A TRADE VIEW OF TEA IN 1895.—In the course of its review of the tea trade the *Grocer* says: "In taking a brief view of the history of the tea trade for the past year (1895), it cannot be considered to have been either a profitable or satisfactory one for the trade generally. Total consumption however, has been good, and shows an increase of nearly 4,000,000 lb. Duty payments for home consumption have increased about 8,000,000 lb. while exports have fallen off owing to Russia and the Continent having imported much more China tea direct. Had it not been for the high rates ruling for the first half of the year for Indians and Ceylons, our deliveries would have been much heavier, as the deliveries of Indian tea during that period fell off 3,000,000 lb. Since the commencement of the new season and lower prices, our deliveries of Indian teas are on a par with last year, while Ceylon teas have increased 3,000,000 lb. China teas for the year show a small increase in the deliveries, and would have been much greater had not the exports fallen off. We may take it, however, that home consumption of China tea has increased owing to the dearness of Indians and Ceylons at one part of the year, and not because the public taste is coming back to it out of choice, unfortunately. It has been a more or less falling market all through the year, and the losses to the dealers on their Indian stock were very severe in the spring and summer months. The general trade have found it a trying and difficult market, with only one short-lived spurt in common grades in the autumn to help them out of stale stock. Trade, however, has been good since August, and now that we have every prospect of a low range of prices for some months to come we trust dealers will have better times in the new year. Owing to the absence of any Russian demand this season, importers had to force off their dearly-bought Monings in October and November; the result has been a drop on opening rates of 3d per lb. on teas up to 9d, and 4d to 7d per lb. on the best. China exports are expected to be about 8,000,000 lb. less than last season, so that we shall not have too much tea from that quarter; if the present low range of value brings in an export demand, which is more than probable in the new year, we are likely to run very short, and there may be some nice profits going for those who have been bold enough to buy in the panic. An export from India, however, of 123,000,000 lb. is more than we want, and if this estimate is confirmed the price of common teas ought to keep very low. On the other hand, no common teas are coming from China, and a large quantity of the lower grades of Ceylon are being shipped direct to the colonies, &c. Low prices of Indians and Ceylons also attract Continental buyers, and other markets may be found to absorb the otherwise alarming surplus of supplies. Ceylon imports and deliveries for the year keep very evenly balanced, each year showing continued increases which even high rates cannot stop, whereas Indian tea is immediately affected by a high market for common grades. Figures look healthy, and we shall commence the new year with about the same stock as 1895. Prices are on a very safe level, trade is improving, and we may confidently expect that dealers will have a more prosperous new year."

INDIAN TEA IN 1895.—The consumption for the first six months of the year fell off 4,000,000 lb. on account of the high prices ruling for common grades, but no doubt this loss will be partly recovered by the end of the year, owing to the fact that of late the value of Indian tea has been much better to the consumer than Ceylon tea, and it is being used more freely in consequence. The total consumption for the season 1894-95 was 114½ million pounds, or say 1,000,000 lb. less than 1893-94, while the import for the season was 115,000,000 lb. or 1,000,000 lb. more. The export of Indian tea from London to other countries is just under 4,000,000 lb. or some half a million more than in 1894. There was a very fair business done for the first half of 1895, and owing to the scarcity of common tea, prices opened high for this class, or, say, a quotation of 7½d to 7d per

lb. which strengthened for the first two or three months, but afterwards gradually fell away in May and June. The weight of the supplies was in medium to fine grades, owing to the crop having been a very good one, and prices dropped very considerably. Dealers were landed with a heavy stock of this class. Nobody wanted them, and the consequence has been serious losses to holders, who could only get out of their holdings by degrees, the liquidation of which took them well into the new season's, and almost any price had to be accepted from those who were willing to relieve them of their stock. Quality fell off towards the end of the season, and finest being scarce, were well competed for at firm prices right up to the end. It is very unlucky that the new crop of 1895-96 has turned out a very poor one, as the low prices ruling in May to July for good medium to fine old season's made it almost impossible to get offers for similar grades of the new crop within 3d to 4d per lb. of the Calcutta cost on arrival. The first sales of new teas were held on June 10, and opened slightly over the previous season. Quality, however, was so poor that there was a very dragging market, with drooping prices until September 9, when an improvement in demand and prices for common grades—and, in fact, for all good liquoring teas—raised values very materially. Unluckily the improvement in value of common grades only lasted a month a telegram from Calcutta being received on October 9th with the news of a probable export of 124,000,000 lb for the season. An increased export of 8,000,000 lb could only mean a glut of common tea, and heavy auctions for the rest of the year have reduced the quotations of Pekoe Souchongs to 5½d and fine and medium Pekoes to 6d to 7½d (the latter are said to have never been so cheap), and these rates are driving them freely into consumption. We have already received about 8,000,000 lb more of the new crop, but if the revised estimate of 123,000,000 lb is confirmed, the stock next year will be greatly increased, as the deliveries for the year still show a falling off from 1894. Prices of common grades will doubtless still tend downwards, as the surplus consists of this class; deliveries, however, will probably increase materially, and show up well against the first six months of 1895, when prices ruled 2d over present rates for common to medium kinds. Good medium to fine Pekoes and broken Pekoes from 9d to 1s 3d improved almost imperceptibly for the last three months of the year, the improvement amounting to 2d and 3d per lb, as compared with the lowest point; finest grades from 1s 6d up have also been in small supply, and have brought good prices, quality considered. The outlook is not a happy one, bearing in mind the estimated crop of 123,000,000 lb and probable increased supplies from Ceylon; low prices may certainly increase our deliveries to, say 118 or 120 million pounds next year, but even then we shall end the season with a much larger stock than we need.

CEYLON TEA.—This most popular branch of the trade continues to expand, and is the last to feel the effects of high prices or poorness of crop. If the island could turn out the quantity, it is thought that its deliveries would soon take precedence of Indian tea. In 1894 we delivered 7½ million lb. more than in 1893, and this year the increase amounts to over 4,000,000, or actually more than we have imported. The increase has been in the last half of the year, or, say, over 3,000,000 lb more than our imports from June 1st. The bulk of this year's supplies have been very poor in flavour, and quite lacking the Ceylon smack—mostly bakey or half cured; but as they are consumed almost as soon as they arrive, and certain people must have them, however poor in comparison with other kinds, losses on bad stock are not often very serious. A notable feature has been the low rates that have ruled for common to good broken pekoes throughout the year, and two or three times they actually got down to the same price as ordinary leaf teas. Often the breaks of pekoe souchong have been very small on account of colonial buyers taking them in Colombo. Fair to good pekoes have relatively fetched high prices,

the demand always being so strong by the blenders, an also for the Continent. Really good and fine liquoring teas have been very scarce throughout, and competition was so keen from them that prices have ruled very high, more particularly for the Pekoes and Pekoe Souchongs; their value, however, is so good that no other class of tea can compete with them for blending purposes. The market opened high in January with a quotation of 7½d for Pekoe Souchong, and soon rose to 8d to 8½d, with Pekoes at 9d to 10½d; but no change in Broken Pekoes at 10d to 1s. These prices only lasted a few weeks, and rates gradually eased off until the end of March, when we had quotations of 6½d for Pekoe Souchong, 7d to 7½d for Pekoes, and 8½d to 9½d for good broken Pekoes. The market then took a turn; demand improved, supplies came forward freely, but quality fell off. From Mid-June to Mid-July the crop was very common, and quotations were at their lowest—viz., 5½d for Pekoe Souchong, 5½d to 6½d for Pekoes, and plenty of Broken Pekoes at 6½d to 7½d. Quality and trade soon began to improve—common slightly, but better grades very materially. In September the real rise commenced, and by the middle of October sweet common leaf was carried up to 7d, or say a rise of 1½d from the lowest point. Fair to good liquoring Pekoes were also very strongly competed for at a rise of over 2d per lb. while fairly good liquoring Broken Pekoes were up 2d to 3d per lb. It is difficult to estimate the rise in really good and fine liquoring teas, but it was well sustained until the end of the year; common or ordinary Pekoe Souchongs fell quite 1d to 1½d per lb. during November and December owing to the better value offering in Indian growths. The supply of these kinds was not excessive, however, or the fall would have been more severe, as the trade devoted all their attention to the wonderful value offering in Indian kinds. In noticing the rise quoted in September and October, the improvement in quality must, however, be allowed for. The long prices that really fine pekoe souchongs, pekoes, and leafy broken pekoes have realised is principally to be accounted for by the strong competition for export and their general scarceness. It is most noteworthy that the export of Ceylon tea for the year is over 7,000,000lb, or say an increase of 2,000,000lb. over 1894, so that really the home trade has only increased about 2,000,000lb. for the year. Lower prices for the common and fair grades have stimulated consumption during the last six months, and deliveries are likely to increase still more as there seems no reason why we should have any material rise in the new year. The weather in Ceylon has been favourable, and increased supplies are expected.

THE PROFITS ON COFFEE.—One cause of the popularity of tea is the fact that the wholesale and retail dealer in it is able to make a fair profit out of it. With coffee it is not so. The sale of coffee has been as unprofitable to the home dealers during the past year as it was in several preceding ones; and interest in this favourite beverage of the breakfast-table has flagged so much that many grocers have ceased to push its sale and promote its consumption with the same energy that they did in bygone days, when quotations for the unroasted berry as imported were from 20s to 30s per cwt lower than they are now. This is mainly owing to the circumstance that the coffee which pays so handsomely to grow consists principally of common sorts, such as Brazil, that is consumed less in Great Britain than in other countries; whilst fancy kinds, which are strongest in request here, being by far the scarcest of any that are produced, fetch prices so extremely high as to virtually preclude the possibility of securing a reasonable scale of profits in preparing and disposing of them to British consumers.—*H. & C. Mail*, Jan. 10.

MARKET FOR TEA SHARES.

THURSDAY EVENING, Jan. 9.

THE YEAR 1895.—In referring to the new issues of the year we omitted in our review to mention

£17,500 fresh capital issued by the Jhanzie Company, which was readily subscribed for at £6 15s per £5 share, or at 1½ premium.

Business has been somewhat interfered with both by the Christmas holiday time, and also latterly by the unsettled state of the stock and money markets, resulting from the so-called South African scare, but nevertheless a steady investment business has been in progress.

CEYLON SHARES.—There is very little business in progress in most of these shares, but the great divergence of view as to the price between buyers and sellers rather prevents business.

DEBENTURES.—Some Eastern Assam 5½ per cent are said to have changed hands at a small premium. Upper Assam Company's "C" Debentures are being asked for at or about par.—*H. & C. Mail*, Jan. 10

TRAVANCORE PLANTERS' ASSOCIATION.

Minutes of proceedings of a general meeting held at the Club, Trivandrum, on Wednesday, 15th January, at noon.

Present:—J. S. Valentine, W. Marshall, J. Stewart, J. B. Cook, A. D. Adams, (D. Cameron, visitor); D. G. Cameron, and R. Ross, Hon. Secretary.

Notice calling meeting having been read, it was proposed by J. S. VALENTINE and seconded by J. STEWART that Mr. Cameron take the chair.

Secretary's report having been read, Mr. Ross was again elected Secretary.

1. Proposed by J. S. VALENTINE and seconded by D. G. CAMERON:—"That those members who have not paid the extra donation of R10 asked for last year be again appealed to do so."

2. Proposed by W. MARSHALL, seconded by J. B. COOK:—"That subscriptions be raised from R15 to R20 per annum in order to meet expenditure."

3. Proposed by J. S. VALENTINE, seconded by W. MARSHALL:—"That a vote of thanks be conveyed Government for granting extensions of estates within the reserved forest area and that a copy of this resolution be forwarded to the Dewan."

4. Proposed by J. S. VALENTINE, seconded by A. D. ADAMS:—"That Government be urged to sanction expenditures on bridges on Bonaccord and Braemore cart-roads, as well as other applications still before Government."

With a vote of thanks to the Chairman, the meeting terminated. R. Ross, Hon. Secy.

(Signed) D. G. CAMERON, Chairman.

CEYLON CACAO AND JAMAICA-TRINIDAD CACAO.—Referring to the comparative analyses of Ceylon, Jamaica, and Trinidad cacao published in our issue of 27th November last, with an accompanying letter from Mr. John Hughes of London, that gentleman now writes:—"Perhaps you can obtain other analyses of Ceylon cacao and publish them side by side with these, as I daresay planters and merchants would be interested with the results. The chief difference between Ceylon cacao and that of Jamaica and Trinidad appears to be that it contains more fibre and less starch compounds, though in soluble, extractive, and flavouring constituents the Ceylon specimen is decidedly superior. No doubt the character of the season affects the particular quality of the cacao as is the case with tea." We shall gladly publish any analyses sent to us.

Correspondence.

To the Editor.

CEYLON TEA IN AMERICA.

CHANCE FOR A CEYLON ROOM AT PHILADELPHIA MUSEUM.

SHOULD CEYLON WORK WITH INDIA OR SEPARATELY.

San Francisco, California, W.S.A., Dec. 14, 1895.

MY DEAR "OBSERVER,"—I did not intend again addressing you until *next year*, but the following letter received by Mr. Bierach, contains news so important to Ceylon's interests here, that I make no apology for sending you a copy; I hope the "Committee of 30" and general planting community will grasp the magnificent opportunity for such a grand *free* advertisement of Ceylon's products, especially as Philadelphia is a great commercial centre, and the letter was quite spontaneous.—[Letter of Dec. 5 to Mr. Bierach, as given in his letter below.—ED. T.A.]

The above letter speaks for itself, and I need only remark, that Mr. Bierach does not care to avail himself of the handsome offer referred to in the latter portion of the letter. He wishes *Ceylon* to benefit here, and not merely his own private brands of tea: his remarks are as follows:—"Ceylon can have a fine show here, I can, I am sure, *arrange for a separate Ceylon Room*, if Ceylon will only appreciate the opportunity, cost will be so trifling." The funds at your disposal will soon tell you the heavy cost of advertising in America; and such chances as the above should in my opinion be snapped up at once. The Book Pamphlet of Plan and Purpose sent me, relative to the above Museum, I must retain, but doubtless you will receive one, and can quote therefrom, it is interesting, especially chap. 4, "Bureau of Information." Leading Ceylon papers, directorics, and books should be kept on file.

It appears to me that Mr. Bierach had the "pull" at Philadelphia. Where would Ceylon have been at that most important show, but for him, without a cent of support either from available funds? Why were none of the Planters' Association tea pamphlets even sent him for distribution? I think it would be good for Ceylon if your worthy Delegate (who is a rattling good business man) were to avail himself of Bierach's services. India is not in it (is it a question of supplies being stopped?); and besides Ceylon *must go by herself* as her teas are wanted in preference to those of India. *Don't mistake this point.*

So it seems S. Elwood May is again *disorganized!* Still we will probably hear shortly of his *organizing* something or other connected with Ceylon tea: this is I think a great pity, for obvious reasons.

Mr. Beling (one of the Burghers who remained in the country after the World's Fair) is now no longer connected with the Ceylon Importing Co. of Davenport, Iowa. These Johnnies seems to be all dropping out of it. Beling was a superior fellow, and I imagine a good business man.

I was glad to learn some time ago that the proceeds of the grant of tea voted to Mr. J. R. Foster were secured to the "30 Committee" and refunded them. Messrs. Castle Bros., who held the bills of lading and had a claim with others, against that gentleman, were *somewhat* surprised when I told them the final results of the transaction; they had previously informed me "that they would first pay themselves and then remit back to Ceylon any balance there might remain after satisfying their and their friend's claims. Thus has the wily Yankee (and Jews at that) been foiled.

I regret to learn that Mr. Bierach has been obliged to let the Wilmington Pure Food show go by, without a Ceylon Court, as he desires to concentrate all his efforts on a good showing at Washington next month. This is a pity, but he cannot be expected to run

shows all over the place for the benefit of Ceylon without any support; and it is unfortunate his experience, and the "pull" he evidently has with Pure Food people, should be lost to Ceylon.

Now, Mr. Editor, I will conclude, and wish you all in Ceylon good luck in 1896.—Yours truly,

T. A. C.

15th Dec. 1895 (Sunday).

P.S.—On taking the above down town yesterday afternoon to post, I found your *Overland* of date Nov. 7th, containing an interesting letter from your worthy Delegate which in some points surprises me. Truly advertising *is* expensive; and your Delegate will be all the more able to appreciate the telling amount of *free* advertising Mr. Bierach is able to get for Ceylon, without more cost to *him* than his valuable time, pen, ink, and paper; and not a cent of cost to Ceylon. I also received a few of the Association pamphlets which will be given by me to the leading grocery stores here, the largest of which, with its four magnificent establishments, continues its Ceylon Tea Demonstrations, by serving free cups daily. This being holiday time is the best season of the year. The tea is *good* and the brew perfect. I instructed the lady in charge, got small teapots used (one for each guest), a time-glass for her guidance, &c., &c. nice biscuits are served also. The teas used are the "Bee" Brands of R. V. Webster's, and they are very well liked. to the big show intended at Philadelphia did not come off; a great pity. £700 sterling (\$3,500) seems a large sum for a 3 weeks show; but, as Wm. Mc.K says, "Philadelphia is a great centre;" and everyone should be thankful that Bierach stepped into the gap. I believe £400 stg. and some natives was all he asked for the Atlanta Exposition which runs *for over 4 months*; but that is ancient history now, unfortunately for Ceylon. I sincerely hope the same mistake will not be made about Canada.

Are you in Ceylon aware that the British Association (for the promotion of science) meets next year at Montreal, Canada? I presume this city was chosen on account of its Exposition.

It was very unfortunate your Delegate was not in America to push Ceylon at Philadelphia. How is it that even if India (why *must* Ceylon wait on India in these matters?) did not have the £350 stg. available as her share, Ceylon did not go right ahead, and make a good show by herself. Would such a course not have met with the approval of 9 out of every 10 men in Ceylon. Is it not their expressed wish that Ceylon stand on her own feet and not be dragged down by India, who is now merely hanging on to Ceylon's coat-tails, metaphorically."

Bierach's application for support at Philadelphia is referred by your Delegate "to Mr. Blechynden, to whom I have left everything in connection with the Philadelphia show." "Blechynden has the staff, booth &c." What staff? A few negroes I believe, one of whom is occasionally dressed up as an "Indian Princess"!!! This won't do for Ceylon; it savours too much of the "fake" dodge, and besides Mr. Blechynden's applications were refused by the Philadelphia authorities. Why? Doubtless Mr. Blechynden "likes having sole charge of the running," but how does Ceylon like it? Is it to Ceylon's best interests that an *Indian* man should have "sole charge of the running"? I think not. Fortunately he had sole charge of running nothing.

I am sorry to see that what your worthy Delegate says about poor teas being sent over here bears out what I wrote some time ago on the same subject. I had hoped this fatal mistake might only be local.

I hope Washington will be well pushed by Wm. McN. and the application made by Bierach be favourably received. Don't you think America is right about the pamphlets? She has 70,000,000 people to feed; and if she can produce pamphlets, guns and chewing-gum, *to be used in America*, is she not quite justified in protecting her own industry and thereby employing, and paying wages to, *her own people*? Free trade is all very well in the abstract; but in the concrete it don't always work; and a mild protection is not a bad thing. I imagine the British farmer would like to try it, and get a paying price for his cattle, grain and other crops.

I gave the same answer, fortunately, to Mr. Perry, as you have given to Henry Cottani, not to go to Ceylon unless he had money to invest, in which latter case he might go to many a worse place.

T. A. C.

132 East 23d, Street, New York, Dec. 19th, 1895.

DEAR SIR,—While at Philadelphia a conducting a Ceylon Court in the interest of the Ceylon Tea Industry, at the food exposition, I was invited to a private view of the commercial museum (not yet open to the public), an institution that will be bound to benefit all countries represented by exhibits. *The plan is a good one.* The accompanying pamphlet will explain fully its purpose, and which I should be glad to have you *publish* with your comments. On the subject I have addressed a letter to the worthy Chairman of the "Thirty Committee," A Melville White, Esq., and the annexed letters will explain themselves and show Ceylon opportunities of which I sincerely hope, advantage will be taken.

The Philadelphia Museums, Philadelphia, Dec. 5th, 1895,

Mr. S. Bierach, 132 East 23d St., New York City.

Dear Sir,—I take the liberty to write you, through the suggestion of Mr. W. B. Smith. Allow me to state that I was extremely sorry not to have been in the Museum when you called some days since; I should take great pleasure in putting on exhibition here a complete collection of Ceylon Teas. When we are open we shall have great numbers of commercial men visiting our place and I feel it will be quite advantageous and as much in your interest as ours to make the collection a fine one of large samples including all varieties on the scientific side, I should like every different kind that you can furnish me with, regardless of its saleability. You can then give us the information with reference to those kinds you are particularly pushing and we will send people to you. *If you* desire to arrange a handsome case with your *own name* upon it you are privileged to do so. In such event we should like to have the samples in sufficient quantity that they might be tried.—Very truly yours, (Signed) W. P. WILSON, Sec. and Director.

Philadelphia Museum, Philadelphia 12, 16, 95.

Friend Bierach,—We send you via mail lot of books as requested, and I am instructed by Prof. Wilson to say we will be pleased to grant you a *special room* for show of Ceylon products and hope to make it a very interesting one. We will *furnish all cases and fix up* and will make a special endeavor to have with your assistance a show worthy of your efforts.

You will understand that we have some very large rooms and some not so big; and if you can arrange to get all the products of the island we can with your assistance make a fine display. Hope to see you soon.—Respectfully, (Signed) W. B. SMITH.

This museum of the products of the world is not intended for an Exhibition of a month, or six; *but to be permanent*; for this reason it is all the more desirable. The planters and commercial firms of Ceylon should not be slow in taking advantage of this offer.

I sincerely trust the response will be a *hearty one*. And that Ceylon will put *its best foot forward* by making a creditable representation at the Commercial Museum of Philadelphia.—I am, yours faithfully,
S. BIERACH.

Copy. 132 East 23d Street, New York, Dec. 16th, 1895.
Wm. Mackenzie, Esq.,

Ceylon Tea Representative, London, England.

Dear Sir,—With this it gives me great pleasure to hand you a copy of a letter that I have addressed to your worthy Chairman, A Melville White, Esq. The letter will explain itself. The object I am sure will meet with your approval; and I fully trust that on close investigation you will endorse the enterprise and that Ceylon will make a suitable display at the Philadelphia Museum.

I trust that you received the copies of the "Household News," "Grocery World," and the photo of the Ceylon Court at the Philadelphia, food show with

my letter covering same. Not to lose any time I shall forward this by the next outgoing mail, trusting that I shall have your favorable reply covering the Washington Exposition.

With best wishes for your health and with compliments of the season.—I am, dear sir, yours faithfully,
S. BIERACH.

Copy

132 East 23rd Street, New York, Dec. 16th, 1895.

A. Melville White Esq., Chairman Planters' Association and "Thirty Committee," Kandy, Ceylon.

Dear Sir,—While at the Philadelphia pure food exposition on the invitation of W. B. Smith, Esq., of that city I paid a visit (Private View) to the commercial Museum not yet open to the public. This Museum is under Municipal patronage.

When complete in scope it will be beneficial to all countries represented. The idea is to show the products of the world and I am of the opinion its importance will be appreciated by all that are connected and represented by exhibits.

I promised that I would interest myself and communicate with your Association, Committee and delegate showing the importance of the enterprise for a display of Ceylon Products, particularly tea.

Your Committee and the Chamber of Commerce should take this opportunity into favorable consideration and make a representation of the products of your beautiful island. *Space and display costs nothing* and will do an immeasurable good, in fact, a standing advertisement for your products.

I know that if the proper commercial exhibits be sent I could arrange with the director, Prof. Wilson, or a separate Ceylon room thus making your advertisement standing out more prominently.

The cost for the proper exhibits would be but nominal, transportation moderate, and if your committee so desire I could install and arrange your exhibit personally and that would not add so very much to the cost.

Requirements for the exhibit:—"Golden Tips" bro. or. pekoe, or. pekoe, pekoe, pekoe sou. souchong, "Silver Tips," and hyson high and low-grown; coffee, cinnamon, cardamoms, cacao-beans, cloves, nutmegs, mace, desicated coconut, plumbago, animal and vegetable fibers, oils, coconuts in husks, &c. &c. &c.

Estates and firms could be invited to contribute for this purpose and in making the display have their products shown under estate or firm names so as to receive all possible benefit. Name of estate, temperature, rain-fall, elevation &c., to be given with tea exhibits.

The exhibit practically would cost your Committee nothing; the cost of transportation and arranging being so trifling in comparison to the benefits to be derived therefrom. The opportunity is a good one that should not be lost but promptly acted upon.

The Mayor of New York has inspected the Commercial Museum plan of the Municipality of Philadelphia and reported that a similar institution should be started in this city.

Trusting that your Committee, Association and the Ceylon Chamber of Commerce will appreciate the importance of making a good Show and taking advantage of this splendid opportunity. I await your favorable and early reply. With my best compliments to yourself, your Association and Committee.—I am, dear sir, yours faithfully,
S. BIERACH.

MR. BELING AND THE CEYLON IMPORTING COMPANY, IOWA.

Colombo, Jan. 24.

SIR,—My attention was called to the para in Mr Cockburn's letter in the *Observer* of the 23rd instant in which it is stated that Mr. L. Beling has severed his connection with the Ceylon Importing Company, Iowa. I have good reason to believe that this statement is incorrect. I would not care to contradict the statement if not that it might work prejudicially to the interests of the Company, and it is not likely from the information I have recently

had that any such thing had taken place. From a letter dated the 10th December, I learnt that the business, the headquarters of which is now at New York, was more full of promise and, having attained this much, that no efforts would be spared to make it a life success.

Unless the unexpected had happened between the 10th December and the 11th, the date of Mr. Cockburn's letter, the news of which could not have reached San Francisco so rapidly, the Ceylon Importing Company of Davenport and New York was at that date and is now I fully believe under the same management.

Mr. W. Mackenzie, the Ceylon Delegate, in one of his earliest letters, spoke of the Company as "perhaps the best friends the planters had in America;" and since then he has doubtless had ample opportunity of watching the work they are doing in pushing Ceylon products, especially tea. Mr. J. H. Reuton when in New York recently had called at the offices of the Company on several occasions; and as a business man and one actively interested in the pushing of Ceylon tea in new markets he would no doubt be able to speak authoritatively as to the work my brother is doing in the interest of Ceylon.

I hope the C. I. C. will long continue to push Ceylon tea without clamouring for extraordinary aid, magnifying their own efforts or crying down that of others in the same direction, nor attempt to interfere with the work of the responsible and duly constituted authority who could use his discretion and experience gained on the spot to push the Ceylon products to the best advantage.—Yours faithfully,

H. P. BELING.

ST. HELIERS TEA COMPANY.

Colombo, Jan. 30th.

DEAR SIR,—It may be of some interest to you and also to some of your readers to know that at a meeting of Directors of St. Heliers Tea Company held today it was resolved to declare an *interim* dividend, for the six months ending 31st Dec. last, of 10 per cent, which has been paid.—We remain, yours faithfully,

BOIS BROTHERS & CO.,

Agents and Secretaries.

COCA, PARÁ RUBBER, SABAI GRASS COFFEE, AND CAFFEINE.

Jan. 7th, 1896.

SIR,—After receiving the *Tropical Agriculturist* 2nd Dec. 1895 I digested the contents, and would like to remark as follows:—

Products of Bolivia (page 377).—Very little is said about the *Erythroxylon Coca*. I am following up this subject because I know that there is much to be learnt still. I had the satisfaction of knowing that I had introduced a valuable drug into England when I brought in the coca leaf and pushed it before the notice of medical men. None of the alkaloid makers supported me until Mr. Merck took it up. I have found out that the large-leaved variety from Bolivia is the most valuable to grow. Further, in testing the coca leaf grown in Java, there is hardly any crystallizable alkaloid; the substance that comes from the Java leaf is more like a glucoside. I had sent to me from India some coca leaf which had been passed through a tea desiccator and its appearance when it arrived here was that of a curled-up, dry leaf. It was pronounced by the authorities of the Pharmaceutical Society to be valueless; nevertheless I sent it to the works where they are most advanced in the manufacture of caffeine and they pronounced it very fine and said they would be glad to take any quantity that could be supplied, and, instead of the price of the Java coca leaf being worth about 3d., this

would be worth about 1s. The point to be noticed after reading these remarks is that this coca was grown at a high elevation in India, comparatively speaking, and the information that I have given to my friends in the report was: "Go up to Assam and try the coca leaf there (the large-leaved variety), dry the whole leaf like tea, pick it tight into bales and send it over. I believe it will then be worth 1s 6d to 1s 8d per lb. here for the extraction of the alkaloid." In testing trees, either for the leaf or for the berry in the instance of coffee, it is most misleading to take the first fruit or foliage from a *young* tree. We see this specially with coffee, because as the seed dries it "shrivels" off a young tree.

PARA RUBBER.—I think it will turn out a valuable enterprise to all those who are planting this variety of rubber in Ceylon. The trees can be planted a good distance apart, close to any moist or wet ground or on the sides of streams; it will be a great pity if they are put so close together that they crowd one another.

SABAI GRASS FOR PAPER.—I should be very glad if I could obtain some of the seed of this grass and also a specimen of the paper which is made from it. I am writing to the only clue that I can find in the article on page 401, viz., to the Deccan Paper Mill Co. for samples of their paper, because it will be very interesting if this paper will stand chemical treatment as well as the Manilla paper does; this Manilla paper I use in large quantities, perfectly free from any sizing and it is 40 inches wide. I should be very glad to see the Sabai grass if it came at the same price or cheaper and was equally strong as the Manilla. This Manilla paper makes a beautiful water-proof material, which there is a great demand for.

COFFEE.—I have lately been thrown considerably into company with some of the large coffee brokers and dealers, and they have informed me of the sums of money which they have collected to start places where pure coffee will be given, because when one asks for a cup of coffee one rarely gets it in this country, and hardly ever in Germany. If the hotels, restaurants and eating-houses were once compelled to give pure coffee when a cup of coffee was asked for, people would commence to know what the flavour of coffee was. They next would ask for coffee to be made strong, and the quantity of coffee that comes to this country would be quite inadequate to supply the demand. There are exceptional places in London and a series of establishments where pure, first-class coffee is to be obtained, and these are well-known and frequented by those who know what the flavour of a good cup of coffee is. The Liberian coffee which comes to England is sold at a good price because it has great strength and flavour and this goes to the north of England and the manufacturing places, but there is not more than 20 per cent to 30 per cent of coffee in the mixtures that are sold. It is a great question if the legislature could not compel restaurants to supply coffee when it is asked for.

You may like to hear that the CAFFEINE industry has gone on increasing and large quantities of tea are consumed. A much larger plant has been erected by the manufacturers so as to cope with the demand. All this industry has been brought into England since 1838. To prove how pernicious the action of some of the dock companies has been of allowing the Germans to have the British made tea sweepings from British warehouses to denature and send to Germany to be made into caffeine, to compete against British industry. An American firm has engaged a German to start a similar set of machinery in London, and to bring pressure to bear to obtain tea sweepings, so that the tea can be denatured and sent to America to be worked up and so compete against British industry.

In conclusion I am glad to say that some of these docks and tea wharves who formerly allowed the tea sweepings to go to Germany have repented and are now acting most honorably in sending the whole supply to the English houses.—Yours truly,

TH. CHRISTY.

EDERAPOLLA TEA COMPANY OF CEYLON, LIMITED.

We have received a copy of the prospectus of this Company which has been formed with a capital of £50,000 in 5,000 shares of £10 each, to purchase from Messrs. Bett and Watt, Ederapolla estate, and from Mr. MacMartin, Ardross estate, both properties being situated in the Kelani Valley District, Ceylon. The Directors are Messrs. James Bett, Ederapolla estate, Ceylon (Vendor); J. M. MacMartin, Ardross estate, Ceylon (Vendor); G. W. Paine, Chairman of the Kelani Valley Tea Association, Limited; R. Porter, Maskeliya, Ceylon, Managing Director of the Kelani Valley Tea Association, Limited. Managing Director in Ceylon—Mr. Arthur Watt, Ederapolla estate, Ceylon (Vendor). Bankers—National Bank of India, Limited, 47 Threadneedle Street, E.C. Solicitors—Messrs. Murray, Hutchins, Stirling & Murray, 11 Birchlin Lane, E.C. Auditors—Messrs. Cape & Dalgleish, 8 Old Jewry, E.C. Secretaries and Office—Messrs. Lyall, Anderson & Co., 16 Philpot Lane, E.C. The estates have been reported on and valued by Mr. R. Porter, Managing Director of the Kelani Valley Tea Association, Limited, and the Company have acquired the properties at the values put upon them by Mr. Porter. The Vendors have agreed to accept payment as follows:—£12,660 in fully-paid shares, £6,330 in cash—£19,000.

PLANTING IN THE STRAITS SETTLEMENTS.

From the Kuala Kangsar Monthly Report for Nov. 1895, published in the *Perak Government Gazette* of Jan. 17, we take the following:—

On the 20th instant, in company with the Acting District Engineer, I went to Padang Rengas, and there met the State Engineer; we then proceeded to Sungai Ati, a small river that takes its rise in the Hijau range; this river has washed down thousands of tons of earth from the side of the hill on which the Waterloo coffee estate is situated. This earth has covered the land in the valley to a depth of one or two feet and destroyed a great many valuable kampongs. There are several hundreds of acres of bendang land below this which will eventually be destroyed unless something is done, and that shortly. The State Engineer has decided to run one or more sections of levels across the upper end of the valley and then put in a succession of dams and turn this part of the valley, which is now worthless, into a sort of catch pit and by this means keep the falling earth from further encroaching upon the lower land. The sooner this is done the better. The original cause of this damage was owing to the fact that the jungle on Waterloo, which at one time, by means of its roots, held the earth together, has been cleared away and the hill being very steep has been washed down by every successive rain.

7. The kampongs that have by this means been totally destroyed belong to the ordinary Malay *raiois* who have been ruined by this. I think that these people should undoubtedly be compensated for the loss they have suffered. The attention of the Government was drawn to this early in the current year but up to the present nothing has been done.

Over 1,400 pikuls of coffee have been shipped from the Kamuning Estate for the year ending on the 31st October. Only 2½ per cent of this was number two coffee. There are altogether 399 acres under cultivation, 265 of which are in bearing. This gives over five pikuls to the acre, which at the present price means over \$200 per acre. There are thousands of acres of land equally suitable for coffee to the north of this estate, and with this land opened up by the Kamuning-Lassag road, which will be about 10 miles in length, access to this land will be easy. When the railway reaches Chumor it will only be a matter of 10 miles of cartage, instead of as formerly, 35 miles to Taiping and then trans-shipping into the railway and again into the Penang boats.

The owners of the Gapis Estate are pushing on with their clearing and planting very fast. The young coconuts on this estate are looking very well

and they have planted already about 70 acres in coffee.

I have had two applications for coffee land this month, from a party of Malays and a Chinaman respectively. Two Chinese towkays have also been inquiring about land for planting coffee. In one instance the would be planter is willing, I understand, to plant up as much as 1,000 acres if he can get suitable land and a good man to manage for him. If these men are prepared to put the money they make out of tin mining into planting, I think it will be a most excellent thing for the State as well as the men themselves. What is wanted now more than anything is a few experienced planters, who are willing to select and plant up and manage the land for them. I think it only requires one or two start, to shew the Chinese what can be done with European management, and many more will follow suit. I would suggest that special and very favourable terms be offered to the first three or four Chinese who are prepared to take up, and plant a certain area in coffee within a certain time. Let them either have the land at a reduced quit-rent free until the plants are in bearing. I personally do not think the Government can do too much to induce the Chinese to take to planting and I feel sure that the future of the State will greatly benefit if this is achieved.

The *Selangor Journal* has the following:—

Not only for coffee planting is there a demand for land in Kuala Selangor. We hear that an application has been received for a very extensive concession for pepper and gambier; also that a gentleman, lately visiting the district, expressed a desire to take up a thousand acres for coco-nut cultivation. This latter application is for land subject to tidal influence, which renders the area applied for useless for any other purpose. It is to be hoped that the application, at any rate, will be granted, for in that event the concessionaire has stated his willingness to import the necessary plant and machinery for the extraction of oil and the working of fibre, and start an industry that would bring wealth to the natives and to the Government. A high authority once informed us that our "tin won't last for ever," and that we were "going on the right lines in developing our agricultural resources." Therefore, let the development be encouraged.

A general meeting of members of the Selangor Planters' Association will be held in the Reading Room of the Selangor Club to on Jan. 11th.

THE CEYLON LAND AND PRODUCE COMPANY, LIMITED.

ANNUAL REPORT.

Your Directors beg to submit the annexed Profit and Loss Account and Balance sheet for the year ending 30th June, 1895, duly audited.

The amount at credit of Profit and Loss Account is £8,836 15 6, which, with the sum of £358 0 2 brought forward from last year, leaves £9,194 15 8 to be dealt with.

On July 18th last, an Interim Dividend of 7½ per cent. on the Ordinary Shares and 3 per cent. on the Preference Shares was paid, and your Directors now propose to pay on the 21st day of January, 1896, the balance of the fixed Cumulative Dividend on the Preference Shares (3 per cent.) making 6 per cent. for the year, and 7½ per cent. on the ordinary shares making 15 per cent. for the year, and in addition a bonus of 5 per cent. on the ordinary shares—all free of Income Tax. It is also proposed to transfer £2,000 from Profit and Loss Account to a Reserve Fund, and carry forward the balance of £1,307 15s. 8d., subject to the Directors' remuneration for the year under review, to be fixed at the general meeting, and to the payment of Income Tax, &c.

The result of the operations during the past season has been very satisfactory, the largest crop of Cocoa yet secured from the Company's estate having been marketed, whilst the realized net price of tea shewed an improvement as compared with the previous period.

TEA.—The year 1895 opened with rather high prices for common teas, and moderate rates for medium and fine. This position was about maintained for the first few months, but subsequently, as supplies increased, a lower range was established until July, when, owing to better teas coming forward, and some recovery in the value of medium and fine, the monthly average again commenced to rise. On the whole the quality of the crop has been a fair average one, and, as showing the increase in the trade, it is interesting to note that about 950,000 packages passed the hammer in the public sale rooms during the last 12 months, bringing in an average price for the whole of 8½d. per lb. or the same as was obtained for 876,300 packages in 1894, and comparing with 9½d lb. for 834,000 packages in 1893, while the London Bonded Stock on December 31st was about on a par with that of 1894, so that the increase of nearly 6 million lb. has been practically absorbed. The export trade from London to the Continents of Europe and America is a growing one, and your Directors are pleased to be able to state that orders from buyers abroad now have considerable influence on the prices obtained in public sale for the classes of tea deemed suitable for their requirements. The total exported from London from January 1st to November 30th in the past three years is:—

1895	1894	1893
6,535,211 lb.	4,795,312 lb.	3,714,751 lb.

COCOA.—The market for this article has been disappointing, and prices have been lower than those of 1894. The position now looks more hopeful, although your Directors cannot at present look for a renewal of the record prices of past years.

COFFEE.—The prices obtained during the year have been satisfactory, but inferior to those of 1894. The highest price paid during the year for *Ceylon Liberian*, viz. 90/6, was obtained for a parcel from North Matale Estate. According to news from the producing countries a lower range of values must be looked for in 1896.

The following Statement shows the average of the Company's Properties at date:—

Name of Estate.	Tea.	Cocoa, Coffee & Coco-nuts.	Forest, Grass, Chana, &c.	Total Acreage.
Alloowiharie ..	107	410	153	670
Andangodde ..	120¾	—	55¼	176
Fetteresso ..	405	—	33	438
New Peradeniya ..	386½	17½	54½	458½
North Matale ..	226	822	459	1,577
Owella ..	27	74½	77¾	179
Riekerton ..	500	—	96	596
Strathisla ..	—	229½	111½	341
Forest ..	—	—	430	430
	1,842¼	1,553¼	1,470	4,865½

At the request of the Board, and some of the largest shareholders, your Chairman and Managing Director, Mr. James Wilson, left this country on a visit to Ceylon in Jan. last year. He has visited each estate several times, and, speaking generally, found the Company's properties doing well. He reports that he is especially pleased with Strathisla, and that Tea bids fair to be a success where planted, both on Strathisla and Owella.

LITIGATION WITH FORMER AGENTS.

Your Directors have been obliged to embark upon litigation with their late Ceylon agents, and at the moment proceedings are in an advanced stage.

The crop prospects for season 1895-96 are, so far favourable, the estimates of tea being in excess of last year's intake.

Your Directors beg to report that they have amply provided for any possible reduction of the book values of the Company's properties in Ceylon, over £20,000 having been set aside from Revenue for this purpose during the past six years.

The mortgage over the North Matale, etc., Estates, which originally stood at £15,000, has been cancelled, and the relative deeds are now in the Company's possession; your Directors, therefore, wish to again

point out that the redemption of this mortgage increases substantially the value of the Debenture holders' security.

Your Directors wish to place on record their appreciation of the services so far rendered to the Company by the Chairman and Managing Director.

THE UDUGAMA TEA AND TIMBER COMPANY, LIMITED.

The annual general meeting of this Company was held at the Company's offices, 20, Baillie Street, Colombo, at 12 noon on Jan. 28.

Present:—Messrs. Chas. P. Hayley (Chairman); H. Creasy and J. N. Campbell, Directors. Messrs. H. Unwin, E. Benham, C. J. C. Conran, by his attorney Chas. P. Hayley; L. M. Torin, by his attorney J. N. Campbell; and J. A. McGillivray representing the secretaries.

The minutes of the last general meeting having been read and confirmed, Mr. Unwin, attorney for Rev. W. E. Rowlands, moved the adoption of the report, which was seconded by Mr. E. Benham.

Mr. Unwin proposed and Mr. Benham seconded Mr. Creasy's re-election as a Director in place of Mr. H. Creasy resigned.

Auditor.—It was proposed by Mr. Chas. P. Hayley, and seconded by Mr. E. Benham, that Mr. Hercules J. Scott be appointed auditor for the current year.

The Chairman and managing Director, Mr. Chas. P. Hayley, stated that notwithstanding the loss incurred during the past year he had every hope that the Company will pay this year.

COCONUT LAND IN THE KURUNEGALA DISTRICT.

"Welikela," the coconut land of the late David Perera, who planted it on the "lease system" which was generally condemned in a series of letters written to the *Observer* some years ago, was put up for sale on Saturday last, when the highest bid obtained was R21,000 for a block of 67 acres. There were various causes which led to this. Firstly, half-improved value has not yet been paid for the entire land which is about 95 acres. Secondly, the grant is not forthcoming. Thirdly, the land is under mortgage to a man in Kandy, and David Perera the planter and mortgagee who has since died, by his last will has provided that the mortgagee should have the refusal of the purchase. All these conspired against the sale taking place, and the land had consequently to be bought. There is the lesson, however, learnt that whereas the official assessor, the Ratemahamaya of the district valued the land at R75 per acre, a slight show of competition has proved that this is quite wrong, and raises the value to R260 per acre. Coconut land in this District is becoming more and more valuable and is attracting the attention of capitalists. Mr. Henry Daniels, the Superintendent of Minor Roads, Colombo, was up here some time ago to value Kohana estate, 1,000 acres of coconut; not for sale but to settle some dispute between the owners, de Silva brothers of Moratuwa. Mr. W. H. Wright came on a commission to value a land of de Mels, on the Dambulla Road near the Dedurnoya. It is close upon a hundred acres in extent, and De Mels want R600 per acre. In the direction of Wellowa 6 miles from Kuru. on the road to Trineo. extensive coconut plantations are coming up. In a few more years there will be hardly any land available for planting, within a radius of twelve miles from the town. European capitalists are reconnoitring the country and with the examples set by Messrs. Finlay, Muir & Co., Melville White and others, we shall sooner or later have a colony of Europeans among our coconut growers.—Cor.

TEA PLANTING IN RUSSIA.

A report on tea growing in the district of Batoum, Russia, has been prepared by Mr. Consul Stevens, from which it appears that great hopes are entertained by the Russian authorities that tea cultivation on a large scale can be successfully carried on in the district. The report says that experiments made in the growing of this article during the past few years, though hitherto on a somewhat limited scale, have brought to light certain conditions which promise a great future for the cultivation of tea in the Batoum district, and it is foreshadowed that before many years have elapsed such culture will become one of the most important industries of that part of Russia. The results obtained clearly demonstrate that the soil found in the hilly country around Batoum is specially adapted for raising the tea plant, since it contains silicious earth, ochreous clay, limo, magnesia, humidity, organic matter, chalk, oxidised iron, and phosphoric acid in the required quantities, besides which the average annual rain and snow falls, the moisture of the atmosphere, and the prevailing winds render the climate specially suitable for successful tea growing.

In addition to Messrs. Solovtsoff and Popoff, the Imperial Domains Department, Mr. Sibiriakoff, Mr. Viasevsky, and one or two other proprietors, have acquired land in and about Chakva and Mahindjanri, both of which places are within a distance of eight miles from Batoum, for the purpose of laying out tea plantations; and the Imperial Domains Department, which has sent a special expedition to India, Ceylon, China, and other tea-growing countries to make a study of tea cultivation, has recently arrived at an agreement with Mr. Solovtsoff, the pioneer tea planter of Transcaucasia, to plant out fifty-four acres for the department. It may be presumed that other capitalists will shortly follow their example and profit by the experience already gained by their predecessors, although for the present one or two of the latter are jealous of their respective undertakings, and insist upon the greatest secrecy being maintained as to their methods of cultivation. It is, nevertheless, a foregone conclusion that if tea is ever cultivated in Transcaucasia in quantities which would enable that country to profitably compete with China and other nations for the supply of her home markets, the bulk of such tea would have to be grown in the district of Batoum. Hitherto Mr. Popoff is the only person who has undertaken to carry out the experimental trials in the cultivation of tea on a somewhat large scale, and his three plantations at Chakva, Salibaouri, and Kaprishun are perfect models as far as the laying out of the grounds, roads on the estates, buildings for the employes and labourers, and other such-like arrangements are concerned, but only the few persons who are immediately connected with his plantations know anything about his methods of cultivating the tea, for his estates are practically a sealed book to all outsiders. According to reports only a small proportion of the seedlings which he planted out this season have taken, whereas on Mr. Solovtsoff's plantations all the young plants are doing well.

The expedition sent out by the Department of Imperial Domains has by now completed its tour through India, China, and Japan. It spent a whole month in a Chinese village near Shanghai, at which place the preparation of tea was studied; and tea seeds and plants and machinery for the tea plantations near Batoum were procured. In Japan the expedition collected some valuable information respecting the soil and climatic conditions of the tea-growing districts in that country. One or two members of the expedition have recently proceeded to San Francisco to study the American system of culture, and the other members are to remain a short time longer in Japan for the purpose of engaging Japanese labourers and obtaining samples of Japanese tea plants and seedlings. It is reported that experimental trials in the cultivation of tea are also to be made in Kachetia during the autumn of this year.

Apart from its reference to tea cultivation, Mr. Stevens's report throws light on the efforts when are being made by the Russian Government to improve the agricultural condition of Transcaucasia. It is admitted at the outset that the general condition of the district is "deplorable," and it is this fact which was induced the authorities to adopt special measures with a view to raising the social condition of the peasantry. The promotion of technical education is one of the means to this end; persons experienced in the scientific cultivation of the soil are continually being sent to the Batoum district from St. Petersburg and other educational centres to instruct the rural population, and sure though slow progress is being made. A scheme for encouraging the manufacture of agricultural machinery in the country itself by the extension of credit to would-be implement makers has been started by the Ministry of Finance, and practical mechanics instructed in the handling and repairing of machinery and implements are to be sent to Transcaucasia as itinerant teachers. Depôts of agricultural implements and machinery, and also of seeds, are to be opened by the Government. Increased grants have been made for the current year for the encouragement of meteorological observations, silkworm cultivation; the destruction of pernicious animals or insects, irrigation, and the establishment of experimental stations, model farms, primary agricultural schools, and agricultural societies. Already the cotton-spinning mills of Moscow are receiving supplies of cotton grown in Transcaucasia as well as Central Asia. The mildness and humidity of the climate and extensive tracts of available free lands are said to be favourable to the industry, and additional efforts are being made to induce the peasantry to experiment by the planting of Crown lands with cotton and the distribution of seed. Nearly 250,000 acres have also been planted with vines, and already upwards of 36,000,000 gallons of wine are produced in an average year; and specialists are engaged in combating the peculiar diseases of the vine, including the phylloxera, oïdium, and mildew. Tobacco is also being successfully grown. Great efforts are being made to extend sericulture in the neighbourhood of Tiflis, and as the industry suffered severely last year through the importation of inferior eggs from Turkey, the central silkworm establishment at Tiflis is taking steps to supply the peasantry at moderate prices with eggs which have been selected after microscopical examination, and which, therefore, can be guaranteed as free from disease. Dairy farming on a large scale is being promoted. In regard to the cultivation of grain extremely primitive methods are still in vogue, and as the peasants do not possess the means of doing their ploughing independently, a system of co-operative ploughing has come into existence.—*H. and C. Mail*, Jan. 10.

TEA FOR THE NATIVES—The *Indian Planter's Gazette* says:—

In the interesting note on the cultivation of Indian tea Mr. J. C. O'Connor while showing that Indian tea is exported mainly to the United Kingdom—to the extent of about 96 per cent. of the average production—comments on the strong contrast between the quantities consumed in the United Kingdom, and India, remarking that the Indian consumption to a substantial extent is due to the European population, more than one million pounds of it being taken by the Commissariat Department for the British Army. That Indian tea is growing in favour with the natives (especially the Mahomedans), as he declares, is a well-known fact. Here, in the capital, the beverage is commonly sold to the masses by petty shop-keepers and itinerant *chahwallahs*; but tea-drinking does not seem to be so prevalent here as in Bombay, where an enterprising colony of Irani Parsees have pitched their tents and practically created what is now a thriving business in the tea shop line drawing extensive patronage from the Parsee, Mahomedan, Arab, Persian, Goanese and Surti communities—and even to some extent from the Hindoo community. There is an opening for similar enterprise here, we think.

DRUG REPORT.

(From the *Chemist and Druggist*.)

42 Cannon Street, E.C., Jan. 9.

ANNATTO SEED.—Still in fair demand, but slightly easier. Common East Indian sold today at 1½d, fair quality at 2½d per lb.

CALUMBA is unchanged. Good washed was bought in at 45s per cwt. while for fair rather dark mixed a bid of 8s was refused, 10s being the price at which it was bought in.

COCA-LEAVES.—Quiet. Ten bales were bought in today—Huanoco character at 1s 6d, broken pale at 1s 2d per lb.

CUTTLEFISH.—Rather slow of sale. Prices remain very low. Three cases of dull dark bone sold at today's auctions at 2d per lb., while for a 6-cask parcel from the Canary Islands, small to medium, barely fair, a bid of 2½d per lb. was rejected 2½d per lb. being the price.

GAMBOGE.—Firmly held, several good bids being refused. Of 26 packages only six sold at 11l. per cwt. for fair broken pipe partly blocky, at 9l. 5s for damp partly blocky pickings, partly ricey in fracture, and at 8l. 15s for ordinary dark pipe of ricey fracture and dull colour. Good bright picked pipe was bought in at 12l. per cwt.

NUX VOMICA remains very low in price, although holders seem disposed to ask a little more money. A parcel of 120 packages small grey fair seed from Cochin was offered today at 7s 6d per cwt. but there were no bids above 4s 6d per cwt. Another lot, from Bombay, was bought in at 6s 6d per cwt.

OILS, (ESSENTIAL).—Extremely quiet. At today's auctions only 3 cases Nutmeg oil (1893 import) sold without reserve at 1½d to 1¾d per oz. Another lot was bought in at 3d per oz. The following oils were among those bought in. 13 cases Cinnamon at 6d to 9d per oz.; 14 packages Citronella at 1s 10d to 2s 2d (for one lot 1s 9d. per lb. was refused).

PATCHOULI.—Nine bales very stalky leaves were bought in at 4d per lb.

PICKING WITH A LOCAL APPLICATION.

In the Ceylon rainfall returns, the largest record for 1894 seems to be that taken at Padupola which aggregated 232.71 inches. I believe some 7 inches is supposed to represent the rainfall in Sind, but Muri-kandy (North-Central road, Ceylon) does not come far behind in 1893, with its 11.2 inches! Ganot mentions that the heaviest rainfall at any place on the globe is on the Khasia Hills in Bengal, where it is 600 in., of which 500 fall in 7 months. As regards England, the driest place is said to be Lincoln with a mean fall of 20 in., the wettest, Styne in Cumberland, with 165 inches.

In reply to an enquiry made by the Governor of Barbadoes as to what efforts had been made to plant economic plants other than sugar-cane, the Secretary to the Barbadoes Agricultural Society in his reply writes as follows:—During the present year the subject of Tobacco and Grape cultivation was brought prominently forward with the result that a Tobacco Process Association was formed: later the Society, in furtherance of the scheme, were able to distribute Tobacco Seed, Indigo Seed and Linseed, to some forty planters: all of whom have promised to plant small trial plots ranging from one quarter of an acre to one acre, of one or other of these seeds; but more especially Tobacco, and to report results in due course.

The following from *The Australian Tropiculturist* refers to coloured labour in New South Wales:—In the northern districts of New South Wales there is a great outcry about "an influx of coloured labour." The classes represented are Hindoos, Afghans, Cingalese, and Chinese, who are, it is said, "ousting white labourers from their legitimate sphere." Some of these aliens have even bought land, and are trying to establish sugar growing on an extensive scale. When employed by settlers the coloured folks work for less per week than the whites. Many of the Chinese have settled down as fruit-growers on leased ground. Their plan is to lease an orchard which is in a good state, and in a few years when it is worked out the owners are left lamenting, and "John" is missing.

The *Barbadoes Agricultural Gazette* writes strongly on the subject of "petty thefts" (prædial thefts) and the leniency of the law in dealing with them. Such condonation and such paltry fines as are

usually imposed are not fair, it says to our struggling proprietors overburdened as they are already with a thousand expenses. Many estates are compelled to employ two watchmen during the ripening season: hundreds of able-bodied men are thus withdrawn from productive labour annually and paid to play hide and seek with wily thieves, who, if occasionally caught, can readily afford to pay the one shilling fine which magistrates usually exact, or without much inconvenience endure imprisonment for a few days. This kind of punishment unfortunately casting no slur on the individual. We protest against this leniency which demoralizes the people fosters evil habits, is an absolute wrong done to proprietors and the struggling industries &c., &c.

For one thing we are better off as regards magistrates here!

Liquorice (an extract from the taproot of *Glycyrrhiza glabra*) is annually imported to England to the extent of 600 tons: Damascus exports £100,000 worth. It is also imported from the West Indies and Brazil.

Nelson's *Home Comforts* gives the following amusing "black man's recipe" for boiling rice:—Wash him well, much wash in cold water, rice flour make him stick, water boil all ready, very wash. Shove him in; rice can't burn, water shake him too much. Boil quarter of an hour or little more. Put one rice in thumb and finger; if all rub away him quite done. Put rice in colander, hot water run away. Pour cup of cold water on him, put back in saucepan, keep him covered near the fire, then rice all ready. Eat him up."

PLANTING IN THE MATALE NORTH-EAST DISTRICT.

A planter correspondent referring to a notice of tea land for sale in the Matale North-East district says:—

It looks like as if owners of old abandoned coffee lands and forest too high for coffee in the olden days, had begun to realize that now is the time to sell seeing that tea is doing so well in this district. When they know that three of the smaller places 1st year gave 700, 600 and 500 lb. of made tea per acre and that the yield of the district has steadily been increasing, they are wise to try and sell their old properties, and new-comers will be most heartily welcomed.

Though it is an outlying district and far from the madding crowd, it is after all within the pale of civilization. It has its post office, dispensary and a very able genial doctor who is anxiously looking forward to the commencement of the new dispensary with six or eight beds it is hoped for patients, as the existing buildings are in anything but good repair. The site most suitable for the new buildings is the old tennis court on Calloogahatenne estate, being on the road side in a well sheltered hollow and a plentiful supply of good water.

Taking the post office as the centre, the district is seven miles only from the beef shop in Rattota. An enterprising firm opened there recently, and as they have made application to Government for a license to sell liquor by the bottle they hope to save their customers from sending further for their supplies.

Several estates do their own transporting to and from Matale and transport rice and produce for their neighbours with the regularity of transport agency firms specially established for the purpose. At present the chief difficulty is not being able to get good straw at a reasonable price. R2 per 100 bundles—and very small ones they are—have been paid during the past six weeks, and if the paddy field cultivators don't lower their prices when the new crop is harvested, Australia will have to be applied for compressed straw or feeding stuffs for cattle. Why this scarcity? Only once before during the past seven years has straw been over one rupee per 100 bundles, but that was before the paddy tax was abolished.

VARIOUS PLANTING NOTES.

COMPARATIVE VALUE OF RICE, WHEAT AND POTATO AS NUTRIENTS.—A correspondent writes:—"I shall thank you to let me know whether rice, wheat, or potato, is more nourishing?" The order in nutrient value is (1) wheat, (2) rice, (3) potato. The last contains 75 per cent of water.

A CINCHONA MANUFACTORY IN JAVA.—It appears, from a prospectus received by the *Java Bode*, that a quinine factory is really to be built in Bandoeng. The ground has already been acquired, and permission obtained to build. The work is to be done by Mr. H. J. van Prehn, C.S.; and when the manufactory, estimated at a capacity of 80,000 kilograms of quinine, is ready, it will be taken over for f250,000 (its cost is not stated) by an anonymous company floated with a capital of f500,000, of which f300,000 will be first issued. The cost of manufacturing is estimated at f5 for a kilogram of quinine; and, as the planters will be charged f6, there will be a profit of f1.

THERE IS A SMALL COFFEE PLANTATION IN the Matang District, which is said to be an ideal one, and the trees are the healthiest in the State and bearing superbly. It is the property of a Malay. On the Jebong Estate, too, some of the plants, planted in March last, are said to be already in blossom. It has been said that coffee planting on low land is a mistake, and that the trees soon wither away. The *Perak Pioneer* is given to understand that the idea is erroneous, and that some trees planted in the Magistrate's compound at Parit Buntar, some fifteen years ago, are still in splendid condition and bearing.—*M. Mail*, Jan. 25.

COFFEE IN INDIA.—The *Times of India*, referring to the statistics of coffee cultivation which we quoted yesterday, remarked:—"The industry can hardly be said to be a very flourishing one, for despite a considerable increase in acreage in 1894, the yield was only a little over thirty-five and a-quarter million pounds, or hardly more than that of the preceding year." Nothing could be more fallacious than this, says the *Madras Mail*, for not only is the industry more stable and prosperous now than it ever has been before, but we very much doubt whether during any one quinquennium since coffee was first taken in hand by Europeans in Southern India fifty-five years ago, the average annual profits calculated over the whole area of actual cultivation have been so great as during the past five years.

THE VANILLA GENUS.—At a meeting of the Linnean Society held on Dec. 19, Mr. R. A. Rolfe gave an abstract of a paper entitled 'A Revision of the Genus Vanilla,' in which some 50 species were enumerated 17 of which were new, though five of them had been previously confused with older forms. The plants in this genus were described as tall forest climbers, some of them leafless, found almost throughout the tropics, though generally somewhat local in their distribution. Of the species described, 29 were American, 11 Asiatic, and 10 African. Six of the American species have aromatic fruits, and three of them are well-known in commerce, though only one of them, *Vanilla planifolia* (often confused with other species), is largely cultivated as an economic plant. Mr. Rolfe gave an account of the morphology and mode of fertilization of the genus, its affinities and geographical distribution, and an enumeration of the species with descriptions. As indicating a still imperfect knowledge of the genus, he remarked that it was even now uncertain to what species the peruvian plant with aromatic fruits belonged which was noticed by Humboldt more than eighty years ago. The paper was illustrated by a series of carefully made drawings.—*Athenæum*, Jan. 11.

THE SEASON IN MADRAS.—On Tuesday the Board of Revenue telegraphed to the Government of India for the week ending the 25th instant as follows:—"No rain except scattered showers in parts of Vizagapatam. Irrigation supplies are adequate except in the Southern districts. Some sowings are still made in places. Standing crops are generally fair. Harvests continue with generally a fair outturn. Pasture and fodder are generally sufficient. Cattle is in good condition. Prices are falling in the Southern districts, stationary elsewhere."—*M. Mail*, Jan. 30.

THE WYNAAD.—Commenting on the article we had recently, the *Madras Mail* says:—"We have steadily advocated the cultivation of tea here, and some two years ago we took occasion to point out that there was no need for Ceylon to fear any extensions in the Wynaad, as, comparatively speaking, it was but a small district. With reference to Mr. William Taylor's remark regarding the *jât* of tea, it may be mentioned that during the last two or three years only good pedigree seed has been used. There are now in the Wynaad some 800 acres of young tea, from one to three years old, all of which are planted up with bushes of an irreproachable *jât*."

SOCIETY OF ARTS (INDIAN SECTION).—Mr. George Curzon, M.P., was to preside at the opening meeting of the Indian Section of the Society of Arts on Jan. 16, when Colonel R. G. Woodthorpe, C.B., lately on special duty in the Mekong Valley, was to read a paper on "The Shan Hills: their Peoples and Products." The paper was to be illustrated by lantern views of sketches made on the spot by Colonel Woodthorpe. Other papers will be read during the Session as follows:—Sir James Lyall, G.C.I.E., on "Punjab Irrigation"; Mr. J. H. Glass, C.I.E., Chief Engineer, Public Works Department, Bengal, on "The Great Landslip at Gohna in Gurhwal, and the measures adopted to prevent serious loss of life"; Mr. Walter R. Lawrence, I.C.S., C.I.E., on "Kashmir: its People and its Products"; Mr. C. Tripp (formerly of Sumatra) on "The Tobacco Industry of India and the Far East"; Mr. G. W. Christison, on "Tea Planting in the Darjeeling"; and Captain Charles Rolleston on "The Deserted City of Hampi." Sir Charles Crosthwaite, who was Lieut.-Governor of the North-West Provinces when the Gohna disaster occurred, will preside at the reading of Mr. Glass's paper.

THE "INDIAN FORESTER" for December 1895 has the following contents:—I. Original Articles and Translations—Recruitment of Officers for the Indian Forest Service, by C.G.R. Pruning Spicormic Branches of Oak, by 'H H' with translation; Is the Lantana a Friend or an Enemy?; II. Correspondence—Dominated Trees, letter from C. P. Fisher; Flowering of *Strobilanthes*, letter from J. L. L. McG; The word 'Sivalik' letters, from E. Mc A. M. and M. Rama Rao; How to Utilize Papilionaceous Plants, letter from H.H. The Patiala Western Sivaliks, letter from G. S. Hart; III. Official Papers and Intelligence—The Reorganization of the Provincial and Imperial Services; Alteration of the Forest School Rules; D'Arcy's Working Plans; IV. Reviews—A Manual of Forestry Vol. III. Forest Management by Dr. Schlich, C.I.E.; The 'Forester', an American Illustrated Forestry Magazine; Forest Administration in Jeypore, in 1894; Forest Administration in Jodhpore, in 1894-95; V. Extracts, Notes and Queries—Manufacture of Camphor in Formosa; Planting Shifting Sands on the Sea-Coast; Holigarna and its Blistering Principles; The Indian Forest Department and Cooper's Hill; VII. Timber and Produce Trade—Churchill and Sim's Circular, November 1895; Market Rates for Produce; Average Selling Rates in N.W.-P. in November 1895; VIII. Extracts from Official Gazettes. Appendix Series—Agricultural Ledger—*Acacia Catechu*.

THE THIRTY COMMITTEE.

Minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy on Wednesday, the 29th January 1896, at half past twelve o'clock in the afternoon.

Present:—Messrs. A. Melville White (Chairman); A. Philip (Secretary); J. N. Campbell; W. D. Gibbon; F. G. A. Lace; R. S. Duff Tytler; F. M. Mackwood; A. W. S. Sackville; A. E. Wright; Alex. F. Souter.

The notice calling the meeting was read.

The minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy on Saturday, the 16th November 1895, were submitted for confirmation. Resolved:—"That they be, and they are hereby confirmed."

Read draft report.

Resolved:—"That the draft report, as submitted, be adopted, subject to additions by the Chairman as indicated by the Committee in the matter of Exports to foreign countries &c."

Submitted letters from the Treasurer of the Colony and from the National Bank of India, Limited.

Read letter from the Secretary, The Ceylon Association in London, in regard to proposed Tea Analyses.

Read letter from Messrs. Gow, Wilson & Stanton enclosing copy of a paragraph which appeared in the "Financial News," and of their reply.

Read letter from Mr. S. Elwood May.

Read letter from Messrs. W. Mackenzie and R. Blechynden to Mr. S. Elwood May.

Read letters from Messrs. C. K. Reid & Co. Resolved:—"That they be referred to Mr. Mackenzie."

Read letter from Mr. Edward S. Greece. Resolved:—"That the letter be acknowledged with thanks, and referred to Mr. Mackenzie."

Read letter from the Secretary the Ceylon Chamber of Commerce with letter from Messrs. Corbitt & MacLeary Company.

Read letters from Mr. S. Bierach. Resolved:—"That the Committee, while fully appreciating Mr. Bierach's services in pushing Ceylon Tea in America, and thanking him for the same feel bound to support the action of their responsible representative on the spot, to whom they fully entrusted the management of their work in America."

REPRESENTATIVE IN AMERICA.

Read letter from the Chairman dated 19th November 1895 to Government asking the approval of His Excellency the Governor to a further expenditure of £6,000 (six thousand pounds sterling) for the purpose of advertising Ceylon Tea in the United States by Mr. Mackenzie.

Read letter from the Colonial Secretary intimating that His Excellency the Lieut.-Governor has been pleased, with the advice of the Executive Council, to approve of the proposed appropriation.

Read letters from Mr. Wm. Mackenzie to Mr. White, dated respectively London, 1st November, 8th November, 10th November, 29th November, 12th December (2), 27th December 1895, 3rd January, 10th January, 1896.

Read Mr. White's letters to Mr. Mackenzie dated 19th November, 28th November, 6th December, 16th December, 1895, January 2nd, January 14th, January 25th, 1896.

Submitted Newspaper cuttings, advertisements, and other printed matter as received.

Read letter from the Manager National Bank of India Limited, enclosing letter of credit No. 33/28 in favour of Mr. Mackenzie per £2,000 sterling our rent till 31st August, 1896.

Read letter from the Manager National Bank of India, Limited enclosing letter of credit No. 34/5 in favour of Mr. Wm. Mackenzie per £2,000 current till 31st December, 1896.

Read cablegrams despatched and received.

Read letter dated 13th December, 1895 from Mr. Wm. Mackenzie to the Secretary enclosing a statement showing expenditure on behalf of the committee. Resolved:—"That the Committee hereby confirms the official and semi-official letters of the Chairman that have passed since last meeting, also

cablegrams from the Secretary, and the action of the Secretary in forwarding letter of credit No. 34/5 per £2,000 sterling on the 17th January." Resolved II:—"That the Secretary do obtain from the Bank a fresh letter of credit for £2,000 being balance of £6,000 sanctioned by Government and forward same to Mr. Mackenzie." Resolved III:—"That the Chairman be authorised to obtain the approval of Government to the expenditure of a further sum of £3,000 sterling in the United States of America on the lines laid down in the letter of instructions to Mr. Mackenzie dated 31st May, 1895, already approved by Governor."

SAMPLES OF TEA.

Read correspondence with Messrs Charles Mackwood & Co. regarding samples of Tea for Chicago desired by a buyer there. Resolved:—"That in further reply it be stated that the Thirty Committee regrets that the tea in question cannot be supplied as the boxes referred to were complimentary packages, the special marking of which cannot be repeated."

CEYLON TEA IN CALIFORNIA.

Read letter from the Agents of the Ceylon Tea Co. Limited transmitting a sale of 26 chests shipped per ss. "Darmstadt" with draft on the Bank of British North America, London for £51-7-8 in settlement.

CEYLON TEA IN THE TRANSVAAL.

Read letters from the Agents of the Ceylon Tea Co., Limited, advising payment of R116'89 to Mr. Souter on account claim for duty charges &c. on grant for free distribution.

CEYLON TEA IN RUSSIA.

Read letter from Messrs. John Tyndall & Co. inviting attention to the accompanying letter from Mr. Stewart M. Anstruther at present in Russia. Resolved:—"That the letter be acknowledged, and in reply that Messrs J. Tyndall & Co. be informed that any assistance granted by the Committee must take the form of advertisement of Ceylon Tea, and that Mr. Anstruther be asked to furnish the Committee with some information as to extent of his business, and his proposals in greater detail, for future consideration."

Read letter from Mr. Wm. Martin Leake advising Draft for R1314'61 equivalent of £250 at 1s 129-32d per Rupee for remittance to Mr. Rogivue of Moscow.

Read letter from the National Bank of India, Limited. Resolved:—"That Mr. Rogivue be asked to furnish the "Thirty Committee" with a memo: of the quantity of Tea that has been imported into Russia through his agency in 1894 which will be considered confidential together with full particulars as to expenditure under the grant of £1,000 (one thousand pounds sterling) now being disbursed."

CEYLON TEA IN SMYRNA.

Read letter from Mr. G. A. Marinitch. Resolved:—"That consideration be postponed."

Laid on the table sketch abstract of the Ceylon Tea (New Markets) Fund account as from July to 31st December 1895.

The "Thirty Committee" then adjourned.

A. PHILIP, Secy. to the "Thirty Committee."

THE IMPERIAL TEA ESTATES COMPANY.

We learn that Mr. W. Megginson, acting on behalf of the Imperial Ceylon Tea Estates Company, Limited, has just concluded the purchase of St. Vigens and Friedland estates in the Bogawantalawa district. The first consists of 185 acres all in tea in bearing, and the latter of 165 acres of which 163 acres are in tea all in bearing except about 2 or 3 acres. Each estate has its own factory fully equipped with abundant water power to drive all machinery. The price paid for these two estates is, we learn, £18,800 sterling or under £54 sterling per acre which is a very moderate price indeed for such fine properties situate in one of the most favorite districts in the island. The new issue of shares in the Company to pay for these properties has all been fully subscribed,

TEA CULTIVATION IN MAURITIUS.

(Translated for the "Ceylon Observer" from the "Revue Agricole" for Dec. 1895.)

The cultivation of tea in Mauritius has during the past few years extended somewhat; and in view of the results already obtained and the promises for the future it deserves in spite of the small acreage actually devoted to it, to engage attention. The quality of the product obtained and the yield of marketable tea from the whole of the surface planted are of such a nature, so far, as to encourage the creole to devote himself thereto more thoroughly, especially if he considers that there are vast tracts of land which on account of their situation and climate, are little suited for sugarcane, as experience teaches daily. On the other hand, according to a very just theory, the danger is constantly being accentuated of having only one string to our bow, of cultivating only one product; and we dangle before our own eyes the spectre of bankruptcy, asking ourselves with anguish what would become of us if, at the end of a crisis which we dread more and more, which every year increasingly preoccupies the mind, and which will issue from that formidable coalition in which all the nations of the world have united to play at the game of who shall produce the most sugar and at the cheapest rate, we were obliged to abandon our single industry and our single culture.

The agriculture, industry and commerce of a country are not transformed in one day: time is needed, and a gradual change; so that, if such an eventuality ever presented itself, we should without doubt be close on ruin. "The Mauritians," a stranger has said in writing of us, "have put all their eggs in one basket." We may add that we live in constant fear of seeing the basket on the ground. Now if, under these conditions, we have localities that easily lend themselves to another cultivation beside and even on the top of that of sugarcane, and if, passing from theory to practice, we have found it remunerative, let us engage in it seriously and do not let us allow such a splendid opportunity of augmenting our resources to pass.

This has been the case very fortunately; and since the impulse was given, since the first plantation was made, we have seen others sprung up in various places. But, after all, what does it amount to! By a careful computation we shall arrive at the very utmost at three hundred acres of tea in the whole colony. This is little indeed; only it must not be forgotten that it is a cultivation which is only in its early days, dating from a few years back, and that many of the existing plantations are not even in full production, so that it has not yet been found possible to establish in a very rigorous fashion the average yield per acre, although it is very good, as we said at the commencement. The example set by the first is being increasingly followed by others, so that the future in store for tea in Mauritius seems brilliant and allows of great hopes being entertained.

In 1894 the imports of tea into Mauritius amounted to:—

344	kilos	from	England
8,824	"	from	Ceylon
21,697	"	from	India
8,490	"	from	Hongkong
5,616	"	from	Singapore
10,290	"	from	China
1	"	from	France

making a total of 53,262 kilos of a value of R47,232.

On examining the figures it will be seen at once that if the local plantations do not yet suffice to supply the consumption of the country they will not long delay. At present they are all young, and often enough one finds in the same plantation trees of different ages, so that, not only is the return not yet what it should be, but there reigns a certain uncertainty even with regard to what it actually may be. Nevertheless, on the Experimental Farm of Curepipe, where Government has had about a score of acres planted, five or six of which are of older date and extend back to eight years, there has this year been produced 6,000 pounds of tea, which makes the average yield

per acre work out at 300 pounds,—average yield, we say, because those plants that, being older than the others, are now in full bearing produced, per acre of cultivated surface, a quantity of marketable tea very much greater, and close on 600 pounds per acre.

Now, at 300 pounds the acre 300 acres would produce 90,000 pounds of tea per annum: that is to say, a quantity about equal to our consumption. Thus we may legitimately hope that we shall soon no longer be indebted to India and China for this article of consumption. But, much better, the Colony might even export some; and the really superior quality of the product would seem to assure for it an easy sale; for we have not forgotten the news, communicated to the public at the time and published by ourselves, that the tea from Chamarel, tasted in London by experts, had been properly appreciated.

The yield of 300 pounds per acre is a normal one; and from what we have said above of the almost double yield from a fraction of the plantation of the Experimental Farm (the only plantation, we think, of all that exist in the Colony, which has reached the age of 7 or 8 years), the planter may reasonably reckon upon it as an average; and it is certain that with an average revenue of at least R300 the acre he can cover expenses which are not more, after the cost of the first opening has been met, than expenses of upkeep.

In India a plantation is in full bearing at the age of six years. The first plucking is made after the third year, and then produces from 75 to 100 pounds of made tea the acre; but the production increases rapidly from year to year, and remains at about 250 pounds when cultivation has become regular and has attained its apogee. This yield is exceeded in Natal, and even considerably in certain cases, as it may amount to 600 or 700 pounds the acre; but these last figures are exceptional, and the quantity of made tea oscillates around 300 pounds—general average of the 2,000 acres of land planted in that colony. This is likewise the average yield of the finest "gardens" in Ceylon.

The variety mostly cultivated in Mauritius is the Assam Hybrid, which combines the qualities of the "China tea" and the "Assam tea," and for which the humid climate of Curepipe and of the highlands of the Savanne and Chamarel is specially suitable. At the Experimental Farm there has also been planted the "China tea," but in small quantity, and it is intended to abandon it entirely. The plants are separated by from 3½ to 4 feet every way. The pruning is done in July-August, and the plucking commences in September-October to terminate in June. The care exercised in plucking and the precaution of putting on one side the "tips" and more or less tender leaves allow, as is known, of the preparation of teas of various qualities, which are in order of merit and of fineness *Pekoe*, *Pekoe Souchong*, *Souchong* and *Congou*. The yield in made tea is about 25 per cent in weight of the freshly gathered leaves. With regard to the preparation it lasts two days and comprises the following phases:—1st, the partial desiccation of the leaves; 2nd, the rolling; 3rd, the fermentation; and 4th, the firing. The length of the fermentation, varying according to circumstances, is about an hour and a half to two hours, which only experience teaches to fix. It is during this phase of the preparation that the perfume, due probably to a kind of oxidation, is developed and accentuated. Finally the "fired" tea is tasted and classed according to quality.

Such is as nearly as possible the actual state of the new industry in our midst. We shall try to procure more complete and circumstantial information, which we shall in turn communicate to our readers.

MARKET FOR TEA SHARES.

Tuesday Evening, Jan. 16, 1896.

Since the reopening of business after Christmas there has been a resumption of investment buying, and prices keep steady.

The *Financial Times*, in its last Friday's issue, published a leading article on Indian Tea Companies

in 1895, and makes some very pertinent remarks regarding the importance of adjusting the par values of capital to actual market values, and it quotes the case of Armstrong, Mitchell, and Co., which company has lately followed this course with great advantage to its shareholders.

FRESH ISSUES.—The directors of the British Assam Co., we learn, acting under the powers conferred on them by the "Article," have issued 323 new Ordinary shares of £10 each (£3,230). They also announce an issue of £15,000 of 6 per cent. Cumulative Preference shares of £10 each in substitution of that amount of the 6 per cent. Debentures which fall to be paid off next month.

MINCING LANE though quiet keeps very steady, with Indian Teas rather firmer at the close.

CEYLON SHARES.—C. T. P. Co. Ordinary are wanted at 24½ upwards, but holders ask 25 the Prets are inquired for but not more than 16 to possibly 16½ would be given for them.

Ceylon and Oriental Estates Ordinary shares are in inquiry, and par value might be paid for £3 paid shares.

Eastern Produce and Estates Co.'s Ordinary £5 shares are also wanted at or near 4½, with holders, however, asking more money.

Lanka Plantations are also inquire for.

New Dimbula B's are said to have changed hands as high as £17.

Oriental Estates Debentures (Six per Cents.) are being asked for, but they are not at present available.—*Home and Colonial Mail.*

THE WYNAAD PLANTERS' ASSOCIATION.

From the annual report we take the following:—

I said in my last annual report that the coming years would be most important ones in the annals of Wynaad and this prophecy is now being fulfilled. The tea industry is developing slowly but steadily. The results of the sales of the first shipments of tea have just been received and give average of 9d and 9½d per lb., which though not so good as Assam and not so good as we were led to expect, from valuations of samples, still leaves the ample margin of at least 4d per lb. profit, which in conjunction with the fact that the yields off the young acreages have been abnormally large, should lead to the more rapid planting up of land. We have lately seen a great deal written in the papers about our Wynaad and all in praise of it with the exception of what appeared in the columns of a paper purporting to be written by planters for planters, and we may trust that this is merely the friendly rivalry of brother planters less favourably situated. At any rate the district has lately been visited by enterprising planters from Ceylon many of whom I am glad to hear are going to settle here. But I sincerely trust that the advantages of the situation will not be left entirely with them; and that the scheme so often advocated by this Association of small acreages under different proprietors with central factories may at last be put into force, and that the old residents may share with the new comers in the prosperity that is to come. Anyhow, those of us who are fortunate enough to hold reserves of land may congratulate themselves on its greatly increased value.

Arabian coffee notwithstanding the continued ravages of leaf disease continues to give handsome profits in certain parts of the district; and it remains to be seen what will result from the large acreages of Liberian which will shortly come into bearing. In conclusion, gentlemen, I beg to lay the accounts on the table and my resignation in your hands. It is with very true and genuine regret that I resign this office which I have now held off and on for ten years, and I thank you all most sincerely for the friendly support and sympathy which you have always accorded to me and without which my work would have been a toil to myself and of no avail to the district.

THE OUTLOOK FOR CITRONELLA OIL.

The present position of oil of citronella is a very strong one, especially as it is based on natural rather than artificial conditions. We reviewed the situation in our issue of July 22nd, 1895, as it then existed, and predicted higher prices, which have since been realized. The general price in single drums is about fifty cents, and dealers are buyers up to forty-five cents. In fact, some purchases have been made at this price. The present level of values would have been reached ere this had everybody interested in the article allowed the market to take its course, but some dealers had made contracts at low prices, without having entirely covered their wants, hence they were desirous of preventing any advance until they had secured themselves against loss, it if was possible for them to do so. It is safe to say that with the price at twenty-five cents per pound, which it was a year ago, and which had been the average price for several years, dealers generally were not believers in higher prices. Even when the price commenced to advance later on, many were loath to believe in the permanency of values. Some dealers, however, purchased liberally in Ceylon, as they were persuaded, from the information in their possession, that the advance was warranted by conditions existing at the source of supply. As the market continued its upward movement they again bought liberally, and subsequent events have proved the soundness of their judgment. It appears that there was serious damage to the grass by drought, hence a short yield was the result. There is, and it is held at high prices, and is only available for January-March or January-July shipment, at the option of the seller. The price quoted is equivalent to about fifty cents per pound, cost and freight New York. The stock in the various consuming markets is also light, and London has more than once been a buyer here since last Spring, at high prices, but the goods were not obtainable, except in one instance last May, when a small quantity was exported.

It is very evident that at twenty-five cents per pound, the Sinhalese are satisfied to produce oil. As we have stated, this was the average price for several years. Under it the demand increased enormously during the year from July 1st, 1894, to June 30th, 1895. The imports into the United States for the last six years were as follows:—

July 1st to June 30th	Pounds.
1889-90	174,457
1890-91	355,735
1891-92	477,623
1892-93	411,151
1893-94	274,279
1894-95	743,663

Lemongrass oil is included in these figures, except the last year, but the imports of this variety have been light.

Consumers will doubtless continue to use oil of citronella, inasmuch as they would run considerable risk in changing the odor of their products, particularly of soaps. As a little oil goes a long way in perfuming, they will scarcely feel the enhanced cost of the oil.—*Oil, Paint and Drug Reporter*, Jan. 6.

THE NEW YORK OIL MARKET IN 1885.

COCONUT OILS.

The year was ushered in by an exceedingly light demand for both Ceylon and Cochin oils, and values denoted weakness despite the favorable statistical situation. This was induced principally by the depression in the price of tallow and other competing articles, supplemented by the fear widely entertained that a large stock of Ceylon oil held here for advance made to a local dealer who had recently failed would be thrown upon the market. It was generally thought that until the status of this oil was definitely defined its influence would be detrimental to the stability of prices, and, accordingly, operators became rather timid and business dragged along in a perfunctory manner, with only slight variations in quotations throughout the earlier months of the year.

The range on Ceylon the first week in January was $5\frac{1}{2}$ @ $5\frac{3}{4}$ c., and excepting a few unimportant changes from time to time these figures represented substantially the market value during the entire year. Cochin opened at 6 @ $6\frac{1}{2}$ c., which was sustained with considerable steadiness for several months, but about the middle of June free arrivals brought about an easier feeling, and quotations fell to $5\frac{3}{4}$ @ $5\frac{1}{2}$ c., and by the first of August the price for spot parcels declined to $5\frac{1}{2}$ @ $5\frac{3}{4}$ c. The requirements of consumption having reduced the local supply of Ceylon oil quite materially, prices rebounded during the latter part of September and again reached $5\frac{3}{4}$ @ $5\frac{1}{2}$ c., and there remained for some time. Meanwhile the market acquired increased strength, due to an improvement in the demand, and this was greatly promoted in November, when several prominent local houses secured control of the bulk of the Ceylon oil in New York. Immediately quotations were marked up to 6 at $6\frac{1}{2}$ c., and this was the range for several weeks. December was a quiet month, and while the general situation was fairly strong, buyers were indifferent, and near the close of the year sellers receded to $5\frac{1}{2}$ at 6 . Ceylon oil was materially strengthened in the latter part of October by the absorption of the bankrupt stock referred to above. The bankers who held it as security for a debt due by the insolvent owner, sold the oil to a syndicate of local dealers and this relieved the market of a long-standing menace. Values became firmer, and, as the arrivals had become less voluminous with the approach of Winter, the general situation presented a very favorable aspect. The year closed with Ceylon oil quotable at $5\frac{1}{2}$ at $5\frac{3}{4}$ c., and the consumption during the period under review reached a full average.—*O., P. & Drug Reporter*, Jan. 6.

TIN CHESTS FOR CEYLON TEA.

Mid-England, Dec. 18, 1895.

NEW MARKETS FOR THE WELSH TIN PLATE MAKERS.

The important proposal among the Welsh tin plate makers for seeking new markets for their product, now that the American trade is virtually lost to them, is gradually assuming a more definite form. The significant meeting of the trade, which I last week advised was intended, was held yesterday in Swansea, and it is alleged that the attendance numbered something like 70 makers. Particular emphasis was laid on the proposal that steps should be taken to encourage the movement for the packing of tea in tin chests. It was explained that the idea was that the makers should start a sort of limited liability company, and provide capital by fixing a certain contribution per mill—say a matter of £10, which for the 500 mills would realize £5,000. With this money "they could send commissioners to our colonies and other places; they could wait on the viceroys, governors and consuls, and try to get the advantages and uses of tin plates prominently put before the merchants of the various towns and cities they visited."

THE PACKING OF TEA IN TIN CHESTS

was considered by the meeting to be important, but it was not I understand thought that any demand that might be created would be sufficient of itself to put the trade in a sound position, and other new sources of use would therefore have to be looked for as well. A resolution was proposed that a commission should be appointed, several speeches being delivered in support of the suggestion, and, finally it was resolved that a committee should be elected to consider the question. The committee is an influential one, representing all the tin plate districts of South Wales. Finally, with the idea of attempting to get unanimity, every member present was asked to pledge himself in support, and it is alleged that all replied in the affirmative, but for this statement there is nothing at present but "official" authority.

WILL THE COMMISSION SCHEME BE CARRIED OUT?

The commission proposal, so far as it is foreshadowed in the terms given above as expressed

at the meeting, seems a somewhat Quixotic one, particularly as regards the class of people to be approached. Indeed, the phrasology under this head reads more like a Christmas story told to an eager throng of gaping children in merry-making attire than a serious business suggestion. I should not be surprised if the committee when they come to details will find a good deal of division among their ranks which may result in nothing being done after all. The Welsh tin plate manufacturers are historically slow to move, and exceedingly wanting in anything approaching cohesion. Still we shall see what we shall see, and meanwhile the Welsh position is being regarded by the other metalliferous industries of the country with a good deal of curiosity mingled with a lesser amount of expectation.

FURTHER INFORMATION ON TIN PLATE TEA CHESTS

is forthcoming this week in an interview which a Welsh correspondent has had with Mr. Frank Randell in reference to objections which have been raised in the grocery trade that the fact of the tin being hermetically sealed would destroy the tea. It is pointed out that if experts decide against the box being hermetically sealed the chests can be so made as to provide the required ventilation. In point of fact the tea, even in the inside lead cases of the chests now chiefly in vogue, is hermetically sealed. In his opinion such conditions of packing were a safe guarantee against mildew. It was an admitted fact that 2 per cent of the metal chests in which tea was brought over were approved of by the planters and traders, and there was no reason why, in the interest of the South Wales tin plate trade, they should not endeavour to capture the remaining 98 per cent.

GETTING HOLD OF THE CEYLON TRADE.

It is stated that an official of the government railways in Ceylon waited upon Mr. W. H. Ludford, the district manager of the Great Western railway at Llanely a day or two ago and asked to be supplied with full particulars of the new method of tea packing. This official is reported to have said that as the industry of tea planting was so rapidly growing in Ceylon, the matter of adoption new methods of packing was of first importance, especially in view of the fact that the present wooden boxes were open to so grave an objection through being smashed in transit. "He considered, therefore, that there was a great future for metal chests."—*American Manufacturer*, Jan. 8.

MORE TEA COMPANIES.—The talk all over business places is regarding the formation of Tea Companies. We learn that several of these are to be floated shortly, and the news now comes definitely to us that two Companies are to be formed in the Kelani Valley, ere long. Negotiations are in train for the purpose of forming Lyndhurst and Mapiitigama estates in Avisawella into one company. The former belongs to Mr. J. R. Bell and Miss Bell, when an acreage of 262, out of which 238 are fully planted with tea, and 2 acres in cardamoms. Mapiitigama is adjacent to Lyndhurst and belongs to a well-known planter upon country. The acreage of this estate is not as large as the former and only 100 is in tea. Another estate, also in the Kelani Valley, is to be floated into a company shortly. The revenue will no doubt benefit materially by the present boom in shares, as the stamps on the documents connected with the formation of new companies must also aggregate to something handsome.—*Local "Examiner,"* Feb. 1st.

The Best Soaps for Warm Climates are CALVERT'S TOILET SOAP (6d. Tablets) and PRICKLY-HEAT SOAP (6d. and 1s. bars), pleasantly perfumed, for Bath or Toilet containing 10 per cent. of Pure Carbolic. Very serviceable as preventives of Prickly-heat and other skin irritation. Sold at Chemists, Stores, &c.

F. C. CALVERT & CO., Manchester,

CEYLON LAND AND PRODUCE COMPANY.

GENERAL MEETING.

At the 11th annual general meeting of the shareholders of the Ceylon Land and Produce Company, Limited, held at the offices of the Company, Leadenhall House, 101, Leadenhall Street, on Friday, the 17th of January, 1896, at 2 p.m., in the absence of the Chairman, Mr. Jas. Wilson, Mr. W. Keiller, of the firm of Jas. Keiller and Son, Dundee, and London presided, and made the following remarks:—

RESULTS OF THE YEAR'S WORK.

I am sorry that our worthy Chairman is not with us today. It is against his wish and against his personal convenience, as you may well understand, that he has been compelled to stay in Ceylon for over a year; but his sense of duty to the shareholders of this Company compels him to sacrifice these feelings to the common good of all of us, and I for one gladly add my feeling of appreciation of the self-denial exercised by him, and I am sure the shareholders will agree with me. Your directors are pleased to lay before you such a cheerful state of things as is depicted in the report which has as usual been sent to every shareholder, and which I presume may be taken as read. It has been our good fortune during the year under review to harvest the largest crop of cocoa that has been handled since this Company has been in existence, viz., 2,836 cwts. The season most closely approaching this record was in 1892-93, when the intake was 2,200 cwts. The very large drop in prices has, however, been a source of regret when it is remembered that in the season 1892-93 the net prices for the crop, which is practically all sold in this country, was 90s 11d, as compared with 52s 9d, which was last year's net. The drop has been most severe and perhaps is more marked when I tell you that in February, 1893, we sold cocoa Nos. 1 and 2 bulked together that grossed 130s 9d, and that during the past season equally good cocoa has been quitted at one-half the price. It is satisfactory, though, to add that whilst this drop eats very considerably into our profit, it by no means wipes it out, and that at present prices a moderate crop will give us a very fair return. As an offset against the drop in cocoa values an increase in tea prices has to be recorded for, whilst in 93-94 we realized 6½d, net for our teas, in 94-95 we got 7-3¼d. Perhaps, it will be interesting to you to listen to a comparison of figures for the past five years compiled by the Secretary:—

Year.	Rate of Ex.	Net.	Cents.
		d.	
90—91	1/6	9.10	48.61
91—92	1 4¼	7.81	46.63
92—93	1/3	7.70	51.33
93—94	1 2½	6.77	46.68
94—95	1 1¼	7.34	55.40

In addition to the better prices obtained a greater quantity of tea was auctioned, and I may add that all our teas are sold in this market. Since June tea has been flushing well at New Peradeniya, and we are ahead compared with same date last year, whilst from our other places we have good reports. We have under tea and in bearing 1,555¼ acres, spread over various districts, and they have produced 385 lb per acre, ranging from 280 lb. at Rickarton to 535 lb. at New Peradeniya. We have in addition 286½ acres of young tea, which will in a comparatively short time be making returns. Turning to coffee and cocoa, and including coconuts, we have 1,137 acres in bearing, and, beyond that, we have 416 acres planted during the past two-and-a-half years. This is an asset of growing value, and, in the course of time, the crops obtained will very sensibly increase our total revenue. The Directors think they are much indebted to their Chairman, for they feel it is due to his initiative that such a large area as nearly six hundred acres have been added to the Company's planted property, a vital point to bear in mind being that the total value of our properties, according to the Balance Sheet for year ending, June 30th, 1893, was £96,958, whilst the figures before you indicate the book value as £93,667. In other words, whilst nearly 600 acres have been cleared and planted in this period, the

capital according to the books has been reduced by £1,291. These figures speak for themselves I think; so that, notwithstanding the fall of exchange, the Directors are confident that our assets are in the total fully worth what they are entered at in the Company's books. Indeed, in view of the very high prices that have lately been paid for Ceylon tea property, perhaps we err on the side of caution in this matter; but, if that is so, then the difference between the book figures and the ideas of value that different people may put upon our properties constitutes an invisible reserve fund, which in itself should gratify each individual shareholder. Taking the acreage presently in bearing 1,556 Tea } and dividing that into the book capital it works out a trifle over £35 per }
1,137 Cocoa } acre, but, including the whole of our }
2,693 Acres } planted acreage 3,395 acres, the result is £28 per acre. With regard to the New Clearings, the Directors are very satisfied with the planting on Strathisla over 220 acres being brought into cultivation within the last two years. The largest portion is under cocoa, but we have also planted both Arabian and Liberian coffee and tea. Mr. Wilson says this place is doing very well, and speaks hopefully of the future. I will now refer to the Balance Sheet, comparing it with last year's figures. Our issued capital stands at the same figure, £47,950. Debentures issued are almost the same indicating an increase of £450. The mortgage account which last year amounted to £2,500 has now entirely disappeared from our Balance Sheet. The relative deeds are in our hands, and thus the mortgage deed for £15,000, which formed a first charge on North Matale and Alloowibarie, has been cancelled, materially increasing the value of the Debenture-holders, security; this security being represented by assets worth over £100,000, and uncalled capital £28,800. The deposits also indicate a small increase, about £280. Sundry creditors show a larger increase, viz., £3,300. Acceptance account shows a welcome diminution, viz., £5,500, whilst the balances due to Superintendents in Ceylon indicate an increase of £750. It will also be observed that the overdraft of £6,250 in last Balance Sheet has now been discharged. Our liabilities are thus reduced from £66,200 to £56,700, using round figures, a difference of £9,500. Turning to the other side of the account our estates capital account stands at much the same as last year. Produce in course of realization marks an increase, whilst the Estimated Produce account shows a reduction. Cash is in pleasing contrast to last year's report, whilst the Sundry Debtor's account has been reduced from £13,795 to £4,909. This speaks for itself. Coast advances are an increasing item. We will now pass on to the Profit and Loss account. The crop expenditure is somewhat in excess of that for last year. Interest remains at much the same figure. The main point of interest on the credit side of the account is the produce account, the total of which amounts to £35,500 roundly, we against £28,300 last year, an increase of £7,200. A vote of thanks was proposed to the Chairman and duly seconded, and which was unanimously carried, for the able way he had connected the business of the meeting, and his lucid remarks with reference to the company's report and prospects.

Mr. KEILLER, in returning thanks, said, "I feel that we ought not to separate today without recording our deep sense of indebtedness to our worthy Chairman and Managing Director, Mr. Wilson, for the exceptional services he has rendered to the company during the past year; only those who know all the circumstances connected with Mr. Wilson's long stay in Ceylon can have any idea of the amount of worry he has had to endure, and I consider the ability and devotion he has given to the company's affairs generally while in Ceylon to be beyond all praise, and I do not think there can be the slightest doubt but that his long sojourn in the Island has been of immense benefit to the company in every way. I would beg therefore to move that we give a very hearty vote of thanks to Mr. Wilson for his exceptional and able services during the past year.

INDIAN TEA SALES.

(From Watson, Sibthorp & Co.'s Tea Report.)

CALCUTTA, Jan. 29th, 1896.

There was a good general demand in the sales held on the 22nd instant. Medium pekoes and pekoe souchongs were in strong demand for the Bombay side and the buyers secured about 4,500 chests at prices fully an anna per lb. over current London rates; other descriptions sold irregularly, the general tendency being upwards. 13,649 packages changed hands.

The average price of the 13,649 packages sold is As. 6-3 or about 7d per lb. as compared with 11,062 packages sold on the 24th January 1895 at As. 9-0 or about 8½d per lb. and 10,665 packages sold on the 25th January 1894 at As. 6-0 or about 7d per lb.

The Exports from 1st May to 27th January from here to Great Britain are 116,499,373 lb. as compared with 111,965,670 lb. at the corresponding period last season and 109,122,618 lb. in 1893.

NOTE.—Last sale's average was As. 6-6 or about 7½ per lb.

EXCHANGE.—Document bills, 6 months' sight, 1s 2 5-32d

FREIGHT.—Steamer—£1-12-6 per ton of 50 c. ft.

THE MOCHA TEA COMPANY OF CEYLON LIMITED.

Interim report for the half-year ending 31st December, 1895.

The Directors have the pleasure to inform the Shareholders that during the period under review both of the estates have made considerably more tea than in the corresponding months of 1894. The total quantity made on both estates has been 145,247 lb. the increase on Mocha being 6,782 lb. and on Glentilt 8,147 lb. The result of the half year's working enables the Directors to declare an Interim Dividend of 8% as was done last year, and after allowing for Depreciation to carry forward R5,035-71. The Dividend Warrants are posted herewith. The Company's Visiting Agent reports very favourably on the condition and prospects of both Mocha and Glentilt, and there is every probability of the estimated crop being fully secured. Mr. Maclure has resumed the superintendence of Mocha after eight months' leave, and Mr. Tench goes on furlough from 1st instant; Mr. Sevier, who has lately been in charge of Mocha, looking after Glentilt during his absence. The Directors are taking steps to increase the withering accommodation on Glentilt, which, they trust, will result in better prices being obtained for the tea from that estate.—H. Bois, J. N. Campbell, W. Moir, Directors.

THE TEA MARKET.

Rules firm with a fairly extensive business, the moderate range of prices inducing the trade to replenish stocks. Indian season is on the wane, but Ceylon shipments now commence on a large scale to keep the market well supplied. The total yield from all sources is not likely to be in excess of the requirements, the increase in the use of tea to all parts of the world showing satisfactory progress.—*L. & C. Express*, Jan. 17.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-earrings and similar appliances entirely superseded, Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN; LONDON.

INDIAN TEA SALES.

(From William Moran & Co.'s Market Report.)

CALCUTTA, Jan. 29th, 1896.

TEA.—On the 22nd inst., 14,200 packages were sold. There was again a large percentage of common Red leaf tea, for which there was not much demand, but the few desirable liquoring kinds offered, were well competed for, and occasionally showed a slight advance on previous rates. Teas suitable for Central Asia were again much wanted, and were rather dearer.

TOTAL QUANTITY OF TEA PASSED THROUGH CALCUTTA

	FROM 1ST APRIL TO 27TH JAN.		
	1895-96.	1894-95.	1893-94.

America	1,073,664	555,870	313,971
Asia	4,377,731	3,622,443	2,569,735
Australia	6,482,923	4,745,216	5,498,563
	128,952,643	120,727,544	118,500,588

VARIOUS PLANTING NOTES.

TEA CULTIVATION IN MAURITIUS.—On page 563 will be found a translation of an article on the above subject which appeared in a recent issue of the *Mauritius Revue Agricole*. It will be seen from this that there is a prospect of tea cultivation being taken up on a large scale in the sugar island in the immediate future, tea being produced for export as well as for local supply. We shall look with interest for the outcome of this movement in our sister colony.

BURMA RICE-CROP PROSPECTS, 1895-96.—From a Summary of the District Officers' reports on the rice-crop prospects on the 31st December, 1895, in the 14 chief rice-producing districts of Lower Burma, we learn that the area under paddy cultivation is now reported as 4,975,555 acres or 7,138 acres more than the area reported last month. Akyab, Hanthawaddy, Thongwa, Bassein, Amherst, Toungoo and Thaton show small increases, while Pegu and Prome show a small decrease: in the other districts the estimated area under crop is unchanged. In Prome, Thongwa, and Bassein the crop is now estimated at 12, 16 and 12 annas respectively against 13, 17 and 14 annas as given last month, while in Amherst the estimate has been raised from 15 to 16 annas. The decrease in the estimate of the Bassein crop is due to the failure of the later ripening showers. It is now estimated that there will be available for export 1,560,000 tons of cargo rice equivalent to 26,440,000 cwt. of white rice.

THE "THIRTY COMMITTEE."—The minutes of the last meeting of this Committee are given on page 567. They are to a large extent a purely formal record without details, but they show that a good deal of business was transacted. With regard to what is being done in America the Committee, while of course fully appreciating the services of Mr. Bierach, could not do otherwise than loyally support Mr. Mackenzie's action as being that of their responsible representative. A good deal of business refers to the finances in connection with the American campaign, and the approval of Government is required for the expenditure of a further sum of £3,000 stg. in the United States. The work of pushing the sale of our staple product in Russia is being taken up by Mr. Stewart M. Anstruther who is at present in that country, but the Committee are anxious to obtain information as to the extent of this business and his proposals before promising assistance in the shape of advertisement.

COLOMBO PRICE CURRENT.

THE AGRICULTURAL MAGAZINE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for February:—

Vol. VII.]

FEBRUARY, 1896.

[No. 8.

GRAPE CULTIVATION IN COLOMBO.

THE vine experiment at the School of Agriculture continues to give satisfaction. There is at present a small crop of fruit—nearly thirty bunches—maturing, some of them being of the black variety. The vines in fruit were planted in Colombo at the beginning of August last—about 6 months ago—and were raised from cuttings planted in Australia in September, 1894, so that they are now only 18 months old. It is therefore far too early to judge of the fruiting capacity of the new varieties of the grape that M. Zanetti has introduced in Ceylon, nor of the suitability of Colombo for their successful growth. In the beginning of January Mr. A. T. Pearson, who has had considerable experience of fruit-growing in Australia, visited the vineyard at the School of Agriculture, and his opinion of the experiment, as given in an "interview" published in the *Times of Ceylon*, is decidedly encouraging. We quote the following paragraph:—

"Mr. Pearson mentioned that he had been out to the Agricultural School in Colombo and inspected Sig. Zanetti's vines, and the appearance of these had given him still greater encouragement. He himself had undertaken viticulture in Australia, and ten acres of his land at Mildura were planted with vines, but he does not contemplate grape-growing here. He says that he should have thought Colombo particularly unsuitable; but he found the vines as healthy-looking as the best he had seen in Australia, and he does not know how Sig. Zanetti has got over the difficulty

of perpetual summer, unless he has bared the roots of his vines and so introduced artificial dormancy. After what he had seen in Colombo, he thinks that grapes might be successfully grown on the hills."

While visiting Matale lately we took the opportunity of inspecting a vine which we saw last August carrying a very heavy crop of fruit. On our recent visit the vine had been pruned early in December, and was just putting out new leafage. The September crop had given half a cwt. of fruit, and after the taking in of the crop,—the vine, which had spread over a large 'pandal'—was subjected to an artificial wintering caused by the exposure of the roots for 7 or 8 days. Since then we have had a visit from a gentleman of Calpentyne who startled us with the results of his vine-growing in that arid climate. He said he had two 'pandals,' each of which carried three vines, and that he got a crop of 1,000 lbs. of grapes from each pandal, *i.e.*, 333 lbs. from each vine. We presume that this represented the annual produce. We were further told that each bunch of grapes weighed about 2 lbs., so that Calpentyne must be a veritable paradise for grape-growing. The climate there is exceedingly dry (we do not suppose that the annual rainfall could be much more than 30 inches, if it is as much as that), and it is necessary, we were told, to regularly water the vines. The wonder to us is, why grape cultivation is not carried on more extensively in the Calpentyne district. Taking only 50 vines (on the 'pandal' system) to an acre, and 300 lbs. per vine as a likely annual crop, we get no less than 15,000 lbs., which at 50 cents per lb. would fetch 7,500 rupees!

Greatest amount of rainfall in any 24 hours on the 9th instant, 1.46 inches.

Recorded by J. D. S. JAYAWIKRAMA.

ORANGES.

The fruit-growing industry which has been so long neglected in Ceylon is at last beginning to be thought of seriously, and a pioneer in systematic fruit-farming has already appeared in Mr. A. J. Pearson. Mr. Pearson is not a stranger to Ceylon, where he had been a resident for some years in the planting districts before leaving for Australia. There he seems to have gained invaluable experience in the matter of fruit cultivation, and he has now returned with a strong determination to grow oranges and lemons successfully and remuneratively in Ceylon. Mr. Pearson will probably choose Uva as the scene of his operations, and intends bringing over grafted trees from Australia and planting at the rate of a hundred to the acre. To a contemporary's interviewer he is reported to have said: "As to the profits to be derived from orange-growing, I consider that £50 net profit per acre is a very moderate estimate—in fact, under the mark."

Mr. Pearson speaks of introducing three varieties of the orange, viz., the Washington Navel, the Mediterranean Sweet, and the Homosassa orange. The three varieties mentioned below (two of which have been chosen by Mr. Pearson for Ceylon) are, we believe, the most highly thought of in California:—

"The Washington Navel is the most popular and undoubtedly the best orange grown at this time in California. It matures at a season when the fruit is most acceptable. Being seedless, it is desirable to the old and young. At its best it is a happy blending of sweetness and citrous qualities. It is a strong and rapid grower when young, and fruits evenly and regularly. It ships well, having good protective qualities. It can be marketed early, and is well advertised.

"The Paper Rind St. Michael is a late variety. It outranks the Navel in thinness of rind, in acidity and the albuminoids; ranks well in sweetness, is of good flavour, and has seeds galore. The tree, like the Navel, is a strong, rapid grower, and requires about the same treatment in culture

and fertilization. It succeeds best under the same climatic conditions as the Navel. The albuminoids are more largely distributed in the flesh of the St. Michael than in other varieties. It is rich in sweetness and is winning its way to popular favour upon its intrinsic merit.

"The Mediterranean Sweet is an orange nearly seedless. Its form is oval and grows to an even size. It is good in sugar and citrous qualities. The tree is less vigorous in growth than either of the other varieties, both in root and leaf. The position of the leaves and short internodal spaces cluster the fruit which is usually evenly distributed over the tree. It ripens before the St. Michael and after the Washington Navels."

[These notes are taken from a paper by Mr. W. C. Fuller of California.]

We most heartily wish Mr. Pearson success in his new enterprise.

AN IMPORTANT DECISION IN AGRICULTURAL LAW.

THE USE OF LAND IN "MALA FIDE."

The House of Lords has recently decided a case of great importance in regulating the rights of a landowner. Contrary to the rule of Scotch law, it has been held that in England there is no ground for redress in law against a landowner who uses his legal rights over his own land with intent to injure a neighbour. A landowner, in other words, in England may dig pits in his land for no object except to intercept the flow of the subterranean water, and so to drive a neighbouring proprietor of water works to purchase his land from him at his own price. The facts of the case, which has now been finally decided by the House of Lords, are these:—The Corporation of Bradford as owners of waterworks, are entitled to take water from certain springs. The defender, who is an owner of adjacent lands, proceeded to make a tunnel for the alleged purpose of draining beds of building stone under his lands, but with the real purpose (as was alleged by the Corporation) of compelling the Corporation to buy his land; for the effect of these tunnels was to cut off the underground stream of water which supplied the Corporation waterworks. Mr. Justice North held that the charge against the defendant was well founded, and that his operations were intended for the drainage of his stone—not in order that he might be able to work it, but in order that the plaintiffs might be driven to pay him not to work it. That being so, he held that, though the defendant's act was lawful in itself, it was illegal, since done with the malicious intent of injuring a neighbour. Accordingly, Mr. Justice North granted an injunction against the defendant from proceeding further with his tunnelling. The Court of Appeal reversed this decision, and refused to prohibit the defendant from exercising his legal rights. They held that, since what the defendant proposed to do did not exceed his rights of the law of England, his motives were immaterial. The House of Lords, in an elaborate judgment, have upheld the decision of the Court of Appeal. They held that the landowner had a right to do what he had done whatever his object or purpose might be, and although the purpose might be altogether unconnected with his enjoy-

ment of his own estate. "This is not a case in which the state of mind of the person doing the act can affect the right to do it. If it was a lawful act, however ill the motive might be, he had a right to do it. If it was an unlawful act, however good his motives may be, he would have no right to do it. Motives and intentions in such a question as is now before your lordships seem to me to be absolutely irrelevant." This decision has caused widespread alarm in England. Every reservoir of public water supply in the kingdom, which depends immediately on subterranean springs and not on rivers, lakes, or surface streams, has become liable to interference and possible expropriation by owners of adjacent lands. The *Solicitor's Journal* and other papers suggest that the law must be altered by Act of Parliament.

THE MANAGEMENT OF DAIRY CATTLE.

BY MR. JAMES MOLLISON,

Superintendent of Farms, Bombay Presidency.

Drinking water or succulent food given immediately before the animal is milked is believed by the *gavli* (milkman) to increase the yield of milk. The quality necessarily must be lowered in a corresponding degree. A native will, when he sells a buffalo guaranteeing a certain milk yield, invariably allow the animal to drink freely before proceeding to milk. It is possible that the milk yield may be affected in this way, for succulent food undoubtedly lowers the percentage of total solids in milk by making it more watery. In 1892, at the Poona Government Farm, during the hot season 10 lbs. buffalo milk on an average yielded a lb. of butter, whilst during the following rains when a good deal of the food was succulent, the average was 1 lb. butter from 12 lbs. milk. During 1893 it was found possible to feed during the whole year a limited quantity of green fodder, and the difference previously marked was not so noticeable although still appreciable. The actual figures were: during February, March, April and May, the average quantity of milk required to produce 1 lb. of butter was 11 lbs. 7 oz.; similarly for June, July and August, the average weight was 12 lbs. 8 oz.

The quality of the milk is in other respects influenced by food. Thus cream from milk of buffaloes, largely fed on oil-cake, will churn into greasy butter even if the temperature of the cream in the churn is lowered artificially to the most favourable point. Cotton seed tends to produce fine firm butter, and the cream can be churned at a comparatively high temperature. The cream from cows fed largely on *chuni* (husk of *Cajanus indicus*) gives butter which has a nice flavour and a better colour than usual.

When green fodder is given in fair quantity, cotton seed and *chuni* (husk of *Cajanus indicus*) can be fed to any reasonable extent. If otherwise, the allowance of each should not exceed 4 lbs. per day. Lucerne is not a good fodder for milk cattle in any quantity beyond 10 lbs. per day. *Jowari* (*Sorghum vulgare*) should be well in flower before it is cut as green fodder, otherwise like lucerne it has a tendency to cause tympanites.

is quite possible to over-do the feeding of milk cattle. A cow in milk should not be in high condition. An animal in very high condition will

give very little milk, and this probably accounts for a common practice with *gavlis* (milkmen,) viz., to give a less quantity of food to fat animals so that the milk yield may increase.

Indian cows and buffaloes are so excitable and irritable that a very trivial circumstance often affects the milk yield. Its secretion is influenced to a very great extent by good management. If the calf dies, the milk yield may be diminished permanently. There is an Indian proverb, the English rendering of which is "soil without manure is like a cow without her calf." Any sudden change in the food, a short journey by road or rail, a strange milker, a cold or wet day, any irregularity in feeding, and especially any irregularity in milking at once re-act on the milk yield. Indian cows, and more especially buffaloes, get attached often in a striking manner to the man that feeds and milks them, also to the companion animals occupying the adjoining stalls; at pasture they clique together in a curious way, and it will be easily understood that any disturbance of these friendly relations will have a distinctly unfavourable effect on milk selection. Aden cattle are different. They have docile tempers and their milk yield is not easily affected by any irregularity. Moreover, their calves can be weaned and handled, whilst it is imperative that the calves of every Indian breed should suckle. At any rate such is the case unless the practice is begun when the cow has her first calf. The maternal instincts are very strong, and neither cows nor buffaloes will yield their milk unless the calf is sucking or is tied close by. When the calf dies it is common to stuff the skin and make a dummy calf which answers the purpose admirably. Where milk is dear it does not pay to rear calves, especially bull buffalo calves, and in many instances buffalo calves are quietly knocked on the head and the dummy substituted. Whether it is intended that the calf should suckle or be raised by hand it should be left with the mother until it is licked dry and clean. This has a salutary effect on the cow as well as on the calf. The viscous slimy matter which covers the calf has a beneficial laxative effect on the cow. When removed from the cow the calf should be kept out of sight and out of hearing.

The most noticeable signs of approaching parturition are:—

- (1.) Full distention of the udder.
- (2.) Loosening and enlargement of the external portions of the vagina.
- (3.) Relaxation of the pelvic ligaments.
- (4.) Restlessness a few hours before calving. The cow rises and lies down frequently in her stall and whisks her tail as if in pain.

(5.) Labour pains and the water bags. The membranes of the latter when broken allow of a slimy fluid to escape which lubricates the passage and facilitates the expulsion of the calf.

The cow, when nearly due to calve, should, when not grazing, occupy a roomy stall in a comfortable part of the byre. The stall should have a dry floor, and, if possible, should be littered with dry straw. This obviates the risk of an inflamed udder. If the udder appears swollen and feels hard, the milk should be drawn once a day even before calving.

In normal parturition the calf presents itself in the pelvic passage with the head resting on the forelegs. The cow generally requires no as-

is to blame if all farmers are not so learned? I say again not the farmers, but the Government. My able colleague, Mr. Hendrick, has recently pointed out that no great comprehensive scheme of education has ever been established in any country, except by a Government or some similarly powerful authority. American, French, German, Danish, and all other systems of agricultural education owe their existence and their chief support to Government aid. In our own country a great system of elementary education has been instituted by a Government Department. Secondary education is organised by Government, and our universities receive large endowments and grants from Government. How is it expected that agricultural and technical education only should be left to voluntary effort? No intelligent man will question the importance of elementary education, but had it been left to voluntary effort alone, it is certain that no such complete and comprehensive system could ever have been instituted. This holds still more true of technical education; and if it be the case that there are branches of agricultural science with which farmers have little acquaintance, I affirm that the fault does not lie with them."

But it ought to be added, after all, the education in Agricultural Science can have only a limited influence on farming. There are many qualities, combined with great and minute practical knowledge, that go to make a successful farmer. Science is only of secondary importance as compared with these: it can only contribute a little more to help a man to success, but so far as it does so, it deserves the greatest attention from all friends of agriculture, and much greater support from them and from Government than it has hitherto received in this Kingdom.

The following is from an address by Principal Smith:—

"Those of you who have been but a short time at the College, and have learned something of the nature, composition, and uses of artificial manures, will be able to gauge the value of the instruction you receive when you are told that farmers may be met with who use superphosphate of lime instead of nitrate of soda for no other reason than that the former is cheaper than the latter. This is simply a matter of ignorance, which will not be possible when instruction in 'science' has become more general.

"Some practical people are prejudiced against 'science' and 'agricultural science.' But I do not think they will quarrel with the definition as given by Mr. Warrington at Ipswich. 'Agricultural science should mean,' he says, 'the best knowledge of the day on the subject of agriculture, and a farmer will do wisely to obtain the aid of this knowledge in all his operation.' We do not ask for science to supplant experience, but to supplement and to aid it.

"In the discussion which followed the reading of Professor Warrington's paper, Professor Marshall Ward pointed out that a system of practical agricultural investigation was one thing, and a system of agricultural education was another. That, I think, was a most appropriate remark. Research and education cannot go along together, and do not to any great extent in other departments of science: a teacher should seek to disseminate the information that has been gained

by research. It may be a humbler function than the office of adding to the stock of the world's knowledge by means of original investigation, but it is a no less necessary one."

DAIRY FARMING AND MURRAIN.

We make the following extracts from the annual report of Mr. Mollison, Superintendent of Farms, Bombay, with reference to the Poona Dairy and dairy herd. [In 1894 the Ceylon Government Dairy was unfortunate enough to experience an outbreak of murrain (rinderpest) among the dairy herd; all the details with reference to this outbreak were made public at the time, and formed the subject of a special report by the late Colonial Veterinary Surgeon, Mr. Lye. With the recollection of that sad experience still fresh in our memory, we can deeply sympathize with the Superintendent of the Poona Farm on the outbreak which the Dairy experienced during the year ending March 31st 1895]:—

The financial results are shown in the appended balance-sheet. The profit for the year is R266-11-6 as against R2,254-13-2 last year.

The reason why the margin of profit is so small is due to a very serious outbreak of rinderpest during the year. If reference is made to Appendix V it will be seen that 54 cattle died during the year; of these one cow (our best Aden) was poisoned (intentionally I believe), one cow died from inflammation of the lungs, and a few calves were lost, as they ordinarily will be. There were 34 deaths due directly to rinderpest, and some calves which recovered from disease died from after-effects. They never recovered their strength though well cared for. The indirect loss due to diminished milk yield in the healthy cattle was probably more than that from death. The disease first broke out amongst unweaned calves, and these had necessarily to be separated from their dams. The maternal instincts of Indian cattle are very strong and the effect of separation from the calves upon the milk yield, especially of the buffaloes, was remarkable. The cattle were in full milk at the time, the whole herd giving about 700 lbs. daily. A week after the rinderpest appeared the daily yield was about 450 lbs., representing a daily loss of 18 rupees. It seems to be practically impossible to wean calves at birth from Indian milk cattle unless done when the heifer has her first calf, but the above results point to the necessity of doing so if possible. The carcasses of the cattle that died were all burnt. This, with medicines, cost R266.

The number of deaths was about 70 per cent. of affected cases. It is significant that indigenous breeds escaped contagion to a far greater extent than exotic breeds. An English cow and calf belonging to his Excellency the late Governor were about the first to succumb. Two Bahrein cows of a noted milk-breed which I had bought at considerable expense from the head of the Persian Gulf, died within thirty hours of the first symptoms. Every Aden which came in contact with contagion became infected and died. We lost one Sind cow, but no Gir cattle, and only two buffalo-cows, though a number became infected but only in a mild manner. Young buffalo and cow-calves died very quickly. Cows advanced in pregnancy

were hopeless cases. Symptoms of abortion became apparent and inversion of the uterus resulted in every case. We had a *post-mortem* examination on one of these cases, and the fetus was found to have characteristic rinderpest symptoms.

As far as I could judge, careful veterinary treatment did very little good. The most effective medicine was carbolic acid given in gruel, its influence being a healing one on the highly inflamed membranes of the intestines. I believe the cure of cases to have been chiefly due to careful nursing and to drenching the animals with good gruel. The gruel consisted of linseed boiled with rice, fresh separated milk, and water. We got rid of the disease by segregation.

The disease was disastrous at the farm, but I can conceive that it was far more so in the city of Poona and the surrounding villages where it was rife. Under existing conditions the spread of contagion is not only absolutely uncontrolled, but is encouraged. The Mhars eat the flesh of animals that die and they offer the diseased skins in any market where they can get a good price. The carcass is generally cut up on the bank of a *nala* or stream, and the offal is left there as a centre of contagion for every healthy animal that grazes in the vicinity. It is common knowledge that when outbreaks of rinderpest occur they generally spread along the course of streams or rivers. These are points affecting the healthiness of the cattle of the country. But there is another question, viz., that which affects the public health. It is absolutely certain that milk from cattle suffering from rinderpest was sold in Poona to the public during the prevalence of the disease. There is some comfort in the fact that as regards buffalo's milk, the public have some protection, inasmuch as a buffalo, unlike a cow, when infected with rinderpest or ailing in other ways almost always refuses to give any.

The dairy produce from about seventy milch cattle was sold for R15,303, cattle food, fodder and fodder grazing cost R10,968. There was a stock of on hand at the end of the year worth R1,507. If the dairy herd keeps healthy there will be no difficulty in any year in making the dairy a profitable institution. The price of dairy produce supplied to the Commissariat Department for sick soldiers in hospitals is lower than the rates charged to the public. The latter rates are fixed purposely higher than the rates of private dairymen in Poona. Yet we could sell to private families to a much greater extent than is done now if there was an available supply, which there is not.

THE DISPOSAL OF NIGHT SOIL.

The subject of the disposal of night soil is one of general importance, but particularly so in tropical countries, where owing to the heat and moisture which generally characterise them, decomposition and fermentation go on much more rapidly than in temperate climes. The views of competent authorities on the subject of night soil in its relation to India, and a reference to the methods of disposing of it there, should prove useful to us in Ceylon, where the conditions of life are so similar to those on the mainland.

Dr. J. W. Leather, agricultural chemist, writes a note on the subject, which is issued as one of the Agricultural Ledger series of publications.

There is perhaps no more important subject in relation to agriculture, says Dr. Leather, than the proper disposal of night soil and other town refuse, for it may be said without exaggeration that nearly one-half of the plant food extracted by food crops from the soil is contained in the materials which are included under these two heads. It follows, therefore, that on their proper disposal and return to the soil depends the addition of a large proportion of the food necessary for the crops. In the case of small villages in India, he says, the customs of the people in a great measure fulfil what is required. At the same time it would appear that there are exceptions even to this practice in some places. For instance, Dr. Nicholson, writing of the Coimbatore district says: "Generally speaking the lanes and hedges around houses are fouled with matter in its wrong place, and the chief manurial agent becomes a curse for want of employment."

In any case, in reference to the custom of the people of using the fields next to the village, there can be no doubt that it would be a great improvement, from a sanitary point of view, if the people could be persuaded to employ a covering of earth. The desirability of this will have been observed by all who have had occasion to visit villages. But in the case of the large towns a more systematic disposal of both night soil and sweepings is necessary.

Dr. Voelcker, in his report on the Improvement of Indian Agriculture, says: "I regard the spread of a good system of utilizing human and household refuse, street-sweepings, &c. on the land as a potent factor in the improvement of Indian agriculture, and having had among other duties to enquire into different schemes for town sanitation, I must record my conviction that the dry system is the one best suited to Indian circumstances, and that any system which diverts from its proper destination, the land, that which has originally come from it, would be attended by loss to the cultivator and to the State, and would not be satisfactory from a sanitary point of view."

Dr. Leather states that the practice in some places consists in depositing all refuse in pits about 3 feet deep and of considerable area, and after the whole has been thus filled, crops or fruit-trees are grown on the land. The objection to this practice, which is adopted in Dumraon, is, says Dr. Leather, that the refuse might be advantageously spread over considerably greater areas.

Another system referred to is the digging of long trenches about 6 inches or 1 foot deep and a foot wide, and filling them in with 3 to 6 inches of refuse and then covering over with the earth which has been removed. This, says Dr. Leather, is undoubtedly a good method, but even here there is a great concentration of the material, and it has been found in some instances, that owing to carelessness in putting more than the proper amount of night soil in one place, the earth thrown over the surface has been insufficient to properly deodorize the refuse.

Dr. Leather further goes on to remark that it is an advantage in the systematic disposal of night soil if it can be distributed over a large area and not concentrated unnecessarily in one place, and it is also an advantage if the system employed does not necessitate its removal after it has once been deposited in the soil.

Some time ago we undertook, at the instance of the then Mayor of Colombo (Mr. H. H. Cameron) to carry on an experiment in the trench system of dealing with night soil. The result of this experiment was so satisfactory, that the trench system has been adopted in connection with the conservancy of the School of Agriculture. The deodorization of the filth was so complete, that a valuable and by no means objectionable fertilizer is now utilized as manure. It has of course to be remembered that the deodorizing and oxidising power of the soil is not unlimited, and that the amount of filth disposed of must be regulated by the capacity of the trenches, while a proper covering of earth should be carefully laid on. Careless work will of course result in objectionable odours being given off from the trenches. If, however, the work is properly supervised, our experience of the "trench system" is that it is an admirable method of disposing of night soil.

(To be continued.)

THE FERTILITY OF SOILS.

BY PROFESSOR KINCH.

Another plan proposed for the estimation of the available plant food in a soil is due to Dr. L. Grandeau. He had been led to the conclusion that the effective mineral matter in a soil is always combined with organic matter—to a certain extent a return to the old humus theory of Thaer, which was thought to have been effectually buried by Liebig—which organic matter is essential to convey the food to the plant. The mineral matter in fertile soils is, he considers, in much the same state as it is in well-rotted farmyard manure. Grandeau therefore treats the soil with very dilute hydrochloric acid to remove bases and carbonates, and decompose humates, and then extracts the residue with ammonia; this solution, he considers, contains the available plant food material of the soil. Although this plan seemed to answer with certain soils, yet it is not altogether satisfactory. It is probable that the ammonium humate formed in the operation is the active solvent agent on the soil ingredients. It has been suggested that perhaps ammonium citrate in solution would answer, or a mixture of citric acid and ammonium citrate would probably still more closely represent the natural processes of the roots. A greater interest has been awakened in such method of soil analysis, and we may safely leave methods to be investigated and worked out by agricultural chemists.

The total amount of combined nitrogen which is found in soils of known capabilities, varies in the rather poor arable soils of Rothamsted from about .1 to .15 per cent. Generally, in the arable lands of this country it is between .1 and .2 per cent. in the surface soil. In the subsoil roughly about one-half of these amounts is commonly found. The surface soil of a pasture will generally contain more than this, from .2 to .3 or .4 per cent. There are many cases, however, in which the percentage of nitrogen in the surface soil is much higher than this, going up to .6 or .8 per cent., and then a very fertile soil, and one not easily exhausted, is found; the black earth of Russia, some of the prairieland of Manitoba, and, in this country, some of the Fen lands of Lincolnshire are

examples of these fertile alluvial lands full of the remains of previous generations of plants. When we remember that an acre of soil to a depth of 9 inches means about $2\frac{1}{2}$ million pounds of fine dry earth, we see that the stores of combined nitrogen, even in a poor soil, means a large number of pounds; .1 per cent. means 2,500 lb., in the top 9 inches; .4 per cent. is equivalent to 10,000 lb. This nitrogen becomes available to the plant by the gradual alteration and oxidation of the organic matter in which it is combined; we know but little of the rate at which it becomes available, but even in a very poor and exhausted soil nitrates are formed annually, and at a rate, as in the Rothamsted drain gauges, equivalent to the oxidation of about 35 pounds of nitrogen, or formation of 2 cwt. of nitrate of soda per acre per annum. In a soil in high condition, certainly twice this amount of nitrogen might be expected to be oxidised per annum, equivalent to about 4 or 5 cwt. of nitrate of soda. A factor which would be of use in estimating the fertility of a soil would be the knowledge of the rate at which the nitrogen became oxidised, and nitrates formed from the actual nitrogenous matter in the soil; this yet remains to be worked out.

The amount of phosphoric acid soluble in hydrochloric acid, as in an ordinary analysis, in a soil should never fall below .05 per cent. and in really first-class soils it will much exceed this amount, though, excepting in some clay soils, it rarely exceeds .5 per cent. As we have seen, the amount of phosphoric acid soluble in a .1 per cent. solution of citric acid should not fall below .01 per cent. The amount of potash soluble in hydrochloric acid in a soil varies within wide limits; in a fairly fertile sandy soil it may be less than .1 per cent., in a clay it may often be over 1 per cent. The amount of potash soluble in a 1 per cent. solution of citric acid should not be less than .005 per cent. of the soil. Lime, which is for the most part present in the form of calcium carbonate, exerts a considerable influence on both the physical and chemical qualities of a soil. In a very sandy soil it may not exceed one-tenth of a per cent., but in most good soils it is not under three-tenths of a per cent., and it may with great advantage rise to 2 per cent. of calcium carbonate. Lime in this form materially assists in the processes of nitrification and absorption going on in all fertile soils, and it helps to keep clay in a flocculated and more workable condition.

The effect of aspect, elevation, temperature, amount of rainfall, and other climatic conditions on the productiveness of a soil are matters of great practical importance, and always open to observation. The biological factors, especially the effect of minute organisms, are most intricate, and at present less well known, but very important. A farmer should obtain all the aid he can from chemistry and physics in studying the composition and properties of his soil; but we cannot too strongly advise him always to take in addition the "opinion of the plants" by making for himself on his own farm a few simple but systematic manurial experiments with two or three different classes of plants—*e.g.*, cereals, roots, leguminosæ. He will then learn much more thoroughly and effectively than in other ways whether his land requires nitrogen, phosphoric acid, potash, or lime, and on which crops these may be most beneficially employed.

POULTRY NOTES.

It is unnecessary to feed chickens for twenty-four hours after they were hatched. The first feed given should be of eggs hard-boiled mixed with oatmeal or bread crumbs in a dry state, placed on a clean board for the chicks to feed from; give them a little new milk to drink.

Feed chickens six or seven times daily for the first eight weeks; always giving food fresh, never allowing any of the last meal to remain on the board. Do not give sloppy food as this causes diarrhoea which kills them off fast.

Give chickens a daily supply of fresh water in which a small portion of sulphate of iron has been dissolved in proportion of the size of a pea to one quart of water. Keep the water in a shady place, for water heated by the sun is fatal to the chicks.

The *Poultry Monthly* gives some interesting facts as regards the rate of the growth of chickens: The egg weighs, 2 oz.; the newly-hatched chicken, $1\frac{1}{4}$ oz.; at one week old, 2 oz.; 2 weeks old, 4 oz.; 3 weeks old, $6\frac{1}{2}$ oz.; 4 weeks old, 10 oz.; 5 weeks old, 14 oz.; 6 weeks old, $18\frac{1}{2}$ oz.; 7 weeks old, $23\frac{1}{2}$ oz.; 8 weeks old, 28 oz.; 8 weeks old, 32 oz.; 10 weeks old, 36 oz.; 11 weeks old, 41 oz.

The value of turpentine for the removal of intestinal worms in poultry and dogs does not, says the *N.S.W. Agricultural Gazette*, appear to be fully appreciated. It is a good plan to scatter a few drops—say two for each bird—over the soft food occasionally. Birds are more liable to worms after a spell of wet weather. Though this will help to remove them, it must not be forgotten that clean floors will do much to prevent them, which is far better.

Compared with well-rotted farmyard manure there are 48.60 of phosphatic acid in hen manure to 6 lbs. in farmyard manure; 41 lbs. of potash to 10 lbs. in farmyard manure and 67 lbs. of nitrogen to 11 lbs. in farmyard manure. This analysis is based on a ton each of hen and farmyard manure.—*N.S.W. Agricultural Gazette*.

OBITUARY.

Hermann Hellriegel, "a type of those quiet and patient scientific investigators for which Germany is famous, and the scene of whose researches is gradually wresting from nature her hidden secrets," was born on October 21st, 1831. After his school career he gave himself up to agricultural research, and for 17 years he developed upon a scientific basis the method of sand-culture, *i.e.*, the growth of plants in pure sand as far as possible free from all plant food, and adding thereto various food materials in known amounts; light, water, heat, &c., being so regulated that all the factors of growth were kept under exact control.

In 1886 he announced the discovery which at once took the scientific world by storm—the connection between the development of the nodules found on the roots of certain leguminosae and the assimilation of free nitrogen in the course of the growth of such plants. The general plan and

results of Hellriegel's experiments may be explained as follows:—

Quite consistently with common experience in agriculture and in accordance with the results of the Rothamsted and other experiments, Hellriegel found in his experiments, that plants of the grass, the beet-root, the buck-wheat and the turnip families depended on combined nitrogen supplied within the soil. On the other hand he found that leguminous plants did not depend entirely on such supplies. His results were indeed not only very definite, but they had a special bearing on the admittedly unsolved problem of the source of the whole of the nitrogen of leguminous crops.

