third day they are slightly beaten; the skin is then peeled, and the stringy substance between the bark and the wood taken out. The fibre is then dried in the sun. This slow process is necessarily expensive, but if the bark is steeped in water, it discolours the fibre. This fibre is, however, strong and possesses many of the properties of Europe flax. It can be spun into the finest thread for sewing or weaving cloth. It resists moisture for a long time. From experiments made its tenacity as compared with other Indian fibres is as follows:—

Breaking weights.

Gigantic Swallow-wort (<i>Calotropis gigantea</i>)	lbs. 552
Sunn (<i>Crotolaria juncea</i>)	407
American Aloes (<i>Agave Americana</i>)	360
Cotton (<i>Gossypium herbaceum</i>)	346
Bowstring hemp (<i>Sansevieria zeylanica</i>)	316
Decaneae Hemp (<i>Hibiscus cannabinus</i>)	290
Coir (<i>Cocos nucifera</i>)	224

The fibre of the gigantic swallow-wort is thus very strong. But it is too valuable for ordinary cordage. It is said by good judges to be better suited for the manufacture of cloth than for cordage purposes. It is much

used in India for bow-strings, ropes, bird-nets, and tiger-traps. The fibre has never, however, been cultivated as a cordage plant. It was once described as much resembling Belgian flax, well suited for prime warp yarns and worth £100 per ton. Royle says that it yields a kind of manna called Mudar Sugar. The viscid juice of the plant has been successfully converted into rubber in Madras. To prepare it the juice is evaporated in a shallow dish, either in the sun or in the shade. When dry, it is worked up in hot water with a wooden kneader. It is soluble in oil of turpentine, takes impressions, and should prove a valuable product, either alone or mixed with other substances. It is strange that this handy plant with its various uses is not more widely cultivated.

Among the Sinhalese *Calotropis Gigantea* is known as *vara*, and the plant is found growing wild in waste places, but has never been cultivated either for the sake of its bark fibre or the silky floss in its pods.

THE INFLUENCE OF SOIL ON THE PERIOD OF FLOWERING.

(To the Editor of the Magazine of the School of Agriculture, Colombo.)

SIR,—It might appear rather strange that the jute plants grown at the Colombo School of Agriculture have run to flower and seed much earlier than expected. In India the jute is harvested, if I am not mistaken, about three and a half months after sowing, that is, when the plants begin to flower, of course. But the jute grown here began to flower and came into season in about six or seven weeks, that is to say, it had to be harvested nearly two months before the expected time.

It will, I trust, be interesting to your readers if an explanation can be offered to this curious fact. I remember a similar instance which occurred in dhall culture when I was Agricultural Instructor at Mullaitivu. A plot of clay land was first sown with dhall, and nearly three months after a plot of sandy soil half a mile away from the previous one was also sown with dhall. To my surprise, however, in little more than three months after the second sowing both came into bearing the same time, the dhall in the clay soil being fully six months old at the time.

It will thus be seen that the dhall sown on the sandy soil was quicker in coming to bearing by about three months. There was, however, another striking difference between the plants on the two plots. The plants on the sandy soil were rather stunted in growth, while on the clay land grew up into big high bushes with stout stems and thick luxuriant foliage. A comparison of the dhall planted in both the places led me to the inference that a clay soil helps the full development of stem and leaf, but a sandy one makes the plants run too readily to seed.

Such difference in development according as the soil is sandy or clayey is not confined to leguminous crops such as dhall, but has been noticed in cereals such as paddy, although the

difference of time is not so great and striking in the latter case. The paddy on a clay soil steadily develops its stem and leaf before its ears are formed, whereas that on a sandy soil runs too quickly to grain, even before the culm is properly grown, seeming as though it were instinctively impatient to reproduce its kind, suspecting that the soil on which it grows could not support it very long nor afford sufficient nutriment for the full formation of the culm as well as the grain.

Now it is very probable that the early flowering of the jute grown here may be also, for similar reasons, largely due to the sandy nature of the soil. The truth or otherwise of this inference may be fully ascertained by comparing the results of the experiments in jute culture that are being carried on by the Agricultural Instructors in different parts of the Island, carefully noting the nature of the soil in each case. Of course the state of the weather may also have something to do with the flowering; thus dry cool weather is said to favour the formation of seed. But I should think the influence of the soil is much greater; and if, as I have said, it can be proved by further experiments that the relative effects of a sandy and of a clayey soil on the growth of jute are similar to those above noticed, we may well draw the inference that clayey and loamy soils are better suited for the jute than a sandy soil. In growing jute our object is to get a thick long stem before it flowers, and the higher the plant grows, the longer and consequently, *ceteris paribus*, the more valuable will be the fibre; and as has been shown in the case of dhal and paddy, a clayey soil favours such results, while a sandy soil produces a stunted growth.

E. T. HOOLE.

ZOOLOGICAL NOTES FOR AGRICULTURAL STUDENTS.

The fifth order of existing birds is the *Scansores* or climbers. They are distinguished by the fact that the feet have four toes each, of which two are turned backwards and two forwards. This arrangement enables them to climb with ease and readiness. Among the *Scansores* come the cuckoos, wood-peckers, parrots, lorries, parakeets, love-birds, and macaws. In the parrots the hooked beak aids the birds in climbing.