In 1883 he commenced a comprehensive series of vegetation experiments in pots, in which he grew agricultural plants of various families, in washed quartz sand. To all the pots nutritive solutions, but containing no nitrogen, were added. To one series nothing else was supplied afterwards: to a second a fixed quantity of nitrogen as sodium nitrate was subsequently supplied: to a third twice as much, and to a fourth four times as much. The result was that in the case of the grass family and some other plants, the growth was largely proportional to the combined nitrogen supplied, while in that of the bean family it was not so. In the case of these plants it was observed that in the series of pots to which no nitrogen was added, most of the plants were apparently limited in their growth by the amount of nitrogen which the seed supplied. Here and there, however, a plant growing under ostensibly the same conditions grew very luxuriantly; and on examination it was found that while no nodules were developed on the roots of the plants of limited growth, they were abundant on those of the luxuriantly grown plants.

In view of this result, Hellriegel, with his colleague Dr. Wilfarth, instituted experiments to determine whether, by the infection of the soil with appropriate organisms, the formation of the root nodules and luxuriant growth could be induced; and whether by the exclusion of such infection, the result could be prevented. To this end they added to some of a series of experimental pots 25 or sometimes 50 cubic centimes of the turbid watery extract of a fertile soil, made by shaking a given quantity of it with five times its weight of distilled water, and then allowing the solid matter to subside. In some cases, however, the extract was sterilized. In those in which it was not sterilized, there was almost always luxuriant growth and abundant formation of root nodules: but with sterilization there was no such result. Consistent results were obtained with peas, vetches and some other leguminosae, but the application of the same soil-extract had little or no effect in the case of lupins, serradella, and some other plants of the family which are known to grow more naturally on sandy than on loamy or rich humus soils. Accordingly they made a similar extract from a diluvial sandy soil, where lupins were growing well, in which it might be supposed that the organism peculiar to such a soil would be present; and on the application of this to a nitrogen-free soil, lupins grew luxuriantly and nodules were abundantly developed on their roots.

Hellriegel died on September 21st, 1895. His further researches into the determination of the requirements of plants as regards phosphoric acid and potash have not yet been published, but their

continuation on Hellriegel's lines is assured in the hands of his friend and colleague Dr. Wilfarth.

to take up the manufacture energetically it will find its reward.

Louis Pasteur, "the most illustrious scientist of this age, or, indeed of any age, in his own special subject of investigation," was born on December 27th, 1822. His father is said to have been a working tanner in poor circumstances, and Pasteur, after completing his general studies and spending some time in teaching, devoted all his time to Chemistry. With his discoveries in fermentation came the turning point of his career, for thenceforward he forsook chemistry for biology and the study of micro-organisms. Says Dr. Fleming writing of him in 1886:—"To have accomplished so much and so thoroughly; to have been the pioneer in investigations which have already revolutionized medical doctrine and greatly added to our knowledge of natural phenomena; to have effected large economies in important industries and agricultural operations; but, above all, to have given us the means of averting or resisting baneful and pestilential diseases, is the honour to which Pasteur is entitled, and which will be greatly accorded to him now, and in still larger measure hereafter." The great Scientist breathed his last on September 28th, 1895, at Garche near Paris, in a house which had been allotted him by the Municipality of Paris in order that he might pursue his studies of rabies therein.

In the number of the *Agricultural Ledger* which has just appeared, Dr. Watt throws an entirely new light on the preparation of Morinda dye. Prof. Hummel and Mr. Perkin of York College, Leeds, have, it seems, placed within the reach of Indian dyers an inexpensive process for simplifying the use of the dye, and point the way to the production of a valuable dye-material for import to Europe. (*Morinda tinctoria* is the Sinhalese *Ahu*, and *M. umbellata*, to which reference is also made in Dr. Watt's article, is locally known as *Kiri-wel*.)

The Inspector-General of Forests, India, gives the following "Simple and infallible means of removing leaf-bugs, smut, and blight from plants," which has come under his observation in Australia: Take a quantity of common starch, dissolved to the consistency usual when required for getting up linen, choose a fine bright morning, and before the sun gets hot, smear the starch well over the plants affected. In some fifteen minutes the starch rets, and in an hour or two it all peels off, taking with it the dead insects, along with their eggs or progeny, and leaving the plants quite clean.

Professor Riley, the greatest Agricultural Entomologist of our age, was born in London on September 18th, 1843, but the greater part of his life was spent in America, where he held important official appointments. Some idea of the extent of his writings may be gathered from the fact that in the "Bibliology of American Entomology" nearly 1,600 letters appertain to Riley alone. It is said of him that "he successfully set himself the task of baffling and circumventing the cunning devices of insect pests in all their bewildering variety. In the cotton-fields of the Southern States, in the orange groves of Florida and California, among the farm livestock of the Mississippi, in the hop gardens of Kent and in the vineyards of France he found work to do, and accomplished in a fashion which the world had never before witnessed."

The following figures, showing the imports into the United Kingdom, will convey some idea of the magnitude of the oil trade. In 1892 the imports into the United Kingdom were:—

OILS (EXCLUSIVE OF ANIMAL OILS AND FATS AND TURPENTINE.)	
Palm Oil ..	£1,169,490
Coconut ..	191,380
Olive ..	762,516
Other Oil Seeds ..	555,832
	£
	2,679,218
Seeds Cakes ..	2,147,099
	2,147,099
Oil Seeds :	
Cotton Seed ..	£2,363,375
Linseed ..	3,730,341
Rape ..	1,032,829
Various Oil Seeds ..	1,000,000
	8,126,545
	£12,952,862

Among the results of his work in the last few years, two may be specified which have been epoch-making in their influence. The one is the use of kerosine (paraffin), emulsified with milk or soap, against all sucking insects; and the other the invention and perfection of the "Cyclone" or "Riley" nozzles which are in almost universal use in the spraying of insecticides and fungicides.

The Boston *Journal of Commerce* in an article on Ramie or Rhea Grass makes the following remarks:—

Professor Riley died in Washington on September 14th, 1895.

GENERAL ITEMS.

The manufacture of Turpentine from the resin of conifers is an industry which, according to the *Indian Agriculturist*, promises to pay well. The operations carried on in connection with the Forest School of the United Provinces of India have proved that the industry can be made profitable. At present it is carried on departmentally under conditions that keep it, for all practicable purposes, in the experimental stage, and it is supposed that if private enterprise were

The great importance of this fibre has been for many years appreciated in this country, and it is said millions of dollars have been expended to render it available. This added to the millions sterling said to have been expended in Europe and the East for a like purpose, is evidence of the vast value which it is believed this plant will add to textile productions. It is three times stronger than Russian hemp; it is long and of a silky nature. When woven it will not shrink or mildew. It can be easily mixed with cotton or wool, and when mixed with silk its beautiful sheen blends perfectly when woven with that brilliant costly material. There are at the present time several mills in Europe engaged

in spinning this fibre, to wit:—Two in France, two in Germany, one in Austria, one in Switzerland, and two in England. In this country the United States Ramie Co. has been recently organized with a capital of \$250,000 to spin these yarns, and it has leased the buildings formerly occupied by the Cranston Mill at Cranston R.I., and operations are to be commenced at as early a period as possible. The two most successful spinning mills at present are said to be those operated at Valobre, France, and at Emmendingen, Baden, Germany. The Valobre factory is now spinning annually 150 tons of yarns, 50 tons of silver, and 70 tons of noils. It spins yarn in numbers up to 90 in fineness. The company has added a dye-house to its plant, and is steadily enlarging its mills. It produces special threads for lace, passementerie, linen fabrics and other products of a higher grade in which the price of the materials is of less importance, while waiting until the abundance and cheapness of the raw material will permit the introduction of threads for coarser goods for which there will be a large demand.

The Editor of the *Australian Agriculturist*, referring to *Eucalyptus globulus*, says that it is only suited for comparatively cool districts. He

remarks that its value as a remedy for malarial fever has been disputed, and states that Dr. Aitken calls the planting of the Roman Campagna "a costly failure." We are told, however, that probably the truth lies half way, and that its absorbent power must make the tree of value in damp situations; also that the Trappist monks planted it largely near Rome with good results.

A farmer, who to cure vermin on stock had used various remedies, among the rest kerosene and lard, camphor dissolved in alcohol, and carbolic acid mixed with lard, and all without the desired success, says that finally he tried onions. Of the result he says:—"One particular animal, a yearling bull, was very full even after using the other remedies. I took a large onion, cut it in two, and rubbed him hard all over till I had used two or more onions and my eyes smarted. Then I gave him some of the pieces that were left, which he ate with relish, and I awaited the result. The second day I examined him, and to my astonishment and joy the hair was full of carcasses, but not a live one could I find. Since then I have treated all the stock in the same way, but did not give the cows giving milk any to eat for fear of spoiling the butter."

[No. 9.]

THE PHILOSOPHY OF ARBORICULTURE AND LANDSCAPE GARDENING.

BY REV. J. G. MACVICAR, A.M., D.D.

(Reprinted from *Transactions of the Scottish Arboricultural Society*, Vol. II.)

HIGH is the calling of the cultivator. It is not to provide food merely, though of all things food is, of course, the most important; but it is in concurrence with the architect and the engineer to extend the power of man over nature in

a friendly way; it is to clothe mere material nature; in the beautiful linements of humanity Nature, indeed, even when left entirely to herself, is always respectable and never ugly—never mean. But how much more beautiful when she bespeaks man's intelligence and tasteful dealings with her; when the panorama on which the contemplative eye is invited to rest, displays not only rocky mountains, or wooded valleys, or open plains, but noble mansions

“Bosom'd high in tufted trees;”

adventurous bridges spanning ravines and rivers, smiling cottages, corn fields, and flower-gardens, parks and meadows, with frequent trees, standing like sentinels to guard the forest on the upland!

Next to the discharge of social duty, next to the endeavour to be a Little Providence in his own sphere, consulting for the happiness and well-being of all around him, the best way in which a man can spend his life, is to devote it to Nature, with a view to draw her out for man's behoofs, either by reminding her of seed-time and harvest, or by rendering her Beautiful for continual enjoyment. And in this there is great encouragement. Those powers in nature which refuse to be trained, and which resist all charge, are not more powerful now than they were thousands of years ago. The storms of the ocean are not more terrible. The rock of the alp is not harder. The climate of the district (if the surface of the ground beneath has not been

changed) is not more cold, or damp, or arid. But meantime man's power over nature has been marvellously increased. Nature can no longer resist him so effectually now as she could do in former times. Let the winds blow and raise the sea into what waves they may, the steamship can cut the waves through as they successively attack her, can hold right on her course in spite of them, and make head-way right in the wind's eye. As to the rocks of the Alps, be they ever so hard, it has been voted that they shall be put out of the way along a certain line, to the end that the traveller to whom time is an object may no longer have to go over Mont Cenis, but right across the base of the mountain. And in a few years a tunnel many miles long will be open right through from France to Italy. Nor is it the engineer alone who is thus coming into the possession of such dominion over nature. The forester also is acquiring such power even over climate—that element on which man's well-being depends more than on any other—what we expect our children will see vast tracts of country, which through the destruction of their forests have long since become arid and inhospitable, or lapsed into the state of mere bogs, restored to cultivation and amenity again, as also other tracts which are now too cold and rainy, rendered genial. Great, in fact, is the power and majesty of the forest tree. It is the finest symbol which the world supplies of the undying state—immortal life. No true man can have any other feeling but that of a sacred respect for a forest tree. Among our ancestors, indeed, or at least the inhabitants of this country, at that time when its history begins, this feeling was carried too far. They worshipped the forest tree. Or if with regard to them this may be a question—it is no question with regard to our fellow-subjects in India. There, some religious sects worship certain forest trees at the present day. And it seems to me not improbable that this worship may have been instituted by the priesthood both as an expression of the veneration which they themselves felt for the forest tree, and also with a view to impress upon the mass of the people an idea of the value of trees and forests. For the institutes of civilised heathen

ism, though, when they are viewed in the light of the true religion, they are very much to be deplored, are often possessed of much social and political value.

It is at all events certain that the way in which the inhabitants of the finest countries on the surface of our globe tend to bring upon themselves the greatest calamities, is by the thoughtless destruction of the forest, first around their dwellings, then all over the country. For a few generations at first, indeed, the felling of the forest is a triumph over nature, for ground that bears grain or annual crops of some kind, is always more convenient than ground that bears trees, however nutritious or delicious their fruit. But when the custom of wood-cutting has once been established in a community, and the necessity of more and more firewood and more and more material for building, as also of new clearings for the sake of obtaining a virgin soil increases with the increase of the population, the process of felling tends to go on too far—even till the whole accessible country is denuded of its forest, and the soil is laid permanently bare to the impact of the sunbeams. Now of this the consequences are most injurious. In the first place the rainfall is proportionally diminished. And though, as we know in Scotland, there are some countries where this would be an improvement, yet in reference to all intertropical countries, and indeed the surface of our planet generally, it is an evil. And in the second place, the soil, when stripped of the clothing which the forest afforded, and exposed naked to the heat of the sunbeam, changes very rapidly from the rich mould which the long-continued fall of the leaf in the forest had made it, and becomes very unproductive. Had occasional trees in the forest been left to give shade during part of the day, the destination of the carbon in the mould would have been to be slowly converted into carbonic acid, and so to supply food to the successive crops growing on the soil as they required it. But when the sunbeam is left free to break in its full force on the soil all day long, it burns the carbon in the soil with great rapidity into carbonic acid. And this gas, unless there be in the soil some oxide having affinity for it to retain it, goes off as gas, injuring the salubrity of the air perhaps, and at all events wholly impoverishing the soil; for carbonic acid is the principal food of all plants. The same course of things, it might be shown, happens with regard to ammonia; and thus, both as itself the immediate food of plants, and as that which by oxidation yields nitre, ammonia is lost. Thus the indiscriminate destruction of forest over any great breadth of country, if that country have plenty of sunshine, is a great evil.

This is not mere theory. There is, on the contrary, good reason for believing that the view now given explains, to a great extent, the character of the surface and climate of all the old inhabited regions of our planet in the present epoch of the world. And what invests the subject with interest is this, that while it explains the cause of certain great evils which prevail very widely, it also suggests a cure for them. Thus, not only is the great breadth of Africa and Australia, in consequence of aridity, unfit for being the dwelling-place of civilized man, but Western Asia, and even the valleys of the Ganges, the Jumna, and the Indus, are greatly at fault in this respect. Now, of the former regions in former times we can say nothing for certain, because nothing of their early history is known. But with regard to those Asiatic regions which have been named, their ancient history is known. There can be no doubt that, in ancient times, they were more densely peopled, and that by races far more energetic than their present inhabitants. There can be no doubt that their climates were more genial and their soils more fertile than they are now. And why the difference? It is due, I believe, to the thoughtless destruction of the forest, with which nature ever tends to clothe the entire surface of our planet, so far as it is possible for her to do so. Hence in the present age a great decrease in the annual

rainfall, and its confinement to certain seasons depending on celestial, not terrestrial, influences, instead of a more uniform distribution over all the year. Hence a comparatively rapid combustion of the soil by the sunbeam, and the loss of the fertility imparted to it by the virgin forest now no more.

But why, it may be asked, press this theory? It is only a speculation, And granting that it is true, what can be made of it? To this the answer is, that it proclaims aloud to the philanthropic traveller, colonist, planter, soldier, and to any government in charge of such bare and desolated territories as have been described, to do all they can to encourage arboriculture to the utmost in their power, and to call for the restoration of the forest.

In reference to many at present inhospitable lands, there is no saying what benignant results might be effected in the course of even a few generations, if only trees could be stolen upon them, and ultimately established in such clumps, belts and breadths as might be required. With regard to Western Asia and Africa, indeed, the case, in consequence of the characters of the governments which rule there, may be hopeless in the present generation. But something might, perhaps, be begun to be done even now for the valleys of the Ganges and Jumna and their tributaries, and for those of the rivers of the Pnnjaub, and for Australia, which are all more or less under our own control.

But can nothing be done nearer home? Is our own much-loved country all right as to arboriculture? In answer to this it may be said, that it is at least very pleasing to consider what has been done. When the Emperor of the French was contemplating to do something for Mexico, he appointed one of the most learned men of science in France to give him in a report as to different nations, showing what nature had done for each of them, and what man had done. The result was, if I remember rightly, that of thirty which were compared, Scotland stood second as to what man had done for her, but lowest and last as to what nature had done for her; while as to Mexico, its position was as nearly the very reverse. Admirable, therefore, is that which man has done for Scotland already.

But from what has been advanced, with regard to other countries, the question may be legitimately asked here, Has our country, too, been denuded of its primeval forest by the unreflecting hand of man? Now, to this the answer is, that in our latitudes the hand of man is not required for that work. Where the temperature in the shade never rises high, the vegetable remains resulting from the fall of the leaf, instead of decomposing too rapidly, as they tend to do in tropical countries, scarcely decompose at all. On the contrary, the mould tends to give birth to certain chemical substances, such as tannin, and especially gallic acid, humic acid, &c., which are not only themselves not decomposable in ordinary course, but which preserve from decomposition the mould-molecules with which they are mixed. Hence the stratum immediately under the trees continually increases in thickness from age to age. Now, like other insoluble media, this sour soil is no food for the trees growing upon it. They spread out and send up to the surface the spongioles of their roots in vain. If they receive anything, it is only poison instead of food. And thus it comes to pass that ultimately the forest falls of its own accord; and its only recorders are the noble shafts of trees found prostrate in the moss when that moss happens to be cut into.

The state of the elements which produces this result extends over Europe for a breadth of about three degrees of latitude. In some regions, however, it is not so inimical to nature's determination towards arboriculture, but that where one forest has fallen she succeeds in rearing another spontaneously of a different kind on the same area. Thus archaeologists, in their recent researches into the antiquity of man, have brought to light by their diggings that Denmark, in successive epochs, has been clothed by three successive forests,—first of pine, then of oak, and now of beech. But to accomplish such an

end in our country seems to require the aid of instructed reflective man,—first in draining and so far reclaiming the bog, and then in planting it anew with suitable timber.

(To be continued.)

CAMPHOR LEAF OIL.

BY DAVID HOOPER, F.C.S.

The recent high price of camphor, on account of the war between China and Japan and trade monopolies, has caused some anxiety in countries where it is largely consumed, and China and Japan being at present the only two countries where camphor is produced on a large scale, it has been thought desirable that its cultivation should be taken up in other lands. In Japan the camphor trees grow at high elevations away from the sea, and only large trees of about one hundred years old are selected for use in making the camphor. From the export returns of this country, it seems that the supply is gradually becoming exhausted. In the island of Formosa the camphor trees are said to be by no means plentiful, and they grow only in certain favourable situations as far as the climate is concerned, with savage tribes in the immediate vicinity. Here the trees are not considered worth taking until they are fifty years old, and the wood only of the roots and stems is subjected to distillation.

The camphor tree grows very well in India. The Calcutta Botanic Gardens possess a fine avenue of trees which were introduced in 1802. It grows well in the Ootacamund Botanical Gardens and in other parts of the Nilgiris. It has been planted, as an experimental measure, at Jhansi in the North-Western Provinces, and in other districts in the plains. Camphor has been known and used in India for many centuries. In A.D. 642, Indian princes sent camphor as a tribute or offering to the Chinese emperors. At one time the tree flourished in Nepal and Tipperah, a large tract of land lying between Beugal and the Upper Irrawaddy. Within the present century camphor was imported from Chittagong, but it has been said that the discovery of the hill-men of distilling it from the root led to extinction of the trees.

In Ceylon the camphor tree grows well at elevations of 5,000 feet and less; it has the habit of a willow in the island, and it has been suggested that, like a willow, the trees should be coppiced, and the leaves and branches used for preparing the oil. The tree grows for ornamental purposes in Naples and other parts of Italy. Professor Maisch in 1891 reported on the cultivation of camphor in Florida, where it flourished in almost any soil. The solid oil was made from the leaves and branches; the yield was 4 per cent, and the product was more like that of Japan, as it had an odour of safrol. California has lately become the scene of an industry which has for its objects the planting of the laurel camphor and the preparation of the oil for the American market. The tree has also become naturalised in Java, Brazil, Jamaica, and other isles of the West Indies, Mauritius and Madeira.

It is very evident that the camphor tree is able to grow very luxuriantly and extensively in the warmer temperate and tropical parts of the world, far removed from China and Japan, but the slow growth of the tree would prevent all but large capitalists from opening up plantations and waiting for the plants to sufficiently mature. If it is true that in the island of Formosa the wood only of the larger trees is used, and the leaves and branches rejected, then there can hardly be a scarcity of the trees, or the manufacture must be conducted in a very reckless and extravagant manner. The camphor from the Dryobalanops tree is said to be quite liquid if a young tree is tapped, and solid if the tree is old. Under such circumstances it would seem that the liquid oil constituted the first stage in the development of the solid substance. It is stated in some text-books on materia medica that the stearopten exists in every part of the plant, including the leaves. On the other hand, it is remarkable that the leaves are not used in China and Japan; perhaps the natives have found that the leaves only give a liquid product which

cannot be profitably turned into camphor. As there is no definite information on this point to be found in any description of the industry, I thought it would be interesting to try the effect of distilling the leaves. Another reason that encouraged me to make some experiments in this direction was the hearty manner in which some energetic planters of Ceylon have taken up the camphor question.

A large number of experiments have been made, and a great deal has been written, with regard to camphor oil, the bye-product obtained in refining crude camphor before it is formed into blocks. This, has been proved to be a very variable liquid with a specific gravity ranging from 0.88 to 1.00, an erratic optical rotation, although usually to the right, and containing camphor in suspension, or in solution, or none at all.

The first sample of leaves came from an unbrageous tree growing in the Government Gardens at Ootacamund. Fifty pounds of the leaves in a fresh state were distilled in a large copper still with sufficient water for six hours. Eight fluid ounces of oil were separated from the distillate, giving the yield of essential oil one per cent. The oil had a slightly yellow colour, a specific gravity at 15° C. of 0.9322, and a rotation of +90.4 in a 2 decimetre tube. It gave off a small quantity of liquid at 160°, and began to boil regularly at 175°.

Collected below	180°	=	20.6
	185°	=	31.0
	190°	=	15.5
	195°	=	10.6
	200°	=	5.6
	205°	=	3.3
Residue		=	8.6

95.2

The loss here was occasioned by some of the camphor congealing in the condenser; the amount, however, in this sample could only be about 10 or 15 per cent. The residue in the retort was quite solid in the cold, and had a yellowish colour and strong camphoraceous odour.

The second sample was obtained from some younger trees grown at Naduvatom on the Nilgiris, a district more than a thousand feet lower than Ootacamund. The leaves were distilled in the same manner as in the previous experiment, but a large quantity of camphor condensed during the process and almost choked up the worm of the still. About four ounces of liquid were collected, having a mass of crystalline matter suspended in it. The oil was strained through cloth, and the solid matter, pressed hard to remove all the liquid portion, was left as a cake of camphor, weighing two ounces. The clear oil had a specific gravity of 0.9314 at 15° C., and twisted a ray of polarised light +54° in a 2 decimetre tube. It began to boil regularly at 165°.

Collected below	185°	=	13.3
	190°	=	20.0
	195°	=	15.5
	200°	=	20.0
Residue		=	25.0

93.8

The loss was again accounted for by some of the camphor condensing in the cool tube. About one-half of this oil consisted of solid camphor, or, calculating the camphor already separated, the oil from the Naduvatom leaves contained 75 per cent., which is a very satisfactory result. The camphor dissolved in rectified spirit, twisted a ray of light +30°. The altitude of the Government Gardens in Ootacamund is 7,300 feet, and it is possible that this elevation influences the formation of the solid stearopten in the leaves. At any rate, it is interesting to know that a large proportion of camphor can be obtained from the oil of the leaves and from the leaves themselves, and probably, if taken from trees grown at a much lower elevation, a much larger proportion of this useful substance could be collected, —*Pharmaceutical Journal.*

VARIETIES OF WOOD MORE, LESS, OR NOT SUITABLE FOR TEA CHESTS.

(Translated for the "Tropical Agriculturist" from "Tasmanian.")

Tea cultivation in Java, as has been the case with other cultivations, has entered upon its years of strict economy. In the good old times this was not so. Then it was profit. But necessity teaches one to pray; and the regally fortunate planters in that golden time would certainly have laughed, if they had been told, that a pound of tea *can* be made and delivered for the price that it now costs the planter.

Amazingly instructive is such a compulsory economy. If only the old prices came back again now! This sigh is generally uttered when once again a lot of tea is sold on less favorable terms. But they have not yet come back; and probably never will.

It is fortunate that tea cultivation in Java, in this "struggle for existence," still holds its own.*

In such a general economizing attention must be given to every detail. One of these details is the article of *tea chests*.

As a rule the planter makes his chests himself. Only a few are in a position to buy chests cheaply. The transport and the profit which the contractor must naturally have make it too expensive. A sawing machine is found upon almost every estate. Some of the larger ones have frame-saws; but a single circular saw, driven by a water-wheel, can abundantly supply the need, and, without much trouble, yield planks for 8,000 to 10,000 chests, representing a production of 640,000 to 800,000 half-kilos of tea.

Sawing is best done with the hand; blocks of wood, still round and with the bark on them, cut up or sawn off to the length of the desired planks, are guided by the hand toward the saw, which turns at a speed of 600 to 1000 revolutions per minute. This method of dealing would not succeed if hard kinds of wood had to be operated upon. Tea-chest wood must be light, and at least so firm of fibre that a wire-nail will hold firmly in it. Further, it must dry easily, and not get mouldy too quickly or shrink too much.

Formerly the wild timber of the Government forests was mostly utilized. Innumerable varieties of all kinds of woods are to be found in these forests. But, partly because the distances, and therefore also the cost of transport, are too great, or because the tariff for these kinds of timber, even the lowest, of 1-5th of *djati* wood, is still too high, the planter had to seek other sources, which were found in *kampong* timber or their own planting. The *kampong*, with their surrounding little gardens, *hoemas*, ravines, &c., yield a number of varieties of wood, suitable for the purpose. Many fruit-trees, which in the lower districts yield sweet, juicy fruits, grow well in the mountains, but yield fruits edible only by natives or quadrumanous inhabitants of the forest, *tant soit peu*. Experience teaches, that the value of the timber of *nanika*, *doeren*, rambutan, mango, *djerock-besar*, jambu, &c., growing at 3000 feet, is greater than that of the fruit. For the tea planter, moreover, there is generally the full opportunity of making himself independent with his own timber by planting along roads and paths or in ravines, or if need be by systematic forest cultivation.

What variety of wood is the best for tea chests is still an open question. So long as that is not decided and an abundance thereof planted, the planter will still have to content himself with a number of varieties of wood, which are more or less suitable, and he will often have experience of varieties of wood which are *not* suitable for tea chests.

At a medium elevation of 3000 feet, in the heart of the Preanger, the tea-planter-chest-maker has to do with the varieties of wood mentioned in the following list. This cannot make the least claim to completeness. Many varieties of trees, however, exist in large numbers in some places, in others sporadically or not at all. Of the varieties of trees from

the primeval forest only a portion of the best known and most important, or that exists plentifully in the forest ravines outside the primeval forest, have been examined. A * denotes the varieties that are suitable for tea chests, and ** those that are specially noteworthy, to be bought up or planted.

For the correctness of the Sundanese names, the writer can answer only so far as they are in use in his immediate neighbourhood, viz., the Malabar mountains to the south of Bandoeng. For the rest, most of the Sundanese names are pretty general over a large portion of the Preanger, if one does not attach too much credit to the unsubstantiated information which one sometimes gets. Not all natives are good arborists. The Latin generic names are taken from "Filet" and from the botanical dictionary of the trees of Java by S. H. Koorders. In that province, even in the generic names, great confusion still prevails. Each writer favours quite distinct names. I have ventured to retain several well-known names from "Filet," although in the work of Mr. Koorders quite different ones are found. For some it was not possible to give a Latin name except by means of a lucky guess. The spelling of the Sundanese names differs in many points from that followed by Mr. Koorders. The simple and rational method of spelling of Geerdink-Coolsma in my opinion deserves the preference.*

1. *Albasia*.** *Albizia moluccana*. A tree of great virtues and great faults. No variety of tree yields, in a short time, so great a quantity of wood, of very useful quality. The wood is somewhat too soft, and must therefore be sawn somewhat thicker and be fastened with longer nails. It is however very uniform, dries quickly, does not shrink much, and is pleasantly smooth to plane. The tree grows everywhere luxuriantly and incredibly quickly, but one loses much wood (1st) by the wind, which often breaks off the largest branches or causes the tree to split down to the roots; (2nd) by a green *boktor*, striped with yellow-brown on the wing-cases, which attacks the tree and causes it to die off on a large scale. The bark then falls off in pieces, and the wood is riddled like a sponge by the larvæ of this chafer. As soon as one sees dying at the foot a fine wood dust, that makes its appearance through small holes in the bark, and gives the first intimation that the tree is doomed, it must be speedily cut down.

2. *Angrit*. *Quercus* spec. (See No. 33 *Kajang*.)

3. *Buros*.* *Manglicia* spec. This tree has its home in the primeval forests. The wood is handsome in appearance, greenish, yellow-brown, but somewhat brittle. Also very suitable for building. The old trees are mostly called *Manglid*.

4. *Beleketebe*.* *Echinocarpus* spec. Wood very good for chests. Comparatively rare. Is very heavy.

5. *Beunjing*. *Ficus*. (See No. 42 *Kiara*.)

6. *Butinoc*.* *Melochia* spec. (Koorders). Good and useful, but even from older stems somewhat too hard; but seldom of sufficient proportions.

7. *Biroc*.* *Canariopsis* spec. (Filet). A handsome, good wood; seldom met with.

8. *Bisoro*. *Ficus* spec. (See No. 42 *Kiara*.)

9. *Boenger*. *Lagerstroemia* spec. This tree, which is every year covered with rose or violet flowers, yields an extremely hard wood, valued in the Government tariff equally with *djati*.

10. *Boctarowa*. *Quercus* spec. (See No. 33 *Kajang*.)

11. *Mangijera* spec. div. The wood of the varieties of mango is too hard and too heavy for tea chests. With the exception of *Limos*, and the wild-growing *Pari*, all varieties of the mango are called in the Preanger *Boewah*, not only the fruit, but also the tree.

12. *Dadap*. *Erythrina* spec. div. All the varieties of dadap, as also the thorny *Dadap tjoetjoek* and the *Tjangking*, must be condemned. The wood is too spongy.

13. *Damar*.* *Dammara* spec. (Filet). Is specially planted for tea chests, in lower lying districts. At

* The words from "struggle" to "own" are given in English in the original.—T.C.

* In the Dutch system of spelling Malayan words a = English oo, eu = Eng. u in *burn*, j = Eng. y, di = Eng. j, tj = Eng. ch.—T.C.

3000 feet the tree does not always grow well, and it is liable to diseases. The wood must be of very good quality.

14. *Djadjawaj*. *Ficus* spec. (See No. 42 *Kiara*.)
15. *Djamboe*. [*Jambu*.] *Jambosa* spec. div. The wood of all kinds of jambu is hard and heavy. In the mountain regions the fruits are all inedible.
16. *Djamoedjoe*. *Podocarpus* spec. When planted outside of the primeval forest this tree grows badly. Its home is in the higher lying belt (4000-5000 feet), where it forms one of the forest giants. The wood is a good timber.
17. *Djati*. *Tectona* spec. Of well-known utility.
18. *Djengkol*.* *Pithecolobium* spec. The quality of *Djengkol* wood leaves not much to be desired for tea chests, but it has an unpleasant odour, which, however, cannot penetrate through the tea lead. The tree grows quickly, and is to be met with in abundance. The fruits are unwholesome. He who eats much of them becomes *djengkoleum*, a peculiar disease.
19. *Djéroek*. *Citrus* spec. div. Only the *Djéroek g'de* or pomelo attains to sufficient dimensions to enable it to be sawn into planks. The wood is however far too hard. The fruits consist (at 3000 feet) of $\frac{2}{3}$ husk and $\frac{1}{3}$ a sour, bitter, fibrous kernel.
20. *Djeungding*.** *Albizia stipulata*. (Filet). Although this wood, which is obtainable in large quantities, is stronger and denser than that of *A. moulucana*, and is one of the most largely used for tea chests, yet serious defects attach to it. The tree is not so easy to plant, and grows much less quickly than its transmarine brother. On the other hand it is better able to stand the wind, and not so subject to damage from insects. The heart-wood and the sap-wood are very differently colored, which gives a mottled appearance to the chests. The sap-wood rots very easily, and then becomes permeated by a dark-colored mycelium. If it is not quickly and thoroughly dried and kept dry, the planks become covered with moulds and fungi, which cause them to adhere to each other. This disadvantage is not possessed by the wood of *A. moulucana*. This last, also named *Djeungding laet*, is in these regions mostly designated *Albasia* (See No. 1) by the inhabitants. Of one variety (?) named *Djeungding cutak* the wood is totally useless. It shrinks to such an extent, that a plank becomes not only much smaller, but wholly distorted.
21. *Djoenti*. This large-leaved tree, with very small blossoms, is seldom met with. Superficially it resembles *Djati* or *Sampoer*. It grows in *tjgal* districts, intermixed with *Malaka*, *ki-bodas*, *hintinoe*, &c. The wood is reddish-colored, pretty strong, but coarse.
22. *Djoeww*. *Cassia* spec. Very suitable as a shade-tree along big roads. The wood is much too hard for tea chests.
23. *Gadok*.* *Bischofia* spec. Very useful for tea chests, but largely attacked by boring chafers.
24. *Galinggam*. *Bira* spec. More suited for living *pagars*.* When well pruned the tree grows pretty high and stemmy and possibly suitable to be sawn into planks. The wood is also sufficiently solid.
25. *Hamcrang*. *Ficus*. (See No. 42 *Kiara*.)
26. *Hamiroeng*.** *Vernonia* spec. A forest giant, belonging to the family of the Compositæ (in this respect unique?). When planted from seedlings in the forest, the tree, with good pruning, grows up vigorously, but it has still to be seen to what dimensions it will attain. The wood is exceptionally suitable for tea chests.
27. *Hampelus*.* *Ficus* spec. This variety of *Ficus* differs from all others by having a wood very suitable for tea chests. As in the leaf, which is on that account used as sand-paper, so the wood also appears to possess siliceous deposits, which render it tougher.
28. *Hantap*. *Sterculia* spec. The wood of the *Hantap* is, *faute de mieux*, useful. The tree, which becomes very large, allows itself to be planted everywhere freely, and planted along roads forms beautiful avenues. The scarlet-red fruits have a pretty effect.

29. *Haroeman*. *Albizia* spec. (or *Pithecolobium*?). The wood is bad and moulds very rapidly.

30. *Hoeni*. *Antidesma* spec. Hard wood.

31. *Hoeroe*. The number of varieties of *Hoeroe* is legion, and very different in appearance. The best known are *H. manock* (*Acer* spec.?), *H. konang*, *H. batoe*, *H. pajoung*, *H. leaëur*, *H. hiris*. All yield a not very durable timber, which is however very useful for tea chests.

32. *Kadoe*. *Durio* spec. The well-known prized and abhorred Duriau. At 3000 feet gives fine large trees, but small tasteless fruits. The wood is rather bad.

33. *Kajang*. *Quercus* spec. Among the Javanese oaks the "*Pesang*" is the most known, but the "*Kajang*" is apparently the best. The wood of the *pasang* is white and coarse of fibre. The red heart-wood is not inferior to the best European wainseoting. When freshly cut and sawn however it may split. It is very durable, when waxed or polished is prettily veined, and is impregnable to white-ants. In some forests the tree is found in large numbers. It is erroneous to speak of *pasang-kajang*, *pasang-kihioer*, &c.

34. *Kaliage*. A shrub, with twining branches, which sometimes attains the compass of a tree. The long, hard and sharp thorns are rightly very much feared.

35. *Kalikiëtan*. *Croton* spec. (?). Perhaps a corruption of *kaliki-oetan* (Filet 3321). In other places also called *ki-rantja*. The treelet is suited for living *pagars*, always handsome, either from the bright-red young leaf, or from the white clusters of flowers, or from the red berries. Deserves to be planted in gardens.

36. *Kalimorot*. *Castanea* spec. Good building timber, not suited for tea chests.

37. *Kanoening*. *Murraya* spec. Very hard wood, yellow-colored, seldom in dimensions of any consequence.

38. *Karanga*. *Cananga* spec. Coarse-fibred, pretty strong wood.

39. *Kanjere*. *Brialelia* spec. Seldom attains sufficient dimensions.

40. *Karet*. *Ficus* spec. (See No. 42 *Kiara*.)

41. *Kareumbi*. *Carambium* spec. A small tree, is not much noticed. Useful as undergrowth in forest planting.

42. *Kiara*. *Ficus* spec. The wood of all varieties of *Ficus*, *Urostigma*, or *Covellia* (with the exception of *Hampelus* No. 27), is too weak for tea chests; some of them are only of value from their regally handsome growth, others as produce of caoutchouc. The genesis of the *Kiaras*, sometimes in the tops of other trees, is very interesting. The seeds are apparently deposited there in the dung of birds. The young plant sends downwards a rootlet as fine as a spider's thread, which at length reaches the ground and ends by becoming a stem that entirely overpowers and overgrows the supporting tree. Sometimes the supporting tree continues to live; and then one sees in a *Kiara* some branches with entirely different foliage, for instance of *Tewreup*; sometimes it dies and then forms a hollow cavity in the *Kiara* stem. When the primeval forest is felled and burnt such a *Kiara* chimney may sometimes stand for several days flaming and smoking. Sometimes two or more varieties of *Kiara* are found grown together on one stem, but bearing various leaves and fruit at different times.

43. *Ki-bako*. A quick-growing tree recommended by natives and easy to plant. Wood not yet tested.

44. *Ki-bodas*. *Blackwellia* spec. Exceptionally hard and durable wood, difficult to work. The tree belongs to the *tjgal* flora and is proof against the yearly burning-off of the high grasses around its foot. This peculiarity it has in common with *Malaka*, *si-hiang*, *hëmpoer*, &c.

45. *Ki-ëndog*. *Xantophyllum* spec. A very large tree. Handsome white building timber, hard and very fine of texture.

46. *Ki-hiang*. *Albizia* spec. A *tjgal* tree. Very hard and heavy wood. (See No. 44.)

47. *Ki-hioer*. *Quercus* spec. (Filet). (See No. 33 *Kajang*.)

48. *Ki-hoë*. *Cynania* spec. Very strong and tough wood.

* Enclosures, fences.—Tr.

49. *Ki-laki*. *Grewia* spec. (Filet). Small and insignificant.

50. *Ki-leho*. *Sauraya* spec. Weak and unusable.

51. *Ki-mcong*. Easy to raise from seed. A handsome tree, with very strong, hard wood. Perhaps suitable for the planting up of roads.

52. *Ki-měrak*. *Podocarpus* spec. This pine yields a handsome furniture wood, useful for all kinds of purposes; too good for tea chests.

53. *Kina*. *Cinchona* spec. div. From the wood of large *C. succirubra* tea chests can be made if need be. It is however somewhat too heavy and brittle for this purpose. It is of more use to the tea-and-cinchona planter as firewood for his drying machines, &c., &c., as well as for *pujers* and for posts for nursery beds &c. It is very durable.

54. *Ki-oraj*. This name appears to be applied in other parts of the Preanger to other varieties of trees also. Here it is generally used to denominate a not thick, but pretty high tree, which is met with in groups, with fine handsome foliage and small white papilionaceous blossoms. Apparently very suitable for shade-trees in coffee gardens, not subject to the diseases of the Albizzias. Rather hard wood.

55. *Ki-poek*. *Pithecolobium* spec. This handsome tree, generally thick, of a dark green shade, allows itself to be easily planted from the black beans. The wood is little known, but may possibly be as useful as *djengkol*. Time must decide this.

56. *Ki-poetri*. *Podocarpus* spec. (as No. 52 *Ki-merak*).

57. *Ki-sampang*.* *Erodia* spec. This tree much deserves attention on account of its beautiful white wood and quick growth. In forest plantations it sometimes springs up of itself in large numbers.

58. *Ki-sera*. *Cinnamomum* spec. (Filet). This fragrant wood is very hard, strong and durable. Its home is in the primeval forest.

59. *Ki-tedja*. *Cinnamomum* spec. Also a variety of wild cinnamon, found everywhere. Little or no odour. Hard building wood.

60. *Ki-tiwoc*. *Meliosma* spec. Bad and useless.

61. *Ki-tjareuk*. A forest-growing, straight-stemmed tree, with a leaf that consists of unlike halves (as in the Begonias). Is recommended by the natives. Wood not yet tested.

62. *Koekoek*. *Schoutenia* spec. Also called *Hali-koekoek*. Magnificently strong and pliable wood. One finds many shrubby-growing specimens, seldom a proper tree.

63. *Koeraj*.** *Sponia* spec. In woody districts, between 4000 and 5000 feet, the tree *par excellence* for tea chests, although indeed somewhat difficult to saw in a moist state, from its great fibrosity, owing to which a plank of it appears as if covered with wood, yet easy to plane, light and sufficiently strong. Also little subject to decay. After the felling of the primeval forest, the *Koeraj* springs up *en masse* and in a short time forms a new forest. Planted in more open, lower-lying regions, the tree languishes very much, and is subject to diseases, which often cause it to die outright.

64. *Kondang*. *Ficus* spec. (See No. 42 *Kiara*.)

65. *Kopeng*. *Ficus* spec. (See No. 42 *Kiara*.)

66. *Kopo*. *Jambosa* spec. This tree strikes the eye chiefly in the blossoming season, when it is covered with rich white-rose flower-clusters. The wood is hard.

67. *Lamc*. *Alstonia* spec. Quickly attacked by insects. Otherwise really good wood.

68. *Limoos*. *Mangijera* spec. A handsome tree, especially in the blossoming season. Hard building wood.

69. *Loa*. *Ficus* spec. (See No. 42 *Kiara*.)

70. *Mala*. *Liquidambar* spec. Among Europeans better known as "*Rasamala*." The natives say for short "*mala*." The king of trees in Java. The wood is often not sufficiently valued, apparently because one frequently bases one's opinion upon timber delivered by contract, which usually consists of comparatively young wood, the most manageable stems, quite sufficient for the required dimensions. The hardest-wood of old, thick trees differs therefrom very much, and is extremely solid. In the primeval forest one sometimes finds trees

fallen from immemorial times, the bark and sap-wood of which have entirely decayed. Such a stem then forms a natural wall, into which the foot sinks when one steps upon it. The heart-wood is then still quite sound and apparently far superior to freshly cut wood. Planks of good *mala* wood lie in the open air, exposed to wind and weather for 20 years and perhaps longer, without rotting. The sharply defined territory of the tree is peculiar. On the Goenoeng Tiloe some portions of the forest consist almost entirely of *malas*; on the flat adjoining Malabar the tree is entirely absent. Yet it allows itself easily to be planted from seed, and there are 10-year old specimens that are growing vigorously.

71. *Malaka*. *Emblia* spec. One of the hardest and most durable varieties of wood. One can seldom get a fine, perfect piece of wood. Most of the stems are hollow and full of holes. The tree grows in open *tjgals*, and does not die when the grasses are burnt off.

72. *Manglid*.* *Manglietia* spec. (See No. 3 *Beros*.)

73. *Mara*.** *Mappa* spec. (or *Pachystemon*?). The green-leaved or *Mara-tjgal* is not so snitable, although also useful, as the brown-leaved or *Mara-beureum*. This tree allows itself to be freely planted, grows quickly, and yields a wood that has exceptional qualities for tea chests.

74. *Mindi*. *Melia* spec. The experiment tried (at 3,000 feet) with this tree for the first time lately in the Preanger has not been successful. The wood is soft and very liable to split. The tree grows up quickly, but, unless planted in favorable spots, the growth speedily comes to a standstill. Perhaps better suited for lower districts.

75. *Moentjang*. *Aleurites* spec. This wood, to be met with in great quantity, must alas! be condemned. The quality is too bad.

76. *Nangka*.* *Artocarpus* spec. Although somewhat hard and solid, this wood must not be rejected, especially as it is to be had in pretty large quantity. The tree grows well on all kinds of soil, and as a fruit tree has scarcely any value. It is best to use this wood mixed with lighter kinds. Some planks of *nangka* or *waroc* wood, especially for nailing up strongly the bottom or top, add much to the strength of a tea chest. Also very suitable for clamps.

77. *Panggung*. *Paratropia* spec. Untilizable. The wood fibre is always twisted in spirals, and splits correspondingly.

78. *Pari*. *Mangifera*. A tree from the primeval forest. Heavy hard wood.

79. *Pasang*. *Quercus*. (See No. 33 *Kajang*.)

80. *Pěer*. *Ficus*. (See No. 42 *Kiara*.)

81. *Pcutenj*. *Parkia* spec. Forms high, very fine trees. Hard wood. Apparently well suited for tea chests.

82. *Pcutenj-selong*. *Leucaena* spec. Too small to be noticed. The wood is besides exceptionally hard.

83. *Poelocs*. *Laportea*. Small trees in the primeval forest, without value. The leaves, which look harmless, burn so severely on being touched, that one feels the pain even after 6 weeks, especially when the burnt part comes in contact with cold water. It appears that vitreous hairs are left sticking in the skin. Natives when in the forest never fail to warn persons following them.

84. *Poespa*. *Schima* spec. Big forest trees {with hard timber, resembling that of *mala*, but inferior to it. The tree can be easily planted, and is once a year fiery red from the new young leaves, by which one can recognize the *poespas* at a considerable distance.

85. *Ramboetan*. *Nephelium* spec. At 3,000 feet the tree seldom yields fruit, and then only small, sour ones. Nevertheless it grows well, and is suitable for planting along high roads. The wood is too hard for tea chests.

86. *Randoc*. *Eriodendrum* spec. The tissue of the kapok-tree can scarcely be called wood, and is perfectly useless, even as firewood.

87. *Reungas*. *Gluta* spec. Very handsome timber. The cutting of this wood causes swelling of the face and hands; this peculiarity condemns the tree.

88. *Sanintěn*.* *Castanea* spec. Very abundant, very useful timber, although somewhat hard for tea chests. It is also very quickly attacked by white-ants and *boeboek* or *toko* (boring chafers) and is therefore especially very inferior to oak-wood.

89. *Sempoe*. *Dillenia* spec. Especially at home in the *tégals* of the low-lying districts and proof against fire. Exceptionally hard wood. Another kind or variety is called *Sempoe tjai*.

90. *Soeren*.** *Cedrela* spec. div. The quality of the *Cedrelas* indigenous to Java is very various. The *soeren* wood is mostly very suitable for tea chests. For planting, these trees are not to be recommended. Outside of the forest they suffer badly from diseases and soon die. It is otherwise with the Sumatran *Cedrela serrulata*, commonly called *Soerian*, and now universally distributed in the Preanger even by the natives, freely planted. Few varieties of wood are so useful for all kinds of purposes. It is tolerably strong, easy to work, prettily marked, on which account it can be used for polished furniture, and durable, and also not exposed to white-ants. The sap-wood also and that of young trees does not differ much from the older heart-wood. Even for building timber it is very satisfactorily strong. Tea chests made of this wood leave nothing to be desired. The growth of the tree is however not yet quick enough. At 3,000 feet about 15 years are needed to produce a beam of 20×20 cm.; with very favorable growth 25×25. Older trees are frequently hollow. Of the indigenous *Cedrela odorata*, the well-known cigar-box wood, specimens have been planted, which grow well, but even up to *ca.* 6 years of age yield no seed.

91. *Talingkoep*. *Claoxylon* spec. A tree, that attains to no large dimensions, but gives hard, durable wood. Is very abundant.

92. *Tangkalak*. *Lepidadenia* spec. (Filet). Soft, bad wood.

93. *Tangogo*. *Castanea* spec. (Filet). Hard timber. The best of the *Castaneas*.

94. *Toureup*. *Artocarpus* spec. A very large tree with very bad wood.

95. *Tisoek** *Hibiscus* spec. Leaf and blossom greatly resemble those of the *waroe* No. 100. As fantastically and crookedly as the latter grows, so straight as a candle the *Tisoek* shoots on high. For some purposes, among others for building, it is therefore more useful, although it is not so solid as *waroe*. The *Tisoek* however does not attain to the bulky dimensions of the *waroe*. The natives often disfigure and damage the tree by lopping so high, that only a small crown remains at the top. Useful for tea chests.

96. *Tjangkring*. *Erythrina* spec. (See No. 12 *Dadap*.)

97. *Tjangtjaratan*. *Nauclea* (Koordeers). A straight-stemmed tree. Hard timber.

98. *Tjaringin*. *Ficus* spec. (See No. 42 *Kiara*.)

99. *Toengeureuk*. *Castanea* spec. Hard timber.

100. *Waroe** *Hibiscus* spec. A very useful wood when one needs great breadth and little length. For tea chests also, *waroe* wood, although somewhat heavy, and difficult to sow owing to its fibrosity, can be used with advantage. If some planks and the clamps consist of *waroe* wood, the chests are very strong. The tree grows everywhere and is not fastidious. A drawback is, that many trees become as if overgrown with parasitic plants "*Mangarden*" (*Loranthacea*), which frequently cause the otherwise so strong tree to die. This tree is very intolerable, just like bamboo. All that grows within reach of its roots languishes.

A. E. KERKHOVEN.

FRUIT CULTURE IN THE HILLS.

"Cosmopolite" writing from Simla to our esteemed contemporary *The Statesman* endeavours to show that a writer in *The Madras Mail* takes a very pessimistic view of fruit culture; the correspondent of the latter journal deals entirely with orchards which have been started in the Nilghiris, and have, according to him, turned out dismal failures. The picture he draws is no doubt a gloomy one, and when one reads of the many drawbacks unfortunate proprietors have to contend against, he would indeed be a bold man who would sink capital in such an industry. Here are a few of them as related by the Nilghiri writer:—

"I can recall the case of a gentleman who at great expense imported some expensive varieties of dwarf fruit trees from home. After patient waiting in due course the fruit set and began to ripen under

its owner's eyes, but when about half-ripe the unhappy man found to his disgust, on entering his orchard, that not only had the fruit been stolen but the branches broken off with it. And worse was to come, for the following year the plants were found with their stems cut off close to the ground, in some cases actually rooted up and carried away! Though this fruit-grower had comparatively few animal and bird enemies to contend against, since he was living in Ootacamund itself, the *genus homo* proved almost too much for him. In another case a fruit-grower enclosed his little garden with a trench and a wall about three feet high. This proved ineffectual to keep out sambur, which vaulted over and did infinite damage nibbling off grafts, etc. Porcupines followed in a way best known to themselves, and they rooted up pineapples, and ate the ripening melons, and cucumbers, and tomatoes. When the porcupines were excluded the rats and squirrels came in and nearly completed the ruin of the orchard. By day the place was infested with birds, that nothing short of shooting could drive away. The depredations of beetles, plant-lice, borers and other insect pests, though serious enough, can almost be passed over in comparison with these troubles. In addition, in this case, the would-be fruit-grower suffered from the depredations of his own servants, who went in one night and gathered some pines that were ripening and by their clumsiness destroyed several of the plants. As the pines were a valuable variety the owner's loss was a heavy one. It may not be generally known that the jackal is a terrible enemy to the fruit garden. Coffee planters know to their cost what he can do to their coffee. He will eat anything in the shape of fruit that he can reach—strawberries, Brazil cherries, melons, figs, etc. and the fable of the fox and the grapes has a practical significance for the fruit-grower which perhaps it may not have for others. The toddy-cat of the plains has a cousin on the Nilghiris who practically lives on fruit. It is a black greyish animal with white spots and more mischievous than the jackal, from the fact that it can climb trees and reach any fruit.

Now we have a firm belief that the real enemy to European fruit-growers is the gentle Aryan, and not the insects, birds, or animals which agriculturists all over the world have to contend against; and there is no doubt that as things stand at present, this enemy is unconquerable.

"Cosmopolite" in *The Statesman* takes a much more hopeful view of the industry and shows how successful it has proved elsewhere. He says:—"My main object, however; in writing to you is not to comment on the failure of fruit culture in the Madras Presidency, but to set off against it the marked success which has attended that enterprise in the Himalayas. Indeed, so hopeful have been the results that the N. W. Himalayas bid fair to realise the proud distinction of becoming, what they have been called, the orchard of India. Let me glance at the results of an experiment which has scarcely lasted a dozen years.

"Formerly Simla used to be supplied with fruit from Naini Tal, and up to 1883 seems to have been destitute of any gardens of English fruit trees, except perhaps a private one on Summer-hill. Since then, however, Annandale has been covered with fruit trees bearing apples, pears, apricots, grapes, etc., no less than 5,000 plants having been grafted in its soil. Private enterprise has also been busy in the same direction, and Simla now numbers about a dozen gardens, owned by residents, containing 2,000 to 3,000 trees bearing English fruit.

"I do not possess particulars of the cultivation on the Kulu range of hills, which are visible from Simla; but Kulu apples have already gained a name in the market. Indeed, it has been established that apples, and pears flourish on high elevations, and if we compare the English fruit produced in these parts from imported seeds or grafts with the miserable small spongy and tasteless fruit known in Calcutta as Cabul apples, the enormous advantage of having Himalaya fruit instead becomes at once apparent.

"Imagine for a moment the improvements in the Calcutta market were scope afforded for the supply

of English apples from the hills, to say nothing of pears, apricots, grapes, strawberries, and other smaller fruit—why, you would be better off there than you were even in the days in which American apples used to be imported with ice, and sold at the rate of eight for the rupee. I have tasted better apples here than ever I did in Calcutta in the best days of American apples. And the experiment of importing apples from Australia would have no chance against fruit which could be put in the Calcutta market within four or five days of its being plucked. The Calcutta market, moreover, is only a single place where Himalayan fruit could be offered for sale. All the stations along the railway route, and indeed every accessible spot on the plains, would be available for the sale of the Himalayan fruit, were culture attempted on a large scale."

All this is perfectly true, but we are inclined to think that in the Nilghiris the wrong sort of people went in for the industry and that the system they worked on was rotten. They were evidently people who did little or no work with their own hands, but small capitalists who planted orchards near villages so as to obtain cheap native labour. Result, villagers reaped and ate of the fruit with gusto after having drawn good wages to grow and guard it. The proprietor's profits might be gauged solely in a expensively bought experience and a profound knowledge of the capacity of his Aryan brother in the picking and stealing line.

But there are evident signs that a revolution is looming over Anglo-Indian society, the depreciation of the rupee is bound to affect even those moving in the highest grades, much more so the middle and lower classes, and they will no longer be able to send their children home for education or go there so frequently themselves. Schools therefore must yearly increase in numbers and be gradually followed by the hills of India being colonised by many of the parents of children educated there. To supply these colonies and schools with vegetables, fruit and poultry, we look to the poor white and a robust class of Eurasians who will start small farms, market gardens and orchards, working themselves without the aid of native subordinates such people ought with fair work and economy to be able to make a far better living in the Himalayas or Cashmere than they would be able to do in a country so played out for agriculture as England. Calcutta and most of all the big Indian cities suffer during the hot weather from a want of English vegetables and fruits, but so far our hill stations can scarcely supply local demands, Let Government encourage soldiers who have served their time to settle out here and aid them with lightly rented land grants and small loans where necessary, and the worthy folk will soon create a valuable industry and colonise the hills with a race from which India can cull her future soldiers and policemen.—*Indian Planters' Gazette.*

ANACARDIUM OCCIDENTALE, *Linn.*

(THE CASHEW NUT.)

The fruit of *Anacardium* is well known to West Indians, who besides eating it in the fresh state, make conserves of it in various ways. Though sweet, it is at the same time very astringent and said to be useful in cases of dysentery and diarrhoea. Many and various are the effects with which this tree, its fruit, bark, leaves and seeds are credited, and if all were true, it would indeed be one of the wonders of nature. It is said to possess aphrodisiacal properties, the leaves to be capable of producing drunkenness, the nuts or seed when roasted to excite the faculties, especially memory, so much so that a confection made therefrom has been called *Confection des Sages*; and the oil from the nut is said to be equal to that made from the finest olives—while an acrid oil is produced from the epidermis of the nut, which is said by Barham in *Hortus Americanus* 1791 to "cure herpes, and cancerous and malignant ulcers abounding in rotten flesh; it also kills worms in ulcers, and ehigoes, it takes away freckles and liver spots, but it draws blisters and therefore must be cautiously made use of." "It has been observed that poor drowsical slaves that have had the liberty to go into a cashew walk, and

eat what cashews they pleased, and of the roasted nuts, have been recovered." Another writer brings an indictment against the West Indian fair sex for using it as a cosmetic when they have become tanned by exposure to the sun. He describes the process as follows: "They take a nut, scrape off the outside skin, and rub their faces with the exposed oily surface. The face swells and blackens, but ultimately the tanned skin peels off; and although the process necessitates rigid retirement for a fortnight, at the end of that time they "re-emerge with a new skin and complexion as fair as a babe." It has been also stated that the oil is to be found useful in Leprosy and that the fruit is a cure for the disorder which causes the patient to become what is known as a *dirt-eater*. The oil is probably worthy of farther examination, but in the absence of a Physiological Laboratory prepared to undertake original work we are bound to obtain the interest of workers in European or American Institutions; and as these are for the most part fully engaged, it is somewhat difficult to secure their interest for the examination of tropical productions.

The tree produces a beautiful clear gum, which makes a fine varnish, and is said to possess especial virtue in preserving woods from insects. The sap of the tree, like its congener *Semecarpus anacardium*, produces an indelible stain upon linen. Professor Lindley makes Martins responsible for a statement that the nut has a wonderful effect upon chronic inflammation of the eyes, especially such as are of a scrofulous nature, when simply borne or carried by the persons affected. It is also a common belief in Trinidad that a necklace collar of Cashew nuts have a remarkable curative effect upon some of the diseases of the Canine Race, especially for coughs, or distemper.—J. H. H.—*Trinidad Bulletin.*

CULTURE IN WESTERN AUSTRALIA.

It is pleasant to learn, through the agency of the Agent-General, that fruit and vegetable culture are making satisfactory progress in the far-away auriferous portion of the globe which has so rapidly risen into fame all over the world. Orchards and vineyards are gradually being developed in valleys where rivers or streams of any capacity run, and in some places, as in Perth, we are told that Grapes are sold at 4d. per pound. Apricots, Peaches, and Melons also are gradually coming into market, and Strawberries, Raspberries, and Currants are to be found here and there. Of course, where the rainfall is limited in extent, cultivation is a ticklish job, but then irrigation is made to assert its beneficent power, and as population grows, so also does the extent of acreage under fruit and vegetable cultivation. Land is cheap enough, for it is stated that the cost of freehold in farms is something like 10s. per acre, the payment being extended over twenty years = 6d. per acre per annum! And so, possibly, it may come to pass that alluvial gold may by-and-bye be found more easily of acquirement than diluvial—as in California. By-the-way, it may be noted that fruit trees and cuttings are sent from both New South Wales and South Australia. We are reminded by the Agent-General that grass seeds are now placed on the free list of imports, as well as garden seeds. In the tariff-free list are to be found bulbs, fruit, and ornamental trees, sections and grafts, manures of all kinds, plants, and Vine cuttings. The following pay a duty of 5 per cent. *ad valorem*:—Agricultural, horticultural, and viticultural implements and machinery (not garden rollers); wire netting and steel fencing wire, standards and staples.

The increase in the value of timber exports is surely worthy of mention here. In 1893 the value of this export was £33,848, last year this had increased to £74,809. It may not be generally known that the forest region of extra tropical Western Australia occupies an area equal to the whole territory of Great Britain—the intratropic zone of forest is also enormous, and there is many an indication that as time goes on more and more of the timber produced in those regions will find its way to the mother country. *E.C.—Gardeners' Chronicle.*

SEAWEED.

We should be glad to know if there are any among our readers whose experience would confirm or the reverse, a statement made to us that seaweeds will not grow upon coral. Perhaps that statement should be qualified by saying that it was intended to apply in a limited sense only, and that it is admitted that certain of the finer seaweeds attach themselves to coral, but that the formation is deficient as affording a holding for those luxuriant growths such as are everywhere seen along the shores of Great Britain and furnish such a valuable supply of manure. It cannot be disputed, we believe, that around the coast of Ceylon there is a singular deficiency of seaweed. It is to be found, but only in certain localities, and there only in limited quantity. Undoubtedly this is a loss to agriculturists near our sea-shore, and we have been asked if we can explain the deficiency. It will be easy to afford this explanation, if it be correct that the coral of which so large a proportion of our marine barriers consist does not give the required foothold for the larger and stronger growths. We fancy that the same cause operates that we assigned as the reason for the sparseness of shingle on our maritime beaches when discussing that subject some years back. Rock formations are scarce upon our coast lines. Were these more common, we believe not only shingle but seaweed would be both more abundant than they are. We know that the fine rocky headland upon which Fort Frederick stands at Trincomalee is abundantly supplied with seaweed. The Galle harbour, too, where there is a good deal of rock "between wind and tide," furnishes a considerable amount. We have always understood that large seaweeds will only grow when the above condition exists. They must be exposed to the air between high and low tides. If we are right as to this, it must follow that the very limited range of our tides would largely account for the scarcity that is so strongly noticeable along our coasts. If to this cause may be added that asserted to be due to the unsuitability of coral for the promotion of growth, we can have no difficulty in giving the explanation asked of us. But it would be a satisfaction to know if the statement as to that unsuitability can be confirmed, or if it is known if rocks of granite type exhibit in any localities the same absence of seaweed growth as is noticeable in the case of coral.

VENEZUELA.

Everything connected with Venezuela has at the present time considerable interest for all English readers. A lengthy article appeared in *The Times* this week dealing with the condition of affairs in that South American republic, and the extract from this that follows will have a special interest for Ceylon as still a coffee-producing country. It cannot be all beer and skittles to conduct planting operations under the conditions mentioned in this extract:—

Coffee is the main staple of Venezuelan wealth, the cultivation extending in more or less degree to all districts of the Republic where soil and climate are suitable. The port of Maracaybo ships annually some 30,000 tons from the Andine States adjoining Colombia, Puerto Cabello about 7,000 tons from the country round about Valencia, and La Guayra from 12,000 to 13,000 tons from the districts within reach of Caracas. Venezuelan coffee deservedly bears a high reputation, and would gain still more in favour if greater attention was paid to the method of cultivation and preparation for the market. The total area under coffee is estimated at from 180,000 to

200,000 acres, and the average yield at a little under 5 cwt. per acre. The plantations have a neglected appearance generally—knee deep with weeds and the trees unpruned and uncared for. The coffee is grown under shade trees, forming a strong protection from the hot sun. The total cost of cultivation and other charges up to the time of the delivery of the bean in a marketable state in Caracas or elsewhere is calculated at about 35s per cwt., thus leaving a considerable profit to the grower at present values. But many drawbacks exist to deter Europeans from embarking in the enterprise. A revolution breaks out, and the male labourers are requisitioned to serve as soldiers on one side or the other. Other difficulties incidental to these South American countries are always liable to crop up. In the sitting room of Mr. Middleton, her Majesty's former Minister Resident to this country, are two large water-colours. The one represents a coffee plantation at 8 a. m. everybody smiling and happy, and the routine work in full swing; the other shows the same place at 5 p. m. with dead and wounded men on all sides, and a fierce firing going on between the Government troops and the insurgents. I know of no better example of the risks to which the owner of a coffee estate is constantly liable. All these dangers are equally present to the grower of cocoa, and, indeed, to any undertaking necessitating the employment of large numbers of labourers. Under such circumstances it is not a matter for wonder that merchants or others making advances against crops should ask and obtain unusually high rates of interest. The coffee or cocoa, once ready for the market, is despatched on the backs of donkeys or mules to the nearest commercial centre, and there bought for shipment to Europe or the United States.—*London Cor.*

PLANTING PROGRESS IN BRITISH NORTH BORNEO IN 1895.

The *British North Borneo Herald*, of Jan 1 says:—During the year considerable progress has been made in the cultivation of general products. We subjoin notices of the principal items:—

COFFEE has been started in one or two new localities, as, for instance, at the seventh mile stone outside Sandakan, on the Beaufort road, where a Chinaman has planted some 50 acres, while most of the existing estates have been enlarged. The following is the monthly crop of coffee in parchment since June last from the Byte Estate, which is estimated to be about 170 acres, and the average age about 2 years 10 months in July, to 3 years 3 months in December.

July ..	pcls.	23.58	October ..	pcls.	65.02
August ..	"	33.36	November..	"	84.22
September ..	"	44.73	December ..	"	

The monthly advance shown by these figures cannot be considered as otherwise than very satisfactory. The crop is delivered in Sandakan on about the 30th of each month where it is at once sold, and the money sent up to the estate in time to pay the wages on the 1st. Byte clean coffee has been sold in Singapore at \$42.75 per picul for the whole parcel, the outside quotation then being \$43; and the better lines of a shipment from Taratipan fetched 89s per cwt on the London market.

The end of the year sees coffee coming in from Byte, Kabeli, Loong Piasow, Segalind, Western Jarvis, Sebuga, Taratipan and Kudat; the price in Singapore is \$45.60 per picul—higher than it has ever been before; and at the Byte, Taratipan, Kinabatangan Buluno and other places further fresh clearings are in progress for immediate planting.

GAMBIER.—This cultivation is extending steadily at Melinao; three boiling houses are at work and two more will be erected by June to meet the requirements of the young plants now some months in the ground, and it is anticipated that the monthly output will then be 180 piculs. The gambier produced is of the best quality and finds a ready local sale at full prices. Felling for fresh gardens is in progress.

COCONUTS.—This cultivation has only been seriously commenced by Europeans during the last four years, but now at a great many different places round the coast, coconut plantations have been started and fresh ones on an increasing scale are contemplated. As yet but very few of the trees are in bearing but when they once commence, the cut-turn of nuts will be continuous, and will increase until it becomes of large consequence to the country. Every month, at a rough estimate, something like a thousand fresh trees are planted at one place or another.

The dwarf nuts that bear in three years are being watched with interest.

MANILA HEMP.—The satisfactory growth of the plant producing this fibre has been fully proved, and in two or three places there are considerable patches of it, but so far difficulty has been experienced in getting a sufficient supply of skilled labour; several gangs of Sooloos that know something about it have been brought over, but after a short time they have always gone off to more attractive forms of work. Three hundred acres are being opened on home account opposite Loong Piasow and, at worst, natives easily learn the process of extraction by hand.

SUGAR CANE. has been experimented with in one or two places with satisfactory results so far as proving the extremely low price at which the raw material, the cane, can be produced, and its high quality and sugar-yielding capabilities, but up to the present the crushers used have been on altogether too small a scale; one is now at work on the Suan Lamba. It is urged that where the raw material is cheapest that is the place to erect factories for whatever the product may be, and nowhere is cane cheaper if so cheap as in North Borneo; and at the end of the year we hear that negotiations are in progress for the erection of a crusher on a larger scale.

COTTON is on trial in one or two places and promises well. Some of the earlier planted patches were in rather lonely districts and were almost entirely eaten up by deer and wild cattle which seem to have a great fondness for it. The later plantings are in places where these animals will not come. The Park Reserve trees are in good bearing.

COCOA, SAGO, NUTMEGS and other products have been planted by Europeans in several places and in all instances promise well. Samples of cocoa have already been obtained.

TOBACCO.—The prices realized in the latter portion of the year did not fulfil the hopes based on the previous sales. Messrs. Binger & Herschell's "Review of the 1894 Borneo Crop" gives the average price all round of 100 Dutch cents, the London and Amsterdam Borneo Co. again heading the list with 138 cents. Koyah commanded 129 cents or with Lamag an average of 99 cents and Lahad Datu 114 cents. The average of the 4 south Maruda Bay plantations was 99 cents, Benkuka fetching 91 cents; the other plantations varied from 81 to 55 cents. The total arrivals at Dutch ports were 9,794 bales, approximately valued at \$588,000. The present crops however are looking well and considerable progress had been made in cutting before the rainy season set in. At Bilit 630 piculs will be harvested and at Koyah 900. Lamag and Batu Putih are well advanced, the former averaging 5 piculs or a little more per field. Details from Lahad Datu and Marnda Bay are unfortunately wanting beyond the general assurance that the plantations are doing well.

PLANTING IN BURMA.

A planting contemporary points out the grand capabilities for planting enterprise offered by the Kachin Hills and the neighbouring immense tracts of primeval forest, but observes that the extreme scarceness and dearness tracts of labour in the district stands in the way. A correspondent who knows the parts in question believes "the whole country would be an ideal planting district especially for tea. The climate is suitable, and the soil good, but labour is most expensive. There will shortly be a railway, however, to Myitkynia, and produce

would in no case be more than 40 miles away. During the cold weather there is a steamer service on the Irawaddy, and country-boats, which are fairly cheap, are to be had all the year round." The tea-growing region he believes to be one of the best in the world. The height of the hills ranges from 1,000 to 6,000 feet, and the rainfall is abundant—or, as he puts it, there is, "a fertile soil and heaps of rain." *Planting Opinion* asks for particulars as to the possibilities of introducing Chinese labour in that part of Burma, and points out that the district in question being continuous with the Chinese frontier no insuperable difficulties should exist. We may observe, in this matter, that the Chinaman, though a steady and hard-working fellow as a rule, as soon as he leaves the Celestial country has a somewhat exaggerated idea of his own value, usually demanding and receiving wages that would make planting unprofitable if Chinese labour were largely utilised. It is a common thing in Darjiling to see Chinese carpenters who receive as much as R2-8 0 a day, whereas an equally skilful carpenter in Northern India would get only eight annas a day, especially in Behar. If coolies, therefore, and carpenters could be imported from Behar, as also from Dinapore, Patna, and other stations, it would be well. Coolies in Behar get no more than from two to three annas a day, and are glad to get that. Unfortunately, however, the coolie agent, in spite of all his blandishments, finds it difficult to persuade the average Behari to emigrate, even though his beloved country has nothing but semi-starvation to offer him at home.—*Madras Times*, Feb. 3.

THE REV. CHAS. MCLEAN ON TEA IN AUSTRALIA.

The Rev. Chas. McLean writes from Geelong on 15th January:

"I write to ask if you can send to me by the first mail a package of your leaflets about tea, how to infuse it &c., and also a list of those who sell pure Ceylon tea in the towns in Australia. I have been a good deal about since landing in Australia, and so far those I have met are in dense ignorance about Ceylon tea. They do not know where to get it, and even those few who have had samples, do not know how to infuse it. The way here is to put the tea in a tin can and boil it for half an hour on the fire. You can imagine the result!

"We had a very fine voyage from Ceylon to Adelaide, where we landed, and since then have been travelling about a good deal principally in the Mallee country which is noted for its growth of wheat, and the manufacture of eucalyptus oil."

BRITISH CENTRAL AFRICA.

From a private letter just received from Mr. A. Whyte, formerly well-known in Ceylon, we extract as follows:—

Via Chinde, The Residency, Zomba, B.C.A.

21st Nov. 1895.

I have often wished that I could write you from time to time, with some notes about this interesting country, but my duties are so numerous as to leave me no spare time for correspondence. I see, however, by the *Observer*, which I continue to enjoy much, that you are well posted up on what is going on here. By this mail I send you a report I drew up as to what we are doing towards establishing experimental gardens, and from it you may get a few hints as to the capabilities of our soil and climate. I should be sorry to pronounce the country healthy for Europeans, as our death-rate has been very high this season, yet it is not worse than, say, Lower Dikova was when being opened up, and I have no doubt it will become annually more healthy. As to coffee, I do not hesitate to say, I think it is a safe investment here, and there is scarcely a tropical product which we could not grow with success. The country is still in some parts unsettled and insecure

from slave-raiding; but you will see by last *Gazette* that our Commissioner, Mr. Johnston, has gained a complete victory over Zerafi—our most powerful enemy. He (Mr. Johnson) is off again for a month to fight the Arab slavers at the north end of Lake Nyassa, and a tough job he will have; yet I have no fear of his ultimate success.

I am constantly sending home collections of the fauna and flora of the country, and many specimens have proved new to science, and of much interest to naturalists. It is a good game country, too, and the grand antelopes of Africa are still well represented on our plains.

I should like much to write you at greater length, but must deny myself that pleasure as time will not permit of it.

EILA TEA COMPANY, LTD.

A meeting of the Eila Estate Company Ltd. was held in the office of Messrs. J. M. Robertson & Co., Agents and Secretaries on 8th Feb. Mr. Henry Bois presided and present were Messrs. Percy Bois, Gordon Bois (Secy.), Herbert Capper and W. E. Mitchell.

The notice calling the meeting having been read, minutes of previous meeting were read and confirmed.

The CHAIRMAN explained that it was an *interim* meeting and it was not customary to bring forward a printed report, although the Articles of Association provided that a meeting should be held. The yield from the Eila estate during the six months ending 31st December 1895 has been satisfactory, but owing to an attack of helopeltis on Kanangama that necessitated the pruning down of the tea, the yield from that estate has fallen considerably short of expectations; but the visiting agent's last report indicated that the estimated yield for the whole year may still be realised and, in the meantime the directors recommend the payment of an *interim* dividend of 4 per cent. for the half year against 5 per cent. paid for the corresponding period last year. He thought that was all the information that required to be put before the meeting, but the Directors would be glad to reply to any questions bearing on the subject.

The report was adopted.

Mr. MITCHELL proposed that a dividend of 4 per cent. be paid.

Mr. HERBERT CAPPER seconded.

The motion was adopted and the meeting thereafter terminated.

WEEDS IN CEYLON.

It is difficult to understand why the planters of Ceylon have such a holy horror of weeds on their plantations. Here in S. India a certain and increasing number appreciate them more at their true value, and though not going so far as to encourage them generally, yet at certain seasons of the year, actually welcome their growth. In a late number of the *Ceylon Observer* there appeared an editorial on the extreme danger of allowing weeds to grow on estates. A moral is drawn from the agitation going on now in Australia about the spread of noxious weeds in pastures, and we are gravely informed that "the presence of a single estate in a district in which negligence in this respect (in clean-weeding) is permitted, may infect, so to speak, the whole of the area of that district." The analogy between pastures and tea-gardens may be very obvious to our contemporary, but for ourselves we fail to see the slightest connection between them. As an old coffee planter remarked to us the other day, a moral of more value might be drawn from the utter collapse of clean-weeded Ceylon coffee and the flourishing condition of our weedy S. Indian estates. By the way

the danger to Australian sheep-growers lies in the seeds of certain weeds lodging in the wool, which greatly reduces the price.—*Planting Opinion*, Feb. 1.

SELANGOR PLANTERS' ASSOCIATION.

We have to acknowledge receipt of a copy of minutes of a general meeting, held at the Selangor Club on Saturday, 11th January:—

The Chairman, Mr. E. Carey, explained to the meeting that Government had intimated to the Association that the subject of discharge tickets for labourers had been under consideration, and although not prepared to pass a compulsory enactment, would be glad, as an employer of labour, to join in any equitable arrangement for the protection of employers against the wrongful employment of absconding labourers.

A draft of proposed suggestions to Government in connection with the above subject having been distributed to the members present, the following form was agreed to after some little discussion—viz.,

"That owing to the facility with which absconding coolies are at present able to obtain employment wherever they may offer their services, thus causing serious loss to employers, and laying the whole community open to the contingency of having the unpleasant charge of crimping preferred against them: it is desirable that immediate steps should be taken to put this question upon a more satisfactory basis, and with this object in view this Association submits for the consideration of Government the accompanying suggestions, the adoption of which it is believed will go far towards rectifying an evil which is becoming every day more apparent and which, unless checked, may lead to every serious results. It is therefore recommended that—

"All coolies being fresh arrivals in the State should be furnished with certificates to the effect that they are *bona fide* new comers, and therefore eligible for employment.

"All employers of labour, other than day labour, should be required under penalty of a fine of not less than.....to furnish a certificate of discharge to every cooly leaving their employ.

"It should be incumbent upon all employers, on a cooly applying for work, to demand from such cooly the production of his certificate either of arrival or discharge, and anyone found employing a cooly without such certificate, unless able to prove the cooly to have been a servant of his prior to the coming into effect of these rules, should be liable to a fine of not less than

"Employers should be entitled to demand from every cooly applying for and obtaining work, the certificate which he possesses on his arrival.

"In the case of labourers employed and paid by the day, whilst their obligation to produce certificates, as in para 3 should remain the same, employers upon settling their accounts, should be required to return to labourers the certificates originally produced by them, under penalty of a fine of not less than

"Such rules should not be enforced for six months after they have been agreed to.

"Proceeds of fines to go towards cost of supplying passes."

The Chairman informed the meeting that His Excellency the Governor had suggested to the S. P. A. deputation that the Hon. Secretary should address the Resident on the following subjects:—

- (a) Written contracts with coolies;
- (b) Preferential claim to mining rights;
- (c) Arbitration on acquisition of land by Government.

A draft of proposed letter was then read to the meeting and agreed to.

The minutes of the S. U. P. A. general meeting, giving Mr. Hill's scheme for the importation of free Tamil labour, were read, and it was resolved that the subject should be left for discussion at the meeting of the United Planters' Association,

TEA IN AUSTRALIA.

A fair business has been done privately in China tea, sales comprising 2,900 half-chests common congou to medium panyong at 4½d to 6½d 100 half-chests panyong at 7½d to 7¾d 200 quarter-chests buds at 5½d 750 quarter-chests medium buds, 160 quarter-chests buds at up to 7½d and 50 half-chests kooloo. Of Ceylon teas, 280 packages have been sold at prices ranging from 6½d to 11d. Of Indians, 50 chests have been sold at 6½d. The auction sales on Friday last were quiet, and prices realised for Ceylon teas showed a decline, which in some cases amounted to as much as ¾d. The quantity of Ceylon offered was 389 chests, 183 half-chests, and 172 boxes, and the quantity sold was 239 chests, 136 half-chests, and 172 boxes. Fine pekoe and broken orange pekoe realised 10½d to 1s 1½d; pekoe, 6½d to 9d; broken pekoe, 7¾d to 8½d; and pekoe souchong, 5½d to 6½d. Of Indian teas, 929 chests and 100 half-chests were offered, but sales were only made of 91 chests and 31 half-chests, at 6½d to 10½d. At the auction sale of Indian teas yesterday (Thursday) only a small business was done, one of the catalogues being almost entirely passed in, as, although the bids were fully up to and in some cases over late market rates, the importers preferred to hold for an advance, looking at the character of recent advices from Calcutta. The total quantity offered was 2,655 packages ex "Argus," and sales were made publicly of 372 packages as follows:—Orange pekoe, 10d; pekoe, 6½d to 7½; broken pekoe, 6¾d; pekoe souchong, 6½d to 8s; and broken pekoe souchong, 6s. Sales have since been made privately of about 700 chests at an advance on auction bids. Cable advices announce the closing of the Calcutta markets for the season 1895-96, and recommend the holding of recent shipments for price.—*Australasian* Jan. 25.

MARKET FOR TEA SHARES.

Thursday evening, Jan. 23.

Since last writing a steady business at rather hardening prices has been in progress for nearly all Indian Tea shares.

FRESH ISSUES.—We shall in future allude to the Cachar and Dooars and to the East Indian and Ceylon Companies in the sequel under their respective headings.

Mincing Lane has shown a distinctly hardening tendency, and even the commoner classes of Teas are now fetching advanced prices.

CEYLON SHARES.—C. T. P. Co. ordinary are still wanted at 24½ upwards, but holders ask £25. The Prefs. were taken early in the week at 16½, and have since changed hands at 16½, and more is now asked for them.

Ceylon and Oriental £3 shares changed hands as high as 3 3-16, or for the first time at a premium.

Eastern Produce and Estates Co.'s £5 shares are still asked for at 4½ without finding shares.

Lanka Plantations, after being rather a ked for, are now sellers, and 5½ downwards would be taken for them.

New Dimbula.—In our last we strongly stated the price at which the "B" shares had been sold as £17, but we learn that the price was really £18, at which more business has since been done.—*H and C Mail*.

PLANTING AND PRODUCE

BRITISH ASSAM TEA COMPANY, LIMITED.—Adverting to the letter which appeared in our last issue referring to this company, we learn that at a subsequent meeting of the company the shareholders by a large majority passed the identical resolutions, as proposed by the directors, which had been negatived at the meeting of December 18th.

DEATH OF A WELL-KNOWN PLANTER.—It is with much regret that we announce the death of Mr. John Grant, who has been manager of the Needem Tea Company in the Dooars since that company com-

menced operations some dozen years ago. No concern in the Dooars district has been more prosperous, or given more splendid profits throughout, than Needem, and Mr. Grant is well-known as a very successful planter. Though not one of the very earliest pioneers, he was, we believe, the oldest Dooars planter remaining in the district. Mr. Grant was a native of Perthshire, and gained his first experience in tea in Sylhet, where he worked a few years before his engagement by the Needem Company to open out their gardens in the Dooars. He long occupied a prominent position in the district, and was for years captain of the local Volunteers. He was widely known not only as a successful tea planter, but as a most kind-hearted, genial, and hospitable man. He passed away on New Year's Day, and his death is rendered all the more sad as he was just on the point of returning home from India for good, and had been contemplating this step for the last two years or more, without feeling able to break away from his congenial duties and surroundings as the time for saying good-bye approached. It seems too often the case with tea garden managers that they hold on a little too long. The sad news will bring much sorrow to Mr. Grant's many friends, and much sympathy will be felt for Mrs. Grant, who had gone home in advance of her husband, and is now in Scotland.

THE PRODUCE OF VENEZUELA.—*Appropos* the Venezuelan dispute, the principal industries of Venezuela are the cultivation of coffee and cocoa, cattle raising, the growth of sugarcane and its manufacture into sugar and rum for local use, gold mining, and the collection of natural products, such as vegetable ivory, ebony, and other woods, dyewoods, and a variety of articles of minor importance for exportation. Coffee is the main staple of Venezuelan wealth, the cultivation extending in more or less degree to all districts of the Republic where soil and climate are suitable. The port of Maracaybo ships annually some 30,000 tons from the Andine States adjoining Colombia, Puerto Cabello about 7,000 tons from the country round about Valencia, and La Guayra from 12,000 to 13,000 tons from the districts within reach of Caracas. Venezuelan coffee bears a high reputation, and would gain still more in favour if greater attention was paid to the method of cultivation and preparation for the market. The total area under coffee is estimated at from 180,000 to 200,000 acres, and the average yield at a little under 5 cwt per acre. The plantations have a neglected appearance generally—knee-deep with weeds and the trees unpruned and uncared for. The coffee is grown under shade trees, forming a strong protection from the hot sun. The total cost of cultivation and other charges up to the time of the delivery of the bean in a marketable state in Caracas or elsewhere is calculated at about 35s per cwt., thus leaving a considerable profit to the grower at present values. But drawbacks exist to deter Europeans from embarking in the enterprise. Revolutions are of too frequent occurrence.—*H. and C. Mail*, Jan. 17.

THE MANCHESTER DIRECT TRADE IN TEA.—The steamer "Clan Drummond," the second of Messrs. Cayzer, Irvine and Co.'s new service to Manchester from Calcutta, arrived in Manchester early last week. Her Manchester consignments included between 5,000 and 6,000 chests of tea, imported by Messrs. Johnson, Dodds and Co., whose efforts to establish a market in that city have met with success.

CAMPHOR.

CAMPHOR FROM LEAF OIL.—The recent high price of camphor, on account of the war between China and Japan and trade monopolies, has caused some anxiety in countries where it is largely consumed, says Mr. David Hooper, writing in the *Pharmaceutical Journal*, and China and Japan being at present the only two countries where camphor is produced on a large scale, it has been thought desirable that its cultivation should be taken up in other lands. In Japan the camphor trees grow at high elevations away from the sea, and only large trees of about one hundred years old are selected for use in making the camphor. From the export returns of this country it seems that the supply is gradually

becoming exhausted. In the island of Formosa the camphor trees are said to be by no means plentiful, and they grow only in certain favourable situations, as far as the climate is concerned, with savage tribes in the immediate vicinity. Here the trees are not considered worth taking until they are fifty years old, and the wood only of the roots and stems is subjected to distillation.

CULTIVATION IN INDIA.—The camphor tree grows very well in India. The Calcutta Botanic Gardens possess a fine avenue of trees, which were introduced in 1802. It grows well in the Ootacamund Botanic Gardens and in other parts of the Nilgiris. It has been planted, as an experimental measure, at Jhansi in the North Western Provinces, and in other districts in the plains. Camphor has been known and used in India for many centuries. In A.D. 642 Indian princes sent camphor as a tribute or offering to the Chinese Emperors. At one time the tree flourished in Nepal and Tipperah, a large tract of land lying between Bengal and the upper Irrawaddy. Within the present century camphor was imported from Chittigong but it has been said that the discovery of the hill-men of distilling it from the root led to the extinction of the trees.

OTHER COUNTRIES.—In Ceylon the camphor tree grows well at elevations of 5,000ft. and less; and it grows for ornamental purposes in Naples and other parts of Italy. Professor Maisch in 1891 reported on the cultivation of camphor in Florida, where it flourished in almost any soil. California has lately become the scene of an industry which has for its objects the planting of the laurel camphor and the preparation of the oil for the American market. The tree has also become naturalised in Java, Brazil, Jamaica, and other isles of the West Indies, Mauritius, and Madeira. It is very evident that the camphor tree is able to grow very luxuriantly and extensively in the warmer temperate and tropical parts of the world, far removed from China and Japan, but the slow growth of the tree would prevent all but large capitalists from opening up plantations and waiting for the plants to sufficiently mature.

DISTILLING THE LEAVES.—As there is no definite information on this point to be found in any description of the industry, it was deemed interesting to try the effect of distilling the leaves. The first sample of leaves came from an umbrageous tree growing in the Government gardens at Ootacamund. Fifty pounds of the leaves in a fresh state was distilled in a large copper still with sufficient water for six hours. Eight fluid ounces of oil were separated from the distillate, giving the yield of essential oil 1 per cent., yielding 10 to 15 per cent. of camphor. The second sample was obtained from some younger trees grown at Naduvatum on the Nilgiris, a district more than a thousand feet lower than Ootacamund. The leaves were distilled in the same manner as in the previous experiment, but a large quantity of camphor condensed during the process and almost choked up the warm of the still. About four ounces of liquid were collected, having a mass of crystalline matter suspended in it. The oil from the Naduvatum leaves contained 75 per cent of camphor, which is a very satisfactory result. It is interesting to know that a large proportion of camphor can be obtained from the oil of the leaves, and from the leaves themselves, and probably, if taken from the trees grown at a much lower elevation, a much larger proportion of this useful substance could be collected.—*H. & C. Mail*. Jany. 24.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, January 16th.

ESSENTIAL OILS.—Oil of cinnamon-leaf is again somewhat dearer, 5½d has been paid on the spot, and there is no more to be had at that price. Lemongrass oil unaltered. Native oils on the spot 2½d per oz; for arrival 2½d. Citronella oil again slightly dearer, which sales of fair quality; usual conditions, on the spot at 2s per lb, but it is doubtful whether any more can be had at that figure, 2s 2d being the general quotation.

AMSTERDAM CINCHONA SALES.

London, January 16.

Our Amsterdam correspondent telegraphing on Thursday afternoon, states that at today's public sales of Java cinchona bark 5,149 packages, representing five-sixths of the supply offered, sold at an average unit of 3c per half-kilo, which is equal to the price paid at the last sales. The principal buyers were: G Briegleb of Amsterdam, representing the American and English manufacturers who bought an equivalent of 5,925 kilos of sulphate of quinine; the Anerbach Factory 4,111 kilos; the Brunswick Factory 4,616 kilos; the Amsterdam and Mannheim works 6818 kilos; the Frankfort-on-Maine and Stuttgart works 2,066 kilos; and general buyers 3,906 kilos. The prices paid ranged from 7½c to 40c (equal to 1½d to 7½d) for Druggists' barks, and from 9½c to 70½c (equal to 1½d to 1s 0½d) per lb for manufacturing barks. The tone throughout the auctions was firm. The total supply consisted of 6,133 bales and 268 cases of Java cinchona-bark weighing 595,219 kilos, are to be offered. The bark contained the large quantity of 32,473 kilos of sulphate of quinine, being an average of 5.53 per cent for the manufacturing bark.—*Chemist and Druggist*.

MR. G. W. CHRISTISON ON TEA.

On Monday week Mr. G. W. Christison gave one of his practical, instructive, and much-needed lectures on tea at Goose Green, East Dulwich, London. The subject was, "Tea Culture and Manufacture in Darjeeling." At the outset the lecturer gave a brief account of the origin and development of Darjeeling as a British territory as well as a tea-producing district, showing that up till 1815 it was a *terra incognita*; that the first effort to grow tea was made by Dr. Archibald Campbell, the first resident Government official there; and that experimental plots of a few acres in extent were planted, fourteen years later, the first tea garden on a commercial footing having been started in 1858, or possibly a year earlier. In a few words the features and situation of the district were sketched, and the area under tea and population (native and European) employed on the tea gardens and resident otherwise employed were given.

Every operation in connection with cultivation and manufacture was described and illustrated by effective lantern representations, from the clearance for planting out on the hill side with the felled timber strewn over it (a graphic account being given of the lively and exciting scene during the burning), to the carrying of a tea chest up the mountain path on the way to market by a hardy Nepali hill-man, to whose climbing qualifications and powers of endurance an evidently hearty, and no doubt well-served, tribute was paid.

We shall not attempt a full account of the lecture, but may allude in a few lines to one or two points that struck us most forcibly. There can be no doubt that, as pointed out by the lecturer, a matter of extreme importance on estates so excessively steep (as shown by the views) is careful cultivation, by terracing and drainage, to prevent loss of soil not only by the operations themselves, but by wash from the great rainfall which often comes down in sudden and heavy downpours. From the several views, and the description of the coolie houses, and their water supply, which was given, we can not only easily credit that "space, comfort, and sanitation are provided up to and in most instances in advance of the tastes and wishes of the occupants," and that "in most cases all is now being done for the coolies' comfort that is practicable and wise," and we fancy, from what we have learned from friends from the tea districts, that these dwellings cannot fall so very far short of some of those provided for European assistants in other districts within the last few years. The system of leaf-plucking was fully illustrated by views, diagrams, and description, also by groups of coolies at work on the hill sides. In regard to manufacture every operation was made clear from the weighing of the leaf on its entry to the factory, "green, fresh, but often wet," till its discharge from the drying machine, "crisp, wiry, and black," and up till the chest was sent on its way to market as referred to. The changes that take place upon the leaf during the various operations were clearly pointed out. Specimens of the various machines were placed on the

screen and their action explained. No one could fail to be struck by the immense advantages in regard to cleanliness of the Indian mode of manufacture by machinery, now all but universally adopted, compared with the antiquated and unsavoury methods of hand and feet manipulation still practised by the Chinese. Views of some of these reprehensible practices were exhibited in contrast to the approved modern Indian methods. Another point rendered strikingly clear was the skill, care, labour, and practical many-sidedness required of those who would efficiently discharge the multifarious duties required of a planter in field and factory.

At the close Mr. Christison called special attention to the fact that his lecture must have gone some way to make clear that, in addition to the inherent superior quality of Indian over Chinese tea, was its immense superiority in regard to cleanliness of preparation. He pointed out that this subject might be much elaborated and he hoped soon to have views to display the contrast more fully. The subject was alone ample for an entire lecture. Speaking of the industry generally, he (the lecturer) doubted whether the producer realised more than half the price for his teas that he did twenty-five years ago; still, in most cases, with skill and industry he was enabled to carry on showing more or less profit over an average of years. This result was due to various causes, of which he had no hesitation in naming as the two which had contributed more than any others—labour-saving machinery and the fall in exchange. There were many subjects requiring a lecture to themselves he had only been able to touch upon very briefly; many others, such as the chemistry of tea, manufacture, &c., blights, manuring, management of natives, the labour question—all of vast importance—he had never once alluded to.

One matter, though only incidentally alluded to in the few introductory remarks referred to, seems startling. It is the fact that the hill district of Kalimpong, annexed from Bhootan in 1865, is "larger than the entire Darjeeling hill territory, and though a most desirable residence for Europeans, and as suitable for European colonisation as anywhere in the Far East can possibly be, it has been reserved by Government entirely for natives, and is now largely in the possession of Nepalese, who are *aliens*, though grants of land there were persistently refused to Europeans by our Indian Government."

The chairman, Mr. John Somerville, member of the Camberwell Vestry and Board of Guardians, in moving the thanks of the meeting to Mr. Christison for his "interesting and instructive lecture," said he had learned a great deal, and had many of his vague and erroneous ideas about tea manufacture corrected. He dwelt upon the universal ignorance on the subject which he felt certain prevailed amongst the very large majority of people of this country who had been drinking tea all their lives.—*H. and C. Mail*, Jan. 24.

THE TEA MARKET

shows further improvement, and all Teas with point and character command good competition. The long spell of low prices look like giving way to a position for remainder of the season to the advantage of importers. Supplies will not be equal to the deliveries, and the corded stock is moderate. The clearances for the month exceed those of last year which were in advance of any former period.—*L. & C. Express*, Jan. 24.

THE BLACKSTONE ESTATE COMPANY.

An ordinary general meeting of the Blackstone Estate Company, Limited, was held in the office of Messrs Carson & Co., the Agents and Secretaries, on 5th Feb. Mr. J. N. Campbell presided, and present were Messrs. G. J. Jameson, H. Creasy, Percy Bois and E. R. Waldoek.

The CHAIRMAN proposed the adoption of

THE DIRECTORS' REPORT

which was in the following terms:—

The Directors have pleasure in submitting their Report and Accounts for the year ending 31st Dec. 1895.

The crop secured was 118,828 lb., being 1,172 lb. short of the estimate, but including 11,767 lb. derived from bought leaf represented an aggregate of 130,595 lb. Tea dealt with by the Company.

The sales realised R52,316.57, or an average of 40.10 cents per lb., while the expenditure thereon, exclusive of items under Capital Account, but including cost of bought leaf, amounted to R30,154.04, or an average of 23.11 cents per lb. The balance available for distribution to the Shareholders is R13,633.13 after providing

	R.	c.
For interest on debentures	..	2,342 99
Depreciation on building and machinery..	3,344	73
And other items connected with the management of the Company amounting to	..	2,886 68

Total	..	8,574 40

The Directors have, in view of the bulk of the manure being recently applied, deemed it only necessary to charge one-third of the cost in the current year's accounts. From the beneficial effects of the manure on the older Tea land which may reasonably be expected during 1896, they hope the balance of such expenditure will be more than provided for by an increased yield.

The Coast Advances outstanding amount to R4,298.70, and being certified to by the Superintendent as recoverable, rank as an Asset.

The Directors recommend a dividend of 8 per cent out of the available balance profit which will absorb R10,400, carrying forward R2,500 to a Reserve Fund, and the balance R733.13 to next year's account. The debentures amounting to R40,000 commence to be repayable in 1900, but the Directors propose making provision for their redemption by an annual increase of the reserve fund proportionate to the results of the year's working.

The Superintendent estimates the yield for 1896 as 140,000 lb. Tea.

The following is an analysis of the yield of Tea for the past year, viz.:—

Acres.	lb.	
190 yielded	.. 109,684	or an average, 578 lb. per acre.
52 new clearing planted 1892..	7,705 lb.	
12 do. 1893..	1,259 lb.	
-----	-----	8,964
254 yielded	..	118,828 lb. Total yield of Tea.
36 planted 1894.		

290 under cultivation.		
50 forest available for Tea.		
53 uncultivated.		

393

Of the land available it is determined to open for cultivation upwards of 25 acres this year.

At the meeting held on Saturday, the 18th January Messrs. J. N. Campbell, H. Creasy, and G. J. Jameson were re-elected to serve on the Board for the year now entered upon.

The appointment of Auditor for the current year will rest with the meeting.

Mr. BOIS seconded and the report was adopted.

Mr. WALDOCK proposed and Mr. Bois seconded that a dividend of 8 per cent be declared and paid forthwith. Resolved accordingly.

Mr. Bois proposed that Mr. Hercules J. Scott be appointed auditor and his remuneration to be fixed at R50 for each audit.

Mr. CREASY seconded, and the motion was adopted.

The proceedings then terminated with a vote of thanks to the Chairman.

CURING COCOA.

The following "notes on curing cocoa for small settlers" are published by Mr. Cradwick, Superintendent of Hope Gardens, Jamaica, under the authority of the Department of Public Gardens and Plantations of that colony:—

The first important point to be observed when about to cure cocoa is that it must be quite ripe, but not over-ripe. The pods must have attained their full color whatever it may be, but if the beans shake about easily then the pod is over-ripe. The reason is that is the beans are not ripe, the mucilaginous matter covering the beans is not properly developed into the stage when it will readily ferment. If left to get over-ripe, the mucilage commences to liquefy.

The best vessel in which a small cultivator can ferment cocoa is an ordinary flour barrel. To prepare this for the reception of cocoa beans, first bore about a dozen holes, each half an inch in diameter, in the bottom of the barrel then place about ten in of banana trash in the bottom of the barrel. Line the sides also thickly with trash, and have a sufficient quantity on hand to cover the beans when placed in the barrel. When the barrel is ready, break the whole of the pods and place the beans in the barrel, covering with the banana trash. The beans must be left to ferment for two days, then remove one-third of the beans and lay them in a heap on the floor and mix them thoroughly; remove the balance of the beans and mix them also, but do not put the two heaps together. After placing fresh trash in the barrel, put the beans which were at the top back into the bottom of the barrel and those which were at the bottom, place at the top. Cover with trash in the same way as before and leave for two more days, when the beans should be treated in exactly the same way as before. They should then be left for two more days, when they are to be taken out and washed thoroughly. On the day the beans are finally removed from the barrel the work should be commenced very early in the morning, so as to get all the sun possible on the first day, for the beans mildew very quickly. They should be washed immediately they are taken out of the barrel as this helps to keep them plump.

The proper amount of cocoa to ferment in one barrel is the quantity of beans obtained from 1,000 ordinary sized pods. If many more than this are put into one barrel, the fermentation is too great and the beans turn black.

If a less quantity, say below 700 pods, are to be fermented, the green trash and more of it must be used, and a weight not exceeding 28 lb. placed on the top which helps the fermentation.

When the cocoa is being dried, it is not advisable to expose it after the first two days to the extreme heat of the midday sun, it is better to take it in about 9 o'clock, and then put it out again between 3 and 4 o'clock. Those who use evaporators are warned against an excessively light temperature.

Great care must be taken when removing the pod from the trees that they be cut off with a good sharp knife, not pulled off. If pulled off, the little knob at the base of the stem of the pod is injured, and the tree will not bear from the same spot the following year. If the pods are cut off carefully, the trees goes on bearing from the same spot year after year. —June 1895.—*Sugar Journal*, Nov. 15.

said that when he looked into this case he saw that the contract was made in Ceylon, and therefore all questions as to its validity must depend upon the law of Ceylon. It was not like the case of a contract in England, and it therefore struck him that the evidence as to the law of Ceylon was very important, far more important than Mr. Oswald seemed to have considered, and he thought it would not be right to let the evidence stand in the way it did unless they were prepared to admit that by the law of Ceylon the contract was invalid, and could not be enforced at all. He had looked at the only evidence given, and as it stood it was somewhat dubious, though he thought that was the intention of the witness who gave it. But whether that was so or not, he remembered that Mr. Oswald had tendered another witness, but did not call him, being under the impression that the witness who had given his evidence was taken at conclusive upon the point. He understood that Mr. Hopkinson was not prepared to adopt that, and if that were so the case ought to be restored to allow Mr. Oswald to call his witness, and then, if necessary, he would give Mr. Hopkinson liberty to call evidence on the subject. If he might say so, he thought the case was argued too much on the footing that it was like an ordinary case of contract here with regard to land abroad, and that the same considerations would apply.

Mr. OSWALD remarked that he argued that the contract being in Ceylon, the law of Ceylon applied.

Mr. Justice ROMER said it was a question whether it would not be the best course to dismiss the action without prejudice to the plaintiff bringing an action in Ceylon, as there was a claim for payments that had been advanced by the plaintiff. The main case, however, was that the plaintiff was entitled to get one-third of the profits of the estate. He should like to have the matter thoroughly looked into, as it would be unsatisfactory to dispose of it in its present condition, and therefore he proposed to have it restored to the paper for further evidence and argument.

Mr. OSWALD said he would prefer to have the action dismissed at once without costs.

Mr. Justice ROMER said that so far upon the merits if he could have decided in favour of the plaintiff he would have done so, and he could not help thinking that if Mr. Oswald's clients were honourable gentlemen under any circumstances they ought to return the money that was advanced.

Mr. Oswald said that an offer of a very much larger sum was made, and it was refused.

Mr. Justice ROMER had no wish to put the parties to any further expense, and he therefore asked Mr. Hopkinson if he would consent to a judgment for the amounts advanced without costs.

Mr. HOPKINSON was prepared to accept that; but till he should like to have a little time to consider it.

Later in the day Mr. HOPKINSON said that though he was himself satisfied with the evidence as it stood, it was thought it would be better if there were some discussion upon it, and therefore perhaps it would be better to restore it.

Mr. Justice ROMER thought so also, and asked counsel to mention it again to him when it was ready to be restored. He would only say at present he thought from a sense of honour the plaintiff ought to be treated liberally.

The subject then dropped.—*Sectman*. Jan. 18th.

A TEA ESTATE AND THE LAW OF CEYLON.

In the Chancery Division of the High Court of Justice in London yesterday, Mr. Justice Romer mentioned the case of *Dickson v. Law*, which came before him on the 20th December, and was brought by Mr. Dickson a marine engineer, residing at Duntocher, for a declaration that Mr. Law was a trustee for him of the third part of an estate now belonging to Mr. Davidson, the third defendant, residing at Middlesborough, and which was a tea estate in the island of Ceylon. In the action Mr. Hopkinson, Q.C., appeared for the plaintiff; and Mr. Oswald, Q.C., for the defendants. His Lordship

A NEW TEA COMPANY.—The cry is still they come. The latest company is the Rondura Valley Tea Company, which has been formed to acquire the Rondura and Broadlands estates, situated near the Ginigahtenne gap. The estates are quite young, and consist together of 350 acres of tea in bearing, and 200 acres of reserve, mostly forest. The price paid was R250,000. A new factory is to be erected on Broadlands, and, as the jat of the tea planted is high, and the soil good, the company ought to do exceedingly well at the price paid. All the capital has been subscribed, we need hardly add. Messrs. J. R. Robertson & Co. are the Secretaries, and Messrs. Henry Bois, A. E. Scovell, and Alfred Scovell, are the provisional Directors.—*Local "Times."*

ON TEA.

THE SECRETS OF MINCING LANE AND ITS IMMENSE TRADE.

One of the most remarkable buildings in the world is the Commercial Sale Rooms, Mincing-lane, in which it is estimated that merchandise to the value of nearly £1,000,000 changes hands every day. There are about twenty auction-rooms, each capable of accommodating between two hundred and three hundred persons; and the "items" disposed of are of such magnitude as to amaze the casual observer. For instance, the sale of 20,000 chests of tea, each containing a hundredweight, is considered quite an ordinary day's work.

It was here that the present writer met Mr. John Layton, the well-known tea expert, who has had nearly forty years' experience in Mincing-lane, and during the short chat which I had with that busy gentleman, I gleaned a good deal of interesting information concerning the tea trade.

There are now some 500,000 acres of land under tea cultivation in India, and that country, together with Java and Ceylon, produce more than two-thirds of the tea imported into the United Kingdom, which, by the way, is something like 250,000,000 lb. a year.

THE "HEATHEN CHINEE" TRADE.

The guileful "Chinee," it appears, is out of the running altogether, by reason of the rubbish which he has of late years considered good enough for the English market. The Rungsook Tea Estate is one of the smallest plantations, and covers only 100 acres; while that of the Assam Company is 9,068 acres in extent. The produce of every important Indian estate is brought to Calcutta and forwarded thence to the docks in London.

Dealers and merchants send a couple of men down to the tea-laden vessels and secure a number of two-ounce samples, which are subsequently paid back, because hundreds of tons of tea are annually consumed in this way.

Then comes the tea-tasting, to see which is quite as wonderful, and far more interesting, than any feat performed on the variety stage. Along polished counters twenty or thirty feet in length, rows of cups are ranged, and just behind each of these is a shallow tin canister containing the day tea, which will presently be brewed. At short intervals "standard test caddies" are placed, and on these are printed details of former price and quality, so as to guide the taster; the latter, however, usually prefers to rely entirely on his own judgment. All being ready, the weight of a sixpence in tea is placed in each cup, and boiling water poured upon it. After some little time the expert commences tasting, attended by an assistant, who has a catalogue of the day's sales.

THE TASTER AT WORK.

The assistant calls out the name and gross quantity of the tea, while the taster takes a mouthful from the cup, and after a moment's pause ejects the liquor into a large copper vessel. Immediately after this the expert determines the price to a farthing which the buyer will be safe in bidding for that particular consignment.

Some tea is unhesitatingly condemned; and it is nothing short of marvellous to watch two experts going over the same samples at different times, rejecting and pricing in exactly the same manner, although the various dry and liquid teas look, taste, and smell all alike to the uninitiated. Of course the tea-taster must take care of his palate; he rarely indulges in alcoholic stimulants, smokes very little, but drinks large quantities of fresh milk.

DANGERS OF TEA-TASTING.

The greater part of his work is done in the morning, and he can get through 300 or 400 samples between nine and twelve. In time, however, he becomes extremely nervous, and a perfect martyr to chronic dyspepsia. So surprisingly expert do the Mincing Lane men become that many can actually name the estate upon which a certain tea was grown, after having tasted a mouthful of the cold liquor.

A deposit of £1 on every chest bid for is required by the vendors, and if the purchase is not completed

within three months, the deposit money is forfeited, even though it should amount to £7,000, as in one case.

Some little time ago a parcel containing 15 lb. of "fancy tea" from the Gallebodde Estate, Ceylon, was received at the sale rooms. This small quantity was the product of many acres, and consisted of very small golden tips, of which there are about six on each bush; these tips had to be gathered on strips of flannel, so minute were they, and so tedious the task of picking.

THE FINEST EVER GROWN.

The bidding for this tea, which, by the way, was exactly like fine bird's-eye tobacco, commenced at 86s per lb., and finally reached £8 10s. It was considered the finest ever grown, and a man had to walk three miles through the plantations before he could gather a single pound.

It is a noteworthy fact that many members of our aristocracy are first-rate judges of tea, yet they rarely pay more than two shillings a pound for it, whether required for private consumption or for five-o'clock reception after State Drawing Rooms. The late Duke of Marlborough, however, had a special tea imported for his own use in large quantities, for which he paid 4s 6d a pound.

Lady Hothfield is really a tea expert; so are the Duke of Connaught, Mrs. Gladstone, the Marquis of Ailsa, Lady Margaret Cecil, the Countess of Suffolk, Countess Cowley and the Countess of Portsouth.

Our greatest private tea-consumer, however, is probably the Bishop of London, who, it is averred, is supplied by one firm with no less than 300 lb. a year.—*Evening News*, January 21.

COFFEE IN GUATEMALA.

The *Bulletin de Musée Commercial* publishes an extract from a report of M. E. Capouillez, Treasurer of the Government, in which he says that coffee constitutes almost the sole article of export from Guatemala. Thus in 1894, out of a total value of 20,325,000 piastres of goods exported, the value of coffee alone reached 19,406,000 piastres. The export trade is carried on through the ports of Champerico, San José, Oco and Livingston, and the principal countries of destination are Germany (342,000 quintals in 1894), United States (130,000 quintals) and England (108,000 quintals). Coffee pays an export duty of 2 piastres, one of which is to be paid in gold (a piastre equals 5 francs). In 1891 a sum of 1,141,533 piastres was thus raised, plus 594,910 piastres in addition on the exchange on that part payable in gold, making altogether a total of 1,736,443 piastres. The exportation of coffee from Guatemala has not increased much during the past five years. Want of labor is the principal reason of this. The Indian only works when he is obliged, and experiments with Kanaka and Japanese labor have not yielded good results.—*American Grocer*, Jan. 8.

"THE PLANTER" writes:—"A private letter from a friend in the coffee region of East Africa bears unexpected testimony to the fact that the early, and seemingly incredible, trials of planters in India are now being endured with unconquerable determination by Scotsmen and Englishmen in the Dark Continent. The writer says that he never saw Europeans in a more miserable condition. Having no connection with the authorities, and being there simply to stake their lives on coffee, several Scotsmen are living in the most veritable native huts, with boards to sit on and eat off, with scarcely a change of clothing—one was actually shirtless owing to some exigence of life out there—and with nothing to read and nothing to do except to watch their coffee. Locusts come up and eat the seedlings, when the men patiently sow the field over again. More than one planter has sown his field thrice in the last season. Such men will succeed, or be followed by others who will succeed. They are the sort who have made India what it is, and who alone can carry it on as it is."—*M. Mail*.

THE ASSIMILATION OF NITROGEN BY
TEA PLANTS.

Dear Sir,—Enclosed please find a contribution to your Magazine "The Indian Forester"—which I trust may be accepted. The vast subject of *cultivation* has received a deal of research from me within the last fifteen years.—Yours faithfully,

GEO. W. C. COCK.

Notes on "Assimilation of Nitrogen through the Agency of the Root Tubercles in certain Papilionaceæ."

[From the Dictionary of Economic Products Vol. V, No. 169 a.]

1 It is now a recognized scientific fact that certain of the Papilionaceæ (called so because their flowers resemble the wings of butterflies) have the property of absorbing nitrogen, which sets up a disease on the rootlets in the shape of small nodules. In these nodules bacteria are bred. When ripe, the nodules burst, and the higher plants—in our case tea—have the power to feed on those bacteria so set free.

2 For the above information we are entirely indebted to Dr. Watt, C. I. E.

3 Now, our object is to make use of this information. The way we would suggest is as follows:—

Select a convenient spot near the Tea Garden, in forest land if possible. An acre or so would do nicely. Prepare the soil as we do in making a Tea-seed nursery. When the land is ready, sow broadcast seeds of Saw (*Albizia stipulata*) or Sensitive Plant (*Mimosa pudica*) the latter appears to us to be more suitable as the rootlets are swarming with those nodules.

4 At the same time a Saw nursery should be prepared. When the trees are of a decent height they may be planted in the Tea Garden say 48 feet apart.

5 Now we come to what we consider of vital importance. The soil of the Sensitive plant nursery after a few months, should be carried away and spread around and below the Saw trees, which we have already planted in our Tea Gardens, as it will be found to be simply impregnated with nitrogen bacteria. These bacteria will fix on to the Saw tree rootlets and set up the irritation which is the cause of the disease which we see in the shape of nodules. These on becoming ripe, as we have seen before, burst and let loose bacteria which the higher plants—in our case Tea—have the property of living on.—*Indian Forester.*

MR. BLECHYNDEN'S PROGRESS.

Extract from letter, dated New York, 13th Dec. 1895, from R. Blechynden, Esq.

MRS. TIPTON.

I propose in this letter to give some details of the work being done by Mrs. Tipton, in continuation of my letter on the same subject, dated the 13th October last.

During the time the Food Show was running in the Madison Square Garden, Mrs. Tipton passed a great deal of her time there, as she had charge of the arrangements for us in the High tea-room, and used the opportunity to get into contact with the different ladies' organisations that we were desirous of utilising. During October, T. Anderson, a grocer, with a very larger number of stores opened a new one and made a particular request that Mrs. Tipton should assist on the opening night and serve tea. This she did with the assistance of a colored girl and of a man whom we dressed up in one of the Khitnagar's uniforms, to the great satisfaction of Mr. Anderson. There was a good deal of work in connection with one or two of the societies, helping them generally making tea sberbet and seeing that they looked after the tea samples we gave them to sell. The acquaintances thus formed have in some instances already proved of use, and have led to work, and others will do so hereafter. One of the results of the High teas was a tea given at The People's Tabernacle, where several of those who were present remembered the tea being served at the Fresh Air Excursions; some ten gallons of tea were served on this occasion, 23rd October.

A very large number of people were interviewed, and the managers of every one of the organisations which had days for High teas. Many of these were useless and will lead to no result while others, as I have said, have already proved fruitful.

POLITICS AND PURITY.

On Election Day (5th November), Mrs. Tipton helped at one of the Election stations in the Italian quarter of the town, where a number of the ladies connected with the Social Purity and other societies had a refreshment and tea booth in a large building. Tea and coffee were served, but the people were poor and not of the class who drink tea, being mostly Italians. Some five gallons of tea were served during the day and much of it taken by the officers, police and others at the halls. The work was done principally to get into contact with the ladies who concern themselves so much about politics, and who have, in their own way, some influence through the clubs to which they belong. Many of the ladies Mrs. Tipton met during the day and in the evening are well known by name and will be useful to us.

TEA AND MUSIC.

On the 16th November Mrs. Tipton attended a "Musical and Tea" given for the benefit of a Christmas Tree Fund in connection with a church in Brooklyn. The reception was given in a private house and admittance was taken in the shape of a dressed doll from each of the visitors. These, I believe, were afterwards sold. The house belonging to a Mrs. Smith, at which the reception was given, is in the best resident part of Brooklyn—211 Lincoln Place. The space assigned to Mrs. Tipton and the method in which these affairs are conducted, I will describe in Mrs. Tipton's own language as the affair was typical and this one description will serve for other similar functions we have attended:—"The space assigned me for the tea was an alcove (three windows) in the music-room which was between the parlour and dining-room. These windows I draped with the Indian goods. I covered the arch with a border and draped the sides, covering completely all wood work. The tea table was covered with an embroidered cloth ("phulkrie.") I had a small table for the packet teas to be sold from, and on this table I had a large palm. The dining-room was used for cake and candy sales, and with the folding doors open the three rooms were practically one. The tea table was very pretty, having a full tea service of silver, two high unique silver tea-pots and a sugar bowl, Dresden tea caddy and about fifty or sixty beautiful after-dinner coffee cups. The tea (which was supplied by Tetley's agent by arrangement made with him by Mrs. Tipton) arrived at three o'clock just as the first carriage drove up. We served from 3 to 6-30 p.m. fully 200 out of the 300 guests. Owing to the music and the recitations in the music-room, it left me very little opportunity to talk tea. I sold 6½ lb. in lb. packets."

AN UNPROMISING LINE.

On the 26th November Mrs. Tipton went with some ladies, who go there every year, to Blackwell's Island, where there are a number of Government institutions, including hospitals, lunatic asylums, etc. The party was made up of charitable ladies who go regularly before thanksgiving to give some of the unfortunate people confined there in the Epileptic Ward a dinner. The idea of Mrs. Tipton's going was to keep in touch with the ladies and get them to be accustomed to call upon her for services and to get at the doctors. Tea was served, but I don't think it will lead to anything.

"HELPERS OF THE HOLY SOUL."

On the 27th tea was served at the Stanton Street Mission at the request of Mr. Pearson of the United Charities and on the 30th, in accordance with arrangements made some time before, at the Waldorf Hotel, the finest hotel in the city, one of the most fashionable and "tony" in the country. A Reception and Bazaar was given by the "Helpers of the Holy Soul," a Catholic order, which was inaugurated at the Waldorf by a tea, admission being by card at a dollar a head, and, it was carried on for the three days subsequent at the Con-

vent of the "H. O. T. U. S." (I believe the full title of the Convent is "Helpers of Holy Souls in Purgatory.") The tea was made the special feature at the Waldorf, although there were the usual Bazaar nick-nacks, flowers, etc., sold, and the small sample boxes of tea were sold at the high price of 25 cents each, the usual price we have sold them being 10 cents. The table which was laid out in the best style by the Hotel people was crowded the whole evening. The Bazaar was continued at the Convent, where one room was given up to the tea and laid out with small tables and chairs, I supplied the new packages recently described and of which I sent a sample, and sent first 6 lb. which was sold at once and order taken for another 6 lb. Some difficulty was experienced at the Convent, as strangers are not allowed in the kitchen, and we had to arrange to meet this with our own gas stove.

FAIRS.

On the 19th to the 21st November there was a Fair held by the Y. W. C. A. at Ellerslie Hall in Harlem (126th street.) A small room was set apart for the tea beside the refreshment room, in which also the same tea was used. The room was hung with our Indian draperies and made to look very nice, and the tea was served by several young ladies, our own colored girl, on whom we can rely for making it properly, being behind a screen and making the tea. We got a supply of tea free from Tetley, and they also sent some packets to be sold, the proceeds to go to the fund. In all some 20 lb. was used and sold in the three days. On the same three days there was a Church Fair at St. Thomas' Church, Brooklyn. Tetley gave 10 lb of tea in half-lb. packets, and we kept a girl there on whom we could depend to make the tea, which was served by two of the young ladies in native costume. The Church choir had charge of the Grocery Counter, where the teas were served and where there was everything from a barrel of potatoes upwards for sale, all donated by different people, some by way of charity and others, like ourselves, with an eye to advertising.

On the 3rd December a Fair opened at St. Andrew's Church, Harlem. We had a colored girl to make the tea and presented 5 lb of the new 1/2 lb packets. But as the India-Ceylon Co. had also given tea, we did not interfere further or push the matter at all. This affair went on from the 3rd to the 6th.

On the 4th December there was a "Birthday Party" given by the Westminster Presbyterian Church, Brooklyn, the name being given to affairs of this kind where those attending are expected to bring one cent for every year of their age. The school-room was set aside for the entertainment, and the corresponding room above it was for the tea; after the entertainment closed I gave a lecture with the aid of a professional who handled the light and lantern as I have no assistant; the charge strikes me as high, viz., \$12.50 for the evening. The lecture lasted just an hour and was quite successful, and some music and recitations followed. After this the whole of the company present—some 250 people—adjourned to the room upstairs, where tea was made by our own colored girl and served by three of the young ladies of the congregation dressed in native costume. I supplied six pounds of tea here in the 1/2 lb. packets.

A great deal of time has been given to trying to get a footing at the Jewish Fair in aid of Hebrew charities, which is now going on at the Madison Square Garden. Ever since the Food Show we have been trying to get a chance to get in here with some of the numerous Jewish ladies with whom Mrs. Tipton came in contact then. The Fair is a very important one as the Jews are powerful people here and they have organised the thing very cleverly. Yesterday, for instance, was "Military Day" and also "Authors' Day," and in addition to the uniformed Militia men, several more or less well known authors sold copies of their own works, and Melba and similar operatic and theatrical stars had booths. We struggled against some difficulties here, as Fisher of the caravan tea is a Jew and has his tea made "Kosher" (or whatever the

term is for ceremonially pure) by having the head Rabbi in New York bless or purify it in some way. The lady on whom we relied for help is unfortunately ill and so we were at some loss, but Mrs. Tipton managed to get a space in the "Russian Booth," where Fisher has also his caravan tea and where we are thus brought into sharper competition with him than I would have wished had I choice. I have presented some packets of the tea and will give as much more as they can sell as the Jews are great drinkers of black teas and want the best of everything.—*Indian Planters' Gazette*, Feb. 1.

TIN TEA CHESTS.

The movement already set on foot to carry out the suggestion made by Mr. Frank Randell, of Lanelly, of superseding the present means of conveying tea in wood boxes by substituting boxes of tin has resulted in several gentlemen connected with the tinsplate trade taking the matter up in a practical way. Among them Mr. G. F. Dewdney, of the Cambrian Tinsplate Works, Dumballs Road, Cardiff, has taken out a patent for a tin tea-box, which is to be brought before the notice of the Tinsplate Makers' Association of South Wales and Monmouthshire. The box, which is remarkable for its simplicity of construction, is made of one cross tin, and is formed of four separate plates which fit together in grooves by which means the box is made air-tight. The object of making the box to take to pieces is, of course, so that when shipped out from the place of manufacture to the tea fields it shall occupy as little space as possible. Mr. Dewdney has sent a sample of his box to Messrs. Webb & Williams, of the Hendry and Glamorgan Tinsplate Works, Pontardulais, and that firm is now in communication with London firms of tea packers, who, in the course of a few days, will express an opinion as to the suitability of the box for the purpose intended. If such opinion be favourable, Mr. Dewdney will, it is said, at once commence to build additional works, for which plans are now drawn up, and the manufacture of his box will be carried on in Cardiff.—*Iron and Coal Trades Review*, Jan. 17.

CORAL STONE.

We doubt if the value of the coral deposits in the northern part of this island is fully recognized. In them our builders have a source for material that might be usefully applied to many of their purposes; and we believe that hitherto this fact has not been fully appreciated. But what we should like to be informed upon is as to why this formation should so materially differ, as we believe it to do, from any coralline formation in any other part of the island. South of Mannar island, so far as we are aware, no solid deposit of coral, capable, as is that north of that limit, of being cut into large slabs and blocks, is to be found. The southern coral growths are characterizable only as "stick" or "branch" coral, and are of no commercial value, save for the manufacture of lime. What is there about the northern waters that tends to cause this distinctiveness of coral formation? And, further, what can be the originating cause of the difference of structure? By some it is thought that the coral stone of the north is due to the deposit throughout long periods of the broken "stick" coral and the consolidation of its debris by the pressure of the relatively still waters of our northern region. It seems difficult to assign any more likely cause; but some other suggestion may offer itself to the minds of some of our correspondents. The stone of the north has long been used in many departments of building. It is admirably suited by its lightness and toughness of texture for use as arch stones, being very readily shaped by an ordinary saw. Several long arched bridges

have been built with it in the Jaffna Peninsula and have proved its great durability as a building stone. It has also been applied to ornamental uses, the dressings and Gothic windows of St. John's Church at Chundikul having been constructed of it. Cut into slabs it has furnished the covering for nearly all the road drainage of the same locality. We cannot but think that much employment could be economically found for this stone in our southern districts, its extreme lightness favouring the cost of freightage. It would be interesting to learn what is known as to the composition of these valuable deposits, as to which we have hazarded a conjecture.

VARIOUS PLANTING NOTES.

LAND FOR SALE IN THE WYNAAD.—Virgin forest land in the Wynaad, suitable for tea cultivation, and situated at an elevation of from 3,000 to 4,000 feet, in blocks of 500 acres or more, is advertized for sale. Small blocks of 100 to 200 acres of coffee land in full bearing, adjoining forest land are also offered for sale.

TEA IN THE WYNAAD.—The Price fetched by the first break of "Eramaculla" Tea in the Home market was 9½d, not 9d as stated in the telegram from London. By the details given in Messrs. Gow, Wilson and Stanton's price-lists, to be found in our market-supplement, it will be noted that the shipment was a very representative one. These results reflect great credit on the Company's Tea Superintendent, Mr. Nicolls, who has had several years experience in Ceylon. The corrected prices, by the way, are 1½d above the week's Indian average.—*Planting Opinion*, Feb. 1.

LIBERIAN COFFEE IN PERAK.—In the Lower Perak Monthly Report for December 1895, Mr. E. J. Brewster, District Magistrate, says:—

I have visited the various small agricultural settlements and was disappointed to find so many people had left; various reasons are given; at the same time I am glad to report that the Liberian coffee gardens, when sufficiently drained, have come on wonderfully. The Chinese who have planted a little say it pays them well now; one Malay told me he had sold over four hundred dollars-worth off his holding and was extending it, the trees look remarkably well. I hope to be able to assist the Javanese settlers a little during 1896; they have cut many drains themselves. It is people like this I like to help, who are not above doing a stroke to help themselves.

TANNING.—Mr. F. C. W. Webb, a practical tanner, curer, and leather-dyer at Dharavie, in Bombay, is credited with being the inventor of the latest process of the art of tanning, which promises to revolutionise that art, at least in India. He has applied to the Government of India for permission to patent his invention. It is claimed for this process that it entirely dispenses with the use of any chemical substances or compounds, that it will supersede all systems in vogue in India by its effecting a saving of 75 per cent of labour to the manufacturer, and of 25 per cent to the public in cost, and lastly, that it will convert raw pelt into the finest tanned leather in from 24 to 48 hours (a thing which at present, by the best processes, takes nearly as many weeks to accomplish). This is regarded as its principal merit. The advantages in the tanned material by this process in Mr. Webb's machine are said to be:—The leather will have better weight and colour, and cost 25 per cent. less; greater durability and suppleness, with equable firmness (as good as that done by the 6 and 9 months systems); and development and retention of the industry in the country.—*M. Mail*, Feb. 4.

DESICCATED COCONUTS.—We learn from London that one of the parties to the coalition in connection with this article has withdrawn, and the Syndicate may now be considered as at an end. There has been a good demand recently, and a very large forward sale has been concluded; but the rate has not transpired. Meanwhile the various desiccating works are in full swing which gives employment to a very large number of hands who would otherwise have no work to do.—Local "Examiner."

CINNAMON IN JAVA.—In the latest number of *Teysmannia* Dr. van Romburgh has a paper on cinnamon, in which he describes the methods of cultivation, distillation of oil, preparation of bark, &c. He then proceeds:—

The cinnamon tree was introduced into Java about 1828. Under the culture system it was planted on a large scale, especially in Krawang, where the cultivation of it held the longest stand, without however yielding the returns that were expected from it. The cinnamon of *C. ceylanicum* cultivated in Java is said to be not so fine as that grown in Ceylon, a fact that need not create surprise, if the statement be true, that the Ceylon cinnamon tree varies so much. The writer then mentions the existence in the Java experimental garden of trees of *Cinnamomum Cassia*, Blume, the bark of which variety is said to fetch high prices in China. After referring to oil of cassia, "Chinese cinnamon," and *Cassia lignea* and *Cassia vera*, Dr. van Romburgh concludes as follows:—

According to Dr. van Gorkom the *Cinnamomum kiamis* found in the high forests of West Java yields a bark the powder of which can serve very well as a surrogate for true cinnamon. It is not impossible, that by a rational cultivation of some of the varieties of cinnamon found growing wild a product of good quality in a form desirable in commerce may be obtained.

We have no fear that Ceylon's monopoly in the production of the finest cinnamon will be endangered by Java or any other country.

WASTE LANDS FOR TEA CULTIVATION IN INDIA.—Discussing objections made by the Indian Tea Association with regard to rules issued by Sir Charles Elliott for the grant of waste lands for tea cultivation and for regulating leases, the *Pioneer* says:—

One rule lays down that a grant of land on an individual application shall be limited to 1,500 acres, the Government view being that such an area affords sufficient scope for a garden to be worked with profit and advantage. The men who have developed the Dnars and partly turned a wilderness of jungle into land yielding a handsome revenue contend that all practical experience shows the limitation to be too stringent. Cases can be cited where it has been possible to utilise for actual cultivation only one-third of the land acquired: and the area remaining to be taken up is far less promising than the older tracts, timber being sparse and the water supply scarce. It is argued that as in the past grants of 2,000, to 3,000 and even 4,000 acres have been given and, as the bigger gardens have invariably been successful, it would be a mistaken policy to lay down the strict limitation of 1,500 acres. The tendency nowadays is to amalgamate small concerns, capital being liberally provided for work on a large scale, and if capitalists are to be checked in their enterprise they will naturally turn their attention elsewhere. The Association ask that the local District Officer shall be given some discretion as to the extent of each grant, and that where very large areas are in question reference shall be made to the Board of Revenue. This seems only fair and reasonable. Again, objection is taken to a rule which apparently debar an applicant from applying again in his own name for more land until the five years of his first lease have expired. This is radically wrong, for the fact that a planter has already given hostages to fortune should not debar him from extending his holding—always provided that he can clearly establish his financial ability to open out more land,

CALCUTTA TEA TRADERS' ASSOCIATION.

Report of the Committee for the year ending 31st December 1895.

The Committee have again to report an uneventful year so far as the affairs of the Association are concerned, but they feel that this is not a matter for regret, inasmuch as it goes to prove that the tea trade of Calcutta is carried on smoothly.

A suggestion for a new rule to the effect that "Brokers should only deliver tea brought by native buyers for Bombay and elsewhere on receipt of cash," was made to the Committee in August last; but it was considered that the matter was one which might well be left to the brokers to decide for themselves, as the selling broker could always protect himself by asking for cash, should he think fit, when the delivery orders were presented.

The working of the Port Commissioners' Tea Warehouse with an improved system brought into operation, and the increased supervising staff which it was stated last year had been sanctioned, has apparently given greater satisfaction to the trade, since no complaint has reached the Committee regarding it.

The subject of thefts from consignments of tea after same have left the gardens came up for consideration in November on a representation from the Indian Tea Association. There was a very strong suspicion that thefts occurred pretty frequently whilst the teas were in transit between inland and ocean steamers and a recent successful prosecution of a boat's *manjia* and crew by the River Police for a wholesale robbery of tea will no doubt have a deterrent effect upon this class, though until the receivers of the stolen goods are prevented from carrying on their illicit trade, there will always be inducements for robberies of this kind. The Committee consider the special thanks of the Association are due to Sir John Lambert, Commissioner of Police, for the very vigorous manner in which he has dealt with the matter of the representations of the Indian Tea Association, and they are also much indebted to Superintendent Hogg for his exertions.

Claims. There has been an increase in the number of claims submitted during the past year, the number being 70 against 47 in 1894. It is noticeable that where claims appear to be just and fair, there is a growing tendency on the part of the proprietors of the gardens interested to pay them without waiting for a reference to the Committee, and this fact in a great measure explains the comparatively small percentage of claims recommended for payment from amongst those which have finally come up for disposal. The Committee would here remark that much inconvenience and delay would be saved, if Members would instruct their Agents at home to obtain fully detailed Dock certificates in support of any claims they may desire to make for loss in weight. It is obvious that were a certificate gives only the total weight of tea instead of the weight of the contents of each individual chest, no opinion as to the probable cause of the loss can be arrived at. The following comparative statement shows the number of claims dealt with during the past five years:—

Year	Total Claims	Aggregate Value.			Average Value.		
		R	As	P	R	As	P
1891	40	2,175	0	10	31	4	11
1892	46	1,561	7	4	34	0	0
1893	72	3,426	8	8	47	9	5
1894	47	1,892	2	2	40	4	1
1895	70	3,186	5	4	45	8	3

The claims for 1895 were distributed amongst the various classes of tea as under:—

Orange Pekoe	-	-	-	1
Broken Orange Pekoe	-	-	-	8
Pekoe	-	-	-	9

TO GROW COFFEE IN CALIFORNIA.

Col. Charles F. Crocker is going to start a coffee plantation in the San Joaquin Valley, and if his experiment proves successful the fertile ranches thereabout will have a boom that will be without precedent. The Pacific Mail Company's steamer *San Juan*, which arrived at San Francisco recently, brought from Central America 1,000 yearling plants with which Colonel Crocker will commence his interesting venture. The plants were carefully selected by Samuel Howe, Colonel Crocker's agent, who died on board the steamer December 1, but the object for which he made the trip has been accomplished, and the collection of plants, which perhaps cost him his life, was landed here safely, and will be taken in charge by Colonel Crocker's gardener.

The coffee plants which Colonel Crocker has secured for his experimental ranch are of the hardy Arabian variety, which produce the bulk of the coffee of commerce. They are mere slips now, and are completely boxed in such a manner that they do not take up much space and might be overlooked by the casual observer. But every precaution has been taken to protect their roots from the chill atmosphere, and they are as good and fresh apparently as when taken from their native soil. The plants will be set out this fall most likely, but six years must elapse before they will be old enough to bear berries.