The sixth order of existing birds is the *Insesores* or perching birds. They are likewise distinguished by the characters of the feet which are chiefly adapted for building the nest and for perching on trees; the toes are slender, flexible, and moderately elongated, with long, pointed and slightly curved claws. The feet have four toes each, three in front and one behind, but the form of the beak varies much. The order *Insesores* is by far the most numerous of the divisions of birds, and includes (to mention a few good examples) the crows, jays, magpies, the humming birds, swallows and swifts. The edible-nest swift is known as *Collocalia francaica*. Naturalists are still divided as to the origin of the isinglass-like matter that enters so largely into the composition of these nests; but the bird

has on either side of the gullet two large glands, which if pressed, in a bird just shot, emit a viscid matter, which doubtless is the substance used in nest-building. In the caves where these nests are found, there are generally large accumulations of guano useful as manure.

The *Raptors* or birds of prey are characterised by the form of the beak, which is adapted for tearing animal food. The upper mandible of the bill is strong, curved, sharp-edged and sharp-pointed, often armed with a lateral tooth. The body is extremely muscular; the legs are robust, usually short, with three toes in front and one behind; all the toes being armed with strong, curved, crooked claws or talons. All the raptorial birds live upon the flesh of other animals, which they either kill for themselves or find dead, and their flight is generally extremely rapid and powerful. The birds of prey are divided into the two sections of the nocturnal birds of prey which hunt by night, and the diurnal birds of prey which hunt by day. In the former section is the single family of the owl, in the latter are the falcons, hawks, eagles and vultures.

Some birds are friends of the agriculturists from the fact of their being insect destroyers, while others do damage to agricultural produce.

The purely insectivorous birds of India include the crowtits, babbling thrushes, solitary babblers, ground babblers, lorries and green bulbuls, king crows, creepers, warblers, strikes, minivets, flycatchers, chats, redstarts and robins, hedge-sparrows, swallows, wagtails and pipits, ground thrushes, swifts, goatmakers, woodpeckers, hoopoes, bee-eaters, rollers, trogons, and cuckoos.

The following are the birds of mixed diet, partly insectivorous and partly fruit and grain eating, in varying proportions: tits, sibilas, white-eyes, bulbuls, nethatches, orioles, starlings and mynas, thrushes, finches, larks, sunbirds, flower-pickers, pheasants, partridges, button quails, rails, cranes, bustards and warders of all sorts.

The frugivorous or fruit-eating birds are the hill mynahs, weaver birds, hornbills, barbets, parrots, pigeons and sand grouse. Lastly, the omnivorous birds comprise the crows and storks.

As a matter of agricultural interest it may be mentioned that the manure of birds of all kinds forms a most valuable fertilizing agent, being particularly rich in nitrogen.

THE SPONGE-BEARING CUCUMBER.

Under the name of "luffa" or "Cucumber Sponge" the skeletons of this fruit are exported in compressed bales from Japan and Egypt. The botanical word "luffa" is derived from the word "luff," by which name the fruit is known in Egypt. From a very early period the reticulated skeletons of luffa were used by the Egyptians in their bath-rooms. Sponge-bearing cucumbers are formed growing in hot countries; the skeletons of some varieties are thick and strong, of others thin and delicate. Like ordinary cucumbers some are edible and are grown for the table, while others are more or less medicinal. As the reticulation forms at a late period, the luffa, when of an edible sort, can readily be cooked as a vegetable

when young. There is, it must be confessed, however, rather a rank odour about the fruit which does not make it universally popular. Egyptian-grown luffas have become quite an article of commerce, being exported mainly to England and Germany, the packages containing 1,000 to 1,500 each; but a small proportion of these are of the whiteness and quality that indicate a proper care in preparation. When a sponge cucumber is dried whole, the netting is easily separated, but its fibre will have a brownish colour, and will have lost much of its textile strength. Naturally the reticulation is of silvery whiteness, but this can easily be preserved by a proper method of cleaning it from the rind, seeds and pulp when the fruit is mature but still green; and the whole must be done at one operation or the sponge will change colours. When the fruit is mature it will be known by its green rind lightening in colour and becoming more dry; it should then be cut off and hung in the house for a week or more until the juice, in large measure, dries out of the rind. The cucumber should then be pared and the cap at the lower end removed, to open the seed channels. It should then be kneaded and squeezed under a large pan of hotwater till the seed or pulp are washed out. When fully ripe the seeds are yet black. When the reticulated skeleton has been well cleaned, hang it up on a pin-hook and string to dry indoors, when it should become of a silvery whiteness. By exposure to the air, even when kept in darkness, the whitest luffa sponges changes to a light orange yellow. The colouring matter is, however, to a great extent soluble in water with soap, and much of it may be washed out. Sponges in frequent use become of a light greyish tint and slowly weaker in fibre, particularly in the outer or circular layer which is not so tough as the internal longitudinal one. The sponges are, however, quite durable compared with those got from the sea, and are odourless when well washed; no fabric when wet has as decided an effect as a rubifacient on the skin, and care must be taken that it does not take too deep a hold when the skin is young and tender. For delicate skin and children the immature skeletons should be selected, or the small end of mature ones which is much finer in fibre than the base. In Ceylon we have two indigenious varieties of luffa, viz., *L. Egyptica* (Sin. *Niyan-veta-kolu*) and *L. Acutangula* (Sin. *Veta-kolu* or *dara-veta-kolu*). The fruits are used as vegetables, and but seldom allowed to mature for preparing luffa-glones.

GENERAL ITEMS.

The idea entertained by some people that a brown-shelled egg is richer than a white-shelled one is simply a theory that has no foundation in fact. The colour of the egg, however, indicates the class of hen which laid it. For instance, the Cochins and Brahmas lay brown-shelled eggs, the Leghorns, Spanish and Minorcas lay white-shelled eggs, while certain intermediate breeds, such as the Plymouth Rocks and Wyandottes lay light brown or cream-coloured eggs. It is the yolk of the egg which is an indication of its richness.

A hundred pounds of sand will absorb twenty-five pounds of water; 100 lbs. of loam, 40 lbs; 100 lbs. of clay loam, 50 lbs; 100 lbs. of clay, 70 lbs.

In the Cuttack District a variety of betel is grown which has a strong scent of camphor, and the leaves are used as a sacred offering in the worship of the gods or reserved for distinguished visitors.

There has been some discussion in poultry circles on the question, whether the colour of a bird has any influence on its egg-producing qualities. A correspondent writes:—I have made the subject one of considerable thought and study, and I must admit that birds possessing black plumage (much as I dislike them) will lay the greatest number of eggs in a given length of time, all things being equal. My observation has been that parti-coloured birds, except those possessing a portion of white in the plumage, come next in order of prolficiency, while those possessing much white, or purely white plumage, range lowest in the scale. I have also observed that black fowls beget the largest percentage of chickens from eggs set, and of a more vigorous nature.

Soot has a considerable manurial value, but is worth more as a manure for some vegetables because it repels insects, and makes the ground warmer by absorbing the heat of the sun which falls upon it. Soot, moreover, has the valuable property of absorbing ammonia from the air and retaining the nitrates in manure.

The absence of sun is bad for the flowers of the tomato setting well, and the fruit is very slow in colouring. A moist atmosphere or soil is detrimental to the plant and one of the chief causes of *cladosporium* fungus.

TEA, COFFEE, CINCHONA, COCOA, AND CARDAMOM SALES.

NO. 2.]

COLOMBO, JANUARY 20, 1894.

{ PRICE:—12½ cents each; 3 copies
30 cents; 6 copies ½ rupee.

COLOMBO SALES OF TEA.

Messrs. FORBES & WALKER put up for sale at the Chamber of Commerce Sale-room on the 10th Jan. the undermentioned lots of Tea (276,033 lb.), which sold as under:—

CEYLON CINNAMON SALES IN LONDON.

London, 26th Feb. 1894, Monday Afternoon.

The quarterly sales today comprised the following assortment:—

Bales.		Bales.	
251	1st sort against	154	1st sort Ceylon last year.
208	2nd do	544	2nd do do
99	3rd do	162	3rd do do
710	4th do	107	4th sort and unworked.
	and unworked }		

1268 Ceylon, against 967 Ceylon.
Bags. do Bags.

679 chips do 9 chips.
Since the last sales some business has been done for arrival at 5 7-8d, cif terms; but not much inquiry on the spot.

The sales today went slowly at previous rates to rather under. Part of the fine was withdrawn, very low bids being made. Some sold at $\frac{1}{2}$ d to 1d per lb. reduction. About 700 bales found buyers in the room. Quotations as follows:—

Ceylon.	Per lb.			
	s.	d.	r.	d.
1st sort, fine and superior ...	0	8	@	1 1
do do common to good ...	0	6 $\frac{1}{2}$	"	0 7 $\frac{1}{2}$
2nd do good to fine ...	0	7 $\frac{1}{2}$	"	0 9 $\frac{1}{2}$
do do middling to fair ...	0	6	"	0 7
3rd do do fine ...	0	5 $\frac{1}{2}$	"	0 10
4th do ...	0	4	"	0 7 $\frac{1}{2}$

Unworked at above rates to rather less.

Chips were chiefly bought in. A few lots sold at 2d. Quillings and Cuttings $\frac{1}{2}$ d to 5d per lb.

The next sales are to be held on the 28th May 1894. WM. JAS. & HY. THOMPSON,
38, Mincing Lane.

LONDON REPORTS ON TRAVAN-
CORE PRODUCE.

(From Patry & Pasteur, Limited, Report of the Colonial Markets for the Week ending March 21st, 1894.)

TRAVANCORE TEA.

The considerable quantity offered in public sale this week had the effect of attracting the attention of the most important buyers, who, as a rule, give little attention to this class of tea. Considering the weakness in the Indian market for low medium kinds, prices were satisfactory, and competition for all grades was keen. Estates showing decided quality or strength realised full prices, the most noticeable of these being a fine liquoring invoice from Arnakal.

	Bro. Pek.	Pekoe.	Pek. Sou.	Souchong.	Bro. Tea Dust.	Quantity.	Av. about.

LONDON REPORTS ON TRAVANCORE PRODUCE.

(From Patry & Pasteur, Limited, Report of the Colonial Markets for the Week ending April 25th, 1894.)

TRAVANCORE TEA.

The supplies have been small, and the quality not sufficiently good to attract attention, prices however ruled steady.

	Bro. Pek.	Pekoe.	Pek. Sou.	Souchong.	Bro. Tea Dust.	Quantity.	Av. about.
Bon Ami	10½d	8½d, 6½d	6½d	...	7½d, 5d	249 chs.	7½d
Nagamally	8½d	7d	6d	...	3½d	34 do	7d
Bonaccord	8½d	6½d	5d 5½d, 4½d	96 ½-ch	6½d
Wallardi	9½d	6½d	5d	...	5d, 4½d	129 chs.	6½d
Atchencoil	9½d	6½d	5d	49 do	6½d
Brighton;	8½d	5½d	4½d	34 pks.	6½d
Home	...	5½d	5d	44 ½-ch	5½d

(unas.)

Total 635 packages, averaging 7d per lb, against 8d last week, and 8½d for corresponding week last year.

(From Patry and Pasteur, Limited, Report of the Colonial Markets for the week ending May 2nd, 1894.)

TRAVANCORE TEA.

Prices unchanged, the quality of the three in voices under offer, with the exception of T. P. C., was poor.