Scientists who have studied the soil and climate of the San Joaquin Valley are some what doubtful as to whether coffee plants will thrive there. The coffee plant not only requires fertile soil and plenty of sunlight, but a certain amount of moisture, and that is where the rub comes in California.—*San Francisco Chronicle*.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, January 25th.

CROTON-SEED remains exceedingly scarce: the nominal price is about 50s per cwt for good quality, but none is offering.

GAMBAGE very steady. Eight packages sold at from 2s 5s for ordinary pickings up to £10 2s 6d for good, partly blocky pipe.

VANILLA.—A fair supply of about 170 tins sold today with good competition.

NIX VONICA.—A trifle easier. Eighty bags fair bright small Cochin seed sold without reserve, at 6s per cwt, while 57 bags sound Bombay realised 7s per cwt. A parcel of 547 bags from Madras was bought in at 4s 6d per lb.

ESSENTIAL OILS.—No transactions of any importance took place at today's auctions. Two cases of Cinnamon oil sold at 7d per oz, and a parcel of Cinnamon-leaf oil at 5d per oz. For 5 cases HWB Eucalyptus oil is a bid of 8d per lb was refused, and 4 cases "Dawson" brand were bought in. An 800-lb drum of Citronella was bought in at 1s 10d per lb; privately 2s 2d per lb is asked.

ARCA-NUTS.—About 6d easier: 4 bags sold today 11s 6d per cwt.

COFFEE PROSPECTS IN NYASSALAND.

Mr. G. Mortimer Craibe, Mlanje, British Central Africa, writes to a contemporary:—

It might interest your readers to know something about the prospects of Coffee in Nyassaland. Several Ceylon planters have visited the country, some of whom have a poor idea of the country and its prospects in coffee, while others have returned with glowing accounts. There are always two sides to a question, but, if the truth be told, the men who have the poor idea are men who have come and gone in a hurry, and who have seen little. Because our district is not quite a success, it does not follow that others are all the same. The men who have returned with favourable accounts are men who have taken the trouble to visit several districts, and who have worked out careful figures. That coffee has splendid prospects before it cannot be denied, but unfortunately the ideas of a good many local planters are strange ones: for instance, one planter who was in a hurry

to get a return from his land planted Indian corn between the rows of coffee. Another, who imagined the higher his coffee grew the more crop he would get from it, topped his coffee at 5 feet, while the general idea is to plant large acreages in as short a time as possible. It is needless to mention the result, but there are always exceptions, and the few men who have planted a small acreage carefully have something to show for their money. For instance, I know of one estate of 240 acres, of which 160 acres are in bearing, that paid 20 per cent in its 4th year, while another planter got a maiden crop of 5 cwts an acre from a 40-acre field. Labor is very cheap, and it is almost entirely paid in calico, a man earning the equivalent of 2s a month, a woman 1s 6d and a child 1s. Transport is unfortunately rather heavy; but it is only a matter of a short time before that is considerably reduced. The country is sadly in want of some good roads, as the present so-called roads are but mere tracks. To men with plenty of energy and a small amount of capital, there are good prospects in this country.

COCONUT CULTIVATION : MANURING.

(Communicated.)

A few months ago it was mentioned that the peasant proprietors of the Negombo district had taken to cultivating their coconut properties, stimulated thereto by the example of Mr. J. D. Vanderstraeten. If so, one contention of mine *re* the distribution of Agricultural instructors has received support and proof. I always contended that for improved cultivation to become popular it was necessary for Instructors to be moved about to demonstrate their methods and to prove their success. Mr. Vanderstraeten cannot rightly be called the apostle of the improved cultivation of coconuts, and yet his system of cultivation is said to be followed by the conservative villager. It is useful to enquire the reason for this. It is not far to seek. Its benefits and advantages have been brought home to him and stare at him on every side. As far as the high cultivation of coconut is concerned, at least in the Western Province and in the Chilaw district, Mr. David Wilson, I believe led the way. He was known as one who went in for a variety of manures, though report says he was not very discriminating in his methods. At Kannwangalla and Waljapala he had a very hard soil in places to contend with, and the cost of working it must have been considerable and the returns not commensurate with it. The earthworks on these estates are monuments of his pluck and determination. Besides the estates of Mr. Wilson, high and intelligent cultivation had been carried on on Golna Pokuna and on the estates in charge of the veteran "W. B. L." and his contemporary Mr. Carry. If their examples had not been followed and that of Mr. Vanderstraeten had been, the reason is not to be found only in the advance of intelligence, but also because their examples were isolated and that of Mr. V. scattered. For energy and pluck commend me to this gentleman. He is a worthy example to all Ceylonese especially to the younger and rising generation. He is not so much in evidence as is Mr. W. H. Wright. His example like that of the veteran should always be quoted to point a moral.

After the Report of the Superintendent, one was not surprised at Mr. Coomaraswamy's motion in Council on the School of Agriculture. But he adduced strange reasons against the institution and its teachings. Because our fathers and forefathers pursued certain methods and were satisfied with their soundness and results, therefore no change was necessary or wanted. Why this conservatism on the part of an intelligent and enlightened man only as regards agriculture? Why does he not preach and practice it in everything else? He is looked upon as one of the most progressive men amongst the Tamils. He surely does not, on his estates, follow the methods of his forefathers.

If the landed gentry of all nationalities in the island realized the benefits of intelligent cultivation and consulted their interests better, their sons

would undergo a course of instruction at this school and carry out what they learnt, on their estates, instead of running after Government appointments for wages that will be scorned at by a first-class domestic. The school is a most useful institution and fills a void in a country whose industries are mainly agricultural. That it does not receive the support it deserves and occupies its present unenviable position is a serious reflection on all landed proprietors.

To the enthusiastic agriculturist there is no branch of his profession which is more fascinating than manures and manuring. Manure plays the most important part in his reaping the result of his labors. It was mentioned recently that Mr. Wright is a great believer in ashes for coconuts. Ashes are a very good manure, but should not be applied by themselves unless the soil to which they are applied has in sufficient quantity the organic matter necessary for the coconut tree. The composition of ashes varies with the substances that yield them. Some are rich in phosphoric acid, potash, lime and the other mineral matters necessary for the growth of vegetation. Others have these or some of these in comparatively small quantities, hence the disparity in the results of their application. The ashes resulting from the burning of the products of the coconut tree must of necessity be beneficial to it. I used to purchase any quantity of the ashes of husks delivered on the spot at '06 cents the bushel. As a sandy soil is very poor in organic matter, and ashes are composed entirely of mineral matter, they are seldom applied by themselves to such soils and are most beneficial to heavy, clayey soils when dug in. Mr. Wright does not stand alone in his belief in ashes. The other gentleman, whose name is mentioned before, is known in these parts as "Alu Mahatmaya" or "ashes gentleman," as he goes scouring the village for ashes. Except under certain circumstances, I do not believe in reducing vegetable matter to ashes for application to the soil. I think it better to bury it in the soil and allow it to decompose, giving out to the soil and the vegetation it is supporting the benefit of the gases evolved during the process. I may be pardoned for saying what is doubtless known to most agriculturists, that decomposition and decay are but another and slow process of combustion. The ultimate results of both processes are the same. As I said before, it is only under certain circumstances that I think that vegetable matter should be reduced to ashes before application. I may mention a few. When a substance takes very long to decay and is too bulky for application, such, for instance, as logs of timber, which take long to decay and benefit only the place where they lie. When, owing to the nature of the soil, burying becomes too expensive an operation. On a sandy soil which is usually characterized a hungry soil, I think it of paramount importance that every scrap of vegetable matter be buried. Owing to its texture, the operation is an easy and inexpensive one; and if year by year these burials take place in different spots, the texture of the soil will be changed as well as the growth of the vegetation which it sustains. On cinnamon estates, this system of burial is the usual thing; and on an estate I know of, which in its day was one of the best kept of estates and where a burial of one year was not disturbed till perfect decomposition had taken place, the usual sand had turned to a rich mould; and well-known cacao planter on watching a hole dug exclaimed "Just the soil for cacao. So rich in vegetable matter." Coconut cultivation is admittedly more remunerative than cinnamon and its cultivation, which in the usual acceptance of the term excludes manuring, costs very little, so that what is possible in cinnamon cultivation is doubly possible in coconut, and all vegetable matter including weeds, branches and husks especially in sand soils should be buried. Some people are æsthetic to a fault and do not like to see the soil, on their lawnlike plantation, disturbed by holes being cut in them. I always sacrifice æsthetics to expediency. The usual process of disposal of branches and husks is by burning. I have myself done this on heavy soils, and have further done what very few do, spread the ashes as far as possible and dug them in. A large surface of soil was

thus cultivated. Burning improves a heavy soil by altering its texture, and for the very same reason impoverishes a light sandy soil by burning out of it the little organic matter it has. In defiance of appearance, I used to cut and arrange the branches of the coconut tree round the stems in dry weather to act as a mulching and conserve moisture. With the first April rains, and when danger from fires has passed, I used to burn them.

B.

LIMES GROWN IN HAPUTALE.

Mr. J. A. Martensz of Macaldenia, Koslanda, writes:—"As there has been some talk lately of growing oranges and lemons &c. in Ceylon on a large scale, and that the Haputale district is likely to be most suited for such cultivation, I send you by today's tappal a small box of limes grown on this estate under ordinary circumstances. You will see that they are of fair size and weight (2½ oz. being about the average), and that they are not thick-skinned. With better cultivation I feel sure much larger limes could be grown."—The limes are fine, large ones; and the flavour and strength of the juice are much superior to those of the lowcountry limes.

CEYLON AND INDIAN TEA IN AMERICA.

Mr. Alex. Philip at the request of the "Committee of Thirty" has forwarded to us a pictorial cutting from the *New York Herald* and an article "A Romance of Commerce," received from Mr. Wm. Mackenzie. The former is an advertisement of Lipton's tea showing an attractively got up coloured girl emerging from a tea box with a packet in one hand and "directions from the tea gardens" in the other. "The Romance or Commerce" deals with the development of the Indian and Ceylon tea industry. It is written in a "taking" fashion and is all in praise of Indian and Ceylon tea.

NEW TEA COMPANIES.

THE ANKANDE ESTATE COMPANY OF CEYLON LIMITED.

The memorandum and articles of Association of "The Ankande Estate Company of Ceylon, Limited" are published in a recent *Gazette*. The objects for which this Company is established are, among others, stated to be:—to acquire the Ankande, Glenury, and Altwood estates, situated in the Districts of Matale North and Matale East, in the Island of Ceylon and to purchase tea leaf and (or) other raw products for manufacture, manipulation, or sale. The liability of the Shareholders is limited. The capital of this Company is R100,000, divided into 1,000 shares of R100 each, with power to increase or reduce the capital. Shares have already been purchased by T Watson Hall, H Creasy, William J Robinson, Laura Louisa Mary Robson, by her attorney William J Robson, Caroline Eliza Robson, by her attorney William J Robson, John F Baker, and Norman Baker.

STINSFORD TEA COMPANY OF CEYLON, LIMITED.

The memorandum and articles of Association of the Stinsford Tea Company of Ceylon, Limited, are also published in the *Gazette*. Among the objects for which the Company is established are—to purchase or otherwise acquire the Stinsford and Ivies estates in the Kelani Valley in Ceylon, or either of them or any part or parts thereof. To purchase tea leaf and (or) other raw products for manufacture, manipulation, and sale, and to manufacture, manipulate, and sell the same. To establish and maintain in the United Kingdom, in Ceylon, or elsewhere, stores, shops, places for the sale of tea, coffee, cocoa, and other articles of food, drink, or refreshment, whole-

sale or retail. The liability of the Shareholders is limited. The nominal capital of the Company is R500,000 divided into 5,000 shares of one hundred rupees each (of which only three hundred thousand rupees are now called up), with power to increase or reduce the capital. Shares have already been purchased by:—Henry Bois, W Forsythe, D R Marshall, D Cameron, Walter J Smith, Wm. F Robertson Reid and J A Hunter.

GLASGOW ESTATE COMPANY, LIMITED.

The annual ordinary general meeting of the Glasgow Estate Company, Limited, was held in the registered office of the Company, Queen Street (Messrs. Whitall & Co.'s), on the 15th ult. Mr. J. G. Wardrop the CHAIRMAN presided and others present were Messrs. C. A. Leechman and G. W. Carlyon (Directors), Messrs. J. H. Starey, H. H. Capper, G. H. Alston, G. C. Walker, C. S. Warren, and by proxy Messrs. A. Thompson, W. H. G. Duncan and H. Tarrant. Mr. Wardrop was called to the chair. Notice calling the meeting having been read and minutes confirmed. The Report and accounts were adopted and a final dividend of 10 per cent was declared making 18 per cent for the year.

THE DIRECTORS' REPORT was presented as follow:—

	ACREAGE.	
Tea in full bearing ..	403	acres.
Do. partial bearing ..	65	"
Do. not in bearing ..	141	"
Coffee amongst 'Tea (65 acres)		
Grass.. ..	2	"
Jungle, &c. ..	100	"

Total Estate .. 714 acres.

The Directors have pleasure in submitting to the Shareholders the accounts of the Company for the past year.

The crop secured amounted to 232,239 lb. Tea and 562 bushels Coffee, against estimates of 205,000 lb. and 500 bushels respectively.

The net average price of Tea and Coffee were over 58½ cents. per lb. and R18 per bushel respectively; the prices in the previous year being 69½ cents. and R18.25.

After making the usual provision for Depreciation of Buildings and Machinery, the result of the year's working, including a small balance from 1894, is a profit of R71,086.64, equal to 21¾ per cent. on the Capital of the Company.

An interim Dividend of 8 per cent. was declared on 3rd August last, and the Directors now recommend the payment of a final Dividend of 10 per cent., making 18 per cent. for the year; and that R12,000 be added to the Extension Fund. After payment of R300 extra fees to the Directors, in terms of the Resolution passed on 18th February, 1893, a balance of R286.64 will remain to be carried forward.

The estimates for the current year are 242,000 lbs. Tea and 200 bushels coffee on an expenditure on working account of R67,414.80. It is proposed to bring under cultivation during this year further 15 to 20 acres of forest land, regulating this area by the demand from neighbouring estates for timber, for fuel and building purposes. The cost of this extension, of additional machinery and buildings, &c., is estimated at R5,870.

The Directors have sanctioned the construction of a weir across the Agra river and contracted for a complete Turbine installation for Glasgow factory at an estimated cost for the whole work of R22,000. When the above are completed, the factory will have at all times an ample command of water power, thereby economizing working expenses and doing away with the necessity for a large fuel reserve.

In terms of the Articles of Association Mr. J. G. Wardrop retires by rotation from the Board, but is eligible for re-election.

Mr. A. L. Cross being about to leave the Island Mr. Megginson has resumed the visiting of the Company's properties.

The appointment of an Auditor for the current year will rest with the meeting.

By order of the Directors, WHITTALL & Co.,
Agents and Secretaries.

Colombo, 23rd Jan. 1896.

THE DIMBULA VALLEY (CEYLON) TEA COMPANY, LIMITED.

The mail has brought us a copy of the prospectus of this Company, which has been formed with a capital of £200,000, in 40,000 shares of £5 each, the present issue being £150,000, in 10,000 six per cent cumulative preference shares of £5 each.

DIRECTORS.—James Sinclair, Esq. (late of Ceylon), 22, Fitzjohn's Avenue, N.W., Chairman and Managing Director; Keith Arbuthnot, Esq. (Sanderson & Co.), 37, Mincing Lane, E.C.; W. Forbes Laurie, Esq. (late of Ceylon), High Wycombe, Bucks.; Alneas Ronald McDonell, Esq., 32, Elm Park Road S.W.; C. J. Rowe, Esq. (Rowe, White & Co.), 16 Philpot Lane, E.C.

BANKERS.—The London Joint Stock Bank, Ltd, 5, Princes Street, London, E.C.

BROKERS.—Messrs. W. I. Carr, Sons & Tod, 2, Royal Exchange Buildings, E.C.

SOLICITORS.—Messrs. Templeton & Cox, 9, King's Bench Walk, Temple, E.C.

AUDITOR.—A. N. Frewer, Esq., A.C.A., 31, Nicholas Lane, E.C.

SECRETARY AND OFFICES (*pro tem.*). B. F. White, Esq., 16, Philpot Lane, E.C.

This Company has been formed mainly with the object of acquiring, working and developing Tea Estates in Ceylon. The success of the Tea Industry in the Island, especially in the Dimbula district, and the growing favour with which the Shares in Tea Companies are regarded by investors, are so well-known that no detailed reference thereto seems necessary.

The Directors have arranged for the purchase of the following six Estates in the Dimbula district, viz., "Bearwell," "Mousa Ella," "Tillicoultry," "Belgravia," "Elgin," and "Lippakelle." These Estates comprise a total area of 2,091 acres, of which 1,835 acres are under tea, 130 acres are available for planting with tea, and the remainder is forest jungle and grass land.

The Estates are in a very efficient state of cultivation, and lie at elevations varying 4,000 to 5,800 feet above sea level. Consequently the Tea produced are of a very high class, and owing to the quality of the soil and the favourable climate, the yield averages fully 500 lb per acre on fields at full-bearing. This compares well with the yield of Estates at lower elevations, with the advantage of a much higher price for the produce. The factories are equipped with modern machinery, the bungalows and lines are in good repair, and labour is plentiful. The conditions of transport are good, as Government roads connect the Estates with the railway. There are native bazaars on Tillicoultry and Belgravia, which are a source of revenue. Mr. James Sinclair, the Chairman and Managing Director of the Company, is the Vendor of "Bearwell," "Mousa Ella," "Belgravia" and "Elgin," and the price fixed by him for these 4 estates is .. £93,500
The price fixed by the Vendors of "Tillicoultry" is .. 30,000
The price of "Lippakelle" purchased at public auction (including commission) is 21,700

Total for the 6 Estates £115,200
Leaving for the general purposes of the Company 1,800
£150,000

Taking the value of the bazaars at £4,000 (10 years' purchase of the present revenue), and of the land not planted with Tea, nearly half of which is bearing Coffee, at £5,120 (£20 per acre), the purchase price of the area planted with Tea works out at about 8 years' purchase of the estimated net revenue which the Directors consider a moderate rate.

The production for the current season of the Six Estates is estimated at not less than 800,000 lb. Tea which with the coffee crop may be expected to yield a net revenue of £16,500. Deducting therefrom the Preference Dividend of £3,000 there would remain the sum of £13,500, equal to 13½ per cent. on the amount of the issue of Ordinary Capital. Moreover, as some of the tea planted on the Estates now acquired is not in full bearing, and 130 acres of land have yet to be planted, the out-turn should, therefore, for some years be progressive.

The shares were fully subscribed for, we hear on, the very first day of publication. 29th January,

DUNKELD ESTATE COMPANY, LIMITED.

The annual ordinary general meeting of this Company was held in the office of Messrs. Whittall & Co., the agents and secretaries, on the 15th ult.

There were present:—Messrs. C. A. Leechman (in the chair) and G. W. Carlyon, Directors; Mr. W. H. G. Duncan by his Attorney Mr. G. W. Carlyon, Messrs. C. J. Donald and G. J. Jameson.

THE DIRECTORS' REPORT.

was in the following terms:—

ACREAGE.	
Tea in full bearing	- 383 acres
Jungle, &c.	- 53 "
Total Estate	- 436 acres

The Directors have pleasure in submitting to the Shareholders the accounts of the Company for the past year.

The crop secured amounted to 157,737 lb. tea, being 32,737 lb. over the estimate, and 54,220 lb. more than the yield in 1894. The net average sale price was about 51 cents per lb., as against 57 cents in the previous year; whilst the cost per pound laid down in Colombo was 29 cents.

The net profit for the year, after making ample provision for depreciation of buildings and machinery, and including a small balance for 1894, amounts to R29,652.65. or 19½ per cent. on the Capital of the Company.

An interim dividend of 9 per cent was declared on 3rd August last, absorbing R13,500, thus leaving a balance of R16,152.65 now to be dealt with.

The Directors recommend the payment of a final dividend of 10 per cent, making 19 per cent for the year; and that after payment of R400, additional fees to the Directors in terms of the Resolution passed on 18th February, 1893, the balance of R752.65 be carried forward to the new year.

The crop for this year is estimated at 150,000 lb. tea, on an expenditure of R41,510.

In terms of the Articles of Association, Mr. Chas. Young retires by rotation from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

By order of the Directors, WHITTALL & Co.,
Agent and Secretaries.

Colombo, 24th January, 1896.

The report and accounts were adopted and a final dividend of 10 per cent was declared making 19 per cent for the year.

THE NORTHERN DISTRICTS CROP ESTIMATE FOR 1896.—We are indebted to Mr. R. N. Anley of Malvern estate, Wattagama, Secretary of the Northern Districts Planters' Association, for the following figures, showing the tea crop estimate for the district for 1896, which was inadvertently omitted from the annual report recently submitted to a meeting of the Association:—

Hunasgiriya	.. 1,136 acres	Crop 515,000 lb.
Elkaduwa	.. 1,852 acres	" 700,000 "
Matala East	.. 5,935 acres	" 2,277,000 "
Panwila	.. 1,625 acres	" 665,000 "

Total .. 10,548 4,157,000 lb.

PLANTING AND PRODUCE.

RUSSIA AND THE IMPORT OF GREEN TEAS.—The Russian Minister of Finance has published a supplementary order permitting the import of green teas into Bokhara and Transcaspia over the Persian and Afghan frontiers, and by transit through Batoum, Baku, and Uzunata, irrespective of origin, according to the tariffs of July 18th and August 24th, 1894. The tariff of July 18th, establishing duties of 14 roubles 50 kopes, and six roubles paper per pood of 36 lb. according to the quality, is extended to tea imported through the custom houses of Irkeshtan, Naryn, and Issik Kul.

JAPAN AND TEA MACHINERY.—It has been hinted that the Japanese are anxious to improve their tea manufacture by the adoption of machinery. This may be so, but we do not think any British engineers will send tea machinery to Japan at present. Japan has refused to enter into patent and trade mark treaties. The explanation of her policy, as given by the chief examiner in the Japanese Patent Office, is as follows: Europe and the United States do not recognise Japan as a civilised nation. Our laws are not good enough for them, so they refuse to submit their subjects to the jurisdiction of our courts. They have also forbidden us to make our own tariff, in not allowing us to impose a duty of more than 5 per cent upon imported merchandise. How can they blame us, then, for being unwilling to make a treaty to protect their patents? Under the new treaties, which take effect in 1899, Japan becomes a member of the International Patents and Trade Marks Union, and will afford to foreign inventions the same protection as to her own.

COFFEE PLANTING ON THE HAWAIIAN ISLANDS.—In a report which has been made to the Executive and Advisory Council of the Republic of Hawaii by an American labour commission relative to coffee planting the experiences of Ceylon coffee planters are turned to account and a comparison instituted. For facts and figures the commissioners refer to Ceylon, and the report goes on to state: "In 1875 the official returns of the island of Ceylon showed that 204,000 acres of land were under coffee, and that 200,000 labourers were required in the cultivation; that is to say, about one labourer to the acre. With the better class of labour and improved methods in Hawaii, it is believed that one man can cultivate three, or in some cases even five, acres. But in the picking season there will probably be needed about one person to the acre. Women and children would supply this need to some extent, if men with families could be induced to immigrate and settle in the islands. If there should be within the next few years 20,000 acres of land under coffee cultivation in Hawaii alone, there would be needed in the picking season, according to the above estimate, nearly 20,000 labourers, including women and children. Regarding the coffee industry as a source of Government revenue, it is stated that in the island of Ceylon the coffee plants have, when in full bearing, for some purposes, the value of 1 dol. a tree. It seems that the same valuation may be justly placed on the plants in Hawaii if the planters meet with anything like the success they expect. The demand for labourers on the coffee plantations is now readily supplied by the Japanese whose contracts with the sugar planters have expired. This demand is as yet limited, but it is evident that with the present rate of increase in acreage there must inevitably develop a competition for labour between the sugar and coffee planters which may prove disastrous to both, or may result in the irreparable losses experienced in Demerara and the Straits Settlements.

LAGOS INDIARUBBER.—The newly-established export of indiarubber from Lagos continues to make rapid progress. In 1893 this trade was all but unknown, and in 1894 the total imports from the colony were only 76,272 lb., valued at £5,995. We learn, however, by the latest mail advices that during October, 1895, alone the quantity shipped was 1,059,158 lb., and the value £57,117, at the rate of £685,404 per annum. Indeed,

it is probable that next to Brazil Lagos has now become the chief source of supply of raw india-rubber. The addition of this new branch of commerce to the trade of the colony may be expected to increase still further the already expanding revenue of the Colonial Government. The official report for 1894, just published, shows that the total receipts for that year were £137,017, against £115,317 in 1893 and £68,421 in 1892. The actual expenditure in 1894 was £125,829, leaving a surplus of £11,188. The projected railway to Abbeokuta and Yoruba, the first portion of which will shortly be taken in hand, may be expected to give an additional stimulus to the trade of Lagos by reducing the cost and the period of transport of produce outward and of imports inward.—*H. & C. Mail*, Jan. 31.

TEA IN AMERICA.

There has been some speculative buying, and also something done in advocacy of a duty on tea, which, we believe, would be a good thing. But in view of the fact that the Presidential election is to take place this year, it is very improbable that Congress would dare put a duty on any of the necessaries of life. Besides, it is almost impossible to get the two Houses of Congress to unite on any measure, owing to the political complexion of the Senate. This market—or, rather, this country—is obliged to take nearly all of the green teas of China. The result is, we have phenomenally low prices, Hyson selling as low as 5c per pound and first Young Hyson at 18@19c. Formosa Olongs of high grade are well held, with the lower grades easy. There is also a firmer market for low grade Japans, while other grades are barely steady. The general market is dull. Today at noon the Montgomery Auction and Commission Company will sell 10,122 packages, viz: 1,005 half-chests Moyume; 3,083 half-chests and boxes Pingsuey; 27 half-chests Japan; 836 half-chests and boxes Congou; 146 packages India, Java and Ceylon 50 boxes Capers; 354 half-chests Foochow; 2,505 half-chests and boxes Formosa, new season's.—*American Grocer*, Jan. 15.

MARKET FOR TEA SHARES.

THURSDAY EVENING, Jan. 30, 1896.

Owing, we believe, in a great measure to public attention being recently diverted to these shares in the public prints, more especially in our daily contemporary the *Financial Times*, there has been a very considerable buying of all the better known shares within the past week, and more than one advance is notified in the official list.

FRESH ISSUES.—The Dimbula Valley (Ceylon) Company offers the greater part of £150,000 to the public this week, one-third being 6 per cent cumulative Preference and the remainder Ordinary shares, all of £5 each. We learn that the former have been applied for six or seven times, over and the latter about twice over, and that the Prefs. are now quoted at a substantial premium, say from 10s to 15s.

MINCING LANE has again hardened this week, with some very high prices paying for the finest Teas, and with also an improving tendency for the medium grades as well.

CEYLON SHARES.—C. T. P. Co.'s Ordinary do not show any business, but the Prefs. after changing hands at 16½ came on for sale, and finished at 16 5-16 for a fair number.

Eastern Produce and Estates Company's £5 shares are said to have again found buyers at 4½.

Lanka Plantations, after being, we understand, as high as nearly £6, came on for sale at 5½, at which, however, a few shares were taken.

The Dimbula Valley (New) Company has been alluded to above under the heading of "Fresh Issues."—*H. and C. Mail*, Jan. 31.

PLANTING PRODUCTS.

(From the Forty-second Annual Report of the Ceylon Planters' Association, held 17th Feb. 1896.)

TEA.

The season has been a favourable one generally, most estimates having been exceeded. The average price for the year in London was the same as last year about 8½d per lb. with a lower average rate of exchange than ruled in 1894. The total Export for the year was 98,581,060½ lb. as against 85,376,322½ lb. in 1894 or an increase of over 13 millions. The Colombo Tea Sales reached a total of about twenty millions or an increase of about 4½ million lb. over 1894. The Home consumption of British grown tea shows the very satisfactory increase of nearly seven million lb. being a consumption of 5.65 lb. per head as against 5.52 lb. in 1894. Foreign markets show steady, although slow development. And whilst you are to be congratulated on the progress made abroad, your Committee would urge on you to in no way relax, but to increase, if possible your efforts to push your staple in all foreign markets, more especially in Russia and America. In this latter country your special Commissioner, Mr. W. Mackenzie, has set to work with the energy you expected of him, and he deserves your thanks. In Russia also Mr. Rogivue has made considerable progress, and has established a certain and, it is hoped, an increasing business, sufficient to encourage others to follow his example there. Local Companies have in nearly every instance declared high dividends. The year has not only seen a large increase in local Companies, but also the formation of many sterling Companies, and the purchase of some Estates by London Companies, at the highest figures yet given for tea in Ceylon, thus proving the estimation in which your staple is held at home. Extension has been steady in a small way during the year. The demand for seed has been very considerable more especially during the latter quarter showing that in some districts large extensions are to be made during 1896-97. Labour generally has been sufficient and Sinhalese labour now comes forward, as a matter of course, during the busy months March-June in all districts adjacent to the villages. There is also a considerable increase in the resident Sinhalese labour force on estates.

COCOA.

The South-West Monsoon was late in 1895 and this retarded the blossoms so that little of the Autumn Crop had been picked by the end of the year. The crops for the last three years are 1893 cwt. 29,775; 1894, cwt. 22,791; 1895, cwt. 27,522-3-20. From these figures it might be argued that the crop of 1896 will be a small one, but the probability is that it will be larger than the one just gathered. The area under Cocoa is about 18,000 acres of which some 6,000 acres have been planted since the beginning of 1891, and were therefore hardly in bearing for the crop of last year. To arrive at the probable yield per acre a further allowance must be made for Cocoa planted with other products, so that it is probably well within the mark to say that the crops of the last three years have been picked off 12,000 acres giving average annual crops of about 2½ cwts. per acre. A great deal of cocoa has been planted in very old coffee land, which means that the average annual yield per acre of cocoa planted in jungle soil, is very much above what these figures indicate. The prices for cocoa have continued low, and the stocks have not been much reduced.

COFFEE.

There has been a remarkable increase in the crop for 1895, as shown by the total exports of coffee. This is undoubtedly due to the exceedingly favorable blossoming season in several districts still maintaining Arabian coffee and points to no increase in the acreage, except in the case of Liberian coffee, which is being slowly extended in the lowcountry districts suitable for its cultivation.

CARDAMOMS.

The export of this product has been fully maintained in 1895, or rather slightly increased. Its extension on any considerable scale cannot however be looked for, but it is a valuable adjunct to tea properties which have land suited to its growth, as it enables the owner to get a good profit from his forest reserve while also conserving his fuel supply. As good and medium crops seem to come in alternate years this year's crop may be taken as an average one in a good year.

TOTAL EXPORTS.

By the courtesy of the Hon. the Principal Collector of Customs your Committee appends the following interesting tables for your information.

Statement showing the total exports during the years ended 31st December 1894 and 31st December 1895 from the Island of Ceylon of the following articles:—

Articles.	Quantity	
	1894.	1895.

OFFICIAL ESTIMATE OF THE TEA CROP FOR 1896.

Your Committee, after due consideration, has decided to estimate the Tea Crop of the Island available for export in 1896 at 101,000,000 lb.

REPORT OF "THE THIRTY COMMITTEE"

CEYLON TEA IN AMERICA.

This being the first Report by the "Thirty Committee", it is desirable to begin at the point which had been reached in the last report on the subject by the Committee of the Planters' Association (*vide* Book of Proceedings for year ending 17th February, 1895) viz. the appointment of Mr. Wm. Mackenzie and Sir G. H. D. Elphinstone as representatives from Ceylon to the United States mainly on a mission of enquiry in the first place. It was found with regret that Sir G. H. D. Elphinstone could place so little of his time at the disposal of the Committee as to render it in their opinion undesirable that he should go. Mr. Mackenzie accordingly took up the work independently and has since carried it on alone. Mr. Mackenzie's chief duty on the occasion of his first visit was to find out those methods which were according to his judgment formed on the spot most suitable and most likely to further the consumption of Ceylon Tea in the United States and to ascertain who were the proper people to assist and to interest in our staple. He proceeded to America in February 1895 and returned in April 1895 to London, and his views are embodied in his letter to the Committee of 8th April 1895 which will be printed with the Proceedings for the past year. The salient points of his report are briefly (1) that as Americans drink green teas we should endeavour to make these (2) that the trade is deeply bound up in China and Japan teas which are so totally different in make and taste to ours that we will have to revolutionise the trade; (3) that even if the retailer makes as much profit per pound of our teas as he did from Chinas and Japans, yet he sells fewer pounds of ours because ours are so much stronger and therefore go further; (4) that our breaks are so small that dealers are often unable to match them whereas he has no difficulty in repeating a line of 500 at 1,000 chests of Chinas or Japans; (5) that methods of advertising as practised in England are unsuitable; (6) that the object should be to enlist in our cause men of capital and energy who are willing to take up our tea and push it and who will in time force the large dealers in the present tea trade to take our tea up in self-defence to assist such men by advertising and other ways and by further general advertising so far as funds permit. Pure food shows and other similar small exhibitions are approved of, but expensive exhibits at large exhibitions are viewed with little favour by Mr. Mackenzie. In accordance with the advice tendered by Mr. Mackenzie which is summarised above, a letter of instructions was issued by the Committee to Mr. Mackenzie, with the approval of the Government. Following the lines indicated, and indeed may be summed up in the word "advertise" though not in the limited sense usually understood as press advertisements. Under advertising the Committee included every form of making known our teas to the American trade and American consumer, so far as our funds would permit. Mr.

Mackenzie was re-appointed the Ceylon representative and returned to the States as soon as funds were remitted to him. At this time a renewed attempt was made through the Ceylon Association in London to bring about combined action with India. But the proposal made failed to meet with the Committee's approval and it was considered that Mr. Mackenzie's Letter of Instructions gave him sufficient scope to unite with India if in his opinion such a line of action was desirable in the interests of Ceylon. Since then it is satisfactory to know that Mr. Mackenzie has seen his way to join forces with India to a considerable extent, as anything like opposition to Indian tea might be prejudicial to the interests of both countries and it is hoped that the Indian Committee will continue to supply funds in the same proportion as Ceylon. A number of firms who are well established in the present trade and whose organisation is thus made available to push the new article have had assistance in advertising and some firms who have taken up our teas from the first and have put energy and capital into the business of pure Ceylon Tea have also received assistance. In addition to this, however, a great deal of advertising has been done in the press, regularly by contract, and specially on occasions of political or other excitement when an event of the moment was seized and adapted by Mr. Mackenzie to his purpose as for example the yacht race, the eclipse, the defeat of "Tammany Hall" and so on. In these special cases the advertisements were pictorial and of large size. At present an advertisement is running containing the names and addresses of all grocers and others who deal in our teas in New York and Brooklyn.

In addition to these advertisements proper, a large number of what are called "reading notices" have been inserted in daily papers and articles in magazines and all are changed at intervals. The cost of advertising in America is very great and the Committee wish to warn members of the Association of this in case they should think that with the funds at their disposal a great deal more can be done. Pamphlets and leaflets have also been largely distributed. The above is a brief outline of what Mr. Mackenzie and the Committee have been doing during the year. Obviously in a matter of this nature it is impossible to publish the names of firms and others who have assisted in pushing our teas and who have in turn received assistance in advertising, but the Committee consider that in Canada, Ceylon tea is now a household word and that it is becoming rapidly known in the Eastern States and Chicago, which are after all the great centres of dense population and they point with confidence to the figures of exports of Ceylon tea from London and from Ceylon direct to the United States and Canada. Nor must these figures be looked at merely in the aggregate. The rate of increase is after all the true test and the Committee venture to think that looked at in that light they are eminently satisfactory and prove that the efforts put forth in 1891 and 1895 have met with adequate reward. In this connection it may be pointed out that the Board of Trade returns of exports from Great Britain of Ceylon Tea were only made available in 1895 at the instance of the Planters' Association and are not available for previous years. The absolute necessity of maintaining and increasing our efforts during 1896 must be apparent to all in view of our increasing exports and the Committee express their earnest hope that these efforts will be still further increased in the future. To Mr. Mackenzie thanks are very specially due for he has thrown himself into his work with all his energy at considerable personal inconvenience. The Committee also desire to express their thanks to the Ceylon Government for its continued sympathetic attitude and its willing consent to the Committee's proposals.

CEYLON TEA IN RUSSIA.

The Committee have continued to give attention to this market, which cannot be considered any less important than the American market. Being already a black tea consuming people their change from China tea to Ceylon Tea may be expected

to be to a great extent a matter of price and more easy of accomplishment than in the case of America. The fact of Russia being a country with a foreign language and having many governmental restrictions renders it impossible for the Committee to extend their operations in the same way as is possible in an English-speaking country less fettered by trade restrictions. The Committee have accordingly continued their support to Mr. Rogivue who has in the past shown himself thoroughly deserving of assistance, and they are glad to think that that gentleman's efforts have not only resulted in his building up a good business in Ceylon teas for himself, but have also forced other large dealers in China teas to take up Ceylon teas and to stock them. This is undoubtedly the most effective method to adopt either in Russia or America and the larger Mr. Rogivue's business grows the better will it be for Ceylon tea and the more will other firms see that they must have it. It is right that Mr. Rogivue should continue to have assistance for he has for several years past proved himself a capable and straightforward man of business devoting himself to the sale of Ceylon tea through a good deal of opposition and hardship and if he has succeeded for himself, his success means success to the Ceylon tea interest. The Committee are glad to hear that he has at last established a good business for himself, and thanks him for his past services in aid of Ceylon tea.

E. & O. E.

A POSSIBLE INDUSTRY.

The *Asiatic* suggests that the Indian people might profitably take up the farming of crocodiles as a new industry. For the skin of the crocodile there seems to be a large and profitable demand; and the teeth also command a price, though for what purpose does not appear. Alligator farming and artificial breeding have long existed in Florida, U.S.A., and the magnitude of the industry may be understood from the fact that between 1880 and 1894 as many as two and a half millions of alligators were killed. But the Florida trade has overreached itself and the American alligator is growing scarce. It is this fact that suggests possibilities for India. There is all around the Bay of Bengal a stock of crocodiles, for all practical purposes quite as valuable as alligators. With this stock ready made at hand, and with at least the nucleus of a native staff versed in the habits and manners of crocodiles in the plucky crocodile fishers or hunters of Dacca, there really seems no reason why Eastern enterprise should not find its opportunity in Western losses. It will be conceded that there is something attractive about crocodile farming, apart from the lurking possibilities of fortune to be made out of a brisk demand for hides. There would be no lack of excitement in tending the stock, and as the business would have to be conducted on somewhat irregular lines, the killing would be more in the nature of sport than slaughter. It would hardly pay to raise crocodiles from the egg, as the reptiles take as much as forty years to reach maturity, and are not supposed to attain their full size until 70 years old or more. But the adult supply is practically unlimited and the rough curing necessary to prevent deterioration of the skins on the voyage could be done by the native on the spot. In the Government reward the native has already a mild stimulus to slay the "mugger," and this tends to smooth the way of the dealer in skins who would thus enjoy the benefits of what would practically be a bounty on exports.—*Pioneer*, Feb. 11.

WYNAAD PLANTERS' ASSOCIATION.

From the proceedings of the annual general meeting held on January 22nd (Mr. Walker in the chair) we extract as follows:—

ANNUAL REPORT.

The most important business before the meeting was the drawing up of an address to the Viceroy, representing our two standing grievances, *i.e.* the amendment of the Labour Contract Act and of the Prevention of Coffee Stealing Act. The address has now been presented and was most graciously received by the Viceroy; and I think that we may take it for granted from the promise given by the Viceroy that a commission will be appointed at once to enquire into the whole question. This, if it takes place, will be the greatest concession that has ever been granted to the planters of Southern India, and it remains for us to make the most of it. As there will probably be only

one planter on the commission, it is of the utmost importance that we should be represented by a good man—a man, who can realise and understand the Government of India's and the English Lawyer's views of the question as well as our own, who has the advantages that we possess under the present Act and the disabilities that we suffer from at his fingers' ends, and who realises that as advances are to us an unfortunate, but absolute, necessity, we require a law which will protect these advances by deterring from fraud while inflicting the minimum of punishment. It will remain for us at this meeting to nominate a planter as a possible candidate to fill this important place.

COFFEE STEALING.—We can again record our satisfaction at the extraordinary immunity from theft which we have again experienced during the present season. Small drying grounds covered with cherry coffee along the roadsides and in the bazaars are no longer to be seen. This is due not to any amendment of the Act, but to the wonderful energy of our Police Superintendent, Mr. Pawcett. By his preventive measures and by the zeal with which he inspires those under him, the trade of receiving stolen coffee has at last received a rude check. But we must not congratulate ourselves too much upon it because after all it is only a check, and without the amendment of Sec. 9 of the Act it will be difficult to strike an effectual blow at the trade of dealing in stolen parchment or cherry coffee.

GENERAL PROSPECTS.—I said in my last annual report, that the coming years would be most important ones in the annals of Wynaad; this prophecy is now being fulfilled. The tea industry is developing slowly, but steadily. The results of the sales of the first shipment of tea have just been received and give an average of 9½d to 9½d per lb., which, though not so good as Assam, and not so good as we were led to expect from valuation of samples, still leaves the ample margin of at least 4d per lb. profit which, in conjunction with the fact that the yields of the young acreages have been abnormally larger should lead to the more rapid planting up of land. We have lately seen a great deal written in the papers about our Wynaad and all in praise of it, with the exception of what appeared in the columns of a paper purporting to be written by planters for planters, and we may trust that this is merely the friendly rivalry of brother planters less favorably situated. At any rate the district has lately been visited by enterprising planters from Ceylon, many of whom, I am glad to hear, are going to settle here. But I sincerely trust that the advantages of the situation will not be left entirely with them, and that the scheme so often advocated by this Association of small acreage under different proprietors, with central factories, may at last be put into force, and that the old residents may share with new-comers in the prosperity that is to come. Anyhow those of us who are fortunate enough to hold reserves of land may congratulate themselves on its greatly increased value.

Arabian coffee, notwithstanding the continued ravages of leaf disease, continues to give handsome profits in certain parts of the district, and it remains to be seen what will result from the large acreages of Liberian which will shortly come into bearing.

In conclusion, gentlemen, I beg to lay the accounts on the table and my resignation in your hands. It is with very true and genuine regret that I resign this office which I have now held off and on for ten years, and I thank you all most sincerely for the friendly support and sympathy which you have always accorded to me and without which my work would have been a toil to myself and of no avail to the district.

The report was cordially approved and adopted unanimously.

FINANCE.—The accounts for the past year were laid on the table and passed. As these showed a considerable deficit a subscription was raised in the room to meet it, and it was resolved that the yearly subscription of members be raised from R12 to R18 per annum.

COFFEE ROBBERY REWARD FUND.—As the balance at credit of this fund is nearly exhausted it was resolved that the accounts be printed and circulated and fresh subscriptions invited.

HONORARY SECRETARY.—The Chairman proposed a cordial vote of thanks to the Hon. Mr. G. Romilly for his services, both as Planting Member of the Legislative Council, and as Honorary Secretary of the Association, for seven out of the last ten years. He felt sure that he was only expressing the feelings of every member of the Association, when he said no man could have done more for the Association than Mr. Romilly had done, and we were all most heartily obliged to him.—Carried with acclamation.

A testimonial to Mr. Romilly in recognition of his great services was presented by the resident members of the Association.

Mr. J. W. Hockin was elected Honorary Secretary for the ensuing year.

GENERAL MEETING.—The meeting being resolved into a general meeting the following proceedings were recorded:—

Resolved that in the event of the appointment of such a Committee by Government Mr. J. W. Hockin be nominated by this association as its candidate for the post of planting member.

Resolved that in the event of another planting member being appointed by His Excellency the Governor of Madras this Association nominates Mr. H. P. Hodgson as its candidate for the post.

COST OF TEA PRODUCTION.

The cost of production of tea on the Nilgiris seems to vary very greatly. The most reliable figures we have hitherto obtained are from a garden off which a (manned) yield of 300 lb. average is obtained per acre; the size of the garden is about 200 acres. The latest machinery is used, the firewood is grown on the estate—which is well roaded—and in fact the circumstances for cheap production seems as favourable for high elevation gardens as they could well be. Yet the cost on the estate per lb. of tea runs up to 6 as. 3 pie, a figure declared by others to be greatly above the mark, though even the most favoured in this district cannot approach the month-watering Wynaad rates.—*Planting Opinion*, Feb. 15.

KONA COFFEE INDUSTRY.

The coffee industry in Kona is exceedingly bright. It is now harvest time and from all of the coffee plantations, as well as in every shady dell, coffee is being picked and shipped. One of the largest crops will be from the estate of the Hawaiian Coffee and Tea Company, which will probably yield not far from 15,000 pounds. Mr. C. D. Miller, its manager, reports the most satisfactory results at an elevation of from 1,000 to 2,000 feet. The blight has entirely left the plants in his care and the trees now appear thrifty.

Mr. Carl Buchholz, who recently purchased 200 acres of coffee land in Kona from Mr. Monsarrat, of Honolulu, is building his houses and making improvements preparatory to the commencement of active work. He will, as soon as possible, clear and plant at least fifty acres. Mr. Carl Buchholz, himself, leaves for Germany soon, but his brother is left in charge.—*Hile Tribune in Hawaiian Commercial Journal*, Dec. 31.

TEA IN THE WYNAAD.—The *Madras Mail* has an editorial on this subject which we quote elsewhere. Comparison is made with Ceylon, and the opinion is expressed that when the annual returns for the young estates that have just come into bearing are published, it will be found that so far as mere quantity of leaf is concerned the Wynaad is able to hold its own against any tea-growing district in the world. The healthiness of the district is also defended.

UVAKELLIE TEA COMPANY OF CEYLON, LIMITED.

The statutory meeting of the shareholders of this Company was held in the office of the Secretaries and Agents (Messrs J. M. Robertson & Co.), Prince Street, at noon on Feb. 24. Mr. Henry Bois presided, and present were Messrs. W. D. Gibbon, W. B. Kingsbury, Moir (Secy.) and Vanderspar, Surgeon-Major Pike (by his attorney, Mr. W. B. Kingsbury), and Mrs. Gibbon and Mr. S. E. Tench (by their attorney, Mr. W. D. Gibbon.)

The notice calling the meeting having been read.

The CHAIRMAN submitted

THE REPORT.

The Directors have now to submit their First Annual Report and Accounts for the year ending 31st December, 1895.

The yield of tea during this period has been 97,714 lb.; the cost per lb. has been 29.81 cents; and the average net price obtained 51.84 cents.

The coffee crop has amounted to 899 22-32nd bushels; the net sum realised, after allowing a safe estimate for a small lot not yet sold, being R15,048.85.

The expenses in connection with the planting of tea, new caddies, and additions to factory have been passed to an Extension Accounts as Capital Expenditure.

After allowing for Depreciation on Buildings and Machinery 10 per cent. and 15 per cent. respectively, and writing off the whole of the Preliminary Expenses R1,140, there remains an amount of R25,722.61 for distribution.

It is proposed to pay out of this a dividend of 10 per cent. for the year, which will absorb R24,000, leaving R1,722.61 to be carried forward to next account.

The tea crop for the coming season has been estimated at 110,000 lb., and the coffee crop at 200 bushels parchment.

The Company's estate now consists of:—

Tea 5 years old and upwards	300	} About 70 to 80 acres interspersed with coffee.
„ 3 years old ..	60	
„ 2 „ „ ..	50	
„ under 2 years ..	50	
	460 acres	
Forest, Chena and Patna	101 „	
	561 acres	

In terms of the articles of Association all the Directors retire, but being eligible, offer themselves for re-election.

It will be necessary to appoint an Auditor for the new season.—H. Bois, W. D. Gibbon, and W. B. Kingsbury.

Colombo, 8th February 1896.

The CHAIRMAN said the report and accounts which had been printed and circulated, he thought, gave all the information that would be of interest to the shareholders; but, if there was any further information desired, he should be happy to furnish it if it was in his power to do so. The certificate of incorporation of the Company was dated 6th March, 1895, so that the present was a statutory meeting as required by the Ordinance. The accounts covered a period of 12 months; but, inasmuch as the share capital or the bulk of the share capital was only paid on 16th March 1895, the revenue-earning period of the accounts was only 9½ months. The estimates for the coming year did not indicate that a very large dividend would be earned; but it had to be remembered that the Company was, to a certain extent, a development Company, having a considerable acreage of tea not yet in bearing;

and, he had no doubt, when the whole place was yielding full crops, that the dividend would be satisfactory to the shareholders. As regarded the dividend they now proposed to declare, he thought, after writing off preliminary expenses, and considering that the working practically only covered a period of nine months, the result was fairly satisfactory.

In reply to a question by Mr. Vanderspar, the Chairman stated that the Company took over the estate from 1st January 1895 and they had to pay the interest on the purchase money until the shares were paid for.

Mr. VANDERSPAR:—In that case don't we get the benefit from 1st January?

The CHAIRMAN in reply to Mr. VANDERSPAR's question said they had the benefit of the working of the estate from 1st Jan.; but *per contra* they had to pay interest on the purchase money from that date.

Mr. VANDERSPAR remarked that he thought the Chairman said 9½ months.

The CHAIRMAN:—The earning period is really 9½ months as the greater part of the earnings for two and a half months from 1st January is counterbalanced by the interest on the purchase money.

Mr. VANDERSPAR seconded the adoption of the report.—Report adopted.

The CHAIRMAN said the next business was to declare a dividend. The Directors recommended a dividend of 10 per cent for the year.

Mr. VANDERSPAR proposed that a dividend of 10 per cent be declared.

Surgeon-Major PIKE seconded.—Resolved accordingly.

Messrs. H. Bois, W. D. Gibbon and W. B. Kingsbury were, on the motion of Mr. VANDERSPAR, seconded by Mr. TENCH, unanimously re-elected Directors.

Mr. VANDERSPAR asked if there was any reason for the shortage in the estimate of the tea crop. He had worked it out and he found that the dividend next year could not possibly be more than 8 per cent.

The CHAIRMAN:—That is so.

Mr. VANDERSPAR:—Is the estate suffering from helopeltis?

The CHAIRMAN:—No. The tea crop is expected to come up to expectation, but the estimate for coffee is only 200 bushels as against 800 last year. It is due to the coffee. Mr. Gibbon informed him that, so far, the yield of tea was satisfactory and if the yield continued as it had done up to date they would do well. The coffee, on the other hand, was very uncertain.

On the motion of Mr. VANDERSPAR seconded by Mr. KINGSBURY, Mr. Hercules Scott was appointed auditor.

This was all the business.

QUININE POWDERS.—Having considered the report of the Government Botanist and Director of Government Cinchona Plantations, the Government observe that the figures furnished by that officer relating to the sale of quinine powders sufficiently prove that the experiment of the distribution of quinine packets by the Postal agency in the five districts originally selected has been on the whole a success, and that there is no reason why the introduction of the system into other districts should be delayed any longer. Mr. Lawson has accordingly been requested to arrange, in communication with the Postmaster-General, for the supply of quinine to the postmasters of the undermentioned districts:—Bellary, Salem, Anantapur, Kistna, Godavari, South Canara, Coimbatore, North Aycot, Trichinopoly, Tinnevely, Tanjore, Nilgiris, Madras, Nellore, and South Arcot.—*Madras Standard*, Feb. 8.

TEA IN THE WYNAAD.

The cultivation of tea in the Wynaad has during the last few months been attracting attention outside the limits of Southern India. More than one capitalist has come up from Ceylon to prospect the district, and we have already chronicled the sale of Perindotty, the only old tea estate of any considerable size, to planters in that island. When the sales of the first breaks of tea from the Errumaculla and Chulika estates realised in the London Market 1d to 1½d per lb. over the average of the week for Indian teas, it became evident that the quality of tea from the Wynaad was all that could be desired. That the yield per acre is very heavy is beyond dispute. When the returns for Perindotty are made up for the current year, the yield per acre over the whole estate will, we understand, be, say, 550 lb. per acre. This figure in itself is not exceptionally high, but it must be remembered that it has reference to a plantation, many fields of which are planted up with bushes of what Mr. William Taylor, a Ceylon planter of long experience, has declared to be the worst *jat* he has ever seen in his life. This implies poor and infrequent flushing. When the annual returns for the young estates that have just come into bearing are published, it will be found, we believe, that so far as mere quantity of leaf is concerned, the Wynaad is able to hold its own against any tea-growing district in the world. The elevation at which the cultivation is carried on, viz. from 2,500 to 4,000 feet, will necessarily prevent any teas of exceptional quality being produced, but none the less they should be of those useful grades which always find a ready competition in Mincing Lane. In Ceylon we notice that Companies whose plantations lie at a similar elevation give handsome returns, though it must be admitted that the best dividends come from Companies in the low country or at an extreme altitude, *i.e.* from those estates which give either the biggest quantity or the highest quality. The cheapness with which tea grown in Southern India can be put on the London market will always be a most important factor of success. In both Travancore and the Wynaad the actual cost per lb. of tea to the producer varies from 1½d to 5d. In Ceylon we believe it is the same, but in Northern India it is stated to be 2d per lb. more. Too great stress can hardly be laid on this fact, for it allows the tea-planter of Southern India and Ceylon to either grow inferior leaf at the same profit or else to produce the same quality with nearly 100 per cent more profit to himself.

A correspondent, himself a tea-planter, but not of the Wynaad, has sent us the following note;—"The coffee crop for the past season may be looked upon as finished, and from all one hears the general result is somewhat disappointing as regards quantity. The high prices ruling at home and locally make the past season, however, a fairly satisfactory one taken all round. The recent boom in tea in the Wynaad seems to have suffered a little check. Several Ceylon planters who came here to prospect are said to have returned not by any means so favourably impressed to the future *El Dorado* that some proprietors in that district would try to make others think of the land they want to get quit of." We do not know on what authority our correspondent bases the latter statement. So far as we have heard, no Ceylon planter who has seen the younger clearings of tea in the Wynaad denies its extreme suitability for the cultivation. Some Ceylon men, we know, have gone back to the Island deterred by exaggerated accounts of the unhealthiness of the district. On this point *Planting Opinion* of the 15th instant writes:—"The Wynaad may not be able to boast of a sanatorium climate like Ootacamund or Nuwera Eliya, but generally speaking we believe it is fully equal, if not in fact superior, to any districts of like elevations in either India or Ceylon. Certainly it is very far from being so unhealthy, owing to its being so well opened out, as many 'new' districts we wrote of. As to labour, there is never any lack of it in the Wynaad, the supply there being probably better than almost any district in Southern India. We would have not dwelt at

such length on the matter, had we not good reason to believe that the above attempts to frighten off Ceylon capital, have been selfishly made by men who feared lest large extensions should raise the labour rates." We can hardly believe that any Wynaad planter could be so selfish or so blind to the interests of the district generally as to spread false reports about its unhealthiness merely to scare away capital because it might possibly at some future date raise his rates of labour. This would be playing the cat in the minger with a vengeance."

Mr. H. M. Knight, the well-known planter of Travancore and at one time in Ceylon, who has recently been through the Wynaad, writes as follows in a Report of his on the question of climate:—"It has been the custom for planters in most parts of the Wynaad to leave their estates in the hot months, March-May, and live on the adjoining hills at a higher altitude, say over 4,500 feet, or to go to Ootacamund or elsewhere. This when coffee was the sole product was a pleasant and suitable arrangement both for Superintendents and labour, and has lapsed into a regular custom, and this no doubt has given rise to the widespread idea that the Wynaad is very feverish during these months; undoubtedly there is some ground for the report as fever prevails more or less all over India at certain altitudes before the south-west monsoon is well in. But I cannot believe fever is more prevalent in the Wynaad than other places at same elevation, nor do I think from all I heard that it is a very severe type." These remarks are straight forward enough; and if they be wrong we should like to have them contradicted on reliable authority with facts and figures given in support of the contradiction. To the best of our knowledge not a single European has died in the Wynaad from the direct effects of malaria during the past ten years. It is moreover too often overlooked that this type of fever is endemic throughout the greater part of India. If Madras, for instance, were not the seat of Government, but only the headquarters of a Sub-Collectorate, we have but little doubt that double batta and extra allowances would be granted on account of the prevalence and virulence of malaria, and with a good deal more reason than is the case at the present time in the Wynaad.

Nothing definite can be said of the effect of the climate of the Wynaad during the hot months on large gangs of coolies, for as Mr. Knight has pointed out, it has been the custom in the district to get rid of labour as soon as the hot weather set in. So long as there was no demand at that season of the year, there would certainly be no supply, but given the demand it seems to us no difficulty will be experienced in obtaining the supply, except, of course, the initial trouble which always attends every new departure. It may be taken for certain that imported labour will not stay in the Wynaad during the hot months when there is no work to be done, but once let it be known that there are wages to be earned, we see no reason why the wage-earners will not be present. Tea has been grown profitably in the Doonars and the Terai in Upper India and in the Kelani Valley in Ceylon, where fever may be said to be prevalent all the year round, so we can hardly suppose that all other conditions being extremely favourable, it cannot be grown profitably in the Wynaad merely because during two months of the year there exists a mild type of malaria. If, however, there are Wynaad planters who are honestly of opinion that fever of such type prevails as to prevent the cultivation of tea, we here ask them to supply us with the facts and figures on which their belief is based for neither at Vayitri nor at Sultan's Battery nor yet at Nellacotta have we heard of this virulent malaria.

The Hon'ble Mr. Romilly, in his annual report of the Wynaad Planters' Association said that he sincerely trusted that the scheme so often advocated by this Association of small acreage under different proprietors with central factories might at last be put into force, and that the old residents might share with the new-comers in the prosperity that is to come. If only this scheme were car-

ried out it would be well for all concerned. It is, no doubt, all to the advantage of a District for the residents to have a direct interest in the staple enterprise and not to be merely paid servants. There has been and always will be a tendency to convert tea properties into Companies, but as Mr. Capper pointed out in his letter to us the other day, in Ceylon at any rate this course only means that instead of a man having all his capital invested in one concern, it is distributed over several. Coffee, both Arabica, Liberian and Hybrid, still flourishes in the Wynnad and so do pepper and cinchona, to say nothing of cardamoms, vanilla, jalap and annatto seed; indeed there is no district where so many products have been proved to thrive and give their yield in due season. Many of these unfortunately have small commercial value now-a-days, but tea is still a very profitable cultivation. Given the assurance of a central factory, every planter within the proper radius, wise in his own generation, will own fifty to one hundred and fifty acres of tea. —*M. Mail*, Feb. 18.

WEST AFRICAN COFFEE.

A small sample parcel of coffee has just arrived in Liverpool from the west coast of Africa. As this is the first lot grown on the coast and brought to this country some considerable interest attaches to it, as very great things are expected of this new industry. Some considerable amount of money has been spent in the experiment to grow coffee in the vicinity of Lagos, and the Ilaro Estates and Plantations, Limited, have at last succeeded in proving the capabilities of the soil and climate in producing a coffee of very rich flavour, which has been valued by experts at 109s per cent. The coffee, made without any adulteration by chicory, contains all the stimulating properties and carries the delicious aromatic flavour necessary to please fastidious coffee drinkers. The estate covers an area of about 50 square miles, and contains over 70,000 plants. —*Journal of Commerce*, Jan. 31.

ANOTHER WONDERFUL COFFEE YARN.

South Carolina, as is now widely known, is already producing a first-rate article of tea for drinking purposes from plants grown in the State. We are glad to be able to make the encouraging announcement that there is now a very good prospect that it will soon be in a position to produce at home also much, if not most, of the coffee it requires for such purposes.

We have seen some of the home-grown coffee. A few seeds were obtained last year by Mr. J.C. Ball, of Cordesville, and were planted on his farm, the Middleburg place, Cooper River, yielding a crop of about a bushel. Some of the product was roasted and ground and made into coffee, which was served to guests at his New Year's dinner a few days ago, and was pronounced by them to be of fine quality and flavour. Mr. Ball only claims for it that it is superior to Rio, and is sure that it will bear that claim at least.

Mr. Ball is so well satisfied with his experience of the new plant so far that he will plant several acres this year. —*Charleston News*.

The above is evidently the work of the professional liar, for a similar report is going the rounds, but applicable to other sections. Possibly it emanates from the same fellow who described the man with a marble leg, and who is given to originating all manner of improbable stories and sending them to the press. As it requires from four to six years for a coffee tree to come into bearing, it is apparent that the South Carolina climate must be phenomenal in its adaptability for coffee-growing, if a tree produces "about a bushel" in one year. Two pounds to a tree is a big average yield. We imagine it will be some centuries hence before our Charleston friends will meet their requirement for coffee from local plantations.

P.S.—The above was written based upon the clipping, which evidently was condensed from the original by one unfamiliar with the characteristics

of coffee. The full text of the article in the *News* indicates that the South Carolina coffee is not the coffee *Arabica* or *C. Liberica*, but a tree which produces a "bean" about the size of a "cowpea," and that in Europe it is called "German coffee," and is used as a substitute for true coffee. We imagine it is no more like coffee than burnt peas or rye mixture. The *News* article is misleading and calculated to puzzle the editor hunting for sensational paragraphs. —*American Grocer*, Jan. 15.

A DISCRIMINATING DUTY ON TEA IMPORTED TO THE UNITED STATES.

The special correspondent of the *American Grocer* at Washington writes on Jan. 14:—

The first gun in the pure tea campaign has been fired in the House by Congressman Cummings, who, has introduced the following bill providing for a discriminating duty on teas imported from this side of the Cape of Good Hope:

"Be it enacted, etc., That there shall be levied, collected, and paid on all teas, the growth or produce of the countries east of the Cape of Good Hope, when imported from places west of the Cape of Good Hope, a duty of ten per centum *ad valorem*. And teas that have been entered for consumption or warehouse, or that have been permitted to remain unclaimed, or that have been permitted to remain for any purpose in any country intermediate between the country of export and the United States, shall not be considered as *in transitu* through such intermediate country, but shall be treated as teas imported from such intermediate country, and be valued and rated for duty accordingly."

This bill is being urged upon the attention of Congress by representatives of the tea trade, and a memorial has been presented to the Ways and Means Committee, in which some of the reasons for the legislation are set forth, and from which I abstract the following:

"Heretofore when the subject of duty on tea has been suggested, it has generally been opposed with the fiction of the 'free breakfast table' by some who have not understood the subject and the conditions which affect the production, distribution and consumption of tea. The fact is, the removal of the duty on tea has been a positive injury to the consumer, because of the poorer quality which has been imported since then.

"The Bureau of Statistics shows that in 1873 the average import price of tea was double the price of today, and the consumption 1.53 pound per capita, which is now only 1.31 pound per capita. The consumer pays the retailer nearly as much today for a pound of tea as he paid in 1873 and receives a much inferior quality, which accounts for the falling-off in consumption. In contrast with this, we find that in all countries where there is a tax on tea the consumption per capita has increased, most notably in England, where the consumption has increased within the last twenty-five years from 3.63 to 5.53 pounds per capita.

"In England, where the duty is 8 cents per pound and the consumer gets better value for the same money, the consumption is four times greater than in the United States, where there is no duty. Some twelve years ago Congress, upon the recommendation of the tea trade, passed a bill excluding adulterated and exhausted tea. Although the bill has been of advantage, it has not prevented the importation of large quantities of poor tea. Duty is the only real safeguard; its imposition, as has been proved by experience, would retard the importation of poor quality by American merchants and at the same time prevent native shippers in the producing countries from exporting to this country, where there is no duty, the inferior and trashy teas they cannot send elsewhere.

"In conclusion, our Government would obtain considerable revenue from a tax, which is recognized by all governments imposing a duty on tea as the most satisfactory tax that has ever been levied; and when the consumer can obtain a better quality of tea for

his money, we believe the consumption within a few years will increase very largely, thus benefiting the consumer, the trade, and the Government."

A vigorous effort will be made to secure a favorable report on the Cummings bill, and while there is little prospect of any action by the committee while the Dingley bill is pending, as soon as that is disposed of the situation will be ripe for prompt and energetic action by the friends of pure tea.

W. L. CROUNSE.

DRUG REPORT.

(From the *Chemist and Druggist*.)

42 CANNON STREET, E.C., Jan 30.

OILS (ESSENTIAL).—About 15 tons of Citronella oil in drums have been sold within the last few days at 1s 10d per lb. c.i.f. for January, March, 1s 9d c.i.f. for January-May, and 1s 8d c.i.f. for January-September steamer-shipment to London.

CEYLON TEA IN AMERICA.

We are in receipt of a letter from Mr. T. A. Cockburn dated San Francisco, 19th January, in the course of which he says:—

I heard recently from Bierach, who is anxiously awaiting word from London as to the Washington Pure Food Show, for which he can have advantageous terms for a Ceylon Court. He, however, requires assistance in undertaking such demonstrations, and at this juncture it is, I think, unfortunate your Delegate is absent, nor is there anyone with authority to act in such matters. Why not have Bierach appointed assistant to your worthy Delegate?—Then all business matters and these shows could be attended to during the Delegate's absence from this country. I received a few of the Planters' Association pamphlets (some 8 or 10 only), which the leading Grocers were glad to have, and put in their windows, but, I could do with 200 or 300 easily, or as many more as could be spared. I received a nice photograph of Bierach's Ceylon Court at Philadelphia, which I am sending you under separate cover. It looks an attractive place and there is a glimpse of a cosy, pretty, and artistic room inside, which looks most inviting. I notice a copy of your Overland Edition on a basket in the foreground. It looks a nice attractive place, with the numerous photographs of natives, Ceylon Scenery, and tea manufacturing processes. It must have been a good advertisement for Ceylon Tea generally, and is very creditable to Mr. Bierach. I think this will be admitted by all. I have not had time to read the last two *Observers* received, but was grieved to notice the deaths of poor old G. H. Hall and Richard Mout, who were fast friends and neighbours of mine for many years. They were alike in many respects, both clever, intelligent and well-read men. I got to know Mant well, and to know him was to admire and respect him, for beneath his rugged exterior there beat a warm and true heart. Hard-working, thoroughly conscientious, and kind-hearted, he was a good friend and neighbour. Keen on a hunt, a game of chess, or a hand at whist, many are the pleasant hours I have spent with others, in the ramshackle rambling old thatched bungalow on the patana, which is, alas, along with its late owner, no more. He was well-informed, and a discriminate and intelligent reader, and loved his books: he had a good memory, and who does not remember how he loved to recite or read some favourite piece of poetry; nor will the writer soon forget his singing of his favourite song, old "Benjie Dundee"! I read with pleasure the sympathetic notice of your Kurunegala correspondent, and have seen the book mentioned, written by Mant's father, for private circulation, and of which our friend was justly proud. I remember on one occasion when "Hallie" and he were having a game of chess, and Mant was called away to speak to some kangani or other person. Rising abruptly from the table he capsized the whole business, table, chess-men, himself and his chair, and,

in trying to save himself, brought down a big centre circular table, with books, photo frames, large vase full of flowers, table-cover, tobacco and pipes, &c., &c. Somehow or other both "Hallie" and myself were in it too, but we succeeded in extricating Mant at last with paws and castles sticking in his ears, "Hallie," who was very amusing at times, remarking "He *always* does this, Cockburn, when he finds he is losing the game," and we chaffed Mant often about it afterwards. On another occasion I acted as barber, cropped close and trimmed him à la *Fandyke*, and took him over the hill to a neighbouring family, whom he hadn't visited or spoken to for many years. After that they were good friends. He was an amusing and entertaining story-teller, and his opinions and remarks on things in general were invariably instructive, and very frequently amusing. He may have made a few enemies, none of us is perfect; let him who is so, cast the first stone. A long farewell, and may he rest in peace.

I enclose a short notice relative to the Canadian exposition, which is going ahead with all speed, I am informed. I trust, when the Delegate is fully informed on this subject, that Ceylon will be to the front.

"MR. STILES COMPLIMENTED."

"When calling at St. Lawrence Hall yesterday, the Premier, Sir Mackenzie Bowell, and Sir Adolphe Caron, Postmaster General, warmly complimented Mr. Stiles on his successful efforts for the exposition.

"Soon after the arrival of the High Commissioner, Sir Charles Tupper, Mr. Stiles will confer with him, the Premier and Mr. Foster, the Finance Minister, with reference to the diplomas and medals. There is every probability of these being provided by the Government, and those much coveted awards will go over the world a lasting advertisement for Canada as diplomas are never hidden."

Since writing the above, I have received a small packet of 25 pamphlets from Mr. Bierach: these will be distributed by me on Monday next. Long before the Delegate ever came to this country, I wrote strongly on the subject of better packages for this market. I even went the length of indicating a good and suitable one, and I am glad to see that your Delegate's remarks on this subject bear out my contention that more attention must be given by planters to the style of package they adopt for this market. The demand for "Ceylons" increases, but it is slow work, and we must be patient.

THE BLENDING OF TEA AT COLOMBO.—In the course of a review of a letter by our contemporary of the "Times" regarding the Colombo tea market, the *Madras Mail* says:—

We are surprised to read that the people of Ceylon fear the growth of blending business. We should pronounce Colombo to be an ideal place for such a business, for it might directly serve all the markets of the world, with the exception of those of the United Kingdom and the eastern countries of Europe, with teas mixed to the liking of consumers. We premise that blending has contributed considerably to the enormous increase of popularity of British grown teas in the British Isles, and, granting that our premise is correct, it should be an equally important factor in extending the popularity of the same teas in other lands. Why Ceylon appears so very suitable to us is not only because of its central position in respect to the great tea-growing countries, but far more so because there would practically be only one or at most two ports of entry and exit, so that it would be easy to check and control all shipments. Some simple law, somewhat similar in its effect to the Merchandise Marks Act, would have to be enacted which would prevent China trash being shipped as Ceylon leaf, and which would also provide penalties sufficiently heavy to deter the fraudulently-minded blender from doing harm to the local industry. There surely can be no difficulty in drafting and passing such an Act.

COLOMBO TEA TRADERS' ASSOCIATION.

The annual general meeting of the Colombo Tea Traders' Association took place on 21st Feb. in the Chamber of Commerce Rooms. Mr. F. M. Mackwood presided, and present were: the Hon. W. W. Mitchell, Messrs. C. E. H. Symons (Secretary), Duplock, Henry Bois, Lampard, W. Seale, L. O. Leefe, W. Haslam, Barber, F. F. Street, A. H. Thompson, G. Thomson, Walker, W. E. Mitchell, A. Gordon Frazer, G. H. Alston, Hancock, R. Caldicott Smith, and W. H. Figg.

THE ACCOUNTS.

The SECRETARY read the notice calling the meeting and minutes of previous meetings.

TEA TRADERS' ASSOCIATION.

The CHAIRMAN said they had heard the minutes of three previous meetings, and if they met with the approval of the meeting, he would sign them. He was following the precedent that was established last year—this being the second year no report had been presented. It was taken for granted that the reading of the minutes of all the general meetings constituted practically a report of all that had been done, and that it was a record of the year's work. He proceeded to the presentation of what they might call their accounts. These accounts were very simple. They began the year by carrying forward a balance of R515.75. To that had to be added the subscriptions from members received since amounting to R370, making a total of R885.75. The Secretary had expended for advertisements, etc. the sum of R177.65, leaving a balance of R708.10 on hand, which was the result of their year's work as regarded finances. He inquired if any member present would like to speak on the question of accounts, or whether anyone might express the view which he heard in one or two quarters, that it would be better to have a report, however short, embodying in a few words what they had done from year to year. He left it to the members to speak on the subject.

Mr. LAMPARD moved the adoption of the accounts.

Mr. W. H. FIGG had pleasure in seconding. He thought it would be desirable to have a short report yearly. They had just heard the minutes of the general meetings read, but there was a certain amount of business done in Committee of greater importance of which the general community might know nothing. He would therefore suggest that a short *résumé* of the business of the year be issued in a report and circulated a week before the next annual general meeting.

The CHAIRMAN said that, personally, he was in favour of the proposal and he thought it would be well to have a short report ready for their general meetings. They had done a fair amount of work; they had made alterations on the rules, made certain suggestions and discussed certain matters of short weight which were likely to bring Ceylon into bad repute in other markets, to say nothing of the annoyance caused to sellers and buyers amongst themselves. He thought it desirable they should have a report.

The accounts were passed and the suggestion that a report be furnished to next annual meeting was adopted.

THE COMMITTEE

was then balloted for with the following result:—
Buyers: Messrs. Duplock, Street, and Tarrant;
Sellers: Messrs. Whittall & Co., Messrs. J. M.

Robertson & Co., and Messrs. Bosanquet & Co.; and *Brokers*: Messrs. Forbes & Walker, Mr. E. John, and Messrs. Somerville & Co.

The CHAIRMAN moved that the Secretary be authorised to write to the firms which had been appointed asking them to nominate a partner or member of their firm who would attend to the work of the Committee; and, in doing so, he trusted he might be permitted to express the hope that the gentlemen nominated would be those who would really attend. They had sometimes had to wait a considerable time, on one or two occasions they had had to wait half an hour, whipping up members before they could obtain a quorum.

Mr. WALKER thought it was a most desirable thing that the Secretary should continue to do as he had done that day, to send them a reminder on the morning of the meeting, otherwise some of them were apt to forget about the meetings.

The Chairman's motion was carried.

A RESOLUTION.

The CHAIRMAN said he now came to put the resolution of which they had all received notice. It was a fresh departure on which there might be some difference of opinion. The matter had been considered necessary by a great many, owing to the increased trade of Colombo, and although it did not originate with him he had been asked to put it from the chair, which, after some consideration, he consented to do. The resolution was as follows:—

"That on and after Wednesday, 4th March, the following alteration be made in Rule 4 of the Conditions of Sale:—The words 'within 5 working days of date of sale,' to be substituted for 'within 3 days of date of sale, Sundays and Public Holidays excepted.'" There was a slight difference members would notice. They spoke of 5 working days instead of 3 days for the simple reason that five working days got rid of Sundays. He had no doubt some of the gentlemen who had felt the pressure of work and the annoyances connected with inspecting tea, getting railway orders and checking invoices &c would speak to the meeting. He felt that, with what was an admirable rule two or three years ago when they were selling less than half the quantity of tea, it was now almost impossible to go through the necessary routine, if they were to get away their tea and exercise the simplest and smallest precautions as to the condition of packages, checking weights, &c. If all their tea was in separate warehouses or godowns in the Fort it might be possible to go on at present; but, when they recollected that a great deal of the tea, they bought might be found anywhere in stores north and south within a radius of two to three miles from the Fort, he thought it would convince anyone of the impossibility of carrying out the existing rule. He would therefore propose that this alteration come into force as from Wednesday, 4th March.

Mr. DUPLOCK said he begged to second the resolution. The Chairman had described the case tersely and clearly, and it was not necessary for him to emphasise what the Chairman had said, because, if he spoke for an hour he could not put it more plainly than the Chairman did when he stated it was utterly impossible to collect their teas. They did not mind paying for them—they would pay on the morning after the sale for that part—but then they often did not get in accounts till Saturday. Then they had got one half-day to collect their teas. They could not do it, try how they would; and some of them thought that the responsibility should last longer than a few hours with the seller, and if

the responsibility were made to last two or three days longer, the sellers would only be taking on their shoulders that which they ought to take upon their shoulders. For his own part he thought the resolution was too modestly framed. He should have much preferred to see the five days made ten days but he was told that he should not have the least chance of getting ten days carried and therefore he accepted half a loaf in preference to no bread. The hardship came in when they parted with their money for tea which was lying, through no fault of their own, till Monday or Tuesday in other people's godowns, at their own risk. They thought the risk should rest with the sellers a sufficient time until buyers had time to collect their teas. He did not think any one could urge any objection to what had been proposed.

Mr. BOIS asked what was the time in Calcutta.

Mr. DUPLOCK replied that the time was 10 days. There, one did not pay for teas until he got delivery of them.

Mr. BOIS said they had already passed a resolution to give more time for tasting; now they were proposing to take that away.

Mr. GEORGE THOMSON said that passing the resolution would bring the conditions of sale more in accordance with those obtaining in other markets. He said let them go ahead with the times. So far as they know, the seller could store kerosine beside their tea. The buyer had no protection.

Mr. GORDON FRAZER although sympathising with the motion that some time should be given to buyers to take delivery of their tea, thought that the great advantage of the market to their upcountry clients—its quick returns—would be done away with, if two or three days were added to the time. Speaking for himself he would be quite prepared to accept responsibility for anything that remained in his store. He did not see there was any object in adding two days to the time, because it took off two days from the time the planter got his return. He understood from Mr. Duplock that it was not a matter of payment and that they were perfectly prepared to pay at once.

Mr. DUPLOCK replied that he spoke for himself, personally. He would pay for his tea on Thursday afternoon. But they never got their accounts until they had dunned sellers to send them in.

Mr. WALKER did not consider there was any use extending the time for delivery until they extended the time for payment. The planter would not get his money any sooner until the buyer knew whether his tea was right or wrong.

At this stage, Mr. GORDON FRAZER, after consultation with other members, withdrew his motion.

The CHAIRMAN said the question on which Mr. Frazer thought it would be better to move an amendment was one that was dismissed; and they felt it was impossible to separate the two days—taking delivery of tea and the matter of payment.

The Hon. W. W. MITCHELL said the resolution must be looked at from two points of view, the buyer's point of view and the seller's point of view. The resolution had been put forward in the buyer's interests.

The CHAIRMAN:—In the general interest, if I may say so.

Mr. MITCHELL (proceeding) said he sympathised with the buyer who could not take delivery within

a certain specified time, but he was of opinion that the longer time they gave people the longer would they take, and he was afraid people would not send in their bills until Monday or Tuesday, and then they would have no relief. Under the present system they cleared off one week's work before they took another on hand. If they went to take delivery of teas on Monday they would clash with teas coming from upcountry that day. Looking at it from the seller's point of view or the broker's, he would have to provide a larger amount of warehouse or godown accommodation. (Cries of "Hear, hear," and "So they ought.") Why should he be obliged to do that?

The CHAIRMAN:—Because it is his duty (and a voice "He is paid for it").

Mr. MITCHELL continuing remarked that for his own part he had not felt any inconvenience. He would rather see the rule as it was, because he felt that any alteration would simply lead to confusion at the beginning of the week.

Mr. FIGG said, with reference to what had fallen from the Hon. Mr. Mitchell, that up to a recent time the tea trade of the Colony had been a small one and they were only just now on level terms with bigger markets like Calcutta where he believed the time was 10 days. As their business increased, so must the time which was allowed. If the necessity of godown accommodation arose such accommodation must be provided for. It had got nothing to do with the buyer, and he was sure the planter had got everything in reason, and they were ready to meet the planter in every way possible, but the proposal before the meeting was nothing more than was reasonable.

The resolution was then put to the meeting and carried, Mr. Mitchell being understood to dissent.

Mr. A. H. THOMPSON asked when the five days terminated.

The CHAIRMAN said he should say up to one o'clock.

Mr. DUPLOCK said he was in favour of 5 o'clock.

Several members expressed the opinion that it should be up to the close of banking hours on Tuesday.

The CHAIRMAN concurred and this became the understanding of the meeting.

Mr. GORDON FRAZER suggested that it would facilitate the working of the trade from the broker's point of view by the cessation of contracts for the sale of tea. This was not done in London, and he never heard of its being done anywhere else. To a seller a contract was necessary, but what more contract did a buyer want than the knocking down of the hammer? It would insure the quicker delivery of accounts if they were allowed to waive this contract.

Mr. DUPLOCK said the contract was in force in Calcutta. For himself, personally, he never looked at his contract, but consigned it straightway to the waste-paper basket. (Laughter.)

Mr. GORDON FRAZER said it was never enforced in London and he thought it was useless. If it worked well in London, he did not see why it should not be applicable in Colombo.

The CHAIRMAN remarked that probably the Committee would consider the point.

The meeting then terminated with a vote of thanks to the Chairman proposed by Mr. FIGG.

INDIAN TEA ASSOCIATION.

ABSTRACT OF PROCEEDINGS OF A MEETING OF THE
GENERAL COMMITTEE.

Submitted letters of 22nd and 23rd November and 6th December, from the Secretary, Indian Tea Association London. The principal matters referred to in these letters were the marking of weights on chest of tea intended for the American market and the packing of Dust Teas. Copy of letter of 20th November from the Secretary of the Tea Brokers' Association, London, was enclosed intimating they were not in favour of placing any marks on the packages. (The letter is printed as an appendix to the minutes.) With regard to the packing of Dust Teas, copy of letter was enclosed from Messrs. Stenning, Inskipp & Co., which is also printed as an appendix to the minutes, suggesting that Dust Teas should be packed in half chests either of metal, or in strong and well made wooden packages, iron hooped, and a circular embodying these recommendations had been issued by the London Committee, which is also re-printed below.

Submitted letter of 16th December, from the Chairman, Ceylon Planters' Association, asking for information as to the terms on which a reduction in passage money of Tea Planters was granted by the Liners' Conference. It was decided to reply to this letter stating that the only concession given to Planters by Liners was a reduction of R100 on the passage money from Calcutta to London; no rebate was given on the return passage, no allowances were granted on passages from Bombay nor any allowance for families. There were no printed rules governing the matter, but a reduction was given to all persons who were certified as planters by the Agents of Tea Gardens.

Considered letter of 9th January, from Messrs. Bathgate, Pim & Co., enclosing copy of a letter they had received from London, regarding a firm in New York who were desirous of entering on the trade in Indian Tea, and asking if a guarantee could be given from the American Market Fund for such business. In reply to this letter Messrs. Bathgate Pimm & Co. were to be informed that they were under a misapprehension as regards business of this kind being subsidized.

Considered letter of 3rd January, from Secretary to the Government of India, Department of Revenue and Agriculture, forwarding for the consideration of the Association extract from a Memorandum by Dr. Watt, Reporter on Economic Products, on the proposal to appoint a scientific expert for the investigation of questions connected with the Tea Industry. Government had thought well to send the Memorandum in question before replying officially to the Committee's letter and it was stated that Woodburn would be quite ready to grant an interview to any representative appointed by the Association if they thought any useful end would be served by personal discussion. The Committee, however, considered it premature to enter upon a personal discussion of the matter at present, and it was resolved to forward the paper in the first instance to the Chairman of the Assam Branch from whom the proposal originally emanated and to ask him if he had any remarks to make upon it.

Submitted statement of contributions to the American Market Fund showing the total amount subscribed to the 31st December to be R88,879 representing a production of 77,067,618 lb. A detailed list of the Gardens' contributions was also submitted and a further statement showing that R6,983.15 was outstanding. The Committee considered the result of the levy was satisfactory.

(True copy).

W. PARSONS, Assistant Secretary. H. S. ASHTON, Chairman.

THE TEA BROKERS' ASSOCIATION OF LONDON.
118, Dunster House, Mincing E.C.,
November 24th.

ERNEST TYE, ESQ.,
Secretary, Indian Tea Association (London).

DEAR SIR,—In reply to the question contained in your letter of 16th September, with reference to the

stencilling of Gross Weight and Tare on packages of Indian Tea, I am instructed by our President (Mr. W J Thompson, Jr) to inform you that enquiry has been made amongst some of the leading dealers who are unanimous in objecting to such process as tending to cause disputes between themselves and their customers whenever a difference occurred between the Factory and Customs weight, one firm going so far as to say it would not knowingly buy any Tea so marked.

It is presumed, however, that the matter would be of indifference to the Blenders who now constitute a large section of the Buyers.

I am requested to send you the enclosed extract from letter received from the London Wholesale Tea Dealers' Association and to ask you to kindly bring the subject to the notice of your Members.

Yours faithfully, W. G. PRICE, Secretary.

EXTRACT FROM LETTER, LONDON WHOLESALE TEA
DEALERS' ASSOCIATION,

Dated 18th Nov. 1895.

"I am requested to ask you to be good enough to draw the attention of importers to the serious loss and inconvenience which arise from Dust Teas being in packages not properly protected against leakage and to suggest in the mutual interest of Seller and Buyer, it is desirable that such packages should be canvassed or otherwise protected before being shipped abroad."

14, MINCING LANE, E.C.,
November 26th, 1895.

ERNEST TYE, Esq.

Dear Sir,—We thank you for Circular of yesterday's date. We would point out that so long ago as 27th March 1890, we wrote the following in our circular of that date:—"In view of some recent cases of heavy loss in weights in respect of small broken and dust descriptions we throw it out as a suggestion to Planters whether it would not be advisable to pack such Teas in future in metal boxes." To this we would now add that as the weight of the above sorts is so heavy, it would be better to pack in *Half-Chests* either of metal or in strong and well made wooden packages, iron hooped.

We do not advise packages being canvassed for shipment as it would be impossible to see their condition besides it is also probable that less care would be taken in handling them in transit, and Tea that escaped into the canvas would be unfit for use.

We are, dear sir, yours faithfully,
STENNING, INSKIPP & Co.

THE INDIAN TEA ASSOCIATION (IN LONDON).

With reference to the packing of Broken and Dust Teas, it is pointed out for the information of Members that it is desirable owing to the weight of these descriptions, to pack them in half-chests, either of metal, or well made, and iron hooped wooden packages.

The use of canvas covering is objectionable.

They not only serve to hide the condition of the packages but probably less care is taken in handling them in transit, besides which, any Tea that may be retained by the canvas would soon become unfit for use.

ERNEST TYE, Secretary.

5th December 1895.

—*Indian Planter's Gazette*, Feb. 8.

FROZEN FLOWERS FROM AUSTRALIA.—It is stated in the *Westminster Gazette* of November 28, that a fine collection of blue and white Water Lilies (*Nymphaea gigantea*) has been sent by a leading florist in Sydney, N.S.W., through Sir Saul Samuel, the Agent-General, for presentation to her Majesty the QUEEN. The Lilies were frozen in ice, and received as long ago as August last by the Colonial Consignment and Distributing Company, Limited, being stored at Nelson's Wharf, until Wednesday, November 27, when they were delivered at Windsor. In spite of the length of time, the flowers were in perfect condition, and, seen through the transparent ice were very attractive.—*Gardeners' Chronicle*.

THE WYNAAD.

The London *Times*, in an ably-written article, having for its text the deputation of the planters of Southern India that lately had an interview with Lord Elgin, recites the leading difficulties under which the planting enterprise in the Wynaad now suffers. Want of communication with the seaboard, of protection for produce in transit, proper organization of labour, and fixity of tenure, and of security of the results to taxation, are among the chief disabilities set out in this article. Our London Correspondent thinks it to be possible that those planters who, being crowded out from Ceylon by our local policy of restricting land sales, are seeking investments in the Wynaad may wisely have their attention called to the very full statement contained in the *Times*. It would seem certainly to be impossible that the planter in the Wynaad can have any reasonable chance of competing either with those of Ceylon or with his fellow tea planters in Assam and other districts of Northern India, while his interests are weighted by such cramping difficulties as those therein set forth. We are not without causes of complaint in Ceylon, wherein tea planting constitutes relatively the prime consideration of its governing power. But although these demand and obtain strong remonstrance—as yet relatively and in some instances ineffectually—we believe it will be admitted that Ceylon is, in comparison with the Wynaad at all events, the Elysium of tea planting. Certainly the *Times* by its revelations utters a by no means indistinct note of warning to those of our own planting community who contemplate investment in the district, the planters of which have such grave reasons to complain of want of attention to their interests. But the fact that there is now scarcely an opening to be found in Ceylon for the younger men who have come here to learn tea-planting inferees these turning their attention to the wider field open to them in Southern India. So compelled, the exodus will no doubt be made, and this must yearly increase the competition that Ceylon now experiences from India-grown teas. In India the area of tea cultivation will be yearly extending, while in Ceylon it must, if the present policy of our Government be persisted in, be restrained within its present area. Surely a policy productive of such a result cannot be a wise one for us to follow. We have repeatedly pointed out that this colony still possesses reserves of land suitable for tea planting that might be sold without injury to the maintenance of needed public reservations. We need not here recapitulate what we have before written as to this matter. But when we see as we do that, owing to this policy, we are doing our best to foster competition with Ceylon in India, it is time to reiterate our remonstrances formerly made. For although it is evident from the *Times's* article that tea-planting in the Wynaad is at present so heavily handicapped by the conditions under which it has to be carried on that competition by it with ourselves must be relatively hopeless, this cannot now long remain the case. When redress is granted, the few who now leave Ceylon for India, despite existing difficulties, will certainly have their numbers largely increased. All the capital, and all the talent and experience that might be retained in Ceylon will pass over to the opposite Continent to increase the competition against which we now have to contend.

TEA IN THE WYNAAD.

You recently referred to the desire of some of your planters to undertake operations in the Wynaad. We believe it to be the case that several of these have already acquired interests in that Indian district, one that appears particularly well suited to tea planting by Europeans. But there is no picture, we are told, however pleasing it may be, that has not its reverse side. What this last is in the case of the Wynaad has been luminously set forth in an article that appeared under the heading of "Indian Affairs" in the *Times* this week. That article contains numerous references, by way of giving contrast, to the condition of things in Ceylon, and is possessed beside of so many other points of interest that it seems desirable that you should be supplied with a copy of it. One is accordingly enclosed with this letter. [See page 621.—ED. T.A.] It is not known to us how far you may already be acquainted with the circumstances therein set forth. But any way the writer puts all the points with such remarkable clearness that his statement of the position cannot be without interest for those of your readers who may be contemplating acquiring properties in the Wynaad. He states that a deputation of the United Planters' Association of Southern India recently interviewed Lord Elgin on the occasion of his late visit to Madras. Its members strongly complained of the labour difficulties under which the planting enterprise in the district is conducted, and of the want of protection for their produce while in transit to the coast. The article recites many other disabilities under which the planters of Southern India lie. Want of good roads is the main objection taken to the present state of things, and in this respect comparison is made with the competing country of Ceylon. It is suggested that legislation is needed for Southern India of the character that now protects the planting industries in the northern districts of that continent. Assuredly all is not yet perfect in Ceylon, but, equally assuredly does it seem to be the fact, that, as compared with the Wynaad, your planters enjoy very great advantages. If those of the Indian district are to have a chance of successfully competing with those of Ceylon, it would seem to be evident that the existing inequality between the two in this respect of roads and of other matters must receive redress. To outsiders like ourselves the perusal of the article sent you leaves an impression that it can scarcely be desirable as yet for Ceylon planters to extend their operations to Southern India. It, however, seems to be the case that many are inclined to do so and that some have already invested capital there. Whether others will feel inclined, after reading the statements in the *Times*, to follow their example, cannot be predicted. Should they do so, however, they cannot say that they are now left in the dark as to difficulties they may have to contend against of a kind comparatively unknown to tea planters in Ceylon. It is evident that the writer of the *Times's* article thinks that in Ceylon you have none of the causes for complaint that have been advanced by the deputation that waited upon Lord Elgin. But it is only those who wear the shoe that know where it pinches, and probably the *Times* writer is unaware of your railway stations being left for years without means of access, and of other minor difficulties with which your planters have from time to time to contend.—London *Cor.*

THE RAYIGAM COMPANY, LTD.

We have received a copy of the prospectus of this Company which has been formed with a capital of R1,000,000, in 10,000 shares of R100 each, of which only 4,250 will at present be issued. The provisional directors are Messrs. F. M. Mackwood, Gordon Frazer E. Rosling and A. Rosling; Bankers: Chartered Bank of India, Australia and China; Proctors: Messrs. Julius & Creasy; and Agents and Secretaries: Messrs. Mackwood & Co. The Rayigam Estate which is in the Nambapana division of Kalutara consists of 350 acres tea over three years old, 219 acres tea from one to three years old, 84 acres land now being holed, and 547 acres forest; total 1,200 acres. The property has been valued by Mr. E. D. Harrison at R402,500 on a seven years' purchase, and on the basis of yield of 500 lb. tea per acre. All the old tea has, however, given 560 lb. per acre. The price which the Vendors have agreed to accept is R400,000, half of it in fully paid-up shares, and balance cash—the remaining R25,000 being called up—is to provide permanent bungalow, two sets permanent lines, complete the new clearing, and take over Coast Advances. The property is being taken over from 1st Jan. 1896.

PLANTING AND PRODUCE.

PLANTING IN SOUTHERN INDIA.—Southern India as a field for tea enterprise is very much in evidence just now. Enterprising young men from Ceylon and elsewhere are turning their attention to it, and capitalists at home have their mind's eye in that direction. Planters on the spot are eager to show that they are quite aware of the strength of their position, and there is a general feeling of enterprise which will no doubt soon show important results.

A SEASONABLE PAMPHLET.—A pamphlet on "The Wynaad and the Planting Industry of Southern India," by Mr. Francis Ford, has recently been issued, and very effective it is as a graphic description of the country and the people. If the thousands of young men on the look out for something to do at home should chance to read some of Mr. Ford's word-painting there will be an increase in the European population of the Wynaad. Here is a description from Mr. Ford's pen: "It is January in the Wynaad. The coffee planter is still busy with his crop; the tea-planter is looking forward to his annual holiday, for during the following few weeks, there will be no rain, and the bushes will rest until the showers of March have fallen. The weather is lovely; bright days and chilly nights. When the moon is at the full the whole land is bathed in silver light, and so clear is the atmosphere that hills distant thirty miles may be discerned. This is the rutting time of the sambhur; sharp and defiant rings out the belling note all night, echoing among the silver hills. In the early morning there is a crisp feeling in the air which speaks of frost, though it never falls in these uplands. A light mist lies in the swamps and bottoms of the valleys, which quickly passes away once the sun has risen. All the day the planter is able to be out and about without minding the heat." Here is another: "Clouds lie low on the land. Looking down from an eminence it is as though a sea of grey silent waters covers the face of the earth. As the dawn comes up rays of gold glorify its surface, and there is a shimmer of opalescent light. Noiselessly subside the cloud-billows; now one peak, now another appears; wooded promontories jut out and forests rise from the vaporous flood. Before the day is two hours old all the tumbled woodland scenery stands out in radiant loveliness, stretching away to the purple distance, with wreaths of snow white cloud sweeping round the hills." But Mr. Ford's main object, we take it, is to show that the Wynaad is the place where tea may be successfully cultivated, and his views are fairly rosy. It is with tea cultivation as with many other things, a case of the survi-

val of the fittest. If tea can be grown in Southern India to greater advantage than elsewhere the cultivation of the product will pay. In these days of plentiful production the weakest will assuredly go to the wall. It is not a question of more tea, but a case of who can grow it profitably. Those gardens which are handicapped in the general competition will suffer. The consumption of tea cannot go on increasing without limit. The Wynaad is, no doubt, in many respects a paradise for planters, but even in an earthly paradise the producer has to compete with his neighbour. Mr. Ford is right in advocating the view that tea planting can best be undertaken by a company, and if the proposed company set to work in a careful and economical manner there ought to be excellent prospects of successful results in Southern India.

PLANTERS AND THE GOVERNMENT.—The weekly article in the *Times* on Indian affairs is this week devoted to the planters of Southern India and the Government. Mr. Ford's book is referred to and quoted in it. The writer in the *Times* says: "Lord Elgin, on his recent visit to Madras, was addressed by a deputation of the United Planters' Association of Southern India. They laid before his Excellency the labour difficulties under which their enterprise is conducted, and the need of increased protection for their produce while in transit from the interior to the ports. The Viceroy, in reply, indicated a willingness to consider the expediency of issuing a commission of inquiry, and it is generally hoped that such an investigation will shortly take place. The grievances of the Southern Indian planter are very practical. He makes no great demands on the Government, but the demands which he does make he regards as indispensably necessary for the working of his business. Fixity of tenure in his estate, safeguards against fraud in the supply of his labour, protection of his produce against theft, and adequate means of communication towards the sea—these are the initial conditions for successfully planting in any country, and they sum up the total of the South India planters' requests. The truth is that in Southern as in Northern India the pinch of competition with other Asiatic countries is every year more keenly felt. The Indian planters merely ask that the Indian Government shall awaken to the fact of this competition, and shall give them the fundamental facilities which a good administration ought to give for carrying on their industry. In the north as in the south we see densely overcrowded districts, and at no great distance from them other districts into which labour has to be imported at almost a fancy price. Between certain of these underpeopled and overpeopled tracts the insufficiency of means of communication acts as a breakwater against the free flow of the population. We also see large sums of British money invested in reclaiming and planting the jungles, with inadequate guarantees as to the claims which may be eventually made by Government on the improvements. From the North as from the South come the same complaint of want of roads or of insufficient expenditure on works for the control of the rivers. A book just published at Madras, 'The Wynaad, and the Planting Industry of Southern India,' sets forth the result of this state of things. The author, who writes under the pseudonym of Francis Ford, has evidently had a very practical experience of his subject, both as a planter and as a coast agent. Until a few years ago, he says, it was idle for the British capitalist in Southern India to plead with the local government for the facilities necessary for the conduct of his industry. Even though he might be supported by the district officers, the reply that he practically received was this: 'You have come to the country avowedly to make money; you must accept things as they are; otherwise you are free to return whence you came.' This demeanour of Government is the main reason why the mineral resources of Southern India remain undeveloped; why manufacturers lag behind; and why the natives of the country do so little in their private capacity to open out new industries or to extend old ones." "We reproduce the foregoing sentences," says the writer of the article in the *Times*, "as they embody

the view of large numbers of Englishmen who have invested their capital in India. These gentlemen compare the starvation allowances for roads and facilities of communication in backward Indian districts with the liberal policy displayed by the Governments of competing countries, such as Ceylon and Japan, in creating facilities for internal development. It would almost seem as if the interests of the Indian Government are so vast and so varied that it is unable to give the same attention to European enterprise that is given by smaller and more self-centred Governments, such as that of Ceylon. The local taxation which an Indian Provincial Government may have thriftily got together for the purposes of internal development and local public works has been liable to be swooped down upon by the Supreme Government of India to make good the expenditure on a frontier war, or to avert a deficit due to other causes. This subjection of local finance to Imperial exigencies forms a recurring source of weakness in the position of the Provincial Governments of India. It is perfectly well known that certain of the tea districts of Bengal have been starved of the necessary means of internal development from such causes. It is equally well known that the Assam tea districts were similarly starved until erected into a separate administration with a strong succession of Chief Commissioners to insist upon their claims.

ADMINISTRATIVE STARVATION.—“Such periods of starvation are, however, seldom continuous. Even in Madras Lord Wenlock has done something to recognise officially the claims of British industry. Yet we believe it is little more than a year since a planter was appointed for the first time a member of the Madras Legislative Council—that is to say, of the body which regulates the *status* and rights of the planting industry in Southern India. So far as we are aware, no tea planter has been appointed as such to the Bengal Legislative Council, although the commercial member of that Council doubtless does his best for all the mercantile industries of the province. Mr. Ford insists on the shortsightedness of a policy of administrative starvation, even from the public revenue point of view. He states that the planting industry expends annually in Southern India 13,000,000 rupees on the cultivation of land which but for that expenditure would be unproductive. He maintains that if the same facilities for development were given in Southern India as in Ceylon this expenditure would rapidly increase. “There is no reason,” he writes, “why the cultivation of tea and coffee should not be regarded by the capitalist as favourably in the Peninsula as in the Island, except that hitherto communications here have been bad and that inadequate protection for the produce and no safeguards for the maintenance of a steady supply of labour have been granted.” We should accept these words as an expression of opinion rather than as a statement of ascertained facts. But Mr. Ford supports his opinion by a striking example. The Government of Mysore, while it remained under British rule, dealt with the question of independent British enterprise somewhat, although not altogether, in the same spirit as that shown by the Madras Government. The great famine of 1876-77 left Mysore almost bankrupt just before its rendition to the native dynasty in 1881. We lately recorded the recuperation of Mysore from its financial difficulties under the late Maharajah and his able Prime Minister. Sir Theshadri Iyer's administration would do credit to any British province, and forms an important testimony to the capabilities of native rule. Mr. Ford points out, however, that in the high praise which ‘this splendid recovery’ won from the Government of India an important factor was overlooked. Sir Theshadri Iyer wisely encouraged European enterprise and strained his resources to the utmost to afford the administrative facilities such as roads and leases for developing it. The result has been that for many years the European plantations poured into Mysore a sum of 7½ million rupees annually in return of labour. ‘It was this Pactolus which made the task of the Diwans of Mysore not

only possible, but easy.’ As a matter of fact Mysore used to supply most of the labourers employed in the neighbouring British districts. It still supplies some of them, but a large proportion are now retained by profitable employments in Mysore itself. ‘To the planting enterprise,’ says Mr. Ford, ‘This province owes the strongest debt of gratitude for helping it to tide over those evil times.’ The South India planters think that there are special reasons why the commission of enquiry, half agreed to by Lord Elgin, should now be granted. The local officers are acquainted with their case and admit the justice of the claims. They have now a representative in the Madras Legislative Council, and they understand that the Madras Government recognises the expediency of legislation dealing with their special needs. But they have not yet been able to convince the Supreme Government. ‘The planter affirms,’ writes Mr. Ford, ‘the necessity of such legislation; the local administration, with a full knowledge of the facts of the case, supports him, but the Government of India stiffens its back in its ignorance and declines to hear reason.’ This puts the case perhaps too harshly, from the planters’ point of view. In the new Governor of Madras they will have an administrator intimately acquainted with the system under which Ceylon has made its brilliant industrial progress.”

THE INDIAN TEA ASSOCIATION (LONDON) AND THE *Times*' ARTICLE.—Mr. Ernest Tye, the secretary of the Indian Tea Association (London) has favoured us with a copy of a letter referring to the above subject, which has been forwarded by him to the editor of the *Times*. The letter is as follows: “Your article of yesterday on the subject of the planters of Southern India sets before the public with absolute clearness the difficulties of planters, not merely in the south, but in all parts of India. The association which I have the honour to represent cannot but feel thankful to you for the effective way in which you have in your columns, for months past, set before the public one of the most important questions affecting the industrial development of British India. I refer to the persistent diversion of provincial funds to meet the demands of the supreme Government. As long as the Supreme Government in India is not allowed to raise sufficient revenue to meet its obligations, Provincial Governments will be fleeced again and again to supply its necessities, and will be required to strave roads, railways, and other public works. In its character as representing the whole of the planters of India, my association is highly gratified to observe that the Viceroy expressed willingness to consider the expediency of issuing a commission of inquiry into the grievances of the planters of Southern India, but possibly the scope of inquiry of such commission might be extended to other provinces of India besides Madras. Good roads, good means of communication, improved steamboat and railway services, are in crying request all through the planting districts. As you have pointed out, the condition of Assam has greatly improved in this and similar respects since, by its conversion into a separate Provincial Government it has met with the more direct attention of able administrators, but even in Assam there is much room for advance. Without the hearty co-operation of Government it must be impossible to make those improvements in obtaining and transporting coolie labourers which are urgently demanded, so as to reduce the enormous expense of recruiting and promote the health, comfort and well-being of the labourers. Other planting districts have not the safeguards of Assam. It was only as late as December 28 last year telegrams from India called attention to the neglect of the roads in the Dooars, one of the most important tea districts in India. The particular road referred to is one which has occupied the serious attention of the Indian Tea Association both here and in Calcutta. It is clear to my association that, if this road is allowed to decay, it will be hardly possible to obtain any help for less urgent claims in other districts. The local district board has not

the means at its disposal, and the provincial funds have been depleted in the urgent need of the Supreme Government for pecuniary assistance; and the result is that the road, which has been a public road for many years, and on which depends the transport of millions of pounds of tea to Calcutta, is, it is rumoured, to be practically abandoned. The vital importance of this road to a small but increasing community by whose exertions wastes have been converted into gardens, is fairly set forth in the following resolution, passed at a meeting of the planters held on the 7th ult.: 'That the Nagrakata Road is one of the most important in the Doonars. It is the only means of communication with the railway station and the outside world for fourteen gardens with 10,800 acres under tea, producing over 70,000 mds, or 5½ million pounds of tea annually, and giving employment to 20,000 coolies living on the estates; the road leads also to a Government bazaar, police station, and to several other bazaars, and there is a large community of resident native cultivators, shopkeepers, and others dependent upon this road for communication and food supplies.' The substitutes proposed are to maintain it as a cold weather track (the pressing need being for a road to carry the tea crop to the market during the season of heavy rains) and to construct a new and distant road outside the district and at the other side of dangerous rivers. What would the people of North Surrey say if their main road along the Thames were to be dismantled on the plea that a better road could be constructed on the other side of the Thames? Yet North Surrey has many alternative routes both by road and rail.'

TEA AND MONEY.—The present mood of the investing public towards tea companies is distinctly favourable. Judging by the way the shares of one or two new concerns recently launched have been snapped up tea is very popular as an investment. The scarcity of investments other than these of the gilt-edge class naturally leads to a demand for anything of the industrial order that looks sound. As compared with the shoal of absolutely worthless rubbish that is handed to investors in exchange for their cheques, the shares of well-conducted tea concerns cannot fail to prove attractive.—*H. & C. Mail*, Feb. 7.

THE WYNAAD TEA ENTERPRISE.

The Pioneer Tea Company, favourable mention of which we made in our last issue, seems to stand an excellent chance of being successfully floated. A large number of shares have, we understand, been already taken up in Ceylon and elsewhere, and before long things should be in working trim. There is apparently a notion in Ceylon that the district is extremely unhealthy and labour very difficult to procure. The Wynaad may not be able to boast of a sanatorium climate like Ooty or Nuwara Eliya, but generally speaking we believe it is fully equal, if not in fact superior to any districts of like elevations in either India or Ceylon. Certainly it is very far from being so unhealthy, owing to its being so well opened out, as many "new" districts we wrote of. As to labour, there is never any lack of it in Wynaad the supply there being probably better than almost any district in South India. We would have not dwelt at such length on the matter, had we not good reason to believe that the above attempts to frighten off Ceylon capital, have been selfishly made by men who feared that large extensions should raise the labour rates. However, it may quiet their fears to learn that to make assurance doubly sure, arrangements are being made to establish Labour Agencies in the Tanjore, Trichinopoly, Madura and Tinnevely districts, from which parts Ceylon draws its labour. In any case the move is a wise one, and it goes without saying that if coolies in the above-mentioned districts will go to Ceylon, it may be taken for granted that they will go to the Wynaad, if work is offered them there. No one can more heartily desire to advance the prosperity of any planting district in South India than we do, and it is with pleasure that we publish these remarks to remove any erroneous impressions in Ceylon concerning the Wynaad, Ceylon capital and

Ceylon energy, though perhaps over-praised in some quarters, will effect a great change for the better in South India. A yet more important point is that they will tend to bring us into much closer contact with home capitalists, who, we are glad to note, are now beginning to pay renewed attention to our planting industries.

In one of our Wynaad Season Reports last fortnight, the writer expresses a conviction that we hold the most depressing views on the capabilities of his district, and indirectly accuses us of being biassed against it. Strange as it may seem to him and others of his thinking, we have been under the impression that the praise we have consistently given the district to be as hearty and unstinted as its most ardent supporters could wish for. True, we have expressed our opinions strongly on the future of the tea market generally and the un wisdom of rash extensions. But we have as strongly insisted on the fact that South India generally, and the Wynaad in particular, holds a very strong position indeed in the matter of cheap production. It is to Ceylon that we must look for capital to be invested in tea, and the planters there are so intensely sanguine of the continued prosperity of the tea-industry, that it will need a far greater show of authority than we can possibly lay claim to, to shake their faith in the staple. If men wish, as so many do, to invest in tea, no district in South or Upper India offers more advantages than does the Wynaad, with its abundant labour, fertile soil, and—best of all—excellent communications. The Chairman of the District Association, the Hon'ble G. Romilly, in the report printed in this issue, again brings the question of central factories to the fore, and most wisely. The scheme has already been exhaustively treated in Mr. Standen's pamphlet, and at this juncture men who may be opening up their land independently of each other, would do well in need to put into practice the method alluded to.—*Planting Opinion*, Feb. 15.

BEAUMONT TEA COMPANY, LD.

The statutory annual general meeting of the Beaumont Tea Co. of Ceylon, Ltd., was held in the offices of the Company, 113, Queen Street, on 25th Feby. Present:—Messrs. F. H. Wiggin (in the chair), D. Michie, F. S. Rashleigh, B. L. Bremner, and the Eastern Produce and Estates Co., Ltd.

Notice calling the meeting was read and the minutes of the extraordinary meeting of 6th Jan. were read and confirmed.

THE DIRECTORS' REPORT

was taken as read. It is as follows:—

The Provisional Directors have the pleasure to submit the Balance Sheet and Profit and Loss Account for six months ending December 31st, 1895. It has been decided that the financial and crop year shall commence on 1st January instead of 1st July. The Balance of Profit is, as shown in the accounts, R29,093.83. The Provisional Directors propose to write off one-third of the Preliminary Expenses, or R1,613.06; to declare a dividend at the rate of 5 per cent for the half year ended December 31st, 1895, absorbing R23,500 and to carry forward R3,980.77. The total tea crop secured from the Company's properties in the six months was 109,346 lb. and 49,747 lb. were made from purchased leaf, or in all 159,093 lb. The nett average realized including a portion estimated) was 9.96 cents.

The Company's property consists of the following, viz. :—

608	acres	Tea in bearing
122	do	Tea not in bearing
112	do	Fuel trees
10	do	Grass
322	do	Reserve and Waste

1,174 acres.

The capital cost as per balance sheet per cultivated area in tea stands approximately R644 per acre. The estimate of crop for the year 1896 is 230,000 lb. tea exclusive of tea from purchased leaf. Negotiations have been opened for the purchase of Delta estate which, it is hoped, will shortly be completed; when the additional share capital (which has all been applied for) will be allotted.

The Provisional Directors retire in terms of the Articles Association, but, being eligible, offer themselves for re-election. The Shareholders will be requested to appoint an Auditor for 1896 and to fix his remuneration.—By order of the Directors, for the Eastern Produce & Estate Co., Ltd.

JOHN H. STAREY,

Manager, Agents and Secretaries.

On the motion of Mr. F. H. WIGGIN seconded by Mr. F. S. RASHLEIGH the report and accounts were adopted.

Proposed by Mr. MICHIE, seconded by Mr. BREMNER, and agreed to, that a dividend of 5 per cent for the half-year ending 31st December 1895 be declared payable on 27th inst.

Mr. F. S. RASHLEIGH proposed that Messrs. F. H. Wiggin, D. Michie, J. L. Anstruther, and F. Liesching be elected Directors. Mr. BREMNER seconded, and the motion was agreed to.

Mr. John Guthrie, on the motion of Mr. BREMNER seconded by Mr. RASHLEIGH, was elected Auditor at a fee of R50 per annum.

Meeting adjourned.

DIMBULA VALLEY (CEYLON) TEA COMPANY, LIMITED.

If there is anything to be urged in favour of the Dimbula Valley (Ceylon) Tea Company, Limited, it is the circumstance that the now too-usual, and objectionable, "waiver" cause finds no place in its prospectus; and we note, too, that particulars of the contracts which have been entered into appear to be fully set forth. It is impossible, however, for us to express a favourable opinion in regard to the general prospects of this Company. The Company, having a capital of £200,000, has been formed to acquire six Tea Estates situated in Ceylon. Four of these estates, valued at £93,500, belong to a Mr. James Sinclair, who is the Chairman of this Company, and he is, apparently, to receive payment for them principally in cash. The total amount to be paid for the six estates (and the greater part in cash) is £145,200. The present issue of capital being £150,000, this leaves but £4,800 cash in hand, or working capital, or whatever it is, for the Company. The prospectus states that this sum of £4,800 is for "the general purposes of the Company"; but when we find further on that, quite contrary to the usual practice, this unfortunate Company has to pay "the legal expenses, brokerage, and expenses attending the issue of the prospectus and allotment," we feel a little in doubt as to the amount of the balance that will eventually be available for those "general purposes." The prospectus contains a number of general and indefinite statements as to the present condition of the tea industry, and the prospective value of the estates to be acquired. We cannot fail to notice, however, the absence of any expert opinion in regard to the property to be taken over. We merely find it "estimated" that, if the estates produce a certain amount of tea, the Company will derive therefrom a certain amount of revenue, &c. &c. Such prophetic ambiguities fail to convince us. We are inclined to think that there is too much of the "vendor" element upon the Board of Directors of this Company, too much cash to

be paid for the properties to be acquired, and too little cash provided to carry on whatever business the Company will get.—*Saturday Review*, Feb. 1.

UDUGAMA TEA AND TIMBER COMPANY, LTD.

At an extraordinary general meeting of shareholders of this Company held in the office of the Secretaries (Messrs. Mackwood & Co.) on the 26th Feby. the special resolution passed at a recent extraordinary meeting was passed. It is as follows:—

1. That the Directors be authorized to borrow money for the Company on mortgage debentures, and to that end to issue debenture bonds bearing interest at not more than 8 per cent. per annum for such amounts as may be required for the purpose of the Company, but not exceeding in the aggregate at any time One Hundred and Fifty Thousand Rupees (R150,000).

2. To authorize the Director to lend money to the Company.

THE CASTLEREAGH TEA COMPANY.

The annual meeting of this Company was held on the 26th Feby. at No. 13, Queen Street, Colombo. The following report was submitted:—

The Directors submit herewith the Balance Sheet and Profit and Loss Account for the year ending 31st December, 1895, duly audited.

The balance of profit (including R4,860.37 brought forward, and after writing off for Depreciation of Buildings and Machinery as shown in the accounts) is R11,876.39. Of this sum R16,800 has been absorbed in paying an Interim Dividend at the rate of 7 per cent. The Directors propose to declare a further Dividend at the rate of 8 per cent. payable on the 28th February, absorbing R19,200, and to pay a bonus of 5 per cent. on the profit divided in the second half-year to the Superintendent, absorbing R960; and to carry forward to 1896 account R7,916.39.

The total tea crop was 200,000 lb., against the estimate of 130,000 lb. (increase in July to 180,000 lb.), the season having been very favourable, particularly in the early months. The cost of the tea delivered to buyers, or put on boardship, was 25.61 cents per lb. including all charges, or 21 cents exclusive of charges for depreciation of buildings and machinery. 187,585 lb. were sold locally, realizing 46.44 cents per lb., and 12,415 lb. shipped to London realizing 51.41 cents. The net value realized from sales was 46.74 cents per lb., leaving balance of gain 21.13 cents per lb. Cost in 1894 was 33.88 cents, and value 52.32 cents, per lb.

5 28.32 bushels of coffee were secured, which sold for R47.

The new machinery came into use in February 1895, since which time no scarcity of water for power has been felt. The old pulping house has been adapted for withering leaf at a cost of R2,270.21. The old store now requires structural repair.

The cost of manuring carried to Suspense Account in 1894 is charged in the 1895 accounts, while a sum of R7,330.06 is reserved to be charged in 1896, representing unexhausted benefit from manure applied. Manure in small doses has been applied over about 143 acres with the object of promoting the growth where it was deemed advisable; the total area manured since the Company acquired the property being computed at 394 acres.

The Company's Property consists of:—

476 acres Tea under leaf. Yield in 1895=420 lb.
Tea per acre.
50 do. Forest.

Total 526 do.

The estimated crop for 1896 is 180,000 lb. Tea.

It will be seen that the property representing Capital stands in the Balance Sheet at approximately R508 per

acre cultivated, as compared with about R502 in the previous year's account, and that the profit per acre is R84.

Mr. Villiers Alexander Julius resigned his seat at the Board on his departure from the Island, and the Directors elected Mr. Harry Creasy in his stead. Mr. John Helps Starey retires from the Board by rotation, and is eligible for re-election.

The Shareholders will be requested to elect an Auditor for the current year.

The report was adopted.

THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

THE TRUST FUND.

The following letters from the Chairman and Mr. Granville L. Acworth on the subject of establishing a Trust Fund for the purposes of the Association have been circulated for general information:—

From W. H. Sprott, Esq., Chairman, United Planters' Association of Southern India, to the Planters of Southern India.

GENTLEMEN,—I have the honour to place before you Mr. Acworth's letter with regard to the funds of the United Planters' Association of Southern India and to appeal to you for your support to place them on a sound financial basis. At present the funds of the Association are only sufficient to meet current expenses, such as Secretary's salary, printing, etc., and at the end of this year owing to expenses incurred in sending a Deputation to meet H. E. the Viceroy in Madras, there will be a probable deficit of nearly R800. As Mr. Acworth truly says, it is an unsatisfactory position for an Association representing such an enormous interest as ours does, to be in. We have started what Government now recognises as a powerful Association, and as the voice of the Planting Community, and now that we have it in our power to make our grievances heard with some chance of getting redress, it would be an eternal disgrace to the Planting Community, if they cannot raise sufficient funds to place the Association on a firm financial basis, so that it can meet all expenses, and be in a position to assume any line of action necessary for the furtherance of our interests. Government looks more and more every year to bodies like our Association, as the mouthpiece of the Community, and we should be throwing our chances away if we do not support the Association to the best of our ability. I appeal to you all, Gentlemen, for your generous support and must leave it to you, as to whether you will subscribe a lump sum or give an annual donation, and I hope that every proprietor in Southern India will come forward according to his means. At the next Meeting of the United Planters' Association of Southern India it will be decided how the fund is to be invested and Trustees appointed. Subscriptions will be received by the Honorary Secretaries of the various District Associations, or by G. L. Yonge, Esq., Secretary, United Planters' Association of Southern India, Madras.

From Granville D. Acworth, Esq., Honorary Secretary, Central Travancore Planters' Association, to the Members of the Planters' Association of Southern India.

GENTLEMEN,—I think it must have struck every Delegate present at the last annual general meeting of the United Planters' Association of Southern India, that the Funds of the Association were in a by no means satisfactory condition and that an Association such as ours, representing as it does several millions sterling of capital and an annual expenditure of about three quarters of a million sterling, should only be able to show a balance at the close of the year of something over R850. This matter was discussed by the Members of the Deputation to the Viceroy, after the business of the day was over, and I was asked by them to bring the question to the notice of the various Associations represented on the United Planters' Association of

Southern India, to suggest some remedy. It will I think, be obvious to all that to raise the value of the subscriptions (or rather of votes) to the United Planters' Association of Southern India, is impossible, and that, even were it possible, the remedy would be insufficient. What we require is a fund amounting say, to about R200,000, which fund should be placed in the hands of Trustees appointed by the United Planters' Association of Southern India and invested by them, such part of the annually accruing interest as remains unspent at the end of the year to be also invested by the Trustees for the benefit of the Association. Money is power, and having such a sum at our command, we need never hesitate to undertake any action, such as sending a Deputation to the Secretary of State, which we consider as necessary to our interests. We might, and as a matter of fact it is our duty to, pay all the expenses of our representative on the Council of H. E. the Governor of Fort St. George. But there are half a dozen different ways, which will occur to any one, in which the Association might find itself at a disadvantage by not having a substantial income at its command.

Finally I think we might do something for our Superintendents. This of course is matter for future discussion, should the fund I speak of be established and assume reasonable proportions. It has however occurred to me that some scheme might be initiated by which any Superintendent subscribing to the fund a percentage of his income over a series of years, say 25 or 30 years, should at the close of that period receive a small pension, such as would at any rate relieve him from actual anxiety in the decline of life. The number of those coming to this country, who have no capital to invest and the great majority of whom will never be in receipt of such an income as will enable them without assistance to lay by a provision for old age, is annually increasing, and it appears to me to be the duty of proprietors many of whom are most prosperous, to aid these young men, if they themselves by their own thrift are willing to assist. This last scheme, I repeat, must be thoroughly threshed out and could not even be initiated until the Association has some capital at its back, but that it is capable of solution I have not the slightest doubt in my own mind. It now remains only to suggest the method, by which the sum I speak of should be raised, and it appears to me there are only two ways, one of these is, that proprietors should each of them pay down a lump sum, each man according to his means; that a register should be kept of all such proprietors as have subscribed together with the amounts thereof, and that any planter investing in the future should be appealed to for a subscription to the fund. A register could be kept by the Honorary Secretary of each District Association, who would forward a copy to the Secretary of the United Planters' Association, who would keep a complete register. By these means new proprietors could be at once identified. The second method is one which commends itself to my mind more than the former, for I think it likely would bring in more money, is that proprietors should be asked to subscribe an annual sum, until such time as the Association has a sum of at least two lakhs invested and in the hands of Trustees. In this case also a register should be kept and any new proprietor appealed to for a subscription over a series of years equal to those, through which the promoters of the scheme subscribed. In the event of the former scheme being adopted I am myself willing to pay a sum of £50 down. In the event of the latter I will subscribe R200 a year over a period of five years. I believe I am correct in stating that Messrs. J. G. Hamilton of South Mysore, G. Romilly of Wynaad, and W. H. Sprott of North Coorg, would lend their countenance to some such scheme as the above. I am also authorised by the Chairman of my own Association Mr. R. I. Imray, to state that he is willing to become an annual subscriber for a term of years. I do not in the least wish to suggest that either of my plans for raising a fund for the United Planters' Association of Southern India should be adopted if a better one can be found, but I am of opinion that such a fund should

be raised, and it rests entirely with the *esprit de corps* of our community, whether we are to go on as heretofore from hand to mouth, or whether we shall have such a sum at our backs as will free us for any anxiety in the future as to assuming any line of action we please for the protection or the furtherance of our interests.

INDIAN AND CEYLON TEAS.

One of the most striking episodes in the annals of modern commerce is the struggle going on between India and China for the tea markets of the world. In this connection, Japanese teas and the small supplies from other non-British sources are included under the general heading of China teas. One by one the markets of the world are falling down before the merit of India and Ceylon teas. As regards the markets of Great Britain, the fight has been already won by the India and Ceylon tea-growers, as the following figures will show:—During a period extending back thirteen years from 1894 China teas have been displaced in the British market to the extent of 76,000,000 pounds, and the price of the competing product has been reduced by nearly one-half. In 1881 the consumption of tea in Great Britain was 112,000,000 pounds of China teas, while in 1893 the consumption of those teas fell to 36,000,000. In 1881, 48,000,000 pounds of India and Ceylon teas were used there, while in 1893 the figures were 172,000,000 pounds. While the total British consumption of tea had increased by 43,000,000 pounds during thirteen years, the purchases of India and Ceylon tea increased 121,000,000 pounds, and the purchases from China decreased 76,000,000 pounds.

This great industrial revolution has been accomplished by an international rivalry almost without parallel. The Chinese and British growers have fought with all the characteristics of the two races. British enterprise has been met by Chinese persistence, and underlying it all the former has been fortified by the fact that the British-grown teas were of better quality. Machinery was introduced that enabled the India and Ceylon tea planters to do away with the hand-rolling process, the teas being manipulated by machinery, and when these facts, together, also, with the fact that no foreign coloring substances are used, were presented to the English tea drinker, and proven, it was only a matter of time when the efforts of the India and Ceylon planters to monopolize the British markets would be successful.

In every market where these teas have been introduced there has been a constant increase in consumption, and while in some it has been slow, largely from the fact that the people's taste has been formed upon the coarse leaf obtained from China and Japan, it has been gradual. The five flavors of the India and Ceylon teas are a revelation to most persons when taken for the first time.

Next to Great Britain the United States are the largest tea purchasers in the world, and the fight successfully won in Great Britain is now on here, and already great gains have been made. Purity and merit are the watchwords of the India and Ceylon planters, and in these days when food adulteration has gone to such an extent that the legislatures of the various states are constantly passing laws against such practices it needs no lengthy argument to prove that they must win.—*Grocer's Criterion.*

YATADERIA TEA COMPANY.

The seventh annual general meeting of this Company was held on the 26th Feb. at 13 Queen's Street, when the following report was submitted:—

The Directors have the pleasure to submit the Balance Sheet and Profit and Loss Account for the year ending 31st December, 1895, duly audited.

The Balance of Profit (including R19,782 97 brought forward from last year, after crediting Reserve Fund

with R5,000 as voted at the last General Meeting; and after writing off for Depreciation of Buildings and Machinery as shown by the accounts) is R115,770 41. Of this sum R23,750 has been absorbed in paying an Interim Dividend at the rate of 12½ per cent., and the Directors propose that a further dividend of 12½ per cent. and a bonus of 20 per cent., absorbing R61,750, be declared and made payable on the 29th February; that R15,000 be transferred to the Reserve Fund account and that the remainder of R12,770 41 (after paying R2,500 special fee voted to the Directors at the General Meeting in 1893) be carried forward.

It will be seen that the property representing Capital stands in the Balance Sheet at approximately R255 per acre cultivated, as compared with about R266 in the previous year's accounts, and that the profit per acre is R137.

No new Factory buildings or Machinery have added during the past year, but it is intended in the present year to extend the factory, and to renew the Turbine and Sifters.

The total tea crop was 575,876 lb. or 25,875 lb more than estimated in the last report. The plucking area was 700 acres. The total quantity of Tea for disposal was 575,917 lb. including 42 lb. made from purchased leaf; of which 105,437 lb. were sold locally averaging 38 74 cents per lb., and 470,480 lb. were shipped to London, of which 147,425 lb. had still to be accounted for; but the average obtained for the 323,055 lb. as yet accounted for is 38 06 cents per lb. The cost of the Tea delivered to buyers or put on board ship, including all charges and Depreciation of Buildings and Machinery was 25 09 cents per lb. (being 1 62 cents more than in 1891.) The net value realised from sales (a portion being estimated), was 37 17 cents per lb. (being 64 cents more than the previous crop). The sum written off for depreciation represents 1 18 cents per lb. of the cost.

The Company's property (including 60 acres purchased during the year) consisted on the 31st December 1895, of:—

Tea planted in.	Acres.	Yield of tea per acre in 1895.
1885 ..	805 acres tea.	172 911
1887 ..		208 819
1888 ..		100 867
1889 ..		43 872
1890 ..		6 750
1891 ..		52 928
1892 ..		119 582
1894 ..		68 not in bearing
1895 ..	37 do do	
		22 Cocoa and Factory site
		270 Forest, &c.
		1,097 as per last report.
		60 purchased from Crown and Natives.
Total ..	1,157	

Average yield from 700 acres 823 lb.

The Directors propose an extension of about 65 acres tea in 1896.

The estimated crop for 1896 is 626,500 lb tea.

Mr. David Fairweather retires from the Board in terms of the Articles of Association and being eligible, offers himself for re-election.

The Shareholders will be requested to elect an Auditor for the current year

The report was adopted and a dividend of 12½ per cent for the half-year and a bonus of 20 per cent for the year declared.

Mr. D. Fairweather having retired from the directorship, and being eligible for election, was re-elected a director, and Mr. J. Guthrie was re-elected auditor.

CENTRAL TRAVANCORE PLANTERS' ASSOCIATION.

From the proceedings of the annual general meeting, held on the 4th Jan., we extract the following:—

ANNUAL REPORT, 1895.

THE UNITED PLANTERS' ASSOCIATION, the importance and value of which we recognise more and more, held its Annual General Meeting in August. It is unnecessary to allude to the proceedings as they have already been laid before you. but there are two matters on which I would touch. The first of these is the funds of the Association. Everybody must admit that, for an Association representing some millions sterling capital and about three-fourth million sterling annual expenditure, these are in a most unsatisfactory position. It is likely that a scheme will shortly be laid before you to remedy this matter, and it is most earnestly to be hoped that all proprietors will come forward and give it their hearty support both materially and morally.

The second point is the Deputation to His Excellency the Viceroy on the subject of our labour laws and the amelioration therein we require.

It was most unfortunate that, just at this juncture, an irresponsible correspondence should have been appearing in the Public Press on the question of advances, some letters emphatically denouncing these as useless. His Excellency naturally laid great stress on the divergence of opinions on this point among planters themselves. Now Mr. Chairman, I myself, though I have taken some pains to make enquiries, have never met a planter of any experience who has not looked on advances as a matter of absolute necessity, and I am therefore led to believe that the assertions as to their inutility emanated from the younger portion of our community. I would do all in my power to encourage writing to the Press and nobody can begin too early, but we are none of us infallible, not even the youngest of us, and I would therefore urge those who are only beginning their career, not to dogmatise on matters of public interest, of which they are hardly competent to judge. I may add that my opinion on the question of advances is backed by the Committee whom I have consulted.

LAND SALES.—Another step forward this year was the re-institution after a lapse of nearly twenty years of Public Sales of Waste Lands, and it is much to be hoped that these will be continued, there being unbounded room in Travancore for the expansion of the Tea and Coffee Industries.

TEA AND COFFEE THEFT.—There is much to be desired as regards legislation in this direction, but we can expect nothing from H. H. Government until the Supreme Government has led the way.

LOCAL TEA SALES.—With unanimous consent Messrs. J. Grieve & Co. were appointed Sole Agents for the Association. These gentlemen have done much in exposing local traders making use of fraudulent marks and selling thereunder spurious teas purporting to be the produce of this district. I trust that the arrangements now made will go far to check this trade.

ESTATES ON ASSOCIATION.—All estates in the district have been borne on the roll of the Association in the past year, but it is very much to be regretted that no representative has attended from the Chenkara Group. These valuable and extensive properties have most unfortunately been placed under the charge of a writer, a fact to be deplored both in the interests of the Association and of the estates themselves.

INDIAN AMERICAN TEA FUND.—Members are to be most heartily congratulated on their response to the appeal made to them for this fund. Every estate and almost every Superintendent subscribed, and the Association which remitted the very substantial sum of Rs. 1,500 has again received the special thanks of the Indian Tea Association. The past year has seen an average decline of fully 1d per lb. in the Tea Market, and I would warn members that a recovery in the coming season is unlikely. The estimates for the year have not yet appeared, but there can be little doubt that, given favourable weather, there will be an increased yield both from India and Ceylon. For this annually increasing production an

outlet must be found. Mr. Blechynden, our representative, is doing admirable work for us in America, and his efforts are beginning to bear fruit; but to continue the campaign the sinews of war must be forthcoming, and I would therefore urge members by every means in my power to respond as liberally in the present season to the appeal that is certain to be made for funds as they have done in the past. It is practically a Life Insurance Fund, for on the success of the American campaign in a large measure depends our own prosperity, and after all the sum asked for from each individual estate is infinitesimal as compared with the interests at stake. It is satisfactory to note that coffee cultivation is again springing up in the district, and this too with every prospect of success. I heartily congratulate the enterprising gentlemen who have extended their operations in this direction. It only remains for me to thank you, Mr. Chairman, and the members of the Committee for the support you have accorded me in the past year.

I now beg to lay the accounts on the table and place my resignation in your hands.

GRANVILLE L. ACWORTH,
Honorary Secretary,

Central Travancore Planters' Association.

On the conclusion of the above, the Chairman said he wished, before moving the adoption of the Report, to say that he heartily concurred with every word that had been said by the Honorary Secretary on the subject of advances, that he considered some form of advance absolutely necessary, and he would later, with the permission of the Meeting, move a resolution relating thereto. He now begged to move that the Honorary Secretary's Report be adopted and the accounts passed.