	Bro. Pek.	Pekoe.	Pek. Sou.	Souchong.	Bro. Tea Dust.	Quantity.	Av. about.
T. P. C.	9d	6d	5½d	—	4½d, 3½d	64 chs.	6½d
Bison Valley	6d	5½d	—	4½d	—	41 do	5½d
Arienkow	6½d	6d	5½d	4½d	—	70 ½ chs.	5½d

Total 175 packages, averaging 5½d per lb, against 7d last week, and 8½d for corresponding week last year.

ROYAL BOTANIC GARDENS.

ABRIDGED REPORT OF THE DIRECTOR FOR 1893.

PÉRÁDENIYA GARDENS.

Cultivation.—To make room for the planting of new trees a considerable number of more or less damaged or sickly old ones have been removed. Scarcely any were of interest, and of all we have numerous other specimens. Among them was the original *Grevillea robusta* (planted in 1856), some large Coniferæ (*Juniperus bermudiana*, *Callitris robusta*, and *Araucaria Cookii*) which blocked out the light from the Herbarium, and one of the *Ficus elastica* (planted in 1833) at the entrance, which had dropped most of its branches.

More Conifers, of eleven species, have been put out on the hill in the South Garden, and additional creepers to the trellisses. Of the latter we find that many fail, the metal apparently becoming too heated for the plants to lay hold.

Scale-insects of the *Coccus* family have always been a great pest in Pérádeniya, and fresh kinds frequently appear. In the early part of the year I first noticed a new one, *Orthesia nacrea*, at first only on acanthaceous plants, but since spreading on to very many other shrubby plants. So bad has this pest become that we have twice had to cut down whole borders of shrubs. These insects have a tendency to spread themselves over all the world, and there is I think little doubt that the sending of living plants in Wardian cases is a principal mode of transport.

Weather.—The year was again exceptionally dry, the rainfall more than 14 in. below the average, the deficit being especially noticeable in May and in July–October. Yet the fall was on the whole well distributed, and on about the usual number of days, and the Gardens suffered but little from drought. June and the early part of July was very wet, as was also November, and there was much dull sunless weather also in these months. Some unusually low temperatures were recorded in the early mornings at the end of January and beginning of February—on 31st January as low as 52° F.

The following table gives the fall in each month for the year, and the averages for the past 9–10 years:—

	1893.				Average.			
	Rainfall. Inches.	Rainy Days.			Rainfall. Inches.	Rainy Days.		
January	0.83	4	...	1.67	4	} For 9 years. 1884-92		
February	2.65	3	...	1.69	3			
March	7.32	13	...	4.79	6			
April	9.67	15	...	9.77	13			
May	4.31	14	...	8.78	13			
June	13.41	18	...	10.18	19	} For 10 years. 1885-92		
July	5.22	19	...	7.09	16			
August	3.85	16	...	6.18	15			
September	2.11	7	...	6.19	13			
October	8.08	19	...	11.55	19			
November	11.52	19	...	9.72	16	}		
December	3.37	5	...	8.09	11			
Year ...	72.38	152		86.56	154	For 9 years		

Visitors.—The names signed in the Visitors' Book at the Lodge during the year amount to 2,046, nearly all being those of travellers from other countries. No record is kept of visits by Ceylon residents. On the 6th January the Gardens were visited by Grand-Duke Franz Ferdinand d'Este, heir to the Crown of Austria-Hungary, who was pleased to plant an Asoka tree (*Saraca indica*) as a memorial of the occasion.

I prepared a new (the 4th) edition of my little "Hand-Guide" at the end of the year, and it was published on 1st January, 1894. It is somewhat fuller than previous ones, contains a new plan (prepared by the Surveyor-General) and an index to the more interesting plants mentioned.

Cattle Trespass.—During the whole of my residence here the Gardens have been defaced and damaged by the cattle of my neighbours. It is the immemorial custom of the country for every one to possess himself of a few miserable half-wild and useless bullocks, regardless of whether or not he be able to afford to keep them. If he cannot do so he turns them out on the road or elsewhere and trusts to their picking up a living for themselves, which is probably at his neighbours' expense. These active little creatures wander widely and cannot easily be caught; they do damage not only in what they eat, but by breaking down and trampling. The injury to newly-planted trees in the Gardens from this cause has been very great. I have fought against this nuisance for years, but without much effect, as the existing laws and public opinion appear to be against any really efficacious measures. I am advised that I must fence the grounds, but I find that in this community no ordinary live fence is any protection: anything that is not actually impenetrable is useless; as an indication of private property it possesses no force or significance.

The nuisance is a general one in the East, and other Botanic Gardens have been forced to protect themselves. The Calcutta Gardens have a high brick wall along the whole roadside, whilst Buitenzorg is protected partly by a high iron deer-fence and along the high road by five strands of barbed wire. It is my intention to take some effectual measures shortly, as the nuisance has become intolerable.

HAKGALA GARDEN.

The works mentioned in my last report as needed in this Garden have all been either carried out during the year, or will be done with special votes in 1894. Several improvements to the Superintendent's house have been effected, adding to its comfort as a residence; and the Foreman's quarters have been repaired.

With the small sum granted for the erection of a shed for sheltering the horses and carriages of visitors, ten pillars of cemented brickwork were erected and timber sawn for the roof; work had then to be stopped for want of funds, but an additional sum has now been granted with which a corrugated iron roof will be provided and the building, which is 36 ft. by 16 ft., finished off.

In April and May the Public Works Department took in hand the reservoir; the leaks have been at last successfully stopped, and it is now in satisfactory working order. A special vote has been sanctioned to enable us to carry water from this reservoir to various parts of the Garden by means of zinc spouting communicating with small tanks in various places; this work has been commenced, and will be pushed on to completion as rapidly as possible.