Carried *nem. con.*

The CHAIRMAN, who signed his intention to decline re-election, and the other officers having resigned, Mr. Goldie was requested to take the chair *pro tem.*, when the election of officers for the current year was proceeded with. The result of the ballot was:—

F. M. Parker, Chairman; G. L. Acworth, Hony. Secy.; S. M. Dighton, R. H. Goldie, and R. S. Imray, Committee.

Mr. DIGHTON, in moving a vote of thanks to the retiring officers, congratulated the Association on its strong position and vigorous life, asserting that it had done more good in the past two years than in the whole course of its previous existence. Mr. Laurie seconded the resolution, which was carried unanimously.

Proposed by Mr. IMRAY, seconded by Mr. GOLDIE, "That this Association endorses the resolution passed by the Wynaad Association, and considers some form of advance as necessary to the existence of our industry."

Carried *nem. con.*

FIRE INSURANCE ON TEA FACTORIES.—The HONORARY SECRETARY drew the attention of the Meeting to the fact that the principal Insurance Companies in London had raised the rates of premium in S. India to what he himself could not but think was an unjustifiable extent, a well-equipped factory now costing some Re. 1-4 to Re. 1-6 per cent. per annum. There was considerable discussion on the subject which, on the motion of Mr. IMRAY, it was eventually agreed to refer to the Committee, who should have full power of action.

Resolved that the subscription for the current year be at the rate of 2 annas per acre.

Mr. ACWORTH reminded members that he had given notice that he would call attention to Mr. Knight's suggestion, that this Association should amalgamate with that of South Travancore. For his part he was strongly opposed to the idea. In the first place the Association was quite strong enough to stand alone, and he thought the argument that it would be to its interests to have a Secretary in the Capital would not hold water. The Association was much more likely to keep in touch with H. H. Government by communicating with that Government direct than by doing so in a roundabout way through a paid Secretary in Trevandrum. Moreover the Association had the advantage of the presence of the British Resident

in its hills during three months of every year, and it could always go to him for advice or support. Secondly, he could not see the advantage of having a United Association of Travancore, when there was a United Association of S. India. Like the gilding of refined gold, it was "wasteful and ridiculous excess." The U.P.A.S.I. would always accord this Association its hearty support, and with far more likelihood of success than even an amalgamated Association of Travancore would have.

Mr. DIGHTON backed Mr. Acworth's views, and Mr. IMRAY, in doing the same, said he thought it a pity that the Travancore Association did not style itself the South Travancore Association, the former name being suggestive of its representing the whole planting industry of the State, which was not at all the case and exceedingly misleading, and was by no means to the interests of the planting community in general. Why minimise the importance of the country? It was to the advantage of the planters of Travancore that the country should be thought of as one of importance and size, as it deserved to be, and this would be more likely to be achieved, were the three Associations respectively called "North Travancore," "Central Travancore" and "South Travancore" in lieu of "Kanan Devan," "Central Travancore" and "Travancore" as heretofore. "Kanan Devan" conveyed nothing to the minds of most people, whilst "Travancore Planters" conveyed a decidedly false impression. After one or two remarks from other members, it was unanimously resolved that the Association remain independent.

INDIAN TEA ASSOCIATION.

The following interesting figures have been placed at our disposal by the Secretary of the Association:—

In their Circular of the 7th October 1895, the General Committee reproduced the original estimate of the Indian Tea Crop in the following figures:—

ORIGINAL ESTIMATE OF CROP OF 1895.

	lb
Assam	57,531,490
Cachar	19,405,880
Sylhet	22,272,900
Darjeeling	8,069,210
Terai	3,176,000
Dooars	19,854,240
Chittagong	842,000
Chota-Nagpore	238,800
Kangra	3,000,000
Dehra Dun and Kumaon	2,000,000
Private and Native Gardens	4,000,000

140,390,520

They also published a revised estimate based upon actual results to the 31st August as follows:—

	Manufactured to 31st Aug. 1894.	Manufactured to 31st Aug. 1895.
	lb	lb
Assam	32,987,585	34,286,191
Cachar	10,783,203	10,332,442
Sylhet	10,695,213	11,967,318
Darjeeling	5,164,574	6,089,418
Terai	2,004,966	1,707,738
Dooars	8,983,916	10,802,538
Chittagong	459,257	361,759
Chota-Nagpore	91,061	131,131
	71,169,775	75,678,535

REVISED ESTIMATE OF CROP OF 1895.

	lb.
Assam	56,874,241
Cachar	17,421,950
Sylhet	22,910,208
Darjeeling	8,479,854
Terai	2,472,116
Dooars	20,041,489
Chittagong	921,746
Chota-Nagpore	203,360
Kangra	2,808,000
Dehra Dun and Kumaon (Estimate)	2,000,000
Private and Native Gardens (do.)	4,000,000

138,135,964

The Committee have now the pleasure to give you the figures showing the actual outturn of the Indian Tea Crop of 1895:—

ACTUAL OUTTURN OF CROP OF 1895.

	lb.
Assam	55,604,187
Cachar	17,543,622
Sylhet	22,223,798
Darjeeling	8,257,179
Terai	2,513,938
Dooars	20,090,427
Chittagong	798,768
Chota-Nagpore	261,143
Kangra	2,186,000
Dehra Dun and Kumaon (Estimate)	2,000,000
Private and Native Gardens (do.)	4,000,000
	135,479,062

The total shipments to all places from 1st April to 31st January 1896 are 128,303,860 lb. The exports to the Colonies and other Ports together with local consumption are not likely to exceed 14 millions which will leave about 121½ million lb. for export to Great Britain. —*Indian Planters' Gazette*, Feb. 15.

VARIOUS PLANTING NOTES.

WOODS SUITABLE FOR TEA CHESTS.—On pages 588-591 we publish the translation of a paper by Mr. A. E. Kerkhoven of Java, on "Varieties of Wood More, Less, or Not Suitable for Tea Chests." This, though referring specially to the trees grown at an elevation of 3,000 feet in the Preanger regencies of Java, will be found useful by Ceylon planters; and it might be well worth while to introduce those trees favourably spoken of that do not at present exist in Ceylon.

WYNAAD PLANTERS' ASSOCIATION.—As will be seen from the extract which we publish elsewhere a change has taken place in the Secretaryship of this Association, Mr. J. W. Hockin having been appointed to the office in succession to the Hon. Mr. Romilly, the Planting Member of Council, who had held it for a period of seven years and performed the duties thereof in a manner which elicited highest encomiums. Mr. Hockin has also been nominated as Planting Member, and in the event of another member being appointed by Government the Association has recorded its desire to nominate Mr. H. P. Hodgson.

LAND JOBBING.—The introduction of sales of waste lands in the Dooars is not at all favourably regarded by the planters there, as being likely to bring land-jobbers on the scene. The system obtains in Assam, but there the planters have this safeguard that competing applicants must apply before the issue of the notification of sale, whereas in the Darjeeling and Jalpigiuri districts it is proposed that if there is more than one application before the date fixed by notification for the sale of lands an auction must take place. In other words—says our Allahabad contemporary—the planter who has been at all the pains to prospect good land has no protection against the unscrupulous jobber. The latter sits at his ease waiting until a notification of sale is issued; he then sends in an application with a truumpery fee of R5; and he is entitled to bid against the man who has been at heavy expense in surveying and examining a promising area. The jobber may offer to withdraw for a consideration, and if this be not given he may bid up the land in sheer malice. The *bona fide* investor, who may not have had experience in prospecting, can also wait his time and outbid the unlucky planter.

THE JAPAN TEA PLANTATIONS.

(BY Y. OBAYASHI, OF TOKYO.)

The tea production of Japan amounts to 62,836,892 pounds and this tea is grown on plantations scattered within the limit of 31 deg. 20 min. to 41 deg. 30 min. N. lat., namely, from Chiran of Kagoshima to Matsumaye of Hokkaido. Though young buds can be plucked from the tea tree in the cold region as far as Hokkaido, yet it is an evidence of unnatural growth. The true limit of mercantile tea production may probably be 36 deg. 30 min. (the upper part of Ibaraki prefecture). In the upper region, or above 36 deg. 30 min., there are very few plantations, which only supply the local consumption and produce 2,047,486 pounds, or 3 per cent. of the entire production of Japan tea. In the middle part of the island there are three or four tea districts, of which the Uji region is the widest and most famous. Next to Uji is the Shidzuoka district, and next to that is the Sayama tract. In the Uji region there are Kyoto, Shiza, Nara and Miye prefectures of large production. In the southern part there found in abundant profusion wild tea bushes among the hills or forests. For those who would be more conversant in regard to the Japan tea districts I have grouped the tea districts according to latitude as shown in the following table:

	above.	m. N. lat.	Production.	per ct.
1 Plantations ..	36d	30	2,047,486 lb.	3.2
2 Plantations ..	35d	20	5,677,250 lb.	9.3
3 Plantations ..	34d	0	41,529,153 lb.	16.0
4 Plantations ..	33d	0	8,084,387 lb.	12.8
5 Plantations ..	31d	20	5,498,616 lb.	8.7

According to this classification the Sayama tea belongs to the second group, and in the third there are Shidzuoka and Uji.

It is well known that the crop tea per acre is very heavy, though the climate is colder than the regions of China or India. Every farmer knows how to cultivate tea with the aid of manure, but does not know how to get the best results without the manure. Every tea man knows that the tea leaves picked from the manured trees are rich in aroma and taste, but does not know how to produce fine tea from unmanured plantations. From a single acre there is sometimes obtained a crop of 2,083 pounds. The yield of the May and summer crops frequently amounts to 1,000 pounds in Shidzuoki, Uji, Miye, Sayama, etc. But as to the average it is far below as shown in the following table:

	Tea	Pounds
	Acreege.	por acre.
1	.. 11,650	175
2	.. 28,110	202
3	.. 76,436	542
4	.. 21,953	368
5	.. 11,300	487
Average	.. —	417

As to the flavour, tea raised on manured grounds is ranked first of all. As an example we have ceremonial tea, or the tea of Chanoyu, obtained from heavily manured gardens. Again Gyokuro tea (having high value) is also produced upon heavily manured land. Japanese gentlemen of and above the middle rank always use Gyokuro (\$2.00 per pound); therefore, they know the actual cost and pure flavour of Japan tea. I feel very sorry that your countrymen serve only inferior variety and cannot use the finest tea of Japan such as Japanese gentlemen consume. The American Consul at Amoy about 1892 said that among Formosa Oolongs there is found tea of very high value, and also in Japan, where a pound of Gyokuro, costing above \$10.000, may be brought in the large cities of the empire.—*Planter.*

MADRAS TEA SEED FOR CEYLON.—A Madras contemporary states:—"The Director-General of Statistics has requested the Madras Government to furnish his office with figure showing the quantity and value of tea-seed exported to Ceylon from the Madras Presidency during 1894-95 and first nine months of 1895-96, and that these particulars may, in future, be furnished monthly."

CEYLON HILLS TEA ESTATES CO. LTD.

An extraordinary general meeting of shareholders of the Ceylon Hills Tea Estate Co., Ltd. was held on Feb. 25th at Messrs. Bosanquet and Co.'s office, Chatham Street.

The meeting was held to consider the purchase of further estates, to increase the capital of the Company, and to authorise the Directors to raise money by issue of debentures.

There were present Messrs. J. F. Traill, G. C. Walker, F. Liesching, W. W. Kenny, Delmege, Reid and Co., (by Mr. Kenny) Misses. Henderson by Mr. J. B. Henderson. Mr. Traill was voted to the Chair. Mr. WALKER moved that the proposal to purchase Lanmamoor estate from Messrs. Perry and Albrecht for £2,800, Mr. H. Perry taking R5,000 worth of fully paid shares ranking for dividend from 15th February 1896, in part payment, be approved.

Mr. FRANK LIESCHING seconded and it was carried.

Mr. WALKER moved that the proposal to issue 200 fully paid shares ranking for dividend from 15th February 1896 in part payment of Lanmamoor estate be approved.

Mr. KENNY seconded, and it was carried.

Mr. KENNY proposed that Agra Oya estate be purchased from 1st April 1896 for £10,000.

Mr. LIESCHING seconded, and the motion was carried.

Mr. WALKER proposed that Rawley, Fawnhope, and Donhead estates be purchased for R60,000 on 1st April 1896.

Mr. KENNY seconded, and the motion was carried.

Mr. HENDERSON proposed that the Directors be authorized to issue not more than 4,050 fresh shares of R100 each, in such manner, time, and terms as the Directors may determine.

Mr. KENNY seconded, and the proposal was carried.

Mr. LIESCHING proposed and Mr. Traill seconded that the Directors be authorised to raise money for the Company on mortgage debentures at a rate of interest not exceeding 7 per cent, and to an amount not exceeding half of the called up capital of the Company.

Mr. TRAILL seconded and the motion was carried.

With a vote of thanks to the chair proposed by Mr. LIESCHING the meeting concluded.

THE PROPOSED TAX ON TEA IN THE UNITED STATES.—The Washington correspondent of the *American Grocer*, writing on Jan. 21, says:—

I described in my dispatch of last week the opening of the fight for pure tea, and I am now able to state that within a short time a bill placing a tax of from 10 to 15 cents per pound on all teas will be introduced. It is possible that the friends of this measure will delay action, in order that their course will not seem to complicate the tariff situation as long as the Dingley bill is pending in the Senate; but as soon as the tariff bill is out of the way, the tea bill will be brought forward. The measure which Representative Cummings introduced last week, and the text of which was printed in the *American Grocer*, provided a tax of 10 cents per pound on those teas only which are transhipped on their way to the United States. This bill will give way to the new one as soon as the latter is introduced. It is estimated that at 10 cents per pound the revenue for the first year would exceed \$10,000,000, and would steadily increase thereafter, for it is the experience of foreign countries that improvement in the quality of the tea imported is followed by a large increase in consumption.

MR. TOM GRAY ON TEA IN AUSTRALIA.

Mr. Tom Gray returned this morning by the ss. "Massilia" from his trip to Anstralia, which he very much enjoyed, having found everyone most kind and hospitable. He visited the Blue Mountains, Mount Victoria, Jenolan Caves, &c., and was charmed with the scenery. But Ceylon tea, Mr. Gray says, is not being properly pushed in Anstralia. It is used chiefly for mixing purposes, and so simply acts as a vehicle for the sale of rubbish. The Planters' Association Committee should see to this.

THE TEA MARKET.

Rules firm for British grown, but China still recedes as regards home consumption, though this is the cheaper market whence shippers can supply their requirements than from China. Yet the trade with this country could be resuscitated if our requirements were more studied. A future for China (Formosa) Teas now lies with the Japanese in their acquisition of that Island. It produces the finest flavoured, and is capable of easily putting 50,000,000 lb. on the markets of the world. With increasing consumption it would find an outlet.—*L. and C. Express*, Feb. 7.

QUEENSLAND COFFEE GROWERS' COMPLAINTS.

When we find experienced coffee planters complaining of the apathy displayed by the Government in not giving more assistance in the shape of expert teaching, it is not to be wondered if the willing but uninitiated grower somewhat loudly. In addition to the two papers on coffee culture which appear in this issue, we have a communication from another constituent who has been struggling for over fourteen years, endeavouring to grow a payable crop. Although having spent thousands of pounds experimenting with coffee, he still persists in going on. Any one capable of forming an opinion will agree with us in believing that Queensland is destined to come to the very forefront as a coffee producer. Looking at the vast importance which the successful cultivation of this crop will add to the welfare of the colony, we cannot but express the opinion that neglect of a glaring character has been shown. Unlike many other crops, coffee can be grown over a very wide extent of country. The number of growers in the colony certainly warrants the introduction of an expert, so that valuable time and large sums of money be not needlessly wasted. There are other crops lying at the very threshold in the establishment of important industries, which are quite in the same category with coffee, but of these we have before spoken. The wine and tobacco industries are both in a most unsatisfactory condition for the want of technical knowledge in particular branches. The same with coffee. The proper machinery for manufacture is not available, and yet the Government are desirous of seeing the plant universally grown. Assistance has been given of a most substantial nature to the sugar, and to the dairy industries, and that assistance has been the means of resuscitating and prolonging the life of the one and of stimulating and placing the other in a position to come into contact with the outside world without fear of extinction. The cultivation of such crops as coffee, which, according to the ideas generally inherited by the average Australian, requires more than book learning, or even more than a mere putting-of-the-shoulder-to-the-wheel sort of teaching, and should not be left entirely to experimental training. We have always believed the Department of Agriculture to be thoroughly in earnest in their endeavour to do the best that lies in their power to assist the cultivators of Queensland, but the importance of agriculture has never as yet been recognised by the re-

sponsible authorities as it soon will and must be. The constituent referred to in our opening remarks is a gentleman of more than ordinary intelligence, and is a thorough believer (as may be readily credited) in Queensland as a climate second to none for coffee growing. He is one of the few who have yet succeeded in overcoming all the difficulties attendant on the proper preparation of the coffee bean for market. We are quite at one with our correspondent in thinking that the Government should, without further delay, import the latest and best machinery and give them in charge of an expert, who could visit the various coffee centres for the purpose of instructing growers in that most important of all subjects to coffee growers, viz: What to do with the crop after it is ready for plucking? We hold an opinion of our own that a coffee grower should not be a coffee manufacturer, but there are certain early stages in what some might call the manufacture of coffee which can best be done by the grower. It is about high time to speak out when we find so many of our most enterprising and valuable settlers disturbing their very wits in order to discover a way out of the difficulty of preparation, by inventing rude makeshifts of their own. The terms sugar planter and coffee planter generally infer that there is wealth behind, but, many of our best coffee enthusiasts have only small capitals on which to work. We trust the matter will be taken up by the proper authorities as the industry is fast assuming an importance which must be recognised.—*Queensland Manufacturer*, Jan. 25.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed, under the provisions of Act V of 1888.

FOR IMPROVEMENTS IN APPARATUS FOR ROLLING TEA-LEAF AND THE LIKE.—No. 38 of 1896.—William Jackson, of Thorngrove, Mannofield, Aberdeen, North Britain, engineer, for improvements in apparatus for rolling tea leaf and the like.

FOR A TEA SIFTER OR SORTER FOR THE SORTING OF GREEN OR "CUTCHA" TEA LEAF.—No. 41 of 1896, Henry George Hills, tea-planter, at present manager of the Silcoori Tea Estate, residing at Silcoori, in the district of Cachar, under the commission of the province of Assam, for a tea sifter or sorter for the sorting of green or "cutcha" tea leaf.

BRITISH CENTRAL AFRICA.

In an interview published in a late issue of the *Bombay Gazette*, Mr. Rhodes Morgan, Deputy Conservator of Forests—so well-known amongst Nilgiri sportsmen—gives a very depressing account of the resources of Central Africa. Mr. Morgan has just spent some eight months in the country and his views should be of value. *Imprimis* comes the assertion that fever of a very virulent type is prevalent all over the country, "blackwater" fever being the most fatal. Dysentery was also common among Europeans and Natives alike. As to the commercial side of the question, Mr. Morgan states that the prospects are very poor.

NATURAL PRODUCTS.—The natural products of the country were few. India-rubber is to be found, but the natives spoil the vines as they do not know how to extract it. Another product is strophanthus, which is used in the cure of affections of the heart, but this market is very easily glutted and it does not fetch good prices, the supply being greater than the demand. Ground-nuts are cultivated to a very small extent by the natives. With regard to ivory the elephants are being killed off—day by day. If there were any elephants, they were mostly in Portuguese territory. Now and again some small herds might come into inhabited tracts, but as soon as a European or a Native heard of it, he immediately

went out to kill them. A large species of Sorghum, known as Mapeira, also grew and attained a height of about 1 ft. Some species of Indiancorn, cucumbers, pumpkins, and tobacco were available. No other vegetables were grown there. Tobacco was grown only to a limited extent for the consumption of the natives. Ground nuts and gingelly oil-seeds were also obtainable. Castor-oil was not cultivated, although it grew luxuriantly in the wild state. Near the houses, Cassava is a good deal planted. Fruit trees are not grown anywhere, but a few lime and orange trees are found in one or two places. The valley of the Shiré River is extremely fertile. The soil is annually enriched by the inundations during the rainy season, and several crops are reaped in succession from these alluvial lands after the subsidence of the floods.

GOLD SPELLS RUIN TO COFFEE.—Then with regard to gold there were three companies who were now prospecting for the metal in British Central Africa. If gold was discovered, then the country must at once develop, and the wages of labourers go up. But, on the other hand, the coffee industry would be almost ruined by the discovery of gold; because the *Kajirs* working on coffee plantations receive only a rupee and a half per month, whereas the labourers working in gold mines were paid from three to four pounds. If gold was found in British territory, coffee plantations would cease to attract the labourers, nor would it be profitable to the planter himself in view of the increasing wages he would have to pay to the labourers, and therefore the industry would inevitably decay. African coffee was superior to Indian, and brought better prices in the London market. The labourers working in the mines at Johannesburg receive £3 or £4 per month as against only one rupee and a half in British Central Africa for working on coffee estates. Therefore, natives from places like Senna on the river Zambezi and Mashonaland and Beira went to Johannesburg to work in gold mines; and there was no manner of doubt that this tendency to desert the coffee fields would be increased by the discovery of gold in the protectorate. Even at present coffee-farming was not an easy task.

DIFFICULTIES OF PLANTERS.—It was impossible to get manure because in the first place cattle was very expensive and most of them which were found near lake Nyassa died from cattle disease. Artificial manure was also quite out of the question, because the cost of freight was very high. The difficulty of navigating the Zambezi river was great, and the cost was absolutely prohibitive, being £6 from Chindé to Katungas, although the distance between the two places is not more than 360 miles. Again there is another most discouraging factor. Longicorn beetles are very common in the Mlanji coffee district. They live upon the roots, and they destroy about fifty per cent. of the coffee plants, in which they lay their eggs. Again the soil in the Mlanji District and over the Shire Highlands has greatly deteriorated on account of the system of cultivation adopted by the natives. It is similar to that which is called Cheena in Ceylon and *Koomvee* in India. Again, humus or surface soil is frequently washed away by the water, and the soil is greatly impoverished in consequence. After relating various other causes for the impoverishment of the soil and the deterioration of crops, Mr. Morgan observed that in certain Districts of Natal and German East Africa leaf disease exists, and said if it once got into Central Africa it will absolutely ruin the coffee estates.

COMMUNICATIONS.—As to the future prospects of the country, Mr. Morgan referred to the projected railway to Blantyre for the development of the resources of the country. New roads were being made from Chiromo to Blantyre, but whether railway enterprise would be successful was quite a different matter. For his part he did not think that the railway would be a success there because there were not sufficient products in the country. If the coffee plantations ceased to exist there would be nothing in the country to be transmitted by rail that would pay. The protectorate was not at all adapted for colonisation by Europeans on account of its extreme unhealthiness.

Readers must, however, bear in mind that Mr. Morgan visited the country for sport, which apparently from his scornful remarks on the butchery of game by Europeans and natives alike, he did not find. His ill-success may possibly have biased his judgment on the economic advantages of the district. * * *

First of all, as a sort of *bonne bouche* (!) we give the following extract from the *Calcutta Planter*:—

A private letter from a friend in the coffee region of East Africa bears unexpected testimony to the fact that the early, and seemingly incredible, trials of planters in India are now being endured with unconquerable determination by Scotsmen and Englishmen in the Dark Continent. The writer says that he never saw Europeans in a more miserable condition. Having no connection with the authorities, and being there simply to stake their lives on coffee, several Scotsmen are living in the most veritable native huts, with boards to sit on and eat off, with scarcely a change of clothing—one was actually shirtless owing to some exigence of life out there—and with nothing to read and nothing to do except to watch their coffee. Locusts come up and eat the seedlings, when the men patiently sow the field over again. More than one planter have sown their fields thrice in the last season. Such men will succeed, or be followed by others who will succeed. They are the sort who have made India what it is, and who alone can carry it on as it is.—*Planting Opinion*, Feb. 15.

TEA IN AMERICA.

New York Jan. 29th.

Buyers have the advantage on nearly every grade but the better sorts of Formosa Oolong. The demand is slow—in fact, ultra conservative. Japans are weak, and despite low prices of other sorts, the market droops, droops, droops. Cause: Too much trash. India and Ceylon sorts steady.

Today at noon the Montgomery Auction and Commission Company will sell 12,132 packages, viz.: 2,693 half-chests Moyunc, including desirable chops; 4,093 half-chests and boxes Pingsuey; 234 half-chests Japan; 93 half-chests Japan, basket-fired; 1,530 half-chests Congou; 35 boxes scented Capers; 78 packages India, Java and Ceylon; 1,163 half-chests Foochow, new crop; 2,213 half-chests and boxes Formosa, including new crop.—*American Grocer*.

DRUG REPORT.

(From the *Chemist and Druggist*.)

42 Cannon Street, E.C., Feb. 6.

ARECANUTS—Sixteen bags sold at unaltered prices—viz., from 10s for damp to 11s 6d per cwt. for sound quality.

BAEL-FRUIT.—Two cases of whole peeled fruit from Bombay were offered; the appearance was good, but owing to the neglected state of the market the parcel only realised 1d per lb.

CALUMBA. Of 114 bags, imported *via* Bombay and Hamburg, 5 of ordinary dark quality sold at the low figure of 9s per cwt.

CROTON-SEED easier. Twenty bags of rather dark seed from Colombo realised from 40s to 41s at today's auction.

OILS (ESSENTIAL). Citronella oil is quiet; two drums shown at auction were bought in at 2s 2d per lb., but no bid of 2s per lb. could be obtained. The quotation for arrival is 1s 9d per lb. c.i.f., shipment within the next six months. Cinnamon oil was bought in at from 1s 8d per oz down to 9d per oz. Three cases leaf oil were bought in at 5d per oz.

GRAPES GROWN IN COLOMBO.—Mr. C. Drieberg has shown us the firstfruits of the vine-growing experiment at the Agricultural College, in the shape of some dozen small clusters of grapes, mostly white ones, but a few of a red variety. These are from vines only eighteen months old, and only six months in Ceylon! The fact is, however, that the heat of Colombo has caused the grapes to ripen too rapidly. Nevertheless, considering the poor soil in which they were grown, and other drawbacks, the result is astonishing, and gives good hope of the success of Mr. Zanetti's experiment.

PICKINGS WITH A LOCAL APPLICATION.

The following reference to the late Editor of the *Ceylon Observer* is from the proceedings of the Agricultural Society of Madras and is taken over in the *New Bulletin* of October last: The cultivation of Liberian Coffee was strenuously advocated in Ceylon by the late Mr. A. M. Ferguson, C.M.G., who published at Colombo an excellent "History of the Introduction and Progress of the cultivation up to 1878." It however made little progress owing to its unsuitability for the "topping treatment" which the Ceylon planters had been in the habit of applying to Arabian coffee, and latterly owing to the superior attractions of tea.

Haberlandt's "Tropenreise"—to judge from the review of the work in "The Forester" (New Jersey)—would seem to be a most exhaustive and entertaining book, containing graphic accounts of Tropical Vegetation particularly as seen in the Indo-Malasian Peninsula. On his return journey Dr. Haberlandt spent a few days in Ceylon before leaving for Egypt.

A correspondent of the *Indian Agriculturist* (who is careful not to reveal his secret) writes as follows on the subject of clearing for tea planting:—

It has always been a wonder to me why tea-planters ever spend any money on their jungle clearing, instead of making it yield them a large profit in the very first year, and also, probably, so prepare the soil of the new clearing that the growth of their new tea would be more advanced than it is by their present method. I have seen the simply marvellous effect of the method I have in view on a rice crop grown on such a clearing. I do not insist that the effect will be the same on tea, the plants being so very different; but it is just possible that it might be. At all events the new tea land would be not only cleared at no expense, but would also yield a large profit in the first year, which gain would go towards lessening, perhaps entirely covering, the expenses of the new tea extension. The outlay on jungle clearing is, as now done, unavoidable, so it ought to be worth the planter's while to try if it is not possible to avoid it, in these days of heavy labour difficulties and expenses. If any planter has any curiosity about the matter and the enterprise to try the experiment on his next small clearing job, I shall be most happy to give him all the information in my power, and should be delighted if my suggestion turned out a success, and feel proud that I had introduced a profitable new idea into Assam.

The name and address of the writer, which our tea-planters may be anxious to know, is Bukit Gantang (Larut).

The average consumption of tea in India is only one-fortieth of a pound per head of population. In England the consumption needs five pounds per head.

Veterinary-Major Kemp's report to the Indian Government makes the following reference to the Indian butter trade. "Dairy enterprise in India has been rapidly taken up and the market is now almost overstocked with butter of all kinds and qualities. The modern dairy machinery we presume, facilitates matters considerably, but it also assists to deceive the public. Now it some times happens that milk and butter are bought from a dairy where, in many instances, not a single cow or buffalo is kept. The milk is purchased from the bazaar *Gowala*, who obtains it in precisely the same manner as before from ill-fed or diseased cows. The milk is exposed to a vitiated atmosphere, kept in dirty vessels, and frequently mixed with polluted water. From this milk, butter is made, and although perhaps more attractive to the eye and taste is still no less dangerous."

Says the *Indian Agriculturist*:—

Divi-Divi is of immense value in tanning, dyeing, and for making ink; for each of these purposes the pod, or bean, is used. Divi-Divi contains a very large percentage of tanning. Used in tanning this product accelerates the process, and gives to the leather a clean, healthy appearance. The Divi-Divi tree thrives on any soil from the sea level up to some two thousand feet above. It is imported into India chiefly from Maracaibo, Paraiba, and St. Domingo, but it is under cultivation in many other places. A large plot of land near Madras is now under cultivation, with excellent prospect of success.

An article on the "Advance of Chemistry" in the *New Orleans Times-Democrat* refers to Vanilline as the greatest success in artificial flavouring, and remarks that this product is keeping down the price of vanilla beans, and it is likely to drive the latter out of the market. Already the chemists are manufacturing oil of banana, oil of pineapple, oil of pear, oil of apple, oil of raspberry, and many others. The essential oil of banana obtained by distilling the fruit, is identical chemically with the laboratory product. Oil of banana is a compound of acetic acid and amyl alcohol, the latter being the chief constituent of fused oil. Oil of bitter almonds has been counterfeited; though chemically different, it has the same flavour as the real. The chemists now know how to counterfeit lactic acid, which is the sour principle of sour milk. They also make citric acid, which is the sour of the lemon. A recent achievement of great importance is the manufacture of salicylic acid from carbolic acid. One of the best remedies for gout and rheumatism is salicylic acid; also it is useful as a preservative. Formerly it was obtained from the wintergreen plant and from certain varieties of willows, and it was very costly. At present it is made by the ton, and is extremely cheap—too cheap in fact, inasmuch as it is freely employed to give a better keeping quality to bottle and otherwise preserved foods. It kills the bacteria that produce decomposition, but in the stomach it destroys the digestive ferments, and on that account it is injurious to health.

The Botanical Department, Jamaica, in a bulletin referring to coconut cultivation, refers as follows to the method of treatment adopted in Bombay:—

It is calculated that in India there are 480,000 acres under the coconut, and the cultivation is attended to carefully. In Bombay, for instance, after the seedlings are planted out, they are watered every day or two for the first year, every two or three days for the second and third years, and every third day for the fourth and fifth year. "During the rains, from its fifth to its tenth year, a ditch is dug round the palm and its roots cut, and little sandbanks are raised round the tree to keep the rain-water from running off. In the ditch round the tree, 32lb. of powdered dry fish manure is sprinkled and covered with earth, and watered if there is no rain at the time. Besides fish manure the palms get salt mud covered with the leaves of the croton-oil plant, and after five or six days with a layer of earth; or they get a mixture of cow-dung and wood ashes covered with earth; or night-soil, which on the whole is the best manure." (*Watt's Dict.*)

In the same bulletin we read:—

In the tropics of the old world generally, it is customary when the plant is one year old to dig round the roots and apply ashes once a month; when the tree is two years old to open up every year at the beginning of the rains the roots to a distance of 4ft. to 6ft. from the stem, to apply ashes and dry manure to the roots, and leave the opening until the end of the rainy season, then to fill in again the soil which had been removed, and level the ground. During the time the roots are exposed, the older worn-out root-stems may be cut away and the roots of other plants removed.

Correspondence.

To the Editor.

RUBBER CULTIVATION IN CEYLON:
CAUSE OF ITS FAILURE.

Powis Place, Queen Sq., London, 31st Jan.

DEAR SIR,—Much obliged for paper. I think you must attribute the failure of the Rubber Enterprise in Ceylon to the mismanagement at Kew. I went to Kew to enquire into their methods; but there was nobody in the place who had ever been in a rubber country, or who knew an atom about cultivation, collection &c.; in a word they knew absolutely nothing beyond the Latin names of the trees. I am not a botanist, but I have seen rubber trees and collected rubber from them; and I feel sure that had your planters obtained help from natives of South America instead of from the incompetents of Kew Gardens, the caoutchouc industry would now be a most flourishing trade in your island.—With thanks for your courtesy, —Yours faithfully,

C. PURCELL TAYLOR.

TWIN AND TRIPLET COCONUT
PLANTS.

Marawila, Feb. 19.

DEAR SIR,—I suppose you are aware of the phenomenon of two coconut plants growing out of one nut. This is often met with. A friend of mine once told me he had three growing out of one nut, and I was at first inclined to think he was romancing, more especially as he told me he had separated the plants and they were all growing. As a rule, when two plants grow from the same nut, one is weakly and does not bear. From where I write there are three trees growing together, evidently out of one nut. As regards size, vigour and bearing properties they are hard to beat.

A coconut, as every man knows, has three "eyes." The sprout is from one of these. I was always under the impression that each "eye" contributed a sprout when more than one plant resulted from one nut. The accompanying has disillusioned me. As you will see, the twin sprouts are from one eye. Others may have known and noticed this before. I did not. —Truly yours, B.

BLIGHT ON TOMATO PLANTS.

Jaffna, Feb. 21.

DEAR SIR,—Do you know any cure for the blight which makes vigorous tomato plant curl up their leaves and pretty much stop growing and bearing?

T. S. S.

[Perhaps some correspondent will answer the above.—ED. T.A.]

THE KIND OF TEAS THAT ARE
REQUIRED.

SIR,—I would draw the attention of planters to the following extract from Messrs. I. A. Rucker & Bencraft's weely tea circular, dated February 6th, received by this mail:—

"Last week we stated that broken pekoes were the cheapest teas on the market. This week they are 1d. to 2d. cheaper. Enquiry shews that the dealers are rather over supplied with this grade, of which a large proportion out of recent invoices has consisted. The practice of cutting up pekoes and pekoes Souchongs, and marking them broken pekoe, in order to secure a higher average, was a subject we discussed fully this time last year. It is now apparently about to work out its own cure. Seldom do we see the best made of the broken pekoes,

when the proportion is greater than 30 per cent of the whole invoice.

"Two or three invoices are before us in which the broken pekoes, and pekoe souchongs, so marked, are in the proportion of 50 to 75 per cent of broken pekoe."

At the present time when every effort is being made to open up new markets, this is worthy of special consideration, as particularly in both America and Russia the Trade must have well made teas, small broken flakey sorts are useless.—Yours etc., J. A. J. C.

THE PLANTING INDUSTRY OF
SOUTHERN INDIA.

Madras, Feb. 29th.

SIR,—In your issue of 25th instant you commence your leading article headed "The Wynaad" in these words:—

The London *Times*, in an ably written article having for its text the deputation of the planters of Southern India that lately had an interview with Lord Elgin, recites the leading difficulties under which the planting enterprise in the Wynaad now suffers. Want of communication with the seaboard, of protection for produce in transit, proper organization of labour, and fixity of tenure, and of security of the results to taxation, are among the chief disabilities set out in this article.

The actual words used by the writer in the *Times* were as follows:—

The grievances of the Southern Indian planters are very practical. He makes no great demands on the Government, but the demands which he does make he regards as indispensably necessary for the working of his business. Fixity of tenure in his estate, safeguards against fraud in the supply of his labour, protection of his produce against theft, and adequate means of communication towards the sea—these are the initial conditions for successfully planting in any country, and they sum up the total of the South India planters' requests.

Allow me, however, to point out that these words of the *Times* do not refer specially to the Wynaad but to the planting industry of Southern India as a whole. The former is a single district, the latter includes fourteen different districts, and therefore what may be a genuine grievance to planters resident in one or other of these fourteen districts may have and does have no meaning to the Wynaad planter. For instance, the fixity of tenure and the means of communication with the sea-board are excellent in the Wynaad; and I do not think any Ceylon planter, certainly not one from the Dimbula district, would have cause to quarrel with the organization of labour. As regards protection of produce in Southern India may I be allowed to quote these words from the Annual Report of the Planters' Association of Ceylon on cocoa stealing:—

"Your Committee regret that apparently the Government is apathetic in the matter and has taken no further steps to check what has been and again will be the scandalous insecurity of growing crops."

The planting industry of Southern India admittedly suffers from "beams," but is that of Ceylon altogether free from "motes"? I am afraid not. However my main reason for addressing you is to request you not to make the Wynaad the scape-goat of the whole industry. I feel that I am in part to blame for this; for had there been no reference in the article of the *Times* to my pamphlet, you would hardly have headed your leading article with the name of a district which is never once referred to by the writer in the *Times*. He confines himself entirely to the second chapter in my book which I have particularly mentioned has reference to the planting industry of our Southern India as a whole. —Faithfully yours, FRANCIS FORD.

THE CASTLEREAGH TEA COMPANY OF CEYLON, LTD.

The annual general meeting of this Company was held on Feb. 26th.

The Chair was taken by Mr. H. CREASY, who, after the usual preliminary formalities, moved the adoption of the fifth annual report now before the meeting.

The MANAGING DIRECTOR, in seconding, said that all possible detail and information having appeared in the report, he need, perhaps, only explain that though the profit earned was about 17 per cent it was necessary to carry forward a balance representing about 3 per cent because the manure applied in the concluding months or weeks of last year was for purposes of accounting more correctly, chargeable this year, though not constituting an asset available for dividend. The Company's investment exceeded the subscribed capital by some R6,000 and it would be seen that as yet there was no reserve fund which he thought every agricultural Company should maintain. The crop represented a yield of 420 lb. per acre against 229 in the previous year, having very considerably exceeded the estimate, which was in a great measure to be attributed to a very favourable season, allowing cost of production to be reduced though, at the same time, the value of the produce had somewhat fallen. The profits of the Company now depend in a marked degree upon the quality of the tea which it is the anxious desire of the management to improve. The new machinery was proving in every way satisfactory, while withering accommodation had been increased. The estimate for 1896 had been placed rather below the figure of 1895, and at present the weather was not favourable to a large yield. The capital account represented the moderate rate of R508 per acre, and the Proprietors who might have purchased at R150 per share had paid the comparatively moderate rate of R762 per acre for the tea. The number of shareholders is now 101, against 87 a year ago.

Mr. GORDON PYPER having expressed satisfaction with the report in all respects except that at present there existed no reserve fund, the formation of which, he thought, should be a first charge upon the profits; the report was put to the meeting and adopted unanimously.

Mr. C. D. PATULLO moved and Mr. J. A. MARTIN seconded, that a dividend of R8 for the half-year ended 31st December 1895 (making with the interim dividend paid in August 1895 a distribution of 15 per cent for the year 1895) be declared and made payable on 28th February 1896.—Agreed to.

Mr. GORDON PYPER moved, and Mr. C. D. PATULLO seconded, that Mr. John Helps Starey be re-elected a Director.—Carried.

Mr. C. D. PAULLO moved, and Mr. GORDON PYPER seconded, that Mr. John Guthrie be re-elected Auditor at a fee of R50 per annum.—Carried.

A discussion then took place on Mr. Gordon Pyper's suggestion as to reserve fund, which resulted in Mr. G. PYPER moving that the Directors set aside every year 2½ per cent of the profits till the sum of R25,000 be attained. This was duly seconded and carried.

A vote of thanks to the Chair concluded the proceedings.

THE YATADERIA TEA COMPANY OF CEYLON, LIMITED.

The following is the report of the proceedings at the annual general meeting held on Wednesday, the 26th Feb.

The notice of meeting was read and minutes of last meeting were passed. The report was taken as read.

In the absence of Mr. Masefield, the chair was taken by Mr. DAVID FAIRWEATHER, who, expressing regret at Mr. Masefield's unavoidable absence, mentioned that he had, however, paid his usual visit to the estate and had sent in a report to the Board which was receiving the best attention of the Directors. He moved the adoption of the seventh annual report now before the meeting.

The MANAGING DIRECTOR, in seconding, said the report had been framed with the object of giving shareholders (many of whom were unable to attend) all possible information in full detail, but he might explain the views of the Board in the proposals before them. It appeared that the profit earned during the past year was slightly over 50 per cent. of which about 30 per cent. had come out of the second half-year, and the proposal to divide only 45 per cent., and carry nearly 8 per cent. to reserve, carrying forward rather over 6 per cent. was made, in a spirit of moderation, in view of the exceptional prosperity of the past year when the weather had been very favorable and the market for teas for price had been much higher than it now is. In building up the reserve, the directors were obeying the mandate of former meetings, and, if the sum now proposed to be transferred, appeared to some unnecessarily large, the occasion for it arose out of the exceptional profits, while, at the same time, the proprietors were to receive half as much again in dividends this year as compared with last. There was another exceptional feature in the figures, in that the portion of 1894 crop not sold when those accounts were made up, had realised much more than expected, to the extent of 4½ per cent. profit now to be disposed of. This year, on the other hand, it was to be feared that, in consequence of the recent sudden rise of about 5 per cent. in exchange, the tea not yet sold might prove to have been over-valued, and hence it was advisable to carry forward a good balance though, indeed, it was only about 1 per cent. more on the capital than that of last year. Under these circumstances he could not suppose there could be two opinions as to the wisdom of following a policy of moderation, rather than declaring record dividends which might perhaps not be maintained for even another year. He had heard of comparisons drawn, but in fact, these was no comparison in the rate of dividends unless other conditions were considered. He had only heard of one dividend exceeding that now proposed, and it was patent on the accounts that 45 per cent in the case of Yataderia showed a higher measure of success than 50 per cent in the other case. The total dividends of this Company would now amount to 167 per cent, while the property had greatly improved in value, the present price of shares representing about R1,275 per acre. The investments of the Company stood at R210,000 which was just balanced by the share capital and reserve fund; at the same time, more land was being purchased and being opened, while the Factory was about to be extended and the turbine renewed; and the time had not, in the opinion of the Board, arrived for scattering all the profits of the Company as fast as they came in. The estimation of shares in the market would stand much higher when there is a substantial reserve than otherwise. The undeveloped resources of the Company are represented by 105 acres tea not in bearing, and 330 acres of good jungle. He was pleased to say that labor was

an ample supply, there being nearly 1,200 coolies, with advances outstanding, averaging less than R4 per head. The crop of 1895 was 823 lb. per acre, against 698 lb. in 1894; the rainfall: 142½ inches, against 145 average for 5 years, and 35 inches more than in 1894. All fields showed increased returns except 2 not pruned in 1894. The estimate for 1896 was 768 lb. per acre. He begged to second the adoption of the report.

Two or three shareholders thereupon expressed their desire that a smaller sum should be placed to reserve, and 5 per cent. more be divided, carrying forward a smaller balance; but the Directors having stated that they could not consent to this without giving other proprietors the opportunity of expressing an opinion, agreeing or otherwise, with the deliberate recommendation of the Board, the proposal was not pressed, and the motion that the report and accounts be adopted was carried *nem. con.*

Mr. J. MARTIN then moved, and Mr. J. R. FAIRWEATHER seconded, "that a dividend of R12.40 per share for the half-year ended 31st December 1895, making (with the interim dividend of R12.50 per share paid in August 1895) 25 per cent. for the year 1895 and a bonus of R20 per share, or 20 per cent. for the year 1895, be declared and made payable on the 29th February 1896.—Carried unanimously.

Mr. GORDON PYPER moved, and Mr. J. A. MARTIN seconded, "that Mr. David Fairweather be re-elected a Director," which was agreed to.

Mr. J. A. MARTIN moved, and Mr. C. M. GWATKIN seconded, "that Mr. John Guthrie be re-elected auditor at a fee of R100 per annum."

Mr. J. A. MARTIN proposed, and Mr. GORDON PYPER seconded, a vote of thanks to the Director and the Superintendent of the Estate for their services and with the usual vote of thanks to the Chairman the proceedings terminated.

THE YATIYANTOTA TEA COMPANY, LIMITED.

The eleventh annual ordinary general meeting of Shareholders, was held on Feb. 29th, when the following report was submitted:—Directors: W. D. Gibbon, Esq., Eric S. Anderson, Esq., Chas. Young, Esq., G. W. Carlyon, Esq. Estate Inspector.—Chas. Young, Esq. Estate Superintendents.—Messrs. W. R. G. Hickey and A. Angus.

ACREAGE.

OLD POLATAGAMA.	
Tea in bearing ..	517 acres.
Tea not in bearing ..	148 "
Forest ..	338 "
	1,003 acres,
	River Reserves 39 acres.
	Grand Total..1,480 "
NEW POLATAGAMA.	
Tea and Coconuts not in bearing ..	285 acres.
Forest ..	212 "
	47 acres.

The Directors have pleasure in submitting to the Shareholders the Accounts of the Company for the past year.

The crop secured amounted to 310,010 lb. Tea, being 35,010 lb. over the Estimate and 46,479 lb. more than the yield in 1894. The net average sale price was 42½ cents per lb., whilst the cost laid down in Colombo was 21 cents per lb. The net profit for the year, including a balance of R431.08 from 1894 amounted to R61,021.42, equal to 61 per cent on the Capital of the Company. An Interim Dividend of 10 per cent was declared on 3rd August last, and the

Directors recommend a final dividend of 40 per cent making a total of 50 per cent for the year, and that after payment of R3,000 extra fees to the Directors in terms of the resolution passed in 1893, and a transfer of R1,750 to Special Reserve Fund, the balance of R6,274.42 be carried forward to the current year's Accounts.

The sum of R2,325.55 transferred to Special Reserve Fund last year has been written off, the debt being now deemed irrecoverable.

During the year River Reserves to the extent of acres 38.3.21 were purchased at upset price from Government.

To provide for repayment of Debentures which become payable on 1st January, 1897, and other debts of the Company, it will be necessary to increase the Capital or to reconstruct the Company before the end of this year, and a scheme will be laid before the Shareholders in due course.

The Estimated crop from Old Polatagama for 1896 is 310,000 lb. Tea on an estimated outlay on Working Account of R65,950. In addition to this expenditure it is estimated that the sum of R13,000 will be spent on Capital Account for a new clearing of 22 acres tea, additions to buildings, upkeep of young tea, planting coconuts, &c. The Directors have still under consideration the question of water supply to the Factory; but the estimates so far obtained have been considered too high to allow of the work being taken in hand at present. The expenditure on New Polatagama is estimated at R13,600, against which it is expected that 25,000 lb. Tea will be secured.

In terms of the Articles of Association, Mr. W. D. Gibbon now retires by rotation, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the Meeting.

By order of the Directors, WHITTALL & Co.,
Agents and Secretaries.

The report and accounts were adopted and a final dividend of 10 per cent was declared making 50 per cent for the year. There were present:—Messrs. Chas. Young, (in the chair), G. W. Carlyon, W. D. Gibbon, Directors; A. Thomson and W. H. G. Duncan represented by G. W. Carlyon, and A. R. Wright by W. D. Gibbon.

THE TONACOMBE ESTATES COMPANY OF CEYLON, LTD.

The following is the report of the Directors presented to the second ordinary general meeting of shareholders of the above Company held on Feb. 28th:—

ACREAGE.

The Acreage of the Company's properties is as follows:—

	Acres.
Tea in bearing ..	357
Tea seed bearers ..	6
Tea not in bearing ..	155
	Total Tea .. 518
Cleared for planting in April ..	22
Cardamoms in bearing 65 acres.	
Do not in bearing 18 "	
	83
Coffee ..	55
Forest and fuel plantation ..	32
Chena and Patna ..	926
	Grand Total .. 1,636

During the nine months under review the total quantity of Tea secured was 98,521 lb., which have been sold at an average of 55.34 cents net.

The total Cardamoms picked amount to 9,525 lb., of which 3,377 lb. have been sold at an average of R1.67 per lb. The balance is estimated in the accounts to realise R1.50 per lb.

319¾ Bushels of Coffee have been harvested and realised R5,234.38, or R16.36 per bushel.

The total expenditure amounts to R36,700.55.

The balance available after providing for Depreciation amounts to R27,854.12, of which R14,000

(=5 %) was paid as an Interim Dividend in October, and the Directors now propose to pay a final Dividend of 4% absorbing R11,200; to place R2,000 to credit of "Extensions Account," and to carry forward R654.12 to the next account.

A wire tramway, rather over half mile in length from the factory to the end of the estate cart road, estimated to cost R10,000, is now being erected. This is a most desirable improvement, as transport, both of estate produce and rice, will be greatly facilitated and cheapened, besides which all cooly transport will thereby be done away with—a great consideration.

During 1896 it is proposed to plant 82 acres of land with Tea and 27 acres with Cardamoms.

The crops for 1896 are estimated as follows:—

140,000 lb. Tea.
12,000 lb. Cardamoms.
250 bushels Coffee.

on an expenditure of R18,955.50.

Of the Directors Mr. W. H. Figg retires by rotation, but is eligible for re-election.

An Auditor for 1896 will have to be appointed at this meeting.—By order of the Directors,

CUMBERBATCH & Co., Agents & Secretaries.

The following are the minutes of the meeting:—
Present:—Messrs. H. Cumberbatch (chairman), Directors Messrs. A. M. Vaughan Hughes and A. M. Caldicott Smith, and by their attorneys Col. E. Corse-Scott, Messrs. W. Bowden Smith, W. S. Bennett, A. Fetherstonhaugh, Col. Langford Brooke and Major MacNab.

The notice convening the meeting was read. The minutes of the last meeting of the 3rd June 1895 were read and confirmed.

The CHAIRMAN said that there were only two items in the report on which he thought he need make any comment, the one being the acreage of the estate which, since the report was printed, had been increased by a purchase from Government of 22 acres, 2 roods, 16 perches, at a cost of R309.14, of which about 15 acres were forest and would be planted with cardamoms this year, and being conveniently situated would in time be available for fuel for the Factory.

The other item was the amount due on Debentures which the Directors had thought it prudent to show at the rate of exchange ruling at the time the properties were purchased by the Company viz., £5,000 at 1s 0d 31-32 R92,530.12. As a matter of fact £5,000 at the exchange of the day say 1.2 14-16ths only represented R81,072.13.

Proposed by Mr. CALDICOTT-SMITH, seconded by Mr. VAUGHAN-HUGHES:—"That the report of the Directors as circulated among the Shareholders be adopted."—Carried.

Proposed by Mr. CALDICOTT-SMITH, seconded by Mr. A. M. VAUGHAN-HUGHES:—"That a dividend of four per cent be payable forthwith."—Carried.

Proposed by Mr. A. M. CALDICOTT-SMITH, seconded by Mr. A. M. VAUGHAN-HUGHES:—"That Mr. W. H. Figg, be re-elected a Director of the Company."—Carried.

Proposed by Mr. A. M. CALDICOTT-SMITH, seconded by Mr. A. M. VAUGHAN-HUGHES:—"That Mr. Hercules J. Scott be appointed Auditor for 1896 at the ordinary fee."—Carried.

THE UPPER MASKELIYA ESTATE COMPANY, LIMITED.

The 1th annual ordinary general meeting of the Shareholders was held on Feb. 29th when the directors report was submitted as follows:—Directors: G. W. Carlyon, Esq., by C. A. Lecchman, Esq., and W. D. Gibbon, Esq. Estate Inspector.—W. D. Gibbon, Esq. Estate Superintendent.—A. E. Wright, Esq.

ACREAGE OF BRUNSWICK & BLOOMFIELD ESTATES.

Tea in full bearing 446 Acres.
Grass, Timber Trees, &c. 72 "

Total .. 518 Acres.

The Directors have pleasure in submitting to the Shareholders the Accounts of the Company for the past year.

The quantity of Tea secured in the year was 227,359 lb., being 7,359 lb. in excess of the estimate, and the average net price realized was about 48½ cents per lb.

After making the usual ample provision for Depreciation of Buildings and Machinery, the net profit for the year amounted to R41,145.84, in addition to which a balance of R11,451.76 was brought forward from 1894, making a total of R55,597.60 available for Dividend equal to over 20½ per cent. on the Capital of the Company.

An interim Dividend of 8 per cent was declared on the 3rd August, and the Directors recommend that a final Dividend of 10 per cent be declared, making 18 per cent for the year. The sum of R5,997.60 will then remain to be carried forward to the current year's account.

The estimate of tea 1896 is 223,000 lb. on an expenditure of R66,742.50, and the estimated profit from other sources is R8,800. In addition to the above expenditure the sum of R1,500 is allowed in the estimates for new caddies and rice store.

In terms of the articles of Association Mr. G. W. Carlyon now retires by rotation from the office of Director, but being eligible offers himself for re-election.

Mr. A. B. Wright having expressed his intention to be absent from the island for the greater part of this year, the management of the Company's estates has been placed in the hands of Mr. L. A. Wright.

The appointment of an Auditor for 1896 will rest with the meeting.—By order of the Directors

WHITTALL & Co., Agents and Secretaries.

The report and accounts were adopted and a final dividend of 10 per cent. was declared making 18 per cent. for the year.

There were present Messrs. W. D. Gibbon (in the Chair), C. A. Lecchman and G. W. Carlyon, Directors:—Messrs. L. E. Edwards, G. H. Alston, C. S. Warren, G. C. Walker, and C. M. Gwatkin. Messrs. A. Thompson and W. H. G. Duncan were represented by Mr. G. W. Carlyon, and Mr. Jas. Forbes by Mr. G. C. Walker.

THE WE-OYA TEA COMPANY, LIMITED

The annual ordinary general meeting was held on Feb. 29th. The report of the Directors was as follows:—

Directors:—Walter J. Smith, Esq.; Eric S. Anderson, Esq. and Chas. Young, Esq. Estate Inspector:—Charles Young, Esq. Estate Superintendent:—A. Angus, Esq.

		ACREAGE.	
Tea planted	1858—1893	..	381 acres
Do	1895	..	16 "
Grass	5 "
<hr/>			
Cultivated..	102 acres
Forest	221 "
<hr/>			
Total Estate	623 acres

The Directors have pleasure in submitting to the Shareholders the Accounts of the Company for the past year

The crop (including about 250 lb. from purchased leaf) amounted to 195,491 lb. Tea, being 25,491 lb. in excess of the estimate and 49,787 lb. more than the yield in 1894.

The net average price realized for the Tea was about 41 cents per lb. against a cost laid down in Colombo of a little over 21 cents per lb.

The net profit for the year, including a balance of R3,215.25 from 1894 but excluding premium on new Shares, amounted to R36,001.61, equal to over 27½ per cent. on the paid up Capital of the Company. An interim Dividend of 10 per cent. was declared on the 3rd August last absorbing R13,000, and the Directors recommend a final dividend of 15 per cent., making 25 per cent. for the year, and that after payment of R1,000 extra fees to the Directors, in terms of the Resolution passed on 18th February 1893, R2,501.61 be carried forward to the current year's account.

On the 1st January, 1895, 250 shares of R100 each were issued at a premium of R50 per share. This premium, amounting to R12,500, has been credited to Profit and Loss Account; but the Directors propose that the amount should be transferred to "Depreciation Account" to provide for depreciation of Buildings and Machinery.

The new Factory referred to in last year's Report was, with the exception of some additions allowed for in this year's estimates, completed during the year, and the manufacture of Tea was commenced in it at the end of November. The cost has very considerably exceeded the Engineer's estimate, but the work has been most successfully carried out and the Factory is admirably suited for the present and future requirements of the Estate.

The Directors propose during this year to issue the unpaid balance of Capital (R20,000) and to offer the shares, in terms of Article No. 7 of Association, at a premium to be fixed later on, due notice of which will be given to Shareholders.

The crop in 1896 is estimated at 210,000 lb. Tea on an expenditure of R45,150 on Working Account. The estimated expenditure on Capital Account for the completion of the Factory and for upkeep of young clearings is R5,167.72.

In terms of the Articles of Association Mr. Walter J. Smith retires by rotation from the office of Director, but is eligible for re-election. Mr. A. Thomson, who was elected a Director at the last Annual Meeting, resigned his seat on the Board when leaving for England.

The appointment of an Auditor for the current season will rest with the meeting.

By order of the Directors,

WHITTALL & Co., Agents and Secretaries.

Colombo, Feb. 1st.

The Report and accounts were adopted and a final dividend of 15 per cent was declared making 25 per cent for the year. There were present Messrs. Chas. Young, in the Chair; and W. Smith, Directors; G. W. Carlyon, G. H. Alston, E. Young represented by C. Young and A. Thomasz, by G. W. Carlyon, Major G. L. Gwatkin by W. D. Gibbon and W. D. Gibbon.

THE AGRA OUVAH ESTATES CO., LTD.

The annual ordinary general meeting was held on Feb. 29th. when the following report was submitted:—

DIRECTORS:—W. H. Figg, Esq., C. A. Leechman, Esq., A. Stevenson, Esq., G. W. Carlyon, Esq. Estate Inspector—Chas. Young, Esq. Estate Superintendent—R. K. Clark, Esq.

ACREAGE:—

Agra Ouvah.

Tea in full bearing	172 acres
„ in partial bearing	28 „
„ not in bearing	102 „
Coffee amongst Tea (102 acres)	
Grass and jungle	29 „

Total Estate 331 acres

Frankerton.

Tea in full bearing	87 acres
„ in partial bearing	17 „
„ not in bearing	61 „
Coffee amongst tea (61 acres)	
Grass, patana and scrub	23 „

Total Estate 193 acres

Grand Total 524 acres.

The Directors have pleasure in presenting to the shareholders, the accounts of the Company for the past year.

The crops secured were 191,685 lb. tea, or 31,685 lb. over the estimate, and 1,291 bushels, parchment and 13 cwt. clean coffee, against an estimate of 1,000 bushels parchment.

The average net prices realised for this produce were 66½ cents per lb. and R17.85 per bushel respectively; the prices in the previous year being 68½ cents and R18.20.

After making the usual provision for depreciation of buildings and machinery, the net profit

for the year, exclusive of R5,382.45 brought forward from 1894, amounted to R83,556.65, or about 22½ per cent on the Capital of the Company. An interim Dividend of 8 per cent was declared on the 3rd August last, and the Directors now recommend the payment of a final Dividend of 12 per cent., making 20 per cent for the year, and that R7,500 be transferred to the Extension Fund. This will leave a balance of R6,439.10 to be carried forward to the current season's account.

The estimates for this year are 200,000 lb. of tea and 400 bushels of coffee, on an expenditure of R80,186.24, which sum includes the cost of manufacturing 200,000 lb. of tea for neighbouring proprietors. The income from this source and from rents is estimated at R25,200.

The expenditure on capital account, chiefly to meet the increased requirements of the Factory, is estimated at R13,500, towards which outlay the above mentioned sum of R7,500 will be available. The Directors recognize the uncertain nature of income from manufacturing "outside" leaf, but they consider that additional accommodation in the factory is in any case necessary, in view of the increasing yield of the Company's own estates.

In terms of the Articles of Association, Mr. W. H. Figg retires in rotation from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

By order of the Directors, WHITTALL & Co., Agents and Secretaries.

The report and accounts were adopted and a final dividend of 12 per cent was declared making 20 per cent for the year. There were present:—Messrs. C. A. Leechman (in the Chair), G. W. Carlyon, A. Stevenson, Directors, G. H. Alston, E. John, C. J. Donald. Mr. A. E. Wright was represented by Mr. W. D. Gibbon, and Mr. H. Tarrant by Mr. C. A. Leechman.

The first ordinary general meeting of the Ruawella Tea Company, Limited, will be held on Saturday, March 14 to receive the report of the Directors and accounts for the past year. The first ordinary general meeting of the Kirklees Estate Company, Limited, will be held on Saturday, March 14, to receive the report of the Directors and accounts for the past year and to declare a dividend. An extraordinary general meeting of the Kandyan Hills Company, Limited, will be held on the 7th March to pass the following special resolution:—That the Directors be authorized to grant a mortgage to Messrs. R. A. Bosanquet, G. F. Traill and J. D. Balfour, over the Pansalatenne estate, to secure the payment of the sum of £4,500 sterling (being the balance purchase money for the estate) on or before December 31, 1898, and until payment to pay interest thereon or on any balance remaining due thereon, at the rate of 7 per cent. The ordinary general meeting of the shareholders of the Drayton (Ceylon) Estates Company, Limited, will be held on March 10 to receive the report of the Directors and statement of accounts to December 31, 1895, to declare a dividend and to elect a Director and an Auditor.

NEW COMPANIES.

THE KNAVESMIRE ESTATES COMPANY, LIMITED.

The memorandum and articles of association of the Knavesmire Estates Company, Limited, are published in the *Gazette*. Among the objects for which the Company is established are—To purchase or otherwise acquire the Knavesmire estate and premises situated in the District of Kegalla. To purchase tea leaf and (or) other raw products for manufacture, manipulation, or sale. To manufacture tea leaf and (or) other raw products. To plant, grow, and produce, buy, sell, trade, and deal in tea, coffee, cinchona, cacao, cardomoms, and other plants, trees, and natural products of any kind or any of them. The liability of the shareholders is limited. The nominal capital of the Company is R500,000 divided into 5,000 shares of R100 each, with power to increase or decrease the capital. A share each has been pur-

chased by S. Payne Gallwey, Arthur Padwick, Thos. S. Grigson, Edward S. Grigson, P. J. de Saram, John Paterson and G. Chapman Walker.

THE RONDURA VALLEY TEA COMPANY OF CEYLON, LD.

The memorandum and articles of association of the Rondura Valley Tea Company of Ceylon, Limited, are also published in the *Gazette*. Among the objects for which the Company is established are—To purchase or otherwise acquire (1) the Rondura estate, situated in the district of Uda Bulatgama, containing in extent 196 acres or thereabouts, from Arthur Edwin Scovell; and (2) the Broadlands estate, situated in the district of Uda Bulatgama, containing in extent 316 acres 3 roods and 33 perches (according to Government title plan, but on subsequent re-survey found to contain 35½ acres or thereabouts), from Arthur Edwin Scovell and Alfred Scovell and their co-owners. To purchase tea leaf and (or) other raw products for manufacture, manipulation, and (or) sale. The liability of the shareholders is limited. The capital of the Company is R500,000 divided into 5,000 shares of R100 each, with power to increase or reduce. A share each has been purchased by Henry Bois, Fred. Wm. Bois, Jas. Murdoch, P. Mould, W. Moir, F. J. de Saram and V. Christian.

THE RAYIGAM COMPANY, LIMITED

The *Gazette* also contains the memorandum and articles of association of the Rayigam Company, Limited. Among the objects for which the Company is established are—To purchase or otherwise acquire the Rayigam estate in the Neboda-Kalutara District, or any part or parts thereof. To prepare, manufacture, treat, and make marketable tea and (or) other crops of produce, and to sell, ship, and dispose of such tea crops and produce, either raw or manufactured, at such times and places, and in such manner as shall be deemed expedient. To purchase tea leaf and (or) other raw products for manufacture, manipulation, and sale and to manufacture, manipulate, and sell the same. To amalgamate with any other Company having objects altogether or in part similar to this Company. The liability of the shareholders is limited. The nominal capital of the Company is R1,000,000 divided into 10,000 shares of R100 each (of which R425,000 are now called up), with power to increase or reduce the capital. A share each has been purchased by H. Creasy, W. Somerville, W. Seale, Gordon Frazer, John Wilson, F. M. Mackwood and T. J. Anderson.

VARIOUS PLANTING NOTES.

TEA IN JAVA.—The tea estates in the Preanger regency, Java, did well last year. The outturn from Sinagar Tjirohani was 1,050,000 pounds; from Parakan Salak without Tjisalak 900,000 lb.; and from Tjiboengoer, which did best of all, 525,000 lb. from 300 bouws Assam tea. Pengalengan, a tract of virgin land of about 800 bouws, in the Bandung district, has been bought by Heer R. Kerkhoven of Gambong, and is to be formed into a tea estate worked by a company.

DR. MORRIS, C.M.G.—It is gratifying and inspiring to hear of the Assistant Director unfurling the flag of Kew, if we may so speak, not only in our colony of Bahamas, but in New York itself. Dr. Morris turned a winter holiday to account by visiting the Bahamas with a view of developing the vegetable resources of the colony, and of promoting the culture of the valuable Sisal Hemp. His lectures were attended by the Governor and the leading citizens, and there can be no doubt that good results will follow. In New York, a descriptive and illustrated lecture was given on the Royal Gardens at Kew, which was specially appropriate, in view of the establishment of a similar institution in the vicinity of New York. Dr. Morris, it appears, visited the proposed site, expressed his approval of it, and took the opportunity to wish God speed to the enterprise on the part of the botanical institutions of the Old World. Before leaving the city, he was entertained at dinner by the President and members of the Torrey Botanical Club.—*Gardeners' Chronicle*, Jan. 31.

COLOMBO TEA AVERAGES.

Our evening contemporary has compiled the following list of averages of Ceylon estates selling in Colombo:—

Estate.	lb.	Avr. Price per lb.	Estate.	lb.	Avr. price per lb.
Palmerston	14,140	75	Nugagalla	33,110	50
Tientsin	24,522	73	Kirklees	30,350	50
Denmark Hill	23,916	73	Harangalla	80,030	49

THE TONACOMBE ESTATES CO. OF CEYLON, LTD.—We congratulate the shareholders of this Company on the *interim* dividend of 4 per cent declared making 9 per cent for the year. The fact of the Directors being able to make such a recommendation and to carry forward R654.12, besides placing R2,000 to the credit of the "extension account" shows the Company to be in a flourishing condition.

COFFEE CULTIVATION IN QUEENSLAND.—The *Australian Agriculturist*, (Brisbane) of Feb. 1 says:—In the course of a report presented to the council, Mr. Sontter, manager of the Acclimatisation Society, stated that there were numerous applications for coffee received from all parts, many of which were totally unsuited to its cultivation. Correspondents residing where the conditions were unfavourable had been replied to, warning them against incurring unnecessary labour and expense in attempting the cultivation of coffee.

"ROYAL GARDENS, KEW."—The Bulletin of Miscellaneous Information for January has the following contents:—Root Diseases caused by the Fungi; Great Frost for 1895; Leppett Tea; Decades Kewenses: XXIII.—XXV; Date Cultivation in Antigua; Miscellaneous Notes.—Visitors during 1895; Botanical Magazine; Index Kewensis; Palm House Terrace; *Geranium wallichianum* as a dye plant; Recent Presentations to the Herbarium; Coloured Figures of Fungi; Robert, Basse, and de Chastillon's Recueil de Plantes; *Ipecacuanha* in Southern India. The paper on "Leppett Tea" is reproduced elsewhere.

A DUTY ON TEA IN THE UNITED STATES.—The *American Grocer* of Jan. 29 says:—This we have always favoured as a source of revenue that would tend to improve the quality of the imports and would not be felt by consumers. A tax on tea and coffee makes all the people supporters of the general government with less inconvenience than any other tax it imposes, with the exception of a duty on sugar. A duty on tea and coffee would yield between twenty and thirty millions, and part, if not the most of it, would be paid by the producers. We have, however, little hope of such a duty being levied, because, as a distinguished Senator remarked, "It might be wise as a business measure, but it would be—bad politics." Neither party in Congress will be willing to be charged with destroying "a free breakfast table," and with a Presidential contest near at hand, it is very doubtful if a measure taxing tea and coffee could be made law.

BURMA RICE-CROP PROSPECTS, 1895-96.—The Department of Land Records and Agriculture, Burma, has issued the following summary of the District Officers' reports on the rice-crop prospects on the 31st January 1896 in the 14 chief rice-producing districts of Lower Burma:—The area under paddy cultivation is now reported as 4,970,228 acres or 5,327 acres less than the area reported last month. The areas reported from Akyab Kyaukpyu, Prome, Henzada, and Tavoy are unchanged. There is a large decrease (20,768 acres) reported from Pegu. A considerable increase in Thongwa, and smaller increases in Tharrawaddy and Thaton; in other districts the changes are unimportant. The *anna* estimates in Akyab and Amherst are now reported as 14 and 15 respectively against 15 and 16 respectively last month; in other districts the estimates given last month are unchanged. It is stated that the grain in some parts of Akyab is inferior and in parts of Amherst it is threshing out light, hence the decreases in the estimates for those districts. It is now estimated that there will be available for export 1,545,000 tons of cargo, rice, equivalent to 26,186,000 cwt. of white rice.

CITRONELLA OIL, if subjected to a certain process, will yield palma rosa or geranium oil.—*Oil Paint and Drug Reporter*, Feb. 3.

COCONUT DESICCATING MILLS.—It is reported in a contemporary that the firm of Messrs. Vavasseur & Co., who already possess an extensive establishment in Colombo, are opening out a branch establishment in the Chilaw District near Madampe for desiccating nuts. By this addition they will be in a position to tap the chief coconut districts of the North-Western Province. Six desiccators are to be erected, and the whole establishment is expected to be in full swing by the end of March.

THE INDIAN TEA CROP.—Commenting on a circular issued by the Indian Tea Association, the *Pioneer* says:—The new trade with Australia and New Zealand is shown to have made up the way it lost in the previous season. In that year the shipments were a million pounds weight less than in 1894, but in the ten months ending on January 31st they had sprung to over 6,185,000 lb., or 600,000 lb. more than in 1894 even. America, too, is taking far more tea from this country and the progress lately has been most marked. Two years ago less than a quarter of a million of pounds were sent to Canada and the States: now over a million pounds have been shipped in ten months. This means that the popularity of our teas is increasing and there may be a great future before this branch of the trade. If a good hold is obtained over the markets of the United States the annual shipments will go up by leaps and bounds. Great Britain is, of course, the greatest consumer of Indian teas and the clearances up to January 31st have been nearly 117 million pounds as against less than 109 million in 1894 and a little over 108 million in 1896. These figures speak for themselves, and in spite of the competition of Ceylon, Indian gardens seem to have a prosperous future before them.

THE COLOMBO MARKET FOR SOUTH INDIAN PLANTERS.—In an article on this subject, *Planting Opinion* of Feb. 29 says:—It is curious to note the great dislike in Ceylon to the extension of the blending business, and the fear that it might injure the name of Ceylon tea in foreign markets. Considering the fate that has more than once befallen pure unadulterated Ceylon tea in foreign ports, *i.e.*, being pronounced unfit for human consumption, the fears are slightly overdrawn. We thoroughly agree with the *Ceylon Observer* and the *Madras Mail* that with the ever-increasing direct shipments from Ceylon, the prosperity of Colombo would be immensely augmented were the obnoxious duty removed and every facility offered for blending. Ceylon tea, good as it is, is not yet perfect and a judicious admixture of the stronger liquoring Indian article would go far to increase the consumption of both. But as matters are at present Indian teas are shipped direct to foreign countries and have to stand or fall by their own merits. Generally speaking they are now not equal as *drinking* teas to the pure Ceylon, so that in sending to the Colombo market the style of manufacture should be somewhat changed. The great strength so which so much attention is paid in London, may be in part disregarded in studying the requirements of the nearer market. The liquors should be thick however, and the Broken Pekoes especially leafy and tippy. Some of our Nilgiri friends who excel in the manufacture of handsome and fine-flavoured drinking teas, might send a few trial breaks with advantage.

PLANTING AND PRODUCE.

THE WILD TEA PLANT OF ASSAM: FROM THE *Daily News*.—"Leppett, or Letpet, tea, an article of local commerce in Burmah, is interesting our botanical experts. It is not entirely new to us. It seems to have been referred to under the name of 'pickled tea' in Watts's 'Dictionary of the Economic Products of India'; and Dr. McClelland identified it as the produce of the *Eleodendron orientale*. Mr. Thiselton-Dyer, however, who has been examining some specimens sent to Kew Gardens from the India Office, says:—"There can be little doubt that Leppett tea is the produce of *camellia theifera*, the wild tea of Assam, where it was discovered in 1834. And I learn from Sir Dietrich Brandis that as a matter of fact the plant is abundant in Upper Burmah and on the Upper Shan hills. The identification is historically interesting as rendering it probable that the Burmese were acquainted with the value of the indigenous plant before its discovery in Assam by Europeans. It further indicates the existence of a new area suitable for the tea industry.' Much curious information regarding the Leppett tea is brought together in the *Kow Bulletin*. It is grown in one of the Northern Shan States. Two crops of tea are secured each year, one in May and one in July. The leaves, while still green, are boiled in large narrow-necked pots made for the purpose. When thoroughly boiled the contents of the pots are turned into large pits dug in the ground and lined with thin walls of plantain leaves. The pit being full of boiled tea and the juices from the pots, a top made of plantain leaves is placed over it, and earth is piled above it, big stones and other heavy weights being finally placed on the top. The tea is thus preserved and compressed for months, the pits are opened, and the tea is sold to the traders, who comes with their caravans of bullocks and carry it away to the Mandalay market. For drinking, it is prepared by boiling it in an earthen kettle, and it is drunk with salt. In Lower Burma it is largely consumed in the solid. The leaves are soaked in oil, a little garlic, dried fish, &c., is added and the concoction thus formed is eaten as a great dainty. Among Burmans, at the important junctures of a man's life, such as birth, initiation into the Church, marriage and death, 'Leppett' plays an important part, and no ceremony is complete without its consumption."

TEA IN THE UNITED STATES.—Our Calcutta contemporary, *Capital*, takes a gloomy view of the attempts made to capture the United States tea market on behalf of Indian planters, and expresses the opinion, founded on statistics taken from the monthly return issued by the Washington Bureau of Statistics, that the special efforts made have so far had little result. Of the total amount of tea imported into the United States during the first ten months of last year China contributed 32,500,000, Japan nearly 27,000,000, while India sent only 437,000 lb. In a comparison of the invoice prices of the three varieties, China tea stands lowest at 6·9d per lb, Japan comes next at 7·2d, while Indian tea averages 7·7d. In order to compete on equal terms with the Far East, the Indian exporter must apparently contrive to place his teas in the Atlantic ports at least a half-penny per pound cheaper than he does at present. The taste for tea appears, however, to be on the wane throughout the States; for the imports during the first ten months of 1895 were more than 5,000,000 lb below those of the same period in the preceding year. Coffee, on the other hand, is consumed in increasingly large quantities, the figures for the two periods being 456,343,000 lb in 1894 and 495,721,000 lb in 1895.—*H. & C. Mail*, Feb. 14.

THE INDIAN RICE CROP, 1895-96.

The Statistical Bureau of the Government of India has issued the following final general memorandum on the rice crop in Bengal, Lower Burma, and Madras, for the season 1895-96:—

This forecast refers to the rice crop in Bengal, the Government villages in the Madras Presidency, which comprise about 2-3rds of the area of that province, and the fourteen principal rice-producing districts in Lower Burma.

The total area under rice in all three provinces amounts to 49,062,428 acres, which is not quite two per cent under the area of last year, but that area again was slightly under the average. The decline is confined to Bengal in which province there is a substantial reduction. In Madras and Burma there has been an increase.

The yield of the crops is estimated at 405,841,000 cwt., more than three-fourths of this quantity representing the production in Bengal, which is estimated at a fraction under 318 million cwt. The outturn in both Madras (39,667,000 cwt.) and Burma (48,258,000 cwt.) is materially larger than last year; but the yield in Bengal is nearly 24 per cent below that of last year, and is almost to the same extent smaller than the average.

The result therefore is, Bengal bulking so largely as a rice-producing country, that the total yield of all three provinces is expected to be about 18½ per cent smaller than last year and 21 per cent below the average.

In Bengal the area and outturn, in cleaned rice, compare with the average as follows:—

	Area in acres.	
	1894.	Average.
Autumn rice	.. 7,045,100	7,400,000
Winter rice	.. 30,447,100	32,600,000
	—	
	Outturn in cwt.	
	1895.	Average.
Autumn rice	.. 45,289,900	54,400,000
Winter rice	.. 272,625,800	359,300,000

The estimate for the outturn of Bengal winter rice as given two months ago (in the second general memorandum issued from this office on the 21st December) remains unchanged. It was stated in that forecast that the season in Bengal had been very unfavourable, the rainfall in September and October having been deficient over large areas, while there was practically none in November. There has been no change since then to justify a favourable modification of the estimate.

In Madras the crop generally is reported to be fair, except in Nellore, North Arcot, Madura and Tinnevely, in where, consequence of the failure of the early rains, the yield is estimated to be not more than nine-sixteenths of an average crop. The crop is also below the average in Godavari and Kistna owing to floods. On the whole the yield for the presidency is estimated to be nearly three-fourths of the average, which represents the outturn of five favourable years.

In Burma the yield is much less than the average in Akyab, Pegu, Prome, and Amherst; and slightly less in Henzada. Elsewhere it is above the average, and the total for all the reporting districts is fractionally in excess of the average and substantially larger than the outturn of last year. The estimate of the quantity available for export is now a little smaller than the estimate of December: it stands at 1,545,000 tons of cargo rice, equivalent to 26,186,000 cwt. of white rice.

MARKET FOR TEA SHARES.

Thursday, Evening Feb. 13.

There has again been a steady, and, indeed, almost an active business in many of the best Indian Tea Companies' shares.

CEYLON SHARES.—C. T. P. Co. Ordinary are said to have been done as high as 25 1-8th, but are now, we understand, sellers at that price or less. The Prefs. have touched 16¾, and now ask a higher price.

Lanka Plantations have been asked for, and 5½ or thereabouts might be given.

Scottish Ceylon Ordinary, after asking as much as 22¾, came to business, we understand, at 22.—*H. & C. Mail*, Feb. 14.

COMPANY MEETINGS IN COLOMBO.

A considerable portion of our space today is devoted to reports of Company meetings; and we offer our congratulations to Messrs. Whittall & Co. upon being the agents and secretaries of so many flourishing concerns, and to the shareholders who have been so fortunate as to have their money so well invested, particularly those of the Yatiyantota Company, who are in the very envious position of being the recipients of a dividend amounting to no less than 50 per cent for the year. The Company was started in 1885, and since then it has paid 242 per cent to the shareholders in dividends and placed 37½ per cent to reserve fund. With close on 400 acres of young tea coming into bearing and 600 acres of reserve forest, and with such a record as it can show, the prospect before the Company can only be described as of a most extremely pleasing character to contemplate. Next comes We-Oya with a dividend of 25 per cent, followed by Agra Oavah with 20 per cent, and Upper Maskeliya with 18 per cent. Into details, we cannot here enter, but we think it will be admitted by all who peruse the reports that they are all very highly satisfactory, and we trust the Companies will long continue to flourish.

THE LATE MR. M. A. LAWSON.

The recent sad death of Mr. M. A. Lawson, Government Botanist and Director of the Madras Cinchona Departments, removes a figure long familiar to many planters on the Nilgiris and elsewhere. Of an extremely unassuming and retiring manner, Mr. Lawson made many fast friends among those whom his work at Naduvatom and elsewhere brought him into somewhat close contact. His record in the Government annals is a noteworthy one, and it is very largely due to his efforts that the present great success of the quinine pice packets distribution has been achieved. His chief forte was, however, in botanical work, and the exhaustive herbarium he collected will afford admirable material for any future botanical work on the flora of Southern India.—*Planting Opinion*, Feb. 29.

THE PLANTING INDUSTRY IN SOUTHERN INDIA.

It appears that in noticing recently an article published in the *Times*, reviewing a pamphlet by Mr. "Francis Ford," we inadvertently did an injustice to the Wynaad district, by stating that it laboured under certain disabilities, which, we are glad to hear, have no existence whatever. Under this heading, we publish elsewhere a letter from the author of the pamphlet putting us right in the matter; and we are very glad, indeed, to know from him, that the Wynaad does not participate in all, at all events, of the grievances mentioned, "fixity of tenure and the means of communication" being excellent. His pamphlet dealt with the Wynaad; and it was, as he recognises, the reference to it in the *Times* article that misled us. With his letter has also come to hand a copy of *Planting Opinion*, congratulating Mr. "Ford," as we heartily do, on the notice that has appeared in the "Thunderer"; and from the article in our contemporary we quote the following:—

It is, we fear, only by making people in England thoroughly understand the true position of British enterprise in India, in face of a rampant

officialism, that we shall get our grievances once for all removed. But the Provincial Government is by no means the most to blame, though the periods of "starvation" are certainly not of every-day occurrence. These gentlemen (the men who have invested their capital in India) compare the starvation allowances for roads and facilities of communication in backward Indian Districts with the liberal policy displayed by the Government of competing countries, such as Ceylon and Japan, in creating facilities for internal development. It would almost seem as if the interests of the Indian Government are so vast and so varied that it is unable to give the same attention to European enterprise that is given by smaller and more self-centred Governments, such as that of Ceylon. The local taxation which an Indian Provincial Government may have thriftily got together for the purposes of internal development and local public works has been liable to be swooped down upon by the Supreme Government of India to make good the expenditure on a frontier war, or to avert a deficit due to other causes. This subjection of local finance to Imperial exigencies forms a recurring source of weakness in the position of the Provincial Governments of India. It is perfectly well-known that certain of the tea districts of Bengal have been starved of the necessary means of internal development from such causes. It is equally well-known that the Assam tea districts were similarly starved, until erected into a separate administration, with a strong succession of Chief Commissioners to insist upon their claims.

COFFEE AND CINCHONA IN BORNEO.

For some time the idea has been considered to transfer the Netherlands Government's direct relation with the cinchona bark cultivation to another direction. The Government's plantations would be gradually decreased and limited to experimental stations, which could form a guide to private planters and at the same time reduce the Government's competition on the cinchona bark market to smaller proportions. As to the way in which this idea could be realised definitive proposals are to be expected from the India Government. From various sides the India Government has been requested to make a trial with the Indo guano for fertilising the Government's coffee estates, but a negative reply was received. The plan to levy a moderate direct tax from the native population in the Western part of Borneo seems to be certain, and it is probable that the measure will take effect in this year.—*L. & C. Express*, Feb. 11.

THE EAST INDIA AND CEYLON TEA COMPANY, LIMITED.

STATUTORY MEETING.

The statutory meeting of the shareholders of this company was held at the offices of the company, Africa House, Leadenhall Street, E.C., on Wednesday.

The chair was occupied by Mr. S. Boulnois.

The secretary having read the notice convening the meeting,

The Chairman said: Owing to the absence of our chairman, Mr. Buchanan, who has been compelled to take a sea voyage for the benefit of his health, the pleasure of receiving you here today at this, our first, meeting devolves upon me, and while we sympathise with our chairman in the cause of his absence we cannot but be sorry for our own sakes that he is not here in order that we might hear from him some details about the properties of the company, both in India and Ceylon, of which he has an intimate and personal knowledge. However, he is expected to re-

turn to England next week, when we shall again have the advantage of his extensive and varied experience as a practical planter. Meanwhile, I will do my best, with your indulgence, to take his place on this occasion. You are aware that, this being the first or the statutory meeting of the company, there are no accounts to be placed before you, and no resolutions to be proposed, and we shall, therefore, confine ourselves to giving you all the information that lies in our power and is likely to interest you about what we are doing to continue the prosperity and promote the future welfare of the company. The company was duly registered on October 12th, and the prospectus having been issued the shares were at once all applied for, the preference being largely over-subscribed—I may say about six times the amount asked for—and all, both preference and ordinary, have been allotted. We have now 322 shareholders on the register. A Stock Exchange settlement and official quotation of the shares in the list have been granted by the committee of that association. By the terms of the agreement with the vendors they (the vendors) were entitled to receive interest at the rate of 6 per cent. per annum, from the time at which their accounts were last made up until the payment of such proportion of the purchase money as they were to receive in cash had been made. Your directors, therefore, deemed it advisable to at once satisfy them, and accordingly they arranged a loan with the company's bankers to enable this to be done, thereby effecting considerable saving in the matter of interest. The loan has since been paid off. The question of garden management at Mookbancherra and Doolabherra, which estates adjoin one another, having been carefully considered, it was deemed inadvisable to disturb existing arrangements at present, but your directors consider that at some near future date one superintendent for both divisions will be sufficient, and thereby some saving in the management expenses will be effected. Now, as to the Ceylon properties, you are aware—as it was stated with the "Particulars of properties to be acquired by the company" sent out with the prospectus—that with regard to Walawadowna Estate, that after it had been acquired, the Ceylon Government being anxious that this block should not be opened up, had agreed to an exchange of the same for other lands, to be approved by ourselves as equally suitable for the company's purposes, in the proportion of three acres to one, and by this arrangement the company will acquire 3,519 acres of suitable land, instead of 1,173, at the same price as they were to have paid for the smaller quantity. With reference to this, on December 15 Mr. Davidson, our colleague and resident director in Ceylon, wrote us that with the Government inspector he had seen some very suitable blocks of land which we could accept in exchange, but owing to the floods of rain that were falling, it was impossible to go fully into details with that gentleman, but he adds: "I purpose, when the weather has cleared in January, and after getting Government's reply to the various points alluded to, to take the matter in hand again, and remain on the spot till the selection of land to be exchanged has been carefully completed; and with proper outlet roads, well-selected land, free from wind as far as possible, and good supervision, the properties of the East India and Ceylon Tea Company in this district will, I believe, pay handsomely." You will be sorry to hear that since writing this Mr. Davidson has been seriously ill, and has therefore been unable up to the present

to carry out the intentions expressed in his letter. In the meantime, on the Hapugastenne Estate we have been clearing the land with all possible speed, a manager has been appointed, and we hope to have at least 300 acres planted out during the ensuing season. On the whole, the reports from all the gardens and estates are satisfactory. The crop to November 30th, 1895, the date of the closing of our financial year from the various dates at which the company took over the properties, amounted to 158,600 lb. in excess of the crop yielded by the estates during the corresponding periods of the previous season. The estimates for the ensuing season are satisfactory, and point to a further increase in crop. Probably the most unsatisfactory feature with which we have to deal is the low price ruling for tea on the London market, but even in this direction there is room for a more sanguine feeling, as, certainly since the turn of the year there has been a continuous hardening of the market, and we look hopefully to some further improvement in this direction. While on this subject I may say that we are able to give you the gratifying information that we have shipped about 1,700 chests of the company's produce to the United States of America, and it is obvious that it must be the wish of your directors to encourage trade in this quarter to the utmost. Anything that tends to relieve the London market of the great pressure of supplies that at times takes place cannot fail to be in our interests. (Applause.) Some thirty years' experience of the tea market has taught me to be chary of prophesying as to its future fluctuations, but I have seen during that period an increase in consumption so remarkable that I do not for a moment doubt its *continued* expansion and the ever-growing success and prosperity of the East India and Ceylon Tea Company.

In reply to questions from shareholders, the Chairman stated that the 1,700 chests shipped to America had been sold at satisfactory prices as compared with those ruling on the London market. The bulk of the tea thus shipped was sold from samples sent from this country. The average price of their tea in the London market was about 7½d per lb. With regard to the labour question they had received excellent accounts. The two Indian places where the coolies were all imported from the North Western Provinces had never been in any difficulty with regard to labour. The property to be exchanged was undeveloped, and it was, of course, difficult to say how much capital it would take to bring those properties into full bearing, but ample had been provided for this purpose by the terms of the prospectus.

A vote of thanks to the Chairman was proposed by Mr. Sealeh and duly seconded.

The Chairman having briefly responded, the proceedings terminated.—*H. & C. Mail*, Feb. 14.

THE CEYLON TEA AND TIMBER SYNDICATE, LD.

We learn from London that a syndicate has been formed there to purchase the properties at Udagama in which Mr. J. Coryton Roberts and others are interested, together with the patent rights of certain improvements in the manufacture of tea chests. The name of the syndicate is the Ceylon Tea and Timber Syndicate, Ltd., formed with the object of reconstructing into or handing over to a larger working company, to plant, so it is proposed, a large acreage of the land in tea; this to be extended by degrees to other developments as far as the directors may

consider safe and advisable. If properly planted the properties are likely to do very well in tea, as they are most conveniently situated with regard to labour and cheap transport &c., and the land itself has been reported upon as of good quality and suitable. The late Mr. William Ferguson expressed an opinion that the timber on the principal block was the finest growth he had seen anywhere in the lowcountry; so that the Syndicate are not likely to lack supplies should eventually boxmaking &c. be decided upon. Very good opinions have been expressed of the improved tea chest; and it is believed that made up by machinery it can be turned out quite to compete in price with the ordinary wooden boxes at present used. The estates referred to are Carbeal, Kondegalla, and two other blocks, of a total acreage of 2,164, of which 55 acres are under tea, coffee, arcanuts and nutmeg. We hope to give further details regarding the Syndicate shortly.

BRITISH CENTRAL AFRICA.

It was with great regret that we heard of our Commissioner's illness when returning from the North-End. During the Arab war the expedition was greatly exposed and the passage down the lake was very stormy. The Commissioner was prostrated by an attack of blackwater fever and unfortunately Dr. Poole had also a very severe attack of ordinary malarial fever. It is eminently satisfactory to learn that both gentlemen have now recovered. The Commissioner spent a night at Domasi on his way from Liwonde's to Zomba.

Mr. Moore, F. R. G. S. and Mr. Williams of Zomba has been to Lake Shirwa to examine and report on the formation. Mr. Moore has taken samples of the Lake water and surrounding earth to send to England for analysis also specimens of the fish etc., and we believe he has also made a discovery of some commercial importance. Cattle have been selling as low as £2, 10s. per head.—Mr. Bowring, who has come to examine the accounts of the Administration Stations arrived at Zomba last month.—Major Forbes went South a month ago to consult with Mr. Rhodes. Rumour has it that he has sent for 200 soldiers (Makha) to clear out the Awemba and also that he intends to bring back 100 whites to help him in keeping order in N. Charterland.—Owing to the heavy rains last month planting was early begun this year in all the coffee districts.—Mr. Bloomfield Bradshaw reports the Mlanje coffee prospects as good.—Mr. Duncan McAlpine has secured two square miles of good land near the Palm Stream on the Zomba-Blantyre road.—Mr. Codrington left Chikala on December 19th. on a visit to Kawinga's at Kanjala's in the Manguru country. He expected to return in a week's time. It is the intention of the Administration to try and get Kawinga settled near Zomba.—Dr. Rendall has resigned his post in the B. C. A. A.—We have had an opportunity of sampling the tapioca made by Mrs. Smith of the Domasi Mission and can fully endorse Mr. Whyte's verdict that it is excellent. The price is 10d. per lb. and it should command a ready sale.—*British Central African Planter.*

THE INTRODUCTION OF COFFEE INTO B. C. A.

We have received the following communication from Mr. Jonathan Duncan of Upper Mudi Estate, Blantyre, giving the details of how he brought the first plants of *Coffea Arabica* to Blantyre. As a certain amount of confusion has been the result of H. M.

Commissioner's statement in his last Bluebook (1894) we hope the subjoined communication will set the matter finally at rest. We have also to thank Mr. Duncan for correcting a mis-statement in our first number by which we gave Mr. Simpson the honour of introducing Liberian coffee in this country. This honour, it appears, belongs to the late Mr. Henry Henderson, Pioneer of the Church of Scotland Mission in these parts.

Dear Sir,

In 1878 I was appointed by the Church of Scotland Foreign Mission Committee to proceed to Blantyre, East Africa. Before leaving, the Foreman (now Curator, and a friend of my own) of the Royal Botanic Gardens, Edinburgh, gave me the first coffee plants which I tended carefully on the way out, and, with the same care, they were planted in the Mission Garden.

In the year 1880 we had a small crop on the parent tree, about 1,000 beans in parchment which was all sown up. Four hundred of the seedlings were planted in the Blantyre coffee garden in Feb. 1881. In 1883, off the four hundred trees, fourteen and a half cwt. of coffee was gathered. I may mention the size of the pits was 6ft. wide by 3ft. deep; they were filled up with alluvial soil, cow manure and wood ashes. I believe this accounts for the enormous crop.

The last crop which I pulled off the mother tree, after, being pulped, washed and dried, weighed seven-and-a-half pounds and I am certain that the coffee culture in some parts of British Central Africa will turn out as well as any other coffee-growing country in the world if well done to.

The late Mr. Henry Henderson, of the Blantyre Mission, brought from home in 1879 fifty-six pounds Liberian Coffee seed which I had the pleasure of sowing. Only seven grew to maturity; one was sent to Zomba, another to Mandala, the rest were planted in the Mission garden. They took nine years to bear fruit; the bean seemed to be sound and of good quality, but little has been done with this variety. Blue Mountain and Orange Coffee were introduced by Mr. John Moir or his brother while joint Managers at Mandala, but I cannot give the year of its introduction. The Blue Mountain as far as my experience goes is well suited for high elevations in the Shire Highlands. The orange Coffee is more tender and perhaps better suited to lower elevations; at the same time I have taken a good crop off the few plants which I have. As to the quality of the coffee I cannot give any opinion, nor as to its origin.—I am, etc.,

JONATHAN DUNCAN.

Upper Mudi, 10th Dec. 1895.

—*Central African Planter.*

WILD COFFEE.

To the Editor of the *Central African Planter.*

DEAR SIR,—I am forwarding you a specimen of some coffee I obtained growing abundantly about Chipanga on the Lower Shire. I learnt in course of conversation with some Portuguese gentlemen that this coffee was largely used here.

All the trees I saw appeared to be growing quite wild, and were bearing well; the best plants seemed those hidden in shady spots. None of the trees were higher than 3 or 4 feet. The leaves are long and narrow, and the berries very small. In one instance on cutting through a bean I found it to contain six very small and distant berries.

Trusting this may be of interest to your readers:—I remain, Yours truly,

W. A. MORGAN.
Chinde,
2nd November 1895.

[We duly received the specimen for which we thank Mr. Morgan. The leaves are small, about three inches long, but very narrow, only a little over half an inch in breadth. The berry is about the size of a pea, seems to have no pulp to speak of, and no parchment with the excep-

tion of the septum dividing the two seeds. The seeds are dark brown in colour and plano-convex like the ordinary coffee beans but have no cleft on the flat side.—*U. A. P.*

PLANTING IN SOUTHERN INDIA

LONDON Feb. 11.

Although the length of the following letter will make a heavy demand upon your space, it seems desirable that it should find place here in further elucidation of a subject which has received discussion, in previous letters of this series. Its writer, Mr Ernest Tye, is a gentleman well-known to all those in any way connected with the tea-growing interests in India and Ceylon. What he writes we are all sure will embody the results to well-weighed experiences; and from his position as Secretary to the India Tea Association Mr. Tye must be exceptionally well qualified to appreciate the obstacles against which the Indian tea planters have to contend. What he has now and so ably written may be well taken into consideration by those of your own planting community who contemplated acquiring interests in their pursuit in the South Indian districts.

TO THE EDITOR OF THE "TIMES."

Sir,—Your article of yesterday on the subject of the planters of Southern India sets before the public with absolute clearness the difficulties of planters, not merely in the south, but in all parts of India.

The association which I have the honour to represent cannot but feel thankful to you for the effective way in which you have, in your columns for some months past, set before the public one of the most important questions affecting the industrial development of British India. I refer to the persistent diversion of provincial funds to meet the demands of the supreme Government. As long as the supreme Government of India is not allowed to raise sufficient revenue to meet its obligations provincial Governments will be fleeced again and again to supply its necessities, and will be required to stave roads, and other public works.

In its character as representing the whole of the planters of India my association is highly gratified to observe that the Viceroy expressed a willingness to consider the expediency of issuing a commission of inquiry into the grievances of the planters of Southern India, but possibly the scope of inquiry of such commission might be extended to other provinces of India besides Madras. Good roads, good means of communication, improved steamboat and railway services are in crying request all through the planting districts.

As you have pointed out, the condition of Assam has greatly improved in this and similar respects, since by its conversion into a separate provincial Government it has met with the more direct attention of able administrators, but even in Assam there is much room for advance. Without the hearty co-operation of Government it must be impossible to make those improvements in obtaining and transporting coolie labourers, which are urgently demanded, so as to reduce the enormous expenses of recruiting, and promote the health, comfort, and wellbeing of the labourers.

Other planting districts have not the safeguards of Assam. It was only as late as December 28 last your telegram from India called attention to the neglect of the roads in the Dooars, one of the most important tea districts in India. The particular road referred to is one which has occupied the serious attention of the Indian Tea Association both here and in Calcutta. It is clear to my association that if this road is allowed to decay it will be hardly possible to obtain any help for less urgent claims in other districts. The local district board has not the means at its disposal, and the provincial funds have been depleted in the urgent need of the supreme Government for pecuniary assistance; and the result is that the road, which has been a public road for many

years and on which depends the transport of millions of pounds of tea to Calcutta, is, it is rumoured, to be practically abandoned. The vital importance of this road to a small but increasing community, by whose exertions wastes have been converted into gardens, is fairly set forth in the following resolution passed at a meeting of planters held on the 7th ult.:

"That the Nagrakata road is one of the most important in the Dooars. It is the only means of communication with the railway station and the outside world for 11 gardens, with 10,800 acres under tea, producing over 70,000 maunds, or 5½ million pounds, of tea annually, and giving employment to 20,000 coolies living on the estates; the road leads also to a Government bazaar, police-station, and several other bazars, and there is a large community of resident native cultivators, shopkeepers, and others dependent on this road for communication and food supplies."

The substitutes proposed are to maintain it as a cold-weather track (the pressing need being for a road to carry the tea crop to the market during the season of heavy rains) and to construct a new and distant road outside the district and at the other side of dangerous rivers. What would the people of North Surrey say if their main road along the Thames were to be dismantled on the plea that a better road could be constructed on the other side of the Thames? Yet North Surrey has many alternative routes both by road and rail.

I am, sir, your obedient servant,

ERNEST TYE, Secretary.

Indian Tea Association (London), 14, St. Mary-axe, London, E.C., Jan. 4.

POSITION OF COCONUT OIL.

It appears to be the almost unanimous opinion of the trade that the general situation in coconut oils has never been better, and the outlook seldom brighter, from holders' standpoint, than it is at the present time. This favorable view is founded partially upon the fact that the outlet for these oils is not only a wide one, but the near future is expected to still further extend the demand. In addition to this, the visible supply of both kinds is considered small for this time of the year, and prices in the primary markets are steadily hardening, owing to tight supplies there. The quantity afloat is approximately stated to be 3,600 tons, and this comprises all the shipments that may be expected to reach this country to the first of next July. Of this, the "Marguerite Elise," with 700 tons, and the "Serbia," with 600 tons, are now about due, while the "Edmonton" and the "Nova Scotia," with 1,100 and 600 tons respectively, are expected to arrive during the present month. The Luzon, which is due in May with about 600 tons, will complete the importations of coconut oils for the first half of 1896. These cargoes, with an estimated stock on hand in our markets of about 1,100 tons, constitutes the supply in sight up to July 1st. How far this will go toward satisfying the requirements of consumers during the period in question cannot, of course, be accurately stated, but it is within bounds to say that there will be no surplus oil here at the end of June, and that meanwhile holders will have the advantage in the matter of prices.

It is said that the consumption of coconut oil in the United States has reached the large average of between ten and twelve thousand tons annually, and that the prospects favor a still further gradual increase. The demand for Cochin oil has made particularly rapid progress, and it is a fact that its use is now almost as extensive as is that of Ceylon, whereas, up to within a very few years past, the former lent a rather insignificant figure. Popular taste has called for a white soap, which no other material seems capable of supplying so well as Cochin oil, and despite its high price the consumption goes on with rapid strides. This does not seem to be the case with Ceylon oil, which continues to find employment in the usual quantities, and thus the favor extended to Cochin has not succeeded in displacing or curtailing the consumption of its rival.

The stock of oil on the spot consists of about 500 tons of Cochin and 600 tons of Ceylon, while the supplies to come forward will probably aggregate 1,500 tons of the former and 2,100 tons of the latter, so that, statistically, Ceylon is in a better position than Cochin. That the general trade understands this to be so is evidenced by the upward tendency in values which Cochin oil has recently displayed. Spot stocks are under the control of strong holders, and natural conditions tend to strengthen the firm views now entertained by them. In fact, it is pointed out that quotations in this market on Cochin oil are lower than the import value of the article, and that the tendency on the coast is to exact full figures. As regards Cochin, very little has lately been available for shipment, owing, it is stated, to a reduced production, and hence there has been an accumulation of this grade in any of the markets of the world. On the first of January the total stock of coconut oil in London was only 594 tons, but of this only an insignificant proportion is supposed to be the Cochin variety, and on the same date the total quantity afloat from primary sources to London was only 200 tons, against 2,000 tons at the corresponding time in 1895. A portion of the stock of Cochin to arrive here was purchased at much lower figures than those now quotable, but as the goods were taken on contracts by actual consumers they will not come upon the market. From the foregoing there is ample reason to believe that prices for coconut oils, especially Cochin, will be characterized by uncommon firmness for some time to come.—*Oil Paint and Drug Reporter*, Feb. 3.

HOW PEARLS ARE GROWN.

Professor Stewart's lecture at the Royal Institution yesterday afternoon was chiefly about the shell-forming habits of the lamellibranchs, or oyster family. The shell-bearing molluscs are all endowed by Nature with the very valuable capacity of depositing beautiful films of calcite or carbonate of lime from the cells of their soft cuticle or outer skin. In this way they build up their shells. The detailed structure of the shell is well worth studying. The layers of calcareous matter nearest the cuticle are beautifully smooth and polished, forming the well-known mother-of-pearl, known to zoologists as nacre. The deposit takes the form of exceedingly thin semi-transparent films, and it is from this cause that the beautiful iridescence of nacre arises. Brewster many years ago thought he had proved conclusively that this iridescence was due to extremely fine lines on the surface, because a cast taken of the nacre in wax exhibited the same iridescence. Professor Stewart mentioned that he had repeated Brewster's experiment, and found that the iridescence of the wax was due to fine films of nacre adhering to it. It may now be taken for granted that the nacre films produce what are known as "interference" effects in diffracting light and give rainbow tints on the same principle as Newton's rings and soap-bubbles. The usual source of pearls found within the oyster appears to be the intrusion of some small foreign body, which sets up an irritation of the cuticle. The only means of defence open to the mollusc is to deposit a layer of nacre round the irritating particle, and thus cut it off from the soft, tender skin. A grain of sand, a small crustacean, or a diatom may slip in between the lips, and, setting up irritation, provoke the cuticle to deposit around it a series of thin films of nacre. These are added to from time to time like the skins of an onion, until ultimately the little nucleus is completely encysted and a pearl is the result. In this way many curious deposits are to be seen in mother-of-pearl, for the oyster applies the same remedy to all sorts of foreign bodies, of whatever character they may be. Thus Professor Stewart has even seen little fish embedded in the nacre. The Chinese with their ingenious habit of turning natural phenomena to account, have taken advantage of this to artificially excite the growth of pearls in oysters. A favourite device is to insert an H-shaped piece of wire into the mantle border, by means of which ordi-

nary pearl-shaped pearls are produced. But the process is not confined to producing ordinary pearls. Larger objects are inserted and coated with nacre, especially metal figures of Buddha, which yield much-prized copies in pearl of that divinity, generally used as charms.—*Daily Chronicle*.

INDIAN PATENTS.

Applications in respect of the undermentioned invention have been filed, under the provisions of Act V. of 1888.

FOR IMPROVEMENTS IN MACHINERY OR APPARATUS FOR DRYING OR WITHERING TEA LEAVES.—No. 49 of 1896.—Arthur William McLeod, Civil Engineer, of 31, Dalhousie Square, South, Calcutta, for improvements in machinery or apparatus for drying or withering tea leaves or similar substances.

FOR A MACHINE FOR BREAKING OR DECORTICATING AND SCUTCHING FIBROUS PLANTS.—No. 54 of 1896.—Taylor Burrows, of 88, Upper Kennington Lane, London, engineer, and Dick Edwards Radelyffe, of 56, Gloucester Crescent, Regent's Park, London, gentleman, for a machine for breaking or decortivating and scutching fibrous plants, stems or straws, such as ramie, hemp and the like, throughout the length thereof at one operation.

FOR AN INVENTION FOR AUTOMATICALLY ACTUATING OR PULLING PUNKAHs.—No. 55 of 1896.—John Phillip Rundlett, gentleman, of 24, Ripon Street, Calcutta, for an invention for automatically actuating or pulling punkahs to be called "Rundlett's punkah motor."

FOR A PROCESS AND MACHINE FOR HUSKING COFFEE.—No. 60 of 1896.—Thomas Frederick Doyer, of Paseroean, in the island of Java, inventor for a process and machine for husking coffee.

The fees prescribed have been paid for the continuance of exclusive privilege in respect of the undermentioned inventions for the periods shown against each:—

FOR IMPROVEMENTS IN TEA ROLLING MACHINERY.—No. 61 of 1889.—John Brown, of London, engineer, for improvements in rolling tea machinery. (From 10th September 1896 to 9th September 1897.)

FOR MACHINE FOR HULLING, CLEANING, AND POLISHING RICE AND OTHER GRAINS.—No. 96 of 1890.—The Engelberg Huller Company, a corporation organized under the laws of the state of West Virginia, United State of America, and having its principal place of business at Syracuse, in the county of Onondaga, and state of New York, United States of America, for machine for hulling, cleaning, and polishing rice and other grain. (From 2nd March 1896 to 1st March 1897.—*Indian Engineer*.)

THE CEYLON TEA AND TIMBER SYNDICATE

The registration of the Ceylon Tea and Timber Syndicate, Limited, was applied for on February 3rd, by Messrs. Ince, Colt and Ince, St. Benet's Chamber, Fenchurch St., E.C., with a capital of £3,000 in £100 shares. Object, to enter into an agreement with Mr. J. C. Roberts and to carry on the business of tea planters and exporters in all its branches. Registered office, 4 Guildhall Chambers, E.C. The signatories are:—Arthur Washington Rowe, Dashwood House, E.C.; Alfred Ledgard Hutchison, 4, Guildhall Chambers, E.C.; William A. K. Gostling, 13, Herbert Crescent, S.W.; John George Wylie, 19, Surrey Street, Strand; Richard W. Roberts, St. George's Club, W.; John Dunham Massey, Broad St. House, E.C.; George Brace Cold, St. Benet's Chambers, E.C.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-earrums and similar appliances entirely superseded, Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN; LONDON.

THE HEALTHINESS OF THE WYNAAD.

A correspondent writing to the *Madras Mail* says:—

There is not the slightest doubt tea will flourish in Wynaad everywhere, the soil being especially adapted to its growth, but tea planters will find that the labour question is not so easily solved as some people imagine. Coolies will not stay in Wynaad during the unhealthy months, because they simply die like rotten sheep. Some districts, of course, are much healthier than others and those closest to the ghats are the bests I consider, in these respects. Inland, Sultan's Battery, especially, is exceptionally unhealthy in March, April and May. I have had 19 years' experience of this district, and labour cannot be had in sufficient numbers during these months, and the few that are sometimes induced to stay on, die or are otherwise so saturated with malaria and fever that they are useless for any work whatever. I am perfectly willing to pay enhanced rates to labour that I can get in April to do certain important work which at that time of year can be done well and for half the cost against June, July and August, heavy wet weather. I have been trying to do this for the past 12 years and failed, with the exception of one year, when I did get up a gang of coolies in April, and after two weeks' work I lost seven from choleraic diarrhoea and the rest "cleared." With regard to Mr. Knight's remarks—quoted by you—that it has become a custom in Wynaad to leave the estates during the hot months, all I have to say is that it is a very good thing it has become a custom, which has probably saved several European lives and which accounts for the non-mortality owing directly to malaria among Europeans. I shall be certainly very pleased to see Ceylon men and Ceylon capital to the fore in Wynaad; but I will not say a district is healthy when it is not, merely to induce men to invest.

TEA IN AMERICA

NEW YORK, Feb. 6.—We still have a dragging market, particularly for Pingsueys and Country Greens, which are selling at phenomenally low prices. There is quite a large offering at this week's auction. English Breakfasts are dull and in buyers' favor. There is a fair demand for the better grades of Formosa which are not in ample supply, and, therefore, these grades rule strong, but other grades are weak. Japans are dull and easy for all sorts. It is the same disappointing, discouraging market that we have had for a month.

Today at noon the Montgomery Auction and Commission Company will sell 8,658 packages, viz.:—2781 half-chests Moyune including some very desirable chops; 4,342 boxes Pingsuey; 101 half-chest Japan and Nibs; 82 half-chests Japan basket-fired; 75 half-chest Japan dust; 631 half-chest Congou; 51 boxes Capers and orange pekoe; 66 packages India, Java and Ceylon; 486 half-chest Foochow, new season's 140 half-chests and boxes Formosa.—*American Grocer*, Feb. 5.

DRUG REPORT.

(From the *Chemist and Druggist*.)

February 15th.

ESSENTIAL OIL.—Citronella oil has been in good demand especially for shipment to America, and fair sales have been made. On the spot the quotation is 2s to 2s 2d per lb, and for arrival the following prices have been paid:—January-March steamer shipment 1s 10d; June shipment, 1s 9d; and August, 1s 8½d per lb, c.i.f.

February 15th.

THE AMSTERDAM CINCHONA-MARKET.—Our correspondent writes that the Java cinchona-bark auction which will be held in Amsterdam on February 20 will be extremely large, the total declarations amounting to 7,715 bales and 325 cases, together containing 725,249 kilos of bark. The average quinine contents of the bark is also exceedingly high, viz., 5.14 per cent, the total weight of Sulphate of quinine is the bark being 36,559 kilos, of which 36,005 k. is contained in the manufacturing bark; the total weight of the pharmaceutical bark being 702,002, and that of the pharmaceutical bark 23,217 kilos.—*Chemist and Druggist*,

AUSTRALIAN COCONUT OIL.

The manufacture of coconut oil is to be one of the new Australian staple industries. The first soil was turned recently at Balmain by Mrs. Lever, the wife of Mr. W. H. Lever, of Messrs. Lever Bros., of the first coconut oil mill in Australia. The establishment is to be of a very complete and extensive character, capable of turning out several thousand tons of oil and oilcake per annum. Mr. Lever has selected New South Wales for his operations because Sydney is the principal port for the South Seas, whence the oil mainly comes in the form of coconuts.—*Euro-ocean Mail*, Feb. 19.

AGRICULTURAL EDUCATION AND EXPERIMENT.

The following are the recommendations of the Committee appointed by Government under G.O., No. 699, Revenue, dated 23rd October, 1895, on the question of how best to adopt the system of education in Primary Schools to the requirements of the agricultural classes. (The Committee was composed of Sir Edward Buck, K.C.S.I., Secretary to the Government of India, Revenue and Agricultural Department, the Hon'ble Dr. D. Duncan, M.A., Director of Public Instruction Mr. H. M. Winterbotham, Acting Commissioner of Revenue Settlement and Director of the Department of Land Records and Agriculture, Mr. F. A. Nicholson, I.C.S., Collector of Anantapur, Mr. C. Benson, M.R.A.C., Deputy Director of Land Records and Agriculture, and Mr W. Keess, M.A., M.R.A.C., Acting Principal of the College of Agriculture):—(1) That Agriculture should not appear as a separate subject in the curriculum of rural Primary Schools but that the effort should be to impart an elementary knowledge of it in the group, "Object Lessons and Elementary Science," which group should be made a compulsory subject; (2) that Agriculture should be recognised as a separate optional subject for boys after they have passed the Fourth Standard, and that, until properly qualified teachers become available, the study of a text-book on Agriculture in Lower Secondary Schools will be better than nothing; (3) that the necessary step is to provide for the training of the teachers of Lower Secondary and Primary Schools' rural schools, and that to this end, every training institution, where such teachers are trained, should (a) have on the staff a master qualified to teach Agriculture, and (b) have attached to it a school garden; (4) that to secure an adequate supply of trained teachers for the rural, Primary and Lower Secondary Schools an agricultural class should be developed in selected educational institutions, where the general education will be carried on up to the Upper Secondary Examination, and special education in Agriculture up to the Intermediate Standard. Such classes will need a small demonstrational farm for teaching purposes, and a portion of a Government experimental farm may be utilised for the purpose, if there be one in the vicinity; (5) that it is not otherwise expedient to combine a Farm School for the above purpose with an experimental farm, as proposed in the scheme of the Madras Government, and (6) that the early establishment of experimental farms, as separate organisations and designed for carrying on agricultural investigation, is advisable.—*M. Times*, March 2.

SMOKERS SHOULD USE

CALVERT'S DENTO-PHENOLENE,
A FRAGRANT LIQUID DENTIFRICE AND
MOUTH-WASH.

Editor of *Health* says:—"The most effective preparation for ridding the mouth of the aroma of tobacco, and leaving a pleasant taste." Sold in 1s. 6d., 2s. 6d., and 1 lb. 7s. 6d. bottles, by Chemists, &c.

F. C. CALVERT & CO., MANCHESTER.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce).

Colombo, March 9, 1896.

EXCHANGE OF LONDON: CLOSING RATES. *Bank Selling Rates*:—On demand 1/2 21-32 to 11-16; 4 months' sight 1/2 11-16 to 23-32; 6 months' sight 1/2 23-32 to 3/4. *Bank Buying Rates*:—Credits 3 months' sight 1/2 29-32; 6 months' sight 1/2 29-32; Docts. 3 months' sight 1/2 29-32; 6 months' sight 1/2 15-16.

COFFEE.—Plantation Estate Parchment on the spot per bushel, R41 to 16'00. Estate Crops in Parchment, Jan. delivery, no quot. Plantation Estate Coffee, f.o.b. on the spot per cwt, R75'00 to 82. Liberian parchment on the spot per bushel, R12'00 Native Coffee f.o.b. per cwt. R60 to 62'50.—Nominal.

TEA.—Average Prices ruling during the week: Broken Pekoe, per lb 51c. Pekoe per lb 34c. Pekoe Souchong, per lb 33c Broken mixed and Dust, per lb 29c.—Averages of Wednesday's sale.

CINCHONA BARK.—Twigs and branch per lb 1 1/2c. to c3.—1 to 4 %.

CARDAMOMS.—per lb R1'00 to 2'15.—Scarce.

COCONUT OIL.—Mill oil per cwt. R15 to 15'25. Dealer's oil per cwt. R14'75. Coconut oil in ordinary packages f.o.b. per ton R330 to 335.—Nominal.

COPRA.—Per candy of 560 lb R42 to R18'00.

COCONUT CAKE: (Poonac) f.o.b. per ton, R40 to 50.—Nominal.

Cocoa f.o.b. R30 to 40

COIR YARN.—Nos. 1 to 8 { Kogalla per cwt. R9 to 18.

THE
AGRICULTURAL MAGAZINE,
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for March:—

Vol. VII.]

MARCH, 1896.

[No. 9.

SEASON NOTES.

JANUARY 1896.

EASTERN PROVINCE.—*Paddy*.—Maha harvest has commenced and preparation is being made for yala. Fruit and vegetable reported scarce in all districts except Colombo,

where the vegetable supply has been fairly good. Harvest prospects good.

CENTRAL PROVINCE.—A good Maha-crop, dry grain good. Fruit and vegetable plentiful, rainfall generally sufficient. *Stock*.—Foot and mouth disease appeared in Uda Hewaheta and Walapane.

NORTHERN PROVINCE.—*Paddy crop* prospects fairly good in all districts. Dry grains satisfactory everywhere except in Jaffna. Tobacco, planting completed, want of vigour in growth reported from some districts. *Stock*.—Cattle plague (murrain) and foot and mouth disease reported from Vavuniya district.

SOUTHERN PROVINCE.—*Paddy*.—Maha crop being harvested except in some parts of Hambantota district, where it is in different stages of growth. Vegetable and fruit scarce. Dry grains fairly good.

EASTERN PROVINCE.—Crop in good condition, except that on lowlands, damaged by rain. Fine grain good. *Stock*.—Foot and mouth disease on the decline.

NORTH-WESTERN PROVINCE.—Harvesting commenced. Maha crop being grown, prospects good. In Puttlam district insect pests reported.

NORTH-CENTRAL PROVINCE.—Crop in various stages, some being reaped, prospects good. Tanks full. *Stock*.—Cattle plague prevailing and no improvement.

UVA.—Yala crop harvesting, sowing for Maha going on, prospects middling, Chena crops good prospects. Fruit and vegetable plentiful except in Udukinda, where vegetables are reported to be scarce.

SABARAGAMUWA PROVINCE.—Maha crop being harvested; yield generally good. Dry grain output satisfactory. *Stock*.—A few buffaloes in Kegalle district succumbed to cattle plague; disease did not spread further.

AGRICULTURAL SHOWS.

Agricultural societies and agricultural shows have no proud record in this Island, for while societies have either sunk into oblivion through the apathy of its members or been transformed into political or other associations, shows, as held in Ceylon have never maintained their true character. Our so-called agricultural shows have generally been of the nature of expositions where the exhibits have been of a very miscellaneous description, and their main object would seem to have been to serve as a medium for recreation and amusement. We are strong believers in the utility of shows as agents in the improvement of agri-

culture, but to fulfil this end, they should be properly organized and managed. The holding of such shows only in capital towns, at very long intervals, and on an elaborate scale with a considerable and costly display of decorative taste, results in little benefit to the agricultural masses in a country such as ours. To be of value these shows should in the true sense of the word be agricultural, they should be held once or twice a year and at different country centres, while, last but not least, they should be under the control of a competent Committee of Management.

Our attention has just been directed to an "Order" dated Nov. 27th, 1895, of the Madras Government, containing a reference to the subject of agricultural shows, which we would respectfully submit for the consideration of our local authorities. It runs as follows:—"The attention of Government has in this connection been drawn to the general subject of agricultural shows and exhibitions. In paragraph 21 of G.O., No. 515, dated 4th July 1890, it was decided to confine expenditure upon these objects to the case of cattle and pony shows, but the Government is disposed to doubt whether this decision should be adhered to. According to the system in vogue prior to 1890, only two agricultural exhibitions were held every year for the whole Presidency, and the benefits derived therefrom were confined to comparatively small areas. As it appears to Government, what is required is rather the institution of exhibitions on a minor scale to be held in each district at much more frequent intervals, say every two or three years. The management of such exhibitions should be under the general supervision of the Director of Agriculture, the details being as far as possible left in the hands of a local committee, and the expenses being defrayed by means of local subscriptions supplemented by a small grant-in-aid from Government of, say, R500 per district. The offer at such exhibitions of prizes for the best agricultural stock, produce and implements, would excite considerable local interest, and their institution might ultimately be productive of real good. Striking results could hardly be expected in the first few years.

"The question raised is one of considerable importance, and the Government desires that it should be discussed at the meetings of the Committee which has been appointed in G.O., No. 699, dated 23rd October, 1895, to confer with Sir Edward Buck on the general subject of agricultural education and experiment.

(Signed) E. GIBSON,

Secretary to Government."

To show more clearly the practical value of agricultural shows in the East, we give the following extract from a report of the Director of Agriculture in the North-Western Provinces of India:—

During the year under report agricultural shows were held in the districts of Bara Banki, Etáwa Aligarh, Bulandshahr, Muzaffarnagar, Muttra, Meerut, Khairabad, Banda, Basti and Benazír (Rámpur State). The fairs at Etáwah, Aligarh, Bulandshahr, Meerut and Benazír were visited by the Assistant Director personally and the rest by other officials of the Department, mostly apprentices from the Cawnpore Farm, in order to arrange for the exhibition of agricultural implements. The Assistant Director delivered lectures on agricultural subjects in most of the

shows attended by him, and assisted in awarding the prizes for cattle, agricultural produce and implements. An interesting and very popular feature of all these shows is a competition between the implements in ordinary use, and the improved but more expensive implements supplied by the Department. The Watts, Kaiser and Baldeo ploughs are shown in competition with native ploughs; the chain pump is worked against the ordinary swing basket, the chaff-cutter against labourers using the chopper and so on. Samples of produce of the Cawnpore and Cherat Farms, chiefly Muzaffarnagar wheat, gur made from sorghum, and foreign varieties of cotton, were also exhibited in them; and prizes were given for the best samples of produce exhibited. A dairy in full working order was arranged under the management of Mr. Keventer at Rámpur, Aligarh and Meerut. The largest sale of ploughs and pumps took place at the Bulandshahr and Meerut shows.

"As stated in previous reports, the agricultural exhibitions are becoming more and more popular every year, and in these the Department finds the best opportunity for bringing improved implements and methods into public notice."

OCCASIONAL NOTES.

This being our first issue since the arrival of the new Governor of the Colony, we take the opportunity of respectfully welcoming His Excellency Sir Joseph West Ridgeway to the Island. Our new ruler has already expressed his sympathy with the cause of agricultural education and his interest in the introduction of new products into the Island, so that we may expect during his rule that every facility will be given for the improvement of the agriculture of the Colony in the direction that improvement is possible.

Tomato cultivation has been carried on at the School of Agriculture with marked success during the first two months of the year, and the credit is due to the manager of the Government Dairy (Mr. J. Rodrigo), late practical instructor at the School. In this connection we would draw attention to some useful Notes on the Tomato which we have taken over from the *Australasian*.

A small crop of grapes was taken from the vineyard at the School of Agriculture on the 23rd February and succeeding days. The crop of about 25 bunches of various sizes,—but none very large,—were the produce from plants only 18 months old, and which, moreover, were brought over from Australia about 6 months ago. The long drought and excessive heat that have been prevailing have tended to mature the grapes rather too fast, and so interfere with their proper development and flavour, but still the outlook is not unpromising for the experiment, which is, for one thing, giving ample opportunity for the study of viticulture from a local standpoint. There is of course much to be done in the way of modifying the treatment of the vines to suit the conditions under which they are at present growing.

We would draw attention to a most interesting contribution to our knowledge (hitherto so limited) of the subject of plant physiology, by Professor

J. Reynolds Green, which appears in the journal of the Royal Agricultural Society of England. The first instalment of Prof. Green's paper is given in the present issue, and all students of plant life will, we are sure, be interested in the article which will appear in parts in the pages of the Magazine.

The giving away of prizes and certificates to successful students at the School of Agriculture was practically a private function last year,—as it generally is every other year. The ceremony was performed by the Director of Public Instruction, who took the opportunity of addressing the students at some length on matters pertaining to their course of instruction at the school. Prizes were won in the senior class by W. O. Rowlands and M.D. Aryachandra, and in the junior class by H. P. Ratnayaka, B. Lucas Mendis, and D. P. Goonewardana. Three of the senior students who have completed their course were awarded certificates of merit by the department.

MEDICINAL PLANTS.

Among other important experiments which should find a place in the scheme of a properly-organized Agricultural Department in Ceylon, should be the trial of medicinal plants, used in European medicine, that might be expected to thrive under local conditions. We have often thought over the desirability of initiating such an experiment, convinced as we are that useful results will come out of it. We lately heard that among the trials to be made in connection with the proposed Experimental Farm with which Mr. Mahawallatenne Ratemahatmaya has identified himself, is the growth of the more useful indigenous and Indian drugs used, we presume, in native medicine. Our attention has also been drawn to the importance of a series of experiments in growing English drug plants by a local chemist. The produce, if the experiment proved successful,

would of course in the first instance be available for the needs (by no means limited) of the Medical Department, but a demand from local druggists may also be expected. It is not every plant that could be expected to thrive under local conditions, but if the proposed experiment be not limited only to the low country, but also extended to higher elevations, a fair number of cultivable medicinal plants will be found. In India, we are aware, a start has been made in the growing of drug-plants, and in the report on the Saharanpur and Mussoorie Gardens we note that Hyocyamus and Teraxicum are grown and also extracts made from them. Hyocyamus extract is sold to the Medical Department at R14 annas per lb., the dried folia at 4 annas per lb.; while Teraxicum extract is sold for R1 per lb. and the dried roots at 4 annas. We believe some saving has been effected in the Civil Medical Stores by the local preparation of certain tinctures, liniments, ointments and standard mixtures. We have no doubt that if the support of the Medical Department be given to local drug production, in the same way that the Department supports the Government Dairy, the proposed experiment will start under happy auspices and with many of the elements of success in it. But then provision should be made for the trials being carried out systematically and thoroughly, and to this end a scheme and estimate for the experiment should be drawn up and sanctioned. We hope in a future issue, to refer to some of the plants which might be locally grown for medicinal purposes.

DAIRIES IN INDIA.

The following descriptions of Indian Dairies (for which we are indebted to the *Indian Agriculturist*) give a fair idea of the progress of the dairy industry on the mainland, and are interesting for purposes of comparison with the working of our local establishment:—At Allahabad Government first made an experiment in dairy-farming in 1891, when a herd of 11 buffaloes for butter and 22 cows was purchased, and the supply of dairy produce to the military hospital most successfully taken up. The herd has gradually been increased by breeding and purchase, till at the present moment it consists of 125 buffaloes, 70 cows, and 156 young stock. The average daily output of milk is 1,550 pounds (or 775 seers), of which about 500 pounds is consumed by the troops as whole milk, and most of the remainder turned into cream, yielding 80 pounds of butter daily. The separated milk is sold at half the price of whole milk, and the unsold balance fed to the pigs. I do not here propose to encroach on your valuable space by entering into the subject of the breeding and keeping of well-bred pigs as an adjunct to a dairy farm, which subject is of equal importance to the public health. Although the dairy produce has been sold to the troops at bazaar rates, the Allahabad Dairy is a paying concern, and since its establishment in 1891 up to date has resulted in a financial profit of over R20,000. I think these results show that the experiment is an unqualified success, and I venture to assert that no better system could be adopted for other stations throughout India, and that further delay in establishing dairies on the same footing is valuable time lost.

While dairy farming is to the front, the attention of our readers may be drawn to what was, perhaps, the first private institution of the kind in India. This is the Chowkooree Dairy Farm at Berenag, Kumaon, which was opened some twelve or fourteen years ago, with the object of supplying good milk and butter to the British regiment stationed in Kumaon. Since then the farm has steadily prospered, the conditions being all in favour of such an enterprise. Labour is cheap, and so is grain. To consume the butter milk, Berkshire pigs are kept, and the farm manure goes on to the plantations, and 25 acres of ground which are under oats, barley, potatoes, &c. The proprietor has cart roads all over the estate to cart the manure to the fields, which is done by English pattern carts on Marshall & Son's iron wheels, carrying 25 to 30 maunds a-piece and drawn by four buffaloes. An English dairy-maid looks after the cream and butter-making, and the proprietor is now arranging to get out a Salenius Butter-Maker, which is said to "pasteurise" the milk, separate the milk, and churn it into butter—all in one operation.

The following is another description of the same institution:—Some 40 miles from Almora and 50 miles from Ranikhet stands the Chowkooree Dairy Farm at an elevation of 7,000 ft. It possesses 2,000 or 3,000 acres of fee-simple undulating land covered over with as rich grass as grows anywhere in Kumaon and plentifully supplied with springs of cool, clear water. This magnificent area is grazed by the Chowkooree cattle. No village cattle are permitted to enter, and pensioned Gurkhas are employed as rangers to enforce this rule. Thus, while rinderpest and foot-and-mouth disease yearly ravage village herds in Kumaon, often appearing in the vicinity of Chowkooree, the farm has been singularly fortunate in keeping its cattle free from infectious diseases. The Chowkooree Dairy Farm has now about 300 head of cattle, mostly of a breed of its own, obtained by judicious crossing of hill and plains cattle. They stand remarkably well the extremes of climate, and are none the worse for 100" of rain or a 12" fall of snow. Timber, stones, and labour being cheap and plentiful, large airy cattle sheds are suitably located on the estate. The dairy is fitted up with the usual modern appliances, and being in charge of an English dairymaid, is kept scrupulously clean. All the milk is made into butter only, and finds a ready sale in Kumaon. Besides the dairy there is a poultry yard containing well-known imported breeds of English fowls, and also a small piggery of Berkshire breed. The manure helps to cultivate large crops of Cape oats, barley, and rye, all of which is consumed on the farm. Chowkooree is not the outcome of separators, but was in existence as a farm long before the public out here began to take an interest in dairy farming. I may add, in conclusion, that all those little trifles which are essential to success in most concerns are kept in view, and that the Chowkooree Dairy Farm is conducted with no little industry and economy, directed by intelligence.

The only station in which a Commissariat Dairy Farm was maintained in India during the past official year, says a Rangoon paper, was Bernardmyo, which worked at a profit of over R350 against a loss of some R2,000 in the previous year.

This favourable result is attributable to a considerable reduction in the expenditure on account of the supply of food to cattle, which were sent to graze, and also in the cost of the establishment for its upkeep. The Government of India in December last, on the very strong recommendation of the local military authorities, sanctioned the continuance of the farm in supersession of their previous order, in which it was decided that the farm should be closed on account of its continued unprofitable working. The stock consisted of 25 cows and 42 calves on the 31st March last. During the year there was an addition to the stock by the birth of 29 calves and by the purchase of cows and cow-calves. The produce of the farm amounted to over 10,000 pints of milk, of which only 3,000 pints were issued to the hospitals at Bernardmyo and the rest sold as surplus, realizing some R1,300.

PADDY PESTS.

Calandra Oryzae.—This small beetle attacks wheat, barley, Indian corn and rice. The weevil is a purely granary pest, and grain can therefore be preserved by isolation and other precautions against infection after it leaves the fields—hardy grains being more easily protected than the softer kinds. The wandering propensities of the weevil make isolation a difficult matter in the neighbourhood of infected localities. It would appear that the husk of rice is sufficient to protect it from the attack of the insect.

Chaetocnema basilis.—This beetle is said to do much damage to the young rice in parts of Burmah &c., appearing when the plants are about 6 inches high, and after first attacking the leaves passing on to the stem and roots. Some of the following means which have been found effectual with other members of the *Halticidae* have been suggested as remedies against this beetle:—(1) Sprinkling the plants with any finely-divided matter such as lime, soot, road dust, ashes &c. (2) Syringing or sprinkling with whale-oil, soap-solution, or an extract of wormwood. (3) Taking great care to keep the land clean. (4) Deeper cultivation. (5) Collecting the insects in kerosine or cloths soaked in kerosine.

Injuries to rice are also caused by insects which are probably "Cut-worms" (*Agrostis suffusa*), and Mr. Coates of the Indian Museum thinks that it is not improbable that much of the damage reported as due to obscure lepidopterous larvæ may also be done by insects belonging to this group. These larvæ attack the young crop just as it shows above ground, and not only feed on the young leaves, but cut through the stems, dragging the tender plants into their underground burrows where they feed on them at night. The following method of destroying the larvæ has been found effectual by Dr. Riley in America:—"Bundles of cabbages, turnip or clover are sprinkled with Paris green water, and laid at intervals between the rows of the crop to be protected. Before the plants come up these poison the cut-worms, which are thus got rid of before the appearance of the crop which they would otherwise attack."