The removal of a row of old *Casuarina* trees has greatly improved the appearance of the entrance to the Garden; and the upper and lower ponds have been rendered pretty ornaments to the grounds by being thoroughly cleaned out, their margins evenly sloped, and the overflows properly arranged.

In my last report I made some remarks on the inadequate supply of manure; this want is now more pressing owing to the loss of that formerly obtained from the Badulla coach-houses. I therefore support the suggestion made by Mr. Nock (see report for 1891, p. 5) that a few breeding cows be purchased and kept in the Garden for the sake of their manure.

I think that the time has now arrived for making an accurate survey and plan of such part (about 26 acres) of the Hakgala Reserve as is occupied by the Botanic Garden. Such a plan would be of much use to me and to the Superintendent in carrying out works of improvement, as well as to the public.

From Mr. Nock's full report for the year I make the following extensive extracts. They show that he is continually endeavouring to develop the Garden, which yearly increases in interest and beauty :—

* * * * *

Animal and Insect Enemies.—The black grub of the little brown moth, *Agrotis suffusa*, was very destructive at the beginning of the year. I find that dressing the surface of the soil with fresh unslaked coral-lime is a capital remedy. "Elk" (Sambur deer) were very plentiful in the middle of the year, and made frequent visits to the upper portion of the Garden, doing considerable damage to the young shrubs, particularly *Fuchsia arborescens* and *Habrothamnus elegans*, and to a liliaceous plant, *Arthropodium cirrhatum*. The most destructive animal this year has been the little mouse-deer, which is not content with what it can eat, but nibbles off the shoots of young plants, and leaves them in heaps on the ground. Some of these have been caught in the neighbourhood of the Garden. A leopard, which had been destroying cattle in this locality, was poisoned, and was found two days later in the jungle at the south-east of the Garden land.

The following table shows the monthly rainfall and averages from July, 1883, to the end of 1893, and the number of days on which rain fell during the twelve years 1882 to 1893 :—

	Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1893... { Rainfall ...	5.25	1.19	11.55	3.15	5.49	11.48	5.82	2.81	1.27	7.64	14.55	10.52	80.72

HENARATGODA GARDEN.

This Branch was maintained in good order during the year, and becomes more interesting year by year.

The weather of 1893 was, as far as rainfall goes, of about an average character, but the fall in April was unusually large—on the 22nd the very heavy fall of 7.95 in. was registered—and that in October much smaller than usual, and in the latter month the Garden suffered somewhat from want of water. The record for the year in months was as follows :—

		Fall.		Days.		Fall.		Days.	
January	...	5.78	...	6	July	...	3.45	...	18
February	...	4.92	...	8	August	...	1.91	...	9
March	...	8.10	...	12	September	...	2.08	...	6
April	...	14.85	...	15	October	...	5.94	...	13
May	...	8.51	...	25	November	...	17.67	...	20
June	...	13.00	...	17	December	...	1.62	...	3

Total for the year, 87.83 in. on 152 days.

Several of the large trees of *Ficus modesta*, which were left standing when the jungle was cleared on the formation of the Garden, have been taken down to make room for new kinds. The little Plant-house has been repaired and painted and covered in with fresh coil-netting.

The original purpose of this Garden was the cultivation and acclimatization of the South American rubber trees, and this object has been well fulfilled during the year, no less than 75,000 seeds of *Hevea brasiliensis* having been sold to planters in the low-country. The Garden has also disposed of 10,000 plants of Liberian coffee, besides making a gratuitous distribution of them to neighbouring villages, and has sent over 2,700 pods of cacao to me for distribution to those Government Agents who are endeavouring to help on this cultivation among the villagers in their districts.

The Garden was visited during the year by 93 persons.

ANURÁDHAPURA GARDEN.

The past year has been a very dry one, only 39.85 in. of rain falling. No month was however absolutely rainless, though August and September were nearly so, and four others had less than

$\frac{3}{4}$ in. each. March, April, July, and December had a fair fall, whilst in October and November as much as 19.18 in. fell. The Garden suffered much from drought in May-September, and during the latter part of the period no water could be got from Tissawewa; many plants, even trees, died, but most have been re-supplied.

The usual Provincial vote has enabled me to put a tiled roof on the cottage of the Arachehi, the timber used being obtained from the jungle trees remaining in the Garden itself. That officer keeps this little Garden in very neat order in spite of the climatic difficulties and the very little interest in it taken by the people of the place.

The plants mostly are doing well. I found, in December, Liberian coffee ripening, and a few pods on the Forastero cacao trees. *Eucalyptus alba* is a great success here. Many of the palms have been killed or much damaged by the attacks of beetles.

BADULLA GARDEN.

As everywhere else, the rainfall here was much below the average—only 70.90 in. for the year. It was however fairly well distributed, September being the driest month with 0.68 in., and November (as usual) the wettest with 15.51 in. on twenty-four days.

This Garden has very greatly improved in appearance, and the place is becoming a favourite resort of residents and visitors. The plants are all growing up rapidly, and it will be necessary now to thin out the numerous trees and palms, leaving only the best ones to form good specimens. It would be very desirable to gravel the paths, and also to put labels to the trees, &c., but I have no funds for these or any other improvements.

The west entrance now looks very well, the avenue of *Castanospermum* and *Spathodea* trees having grown up rapidly. The young trees of the new large-leaved mahogany (*Swietenia macrophylla*) are doing specially well, the largest being now 12 ft. high and 10 in. round the stem. Oranges and cacao are beginning to fruit, and on the application of the Government Agent 446 fruit-trees were supplied for distribution to the resthouses of the Province; but the sale of plants to the public is very small.

The Garden has had the great advantage for the latter half of the year of a regular supply of manure (town refuse) supplied by Mr. Rettie through the Government Agent.

The Public Works Department repaired, in May-June, the Conductor's little cottage. On account of its bad position and insanitary state I had strongly recommended its removal and the erection of a better one in a more suitable site, but this unfortunately has not been agreed to. The cooly lines have been newly thatched, but require rebuilding.

NOTES ON ECONOMIC PLANTS.

Tea.—The great increase (over 13 million lb.) in our export for 1893 over the previous year, coupled with the gradual but steady fall in average price (about 9d. per lb. in 1893), renders still more pertinent the remarks I ventured to make in my last report on the danger of over-production. I see no other danger to the industry in Ceylon, but that is imminent; and the only justification for any further large addition to the area of this cultivation here must be based on some probable expectation that the existing markets can be added to or greatly extended. I believe it would be to the true interest of the Colony if the acquisition of new land for tea planting, especially in the low-country, were made as difficult as possible.

We exported 84,406,064 lb. in the year, of which 75½ million lb. went to the United Kingdom (an increase of over 10½ million) and nearly 7 million lb. to the Australian Colonies (an increase of nearly 2 million). Of other markets it is satisfactory to notice a commencement made direct to Russia (over 53,000 lb.), a country where the consumption of tea is enormous. The *direct* export to America is at present trifling. No change is reported as to the proportion of Ceylon to other teas used in England; it is still about 31 per cent.

In consequence of numerous reports made to me of the damage done to plantations by a "mosquito" blight, I thought it my duty, after satisfying myself that the mischief was wholly due to the attacks of the native flying bug, *Helopeltis Antonii*, to address, in August last, a letter to the newspapers (as the best means of publication among those concerned) strongly urging a general concerted attack on the insect by catching and destroying it. When in 1884 the same insect did much harm to cacao in some districts, it was found practicable in this way to much mitigate the injury done, and I therefore felt warranted in making a strong appeal. This was generally supported, and the campaign has been vigorously carried on. How numerous these creatures really are (though rarely seen unless looked for) may be judged from the fact that several superintendents have told me that they destroy from 3,000 to 5,000 daily by systematic hunting. I trust that all interested will join the campaign, as I fully believe that in a universal slaughter we have the means of coping with this pest in Ceylon.

Several points connected with *Helopeltis* (it is better to employ this name than "tea bug," which though correct is apt to mislead, or "mosquito," which is absolutely incorrect) have come up during the campaign. The insect is stated to be by no means restricted to low elevations, but as a pest on tea there is no doubt that it is chiefly to be found below 3,000 ft. At higher elevations it is more of a straggler; I have assurance of an attack at about 4,000 ft., but it was slight. There appears to be some good evidence that it is the inferior "jats" of tea especially that suffer, and that high-class plants, even when grown alongside the inferior, to a large extent escape. This has been observed also in Assam. As regards catching there is really little difficulty; the immature ones are wingless, and the mature ones fly only a short distance at a time. A good suggestion is the use of a small stick tipped with jak-milk or other glutinous substance, by which the insects may be picked quickly up; a broad band of similar substance might be smeared round the base of the stems to catch any of the young ones that may have fallen to the ground and attempt to again crawl up to the leaves. As regards the eggs of *Helopeltis*, it has been stated that they are found on the very common wayside weed, *Stachytarpheta indica* called "nai-orangi" by the Tamils and "bala-nakuta" (dogs-tail) by the Siphalese; but I have not been able to obtain any confirmation of this, nor does the insect seem to have been raised from the supposed eggs. As, however, the eggs have been undoubtedly found on tea itself as well as on cinchona and cacao, the discovery of an additional locality for them is of no great significance. With the exception of *Helopeltis* the tea plant is remarkably free from serious enemies.

Coffee.—There was an increase in our now small export of this product to 55,190 cwt., but this is not due to any increased cultivation of Liberian. I regret to see as yet no revival of this culture in the moist low districts, as it is one which, having an eye to the future, is much to be recommended. It is cropping well and proving profitable in many portions of Malaya, especially in portions of the peninsula and in Java and N. Borneo; and if estate proprietors are not inclined to take it up here, I think it most desirable to stimulate and encourage it as a native cultivation. I have urged this for many years past, and this year have made a gratis distribution of seedling plants from Henaratgoda Garden to the neighbouring villagers; I am prepared to do so on a large scale if desired.

A small plot of *Coffea bengalensis* was made at Péradeniya in September. This species is a native of Assam, Burma, and Siam, and was at one time much cultivated at Calcutta; but the product is poor in quality. Like all the genus here it suffers from "leaf-disease" (*Hemileia*).

Cacao.—Very much the largest export yet made from Ceylon has taken place in 1893; 30,658 cwt. (against 17,327 cwt. the previous year). This, however, is not so significant as it looks, as owing to the 1892 crop having been late and the 1894 crop early, the total for 1893 is unduly swollen. Still there is a satisfactory increase.

In April I despatched direct to Mr. Hart, Superintendent of the Botanic Gardens, Trinidad, in response to his request, a Wardian case containing 56 plants of our "Old Red" cacao, for the purpose of comparison with the varieties in cultivation there, so as to determine, if possible, whether it be the "criollo" of the West, and also to ascertain if the white colour of the seed will be there maintained. A few of the plants survived the long journey, and I hope in time to hear something definite as to their relationship with the Trinidad varieties. Mr. Hart has recently visited Nicaragua in Central America, a great cacao-growing country, and it is interesting to note that he found there the seeds to be usually white in section, and that after curing they acquired an appearance "identical with the best strains of Ceylon cacao, but with beans more than double the size." It is possible that we may have here the original of our "Old Red," and I have asked Mr. Hart to compare our plants with it. I hope also he may be able to spare a few of this fine Nicaragua sort, and especially of a variety of it known as "Alligator" cacao.