The rice-sapper (*Leptocorisa acuta*) is an insect which does considerable damage to rice. By the Sinhalese it is called goyan-messa. The insect is most destructive in the larval state, sucking out

the juices from the halm which withers and turns yellow. A common means of riddance is the smoking of fields by burning vegetable refuse to windward. As much as three-fourths of a crop is destroyed by this insect.

Hispa ænescens is another rice pest widely distributed through India. It is a beetle belonging to the family Chrysomelidæ, almost all the species of which feed on leaves, both in the larval and mature stage, by far the greater part of the damage being done by larvae. Mr. Coates of the Indian Museum writes thus of this pest:—"From the reports that have been received, it seems that the pest appears often in large numbers during the rains, when the rice has just been planted out, and is still young and tender, the insect feeding on the parenchyma of the leaves and stalks, leaving the fibre exposed so as to give the plants a white and withered appearance. The effect of the pest would seem to be to stunt and weaken the plants and cause them to yield but a small crop." The crop is apparently in no case completely destroyed by the insect, but the out-turn may be reduced by from twelve to fifty per cent. The two common remedies against this pest are (1) smoking out the insects by burning paddy-straw covered over with green leaves, and (2) letting out the water from the fields. The latter, where practicable, is recommended by Mr. Coates, as it appears that only paddy which is almost completely submerged is attacked.

(To be continued)

THE NUTRITIVE PROCESS IN PLANTS.

(PROFESSOR J. REYNOLDS GREEN, D.S.C., F. R. S.)

There seem at first sight to be very great and almost characteristic differences between plants and animals in regard to their methods of nutrition. The food materials which the several organisms avail themselves of are at the outset very different, so simple in the one case, so complex in the other. The regularity with which the animal takes in nourishment at fairly constant intervals contrasts strongly with the long periods of absorption varied by long and irregular periods of intermittance which are characteristic of the plant. Yet when we come to study the details of the nourishment of the actual living substance of the plant, as distinguished from the absorption of the raw materials of which that nourishment is composed, the difference almost disappears. The study of the chemical process which go on in plants, or as it is technically called their metabolism, shows us that the apparent process of feeding, the absorption of very simple compounds from the air and from the soil, is not the feeding or administering of nourishment itself, but only a preliminary operation, enabling the living substance of the plant to construct its pabulum from these simple bodies, the pabulum really being as complex as that on which an animal is nourished, and consisting of almost the same substances, at any rate of bodies which correspond very closely to those of the animal diet. In other words both classes of organism feed upon the same or corresponding substances, the animal absorbing them from the exterior in a state in which they are almost fitted to nourish its living substances, the plant taking them in such a condition that an

enormous amount of preliminary constructive work has to be expended upon them before they are of nutritive value, this constructive work being the formation from the simple bodies absorbed—of materials such as the animal absorbs directly as its food. The difference between them thus becomes at the outset one of considerable interest. It is not that the protoplasm of the animal needs different food from that of the vegetable; it is rather that while in both cases chemical work has to be performed upon the absorbed material before it can be regarded as food in the strict sense, that work in the case of an animal is on the whole a breaking down of complex bodies, but in that of a vegetable it is a building up of simpler ones till the same stage is reached in both cases, namely, a material which protoplasm or living substance can absorb into itself, and from which it can be constructed.

But so far as the vegetable organism is concerned, this is not by any means the whole story. Leaving aside for the moment the cases of such plants as fungi, which can do nothing with the food supply yielded to a normal green plant by the atmosphere, we find that the conditions of life of an ordinary green plant involve a great extension of the original constructive process. It has no definite and regular meal times at which it can take in a certain quantity of food regulated partly by the needs of the organism, and partly by the mysterious factor which we call appetite. Its absorptive processes are much more under the influence of natural phenomena, the degree of light, the amount of warmth, moisture, &c. Periods of intermission of irregular length are caused by the alternation of day and night; in the case of perennial plants still greater disturbances are caused by the succession of the seasons of the year, and the alterations these produce in the amount of foliage which the plant preserves; weather and its vicissitudes form a series of disturbing influences. We have thus the certainty of failure to survive in the struggle for existence unless the initial absorptive and constructive process are supplemented by others which in some way shall make the organism indifferent to these changes and intermissions of supply, and capable of carrying out true nutritive work, though the initial stages of such work are checked or suspended. Such a secondary process involves the whole story of what it is usual to call *reserve materials*. It is evident to us all, from a very general consideration of the peculiarities of the vegetable kingdom, that the constructive process is very much the leading one in the history of most of its members. Growth proceeds for such long periods, that there is stored up in such a structure as a forest tree for example, an enormous amount of material and of potential energy. This gross accumulation, however, of which as food supply the organism makes no use, must be distinguished from the storage of material intended for, and ultimately applied to, direct consumption by the plant in the processes of nutrition. It is the latter which constitutes the material truly and properly called *reserve*.

LIME IN AGRICULTURE.

There is perhaps no subject that is more often written about in agricultural publications than the value of lime in agriculture, and yet the im-

portance of "liming"—as the application of lime is generally called—is seldom fully recognised by agriculturists. If the reproach can be laid to the charge of Western agriculture, with much greater force can this be done in the case of Eastern agriculture where the benefits of liming are but dimly recognised and the practice seldom adopted. The *Scottish Farmer*, taking as its text "Use more lime," summarises the advantages of liming for the benefit of its readers, and we are inclined to think we cannot do better than follow our contemporary's example.

Lime is valuable as a direct plant food. Wherever soils are deficient in it, the application of even a limited quantity exerts a decided effect on vegetation. Its influence in hastening the decay of organic matter in the soil is of great value where that constituent is plentiful. Similarly, its action in liberating inorganic plant food, and making it readily available, is one of the most valuable benefits which it confers. Its indirect advantages in these ways are strong recommendations in its favour. The improvement which it brings about in the mechanical condition of the soil—especially heavy loams and stiff clays—ought not to be overlooked. But what we regard as one of its greatest advantages is apt to be either ignored altogether or made comparatively little of; we refer to its effect in sweetening soils and making them mellow by combining with or neutralising such injurious acids in the land as have made it sour. No other fertiliser exerts the same kind or degree of influence in this respect as lime. In fact, the extensive and repeated application of some classes of artificial manures has helped to generate these objectionable acids in the soil, and to that extent has checked its fertility. Such being the case, there is the greater reason why such an agent as lime should be used to neutralise these. Plain, practical men may be unable to understand the scientific side of this truth; but everyone who has observed at all closely the application of lime to land cannot but have noticed its practical operation, not only in its striking effect in stimulating luxuriant growth, but also in the more healthy character of the vegetation promoted by it. For a series of years after a judicious application of lime has been made to land it is apparent, even to the most superficial observer, that the plants at every stage of the rotation show a more healthy and vigorous life than on most land where that fertiliser has not been used. This is not simply that a more plentiful supply of plant food has indirectly, as well as directly, been made available, but that the general condition of the land has been improved by its being freed from sourness and other kindred objectionable elements which militate against the healthy growth of farm crops. To the value of lime in bringing about such results we attach much importance.

The *Agriculturist* of Florida for January 8th, also dilates upon lime "as a fertiliser and insecticide," and states that the purposes served by lime as a chemical constituent of the soil are at least of four distinct kinds:—

"1. It supplies a kind of inorganic food which appears to be necessary to the healthy growth of all cultivated plants.

"2. It neutralizes acid substances which are naturally formed in the soil, and decomposes or renders harmless other noxious compounds which

are not infrequently within reach of the roots of plants.

"3. It changes the inert vegetable matter in the soil, so as gradually to render it useful to vegetation.

"4. It causes, facilitates, or enables other useful compounds, both organic and inorganic, to be produced in the soil—or so promotes the decomposition of existing compounds as to prepare them more speedily for entering into the circulation of plants."

From these deductions it is plainly apparent that liming lands is requisite to greater success in cropping, whether newly cleared, fallow, or fields in actual cultivation. If no other result than the destruction of worms and insects in the soil were obtained, it would be a paying investment for truck gardeners alone.

This paper recommends that on high sandy soil 30 to 50 bushels of freshly-slaked lime is considered sufficient, but on such lands as are rich in vegetable matter, it must be still more abundantly applied—from two to three hundred bushels per acre: its application producing the best results when sown broadcast over the surface after the land has been worked up.

THE MANAGEMENT OF DAIRY CATTLE.

BY MR. JAMES MOLLISON,

Superintendent of Farms, Bombay Presidency.

(Continued from last issue.)

If reared by hand, Indian calves, which are generally small, can be kept in fairly thriving condition on 4 lbs. of whole milk per day, given at two meals. This, if continued, for 4 or 6 weeks, will bring the calf to a time when it can be fed on other food. The whole milk can be replaced by separated milk, but every cow-owner cannot procure separated milk, and on account of the heat in India there is no such thing as sweet skim-milk. The young calf will soon learn to eat a little *chuni* (husk of *Cajanus indicus* or *dhal*) and bran, also a little good hay or green grass.

A handful of mixed *chuni* and bran (about $\frac{1}{2}$ lb. per day) in two meals is all that is required at first. The quantity may gradually be increased until, when 8 months old, $1\frac{1}{2}$ lbs. per day should be allowed. On the ordinary milk ration of Indian calves, large framed English calves would literally starve. When a calf is raised by hand it has to be taught to drink. Its instinct is to suckle and this is taken advantage of in giving the first lesson. If sufficient time after birth is allowed, the calf gets hungry. It will suck one or two fingers of the right hand if introduced into its mouth. If at the same time the head is forced gently into a vessel containing the milk so that the muzzle just reaches the milk, the calf will soon learn to drink. The first milk is drawn into the mouth unconsciously and swallowed in the act of sucking the fingers. The important points to be attended to in rearing hand-fed calves are that the milk and food should be clean and fresh and of course given in a clean vessel. Sour milk or milk tainted in any way is apt to produce diarrhoea or scour. Well-ventilated and well-drained accommodation for calves is necessary. All excreta should be removed at least twice a day. The droppings from calves, fed on milk, soon acquire

a most disagreeable smell. Any unsanitary condition tends to cause scour. Over-crowded calves never thrive. They are subject to be attacked by parasitic vermin and skin disease, especially ring-worm and itch. A piece of rock-salt should be placed so that the calves can lick it. If a hole is bored in the lump and the lump is suspended by a string, none of the salt is wasted. A lump of lime or chalk placed within reach will also be regularly licked. The chalk is beneficial, because it has a tendency to counteract that acidity in the stomach which always accompanies scour.

If proper attention is given to the feeding and management of calves during the first few months of their life, and if satisfactory progress has been made in growth during that period, they will continue to thrive often with much less care and with much less food than a young animal which has previously been half starved, and this remark is applicable to all animals. If young stock are to make satisfactory progress, even in India, a certain amount of shelter is necessary. The monsoon is decidedly the most trying season. Roomy yards with shelter standing must be provided to be used during excessively heavy rain. Grazing ground gets so soft and so easily puddled that any attempt to turn young stock out to graze would be alike harmful to them and to the pasture. In India the conditions associated with the rearing of young stock are different from those found in other countries. There is in India grazing of a sort all the year round. The grazing is not equally good at all seasons. Usually there is only green grass for 5 or 6 months, and the natural food must afterwards be supplemented by other food. The daily ration must be especially liberal at those seasons when the natural food is scarce.

Superabundance at one season and semi-starvation at another is a fruitful cause of loss. Particular care should be exercised when young grass begins to grow. It flushes up very suddenly in India. The first growth, although it is green, is not nutritious, and, being succulent, is not well suited as a change from the hard dry fibrous fodder previously given. Most of the cattle which die in India die at this season.

The change of feeding is so sudden that impaction of the stomach is induced. The innutritious fibrous food previously given collects in the rumen and becomes impacted, whilst the green food passes through the alimentary canal without being properly digested. The first symptom is that the animal scours. Young stock should be prepared before they are turned out to grass. Linseed meal is a useful food at this season on account of its laxative character and its softening effect on food with which it becomes mixed during the process of digestion; but linseed cake is not usually procurable in India. A cake rich in oil and free from fibrous matter, for instance sesamum cake, should be fed to all young stock for at least a fortnight before they are turned out to grass; 2 or 3 lbs. per day along with the usual ration of dry fodder will prevent the serious consequences which would follow a sudden change from dry fodder to green grass.

Indian cows and buffaloes are at the best irregular breeders. Some breeds are more irregular than others. Gir cows are very unsatisfactory in this respect. On the other hand, Aden cattle, if well fed, will come in season for the bull six weeks or

two months after calving. Buffaloes are less regular than cows. Green food given in moderation all the year round tends to bring cows and buffaloes sooner into "season" after calving. This would be the care even although the animals are otherwise well fed. A bull turned out to pasture with the cows periodically, say once a week, and especially a buffaloe bull with buffaloe cows tends to bring them into season sooner than would otherwise be the case. The following table of figures shows the average period of lactation and the average time between two successive births of the cow herd and buffaloe herd on the Poona Farm in 1893:—

	Av. period of lactation.	Av. period between two successive births.
	Days.	Days.
Whole buffaloe herd	364	524
Whole cow herd	360	475

The longer period between births in respect of buffaloes arises partly because buffaloes are longer pregnant than cows.

Buffaloes are in the average pregnant 315 days
Cows " " " " 282 "

An old cow will carry a calf 10 days or a fortnight longer than a heifer, and a cow bearing twins will usually go 272 to 275 days.

THE DISPOSAL OF NIGHT-SOIL.

In his last annual report the Superintendent of the Poona Farm gives an account of an experiment, undertaken on behalf of the Cantonment Committee, in the direct application of night-soil to cultivated land. The method of application is described as the shallow-bed system. We quote as follows from the report:—"Beds are formed along one side of the area to be treated. The beds must be sufficient in number and extent to receive the night-soil of the following day or night. The beds are best made moderately small, one for each cart-load of night-soil. The soil inside the bed should be dug up and loosened, so that the liquid part of the night-soil soaks at once into the soil. If the beds are small, the semi-liquid night-soil as it escapes from the carts distributes itself equally. It should be covered immediately with three inches of soil, the soil being obtained by digging out the beds necessary for the reception of the night-soil of the following day. When sufficient soil is removed to cover the night-soil properly, the bottom of each bed should be dug up to loosen the soil. If the beds are properly prepared, there is a guarantee that the night-soil is also sufficiently covered, consequently close supervision is not necessary. One inspection each day to see that the beds for next day's night-soil are properly prepared is all that is necessary.

The Poona night-soil carts have each a capacity of 200 gallons; probably on an average each cart contained about 120 gallons, or, say 1,400 lb. Approximately 200 cart-loads were applied per acre, and it is said that this was equivalent to 100 tons and probably 120 tons of mixed solid and liquid human excrements. The night-soil was applied between the 23rd June and the 9th July. There was hardly any noticeable smell when the night-soil was covered with the necessary quantity of soil, and in a day or two there was nothing offensive or insanitary. The night-soil layer (when brought to view) could be distinguished by its

characteristic slate colour, the colour of poudrette. There was absolutely no taint or odour on its exposure at the surface. It had been buried three or four weeks."

And yet Mr. Mollison believes that the manufacture of poudrette will continue, because cultivators will prefer to use this form of night-soil, which has nothing objectionable about it and is easy of transport, and also because manufacturers of the manure can count on a profitable business in it.

The *Indian Agriculturist* mentions that the last quarterly report of Surgeon-Lieutenant-Colonel King, Sanitary Commissioner of Madras, contains some correspondence which he has had with the Coconada Municipality on the subject of sewage farming, about which his advice was sought. It seems that the Municipality in question intended to confine its operations to the manufacture of poudrette; but Surgeon-Lieutenant-Colonel King points out how easy it is to combine this with ordinary fluid sewage irrigation, such as is carried on successfully by the Madras Municipality. He explains the simple means by which this can be effected, giving all the necessary details as regards the best and cheapest plant and the easiest system of cultivation. He remarks that hurrial grass is perhaps the most satisfactory crop to grow under sewage. The only care requisite is that sewage irrigation should be checked as the crop becomes ready for cutting for from five to ten days previously. As regards the poudrette system, the main feature to remember, the Sanitary Commissioner says, is that the trenches should be shallow. What degree of shallowness is used must depend upon the area of land at disposal. At no time should the trenches be deeper than 18 inches, the depth up to which microbic life is most active. No rule, he says, can be laid down as to when the manure is fit for use; this can only be ascertained by direct observation, as the results vary much in different soils. Some period within six months may be taken as a safe calculation. But by occasionally opening a trench the state of progress can always be easily gauged. What is required is that before removal the trench contents shall in no way be distinguishable from the surrounding soil, unless it be by the rich dark colour and a tendency to the character of garden mould. As regards the nature of the soil best fitted for the securing of the change required, the nearer the soil approaches the character of garden mould, the better, and from this one may, in descending order of choice, select gravel, sand, or clay. The latter soil, however, unless well mixed with sand, vegetable matter, or ashes, cannot be expected to enable the necessary nitrification to proceed. Having prepared the soil, the question simply resolves itself into one of careful husbandry—the only care requisite being to guard against the tendency to overload the plants with manure.

Dr. Leather in his note on night-soil refers to the methods of preparing poudrette in certain Indian towns.

The practice at Nagpore, in the Central Provinces, is to fill night-soil and town-sweepings into pits measuring 10 feet by 4 feet and 4 feet deep into which about 100 cubic feet of sewage is emptied in 10 or 12 portions, 3 or 4 inches of earth being thrown over each layer.

At Poona a similar practice prevails, the pits there being 18 feet by 15 feet and only 1 foot deep. Ashes are spread over the night-soil.

A similar system prevails at Cawnpur.

After a time the material becomes dry and nearly odourless and is taken out of the pits and sold for manure.

Regarding the chemical composition of such poudrette, it will be evident that this will depend on the proportion of earth which is mixed with the refuse, and secondly, on the comparative dryness or wetness of the material when taken out of the pits. The larger the proportion of earth and the wetter the condition of the poudrette, the smaller will be the percentage of plant-food ingredients, such as phosphoric acid and nitrogen.

The following analyses of samples of poudrette which have been made by Dr. Leather, himself, may be quoted:—

	<i>Poudrette</i> <i>form Cawnpur.</i>	<i>Poudrette</i> <i>from Poona.</i>
Moisture ..	2.64	22.91
Organic matter ..	7.82	18.10
Earthy substance	89.54	58.99
	100.00	100.00
Containing		
Nitrogen	0.468	0.906
Phosphoric Acid	0.499	

NOTES ON THE TOMATO.

This having of late become one of our most common and valuable fruits, it may interest our readers to know that the *American Agriculturist* reports a series of experiments made as to the chemical composition of both the fruit and the vine. These show that the crop requires almost twice as much potash as any other ingredient; and also that because nitrogen, the most expensive element of plant-food, can only have its full effect when available potash and phosphates are present in excess in the soil. Any excess of potash over the requirements of the crop will not waste from the soil by drainage, but will be retained in combination by the soil for use in future crops.

The experiments show that when potash is deficient in the soil, the growing plant, of whatever description it may be, becomes much more sensitive to adverse conditions of soil or season, and is more readily attacked by disease, especially mildew and other fungoid growths.

Wood ashes contain a large percentage of potash, and will be found an excellent manure for tomatoes. Not only do they correct any acidity in the soil, but they favour nitrification, and they supply carbonate of lime, of which a tomato crop requires at least 50 lb. to the acre. A small amount of available phosphate will in most cases be sufficient for a successful tomato crop. Having made sure of an excess of lime, phosphates, and potash salts in the soil, nitrogen should be used freely but economically; a small quantity given frequently is much better than a large dose supplied all at once.

Applications of soluble forms of nitrogen, and particularly of nitrates, seem to increase the yield

of fruit without retarding maturation, and even to hasten the latter, provided there is sufficient heat at command.

The usual distance apart tomatoes are planted is 4 ft. Upon this basis, an acre will contain about 2,700 vines, weighing after the last picking about 8,700 lb. The roots will weigh about 1,350 lb. Taking 10 tons as an average yield, a tomato crop will take from the soil in pounds per acre:— Nitrogen—In fruit 28 lb., in vines 28 lb., in roots 3 lb.; total, 59 lb. Phosphoric acid—In fruit 11 lb., in vines 6 lb., in roots 1 lb., total, 18 lb. Potash—In fruit 53 lb., in vine 44 lb., in roots 4 lb.; total 101 lb.

Dr. Jenkins, of the Connecticut Experiment Farm, reckons that one-half of what is taken up by the plants from the soil is returned to it again in the vines and roots, that is, presuming these are returned to the land as manure.

In some parts of the United States of America, the tomato crop is an important one, and with skilful cultivation 15 tons to the acre are often secured. The Canary Islands export to England about 150,000 cases, or something like 2,700 tons of tomatoes per annum. They are grown, packed, shipped, and delivered in London at a cost of 2d. per lb. The seed they import from England, and this is distributed among them on their undertaking to sell their produce at so much per cwt.

GENERAL ITEMS.

A cursory glance at the Report on the Aborigines' operations, N.W. Provinces and Oude, for the year ending 31st March, 1895, reveals the fact that the authorities concerned have been very active in the matter of roadside aborigiculture. We are told in the report that the actual length of avenues at the beginning of 1894-95 was 8,251 miles; that 234 miles of new avenues were planted during the year; and that the total length of avenues on the 31st of March, 1895, was therefore 8,485 miles. Roadside aborigiculture in the neighbourhood of Colombo would seem to have almost died out with the late Mr. William Ferguson, with whom the work of tree-planting—for ornament and utility—was indeed a labour of love. Such tree-planting as is at present done is carried out in a perfunctory manner with little display of taste, and the result is that while many public thoroughfares provide no shelter from the burning rays of a tropical sun, the rest present wretched specimens of vegetation, left to struggle on as best they can.

Meehan's Monthly for December makes the interesting statement that the Tangerine orange, and possibly some other varieties, are formed through the effort of the orange to make a secondary fruit at the apex of the original one, only that it failed to make any original at all. In other words, the Tangerine orange is a well-developed secondary fruit. How this can be brought about may be readily understood by carefully examining the oranges known in the markets as the Navel variety. In these cases, a small orange can often be found at the apex, sometimes of considerable size. When this small one is largely developed, and the larger one wholly suppressed, then we have the Tangerine.

A writer (W. B. Hall) on "lemon culture" gives the following hints, which we take over from the *Rural Californian*:—"The distance trees should be planted apart depends somewhat upon the soil and their future management or training. I believe 25 feet to be generally about right. Head the tree about two and a half feet from the ground, keep it shortened in for three or four years, forcing a thick stocky basis for after growth. The tree by this time is bearing freely, and the fruit will pull or bend down the long shoots, which will then put up or throw out small fruit-bearing timber along the upper side of the drooping limb. I think this preferable to a continuous shortening of all long growth. A dense shady tree is what is wanted, since the denser the shade the more symmetrical and smooth the fruit will be. Limbs that reach to and lie upon the ground may from time to time (as needed) be tipped off."

The treatment of the lemon tree in Sicily is again very different from the method above described. In the report of the British Consul at Palermo (published in the *Kew Bulletin* for October 1895) we read with regard to lemons:—"Tree should be trained high to admit free ventilation, pruning to take place regularly once a year. The clearing away of dried twigs and suckers precedes the pruning and sometimes renders the latter unnecessary."

An exceptional crop of onions is said by an American paper to have been raised by the following method. A patch three rods long and two wide was selected. The ground was prepared in the usual way, well fertilized and raked smooth. Then foot boards 12 feet long were placed so as to leave an opening about 4 inches between them. Along this opening onion sets were planted about six inches apart. The boards were not removed during the growing of the crop, and acted as a mulch through which weeds could not penetrate. A very little labour kept the weeds out of the rows, and the crop matured in fine shape, giving an extraordinary large yield. It took sixty-six boards to cover the patch, and they cost the grower about \$5. The boards will last many seasons for this purpose, if taken up during the winter, and the cheapest kind of lumber will answer the purpose. The enforced idleness to the land conveyed by the boards adds greatly to the productiveness, claims the grower of the crop. Six-inch boards would answer the purpose fully as well, and then nearly twice the quantity could be grown upon the same amount of land.

The Madras Government lately appointed a Committee to report on several water-lifts for agricultural purposes that are now in the market. The Committee found some good points in these lifts, but suggest that a reward of R1,000 be offered for a really efficient lift suitable to the needs of the average ryot. As the matter is of imperial interest, the Government of India are to be asked to consider whether it would not be possible to promote a competition throughout the country by the offer of substantial prizes.

No absolute specific has yet been discovered for the various diseases to which the tomato plant is subject; but correspondents of the *Journal of Horticulture* recommend that the plants when

badly affected should be rooted up and burnt, and that the same soil should not be again used for tomato culture. If avoidable, organic manures should not be used. Charcoal is said to be good for keeping the soil sweet, and lime assists in preventing the drooping disease as caused by either slime or sleepy fungus. "Fostite," a French preparation of talc and salts of copper, has proved effectual as a remedy for fungoid disease incidental to the tomato. Green copperas applied to the land while fallow is also recommended.

F. Alberts, proprietor of Moulton Hill vineyard two miles south of Cloverdale, has for many years been experimenting on a process for the manufacture of a syrup from grape juice, and has at last succeeded in producing the article desired. Last season he manufactured nearly 25,000 gallons of this syrup. Its uses are manifold. It is excellent for sweetening wine and whisky, thus taking the place of cane syrup, which is not so desirable for that purpose. The syrup is also

used as a substitute for honey and cane syrup. This invention will be beneficial to the wine trade as it yearly withdraws grapes equivalent to 250,000 gallons of wine.—*San Rosa Republican*.

It is reported that most of the Florida orange groves have been destroyed by frost. The orange industry in Florida was of the annual value of nearly a million sterling. This failure has led growers to think of starting cultivation in Jamaica and the Bahamas. It is said that during 1895 only 100,000 boxes of oranges were shipped from Florida instead of 5,000,000 boxes!

We have to acknowledge with thanks the receipt of copies of *The Sugar Journal*, *The Barbados Agricultural Gazette*, *The Central African Planter*, *The Agricultural Gazette of Cape Colony*; and of local publications, *The Ceylon Forester*, *Our Boys*, *The St. Thomas' College Magazine*, *The Ceylon Commercial News*.

[No. 10.]

THE PHILOSOPHY OF ARBORICULTURE AND LANDSCAPE GARDENING.

BY REV. J. G. MACVICAR, A.M., D.D.

(Reprinted from *Transactions of the Scottish Arboricultural Society*, Vol. IV.)

(Continued from page 587.)

AND now for the labours of the arboriculturist, afterwards his enjoyments.

As in other matters, the arboriculturist in this country has many difficulties to contend with. Of these our very extensive sea-board, compared with our very limited interior,

is one. Particles of sea-salt, when plentiful in the air, are most inimical to the growth of forest trees in general. Even in the finest climates, if particles of sea-salt abound in the air, they attack and kill all expanded leaves and young wood, and prevent the formation of buds. On the Bay of Naples, in the south of Italy, just as on Bressay Sound in the Shetland Isles, deciduous trees can be grown, in the first instance, only under the lee of a wall. And each row of trees, as it is farther from the sea, only rises above the one that is nearer, like the roof of a house. Evergreens, indeed, whose leaves and life are more torpid, are not so sensitive; and the Bay of Naples, where man has not interfered, is beautifully clothed with orange and lemon trees. Some plants also have the power of absolutely resisting the entrance of sea-salt into their tissues, which, accordingly, may be seen encrusting their leaves; and they suffer nothing from salt. Other trees, again, as the coconut palm, may have a truly maritime habitat, and may refuse to be productive at any very great distance from the sea. But a large sea-board, especially in a windy country like ours, is certainly a great barrier to arboriculture. And those gentlemen and foresters who have

succeeded in giving old Neptune a sight of a group of goodly trees which they have raised within the reach of his breath, have a great triumph.

The great prevalence of westerly winds also in our latitudes is a great disturber of the growth and symmetry of trees, especially in those valleys which lie west and east from sea to sea.

But much, very much, has been done at once to protect, to enrich and to beautify our country by arboriculture. But happily for the earnest arboriculturist, much remains still to be done; and of his rural art, the praises stand in special need on being celebrated at the present moment, when, if consequence of the increasing demand both for corn-fields and pastura land, arboriculture runs such a risk of being neglected. It is certain, however, that in order to have the best, whether green hills meadows, or corn-fields, there must be in the landscape a fair proportion of trees.

There is another fact which, in reference to our own country, especially the southern and western-counties and highlands, invests arboriculture with peculiar claims; and it is this,—to a far greater extent than ever before, the draining of all boggy lands, both low lying and upland, is being practised. Now, this is all right. It is the hand of man doing for nature in our latitudes what nature is usually able to do for herself. It is the hand of man proceeding to abolish the bogs which were the death of the primeval forest in all those localities where trees could formerly grow. But if man is to take a second leaf out of the book of nature, it is that he should plant these new drained bogs again; for that is what she does whatever she can. Of this draining, the immediate consequence has been a great improvement in the quality of the grasses growing on the lands formerly bogs, and therefore a great encouragement to the agriculturist, and especially to the sheep farmer, to continue draining till no bog remains over which he has control—an encouragement which, at the present moment, is felt intensely in consequence of the unprecedented value of sheep.

Now, there can be no doubt that this universal draining is ameliorating our climate, not perceptibly in reference to mean temperature perhaps, but certainly in reference to sunshine and fair weather. The southern and western counties—the Atlantic side of our island—is in point of rainfall approximating the eastern counties, or the Continental side. But this is what the western districts cannot stand without serious loss to the country. The amount of rain to which they have been subjected for ages has carried out of the soil the most part of the aluminous elements, in union with water (for which alumina has a remarkable affinity) into the sea, or, at all events, into the lowest troughs of the land. The soil generally is consequently light and sandy, sharp and good for growing oats and grasses, and therefore for giving green hills instead of heathery hills, but less fit for wheat and beans, and even barley. Green hills must always be the peculiar treasure of the southern and western highlands of Scotland. And, accordingly, such is the character of those hills generally as elsewhere in the corresponding localities in England. They are remarkable for their verdure. They form in this respect a striking contrast to the Grampians and the mountains of Aberdeenshire, which are very brown and purple, with rocks and stones, and heather out of flower or in flower.

But will the southern and western mountains continue green in ages to come, when the whole country is thoroughly drained, as they have continued for ages past? No; even already it begins to be commonly said of many of the most profitable sheep-walks, that they could take a shower every day, and, at all events, they could take, and would be the better for more than they get, even in districts which were wont to be very wet. Is there any method, then, whereby the rainy character of a county-side, which has departed through the draining of that country, can be restored to the extent that is needed to preserve the green hills, so that the sunshine, which has been obtained by the draining, may be preserved, while yet the former moisture may be recovered for the vegetation? Is there any method, in a word, by which a habitual or muggy raininess of climate may be transformed into sunny showeriness?

This problem, I believe, the arboriculturist is appointed to solve. By judiciously planting the crests and slopes of the mountains, and giving to nature such breadth of forest as she requires, the hills may be kept perpetually green, and the beauty of the country at the same time immensely enhanced.

Moreover, the timber will in the course of time pay its own way, and something more. Even supposing the larch should refuse its assistance in the work, the great study now bestowed upon the conifers in their whole treatment, and their cultivation by many (and by none more admirably than by the President of this society), opens up the hope that some substitute for the larch may be found. And if even statesmen are making provision for times supposed to be coming, when coal-fuel, as is thought, will be scarce and dear, the timber of our country will acquire new value. At present, indeed, it seems as if it were thrust aside, and were put *hors de combat* by iron. The sound of the hammer in the navy-yard now is quite different from what it used to be. No longer may we sing—

“Heart of oak are our ships.”

But will it not be a pleasing conversion when our ‘wooden walls’ protect our firesides, not on the stormy main, but at the very glowing ingle-neuk itself. At all events, there is no reason to apprehend that the economic value of timber will ever cease. Rather let us anticipate a time when the reasonable supply of the wants of our population, both gentle and simple, and a general contentment, which alone is true wealth, will leave the general eye more open to the charms of beauty, and when people in general will drink in a far larger supply of enjoyment than they do at present, from communion with Nature and the contemplation of the Beautiful. An eye for beauty is in reality the richest inheritance. It needs no title to hold, but merely

one to behold, and this is the title of every man that has an eye to see with, and a soul to feel. And a true friend among his neighbours assuredly is that man who, by his art, has succeeded in presenting permanently to the spectator who is living there, or frequently passing that way, a beautiful object where there was none before. And here let us maintain, that whatever the field of the sculptor, or the painter, or the architect, however much of the beautiful they may possibly create in their respective provinces, the field of the arboriculturist and landscape gardener is more ample than any or all of them. The finest works of the sculptor or of the architect are manifestly only accessories to the landscape gardener. These artists have to come to him to assign a place where their creation may stand, or if they venture to fix upon that place themselves, it is only by becoming landscape-gardeners themselves for the occasion.

Not that there is any incongruity in their so doing if they have strength for it. The principles of beauty, whether in the elect field of the sculptor, the painter, the architect, or the landscape-gardener, are the same in all. And on these principles I shall here venture a few remarks, because I am not aware that they have as yet been advanced in connection with the landscape, while, even in ancient times, they have been verified in reference to architecture and sculpture, and some of the most eminent of modern sculptors have been eager to embrace them.

That in speaking of landscape-gardening I am not wandering from arboriculture, follows from this, that scarcely otherwise than by modifying the surface of the country by planting or felling, can man change the aspect, the beauty, and expression of a landscape at all. But let it not be inferred from this that his power to do so is but small. We all know to what an extent a man may change the aspect and expression of his head by beard-and-mustache gardening. Not less is the power of the landscape gardener in modifying the expression of the landscape, through the cultivation of trees and underwood.

As to the beauty of the landscape, then,—the mansion-house with its rural panorama and the cultivation of its beauty,—we cannot too soon draw a distinction between the effects of *colour* on the one hand, and of *form* on the other.

Colours are for the eye only. They can please, they can cheer, they can delight, nay, to some extent, they can awake delightful associations; or they can depress and awake mournful associations; but they do not move the soul as certain *forms* do; and they never attain the rank of picturesque or sublime. When beholding colours, also, the mind is quite differently engaged from what it is when contemplating forms. In beholding colours, the eye rests on the colour. The arch, the space which the colour covers, is everything. In beholding forms, on the other hand, the eye, though secretly, is yet ever in motion, ever ranging along the contours or some line or other in the form beheld, conscious that therein the charm of the beauty lies, and very able to enjoy half beauty, though not to discover the secret of it.

Hence the development of beauty in reference to colour is easy:

(1) Colour, as to cheerfulness or gloom, must be answerable to the expression of the forms which it clothes.

(2) Colour must be in breadths, not too small.

3.) Colour must, however, be sufficiently varied and,

4.) Every variation of colour must be harmonious, if the colour is not to interfere with the transparency and amplitude of the landscape.

The first and last of these conditions may be considered as of the same order. Scientifically considered, they are rather obscure; but happily the eye is an adequate judge. The conditions of harmony have, however, been completely ascertained in reference to music, and the same principles (though not the same ratios) apply to colours. But on this subject let us content ourselves with saying that, as the musical composer of a great piece, almost indeed in every page of it, in order to keep the ear awake, finds it necessary to have recourse to discords and

modulations from one key to another, so does the gardener, both in reference to the landscape and the flower-garden. Of late, indeed, the principle of discord has ruled in the flower-garden; and this it ever must do when the object is to fill the eye with a great show of colour. For the harmony of colours imparts transparency; and though harmony be necessary, if every colour is to be seen in its purity, yet when the impression of all the colours is received simultaneously, they fill the eye much more completely when they are not in harmonious juxtaposition. Suppose for instance, three varieties of pansy, one of which consists of violet and yellow (both pure and finely modelled forms), so that they just balance each other, another which is wholly violet, and the third wholly yellow, then a bed composed wholly of the first, even at a very short distance from it, would soon cease to have any effect at all. Violet and yellow are harmonic or complementary colours: when, through distance, they overlap each other, or a confused sensation of both is received by the eye, all colour tends to vanish, and mere transparency, or the ground colour beneath, tend to remain. And indeed, almost all colour, even at the distance of distinct vision, may be made to vanish if the yellow and violet be in just proportion to each other and perfectly complementary or harmonious. By spinning the flower round under the eye with sufficient rapidity it will seem merely white or grey. If, again, half the flower-bed be planted with the pansies which are wholly violet, the whole bed will bear to be looked at from some distance, and will still, in some measure, fill the eye. But let the violet colour, which is harmonic with the yellow, be removed and its place be taken by some discordant colour, such as bright red, and the bed, now half scarlet now half yellow, will send on its yellow as well as its scarlet to the eye, and fill it to a much greater distance. It is to be admitted, therefore, that though it seems at first as if there were much that is merely *bizarre* in the prevailing fashion of flower-beds, yet there is principle for it too.

But there must be no such tampering with the landscape. There, transparency and purity of tint come to be the primary object of regard; for the beauty of the landscape is that of expression, and almost everything depends upon form. Staring colours may, indeed sometimes be introduced with good effect, and serve a valuable purpose, but only to draw away the eye from defects, never to enhance beauty. One of the first demands of the soul in reference to the landscape, is for amplitude; and bright colours always give the impression of littleness. No-doubt the idea of "smg," "box," &c., is not without a certain charm; but the treatment of such subjects lies outside the sphere of the landscape-gardener, except, perhaps, as a discord. That charm, in fact, is wholly of a social nature.

What, then let us ask, are the forms which impart beauty to the landscape and which the landscape-gardener and agriculturist has to observe and develop in order to perceive and to exalt the beauty of a domain or country side? To most persons this question will seem a very bold one, perhaps a needless one, since the general impression is that no such forms are discoverable in scientific way, but only can be seen, or rather, indeed, felt, when the beautiful objects are under the eye. It is certain, however, that the artist,—when fully entitled to the name, whether he be a musical composer, an architect, a sculptor, a painter, or a landscape gardener,—knows perfectly well that a certain expression uniformly attaches to certain modes of composition, and the development of certain forms on his part. He may not be, and, indeed, seldom is able to give an account, either to himself or to others, of the particular areas, forms or lines on which that effect depends. But never doubts that the pleasing effect has its cause in the visible features which his art enables him to introduce in his compositions. He never doubts that there are principles of beauty which never fail to strike and to please good taste. Nay, he knows and he shows that he is himself in possession of these principles, though he cannot disentangle them from their accessories or say precisely what they are.

Nevertheless, they have been disentangled to a great extent, and here let us shortly bring them forward. It will at least, be a pleasing exercise of mind for those whose calling is to converse with nature, to observe nature in relation to the principles of beauty in the landscape, and in its several elements now to be unfolded, with a view to verify these principles, and, if found true, to apply them in art.

What, then let us ask, is the secret of the beauty of the landscape, and how, in any given case, may that beauty be enhanced by the landscape-gardener, the architect, or other artist? Now, to this the answer undoubtedly is, that secret of the beauty of nature is one and the same thing with the secret of nature herself. It is the same economy which makes nature to be what she is which also makes her to be beautiful. In other words, the laws of nature are the sources of beauty. And any landscape or scene which is eminently beautiful, is so beautiful just because their nature is moving according to her own laws in triumphal procession from the point of view of the beholder.

But this theory it may be justly said, is too general to be of any practical use. It is not disputed, but it cannot be applied. Now, this criticism is just. We must, therefore, ask in detail what are those features which the free and unimpeded operation of the laws of nature tend to induce in the landscape? And, as a first step in this direction, we must ask what it is that makes any portion of country to be entitled to the name of a landscape? Now, to this the answer is, that a portion of country becomes to the observer a landscape as soon as he regards it as a unity, that is, as soon as he can look upon it or fix his gaze upon it, without his thoughts or his eye wandering to other quarters. This will not be disputed. But, in making this step, we have also made a step in the discovery of the secret of beauty. The mind can never be happy except when it is moving in harmony with the laws of its own activity, that is the laws of intelligence. The Beautiful, therefore, which makes the mind happy, must be something which draws out the mind, and invites it to move in harmony with the laws of intelligence. Now of all these laws, one of the most imperative is, that the unity of consciousness, which is the very centre and characteristic of intelligence, shall not be disturbed, but, on the contrary, shall be supplied with some unity in the outward which it may fix upon. Hence the eye, in limiting for itself, and electing a portion of country as a landscape, has already disclosed what is the first principle of the beautiful in every department. And it is this, that the beautiful object, however vast, must still possess a certain *unity*. This, in the most general point of view, is the first principle of beauty, whether in the landscape or any other beautiful composition. The object must admit of being construed as a unity. The mind must be able, which effort, to embrace it as *one*.

But the mind such an agent, that while it will not and cannot give itself to more than one object at a time, it is so intrinsically active, that it wears almost immediately if the unity which engages it be a unity or uniformity merely. Along with unity in the object, which is the first condition called for, because it is the condition of undisturbed attention or contemplation, the mental activity calls for variety in that object, so that the mind, without losing hold of it as a unity, may be free to ramble over it and discourse freely upon it.

(To be concluded.)

A BIBLIOGRAPHY OF TEA, COFFEE, AND CACAO.

(To the Editor, "Tropical Agriculturist.")

HAMPSTEAD, LONDON.

DEAR SIR,—I herewith send you the sketch of a work which I hope soon to extend into book form, and which has occupied me off and on for the last three years. It is a "Bibliography of the Literature of Tea, Coffee, and Cacao"; and I thought it only

right that the *Tropical Agriculturist*, which has done so much (in connection with the *Observer*) to encourage and extend all that contributes to the true welfare of a country, should be the first to introduce it to the public; that is, of course, provided it be judged worthy of such introduction. The work has been one of absorbing interest, pleasure, and instruction to myself, and, I hope, will prove of some use to merchants, brokers, planters, and even consumers, of that most beneficial and least harmful of all products—Tea.

Just as "Ingê Vâ" was the putting into shape of my Tamil notes as a Simna Durai on Scalpa Estate, so this "Bibliography" is the outcome of my own endeavours in the British Museum to read up on the subject of Tea. When I came over three years ago I vainly searched for a good list of titles and authors of books on this our leading staple. I first discovered in "Notes and Queries" a short "Bibliography of Tea, Coffee, and Sugar" (evidently by P. L. Simmonds), but it gave only about twenty books on Tea and had many mistakes. For instance, *Keen, W.*, was evidently meant for William Skeen, and a book on Coffee in Ceylon was ascribed to Lewis, G. C. (*i.e.* Sir George Cornwallis Lewis!). This ought to be Lewis, R. E. I next lighted upon Bergsma's "Catalogus auctorum qui de theâ scripserunt," and this helped me considerably, though, being antiquated and in Latin, many of the names were ludicrously mis-spelt. And besides, as nearly all scientific men in those days adopted a Latin form of their name, and as the British Museum authorities insist on giving the original form in nearly all instances, it was sometimes very difficult to trace the proper man. For instance, the real name of Bernhardus *Albinus* was B. *Weiss, albus* being the Latin equivalent of the German *weiss* (white). Borrichius stands for Borch; Crockisius for Crocq; Francius for Franz; Francus for Francke; Frisius or Phrisius for Vries or Friese. Then again an author had a happy knack of appearing under a different name as quoted by different authorities. At one time he was Herrichen; at another Heinrichem; at another Henichen. Ovington changes to Overton; Joseph Serer seems to be the same man as Giuseppe Seker; our English doctor John Coakley Lettsom appears in French as simple Jean Coakley; the real name of C. Bontekoe was C. Decker van Alkmaar; he got his nickname from the *bonte koe* (spotted cow) on his father's signboard! [We have the word *bonte* in our name for flags,—bunting.] There seems some inexplicable mystery about Elisha Mills Ely and S. Millesly: they wrote exactly the same book, and Mills Ely and Millesly sound suspiciously alike; yet they appear in catalogues as totally separate individuals. And whether Philippe Sylvestre Dufour was a pseudonym for Jacob Spon or *vice versa*, or whether they were two or more individuals, is, as far as I know, still an unsolved problem. One man I must mention: he was called by his contemporaries the "person of many initials": his proper name was Worp, but he is more often to be found under Peyma or Beintema; and his full title is Johan Ignatius Worp Beintema van Peyma. It may be interesting to mention that R. James was the doctor who first prepared the celebrated "James's Powders." Of the wretched quack who called himself Sir John Hill it was said "For physic and farces, his equal there scarce is, His farces are physic, his physic a farce is"; and of Motteux, who was a Frenchman, but who established an emporium in London, and who wrote vigorous English poetry, Lady Wortley Montague, in "The Toilette," makes mention, thus:—"S'rait then I'll dress, and take my wonted range Through India shops, to Motteux's, or the Change." I found my smattering of many European and oriental languages most useful in making out the various titles; and it will be interesting to note how many nations are represented. The greatest assistance I derived was from Dr. E. J. Waring's "Bibliotheca Therapeutica," which contains very full lists of works on all sorts of articles of the *materia medica*, and from which I copy some of the most perplexing Latin equivalents of the towns where the volumes were issued. These

I append separately. In conclusion, I may say that to prevent the list from swelling to unmanageable bounds I had to limit it to such works as refer directly in their titles to Tea, Coffee, and Cacao.—I am, yours truly,

A. M. FERGUSON.

LIST OF LATIN AND FOREIGN NAMES OF
SOME OF THE LOCALITIES OCCURRING
IN THE "BIBLIOGRAPHY."

Argentoratum, Strasburg.
Budissina, Bautzen (Saxony).
Colonia Agrippina, Cologne.
Colonia Allobrogum, Geneva.
Erfordia, Erfurt.
Francofurtum ad Moenum, Frankfort-on-the-Main.
" ad Viadrum, " " " Oder.
Gedanum, Dantzic.
Gravenhage, The Hague.
Hafnia, Copenhagen.
Hala Magdeburgica, Halle (in Prussia).
" Suevica, " (in Wurtemberg).
Holmia, Stockholm.
Kilonium, Kiel.
Lugdunum Gallorum, Lyons.
" Batavorum, Leyden.
Regiomontium, Königsberg.
Ticium Regium, Pavia.
Tigurum, Zurich.
Trajectum ad Mosam, Maestricht.
" ad Oderam, Frankfort.
" ad Rhenum, Utrecht.
Utrajectum, Utrecht.
Ulyssipolis, Lisbon.
Vindobona, Vienna.
Vratislavia, Breslau.

FRUIT TREE ROOTS.

Widely extended observation has convinced me that few greater mistakes are made in cultivation than by neglect of the roots of plants under our care. Early in my gardening career this truth was impressed upon my mind by many lessons from a respected tutor, and subsequent experience has served to confirm it in every respect. Whether we are dealing with plants in pots grown under artificial conditions as to heat and protection, or with occupants of the open ground, the results are similar. Work connected with potting or planting is too often carelessly or thoughtlessly performed, because the immediate neglect is concealed, but the effects are sure to become apparent later on, when it may be too late to repair the mischief. It is most difficult to convince beginners what delicate and important organs the roots of all plants are, and I have found close supervision, repeated and patient instruction, or sometimes stern reproof needed before the matter is properly grasped.

But it was not my intention to discourse upon root neglect generally just now. I wished to point out with regard to fruit trees one little attention that all should receive at planting time—namely, cutting the damaged ends of the roots cleanly, so that they can heal quickly and thoroughly. Thousands of trees are planted as they are received from the nurseries. Probably the roots are spread out carefully and the planting done in a correct in all other respects, but a large proportion of the labour is lost when that one point is overlooked. It is as necessary to cut the roots ends smoothly and sharply if fresh feeding fibers are desired as it is to make a clean section of a cutting to be rooted.

Some years ago I was present at a lecture delivered by Mr. J. Wright in the Crystal Palace, when the chief subject under consideration was, the treatment of fruit tree roots at planting time and the subsequent results. Diagrams were employed to illustrate what was being explained, and one of the most striking was that which depicted the effects produced by cutting the tips of roots cleanly as compared with rough hacking or non-attention to trimming. Such results had come under my notice many times in actual practice, but I had never seen the matter so clearly illustrated before, and that appeared to be the general opinion of those present.

It is so important that I thought a few examples would serve to call attention to it now. Specimens are therefore enclosed, cut from roots of dwarf Apple trees planted last year, and which have just been lifted to enable some alterations to be made in the garden. They are fair examples of several hundreds and were not especially selected.

Fig. 81 (Worcester Pearmain* on the Paradise stock) is a portion of a root that was improperly cut. The lower portion has not healed, and the only new rootlets produced are a few in the upper part. Happily there are not many such unsatisfactory specimens, as nearly the whole of the root trimming was done by myself or under my immediate supervision. Fig. 82 (the same variety) includes examples of careful and clean cutting, where complete healing of the wounds has taken place, and a quantity of young feeding rootlets have been produced from the ring of new tissue formed round the cut edge; while in one case the whole of the cut surface has been covered with fresh cellular growth, which has emitted a thicket of fibrous roots. The value of such growth as this compared with the former cannot be misunderstood. In the latter the trees had not only recovered from the check, but they were even in a better condition as regards their roots than they were at the first planting. Fig. 83 is from the same variety of Apple on the Crab stock, and is sent to show the marked difference in the style of root growth in a very early stage, the roots few, straight, and comparatively fibrecless.—A BRITISH GARDENER.—*Journal of Horticulture.*

ORANGE CULTIVATION IN CEYLON.

MR A. J. PEARSON ON HIS NEW SCHEME.

Our London correspondent (two weeks ago gave our readers some idea of the plans Mr. A. J. Pearson has in view for growing oranges and lemons in Ceylon on a much larger scale than has hitherto been attempted, and some further particulars supplied by Mr. Pearson in the course of an interview will, we feel sure, be read with interest. Mr. Pearson knows Ceylon well having resided in the island for several years before he went to Australia, and there has carried on fruit culture for the last five years on his own estate (of some 60 acres) at Mildura. Believing that what he had found so promising in Australia was likely to be even more so if tried in Ceylon, he availed himself of a trip to England to bring up some young orange trees from the Mildura groves and plant them up-country, at the same time inspecting some that he had sent up previously for planting to Mr. J. Brown of Messrs. Brown & Co. of Hattou. He found the latter doing very well, and, though he has not yet had an opportunity of seeing those more recently planted, he says he has heard

nothing to lead him to suppose that they are not progressing equally well. He is, therefore, convinced that there is a very bright future in Ceylon for this new planting industry, and he has decided to remain in Ceylon for some time; seek a grant of land from Government on favourable terms; form a syndicate to work it; and start the new venture on a commercial basis.

HIS PLANS

"I propose to ask the Government," he said, "to let me have 300 acres of land, 50 of which would be planted up at first, and the remainder afterwards when we saw our first returns. In my opinion the best site would be some where in Uva, though Mr. J. L. Shand (of the firm of Messrs. Shand and Haldane) suggested Teldeniya. I, however, think Uva would be better, because we can be sure of dry weather there in the ripening season, and fruit which is ripened when the weather is dry has a better flavour and is firmer than fruit ripened in wet weather. The ripening season in Dikoya is when the monsoon is on, and the fruit consequently is watery and will not keep or carry so well as fruit grown in dry weather.

"What kinds of fruits do I intend growing? Oranges and lemons entirely at present, though limes would not be a bad thing, for, when I was at home this time I found them selling for tenpence a dozen in Edinburgh I should, of course, cultivate the Lisbon lemon, while the classes of Oranges I should introduce would be three in number, namely, the Washington Navel, the Mediterranean Sweet, and the Homosassa oranges. They are all very fine fruit. The Washington Navel was introduced to Australia from California, and it grows exceedingly well at Mildura. It is the best orange in existence in my opinion. It is seedless—only a very few of the oranges have a seed, and never more than one (in the centre); it has a very tough—but thin—skin; and it is double the size of the orange ordinarily seen here. That, of course, is the *desideratum* in orange-growing—to get the maximum of the edible with the minimum of the waste quantity in the fruit. The kind of orange I refer to sells at two-pence each in Melbourne; while the Earl of Ranfurly, one of the largest holders of land in Mildura, had an offer from Melbourne this season of £1 per case for 10,000 cases if he could supply them. At present all the oranges that are grown in Australia are sold there, and I anticipate that all we grow in Ceylon will be sold locally for a long time to come. In some ways, it seems to me, Ceylon is better suited for this cultivation than is Australia. The cost of labour is one very important matter, and labour is a great deal cheaper here, and there are other advantages. For the first few years we should not require a great amount of labour, but of course in the plucking season a lot of hands are necessary. The principal labour is wanted for picking and pruning, and that would be at one season in the year, though the season is protracted—especially for lemons.

THE TIME REQUIRED.

"I have heard the objection raised," said the interviewer, "that you would have to wait a long time for your first results. Is the orange-tree long in perfecting?"

"It depends whether you grow from seedlings or from grafted trees. If you grow from seedlings you have to wait a matter of seven years for a return, but with grafted trees you begin to get a return in three years. I should adopt the latter plan, and not only for the sake of quick returns. If you grow from a seedling you seldom get so good a class of fruit as you get on the parent-tree, whereas from a grafted tree you get a precisely similar fruit as the parent tree yielded. That is why orange-growing in Ceylon has deteriorated, the little there has been of it. Seeds have dropped off the trees and struck into the soil and grown, and then the young tree has been transplanted. I should, on the other hand thing up grafted trees from Australia, plant them here, and also form nurseries for propagating varieties by grafting them later on."

THE CURING OF THE FRUIT.

"Do you think you could produce a really fine, flavoured fruit?"

"I feel sure of it; and, as for sending the oranges over long distances in good condition, the great thing lies in the curing. The oranges that are now sold here are as a rule simply picked and sold—not cured at all. What I mean by curing is this: the oranges are sweated in heaps and dried off, and the effect of this is to make the rind a sort of impervious shell, which prevents the fruit inside getting injured. When they are packed with the skins soft, they often rot, but curing prevents that, and, as shewing what can be done by curing, I may say that, when I came here in August, there was a Mr. Smith with me—a man who had been all his life orange-growing—and he brought up some cases of lemons from Mildura. They had been packed a month before they were shipped; they were, of course, three weeks in coming here but they arrived in perfect condition, and some cases that he intended to take on through India lay at the wharf for a fortnight and were examined at the end of that time and found to be still as good as when they were shipped. That I attribute entirely to the curing process."

"How many trees should I plant to the acre? I think that here the trees might be planted closer together than in Australia. Down there, as horse labour is employed, we plant 80 trees to the acre, but in Ceylon, where we should only have hand labour, I think we might put 100 trees to the acre. And as to the soil? The Ceylon soil is poor compared with Australia, but the orange tree is a surface-feeder, and orange cultivation is largely dependent on manuring, and some chemical fertiliser would have to be used."

A FEW FIGURES: £50 TO THE ACRE!

"And now for a few figures."

"Well," said Mr. Pearson, "it may be interesting to you to know that in Jamaica last year the output was over half a million sterling, and the output of Florida is a million and a half sterling; but there is still plenty of demand, for when I went home I interviewed a lot of men in Covent Garden and they said that if we in Ceylon could send home oranges from the beginning of August till the end of October almost fancy prices could be realised, for at present oranges cannot be had till the beginning of November, and then they are Jamaica oranges selling at two-pence a piece and very poor at that. As to the profit to be derived from orange-growing, I consider that £50 nett profit per acre is a very moderate estimate,—in fact, under the mark—and that return, of course, is far better than can be got from tea, seeing that £10 an acre of profit is considered very good indeed.

In conclusion Mr. Pearson mentioned that he had been out to the Agricultural School in Colombo and inspected Sig. Zanetti's vines, and the appearance of these had given him still greater encouragement. He himself had undertaken viticulture in Australia, and ten acres of his land at Mildura were planted with vines, but he does not contemplate grape growing here. He says that he should have thought Colombo particularly unsuitable; but he found the vines as healthy-looking as the best he had seen in Australia, and he does not know how Sig. Zanetti has got over the difficulty of perpetual summer unless he has bared the roots of his vines and so introduced artificial dormants. After what he has seen in Colombo, he thinks that grapes might be successfully grown up on the hills.—*Local Times.*

COFFEE IN JAVA.—In 1895 the total crop of coffee harvested from the private estates in Java was 318,574 piculs Java, and 30,987 piculs Liberian coffee, whereas the estimate for 1896 is 371,858 piculs Java, and 53,657 piculs Liberian coffee.—*London and China Express*, March 6.

TEA AVERAGE AND INVESTMENTS.

A planting correspondent writes:—What low tea averages there are now. Scarcely 10 estates reach the 10d. 8½d tea with exchange at 1s 2½d will not make us fat. We hear that dabblers in tea shares are finding facilities for borrowing money becoming less and less available, and a very good thing too. When shares only give 10 per cent while tea is booming they are likely to give only 5 per cent in bad seasons or when low prices prevail.

You hear it argued, go in for sterling companies. Sterling Companies such as the old Ceylon, Company, Limited, and Lanka teach a different lesson. If you buy too dearly in either sterling or rupee companies, the day of reckoning comes.

THE KANDYAN HILLS COMPANY,
LIMITED.

An extraordinary general meeting of this Company was held at the Offices of the Company, No. 21 Baillie Street, on the 7th March. The following special resolution was adopted by the meeting:—

“That the Directors be authorised to grant a mortgage to Messrs. R. A. Bosanquet, G. F. Trail and J. D. Balfour over the Pansalatenne Estate, to secure the payment of the sum of £1,500 sterling (being the balance purchase money for the estate), on or before the 31st December, 1898, and until payment to pay interest thereon or on any balance remaining due thereon at the rate of 7 per cent.”

COMPANY MEETINGS.

The first general meeting of the Kelani Tea Garden Company, Limited, will be held on Thursday, March 12, to receive the report of the directors and accounts to December 31, 1895; to elect directors, and to appoint an auditor. The first general meeting of the Udabage Company, Limited, will be held on Saturday, March 14, to receive the report of the directors and accounts to December 31, 1895, to elect directors and, to appoint an Auditor. The first ordinary general meeting of the High Forests Estates Company, Limited, will be held on Saturday, March 21, to receive the report of the Directors and accounts to December 31, 1895. The annual ordinary general meeting of the Maha Uva Estate Company, Limited, will be held on Saturday, March 21, to receive the report of the directors and accounts for the past year, and to declare a dividend. The annual ordinary general meeting of the Estates Company of Uva, Limited, will be held on Saturday, March 21, to receive the report of the Directors and accounts for the past year, and to declare a dividend.

TEAS TAKE A TUMBLE.

MARKET OVERSTOCKED WITH CHEAP
ARTICLES.

TARIFF: A SUGGESTED REMEDY.

VIEWS OF IMPORTERS—MANY GROCERS NOT QUALIFIED TO MIX TEAS PROPERLY—MUCH RUBBISH SOLD.

Ever since the cessation of hostilities between China and Japan the price of tea in the markets of the United States has been gradually falling, until now it has reached a point beyond which it can hardly go and show a profit to the importer. This has been brought about largely by the fact that importers had rung the changes on the prospects of a long war, and advised the buying of large quantities of tea by the distributing trade, and the result is that there is now probably the largest stock of tea here that this country ever had, and apparently no outlet for it at the moment.

The proposed duty on tea is causing considerable comment in tea trade circles, and there is a great diversity of opinion as to just what effect a specific duty on tea would have in checking the importation of spurious and adulterated teas. A number of importers who were seen by the representative of the *Press* feared that the imposition of a duty of 10 or 15 cents a pound would not in itself check the importation of low-priced teas. They feel that the teas now pronounced unfit for use could still be imported, and that the only way to absolutely stop this admitted evil would be by the rigid enforcement of existing laws against the importation and sale of exhausted, adulterated and spurious teas.

VIEWS OF IMPORTERS.

Among the gentlemen seen in reference to this important matter were R. Blechynden, the Commissioner for the India Tea Association of Calcutta, who represented the India tea industry at the World's Fair. Mr. Blechynden was rather loath to talk on the subject, but he finally said:

“Of course, the duty, if imposed, would have some effect upon us, but it is difficult to say beforehand what that influence would be. Taking the figures put forth by the Tea Committee which started this agitation as correct, the average price of tea landed in the United States is 14.6 cents per pound. But the average price of India (in which may be included Ceylon) tea is 25 cents per pound. If the standard of quality is raised, the pure teas of India and Ceylon will have to face a sharper competition with the improved article than they do now, with what is confessedly mostly rubbish.

“But, on the other hand, an improved taste for good teas will be established. In this respect the duty will help the India and Ceylon planters. There are, however, two sides to every question, and the sale of rubbish is to some extent a help to the pure English-grown teas, as the grower can buy the former, say at 10 cents per pound, and by mixing them with 15 per cent. of pure India tea, which would cost say 20 cents per pound, he could produce an article which he could sell better and be of better value than the ‘rubbish’ at 15 cents per pound.”

NO COLORING USED IN IT.

Among others seen was the firm of Bottomely & Beling. Mr. Bottomely who has been a practical tea grower in Assam for sixteen years, said that while he was not competent perhaps, to speak of China and Japan teas, in the manufacture of teas in India and Ceylon, not the slightest coloring matter was used. The natural color of the manufactured leaf is black and not green, the tea being made entirely by machinery and dried in hot air furnaces.

“All green teas are colored with substances more or less harmful,” said he, “and the idea that most consumers have that the natural color of the leaf is green and not black is erroneous.”

Mr. Beling, who is a native of Ceylon, and was secretary to the Ceylon Commission at the World's Fair, said: “I was surprised to see the statement in a recent issue of a morning paper that not an ounce of pure tea comes into this country from China and Japan or any other tea-growing country, and that all tea leaves are colored as they are dried. This is certainly very fallacious and misleading. It may be true of China and Japan teas, but to embrace India and Ceylon would be absurd, and the importer who made the assertion is ignorant of the modern processes of manufacture in those countries.”

WILL IMPORTERS ACT?

Mr. Beling thought that in attempting to prevent the importation of spurious teas the matter lay in the hands of the importers. If they ceased importing tea at 3 cents a pound—tea made of willow leaves—the public would be served. Public taste could soon be improved, and tea drinkers would pay a fair price for a good article.

America is not as great a tea drinking country as it should be, because it has been made the dumping ground of tea offal. With the public satisfied that it is buying a pure article there is no doubt but that the consumption of tea here would rapidly increase, for as a beverage from a health

standpoint it is preferable to coffee, being less injurious to the nervous system, according to the best physicians of the land.

A. R. Robertson of No. 138 Front street said: "I think a duty upon tea a very wise move indeed. If people would sift the matter to the bottom, they would find out that it is almost the only remedy for the salvation of the business. The general trade has been ruined by offering consumers what virtually is either a bad, or at best, not a desirable beverage, to put it in mildest form.

"During my business career in this country, nearly 20 years. I have found out over and over again that if you can sell people good tea, you not only gain their confidence, but their trade. They flourish and so do you. Consumers buy their tea from a grocer with whom tea is only one branch, and although there are a large number of keen, intelligent men among the retailers, unfortunately there are few who have had the opportunity to study teas in such a manner as to be able to blend them scientifically, and which is really required to make a refreshing cup of tea. The bulk of tea sold is mixed, prepared in a slipshod manner behind the store or upon the counter.

"When they first start, they have a good mixture and get some trade, but as they grow busier they degenerate into buying tea on its appearance, taking for granted as long as it has the style the liquor will be all right. But the result is that the customer does not like the change and either moves his trade to another store or begins using more coffee and less tea, a fact that can be seen on the faces of dozens of people you meet every day.

HOW TO BUY TEA.

"Tea is a healthy, useful beverage and every one would do well by using some at least once a day for their own benefit. Tea should be bought entirely on 'cup' quality—never by appearance—as the idea that this sample looks as well as that and is ten cents a pound cheaper is the stumbling block of the business.

"The remedy is open for you. Put a heavy duty upon all teas, which will debar importers from taking chances upon rubbish even at a low price. The better teas imported will then be possessed of the refreshing, stimulating properties which we drink tea for, and then its benefits will be felt with the result that the demand will increase right along.

"Should the duty not be levied, then other means must be found to keep up standards of quality, and revive the business."—*The Press, New York, Feb. 2.*

PLANTING AND PRODUCE.

THE MARKET FOR TEA IN NORTH AMERICA.—From the figures given in the circular issued by Messrs. Gow, Wilson, and Stanton, it will be seen that the result of the efforts made to popularise Indian and Ceylon teas in North America is very encouraging, and that the outlook is most hopeful. An advance from 5,360,083 lb. to 9,283,141 lb. in a year is a really substantial result, and should encourage planters to go ahead in the same direction with renewed energy. As Messrs. Gow, Wilson, and Stanton point out, a market where 100 million pounds of tea are consumed annually is worth working for, and such an enterprise should not be retarded for want of funds. As a matter of business pure and simple, the work should be supported and encouraged in every possible way, even if it necessitates the raising of the levy for next year. To halt now would be a serious mistake, while a policy of enterprise and liberality cannot fail to show valuable results. The circular referred to shows that India and Ceylon teas are advancing in public favour everywhere, and that planters may congratulate themselves not only on the present extensive demand, but on the chances in favour of a steady increase in the consumption all over the world.

CHARGES ON PRODUCE.—The subjoined protest against the proposed agreement between the London and India Dock Joint Committee and the shipowners, involving an increase of charges on produce, has been signed by a very large number of merchants and other persons and firms: "London, February

10, 1896. To the London and India Docks Joint Committee. Gentlemen,—We the undersigned merchants, importers, exporters, and brokers of the City of London, hereby protest against the agreement proposed between you and the shipowners of London, relative to the delivery of cargo brought to this port, and to charges on same, as we feel certain that the advantage of any addition to your revenue which may result from these increased charges will be but temporary, and will be at the cost of great permanent and increasing injury to the trade of London. We must point out to you that the merchants and importers, who have hitherto had the right of taking their goods from the ship free of charge, have not been consulted, although it is now proposed to take away this right from them. That the existing London charges are already in many cases above those of competing foreign ports, and that already this fact and the increased facilities provided by the Continental ports have seriously interfered with our trade, and diverted a large proportion of goods from this port; and, therefore, that any increase in these charges will further cripple London produce business and divert it still further to other places. That, with reference to goods sold here for transshipment, the pursuance of such a policy as you propose can have no other result than to destroy the greater part of this foreign *entrepôt* trade of London, and give a further impetus to the same class of business at foreign ports."

THE OUTLOOK FOR COFFEE.—Referring to the position of coffee, which towards the close of 1895 was apparently involved, the *Grocer* says it has, in a comparatively short time, become more clearly defined, and what appeared doubtful and problematical is now seen to be almost certain of being attained. In the first place it may be noted that the expectations of a total yield of 5,500,000 bags for the Brazil crops of 1895-96 are in course of being confirmed by the increasingly heavy receipts that are taking place at the ports of shipment, Rio, and Santos; and so long as these keep up, so sure will the effect be to depress the principal markets of the world. A fact still more significant is that the entire production of Brazil coffee for 1896-97, which is even thus early beginning to arrest attention, is now boldly stated to be equal to about 8,500,000 bags, and may probably reach the highest calculation of 10,000,000 bags formed by sanguine individuals months ago. Without waiting for the actual realisation of so enormous a crop as the figures just named necessarily imply, no one can fail to observe that the moral influence of so tremendous a weight of supply being available, and at the disposal of buyers at no very distant date, has already been most powerful, and feeling of depression which showed itself at New York soon after the opening of the present year has since been extended to the "terminal" markets of Europe, where, in sympathy with the decline that has ensued at other *entrepôts*, a rather rapid fall in quotations has resulted. To appreciate this reaction at its full worth the trade must go back to the time (at the close of November last) when the rates quoted for fair Channel Rio at the London Produce Clearing House were as follows: 64s 6d to 63 6d for December to May deliveries, 61s and 58s 6d for July to September, and 55s 6d for December of this year. From the average of these prices there has lately been a reduction of 6s per cwt. making the value of the same quality and description of coffee on the 6th instant, 58s 5d and 58s 6d for March and May next, 55s for July, 53s for September, and 50s 6d for December, delivery, with the prospect of a further depreciation as the season progresses. For similar periods to the above the quotations in February, 1895, ranged from 70s down to 66s, showing unmistakably how great has been the concession in price from the then highest point.

THE REQUIREMENTS OF THE TRADE.—Nothing like so severe has been the drop in quotations for landed parcels of coffee in the London market, and even where there has been some approach to it the lower prices established have been principally, if not exclusively, for the commoner sorts, which the

trade, purchase with the utmost reluctance. The dealers however, have yet to receive the bulk of the supplies of the new season's crops from the East Indies and Central America, when the market on the spot will be fairly tested and business placed on a sounder footing than it is now. What the home trade really want is a liberal assortment of colory or fancy coffees, such as are to be found among the plantation growths, which are much too dear to make their larger consumption possible, and a return to a lower range of prices for these particular kinds would come as a boon to the retailers of genuine coffee throughout the kingdom. Spurious compounds and foreign admixtures, in imitation of the pure article, would then be less able to compete with the well-selected and carefully-blended preparations of the real aromatic coffee berry; and votaries of the same would have restored to them in all fulness the peculiar fragrance and gentle stimulus of their favourite, though long neglected, drink. The time of year is fast approaching when an ample supply of desirable qualities will be on offer, and, with the promise of more reasonable prices ruling while it lasts, there may be an opportunity for the dealers and others to secure better profits on their sales than they have been in the habit of obtaining hitherto.—*H. and C. Mail*, Feb. 21.

THE PUBLIC SALES.

TO THE EDITOR OF THE HOME AND COLONIAL MAIL.

SIR,—It is pretty generally admitted in the market that some alteration of the days of the public sales might be made with great advantage to those whose duty calls them to attend regularly.

The point which strikes one most forcibly on looking into the subject is the utterly unreasonable policy of crowding the entire offerings of Ceylon tea into one day's sale in each week. The number of samples which have to be valued is proportionately greater than in the Indian sales, and the length of time taken to sell 1,000 packages of Ceylon tea being also greater owing to the smaller average size of the breaks the effect is that Ceylon buyers have on one day of the week a most exhausting ordeal to undergo if they faithfully sit through the whole sale. Common sense would suggest that in the interests of sellers, and for the greater convenience of buyers, the week's offerings should be spread over two days. But the difficulty is—which days should they be? Monday has been the Indian tea day for many years, and could scarcely be interfered with Tuesday has been the Ceylon sale day for a considerable time. Wednesday has been another Indian sale day, when generally about half a week's offering came to the hammer and Thursday has been a sort of make-weight day, when about a tenth of the total quantity of Indian tea offered in the week is brought to sale, Friday and Saturday being unappropriated. It is somewhat difficult to make changes that will be universally approved, but there is no question that much good would result from some lightening of the labour of those engaged in the Ceylon sales on Tuesdays, and it might perhaps be found a convenient way out of the difficulty to adjourn the Tuesday Ceylon sale punctually at two o'clock until Wednesday at twelve o'clock, when the remainder could be sold with the benefit of an extra morning's tasting. But, this, of course, takes away Wednesday from the Indian sale, and to meet this objection let the week's offerings of Indian tea be divided into two sales—Mondays and Thursdays—still retaining Monday for the larger part, say three-fifths of the total on Monday and two-fifths on Thursday. Then it is evident that the opportunities for tasting the samples would be more evenly distributed over the week, and confidence in the valuations, which is the surest guarantee of satisfactory biddings, would naturally result.—I am, &c., D. F. SHILLINGTON.

TO THE EDITOR OF THE HOME AND COLONIAL MAIL.

SIR,—As your valuable paper reaches nearly all who

are concerned with Indian tea, will you kindly be the means of ventilating a proposal which, I understand, is likely to be made to importers and their brokers by some of the London buyers.

It is to do as Calcutta does, and to cease holding any public auction of Indian tea for some few weeks in the summer in order to give "the market a period of rest, and to agree to a date upon which the first public sales of new crop shall be held in London.

If the proposal be a good one, there is not much difficulty in carrying it out now that nearly all producers close their crops so much earlier than they used to; but such arguments in its favour as there may be will no doubt be put forward by those who urge its adoption.

My object in writing to you is merely to secure early consideration for the proposal; inasmuch as the co-operation of shippers in India with importers in London would be required to effect it. Speaking from somewhat considerable experience, however, I may perhaps be permitted to say that the small intermittent sales during June, attended by unwilling buyers, are not altogether conducive to the interest of producers.—Yours faithfully,

HERBERT S. PARKER.

38, Mincing Lane, February 20.—*H. and C. Mail*, Feb 21.

DISEASE AMONGST COCONUT TREES.

TO THE EDITOR OF THE "TIMES OF INDIA."

SIR,—Coconut trees are attacked by a disease called in Goa *Mandolim*, which manifests itself in two forms, in one of which a gummy liquid runs out from small slits in the tree, and in the other a yellow powder is formed and thrown out from similar slits. The disease generally appears in the more healthy and luxuriant plants, and the cultivators comes to know that a tree has been attacked only when the leaves begin to droop lifeless and the fruits to fall. It is strange that no mention is made of the disease in either Watt's "Dictionary of Economic Products" or in the "Bombay Gazetteer," which leads me to the conclusion that the disease is localized. Can any of your readers inform me whether coconut trees outside Goa have been seen attacked by *Mandolim*, and also give me the causes and the remedies used in its cure. I myself believe that the disease is the result of a fungus, but I cannot be sure, as I am not an expert at examination with the microscope. In Goa the cultivator makes a hole through the tree above the part affected, but this cure is not always successful. I have with me specimens from trees attacked, and will only be too glad to show them to anyone desirous of seeing them. Mr. Bernardo Francisco da Costa, who lately died at Diu, has written an interesting book in two parts—*Agri-cultor Indiano*—in which he treats minutely of the disease. Before him a Jesuit, who was in charge of the vast plantations his Order possessed in Salsette, Goa, had described the the disease in his *Arte Palmariæ*. The disease must be one which has existed for years. The specimens above referred to I obtained through the kindness of Mr. da Costa, just a month before he left for Diu. J. C. LISBOA.

—*Times of India*, March 3.

A writer in the *Times of India* says:—In reply to Dr. Lisboa's letter in your issue of this day soliciting information as to whether coconut trees outside Goa have been seen attacked by a disease called in Goa *mandolim*, I have much pleasure in informing him that I have seen and examined coconut trees attacked by *mandolim* at Madras, Cochin, and Travancore, and even at Juvem, near Bandora, and I can assure him that the disease is not confined to Goa alone or localized, as he believes it is. In my own little garden at Mazagon I have two fine coconut trees brought down from Penang and planted some years ago, one of which was last year attacked by the disease or insect called *mandolim*, which was instantly removed by a Goanese toddy-drawer, almost all of whom are experts in coconut cultivation and

the cure of trees attacked by *mandolin*. Not many months ago I read several well-written articles in the Goa newspaper called *India Portuguesa* on the cultivation of coconut trees and the insects which kill or attack them, and I would recommend our expert in Botany to peruse the same. A book on the same subject was also published in Trevandrum some 25 years ago by order of the Dewan, the late Sir T. Madhava Rao, copies of which are, I believe, still available in Trevandrum, and he will find that coconut trees both at Madagascar and the West Indies are also subject to the same disease; but, as in the case of the coffee-borers, bugs and leaf disease, no remedy has been discovered as yet to prevent a repetition of attacks from beetles, borers, mandolims, &c. The insect generally attacks young and luxuriant plants, particularly those well watered and heavily manured.

THE DIMBULA VALLEY (CEYLON) TEA COMPANY, LIMITED.

By mail we have particulars of the prices paid for the several estates purchased by the Company, viz. Tillicoultry £30,000, Belgravia and Elgin and Bearwell and Mousa Ella £93,500.

DR. TRIMEN.

We desire to welcome back to Ceylon Dr. Trimen, the respected Director of the Botanical Gardens, and to express the hope that he will enjoy a measure of good health, not only for his own sake, but for the sake of the great work on which he is engaged. Dr. Trimen is accompanied by Mr. Freeman, a young botanist from the Royal College of Science, South Kensington.

TEA IN AUSTRALIA.

Business in China tea has been rather more active. Sales comprise 550 half-chests common congou, 800 half-chests congou at 4½d to 5½d 500 half-chests panyong at 5½d to 6½d 300 half-chests panyong at up to 7d½ 1,050 quarter-chests buds at up to 6d and 300 quarter-chests S.O. pekoe. Of Ceylons 60 half-chests have been sold privately at 8½d and of Indians 70 half-chests, at 9d. At the auction sale on Tuesday there was a good demand for the Ceylon teas, which generally realised firm rates. Out of 562 chests and 260 half-chests offered sales were made of 425 chests and 106 half-chests; pekoe at 6d to 9½d and pekoe souchong a 6½d to 9½d.—*Australasian*, Feb. 22.

GREEN TEA.

(To the Editor of the *London and China Express*.)

DEAR SIR,—Your issue of 11th inst. In your "Monetary and Commercial" column the writer of the Tea Market Report appears to be under some misapprehension as to the position of "Green Tea." It is quite true the market is unprecedentedly low, and that certain kinds are almost uncalculable at the present moment, but it is altogether incorrect to remark that the class "seems clearly going out of consumption."

The writer of the report has apparently fallen into the popular delusion that because the "home consumption" may have fallen off the class is being displaced by "British grown" teas. As a matter of fact, the deliveries from the bonded warehouses last year were 600,000 lb. more than the previous year, and larger than we have had for some three or four years. The reason of the market this season being so low is because of the large increase in the supplies, both to America and this country. Perhaps you may think this matter worth correction in your next issue.—Your obedient servant,
London, Feb. 18.

GREEN TEA.

TEA-PLANTING IN INDIA.

ADVICE TO YOUNG MEN.

In reply to a query concerning the prospects of tea planting in India, a correspondent sends the following extracts from a lecture on the subject delivered by a planter of thirty years' experience:—

All the tea districts are now as a rule fairly healthy. The hill districts are the pleasantest to live in, but in the tea garden ranges in elevation more than, say, 2000 feet (and I resided upon and for twenty-eight years managed one which varied in elevation nearly twice that range), I doubt if, for most constitutions, it be so much more healthy than the plains districts, and I believe the statistics of mortality, if carefully examined, bear this out.

The prospects in tea are, I believe, much over estimated. With those who have tried the tea life the rule has been to retire in a few years disappointed or broken in health, or drag along penniless and often in debt—life being as it were a continual struggle for subsistence—the few successful men holding on too long, most finding a grave sooner or later. Retiring with fortunes or even a competency is the exception. No doubt a small proportion have come home with fortunes or a moderate competency, but those results have been obtained, as a rule, through the purchase and sale of lands, or investment in gardens, under specially advantageous conditions. But, alas, not a few of those who so retired, lived but a very short time, and seemed never to enjoy a day's real health after their return to their native land. The competencies even acquired by service to limited companies or private proprietors have been but few and far between; and though the prospects of private ownership or from speculation seems less promising now, the ventures of the majority in those lines in the past have often been doomed to disappointment or failure. We hear much of the prosperous few, but little of the misfortunes of the many. Such is a fair though unvarnished statement of the case, from a full survey and careful study of the statistics of careers within my knowledge and experience.

Rest assured, however, young men, that your inability to obtain desirable appointments and full scope for your energies, where such is the case, you have my fullest sympathy, having myself had that experience from forty to thirty-three years ago, and am well aware that competition is now even more acute. All considered, I am therefore free to admit that those with a capacity for conscientious work would be wrong to decline a really eligible offer in tea. Those suitable for the work and life—energetic, industrious, persevering, and determined to work unremittingly and get on, who can meet with an appointment in a good concern—are likely sooner to get into a position to support themselves, and if economical save a little money, and ultimately do as well as in most lines I know of.

I am further free to admit that India is a highly interesting country. The tea life comes to have many attractions for those who take to it, and whatever their fortune may be, there are few who altogether regret their experience. Besides, experienced, conscientious, competent men are always in demand, and sure to get on; but it is at the same time extremely difficult to obtain suitable candidates, and next to impossible to convey to them, before leaving home, any adequate conception of the life, duties, or necessary equipment.

As yet tea appointments have not been thrown open to competitive examination, nor could they well be, in so much as the tests ought to be character, industrious habits, and physical qualifications. The only way to obtain such appointments is through knowing proprietors, managing agents, directors, or estate managers. Appointments are much run upon, and therefore difficult to obtain. As a proof that the supply of applicants far exceeds the demand, many well educated young gentlemen join tea gardens as what is styled "creepers," that is, giving their services for nothing, in addition to paying their own board—some actually paying down a good round sum in shape of premium for permission to learn the business. Let

such at least make sure that they are going to a good climate, and not find themselves set down in the Darjeeling-Terai instead of the Darjeeling Hills, as has happened. No one should go out on chance on any consideration, but have an appointment assured before setting sail.

The main qualifications for an assistant on a tea garden in order of importance are a thorough practical knowledge of mechanical engineering, gardening or farming, building, surveying, accounts, tea-tasting, correspondence, medicine. But mechanical engineering is not now of the importance it once was, or which many attach to it, because in all districts there at the present day no lack of qualified engineers devoting themselves specially to that branch, a smattering of engineering being often worse than useless. The same in regard to medicine; a little knowledge in that line, as can easily be understood, is a dangerous thing; and there are now numerous qualified practitioners, with native doctors under them, on tea gardens. The same applies to tea-tasting, though also an important branch of the business. To be a successful planter a man need not necessarily be muscularly strong, but he should be endowed with a constitution sound in every fibre, and have good powers of resistance of fatigue and contagion. He had well also be a good pedestrian and a fair horseman.

Though the duties are not always exhausted throughout the whole course of the operations, the hours are generally long—often from 5 a.m. till 9 or 10 p.m. during busy and anxious times; and as a rule the more a man can be at his post or in readiness to drop into it, and the closer his supervision of details, the better. During from five or six months of the year Sunday labour and supervision are frequently unavoidable in connection with manufacture. The life, as a rule, is a retired and solitary one, beset with peculiar temptations, and often wanting in plain comforts. To resist the climate, the worries and monotony of the life, a sound mind in a sound body, is, in short, absolutely necessary.—*Weekly Scotsman*, Feb. 15.

THE COMMERCIAL STORY OF QUININE.

BY FRANCIS B. HAYS.

At the bark auctions in Amsterdam Jan. 16th the bidding on cinchona augured a further advance in the price of quinine, and this naturally brings to mind that perennial subject, the varying figures at which that drug is sold from year to year. Speculation as to whether the price of that universally employed alkaloid will ever reach the figures which were once used in quoting it is out of order, as no sane person dreams that quinine will ever fetch more dollars per ounce than it has recently been fetching cents.

Although made in the laboratory as early as 1820 by Pelletier and Caventon, quinine sulphate remained little more than a curiosity for ten years, during which time it dropped in price from \$20 in 1823 (the first year when it was on the market commercially) to \$1.75.

The physician Maillot, to whom the credit of introducing this drug as a popular remedy for fevers belongs, more than to any other one man, perhaps, died recently at the age of 91. He gave it to French soldiers in Algiers in 1834, reducing the death rate from 1 in 3½ to 1 in 20 the first year.

In this country the variations in the prices of quinine sulphate from year to year and even during a single year have been phenomenal. The readily understood causes of the tariff, the opening of new groves, cultivation of the trees and such things have, of course, exerted influence on the commercial aspect of the drug, yet some rises and falls in the price seem to have been purely idiosyncratical, as it were. During the latter part of the '50s the low tariff brought quinine down to a lower figure than it had ever before reached. This price held the record until 1884; since then we all know the story. At the beginning of the war between the States, owing partly to increased consumption and greater perils of naviga-

tion, the price began a rapid climb, until in 1864 it was higher than it had been since its general introduction. The tumble the next year was sudden and decisive.

In 1877 the enormous price of \$4.50 per ounce was reached; this is high-water mark since quinine has been a staple. These variations I have shown in a graphic manner in the annexed diagram* which needs no explanation further than the statement that the continuous tracing represents the highest prices at which quinine sulphate has sold each year from 1829 up to the present time, and that the dotted line beneath represents the lowest prices during the same period. As it was not possible to indicate with accuracy the prices in cents on a diagram of convenient compass, we append a table showing the precise figures. When quinine fell from \$4.50 in 1877 to \$1 in 1884 speculators bought large quantities of it, expecting it to go up again. Should any of them glance at this diagram, the magnificent and continuous downward sweep of the lines for several years past will probably produce a sensation similar to that made by taking an unexpected and too precipitous toboggan ride. John G. Longdon, who died at Kansas City, Mo., a few weeks ago, was one of the heaviest plungers into \$1 quinine. He took 100,000 ounces, which he was reported to be still carrying at the time of his death. He was not compelled to sell, and declared that he never would until he could make a profit, or at least come out even. A loss of \$75,000 or \$80,000 was not a very severe blow to him. Some others are less fortunate.

PRICE PER OUNCE.

1849..	3 65	2 95	1886..	80	65
1850..	3 70	3 70	1887..	70	46
1851..	3 25	3 25	1888..	50	30
1852..	3 00	2 80	1889..	30	22½
1853..	3 20	2 70	1890..	32	23½
1854..	2 50	2 50	1891..	24	18½
1855..	3 00	2 60	1892..	20	17
1856..	2 60	2 40	1893..	22½	17½
1857..	2 00	1 40	1894..	25	22
1858..	1 40	1 25	1895..	27	22½
1859..	1 50	1 25			

It will be noted by reference to the tables that the highest and lowest price in 1837 were the same. A similar uniformity existed in 1850 and 1851, and again in 1854, since which time such a coincidence has been lacking. The highest price did not vary for the three years beginning with 1845, and several times since then it has been the same for two consecutive years. The lowest prices, on the other hand, while not presenting such extremes, are

* Not reproduced.—Ed. T.A.

more vacillating, never falling into the same notch twice in two years. Bottom was touched in 1892, since which time a gradual rise has been noted. This is accounted for partly by the fact that manufacturers are keeping the drug out of the hands of speculators as far as possible, and only making enough each year to supply the legitimate demands of the trade.

The figures for later years refer to the foreign makes, some American brands being a couple of cents or so higher.—*Druggist' Circular*, Feb. 1896.

DELFT GRASS.

The Principal of the Agricultural College write to us:—

The so-called "Delft grass" to which reference was made by you, as having been tried at the School of Agriculture, was, so far as growth is considered, a great success. I have referred to the experiment somewhat in detail in my annual report for 1895. My experience of the grass as a fodder is that neither stud-fed horses nor cattle will eat it, but cattle at grass will browse on it, particularly when other natural grasses are scarce. Indeed, it is what I am informed is the case even in Delft, and it is no doubt an advantage to have such a grass as is able to flourish when other grasses fail owing to drought and also that it is not eaten down except when these latter are scarce in pasture land. The grass (of which I forward a specimen) is variously known as "geranium grass," "rusa oil grass" and "oil of ginger-grass," its botanical name being *Audropogon Schoenanthus*, var. *versicolor*. It is said to be found wild in parts of India and some accounts mention that it is a favourite fodder for cattle. From the grass is extracted an oil which is used to adulterate attar-of-roses. The Tamil name for the grass is "attar pillu." Though it is supposed to exist in none of the other Northern islands except Delft, Mr. William Ferguson mentions that it is common at Wilson's Bungalow. It is most appropriately named the "anise-scented grass," and when bruised emits a strong odour.

KALUTARA PLANTING NOTES.

Bentota, March 9.

WEATHER.—After a spell of 23 days of scorching weather we were last evening favoured with a small shower depositing however only 0.23. The drought we may say has lasted since the 29th January ready for me only had 0.47 during all Feb. The season so far as been very similar to last year, last year we had 6.35 in Jan. and 1.19 in Feb. This year 9.39 and 0.47. The weather has been very trying on the tea bushes especially those near rocks. Even the jungle shrubs and crotons about the bungalow are drooping. It looks cloudy again this morning and it is to be hoped we will get a more liberal supply of moisture some time during the day.

HEALTH.—Not much to complain of, on the score of health; a little fever prevails mostly brought over from other parts of the country.

COMMUNICATION.—Roads in good order and Muna-malwatta Bridge finished.

RAILWAY.—It is surprising to find that bullock carts can successfully compete with the railway, at all events as far as Alutgama, nearly all the boutique-keepers in Bentota and Alutgama got their goods across by carts. This surely should not be. The refreshment bar having taken up the ladies' waiting-room, lady-passengers are often put to very greater inconvenience. Then again no arrangements seem to be made for the third-class passengers: fancy a third-class passenger (female) travelling all the way from say Matara with no convenience nearer than their destination which may be Bandarawela.

LABOUR SUPPLY.—Sinhalese labour falling off yearly. Punchi Nona having laid by a supply of silver bangles and good comboys to last them for some time think

it not worth their while to turn out to pluck now unless the flush is exceptionally good and they can earn twice as much a day as their husband? Tamil coolies are however coming to the district from India more freely.

TEA FLUSH.—It is needless to say the flush is almost at a standstill, but on most places the tea bushes are in good heart and only require 2 or 3 inches of rain to make them burst out with a rush.

THE DRAYTON (CEYLON) ESTATES CO.

The ordinary annual general meeting of this Company was held in the registered office (Messrs. Julius & Creasy's) on 10th March. Present:—Messrs. A. W. S. Sackville (in the chair), C. Wilson Wood, H. Whitham (Secy.), C. J. Donald, A. H. Dunsmure and F. Liesching. Notice calling the meeting was read and

THE ANNUAL REPORT

was submitted:—

The Directors beg to submit the annual balance sheet and profit and loss account for the year ending 31st December 1895.

After providing for depreciation of buildings and machinery the balance of profit available is R58,009.95. The Directors propose that a dividend of six per cent be declared, making with the interim dividend of nine per cent fifteen per cent for the year, and the balance R15,109.95 be carried forward to next year's account.

The crop of tea secured from the Company's Estates was 346,695 lb. against an estimate of 330,000 lb., and there were also 24,051 lb. tea made from Cwm leaf. The Cwm estate, consisting of 90 acres tea in full and partial bearing, has been leased by the Company for a period of three years from July 1895, at a rental of R4,500 per annum.

The total cost of the 370,746 lb. tea after deducting profit on made tea for other estates was 27.04 cents per lb., exclusive of depreciation, and estimating that the tea unsold will fetch 57½ cents per lb. the net value realised for the whole crop will be 60.07 cents, showing a profit of 33.03 cents per lb.

The Company's properties consist of—

DRAYTON:—	Acres.
Tea in Bearing ..	674
Young Tea ..	95
Grassland ..	8
Timber ..	10
Forest ..	17
Waste Roads, &c..	79
YUILLEFIELD:—	
Tea in Bearing ..	200
Young Tea ..	10
Forest and Timber..	15
Waste ..	8
Total acres ..	1,116

The estimated crop for 1896 is 400,000 lb. to cost cents 27 F. O. B.

Mr. V. A. Julius resigned his seat at the Board on his departure from the island, and the Directors elected Mr. F. Liesching a Director in his stead.

In terms of the articles of Association, Mr. F. Liesching retires from the Board by rotation, but is eligible for re-election.

The shareholders will be requested to appoint an Auditor for the current year.—By order of the Board of Directors,

HARRY WHITHAM, Secretary.

Colombo, 2nd March 1896.

The CHAIRMAN moved, and Mr. DUNSMURE seconded the adoption of the report.—Report adopted.

A dividend of 6 per cent was declared, making, with the interim dividend, 15 per cent for the year, and the balance was carried forward to share account.

Mr. Liesching was elected a Director, and Mr. Hercules Scott re-appointed auditor,

MR. BLECHYNDEN'S CAMPAIGN.

The following extract from letter dated New York 7th January 1895, from R. Blechynden, Esq., has been placed at our disposal by the Indian Tea Association:—

THE BAZAAR MEDIUM.

I have now the pleasure of submitting a General Report for the month of December.

As stated in my letter of the 13th ultimo, we assisted at a Bazaar got up by a Catholic community in aid of a Convent which was inaugurated at the Waldorf Hotel, the most fashionable Hotel in the city, and probably the finest Hotel in existence. Cards of invitation were sent out which entitled the recipient to buy admission tickets at one dollar each. We supplied packets of tea in $\frac{1}{4}$ lb. paper boxes of the kind previously described, and the small sample boxes which were sold and the proceeds went to the fund. The cards of invitation were worded inviting people to a tea, and the tea was made the feature of the Bazaar. At the close of the affair at the Waldorf the Bazaar was continued for three days at the Convent, for a different class of people, where our tea was also served and sold.

A Bazaar was given by the St. Andrew's Church congregation at 129th Street Harlem from the 3rd to 6th December.

We supplied tea in packets, and loose tea to be served, and kept a coloured girl whom we have trained to make the tea. The Bazaar also obtained a supply of Indian tea from a packer, so we did not push our packets against his. But continued to serve the tea, for the three days and nights the Fair lasted.

YOUNG LADIES DRESSED AS NATIVES.

A birthday party was given at Westminster Presbyterian Church on the 4th December. The name is given to affairs where entertainments are organised by the Church and where members contribute as the price of admission as many "penuies" (or cents) as their year's number. The Church is a well-to-do one and has good arrangements for such affairs in the shape of large rooms, kitchen etc. attached to the Church. I had arranged to give a lecture on "Some aspects of life in India" (the title was framed to conceal the advertisement) and it was listened to with attention. The lecture was followed by music, singing, and recitations and at the close all adjourned to a large hall over the one in which the entertainment had been given, and our tea was served by some young ladies of the congregation dressed in costumes we provided as natives of India. I subsequently received a letter of thanks from the management for my share in the entertainment.

TEA, CIGARETTES AND DIAMONDS.

The fair in aid of Hebrew charities to which I have alluded in previous letters, opened on the 9th December. The Jews form a very powerful body in New York, and many of them are well known as leaders in Commerce and Politics. The display of diamonds and dresses was something unique even for America. The Madison Square Gardens had been hired by the Organization, and booth laid out and decorated in a systematic manner. I had the promise of space from a Jewish lady whom I had met at one of the charitable booths at the Food Show, but unfortunately she was laid up at the time the Fair opened, and I had to send Mrs. Tipton on the chance of getting into touch with some one in a position to help us. After many rebuffs, Mrs. Tipton interested the "Russian Tea Booth" representing the Both-Israel Charity. Here tea, cakes, and cigarettes, (all Russian) were served. The Russian tea in this instance being our old friends B. Fischer and Co's Black packet Russian Caravan tea a blend of China, Japan and some India or Ceylon. This tea is largely advertised and is stamped by the Rabbi with a small lead seal, so that it is "Kosher" or clean in a ceremonial sense. Fischer has presented \$100 worth of tea (nominal value) to this booth, and was making an excellent advertisement out of it.

A NICE LOOKING SPANISH GIRL MAKES HEADWAY.

We had a good deal of opposition at first and for some time with the people Fischer had in the booth; as they were Jewish women, and could speak German, the language most used amongst Jews in New York. After some time, and by dint of steady and successful work and the display of a good deal of tact on the part of the young girl I put into our end of the booth, and by Mrs. Tipton, we got the support of the ladies in the booth. Our demonstrator here was a young half Spanish girl, who looked exceedingly well in the Native costume we dressed her in and who thus attracted a good deal of attention from the visitors to the fair, and made head in this way against the opposition which Fischer's people were able to work up at first. We supplied the packets I have described of Indian and Ceylon Tea, sample boxes, and tea in the cup.

JEWISH EPICURES.

If the work done at the Fair introduces the tea into a few Jewish families, it will do us a great deal of good. These people pay extravagant prices for the tea they use, two dollars a pound not being thought out of the way. Mrs. Tipton in her Report to me said:—"The Russian girls served the Russian caravan tea in glass with lemon, but towards the last everyone took the hot India (and Ceylon) even the ladies in the booth, who were Russian Jews came to Josie for tea."

MOTHERS' MEETING

A meeting of the mothers of the Bethany Chapel congregation was held in Brooklyn on the 11th December at night and Mrs. Tipton helped by the colored girl served tea there. She gave them a talk and there was a proposal made that I should give a lecture under their auspices, which they agreed to announce in the *Bethany Tiding*, but nothing further has as yet come of it.

TEA AT THE THEATRES.

As there are at present no Food shows in this neighbourhood, and those contemplated in Washington, Trenton and other places seem to me undesirable, I have turned my attention to reaching the Public in the same manner *i.e.* by actual demonstration, at the Theatres. Through the assistance of Mr. Williams, the gentleman through whom we placed our advertising, I got a footing in the Casino, a handsome theatre prettily fitted up in a curious mixture of Chinese and Indian styles, and put up a booth and began to serve tea there on the 24th December. The tea is getting to be appreciated, and the arrangements we made are effective enough to enable us to use them as a good introduction to other managers of theatres. We have here a good substantial booth decorated with Indian goods, and with one of the urns put in to heat the water. The attendant has been for some time the young lady we had at the Jewish Fair, but I think we can get along as well with a less expensive class of help and I am trying to get the waitress class. At the Casino the attendant is dressed as a Native, as the style of the Theatre, the decorations of the Foyer, and the fact that some of the assistant ushers are Japanese in costume, make this almost a necessity. The arrangements now in progress for other Theatres will come into the report for January, and I will not go into them now, as they are not completed, and take much time and tedious negotiating. The announcement that the tea is served is made in the Programme at the Casino and some of the merits of India and Ceylon teas are referred to.

AT THE CALL OF MRS. GRANNIS.

A convention was summoned by Mrs. Grannis and ladies from all parts of the States assembled at her home, delegates coming from Montana, Florida, California, etc. some 30 ladies in all. Mrs. Grannis met me by accident and told me of this, so with her permission I sent Mrs. Tipton and the colored girl to her house and had the tea served to the delegates. Mrs. Tipton reported the result as a great success, and that Mrs. Grannis had herself spoken to the people about the tea, referred to assistance I had

given her (I had helped to put up and decorate her booth at the food show myself, and had been at her call there) she enumerated the places and clubs where the tea had been served by us and then introduced Mrs. Tipton to give her regular tea talk. The ladies individually spoke to Mrs. Tipton afterwards asking where the tea could be had etc., so the next day I sent some of the packets round to be distributed by Mrs. Grannis to these ladies together with list of grocers.

PRINTED MATTER WANTED.

On occasions like this I miss the advantage I could take of suitable printed matter, giving some particulars about tea and its manufacture etc. If the Committee have any such matter in type, it would be easy to get a stereotype or cast for me, and I could have a few printed as required, at a small cost. Even the leaflet Mr. Mackenzie is having printed, or will have printed at some time would be useful if it included India. I must say, however, I would like something more interesting with many more cuts and less telegraphic in form.—*Indian Planters' Gazette*, Feb. 29.

THE COFFEE INDUSTRY IN HAWAII.

Coffee planting is making steady progress in these islands, and as the young trees come into bearing, as they are now beginning to do, the area will be rapidly extended. Thrum's Almanac for 1896 gives a table showing the parties engaged in this business, the extent of land cleaned and planted and the acreage of trees in bearing. The area shown as devoted to coffee comprises 4,806 acres. There are a few names and areas omitted, however, and the actual extent probably exceeds 5,000 acres. Within three years the whole of this will be in bearing, and giving crops which will show an increased yield each succeeding year, as the trees grow larger.

The average number of bearing trees to the acre is not over 500 in the best fields, and where forest trees are left standing for shade, the number of coffee trees is even less than that. Many more trees may have been planted, but in estimating for crops, it is safer to figure low. Even this area, with all its trees in good condition and bearing well, should return to the growers not less than 2,000,000 pounds annually, which will figure among the exports within a very few years. And this will only be the commencement of an industry which will continue to grow year by year, should no disaster overtake it. And yet there is room for hundreds of new coffee plantations.

Strangers frequently inquire regarding coffee land, and where is the best place to locate. As most of the coffee growers locate on Hawaii, it gives the impression to many that Hawaii is the only island in this group where coffee will flourish. There is just as good land, though of much less area, on Oahu, Kauai, Maui or Molokai as on Hawaii, and with this advantage that it is more accessible, especially when located on Oahu. We are glad to learn that a plantation is to be started at Makaha, which is about four miles beyond Waianac village on the line of the Oahu railway, and within two hours' ride from this city. Messrs. F. B. McStocker, J. A. Lowe and W. H. Hoogs are the promoters of this enterprise. Coffee is found growing in most of the valleys along the Waianac range of mountains, and also in those of the Koolau range on Oahu. One of the finest coffee plantations that we have ever seen was in the Hanalei valley on Kauai, cultivated by Charles Titcomb and later by Godfrey Rhodes, the latter gentleman being now in the city. Some years later the blight appeared in Hanalei and the valley was abandoned to sugar cane, which in turn gave way to rice. That was long before the lady bird proclaimed herself as the friend of the coffee and fruit grower. With her assistance, coffee may now be successfully grown in any part of this group wherever suitable land and moisture are found. But, like every other agricultural enterprise, it takes

time, patience and capital to develop a successful coffee, sugar or orange plantation here or anywhere else.—*Planters' Monthly*, January.

FOR A DUTY ON TEA.

THE IMPOSITION OF A DUTY ON TEA BEING ADVOCATED BY THE COMMITTEE ON TEA TRADE OF THE UNITED STATES.

We, the undersigned committee, representing of tea trade of the United States, beg to make the following recommendation:

That a specific duty be imposed upon importations of tea, sufficient to correct certain evils which cannot be avoided under present regulations.

Heretofore, when the subject of duty on tea has been suggested, it has generally been opposed with the fiction of the "free breakfast table" by some who have not understood the subject and the conditions which affect the production, distribution and consumption of tea. The fact is, the removal of the duty on tea has been a positive injury to the consumer, because of the poorer quality which has been imported since then.

The Bureau of Statistics at Washington shows that in 1873 the average import price of tea was double the price of today and the consumption per capita 1.53 pounds, since which time the average quality and price have steadily declined, together with the consumption, which is now only 1.34 pounds per capita. The consumer pays the retailer nearly as much today for a pound of tea as he paid in 1873 and receives a much inferior quality, which accounts for the falling-off in consumption. In contrast with this we find that in all countries where there is a tax on tea, the consumption per capita has increased, most notably in England where the consumption has increased within the last twenty-five years from 3.63 to 5.53 per capita.

In England, where the duty is 8 cents per pound and the consumer gets better value for the same money, the consumption is four times greater than in the United States, where there is no duty. The average price of tea at retail throughout this country is about 50 cents per pound and considering that one pound of good tea will make over 200 cups, giving four cups of tea for 1 cent, it will be seen that good tea is an economical beverage. The difference in value to the consumer between good tea and poor tea is very much greater than the public realizes.

Some twelve years ago, Congress, upon the recommendation of the tea trade, passed a bill excluding adulterated and exhausted tea. Although the bill has been of advantage, it has not prevented the importation of large quantities of poor tea. Duty is the only real safeguard; its imposition, as has been proven by experience, would retard the importation of poor quality by American merchants and at the same time prevent native shippers in the producing countries from exporting to this country, where there is no duty, the inferior and trashy teas they cannot send elsewhere.

The Russian Government imposes a duty of 45 cents gold per pound, and it is a well-known fact that the people of Russia receive the best tea of any people in the world. The duty on tea in France is equal to 21 cents, Germany 11 cents, Austria-Hungary 20 cents, Spain 28 cents, Portugal 48 cents, Norway 24 cents and England, a free-trade country, collects a duty of 8 cents per pound, not only from tea imported from China and Japan, but the same duty from her own colonies, India and Ceylon.

Worthy of mention in this connection is an article by Mr. Stanton, of Gew, Wilson & Stanton, London, one of the leading firms importing teas from British colonies, which was read before the Society of Arts, January 23, 1895, in which he states that no tax was more cheerfully paid, or more imperceptible in its weight than the duty on tea. Sir Henry Peek, baronet, confirmed Mr. Stanton's remarks and showed that the duty collected from tea in 1894 has amounted to £3,499,000, equivalent to about \$17,000,000, sufficient to provide the country with four new war-ships.

In conclusion, our Government would obtain considerable revenue from a tax which is recognized, by all governments imposing a duty on tea, as the most satisfactory tax that has ever been levied, and when the consumer can obtain a better quality of tea for his money, we believe the consumption within a few years will increase very largely, thus benefitting the consumer, the trade and the government.

(Signed)

COMMITTEE OF TEA TRADE OF UNITED STATES.

By Geo. H. Macy, Secretary.

The foregoing is a synopsis of arguments being used by those advocating the placing of the duty on tea.—*Interstate Grocer.*

THE TEA TRADE OF WENCHOW.

A despatch, dated January 21, has been received from the Foreign Office, enclosing copy of a report on the Wenchow tea trade by Mr. Fox, Acting Consul at Wenchow, as follows:—

“The export of tea from Wenchow, hitherto insignificant, has increased so rapidly during the last three years that a few notes on the conduct of the trade and its chances of development should be of interest to British merchants.

For many years after the opening of the port to foreign trade (in 1877), the tea grown in this district was sent, in an unprepared state, either overland to Foochow, or by junk and steamer to Shanghai and Hankow. At these places it was mixed with other teas, losing both its name and distinctive flavour. The trade was entirely in the hands of Chinese merchants, who, with limited capital, bought only small quantities at a time, being unwilling to pay out either the large sums for the cost of conveyance to Shanghai or the coast trade duty levied there. This latter charge was in the nature of an advance, the amount being refunded to the merchant on re-shipment abroad. However, an arrangement was made in 1891 by which a bond was deposited by the owner of the steamer carrying the tea in lieu of the duty referred to above.

From this time forth the export of tea to Shanghai gradually increased. In 1893 a tea firing “hong” was established, and green teas (Gunpowder, Imperial, and Young Hyson) appear for the first time in the Customs’ Export Returns. There are now (1895) five tea-firing establishments in Wenchow, and the export of tea (black, green, and unfired) has exactly doubled since 1893, the figures being 2,668,933 lb. for 1895 as against 1,381,600 lb. for 1893, a sufficiently remarkable result when compared with the stagnant state of the trade in old established tea ports, like Foochow, Amoy, and Canton. The following table will show the increase under the different headings since 1891.

Year. (Congou).	Quantity.			Total. Lb.
	Black Lb.	Green and other kinds. Lb.	Unfired. Lb.	
1891	313,733	10,667	582,533	906,933
1892	401,200	4,133	620,133	1,025,466
1893	530,133	—	851,467	1,381,600
1894	412,800	35,467	1,201,867	1,650,134
1895	476,534	679,210	1,513,120	2,668,933

The prices in Wenchow this year were good, and some of the merchants have made large profits. Black tea averaged from 14 to 16 dols. (best congou 25 dols.) per picul; green, from 13 to 15 dols. (best gunpowder 50 dols. per picul).

Tea can be prepared at less cost in Wenchow than many other places, owing to the cheapness of labour and the abundance of charcoal. Freight to Shanghai, owing to the monopoly of a Chinese steamship company, is at present excessive, but the competition which must inevitably come, should the trade of the port continue to increase, will effectually remedy this evil.

The time has certainly arrived for at least one British firm to establish a branch in Wenchow and buy teas locally. The expenses connected with coolie and cargo boat hire, godown, and packing charges are much lighter than in Shanghai and other places, the tea-growing districts are close at hand and easy of access. The Chinese dealers will be only too glad to sell their tea on the spot, instead of waiting for their

profit; till it is sold in foreign markets. The quality of the tea is good and likely to improve. The superior kinds have already been favourably commented on by connoisseurs. There is, therefore, a good opening at the present time for foreign enterprise in Wenchow, and it is to be hoped that British merchants will be the first to take advantage of the situation.—*Board of Trade Journal.*

CENTRAL TEA FACTORIES IN THE NILGIRIS.

Cheapness of production is a factor of the utmost importance in the cultivation of tea, as every one will readily admit. But beyond granting the truth of the axiom, so trite as to be almost needless to insist upon, how many have given really serious consideration to plans for effecting the reduction in cost aimed at. It is beyond all dispute that small independent gardens in Upper India generally, in Ceylon and also in Southern India will be the first to go to the wall. Writing on the vexatious restrictions to the cultivation of large areas of tea on the waste-lands of Upper India, newly introduced by the Government, in limiting individual grants to 1,500 acres, our Calcutta contemporary, the *Planter*, says: “Little planters, like little men in all industries, at home and abroad, are going to the wall and seeking absorption in large companies with plenty of capital. It is unpicturesque; it is cruel, it is perhaps unjust, but it is the fact.”

Dealing more directly with the question as it affects the Nilgiris, what do we find? Small and scattered areas, independent factories on each garden, high cost of production and worst of all, a low London average price. Now it is perfectly possible by means of combination to radically alter the last two drawbacks. Let all estates within say, a five-mile radius, agree to start a central factory and have all their leaf manufactured therein by the best man that money can procure. We are extremely loth to hurt the feelings of any of our readers, but we venture to think that Nilgiri tea should, if made in the latest approved methods, compare favourably with the bulk of Darjeelings and the best of Ceylon. In our small local factories the appliances and machinery are still in many cases, primitive to a degree. In addition to this, many tea-planters are also more or less interested in coffee, and consequently can give only a portion of their attention to the extremely important details of cultivation and manufacture. It were therefore absurd to suppose that teas of any high quality could be produced under these conditions.

Now this could be all changed by the adoption of central factories. If water-power were available, the factory should be installed there. If not, one of the existent factories could be enlarged and altered so as to suit the new requirements. The manner of arranging this matter seems very complicated at first sight, but is in reality simple enough. Supposing an existent factory be chosen, the value must be fixed by arbitration, and the amount, together with the cost of the improvements required, should be distributed among the shareholders, *i.e.*, the owners of the various gardens in proportion to their yield or acreage. Should it be convenient, the original owner of the factory might arrange to accept a lien on the profits or even the estates, in lieu of cash payments. This being arranged, every owner of a contributory garden becomes part owner of the central factory.

We have left, however, what we think to be the most important part of the scheme, to the last. The best of buildings, the latest types of machinery are all good in their way and will of themselves largely reduce the cost of production. But like all factories, they want skilled supervision, and no money should be spared in obtaining the services of the best tea-maker available in Darjeeling or Ceylon, of proved capabilities and long experience in districts similar to these Nilgiri Hills. It would be but of the slightest use in engaging a man of average capabilities even though he hailed from Darjeeling or Ceylon. A man who could not rise above an average of 9d. for Hill teas is not the sort required. What is wanted is the best tea-maker to

be got in reason, say for anything under one thousand rupees a month. It seems a great deal to pay for a tea-maker alone, but in reality it works down to very little. Supposing an average of only even 500 acres of tea were attached to the central factory, and putting the yield at 250 lb. per acre, even Rs. 1,000 a month would only mean a charge of about one anna and six pice per pound. A man at this salary should be able to obtain a 11d. average for every pound of tea manufactured, which would easily pay his charges, and still leave a very handsome profit to the shareholders. In addition to this the cheaper cost of manufacture would very appreciably lessen this tax. Besides attending strictly to the manufacture, he would be able to place his experience of the latest and best methods of cultivation at the disposal of his employers.

Now let us see how this will affect the owners of the small gardens affiliated to the central factory. In the first place he is asked to contribute a round little sum in cash for his share in the factory, or also make an arrangement if possible to deduct this sum from the amount realised by the sale of his teas, giving as security a lien on his estate for the amount. It does not seem too sanguine to expect that if the arrangement were carried over two years, the increased profits alone (i.e., the difference in profit between his former workings and the central factory scheme) would clear off his debt, and the third year he would have very materially increased his yearly income. By allowing the two years for payment of his share, his receipts for that space of time would be as usual and no inconvenience felt through want of funds for cultivation, etc.

This plan has been sketched out very roughly, but we venture to think that at bottom the scheme is sound enough, though of course as a working basis for a business undertaking a great deal of elaboration is required. The suggestion will not be acted on for many a long day yet, if at all, but even those who will decide the possibility of such a scheme being practicable, must acknowledge the great need to which its publication is intended to draw attention.

—*Planting Opinion.*

TEA AND EXPERTS.

(Communicated.)

In a daily contemporary lately we have seen defence and defiance in the shape of Mr. Bamber's letter and the editorial *in re* the benefits that the tea plant derives from the tree called the *sau* being intermingled throughout the plantations. In the first, Mr. Bamber claims the discovery, and in the second, the Hare Street paper stands up for Dr. George Watt, *c.r.e.* Some time ago we pointed out with regard to what may be termed a "so-called discovery" by the late Mr. Wood-Mason with regard to mosquito blight and quoted by Mr. Cotes, if we remember rightly, that this was no discovery by Mr. Wood-Mason, but simply the information he had picked up during his visit to Cachar to investigate mosquito blight and for the purpose of suggesting a "remedy." We then stated our views, and we stand to our guns, that the total discovery amounted to classifying the destroying insect and giving it an unpronounceable name; that with regard to its habits and mode of destroying the flush, the information was all supplied by the practical planter, and for the remedy we are still looking. Now with regard to the *sau* tree, we are of opinion that in the records of tea planting compiled by the late Mr. Wyman if we are not mistaken, mention will be found of the benefits accruing from planting the shrub amongst the tea. At any rate, before Mr. Bamber's advent on the scene the Hon'ble Mr. J. Buckingham called the attention of the Indian Tea Association to the *sau* tree, and its beneficial results when intermingled with tea, and one estate we have in our mind's eye planted it over a large area, and this some ten years ago. Now, it cannot be supposed that so intelligent a body of men carry on tea plantations planted this tree for shade, as they are quite well aware of the disadvantages of shade. What then did they plant it for? We don't suppose

for pleasure or philanthropy. Be this as it may, it is amusing to read the vapourings of our "authorities" sent to the districts for a definite purpose, and who simple return from their "pleasure trip" to impregnate the air with a long string of technical terms, expressive of what?—the pickings of practical planters' brains and only exhibiting the "exuberance of their own verbosity." What has Mr. Bamber's visit to the tea districts and research into the chemistry of tea manufacture done? Has it raised the price of tea in the districts he visited a fraction of a penny per pound? What has Dr. Watt's visit done with regard to blight? Echo answers "What?" Up to date the planter has had to rely entirely on his own efforts, and so far as we can see is likely to have to do so in future. Those who in their enthusiasm ventured to think there was a millenium coming when they heard that a Government officer had been appointed to investigate their troubles, had better "bide a wee" and still go on in their old groove and act on the great principle of Smiles' "Self Help."—*Indian Planters' Gazette*, Feb. 29.

THE PROPOSED DUTY ON TEA IN THE UNITED STATES.

A movement has been set on foot in New York, recently among importers of tea to urge upon the Ways and Means Committee of the House, the levying of a duty of 10 to 15 cents per pound upon tea. It is urged that a satisfactory duty should be imposed upon tea, sufficient to correct certain evils which cannot be avoided under the present regulations. As tea is now free of duty it is held that all of the low grades of tea produced naturally seek this market, whereas if a specific duty were levied upon teas, that then the higher grades would be imported to the advantage of consumers, and the lower grades excluded owing to the relatively greater proportion that a specific duty would bear to the cost value of these lower grades. It is said that the average import price of tea was in 1873 double in price of today, that the consumption was then 1.53 pounds per capita and has since steadily declined until at present it is but 1.34 pounds per capita; that the consumer pays nearly as much today for a pound of tea as in 1873, and gets tea of inferior quality which accounts for the diminished consumption.

This effort on the part of the tea dealers to have themselves taxed, brings to mind the altruism of the distillers two years ago in their earnest efforts to have the tax increased on whiskey. The distillers had such great consideration for the government finances that they thought it wise to have the duty on whiskey increased some 25 per cent., not that it would enrich them to the extent of several million dollars by the increased value of the whiskey on hand, but because the government would secure the much needed increase in its revenues. The facts are that the duties at the low rates were paid on a very large amount of whiskey to avoid the increase under the new law—the Wilson Bill—and the revenues from this source were largely diminished.

In like manner we can see that the importers of tea are now far more interested in the increase in the value of the stock on hand, which would inure to their benefit if the duty were levied upon tea, than any protection of the American people from low grade teas by their proposed modes of exclusion.

Long experience has shown that in the United States the most deally perfect article upon which to secure a competent revenue for the government is sugar. Any tariff levied upon this staple will produce a larger proportionate revenue than can be got from any other leading staple article. At the same time, any duty levied upon sugar would incidentally protect the existing American sugar industry, which is now able to supply some 15 per cent of the total amount of sugar consumed in the country and which is the one agricultural interest in which our country has thus far fallen behind Europe in its plans for legislative consideration and protection, and in which the largest possibilities now lie for Ameri-

can agriculturists north and south of Mason and Dixon's line. Nebraska, Colorado, Utah, California, Washington, and Arizona have before them wonderful possibilities in beet sugar production, while the whole tier of Gulf States can readily become enormous producers of sugar from tropical cane. If that consideration were given to the American sugar industry by our national legislature that is given to the sugar industry in France, Germany, and Austria, we should have it quickly placed on safe grounds and its rapid development made certain.—*Louisiana Planter and Sugar Manufacturer*, Feb. 8.

DISEASE AMONG COCONUT TREES.

TO THE EDITOR OF THE "TIMES" OF INDIA.

SIR,—Without pretending to be an expert in botany, I would like to inform my friend Dr. J. C. Lisboa what I know from one year's experience in this land of coconuts. I came here from Baroda in December 1894, and during this time I have seen many a coconut tree wither and die of the disease called *mandolin* in Goa; but here it goes by the name of *kir*. I have seen here the gummy liquid that runs out from small slits in the tree, but not the yellow powder. The cause seems to be a worm that incessantly gnaws the pith of the luxuriant plant with its metallic teeth. The remedy used here is a concoction of camphor and salt that the cultivator injects into a hole made just above the part affected. This place has a lovely grove of coconut trees extending between Bandora and Versova.—
Yours, &c., H. PEREIRA.

Juven, March 4th.

LIBERIAN COFFEE.

No 6. (Half-yearly.)

SINGAPORE, Dec. 31st, 1895.

CROPS.—From the Southern District of Johore, I am favoured with the following: "We have been busy the last three months (July to September) with crop, which has turned out well and has almost made up for the shortness of the crop in the earlier part of the year, which had been caused by the destruction of the blossoms by rain early in 1894. We have also had a series of good blossoms during this quarter of the year, all of which seem to have 'set,' those coming after the good blossoms of the early part of the year should ensure a good crop in 1896. We have had very little rain so far this year compared with the usual rainfall in this part, and the dry weather though favourable to outdoor work and curing of coffee is not altogether beneficial to the coffee plants themselves."

KLANG REPORTS :—		Piculs.
Total Klang District Coffee Exported in		
1895	1,631.63
Total Coffee Exported from rest of		
Selangore	2,849.58
Total Exported from Selangore	4,481.21

"There are now fully 3,000 acres under coffee and owned by natives, and about 1,000 acres of this is owned in bearing and will give at least 3,000 piculs during 1896. About 1,000 acres have been opened by Europeans, of which 200 acres are in bearing. It is expected that from 1,500 to 2,000 acres more will be opened during 1896. High prices have been paid for coffee in bearing by natives, principally Chinese.

Coffee 2½ to 4½ years has parted hands at from \$350 to \$650 per acre, and it is reported that \$700 per acre has been refused for some 5½ years old coffee. This season's crop has come in very slowly, but with the advent of fine weather a rush may be expected. Very good crops from Kuala Lumpur district estates are reported, 5 and 6 piculs per acre from comparatively young estates being obtained."

CROP PRODUCTION.—The following figures shew receipt of coffee in Singapore for each month of the 3rd and 4th quarter of 1895.

1895.		Piculs.
July	1,720
August	1,310
September	833
October	896
November	812
December	589

		6,183

MARKET.—Prices throughout the 3 months, July-September—remained steady at \$12 to \$13½ the differences in value being chiefly due to quality of different parcels. October shewed little change at \$12.50 to \$13.20, but November opened with a spirited advance at \$14½ finally reaching \$15.50 which latter is the record for the period under review. Beginning of December shewed a decline at \$15, closing value being \$14½ steady.

J. LYALL, Coffee Broker, Change Alley, Singapore.

STATISTICS OF CINCHONA CULTIVATION IN INDIA.

AREA.

At the end of the official year 1894-95 there were 8,710 acres of land under cinchona cultivation, of which about 71 per cent was situated in Southern India, the remainder (nearly 23 per cent) being in Bengal. The area in Bengal, comprising 2,508 acres lies in and near Darjeeling. Most of the area in Southern India is in the Nilgiris and Malabar, thus: 2,400 acres in the Nilgiris, 1,902 acres in Travancore, 350 acres in Mysore, 33 in Coorg, 25 in Cochin, and 40 in Madura.

In Bengal the land under cinchona was in the main planted and is maintained by Government, the plantations of the State covering 2,351 acres. In the Madras Presidency on the other hand the industry has lain to much the largest extent in private hands, the State plantations covering only 821 acres.

During the ten years ending with 1894-95, the area under cinchona has fallen from 10,418 acres to 8,710 acres. There has been a substantial decline in Bengal, and in Coorg the cultivation has been almost entirely abandoned. The area in the Madras districts has fluctuated greatly.

The number of plants in permanent plantations has fallen in the same period from 17¼ millions to 9¼ millions. In 1894-95, a little over 7 millions were classed as mature, and nearly 2¾ millions as immature plants.

PRODUCTION OF BARK.

The quantity of bark collected has largely increased. But, so far as the figures relate to Southern India, they have evidently been greatly understated, as they are in every year smaller than the quantities recorded as exported thence to countries out of India. In Bengal practically all the bark produced is manufactured by Government into febrifuge and sulphate of quinine and issued to medical stores and hospitals or sold to the public:—

	Bark Collected.		Exports.	
	Madras.*	Bengal.	Madras.†	Bengal.
	lb.	lb.	lb.	lb.

*Including Travancore and Cochin.

†Including exports from Cochin.

COOLIES AND CONTRACTS.

The planters of Selangor have been making very strong representations to the Governor of the Straits Settlements on the Labour Question. Their greatest grievance is the fact that, under existing regulations, labourers can leave the service of their employers at a month's notice without settling their liabilities, unless bound by written contracts of service. It is admitted that employers have their civil remedy, but they urge that as, in the majority of cases, coolies' assets are nil, it is useless for employers to try to recover advances through the Civil Court. They submit that there can be no injustice in making it compulsory for coolies to either pay or work off their advances. The address proceeds:—

It is claimed that written contracts obviate this difficulty, but we are of opinion that such contracts are utterly opposed to the spirit of free operations as binding the labourer to work for a fixed period exceeding a month, and we know that they are exceedingly unpalatable to the coolies themselves. We would have our labourers free to leave us at a month's notice if they choose, and if we cannot so identify our interests with theirs as to make it to their obvious advantage to stay with us; but we ask that this freedom with regard to their movements should be contingent upon the proper settlement of their just liabilities, and we quote the instance of Ceylon where this principle is most strongly insisted upon by planters and recognised as equitable by the Ceylon Government. We sincerely trust that Your Excellency will see fit to meet our views in this connection before the new Labour Code becomes law.

Sir Charles Mitchell's reply was not very encouraging to the writers. Whilst sympathising with the difficulty experienced by planters in being unable to compel their labourers, if engaged on verbal monthly contracts, to either work or pay off their advances, H.E. held out no hope whatever that the relief asked for would be granted. He contended that the case of Ceylon, which had been quoted as a precedent, was no precedent at all, that Government always having had trouble over the labour question. And he assured the deputation that the matter had been thoroughly threshed out, and that the law officers of the Colony were very strong against connecting the element of criminality with breach of verbal contracts of service.

It is needless to say that this particular matter has been a subject of peculiar difficulty in British North Borneo. The local industry chiefly affected is wood-cutting, and, unfortunately, only certain races care to undertake that sort of work. Tamils will not do it, and but few Chinese, while Japanese are equally averse to it if required to reside at any distance from the settlements. Banjerese, Sooloos, and others belonging to the Malayan races are alone willing to make to their homes in the jungle for the necessary periods. But though excellent woodmen they are careless and absolutely unprincipled as regards money matters. They keep no accounts, and will deny the receipt of advances, food, &c., &c., in the most barefaced manner, in spite of absolute proof that they are speaking untruths.

To the suggestion that but very small advances should be given and that the labourers should not be allowed to run into debt, employers rejoin that, under such conditions, labour is unprocurable. They say that a large advance, and the certainty of always getting food and money, no matter whether the debt be paid off or not, is the only arrangement which tempts the shiftless native to sacrifice his independence and undertake regular work.

There is a good deal of truth in this assertion, but employers themselves might do much to break down a bad system if they would agree to work in concert. Were it thoroughly understood that *nobody* would advance more than a small sum easily repayable, and fix a fair limit to the amount of food and cash advanced during each month, from which there would be no departure by anyone, much of the difficulty would disappear. Nothing seems more strange to those familiar with complaints by and against wood-cutting labourers than the fact that no two men

seem to eat the same amount of rice or receive the same amount of cash during any given month. Were some such arrangement as above indicated made, it would immensely simplify the work of Magistrates and others who have to decide the numerous differences arising between employer and employed. Concerted action however would be necessary to carry this out, and the question is whether that can or will be adopted.—*British North Borneo Herald*, Feb. 16.

THE KELANI TEA GARDEN COMPANY, LIMITED.

The first general meeting of the Kelani Tea Garden Company, Limited, was held on 12th March at the registered office in Baillie Street. Mr. H. Creasy presided, and the others present were Messrs. G. J. Jameson, W. Shakespeare, H. M. Waldoek, and W. Seale.

The notice calling the meeting was read by Mr. Jameson.

THE REPORT

for the past half-year was taken as read. It is as follows:—

ACREAGE:

282 acres in full bearing.
6 do ravines and swamps.
5 do grass.
295 do reserve and jungle mostly available for Tea.
—
588 acres.

Of the reserve 37 acres are in course of being planted, and it is intended to open up to 100 acres during the year.

The Directors have pleasure in submitting to the Shareholders, the accounts of the Company for the past six months.

The Crop secured amounted to 85,675 lb. realizing R36,298.42, or an average price of 42.35 cents per lb., as against an expenditure (exclusive of items under Capital Account and Profit on Rice) of R20,824.97, or an average cost of 24.30 cents per lb.

The balance at credit of Profit and Loss account after making provision for

Depreciation on Buildings and Machinery	R2,702 57
Preliminary expenses in the formation of the Company	3,088 78
Stationery and Postages, &c.	74 40
Auditor's fee and management expenses	1,550 00
	<hr/>
	7,415 75
Less Transfer Fees and Interest	98 14

Total .. R7,317 61 amounts to R8,255.84, which sum the Directors recommend being dealt with as follows:—

R5,000 to a fund for extension purposes.
R3,255.84 to next account.

The Estimated Crop for 1896 is 180,000 lb.

The appointment of Directors and Auditor will rest with the meeting.

Carson & Co.,
Agents and Secretaries.

On the motion of Mr. SEALE, seconded by Mr. SHAKESPEARE, the report was adopted.

On the motion of Mr. WALDOCK, seconded by Mr. SEALE, the retiring Directors were re-elected.

On the motion of Mr. SEALE, seconded by Mr. SHAKESPEARE, Mr. F. W. Waldoek was elected as Auditor at R50 for each audit.

With a vote of thanks to the chair, moved by Mr. WALDOCK, the meeting terminated.

SA TREE IN TEA CULTIVATION.

TO THE EDITOR.

Sir,—In your issue of December appeared an account of Dr. Watt's (the Reporter on Economic Products to the Government of India) recent visit to Assam for the purpose of investigating tea blights, &c. In this account I noticed that Dr. Watt claims to have made a discovery of no small importance, which

would necessitate his amending the review of the literature on the subject in Europe. The discovery is briefly this:—Some years ago on certain tea gardens in Assam the "Sa" tree (*Albizia stipulata*) belonging to the sub-order Mimoseæ of the group of leguminosæ, was planted for shade purposes among the tea bushes. This sub-order was not known to produce the root tubercles, which contain nitrogen-feeding bacilli, and which make several other sub-orders of the leguminosæ so valuable in enriching soil with nitrogen, by their means. It was demonstrated to Dr. Watt that the effect of the shade was to lower the quality of the tea, while it increased the out-turn. To account for this increase, a young "Sa" tree was dug up, and examined by Dr. Watt, who observed that the roots were covered with multitudes of the tubercles, and further, that under the microscope these were actually found to contain the nitrogen-feeding bacilli. From this discovery he was led to the practical consideration, which he now regards as almost of supreme moment to the tea industry, that the cultivation of a herbaceous leguminous plant to be hoed in as green manure, would secure the strength to resist many blights, without entailing the disadvantage of the shade given by the "Sa." Dr. Watt accordingly recommended the Assam planters to sow in October and hoe in about February, a crop of matti kalai, or some other of the numerous pulse crops common to the neighbourhood.

If you will kindly allow me I should like to draw attention to the fact that the discovery in question was made by me in 1892 in support of which I subjoin a few extracts from my book on the Chemistry and Agriculture of Tea published in 1893 by the Indian Tea Association. I may mention that while conducting my experiments in Assam (as Chemist to the Indian Tea Association), on a garden almost adjoining the one on which Dr. Watt made the discovery I had frequently pointed out to planters the effect of the "Sa" as a nitrogen producer for tea, the beneficial effect being at once apparent from the dark green colour of the leaves and the healthy growth of the tea plants beneath them. When visiting one of the gardens near Jorhat, the question of the "Sa" tree arose, and I obtained one of the trees, on which were the tubercles as described by Dr. Watt. On microscopical examination these contained certain bacilli, but as I had no means of obtaining pure cultivation of them, it was impossible on mere microscopical observation, to state absolutely that the bacilli in question were identical with the nitrogen feeding bacilli observed in Europe, although from the effect of the plant I have no doubt they were so.

The following extracts from the book above mentioned, will show that the subject has been previously brought to the notice of planters and others concerned in tea (page 142 lines 1-10):—"Numerous experiments and investigations have been made to determine whether plants had the power of utilising the free nitrogen of the air, and it has been found that certain orders of plants have that power of utilising the free nitrogen of the air, and it has been found that certain orders of plants have that power, free nitrogen being fixed by the agency of certain bacteroids which occur in nodules on the roots of plants. This discovery explained why certain plants enriched the soil by their growth even when the crop was removed, the roots containing a large portion of the nitrogen stored up in the above manner, which was liberated again as ammonia on their decomposition; this ammonia could then be utilised by other plants, which had not the power of fixing free nitrogen." Again on pages 147-148, when treating of the sources from which the nitrogenous compounds of plants derive their nitrogen:—"In some cases it (nitrogen) is also derived from the free nitrogen of the atmosphere, which certain plants have the power of fixing and utilising by means of bacteroids in nodules on their roots." (Page 178, lines 12-25):—"It is a curious fact that tea garden jungle in any district rarely contains plants of the Natural Order "Leguminosæ" as the clover or gram, perhaps partially due to all tea soils containing such a small proportion of lime. Trees of this order as the "Sau" (Sa) have been planted among tea in some gardens, as it was originally noticed that its

presence appeared to have a beneficial effect on the bushes, but it is now being generally removed, as its shade has been found detrimental to outturn to a great extent, and counterbalances any other benefit derived from its use. A great advantage would, I think, be gained if the jungle growth could be gradually and economically changed to the above natural order, as its powers of enriching soils with nitrogen which it derives indirectly from the atmosphere would make it the cheapest means of supplying that useful and necessary constituent to the tea." (Page 181, 7 lines from bottom):—"The growth of other classes of weeds of a different natural order to the graminaceæ or grasses is an advantage during the cold weather, as they are gradually accumulating from the atmosphere, at a time when the tea plant is practically dormant, large quantities of carbonic acid and some nitrogen, which, when the weeds are buried and decomposed, are again liberated for the use of the tea."