A packet of seed of Forastero cacao was sent to Mr. J. W. Moir at Milanji, Brit. Central Africa, for experiment.

Cinchona.—It is worth a note to mark that at last the end of this product in Ceylon is coming. The export for the year, 3,571,321 lb., was very little above half that of 1892, and it will now so rapidly fall that Ceylon bark will soon be a thing of the past.

Indiarubber (*Hevea brasiliensis*).—As the Forest Department did not take any seed, we were able to make a large distribution to planters. I advertised it at Rs. 5 per 1,000, and the demand so exceeded my expectation that though I restricted the number to 2,000 for each estate, we were unable to supply all the applicants. The crop was a large one, the Henaratgoda plantation affording about 75,000 seeds, and the few trees at Péradeniya about 16,000. The estates supplied were mostly situated in the moist low-country of the Western Province; we also sent seed to the Assistant Government Agent at Mátara. Our largest tree at Henaratgoda is now 6 ft. 7½ in. in circumference.

Though I have expressed the opinion that this is a cultivation more suited to a Government Department than to private planters, yet if the cultivator can afford to wait for about twelve years, there is little doubt of a profitable return. After the trees are once in full bearing they are said in Brazil to continue to yield for a period of 75-100 years.

Castilloa elastica.—A sample of this rubber sent home on trial, grown on an estate in Mátalé was favourably reported on, being valued at 2s. 3d. to 2s. 7d. per pound. The quality of this kind of rubber produced in Ceylon has always been excellent, but my experience hitherto has been that the amount of caoutchouc obtained from the milk is too little to make it a profitable cultivation; the yield per tree seems very small.

Manihot Glaziovii.—Ceara Rubber has not taken any hold on planters here as a permanent cultivation; yet it might, I think, be worked at a profit by a system of annual planting, and the sacrifice of successive crops of trees when they reach ten or twelve years. About 1½ lb. of dry rubber is at that age obtained from each tree.

Gambir.—I am unable to report at present any success with this. None of the seed produced germinated, and we have still only five bushes, which do not grow rapidly here. Out of many attempts we succeeded in getting from these only three more plants by layering. I fear our climate is unsuitable. In North Borneo this product is reported to have done very well in the Government Garden at Sandakan under the care of a Chinaman; and a sample analyzed by Messrs. Huttenback & Co. was all that could be desired in tannin strength—27·83 per cent. It seems likely that this will become a large export from the new colony in time.

Coca (Erythroxylon Coca).—In my Report for 1888 (p. 14) I gave analysis of three samples sent to London for report; the percentage of crystallizable cocaine was 0·47 to 0·60 per cent. These samples were all of the large-leaved typical variety (of which a figure has just been published in the Botanical Magazine, t. 7334), which has been grown here for many years. But we also cultivate the smaller-leaved form which has been named var. *novo-granatense*, and I sent to Kew in April a sample, prepared at Henaratgoda Garden, with a request for an analysis of this also, for comparison. Mr. A. G. Howard gives it as follows:—

Crystallized alkaloid	0·56 per cent.
Uncrystallized	0·47 "
			Total	1·03 "

and he remarks that the amount of uncrystallized alkaloid detracts from its commercial value. So far as these analyses go, it would appear that, contrary to what has been stated, this variety is less valuable than the old large-leaved kind.

Cubebes.—Our plants are now growing luxuriantly, and are undoubtedly the true species, *Piper Cubeba*. They are in full flower, but all prove to be male plants, and of course useless from the cultivator's point of view. I shall endeavour to obtain fruit-bearing plants.

Camphor.—A large quantity of seed of the Camphor Laurel (*Cinnamomum Camphora*) was obtained from Japan, but as it travels badly only a small proportion was raised. About 2,000 seedlings are now at Hakgala. This tree may do in the drier parts of our hill-country; there is a very old tree of large size in Pérádeniya, but it never flowers here.

Sansevieria cylindrica.—This has recently been praised as affording the best of the "Bowstring Hemps," especially useful in deep-sea soundings. It is a native of Tropical Africa, and we have grown a few plants here since 1884. As a renewal of interest has lately been shown in this fibre-plant we are propagating it and shall form a small plot.

Sisal Hemp (Agave rigida, var. Sisalana).—The plants of this in our plot at Pérádeniya (see report for 1890, p. 12) have not grown rapidly, and, compared with many other Agaves, produce very few off-sets. We are therefore not able to make progress in its propagation, a matter of little importance here, where fibre cultivation is little likely to be taken up.

Fruit Trees.—The year was a good one for fruit. The little plot of Singapore Mangosteens at Henaratgoda fruited for the first time, one bush bearing thirty fruit. The curious stoneless Mango at Pérádeniya (given to us a few years back by the Maha Mudaliyár) also fruited in July. In this the stone is usually represented merely by a thin membranous seedless plate; occasionally, however, a stone and seed is formed. Four of the thirteen selected grafted mangoes received from Poona in 1884 also flowered for the first time, but set no fruit. They have been heavily pruned and manured.

Fruit Trees at Hakgala.—Mr. Nock reports :—

Some of the apples grafted in December last year have made remarkably fine growth, many of the shoots being over 5 ft. long and stout in proportion. Sixteen of these have been planted out in the borders of the walled-in garden; also 12 pear plants, which were grafted on to stocks of the well-established and common cooking pear. Twenty-nine sites were specially prepared round the wall and planted with pears (7), plums (7), peaches (4), figs (5), cherries (3), apricots (1), and grape vines (2). A galvanized wire trellis, 6 ft. high with eight rows of wire, has been fitted up against this wall all round to train these on, and it is hoped that, with the protection of the wall and good soil and situation, they will become established. The figs have done very well this year, producing a good crop of very fine large fruit. Though but few ripened properly, they were excellent when stewed, and are well worth growing if for this purpose alone. The English blackberries have continued to do well, and have again given good crops of large handsome fruit. The American variety, though growing well, does not produce fruit freely, and I think it is now fully proved that it is not worth growing in this locality.

Strawberries at Hakgala.—Mr. Nock further reports :—

The seedling plants of strawberries in the border of the walled-in nursery fruited really well during the months of February, March, and April. I have seldom seen such a good show of fruit as there was on them at the beginning of March. I counted the set fruit in three plants with the following results:—No. 1 had 337; No. 2, 175; and No. 3, 116. The plants were literally covered with fruit in all stages, but the heavy rain in March spoiled a large quantity of them. In April they fruited in appreciable quantities, and were of good size and flavour; the largest gathered was 1½ in. long and 4 in. in circumference. They suffered a good bit from the drought in August and September, and subsequently from heavy rain at the end of the year. I see no reason, however, why good strawberries should not be grown in the mountains, if a well drained open situation is chosen for them, care taken in the preparation of the beds and planting, and subsequent cultivation.

Nutmegs.—It is somewhat remarkable that there is no export on any commercial scale of this product, as there must be a very large number of trees in the country. The few old trees in Péraдениya are I believe about contemporary with the Gardens, *i.e.*, about seventy years old; they are a fine sort, and bear copiously nearly all the year round without any attention whatever. During the last ten years we have supplied over 118,000 seeds from these trees to meet a pretty steady demand for cultivation on low-country estates.

Potatoes at Hakgala.—Mr. Nock gives the following interesting report :—

As being the tenth crop from tubers grown in the Colony, the following results are of interest. They were planted over a patch of ground 33 ft. long by 15 ft. wide at the end of August and lifted in the early part of November, being in the ground not quite three months. The weather was for the most part dry. The name of the variety was "Imperator," and the yield was 836 tubers, which weighed 199 lb. 4 oz. There were only nineteen small ones among them, and seventeen diseased. The tubers were very handsome and of good size.

Calathea Allouia.—This plant produces small tubers, which are used as a vegetable in the West Indies and Trinidad, and when boiled form a fair substitute for potatoes. We received several roots in March from Trinidad, which are doing well at Péraдениya, though much sought after by rodent animals.

Polygonum sachalinense.—This coarse but rather handsome weedy plant, occasionally grown in European gardens, has been lately strongly recommended as a fodder plant, growing as it does with great rapidity and vigour to a large size; it is said to have yielded from 89–178 tons per acre. It is a native of Siberia and North Japan, and takes its name from the Russian island of Sakalin between those two countries. We received in December four roots of this from Mr. T. Christy, of London (two through Mr. J. Ferguson), and they have started growth at Hakgala.

HERBARIUM, MUSEUM, AND LIBRARY.

General Herbarium.—Some progress was made in the early part of the year in mounting, naming up, and arranging this extensive collection, and in this work I had the assistance of Mr. C. H. Nicholls of New College, Oxford, who spent a few months of study at Péraдениya. There is yet work of this sort enough to occupy many years remaining to be done, but it requires some knowledge of herbarium work to do it properly, and I have no time for it myself. During the latter part of the year, however, the Draughtsman rendered good service in this way, having mounted and arranged the large additions to the Foreign Ferns accumulated during recent years.

The following additions were received during the year :—

- 391 species, named and mounted, of Indian Plants. (From the Calcutta Herbarium.)
- A large collection from India and Malacca. (From the Kew Herbarium.)
- 136 species of named Indian Plants. (From Dr. Eyre de Crespigny, England.)
- A collection of Ferns from St. Vincent, W. Indies. (From the Kew Herbarium.)
- A collection of Mosses and Hepaticæ, various. (From the Kew Herbarium.)

Ceylon Herbarium.—This fine collection has been kept steadily up to date, and many additional specimens mounted and laid in.

I have been too much occupied with writing to do much collecting during the year, the only district personally examined being the country about Nála and Lenadora, which possesses a rather peculiar flora. The plant-collectors, however, have made tours in the Lagalla and Rakwana Districts, and in the latter were accompanied by the Draughtsman. This officer has during the year made twenty-eight complete drawings of Ceylon plants and twenty-five of Orchids cultivated at Pérádeniya.

Museum and Laboratory.—An additional wall-case was put up in Room IV. I hope to find time to finish off the arrangement of this room, which is devoted to Foreign specimens, during the coming year.

At the end of the year Mr. F. W. Keeble, of Caius College, Cambridge (Frank Smart Scholar), arrived, and has commenced work in the Laboratory.

“Handbook to the Flora of Ceylon.”—The first part of this book was published in London (by Messrs. Dulau) on 15th May, and consists of an 8vo. volume of 328 pages and a quarto atlas of 25 coloured plates. The book has been well got up; printers, lithographic artist, and colourists having all done their part to my satisfaction. The volume contains a full account of all the Ceylon plants (about 500) contained in the first 42 Natural Orders, *i.e.*, to the *Anacardiaceæ*. I expect the second Part to be out in a few months time, and this contains about 600 more species (to the end of the *Rubiaceæ*), accompanied with 25 more coloured plates. The drawings for Part 3 are in the hands of the lithographic artist, and I am engaged on the descriptions of the plants. When this Handbook is completed I believe that Ceylon will be in possession of an account of its native vegetation more detailed and complete than that of any other British Colony.