I should have laid more stress on the subject of "Sa" trees in the above book, but for the fact that on nearly every garden I visited, on which the tree had been originally planted for shade purpose, it was being cut down and removed owing to the detrimental effect of its shade on the quality of the tea produced beneath it. (Page 210.) As regards Dr. Watt's suggestion to planters to grow mattikalai or some other of the numerous pulse crops common to the neighbourhood in my first report published in 1891, after a short tour in Cachar and Assam, I recommended the use of four leguminous plants for experimental green manuring viz:—Ground-nut (*Arachis hypogæa*), gram (*Cicer arietinum*), field pea (*Pisum arvense*) and lentel (*Ervum lens*) also to certain planters, during my tour in Cachar the growth of "matikalai," which, I was informed, yielded the largest amount of green leafy material (for manrial purposes) of the pulse crops grown in the districts.

M. KELWAY BAMBER.

Muktesar, Kumaon, Jan. 27.

—*Indian Agriculturist*, March 2.

DRUG REPORT.

(From the *Chemist and Druggist*.)

42 Cannon Street, E.C., Feb. 20.

CAFFEINE is very quiet at 18s per lb. The market, especially in America, seems to be a little over-supplied.

CALUMBA remains quite dull. About 55 bales ordinary dark sold at 8s 6d per cwt. subject to approval.

COCA-LEAVES. Five cases common dark and damaged leaves sold without reserve today at the comparatively high figure of 7½d per lb.

COCCULUS INDICUS—Tending lower; 30 bags were bought in today at 8s 6d per lb.

NUX VOMICA remains very low in price. Thirty-eight bags fair small to medium pale seed realised 6s per cwt. while a parcel of 547 bags from Madras and Calcutta was bought in at 4s 6d per cwt.

OILS (ESSENTIAL)—Two cases, described as Cinnamon bark oil of first quality, sold today at 7d per oz., an exceptionally low figure, if the statement in the catalogue be true. Another parcel of two cases fair cinnamon oil was priced at 8d per oz. Citronella oil 2s per lb. on the spot, or 1s 9d per lb. c.i.f. for June shipment. Lemon-grass oil tending a little firmer: spot 2½d per oz. for shipment 2¾d c.i.f. per oz. for near-at-hand, and 2½d per oz. c.i.f. for distant shipment.

AMSTERDAM CINCHONA TELEGRAM.—Our Amsterdam correspondent, telegraphing on Thursday night, states, that at the cinchona auctions held in his city today, 6,251 pkgs. of Java cinchona (out of 8,840 packages offered) sold at an average unit of 2'82c. per half-kilo. for the manufacturing bark, a decline of 0'18c., or, say, 6 per cent upon the January auctions, chiefly to the excessive quantities of bark placed on sale. The principal buyers were:—G. Briegleb (American and English makers), who bought the equivalent of 7,223 kilos. of sulphate of quinine, the Auerbach works 3,678 kilos, the Brunswick factory 3,495 kilos., the Mannheim and Amsterdam works 8,261 kilos., the Frankfort-on-Main and Stuttgart works, 1,727 kilos, and various buyers 2,708 kilos. The range of prices was: Drug-gist barks 5½c. to 32½c. (= 1d to 5¼d per lb.) manufacturing barks 6c to 76½c. (= 1½d to 1s 3¼d per lb.)—*Chemist and Druggist*.

BRITISH BORNEO PLANTING NOTES.

The Bye December crop of parchment coffee, necessarily omitted from our returns of the 1st January, was piculs 103.25 totalling piculs 358.54, obtained from an area estimated at about 170 acres during six months. Thus is a shade over piculs 2 per acre for that period, which is a very fair result to obtain from trees of about three years of age considering that the seedlings when planted were some three or four months younger than is customary. The Kibeli crop for the same period was piculs 62.33 the trees being some six months younger on the average and the area about 60 acres. Seedlings when planted also under age.

From all sides we hear very encouraging accounts of the coffee. The last put-in plants are coming up stout and strong, older ones are shaping into very handsome trees, and more and more crop is collected every month. Even the old Sebooga, planted in 1884, deserted almost as soon as planted and most of the young plants trodden out by elephants and wild cattle, and its very whereabouts lost for years, is coming to the fore again; it gave something like a picul and a half of parchment for the month of December in repayment for a very little trouble in clearing up round the feet of the fine, strong, but very badly shaped trees. From all the estates an increase is expected for the month of January.—*British North Borneo Herald*, Feb. 16.

RUANWELLA TEA CO., LTD.

At the first annual ordinary general meeting of the Ruanwella Tea Co., Ltd., held on 14th March the report and accounts, as published, were adopted. There were present:—Messrs. A. M. White (in the chair), E. S. Anderson, G. W. Carlyon, Directors; L. E. Edwards, C. J. Donald, A. Thomson (by his attorney Mr. G. W. Carlyon), and F. G. A. Lane (by his proxy Mr. G. W. Carlyon). The report is as follows:—

ACREAGE.		
Tea in full bearing	313 Acres.	
.. not in bearing	45 ..	
Jungle and Waste land	215 ..	
Total	573 ..	

The Directors have pleasure in presenting to the shareholders the accounts of the Company for December, 1895, from the 1st of which month the estate was taken over.

After providing for all expenses incidental to the formation of the Company, a balance of R254.87 appears at debit of profit and loss, which amount has been carried forward to the current year's accounts.

The estimated outlay on working account in 1896 is R36,742.50 against an estimated crop of 169,000 lb. tea. In the valuation obtained by the Company before purchasing the estate allowance was made for the cost of extension to the factory and new machinery, and in this connection it is proposed to spend R14,750 this year. Arrangements have been made for planting 30 acres jungle in tea this season, and ample nurseries of high jat Indian seed have been prepared. The cost in 1896 of this extension is estimated at R4,920.

The appointment of an Auditor for the current season will rest with the meeting.—By order of the Directors, WHITTALL & Co., Agents and Secretaries.

KIRKLEES ESTATE COMPANY, LTD.

At the annual ordinary general meeting of the Kirklees Estate Company, Ltd., held on 14th March the Report and accounts as published were adopted and a dividend of 12½ per cent for 1895 was declared. There were present:—Messrs. G. W. Carlyon and G. H. Alston, J. Armitage Ogden, and C. J. Donald (Directors), Mr. Jno. Gordon (by his proxy Mr. G. W. Carlyon), Mrs. E. Armitage Ogden (by her proxy Mr. J. Armitage Ogden), Mr. A. Thomson (by his Attorney Mr. G. W.

Carlyon), and Misses Clarke and Juneaux, Misses Armitage, Mrs. J. Booth and Mr. C. Juneaux (by their Attorney Mr. J. Ogden).

THE REPORT

is as follows:—

ACREAGE OF KIRKLEES ESTATE.		
Tea in bearing	200 acres	
.. .. partial bearing	82 ..	
.. .. not in bearing	50 ..	
Total Tea	332 acres	
Cardamoms	21 ..	
Coffee	36 ..	
Timber and Uncultivated Land	325 ..	
	717 acres	

The Directors have pleasure in submitting to the Shareholders the accounts of the Company for the past year.

The crops secured in the year were 63,854 lb. Tea, 314 bushels Coffee and 643 lb. Cardamoms. The average net prices realised were 51½ cents per lb. for the Tea, R15.28 per bushel for the Coffee and R1.21 per lb. for the Cardamoms.

After making ample provision for depreciation of buildings and machinery and writing off the whole of the preliminary expenses (R392.81) the net profit for the year amounted to R14,041.57, or about 14 per cent on the capital of the Company. The Directors now recommend the payment of a dividend of 12½ per cent for the year, leaving a balance of R1,541.57 to be carried forward to the current season's account.

The estimates for this year are 75,000 lb. Tea, 150 bushels Coffee, and 1,000 lb. Cardamoms, on an expenditure of R27,673.

The estimate of expenditure on capital account is R7,700, which provides for the upkeep of the 48 acres not in bearing and the planting up of a new clearing of 40 acres.

In terms of the articles of Association all the Directors now retire from office, but are eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.—By order of the Directors,

WHITTALL & Co.,
Agents and Secretaries.

THE UDABAGE COMPANY, LIMITED.

The first general meeting of shareholders of the Udabage Company, Limited, was held on 14th March at the registered office, No. 21, Baillie Street. Mr. G. J. Jameson presided, and there were present Messrs. E. B. Dawson and W. Shakespeare.

THE REPORT.

The following report was submitted by the Provisional Directors:—

ACREAGE :		
	A.	R. P.
Tea in bearing	210	0 5
Planted in 1894	6	0 0
.. .. 1895	7	3 33
	223	3 38
Jungle, &c., mostly available for Tea	131	0 20
	355	0 18

The Directors have to report that since the formation of the Company, a block of 66 acres 1 rood was purchased at Government sale at R25 per acre, and is now included in the acreage of the Company's property.

It is intended to open 100 acres this season, of which 60 acres have already been felled.

In order to commence the financial year on the 1st January, the Directors have made up the accounts to the 31st December last, which are now submitted, and from which it will be observed that after writing off the following items, viz:—

Part preliminary expenses in connection with incorporation of the Company ..	R1,709	33
Interest.. ..	91	48
Stationery, Printing, &c. ..	119	00
Management, expenses, &c. ..	637	50
	<hr/>	
	R2,557	31

There is a balance in Profit and Loss account of R1,221.74.

The Directors estimate, that after making provision for further expenses in connection with the Transfer of the Estate to the Company, amounting to about R250, there will be a balance of R971.74 to carry forward to next account, which, in view of the fact that the Capital of the Company was only subscribed in January, may be considered satisfactory in that the incorporation of the Company has cost the Shareholders practically nothing.

It will be necessary to elect Directors and Auditor at the Meeting.

CARSON & Co.,

Agents and Secretaries.

On the motion of Mr. DAWSON, seconded by Mr. SHAKESPEARE, the report and accounts were adopted.

On the motion of Mr. DAWSON, seconded by Mr. SHAKESPEARE, the Provisional Directors—Messrs. J. N. Campbell, R. P. Hudson, and G. J. Jameson were re-elected Directors for this year.

Mr. F. W. Waldock was re-elected as Auditor, and this concluded the business of the meeting.

THE SELANGOR PLANTERS' ASSOCIATION.

Minutes of a general meeting of the Selangor Planters' Association, held on Saturday, 22nd February 1896, at 10.30 a.m.

Present:—Mr. E. V. Carey (Chairman), Mr. Tom Gibson (Hon. Secretary), Messrs. C. Meikel, E. B. Skinner and H. Huttenbach (Members of Committee), and Messrs. Lake, J. Glassford, R. Meikle, Walker, Nissen, Dougal, Christie, Hicks, Stonor, Tollemache and Allen; Munro (visitor).

1. The notice calling the meeting was taken as read.

2. The minutes of last general meeting were read and confirmed.

3. The following gentlemen were elected members of the Association:—Messrs. T. North Christie, J. B. M. Leech, A. Lutyens, F. B. Hicks and M. S. Parry.

4. Read letter from Government Secretary in reply to suggestions from the Association *re* discharge tickets.

5. Read letter from Government Secretary, notifying that His Excellency the Governor had decided to refer to a Commission of five persons, consisting of the Resident Councillor, Penang, the Auditor-General, representative planters of Province Wellesley and Selangor, and an official from Perak, the following questions in connection with Indian Immigration:—

(1) What amendments it is desirable to make in Ordinance 16 of 1892, before bringing the same into operation; (2) Whether any further action on the part of the Government (as distinguished from individual action by employer, or labour) is desirable to promote immigrations to benefit immigrants; and if so what action is recommended.

It was decided that Mr. E. V. Carey's name should be submitted to the Resident as the Selangor representative.

6. In the absence of Mr. Darby, Mr. Gibson proposed the resolution in his name:

"That the Government of Selangor be asked to reconsider Order No. 603 in the *Government Gazette* of 6th December, 1895, *re* sale of Government Medicines, and that the collection of payments for medi-

cines dispensed at District Dispensaries and Hospitals be made quarterly as is now done in the case of accounts for Hospital patients."

This was seconded by Mr. Walker and carried unanimously.

7. The Annual Report for 1895, having been distributed to members present, was taken as read and adopted *nem. con.*

8. Mr. Carey, vacating the chair, intimated that there was a general feeling amongst members that it was desirable that the Committee should in future consist of five members instead of three, and on this being put to the meeting the motion was carried, the change being subject to confirmation of the next general meeting.

9. Mr. Carey proposed that Mr. C. Meikle seconded that Mr. Dougal take the chair *pro tem.*

10. A ballot for office bearers for 1896 was then held, with the following result:—Mr. E. V. Carey, Chairman, Mr. Tom Gibson, Hon. Sec., and Messrs. C. Meikle, E. B. Skinner, A. B. Lake, L. Dougal and A. Walker members of Committee.

11. The meeting terminated with a vote of thanks to the chair at 12.15 noon.

THOS. GIBSON,

Hon. Secretary.

THE ANNUAL REPORT 1895.

GENTLEMEN,—In submitting this, the third Annual Report, your Committee are pleased to state that during the year thirteen new members have been enrolled upon the books of the Association, and the attached statistics show an increase of 3,546 acres under cultivation and of 1,240 labourers of all nationalities employed on estates.

Great as the above increase is, there is every reason to think that it will be dwarfed by comparison with 1896, judging from the reported large clearings contemplated in the Klang, Kajang, and Kuala Selangor Districts.

This result is most encouraging and clearly shows increased confidence in the planting enterprise on the part of the investing public; and doubtless the good prices of \$42.50 to \$45, which have ruled steadily during the year, have much to do with it.

Besides the above acreage under European cultivation, a very large area is now planted with coffee by native holders all over the State, but particularly in Klang District, where it is estimated that not less than 3,000 acres are under native coffee, and the cultivation is extending rapidly.

MEETINGS.—During the year 1895, six general meetings and 11 committee meetings have been held, and as a rule were well attended. One extraordinary general meeting and one extraordinary committee meeting were also held during the year.

MR. CAREY'S VISIT TO INDIA AND REPORT ON SAME.—Early in the year the Chairman (Mr. Carey) having occasion to visit Southern India kindly offered in the interests of the Association to interview the officials of the Indian Emigration Department, and to make enquiries generally in connection with the recruiting of Tamil labour in that country. On his return to Selangor he submitted a lengthy and interesting report of his visit, which has been circulated amongst members. One thing in particular disclosed by the report was the fact that the main obstacle to the recruiting of free labour in India lay in an old Madras General Order dated 15th May, 1888, which contains a rule to the effect that no agent or recruiter shall receive any commission on coolies not entered in the list of indentured coolies.

With a view to having above restriction removed—or, at least, exceptions made in the cases of mercantile firms of standing—your Committee addressed the Government on the subject, and the outcome of this correspondence was a despatch from the Colonial Secretary, S.S., to Secretary to Government of India, Rev. and Agri. Dept., in which he says, that the Governor of the Straits Settlements, Sir C. Mitchell, hopes that the Government of India will secure for the congested districts of the Presidency of Madras, and the newly developed territory of the Protected States of the Malay Peninsula, the great boon of a free interchange of labour which will be highly

beneficial to both countries. If this step is likely to entail any long delay, then the Governor hopes that the request of the Selangor Planters' Association for a relaxation in the present law of recruiting in Indian labour for the Straits Settlements may receive the early attention of the Madras Government.

DISCHARGE TICKET SYSTEM.—When this question was laid before Government last year no reply was received, but in October last a letter was addressed to the Association by the Government Secretary intimating that Government, although not prepared to pass a compulsory enactment, would be glad as an employer of labour to join in any equitable arrangement for the protection of employers against the wrongful employment of absconding labourers.

Your Committee then submitted a form of rules which in their opinion would meet the case, but the Government Secretary in reply stated that the rules appeared to involve the passing of a compulsory legislative enactment; this the Government was unable to sanction, but would join the members of the Association in a mutual undertaking only to employ coolies in possession of a discharge certificate. As, however, such an undertaking might prejudicially affect Selangor employers of labour as compared with those of the Colony and the other Native States, it would, in the opinion of Government, be advisable to defer taking any immediate further action in the matter—at all events, pending the Federation of the Protected Native States.

LABOUR CODE.—The Acting Resident having appointed a Committee to report on a proposal to adopt the Perak Labour Code in this State, the Chairman of the Labour Code Committee wrote asking your Committee to appoint a representative of the Association to meet the Labour Code Committee, and to give them the benefit of the views of the planting interest in Selangor on the subject. Mr. C. Meikle attended said meeting as representative of the Association.

UNITED PLANTERS' ASSOCIATION.—Your Committee are glad to state that the hope expressed in last annual report of forming a powerful Central Association for all the Native States is nearly accomplished, as it has been arranged to hold a general meeting of members of the Selangor, Sungei Ujong and Pera Associations in Kuala Lumpur at the time of the forthcoming Selangor Race Meeting. A United Association on some such lines as the United Planters' Association of Southern India will undoubtedly be of great value to the planting interest and their representations to the Government will carry greater weight than those of any individual Association.

DEPUTATION TO HIS EXCELLENCY THE GOVERNOR.—The Association being of opinion that the occasion of His Excellency the Governor's visit was a good opportunity to interview him on certain subjects, it was decided to present an address praying for certain reforms which appear to be much needed in connection with land policy and other matters.

A deputation consisting of the whole of your Committee was received by His Excellency the Governor on the 19th December, when he granted them an interview of over two hours. His Excellency was of opinion that the points raised in the address should have been forwarded to him through the Resident, but nevertheless very fully discussed each question *ex officio*.

His Excellency sympathised with us in the matter of our inability to recover advances from labourers under verbal contract, but promised with regard to written contracts that the question of whether any document could embrace a number of contracts should be gone into. His Excellency also recommended that the questions touching (1) the planters' preferential claim to the mining rights on his own land and (2) terms of arbitration on acquisition of private land for public purposes should be reopened, and held out to the deputation, the hope that their views would be favourably considered.

In accordance with His Excellency's suggestion, your Committee have written to the Resident of Selangor fully on the above three points, but have not yet had an answer.

FINANCE.—Your Committee have the pleasure to announce that the substantial balance of \$510.83 stands to the credit of the Association at the end of the year 1895, and is arrived at as follows:—

Balance in hand at end of 1894 ..	\$243.83
Subscriptions paid during 1895 ..	385.00
Subscriptions still due ..	35.00
Total ..	\$663.83

Less Printing, Postage, and Stationery ..	\$67.00
Less Indian Advertisements, etc. ..	84.00
	-----153.00

Balance at credit .. \$510.00

TEA IN AMERICA.

New York, Feb. 12.

Notwithstanding the general tone of business circles was lifted higher as the result of the bond sale, there was no improvement in the tea trade. The market drags its weary length along the rules in buyers' favour, except in those grades which are in limited supply. There has been a moderate invoice trade during the week, and we have no change to note in prices.

Today at noon the Montgomery Auction and Commission Company will sell 9,171 packages, viz.: 2,570 half-chests Moyuue, including many desirable chops; 3,123 half-chests and boxes Pingsuey; 262 half-chests Japan; 95 half-chests Japan, basket-fired; 60 half-chests Japan Nibes; 1,257 half-chests and boxes Congon, including all grades; 25 boxes Scented Capers; 183 packages India, Java and Ceylon; 1,596 half-chests and boxes Formosa, new season's, including the celebrated "White Bear" chops.—*American Grocer.*

UNDEVELOPED AUSTRALIAN INDUSTRIES.

(By John Plummer, Sydney, New South Wales.)

Australia abounds with the elements of successful manufacturing and other industries, which remain at the present moment, from various causes, in a neglected or undeveloped condition, especially in New South Wales, where the surroundings are of an exceptionally favourable character. Take, for instance, the flower farming industry. Although the colony has been described as a floral paradise, from the abundance and luxuriance of its native and cultivated flowers, the manufacture of floral perfumes and essences is unknown, although experimental scent farms have been established in the adjoining colony of Victoria. The quantity of eucalyptus oil annually exported from the colony is insignificant, yet the rich abundance of the trees from which it is obtained should enable the Australian trade to rival that of Algeria and California, from whence the world's supplies are principally obtained. The abundance of citrus fruits may at some future time lead to the establishment of manufactories for the preparation of candied citron, orange, and lemon peels, as well as of lemon, etc., oils and essences. The crystallization of mandarin oranges and the manufacture of orange marmalade are also coming industries; in fact, the latter has already been initiated on a limited scale. At present the chief obstacle to the development of the marmalade industry consists in the absence of the Seville orange, which could be introduced and acclimatized without difficulty. The olive is very sparingly cultivated, notwithstanding the fact that the soil and climate of New South Wales are identical with those of the leading olive-growing countries of Europe. The castor-oil plant grows luxuriantly in the humid coastal districts of the colony; as it does, indeed, in most tropical and sub-tropical countries, and in the regions bordering the Mediterranean, viz., Greece, Italy, and Spain. The annual consumption of castor oil in Australasia is over 600,000 gallons, of which 130,000 gallons represent the requirements of New South Wales. Nearly the whole of the supply is derived from India; and the wholesale price of the oil in Sydney is about 2s 6d per gallon. The initial cost of establishing the industry would be heaviest in the item of machinery for expressing the oil, although the price of labour would also have to be considered carefully, as the Calcutta oil is produced at a minimum outlay in this particular. Flax cultivation is another neglected industry. As is well-known the plant not only supplies flax and tow fibre, but also a valuable seed, of the greatest use as a fodder for cattle, in the form of oilcake, of which it forms the chief ingredient; also for medicinal purposes; and above all, linseed oil, which forms the base of all paint-medicines. Cottonseed oil is imported to some extent, although it could be locally obtained, the cotton plant being capable of easy cultivation in many places. Indigo can also be readily grown. There is in the colony a wild plant, so abundant as to be a pest, from

which it was hoped tinctorial juice might be obtained; but experiments have hitherto proved unsuccessful. The true plant which supplies the indigo of commerce occurs wild in Queensland, and there is no reason why it should not be acclimatized in New South Wales, experiments in this direction always having proved successful. Hops are but little cultivated in New South Wales, although a few very small crops are picked in the neighbourhood of Orange. In Victoria, Tasmania, and New Zealand, however, they are successfully grown, the product being but little, if at all, inferior to the best Kentish hops. In the opinion of experts the plant could be successfully grown, in New South Wales, which imported during 1894 no less than 841,938 lb. of hops, valued at £36,010. Many other instances of neglected industries might be adduced, but the foregoing will suffice to show the opportunities afforded in New South Wales to those possessing the requisite capital, experience, and energy.

THE INDIAN TEA ASSOCIATION, LONDON,
AND THE PROPOSED TAX ON
OVERSIDE DELIVERY.

The following letter has been addressed by the Indian Tea Association to the Secretary of the London Chamber of Commerce, protesting against the proposed tax on the overside delivery of tea which, if it became operative, would seriously interfere with the customary transshipment of parcels destined for other markets than those of the United Kingdom.

"Indian Tea Association, London,
"14, St. Mary Axe, E.C.
"February 18, 1896.

"Kenric Murray, Esq., "Secretary,
"London Chamber of Commerce,
"Eastcheap, E.C.

"Dear Sir,—On the part of the Indian Tea Association I beg to signify their desire to join in the protest against the proposed agreement between the London and India Docks Joint Committee and ship-owners, as being greatly detrimental to the interests of the Indian Tea industry, and I beg to request that you will be good enough to notify this fact at the meeting convened for today to consider the matter.—I am, dear sir, yours faithfully,

"(Signed) ERNEST TYE,
"Secretary."

—H. & C. Mail, Feb. 28.

THE TEA MARKET,

early in the week, commenced with a strong feeling, but closes with a quiet, if not dull, tone. The fact is the trade will not buy forward to any great extent when the general run of imports proves so indifferent in quality. For any district Teas with point and character there is real competition. On the eve of another season in China there is again an opening to pick up the lost trade. Russia, however, now holds the field, paying not only prices far in excess of London quotations, but buying five-sixths of the northern grown Teas. Consumption is growing apace in Asiatic Russia, the Siberian railway opening up hitherto inaccessible regions.—*London and China Express*, Feb. 28.

PLANTING AND PRODUCE.

THE PROCEDURE AT THE SALE ROOM.—The correspondence which we published last week on the subject of the public sales of tea ventilates a matter, which has forced itself upon the attention of the trade. The growth of business in India and Ceylon tea renders the consideration of proposals tending in the direction of reform in the procedure of the sale room, a question of urgent importance. In our columns, Mr. D. F. Shillington called attention to the unreasonable policy of crowding the entire offering of Ceylon tea into one day's sale in each week, and made the suggestion that the week's offering should

be spread over two days. Admitting the difficulty of the choice of the other day, Mr. Shillington suggested that a convenient way out of the difficulty might perhaps be found if the Tuesday Ceylon sale were adjourned punctually at two o'clock until Wednesday at twelve o'clock, when the remainder could be sold with the benefit of an extra morning's tasting. But, as this takes away Wednesday from the Indian sale, Mr. Shillington would meet this objection by dividing the week's offerings of Indian tea into two sales—Mondays and Thursdays—still retaining Monday for the larger part, say three-fifths of the total on Monday and two-fifths on Thursday. "It would be evident," he points out, "that the opportunities for tasting the samples would be more evenly distributed over the week, and confidence in the valuations, which is the surest guarantee of satisfactory bidings, would naturally result. Coming from such an authority, the suggestion will, no doubt, receive the consideration it deserves. Mr. Herbert S. Parker in his letter directs attention to a proposal which is likely to be made to importers and their brokers by some of the London buyers. It is to follow the example of Calcutta, and to cease holding any public auction of Indian tea for some few weeks in the summer in order to give "the market" a period of rest, and to agree to a date upon which the first public sales of new crop shall be held in London. If the proposal be a good one, says Mr. Parker, "there is not much difficulty in carrying it out now that nearly all producers close their crops so much earlier than they used to; but such arguments in its favour as there may be, will no doubt be put forward by those who urge its adoption." In these days of keen competition it is, no doubt extremely difficult to ensure combination in any plan which necessitates departure from established custom. There is, however, so much of "sweet reasonableness" in practical suggestions for relaxing on the one hand the "exhaustive ordeal" of sitting through the whole sale of Ceylon tea during one day, as described by Mr. Shillington, and obviating the need for calling together annually buyers to intermittent sales during June, as mentioned by Mr. Parker, that we feel sure those concerned will give due consideration to the remedies suggested, coming as they do from correspondents who are intimately acquainted with the ways of the sale room and the interests of the trade.

INDIAN TEA CULTIVATION.—Under this head the *Times* of Tuesday refers to the note in the *Gazette* of India, on Mr. J. H. O'Connor's statistics on tea cultivation, giving the following summary: The statistics show that the area under tea is somewhat less than half a million acres, about two-thirds of which is, in the Brahmaputra and Surma Valleys—that is, in Assam, Cachar, and Sylhet. The figures given by Mr. O'Connor show, that tea cultivation is almost wholly confined to Bengal and Assam, the tea gardens elsewhere being only 7 per cent. of the area under tea. At present the cultivation in India is concentrated almost entirely in districts with a damp and equable climate where repeated pickings are possible. One point brought out clearly by the returns, is that for years past there has been no check to the growth of the industry, which annually shows a considerable expansion. Every year since 1885 has seen an increase in the area cultivated, ranging from over 9,000 acres in 1889 to nearly 27,000 acres in 1894, and the percentage of increase is growing greater. The largest increase of all, Mr. O'Connor observes, was in 1893 and 1894, "the former of these being the years in which the mints were closed, an event which was regarded by some as the herald of disaster to the tea industry." One table given by Mr. O'Connor shows how completely the tea gardens of India are dependent on the external demand, the consumption of India being trifling in comparison with the whole production. Thus in 1894 nearly 125 million pounds of tea were produced in India, of which all but 4½ million pounds were exported. If to this be added the amount of Ceylon tea consumed in India—nearly 2½ million pounds

—it is seen that the population of India consumes about seven million pounds a year, or about one-fortieth of a pound per head, or one-hundredth part of the consumption of the United Kingdom. Indeed, if the quantity consumed by the small European population of India, including the Army, is deducted, there would not be very much left for the native population. Mr. O'Connor, however, records that the consumption of tea is increasing amongst the native population in the larger towns, especially amongst the Mahomedans.

NATAL AND ITS PRODUCE.—In his paper on Natal, read at a meeting of the Royal Colonial Institute on Tuesday, Mr. John G. Maydon, M. L. A., of Natal, made the following reference to the various productions of the colony, which are chiefly sugar, tea, and fruit growing. Of sugar he said: Sugar planting has, after a chequered history, now settled down into an occupation of very great importance, with a thoroughly established assurance of success, which is chiefly founded on the establishment of central mills enabled to deal with large growths of cane, and thereby to apply the most economic and approved methods to the actual manufacture of sugar, the production of which has accordingly become possible much more cheaply than heretofore. But the system has a much farther reaching consequence, because the actual planter has by it been enabled to turn all his attention and capital to the agricultural portion of his business, which is by so much the better and more profitably conducted. Moreover, sugar planting has by this means been brought within the reach of many men who, from lack of the very large capital necessitated to conduct the two operations of planting and manufacturing, were formerly debarred from the pursuit of this industry. A very modest capital will now suffice to start a sugar plantation, provided ordinary business energy and acumen are displayed. The demand for sugar in South Africa is, of course, far beyond the production, and the consumption with the rapidly-increasing population, is likely to grow for many years to come in a quite disproportionate ratio to the possibilities of increased production. The cane will not thrive farther south than the river Umzumkulu, as although it grows still further south its sugar-producing qualities diminish, thus unfortunately the Cape Colony is deprived of the benefits of devoting its coast lands to this very remunerative and successful industry. Frost is, of course, fatal to sugar cane, and for that reason only the semi-tropical coast lands are adapted to its production, but in Natal many thousand rich acres, and happily situated, only await the mattock and the ploughshare to return an ample rich harvest to the planters who shall commence their tillage. This remark is especially applicable to the land lying south of Durban, now being opened by the railway in course of construction through it, and which is generally very fertile.

NATAL TEA.—Referring to tea Mr. Maydon said: It is only within the past five years that it has emerged from the experimental into the industrial stage, and to the dogged perseverance and industry of Mr. J. Liege Hulett this successful *début* is largely due. Even yet, however, the annual production has not reached quite 1,000,000 lb. though this present season of 1895-96 will probably see that limit exceeded. This increase of late years has been exceedingly rapid, which is partly due to an ever-growing acreage under tea cultivation, but also, still more largely, to the greater productiveness of the tea plant as it reaches maturity about eight years after being planted. The very slow growth of the tea shrub, and the consequent long period of waiting for a return on the capital invested, will always prove a deterrent to the wide embarkation in this special industry; at the same time the very delightful nature of the occupation and its extreme profitableness when once established offer a very strong inducement, and where a pleasant occupation is the desideratum, with a view to ultimate rather than to immediate return on capital, it is difficult to conceive a more attractive career. Tea planting is, like sugar, confined to the

coastlands, but being a hardier plant, and thriving best on a lighter and less fertile soil, is conducted on a slightly more elevated plateau than it. Both industries are alike in offering a very wide field for expansion, and a demand far, far larger than production can reach for many years to come.—*H. and C. Mail*, Feb. 28.

ORANGES, LIMES, AND COFFEE.

THE HAWAIIAN LAND AND IMPROVEMENT COMPANY'S ESTATE.

When men who have established and managed successfully large and extensive sugar plantations upon these islands, leave the line of their beaten track and engage in other enterprises, it means to the average mind something deserving of more than passing note. It shows that minds trained to business, with sagacity born from experience and success in all their undertakings, active from constant contact with others of like character, scent in the distance the trend of future enterprise and industries, and with their desire to be in the lead in the new as well as the old pursuits, they at once seek to secure that advantage which diligence gives, and will insure the success they so like. So, when the promoters of the Hawaiian Land and Improvement Company secured several thousand acres of Mr. W. H. Shipman's large tract of land, best suited to coffee raising and fruit culture, the coffee growers and fruit raisers in Hawaii at once felt encouraged, and these industries received a new impetus. When persons, who so long acted on the belief that sugar alone is king and the only product of worth here, and thought all other pursuits must be subordinate thereto, embark in coffee growing and fruit culture, it is because they believe in its success and future prosperity. That these men knew their ground well and had good reason for their action and for the selection made for their operations is now fully corroborated. While but little in comparison with their proposed plan has been accomplished, yet enough is done to fully warrant the statement that their enterprise is a success.

It is truly gratifying to look over their operations and note the evidences of abundant promise. Through the kindness of Manager Ross we were shown over the properties of the Hawaiian Land and Improvement Co. It comprises several thousand acres of the choicest land in Hawaii for coffee raising and fruit culture, being between the ten and eleven mile post on the Volcano road, joining it and to the right thereof, extending to and into the forest, so that nearly two-thirds of their holdings are forest lands. It is divided up into lots of various sizes, each of which is to be reached by good roads directly from the fine macadamized road leading from Hilo to the volcano. It all faces the sea which is clearly visible. The land itself is of the *a-a* formation, covered with a rich leaf mold. It can be easily cleared and made ready for a crop of coffee or fruit at a small cost. The company and those closely connected therewith have now about fifty acres cleared thirty-seven of which is planted to oranges and limes, eleven acres will be planted to coffee, all of which is now ready and some planted. The oranges and lime planted are thrifty and doing well, the variety used the navel, shipped from southern California, three shipments having been made, two of which were quite successful, the other partially so. The limes are grown on the place from seed. The coffee plants are also grown in nurseries on the place. The company now has over 2,000 lime trees standing in their nursery and many coffee plants. While it has been the policy of the company heretofore to ship their trees from California, in the future it will be its policy to grow seedlings from the native orange and to bud in the California navels. It is claimed that these oranges will ripen and reach the Pacific coast markets during the months in which the California oranges are yet unripe.

This company certainly can be congratulated on its foresight, and upon the success which it now can rest assured is an accomplished fact. Navel oranges

will grow here as well as in California, and in quantities to fully supply all the market's demand. Limes will grow in quantities and quality to be a success, and this large tract of land is now without doubt, proven to be especially adapted for the successful growing thereon of oranges, limes and coffee. Much of the success which this company has met with must be attributed to the thorough manner in which their land has been handled, the care bestowed in the clearing and preparing for planting, and in the setting out of plants and the cultivation bestowed thereon thereafter. No one can fail to realize this upon an examination of the land of the Hawaiian Land and Improvement Company.—*Hilo Tribune*, Dec. 14.

CITRONELLA-OIL ARBITRATION.

One of the topics widely discussed in Mincing Lane drug circles during the past two or three weeks has been the progress of an arbitration case relating to a parcel of citronella oil, the invoice value of which was about 300*l*. As it is possible that more may be heard of this case, we refrain on this occasion from mentioning the names of any of the parties connected with it, and simply present the following outline of facts:—

On December 10 last, a London drug-firm purchased, through a drug-broker, four drums of citronella oil, weighing about 7 cwt. each, at 1*s* 8½*d* per lb. which was then the market price of the drug. The article was offered by the broker, as "Citronella oil, as per sample herewith," for delivery during January or February 1896, but the buyer does not appear to have exercised any special care in the examination of the sample before accepting the offer. The contract was dated December 19. It is written on an ordinary form, bearing on the back (as all such documents do) a clause to the effect that disputes must be referred to arbitration, according to the rules of the London Produce Brokers' Association. The contract reads:—"Bought by your order and for your accounts four drums citronella oil. . . as per samples in your possession." On January 17, the broker tendered the goods to his buyer, who then applied for samples representing the average quality of each of the four drums. These arrived and were apparently subjected to a closer scrutiny (although no analytical tests seem to have been applied) than had been bestowed upon the first sample. The result of the examination was altogether unsatisfactory. The buyer sent for the broker and expressed the opinion that the oil was not up to the fair standard of quality. He also then asked, we understand, for the name of the ship in which the goods had come. It should here be observed that it is the rule in transactions of this kind either to ask for the name of the ship at the time of purchase, or, in forward contracts, to do so when the time for delivery is near. This gives the buyer the security that the goods are of direct import—*i.e.*, will be handed the him in the same state in which they arrive. In this case the buyer appears not to have exercised that precaution. When, however, the quality of the goods was challenged the broker said that the oil was "land carriage"—that is to say that it came from a private warehouse. This the buyer declares, came to him as news, and confirmed him in his decision to refuse the tendered parcel. The broker thereupon stated that he would communicate with his principal, whose name then transpired for the first time. The principal held the buyer to the contract, stating that the sale had been by sample, and the goods were equal to that sample. Each of the parties then named a produce-broker as arbitrator. The arbitrators failed to agree, and called in an umpire, who decided that the bulk was equal to the sample, and that therefore the buyer was bound to accept delivery. The buyer then offered to forego the goods at the price paid for them, notwithstanding that in the meantime the market price of citronella oil had advanced from 1*s* 8½*d* to 2*s* per lb. This the seller also declined, and thereupon the question was referred to a committee of the London Produce Brokers' As-

ation, now pretty general, that there is not likely now to be any material dropping off in market values until the completion of sales of the past year's crop.

FRESH ISSUES.—Cachar and Dooars shares, both Ordinary and Prefs., have now been granted an official quotation and a special settling day (March 5), and in our future issues they will appear under "Market Stocks" in our table of shares.

Dimbula Valley Ordinary Shares are still inquired for at or about par, while the Preferences are buyers at anything under £1 premium, though this latter figure has not yet been actually reached for them.

CEYLON SHARES.—C. T. P. Co. Ordinary have touched 25½, record price; and the Prefs. have changed hands at £17. Eastern produce shares are still wanted at 4½ upwards.

Lankas are buyers still at 5½, but holders want a considerably higher price, say 5½ to 5¾.

INDIAN DEBENTURES.—Assam Frontier and Upper Assam Firsts are wanted, and a moderate premium, say 4 or 5, would be paid, but none are at present to be had.—*H. and C. Mail*, Feb. 28.

NOTES FROM OUR LONDON LETTER.

LONDON, Feb. 28.

The subjoined extract contains matter which may or may not have come under your observation. [Quoted on page 684.—ED., *T.A.*] At all events it seems desirable to draw your attention to it, as

THE TEA INDUSTRY OF INDIA,

is so closely associated with that of Ceylon. What has especially struck us in our perusal of this extract has been the statement that nearly 2 and half million pounds of Ceylon tea is consumed in India! To us outsiders this appears a statement of a curious character. Perhaps the tea may be used in India for blending purposes. Can you enlighten us on this point? For it seems very singular that with its once large production of tea such an amount as 2½ million lb. should be indented for on Ceylon.

INSPECTION OF MACHINERY.

We are glad to see that upon another subject the "Old Rag" has succeeded in arousing Government intervention. You were the first to ventilate the subject of the necessity for some supervision over boilers and machinery. What you initiated was echoed at home in the columns of the *Engineer*, and we are sure it will be satisfactory to you that at last your Government is acting upon your suggestions, and that legislative action is being discussed in your representative chamber.

COFFEE.

The extract that follows will remind you of the time when your interest in all that concerned coffee was of a paramount character. It is not to be supposed that you are altogether without some remains of that interest now, for from all we read coffee, though "scotched," is not absolutely dead among you. Opinion will be divided, as it always has been, as to whether the reduced consumption of coffee among our home population can be assigned to the amount of duty payable upon it, or whether it should be assigned to the developed taste of the British islanders for tea. The improved quality and cheapness of the latter article is no doubt largely accountable for this development. Coffee, to be really palatable, requires a large admixture of milk or cream. Both these are somewhat expensive luxuries with us. On the other hand there are persons, and a large number of them, who possess a singular preference for tea without any admixture of milk at all. Economy, therefore,

is probably largely at the bottom of the preference shared here for your new over your old chief product.

THE DUTY ON COFFEE.—At the House of Commons last night a deputation, representing the importers, exporters home trade dealers, and brokers engaged in the coffee trade, waited upon the Chancellor of the Exchequer for the purpose of urging the total abolition of the present duty on coffee. Mr. Lough, M.P., in introducing the deputation, stated that the coffee trade was in such a condition that if it was not assisted it would be extinguished. Since 1873 the trade had decreased by about a million hundredweight. At present the import trade only totalled about three-quarters of a million hundredweight, while the export trade was about half-a-million hundredweight; and if their request were not granted he feared the trade would still further decrease. Mr. Robert Wales (Chairman of the coffee section of the London Chamber of Commerce) urged that the imposition of the duty cause restrictions in mixing and other operations while the coffee was in bond, the result of which was to drive the trade to Hamburg and to Holland, where there was no duty on coffee. The Chancellor of the Exchequer, in replying, said that obviously if the duty on coffee was to be repealed that on chicory must also be abolished; and, following that, he had no doubt claims of a similar nature would be advanced regarding tea and cocoa. So far as the consumer was concerned he thought there was no case for the repeal of the duty; and he pointed out that, although the duty was halved in 1873, no increase of consumption followed. In fact he had received representations antagonistic to the views of the deputation. As to the export trade he was afraid that its decrease was not due to the duty. The Brazilian production had largely increased, while that of British India, whence coffee to a great extent formerly came, had decreased; and the result had been that, whereas it used naturally to come to England, now it went to the agents at Continental ports, because it could be more easily distributed there, not because of the duty. Moreover, France had placed a tax on the article; and the port and dock dues and warehouse charges at Hamburg were lower than in London, both of which still further tended to decrease the export. In conclusion he announced that as regarded the arrangements affecting bonded coffee he would endeavour to make them more convenient than they were.

FICTION ABOUT PLANTAINS.—A great deal of literature and romance about the plantain is just now going the rounds in Great Britain. The importation of the succulent fruit from Jamaica has fired the public imagination. We forget at the present moment how many families can be supported on an acre of bananas, as they are called; but it is something that would alarm a Malthusian. Mr. Stanley, M.P., found some plantains in Darkest Africa twenty-two inches long and eight inches round, one of which was a square meal to the most voracious of his friendly savages after ten days' semi-starvation. Each stalk, he says, bore fifty or a hundred of such fruit. The most interesting feature, however, about the plantain is that it makes excellent wine. Speke, in his Nile Journal says, the wine is rather like hock, but he omits to state when he had last tasted hock. In Fiji, they make wine, as they call it, from the banana, and with such success that an enterprising trader wanted to import pulp bananas to compete with the domestic gooseberry in the manufacture of "simkin." A tree from which one can manufacture Manila hemp, lace pocket-handkerchiefs, hats, plantain fritters, marking ink, and champagne is evidently no ordinary growth. At present the export of Manila hemp is valued at three millions sterling.—*British North Borneo Herald*, Feb. 16.

THE COFFEE CROP IN JAVA.

According to a telegram from the Governor-General of Netherlands India, dated 19th inst., the Government's coffee crop in Java for this year is now estimated at 299,900 piculs.—*L. and C. Express*, Feb. 28.

COCONUT OIL.

CEYLON.—The placing for consumption early in the week of the lots of speculative oil, which have been like a "wet blanket" hanging over the market for some months, has imparted more strength to prices, and given both holders and buyers more confidence in the situation. Cables to hand, giving cost for shipment from the coast equal to about 5½c. here, induced a large importer to gather up what stray lots they were offering on the market, and at the close 5½ to 5¾c. was quoted, though a small lot might be had at 5c. The sales comprised 200 tons early in the week for consumption in the West at 4¾c. less 1 per cent. for sharp cash. Later 25 tons at 4.85c., 25 tons do. at 4.90c., 25 tons at 4.92½c. and 25 tons at 4.95c., all on regular terms.—*O. P. D. Register*, Feb. 17.

INDIAN TEA ASSOCIATION.

Abstract of proceedings of a meeting of the General Committee, held on the 17th Feb. 1896:—

Read letter of 14th January, from Mr. W. T. Carter, resigning his seat on the Indian Tea Fund Committee on departure for England. This was ordered to be recorded.

As the remaining Members of the Indian Tea Fund Committee were also members of the General Committee and there appeared to be no longer any special reason for carrying on the former Committee, it was decided that it should be dissolved and all business in connection with the American Market Fund should be submitted direct to the General Committee.

Letters of 1st, 8th, 15th, 22nd, and 29th November; 6th, 13th, 20th, and 27th December; 3rd, 10th, 17th, and 24th January; with their respective enclosures and accompaniments from the Secretary of the Indian Tea Association, London, were brought up for record, having been previously submitted to members in circulation; also letter of 22nd December from the Honorary Secretary, Travancore Planters' Association, forwarding R1,472-10 6 on the American Market Fund, for which the special thanks of the Committee had been sent.

A statement was submitted showing the total amount collected to February 15th, under the present levy to be R85,382 3-9, of which R38,921-10 2 being the equivalent of £2,250 had been remitted to London. Payments in Calcutta amounted to R1,283 13 8 and the balance in hand was R48,115 6 2. The amount outstanding had been reduced to R1,105-5 0. It was decided to make a further attempt to induce the firms holding aloof to subscribe.

Considered letter of 11th January, from Messrs. Watson, Sibthorp & Co., stating that a very considerable quantity of sound high class tea had been shipped from this market to Persia for some seasons past, and asking the Committee to place on record their statement as brokers for the largest buyers for the Persian market, that so far as they knew no unsound tea had ever been shipped from this port.

Considered letter of 16th January, from Secretary to the Government of India, Revenue and Agricultural Department, forwarding a copy of further correspondence with Messrs. T. Christy & Co. respecting the manufacture of Theine from low grade Indian Teas.

This correspondence had been reprinted and circulated for the information of Members, and the letter was to be acknowledged with thanks.

Read letter of 1st February, from Secretary, Calcutta Tea Traders' Association, drawing the attention of the General Committee to the delay in issuing the

revised estimates of the Tea crop for 1895 as compared with 1893 and 1894. The Assistant Secretary having stated that the estimates in question were issued about twelve days later in 1895 than in the previous year, but that there were special reasons for the delay, it was decided to reply to the Committee of the Tea Traders' Association, stating that every effort would be made to expedite their issue in future, but that it had been found in practice quite impossible to obtain the information from gardens under a period of one month.

Considered letter of 1st February, from the Chairman, Assam Branch, conveying his views on the Memorandum by the Reporter on Economic Products to the Government of India, on the subject of a scientific officer for the tea districts.

Mr. Buckingham thought the first step should be to secure the services of an agricultural chemist, as it could hardly be expected to secure the services of a scientist whose experience would embrace all the subjects on which information was wanted. Mr. Buckingham did not see any difficulty as regards the equipment of a laboratory. The Committee decided that it would be now advisable to avail themselves of the offer of an interview with the Hon'ble Mr. Woodburn on this subject, and the Chairman and Mr. Ormiston undertook to represent the Committee in the matter.

Considered letter of 10th February, from Messrs. Begg, Dunlop & Co., enclosing letter addressed to the Chairman by Mr. W. H. C. Whigham, Manager of the Hautley Tea Estate, Assam, giving an account of certain insect pests which did considerable damage to the tea bushes in his garden from which he sent some cuttings.

It was decided to submit the letter and specimen to Dr. Watt, the report on Economic Products to the Government of India and to ask him for the favors of his report.

TEA IN AUSTRALIA.

There has been a good demand for China tea, and sales are reported at 700 half-chests common congou, 2,350 half-chests panyong at 4½d to 5½d, 650 half-chests panyong at 6d to 6½d, 50 half-chests panyong at 7d, 100 half-chests panyong at 8d, 350 quarter-chests buds at 6d, 200 quarter-chests buds at 8d, 200 half-chests kooloo and 300 quarter-chests S.O. pekoe at 6½d. Of Indian, 300 packages have been sold privately at 7d to 9d. Business in Ceylon covers 470 packages at 6½d to 9d, and 100 packages at 10½d to 1s 1d. At auction, on Tuesday, 101 packages Ceylon were sold at 6d to 8½d. At auction, on Thursday, 1,966 chests, 147 half-chests, and 50 quarter-chests Indian ex New Guinea were offered, and sales were made publicly of 1,198 chests, 147 half-chests, and 50 quarter-chests. The bidding at first was rather slow, as some of the earlier lots were rather unattractive, but as the sale advanced the bidding became animated, and the prices realised were firm all round. The sales were as follows:—Orange pekoe, 333 chests, 67 half-chests, and 50 quarter-chests at 7d to 10d; pekoe, 550 chests and 80 half-chests at 6½d to 10d; pekoe souchong, 315 chests at 6½d to 7¾d.—*Australasian*, Feb. 29.

COFFEE PLANTING IN NEGRI SEMBILAN.—From the report of the Acting Collector and Magistrate, Coast district, for the month of January 1896, published in the *Negri Sembilan Government Gazette*, we quote the following:—

On 1st January Mr. J. R. Watson, manager of the Port Dickson Coffee Company's estate, arrived from Johor with 110 Tamils (men, women, and children), and conveyed them by special train to the estate, which is at the 10th mile on the Railway. Very good work has been done by this Company during the past few months, 300 acres of forest having been felled, nurseries made and cooly lines constructed. A large number of coolies, consisting of Chinese, Tamils, Malays of the country, and Banjar Malays, are employed and Mr. Watson reports favourably on their health.

THE JAPAN TEA CROP.—The *Japan Weekly Mail* of Feb. 8 says:—There is nothing doing in Tea, and nothing yet can be said about the new crop, but if the recent cold spell we have had is much further prolonged, we shall look for a delay in budding and a late season.

TEA IN AMERICA.—We have received a copy of the *New York Press*, containing the report of an interview with Mr. Blechynden regarding the effect which the proposed duty on tea would have, and we hope to be able to quote it in our Monday morning's issue. It appears that it was with some hesitation that Mr. Blechynden consented to be interviewed, and he was very cautious in what he did say. If the standard was raised the pure teas of India and Ceylon would of course have to face a keener competition than they do now, but on the other hand an improved taste for good teas would be established. The views of Mr. Beling are also given.

THE "INDIAN FORESTER."—The contents of the February number are as follows:—I. Original Articles and Translations: An injurious insect in Jodhpur, by E. Stebbing; Re-afforestation of the Mahasu-Fagu Ridge, by Pandit Sunder Lal Pathak; Die Mathematik mdder Wald. II. Correspondence: Forest Appointments in Bombay, letter from 'Forest Officer.' III. Official Papers and Intelligence: Summary of Progress during the five years 1889 to 1894. IV. Reviews: Wood Working Machinery; Forest Administration Reports for 1893-94 for Bombay, Baluchistan and Burma. VI. Extracts, Notes, and Queries: Oil of Turpentine; Shifting Sands; Death of Professor Wilkomm; Dr. Grassmann; The Turpentine Tree. VII. Timber and Produce Trade: Churchill and Sims' Circular, January 1896; Market Rates for Produce. VIII. Extracts from Official Gazettes.

CENTRAL TRAVANCORE.—*Weather*.—Fine with a little land wind in mornings. *Tea*.—As is usual at this time of year, not flushing much. Pruning is going on in most estates just now. *Coffee*.—Crops fairly up to estimate with one or two exceptions. Nearly all new clearings have been burnt off, and in most cases the burns have been all that could be desired. At this time of year when the grass is burnt, more or less damage is caused by buildings being destroyed. One estate lost three lives and a writer's house in this way. Another estate had its factory burnt in which was stored 500 bushels coffee. This last however was caused by upsetting of an open kerosine lamp. I am told the accident was caused by the same cooly who managed to set fire to the Glenmary Factory three years ago in the same way. It seems almost incredible that the same man should do the same thing again.—*Planting Opinion*, Feb. 29.

TEA IN AMERICA.—Reviewing Mr. Blechynden's work in America during Dec. the *Pioneer* says:—If we make a suggestion it is that a large sum should be provided annually for extending such advertisements as are already issued in the States, where the people are accustomed to sensational posters and placards. The present age is one in which a demand for any article for domestic use or consumption can be created by extensive advertising, and many a firm spends thousands of pounds monthly in forcing its wares on public notice. This practice is found to pay, the greater the cost of the advertisements, the larger being the trade demand. If the Indian Tea Association were to flood America with announcements regarding the product in which they are interested, and keep up the pressure for two or three years, the effect would soon become apparent. The advertising would have to be on a large scale and it might cost some thousands of pounds, but it would be money well laid out.

THE ERECTION OF CENTRAL TEA FACTORIES on the Nilgiris is strongly and, says the *Madras Mail*, sensibly advocated by *Planting Opinion* in an article which will be found in another column. In these days of keen competition, the only way in which the small man can live is by co-operation. This is true in every business in which cheapness of production is a prime factor. The main reason, we believe, why Nilgiri tea does not generally secure the big prices realised by that of Darjeeling and the higher altitudes of Ceylon lies in the fact that a number of small estates have to depend for the manufacture of their leaf on under-equipped factories. There are many localities on the Nilgiris where a central factory might be worked at once to the advantage of the neighbouring tea-planters.

A FLOURISHING COMPANY.—The Bandarapola Estate Company is doing very well, and the extent of the property is being steadily augmented—plots of land, sometimes of very small acreage being continually added to the already large area of Bandarapola estate from the adjoining villages Ovals, Mnaudeniya, Godapola, Akirilla, Allacollamada, Bandarapola, etc. The new purchases are being put, some under tea, and others under cocoa, according to the soil. The villagers seem to have been convinced of the absurdity of keeping their holdings of land uncultivated, and so they dispose of their plots and some of them seek employment under the European purchasers. The gradual absorption of the surrounding properties in this way will in time make the Bandarapola Estate Company one of the largest Companies in the island. Sir George Pilkington, one of the directors of the Company, came up on a visit to the estate today, accompanied by Mr. Hugh Fraser. They drove to Bandarapola round Snduganga, and had a look over the new clearings on that side. After paying a flying visit, Sir George left for Kandy this evening with Mr Fraser.—*Matale Cor.*, March 6th. Local "Times."

THE SA TREE IN TEA CULTIVATION.—Referring to the letter on this subject which we reprint from the *Indian Agriculturist*, our contemporary says:—

We venture to think that Mr. Bamber, whose letter appears elsewhere, is labouring under a misapprehension. Dr. Watt's report has not appeared, and it is therefore premature to discuss his discoveries. At the same time, we would remind Mr. Bamber that neither he nor Dr Watt are the discoverers of the action of certain leguminous plants in nitrating the soil through the agency of root-warts. In a recent issue of the *Agricultural Ledger*, indeed, Dr. Watt gave the history of that discovery. He there maintains that investigators in Europe had restricted the formation of nitrogen-forming warts to the Papilionacea. The *Sa* tree (*Albizia stipulata*) belongs to the Mimoseae, and should therefore not have nitrogen-forming warts on its roots. Now the discovery that it does possess such warts is the discovery which Dr. Watt claims to have made. Mr. Bamber says that he also had made that discovery, but we do not find that the quotations from his book support this statement. Dr. Watt has every right to say that he was the first to publish the fact that a number of the Mimoseae forms on its roots nitrogen-giving warts. As to the practical aspect of the case it would seem that until Dr. Watt urged the cultivation of indigenous pulses as green manure, Mr. Bamber's recommendation for ground-nut, gram or lentils for the purpose received at most only a passing consideration. We doubt very much whether any of the pulses mentioned by Mr. Bamber would be half so useful as the *Matikalai*, specially recommended by Dr. Watt. Be that as it may, the value of a leguminous green manure, though well-known in Europe, seems to have been too long neglected by tea-planters.

FOR A SPECIAL DUTY ON TEA.

TEA MEN TO APPEAR BEFORE HOUSE
COMMITTEE OF CUSTOMS.

THEY WILL PRESENT PETITIONS FROM THE TEA TRADE—
VIEWS OF PROMINENT MEMBERS OF THE LOCAL TRADE
—NO AGREEMENT AS TO THE AMOUNT OF DUTY
TO BE CHARGED.

Members of the Committee of the Tea Trade of the United States will appear this afternoon, before the House Sub-Committee on Customs at Washington, to argue in favor of the imposition of a specific duty on tea.

The Committee will, it is understood, present a petition signed by nearly every important tea house in New York city, and will also present similar petitions from other large centres.

A representative of this journal, spent some time in the tea district on Saturday, in conversation with people engaged in the various branches of the trade; and found that the organized movement to restore the duty on tea is steadily gaining ground. Those in the trade in this city are almost unanimous in its support. The arguments advanced in its favor are varied, but the end in view is the same. They are not agreed as to the amount of duty to be charged, but it is generally maintained that a specific duty is absolutely necessary to effect an improvement, and it is confidently asserted that an improvement in the quality would bring about an increase in the consumption, and that tea would very soon become a popular beverage, as is the case in countries where a duty is levied. The result, they argue, would be satisfactory to all. The Government would receive a welcome addition to its revenue, the public would once more have a wholesome palatable beverage and a much needed improvement would take place in the tea business.

Appended are a number of interviews with practical tea men who are requested to give for publication their ideas on the benefits to be deprived from a specific duty.

Mr. Thos. A. Phelan, of Geo. W. Lane & Co. 93 Front Street: "There is hardly another article upon which a duty could be laid and at the same time benefit the people. Good tea is an economical beverage and an increase in consumption would be a National benefit. The only way this can be brought about is by the Government imposing a duty, a specific duty, and the higher the duty the better the quality that would be shipped to our country. It is worthy of note that while hotels and restaurants charge the same price for a cup of tea as they do for a cup of coffee, the original cost of a cup of coffee is about five times that of a cup of tea."

Mr. Chas. E. Beebe of Beebe & Bro., No. 130, Water street: "The policy of this country for the past 25 years has tended to fill this country with teas that cannot be shipped elsewhere, for the tea planters will always send their inferior grades to the country that does not charge a duty. They would be foolish to do otherwise, as they can afford to sell their goods here for less than the amount of duty which they would have to pay to get them into other countries. In fact anything they receive above the freight and other incidental charges is so much profit. A general prejudice against tea is the result of the admission into the country of such teas."

Messrs. Howlet & Lee: "What we want to revive the tea business is a specific duty of 10 to 25 cents a pound. An ad valorem duty would do no good; in fact, we think it would, if anything, create a worse state of affairs than exists at present, if that is possible. It is disheartening to see the consumption annually falling off, and we believe it to be directly due to the fact that consumers are given so much worthless, unwholesome quality. It is at present difficult for them to get good tea at any price."

Mr. E. M. Payne, 132 Front street: "The efforts that are being made to improve the condition of our tea trade by eliminating from our market all worthless low grade colored teas, whether done by legislation or education, is to be commended by every honest dealer and lover of pure tea."

"A moderate duty on pure tea, with a prohibitory one on all colored and adulterated tea, would be a blessing to every consumer, and especially to the poorer classes, who are the principal consumers of these low grade colored teas, for which they pay exorbitant profits to the retailers, actually receiving less of the pure essence of the tea in one pound than they would receive in one-quarter the quantity of the good article. These low grade teas bear the same relation to fine teas that the coarse, outside, ground-trodden, worm-eaten leaves of the cabbage bear to the tender, nutritious leaves of the head. Are these teas poisonous? The tea tester says no, but I claim that the tea experts are no authority as to whether these teas are poisonous; they are too good judges of tea to put filthy stuff in their mouth, and would no sooner drink a cup of it than they would drink a cup of water from a Chinaman's bath."

"Too little importance is placed on the benefits of good tea and the injury of bad tea on the human system. The alkaloid, theine, is craved by nearly all the human race. With the great masses a good tea satisfies that craving, while a poor tea only partly satisfies it, so that tobacco, snuff, morphine or liquor is resorted to. Statistics will bear me out in the statement that where the laborer uses good tea there is far less intemperance by the use of tobacco and liquor in that family than where the commonest teas are used."

Mr. F. S. James, of the firm of Fraser, Farloy & Varnum, an old and prominent house of Yokohama, Japan, and who has lately arrived from Japan, said.

"I have read, with interest, the various correspondence relative to tea duty, and as I am a tea packer I should like to give you my views on the subject."

"In my opinion a duty on tea would be a great benefit, not only to tea drinkers, but to tea importers, for the reason that it would keep out the trash and deleterious leaf that now reaches the States."

"In Japan this poor quality is grown in an almost wild state, near Nagasaki, and also in Mino, and is principally used for mixing purposes."

"A duty would exclude this from being imported and raise the standard of excellence, and the tea drinking portion of the people would gradually learn to appreciate leaf of good quality and help in time to increase the consumption of the article."

"The importer would benefit, because he would have to deal in a better article and reduce the risk that he at present runs in, having his teas rejected by the Custom House inspectors on account of poor quality."

"The Japanese Government have tried and are still using their best efforts to keep the growers from bringing trash to market, as it recognizes that the poor quality of a great deal of the tea now being shipped is spoiling the trade, and if this Government would only help it by levying a duty, the commonest sorts would entirely disappear and become a thing of the past."

Following is a complete list of the members of the tea committee:—Mr. E. Tomlinson, of Millikin-Tomlinson Co., Portland, Me.; Mr. A. S. Woodworth, of Robinson & Woodworth, Boston, Mass.; Mr. Fred'k Mead, Jr., of Fred'k Mead & Co., New York; Mr. Geo. H. Maey, of Carter, Maey & Co., New York; Mr. M. P. Heraty, of E. J. Heraty & Co., Philadelphia; Mr. Geo. N. Crouze, President New York State Wholesale Grocers' Association, Syracuse, N. Y.; Mr. Geo. E. Lavenack, Buffalo, N. Y.; Mr. Wm. H. Brace, of Phelps, Brace & Co., Detroit, Mich.; Mr. Greame Stewart, of W. M. Hoyt & Co., Chicago, Ill.; Mr. Abel P. Upham, of Sprague, Warner & Co., Chicago, Ill.; Mr. F. Sanders, of Sanders & George, Baltimore, Md.; Mr. P. H. Kelly, of The P. H. Kelly Mercantile Co., St. Paul, Minn.; Mr. M. J. Brandenstein, of M. J. Brandenstein & Co. San Francisco; Mr. F. H. Krenning, of F. H. Krenning & Sons, St. Louis, Mo.; Mr. H. E. des Bordes, of Preston, & Stauffer, New Orleans, La.; Mr. J. Wilcox, of The Rotan Grocery Co., Waco, Tex.; Mr. E. A. Wilrud, Secretary.

The Sub-Committee on Customs is composed of Representatives Dingley, Payne, Dalzell, Hopkins, Grosvenor, Crisp, and Turner.—*Journal of Commerce* (N. Y.), Feb. 17.

LONDON CINNAMON SALES.

The information to hand by the last mail regarding the Quarterly Sales of Cinnamon held in London on the 24th ultimo, is of even a more cheering description than the brief telegram on the day of the sale led one to expect. The Sales were reported irregular, though with a slightly upward tendency, and about 800 Bales were said to have been sold. We now find that the offerings were as many as 1,792 Bales, which though smaller than in November last, when 2,817 Bales were offered—an excessive supply for even the usually heavy sales at the end of the year—were greatly in excess of the quantity offered during the corresponding sales of the previous year, when only 766 Bales were offered. Of these 1,792 Bales, 1,207 were knocked down to bidders in the room, after good competition, at prices ½d to 1d higher than ruled at the November Sales, and about one-half of the remainder found buyers immediately after the auctions. The price of First Qualities of superior spice ranged from 1s 1d to 1s 5d per lb.—ordinaries fetching 11d to 1s; Seconds from 1s to 1s 3d, and 10d to 11d; Thirds 11d to 1s 1d and 9d to 10½d; Fourths 9d to 10½ and 8d to 8½d per lb.

Now, these prices may be considered nothing remarkable, as compared with those which ruled, say 20 to 25 years ago. True enough, but they are very good as compared with those which obtained 10 to 15 years ago. The really satisfactory feature in them is, we think, their uniformity. It will be remembered that at the August Sales there was considerable inflation, and ordinary sorts fetched as much as some of the best known brands of Superior Cinnamon, and in some cases secured even higher bids. It was apparent that the Sales were not *bona fide* throughout, that some of the bids were fictitious; and the explanation was that some speculators having imported large quantities of the spice, in anticipation of a rise in price consequent on the small offerings that were expected through the droughts which had distinguished 1894, ran up the market to save themselves loss through the imports having been beyond expectation. It was naturally expected that the result would be a serious fall in prices shortly after; but they were maintained; and although at the November Sales there were not the wild bidding and fanciful prices which had distinguished August, prices were by no means disappointing. The removal of artificial bolstering had not produced a violent run down; there was no demoralization in the market; and where prices receded, it was to their fair and normal limit. The ordinary sorts, which had been unduly inflated, did not rush down below their true value; the superior kinds, which had shared moderately in the advance, receded somewhat; but the averages compared favourably with those which had ruled for years past. This was a great gain, as it was feared, not only that the operations of August would seriously unsettle the market, but also that the rushing of large quantities of the spice into the London market under the stimulus of the extravagant bids at the August sales, would lead to a heavy fall. As we saw at the time, the November sales passed off fairly, notwithstanding that as many as 2,817 bales were offered, and that most of the parcels found buyers. The steadiness of the market and maintenance of prices for another quarter, after the experiences of two previous sales, are decidedly cheering features; and cinnamon growers may now fairly believe that the

demand for their spice, which had been slack for many years past, is decidedly better; and the proof of it is in the uniformly satisfactory prices which have ruled in the London market. The leading Kaderane Brands showed an advance of quite 1d—the highest price for Golua Pokuna having been 1s 4d in November, while last month it was 1s 5d. It is in common sorts, however, that the maintenance of prices must be regarded with special satisfaction. These constitute the bulk of our exports, and hitherto rarely went beyond 8d to 9d. At the last sales, the spice of the C. H. De S. (De Soysa) marks sold up to 10d and 10½d; and notwithstanding that they were “unworked.” Working is an operation which the Dock and Warehouse Companies indulge in for their own profit. It consists in undoing and redoing every bale at double or treble the cost of careful sorting and baling here, and objections to this costly and needless proceeding were met by the statement that the trade would not look at unworked spice. This was rather a reflection on the honesty of exporters here; but unworked cinnamon has been gradually working its way in the market; and now that it has the support of so influential a brand as C. H. De S., it is sure to be adopted. We congratulate Cinnamon Proprietors on the satisfactory outlook for their growths in the London and local markets, and append the report on the last sales by a leading firm in the trade:—

London, 26th Feb. 1896.

CINNAMON.—At the first auction of the year held on the 24th instant, 1792 Bales Ceylon were catalogued against 2,817 bales at the November sales, and 766 bales at this period last year. There was good competition and 1,207 bales were disposed of under the hammer at generally better prices, chiefly at ½ to 1d per lb. above November sales rates and since the auctions some 250 bales of the bought in lots are reported sold making a total clearance of close upon 1500 bales.

“FIRSTS” superior 1s 1d to 1s 5d good to fine 11d to 1s.

“SECONDS” superior 1s to 1s 3d, good 10d to 11d. “THIRDS” superior and fine 1s 1d to 11d medium to good 9d at 10½d.

“FOURTHS” good to fine 9d to 10½d and fair ordinary 8½d to 8d per lb.

Of Chips there offered 634 bags of which 250 bags were cleared at 3d to 3½d per lb. Quillings realized 5½d to 8½d per lb.

The stock here is 4,580 bales Ceylon against:—

1895.	1894.	1893.
3,385 bags.	3,515 bags.	3,520 bags.

The next auctions are fixed for the 1st June.

FORBES, FORBES & Co., Limited.
JAMES J. FORBES, Managing Director.

TEA PROSPECTS.

Tea Report of Messrs. Gow, Wilson, and Stanton of 28th February, apart from its general interest, is deserving of notice as embodying statistics for eight months from 1st June last relating to Indian, Ceylon, and China teas. The figures before us are eminently gratifying, save in one particular—price. In all other respects, Ceylon shows to advantage in the comparison. It is some time now since China was dethroned from its pre-eminence, and had to give place first to India, and next to Ceylon too; but the general reader may be startled to find how far the great celestial Empire lags behind our little island in the custom it commands in the British Isles and the London market. Even some of those specially interested in tea may not be

aware that the quantity of China tea entered for home consumption is only about one-third of what is taken from our produce. Taking the figure for the eight months from 1st June 1895 to 31st January 1896 for the last four years, we find that in 1892-93, the quantity of Indian tea on which duty was paid at all Bonded Warehouses in the United Kingdom, amounted to 71,359,321 lb., against 43,339,624 lb. from Ceylon, and 23,389,347 from China. The percentages were thus 52, 31, and 17 respectively of the total quantity. Each year has seen a rise in Ceylon teas and a fall in China teas, until for the 8 months ended the 31st January last, our ratio stood at 35 per cent, against China's 12 per cent. Our gain has thus been 4 per cent, and China's loss 5 per cent—India having gained during the year 1 per cent. And it is herein, we have cause for special satisfaction, that we do not yield even to our big neighbour! We are quite prepared to rejoice over India's successes, as everything that makes for the larger consumption of British grown teas is a gain, so far as it means the displacement of China; but despite brotherly feeling and comradeship, comparisons are inevitable between the two countries, and Ceylon shows to advantage in the comparison. From 52 per cent 4 years ago, India advanced to 53 per cent the following year; but she has not been able to gain on it—53 being the percentage for the last two eight-monthly periods. Not that her figures have been stationary, for she has advanced, year by year, from 71 million lb. in 1892-93 to 80 million lb. in 1895-96; but her advance has only kept pace with the increased consumption. Ours has gone ahead of it! Hence it is that our percentage has increased by 4, while India's has advanced by one. Thus, whereas the total quantity on which duty is paid has risen from 139 million lb. to 151 million within the four years, the increase in Indian tea has been (roughly) 9 million lb., and in Ceylon, too, 9 million, while the decrease in China has been about 5 million lb. The proportionate advance of Ceylon has been greater than that of India.

When we turn to the quantity of Tea exported from Great Britain—the figures are, of course, quite independent of those relating to home consumption—we again find Ceylon ahead of India, and in this comparison it is more distinctly so. Thus, while in 1892-93, the re-exports were almost the same—the figures for India being 2,167,931 lb., and for Ceylon 2,205,760—every year the distance between the two countries has widened, till the eight months under notice show 4,785,867 lb. of Ceylon Tea exported from Great Britain, against 2,593,201 lb. of Indian. For home consumption, the proportionate rise of our Teas has been greater than that of Indians, and for export our Teas have been more largely in demand. So long as the former fact remains, the latter cannot be turned to our reproach, as indicating a desire to get rid of our Teas. China Teas seem to be imported chiefly now for re-exportation; but even there the trade has been dwindling down; for whereas nearly 20 million lb. of China were exported in 1892-93, the figures for 1895-96 are 12½ million. This fact and the diminishing consumption of China Teas in Great Britain, as evidenced by the figures we have quoted in the first paragraph of our article, show how steadily British grown Teas are rising in public favour.

The one point in the situation which, as hinted above, fails to give satisfaction, is the price of our Teas as compared with India. The "stand-

out" Teas of India are almost invariably higher priced than ours; and in the catalogue before us, we have marks which fetched from 1s 2½d to 1s 3½d per lb.; whereas our highest figures are 1s 0½d to 1s 1½d. Often, the difference is even greater than a penny or two. One explanation may be that with a much larger outturn, finer Teas can be more easily manufactured; but that explanation cannot avoid the significance of the other fact, that the Indian weekly average is, too, almost always higher. For the week under notice, the Indian average was 9½d against 9¼d for the corresponding week last year; while our average had fallen from 9d last year to 8¾d. A larger outturn might excuse a lower average; but here India claims a higher average. We do not seek to explain the fact, but we desire to bring it prominently to the notice of our planting friends, so that they may make note of it, ascertain the cause, and, if possible, devise a remedy. The Island has for a long time maintained not only a high position, but even a pre-eminence, for its products. We need only mention coffee, cinnamon, cocoa, plumbago, and, to some extent, tea. Is there any reason why our teas should take second place? We are, of course, aware that we are India's junior in the contest; that elevation tells, and India has a wider range of highlands; and that the bushes in India have an appreciable rest, while ours are cropped all the year round. Is the explanation to be found in these circumstances? If not, has there been any growing carelessness in manufacture, or in cultivation, or in packing, which has been operating against us? It is for tea experts to decide. Then, what about all our teas being forced for sale into one day in the week? Can justice be done to them within the time allowed for tasting and bidding? These are some of the questions which demand an answer; and it will be for the Planters' Association to say whether they should not be investigated by a Committee.

TOMATO GROWING AT THE AGRICULTURAL SCHOOL.

We have had the pleasure of seeing and tasting some splendid tomatoes grown on "Cinnamon Sand" at the Agricultural School—by Mr. Rodrigo, the Dairy Manager, who has had a very successful season with a garden of tomatoes. The 7 fruits sent us which do not of course represent the average size, weighed over 3lb. and were very fine in taste.

THE HOME COFFEE DUTY.

Although it is certainly the case that our interest in the above topic is relatively small to what it was in the palmy days of coffee growing in this island, we are pleased to think that some of that interest yet survives, and that it may even some day increase. Without doubt there is a survival of it sufficient to ensure some local sympathy with the effort made by a deputation which recently waited upon the Chancellor of the Exchequer to advocate the abolition of the existing duty on the article. From some cause or other the consumption of coffee has been for many years steadily on the decline in the United Kingdom. It was stated by the deputation that this decline had amounted to about a million hundredweight, since 1873. It is difficult to realize that the imposition of the existing duty can account for this. The

charge of it upon the individual consumer must be too light to operate to the extent referred to above, and the Chancellor of the Exchequer pointed out with much pertinence that the reduction of the duty by one-half in 1873 had produced no increase of consumption whatever. It will probably be within the memory of many of our readers that when this reduction took place there were many of those concerned with the coffee trade who opposed it. Notable among these, if our memory serves us rightly, was Mr. J. L. Shand, who, we think, delivered a lecture at the Society of Arts in which he demonstrated that the reduction would be injurious to the interests of the Ceylon coffee growers. Apparently that view does not recommend itself to the present generation in the trade. This sees in a farther reduction the panacea for existing evils. But the Government is surely in the right in its convention that, were the relief of the duty on coffee to be granted the action would but herald similar demands with reference to other productions that might be languishing, and revenue, it is needless to point out, must be raised by some method of taxation. Altogether upon review of the paragraph sent to us, we are inclined to think that the Chancellor of the Exchequer had the best of the arguments with the deputation. We feel that the decline in the use of coffee must be attributable rather to the strong preference now shown for tea, than to what is a tax on the consumer of a very trifling character.

CINCHONA BARK.

(From C. M. & C. Woodhouse's Report.)

London, February 27th, 1896.)

BARK.—The public auctions held during January, comprised:—

971 pkgs. East India	} against	138 pkgs. East India
43 do Ceylon		194 do Ceylon
2 do Java		456 do African
733 do S. American		229 do S. American
		50 do Java.

during same period last year.

SHIPMENTS FROM CEYLON 1ST JANUARY TO 3RD FEBRUARY.

1896	70,677 lb.
1895	46,845 lb.
1894	311,885 lb.
1893	469,306 lb.

Although shipments from Java have lately been heavy, and since 1st October show an increase of 1,200,000 ½-kilos as compared with last year, yet the statistics of bark in Holland for the year ending 31st December are decidedly favourable, and if the importers of Java bark showed a little more firmness, an improvement in prices would soon follow.

On the 18th instant the monthly sales were held in London and 2,731 packages were offered, against 1,761 packages in January. The bulk of the East India bark sold with fair competition at an average unit of about 3d per lb.

On the 20th instant 7,715 bales, 325 cases Java bark were offered in Amsterdam, against 6,401 packages in January. The manufacturing bark was estimated to contain 36,005 kilos of sulphate of quinine. Of these 6,251 packages sold at a decline of 6 per cent, the average value of the unit being 2.82 cents, against 3 cents in January.

The next sales in London will be held on 17th March, and in Amsterdam on 26th March.

Quinine has been very dull during the past month in the absence of orders from America. German on the spot is quoted 1s 1½d per oz., but to effect sales, a lower price would have to be accepted.

	1896.	1895.	1894.
	Cwt.	Cwt.	Cwt.
Imports, 1 month	3,684	5,529	3,641
	£	£	£
Valued at	6,531	10,045	7,406
	Cwt.	Cwt.	Cwt.
Exported, 1 month	1,769	4,424	2,624
	£	£	£
Valued at	2,485	7,856	3,806

Stock of Quinine 31st January 1896, 1,963,888 oz., against 2,701,568 oz. 1895.

The present value of British Sulphate of Quinine (Howards') in bottle is 1s 4d to 1s 5d per oz., against 1s 4d to 1s 5d per oz. last year.

The present value of German Sulphate of Quinine (best marks) on the spot is 13½d (nominal) per oz.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed, during the week ending 29th February 1896, under the provision of Act V of 1888:—

For a Cleaning apparatus for the Acme Tea Sorting Machine.—No. 223 of 1895.—George Murray Collom, engineer and tea planter, care of W. G. Forbes, Esq., Her Majesty's Mint, Calcutta, for a cleaning apparatus for the Acme tea sorting machine or other machines of the reciprocating class. (Filed 18th February 1896.)

For Punkah-pulling Apparatus.—No. 229 of 1890. Mr. J. R. Romanes' invention for punkah-pulling apparatus adapted for the use of pulling punkahs in barracks, offices, private residences, etc. (Specification filed 14th November 1890.)

For Improvements in the Construction of Metal chests or boxes.—No. 253 of 1890.—Mr. Arthur Andrew's invention for improvements in the construction of metal chests or boxes. (Specification filed 24th November 1890.)—*The Indian and Eastern Engineer* March 14th.

PICKINGS WITH A LOCAL APPLICATION.

M. Berthelot, the new French Minister of Foreign Affairs, is now about sixty-eight years old. In his special domain of chemical knowledge he ranks among the first of his contemporaries. Chemical synthesis—the science of artificially putting organized bodies together—may be said to owe its existence to him. The practical results expected to flow from his experiments and discoveries are enormous. Thus, sugar has recently been made in the laboratory from glycerine, which Prof. Berthelot first made direct from synthetic alcohol.

Commerce has now taken up the question, and an invention has recently been patented by which sugar is to be made upon a commercial scale from two gases at something like 1 cent per pound. M. Berthelot declares he has not the slightest doubt that sugar will eventually be manufactured on the largest scale synthetically, and that the culture of the sugar cane and the beet root will be abandoned because they have ceased to pay.

The chemical advantages promised by M. Berthelot to future generations are marvellous. He cites the case of alizarin, a compound whose synthetic manufacture by chemists has destroyed a great agricultural industry. It is the essential commercial principle of the madder root, which was once used in dyeing, wherever dyeing was carried on. The chemists have now succeeded in making pure indigo direct from its elements, and it will soon be a commercial product. Then the indigo fields, like the madder fields, will be abandoned, industrial laboratories having usurped their place.

But these scientific wonders do not stop here. Tobacco, tea, and coffee are to be made artificially. Not only this, but there is substantial promise of such tobaccos, such teas, and such coffees as the world has never seen, will be the outcome. Theobromine, the essential principle of cocoa, has been produced in the laboratory. Thus, synthetic chemistry is getting ready to furnish the three great non-

alcoholic beverages in general use. The tea plants, coffee shrubs, and cocoa trees must some day follow the lead of madder and indigo.

Tobacco will be obtained in a similar fashion. Professor Berthelot has obtained pure nicotine, whose chemical constitution is perfectly understood, by treating salomine, a natural glucoside, with hydrogen.

—Grocery World.

Says the *Rubber World*:—

Not alone in coffee are the Straits Settlements becoming interested, but also, it seems, in respect to the cultivation of rubber. The *Ceylon Observer* has received a visit from the proprietor of a plantation in Lower Perak on alluvial riverside soil, which there are either planted, or about to be planted, some 500 acres of Para rubber trees. The progress of the clearing, and the eventual harvests of rubber made by the experimentalist, Mr. Baker, will be watched with interest. In the past two years, however, a good deal has been done in Para rubber in Ceylon, especially in the Kalutara and other low-country districts.

Here is an amusing parody of Goldsmith, describing the state of affairs in the West Indies:—

Ill fares the land, to hastening ills a prey
Where blacks accumulate, and canes decay;
Plantains and yams may flourish, or may fade;
You scratch and grow em—capital, a spade;
But great estates, that erst on sugar thrived,
Once squatted on, can never be revived.

Mr. Westinghouse, the well-known inventor, manufacturer, and capitalist, confirms the announcement recently made that he has "solved the problem of converting coal into energy without the intervention of steam." In other words, he claims to have discovered a simpler method for generating electricity directly from coal. The reputation of Mr. Westinghouse is an ample guarantee of his sincerity. What he says he undoubtedly believes. And there is no man more capable than he of judging what a new device in the development of power will accomplish. It is, therefore, reasonable to assume that the time is at hand for the discontinuance of the use of steam generators in developing electric force. With all the progress that has been made in steam engineering, it has been impossible hitherto to utilise more than 10 per cent. of the power of the coal consumed. The waste of energy is enormous—beyond calculation. Of every 100 tons of coal consumed under boilers on sea or land, 90 tons are lost. It is claimed that Mr. Westinghouse's discovery will save more than half this waste. If this claim should be verified by experience, the discovery would mark an era in human progress. The apparatus which is to perform these wonders is very simple in construction. Turning coal into producer gas is the idea. In doing this the least number of heat units are lost, so that the resulting gas contains 90 per cent of all the heat units of the coal, while this gas has been used with great success for metallurgical purposes, it is not one that can be distributed for heat or light, so in the development of power the gas-producer apparatus must be located in close proximity to the gas engine. Thus the gas is easily converted into electrical energy. Since the alternating currents of 10,000 volts can be easily delivered and used, and by means of Tesla's multiphase actors be handled for the transmission of great power, it follows that sites can be selected for establishing the generating plants where coal can be conveniently delivered.

The report of W. F. T. McHarg, an assistant conservator of forests in the Upper Burma states that the rubber from the west of the Mindu hills comes from the *Ficus elastica* and not from a creeper as was generally supposed. The most interesting point in this discovery is that heretofore it was not believed that this tree flourished in such low latitudes, though the major part of the Burmese rubber output has always been known to be the product of the *Ficus* trees. As a matter of fact exploration does not point to any great increase in the output of rubber from the Mindu district but the news is of extreme interest from a botanical standpoint.

The report of the valuation survey throughout that country as published in the *Indian Forester* is of great interest, especially the portions that treat upon the

chats with the heads of different villages who are but just learning that rubber is valuable, but do not know how to gather it. Those who have learned the work, however, are intelligent enough to appreciate that the trees must be allowed rest between the tappings, and that the incision must be such that the wound may heal easily. The trees are all tapped in cold weather, as then the yield is best. There are only a few men in a village who are expert enough to do the work, as it necessitates a great deal of climbing. They tap not only the aerial roots but the large branches, indeed, anything that is large enough to bear a cut.

The following will raise a smile among those who have not forgotten the Rev. H. R. Haweis, who visited us some time ago:—

While doing some pioneer lecturing during his recent visit to New Zealand, Mr. Haweis occasionally found himself regarded in a dubious manner by reason of his violin. On visiting an out-of-the-way place, where he was going to lecture on music, a deputation of local big-wigs came to the station to meet him and escort him to the place of entertainment. He alighted only to find that these august personages failed to recognise him, and he heard them inquiring of the stationmaster, "Hasn't the lecturer come by this train?" "No," was the reply; "there's nobody come, but you little chap with the fiddle case."

THE TEA MARKET.

The Tea market exhibits the same distinctive feature that has generally characterised it during the season—viz., a constant steady demand for "character" teas, which have not been abundant, whereas the preponderance of ordinary quality has kept the market frequently over-supplied, hence the lower range of prices that are current as against last year. With supplies for the season from India drawing to a close, attention will now be diverted chiefly to Ceylon growth. Recent imports comprise a marked absence of teas with point. The few invoices received from favourite gardens realise better averages, and that alone should encourage the manufacture of a better class. Java growth comes more into prominence as quality improves. China is almost a dead letter, but at current quotations surely must be worth attention on the part of blenders of tea "for price."—*L. & C. Express*, March 6.

MARKET FOR TEA SHARES.

Thursday evening, March 5.

Business still goes on increasing in the shares of all the better known Tea companies, and the Stock Exchange official list, besides numerous daily "markings" of business, shows rises during the week in the quotations for no less than seven out of the seventeen Indian companies included in the "List," while in one case (Singlo) there have been three successive advances, bringing the quotations of 10½ to 11½ up to 11—12, at which it now stands. This upward tendency now looks like being intensified up to the dates when the various companies issue their reports and announce their dividends.

Mincing Lane keeps firm for Indians, though easier for Ceylons.

FRESH ISSUES.—Dimbula Valley Prefs. seem "a shade" easier at ½ prem. to 1 prem. only.

CEYLON SHARES.—C. T. P. Co. Ordinary have been done at 26, and more wanted, even at this elevated figure. The Prefs. ask £17 upwards.

Eastern Produce and Estates shares have changed hands at 4½.

Lankas have been taken at 5½, and now ask more money.

Ouvahs are said to have changed hands at 10½ or thereabouts.

Ceylon Debentures.—Business, we hear, has been done in some of these at a premium for ¼ per cent.—*H. & C. Mail*.

DRUG REPORT.

(From the *Chemist and Druggist*.)

Feb. 29.

OILS (ESSENTIAL).—Citronella, 2s to 2s 1d per lb. on the spot. Lemongrass, 2½d per oz. spot, 2½d per oz. c.i.f. January-March.

THE TEA SALES.

To the Editor of the *H. and C. Mail*.

SIR,—I hoped to have seen last week some marked criticism of my proposals in regard to the public sales, but I suppose "the market" has "such a big mind it takes a long time making up." Some suggestions have reached me since, which, I think have reasonable foundations. One is as regards the Indian sale on Monday, "That it should commence at 11 30 o'clock instead of 12 o'clock and be adjourned at 3 o'clock until Wednesday." Another is, "That all garden teas should be printed in separate catalogues and sold on a certain day, whilst Calcutta bought tea and reprinted or second hand lots should be printed also separately and sold by themselves. The reason for this suggestion is that many buyers do not taste any other than garden invoices, and it seems a great waste of time forcing them to sit hour after hour in public sale whilst Calcutta invoices, which they have not seen, are being auctioned. It might be supposed that the sellers' interests would suffer by this, but a moment's consideration will show that a roomful of indifferent people who are taking no interest in the sale, but chattering to one another, will do more harm to the seller than their absence would occasion. Some change will be needful before this year is out, and a free discussion may help to make that change in the wisest manner.—I am, &c.,

D. F. SHILLINGTON.

—*H. and C. Mail*, March 6.

PLANTING AND PRODUCE.

MANCHESTER AND THE DISTRIBUTION OF PRODUCE.—The good people of Manchester yearn to show their independence of Mincing Lane, and some of them seem to think that, thanks to the Ship Canal, they can do it. Direct shipments of tea and other produce arrive and are duly disposed of; and now an Association, called the Manchester Fruit Brokers, Limited, has been formed for the purpose of providing a ready means of distribution for tea, coffee, and dried fruit brought into the Cottonopolis district via the canal. The support of the leading shippers of the commodities named is stated to be assured, and it is expected that as a result this branch of the import trade over the waterway will show a considerable development. The new Association is to be continued on pure brokerage lines, similar to those which prevail in Mincing Lane.

PLANTING IN BURMAH.—Attention is being directed in India to the capabilities for planting enterprise offered by the Kachin Hills and the neighbouring immense tracts of primeval forest, but it is said that the extreme scarceness and dearness of labour in the district stands in the way. A correspondent who knows the parts in question believes "the whole country would be an ideal planting district, especially for tea." The climate is suitable and the soil good, but labour is most expensive. There will shortly be a railway, however, to Myitkynia, and produce would in no case be more than forty miles away. During the cold weather there is a steamer service on the Irrawaddy, and country boats, which are fairly cheap, are to be had all the year round." The tea-growing region he believes to be one of the best in the world. The height of the hills ranges from 1,000 ft. to 6,000 ft., and the rainfall is abundant—o; as he puts it, there is "a fertile soil and heaps of rain." The labour question has to be considered, and the chance in favour of introducing Chinese labour, which, by the way, is not always cheap.

THE DOOARS PLANTERS AND THE GOVERNMENT.—The tea planters of the Dooars do not appreciate the lead-

ing strings which the Bengal Government wishes to employ in regulating the development of tea cultivation in that district. The proposed rules for the quantity of waste lands for cultivation are calculated to irritate the cultivator very considerably, and it is not surprising that the Indian Tea Association have expressed their opinion on the subject very forcibly. One rule lays down that a grant of land on an individual application shall be limited to 1,500 acres, the Government being under the impression that a garden of greater extent could not be worked with advantage. But the planters are of opinion that such a limitation would be most detrimental to their interests, as gardens of larger areas have invariably been the most profitable, the tendency being to amalgamate the smaller gardens and to carry on work on a large scale. If capitalists are restricted to comparatively small areas they will not care to invest. Another rule debar an applicant from applying again for more land until five years of his first lease have expired. The effect of such a rule would be to prevent successful planters of experience from extending their plantations for some years at least. This rule is also open to the same objection as the one restricting the limits of a garden to 1,500 acres. It is also proposed to introduce the sale of waste lands by auction, although this method has involved much trouble in Assam. These restrictions and the fact that only a thirty years' lease is to be granted are naturally resented by the tea planting community, who rightly think they are entitled to much more consideration at the hands of the Government.

THE DUTY ON COFFEE.—The Chancellor of the Exchequer has declined to entertain the idea of abolishing the duty on coffee. The deputation of coffee-traders which waited upon him last week had some good reasons to urge in favour of their proposal. The trade in coffee has been steadily declining for many years. Compared with that of 1873, the trade of the past year shows a decrease of a million hundredweight, so that the import of coffee is now only about three-quarters of a million and the exports half a million hundredweight. This decline is attributed to the hindrances thrown in the way of merchants by the system of warehousing in bond, which is necessitated by the duty. If, say, the traders, coffee could be imported free, it could be prepared for use here as cheaply as in Hamburg or Holland, and the trade would revive. The consumption of coffee in England has steadily diminished—in 1870, nearly one pound was consumed per head, and in 1894 only about two-thirds of a pound—so that the future of the trade evidently depends upon the extent to which the exports can be increased. The deputation pointed out that the Customs, to collect a paltry gross revenue of £174,000 on 249,000 cwt., controlled, and no doubt unintentionally, were fast destroying the poor remnant of our great coffee export trade, which is still 447,224 cwt., or not far short of double our home trade. The Customs, in short, to obtain 1½d per lb. on coffee, have to take in charge three times the amount they get duty on, and hamper business. It was further pointed out that it had been for many years the policy of our finance Ministers to levy duty only on commodities bringing in some substantial revenue, and also that our successive Governments owed a debt of expiation to the coffee trade for so long allowing it to be the prey of the adulterator to an extent permitted in no other trade. The imports of chicory were more than half as much as the entire home consumption of coffee, so that on the average our consumers drink 0.36 lb. chicory to 0.71 lb. per head of coffee. This does not represent the adulteration, for a vast number of people even now drink pure coffee, while coffee may be, and is adulterated with 70, 80, and even 90 per cent. of chicory, and freely sold at the price of pure coffee. The deputation was listened to with his habitual courtesy and attention by Sir M. Hicks-Beach, but he gave them no hope whatever of an abolition of the coffee duty. Sir Michael argued that the decline of the export trade was due to other causes, such as the tendency of Brazilian coffee to go to Continental ports rather than to London, and he could practically do nothing for the coffee industry.

THE QUARTERLY SALES OF CINNAMON.—Cinnamon has this year shown an advance in rates. The landings of the Ceylon description in London during the eight weeks ended the 22nd ult. were 1,435 pkgs. against only 585 packages in the same period last year. The total deliveries amounted to 1,080 pkgs. as opposed to 785 packages, and the stock at the above-mentioned date showed an excess of 1,245 packages, being 4,610 packages against 3,495 packages in 1895. The periodical sales held last week comprised 1,790 bales Ceylon, which met a fairly good demand for although the prices realised were not fully on a par with those lately current by private treaty, they were $\frac{1}{2}$ d to $\frac{3}{4}$ d per lb. higher than in November, 1895, and the commonest sorts went at the extreme advance. Of the whole quantity offered about 1,400 bales were described a "unworked," and these parcels, as well as the remainder of the supply, found free buyers as the following rates:—Low to fine firsts at $9\frac{1}{2}$ to 1s 1d, superior at 1s 2d to 1s 5d; seconds from 9d to 1s 1d, finest at 1s 3d; thirds at $8\frac{1}{2}$ d to 1s 1d; fourth and fifth qualities at 8d to $10\frac{1}{2}$ d; and broken (in three boxes) at 9d to 10d per lb. A favourite growth which failed to appear in the previous sales fetched the top market value.—*H and C. Mail*, March 6.

TEA IN AMERICA.

New York, Feb. 19.

We can only repeat the old, old story of a dull and unsatisfactory market. Recently, there was sold an invoice of Japan-Gunpowders at $33\frac{1}{2}$ per cent. less than the actual cost of the manufacture in Japan, and which the owner would be glad to resell at 12c per lb. which is still below the cost of manufacture. Low grade teas are in buyers' favor, in fact every grade except such as may be in scant supply.

Today at noon the Montgomery Auction and Commission Company will sell 6,215 packages, viz.: 999 half-chests Moyune; 2,105 boxes Pigsuey; 36 half-chests Japan; 97 half-chests Japan, basket fired; 179 half-Congou; 25 boxes Capers; 197 packages India, Java and Pekoe; 30 half-chests and boxes Amoy; 333 half-chests Foochow—new season's; 2,304 half-chests and boxes Formosa, including new season's.—*American Grocer*.

FOR A SPECIFIC DUTY ON TEA.

ARGUMENTS BEFORE SUB-COMMITTEE OF WAYS AND MEANS.

MEMBERS OF THE TRADE OF NEW YORK, BOSTON, AND OTHER CITIES MAKE STRONG PRESENTATION IN FAVOR OF A SPECIFIC DUTY—BY THIS MEANS THEY HOPE TO KEEP OUT THE POOR TEAS WHICH ARE FLOODING OUR MARKETS.

WASHINGTON, Feb. 17.—A strong presentation of the case for a specific duty on imported tea was made before the sub-committee of the Ways and Means Committee today, by the delegation of importers which came here for the purpose from New York, Boston, and other importing cities. Governor Dingley, the chairman of the full committee, presided, and the other members present were Messrs. Payne of New York, Dalzell of Pennsylvania, Steele of Indiana, Turner of Georgia, and McMillin of Tennessee. They all paid keen attention to the closely reasoned arguments of Mr. E. A. Willard, the secretary of the committee of the tea trade, who has done so much to give definite shape to the present movement. Mr. Fredk. Mead, Jr., of New York, Mr. Geo. H. Macy of New York, and Mr. Charles U. Shepard.

Mr. Willard stated that a duty of 10 cents per pound would accomplish what was desired in the direction of shutting out cheap and injurious teas, and that the United States was the only country that did not impose a duty. Governor Dingley inquired whether the bill introduced by Representative Cummings imposing a discriminating duty of 10 per cent ad valorem on teas from the west of Capo of Good Hope would not serve the desired purpose. Mr. Willard replied

that he did not think that it would serve, because an ad valorem duty would make the duty so much heavier on the high class tea than on the low class that it would not effectually shut out the latter. Mr. Payne inquired whether the importers had not changed their minds since they advocated a discriminating duty before the committee in 1890. Mr. Mead replied to this question by saying, that they had not changed their minds, and that the bill then presented had an entirely different purpose. It was to shut out the English jobbers, who could carry teas so much cheaper because of the difference in warehouse charges and other charges in England. It was also aimed against the 10 per cent discriminating duty imposed by Canada upon tea.

"We do not come to talk about revenue," said Mr. Mead, "we want to shut out so much trash and poor tea which has come to such a pass that one-third to one-half of that imported has been sold at ten cents or less. It is all sold at retail at fifty cents a pound. People will not buy any tea at lower prices, but retailers give presents with it. Nearly all that trash comes here and shuts out good tea from this country. It has been going on for some years, but has grown to enormous proportions this year.

Mr. Payne inquired whether they did not mix it with good tea.

"O, no, sir; they do not mix it with good tea at all," replied Mr. Mead. "They give presents with it. Through the West and Southwest you really cannot get a cup of good tea. The consumption is fast decreasing."

Gov. Dingley inquired why the law prohibiting the importation of such bogus teas was not more effective.

"In the first place," replied Mr. Mead, "the law provides for an arbitration, and if the staff is shut out by an inspector the importer appoints one, and the Government one, and these two appoint a third, member of a board of arbitration, which is a mere matter of bargain, and the arbitration becomes a farce. People do not like, as arbitrators, to sit down on their neighbours' tea. In addition to that, if it is shut out in New York it slips in somewhere else. Mr. Bunn, the Appraiser at New York, told me that they had tried very hard with that law and found it impracticable to shut out this poor tea. There is a good deal of this tea that would not come under that law, because it is tea, although it is a very low grade tea. Mr. Bunn said to me that if Mr. Dingley wants him to come before him and tell him about this, he will be very glad to do it. He agrees with us that a specific duty on tea is the only solution for us. He sent out a man through the West, and that report is in the Treasury. We cannot come to any conclusion how that law could be made practicable."

Judge Turcer inquired the prices of teas and said, that he would like to hear from the consumer, but Mr. Mead assured him that the consumer could get no good tea now and none at retail less than 50 cents a pound.

Mr. Dalzell inquired how a specific duty of 10 cents would shut out poor tea for the benefit of good tea.

Mr. Meade pointed out that a duty of 300 per cent, the ad valorem equivalent of 15 cents a pound on 5-cent teas, would prevent bringing the lower grades into the country. He explained, also, that the tea was not brought here by American purchasers, but was sent by foreign shippers on credit and that if there was a duty these shipments would not be made. That, he declared, was the history of the matter during the war. We had no bad tea while the duty was on. The stuff that we got before that ceased coming. It was nothing but the specific duty that did it.

Mr. Willard resumed his argument and declared that one of the largest firms in the trade had given up buying tea, but was still handling it on these credits. This firm thought that the business ought to be stopped, and had signed the petition to the committee. The tea sold at 50 cents with presents thrown in, Mr. Willard declared, is absolutely injurious to the people, and there is nothing but the presents that makes it go. People were coming to know much less about tea than formerly.

Governor Dingley again put the question, "Mr. Willard, do you not consider it practicable to exclude injurious adulterated and bogus teas by a direct act appropriately framed with proper administration—to do it directly rather than indirectly?"

"No, sir: I do not," was Mr. Willard's reply. "We have given that subject as much thought as possible for twelve years. We have thought of everything we can think of, but the fact is, if we could improve it at New York and Chicago, it would come through some other port. It has been shnt out of New York and comes back through Canada and Providence. That has happened. Every town that shnts it out and lets it in to some other town has lost some of its distributing trade. There is no way to do it except the universal barrier of a specific duty. That operates in every city, and there is no other way that it can be done."

Mr. Mead then read the opinion of a retailer printed, as he said, in the *Journal of Commerce and Commercial Bulletin* of Jan. 23rd. He said, in reply to Judge Turner, that he did not believe the subject could be reached readily by the Police powers of the States.

Mr. Charles U. Shepard, the South Carolina tea grower, attracted the keen interest of the committee by his descriptions of his experiments at Sommerville, S.C., twenty-three miles from Charleston, during the past half-dozen years. He said that he had recognized from the start that it was impossible to compete with the Orient on cheap or medium grade teas. He had obtained seeds of the best grades and there was no question about making the tea green nor about obtaining a good quality. He believed that the finer grades could be profitably produced here, and said that he had increased his production from 200 pounds three years back to 450 pounds two years ago and 850 pounds last year and expected to raise 2,000 pounds next year. He had made many errors and mistakes, but so far as he could determine he had succeeded in obtaining a yield of 1½ ounces of good tea to the plant.

This petition in favor of a specific duty on tea was presented:—

"We, the undersigned, engaged in the tea trade of New York city, are in favor of a specific duty being placed upon tea. (Signed); Frederick Mead & Co., Geo. W Lane & Co., H W Banks & Co., E J Heraty & Co., The G B Farrington Co., G R Montgomery, S W Gillespie & Co., Hewlett & Lee, Irwin, McBride, Catherwood & Co., E D Morgan & Co., Mosle Bros., Middleton & Co., W P Roome & Co., E F Phelan, Russell & Co., L F Jackson, T A Sheffield & Co., Wells Bros., Purdon & Wiggins, Jos. —*Journal of Commerce*, (N.Y.) Feb. 18.

PALMERSTON TEA COMPANY, LIMITED.

The memorandum and articles of Association of the Palmerston Tea Company, Limited, are published in the *Gazette*. Among the objects for which the Company is established are.—To purchase the follow-

ing estates, to wit: (1) Palmerston, situated in Dimbula, Ceylon, containing in extent 212 acres or thereabouts, for R248,500 currency or £4,500 sterling; and (2) Queensland, in Maskeliya, Ceylon, containing in extent 281 acres or thereabouts, for R149,000 Ceylon currency or £3,050 sterling, as from 1st January, 1896, upon such terms and conditions as may be agreed upon between the Company and the proprietors of the said respective estate, and for such purpose forthwith to borrow at interest the sum of £7,550 English sterling currency, upon primary mortgage of the said estates and premises or any part thereof. To improve, plant, clear, cultivate and develop the said estates, and any other lands that may be purchased, leased, or otherwise acquired, as tea estates, or with any other products, or in any other ways, and to construct, maintain, and alter any buildings or works necessary or convenient for the purpose of the Company. To acquire or establish and carry on any other business, manufacturing, shipping, or otherwise, which can be conveniently carried on in connection with any of the Company's general business. To purchase tea leaf and (or) other raw products for manufacture, manipulation, and (or) sale. To carry on the business of planters of tea and other products in all its branches. The liability of the Shareholders is limited. The capital of the Company is R1,000,000 divided in 2,000 shares of R500 each, with power to increase or reduce. The shares forming the capital (original, increased, or reduced) of the Company may be divided into such classes, with such preferences and other special incidents, and be held on such terms, as may be prescribed, by the articles of Association, and Regulations of the Company for the time being or otherwise. Shares have been bought by Messrs. Percy Bois, W. Moir, E. M. Shattock, G. H. Alston, G. Chapman Walker, J. E. Alston, and F. J. de Saram.

HIGH FOREST ESTATES COMPANY, LIMITED.

At the first annual ordinary general meeting of the High Forest Estates Company, Limited, held on March 21, the report and accounts were adopted. There were present Messrs. J. G. Wardrop (in the chair), G. Halston and G. W. Carlyon (visitors), C. A. Leechman, G. C. Walker, W. Moir, L. E. Edwards, C. J. Donald, and A. Thomson by his attorney G. W. Carlyon.

THE REPORT

was in the following terms:—

	ACREAGE.
Tea in bearing ..	430 acres.
„ in partial bearing ..	103 „
„ not in bearing ..	53 „
Coffee ..	51 „
	—
Forcst ..	637 acres.
Patna Land, &c. ..	952 „
	43 „
	—
	Total. 1,632 acres.

The Directors have pleasure in submitting to the shareholders, the Accounts of the Company for the months of November and December, 1895.

The Expenditure on Working Account for these months was extremely high, as the Estate had to receive very careful treatment, it having been found necessary to change the entire system of cultivation and management, whilst a large new labor force had to be secured and trained to a proper mode of plucking. A marked improvement in the appearance of the tea is already visible, and to bring the bushes into a satisfactory condition, this special treatment will be required for some time to come.

The two months' working shows a loss of R1,926.98 on Estate account, and after paying preliminary expenses and Colombo charges, there remains a balance of R3,608.54 to be carried forward to the debit of the Current year's account.

During the period under review the sum of R17,470.21 was spent on Capital Account for Buildings, Machinery, and Nurseries.

It is intended to plant up with Tea this year 200 acres of jungle land as well as 51 acres now under Coffee, and a commencement of these extensions has already been made.

The expenditure on Capital account this season is estimated at R104,578, which, in addition to the above, includes the cost of rebuilding and enlarging the Factory, additional Machinery, the erection of two new Bungalows, and large accommodation for coolies, as well as Nurseries, etc. for further extensions.

The yield of Tea in 1895 is estimated at 200,000 lb. against an expenditure of R65,948. This sum includes the extra cost of manufacturing a considerable proportion of the crop on neighbouring estates instead of in the Company's own Factory, which, however, is expected to be ready for working in May.

The appointment of an Auditor for the current year will rest with the Meeting.

By order of the Directors.

WHITTALL & Co., Agents & Secretaries,
Colombo, 13th March, 1896.

MAHA UVA ESTATE COMPANY.

At the annual ordinary general meeting of the Maha Uva Estate Company, Limited, held on March 21, the report and accounts were adopted and a final dividend of 8 per cent was declared making 16 per cent for the year. There were present:—Messrs. C. A. Leechman (in the Chair) and G. W. Carlyon. Directors; Messrs. W. H. G. Duncan and A. Thomson (by their Attorney Mr. G. W. Carlyon) Mr. H. Tarrant (by his Attorney Mr. C. A. Leechman) and Messrs J. MacLiesh and E. S. Anderson (by their proxies Mr. G. W. Carlyon). The following is

THE REPORT:—

ACREAGE.	
Tea in full bearing ..	144 acres
„ „ partial bearing ..	155 „
„ not in bearing ..	306 „
Coffee amongst Tea (160 acres)	
Cardamoms in bearing ..	10 „
„ not in bearing ..	60 „
Grass ..	15 „
	—
Total Cultivated ..	690 acres
Jungle and Waste land ..	249 „
	—

Total of Estate—909 acres

The Directors have pleasure in submitting to the Shareholders the Accounts of the Company for the past years.

The crops secured during the season were 105,472 lb. Tea, 2,453 bushels Coffee, and 615 lb. Cardamoms, which were sold at average net prices of 52 cents per lb. R16.80 per bushel and R1.18 per lb. respectively. The weather was generally favourable for tea and coffee, and the estimate of the former was largely exceeded, whilst the Coffee crop proved to be an exceptionally good one.

After making ample provisions for depreciation of Buildings and Machinery the net profit, including a small balance from 1894, amounted to R46,590.79. An Interim Dividend of 8 per cent was declared on the 3rd August last, absorbing R22,800 and the Directors recommend a final dividend of 8 per cent making 16 per cent for the year. The sum of R990.79 will then be left to be carried forward to the current year's account.

During the year 30 acres of land were planted with Cardamoms and 6 acres of old Cardamom fields with Tea, whilst about 5 acres of land were purchased from a neighbouring proprietor. The Directors are pleased to report that all the young clearings are progressing favourably.

The Capital was raised on the 1st January 1895, to R285,000 by the issue of 90 shares at par, and the Directors propose to offer the remaining shares (30) to shareholders in the course of the year, at a premium to be fixed hereafter.

It is intended to plant this year 10 to 15 acres more land with Cardamoms and to replace with Tea

the remaining 10 acres of old Cardamoms, which are now almost exhausted.

The estimates for 1896 are 127,000 lb. Tea, 400 bushels coffee, and 500 lb. cardamoms, against an expenditure on Working Account of R42,701. The estimate of coffee crop is merely a preliminary one, as it is impossible at this early period, to judge how much will be gathered by the end of the year. A further sum of R5,220 has been allowed in the Estimates for upkeep of young clearings and extensions, whilst an engine and boiler will probably be needed to provide against any temporary failure of water power.

In terms of the Articles of Association, Mr. C. A. Leechman now retires by rotation but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.—By order of the Directors,

WHITTALL & Co.,
Colombo, Feb. 28, 1896. Agents & Secretaries.

COFFEE PLANTING IN KLANG.—The *Singapore Free Press* of the 11th inst. has an editorial article dealing with the abandonment of the blocks of “supposed coffee land” at Klang purchased by Messrs. T. N. Christie and W. Forsyth, in which it is said, that the “only party that has profited out of their loss is the Government of Selangor, which is well in pocket to the extent, in one of these cases we understand, of some \$15,000, for which, as investigation has proved unfortunately, the Government, through no fault of its own, has given no valid consideration. The position is one out of which there is only one way, seeing that we are bound to credit a Government, until the contrary be proved, with the principles of a gentleman and man of business, instead of the predatory instincts of a Shylock. We do not, of course, assume for a moment that the Government will do anything else, than that which self-interest as well as ordinary honesty dictates, and we therefore, take it to be granted that the planters who have felt it necessary to throw up their land, on which they have sunk money in most cases in useless clearing, will be given the open option of selecting similar areas in any other localities within the State, with a fair time for the exercise of that option, say one year, in lieu of the handsome prices extracted from applicants for land by the easy process of putting up a limited number of blocks in one area and then putting the applicants against each other by dint of auction. We shall yet hope that by a liberal and honourable policy towards the disappointed planters the Selangor Government will do itself a good turn by still securing Messrs. Forsyth and Christie among the members of the planting community of Selangor. It is now in the power of the Selangor Government to make for itself a decent name amongst the holders of planting capital elsewhere. The world is wide and suitable areas for planting enterprise, are gaping by the hundred thousand acres in many tropical lands. It should be the policy of Selangor to tempt, not to choke off by a Scrooge-like policy, the men whose advent would be but the beginning of a procession of investors for where one eminent planter goes, others are ready to follow, relying on his judgment and on his experience. But where one or two eminent planters go and have reason given to them to refrain from staying, that is a lesson that will be greedily assimilated by hundreds outside who are watching the result of their experiment. We have some faith in the Selangor Government, if left to itself, and its own appreciation of the position.

THE ESTATES COMPANY OF UVA, LIMITED.

At the first annual ordinary general meeting of the Estates Company of Uva, Limited, held on 21st March, the report and accounts were adopted and a final dividend of 4 per cent was declared making 8 per cent for the year. There were present Messrs. G. W. Carlyon in the chair, C. A. Leechman and W. H. Figg, Directors; Messrs. G. J. Jameson, W. Moir, H. H. Capper, Mrs. E. Mandy (by her attorney Mr. J. Wilson), Mr. J. MacLeish (by his attorney M. J. Wilson), Mr. H. Tarrant (by his attorney Mr. C. A. Leechman), Messrs. A. Thomson and W. H. G. Duncan (by their attorney Mr. G. W. Carlyon) Messrs. G. S. Anderson and A. F. Souter and Mrs. C. Souter by their proxy Mr. G. W. Carlyon.

THE REPORT

is as follows:—

	Tea in full bearing.	Tea in partial bearing.	Tea not in bearing.	Coffee, Cocoa & Cardamoms.	Timber Trees and Grass.	Total Cultivated.	Forest & Waste Land.	Total.
Dammeria (including Mahatenne, Velloongalla and Tillycairn)	399	54	117	51	23	644	486	1130
Battawatte (including Forest Hill)	209	110	226	43	24	612	135	747
Gampaha	282	50	127	71	82	612	257	869
	890	214	470	165	129	1868	878	2746

(Some coffee also remains amongst tea and timber trees on Gampaha and Battawatte estates.)

The Directors have pleasure in submitting to the shareholders the accounts of the Company for the past year.

Since the Company was formed, the Directors have purchased Mahatenne and Velloongalla estates as from 1st January, 1895, Tillycairn estate as from 1st November, and Forest Hill estate as from 1st September. The first three of these properties now form part of Dammeria, and Forest Hill is worked with Battawatte.

The prices paid were as follows, viz:—

For Mahatenne and Velloongalla, consisting of 409 acres of which 144 acres were under cultivation, R15,000 in cash and R15,000 in shares—total R30,000.

For Tillycairn, consisting of 70 acres, of which 25 acres were under cultivation, R3,500 in cash.

For Forest Hill, consisting of 383 acres, of which 196 acres were under cultivation, R44,240.13 in cash, R35,500 in shares, and R16,695.65, the amount of a mortgage payable in June next—total R96,435.78.

A re-survey of Gampaha Estate shewed the acreage to be 39 acres in excess of the approximate figures given in the Prospectus, and the total property now owned by the Company, including the purchases above referred to, comprises 2,746 acres of land as against 1,845 acres contracted for when the Company was formed.

The crops secured last year and the net average prices realized were as follows, viz:—

314,753 lb. Tea (including 71,654 lb. from purchased leaf)	average R. 0.51½ per lb.
3,070 bushels Coffee	„ „ 16.23 „ bus.
707 lb. Cardamoms	„ „ 1.14 „ lb.
55 cwt. Cocoa	„ „ 32.87 „ cwt.

in addition to which the sum of R6,759.36 was obtained by sale of green leaf, rents and receipts for manufacturing tea for other estates.

Excluding the special items of preliminary expenses and of interest to Vendors, the profit realized was equal to 10 per cent on the present paid-up

capital of the Company a result which, taking into consideration the undeveloped state of the different properties, will no doubt be satisfactory to the shareholders.

After writing off all charges incidental to the formation of the Company and making due provision for depreciation of Buildings and Machinery, the ten profit available for Dividend amounted to R54,626.43 or 8.40 per cent on the paid-up Capital. An interim Dividend of 4 per cent., absorbing R24,600, was declared on the 15th August last, and the Directors now recommend the payment of a final Dividend of 4 per cent making 8 per cent for the year. A balance of R4,006.43 will then remain to be carried forward to the current year's accounts.

The new Factory on Gampaha Estate, referred to in the Prospectus, has been successfully completed.

The estimates for the present season are 350,000 lb. tea from the Company's estates, and 66,000 lb. from purchased leaf, 970 bushels coffee, 500 lb. cardamoms and 50 cwt. cocoa.

The Directors propose making a further issue of shares during the year, due notice of which will be given to shareholders.

The first Statutory Meeting of the Company was called for the 15th February but had to be postponed *sine die*, owing to an insufficient attendance of shareholders. Under the circumstances, the Directors now tender their resignation and, being eligible, offer themselves for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

By order of the Directors, WHITTALL & Co., Agents and Secretaries.

Colombo, March 7th, 1896.

COFFEE PLANTING IN KLANG, SELANGOR.

THOUSANDS OF ACRES BOUGHT BY CEYLON PLANTERS, USELESS.

Confirming the brief statements we have already published as to the uncultivable land which Messrs. T. North Christie, W. Forsythe and others had purchased, we now give extracts from a Singapore contemporary to hand this morning:—In the *Straits Times*, of March 5th, a long letter appeared from its Selangor correspondent, describing the existence of "sour land" at Klang, and the temporary and permanent abandonment of coffee estates there. We summarise the contribution as follows:—

The Klang land boom has received a serious check. A large proportion of the land sold by public auction in the months of February and August, 1895, has proved too sour for the cultivation of coffee in its present condition, and several owners have resolved to stop all work on their estates. Opinions as to how this untoward state of affairs has arisen vary considerably. Several experienced planters consider that the soil—particularly on the eastern side of the Klang-Kuala Langat road—lacks those constituent parts which are essential to the growth of coffee, while others, who are perhaps better qualified to judge, are of opinion that the difference between the soil on the two sides of the road is, in a great measure, if not entirely, due to drainage. But, although opinions vary with respect to the value of the different blocks of land purchased at auction last year, it is unanimously agreed that, through undertaking drainage, which it was either unable or unwilling to carry out within reasonable time, Government has done a great disservice to the planting interests of the district. On the plans published previous to the selling of the land, various drains were shown as under construction. (The writer proceeds to describe how these lie, and their uncommenced or backward state.) Now let us see what the planters had been doing during the same period. One instance should suffice for comparison. The Datu Dagang Estate, now to be temporarily abandoned [corrected next day to complete abandonment.—Ed. *T. of C.*], which was purchased by Mr. W. Forsythe in separate, but adjoining blocks, at the Feb.

ruary sale, is about two thousand acres in extent; and a very large portion of this property would have been immediately planted up had everything gone well. Nearly 400 acres have been cleared, and a number of substantial buildings have been erected. There are upwards of one hundred thousand plants in the nurseries, and several acres have been planned up. Of main and outlet drains alone, more than 14 miles have been cut. Even had the Government carried out its proposed drainage scheme, it would not equal the work which has been accomplished on this estate alone! But, of course, so long as the Government road drains remain uncompleted, the cutting of drains or any other work which may be done on the estate is so much labour lost. We may presume that the Government will not attempt to sell any more agricultural blocks at Klang for the time being, and that a commission will be appointed, without delay, to report on the drainage question * * * And now, what will become of that highly-valued Cultivation Clause? If the Government proves equal to the occasion and carries out its undertakings immediately, then work may be resumed on the estates which have been, or are about to be, abandoned. Possibly the owners will consider their land fit to be planted twelve months hence—five years hence—ten years hence—in any case it is evident that the Cultivation Clause will have to be waived so far as regards this land sold by auction, because no one but an experienced planter will be qualified to decide when the soil will be fit for growing coffee, and at the present time, this problem is beyond the ken of even the wisest. It is to be hoped that Sir Charles Mitchell will grant the Resident of this State a free hand to do all that can be done to re-establish the planting reputation of the district. There are of course, many hundred acres of excellent coffee land owned both by Europeans and by natives, in the neighbourhood; but it will be a serious matter if half, or two-thirds of all the land sold at public auction has to be permanently abandoned. Hopes for the future prosperity of the Federated States are mainly based on agriculture, and, therefore, no reasonable effort should be spared to maintain the good repute of the coffee planting industry.

Our Singapore contemporary, in the course of a leader commenting on the foregoing, says:—

Probably sales of coffee land in Klang in the districts affected will have now to be stopped, pending the settlement of the questions thus raised. Another question arises from the cultivation clause which the Governor is anxious to fasten upon planters who buy land from Government to enforce the clause on the planters who have just come to grief in Klang through the fault of Government runs counter to justice. These planters, in short, appear to suffer from official shortcomings, and the Governor should rouse the Selangor Government a keener sense of duty. The future of Federated Malaya admittedly depends mainly upon the progress of agriculture there, but planting enterprise cannot be expected to make head under official discouragement such as that now instanced in Klang. Disrepute has consequently befallen that district which has hitherto stood high in coffee-planting circles. The Governor has already shown that he is disposed to take planters' grievances into due consideration, and H.E. has now another opportunity to do justice to the planting community. It is to be hoped that H.E. will rise to the occasion.

MESSRS. FORSYTHE AND CHRISTIE AND THE FIASCO.

On the 6th inst., the *Straits Times* "gave away" the situation more completely. The article has some humour in its grimness, as will be seen by a perusal of what follows:—

THE END OF THE KLANG BOOM.

We stated yesterday that "the land boom at Klang may become a thing of the past, unless the Selangor Government radically mends its ways." The additional information tendered us is that the land boom at Klang is already a thing of the past, and that even a Government of archangels could not mend that matter, not even by digging drains the size of canals. The land boom at Klang has been exposed chiefly by Messrs. Forsythe and Christie, two

planters of Ceylon now in Singapore. It seems that the local agents of these gentlemen bought for them by auction large areas of Klang land, intended for coffee planting. Now that Messrs. Forsythe and Christie have seen the land, they have arranged to surrender it back to Government, asking that the Government will be so good as to let them select other land in exchange.

It appears that the alleged coffee land at Klang, is land upon which coffee cannot grow. It is peat land; and coffee will not grow on peat. Still the land is not without its uses. If it be left alone for twenty-five thousand years it will probably develop into a magnificent coal bed.

In plain truth, the land boom at Klang arose from a mistake, a ludicrous mistake. A Malay had a small coffee garden there, and it produced some excellent coffee in wonderful quantities; and since the surface of the Malay's garden was peat, people jumped at the conclusion that coffee should be grown on peat. But it happened that only on top of that Malay garden was there peat; below that, the land was an excellent blue clay. The land that was purchased by auction has not merely a surface of peat, but it has 20 feet of peat, and the man who attempts to grow coffee on it would fail. There is a trifle of good land similar to the Malay's garden, which has been picked up by Tambosamy Pillai and a Chinaman; but the rest of the land is said to be quite unfit for coffee.

Probably the Government will make no great difficulty about taking back the land and letting the unhappy buyers choose other soil.

So ends the Klang land boom.

The same paper appends the following further remarks:—

With reference to the statements contained in the Selangor Correspondent's letter, printed in our issue of yesterday, and, the remarks founded thereon, we are informed that these are wrong so far as they apply to the lands owned by the Ceylon planters, upon which work has now been permanently stopped. The Selangor Government may be guilty of not carrying out the drainage scheme promised and relied upon, but had they done so, it would not have saved the lands; and the blame attached to this unfortunate venture cannot be saddled on the Government, but rather upon the misjudgment of local planters, who to the last remained blind to what the owners of the lands consider to be conditions of so which carried failure written across them—drains or no drains.

The *Singapore Free Press*, after describing the hopelessly peaty condition of the abandoned land, remarks:—

The promptness with which the position was recognised by the chief investors concerned, has probably saved them and others from heavy future losses. Other men who have likewise ventured in on some of the adjacent blocks are likely with more or less alacrity to follow their example and throw up their newly acquired holdings. It is indeed fortunate that the chief losses are falling upon well-to-do outside investors, and not so much upon the younger men, who might have ventured all they had upon an enterprise that would shortly have spelt ruin to their planting fortunes.

We understand that what appears above only applies in the main to the group of contiguous blocks recently put up by Government, and probably to some other adjacent areas in the Klang district. In some places the layer is thin and the whitish clay soil can be reached at a depth that would not hinder planting. This latter applies to some of the native clearings.

This extremely regrettable fiasco affecting a large group of blocks of 320 acres each or thereabouts throws upon the Selangor Government the task of trying to undo the bad impression that even the above uncoloured statement of facts is bound to create. And as far as we can learn it is understood that the sympathies of the Selangor Government, now that it has had the various evidence laid before it, are with those who have been so greatly disappointed at the result of the more critical inspection of the soil of planting blocks sold in February of last year.—*Local Times*, March 16.

THE KURUNEGALA ESTATES CO. OF CEYLON.

This Company is being formed with a capital of R1,000,000 divided into 1,000 shares. The Company is purchasing the following estates:—Ambapitia for R14,000, Bridstowe for R61,000, Pattiakande for R85,000, Matilda Valley for R7,000 and Morretenne for R19,000. The Agents and Secretaries of the Company are to be Messrs. Lee, Hedges & Co., and the Proctors Messrs. Julius & Creasy.

The properties have been valued at R201,450, and R186,000 is the amount to be paid. Of this the various vendors take R160,000 in fully-paid-up shares ranking for dividend from the 1st of January, 1898, and the balance in cash. Only 2,400 other shares are to be issued at present, payable as follows:—R20 on application, R20 on allotment; R20 on January 1st, 1897, and the balance a year later. During the next three years it is intended to open up 600 acres in tea and coconuts, and by degrees to plant up all the estates as far as possible with these products and with Liberian coffee and cocoa. No dividends are to be paid for the first three years; but, after that, very profitable returns may be looked for.

COFFEE PLANTING AT KLANG.

To the Editor.

Dear Sir,—In the interests of prospective, as well as actual, proprietors of Klang land in other countries I trust you will permit me to point out that although some thousands of acres in this district may be "peaty" and at present unsuitable for planting, by far the larger proportion is excellent land in every respect. Owing to the unfortunate fact that almost the entire area disposed of at the two auction sales was of the undesirable character which has since led several buyers to temporarily suspend operations, it seems not improbable that the coffee enterprise in Klang will in future be eyed with disfavour so extreme that the men who stick to their guns will be regarded by the uninitiated as little better than lunatics;—not that this will affect them much, as the laugh will be on their side in the end,—but it seems a pity that so erroneous an impression should get abroad and remain uncontradicted, and that the development of a really agricultural district should be retarded for so insufficient a cause.

It cannot, I think, be denied, in view of the disastrous effect which the recent severe extremes of wet and heat have had upon the already planted coffee, that this peaty land must be allowed to settle and consolidate under the influence of the elements before it can be safely cultivated, but that it is purely a question of time is manifested from the fact that the Datu Dagang's field, which is always quoted as the finest coffee in the State, is growing on soil precisely similar, but now settled down and dry.

On the other hand equally recently planted coffee, growing in stiff clay over a far larger area than that which has now been abandoned, may be seen in twenty different directions, flourishing vigorously and full of vitality and promise; and there is no getting over the fact that one of our Ceylon visitors who has recently stopped work on his present block, has put in five fresh applications for land, for wet land too, and, curiously enough, land situated in Klang.

To put the case in a nutshell, there is an abundance of good planting soil in the district and some which requires time to settle and which, if opened straight away, has been found wanting when subjected to drastic climatic trials.

Any amount of draining, whilst it would of course have helped the peaty land to consolidate, would never have rendered it fit for immediate planting, but it is none the less a matter of the greatest regret that the Government have not strictly adhered to and at all costs carried out their advertised drainage guarantee.

Sir Charles Mitchell's maiden effort at land reform has not proved an unqualified and brilliant success, but if he takes to heart the lesson which the recent *denouement* in Klang should teach him, he will realise that to make a pile in coffee is not by any means as easy or certain as it looks, and that the planter, it must also not be forgotten, is a direct revenue producer through the export duty on his coffee alone to the tune of from \$4 to \$5 annually, for every acre of forest he reclaims, and requires every assistance and encouragement, or he will turn his attention elsewhere.—I am, dear sir, yours faithfully,

E. V. CAREY.

Kuala Lumpur, March 8th, 1896.
—S. F. Press, March 11.

IMPORTS OF COCOA TO THE U.S.A.

The total imports in 1895 were 29,969,518 pounds, valued at \$3,198,659, a gain in quantity over 1894 of 9,229,391 pounds. South America furnished 16,127,046 pounds, of which 4,160,000 pounds came from Brazil. The British West Indies sent 9,555,537 pounds; other West Indies, 546,220 pounds; Central America, 332,733 pounds. Europe furnished 3,107,556 pounds.—*American Grocer*, Feb. 19.

THE TEA SUPPLY OF THE UNITED STATES.

The imports in 1895 were 97,883,051 pounds, a decrease as compared with 1894 of 4,199,651 pounds. The total value of imports was \$13,320,341. The movement for the year was as follows:—

	Pounds.
Imports.. .. .	97,883,051
Exports	768,143

Net imports or consumption .. 97,114,908

China supplied 51,458,868 pounds, or nearly 53 per cent. of the total imports; Japan, 39,914,508 pounds, or over 41 per cent.; United Kingdom, 3,696,192 pounds; all other countries, 2,813,483 pounds.—*American Grocer*, Feb. 19.

TEA IN AUSTRALIA.

TEA.—There has been a good inquiry for China tea, for which the market is firm. Sales comprise 450 half-chests congou at 4½d to 4¾d, 700 half-chests panyong at 5½d, 450 half-chests panyong at 6d, 400 quarter-chests S.O. pekoe at 6½d to 6¾d, and 100 quarter-chests buds at 5½d. Of Indians, 150 packages have been sold at 7½d to 8d. In Ceylons, 100 packages have been sold at 6½d. At the auction sale on Wednesday there was good competition for Indian tea at steady rates, the better grades being slightly firmer. Out of 445 chests and 462 half-chests offered, sales were made publicly of 397 chests and 462 half-chests, as follows:—Choice pekoe and orange pekoe, 11d to 1s; orange pekoe, 67 chests and 55 half-chests at 7d to 8¾d; pekoe, 37 chests and 120 half-chests at 6½d to 7½d; pekoe souchong, 260 chests and 166 half chests at 6½d to 7½d; broken pekoe souchong, at 5½d. Of Ceylons, 233 chests and 30 half-chests were offered, and sales were made of 152 chests and 40 half-chests at 6½d to 10½d.—*Australasian*, March 7.

INDIAN PATENTS.

Specifications of the undermentioned inventions have been filed, under the provisions of Act V of 1888.

For improvements in the manufacture of tea and in apparatus therefore.—No. 260 of 1890.—Samuel Cleland Davidson, of Sirocco Works, Belfast, Ireland, merchant, for improvements in the manufacture of tea and in apparatus therefore. (From 24th March 1896 to 23rd March 1897.)

For fixing the bottoms and lids of boxes and chests.—No. 153 of 1891.—Mr. C. Bald's invention for fixing the bottoms and lids of boxes and chests used in packing tea, indigo, opium, coffee or other valuable produce. (Specification filed 7th December 1891.)—*Indian and Eastern Engineer*, March 21.

IMPORTS OF COFFEE TO THE U. S. A. IN 1895.

The total imports of coffee in 1895 were 642,318,319 pounds, valued at \$96,512,370, or an average of 15.02 cent per pound. The total movement was as follows:—

	Pounds.
Imports ..	642,318,319
Exports ..	8,190,476
Net imports or consumption	634,127,843
Less lost in roasting 15 per cent	95,119,176
<hr/>	
Roasted coffee consumed ..	539,008,667
1 lb. coffee makes 2 gallons infusion, making gallons consumed as beverage ..	1,078,017,334
Gallons coffee per capita ..	15.4
Beer consumed per capita ..	16.8

Coffee and beer are the popular beverages. The supply of coffee came from the following countries as follows:—

	Pounds.
Brazil ..	426,559,035
Other South American countries	73,484,884
Central America ..	52,320,272
Mexico ..	36,961,939
West Indies ..	18,532,745
East Indies ..	16,166,002
United Kingdom ..	4,205,826
Netherlands ..	4,033,274
Germany ..	2,739,813
Other parts Asia and Oceanica	2,228,255
France ..	1,870,717
Africa ..	34,616
All other countries ..	3,180,941
Total ..	642,318,319

—*American Grocer*, Feb. 19.

TEA ASSORTMENT AND BULKING.

As the season for manufacture is again approaching, at the risk of wearying our readers, we purpose reviewing (with regard to assortment and packing) Messrs. Stenning, Inskipp & Co.'s annual circular, which is always most interesting reading, more especially to young Managers. Unfortunately, Agents do not, as a rule, send these to their gardens; and Managers miss valuable information, more especially in these days of cutting things fine. With regard to assortment, we should say, the advice is sound that recommends only four grades of tea—Broken Pekoe, Pekoe, Pekoe Souchong and Broken mixed. It is unfortunately the tendency of young managers, to run to making six or seven grades, many of them with a view to getting into the "Honor" list, and to such an extent has this been carried within the last few years, that the work the Calcutta Brokers have had to do is simply appalling and cannot but indirectly act against the interests of good prices. It is true that sampling breaks are supposed to consist of at least 50 quarter, 30 half, or 20 full chests; but, many are sent below this, and brokers for their own credit, are compelled to sample or run the risk of having it thrown at their heads that they have "chucked the tea away." It would be well then, if our agency houses would insist on Managers adhering strictly to the rules laid down with regard to the size of breaks; business would be facilitated in every way, and the hard-worked broker would have a little more breathing time. As it is, the sampling work connected with Indian tea has increased so much of late years, that it is no wonder the strain has been almost too great for many of those engaged in it.

Loss in weight has come very much to the front, and as yet but little effort has been made to cope with it. We see no reason why the matter, if vigorously tackled, could not be checked. Let the Agents insist upon receiving the tea as per bill of lading and pilfering will soon stop. The River Companies, since they were unable to get the law altered removing them from responsibility, are very parti-

cular as to the bill of lading, and if so much as a box is stained with mud, it is carefully remarked upon on the margin; so that if the Agents in Calcutta, were as particular on their part in taking delivery there would not be so many complaints of shortage in weight. With regard to complaints from home of shortage, we think that this very often arises from want of knowledge on the part of the manager of the garden, and we venture to insert Messrs. Stenning, Inskipp & Co.'s remarks thereon in full:—"Loss in Weight.—As this occasionally gives rise to much dissatisfaction, we offer the following suggestions; that the gross weight of the packages should be a few ounces, say, four or five, above an even number of pounds, and that the empty package complete with lead, nails, bands, etc., be to a like extent below an even number of pounds. In weighing here, *i.e.*, in London, the gross weight is reduced to the even number of pounds, whilst the tare is increased to an even number of pounds. With regard to garden bulked teas it is imperatively necessary to put an equal quantity into each package of the break, and the quantity should be four or five ounces over the desired weight of contents, viz., if the packages are invoiced to contain 100 lb. tea each, not less than 100 lb. 4 oz. should be weighed in; test packages weighing here a fraction under 100 lb. are reckoned as 99 lb. only, or a loss of 1 lb. on each chest of the break. Draft of 1 lb. per package on all packages grossing 28 lb. and upwards is allowed to the buyers. When a gross of 129 lb. is exceeded, there is an additional charge of 5d per chest up to 159 lb. *Marks on Chests.*—Nothing is wanted or is of any service here beyond 1st, garden mark; 2nd, description of tea; 3rd, garden numbers. Gross tare and net are not of the least use and should be discontinued."

Reading between the lines here, there is a great deal of useful information of which a great many planters may be quite ignorant. At the same time, we think that there is one point that might be made more clear, for instance, with regard to this question of factory bulking; these Brokers say that a uniform quantity of tea should be put in, and the gross should have a few ounces over an even number of pounds, etc. This would lead one to suppose that a record of gross, tare and net in the invoice was necessary; whilst, further on, with regard to marks on the boxes, they say that gross, tare and net should be discontinued. The two statements are quite contradictory, and we fail to see how putting it on the boxes is a matter of any moment; if it is necessary to keep a record of it, one would have thought it was the simplest way. One thing is certain, packages marked with it are taken for the American market; in fact, if you wish to sell your tea in America, it is imperative. We believe that Messrs. McLeod & Co. last year suggested to the Indian Tea Association, that it might be enough if the gross, tare and net were recorded in the invoice, but what the result of this representation came to, we never heard. We trust that our drawing attention to this ambiguity may be sufficient to bring an authoritative deliverance on the point from the Brokers, to whose circular we are indebted for so much useful information, and which we hope our young planters will read, learn, and digest, for we have been told that attention to these little details effects a saving of one to two per cent. on gardens delivering satisfactorily "*Factory bulked teas.*"—*Indian Planters' Gazette*, March 14.

A NEW CACAO DRIER.—The Director of Public Gardens and plantations in Jamaica, Mr. W. Fawcett, states that having found a difficulty in meeting with a satisfactory dryer for cacao beans, he has been in correspondence and personal communication with Messrs. John Gordon & Co., London, who have designed a Cacao Dryer, which effects the regular presentation to the heated air of all parts of the surface of the beans, and is an improvement in this respect to the machines now in use.—*The Sugar-cane*, March 2.

COMMERCIAL FIBRES OF TRAVANCORE.

The Palmyra Palm is widely distributed in the Trivandrum and Southern Divisions of the Travancore State, and owes its name to the Portuguese, who styled it *per excellence* "Palmier" or the Palm-tree. The tree is Botanically known under the name *Borassus flabelliformis*. This Palm is generally found in a cultivated or semi-cultivated state in Travancore; but, it is however, truly wild in tropical Africa. In the East it is found all over Southern India, east of the Western Ghats, and away north beyond the Deccan. It is a toddy and sugar bearing palm, the former term being a perversion of the Urdu word "Thadi," which has been anglicised into "Toddy." The young germinating nuts (Panna kalanga) are boiled and eaten as a vegetable, and as they contain a considerable amount of starch, are fairly nourishing to the average native, though rather coarse to the English palate, and unless well cooked, indigestible. The leaves were formerly, and even at the present day, in out of the way villages, employed in the place of paper for the purpose of writing, &c. Some of the most ancient classic books of the Pali and Singhalese languages having been written on the leaves of this Palm, and which are in existence at this present day. The timber is exceedingly hard and durable, and is largely employed in house building purposes, more especially for rafters and joists, and being almost impervious to the attacks of the destructive White ant, is therefore highly prized. From the base of the petioles or sheathing leaf stalks is obtained a stiff, wiry, dark-coloured fibre. This was at first termed "Bassine" in the market, to distinguish it from "Bass" and "Piassava" fibres. It came into notice as a commercial product in 1891, when the high prices of Piassava induced the production of substitutes. At that time, even split rattan, dyed black, was requisitioned as a brush fibre. Palmyra fibre has steadily increased in quantity, and, contrary to what was at first anticipated, it has also risen in value; but, great discretion is necessary, as the mild but wily Hindoo, to gain weight, introduces a large quantity of water and refuse matter, and the cost of separating the really good fibre from the mass of second and third class stuff, and clearing it from foreign matter, adds considerably to its original cost. In 1892 Messrs. Idc and Christeson wrote:—"The chief objection to Palmyra fibre is that it lacks straightness, but experiments are being made in this country to overcome this defect, and should they prove successful, it is claimed by the importers and dressers, that Palmyra should, for wear, be found equal to the best Para." These anticipations have to some extent, been realised. Palmyra has now practically taken the place of West African Bass. The latter on the 16th September 1895, was "dull, business small, £14 to £23 per ton." While Palmyra fibre on the other hand was "good £26 to £34; medium, £22 to £25; common, £15 to £19 per ton." The natives of India, as we have shown above, are unconsciously copying the evil practices of the Indians of Brazil, in sending consignments of Palmyra to this country, in a damp and dirty condition. The result is, that the bales on being opened are found to be wet, and the fibre to a large extent perished and powdery. Should this short-sighted policy be further indulged in, we have no hesitation in saying, that the trade will be most seriously injured. Another fibre-bearing Palm of Travancore is the Bastard Sago Palm, variously known in the vernacular as *Chunda Panna*, *Anna Panna* and *Olati panna*. Botanically it is known as *Caryota urens*. This is a stout well grown palm, one of the handsomest of its tribe, bearing a smooth annulated stem 20 to 40 feet in height. As the Palmyra predominates in South Travancore, so this palm is found to flourish best in the central and northern portions of Travancore. It also is a toddy and sugar bearing palm. The flavour of both the fresh toddy and jaggery (sugar) being superior to that of the palmyra. When the tree arrives to an age of from 25 to 40 years, and its yield of sap is no longer paying, the tree is cut down, and its trunk is cut into blocks about two to three feet in length. These blocks are now split open, and the farinaceous

and fibrous soft inner pith is cut out and chopped into small pieces. These are transferred to a common paddy mortar and pounded until the farinaceous portion becomes detached from the fibres. The pulverized matter is now placed on a cloth, and water freely poured thereon, by this means, the farina is carried off into the vessel below, while the fibre and refuse matter is detained in the cloth sieve. The farina is allowed to settle, and supernatant water is poured off, and the farina or starch is dried in the sun. If a particularly fine kind of starch flour is required, this starch undergoes a further pounding in the mortar, and is again subjected to several drenchings of pure water. The fibre of this plant is technically known in the market as "Kittul fibre," and is extracted principally from that portion of the petiole or leaf-stalk that envelops the stem of the parent tree. Mr. J. R. Jackson gives the following account of this fibre in Commercial Botany:—"Kittul fibre has been known in this country (England) for some 30 or 40 years, but it is only within the last 10 years that it has become a regular commercial article. When first imported, the finer hairs were used for mixing with horse hair for stuffing cushions. As the fibre is imported, it is of a dusky-brown colour; but after it arrives in England, it is cleaned, combed, and arranged in long straight fibres, after which it is steeped in Linseed oil to make it more pliable; this has also the effect of darkening it. And it indeed becomes almost black. It is softer and more pliable than Piassava, and can consequently be used, either alone or mixed, with bristles in making soft long handled brooms, which are extremely durable, and can be sold at about one-third the price of ordinary hair brooms. The use of Kittul fibre is said to be fast spreading, not only in the Home markets, but also on the Continent and America. The values in September 1895 were quoted as follows:—"Long, 10d to 10½d; No. 1, 7d to 7½d; No. 2, 2d to 2½d; No. 3, 1d to 1½d; per pound. Judging from the above quotations we are sure that there is a grand opening for the exporters of Raw Produce, as this palm grows to great luxuriance in the land lying between the backwaters and the Ghats, up which they extend, in their wild state, to an elevation of something over 2,000 feet; but it is found to be most prolific in the gardens situated as above stated, from Kullitorry away up to the Northern Boundary. The still further North we go the more frequently it is to be met with. Messrs. Cameron Chisholm & Co., of Quilon have been to considerable trouble in developing the trade in Palmyra fibre in Southern Division. If some of the enterprising firms at Alleppey or Cochin would be equally pushing, and undergo the same trouble, we have no doubt but that the "Kittul fibre" would soon form one of principal exports to Europe from this Coast.—*Western Star*, March 21.

TEA INSPECTION.

Thirteen years ago Congress provided that it should "be unlawful for any person or corporations to import or bring into the United States any merchandise for sale as tea adulterated with spurious leaf or with exhausted leaf, or which contains so great an admixture of chemicals or other deleterious substances as to make it unfit for use." That prohibition is executed here by an examiner from whose decision that a sample of tea is adulterated with spurious or exhausted leaves, or with enough chemicals to make it unfit for use, there is an appeal to a Committee of arbitration.

The language of the statute permits the importation of very inferior teas. The complaints usually are, not that the examiner rejects tea, but that he admits teas which importers think ought not to come in, and it is urged in support of this that there has been a decline in the quality of tea imported, and that the decline in the average consumption of tea is due to this decline in quality.

It is not customary for the Government to require imported goods to conform to any given standard of quality or purity. Generally speaking, an importer must settle with his own conscience and the consuming public when he imports a very poor grade of an article, or an article which is not entirely what it seems. The Government tests vinegar and alcoholic liquors, but not in the interest of the public health or the public purse; it is only in the interest of the national revenue; the duty to be assessed is based upon the amount of acid or proof spirits there are in the commercial vinegar and liquor. In like manner sugars used to be inspected because the amount of duty depended on the saccharine strength. In the case of drugs and teas standard of quality is insisted upon. Of teas it is only required that they shall not be fraudulent or injurious to health, and drugs, as to which the consumer has no possible means of ascertaining their purity, are required to conform to the standards of strength and purity established by the drug trade and recorded in the standard pharmacopia. The Government does not attempt to fix a standard, but it accepts the one fixed by the trade, and undertakes to exclude articles which according to that standard are fraudulent or injurious.

The establishment of a tea standard, therefore, by the Government would be quite without precedent. It certainly could not be done without legislation, and Congress would be reluctant to authorize the Secretary of the Treasury to define the quality of tea that should be admitted to the country. If the tea trade could agree on a standard, as other trades agree on standards of the goods they deal in, it is not unlikely that Congress would adopt such a standard and prohibit the importation of teas below it.

We have already pointed out why a discriminating duty against teas brought hither from the ports of Europe would not serve to keep out the teas of India and Ceylon, and also that the teas of India and Ceylon ought not to be excluded in the interest of the teas of China. A duty on all tea, while it is desirable as a revenue tax, will not be agreed to by this Congress, and it is not at all certain that it would keep out the rubbish if it were imposed. It is a fair question whether the imposition of a tax would not drive the importers of the very worst teas to see if they could not partly offset the tax by finding a still cheaper article to be sold as tea. The discovery of cheap substitutes and imitations is usually stimulated by an advance in the price of the article imitated. But, if the tax promised to be efficient, it is at present impracticable.

In regard to chemical adulteration there ought, of course, to be something more specific than the language of the statute. The mixture of tea with deleterious substances is not prohibited. It is provided that there must not be so great an admixture as to render the tea unfit for use. It is left to the judgment of the examiner and the arbitration committee to determine what amount of adulteration is injurious.

If the trade can discover any means whereby dealers in tea can be compelled to desist from giving away chromos and crockery that would be an advantage, for it would result in their selling real and better tea. That this can be readily accomplished we are not confident. So large a portion of the public is indifferent to what it eats and drinks, provided that with what it buys it gets a coloured picture or a butter plate without paying for it, that the prize packages of imitation tea people seem to have founded their business on—a fundamental weakness of human nature. If the customers knew enough to go without their prizes, the dealers could afford to supply a better tea than that now offered without advancing their prices. The simple patrons of these places may suppose that the dealers give things away, but they do not. They take out of the quality of the tea all that the pictures and the crockery are worth. But so long as a great many people would rather buy unwholesome imitations of tea and have something given to them than buy a good quality of tea, it is going to be very difficult to deal with the men who supply them with what they are willing to give their money for.

It is worth while for the tea trade to see if they cannot agree on some method of checking the importation of trashy teas. The movement to provide consumers with better grades of tea deserves every encouragement.—*Journal of Commerce Bulletin*, February 25th.

USES OF THE LEMON.

Doctors say, that lemons rid the system of humours and bile and leave no ill effect, and that weak debilitated people oftentimes may be greatly benefitted by a free use of them. Lemon juice should be diluted with water, or sweetened sufficiently, so that it will not produce a drawing or burning sensation in the throat. Clear lemon juice is very irritating; the powerful acid of the juice will cause inflammation if the use of it is continued any length of time,

A bilious attack may be soon overcome by taking the juice of one or two lemons in a goblet of water before retiring and in the morning before rising. Where taken on an empty stomach the lemon has an opportunity to work on the system. Continue the use of them for several weeks.

Lemons are an excellent remedy in pulmonary diseases. When used for lung trouble, from six to nine a day should be used. More juice is obtained from lemons by boiling them. Put the lemons into cold water and bring slowly to a boil. Boil slowly until they begin to soften; remove from the water and when cold enough to handle, squeeze until all the juice is extracted, strain and add enough loaf or crushed sugar to make it palatable, being careful not to make it too sweet. Add about twice as much water as there is juice. This preparation may be made every morning, or enough may be prepared one day to last three or four days, but it must be kept in cool place.

Lemon juice sweetened with loaf or crushed sugar will relieve a cough. For feverishness and an unnatural thirst often a lemon by rolling on a hard surface, cut off the top, add sugar and work it down into the lemon with a fork, then suck it slowly.

During the warm months a sense of coolness, comfort, and invigoration can be produced by a free use of lemonade. For six large glasses of lemonade use six large, juicy lemons; roll on a hard surface, so that the juice can be easily extracted. Peel and slice. Add sufficient sugar to sweeten and stir it well into the juice before adding the water.

Hot lemonade will break up a cold if taken at the start. Make it the same as cold lemonade, only use boiling water, and use about half as much sugar.

A piece of lemon or stale bread moistened with lemon juice bound on a corn will cure it. Renew night and morning. The first application will produce soreness, but if treatment is persisted in for a reasonable length of time a cure will be effected. The discomfort caused by sore and tender feet may be lessened, if not entirely cured, by applying slices of lemons on the feet. To cure chilblains, take a piece of lemon, sprinkle fine salt over it, and rub the feet well. Repeat if necessary.

Lemon juice will relieve roughness and vegetable stains on the hands. After having the hands in hot soap suds rub them with a piece of lemon. This will prevent chapping and make the hands soft and white.—*Rural Californian*.

CITRONELLA OIL AND ITS ADULTERANTS.

BY JOHN C. UMNEY, F.C.S.

In the leading article on "A Citronella-oil Arbitration," which appears in the last issue of the *Chemist and Druggist* easy physical tests are set out for the detection of kerosene in citronella oil. The exertions of Messrs. Schimmel to check the adulteration of citronella oil have unfortunately only been successful up to a certain point—namely, in causing the natives to cease the admixture of their oil with kerosene, and to look about for some other substance which is not so easily detected, and at the same time almost equally cheap. I have recently had the opportunity of examining several samples of citronella oil which contain no kerosene, but whose charac-

other than their specific gravity and solubility in per cent alcohol indicate admixture with another adulterant, possibly as observed on one occasion by Messrs. Schimmel & Co., one of the so-called wood oils derived from a species of *Dipterocarpus*, although probably not those from which the gurjun oil of commerce is derived (*Dipterocarpus turbinatus* and other species). Three of the oils may be taken as types of this form of adulteration and their characters are briefly as under:

SPECIFIC GRAVITY—The sp. gr. at 15deg C are somewhat high, being in the case of No. 1, '9027 and No. 2, '9034 and No. 3, '9056. The oil which I have distilled from gurjun balsam has a sp. gr. of '916 at 15deg C, whilst pure citronella oil distilled from fresh grass, rarely exceeds '900.

SOLUBILITY IN 80 PER CENT ALCOHOL—These three samples are readily soluble in alcohol of 80 per cent strength, in a proportion of one part in three, but on further dilution a turbidity occurs, and after about eight to twelve hours a dark-brown deposit results.

OPTICA ROTATION—The optical rotation of the three oils is more levo-rotatory than is usually found in pure citronella oil, being between -11deg and -13deg in a tube of 100 m.m.

FRACTIONATION—Differences are observable when fractionation of the oil is carried out. The following columns show a comparison of the proportions obtained at various temperatures from a sample of pure oil and these three oils respectively:—

Fractionation deg. C	Pure	No. 1	No. 2	No. 3
Below 200	6 per cent	6	9	8
200-205	7 do		7	4
205-215	12 do	13	8	12
215-225	30 do	17	13	16
225-240		38	43	32
Above 240	29 do	24	15	28

It will be noted that the proportion in the impure oils boiling from 225deg to 240deg C is greater in the case of Nos. 1, 2 and 3 than in the case of the pure oil. This is rendered more suspicious by the fact that the oils contain less geraniol (B.P. 231-232deg C)

PERCENTAGE OF GERANIOL—Experiments have been made with a view to determine the amounts of geraniol present in the pure and adulterated oils. The amount present, as shown by the acetylation process is, in the case of the pure oil, 64 per cent, and in all the pure oils examined falls between 60 and 64 per cent; in the case of No. 1 it falls as low as 52 per cent, No. 2 to 50.4 per cent, and No. 3 to 51 per cent. An important difference is shown in the saponification figures of the pure and adulterated oils, the former being from 35 to 40, whilst the latter vary from 48 to 54. This difference is probably due to the presence of resin acids in the adulterant rather than a greater proportion of esters.

It is necessary, therefore, to take into consideration not only the specific gravity and behaviour of the oils in alcohol of 80 per cent strength; but also to observe the optical rotation, which should not exceed -8deg in a 100m. tube, and in addition the proportion boiling from 225deg C to 240deg C in comparison with its geraniol percentage as well as the saponification figure of the oil.

It is worth noting that neither the oil nor the portion of it boiling above 225deg C gives Fluckiger's reaction for gurjun oil, which consists in the addition of a drop of a cooled mixture of equal parts of sulphuric and nitric acids to a solution of the oil in twenty times its volume of carbon bisulphide, when a violet colour is produced. This colour is afforded with that usually imported into this country. The author of that test refers to the great number of wood oils which are obtained from various parts of Eastern Asia, and points out that should a wood oil not give this reaction it is probably derived from a different species of *Dipterocarpus* than those he has examined. This also confirmed by Hirschsohn's observations on the same subject.—*Chemist and Druggist*, March 7.

time we shall see more Russian buyers here. When in Colombo they purchased a Sirocco from Messrs. Davidson & Co., and it will be sent to Hankow shortly. If found successful, as it probably will be, an order for further machinery, Mr. Schultze believes, will be certain.

THE CEYLON HILLS TEA ESTATES COMPANY, LTD.

This Company has acquired the Agra Oya group which includes Glenalvah situate in Lower Dikoya. It comprises about 450 acres, and has been purchased for £10,000 sterling.

DIMBULLA VALLEY CEYLON TEA COMPANY LIMITED.

Mr. James Sinelair has left for Europe having received special instructions to return to London in connection with the actions it is intended to institute to enforce specific performance of the contracts to sell. In connection with this matter we also hear that Mr. P. M. Anstruther leaves for England immediately.

DRUG REPORT.

(From the *Chemist and Druggist*.)

42 Cannon Street, E.C., March 5.

ESSENTIAL OILS—Citronella oil is firm on the spot; possibly 1s 11d per lb might buy oil of good quality, standing the usual test, but in several quarters 2s is asked. For shipment the quotation is 1s 10d per lb, c i f February to June. Lemongrass oil is quiet, at 2½d per oz.

SEEDS (various)—Thirty bags wormy Areca nuts sold without reserve at 8s 6d per cwt. The 25 packages fair Madras annatto seeds were bought in at 3d per lb.

VANILLA was in fair supply, but the demand has slackened off, and only a small part sold, but good qualities brought steady prices: fine 7 inch to 8 inch, 25s to 23s; 4 inch to 7½ inch 20s to 26s 6d; fair small chocolate 15s to 18s, and common kinds from 7s 6d down to 6s per lb.

COCOA-BUTTER—Five hundred 2-cwt cases of Cadbury's brand sold at auction this week at from 12½d up to 13½d per lb, the opening price being lower, with a steady market at the close. At auction in Amsterdam 70 tons of Van Houten's sold at an average of 68'19c per half-kilo, the tone being steady.

COCA-LEAVES of good quality are scarce and inquired for Green Truxillo offer at 1s c i f terms. On our market good qualities are very scarce, and for fine bright Truxillo 1s 1d to 1s 2d per lb would be the price. At auction 10 bales very common dark brown damaged leaves were bought in at 1s per lb.

CUBES—Five bags fair small sifted berries from Singapore sold today at 32s 6d per cwt.

COFFEE PLANTING IN THE LANGAT DISTRICT.

Regarding planting in Ulu Langat, Selangor, Mr. Skeat writes in his report:—

The outlook as regards the development of the district by European planters is, on the other hand, most encouraging; and it is greatly to be hoped that the present year will see coffee planting started in earnest on a large scale. Four applications for 320 acres each were received from Messrs. F. B. Hicks, E. B. Skinner, A. A. Allen, and E. J. Allen; and two more applications, also for 320 acres each, from Messrs. G. F. S. and M. Sydney Parry, whilst a previous application from Messrs. Kindersley for 320 acres on the Rekoh Road has been granted. The land embraced by the first six applications is a tract upon the right geographical bank of the Langat River, in the neighbourhood of Merbau Tumbang and Bukit Tempurong. It forms the upper end of

THE PURCHASES OF THE RECENT TEA BUYERS.

Messrs. Isgaieskeff and Jaegar, representatives of Messrs. Popoff, the well-known firm of tea merchants on the occasion of their recent visit to Colombo purchased somewhere about 60,000 lb. of tea. This has been shipped to Russia by Messrs. Schultze, and will be distributed as pure Ceylon tea, unblended with Chinas. Mr. Schultze has informed a contemporary that the demand for Ceylon tea in Russia is steadily increasing, and other firms besides Popoff Bros. are evincing an interest in the article. It may, therefore, be expected he opines, that in a short

the broad alluvial flats which stretch, roughly speaking, from the Langat River at Rekoh to the Langat Road at Klang, and merge into the coffee reserve in Klang district. When it is once thoroughly drained and roaded, it should include an abundance of excellent coffee land from which selections could be made by intending planters, and it would therefore prove of no small advantage if a continuous coffee reserve, running through the two districts, could be proclaimed by the Government.—*S. F. Press*, March 16th.

PLANTS THAT GIVE LIGHT.

One of the early naturalists, Mme. Merian, I think, describes an extraordinary spectacle which she observed in Asia. Her party was moving through a forest at night, when, without warning, a large light appeared. At first dim, it increased in size, growing larger and larger until finally a tree was outlined in a soft pulsating light. The natives were demoralized, and refused to approach it, saying it was the sacred tree of fire. But the naturalist had little faith in trees of fire and investigated it, finding that the light was due to certain insects, which, by the way, has never been observed since. That a tree or plant could give light was deemed a figure of the imagination, yet today it is known that light-giving plants are not uncommon, and among the most striking and remarkable of natural phenomena. Once in returning from a day's hunt through a deep forest in the heart of the Adirondack region I stumbled against a dead limb of a tree, when, to my amazement, I was at once surrounded by a silvery light that flew in all directions, like darts and arrows of fire, each piece burning where it lay. This was an unusually brilliant display of the best known of luminous plants, the "fox fire," or "witches' glow" of childhood days.

To the layman it is often mysterious, as investigation shows nothing but the decayed wood, and sometimes a soft pulpy mass. The botanist will soon point out the light giver in the mycelium of some fungus that has permeated the old branch and fairly taken possession of it, converting it into a glorious spectacle when disturbed. The vividness of the light may be estimated when it is known that print can often be read by it, and the light of some has been known to penetrate through several thickness of paper. Singular to say, the smallest plant is often the means of producing the greatest luminous effects. This is the diatom, which the naturalist of the *Challenger* found floating in the ocean in vast numbers, and as the nucleus of the diatom is often brilliantly phosphorescent some of the most remarkable displays of light observed by the naturalists were occasioned by these little plants. But what shall we say to a sight observed by a Norwegian bark in the Bay of Funchal? The waters here are fairly alive with these little luminous plants the year round, and on the occasion referred to a waterspout formed among them. During the day it would have attracted little attention, as the phenomenon is a common one, but the crew of the ship were suddenly confronted at night by a literal pillar of fire or light that extended upward to a distance seemingly of one thousand feet and moved along with a decided bend. It emitted a pale yellow light that stood out in strong relief against the black night, a weird and formidable spectacle, rushing on before the wind.

An English naturalist, wishing to astonish some natives in a wild part of Asia in which he was travelling and impress them with his supernatural powers, secured a certain vine known as *Euphorbia phosphorea*, and, rubbing it upon a big rock, caused the latter to gleam with flame and present so remarkable a spectacle that the natives ran, believing that he had set the rock afire by simply touching it. The naturalist was aware that the milky juice of this plant, that resembled the dandelion, was brilliantly phosphorescent. In the Harz Mountains there has been for ages a cave known as the haunted cavern. An Englishman, travelling in the vicinity and hearing of it, determined to investigate the mystery. After a long climb he reached the cave. No sooner did complete darkness set in

than the phantom of the cave appeared—a remarkable semblance to a human form, with arms outspread, outlined against the gloom. Making his way to the figure that had alarmed so many wayfarers he found that it was a plant that grew upon the wall. It was the well-known phosphorescent fungus, *Rhizomyspha subterranea*, frequently found in caves and familiar to miners. Its light is often so vivid that people have read by it.

These curious lights, are not found in the tropics alone. Some years ago Mr. Morrill, editor of the *Gardiner (Me.) Journal*, wrote me that he had observed a brilliant steady light in his garden at times, totally unaccounted for by mechanical contrivance, and which upon investigation, proved to be the phosphorescent light emitted by the young of plant *Tainus Sydeticus*. Perhaps the most startling exhibition was observed several years ago by an English traveller in Borneo. Belated, he was overtaken by night, and there being no moon, he was fearful of losing his way, when as the darkness came on, singular lights appeared here and there in the bushes and by the roadside. Some were yellow; others burned, or seemed to, with a bright greenish hue. As it grew darker, the blaze of light increased, and finally the traveller was amazed to find that he was passing through lines of luminous bush which emitted light so wondrously brilliant that he could read his newspaper by it with perfect ease. The principle light-giving plant, mechanical in its growth rather than botanic, is the electric light plant, thousands of which are scattered through the country. The fruit of the electric light plant are commonly known as electric currents.—*American Grocer*, Feb. 12.

VARIOUS PLANTING NOTES.

A SYLHET TEA PLANTER.—Mr. A. G. McMeekin, a young American, who has come out to the East to plant tea in Sylhet, has been recently on a visit to the island. His home is at Schenectady, New York, in which city he has been for some time following the calling of an Electrical Engineer, and holding the post of Assistant Production Manager in the General Electric Company (Edison's own Company). Mr. McMeekin's father has, however, been a resident in India for the past 35 years, and his son has now determined to come out and join him. Mr. McMeekin, senior, was one of the pioneers of the Indian tea-planting industry, and now has valuable tea property of his own in Sylhet, whither Mr. McMeekin, junior, proceeded by a Clan steamer.

THE WORKING OF THE GOVERNMENT DAIRY AT POONA, says the *Indian Agriculturist*, was not so profitable in 1894-95 as in the previous year, owing to an outbreak of rinderpest which resulted in the death of 34 head of cattle. The disease first broke out in unweaned calves which had necessarily to be separated from their dams. The natural instinct of Indian cattle being very strong, this separation resulted in a diminished yield of milk to an extent of 36 per cent within a week. This fall represented a daily loss of Rs. 18. The significant facts about the disease are that indigenous breeds escaped contagion to a far greater extent than exotic breeds, that young buffalo and cow calves died very quickly, and that cows advanced in pregnancy were hopeless cases. The most effective medicine was carbolic acid given in gruel consisting of linseed boiled with rice, fresh separated milk, and water. The city of Bombay, which set the example to other cities in the matter of introducing improved dairy machinery, has naturally become the great centre of butter-making for India and also for export. About three lakhs of rupees worth of dairy apparatus have been sold, and so far the progress made by the new industry is extremely satisfactory; but the industry is likely to suffer greatly unless those employed in it mend their ways in the matter of cleanliness.

HORREKELLY ESTATE COMPANY LTD.

The annual ordinary general meeting of shareholders of this Company, was held in the registered office (Messrs. Lewis Brown & Co.'s) on March 26, Mr. C. E. H. Symons presided and present were:—Messrs. F. Leisching, Percy Bois, Fred Bois, F. M. Mackwood, S. Green, R. L. M. Brown (Secretary) and other shareholders by proxy.

Notice convening the meeting having been read and minutes of previous meeting confirmed, The CHAIRMAN submitted

THE ANNUAL REPORT

which was held as read. It is in the following terms:—

1. The Directors have pleasure in submitting the accounts of the Company for the past year showing (with R1,472.84 brought forward from 1894 and after writing off R3,331.21 for depreciation of Plant and Machinery at the usual rate) a net sum of R30,051.66 at credit of Profit and Loss account available for distribution.

2. The Directors recommend that a dividend at the rate of 7 per cent be declared on the capital of the Company (which has been all called up and received). This will absorb R23,000 and leave surplus of R2,051.66 to be carried forward to 1896.

3. The crop of coconuts in 1895 was a very good one and realized full rates, the yield being due to the favorable rainfall and to the steady application of manure.

4. During the year Mr. Thos. Carey left the service of the Company as Superintendent and Mr. A. W. Beven has been appointed his successor. It is expected that with the regular application of manure now being made, the crop for 1896 will be a very favorable one if normal rainfall is experienced.

5. The working of the seasons 1893, 1894 and 1895 compares as follows (the item of interest being excluded:—

	1893.	1894.	1895.
Expenditure on the Estate and in Colombo Office	R. c. 31,385 55	R. c. 33,243 74	R. c. 32,747 69
	Candies.	Candies.	Candies.
Quantity of Copra produced	.. 958	773	1,036
	Ballots.	Ballots.	Ballots.
Quantity of Coir Fibre made	.. 39,869	40,245	25,703
	R. c.	R. c.	R. c.
Average price obtained for Copperah, per candy	47 43	48 06	49 70
Average price obtained for Coir Fibre per cwt.	3 80	4 25	4 67

6. Two Directors—Messrs. C. E. H. Symons and F. C. Loos—retire, and are eligible for re-election.

7. The Shareholders have to appoint an Auditor for 1896.

By order of the Board of Directors,
LEWIS BROWN & Co., Secretaries.

Colombo, 16th March, 1896.

The CHAIRMAN, in moving the adoption of the report, said the Directors had a better state of matters to report, to the shareholders than had been the case for some years past. It would be seen from the report that the Directors recommended a dividend of 7 per cent. per annum after having written off the Ordinary depreciation. The prospects of the coming crop were considerably better than those of the past year and he thought there was every chance of their being realised. They had experienced good rains during the past year and they were having good rains up to the present time. The sale of the produce for the coming year promised to be quite as good if not better than the past. The price of copra had gone down, but the price of coconuts had gone up, very much, owing to the desiccated interests. Of the first crop of the present year 300,000 coconuts had been sold on the estate at R40. That, he thought, must be

regarded as very satisfactory in view of the price of copra at the present time. Of the second crop the same price had been offered for the same number, but it had not been accepted yet. That was a matter for the Directors to settle by and by. On the whole, he thought, they might congratulate themselves and look forward to a very prosperous year. They had lost Mr. Carey, but now they had got Mr. A. W. Beven in his place. A considerable amount of trouble had been experienced owing to the coolie question. All the experienced coolies had left the estate and they were employed not very far from it. No doubt they had been enticed away. It had left Mr. Beven in a very unpleasant predicament, but he was doing his very best to find coolies and that he would be able to do, that he (the Chairman) had very little doubt. He concluded by moving the adoption of the report.

Mr. MACKWOOD inquired how it was that with a larger output of copra, which involved a large number of coconuts, they were selling less fibre.

In explanation, the Chairman stated that they had as much fibre as formerly but, owing to the scarcity of labour, only that part which really paid was prepared for the market.

The report was adopted.

Mr. MACWOOD proposed and Mr. Green seconded that a dividend of 7 per cent. be declared payable on 1st April.

Agreed.

On the motion Mr. Green seconded by Mr. Fred Bois the retiring Directors Messrs. Symons and F. C. Loos were re-elected Mr. Hercules J. Scott was appointed Auditor.

This was all the business.

A NEW COMPANY.

THE KALUTARA COMPANY, LIMITED.

The memorandum and articles of Association of the Kalutara Company, Limited, is contained in a recent Gazette. Among the objects for which the Company is established are—to purchase, or lease, or otherwise acquire any estate or estates, land or lands, or any undivided share or shares in any such, any machinery, implements, tools, live and dead stock, stores, effects, and other property, real or personal, movable or immovable, of any kind whatsoever in the Island of Ceylon. To purchase tea leaf and (or) other raw products for manufacture, manipulation, and (or) sale. To manufacture tea leaf and (or) other products. To carry on the business of planters of tea and other products in all its branches. The liability of the shareholders is limited. The nominal capital of the Company is R750,000, divided into 1500 shares of R500 each, of which 500 shares may be issued with any guarantee or right of preference as may be determined or provided by the Articles of Association of the Company. A share each has been purchased by:—Messrs. C. E. H. Symons, T. J. Anderson, G. H. Alston, C. J. Donald, Jas. A. Henderson, A. J. Sawyer, and G. W. Carlyon.

INDIAN AND CEYLON TEA COMPANIES' PREFERENCES.

An investment which will bring in from 4 to 4½ per cent., and at the same time afford a very fair degree of safety, with a good prospect of appreciation in capital value, is now-a-days becoming so rare that we make no apology to our readers for reverting to a class of security to which we have more than once called attention. We refer to the shares of Indian Tea Companies, and especially to the Preference shares, which partake more of the nature of an investment stock—speculative, it is true, as every stock of the kind must be, but by no means more so than the shares of first-class home industrial securities. During the past year both the

Preference and Ordinary shares of Indian Tea Companies have had a considerable rise. The market has become more free and active, and the enlarged dealings are the result of greater public attention being attracted to this class of security. The widening of the market is still going on, and it is highly probable that a further appreciation of prices will take place during the next few months. Purchasers, therefore, need be under little apprehension that they are buying on the top of the market. On the contrary, we are of opinion that the present is about as favourable an opportunity for "getting in" as they are likely to see for some time to come. Compared with the advance that has occurred in many home securities of equal character and standing, the improvement in Tea shares has been only moderate, and they may still be regarded as fairly cheap. As we have said, the Preference shares in even the best companies will return at present quotations a yield of from four to four and a-half per cent., while the Ordinary shares can yet be bought at figures yielding from six to seven per cent., with a very fair chance of a continuance of that rate of interest.

It is, however, with the Preference shares that we are concerned just now, and for the convenience of investors we subjoin a table showing present quotations and yield of the soundest and best-known of these securities:—

Interest per cent.	Name of Company.	Value of Share.	Present quotation.	Yield per cent.
		£	£	
7	Dooars ..	10	17½	4
6	Jokai ..	10	15	4
5	British Indian ..	5	5½	4½
6	Lungla ..	10	13½	4½
6	E. India and Ceylon	10	13	4½
6	Cachar and Dooars..	10	13	4½
6½	Singlo ..	10	14	4½
7	Chargola ..	20s	28s	5

All of these shares, with the exception of those of the Singlo Company, are cumulative; and have a preferential claim not only as regards interest, but also as to capital in the event of a distribution of assets. A point to bear in mind is that in the majority of cases not more than one-third to one-half the total capital takes the form of Preference stock; and in many instances, notably in that of the Jokai, the future issue of such stock is limited to a small proportion by the Articles of Association. It may be taken, therefore, that as a general rule the value per acre as represented by the Preference shares is very moderate—a fact which naturally adds to the worth of the security. A point which holders of Preference shares always have to take into consideration is the possibility of a further issue of Debentures being placed ahead of them. In this respect there need be little present apprehension as regards the companies mentioned, or indeed as regards Tea companies generally. There exists a strong feeling against this method of raising money as tending to weaken the status of the share capital, and few if any, of the companies have urgent necessity to increase their funds. In reference to the possibility of a further appreciation in value, the fact, that the total amount of available Preference stock is comparatively small is worth bearing in mind. No doubt as the market continues to open up, several of the companies that have not already done so, will be inclined to split their shares into Preference and Ordinary, and this tendency is already observable to some extent. Fresh shares will also be issued for the purpose of acquiring new estates, but there is not the slightest fear of the market being flooded with securities of this class. Another question of the first importance to investors is that of the reserve fund. No industrial company, however sound, is free from the vicissitudes inseparable from trade; and in addition to fluctuations of this kind, planting companies are also liable to the risks of a bad season and short or poor crops. It is therefore re-assuring to find that the majority of the Tea companies possess an adequate reserve fund in some form or other, either in the shape of undivided profits, or else in extensions of

ground purchased out of surplus earnings. This last is, of course, a form of reserve which is open to some objection, since it is not liquid, but it is at any rate a more tangible asset than when money is sunk in a purely manufacturing business, and the security behind the Preference shares is proportionately increased. In the case of the companies mentioned in our list there is, besides, a substantial reserve in actual cash, a circumstance which will no doubt tend to increase the confidence of investors.

It must not be supposed that the list given above by any means exhausts the catalogue of shares that can be safely recommended for a purchase. In the table of shares which we publish weekly there are a number of others whence a selection might be made. There are also the Ceylon tea companies' shares, which are at present neither so well known nor so freely dealt in as those of the Indian undertakings, but nevertheless present an attractive and improving form of investment. The only disadvantage about purchasing the lesser-known shares is that the acquirement or disposal of them might necessitate a little more negotiation than in the case of those we have quoted. Doubtless the yield might as a rule be a little better, and the one advantage must be set against the other. However, the return even upon the shares mentioned, which may be looked upon as the pick of the basket, is sufficiently alluring in these days of cheap money and meagre yields. If a thousand pounds were spread over the eight companies in our list, the investor would obtain an overhead return of 4½ per cent, together with a considerable prospect of an improvement in capital value. The risk of depreciation upon an investment so distributed would be very slight, and might almost be disregarded, provided no great calamity, such as a war, affected the industry; for in normal times the market is absolutely certain, and is steadily expanding, thereby correcting the increase in production. The exhaustion of the gardens, moreover, is a contingency so remote that it may be eliminated at present from consideration. One word of caution is necessary to those who are thinking of investing in 'Tea companies' Preference shares. The market, though much freer than it used to be, is still to some extent a limited one, and if a purchaser insists upon buying a particular share he may be obliged by the conditions prevailing at the moment to give a higher price for it than would be necessary if he waited for a more favourable opportunity. It is therefore advisable to give a limit, and also a little discretion, as to time. But it is better still to allow the broker a range over one or two shares. In the list above, there is really not very much reason why one share should be preferred to another, and the soundest manner of operation is to spread the amount available over two or three different securities. As regards the general position of the companies, both with reference to the tea produce market and the increasing popularity of the shares, our anticipations of a few weeks back have been more than fulfilled.—*Financial Times*.

MR. E. E. GREEN ON A CEYLON INSECT.—At a meeting of the Entomological Society on February 5th, Mr. E. E. Green remarked that in the *Trans. Ent. Soc.*, 1881, p. 601, was a short paper by the late Professor J. O. Westwood, describing a curious little insect from Ceylon under the name of *Dyscritina longisetosa*. Professor Westwood believed his typical specimens to be immature. Mr. Green exhibited what he supposed to be a later stage of the same species. He said his example differed in some particulars from Westwood's description and figure—notably in the proportions of the caudal appendages. The present specimen was taken in the Panulunya district of Ceylon, at an elevation of about 4,000 feet. Mr. Green said he had more than once seen this insect under loose pieces of bark and in crevices of rocks, and had always been struck by its likeness to an earwig both in appearance and habits.—Dr. Sharp, Messrs McLachlan, Gahan, Blanford and Hutton made some remarks on the subject.—*Athenaeum*, F. 5. 15.

WITH DR. D. MORRIS, C.M.G.

What is to be done with our West Indian Colonies is a question that, I have reason to believe, is occupying Mr. Chamberlain's attention just now. Not from the political, but from the economic or industrial standpoint is the Colonial Secretary's mind occupied with them. Among the gentlemen whose knowledge and experience of our Colonies and their natural products has led to their being consulted is Dr. D. Morris, C.M.G., Assistant Director of the Royal Botanic Gardens at Kew, who has made a special study of what I may term commercial botany. I am afraid this is not a generally recognized branch of the science; but I mean to convey the impression, a perfectly correct one, that Dr. Morris has given an eye to the commercial possibilities of vegetable products. His first official appointment was to the Assistant Directorship of the Botanic Garden in Ceylon, where he made investigations into the fatal coffee leaf disease. Then he was transferred to Jamaica, and spent seven years in the West Indies, while he has been to St. Helena and other places, so that he is something of a traveller, even in these days when never to have left London is becoming quite an enviable distinction.

Last year Dr. Morris spent his winter vacation in the Bahamas, where, though his visit was purely unofficial and of a holiday nature, it was felt that it was not the sort of circumstance that could be allowed to pass without benefiting somewhat the inhabitants. Dr. Morris cheerfully placed his stores of knowledge and experience at the disposal of the Governor and gave a series of lectures on the best means of making the most of the various resources of the islands that were immensely and deservedly appreciated. He has not long returned to his post, and it follows as the day the night, that I was not long in tracking him to his lair. This, I may explain, is a political mode of reference to a very comfortable study in Kew, where I was cordially welcomed. Dr. Morris has had so much practice in handling thorns and prickly plants that the ubiquitous interviewer has no terrors for him.

"I am afraid you will know almost as much about the Bahamas as I shall be able to tell you," said Dr. Morris, laughing, when I had explained to him the dire object of my visit.

"Well, now," I whispered, confidentially, "I really think professional etiquette demands that I should answer that observation in the affirmative. But as we are here alone, I don't mind confessing that I am not omniscient and that pretty well everything you can tell me will be news."

"Is that so?" quizzically interrogated Dr. Morris. "Perhaps, then, I shall not be far wrong in starting by telling you that the Bahamas consist of a chain of islands some twenty of which are inhabited, comprising in all about 5,794 square miles, and forming the largest West Indian colony, with the exception of Jamaica. They lie in the Atlantic Ocean off the South-East of the United States. The principal islands are New Providence in which the capital Nassau is situated, San Salvador, Abaco, Grand Bahama, Long Island, etc."

"And what about population?"

"Over 48,000 in 1891, showing an increase of 6,000 as compared with 1881. The whites are one in seven or eight of the total population, thus constituting a much greater proportion than in Jamaica, where they are only one in twenty-three. The whites are descendants of old Royalist families, and are a very fine, pleasant people. Many are of Scotch and Irish descent, and it is curious that the latter still retain the brogue though they have been isolated for ages. It struck me as decidedly curious and interesting that this should have persisted. They are a hard-working, steady people, and intensely loyal. Although, owing to geographical reasons, their trade is chiefly with the United States, their attachment to Great Britain is very great, and they are intensely grateful for any sign that the mother country is interested in their welfare, and very thankful for a helping hand. They do not want money; but some trouble to consider their special requirements, and advice to help them

to prosperity; and I am very pleased that there is every prospect of Mr. Chamberlain not forgetting them, spite of the great calls more pressing matters are making upon him."

"There is a feeling of interest in the Colonies, little as well as big, growing up everywhere in Great Britain now, I am glad to say, so that your observations do not surprise me. What sort of climate have the Bahamas?"

"Very pleasant and salubrious indeed in the winter season, when they are much frequented by visitors from the States, especially those in search of health. There is an excellent hotel owned by the Government, which is open during the season. In the summer of course it is much hotter. The rainfall is about 40 inches."

"Would the Bahamas be suitable as a winter resort for such persons as now go to Madeira?"

"Undoubtedly they would, and I should say would have some advantages over Madeira in that the climate is more bracing. But as regards European visitors, the distance and the difficulty of communication have to be considered. You see you have to go to New York first, and then from New York to the Bahamas."

"Is there no direct communication with Great Britain?"

"Not now," answered Dr. Morris. "There used to be a monthly steamer, but it didn't pay, and now there is none at all."

"And next, Dr. Morris, I shall be glad if you can give me some information as to the trade of the Bahamas?"

"With pleasure, my dear Hermes. I remember enough of my classics to know that your mind was always directed to business, and I see that your survival into the fog end of the nineteenth century has not made any change in you. As I have already mentioned, the islands trade almost entirely with the United States. A glance at the map and a thought as to what I have just said about communication will sufficiently explain why. For the year 1891, the latest of which the returns are available, the imports amounted to £175,000, and the exports to £120,000, a total trade of £295,000. Of this total about 25 per cent. was done with the United Kingdom. The imports, I may say here, consist chiefly of foodstuffs, hardware, cotton and other fabrics, and wines and spirits."

"Sponges, pine-apples, hemp, turtle shell, logwood and other timber, and fruit of various descriptions. I should like to tell you something in detail about these items if you will permit me."

What need to mention that my permission was freely and unreservedly granted. Dr. Morris asked me too pleasantly to be refused. Besides, though this is secondary, had I not visited him specially to hear what he had to say?

"Well, the chief industry from the money point of view is the sponge fishery, the annual output, if that manufacturing term may be employed, being £60,000. A large fleet is employed in this industry. There is also a native-built fleet of over 100 boats employed in other forms of fishing, amongst which I may mention pink pearls, and there are 500 men employed in this way. Do I think these industries capable of much more development? No, I do not think they are. I fancy that as much capital and energy are devoted to them as they will stand. It is in the development of small industries, in putting labour into the land that the salvation of the West Indian Colonies is to be found and it was by indicating the way in which this may be most advantageously done that I may claim to have been of some little service during my trip. Living, as the inhabitants of the Bahamas do, out of the main track of travel, they want some outside help as to what they can produce that other people are ready and willing to buy from them. I don't like to appear egotistical, but in Jamaica the development of the fruit industry was a matter in which I took much interest, and, as results are showing, not unsuccessfully."

"I am aware that Jamaica may be said to have saved itself by fruit, and there is no immodesty in your claiming a share in a good work," I replied

warmly. As a rule, too little is known of the quiet, unobtrusive, but valuable help afforded by scientific men in connection with commercial matters.

"Well, to return to the Bahamas, not literally," for I had made a jump from my chair and was looking round for my hat, which I ultimately found I had utilised as a seat cushion, "but in our conversation. After sponge comes pineapple. Large quantities of this fruit are sold to the United States, the value for the year 1894 being not less than £50,000. At the same time, I am of opinion that with more care and attention in the cultivation and manuring of the pine-apple, it would be possible to increase this item of production considerably. Oranges are also grown, and I do re- say the destruction of the Florida orchards by frost will lead to an increased cultivation of oranges all over the West Indies. Then there is the grape fruit."

"Which, I suppose, is not the grape?"

"You suppose rightly. The grape fruit is something like a large yellow orange but with a slightly bitter flavour, due to a tonic principle which is highly valued in the States, where the fruit is largely taken as a digestive. In greater attention to oranges and grape fruit, and in arranging to supply the States with early fruit and vegetables for which they are specially adapted, I think the Bahamas have a prosperous future before them; and though a small and comparatively insignificant portion of the British Empire, their well-doing cannot but be a source of gratification to us all."

"I take it, then, that you think there are great possibilities in early fruits and vegetables, Dr. Morris?" I asked.

"Undoubtedly. Look at the Bermudas, that turn out spring onions to the tune of £60,000 a year, new potatoes to the tune of £27,000 a year, and lilies to the tune of £21,000."

"Are lilies early fruit or vegetables?"

"You are too particular," smilingly answered Dr. Morris. "But to resume. Look also at the fruit trade of the Canary Islands, the Azores, and the Channel Islands, worth in the aggregate several millions sterling per annum. St. Helena, again, is now getting more prosperous, because it has devoted itself to supplying the Capo with new potatoes. It is in these minor industries, as they have been styled, that no inconsiderable portion of the wealth of planting countries is found, and more will be found in the future. But they want cultivating with intelligence and enterprise, otherwise by growing unsuitable products or not preparing them for market in the best way, loss instead of gain will naturally result. But the inhabitants are waking up to the conditions of the times, and I do not think they will be found lacking in the qualities that deserve success, and go so far, also, towards commending it."

"And what about sisal? I understand that it promises to be a great source of wealth to the island."

"At present there are 20,000 acres under cultivation. The plant existed in the island for more than 50 years, but had run to weed. Successive governors tried to utilise it, Mr. Bayley, Sir William Robinson, and Sir Henry Blake. In 1888, Sir Ambrose Shea, who had succeeded Sir Henry Blake, took up the matter. There has been some controversy on this point, but while there is no doubt that he was not the first to note its value, it is largely due to his personal effort and spirit of enterprise that the industry has been so far established. It was he who first engaged the attention of capitalists in the industry, and so impressed them with the capabilities of the plant that they were willing to embark their money in its cultivation. The industry has been somewhat hampered too."

"Indeed! In what way?"

"When the industry was started in the Bahamas the price of fibre was exceptionally high. This led to exaggerated ideas being entertained as to the profits likely to be realised, and no doubt much land that was unsuitable for the purpose was planted with sisal. Then, too, the enterprise was overloaded with capital, which was due to the same cause, and consequently the cost per acre was increased so as

to make a reasonable return unprofitable. A similar mistake was made when the fibre industry was started in the Mauritius. Of course, when the price fell, many of the companies could not pay. You see all white-rope fibres, of which sisal is one, are liable to violent fluctuations. Take sisal itself. In 1889 it was £56 10s per ton. In 1895, it fell to £13. This, it is true, was a quite exceptional fall, and due largely to over-production consequent upon high prices and to the depression of trade in the United States."

"Then you do not take a hopeful view of the future of the sisal industry, Dr. Morris?"—I enquired with considerable curiosity.

"Well, I should hardly be justified in desponding about the future of sisal. If white-rope fibres pay anywhere they should pay in the Bahamas. The plant is the best of its kind, and it yields excellent fibre. I am informed on good authority that the latter can be placed in the New York market at a cost (including cutting and carting the leaves, cleaning, baling the fibre, and shipping it) of something like one penny (two cents) per pound. Now, manila costs two pence (four cents) per pound at Manila and Yucatan. hemp costs a penny halfpenny (three cents) per pound at Progreso. These are the official figures quoted in my Canton Lectures before the Society of Arts. Bahama sisal should therefore hold its own. The people are, I believe, determined to keep down expenses, and to ship only first-class fibre, so as to establish a name for it."

"And what about cleaning the fibre? Has the machine difficulty, about which we have heard a good deal, been satisfactorily solved?"

"That I regard as one of the most satisfactory points about the Bahama industry. They have better machines than are used in Yucatan—all doing good work. For instance, I saw the Todd machine working both at Andros and New Providence. This turns out about three-quarters of a ton of fibre per day. The total cost of an engine of 24 horse-power, driven by kerosene gas, of a Todd fibre machine, complete, and of a double-screw press is about £1,000. If a second machine were added, making the total cost about £1,600, the same engine would drive them both. The output of fibre would then be about a ton and a half per day, at a slightly reduced cost. The position of sisal on good lands is, therefore, not so bad. In fact, the people who know most about it say that sisal in the Bahamas has come to stay. At the same time it must be said that sisal is not a small man's cultivation—on the contrary, it requires considerable capital and organisation."

And then I discovered that I should miss my train if I lingered longer talking over sisal, so I bade Dr. Morris a cordial but hasty farewell, and within a very few minutes a railway porter had discovered that he was unequal to the task of keeping out of a train in motion the winged

HERMES.

—Commerce.

THE TIBETAN TEA TRADE.

Much is said about the expansion of the tea trade of British India and the possibility of extending it to Tibet. It appears there are powerful obstacles, the chief being that the sale of tea in Tibet is a Chinese Government monopoly, which the wily Celestials are most indisposed to relax their grip of. Most of the tea consumed is grown in Western Szechuen, and though the three qualities produced there are all very poor, the worst of the three is the only quality used, and 65 per cent of that consists of twigs and brushwood! This singularly attractive blend appears to have been introduced to the notice of the Tibetans in 1074 A.D. (a long time before England tasted tea), at which period it used to be bartered for horses. From the first the traffic was under Government control, and the system of "permits" now in vogue was introduced in 1127. These permits are issued by the Board of Revenue in Peking each season, and must be returned thither by the end of the year, with the revenue arising from the amount of trade repre-

sented by them, each permit covering five packages of tea. The so-called tea is chopped fine, steamed in tubs, partially dried, mixed with rice water and packed tightly in cylinders of bamboo matting at about two-thirds of a penny a pound, on which the profit is 75 per cent.! Mr. de Rosthorn, who tells us all this, is confident that Indian tea could not compete with this rubbish in point of cheapness—but the question is. If Tibetans were once to be, come acquainted with the superior Indian article, would they not prefer it? The Chinese could easily be pacified by the proceeds of an import duty.—*Sunday Times*, March 1st.

BRITAIN IN AFRICA.

Last night (Tuesday March 3rd) Mr. G. Scott Elliott read a paper before the Society of Arts on "English East Africa and British Central Africa," Sir J. Crichton Browne occupying the chair. The speaker said the various districts of Africa were essentially distinct—a fact which had to be borne in mind. Elevation was a great factor in this connection. The Zambesi and Shire valleys, as well as much of the plain round Nyassa, were below the altitude of 3,000 ft. Here woods were valuable native products, such as the rubber-vine, kula wood (a new dye), and the oil palm. The cocoanut palm was also a promising product. Some plantations, such as sugar, could be carried on in spite of the climate, and cotton was also produced. Other "sure" articles of commerce were sesame rice, the ground nut, and castor oil. Of unproven plants were the cocoa-tree, which had been a great success in the German Cameroons, while caoutchoucs had also been suggested, but these plants take long to mature. Vanilla has so far been profitable in German East Africa. In English East Africa the natural products were similar. Gum copal and orchilla may be also expected. Ostrich feathers might also be exported, and a few ostrich farms might be made in the district. The clove tree was suitable to the district. The lower districts of English East Africa were, however, not very promising, and only the coconut palm and cloves could be safely recommended by the author.

In British Central Africa, at the levels between 500 ft. and 3,000 ft., there was a thriving and flourishing community. The coffee from here obtained the highest price in the London market, and suitable coffee ground existed for the supply of the whole of the civilised world. Tobacco, quinine, tumeric, ginger, and hemp grew in a satisfactory manner. Indigo was the most promising plant yet untried, but new fibre plants were to be avoided. The ivory trade in Uganda would become quite insignificant in another five years, while there was no proof of gold or other valuable minerals, and the iron could hardly bear to be exported. Coffee was found in a half wild condition, growing near the Victoria and up some of the valleys. Wheat and rice had been successfully grown by Europeans. Cotton was indigenous, and should be quite satisfactory. The unfortunate point about the country was its distance from the coast, and the author considered that a railway of 657 miles in length implied a cost of £323 to run a train from Nyanza to the coast. Hence the cost of transport would have a bad effect on agricultural development. This prohibitive cost could be diminished, perhaps by one-half, through water transport, either by the Kagera and Tanganyika or by the Nile; but that was a question of the future.

Above 5,000 ft. was, according to Sir John Kirk, the only part of tropical Africa where Europeans could permanently reside, but the area in British

Central Africa fit for colonisation had not yet been tested.

Suggestions were made by Mr. Elliott as to the future. The first essential was the maintenance of our national policy of non-interference with planters and settlers; the next to avoid monopolies or concessions, whatever the name under which they were disguised; that the administrator should not be made a mere telegraph clerk; and that for subordinates in administration properly-trained men should be appointed. A railway was most urgently required in British Central Africa.

For our own country, at present it seemed to the author that there were three requisites of paramount importance. First, an outlet for our congested capital and overflowing population; secondly, new markets; and thirdly, that all our imports of food and raw material should be derived from countries directly under our own. All these requisites were fulfilled by parts of our African possessions.—*Financial Post*, March 4.

RETROSPECT OF THE PAST TEA SEASON.

The final tea auction has been held, and the season 1895-96, as far as Calcutta is concerned, is virtually closed. A retrospect, says *Capital*, is not pleasant contemplation; there can be only one verdict, it has been a failure. Poor outturn, poor quality, and still poorer prices, the previous season was so exactly the reverse in every direction that the industry, as represented by present quotations for tea stock, has received a heavy blow. The drop has been too accentuated. Although a season such as that of 1894 is not likely to recur for some time, yet 1895 must for the same reason not be taken as representing the future of the industry. It is to the weather we must ascribe both the previous good fortune and the present misfortune. 1895 was unusually capricious as regards rainfall, and even in those districts that can point to a full supply it was so fitful that they were not able to reap the benefit. Continuous periods of drought followed by abnormal downfalls spell failure both to outturn and quality, and when, as in Assam, the crop is mainly gathered after the rains have fairly set in, an early cessation, as in 1895, means all but disaster. There can be but one opinion—the quality has been poor, or, to use the words of the brokers, common, an average of two to three annas worse than that of the previous year has been general, proving conclusively that the same climatic influence has pervaded all tea districts, and it is hard upon the interest that for one bad year tea stock should depreciate to the extent of fifty per cent. Notwithstanding the outcry as to the heavy extensions of late years the increase in the crop for the past three years has barely exceeded six per cent per annum, which is surely not excessive. Considering the amount of the crop, and compares favourably with the increase from Ceylon, which has been a far more potent factor in depreciating prices. India does not seem to be awake to the efforts that Ceylon is making at home and elsewhere to push its teas. In Mincing Lane itself India more than holds its own, but it is when the tea reaches the trade that Ceylon is to the front; every planter that goes home from Ceylon seems to consider it a pride as a duty to push the produce of the Island. It also possesses an advantage. All tea from the Island is known as Ceylon, there is no diversity when asking for the tea. This is not so with India. The trade is confused with Darjeeling, Assam, Dooars, etc. There has been the usual shuffling of the cards with managers; it is becoming painfully evident that the sins of climate, agency, etc. are being visited too frequently on the managers, and these constant changes are detrimental in the extreme to all interested. It must be a source of more anxiety to the managers than to any one with a bad season in the past over which he has no control; it robs him of any commission

and threatens even his very bread and butter, and far too often bad advice and misdirection from the agents have brought about his dismissal. The question as to quantity or quality is continually cropping up; it resolves itself finally into a question of market. In a year like the past, providing it was possible, quality would have paid.

In 1894 either the quality was superior or made so, but would any planter allow that there was any alteration or endeavour on his part to produce a poorer quality of tea in 1895 than in 1894, and to lay the blame to planters is to come to the conclusion that old and experienced men went out of their way to produce inferior tea. No; there is but one verdict. 1895 was a bad year entirely through climatic causes. It is painfully evident from the various reports to hand that Assam is being severely taxed as regards labour. It has reached a critical state; the cost of labour in some cases has reached R140 per adult in the railway is opened throughout, free labour may be attracted as in the Dooars, and there can be no doubt Assam can per head afford to pay more for its labour or wages even than the Dooars, and it only requires to be directed that way by the incentive of higher wages and easy mode of transit to seek work there. Let us hope this will be the case. At the present the position is very serious, the journey by the steamer is fraught with danger; cholera has been rampant on the voyage, and it is melancholy to calculate the loss of life and money that has resulted during the last six weeks. It may seem ungrateful to exercise the efforts of Mr. Blechynden in America, but there is a want of business tone in his letters too much playing to the gallery and we doubt if the American taste, for the garden. When the beverage is to be reached through the aid of ladies' conferences.

The prospects for 1896 as reported so far from most districts is unfavourable. The drought that has pervaded India for months has had a prejudicial effect on tea, and Cachar alone has had a rainfall of any service, but it is early yet to foretell the result. The increased rate of consumption at home, that in the past month of February represents 1,700,000 lbs., is so hopeful that it bears out our contention that the extensions are not to be feared, and that prices are likely to harden, so that 1896 may yet gladden the pockets of investors. Might we suggest to the Indian Tea Association whilst laudably anxious to give the increased area under plant, that it would be of interest to all connected if they obtained some statistics.

A factor for the coming year that must be reckoned with is the rise in exchange. It mainly affects those districts that go for producing quantity, and pride themselves on ten maunds per acre. Any further serious rise in exchange means the difference to them of the slight margin that now exists between cost of production and price realised, otherwise profit or loss. This rise must not be regarded as a bad omen for the industry; on the contrary, the continued depression in exchange has in a measure to answer for the increased bulk of the poor and common stuff that went forward in 1895, and if this rise forces more careful plucking we may look for an improvement in the lower class of tea. The area under plant that has been abandoned during the past ten years must be very considerable. In conclusion we deprecate too much stress being laid on producing finger quality; so much depends on the weather that every manager should be left to himself; it is to his interest to get good prices, and to dictate to him from Calcutta or London how to pluck is to remove responsibility from the proper quarter and too often results in failure.—*Indian Planters' Gazette*, March 14

THE TEA MARKET.

At the low level of prices is void of activity. Ceylon growth at the moment shows best value and interferes with China business. Indian, with the season's supply nearly all to market, tends to former rates. Deliveries go on at a favourable pace, thus relieving the accumulation of the bonded stock.—*L. and C. Express*, March 13.

MARKET FOR TEA SHARES.

Thursday evening, March 12.

Tea shares continue to attract more and more attention among investors, and there has this week again been wholesale buying of shares in all the better-known companies, and "record" prices have in many cases been paid.

MINCING LANE.—Easier for all Ceylons, but steady to firm for the reduced supply of Indians.

FRESH ISSUES.—Dimbula Valley Ordinary are inquired for, but without business. The Preft. have been taken freely at £6.

CEYLON SHARES.—C. T. P. Co. Ord. have been taken as high as 26½, and the Prefts. are wanted at 17 upwards.—*H. & C. Mail*.

PLANTING AND PRODUCE.

PRODUCE AND THE BOARD OF TRADE RETURNS.—The condition of trade as indicated by the Board of Trade returns is good. For the month of February imports have increased by 26 per cent over February, 1895, and exports by 23·2 per cent. Even when we take into account the fact that from 3 to 4 per cent of this increase is due to the extra day of a leap year February, or the still further fact that the totals for the same month last year were depressed by 17 per cent in the imports and nearly 10 per cent in the exports, owing to the extraordinary prolonged frost, this year's returns are the best by from 6 to 10 per cent seen for a long time. All classes of merchandise share in the improvement; but in imports, articles of food and drink (duty free) and manufactured articles more than half fill up the total increase. As regards produce, sugar, both raw and refined, is more both in quantity and value, and there is also a considerable rise in its price, owing partly to the Cuban insurrection having continued so long. Tea and cocoa have been landed in much larger quantities, but coffee is much below last year's level.

A NEW INDIAN TEA COMPANY.—We have received the prospectus of the Rema Tea Company of Sylhet, Limited. The capital of the company is £50,000, in 5,000 shares of £10 each. The prospectus states that the company is formed to acquire as from January 1, 1896, from the Rema Tea Syndicate, the Rema Tea Estate in South Sylhet, in the Province of Assam, India. The estate consists of a grant of land comprising 1,911 acres, or thereabouts, of which the Government have agreed to grant to the nominee of the syndicate a renewable lease, and which has been opened out and planted with tea during the year 1895 to the extent of fully 600 acres. There are about 400 acres more of suitable tea land upon the grant which it has been arranged to plant out in 1896, and which will give the company by the end of the year an area of 1,000 acres under tea. The planting out so far has been inspected by Mr. H. Sanderson of Chuudeecherra Estate, Sylhet, who reports that it is practically full. The land is held direct from Government and is at present rent free, but subject later on to a rent of about R1·8 per acre.

THE DUTY ON COFFEE.—With reference to the recent deputation to the Chancellor of the Exchequer on the coffee duty the *Grocer* says: "There is hardly a dutiable commodity in the Customs tariff that requires more help and relief from the burden of taxation than coffee, and yet the Chancellor of the Exchequer makes light of it by telling his hearers that 'if coffee and chicory were to pay no duty cocoa also should be relieved from duty, and he (the Chancellor of the Exchequer) thought it was probable that if the matter went on further he would hear something from the consumers of tea and those interested in the trade.' This is clearly an unfair way of viewing the question, as there is no parallel between coffee and cocoa, for the reason that the latter flourishes astonishingly well under the duty it bears, and therefore does not need the same measure of legislative assistance; and as to tea, why, the answer to repealing the duty on that is quite as good as any of those that were rendered in

favour of abolishing the duties on sugar, which event took place in 1874. Still, in upholding the views of those persons who are strong advocates for a "free breakfast-table," we, for our part, should be glad to see the impost on tea, coffee, cocoa, chicory, and dried fruits all swept away at a stroke and especially those on the minor articles, which yield only a paltry addition to the revenue of the country. One of the speakers at the meeting put the whole case in a nutshell when he said that 'on the face of the memorial there are two things—one is the smallness of the sacrifice asked for, and the other the benefit it would bring to a very large and important trade.' In fact, the duty on coffee amounts to only about £170,000 per annum, whereas that on tea reaches no less than £3,696,000 in a single year, so that there is virtually no excuse, on any grounds that can be urged, for not repealing the impost on the former because it would, as the Chancellor of the Exchequer puts it, be unjust not to abolish the duty on the latter claimant for exemption. Coffee, as a harmless yet refreshing kind of beverage, is more beset with difficulties in its path to consumers than any other drink, and when these are duly pressed upon the attention of the Legislature it is for them to seek to remove them as quickly as possible. A great bar to the consumption of coffee in the United Kingdom is the absence of liberal supplies of a desirable character: and the main cause of its consumption not progressing at an advanced rate, since the duty was halved in 1873, has been the serious and alarming falling off in the imports from Ceylon, which, in consequence of the failure of the crop through the setting in of the leaf disease there, about the same year, have since dwindled almost to nothing. Substitutes, it is true, such as Costa Rica and other Central American descriptions, have been found for plantation Ceylon, but these have proved totally inadequate to make up for the deficiency in the receipts from Ceylon, and no fresh sources of supply have been opened up that would serve as a beneficial stimulus to the home trade.—*H. & C. Mail*, March 13.

IN THE COURTS.

MR. GORDON CUMMING AND THE DOOARS COMPANY, LIMITED.

In the High Court of Justice, Queen's Bench Division, before the Lord Chief Justice and a special jury, last Friday, (March 6) the case of H. W. Gordon Cumming v. the Dooars Tea Company, Limited, came up for hearing. The case is of much interest to the tea industry and planting community generally. The plaintiff claimed compensation for alleged arbitrary and unjust dismissal, without due cause, contrary to custom and engagement, reasonable notice not having been given.

Mr. Dickens, Q.C., and Mr. C. A. Russell appeared for the plaintiff; Mr. Robson, Q.C., and Mr. Brenner for the defendants.

Mr. Dickens, Q.C., opened the proceedings for the plaintiff by making a lucid statement of the case. He said the gardens, which were the starting point of those which now constitute the property of the Dooars Company, were opened out for the Messrs. Verner and others at Tondoo about 1880, when Mr. Cumming joined their service. Subsequently it was deemed advisable that Mr. Cumming should proceed to Assam and take employment on a tea garden in that province. This Mr. Cumming did, remaining in active employment and gaining all possible experience in the interests of the Dooars concern. The Dooars Tea Company was formed about 1886, with Mr. Verner as superintendent in India and Mr. Cumming as a divisional manager under him. Mr. Verner was sometimes unwell, and absent from the gardens in consequence, and thus the entire charge of the concern and responsibility of the garden operations were left to Mr. Cumming for lengthened periods. Soon after the formation of the Dooars Tea Company Mr. Verner,

the superintendent, had to go home on furlough, and Mr. Cumming acted for him, taking full charge, as he did on other similar occasions. A communication from the board to Mr. Cumming, with an extract from the minutes, was read expressing satisfaction with the manner in which he had discharged his duties, and appointing him deputy superintendent on a monthly salary of 700 rupees, to rise annually till it reached 1,000 rupees a month, and he was also to receive a commission of 1½ per cent on the profits of the Company. This arrangement continued until 1894. Mr. Cumming officiating as superintendent during Mr. Verner's absences till Mr. Cumming went home on sick leave in that year. When at home in October, 1894, he received a letter from the secretary to the company stating that as the board had not found the appointment of deputy superintendent answer the purpose intended, they had resolved to abolish it, but they offered Mr. Cumming the management of one of the company's gardens with a monthly salary of 700 rupees and ½ per cent commission on the profits, and otherwise on the same conditions as the other garden managers of the company. To this Mr. Cumming at first demurred, but ultimately agreed, and in due time returned to India to resume his duties. After reaching the gardens in March, 1895, he received intimation that he was to hold his appointment, as all the other garden managers did, on the condition that it was terminable at any time on one month's notice being given. This, however, Mr. Cumming declined to agree to. A communication from home to Mr. Verner, the superintendent, was read, stating that if Mr. Cumming was unwilling to accept this condition there would be no help for it but to give him notice that his services would no longer be required, but in the latter case to give the customary term of notice. The superintendent then intimated to Mr. Cumming that if he would not agree to the terms offered he was then to accept one month's notice, and forthwith make over charge at an early date named. This Mr. Cumming did and proceeded home in the hope of obtaining redress and compensation from the directors of the Dooars Company. In addition to stating the case as above, Mr. Dickens contended that in the working of tea gardens there was a "season" which closed with the gathering of the last of the crop, generally in December, and that in consequence changes of managers were made at the end of the season. Anyone dismissed, therefore, at the time Mr. Cumming was, would find it impossible to obtain another appointment. It was customary, also to give a manager at least three, but more commonly six months' previous notice of the termination of his engagement even when it was to take place at the end of the year.

At one stage the Lord Chief Justice asked Mr. Dickens if he contended that the Dooars Company had endeavoured to introduce fresh conditions after the engagement of his client, the learned counsel replying that this was so. After the reading of some letters referred to, his lordship remarked that it was eminently a case in which the parties should "meet each other," and he strongly urged a settlement.

The defendant company's counsel, Mr. Robson, Q.C., then stated that he did not admit the plaintiff's statements, that all the correspondence had not been read, and that he was prepared to prove that one month's notice (or one month's salary in lieu of notice) was customary in the Dooars district.

The Lord Chief Justice thereupon made a remark to the effect that if the jury had been deprived of a pleasure he was entirely to blame for it. This was in reference to his lordship having at an early stage urged Mr. Dickens to lead up to the main point as briefly as possible, when the learned counsel, evidently with some regrets, turned over numerous pages of the correspondence, merely reading some of the letters last referred to. After some consultation, counsel announced that a settlement had been arrived at, and it was agreed that a verdict should be given for plaintiff for a sum to be afterwards fixed, on the basis of three months' salary and commission down to July 17th, 1895.—*H. & C. Mail*, March 13.

A CENTRAL LABOUR AGENCY.

Everyone interested in tea will welcome the appointment of the committee who are to draw up a scheme for the formation of a central agency for the supply of labour to the gardens. There will be difficulties, one which may be found in the disinclination among planters themselves to combine towards this end, but if the scheme can be put on a thoroughly practical working basis, there can hardly be two opinions as to the immense advantage it would be to the tea industry.

Local agents have resolved to take the matter up without further delay, and began with a meeting at No. 12, Mission Row last week at which Mr. D. A. Campbell presided, and at which, by special invitation, were present Mr. H. C. Williams, I.C.S., President of the Labour Enquiry Commission, and Surgeon Lieutenant Colonel D. W. D. Comins. The proposal had the hearty support of those present, and the first move was made in the appointment of the committee alluded to above and which consists of the following gentlemen who have power to add to their number:—G. G. Anderson Esq., of Messrs. Williamson Magor & Co.; H. C. Begg Esq., of Messrs. Begg Dunlop & Co.; A. F. Bruce Esq., of Messrs. Kilburn & Co.; C. C. McLeod Esq., of Messrs. McLeod & Co.; G. A. Ormiston Esq., of Messrs. Balmer Lawrie & Co.; C. D. Stewart Esq., of Messrs. George Henderson & Co.; A. Tocher Esq., of Messrs. Duncan Bros. & Co.; and C. W. Wallace, Esq., of Messrs. Shaw Wallace & Co.

There have been suggestions made in this connection before; but, unfortunately, the idea of combination did not meet with sufficient general support to warrant the projection of any well considered scheme. We trust the committee will be able to make such proposals as will satisfy all concerned, for this question of labour supply has now reached a point when something really must be done. It is most regrettable that the tea industry should year after year put lakhs of rupees into the pockets of such disreputable people as the *arkuttis* have proved themselves to be. What is now needed is a strong pull and a pull all together in order to bring about general agreement on the question; and we should say there is little doubt that Government would be willing to lend hearty co-operation to such a project if planters and all interested show that on it they are agreed among themselves.—*Indian Planters' Gazette*, March 21.

INDIAN TEA.

To the Editor of the *Financial Times*.

Sir,—Having read the article in which you brought Indian tea planting companies before your readers as a suitable channel of investment, it occurs to me that you may possibly like to have some confirmation of your advice from one who has long been conversant with the position and development of the industry as a tea-taster and agent in the London market for some of the principal growers.

So little has been known in the past about this branch of our commerce that it is not surprising that investors, as a rule, have regarded it with diffidence, or have altogether ignored it. But the experimental stage has long been passed, and we have now the benefit of some fifty years' experience, with the result that it is proved that nearly all, but not quite all, plantations in India are permanent in respect of soil and the capacity of plant to yield freely and vigorously; that while weather causes some variation in the amount and quality of the yield, such a thing as the failure of a crop is unknown, and that no limit has yet been found to the consumption of Indian tea.

A most important fact is, that the oldest plantations in Assam still produce the finest tea. Proof of this is to be found in the history of the Assam Company, which has been at work since 1843, and last year showed a profit of £50,000 on the season's production, equal to more than 25 per cent on the capital, and due to the fine quality of the tea produced. Another weighty fact is that no other tea-producing country has yet been discovered which can give tea equal to the

best from Assam and Darjeeling. Another is, that notwithstanding the steady increase of production, there is in no market of the world a surplus stock of Indian tea, the year's consumption regularly using up all that is grown. Last year 135 million pounds were produced by India; of this, 120 millions at least will be used in the United Kingdom, and the remainder in other countries, where the use of Indian tea in place of China is rapidly increasing to a point which makes them keen competitors with English buyers.

The effect of these developments in trade has been to maintain the market value of Indian tea well above the cost of production. You may like to know some details. A crop of "common tea" costs from 5½d to 6d per lb. to make, and realises 7d to 7½d per lb.; a smaller crop of "good tea" costs about 7d per lb. and the realises from 9d to 10; a still smaller crop of "fine" tea costs from 9d to 10d, and realises from 1s up to as much as 1s 6d per lb. There is, therefore, a good margin left for lowered market value or increase cost of manufacture. The items that would increase cost are: a rise in the value of silver, a rise in freights, or a scarcity of coolie labour.

So much with regard to the general position and prospects of the industry. The would-be investor will, of course, want to know which are the strongest and soundest of the many companies, but it is not my purpose to tell him. Some general hints, however, may perhaps be given. These are: To notice the capital cost per bearing acre, and prefer those whose gardens show a low cost; to ascertain what additions to the planted area have been made out of the profits of past years; to discriminate between those who pay dividends and also create reserve funds, and those who do not to inquire what is the average value of the tea produced, and if the estates are situated in the best districts.

Most of this information can be found in the elaborate tables of statistics now published by some of the stockbrokers, who are beginning to realise that 6 per cent or 8 per cent can be obtained on investments in Indian tea with much less risk than is run in many kinds of industrial and commercial concerns for the sale of 5 per cent. From a shareholder's point of view it is much to be desired that the older companies would rearrange their capital on a modern basis, divided into the preferred and deferred shares of small nominal amount that the investor of to-day so much prefers.—I am &c., ASSAM.
—*Financial Times*, March 11.

VARIOUS PLANTING NOTES.

THE "BULLETIN" of the Botanical Department, Jamaica, contains:—Rum Aroma: III; Notes on the Orange; Coccidæ or Scale Insects: VIII; Insecticides; Grants for Agricultural Education; Notes on Curing Cocoa; Notes on Kola; Orris Root; Wild Lime; Ornamental Plants; Eucalyptus Oil in Yellow Fever; Ferns: Synoptical List.—XXXII; Castleton Gardens; Contributions to the Department.

THE KEW BULLETIN of Miscellaneous Information for February contains:—Gold Storage of Fruit; Decades Kewenses: XXVI.-XXVII; Dominica; New Orchids: 16; Two African Holarrhenas; Natural Sugar in Tobacco; Miscellaneous Notes; Botanical Magazine; Hooker's Icones Plantarum; Hand-list of Orchids; Water Supply; The British Honduras Pine; Beetle Larvæ attacking Orchids *Solanum torvum* in Assam.

JAVA CINCHONA SHIPMENTS.—Our Amsterdam correspondent writes on March 2nd:—"It was made known today that the February shipments from Java of cinchona-bark amounted to about 546,000 Amsterdam lb., against 756,000 lb last year. This makes for January-February 1896, 1,516,000 lb against 1895, 1,413,000 lb; 1894, 1,351,000 lb; and 1893, 1,255,000. Our next sale will contain about 6,000 packages of bark, and the stock in first hand, all told, is now about 15,100 packages.—*Chemist and Druggist*.

Correspondence.

To the Editor.

GUANO FOR COCONUTS.

DEAR SIR,—Can any of your readers inform me whether guano is good for coconut trees, and how much per tree should be applied? It seems to me it might be useful on distant parts of an estate, where bulky manure could not be so conveniently applied.—Yours truly,
 PROPRIETOR.

YIELD OF CACAO PER ACRE.

41 Eastcheap, London E.C., 19th Feb. 1896.

SIR,—Your correspondent A. v. D. P. of the 13th December states, that an African estate of 300 acres yields 19½ cwt. of cacao per acre; allow me to inform him that in Grenada, West Indies, there is an estate which yields that quantity stated; but of course it is highly manured; whereas the African estate is virgin soil, hence the large return.—Yours truly,
 A. G.

CEYLON AND AFRICA.

DEAR SIR,—Agriculturists and others in Ceylon, ought to be most thankful that we are spared any such similar visitation as that referred to in the appended extract from a letter recently received from South Africa. I wonder if the introduction of the blood-sucker, chameleon and other of the lizard tribe, in LARGE numbers, would be beneficial in the way of keeping the locust pest in check.—Yours faithfully,
 E. F. T.

Extract.

"The plague of locusts in this part of the world, Natal, is becoming most serious! On this estate alone out of a plot of 600 acres we have lately dug up over a ton and a half of locusts' eggs. They lay in cocoons—each cocoon contains on an average eighty eggs, and 550 cocoons go to 11b., so for a ton and a half we destroyed the small number of 147,840,000 eggs—this is only a part of the destruction carried out all over the Colony, and still immense quantities are left to hatch and carry destruction to vegetation wherever they appear. Wise and very stringent measures are however being taken by Government for the eradication of the pest."

P.S.—Can the insects referred to be descendants of the Mosaic plague?

TEA CHESTS: THE ADULTERATION OF COFFEE.

March, 4.

SIR,—When I sent you the information about the self-opening tins for Tea, I did not know so much about the subject, as I do now, and I would like to explain to your readers some of the points.

I stated that the lids were made perhaps best in this country and shipped out, but I did not say that as soon as the patent had expired the rims to fit the lid were also run out of tin. Now the point is this, that the lid and a small rim can be shipped out as they fit one another, and this small rim can be most easily soldered on to the flat sheet of tin, which would be at the top of the Tea chest; therefore you will have an air-tight joint.

Another point which had not occurred to me was that in making some of these tea chests in India, by placing four tin boxes in close position to one another, the packages can be made to hold up to 150lb. of tea and only one chest is required (of wood); hence there is a very great saving and beyond this the tea is all packed in to a uniform size, Very tightly it arrives home, and the Customs at once see that it is carefully weighed. They tare one package

and by this means get to know the exact weight of the tin and the lid, therefore if they scale a few of those unopened tins they have a perfect record of the weight without opening, taring, bulking, or anything else.

The object of putting the name of the estate on the tea chests is for advertisement. This advertisement have been handed down by the Chinese and in China the natives used to buy the tea because they knew the name or brand or mark of the estate or packer. These chests from Ceylon now come into the hands of the grocers, and also into the hands of the large stores here. These people find it advantageous to order home from Ceylon so many chests of tea and they send out a sample to the Ceylon garden asking at what price they can be supplied with a certain tea. The Ceylon garden, seeing this order coming along, puts on a profit, knowing that it will be saved all its expenses, and stipulates for each being paid through the Bank, hence the planter who has been fortunate in having his tea selected gets a considerable advantage. This trade has commenced and is rapidly extending.

There is one other point which you will find crop up very shortly, and that is, the Legislature are about to put in force the question of "adulteration" of coffee." This has been brought before the Chamber of Commerce of London and in the presence of some of the members of the Committee of the Chemical Trade Section, at which analytical chemists attend. It was argued and admitted that the producer of milk had now to be so careful that he had to keep cows giving an excess of cream to fetch up the quality of milk of any cow that yielded quantity without quality.

The analytical chemists were next asked whether it was true that they were well aware that in very few instances could pure coffee be obtained when a cup of coffee was asked for in any restaurant, café or hotel, or railway bar. They were further asked if they did not consider that it was unfair to attack the producer of milk and at the same time allow the vendor of the coffee to put any muck and filth into it and call it "Coffee." They admitted that the state of the law was such that it ought to be altered and Sir Michael Hicks-Beach is the minister in charge of this department, who will at once put the law in motion. It is thought that if this is properly carried out it will immensely increase the consumption of real coffee because the people who ask for a cup of coffee dread what they may get served out to them.—Yours truly,

THOS. CHRISTY.

THE PRODUCTION OF THE ORIGINALS OF TELEGRAMS.—At the Appeal Court today, Mr. Advocate Jayawardene on behalf of the complainant in a Police Court case from Avisawella moved for an order on the Postmaster-General under section 70 of the Criminal Procedure Code to deliver to the Police Magistrate of Avisawella the original of a telegram for the purposes of being put in evidence. Mr. Jayawardene tendered an affidavit from his client and stated that the Magistrate of Avisawella had issued summons on the Postmaster-General to produce the original of the telegram, when the latter referred the Magistrate to section 70 or the Criminal Procedure Code. The complainant was one Paul Jacolyn, the Recordkeeper of the Avisawella Courts, who charged the accused with having given false information to the Magistrate of that Court. The false information consisted of the following telegram received by the Magistrate from the accused:—"Furnished sureties, R600. Did not take bail. Others bailed R1 to Paul and they released." The meaning of which was that the Recordkeeper received a bribe of R1 from each of the other accused and enlarged them on bail. After hearing Mr. Jayawardene, who read the complainant's affidavit, His Lordship Mr. Justice Withers made order directing the Postmaster-General to cause the telegram to be delivered to the Magistrate of Avisawella for the purpose of that officer investigating the charge preferred by the complainant against the author of the alleged telegram.—Local "Examiner," April 2.

NOTES FROM HOME.

Dover, March 7.

The Evening *Standard* had a very pertinent editorial note the other day, expressing surprise at the interest still felt in the

CULTIVATION OF COFFEE

in so many different countries, in the face of the steadily decreasing consumption in the United Kingdom. The cause of such decrease is, of course, found in the persistent adulteration, or admixture with chicory—so that it is almost impossible to get a cup of pure coffee in Britain. This was brought out very clearly by the Deputation which recently waited on the Chancellor of the Exchequer—particulars of which have, no doubt, been already published by you. The following editorial deliverance on the subject is from the *Manchester Guardian* and may be worth putting on record:—

The Chancellor of the Exchequer yesterday declined to entertain the idea of abolishing the duty on coffee. The deputation of coffee-traders which waited upon him had some good reasons to urge in favour of their proposal. The trade in coffee has been steadily declining for many years. Compared with that of 1873, the trade of the past year shows a decrease of a million hundredweight, so that the import of coffee is now only about three quarters of a million and the export half a million hundredweight. This decline is attributed to the hindrances thrown in the way of merchants by the system of warehousing in bond, which is necessitated by the duty. If, say the traders, coffee could be imported free, it could be prepared for use here as cheaply as in Hamburg or Holland, and the trade would revive. The consumption of coffee in England has steadily diminished—in 1870 nearly one pound was consumed per head, and in 1891 only about two-thirds of a pound,—so that the future of the trade evidently depends upon the extent to which the exports can be increased. Sir Michael Hicks-Beach argued that the decline of the export trade was due to other causes, such as the tendency of Brazilian coffee to go to Continental ports rather than to London. It is not easy to decide which of the two explanations is the true one, but if the coffee trade is being ruined by a duty which only produced last year £173,268, there should be little hesitation about the reduction or abolition of the duty.

The strong point made by Sir M. Hicks-Beach, it seems to me, was that, if he abolished the duty on coffee, that on cacao should follow and then it might fairly be said that tea was unduly weighted. "A free breakfast table" would seem to be the only equitable reform in this direction; but I think it was a pity that the Deputation did not have an alternative request to make of the Chancellor, namely, that the rule should be far more clearly and fully enforced of the proportions of coffee and chicory in each packet sold, being printed on in bold type or figures. If even working-people read at a glance "This is mixture of one-fourth coffee and three-fourths chicory"; or of "half coffee and half chicory"; or again "three-quarters coffee and one quarter chicory", they would speedily come to know what they were really buying and turn to the packets with the larger proportion of coffee. At present, there is no check on the proportions in the packets sold by the grocers.

Notwithstanding that, according to the deputation, two-thirds of the London coffee trade has, within the past quarter of a century, been diverted to Continental ports, British capitalists are not behind others in the attempt to grow more coffee. This is seen not only in the Straits and North Borneo (not to speak of revivals in Ceylon and India—with Liberian especially), but

also in Java and Central Africa, in Mexico, Central and even in South America. The latter

COFFEE-GROWING COMPANY

is reported by a friend to have a very large capital at its back, for the purpose of opening a large area of line land with coffee in the South American State of Colombia. This project is freely supported in the City, notwithstanding the unsettled state of affairs in the neighbouring Republic of Venezuela; but Colombia it seems, bears a better record. On the other hand, the Company's Directors wisely require a preliminary Report by an experienced and competent collector-planter, and I have been consulted by a city friend as to a suitable Ceylon man for the post. The salary or fee would be £500 and all travelling expenses paid and English agents in the State would give needful assistance in providing guides, interpreters, &c.

There can be no doubt of the steady demand for coffee on the continent of Europe and throughout the Americas. Even if we rapidly gain on the States of Canada with our teas, the victory will be more over the China and Japan rubbish and green, or Prussian-blue-faced teas, than over coffee; although I have no doubt that many of the British emigrants to America during the past 30 to 40 years when they found good tea made available to them, would turn even from coffee, to their original love. I do not see, therefore, that Ceylon and Indian tea planters need fear the extending cultivation of coffee in other lands. We have plenty of room for our tea for years to come, if we oust the inferior China and Japan tea products supplied to North America, Russia and the rest of Europe and Australasia; the demand elsewhere is increasing, and there is already a large and increasing consumption among the natives throughout India and Ceylon of the cheaper inferior teas.

I am sorry to see from Gow, Wilson, & Stanton's weekly report that Ceylon tea has again been weaker in Mincing Lane this time, although exchange is up $\frac{1}{2}$ d in the week, and the quantity offering was small!

In the *Daily Chronicle* of this morning, there are reports of the meetings of two

SOUTH AFRICAN COMPANIES

of some general interest from what was said and, in the case of one, Sir G. W. R. Campbell presided:—

PARDY'S MOZAMBIQUE.

An extraordinary general meeting of the shareholders of this syndicate was held yesterday, at Winchester House, for the purpose of increasing the capital of the company by £20,000.—Mr. E. H. Watson presided, and in moving the resolution stated that the company had paid 267½ per cent. in bonuses and cash, and they had today £111,083 worth of shares in subsidiary companies. It might be asked why, under such circumstances, they proposed to increase their capital. One reason was that if they disposed of those shares by putting them on the market it would have the effect of reducing the price of Pardy's Mozambique shares. Another reason was that when they could realise this money they would be able to pay 350 per cent. more in dividends. They, however, had no right to utilise that money as capital, Acting on the advice of Mr. Pardy, the directors had come to the conclusion not to sell any more of their properties until they were thoroughly developed, when naturally they would command far better prices. They had still the right to locate 219 more claims.—Mr. Pardy, in seconding the resolution, referred to the recent invasion of Dr. Jameson into the Transvaal, and expressed the opinion that that gentleman was simply the victim of deceit on the one side and trea-

chery on the other. He said it was common to describe Dr. Jameson's action as a "raid," but, in his opinion, it would be better described as "Dr. Jameson's Ride."—The resolution was carried after some discussion.

RHODESIA, LIMITED.—An extraordinary general meeting of the shareholders of this company was held yesterday afternoon at Winchester House, for the purpose of confirming the resolutions which were passed at the meeting held on the 14th ult. The resolutions were to the effect that the capital of the company be increased to £300,000 by the creation of 100,000 new shares of £1 each, and that the agreement which was produced for the purchase of certain of the assets of the Buluwayo Mining and Finance Company for £10,000 cash and 60,000 fully-paid shares be sanctioned and confirmed.—Sir George Campbell, who presided, in moving the confirmation of the resolutions, said that the affairs of the company were going on extremely well. As regarded one of the assets, which they acquired by taking in the Buluwayo Mining and Finance Company, they had received the following cablegram from their manager:—"New shaft on the Somerset claims in the Selukwe district has been sunk to a depth of 50 ft.; the width of the vein is 2 ft. Gold is visible throughout." In conclusion, the chairman said, they had several transactions on hand which they thought would benefit the company very much, but it was not advisable at that moment to say more about them.—Mr. R. J. Price seconded the resolutions, which were adopted unanimously.

I have been hearing a little lately of the

INDIAN AND CEYLON EXHIBITION

to be opened this year at Earls Court, and I am inclined to think well of the enterprise of Mr. Hartley (whom I hope to meet shortly), the more especially as he and his spirited brother-capitalists do not require any subsidy from Governments, but only their countenance and such as can fairly be given in loans of exhibits. From a letter addressed to me by Mr. Hartley, as Director, I quote as follows, in case you have not already had the particulars:—

"I noticed some few weeks ago there was an article in your paper in reference to our proposed Exhibition which was not altogether satisfactory to us. Whoever wrote it was evidently under the impression that it was the intention of this Company to apply to the Ceylon Government for pecuniary assistance with regard to organizing the Ceylon Section. I may tell you that we have no idea whatever of doing anything of the kind. This Company is purely a commercial undertaking, and is provided with ample funds for carrying out the proposed work.

"In all probability we shall send out a commissioner from here at a very early date to organize the Ceylon Section, and I will make it my business to give him an introduction to you, although it is possible he may not be unknown to you, and if you can render him any assistance, I know my friend Mr. Christy will greatly appreciate it.

"The terms we offer to native exhibitors are by no means onerous. This being, as I say, a commercial undertaking, we are unable to grant free space to exhibitors except for loan exhibits. The charge we propose is a reasonable commission upon takings only.

"On the list of the Honorary Committee you will notice a number of names well-known in Ceylon.

"Since writing the above, we have received a letter from the Secretary of State, informing us that a despatch has been sent out by the Colonial Office to your Government.—H. II."

In case you have not had it already, I give a letter from Sir James Linton, Chairman of the Fine Arts and Loan Committee of the Exhibition, as "Ceylon" is expressly mentioned by him:—

EASTERN ART AT EARL'S-COURT.

To the Editor of the *Times*

Sir,—Last year you were good enough to insert a letter in your columns from Sir George Birdwood appealing for contributions to the Loan Section of the

Empire of India Exhibition at Earl's-court; may I ask you to grant me the same favour upon the present occasion for the same purpose? The intention of the honorary Committee, of which I am Chairman, is to follow the same lines as the very successful gathering of loan objects of Indian art brought together at Earl's-court last year, with the addition of Ceylon, Hongkong, and other Crown dependencies in Asia.

The honorary Committee of advice consists of Vice-Admiral the Hon. Sir E. Freemantle, Lieutenant-General Sir Andrew Clarke, Sir George Birdwood, Mr. M. M. Bhowaggee, M.P., Mr. C. Purdon Clarke, Mr. F. H. M. Corbett, and Mr. G. Collins Levery.

The educational and artistic value of the collection of last year, and the very great interest attached to it, lead my Committee to hope for the help of all who are interested in the advancement and conservation of Eastern art and art manufactures, so that we may present to the art-loving public an even more exhaustive and representative collection in the coming exhibition of this year.

The primary object of my Committee is to stay, if possible, by the exhibition of fine examples (thereby encouraging their production), the rapid decay of good native art and workmanship, a decay that seems ever to be one of the evil consequences of the influence of Western civilization upon the arts of the East, and to this end my committee appeal to such of your readers as are desirous of helping so good a cause by lending for exhibition such objects as are in their possession.

The loan Committee will be glad to receive, as early as possible, particulars from owners of historic objects emanating from or connected with India, Ceylon, or any of our Eastern possessions, such as arms, furniture, costumes, jewelry, ancient and modern art works of all kinds, models of natives of the various countries, their dress, objects of worship, musical instruments, means of conveyance, amusements, and anything of ethnological or general interest. Historical pictures, portraits of generals and statesmen conspicuous in the history of British conquest and colonization in the East, as well as paintings by European and native artists in oil or water-colours, black-and-white drawings, and miniatures connected with India, Burma, Ceylon, and the East generally, are particularly desired for this collection.

The directors of the London Exhibition Company will undertake every reasonable responsibility for the reception, custody, insurance against fire, damage, and loss, and the return after the close of the exhibition of the objects lent.

If those who have works or objects which they are willing to lend will be good enough to communicate with George Collins Levery, Esq., C.M.S. Hon Secretary, Fine Arts and Loan Section Committee Earl's-court, S.W., the necessary form of information will be forwarded by return.

I beg to remain yours faithfully,

JAMES D. LINTON.

5, Cromwell-place, South Kensington, S.W.,
March 2nd.

PREFERENCE SHARES IN TEA COMPANIES.

I call attention to an article on another page from a London financial paper on Indian and Ceylon Tea Companies and Preference Shares, showing how good and safe these investments are from British Capital. (The article is given on page 707. An average of 4½ per cent. may not seem much to Colonial readers; but in the eyes of home investors, with Consols yielding less than 2½ anything safe which gives 4 per cent or over is bound to be run after; and as the attention of the home investing public is being, more and more, turned to Tea Plantation Companies, we may be sure of an increasing demand for both Preference and Ordinary Shares in good Companies.

I was much pleased to learn from DR. MORRIS of Kew, of his interesting trip to

THE BAHAMAS

from which he recently returned. He refers me to an interview reported in *Commerce* as giving the

best account of his trip. (It is quoted on page 709.)

Dr. Morris is to deliver an illustrated lecture before the Society of Arts on March 18th, on the "Balamas Sisal Industry" which is sure to be full of interest.

I am exceedingly pleased to learn of

MR. E. E. GREEN'S

forthcoming work on the "Scale Insects" which constitute so large a proportion of the worst enemies of tropical products. The prospectus has been already noticed in your columns, and I sincerely hope the venture—a very plucky but risky one financially—will be well supported in Ceylon. Surely, every Tea Estate Company should subscribe for at least one copy to put in the hands of its Chief Manager for reference; and the Ceylon Government most certainly ought either to take 50 copies, or make a substantial grant in aid of the work—one of great economic importance to the Colony as I am sure Dr. Trimen will report, if called on by Governor Ridgeway. Writing to me under date the 1st instant, Mr. Green states:—

"I have received very kind encouragement from many of the leading Entomologists in England. But the public has not as yet responded very freely to my invitation for subscriptions. I believe I can count scarcely more than a dozen subscribers at present! But the prospectus has not been out very long. My publisher's estimate for the production of the work is a cool £1,000—so I shall require 200 subscribers at £5 to cover the cost. I am informed that I shall be fortunate if I obtain half that number: the publisher warning me that the demand for scientific works of the kind is very limited. Don't you think that this is a case where the Ceylon Government might give a substantial grant? It is surely of as much use—though not of such general interest—to the public as Moore's work on the Butterflies and Moths of Ceylon which was largely subsidized by Government."

Most certainly—our reply is—this work on the "Coccidæ" is fully as deserving of official support as that on the Butterflies. Could not the Planters' Association Committee move in the matter—(1) by taking the names of subscribers and (2) by requesting some official help to so desirable a production? Surely no planter or merchant in Ceylon would desire to see Mr. Green out of pocket, in addition to all the trouble and time he has given to a useful work in the interests of science, of his adopted Colony and of his brother planters?

"INDIGENOUS COFFEE."

Dear Sir,—With reference to your issue, dated the 29th ultimo, I notice a very interesting letter from a correspondent signing himself "R. S. Hagan," anent the above. I heard of the existence of the above variety of coffee in the locality "as mentioned by your correspondent" through the late Mr. R. E. Norman, an old and an experienced planter in the Oucherlony valley. This variety of coffee was brought to his notice, I think, by a Mr. Cootes some 25 years ago as existing in the Suffolk and Goodalore Mullay belt, and when I was appointed a Superintendent of the Goodalore Mullay Estate, I was told about this variety and was asked to institute a search in the above belt for the trees in question. I was fortunate enough to find two trees in close proximity to each other, the appearance and description of the trees I discovered tallying exactly with the observations made by your correspondent in the issue mentioned, except in that the height of the trees discovered by me was not more than 20 feet; the observations made by your correspondent during the time he was in the valley with reference to this species of coffee is borne out fully by the investi-

gations I made at the time. Regarding the difference in the fruit between this variety and the coffee arabica, the only cause that I can ascribe to the want of maturity in the beard of the indigenous coffee is that our investigations in this part of the functions of the tree has not been carried far enough, for whenever I visited the locality in which the trees were, to see how the berries were progressing towards maturity, I invariably found the trees quite empty of berries, having been stripped of their fruit by monkeys and birds which used to abound in the vicinity of the above trees. I tried to preserve the berries by tying muslin bags around them, but my efforts always proved futile, for the monkeys invariably pulled the bags off and took the berries, so I could not get the opportunity of seeing if the berries would come to the same state of perfection and maturity as the berries of the coffee arabica. The late Mr. Lawson was much interested in this species of coffee; I sent him several branches of it with blossom, and later on a branch with berries; we also sent Mr. D. Hooper specimens of branches, blossom, and berries of the trees under observation, but I have never heard what conclusions the above gentlemen arrived at in connection with the same; so if this letter should attract Mr. Hooper's attention, I should feel much obliged to that gentleman if he would kindly make it known through the medium of your valuable paper the results of his investigations, as I am sure it would be very interesting to those interested in the matter. I am sorry to add that the tree I discovered has since been destroyed by the opening out of the locality in which I found the "wild coffee," but happily I am acquainted with another locality in which this species of coffee abounds. I shall be glad to send specimens of the tree to anyone who is anxious to go into the matter scientifically with a view of trying "grafting, budding and cross fertilization, &c." and thus establish a new variety of coffee.—Yours faithfully, R. DE R. N.

Suffolk, 9th March 1896.

"WILD COFFEE."

(*Diplospora sphaerocarpa*.—DALZ.)

Mr. Hooper has kindly sent us the following extract from the "Pharmacographica Indica," which gives some further information on this interesting tree:

"The berries of this tree, growing on the Western Ghauts, are known as 'Wild Coffee,' and, when ripening, are eaten by birds and jackals, but they have not been known to be used as a substitute for coffee either by the natives or European planters. The berries are from half to three-quarters of an inch in diameter, and are crowned by a calyx and areole. The seeds, numbering from 4 to 10 are arranged in a vertically imbricate manner in the sweetish pulp; they are round and flattened in shape, glossy on the surface, light brown in colour and horny in consistence. The seeds turn dark brown when roasted, throwing off the parchment like testa, and when powdered, possess an aroma resembling that of coffee. The roasted and powdered seeds were submitted to Brig.-General Kenny Herbert, a great authority on Indian cookery, and he reported as follows:—'The percolated liquor had a remarkably pleasant taste having a marked flavour of coffee. Indeed the only difference I could detect was this,—the liquor was not so brown in tint as coffee, being more golden brown than dark brown and the beverage brewed seemed not quite so strong as would have been produced by a similar quantity of coffee powder. There can be no doubt of the distinct coffee-like properties of this powder and the absence of any twang or conflicting flavour to mark its pleasant taste.'

The seeds contain an alkaloid, which can be separated in the same manner as caffeine, an astringent acid, an aromatic body, some fat, one or more sugars, and four per cent. of mineral matter. The dried extract obtained by boiling water is 16 per cent. or something less than that obtained from cultivated coffee berries."

It will be seen that, coupled with the immunity that it seems to enjoy from leaf-disease "wild coffee" appears to have a future of some importance before it. We are taking steps to procure samples of the ripe seed to send home for report and valuation, but judging from the high favour the sweet pulp is held in by those inveterate coffee thieves, monkeys and birds, we are somewhat doubtful when we shall obtain them. A letter emphasizing this difficulty will be found in our correspondence columns: even tying muslin bags round the fruit, usually an effective method of preservation, was found to be of no use.

D. sphaerocarpus is found, by the way, on the higher ranges of the Western Ghats, all the way from Bombay southwards.—*Planting Opinion*, March 28.

A CUP OF TEA.

Has any one the least idea of the modern uses of tea? In the days of our childhood a lesson of tea was easily got by heart. We read that the tea plant grew in China, and at certain set times the leaves were gathered by the natives thereof, who after drying and rolling them, exported them for use as a beverage to our own and other countries. That was all, or about all we had to remember on the subject. Here and there some old bachelor dominie might add a few exhortations of his own on the proper way of preparing tea, how important it was to see that the kettle boiled, and how the teapot ought to stand at least fifteen to twenty minutes' "drawing" on the hob.

Nowadays we have changed all that. We no longer speak of "drawing" tea, as though the tea-pot were some special kind of carrier's conveyance, and we are all aware that the tea plant has been successfully introduced into many other parts of the world besides its original Chinese home. The bankrupt Ceylon Coffee planter found in tea his deliverance from all the harassments that followed the appearance of the mysterious *Hemaleia Vastatrix* on his estate, and the Mysore and Assam growers have obtained a world-wide reputation.

So far so good. But there is a great deal more to learn about tea than that. When we have finished our afternoon cup, and Mary Jane has emptied out the teapot, we are apt to imagine, if we ever give the matter a moment's thought, that the leaves it contained are done with when they are thrown away. By the natural process of decay, the tea will be resolved into its original component parts, and as our neighbours across the Channel say, "Voilà" there you are. But not so, dear reader. The tea has only, as it were, begun its career then, and many are the processes through which it may yet have to go.

Tea refuse is highly valuable, and is turned into account in various ways as follows; The best of it is sold to be redried, and used as tea again. In this metamorphosis it is generally mixed with fresh tea, and resold at a cheaper price. This process may be repeated as long as it is possible to delude any one into buying the adulterated article, but by-and-by a point is reached when no more tea, so called, is to be got out of the mixture. In this connection a curious fact may be mentioned. The old tea is mixed in one of its downward stages with the sweepings out of the tea chest after they have been emptied. Nails and other rubbish are sometimes present in this mixture in too large proportion to be palatable, and to clear these away strong magnets are employed, which draw all the iron at least from the other ingredients. It can hardly be supposed that any of the tea drinking will regret the loss of this tonic addition to their cup.

Then you are done with it, you say? Not at all. Old tea leaves help to make the basis of those beverages, aptly termed "suckers," first popular in America, but now in use here also, drinks which are sucked through a straw, and the process is so ingenious that no one uninitiated would recognise in the refreshing drink any reminiscence of the kitchen tea-pot; but there, as we are credibly informed, it is, for all that.

And what after that? Well, the refuse left after all these operations was not until recently considered of any commercial value, but even for it

some use has been found. Old tea leaves, it seems, make capital fertiliser, and ardent gardeners are now using the sweepings of tea refuse in this way. Tea leaves have long been admittedly useful helps to the housemaid. The judicious use of them will make the dulcetest table glass shine, and we are all familiar with the sight of tea leaves sprinkled over the carpet before sweeping, but it is new for the gardener to make to tea manure.

However, if any of the readers of "The Presbyterian" are on the outlook for a good and inexpensive compost, let them try the effect of the drainings of the tea-pot. A sackful of tea leaves is the proper quantity to start with, so the amateur horticulturist will find his work cut out for him during the winter months in collecting the necessary amount. Then when the happy spring time comes, let him sally gallantly out to his back garden, bearing his sack, and let him sprinkle his centre plot thickly as with rose leaves in Vallombrosa, every brown tea leaf reminding him of pleasant social half hours by the drawing room fire. He could, in fact, have the remains of each individual tea fight on a separate plot thus, rearing to himself a sort of private monument like that of the ancient Egyptians, on which lie hidden sentiments of past *ennui* or enjoyment would be inscribed. But there is no use in carrying the point further. Everyone can see what a wealth of ideas lie under the suggestion, and when the garden blooms with gay and vigorous beauty, the gardener will, as he sips his afternoon tea out of doors on his lawn, be more than ever grateful for the "cup that cheers" not only him, but his garden.

Such are some of the recent "wrinkles" about tea, and I think I have written enough to show that there is more in the tea-pot than the tea-drinker always wots of.—*Presbyterian*.

TEA IN AMERICA.

NEW YORK, Feb. 26.

Demand is meagre, and the same dull condition and low prices continues. It is still a buyers' market except on lines which are scarce.

Today at noon the Montgomery Auction and Commission Company will sell 7,230 packages, viz.: 1224 half-chests Moyne; 535 half-chests and boxes Pingsney; 20 half-chests Japan; 50 half-chests Japan; basket-fired; 35 half-chests Japan Nibs; 903 half-chests Congou; 320 packages India, Java and Pekoe; 1057 half-chests Foochow, new season's; 3,086 half-chests and boxes Formosa, new season's, including some desirable teas.—*American Grocer*.

TEA IN AUSTRALIA.

China tea continued in demand at steady rates. Sales reported comprising 800 half-chests common congou at up to 4½d, 1,400 half-chests panyong at 5d to 6d, 600 half-chests panyong at 6½d to 8d, 1,000 boxes congou at 5½d, and 100 quarter-chests buds at 5½d. Of Ceylous 650 chests have been placed at prices ranging from 6d to 1s. At auction on Tuesday a catalogue of 431 chests Ceylon was disposed of, 303 chests pekoo at 6d to 7½d, and 128 chests pekoe souchong at 5½d to 6¾d. At auction on Wednesday a catalogue of 3,282 half-chests and 145 quarter chests China was offered. There was a good demand at unaltered rates, and sales were made of 1,805 half-chests common congou to good medium panyong at 4d to 5½d, and 145 quarter-chests buds at 5d to 5½d.—*Australasian*, March 14.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear, stumps and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN; LONDON.

CORAL AND CORAL REEFS.

D. Andrew Wilson delivered the concluding lecture at Cork, under the Gilchrist Educational Trust, and took for his subject "Coral, Coral Makers and Coral Reefs." There was a very large attendance.

Dr. Wilson, in the course of his lecture, said the subject of coral involved two distinct phases of nature. The first question they had to consider was coral animal work, and, secondly, they had to study how that animal had been able to rear up what had been well called the imperishable masonry of the sea. Coral was a kind of chalk. The scientific name of chalk was carbonate of lime, and coral was a hard description of carbonate of lime. The Romans believed the coral was a plant, that it was soft in its native waters, and became hard when exposed to the air. Curiously that belief that coral was a plant remained as a part of science till about 150 or 200 years ago. About 150 years ago a certain Frenchman, the Count de Marseille, descanted amongst other things on the history of the sea, and the coral plant—that was the red coral found in the Mediterranean sea. He had a student, Peysommel's, who went to the North Coast of Africa there to study coral. He wrote home that they had all been mistaken in thinking that coral was the work of the plant, for he discovered it was the work of an animal. They pigeon-holed his reports, and one who took pity on him wrote to him saying to cease sending his reports. They had decided that coral was a plant, and nothing could change the course of nature because they had so decreed. He then sent his report to the Royal Society of London, and they published his report, and gave forth to the world that coral was the work of an animal. The lecturer then gave a lengthened and interesting description of the coral animal and its internal structure, which he likened unto an excise ink bottle. The difference between coral animals and sea anemones was firstly that coral animals made a skeleton, whereas sea anemones did not; secondly, coral animals were generally single. The fact that coral animals were compound gave them great power—the power of budding and increasing and making a tree. Illustrations of the different forms and shapes of coral were depicted on the screen. Dealing with the conditions of coral life, he said that corals required a certain heat and they required a certain depth. They would not get coral islands in any place where there was not from 60 to 66 degrees of heat. If they drew a line 1,800 miles at each side of the equator, between those two lines they could find living coral. They had plenty of fossil corals in the rocks in the British seas and that indicated a time when the climate was very different from what it was now. There was only one coral existing in British seas—off the Devonshire coast they got a single cup coral, a remnant of a once prolific coral. Living coral could only exist at a depth of from 160 to 200 feet. He questioned very much whether any living coral went down 240 feet. Coral wanted light and air. In fact corals flourished best where the water was roughest and where they found the sea was agitated, and where the coral could get plenty of oxygen to live on. Darwin's theory with regard to coral was that they could only explain the erection of coral by taking into account one circumstance, the sinking of land. There were three kinds of reefs. First was the fringing reef. The island of Mauritius was surrounded by a fringing reef, which practically meant that the coral animals had built a reef on the sides of the mountain. Suppose the island began to sink, the coral reef grew upwards, and as the island went down they would get a barrier reef. The third kind of reef was the perfect form of coral island—what was called lagoons or atolls. Darwin's theory was that one reef was the formation of the other. The lecturer expounded and supported this theory. In concluding he said the wish of the Gilchrist Trustees was that some educational benefit would accrue to them. He believed they were in want of an extension of technical education. He believed it was one of the most important things they could have. If they were to have "Made in Germany" not quite

so frequently on products in that country, the workmen had it in their own hands. If they could give the same stuff as was made in Germany, only a little better, it would be meeting Germans on their own ground. The Germans had the benefit of technical education, and they, in these islands, had all that time been nursing, in the hope that they were quite equal to Germans, with their old common rule of the thumb. If these lectures had the effect of impressing on the large and intelligent body of workmen whom he was addressing—that in themselves lay the root of maintaining their future success and superiority—then he knew that the Gilchrist Trustees would consider their money had been well spent in sending their lecturers to Cork. What use were these lectures to be to the man in the street? They devoted so much time to hammering away at politics that they had no time to ask themselves something about the world itself. What was the difference between one man and another in that life? The difference was not in wealth, was not in position. The difference was in the opportunity of getting out of the daily rut they lived in. The difference between one man and another was that one man lay in the rut, and the second man, with a little aspiration, perhaps begotten at a Gilchrist lecture, got his head a little above the rut, and saw something of the blue sky of intellect which was always beneficently shedding its rays upon them if they turned their faces to the rising sun. He wished that they would cherish something that they heard at the Gilchrist lectures which would make them take a little study of these things, not to put money in their pockets, it would not do that, but to increase their enjoyment of life by understanding something of the world, and when they had climbed through the hill of difficulty and had come to the summit of the mountain they might see foot-steps throughout the shining valley.—*Cork Constitution*, Feb. 18.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, March 12.

ESSENTIAL OILS.—Lemongrass oil is firmly held at 2½d per oz for fair native qualities. Citronella oil is still quoted nominally at 2s per lb on the spot, but it would probably be possible to buy, with an order, at least a couple of pence below that figure. For arrival 1s 7½d per lb c i f April-May, would now probably be accepted. Arrivals have been very heavy lately, the "Clan Murray" which came into port today, alone bringing 637 to 8 cwt drums, and 138 cases and kegs.

CAFFEINE.—Very quiet; 18s per lb., however, is still the quotation.

SPICES.—Nutmegs are very quiet, and Mace remains dull of sale.

MR. E. E. GREEN ON A CEYLON INSECT.—At a meeting of the Entomological Society on March 4, Mr. E. E. Green exhibited a larva of an homopter, one insect—one of the Cicadæ—from Ceylon, having what appeared to be a head at its caudal extremity. He pointed out that the larva had caudal appendages which might be mistaken for hairy antennæ, and pigment spots resembling eyes on the antepenultimate segment of the body. The insect walked either backwards or forwards, and when first seen looked like a beetle of some kind—the caudal extremity representing the head.

CLOSETS, Urinals, Night Commodes, Stables, Kennels, &c. should be lightly dredged (after cleansing) with CALVERT'S 15 per cent. CARBOLIC POWDER, to destroy bad odours and to kill or keep away insects.—The most effective preparation.—In ½ lb., 1 lb. and 2 lb. dredgers, at 6d., 1s., & 1s. 6d. each, from Chemists and Stores.

F. C. CALVERT & Co., Manchester.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce).

Colombo, March 30, 1896.

EXCHANGE OF LONDON: CLOSING RATES, *Bank Selling Rates*:—On demand 1/2 9-32 to 11-32; 4 months' sight 1/2 5-16 to 3/8; 6 months' sight 1/2 11-32 to 13-32. *Bank Buying Rates*:—Credits 3 months' sight 1/2 1/2; 6 months' sight 1/2 17-32; Docts. 3 months' sight 1/2 11-32; 6 months' sight 1/2 9-16 to 19-32.

COFFEE.—Plantation Estate Parchment on the spot per bushel, R14 to 16 00.—Nominal. Very scarce. Estate Crops in Parchment, delivery, per bushel, no quot. Plantation Estate Coffee, f.o.b. on the spot per cwt, R77.50 to 82.—Nominal. Very scarce. Liberian parchment on the spot per bushel, R11.50 to 12.00.—Nominal. Very scarce. Native Coffee f.o.b. per cwt. R60 to 62.—Nominal. Very scarce.

TEA.—Average Prices ruling during the week: Broken Pekoe, per lb 50c. Pekoe per lb 34c. Pekoe Souchong, per lb 33c Broken mixed and Dust, per lb 29c.—Averages of Wednesday's sale.

CINCHONA BARK.—Per unit of Sulphate of Quinine, per lb 1 1/2c. to 3c. Twigs and branch no quotation.

CARDAMOMS.—per lb R1.00 to 2.00.

COCONUT OIL.—Mill oil per cwt. R15.25 to 15.12. Dealer's oil per cwt. R15.00 to 15.12. Coconut oil in ordinary packages f.o.b. per ton 340.—In small packages. Early shipments.

COPRA.—Per candy of 560 lb R40 00 to R48 00

COCONUT CAKE: (Poonac) f.o.b. per ton, R65 to 70.

Cocoa.—Unpicked and undried, R30 to 38.

COIR YARN.—Nos. 1 to 8 { Kogalla per cwt. R9 to 18.
Col. side " R7 to 14.

CINNAMON.—Nos. 1 & 2 only f.o.b. 66c.

Ordinary Assortment, per lb 62c.

PLUMBAGO: Large Lumps per ton, R150 to 330.

Ordinary Lumps per ton, R130 to 290. Chips per ton, R30 to 140. Dust per ton, R30 to 90.

EBONY: per ton.—No sales.

RICE.—Soolye per bag, R7.00 to R7.95.

Pegu and Calcutta Calunda per bag R7.80 to R8.15.

Coast Calunda per bushel, R3.00 to R3.35.

Muttusamba per bushel, R3.10 to R3.50.

Kadappa and Kuruwe per bushel,—no quotations.

Rangoon Raw 3 bushel, bag, R9.00.

Native Coffee	—	55.00 to 57.00	per cwt
do f.o.b.	—	62.00 to 63.00	do
Liberian Parchment,	—	12.00	per bushel (nominal)
do Coffee,	—	60.00 to 62.00	per cwt
CARDAMOMS.—	—	0.70 to 1.75	per lb (nominal)
COCOA.—(nominal)	—	30.00 to 38.00	per cwt do
RICE.—Market Steady:—	—	R6.50 to 6.75	per bag
Kazh	—	7.00 to 7.75	do
Soolye	—	7.75 to 8.00	do
Callunda	—	3.00 to 3.06	per bushel
Coast Callunda	—	2.75 to 2.87	do
Kuruve	—	3.25 to 3.50	do
Muttusamba	—	63c and Nos. 1 and 2 at	
CINNAMON.—Quoted Nos. 1 to 4, at	—	66 cents per lb (nominal)	
CHIPS.—R75.00 per candy (nominal)	—		

COCONUTS.—Ordinary R35.00 to 38.00 per 1,000 (nominal)
do Selected 40.00 to 43.00 do do
COCONUT OIL.— 15.37 to 15.50 per cwt do

COPRA.—Market steady:—

Kalpitiya R18.00 to 48.50 per candy
Marawila 47.00 to 47.50 do
Cart Copra 43.00 to 45.00 do

POONAC.—Gingelly 90.00 to 95.00 per ton

Chekku 105.00 to 110.00 do

Mill (retail) 70.00 to 80.00 do

EBONY.—quotations at R100 to R185 (nominal)

SATINWOOD.—cubic feet 1.50 to 2.12 do

HALMILLA.— do 1.25 to 1.50 do

KITUL FIBRE.—Quoted at R30.00 per cwt (nominal)

PALMYRA FIBRE.—Quoted nominally:—

Jaffna Black.—Cleaned (Scarce)

do Mixed R17.00 to 18.00 per cwt.

Indian do R7.00 to 9.00 do

Do Cleaned 10.00 to 14.00 do

SAPAN WOOD.—Quoted 55.00 to 60.00 per ton

KEROSENE OIL.—American 7.30 to 7.35 per case

do Russian 3.40 to 3.45 per tin

KAPOK.—Cleaned f. o. b. :— (Scarce)

do Uncleaned do

Croton Seed 13.00 to 17.00 do

Nux. Vomica 2.50 to 3.00 per cwt

THE
AGRICULTURAL MAGAZINE,
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for April:—

Vol. VII.]

APRIL, 1896.

[No. 10.

SEASON NOTES.

EASTERN PROVINCE.—A good maha paddy crop is being harvested and preparations made for sowing yala. Fruit and vegetables reported scarce.

CENTRAL PROVINCE.—The maha harvest is being reaped with very satisfactory results. Dry grain fair, except in Udunuwara.—Matale North crops reported to be excellent. *Stock*.—Hoof and mouth disease reported from Waladane.

NORTHERN PROVINCE.—Maha paddy crops being harvested, results satisfactory except in Panankawan in Vavoniya district. *Stock*.—Foot and mouth diseases and a few cases of cattle plague reported from Vavoniya.

SOUTHERN PROVINCE.—Maha paddy crop has been harvested in the greater portion of the province and with satisfactory results, vegetables rather scarce. *Stock*.—Foot and mouth disease and a few cases of a form of dysentery reported from Giruwa Pattu of the Hambantota district. (Galle report not published.)

EASTERN PROVINCE.—About 40,000 acres under paddy crop, some in ear, and late sowing will be in ear in a month's time; prospects good. Indian corn and fine grain unsatisfactory owing to heavy rains when in blossom. *Stock*.—Foot and mouth disease dying out.—(Trincomalee report not received.)

NORTH-WESTERN PROVINCE.—Harvesting of grain crops, dry and wet, with satisfactory

results. In some villages in Kalpitiya of Puttalam district paddy crops damaged by elephants.

NORTH-CENTRAL PROVINCE.—Paddy crops are in various stages, most of the tanks full. Fine grain being harvested and satisfactory. *Stock*.—Cattle plague still prevailing.

UVA.—Harvesting of yala crops and sowing of maha; yield middling in Yatikinda, Veyaluwa, having suffered from rain: rest of the district satisfactory. Fruit and vegetables plentiful except in Bintenne and Udukinda, when it is reported to be scarce. *Stock*.—Foot and mouth disease in Veyaluwa

SABARAGAMUWA.—Maha paddy crops harvested, yield generally good. Yala cultivation going on *Stock*.—Cattle plague reported from Yatatawalla in Kegalle district.

THE NITROGEN QUESTION AGAIN.

The March number of the *Indian Agriculturist* contains a letter from Mr. Bamber (the author of a well-known work on tea cultivation) who claims to have discovered the fact that the *Mimoseæ* as well as the *Papilionaceæ* are capable of fixing the free nitrogen of the atmosphere through the organisms contained in the tubercles found in their roots. Dr. Watt, the reporter on economic products to the Government of India, it is also alleged, claims to have made the same discovery, and the *Indian Agriculturist* decides that the credit is due to Dr. Watt. Both claimants seem to have been led to the discovery by an examination of the roots of the "Sa" tree

(*Albizia stipulata*), which is planted as shade for tea in Assam. The "Sa" is none other than the "Kabalmarā" or "Hulanmarā" of Ceylon, which is also here planted for shade owing to its quick growth. It is not uncommon to find disputes arising out of discoveries and inventions. Indeed the discovery of the nitrogen-fixing power of the *Papilionaceæ*, which was made by Hellriegel, was even claimed by, or rather for, a Scotch professor of Botany. The credit, however, will always go to Hellriegel (alas! now no more). We are inclined to think, however, that except where useful for shade purposes, the value of perennial trees as nitrogen-fixers are by no means so important as that of herbaceous annuals or smaller shrubs which can be wholly returned to the soil in the form of green manure, so that the land while gaining in nitrogen will not suffer any loss of the mineral ingredients of plant food. It is strange to find Mr. Bamber saying it was from the discovery of the nitrogen-feeding bacilli in the root tubercles of the "Sa," that Dr. Watt was led to the practical consideration that the cultivation of an herbaceous leguminous plant to be hoed in as green manure, would be advantageous to tea. Accordingly, we are told, the doctor advised the Assam planters to sow and hoe in a crop of "Mati-kalai," or some other of the numerous pulse crops common to the neighbourhood. But "Mati-Kalai" (*Phaseolus aconitifolius*) and all the pulses are papilionaceous leguminosæ, and the importance of these as nitrogen-fixers has been acknowledged since 1886 when Hellriegel first announced his discovery, and it did not require the further discovery now in dispute to bring out their value for green manuring tea or any other cultivated perennial crop. *Phaseolus aconitifolius* though indigenous to Ceylon apparently has no distinctive native name. The plant is rather a common one, and though not grown here is cultivated on a fairly large scale in India.

If as Mr. Bamber claims he was the first to discover and proclaim the fact that he discovered tubercles on the roots of the "Sa" and found bacilli (which, however, he was not able to identify) in these tubercles, then much credit is due him for as it were paving the way for further and fuller investigation of the matter; and, going upon analogy, Mr. Bamber would seem to have had ample justification in inferring that the bacilli in the roots of "Sa" were of the same nature as those associated with the papilionaceæ. But this much is clear, that none of the extracts which Mr. Bamber quotes from his book go to establish his claims to the discovery regarding the mimosææ.

While referring to this matter of the discovery of a nitrogen-fixing perennial tree, we may state that in his article on the nitrogen question in the *Nineteenth Century* some months ago, Prince Krapotkin mentions that *Ælæagnus angustifolia* (a garden shrub nearly allied to the laurel tribe) has also been found to harbour the bacteria that utilize atmospheric nitrogen. The plant belongs to the order *Ælæagnaceæ*, which is represented in Ceylon by *E. Latifolia*, the Sinhalese *Welumbilla* or *Katuembilla*. We also know, through the researches of Schlosing and Lanrent, that certain of the lower green plants, such as mosses (*Bryum*, *Leptobryum*) and Algae (*Confervæ* *Oscillaria*, *Nitzelia*) also absorb nitrogen from the air, but, however interesting all these dis-

coveries may be from a scientific point of view, the agriculturist is most concerned with such quick-growing herbaceous plants as will thrive weed-like on our lands, and grow, without any help on the part of the cultivator, only to be cut down and returned to the soil. Here we may mention the results of independent observations made by a gentleman in Ceylon on the effect of the growth of the "sensitive plant" (*Mimosa pudica*) Sin. Nidikumba, on coconut land. Without any knowledge either of Dr. Watt's or Mr. Bamber's discovery relative to the *Mimosææ*, this gentleman alleges that he finds coconut palms thriving more luxuriantly wherever this plant, which is generally considered a pestiferous weed, flourishes. On examining the roots of this *Mimosa* we found an abundance of root tubercles similar to those to be found on most papilionaceous leguminosæ, and by the same analogy as guided Mr. Bamber's reasoning we are led to infer that these nodules harbour the nitrogen-fixing bacteria. We hope to be able to induce the gentleman referred to above to write an account of his experience with reference to the influence exerted by the sensitive plant on soils, for we consider that the result of his observations are far more important from a practical point of view than those relative to a perennial tree such as *Albizia stipulata*, for in *Mimosa pudica* we have just such a plant as will suit the purposes of the coconut cultivator, for without requiring any encouragement to grow, such as the cow pea and most papilionaceous crops do, it only demands the judicious use of the knife to check too rank a growth.

OCCASIONAL NOTES.

We would draw special attention to the interesting contribution by Mr. Frank Modder on the Peaty Deposits in the Kurunegala tank. Mr. Modder has already contributed more than one valuable paper to the Ceylon Branch of the Royal Asiatic Society on the topography of the district in which he resides, and has proved himself an enthusiastic student of nature and a careful and thoughtful observer. The specimens of peat forwarded by Mr. Modder are thus reported on by Mr. W. A. de Silva, Instructor in Chemistry at the School of Agriculture.

The following are the percentages of ash found in the specimens of peat from the Kurunegala tank:—

(9)	specimen from Case No. 1	...	6 per cent.
(2)	" " " " 2	...	13 " "
(3)	" " " " 3	...	10 " "

We would also draw attention to an eminently practical paper on Soil Analysis, (to be concluded in our next issue) by F. B. Guthrie, and to the second instalment of Prof. Green's paper on Plant Nutrition.

Dr. Trimen, who has returned in better health to Ceylon, will be welcomed by all who are looking forward to the completion of the learned doctor's *magnum opus*, for it is mainly with this object that Dr. Trimen has come back to the Island. We have also to welcome back Mr. A. F. Brown, the Conservator of Forests, on his return to Ceylon from leave.

Greatest amount of rainfall in any 24 hours on the 13th instant, 2.81 inches.

Recorded by J. D. S. JAYAWIKRAMA.

THE PEATY DEPOSITS IN THE KURUNEGALA TANK.

Nearly a half of the surface of the Kurunegala Tank, which is about 104 acres in extent, is covered with a mass of floating vegetation, about 6 feet in depth in some places, and of greater depth in other places, possibly identical with what is known in Ireland, as the "Old Widow's Tow." This mass is a veritable eyesore, and completely takes away from the effect, both from a picturesque and a sanitary point of view, of what has not been inappropriately termed "the lungs of the town." Various schemes have been at different times proposed and tried for getting rid of this mass, and many attempts were made to remove it, but with very little success.

In September, 1877, an experiment was made to slice it and float out the detached pieces through a cutting in the S.-W. bund, which was secured by a coffer-dam. Blocks of vegetation 9 feet square and 3 to 4 feet in thickness, and one 6 feet thick, were floated out successfully, but as ill luck would have it, the coffer-dam began to leak, and though every means was employed to check the flow of water, the whole coffer-dam was carried away, a large breach formed where the cutting was made in the bund, and within three hours the tank was empty.

After the bursting of the tank, the floating mass resting on the soft mud at the bottom gave rise to fresh growths with wonderful rapidity, and in the space of six months the area of the tank became a jungle of rushes, and sedges and other bog plants. To clear this jungle away, it was fired during the dry weather and everything was burnt off, except the peaty deposits underneath. As an experiment, the peat was dug and carried out by prison labour, but the progress was so slow, that it was abandoned.

In May, 1878, Mr. Daniel Morris, then Assistant Director of the Royal Botanic Gardens, Peradeniya, was specially deputed by Government to examine and report on the character of the vegetation and suggest means by which it could be removed

and the subsequent re-growth prevented. Mr. Morris made the necessary examination and suggested that the peaty deposits be burnt off *in situ*, and advantage be taken of the burning to destroy the roots, stems, and corms of all troublesome weeds; that the mud and silt which could not be burnt be as far as possible removed, and the weeds along the sides and slopes of the tank be carefully taken up before the tank was filled again. In order to prevent the re-growth of the vegetation, Mr. Morris urged that it was most important that a uniform depth of at least 6 feet of water be maintained over the whole area; for when full, the greatest depth, namely near the S.-W. bund is about 9 feet, in a few other places it is 5 to 7 feet deep, but for the most part the tank has a depth of only about 3 to 4 feet even in the wet season; during the dry months the depth of water is still less—conditions so favorable to the growth of aquatic plants. Lastly, he recommended encouraging the growth of water lilies such as *Nymphaea lotus*, and *Nymphaea stellata*, which would tend to check the spread of plants growing on the sides and keep the tank free of noxious weeds.

None of these suggestions were, however, carried out, and with the repair of the bund, and the refilling of the tank, the floating mass resumed its original position, and goes on increasing daily in size.

Being interested especially from a geological point of view, I address you on this subject, and send you three cases of specimens. The floating mass may be divided into three parts. The first is a compact mass, as contained in Case 1, and supports a growth of rank vegetation, specimens of which also as far as I have been able to gather I send you. The *second* consists of fibrous roots only and forms the connecting link between the crust or the first part, and the *third*, which is composed of slushy matter (seemingly peat in the course of formation) to which it is attached. There is water between this part and the bottom of the tank, with which it is apparently unconnected.

You will see from Case No. 1 that the peaty deposit in the crust is composed of fibrous roots, stems, and partly decayed leaves of grasses, and sedges, and a variety of aquatic plants. When cut vertically the peat appears stratified with each year's growth, and is evidently the result of many years' accumulation. Mr. Morris at the date of his visit could not identify the most important plant which enters largely into the floating mass, as it was not sufficiently grown to enable him to do so. He identified among the grasses, *Panicum myurus*, *Panicum interruptum* and members of the *Carex* and *Cyperus* families. The matted growth of these are mixed with *Ceratophyllum*, *Polygonum*, *Zinnophila*, *Marsilea*, and *Utricularia*. During the dry weather most of the grasses and sedges wither down and their dead leaves accumulating around the floating stems, which are at times 20 to 30 feet long, serve to increase periodically the size of the mass and to gather around the fine mud and other deposits brought in by the rains.

Looking at the matter from a point of industrial economy, could the peaty deposits be utilized as fuel? I believe some attempt was made in this direction with the peat found at or in the neighbourhood of Maturajawela town, but with what success as a commercial speculation this deponent knoweth not.

Mr. Morris found the residual ashes obtained by burning the peat, rich in potash and other salts, and mixed with soil, he thought they ought to prove a useful manure for estates and gardens.

Floating masses, identical with that in the Kurunegala tank, are to be met with in some of the other tanks in this district, which it is believed is the only division in the island in which they occur.

FRANK MODDER.

THE MANAGEMENT OF DAIRY CATTLE.

BY MR. JAMES MOLLISON,

Superintendent of Farms, Bombay Presidency.

(Concluded.)

The period of heat or œstrum in a buffalo is of short duration, usually only a few hours. A buffalo should therefore be put to the bull at once when the symptoms of heat are observed. In the case of a buffalo they are unmistakable. At pasture a buffalo in heat will rush all over the field and bellow or rather grunt vigorously.

A cow remains longer in heat, usually about 24 or 30 hours. The cow though also excited does not make so much fuss or noise as the buffalo. The cow is most likely to hold to service if covered when going off heat. Neither cows nor buffaloes should be covered more than twice during the period of heat. A stud bull is a much more certain stock-getter if he is as regularly worked as an ordinary work bullock. He must, however, be liberally fed. If a cow has been covered and does not hold to service, she will, if in thriving condition, come in season again in 21 days. Buffaloes may come in season every three weeks, but often a much longer period elapses between periods of œstrum. If a cow is healthy, she will not come into heat when pregnant. The other signs of pregnancy are—the belly enlarges particularly on the right side, and about the sixth month the calf can be felt as a hard lump near the flank on the right side. The calf can be seen even earlier than this to jump especially when the cow drinks cold water.

One attendant is required to feed, attend to and milk 8 to 10 cows. Each animal should be milked always by the same man. At milking time the stalls should be clean. The milkman should wash each udder and dry it with a cloth immediately before milking. This is specially necessary with buffaloes which when excited urinate in small dribbles, which run down the thigh on to the udder and drop from the teats. The milker's hands should also be washed clean. It is almost needless to add that the milk vessel used must also be clean. Milking should be done expeditiously and the last drop of milk extracted. The calf usually is accountable for the thoroughness of the latter operation. It is common in dairy farms, where no calves are suckled, to go over the cows a second time and draw away the last milk, which is called "strippings." This, as already noted, is the richest part of the milk and is usually set

aside in farmers' households to answer the purposes of cream. Any milk left in the udder does not tend to increase the yield at next time of milking but rather to set up local inflammation.

The milk is easily tainted by the food given to the animals. Buffaloes are indelicate feeders, and with good reason their milk is often objected to on this score. Any plant with a pungent aromatic odour is apt to taint milk. Turpentine given as medicine will taint milk secreted during the following 24 hours, so much so that the milk is quite undrinkable. The drinking water of cows, if polluted with sewage or with decaying organic matter, whether animal or vegetable, may be the cause of tainting the milk, so that it becomes dangerous as human food. Every contagious disease has its own germ, and milk at any ordinary temperature is perhaps the best medium in which these germs may be propagated. Disease in the human subject has been repeatedly traced to impure milk. How far enteric fever, cholera, diphtheria and many other diseases, can be communicated through milk may be conjectured. There is no question that unsanitary conditions surrounding cow-sheds and dairy premises furnish a public danger of no common order. A simple test to determine whether organic matter is present in water, is accomplished by evaporation and by burning the residue in an open vessel; if the smell peculiar to burning organic matter is given off the water is unwholesome. Nitrates or common salt present in drinking water indicate contamination by sewage, the salt being an indication that the contamination is due to human urine.

Cow-sheds in India should be airy, well ventilated, have *pukka* floors and open gutters or drains to carry the urine directly to the manure pit. The byres should be situated on a high well-drained situation. Cows should not stand crowded in the stalls.

PADDY PESTS.

Leucania loreyi.—Specimens of this Noctuid moth were received at the Indian Museum in 1888 with the report that it had done considerable damage in the larval stage to the rice crop in the Central Provinces of India. The insect is allied to the "Cut-worms." Several other species of Lepidopterous pests of rice have from time to time been reported, but as yet the knowledge with regard to them is very incomplete. One form which is said to attack the rice crop in Burmah is described by Mr. Wood-Mason as *Paraponyx oryzalis*; and the "wolf moth" (*Linea granella*) has been known to have on several occasions done great damage to cargoes of rice shipped from Calcutta to London, while lying in Kingston, Jamaica.

Suastrus gremius is said to be destructive while in the larval stage to rice,—feeding on the young, tender leaves. Though the damage is not considered very great, its destruction is recommended by raising the bunds or dams of affected paddy fields and submerging the crop under water for a time.

Hicoglyphus furcifer and *Euprepocnemis bramina*.—These are orthopterous insects, and are

reported to have done considerable damage to young paddy and small millet crops in Central India.

Lechnosterna impressa.—Dr. Watt mentions that the larva of this species, or of a beetle very closely allied to it, attacks the roots of rice and Indian corn in Chittagong, emerging from the ground in July and August. Paddy kept covered with water during these months is said to be unaffected.

Cecidomyia oryzae. This insect, which is of special interest as belonging to the same genus as the destructive "Hessian Fly" of Europe and America, was described and named by Mr. Wood-Mason about ten years ago; but though it is said to have played great havoc among the paddy crops in some parts of India, it does not appear to have been heard of since.

THE PRESERVING OF FRUIT.

There is much that has been written about fruit cultivation in Ceylon and the capabilities of certain districts in the Island to produce good fruit in abundance. But though the required conditions of soil and climate may exist, it is a noteworthy fact that fruit culture has not made much if any progress with us. Large native capitalists will continue to invest all their capital in coconut cultivation as long as coconuts continue to give anything like the returns they do at present. It is only among the comparatively poorer classes that any attention is given to fruits as a source of revenue; the produce coming from more or less scattered clumps of fruit trees found in the villages. It is true enough that fruits fetch good prices in town markets, but these prices may be expected to be appreciably diminished as soon as the out-put is increased when the systematic cultivation of fruits is taken in hand. It is no doubt from an apprehension of this latter fact as well as owing to the perishable nature of our succulent fruits which require a ready market, that fruit cultivation is not being extended. Some fruits can no doubt be packed for transport without suffering deterioration. Oranges and lemons after undergoing what is known as "curing" can be carried long distances without spoiling, and even grapes come all the way from Australia in fair condition. But it is doubtful whether such succulent fruits as the mango and pine-apple or even the plaintain will remain good through a long voyage. One solution of the difficulty of disposing of fruits produced on a large scale is undoubtedly to adopt the system of preserving them by canning. If the fruit canning industry can possibly be started in Ceylon it will give life and energy to fruit cultivation in the Island. That there will be a demand for canned tropical fruit may be reasonably anticipated. Fruits properly canned will "keep" for an indefinite period in any climate, and canned fruit, more nearly than that preserved by any other method, resembles in flavour and texture the natural article. "Nothing," says Prof. Shelton, "is truer than this,—that the demand for fruits—preserved and green—can be almost indefinitely increased. The appetite grows on what it feeds." And again, "The canning of fruit is not alone work for the factory or capitalist . . . it is one of the 'home industries' that is within easy reach

of every adult person of ordinary intelligence. There is nothing occult, mysterious, or difficult in the work. It requires no more skill or greater knowledge than is employed in making a good article of bread or butter."

It is as well to have a thorough understanding of the object with which canning is carried out, and this is well explained in the following paragraph:—The work of placing fruit in airtight cans, bottles or jars, and then subjecting them to heat, and the final sealing of the jars, have no other object than to exclude the germs of fermentation. The sugar employed in making the syrup has nothing whatever to do with the preservation of the fruit. Much or little sugar, or none at all, may be used in the process to suit the taste. These germs require certain conditions of temperature, moisture and food supplies. When we dry fruit by means of an evaporator or drier we prevent the action of the germs by depriving them of the necessary moisture; in freezing meats the temperature is made too low for their existence, and in canning we by the aid of heat drive out the germs of fermentation and keep them out by hermetically sealing the jars.

It has been found by experience that the germs of fermentation cannot find their way through a mass of fluffy cotton, and the plan is sometimes adopted, after cooking and seasoning the fruit as in the ordinary process of canning, to close up the vessel with a close-fitting plug of cotton wool which should be secured on the outside of the neck of the bottle or jar, and covered with a wrap of paper. This will, however, only do where the preserved fruit is for home consumption.

Further details on canning, as given by Prof. Shelton in his bulletin on the subject, will follow.

W. A. D. S.

SOIL ANALYSIS.

BY F. B. GUTHRIE.

(*Agricultural Gazette of N. S. Wales.*)

The analysis of soils constitutes a large part of the routine work of the chemical branch of the New South Wales department of Agriculture, the number of complete analyses of different soils made during the four years of its existence being about 350, exclusive of a large number of which only a partial examination was made. Concerning the value of soil analysis to farmers, I am aware that there is considerable difference of opinion, some excellent authorities denying its value altogether, whilst there are not wanting those who go to the other extreme, and expect a chemical analysis to indicate both the nature and the exact quantity of fertiliser which is required to make the soil productive.

In this as in most other debatable matters, I believe that the truth lies somewhere between the two extremes, and that a great deal can be learnt as to the proper treatment required from a rational system of analysis, which shall take into account the nature of the operations going on within the soil as well as its percentage composition.

That soil analysis, rationally conducted, has a considerable economic value I am convinced, and this conviction is strengthened by the continually increasing number of soils sent in for report from all parts of the Colony, by the number already

done, and, unfortunately also by the arrears which accumulate.

Those who deny any value to soil analysis found their objections upon the means at present at our disposal in the laboratory of reproducing the natural condition of affairs going on within the soil; in other words, they argue that we cannot say what quantity of any given ingredient is in a condition in which it can be assimilated by the plant.

Let us hear what M. Ville says on the subject: "Chemistry is powerless to throw light upon the agricultural qualities of the soil, its resources and its needs, because it confounds in its indications the active assimilable agents with the assimilable agents in reserve, the active with the inert and neutral principles."

This is the conclusion he arrives at from the discussion of analyses which give the percentage composition of the soil together with the so-called mechanical analyses, the proportions of sand, clay, gravel, &c. M. Ville further points out that extraction with water yields results no less unsatisfactory, since the plant is able to utilise soil material which is insoluble in water.

In order to remedy this evil, the existence of which I suppose no one will be hardy enough to deny, various methods have been suggested and tried with the object of attacking the soil in a manner representing as nearly as possible the actual conditions which prevail in a field under cultivation. A few such reagents may be mentioned; they include water saturated with carbonic acid, oxygenated water, acetic acid, citric acid, and different salts, such as ammonium citrate.

In a recent series of researches Dr. Bernard Dyer* has experimented with a 1 per cent solution of citric acid, which appears to approach closely, in its action upon the soil, the solvent power exerted by the acid secreted by the roots of certain plants. I venture to think that, notwithstanding the great scientific value of such a line of investigation, and of the light it may be expected to throw upon many obscure functions of plant-life, it leaves us pretty much where we were if we attempt to base upon its use any practical advice to the farmer as to the nature of the manures or other treatment his soils requires.

I am prepared to go a step further than M. Ville, and to say not that we are unable to reproduce the agents at work within the soil in supplying the plant with food, but that we should gain very little from an economic point of view if we were possessed of them.

For, let us assume that the "universal solvent" has been found, that we are possessed of a reagent which exercises the same solvent action on the soil as, let us say, a wheat crop; in other words, one that dissolves from the soil the same amount of mineral and nitrogenous matter as the wheat crop will extract during the period of its growth. We are met with the following difficulties:—

Our wheat crop, though it contains less nitrogen (say, one-third less) than a crop of turnips, will nevertheless benefit very much more than the latter by an application of nitrogenous manure; that is to say, the wheat crop cannot make the same use of the nitrogen in the soil as the turnip does—exercises, in fact, a different solvent action upon the nitrogenous constituents.

Or, since the nitrogen in the soil is continually changing its condition, and there are external sources of nitrogen which may have some bearing in the above instance, we may take a case which is even less ambiguous.

The mangel crop removes from the soil nearly double as much phosphoric acid as the turnip crop does; nevertheless, manuring with superphosphate is of less benefit in the case of mangels than with turnips, the recognised reason being that mangels are able to utilise the phosphoric acid, as it exists in the soil, to a greater extent than turnips. So that it will be necessary for us to devise one solvent for turnips and another for mangels, one for phosphoric acid and one for potash—a separate set of solvents for every crop; and such a scheme, if it were feasible, would be far too cumbersome for practical purposes.

A second objection lies in the fact that the agencies at work within the soil are unceasing, and, as a consequence, the combinations in which the nitrogen and mineral matter exists are also constantly changing. What is true of the chemical constitution of the soil today is no guide as to its constitution a week hence.

The determination, especially of the quantities of nitrates, of ammonium compounds, and of "organic" nitrogen, provides us with no information to the purpose, for these, of all soil constituents, are most rapid in their changes.

Further difficulties present themselves in the large quantities of soil which it is necessary to employ in the determination of the substances soluble in water and weak acids, and the consequent length of time required for each determination, and also in the initial difficulty which presents itself in all soil analysis of ensuring the proper selection of a sample which shall represent anything but itself.

This difficulty, which is felt in all attempts to judge of the character of a soil from a given sample, applies more particularly to a chemical analysis, and increases in proportion as the quantities of the estimated substances diminish.

A chemical analysis alone, therefore, is of little value in guiding the farmer as to the requirements of his soil, and it is not in the refinement of chemical methods that we may look for help in this direction. We shall, I believe, obtain much more valuable information if we can ascertain the conditions under which the fertility of the soil is maintained.

The fertility of a soil depends in the first place upon the presence of a sufficiency of plant food, and secondly upon certain properties, possessed more or less by all soils, which effect the splitting up of the mineral ingredients in such a manner as to render them available to plants, as well as regulating the supply of water, air, warmth, &c.

We shall discuss the most important of these properties, and shall find, I think, that they are capable of identification in the laboratory. A large number of those properties conducive to fertility are dependent upon the porosity of the soil—in other words, its fineness of texture.

(To be concluded in next issue.)

HOUSEHOLD HINTS.

Some of the most beautiful grasses and ferns for home decoration may be made as follows:—Place a small saucepan partly filled with water on

* Journal of the Chemical Society, March, 1894.

the stove, add to the water enough alum to make it of sufficient density to bear an egg, and let it boil. Then remove the saucepan, and place the grasses, which should be already bunched, in the water. When the water is cold lift them out, and they will have become a mass of beautiful crystal. For decorative purposes the beauty of dried grasses and ferns is greatly enhanced by this process.

A Japanese furniture polish, said to be exceptionally valuable for its purpose, is prepared by mixing well together one pint of linseed oil, one pint of strong cold tea, the whites of two eggs and two ounces of spirits of salt. When thoroughly combined pour into a bottle, which must be shaken each time before the polish is used. Make a pad of soft linen, pour on a few drops of liquid, rub well over the article to be polished, and finish the process with an old silk handkerchief or dry chamois skin. The Japanese use their fine paper, both as polisher and first applicer.

Some very cooling summer drinks for use in health or disease may be made as follows:—Cut a lemon in slices, put in a jug, add a heaped teaspoonful of sugar, and fill up with boiling water, let it stand until cool, then strain and place on ice until wanted. Or, peel and slice an apple, add a small slip of lemon-peel and three lumps of sugar, pour on boiling water, and strain. In fevers the latter drink is very refreshing.

To take ink out of linen dip the spotted parts immediately in pure melted tallow; then wash out the tallow and the ink will have disappeared.

To make green tomato pickle, take 1 gallon green fruit gathered on a dry day, wipe them to remove any grit, and remove the outer skin with a sharp knife, slicing them when peeled. Take 1 tablespoonful of salt, 1 oz. peppercorns, 2½ tablespoonfuls of mustard seed, 1 ditto of powdered cinnamon, 1 tablespoonful black pepper, 2 ditto cloves, 1 teaspoonful of cayenne, 1 lb. brown sugar, and 3 pints of vinegar. Divide the spices into three, and place in three small muslin bags. Take half the vinegar, boiling it and the spices together with the sugar, pepper, mustard, &c., for half-an-hour. Get jars ready, and first put in a third of the sliced tomatoes at the bottom of the jar, then a spice bag, and pour some boiling vinegar, &c., over them; repeat same process till the jars are nearly full, finally adding the cold vinegar to fill up with. Seal the jars securely, and put away.

Evergreens and flowers may be preserved by the following simple process:—Immerse them in a solution of gum arabic and water two or three times, allowing sufficient time between each immersion as will allow them to get dry. As the result of this dipping the specimens are preserved from the air by a thin coating of gum, which prevents their decay.

Roup is one of the most dreaded diseases in chickens we have to fight against. Much has been said and written on this subject, and there are hundreds of remedies on the market guaranteeing a cure, but many of the guarantees prove false, because the disease has gained such a hold before the remedy is applied that it is impossible to effect a cure. For mild cases of roup I give the bird

half a teaspoonful of camphor and put a little in the drinking water, and by giving the patients good warm quarters and good feed for a few days they are soon over it.

THE NUTRITIVE PROCESS IN PLANTS.

(PROFESSOR J. REYNOLDS GREEN, D.S.C., F.R.S.)
(Continued.)

When we consider the conditions of life of the plant with the irregular intervals of feeding which they necessarily involve, we see that the organism not only absorbs material for immediate use, but—taking in a far larger amount than the exigencies of the moment demand—accumulates a reserve store on which it can subsist during the periods, short or prolonged, when no absorption is possible.

We may view the matter from a slightly different standpoint and yet come to the same conclusion. The processes of absorption in a plant depend to a far larger degree than in the animal upon purely or almost entirely physical conditions. Given a certain amount of carbon dioxide in the air, and a certain amount of water in the plant, to which that air has access, and the carbon dioxide will be dissolved according to the power of the water to dissolve it, or—putting it more technically—according to its co-efficient of solubility. In the presence of the chlorophyll, the green colouring matter of plants, with the access of sunlight other changes supervene which lead to the continuation of the process of absorption of the gas. Similarly with the root and its relations to the soil, the process of absorption of water with its dissolved substances will proceed so long as certain physical conditions obtain. Thus the plant is on the whole rather passive than active in the initial stages of its own feeding, exercising no inhibitory power such as that attendant in the animal on a failure or cessation of appetite. Again we are led to the fact that when the absorption of food in a plant is proceeding, the probabilities are decidedly in favour of such absorption being much greater than the immediate need for direct consumption; and thus that the excess must either be got rid of wastefully, or be stored in some advantageous form for consumption later on, when absorption shall be suspended.

It must be noticed, however, that these reserve materials are not a simple accumulation of food pabulum in the form in which it is of immediate use. Granted that the plant in the first instance forms certain bodies on which its living substance draws at the place where it is originally constructed, then, so long as the immediate needs are in excess of the amount prepared, it follows that there will be no overflow from that spot: it will be at once utilised by the living substance in the processes of nutrition and growth. But if there should be a greater amount formed than can be immediately used, it is not simply retained unchanged in the cell, nor does it overflow unchanged to contiguous cells where demand exceeds supply, or where provision is made for temporary storage. The storage forms are different from, and more complex than, the originally prepared ones, and more energy has to be expended on them, either where they are made or in the place of storage itself. When, therefore, they come to be utilised in after time, they are necessarily made to undergo a

process of digestion comparable in its broad lines to the process which awaits them after they are eaten by an animal. In other words, a plant when living on its reserve materials is almost strictly comparable to an herbivorous animal, both as regards the substance of its food and its manner of making it available for nutrition.

The importance of the reserve materials of plants is therefore two-fold. In the first place it is at their expense that many of our agricultural plants fulfil their ultimate duty of preparing flowers, fruits, and seeds. If we consider the case of a carrot, we find that it does not enter upon this task during the first year of its life. Its constructive processes are then at their best, and a large amount of reserve material is provided by its leaves and stored away in its bulky fleshy root. During the second year, the constructive activity is much less; it develops however its fruit and seeds, exhausting as it does so the store which the root then contains. The same process is seen, though in a slightly different way, in the development of the seed itself. Though the parent plant often does not survive the production of seeds, it finishes its own life work by providing its young embryo or embryos with a store of nutritive material, which enables it or them to make a start on their own account; depositing this either in the embryo itself, as in the pea or bean or in its immediately surrounding tissue, the endosperm, as in the buckwheat, oat, carrot, or other similarly constructed seed.

In the second place these reserve materials are of the utmost importance, not so much to the plant as to its cultivator, constituting as they do the valuable part of most of our harvested crops, providing us with the material on which animal life is immediately dependent. Thus the seeds of cereals, the tubers of potatoes and artichokes, the roots of beat, carrots, turnips, &c., the inflorescences of cauliflowers, the bulbs of onions, &c., are of value commercially according to the nature of the materials the plants have deposited in them and the condition in which they exist when we call the particular member of the plant *ripe*.

A further division of the food materials of the plant still may be made. The reserve materials we have seen may be destined for almost immediate use, or may be intended to be deposited for months or even years in some special receptacle such as root, stem or seed. In the first case the form they take is not quite so complex as in the second; there is no need for the preparation of such an elaborate product. We get thus a certain class of material which is intended for circulation or short transport; these may be considered as circulating reserves, drawn upon immediately by the growing cells, situated perhaps not far from the seat of original formation. These usually are soluble products, and can only be detected in the fluid or sap which passes from cell to cell. As, however, the local, like the general, demand varies much in amount from time to time, we find a sudden cessation or diminution of it marked by temporary deposits, small in quantity, which usually remain a very short time where they are laid down. In the young shoots, and even in the leaves themselves, we frequently, if not generally, find quantities of starch grains present in definite cells or layers of cells. Sometimes these are present, sometimes they are not: in the leaves, for instance, after a bright day, we find a quantity of starch,

which, however, disappears during the succeeding night. This store of starch may be for the use of the leaf tissue should the process of manufacture be checked by the failure of sunlight, or it may be transported to more permanent reservoirs, to be again stored up.

This store of circulating material can thus be distinguished from the more permanent store which we generally associate with the term reserve material, and which we have seen is deposited in parts where active metabolism is not the leading feature of the tissue.

RHEA FIBRE.

We take the following account, which gives some interesting details of rhea cultivation, from the *Sugar Journal*. The information that the leaves of the ramie plant are very nutritious fodder and are eagerly eaten by cattle, is new to us. In spite of the facilities afforded for procuring cuttings from the trees (imported as plants from Calcutta) established at the School of Agriculture, and the facilities to locally dispose of the raw dried bark, no one has been enterprising enough to give rhea a fair trial in the island:—

We have to thank the Department of Agriculture for the following letter received by the Secretary to the Queensland Agent-General, from the Managing Director of the Boyle Fibre Syndicate, 2, Victoria Mansions, Westminster, London:—

There is no difficulty in either the decortication or degumming of the ramie plant, and if the farmers can be induced to grow it, a good paying profit per acre can be obtained. In the Straits Settlements, where there is no winter, and scarcely any variation of temperature during the year, daily cuttings of the stems can be made, and the machinery consequently kept at work during the whole year; 300 lb. of stalks will produce 12 lb. of white degummed filasse; this is the daily product of one acre of land, say $1\frac{1}{2}$ tons per year, reckoning 300 working days. I am not aware whether or not there is any part of Queensland where ramie can be grown under climatic such conditions as in the Straits. The climate there is a moist one, with an average rainfall of 120 in, but at all events on irrigated land $1\frac{1}{4}$ to $1\frac{1}{2}$ tons can be relied upon if the soil is good. The ramie plant, as you are aware, is perennial, and requires no cultivation, and after the plant has reached 3 ft no weeding is necessary; it destroys every other weed, and all the farmer has to do is to cut the stems as they mature; the root will last 20 to 30 years and only requires thinning. The surplus plant can be used for extending the plantation or sold to other planters. A properly grown stem without leaves will weigh about 4oz, so that the daily product of one acre will be about 1,200 stems. One man could therefore look after five acres working 10 hours per day, this would mean cutting 10 stems per minute, but kanaka labor would probably produce less. The labor of cutting is very suitable for boys and women, as it is light.

Twenty-five acres would bring a return of about £15 per week to the farmer, out of which he would have to pay wages and carriage of the stems to the mill. The stems to be delivered every day from a 25-acre patch would weigh approximately about $3\frac{1}{2}$ tons, without leaves, so that it is neces-

sary to have the mill in a central position as near to the growers as possible; it is also of greatest importance that the mill should be erected on the banks of a river where water can be obtained the whole year round, and that easy access can be obtained to a railway or navigable river.

The leaves of the ramie plant are very nutritious, and are eagerly eaten by cattle, and as a 25-acre patch will produce about 1½ tons per day of leaves and the sweet tops of the stems, this will form an additional source of income to the farmer as cattle food, the manure being used on the land.

If a guarantee could be given that 500 acres would be put under cultivation and the product supplied to the mill, my Company would be disposed to put up the mill and the necessary machinery, and pay the farmers at the rate of 2d per lb for every lb of white degummed filasse produced from the stems supplied by them, or so much per ton for the stems supplied after we have tested the amount of fibre produced, which would be about 4 per cent of the weight of the green stems.

Department of Agriculture,
Brisbane, January 16th, 1896.

Correspondence.

To the Editor, "Agricultural Magazine."

Dombowinne Estate,
Mirigama, 18th March, 1896.

SIR,—In that very valuable work "Ceylon Manual of Chemical Analyses," Mr. Cochran gives a large number of tables. They are all of importance to agriculturists in the Island.

To complete those of the third chapter devoted to the "products of the coconut plan," there are wanting the following tables of analysis:—

- 1.—Of the husk of the coconut.
- 2.—Of the shell.
- 3.—Of the reticula.
- 4.—Of the various parts of the frond.
- 5.—Of the various parts of the flower, and
- 6.—Of the various parts of the trunk (bark, root, wood, sago).

I write this in the hope that the learned author will publish a supplement containing the information desiderated, together with other matters of usefulness.

Mrs. Jules Lepine's table quoted in page 44 needs confirmation, because many other things of which he treats in the same connexion are erroneous within my knowing. See page 57 of "All about the Coconut Palm" where some of his errors are shewn up. As a rule sugar, gum and fatty matter ought to be shewn distinct from each other.

In "All about the Coconut Palm," I find the following statement:—

"One great difference exists between the coconut tree and such trees as the mango; for, whereas in the latter, there is bark surrounding the wood, in the former there is none. Indeed, the whole trunk of the coconut tree appears to be tolerably well adapted for carrying on all the functions of life. On one hand you see fruit-bearing trees, of which, for some feet high, almost the entire trunk has been destroyed, so as to leave a mere shell, barely sufficient to support the tree; on the other hand, the outside of the tree

is destroyed so as to leave merely a central column; from which it would appear, that all parts of the trunk indiscriminately are capable of discharging all the necessary functions of life." (pp. 72-73). Is this so? I have seen barkless coconut trees invariably die in 4 or 5 years. How is this accounted for?

I subjoin an article from the Fiji *Argus* as found in page 171 of "All about the Coconut Palm." I know of only one planter in Ceylon who limits the number of trees to something like 40 trees per acre to the intense amusement of his neighbours. But his produce, instead of being 72 sound nuts, varies from 200 to 800 per tree per annum without a single unsound nut being found amongst the whole. He counts 36 bunches in the year per tree, instead of 25. Will the ordinary cocalist believe this?

Yours truly,

COCOAPALMIST.

"COCONUT CULTIVATION IN FIJI."

"A great amount of nonsense was spoken at a recent meeting here about coconuts, and this nonsense has gone forth to the world under the endorsement of the aforesaid Fiji notables.

I desire now, as a coconut planter, to give you the result, so far of my experience. Thirty-five feet apart is the smallest space that should be allowed to coconut trees, and this will give about thirty-five trees to the acre; apple trees in Canada are planted forty feet apart. A coconut tree under ordinary fair circumstances will throw out a flower bunch or spathe every fortnight, say twenty-five in the year. Of these one-third will be abortive and barren, the other two-thirds, say in round numbers, eighteen will produce on an average on a one-acre plantation four nuts to the bunch, making the yield of each tree in the year seventy-two sound nuts fit for copra—many nuts are infected, and I am sure I am giving the full yield under ordinary circumstances, of a healthy cocoanut tree, one of many thousands growing together. A coconut, from the flower to the ripe nut, takes nearly twelve months before it drops, and if sound and well formed, will give half a pound of copra, equal to thirty-six pounds of copra to each tree, or something over half a ton to the acre, and under the present labour regulations, added to the heavy charges on planting, in other ways, copra at present costs the planter not less than £5 a ton to make, which amount leaves but a small margin, if any, to meet failures in the crops at any time arising from hurricanes or other causes."

"A PLANTER."

GENERAL ITEMS.

The following, sent by a correspondent to the *Cape Agricultural Journal*, contains good news for those whose crops are sometimes ravaged by locusts. In certain parts of the Sabaragamuwa Province—as in the Kolonna Korale—locusts have been known to do great damage:—

As in every paper I look at I see accounts of the destruction done to crops in some district or other by locusts; I wish, through the medium of the *Agricultural Journal*, to let other farmers know how I have so far succeeded in saving my crops.

I got a strong fishing line 150 yards long (the width of my oat hay lands,) to which I tied white rags about every five yards, and had this drawn along the tops of the forage by two men, one at each end of the line. It was wonderful how soon I cleared the land of locusts; the oftener the operation is repeated the better. For very long lands I would suggest more than one line drawn by men on horseback, and perhaps different coloured rags would be better.

As the saying is, "I am not out of the bush yet," but having mastered two large swarms, I have every hopes of reaping my Oathay and Mealie crops. Hoping that my remedy may be the means of other crops being saved.

WEST H. FYNX.

Redlands, January 8th.

A French agriculturist has discovered a very simple method of protecting all kinds of grain from the ravages of mice. He states that a few sprigs of wild mint in full leaf, placed at the top and bottom of each sack, will effectually prevent the little rodents from attacking it, as they seem to entertain an invincible antipathy to its odour. He adds that he finds the herb equally beneficial for safe-guarding his cheese dairy. Wild mint also possesses antiseptic properties.

Artificial camphor, says *Food and Sanitation* may be made by passing a current of dry hydrochloric acid gas through spirits of turpentine cooled from a freezing mixture. The liquid darkens and deposits crystals, which are dissolved in alcohol and precipitated by water. The separated crystals are then drained and dried.

Last year several planters made inquiries about refuse tea-seed and its value as a manure, and asked if its oil could be extracted profitably and was in any way superior to other well-known fixed oils. Mr. Hooper made a complete analysis of some seeds from a Nilgiri tea estate, and found in them 22.9 per cent of fixed oil, 9.1 per cent of

saponin, 8.5 per cent of albuminoids, besides the ordinary constituents of plants. He concluded from the analysis that the seed would not be suitable for manufacturing an oil, as the proportion of oil was much smaller than that found in such well-known products as sesame, coconut, and castor, and the expressed oil would always contain some of the bitter and acrid saponin, which would render it very objectionable. The seed might be used as manure or as an insecticide, as saponin is a poison and a strong decoction of the bruised seeds might kill many of the insects that infest cultivated tea-bushes.

Mr. Lawson's report contains some interesting notes on the progress of the medicinal drug cultures in his district. The Botanical Gardens in the Nilgiris supply the Madras Medical Department with all the jalap required by it. A planter who has succeeded in growing Ipecacuanha under light artificial shade, and 20 lb. of dried root obtained from the plants sent to London were sold by auction for 5s 4d per lb. Messrs. S. Figgis & Co., the brokers, described it as "very fine picked root of nice colour," while as a matter of fact it was not picked at all.

Mr. David Hooper has been carrying on some experiments in the distilling camphor leaves. The following from Mr. Hooper's report is certainly complimentary to the planting community of this Island. "Another reason that encouraged me to make some experiments in this direction was the hearty manner in which some energetic planters of Ceylon have taken up the camphor question." In conclusion, Mr. Hooper says it is interesting to know that a large proportion of camphor can be obtained from the oil of the leaves and from the leaves themselves, and that probably if taken from trees grown at a much lower elevation (than Ootacamund), a much larger proportion of this useful substance could be collected.

[No. 11.]

THE PHILOSOPHY OF ARBORICULTURE AND LANDSCAPE GARDENING.

BY REV. J. G. MACVICAR, A.M., D.D.

(Reprinted from *Transactions of the Scottish Arboricultural Society*, Vol. IV.)

(Concluded from page 661.)

SUCH, then, are the principles, or rather, such is the principle of beauty, when regarded in the largest and most general point of view in the landscape, and in everything. It is unity in variety. And, with regard to the beauty of the theorems and intellectual objects generally, it is not possible to be more explicit. But with such objects we have nothing to do here. It will be satisfactory to you to know, however, that this principle of unity in variety covers all ideal compositions that are beautiful, and explain their beauty. The development of beauty is the felicitous treatment of some central unity, often for a time concealed and forgotten, but coming in at the close in the midst of a rich and abounding variety. To such a state of things a good novel, no less than a fine mathematical proposition, owes all its charms as a composition.

But it is with visible objects alone that we have here to do, and with regard to them it is possible to be more explicit. Thus, we can say that when unity in variety has been most completely established in any composition, then there is an exquisite symmetry in that composition. Thus, as the secret of the simplest kind of beauty,—that kind, namely, which bespeaks the repose of intelligence, while it flatters the eye and permits mental play upon it, but which does not tend to awake thought and feeling,—we have symmetry. And hence the universally acknowledged beauty of flowers and of well-designed geometrical gardens, which may be said to be imitations of flowers. They owe it all to the symmetry which they display. This kind of beauty may be called kaleidoscopic beauty.

But my readers will, I doubt not, have already detected a seeming fallacy into which I have fallen or rather, indeed, a piece of seeming self-contradiction. I set out with the theory that nature is the grand storehouse of beauty, and that the laws of nature are the principles of beauty, whereas I have now represented beauty as depending on the make of the mind of the beholder, his love of unity in variety, and consequently of symmetry. Now here there certainly seems to be a contradiction; but the contradiction is only seeming. Though mental action and intellect be not material nature, yet material nature is a creation of intellect; it reflects intellect, and the laws of material nature work towards unity in variety also just as intellect does. The laws of nature, consequently, work towards symmetry also. Nay, so true is this, that when they have established symmetry their work is done, and they are at rest. The proper expression of the beauty of symmetry, therefore, ought to be that of a balance of forces, or repose. The spectacle of a perfect symmetry ought, therefore, not to animate the beholder, but merely to please him, so as to induce him to prolong his gaze. Now, is not this precisely the state of mind which the beholding of a very symmetrical composition tends to induce?

The discussion of symmetry, therefore, cannot be the close of our theory of the Beautiful. No; if the work of the forces of nature were done, if all were symmetrical, all nature would be motionless, stereotype, dead. But this would never do for the busy mind. Plainly, the exhibition to the living mind of any extensive production of nature in which symmetry rules must be disappointing, deadening; for the living soul, active within herself, is ever seeking for the manifestation of life and action all around. And hence the great secret of the landscape-gardener. It is to maintain unity in variety strong, without allowing symmetry to show. In the very proportion in which he can succeed in awaking the idea of forces in which still acting and preventing the forms of nature from falling into a regular symmetry, towards which they tend, he succeeds in the creation of the *picturesque* and the

sublime,—that is, kinds of beauty expressive of animation—the former of not terrible, the latter of terrible powers.

On these principles of the beautiful, the picturesque, and the sublime, therefore, two points in the scientific practice of landscape gardening fully appear:—

1. Where the gardener is dealing with bright colours merely in the flower-garden, supposing it to be viewed from the mansion-house or elsewhere as a unity, he should place colours of the same tint in considerable breadths, so as to give a sufficient area of colour for the eye to rest upon. His colours should not be placed in juxtaposition in too harmonious tints, and he may adopt with advantage, provided there be ample nature around, the geometrical mode of gardening; for colour is not capable either of the picturesque or the sublime. No higher order of beauty than that which is merely kaleidoscopic is attainable by it.

2. In the landscape, the problem is to establish or preserve unity in its variety, so that the eye may not wander at large and go adrift in beholding it, and along with this to avoid all obvious symmetry as carefully as nature. Nature on the great scale, in the present epoch, everywhere displays departures from symmetry. Instead of a perfectly spherical globe, with a perfectly smooth surface and a regular orbit in the heavens, which is that to which the laws of nature would reduce our planet, if the action of these laws were completed, the surface of our globe is diversified by sea and land, mountain and valley, river and lake. It is expressive of great forces by no means composed into an eternal repose and sameness, but operating still with immense power and from different centres, and therefore in seeming (though in seeming only) conflict with each other. It is in small individualised objects alone—in crystals, plants, and animals—that the forces of nature are in any measure balanced, and that symmetry is developed. Hence, as has been said the picturesqueness and the sublimity nature; for these terms bespeak the consciousness of a force operating in nature, with which, though it be very different from our own, we may yet hold communion.

The landscape gardener, therefore, whilst he must not neglect a balance and even a repetition of parts in his landscape, must be on his guard against allowing any obvious symmetry to show itself. If he do, he will kill his composition. He will speak to the eye only, and not to the soul. And this state of things the architect also must observe, though within limits which are much narrower than those of the landscape gardener; for the mansion-house stands, as it were, midway between the flower-garden and the landscape. A large amount of obvious symmetry is almost indispensable in its construction. Symmetry bespeaks repose. It therefore fits the mansion for being a central resting-place for the eye.

But may we not reduce the practice of the beautiful in the landscape to principles still more specific? Artists are continually speaking of lines. They find that all the expressiveness, and much of the beauty of their creations, arise from the character of the lines and contours which they impart to these compositions. Now, this is only what is to be expected; for motion is the first sign of life, and a line is always a symbol of motion. The eye, in fact, just as it rests on an area, always runs along a line. Hence the importance of the lines which give the contour to the whole landscape, and of the forms of the individual objects which compose it, plainly appears. Does our theory, then, "that the laws of nature are the principles of beauty," throw any light on the relative value of different lines in imparting beauty? Yes, it gives specific diagrams. It defines those very lines on which, according to its own principles, all beauty must depend, in so far as that beauty depends upon the lines in the landscape or object, and not on colours and areas. It has been completely ascertained by natural philosophy, that material elements—elements possessing inertia, &c., and masses composed of such elements—when they move according to the laws of nature, and develop lines by their motion, constantly tend to move in one or other of that

series of lines which is named the conic sections; and when natural motions leave lines behind them, these lines are traces, more or less extended of the conic sections. These are the circular line, the elliptic line (to which we may add the spiral as a resultant form, when the line changes its plane), the parabolic line, the hyperbolic line, and the asymptote or straight line. They have now been named in the order in which the physical forces, in producing them, grow more and more unbalanced or intense, and consequently, in the order in which they grow more and more expressive. The circular line and the elliptic both return into themselves. They are both finite like our minds, and therefore commensurate with ourselves; and, accordingly, such is the expression which they impart to objects in which they appear. The circle, indeed, is not usually included among the conic sections, and it need hardly be included among expressive lines. The circle is too symmetrical. But it is far otherwise with the elliptic line. Wherever it appears it renders the object which displays it "graceful" and very pleasing to the beholder, when he does not desire to be thrown into emotion. The other lines, again, do not return into themselves. They are infinite. They bespeak active force still actuating them, and their expression is more grand and severe. They are the parabola, the hyperbola and the straight line.

But, with regard to all those lines, it must be here remarked that in nature a part of each is usually combined with another part, according to the law of symmetry; that is, placed in an inverse position, both parts together, thus giving a waving line. And of this line the value, as an element of beauty has long since been formally recognised, and known by the name of Hogarth's line of beauty.

And now it would form a most pleasing theme to dilate upon each of these lines in detail, and to show how exactly they maintain, in imparting beauty and expressiveness to nature, the function which has been assigned to them. But this would imply a considerable lengthening of a communication which is long enough already. Let us merely glance at them in reference to that which is simpler than the landscape, I mean the Ocean.

Say, then, that we are gazing upon the ocean first when it is perfectly calm and splendid with silvery radiance in the beams of the morning sun; there is nothing here for the eye to rest upon but a boundless plane glassy surface, and the perfectly straight but equally boundless horizon line. The straight line, in a word, rules the scene. The expression of the calm ocean, therefore, according to our theory, ought to be sublime. It ought to awake in the soul of the beholder the pleasing but awe-inspiring emotion of the infinite. Now, it will not be denied that this is precisely the expression of the ocean when contemplated in a state of repose.

Say, now, that in some distant region a storm is raging, but is indicated in the place where the beholder stands only by what is so well known as a "ground swell." This is a mode of action which does not ruffle the surface of the sea, but which, instead of leaving the glassy surface straight and level as well as glassy, has heaved it into a state of undulation with long circular crests or waves, and wide circular hollows or troughs between. Here, then, we have a change from the straight line to the circular line, from the infinite line to that which is the most finite of all lines. The change, therefore, ought, according to our theory, to be most unfavourable to the development of pleasing emotion in contemplating the ocean. And is not this eminently the fact? Was there ever a spectator yet who admired a ground swell, compared with any other state of the ocean?

But let the waves be now raised, so that their summits bespeak a smaller radius than their bases,—let them, in a word, assume a parabolic form, and what, let us ask, is the effect? Every one feels that more life has been infused into the scene.

And now, let the summit of the wave become still more acute, until at last it turns over and falls down on its own base as a breaker, and has

not the expression become intense? In a word in proportion as the circular and the symmetrical disappear, and lines of the infinite order present themselves, the sea becomes more expressive, more animated, and more animating.

The very same phenomena may be observed in reference to the landscape. How awful is a boundless plain or tableland, giving on all sides a horizon line as straight as that of the ocean!

The art of the printer has seldom succeeded in awaking a more powerful emotion than when such a desert has been drawn with an eagle or camel, or some sentient creature, in the foreground.

How uninteresting, on the other hand, is a country whose surface is everywhere equally undulated with round-backed rising grounds, and corresponding low grounds between! Nay, though the undulations rise to the magnitude of mountains and valleys, still, if their contour is composed of circular arches, expression is found to be very tame. But when the parabolic line begins to show itself, now in its vertex, on the somewhat conical hilltop, now in its long arms, changing insensibly into the straight line down the valley and into the plain; and when mountains and valleys of this character are so compressed that a unity reigns amid all the variety, the effect is charming. It needs only the vertical straight line of the precipice here and there, and the horizontal line of the lake or sea, to make it sublime.

But yet, how wanting as a masterpiece of nature is any and every landscape if arboriculture has not been there,—either that of Nature, the great arboriculturist, or that of man, her intelligent imitator and friend.

VITALITY OF SEEDS.

The duration of the vitality of seeds is perhaps the most important of the various phenomena of plant-life, especially when considered in connection with the introduction into a country of the economic plants of other countries. It is a subject that has engaged attention from very early times, and the literature relating thereto is considerable. Much of this, however, is of a traditional and unpractical character; but even if we confine ourselves to the demonstrable, or demonstrated, the subject is almost inexhaustible. There is such an infinity of variety in the behaviour of seeds under different conditions, that it is impossible in a short account, such as this must be, to do more than convey a general idea of the subject. Perhaps the best way to treat the question, apart from technicalities, is to consider the vitality of seeds under ordinary, and under extra-ordinary, conditions. In the development and germination of seeds, there is, in a sense, usually a period of gestation and a period of incubation, as in ovi-parous organisms of the animal kingdom; and the duration of these periods is within definable limits, under ordinary conditions though seeds do not exhibit the same fixity of time in regard to develop-ment and vitality as eggs. The embryo of a seed is the result of the impregnation of the female ovum in the ovary or young seed-vessel, by the male element, generated in the anthers; and in the mature state this embryo may fill the whole space within the skin, or testa, of the seed, as in the bean and acorn; or it may be a comparatively minute body, as in wheat, maize, and other cereals; the rest of the seed being filled with matter not incor-porated in the embryo. The difference is one of degree in development. In the one case, the grow-ing embryo has absorbed into its own system, as it were, before germination or the beginning of the growth of the embryo into a new plant, the whole of the nutrient material provided in the seed for reproduction; whereas, in the latter case, the process of absorption and utilisation of the "albumen," or nutrient matter, takes place after the seed is de-tached from the parent plant, and during the earliest stage of growth of the new plant; so that the plant is nourished until it has formed organs capable of assimilating the food obtainable from the atmosphere and earth. Between these two extremes of develop-ment of the embryo, or future plant, before organic connection with the parent ceases, there is every conceivable degree and variety; and, as will presently be explained with examples, some plants are vivi-parous, in the sense that the embryo commences active life before being severed from the parent, so that when this occurs the plant is in a position to draw its sustenance from unassimilated or inorganic materials. Now it is a curious and unexplainable fact that certain seeds exhibiting extremes of embryonal development, instanced in the bean and wheat, are equally retentive of their germinative power. The longevity, if it may be so called, of seeds is exem-plified in "exalbuminous" seeds as well as in "albuminous" seeds of every degree. It should be mentioned, however, that the difference is not so much one of assimilation or development as of the earlier or later transfer of the nutrient matter of

the seed to the embryo or plantlet. Assuming the perfect maturation of a seed, certain conditions are necessary to quicken its dormant vitality; and the two principal factors are heat and moisture, varying enormously in amount for different plants, and acting much more rapidly on some seeds than on others, even when the amount required is much the same. Neither under natural nor under artificial conditions will some seeds retain their vitality more than one season; and all the resources of the accumulated experience of seed-importers from distant countries are insufficient in some cases to maintain their vitality. It is not altogether because the interval between the dispersal and the germination of the seed, under ordinary conditions, is necessarily longer; but rather because in the one case the conditions under which a seed will germinate are much more restricted than in the other. Let us now examine the natural conditions under which seeds are commonly produced and dispersed, in relation to the retention of their vitality; and we shall learn how much more it depends on their nature, or natural means of protection, than on the seasons. An oak tree sheds its acorns in autumn, and the leaves which fall afterwards afford them some protection from frost and excessive dryness. But the leaves might be blown away from one spot, and the acorns exposed to intense frost or drought, either of which will speedily kill them. In another spot the leaves may drift into thick layers, with an excessive accumulation of moisture, causing decay of the underlying acorns; and there are many other unfavourable conditions which may destroy the vitality of the acorn. It is apparently impossible, however, to preserve an acorn's vitality by any artificial means for more than one season.

The scarlet-runner bean loses its germinative power on exposure to comparatively slight frost, the degree depending upon the amount of moisture in it; yet it will retain its vitality for an almost indefinite period under favourable artificial conditions. In both of the examples given, germination would naturally follow as soon after maturation as the conditions allowed. The seeds of the hawthorn behave differently. Each haw contains normally three to five seeds, every one of which is encased in a hard, bony envelope, in addition to its proper coat or testa. Committed to the earth, and under the most favourable conditions, these seeds do not germinate till the second year, and often not so soon. In this instance prolongation of vitality is probably due in some measure to the protective nature of the shell enclosing the seed.

Returning to seeds in which the embryo or plantlet forms only a very small part of the whole body, wheat may be taken as a familiar and easily observed illustration of a seed, the vital energy of which requires very little to stimulate it into active growth; and yet this same seed, having no special protection in the way of coating, will retain its vitality as long, perhaps, as any kind of seed, if not under the influence of moisture. The primary condition to the preservation of vitality in a seed is perfect ripeness. Unripe seeds of many kinds will germinate and grow into independent plants if sown immediately after removal from the parent. The facility with which immature wheat will germinate is most disastrously exemplified in a wet harvest, when the seeds will sprout while the corn is standing or in sheaf; thus destroying more or less completely the value of the grain for flour, as the starch or flour is consumed in the development of the embryo, or what is left is so deteriorated by chemical change that it is not good for food. There is perhaps no other seed more susceptible to moisture, and none less affected by dryness, or by heat or cold in the absence of moisture.

The kind of vivipary exhibited by the wheat is occasionally observed in various other plants; and sometimes the seeds of pulpy fruits germinate in the fruit. There is also a class of plants in which vivipary is normal. Prominent in this class are the mangroves (*Rhizophora*, &c.) of muddy sea-shores in the tropics. In these plants there is a remarkable adaptation to conditions, which ensures their reproduction. From the very inception of the embryo

there is no apparent interruption of active vitality in its development and germination. In the earliest stage the cotyledons or seed-leaves are formed, and the radicle or future primary root is represented by a very small point. When the former have attained their full development, which is not great, the water begins to grow and rapidly increases in size. Each fruit or seed-vessel, it should be mentioned, contains only one seed, the rootlet of which points to the apex of the fruit. Soon this rootlet pushes its way through the apex of the fruit, and grows into a spindle-shaped body of great density and length; the cotyledons or seed-leaves remaining partly inside the fruit, and acting as an organ of absorption from the parent plant to nourish the seedling. In *Rhizophora mucronata* this radicle attains a length of two or three feet, and the seedling eventually falls, and by its own weight penetrates and sticks in the mud, leaving the fruit, containing the exhausted cotyledons, attached to the tree, where it dries up. Another singular adaptation to conditions is the vital development of the seeds of aquatic plants which ripen their seeds on or under water. *Vallisneria* is a remarkable instance of this. The unisexual flowers are formed under water; the female on long coiled stalks, which at the right period uncoil, and the flower rises just above the surface of the water. Simultaneously the short-stalked male flowers are detached from the base of the leaf-stalks, and also rise to the surface. After impregnation has taken place, the stalk of the female flower coils up again, and draws the seed-vessel down under water, where the seeds ripen.

It has been explained that heat, moisture, and air are necessary to the germination of seeds, varying immensely for different seeds. We come now to the behaviour of certain seeds under the influence of an unusual or unnatural amount of moisture, heat or cold especially in relation to the length of the duration of the exposure to any one of these factors. It has been proved beyond dispute, by actual experiment, that the vitality of certain seeds, notably various kinds of bean and convolvulus, is not impaired by immersion in sea-water—or rather floating and partially submerged—for a period of at least one year; and that after having been kept quite dry for two or three years. Plants are actually growing at Kew from seeds treated as described; and some years ago several seeds of *Entada*, cast ashore in the Azores, whither they had been transported by the Gulf Stream, were raised at Kew. So far as at present known, all the seeds that will bear very long immersion without injury have an intensely hard, bony, or crustaceous coat, that would withstand boiling for a minute or two without killing the embryo. Yet it is difficult to understand this power of resistance, especially after being kept dry for a long time. This imperviousness to water explains the wide distribution of many sea-side plants, the seeds of which are conveyed by oceanic currents. How long such seeds would retain their vitality in water is uncertain, because experiments have not reached the limit. Many readers will remember Darwin's experiments in this connection; but it should be borne in mind that they were chiefly with seeds of plants not at all likely to be dispersed by the sea.

It has already been stated that some seeds will bear immersion in boiling water for a short time, and gardeners occasionally practise this treatment to accelerate the germination of hard-coated seeds. But seeds of all kinds will bear for a considerably longer period a much higher dry temperature than soaking in water of the same temperature. It is recorded, by trustworthy authorities, that the seeds of many plants—poppy, parsley, sunflower, and various kinds of grain, for instance—if perfectly dry, do not lose their vitality when subjected to a temperature of 212° F. for forty-eight hours; and for shorter periods to a much greater heat. The result in most cases, though not all, is a considerable retardation of germination. Dry grain is equally impervious to cold. In 1877, seedling wheat was exhibited at the Linnean Society that had been raised at Kew from grain that had been exposed

to the intense cold of the Arctic expedition of 1874 to 1876. The next question that arises is: how long of seeds retain their vitality when stored in the ordinary ways adopted by dealers? As a rule, seedsmen and gardeners prefer new seed, because a larger percentage germinates; and mixing cold seeds with new, tells its own tale in irregular germination. Nevertheless, there are many seeds that retain their vitality from five to ten years sufficiently well to be depended upon to yield a good crop. Old balsam seed, other things being equal, has the reputation of yielding a larger proportion of double flowers than new; and some gardeners consider that cucumber seed of four or five years of age gives better results than the seed of the previous year. As already mentioned, perfectly ripened seed will retain its vitality longer than imperfectly ripened seed. In illustration of this, we note that carrot seed grown in France retains its germinative power, on the average, longer than English-grown seed, owing to climatal differences.

There is one other natural condition in relation to the vitality of seeds that should be mentioned; that is, the duration of the vitality of seeds on the mother plant. Some of the Australian *Proteaceæ*, and some of the fir trees, especially North American, bear the seed-vessels containing quick seeds of many successive seasons; and only under the influence of excessive drought or forest fires do they open and release the seed. Rapid forest fires are often not sufficient to consume the cones, but sufficient to cause them to open and free the seed for a succession of trees. The unopened cones of thirty years have been counted on some fir trees; and it is averred that the first seed-vessels of some proteaceous trees do not open to shed their seed, under ordinary conditions, until the death of the parent plant, so that a tree may bear the accumulated seed of half a century or more.

Finally, a few words respecting the extreme longevity attributed to certain seeds. The reputed germination of "mummy wheat," from two to three thousand years old, has been the theme of much writing; but the results of careful subsequent experiments with grain taken from various tombs do not support the doubtless equally conscientious, though less skilfully conducted, experiments, supposed by some persons to have established the fact of wheat of so great an age having germinated. Indeed it is now known that the experiments mainly relied upon to prove this long retention of vitality were falsified by the gardener who had charge of them. Nevertheless, there is no doubt that some seeds do retain their vitality for a very long period, as is proved by numerous well-authenticated instances. Almost every writer on physiological botany cites a number of instances. Kidney beans taken from the herbarium of Tournefort are said to have germinated after having been thus preserved for at least 100 years. Wheat and rice are also credited with having retained their vitality for as long a period. Seeds of the sensitive plant (*Mimosa pudica*) kept in an ordinary bag at the Jardin des Plantes, Paris, germinated freely when sixty years old. A long list might be made of seeds that have germinated after being stored for twenty-five to thirty years. If seeds retain their vitality for so long a period as this under such conditions, it is quite conceivable that seeds buried deep in the earth, beyond atmospheric influences, and where there was not excessive moisture, might retain their germinative power for an almost indefinite period; and the fact that plants previously unknown in a locality often spring up where excavations have been made, bear out this assumption. The same thing happens in arable land, should the farmer plough deeper than usual; and deeper tillage, which would otherwise be beneficial, is often avoided on this account. A careful writer like Lindley states, though without qualification, that he had raspberry plants raised from seed taken from the stomach of a man, whose skeleton was found thirty feet below the surface of the ground. Judging from coins found at the same place, the seeds were probably 1600 or 1700 years old. One more example of seeds germinating that

are supposed to have been buried some 1500 to 2000 years. About twenty years ago, on the removal of a quantity of slack of the ancient silver mines of Greece, several plants sprang up in abundance previously unknown in the locality. Among these was a species of *Glaucium*, which was even described as new; and it is suggested that the seed may have lain dormant for the long period indicated. But there is not the amount of certainty about any of these assumed very old seeds to convince the sceptical or to establish a fact. It remains yet for somebody to institute and carry out careful investigations where excavations are being made.

W. BOTTING HEMSLEY.

—Nature.

WILL THERE BE A RUBBER FAMINE?

We are surprised to see in the London *India-Rubber Journal* a prediction of a rubber famine, written in a style suggestive of those newspaper articles which tell us from time to time how rubber is gathered in hollow pumpkins, or that "para" is not rubber until it has been vulcanized. Fifty years ago it was well enough to talk about the known supplies of rubber becoming exhausted, and it was the work of an intelligent man for John Forbes Royle, for instance, to urge that new sources of this valuable material be looked for. But in Royle's time no rubber had been marketed from India, its presence in Bolivia and in Africa was unknown, and the extent of the Amazonian forests unsuspected. The situation is far different now, since Stanley's great work in revealing the resources of the Congo basin and Emin Pasha's discovery of rubber in the Soudan, and since the French have come into a position to develop Madagascar on a broader scale. We feel safe in asserting that the *India-Rubber Journal* does not know of any country, important at any time as a producer of rubber, which is not still exporting it. Has it seen any evidence that Para rubber is growing scarcer, or that the African grades are becoming harder to obtain? Can it show that, on the whole, there are fewer rubber-trees available than time in the past?

The reasons which our contemporary gives for its alarm are (1) the rapid growth of the bicycle industry; (2) the probability of rubber tires being largely used for carriages; and (3) the recklessness of "the owners of plantations in west Africa and elsewhere" in their "method of tapping the trees." We can say that, as for the United States, the largest estimate of the consumption of rubber by the bicycle trade does not exceed five per. cent of our total imports, while the carriage-tire demand does not promise soon to equal in value even the rubber-stamp trade. In a country where the importation of rubber has bounded upward at rate of millions of pounds annually, none of these items is of commanding importance, and importers believe that all the rubber actually demanded by manufacturers will long be forthcoming. There is no more fear on this side of the Atlantic that rubber will become exhausted than that coal or wheat will. And we presume that our rubber-merchants have studied the situation as carefully as those of any other country.

All the rubber-vines that have ever been killed in Africa are as a drop in the sea compared with what still remain there, and we cannot learn that the rubber-gatherers on the Amazon are so different from the rest of mankind as to be unable to see that, if they kill their trees, their occupation will be gone. It is a half-century since the expression "killing the goose that lays the golden eggs" was first applied to the rubber industry, and it is time that some new stock phrases were introduced into the work-hack-writers on this subject.

The most surprising thing of all is that the *Journal* should see in the development of the balata crop a remedy for the threatened famine. It hears that in the handful of forests in the Guianas there is enough gum—only slightly inferior to caoutchouc to support a trade for centuries. Evidently our contemporary has only just got hold of the remarkable prospectus issued a year or so ago by an enthusiastic French gentleman, who figured out that the penal colony of Cayenne could gather in the balata

forests there ten times as much rubber every year as the whole world now requires. It would be a strange thing, indeed, if the narrow strip of land embraced in the Guianas should become of greater value as source of rubber than the valleys fringing the 50,000 miles of waterways in the Amazon system and an equal area of rubber forests in Africa.

If such a thing were really possible as the exhaustion of the natural rubber supply in the next century, there is ample reason for believing (1) that rubber-trees will grow as well from seeds planted by hand as from seeds scattered by the winds; (2) that rubber cultivation is practicable wherever the trees now grow native; and (3) that the rubber zone embraces millions square miles. The cultivation of rubber—when the time comes—is as practicable as that of oranges, olives, tea, coffee, cloves, or cinchona. We hope, therefore, that further predictions of a rubber famine will be left for those who think that the planting of old shoes is the surest way of starting a rubber plantation.—*Indiarubber World*

RUBBER CULTURE IN FLORIDA.

A writer in the New Orleans *Times-Democrat* revives the idea of planting rubber trees in Florida, and states that it is moist and hot enough there to raise rubber of an excellent quality. It seems that one generation speedily forgets the experience of a preceding one. About forty years ago the United States Government planted rubber trees in Florida, and they may be there yet. Some were cared for also at the Centennial Exposition, and some are found in botanical gardens elsewhere. The trouble is they don't produce rubber. Florida is outside of the Tropics; Pará is on the Equator. It rains every day at Pará or else there is fear of a drought; Florida gets its quota of rain a good deal in the winter and not so much in the summer. Rain, continual hot weather, monkeys, and rubber go together; and rubber is the first to drop out of the combination. The New Orleans writer states that Da Silva planted 20,000 rubber trees near Pará, on Bom Intento, in 1865, at a cost of 3,200 dollars. Of these, only 1,000 remain; the Amazon which revels in nature and cares little for art, washed 19,000 away in one of its annual "tears." These trees yield a small profit now; but the practical mind asks, what is the use of spending 3,200 dollars, which in twenty-five years amount, with compound interest, to 50,000 dollars, to obtain something that is so free that what would be called good-sized countries in Europe are lying idle in a virgin forest that will not be reached before the shoddy man has found a way to pay a little something to the importer to go out of the business altogether?—*Indiarubber World*.

TOBACCO CULTURE IN THE EAST.

Mr. Tripp read a paper at the Imperial Institute, on "The Tobacco Industry of India and the Far East," the meeting (over which Lord Harris presided, in the absence of Lord Lorne, M.P., who is on the Continent) being held in connection with the Indian Section of the Society of Arts.

Mr. Tripp's experience has been derived in Sumatra, and he spoke in high terms of the suitability of its climate and soil for the cultivation of the tobacco plant. But there is a third factor of great importance—labour. For the higher or skilled labour a European is apparently needed, and he must be a man of strong common-sense and possess qualities—so the lecturer hinted—other than those that go to make a brilliant statesman or journalist. For the manual and mechanical work the Chinese are found best qualified. Javanese labour is cheaper, but practically of no use at all. Europeans, by adopting scientific methods, have converted a trade which, thirty years ago, was measured by a few hundreds sterling, into one calculated by millions: yet the natives, blind to facts, deaf to advice, and doggedly conservative, go on growing tobacco in their own way, insisting that they are right and that the white man is wrong. This consideration was vital to the main argument of the paper, for Mr. Tripp is anxious that the quality of Indian tobacco should be improved. He cannot bring himself to believe that

the soil of India can "aspire to the perfection of Sumatra," but the climate is all that can be desired. Therefore, why does India produce that "coarse, thick-ribbed pungent tobacco" that is "quite unsaleable in Europe?" Mr. Tripp suspects that inferior culture has a great deal to do with it. Nay, he went so far yesterday afternoon as to indicate where the Indian growers and curers are at fault. The plants are "topped" too soon, the newly-reaped tobacco is exposed too long to sun and light, and the fermentation is not properly understood. There are also, he thinks, important undeveloped possibilities in connection with Borneo, though, it should be pointed out, his modest estimate of results already produced there was taken exception to, in the subsequent discussion, by Mr. Strutt, M.P. Mr. Tripp concluded his paper by indicating the new field for English labour that would be opened up by the development of tobacco cultivation in the directions he had indicated. He looks forward to the time when the British smoker will consume cigars produced from British soil, with British capital, and made by British hands. For why do we import 80,000,000 cigars from the Continent every year? Mr. Tripp answers that question in one word—prejudice.—*Overland Mail*.

PLANTS FOR GREEN MANURING.

With a view to determining the amount of nitrogen by which various leguminous plants enrich the soil, some interesting and valuable experiments were made last year on the experimental fields at Hohenheim, Wurtemberg. The soil was a heavy loam, on which rye and winter peas had been grown in the third year previous, rape manured with superphosphate and nitrate of soda in the second year previous, and winter barley in the previous year. After the barley was harvested, 17 different kinds of leguminous and other plants were sown for green-manuring on 17 plots, each containing about 50 square yards separated by uncultivated strips. In September following the crop on each plot was dug under, and Sheriff wheat drilled on all the plots. The yield of wheat where different leguminous plants had been used as green manures (lupines, clovers, field beans, peas, vetch, and serradella), ranged from 15 lb. to 22 lb. averaging about 20 lb. It was lowest with serradella and highest with red clover and white and yellow lupine. Second to the latter were field peas and beans and scarlet clover. The yield with kohl was 16 lb., with white mustard 15½ lb., and with three varieties of buckwheat the average yield was 13 lb. per plot. It was noticed that on the plots, especially those with lupines, many heads of grain were backward in ripening. On examination the roots of such plants were found to be covered with a white fungus. No such fungus was found on the roots where non-leguminous plants were used for green manure. In how far this occurred was due to the green-manuring with leguminous plants was not determined. In another series of experiments, the object was to compare the total amounts of nitrogen contained in crops of different leguminous plants, and in the leaves, stems, and roots of the same separately. The soil on which this trial was made had been in grain for three years previous. Whether or not it was manured in any way for the present crop is not stated in the abstract. The seed was broadcast on the different plots. It was found that the large field beans gave the largest yield of nitrogen per square yard of land; but considering the cost of sowing this crop, it is believed that, from a financial point of view, it does not exceed the lupines in value. The difference in the nitrogen in the white and blue lupines raised from native and from foreign seed is very marked, the foreign seed yielding over a third more. It is seen that an acre crop of large field beans is able to take from the air and so give to the soil more than 225 lb. of nitrogen, while the same crop of lupines yields some 165 lb. To supply these amounts of nitrogen in the form of nitrate of soda, would require from a 1,000 lb. to 1,500 lb. of that material.—*Agricultural Journal*, Cape Colony.

“A NATURAL HISTORY OF ALL THE
SCALE INSECTS OF CEYLON.”

Such is the proper designation of the important work on which Mr. E. Ernest Green of Pundaloya is at present engaged in the old country, and I must again press on his brother planters, the Planters' Association and the Ceylon Government the great call there is for extending support to the author in his most useful enterprise. In my opinion no work of more practical value to our planters of all grades and products has been heard of since “Nietner's Enemies of the Coffee Tree.” But, unfortunately, Mr. Green has done himself far less than justice—at any rate in the estimation of practical, non-scientific planting and business men—by his very scientific, not to say non-popular, dry-as-dust Prospectus. I have pointed this out to Mr. Green and remarked that it is not likely Tea Plantation Companies or other large proprietors in Ceylon even—much less in other lands—will be attracted by a “Descriptive Catalogue of the Coccidae of Ceylon” even though backed by a long array of scientific men. I have urged Mr. Green to draw up a fly-leaf prospectus making plain to planters what his work will really do for them and I am glad to say that he is likely to comply with my suggestion. What this will mean may be understood from the following extract from my latest letter from Mr. Green:—

“My prospectus—as you point out—does not perhaps describe my work to the best advantage. It was drawn up rather hurriedly, and I was advised by the publishers to make it as brief as possible. Although my book is there described as ‘a Descriptive Catalogue,’ it will really be—as far as possible—a natural history of all the Scale Insects of Ceylon, with full illustrations of every species which should enable anyone to recognise—almost at a glance—their particular enemy.

“As I mentioned in my letter of 2nd January (which must have reached Colombo after your departure), although my work is primarily a natural history of these insect pests, I shall add a general review of all the remedies and experiments that have been used against them, pointing out the particular treatment most suitable for particular species as suggested by their habits. There is scarcely a plant or tree of any kind in Ceylon that is not subject to one or more species of these ‘scale-bugs,’ and some change in the conditions of their life, such as the partial extermination of their natural enemies, may at any time cause any of them to suddenly spring into importance.”

In view of the above, and of the further facts which Mr. Green will no doubt bring out in his supplementary prospectus, I have no doubt that though the cost of the work is considerable (some Rs5 in Ceylon) that a great many of the Tea Companies and other large Plantation Companies will act on the suggestion about making a copy available in the hands of each of their Chief Managers for reference by their Superintendents. At the same time the Planters' Association and the Ceylon Government should take notice of Mr. Green's work and the latter should either subsidize, or offer to take a considerable number of copies for their Kachcheries, Forest and Botanical Departments as well as to present to other Colonial Governments. J.F.

P.S.—Since the above was written, Mr. Green has requested that subscribers' names to his new work should be registered at the *Observer* Office—a request we have much pleasure in complying with; but we feel sure the Planters' Committee and the other bodies and public men will do what they can to give the enterprising author all due support.

IN THE METROPOLIS.

London, March 13.

DR. MORRIS

was as interesting and instructive in conversation as usual. His latest trip to the West Indies, and especially the Bahamas afforded interesting topics: though great success has not attended the efforts of Ceylon planters who have gone Westwards—Messrs. W. Sabonadière, Marshall, Barnett and others—yet there is no doubt of a revival of prosperity in many of the islands and this is due to their taking advantage of the grand and ever-growing market at their door, almost for nearly all the produce they produce, namely the United States. Frost is considered to have wrenched the golden prospects of much of Florida and California and so the West Indies have the ball at their foot in supplying fruit, and tropical produce generally, to North America. I will say nothing about the Bahamas and its Sisal industry until I hear (as I hope to do) Dr. Morris's lecture on the subject before the Society of Arts on Wednesday next. The efforts of Dr. Morris, when Director of Gardens, backed up by his Assistants, Messrs. Neek and Hart, did much for Jamaica and it is now rapidly going ahead. One want in the West seems to be an independent enterprising Press; but it is difficult for the separate island communities to pull together and there is no common metropolitan centre which for a paper would ensure general support. The *Tropical Agriculturist* continues to be well supported and much appreciated in the West. Dominica may now be expected to come to the front, though an unkindly critic seems to have anticipated the advent of the Ceylon administrator by saying that he was a better judge of the good things of the table than of a Colony's public requirements! That is not fair; for put on his mettle in a responsible charge, Mr. P. A. Templer will, I have no doubt, give scope to his admitted ability.

The interest of the gathering in the Whitehall Rooms was enhanced by ladies being now admitted to the Dinner as well as the meeting; Sir G. Baden-Powell, Sir Francis Scott (just returned from Ashanti) and others were thus accompanied by their better-halves. The lecture, as I have said, was discursive and dealt chiefly with West Africa, about which most of the speakers—including Mr. Alfred Jones of Liverpool, the king of commerce in that part, Mr. Hodgson, Colonial Secretary, Sir Quayle-Jones, Chief Justice, and the Governor of St. Helena, besides Sir Francis Scott, and Sir F. de Winton. The last mentioned indeed, in dwelling on the absolute necessity of roads and railways, referred to South Africa. Dr. Morris made the most useful contribution to the discussion in describing what “Botanic Stations” had done and were doing for the West African Settlements. He praised Governor Mollony for being the first to develop the rubber trade from the Gold Coast, now worth a great deal per annum, and when he was transferred along the Coast, that Governor got trained men from the Gardens to search the natural forests, who, instead of a rubber vine (*Landolphia*) which got killed in collecting the rubber, found a vigorous rubber forest tree which merely required scoring and would be ready for further harvests in a certain number of years. This was in Lagos. Dr. Morris dwelt on the fact that the exports were chiefly natural forest products; but coffee and cacao could well be cultivated. He mentioned how in New York a monopolist of mahogany got from Africa via Liverpool, called it “vermillion”—origin unknown—to deceive rivals in

the trade. The African mahogany trade is rapidly growing and somewhat injuring that of Honduras.

SIR ROBERT HERBERT

(who made a most admirable Chairman) after Dr. Morris sat down, unexpectedly called on me to speak, saying:—"We have Mr. John Ferguson of Ceylon with us this evening and as he has paid much attention to tropical agriculture, perhaps he may have something to say on the subject of the paper."

My few remarks were as follows:—Sir Robert Herbert, ladies and gentlemen,—I venture to intrude solely with reference to one passage in the interesting lecture to which we have listened. It is where Sir Geo. Baden Powell says:—

"I may here add that tropical Africa also offers a great arena for the work of many of our Indian fellow-subjects, traders, artisans, soldiers and planters. Our rule in India tends to a great redundancy of population, and in Africa this surplus will find a useful and profitable field."

Some two years ago, I was applied to by a prosperous Ceylon coffee and tea planter for advice: he had £5,000 of capital ready for investment outside his plantations and he wished to know should he take up land for coffee in Java or in British Central Africa. I advised a visit to the Shiré Highlands. The country was inspected with such satisfactory result that my friend took up a large block, came back and was induced to form a "Nyassaland Coffee Co., Ltd.," which was supported by shrewd business and planting men in Ceylon, who have sent over practical superintendents to open a coffee plantation. This, so far as I know, is the finest plantation company in that part of Africa and it owes its initiation to, and has its headquarters not in London but in, Ceylon—so establishing a bond of union between our leading Asiatic Colony and Central Africa. Ceylon long before this had given Sir Henry Johnston his first working Horticulturist and Botanist, surveyors and some planters. The pioneer of coffee was Mr. Buchanan, a Mission Agent; but he was now followed by Ceylon men, and if the present new administration is continued, roads opened and railways encouraged, we may look for the speedy development of British Central and East Africa—and more particularly of Nyassaland. There is a growing demand for Coffee both in America and Europe though not in the United Kingdom, and no present fear of over-production, and Africa is the indigenous home of Coffee. Referring to the latest news from Nyassaland, I mentioned how the Manager of the Company had reported coffee plantations paying 20 per cent return in their 4th year; and in contrast with Sierra Leone where the Chief Justice had said native labour had risen to 1s per day, I quoted Mr. G. M. Crabbe as naming the equivalent in calico of 2s a month for men, 1s 6d women and 1s for children as the wages paid! This constituted a perfect paradise for cheap labour, even when compared with the 12 million of people in Southern India who were content if they earned 2s 6d a week for family of five.

The Governor of St. Helena (the smallest but not least interesting British Dependency) would p the discussion

Next day I met by his appointment, Mr. H. T. Hartley, one of the Directors of the

"INDIAN AND CEYLON EXHIBITION OF 1896."

who was accompanied by Mr. Wickremasinghe of the British Museum. No one can come into contact with Mr. Hartley without forming a high opinion of his business capacity and sterling good sense; and I was disappointed to learn that the Ceylon Government before

the advent of your new Governor had decided adversely on the point of making a Loan Collection illustrative of Native Industries and of lending any buildings available from Chicago, the Tea Kiosk for instance. As the Company are ready to bear the expense of transport, &c., I trust H.E. Governor Ridgeway will reconsider this decision in a sense favourable to the Exhibition and what I believe to be the best interests, of the Colony. There can be no doubt of the grand advertisement for Ceylon, her products and industries which the Exhibition will afford, and I trust, therefore, that the Planters' Association or Thirty Committee will see that a good exhibit of Ceylon teas, coffee and cacao is made; while plumbago, cinnamon oil, etc., ought to come from the Colombo merchants. I have asked for a copy of the official letter to Government which, however, you may already have seen in the *Gazette*. If not, here it is:—

London, 24th January 1896.

The Hon. the Colonial Secretary, Colombo, Ceylon.

Sir,—We have the honour to address you, having received a communication from Sir Robert Meade notifying us that the Colonial Office has sent out a despatch to your Government, respecting this Company's forthcoming Exhibition:—

Empire of India and Ceylon Exhibition, 1896 including other Crown Dependencies in Asia.

We understand that this despatch has been supplemented with a copy of the Report of the Empire of India Exhibition of 1895, together with our various printed matter in connection with the forthcoming Exhibition of 1896.

A perusal of the Report will we think convince your Government of both the ability of this Company to adequately carry out their scheme for the forthcoming season as well as convey some idea of the substantial commercial advantages likely to result from co-operation therewith.

We feel that our enterprise should commend itself to your Government in view of the fact that the Empire of India Exhibition 1895 was a purely tentative effort, and the first time that any undertaking of this nature has been carried to a successful issue unaided by a Government grant.

Now that the Company have practically proved their capabilities, they trust that your Government may be so good as to extend to them their cordial assistance, and also permit themselves in some way or other to officially recognise this enterprise, (a recognition which has been accorded by the Indian Office) without which we fully appreciate that no commercial undertaking like our own can meet with any substantial adhesion.

The Directors are now in a position to state that the prominence given at the late Exhibition to Indian products, especially to Indian tea and tobacco proved a direct benefit to Indian trade, to the extent of not less than £75,000. We think that such results, achieved by a private Company, without the slightest charge against Indian revenues, compares most favourably with those of the Colonial and Indian Exhibition of 1886.

Although such a large measure of success has attended the efforts of this Company, it is still felt that India was but inadequately represented, and that nothing like justice was done to her.

This consideration has largely influenced this Company in deciding to continue the Empire of India Exhibition this year, and rendering the same more important and interesting by the inclusion of Ceylon and our Asian Crown Colonies, thus giving a more complete idea of their almost inexhaustible economic resources.

Briefly, the following are the principal matters and suggestions to which we are desirous of drawing the attention of your Government.

1. BUILDINGS.—It is intended to devote a large space for the erection of buildings of Ceylon Architecture, and also to set aside a considerable area in the Queen's Palace for a Ceylon Court for Sinhalese exhibitors.

2. NATIVE EXHIBITORS.—The Company being aware that native exhibitors cannot take active part in the Exhibition without considerable outlay, are willing to waive premiums in advance for the space occupied which is a necessity in Exhibitions not depending upon Government aid, and to accept in lieu thereof a moderate percentage on their gross sales.

3. STILL EXHIBITS.—This concession does not apply to what are termed "still exhibits" that is to say, show cases without attendants, where no selling is done; for the latter however when of *bona fide* Ceylon industries, liberal arrangements will be made.

4. STAPLE PRODUCTS.—Our Company are very anxious to give special privileges and prominence to the more important staple exports of the Colony, such as, tea, coffee, cocoa, and the valuable and numerous products of the coconut palm.

5. LOAN COLLECTION.—Deeming it desirable that we should convey to the visitor some adequate idea not only of the products and manufactures of the Colony, but also the typical features of the country and her art developments, considerable space will be reserved in the Ducal Hall for a Loan Collection of Ceylon Art Work, including Historical Records, pictures and views of the Colony, carved wood, arms, armour and metal work of all descriptions, embroideries, and in brief all ornamental manufactured articles. We particularly desire the co-operation of your Government in this direction.

6. COLLECTIVE EXHIBIT.—We would point out that whilst at the Imperial Institute your Government have very liberally represented the staple products of the country, the Art Manufacturing side of it is not represented at all; and feeling that these are a class of goods which meet with a ready sale in European countries, and only require more prominently bringing before the public to much increase the trade therein, is the reason why we seek the co-operation of your Government in this section, and ask them to get together as widely representative a collection as possible for exhibition.

Our suggestion is, that at the close of the exhibition, this collection should be handed over to the Imperial Institute.

For the installation of such a collection, our Company are prepared to pay all expenses for carriage and freight, and insure the goods to their full value whilst in our custody as well as to allot the space free of charge.

7. NATIVE PERFORMERS.—With the idea of making the Ceylon Section popular, it is intended to include one or more troupes of Sinhalese performers. The public will by this means obtain some adequate conception not only of the products and arts of Ceylon, but also of its people and their country, and we trust your Government will give what permission may be necessary to enable the performers to leave the country; our Company guaranteeing their return passage.

8. GOVERNMENT BUILDINGS.—We believe that your Government have in their possession some of the buildings erected in the Ceylon Section for Chicago. Could the loan of these be made available for the purpose of a tea house?

We are sending you by the same mail duplicates of our printed matter.

Finally, it is intended to open the Exhibition early in May, and all goods should be delivered here by not later than the 15th April.—I have the honour to be, sir, your obedient servant,

(Sgd.) HERMAN HART.

It speaks for itself. Mr. E. B. Creasy is the Colombo Agent—there could not be a better—of the Exhibition which is certain to be a great success, even if Ceylon does not do justice to itself—as I hope it may in all departments.

IN THE CITY.

Poor prices for tea notwithstanding high exchange is not satisfactory news; but this is a slack time in the

TEA TRADE

for there is nothing in Supplies or Stocks to justify depression, even though February Colombo ship-

ments were heavy. One question asked is how does the tea distributing trade falling more and more into the hands of half-a-dozen or so big firms and companies affect Mincing Lane. Suppose a few even of such big buying houses to hold aloof from a sale, does not it make a vast difference? Exchange has been receding a little and may go lower when all is settled for the Chinese Loan, though there are City men who think it may go higher yet this year—even to above 1s 3d and yet higher prices for tea plantations are asked! For a compact Udapussellawa-Nuwara Eliya place I hear the rate demanded is equal to £109 per acre! Lippakelle has to account for much.

Mr. Alfred Brown, Chairman, and Mr. Roberts the Secretary of the group of (Uva) Spring Valley and Hunasgiriya Company I found well and interested in all that concerns the island's progress: they anticipate Mr. Wardrop's arrival home. Mr. Alex. Thomson leaves in a fortnight by the ss. "Orient."

It is just possible, though by no means decided, that

MR. A. H. DUNCAN

(brother of Messrs. John and Hamilton Duncan), so well-known as an experienced Rangala coffee planter and clever all round, may get the appointment to visit and report on the coffee lands of the London-Columbia Company which is expected to have a capital of £100,000 at its command.

RESPECTING CEYLON TEA COMPANIES

with rupee capital, I have the following expression of opinion from a broking friend:—

"Letters from Ceylon inform me that the rise in exchange has put a damper upon the share market there, and I am just afraid they have been choking themselves, for the small number of dealers is not enough to keep up strength during a time of depression, so that they are now anxious to form a market here which I have urged them to do more than a year ago. Everything was then on the boom and their quotations were always too high. The only safety is to take advantage of the London market now and convert two or three companies into one, the shareholders taking their interest in sterling and ask for a small sum from the London subscribers and they would reap their profit from increased value of their shares. This I have repeatedly suggested, for, unless they do something of this kind, difficulties will arise."

The planters of Ceylon and indeed of other lands have had no better or more intelligent and energetic friend in many ways than

"MR. THOMAS CHRISTY"

of Lime Street, and a chat with him always brings some topic of interest to the surface. It will be remembered how persistently Mr. Christy moved in reference to the sale of tea-sweepings from the various Docks, until now, in nearly every case, the stuff is denatured and prevented from coming into the tea market, though used for the extraction of caffeine, &c., Our tea planters owe Mr. Christy their thanks for this action. Now in respect of

COFFEE ADULTERATION

a far more important matter than the abolition of the Coffee duty, Mr. Christy is interesting himself very actively. He has stirred up the Public Analysts by showing them how they are down on the poor farmers, dairymen, spirits sellers and a host besides, for anything like mixing or adulteration, while coffee dealers may sell 90 per cent of chicory to 10 of coffee, with impunity! The London Chamber of Commerce is likely to move in the matter.

INDIAN TEA.

To the Editor of the *Financial Times*.

Sir,—Having read the article in which you brought Indian tea planting companies before your readers as a suitable channel of investment, it occurs to me that you may possibly like to have some confirmation of your advice from one who has long been conversant with the position and development of the industry as a tea-taster and agent in the London market for some of the principal growers.

So little has been known in the past about this branch of our commerce that it is not surprising that investors, as a rule, have regarded it with diffidence, or have altogether ignored it. But the experimental stage has long been passed, and we have now the benefit of some fifty years' experience with the result that it is proved that nearly all, but not quite all, plantations in India are permanent in respect of soil and the capacity of plant to yield freely and vigorously; that while weather causes some variation in the amount and quality of the yield, such a thing as the failure of a crop is unknown, and that no limit has yet been found to the consumption of Indian tea.

A most important fact is, that the oldest plantations in Assam still produce the finest tea. Proof of this is to be found in the history of the Assam Company, which has been at work since 1813, and last year showed a profit of £50,000 on the season's production, equal to more than 25 per cent. on the capital, and due to the fine quality of the tea produced. Another weighty fact is that no other tea-producing country has yet been discovered which can give tea equal to the best from Assam and Darjeeling. Another is, that notwithstanding the steady increase of production, there is in no market of the world a surplus stock of Indian tea, the year's consumption regularly using up all that is grown. Last year 135 million pounds were produced by India; of this, 120 millions at least will be used in the United Kingdom, and the remainder in other countries, where the use of Indian tea in place of China is rapidly increasing to a point which makes them keen competitors with English buyers.

The effect of these developments in trade has been to maintain the market value of Indian tea well above the cost of production. You may like to know some details. A crop of "common tea" costs from 5½d to 6d per lb. to make, and realises 7d to 7½d per lb.; a smaller crop of "good tea" costs about 7d per lb., and realises from 9d to 10d; a still smaller crop of "fine" tea costs from 9d to 10d, and realises from 1s up to as much as 1s 6d per lb. There is, therefore, a good margin left for lowered market value or increased cost of manufacture. The items that would increase cost are: a rise in the value of silver, a rise in freights, or a scarcity of coolie labour.

So much with regard to the general position and prospects of the industry. The would-be investor will, of course, want to know which are the strongest and soundest of the many companies, but it is not my purpose to tell him. Some general hints, however, may perhaps be given. These are: To notice the capital cost per bearing acre, and prefer those whose gardens show a low cost; to ascertain what additions to the planted area have been made out of the profits of past years; to discriminate between those who pay dividends and also create reserve funds, and those who do not; to inquire what is the average value of the tea produced, and if the estates are situated in the best districts.

Most of this information can be found in the elaborate tables of statistics now published by some of the stockbrokers, who are beginning to realise that 6 per cent. or 8 per cent. can be obtained on investments in Indian tea with much less risk than is run in many kinds of industrial and commercial concerns for the sake of 5 per cent. From a shareholder's point of view it is much to be desired that the older companies would rearrange their capital on a modern basis, divided into the preferred and deferred shares of small nominal amount that the investor of today so much prefers.—I am, &c.,
—*Financial Times*, March 11th. ASSAM.

AGAINST A DUTY ON TEA.

The following petition has been prepared and circulated by a tea buyer on the East Side. Mr. C. R. Banks, expressing, as he claims, the opinion of a large number opposed to a duty on tea:

To the Honorable House of Representatives Washington, D. C.

We, the undersigned citizens, merchants and tea dealers, learning that a bill is to be presented to Congress to impose an import duty on tea, beg to present for consideration the following objections to such duty:

Such a duty as is proposed was in force for a number of years. It was repealed, so that all, no matter what their circumstances, might have at the lowest possible cost, and enjoy without tax "at free breakfast tables," an article so indispensable that it has almost or quite ceased to be considered a luxury.

The ostensible object of those who are desirous of imposing an import duty on tea is that the standard of quality would thereby be raised, which object can be equally obtained by the more stringent enforcement of existing laws for the inspection of tea at the port of entry, without imposing a tax on the poor man's comfort and consolation.

We humbly pray your honorable body not to reverse the wholesome and consistent policy now in force for twenty-three years, keeping a staple article of daily use free from taxation, which falls heavier on the poorer classes than on those better able to contribute to the support of the Government.

We further desire to call attention to the fact that the proposed tax is sought to be imposed chiefly in the interest of large capitalists, as such a tax by almost doubling the import cost of the article, would be a burden upon the dealers of smaller means.

We beg to submit that the existing laws for the inspection of tea of a healthful and reasonable standard can and should be maintained at all ports of the United States, and that no duty be imposed for the benefit of a few capitalists and to the detriment of the public at large.

There is nothing in the present revenue laws which forbids the entry of clean, low-priced tea. The decline in tea since 1872 has not tended to increase consumption, which was larger per capita in 1872 and 1873 than it has been since, and greater in 1886, 1887 and 1888 than at any time since. In 1873 and 1874 the average import price of tea was 37½ cents, and now, when it has fallen to 15 cents, we find no increased use of the article, conclusively showing that the American people do not care for tea as a beverage. Beer and coffee are the favorites. Is it any wonder that the tea trade does not increase when the bulk of the importations are cheap and herby teas, giving forth a flavour that does not captivate and win the palate? Not one consumer in fifty drinks tea for the sake of that flavour but simply from habit or through the natural craving for a warm drink. Does anyone imagine that cheap, poorly flavoured coffee, or coffee mixtures, tend to increase consumption? The introduction of the portable coffee mill into the grocers' shops did more to make coffee the popular beverage it is than did making coffee duty free. It forced the sale of roasted coffee in the bean, while competition kept up the quality and stimulated the sale of pure coffee.

Mr. Banks claims that tea has "quite ceased to be considered a luxury." Simply, we believe, because of inferior quality. Tea should be regarded a luxury, as coffee is, which pleases the palate and awakes good cheer and brings comfort. If the people were educated to an appreciation of tea for its delicate and peculiar flavour and for its marked characteristics, the trade would make more money than it does now and the people would worship the teapot as they adore the coffee urn, the chocolate cup and the beer mug.

If Mr. Banks went into the tenement districts and the slums he would be surprised to find the poorest of the poor buying the better grades of tea, unless forced by the most abject poverty to crucify their desires. What the tea trade want is a campaign having for its object to demonstrate to consumers,

there is as much of delight to the senses in a cup of hot, fragrant tea as in glass of Madeira, sherry, rich old Burgundy or a well seasoned Sauterne. A tax would tend to improve the character of the imports and would give the Government ten millions of revenue, so distributed as to be felt by no one. If the tax be ten cents per pound it means that each cup of tea is taxed one-third of one mill. Let us have a duty on tea and coffee, with an additional tax on beer, as a measure of revenue only.—*American Grocer*, Feb. 26.

THE ASSIMILATION OF NITROGEN BY TEA-PLANTS.

DEAR SIR,—In his note on "Assimilation of Nitrogen through the Agency of the Root Tubercles in certain Papilionaceæ" published as an enclosure to Mr. G. W. C. Cock's letter on pages 5 and 6 of the January number of the *Indian Forester*, Mr. Cock recommends the planting of Saw (*Albizia stipulata*) or the Sensitive plant (*Mimosa pudica*) in tea gardens for the fixation and storing of nitrogen the nodules of its roots for the use of the Tea plants. Both the Saw and the Sensitive plant belong to the sub-Order *Mimoseæ*. As far as I have read the recent literature on this important subject of assimilation of the free nitrogen of the air in the root tubercles of plants. I have not come across any writer who claims this precious property for the roots of any other plants than those of the Papilionaceæ. I am therefore led to ask you, Mr. Editor, to kindly state for the information of your readers in your next number of the *Forester* whether all or any of the plants of the sub-Order *Mimoseæ* also possess this inestimable property of fixing the free nitrogen of the air in their roots. M. R.

Note.—Our correspondent's question is practically answered in Dr. Watt's paper published at page 343 of our Vol. XXI; we regret we can give him no further information.—*Indian Forester*, March.

MARKET FOR TEA SHARES.

There is still a large amount of inquiry for Tea Companies' Shares, and again the "official list" shows, during the week just closed, a large number of advances in quotations, while many of the Money Market Reports in the daily Press make pointed references to these investments.

The *Financial Times* again makes some special reference in its leaderettes to the progress made in the opening of fresh channels of consumption for Indian and Ceylon tea.

MINCING LANE, with rather more limited offerings, keeps steady, but without any very noted advance in values. The estimate of immediately-expected supplies continues to be decreased. Indians have pretty well come to an end, and the March exports from Ceylon now look like being reduced in quantity.

FRESH ISSUES.—Dimbula Valley Ordinary have changed hands at 1-16 under par, while the Prefs, have again being placed freely at 6.

CEYLON SHARES.—C. T. P. Co. Ordinary are said to have changed hands as high as 27½, and the Prefs, have been taken at 17½.—*Il. & C. Mail*, March 20.

TEA IN AMERICA.

New York, March 11.

At the last auction sale the market was very well supported on high grade Formosas, but low grade sold off and ruled weak. Other descriptions are steady and without change with demand light.

Last Wednesday the Montgomery Auction and Commission Company sold at auction 8,779 packages teas as follows:—Moyunc—50 Hyson 6½ to 6¾; 517 Young Hyson 7 to 20c; 215 Imperial 12 to 16¾c; 174 Gunpowder 12 to 25¼c. Ping Sney—13 Young Hyson 9¼c; 451 Imperial 8 to 13c; 1,654 Gunpowder 7¾ to 2¼c. Japan—70 Pan Fired 9¾ to 12c; 25 Capers

16c; 593 Congou 8½ to 16c; 180 India and O. Pekoe 11¾ to 21¼c. Oolong—2,352 Foochow 8½ to 20c; 2,463 Formosa 13½ to 46c. High grade Formosas were well supported and higher, while low grade blacks went off.

Today at noon the Montgomery Auction and Commission Company will sell 9,602 packages, viz., 1,716 half-chests Moyunc, including "Choicest" Moyunc Chops; 2,785 boxes Pingsuey; 32 half-chests Japan, basket-fired and sun-dried; 1,183 half-chests Congou, including some particularly choice lines; 102 packages India, Java, Ceylon and Pekoe; 50 half-chests Amoy; 1,037 half-chests Foochow, new season's; 2,647 half-chests and boxes Formosa, all new season's and comprising some choice teas.—*American Grocer*.

THE TEA MARKET

remains much as before, with more than the lower qualities available than can be readily disposed of. The free imports from Ceylon are generally disappointing, whereas it is to that country good quality was looked for to meet the demand at a time when standard teas are at the lowest cbb. All "stand out" teas are readily competed for—an encouragement to intending operators in China. Deliveries, both for home consumption and export, give highly satisfactory evidence of the increasing use of tea.—*London and China Express*, March 20.

PLANTING AND PRODUCE.

PRODUCE AND ADULTERATION.—The twenty-fourth annual report of the Local Government Board on the adulteration of food samples for 1894-95 has just been issued. So far as the reference to tea is concerned, it is not at all disturbing to the public mind. Five hundred and twelve samples of tea were taken, and one was condemned because it contained an excessive quantity of mineral matter (including minute particles of glass, straw, woody fibre, etc., suggestive of shops sweeping) Four samples, although passed by the analyst, were found to be impregnated with lead. In one case legal proceedings were taken against a person for refusing to sell a sample of tea to an inspector, and a fine of £2 was inflicted. Of 1,724 samples of coffee examined, 180 (or 10.4 per cent) were condemned. There is an element of satisfaction in this when it is remembered that for the ten years after the passing of the Act of 1875 the average percentage of adulterated coffee was eighteen. Legal proceedings were taken in 126 cases, and 112 penalties were imposed, amounting in all to nearly £140. Of sugar, 397 samples were analysed, and twenty-nine were condemned. Most of these were beet sugar coloured to imitate Demerara sugar, but four samples contained small proportions of mineral matter. Small fines were inflicted in nine cases.

TEA v. TOBACCO.—When Indian and Ceylon tea planters set about the capture of the American tea market they did not contemplate that the demand for tea would be increased owing to the new use for it as a substitute for tobacco. It appears from American papers that the craze for smoking cigarettes made of tea is rapidly spreading among women in the United States. To make the tea cigarette one takes a grade of green tea which has but little dust, being composed of unbroken leaf, and dampens it carefully, just enough to permit the leaves to be unrolled without being broken, and so to be left pliable and capable of being stuffed in the paper cylinder, while the dampness is not sufficient to stain the paper. The cigarettes are laid aside for a few days, and are then ready to be smoked. The feeling of a tea cigarette in the mouth, says an American contemporary, is peculiar. The taste is not so disagreeable as might be supposed, but the effect on the tyro is a sense of dizziness and a disposition to take hold of something or to sit down. If the beginner leaves off then, that settles it; she will not try tea cigarettes again. If, however, the smoker sit down and try a second cigarette, inhaling it deeply, then the dizziness passes, and is succeeded by one of intense exhilaration. This stage lasts as long as the smoking

continues, which is until the reaction of the stomach sets in. Words cannot describe the final effect of the tea cigarette. The agony of the opium fiend is a shadow to that of the nauseated victim of the tea cigarette. It will be hours before food can be looked at, yet the first step towards a cure is a cup of tea. An hour afterwards comes the craving for the cigarette. A tea cigarette, in the quantity of tea used, is about equal to the tea for two cups of pretty strong green tea, and, being inhaled instead of taken in the form of an infusion, its action is about ten times as great. If a tea smoker gets through twenty cigarettes a day, he takes the equivalent of about forty cups of tea as regards the quantity consumed, or of 200 cups as regards the effect. This shows at once what the result in the nervous system will be. The tea cigarettes are on sale in New York at several first-class stores of cigar dealers who have a women's trade, and this has come about simply because the women ask for them.

THE COFFEE TRADE AND THE CHANCELLOR OF THE EXCHEQUER.—A large attended meeting of merchants, brokers, and dealers interested in the coffee trade was held last week at the London Commercial Sale Rooms, Mincing Lane, for the purpose of appointing a committee to formulate a system for the better working of coffees in bond, to be submitted to the Chancellor of the Exchequer. Mr. George Rouse presided. Mr. R. Wales said that the resolution he wished to propose was as follows: "That a committee of import and export merchants, home-trade dealers, and brokers be formed, with the object of formulating a system for the better working of coffees in bond, and that the committee do report to a general meeting of the trade the result of their deliberations, prior to placing it in the hands of the Chancellor of the Exchequer for his consideration. He said he would like to remind the meeting that the movement was not a new one, but had arisen out of the conference which the trade recently had with Mr. Goschen—which conference took place with the sanction of that room. They were aware that, on that occasion, they did not succeed in getting the Chancellor to abolish the duty, but he gave them an intimation that if they would put before him any plan or scheme by which difficulties in the present bonded system could be removed—difficulties that prevented the expansion of the export trade, he would be very glad to receive and consider it. The object, therefore, in appointing the committee was to lay before the Chancellor some definite plan for improving the bonded warehouse system, and which he was quite prepared to listen to. He did not think there would be any difficulty in appointing the committee, for it was thought very desirable that any plan which they might devise should have the entire approval of the trade, so that they would be able to tell the Chancellor that the scheme embodied the opinion not of a few individuals, but that it was the opinion of the whole trade. With that object in view they proposed that the committee, if appointed, should do nothing without it was first submitted to a general meeting of the room. It was an eminently safe course to propose the formation of a committee, and if that were agreed to he would then submit the names of the gentlemen who they thought should constitute the committee. Mr. Asser seconded the motion, which was carried *nem con.* A committee consisting of the following gentlemen was then formed: Mr. Oschwartz (Messrs. F. Huth and Co.), Mr. Julius Ehmann (Messrs. Edward Schluter and Co.), Mr. J. Davies (Messrs. Peek Brothers and Winch), Mr. Landsberg (Messrs. Landsberg and Co.), Mr. R. Wales (Messrs. Moffat and Co.), Mr. E. A. Rucker (Messrs. Rucker and Bencaft), Mr. George Rouse (Messrs. R. J. Rouse and Co.), and Mr. J. C. Sanderson (Messrs. Sanderson and Co.).

JUTE SPINNING IN GERMANY.—The movement for extensions of jute spinning and weaving in Germany seems to be spreading, in spite of the warnings of the recently dissolved association of manufacturers. It is stated that the directors of the North German Jute Spinning and Weaving Company, of Hamburg, have decided to add 4,000 fine spindles

and 188 looms to the machinery of the mills in Schiffbek and Ostritz, and to erect 2,000 fine spindles and 52 looms in the mill of the affiliated Alsacian Jute Spinning and Weaving Company at Bischweiler, so that, to the three mills, there will be an addition of 6,000 spindles and 240 looms. Following the example of the Hamburg Company, the Bremer Jute Spinning and Weaving Company of Hemlingen is about to add 1,500 spindles and 110 looms to its existing plant; and the Bremen Jute Spinning and Weaving Company has decided to add 6,000 spindles and 330 looms to its producing power.

AIR PLANTS.—At a meeting of the Royal Botanic Society held on Saturday, Mr. John Birkett in the chair, the Secretary, Mr. J. Bryant Sowerby, called attention to a number of species of the so-called "air plants"—*tillandsias*—exhibited from the society's collection. In the forest of the West Indies and tropical America these plants are found growing upon the branches or trunks of trees high above the ground, and as they are easily moved, and, moreover, very ornamental when in flower, the natives pull them down and attach them to wires from their verandahs, where they live for months without attention.—*Home and Colonial Mail*, March 20.

THE NAHALMA TEA ESTATE COMPANY LIMITED.

Board of directors: Arthur Marshall, Esq., Chairman William Forsythe, Esq. (in Ceylon), and John Abernethy, Esq. Office: 29, Victoria Street, Westminster, S. W.

The following is from the report of the directors to be presented to the shareholders at the second annual ordinary general meeting to be held on Thursday next.

The directors have the pleasure to submit the general balance-sheet and profit and loss account for the twelve months ending December 31st, 1895, duly audited. The net amount at credit of profit and loss account at December 31st, 1895, after providing for general expenses, directors' and auditors' fees, interest on debentures, &c., £2,043 0s 6d. An interim dividend of 3 per cent. on the ordinary shares was paid October 3rd, 1895, amounting to £420. It is now proposed to pay a final dividend on the ordinary shares at the rate of 5 per cent (making a distribution for the year of 8 per cent per annum free of income tax), which will absorb £700; it is proposed to place to credit of Debenture Redemption Fund, bringing it up to £1,267 16s 2d, £625; it is proposed to write off the amount expended during the year 1895 upon new turbine, £168 3s 3d; leaving to be carried forward to next year, subject to payment of income tax on profits, a balance of £129 17s 3d.

The directors recommend the distribution of a final dividend at the rate of 5 per cent on the ordinary shares of the company, payable on April 30, 1896, making, with the interim dividend paid October 3, 1895, a distribution at the rate of 8 per cent per annum for the year ending December 31, 1895, such dividend to be paid to those shareholders whose names appear on the share register on March 26, 1896 after which date such shares will be transferable ex such said dividend. The acreage of the company's properties on December 31 last was: Tea in full bearing, 446; jungle, 246; total, 692 acres. The superintendent reports the estate in good order, that the erection of the turbine and reservoir is now nearing completion, that he is more than ever satisfied that it will prove economical, and that Messrs. Walker and Co. have given substantial work. The crop for 1895 was 235,974 lb, as against an estimate of 220,000 lb. With a favourable season the crop for 1896 is estimated at 240,000 lb. Mr Arthur Marshall, the director retiring by rotation, being eligible, offers himself for re-election. Messrs. Fox, Sissons and Co. auditors to the company, offer themselves for re-election.—*H. and C. Mail*, March 20.

LIBERIAN COFFEE.

The African republic is looked to for a coffee crop of 50,000 piculs this year, against 30,000 piculs produced in 1895.—*American Grocer*, March 11.

IS THE LANTANA A FRIEND OR AN ENEMY?

SIR,—The Lantana is an abomination, we shall all agree in that, but I am strongly of opinion that it is an abomination that we shall have to put up with, and in many cases, ought to encourage. We have no sufficient experience to come to a decided opinion, but I fancy I see in the Lantana "the way out" of more difficulties than one, notably as a means of taking possession of the soil to begin with, and protecting the young plants afterwards. I hope no Forest Officers will waste money trying to exterminate this shrub, except by the legitimate method of inserting young plants which will eventually kill it out by their cover.

VELLEDA.

—*Indian Forester* March.

THE INDIAN TEA ASSOCIATION (LONDON).

FURTHER INTERIM REPORT OF THE AMERICAN AND FOREIGN TEA COMMITTEE.

The following is the Committee's interim report on its operations since the issue of the general report on July last:

In response to the circular, issued by the direction of the Committee on September 25 last, requesting that subscriptions to this fund for the past season should be based on the scale of four annas per acre, and half anna per maund of tea, a total sum of Rs8,879-7-0 has been subscribed, representing a production of 77 million pounds of tea; this includes a generous contribution from the Central Travancore Planters' Association of Southern India.

Mr. Blechynden, the representative of the Association in America, has, under the direction and supervision of your Committee, continued to display much energy and ability in calling attention to the teas of India by advertisements, paragraphs in newspapers, supplying tea free as a beverage in places of public resort, &c., and has also arranged in conjunction with the Ceylon Commissioner to co-operate with private firms and others engaged in selling British-grown teas by granting subsidies to their advertisements, and other similar measures.

With reference to the disposal of the fund collected, the Committee have to report that they have spent, or authorised to be spent, up till the end of June next, the sum of £5,300, which is made up approximately as follows:—Salaries, travelling, servants, office, &c., £1,300 newspaper articles, £500 advertising £700; food shows, tea demonstrations, &c. £800; subsidies, £2,000; total £5,300.

The results of the various efforts made to obtain a footing in the markets of America are shown in the valuable statistics published by Messrs. Gow, Wilson, and Stanton. From these figures it will be seen that the increase in consumption is satisfactory. The total quantity of British-grown tea taken by the United States and Canada during the last six years has been: 1895, 9,283,141 lb.; 1894, 5,379,542 lb.; 1893, 4,211,075 lb.; 1892, 3,208,655 lb.; 1891, 2,635,772; 1890, 2,364,152 lb.

Of this quantity the amount of Indian tea used was as follows:—Re-exports, U.K. to U.S.A., 1895: 198,619 lb.; re-exports, U.K. to Canada, 821,195 lb.; transshipments, U.K. to U.S.A., 1,549,501 lb.; transshipments, U.K. to Canada, 750,280; direct exports, Calcutta to North America, 1,134,432 lb.; total 5,154,027 lb. Re-exports, to U.K. U.S.A., 1894: 708,921 lb.; re-exports, U.K. to Canada, 711,284 lb.; transshipments, U.K. to U.S.A., 768,404 lb.; transshipments, U.K. to Canada, 127,621 lb.; direct exports, Calcutta to North America, 551,750 lb.; total, 2,867,980 lb. Re-exports, U.K. to U.S.A., 1893: 848,302 lb.; re-exports, U.K.

to Canada, 648,271 lb.; transshipments, U.K. to U.S.A. 352,961; transshipments, U.K. to Canada, 154,713 lb.; direct exports, Calcutta to North America, 187,798 lb.; total, 2,228,045 lb. Re-exports, U.K. to U.S.A., 1892: 600,216 lb.; re-exports, U.K. to Canada, 789,065 lb.; transshipments, U.K. to U.S.A., 121,958 lb.; transshipments, U.K. to Canada, 25,187 lb.; direct exports, Calcutta to North America, 81,862 lb.; total, 1,618,288 lb.

It has been suggested that the teas of India and Ceylon have now obtained a footing in Western markets, and that the ordinary trade organisations and commercial rivalry of keen business men may be left to push British-grown teas into consumption. The committee are strongly opposed to this view, for, having regard to the very large extensions which are coming into bearing both in India and Ceylon, they are of opinion that it would be a grave error to leave, at present, entirely unaided the extension of consumption in the United States. It is, therefore, essential, in their opinion, that there should be a levy for the season of 1896, on the same basis as in the past year, and that immediate steps should be taken to collect subscriptions.

Should the whole of the fund thus raised not be spent in America, the committee would be prepared to support efforts to extend new markets in Russia, South Africa, and other places.

The committee have much pleasure in testifying their satisfaction with the work done by Mr. Blechynden during the period under review.

ABSTRACT OF PROCEEDINGS OF A MEETING OF THE GENERAL COMMITTEE OF THE ASSOCIATION, HELD ON TUESDAY LAST.

The minutes of the preceding meeting were read and confirmed. A letter was received from Mr. George Williamson regretting his inability to attend, and asking to be allowed to resign the office of vice-chairman, owing to ill-health. The secretary was requested in reply to express the regret of the General Committee, and to ask Mr. Williamson to allow his resignation to stand over until the annual meeting. A letter from Mr. D. M. Stewart was read in support of the movement for a further levy to continue the work in America. The chairman, in presenting the interim report of the American and Foreign Tea Committee, which was taken as read, said he thought that the meeting would generally agree that the Committee was working on the right lines. Mr. Blechynden had altered very considerably his plan of operations, which in place of consisting, as formerly, of native servants and food shows, was now chiefly carried on by means of advertisements and assistants given to firms engaged in pushing Indian tea, although he still occasionally made use of food shows. Mr. Raban wished to know of what basis the subsidies were given. The chairman stated that Mr. Blechynden gave a sum equal to one-third, or in some cases one-half, of the amount the firm was prepared to spend for advertising in order to increase their advertisement fund. Mr. Roberts wished to know if the amount of the proposed levy was to be the same as last year. The chairman said the committee recommended a levy on the same basis as last year. Mr. Bryans said he had hesitated to recommend a continuance of the work in America, because he was the only member of the committee actually interested in spending more money in pushing the tea in America, although he thought it would be a great mistake to leave off just now. Since the report was printed he had received a letter from his New York Agents, which he asked permission to read to the meeting: "In regard to work which has been done by the Indian Tea Association in working up this market, I learn from Mr. Blechynden that there is a great probability of his being retired in May and, should this be the case, it would be a matter of regret for the India business, as Mr. Mackenzie has been telling us that a further large sum of some thousand pounds has been voted by the Ceylon Committee for the continuation of pushing their teas on this market. . . . It has taken Mr. Blechynden years to find the best means to use, and now that success has rewarded his efforts it would be a pity to send some new man to begin at the beginning again." From this letter it was quite evident that

his people over there had a high opinion of Mr. Blechynden. Mr. Blechynden and Mr. Mackenzie were pulling very well together now, and it would be a great pity to stop this. At the last meeting he had stated that he thought another year or two would be sufficient to open the American market, but he now thought it required still the one year more.

The Secretary then read the latest letter from Mr. Blechynden bearing on this point. After further discussion, in which the following gentlemen, Messrs. W. Roberts, George Seton, R. G. Shaw, R. Lyell, R. B. Doake, Arthur Odling, and J. N. Stuart took part, the following resolutions were carried unanimously:

1. That this meeting is strongly of opinion that a further effort to carry on for another year the work of pushing Indian tea in America is essential, and it resolves that a further levy, on the same terms as in 1895, shall be made, and that the Calcutta Association be asked to collect the levy, as before, at the earliest date possible.
2. That this meeting desires to express its appreciation of Mr. Blechynden's services during the past year.
3. That either a letter be addressed to those leading companies and others who do not support the levy, or that a deputation be sent to them, the American and Foreign Tea Committee being left to determine the best means to obtain their support.
4. That Mr. C. A. Goodricke be invited to join the general committee.
5. The subject of new rules was then brought before the meeting, and the rules as approved by the special committee, which had been circulated to all the members, were taken as read. After a full discussion, especially on the question of retaining a general committee as heretofore (which included nearly all the members), it was resolved:—That, with reference to observations that have been made, the new rules be referred back to the special committee, and subsequently be brought before the annual general meeting.
6. A vote of thanks was passed to the chair.—*H. & C. Mail*, March 20.

THE DUTY ON COFFEE.

It cannot be said that the deputation of importers, exporters, home dealers, and brokers engaged in the coffee trade, who had a formal interview with the Chancellor of the Exchequer at the House of Commons last week (a full report of which appeared in *The Grocer* of February 29th, pp. 512-14), met with much encouragement in the efforts to persuade him that a repeal of the duty on coffee is necessary and expedient in order to give the article free play and more scope for its consumption in this country. There is hardly a dutiable commodity in the Customs tariff that requires more help and relief from the burden of taxation than coffee, and yet the Chancellor of the Exchequer makes light of it by telling his hearers that "if coffee and chicory were to pay no duty, cocoa also should be relieved from duty, and he (the Chancellor of the Exchequer) thought it was probable that if the matter went on further he would hear something from the consumers of tea and those interested in the trade." This is clearly an unfair way of viewing the question, as there is no parallel between coffee and cocoa, for the reason that the latter flourishes astonishingly well under the duty it bears, and therefore does not need the same measure of legislative assistance; and as to tea, why, the answer to repealing the duty on that is quite as good as any of those that were rendered in favour of abolishing the duties on sugar, which event took place in 1874. Still, in upholding the views of those persons who are strong advocates for a "free breakfast-table," we, for our part, should be glad to see the imposts on tea, coffee, cocoa, chicory, and dried fruits all swept away at a stroke; and especially those on the minor articles which yield only a paltry addition to the revenue of the country.

One of the speakers at the meeting put the whole case in a nutshell when he said that "on the face of the memorial there are two things—one is the smallness of the sacrifice asked for, and the other the benefit it would bring to a very large and important trade." In fact, the duty on coffee amounts to only about 170,000*l* per annum, whereas that on

tea reaches no less than 3,696,000*l* in a single year, so that there is virtually no excuse, on any grounds that can be urged, for not repealing the impost on the former because it would, as the Chancellor of the Exchequer puts it, be unjust not to abolish the duty on the latter claimant for exemption. Coffee, as a harmless yet refreshing kind of beverage, is more beset with difficulties in its path to consumers than any other drink, and when these are duly pressed upon the attention of the Legislature it is for them to seek to remove them as quickly as possible. A great bar to the consumption of coffee in the United Kingdom is the absence of liberal supplies of a desirable character; and the main cause of its consumption not progressing at an advanced rate, since the duty was halved in 1873, has been the serious and alarming falling off in the imports from Ceylon, which, in consequence of the failure of the crop through the setting in of the leaf disease there, about the same year, have since dwindled almost to nothing. Substitutes, it is true, such as Costa Rica and other Central American descriptions, have been found for plantation Ceylon, but these have proved totally inadequate to make up for the deficiency in the receipts from Ceylon, and no fresh sources of supply have been opened up that would serve as a beneficial stimulus to the home trade.

In dwelling on the significance of the immense increase in the production of Brazil coffee, equalling "about 8,800,000 cwt., or something like two-thirds of the whole produce of the world," the Chancellor of the Exchequer ignored the fact that this enlargement of the available supplies did not flow hither so as to improve the position or prospects of the article in our own country, as the British consumers, as a rule, are not drinkers of Brazil coffee, it being notoriously unsuited to their taste; and thus it has followed that the prices of fancy coffees or of any grade approaching to excellence of quality—such, indeed, as could be used unstintedly at home—have considerably risen, making the berry in many cases extravagantly dear, and drawing a hard-and-fast line beyond which it is impossible for the consumption to extend. Again, the importation of cheap and adulterated preparations of coffee and "mixtures" has done a deal of harm not only to consumers, who have been deceived, but to honest traders, who have been repeatedly undersold in their own markets, without the least chance of redressing their wrongs, and who in their sale of the genuine product have been unable, through prolonged scarcity, dearness, and the oppressive duty on the unroasted coffee bean, to compete, with advantage, against their unscrupulous rivals in the trade. Much more could be urged on the same point, but sufficient proof has been adduced to show that the grievances of which the coffee dealers and others complain are of no common order; and while some remedy is needed to restore the trade to a healthy and prosperous condition, there is no surer or more fitting method than that of at once repealing the duty on the article.—*Grocer*, March 7.

SOUTH WYNAAD.—The *Madras Mail* directs special attention to the returns for the past season of the Perindotty Tea Estate, in South Wynaad. These are of special interest, in that the tea made in each month of the year is shown, which will enable planters to see when the flushes occur and labour is needed. The average yield of over 500lb. per acre is splendid, remembering what Mr. William Taylor, of Ceylon, has said about the *jât* of the bushes on this plantation. It will be noticed that Messrs. Patry and Pasteur record the sale of a small break of a tea from the Kanambyle Estate, Cherambadi, which averaged 10*d* per lb. being the same average as Assam for the week and 13*d* better than Cachar and Sylhet. This is the first sale of tea from this district of the Wynaad, and the price is most satisfactory. We hear that another break from the Mappadi district has also obtained an equally high average.

COFFEE UP TO DATE.

We have before us a beautiful example of the ingenuity of our American cousins. It is cleverer than the wooden nutting and the world over. It is concocted, like the Heathen Chinese card playing, "with intent to deceive," and it would no doubt deceive 999 persons out of every 1,000. It is an imitation coffee bean, and its uses are obvious.

It was accompanied by the following thoroughly business-like letter:—

[COPY.]

"The Dowling Manufacturing Company, sole manufacturers of Compressed Coffee Compound, No. 104, North 15th-street, Philadelphia.

"To the Wholesale Trade.

"Dear Sir,—Herewith we present for your inspection a sample of our coffee compound. It contains nothing but the best of price and beautiful ingredients, and is made only in one bean shape.

"By blending it with natural coffee bean you can improve it and bring it within the reach of those unable to purchase at the present high price of coffee.

"We sell only to the trade at 8 cents per pound, in barrels of about 185 pounds. F.O.B.

"Our process is patented.

"In ordering send sample of roast, so we can match your goods.

"Terms: 30 days, 2 off 10 days.—Yours, etc., The Dowling Manufacturing Co., 104, North 15th-street, Philadelphia, Pa."

It is a pity that so touching an object-lesson in American honesty should have come our way, for we feel it our duty to bring this latest fake in coffee, as we brought that of re-firing exhausted tea leaves before the Customs House authorities and the Board of Trade. They may curse us for disturbing their peaceful slumbers for any purpose other than that of drawing their salaries, but as we like coffee pure, we hope these authorities, in grateful memory of our many previous tips to them, will squelch this latest move in Yankee smartness.—*Food and Sanitation*, March 14th.

OUR LONDON TEA LETTER.

(From Our Own Correspondent.)

March 6th, 1896.

THE LONDON PUBLIC SALES.

There has been some interesting correspondence on this subject in *The Home and Colonial* of 21st Feb. Mr. F. D. Shillington advocates that the week's sales of Ceylon teas should be spread over two days instead of being crowded into the one day (Tuesday) as has been. He suggests that Tuesdays and Wednesdays be in future devoted to Ceylon teas, and Mondays and Thursdays will be given to the Indian instead of Mondays, Wednesdays and Thursdays as hitherto. This is a doubtless a matter calling for most careful consideration from all interested and most competent to judge, in order that all be arranged for the best interest of the producers and the convenience of the trade if any changes are desirable. It does not seem unreasonable that Ceylon, with her rapidly increasing trade should desire more time for her weekly offerings, but it may not be to the interest of India to submit to any curtailment. How is the fairest adjustment to be arrived at? Though Thursday is not a full day so far Mr. Shillington's proposal of two days for each would hardly be an equitable arrangement considering the present claims and future outlook of Ceylon and India respectively. If convenient for the buyers to have representatives at two sales at once, (and this may ultimately have to become the rule not the exception), it might suit to make Thursday both a Ceylon and Indian day and allow Mondays Tuesdays and Wednesdays to be occupied as at present. Friday being mail day, it is doubtless well to have it and likewise Saturday unappropriated as hitherto.

The other proposal of suggestion is, as in Calcutta, to have "an off" season, to cease holding any public auction of Indian teas for some weeks about June "to give 'the market' a period of rest, and to agree to a date upon which the first sales of new crop

shall be held in London," and is called attention to by Mr. Herbert S. Parker of Messrs. Wm. Jas. and Hy. Thompson as "likely to be made to importers and then brokers by some of the London buyers." This seems a most reasonable proposal and a simpler affair than the other. It would also give more time for Ceylon produce which comes in more all the year round than the Indian; and most will readily assent to Mr. Parker's concluding remark,—"that the small intermittent sales during June, attended by unwilling buyers, are not altogether conducive to the interests of producers."

GOVERNMENT STATISTICS OF TEA CULTIVATION.

Mr. O'Connor's note on this subject is most interesting. I will only notice one point especially referred to, that is the fact of the quantity of tea produced having increased during the 10 years under review (1893-94) in a much greater ratio than the area under cultivation.

This would seem difficult to account for. Of course young tea does not bear at all the first year, and very little for several years, in fact comes into bearing much more slowly than most allow for in their estimates owing to scarcity of labour, sickness, unfavourable weather, and the like, but this acts almost all the other way; the same may be said of the altered style of plucking which I understand has become more select and sparing year after year. It would also seem to me, judging from the districts with which I have the more intimate acquaintance, that the extensions of recent years must have been very fully estimated—nothing more likely when not actually surveyed by a reliable professional (as was very common in the early days of tea)—but this would likewise operate all in the opposite direction if it were so. It would therefore appear entirely due to the young planting in the decade previous to 1885 coming into full bearing during that under review. This can hardly be the only cause though those who extended in duller times are now reaping the benefit, and large extensions made during the last three years will likely come into bearing—for less remunerative markets where over-production is once more the cry! Perhaps some of your readers, Mr. Editor, will kindly clear up the point referred to.

One encouraging feature however is, the increase of consumption in markets outside the United Kingdom. This consumption in all amounted to 38,428,157 lb. last year against 29,453,539 lb. in 1894, 19,300,000 lb. in 1892, 13,400,000 lb. in 1890.—*Indian Planters' Gazette*, March 28.

THE FIRST SUGAR MILL AT HANWELLA.

Hanwella, April 7.

The sugar mill recently got down by Mr. G. E. Amarasekara through Messrs. Walker Sons & Co. of Colombo, has been now put up in position and is worked by means of a pair of bullocks. It is capable of pressing three cart loads of sugarcanes a day. The juice thus pressed out is strained into three large copper vats which are fixed to an oven having a chimney twenty-five feet high at one end, and boiled into a consistency, removing all the scum, and poured into a wooden box with large ladles, where it is left to be hardened. When it is quite firm, it is cut with spades and removed in buckets to another wooden box, and left there till the sugar is separated from the treacle, when the sugar is gathered and dried, and put into bags for the market, and the treacle is poured into casks.

The tea estates at Hanwella and the neighbouring districts supply us with all the tea we require for our daily use, and cheap sugar was what we were badly in want of, which too has now been placed within our easy reach by Messrs. G. E. Amarasekara and D. J. Amarasekara Mudaliyar, whom we have also to thank sincerely for the introduction of new implements in our midst, for giving employment to the poor labourers, and also opening a market for the sugarcane growers in this district in the way of encouragement, we wish Messrs. Amarasekara all success and good speed in their new enterprise.

A VILLAGER.

THE RE-EXPORT OF TEA.

We recently offered some remarks upon statistics published by Messrs. Gow, Wilson & Stanton, showing the re-export of tea from the United Kingdom. That firm, in its Circular of March 13th, has amplified the information previously given on the subject. The added information is particularly full, interesting, and valuable, and tempts us to further observations relating to this topic. From the analysis now available it is evident that it is not alone with respect to the gross re-export that Ceylon takes the foremost position. With the exception of Holland and Turkey, the quantities of Ceylon tea re-exported to all the countries mentioned in the analysis is very largely in excess of that of Indian tea. In the case of one of the exceptions mentioned—that of Holland—it received 341,435 lb. of Indian tea as compared with 216,422 lb. of Ceylon tea from the United Kingdom during 1895. Why there should have been this exception it is not easy to discover. But we notice that Germany took of our teas 2,288,895 lb. as compared with only 424,100 lb. of Indian! Messrs. Gow, Wilson & Stanton intimate in a footnote their belief that the bulk of this exportation was intended for the Russian market. It would seem to be far from improbable that no inconsiderable portion of this Ceylon tea might also have found its way into Holland. If so, the almost single discrepancy existing would probably be largely redressed in favour of the Ceylon article. The large amount of excess of our teas re-exported to Germany heads the superiorities to be noticed in the analytical list. But that observable in the instance of America is of special interest to us just now. Of Ceylon, the United States and Canada received respectively 1,423,573 lb. and 1,033,646 lb., while of Indian the relative figures were but 908,743 lb. and 780,225 lb. during 1895. If this great superiority stood by itself, we might perhaps attribute the preference shown to some adaptability of the Anglo-Saxon palate to the flavour of Ceylon teas. But, as has been mentioned, similar superiority is shown in the case of Russians, French and Germans, so that the hypothesis we ventured upon when first discussing this subject of re-exports may be applied to all, or nearly all, of tea-drinking nationalities. Turkey has been mentioned as forming one of the two exceptions to what is observable as the rule. In her case she received 319,247 lb. of Indian and only 29,090 lb. of Ceylon tea. We have no means for judging as to any cause which may have led to this. Coffee is, however, so universally the national drink throughout Turkey, that it may be suspected that the consumption of tea in that country is limited chiefly to its French and English residents. Without touching further on particular countries mentioned in the analysis we may just refer to the figures grouped under the heading "Other Places." In this instance the preponderance of Ceylon is very marked, the figures representing it being as 1,006,197 lb. against 638,345 lb. of Indian tea. After full examination of the details that Messrs. Gow, Wilson & Stanton have now afforded to us, we feel compelled to fall back still upon the hypothesis mentioned in our original article. In whatever light, or from whatever point of view, we may regard the figures given, all seems still to point to the assumption that the flavour of Ceylon teas is more generally and more widely appreciated than that of the Indian variety. But although we think such a view to be justified, it should not induce us to relax effort to maintain the superi-

ority established in the outside markets of the world. As time goes on, and the taste for tea-drinking expands, India must reverse the present position, for she will be able to supply the increasing demand, while territorial restriction must keep Ceylon about at a standstill.

CEYLON TEA IN LONDON.

A planting correspondent writes:—

"Buyers are holding off, the country demand has been so slack, and they seem to fear excessive supplies from Ceylon, but in this respect the latest Ceylon telegrams should reassure them, and we think we shall have a better market soon."

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed, during the week ending 14th March 1896, under the provisions of Act V of 1888.

For a new process for the utilisation of the stones and seeds of fruit of the mango for the purpose of manufacturing paper.—No. 93 of 1896. The Aryan Company, general dealers and commission agents trading in the towns of Baroda and Surat, in the presidency of Bombay, for a new process for the utilisation of the stones and seeds of fruit of the mango for the purpose of manufacturing paper therefrom.—*Indian and Eastern Engineer*, March 28.

WILL COFFEE PAY?

To the Editor of the *Central African Planter*.

Dear Sir,—I hear that opinion is gaining ground, that coffee planting in B. C. A. with the present methods, is not the remunerating investment it has been represented to be. That the average crop for the whole of B. C. A. for the years we have been planting, does not exceed 1½ cwt., dry parchment to the acre in bearing. That including weeding, cultivating, road and house building and repairs and general expenses, it takes £2 10s per acre per annum to keep a plantation in fair condition. That 150 acres in bearing at past output, hardly give a man a living much less save money, and if he keeps an assistant he will lose by his investment even with 150 acres in bearing at the average crop for the past. It is possible that our methods are seriously in error and yet surely it would have been discovered after so many trials for such a long period. The coffee tree seems to bear one good crop and then practically nothing for the two following years.—Yours faithfully,
A. C. SIMPSON.

MR. SIMPSON'S VIEWS ON COFFEE PLANTING.

As the *The Central African Planter* has not only a local circulation but goes to all parts of the world we feel it incumbent upon us to make a few remarks on Mr. Simpson's letter which appears in this issue. Our local readers are not likely so to be disturbed by Mr. Simpson's views but the same cannot be said of our foreign readers who are unacquainted with the facts. On what grounds, we would ask, does Mr. Simpson assert that 1½ cwt parchment per acre is the average crop for the whole of B. C. A.? So far as we are aware there is not one who can at present authoritatively state what the average crop for the whole district is, simply because we have no statistics to go upon and because coffee-planting at all extensively is only five or six years old. What we do know is, that coffee planting has been sufficiently remunerative in the past to encourage our oldest planters to go on extending their cultivation and that the yield in many cases, especially in the first years, has been very great. Mr. Buchanan in his article in our second number states an "average yield of three to four cwt may be reasonably looked for." He mentions instances of 7 cwt. and 8 cwt per acre being gathered as a maiden crop. Mr Hastings yield last year was between 3

and 4 cwts. Messrs de Josselin de Jong and Visser's Makungwa plantation gave about 7 cwts per acre and we believe the Messrs Pettitt Brothers got 12 cwts per acre. Mr. Simpson also states that coffee trees seem to bear one good crop and then practically nothing for the next two years. This is a result which would follow planting in unsuitable soil, want of manuring, and exhausting the trees by too heavy a maiden crop in any country. On the other hand coffee liberally manured and well cultivated goes on yielding year after year, witness Mr Duncan's letter on our last issue in which he states that the last crop he off the mother tree of B. C. A., weighed seven and a half pulled pounds [parchment!] also Mr Buchanan's oldest Zomba coffee which bore last year a splendid crop and which has never been cut down. It is not only possible, it is certain, that our methods in the past have been in error and yet the results which have been obtained, although most of us knew nothing practically about coffee planting have been most encouraging. Under such conditions it is certain, as Mr Scott-Elliot says, that there will be some failures. Lastly, the best coffee districts are also the youngest and their results are not yet forward. Cholo and South Mlanje have advantages in climate and forest land which the other districts lack and if cultivation is adequate there can be no fear but that the best results will be realised.

BOGUS OR ADULTERATED QUININE.

With quinine selling at the prices which have prevailed for a number of years past, it would scarcely be thought to offer sufficient inducement for sophistication, as compared with many of the more expensive and almost equally salable drugs, to attract the cupidity of the class which finds honesty an uninteresting means of gaining a livelihood. Indeed, since the price declined below a dollar little has been heard either of its admixture with cheaper salts or their substitution for it in preparations supposed to contain quinine. The analytical investigator was wont in former times to discover gross frauds in the substitution of cinchonidia for quinine in pills, and even in bulk form, and to make his discovery the basis of a contribution to pharmaceutical literature, but there were seldom other evidences that the cheaper salt was usurping the place of the other, and, outside of preparations whose components were not definitely stated, it is, doubtful if the substitution was very largely practiced. During the last year or two, despite the fact that quinine has been selling at an average of less than thirty-five cents per ounce to the retail trade there has been a good deal of activity in "outside lots" offered through distinctively "outside" channels, and there is a suspicion that they have not been entirely straight. Samples of these lots submitted to pharmaceutical houses have been found to respond to the tests of pure quinine, but in several instances where offers to purchase have been conditioned upon a test of every can, the "representative of the owner" has found that the lot had already been sold. These goods have been represented, for the most part, as foreign brands held by a speculator in large bulk, and repacked for the purpose of effecting sales. In several instances the Reporter has endeavored to trace them to some responsible source, but never with success, and their amount or their final disposition has remained as deeply shrouded in mystery as the source whence they came. It is not probable, however, that the goods, whatever they were, ever found much of an outlet to the large consuming trade, and of late there has been evidence that they, or something similar, were being hawked to the drug trade through the country. The Reporter of last week contained an account of the operations in the West of one of the parties who was working this market less than twelve months ago with the same brand that he is now offering to the retail trade of the interior. A man of the same name has been a large buyer of cinchonidia in this market during the past few months, and it may fairly be assumed that this constitutes his stock of quinine, with the possible exception of enough

of the genuine article to stand as a sample for testing in the event of the buyers caring to make close investigation. It would appear, however, that Mr. Borst, that being the brand under which the gentleman was travelling, at last accounts, finds the retail trade of the country what might be termed an easy mark, and that they allow him to test his own samples with his own reagents. If such be the case, there would seem to be a favourable opening for some enterprising fakir to undertake the sale of gold bricks to the drug trade, for it is evident that the operations of the quinine swindler have been extensive and widespread. A short time ago this office received from a prominent jobbing house at the South an inquiry for some quick and trustworthy method of detecting cinchonidia, the writer stating that his customers were buying what purported to be quinine for less than he was paying the manufacturers, and that he was suspicious of its genuineness.

Of course, there are simple and safe tests which should make the successful substitution impossible, and buyers should not hesitate to apply such a test to every package coming to them through any irregular channel, or which does not have the indisputable evidence of being the original packing of the manufacturer. "Guarantees" are of little weight on goods of this class which have been repacked, because the necessity for repacking does not exist, and is likely to be a mere subterfuge for sophistication. The standard brands of quinine are, or at least should be, familiar to every dealer in the article, and there is no reason why any desired quantity should not be furnished in packages of undoubted originality of packing. These facts suggested a safe-guard against fraud, and when to this is added a natural doubt concerning the integrity of anything that is offered much below current market prices, or by persons not directly in the business, there would appear to be no excuse for a druggist buying bogus quinine, unless he wanted to.—*Oil, Paint & Drug Report*, Feb. 24.

INDIA AND CEYLON TEA.

Elsewhere attention is directed to the wonderful results of the campaign in the interest of tea produced in the colonies of the United Kingdom. One must admire the pluck, persistency and wisdom which has marked the operations of the Calcutta tea syndicate in this country. The hardest work has been to educate consumers to a proper use of India and Ceylon tea, a given quantity of which will produce a much stronger infusion than a like quantity of Japan and China tea. As a rule, the leaf is steeped for too long a time, and hence, an infusion results which is not as pleasing to the palate as that to which the tea-drinker is accustomed. If buyers would follow the directions which every seller should furnish, and use less in weight, and infuse for five minutes or less, there would be a phenomenal increase in the use of English-grown tea. The finer selections of Ceylon and India tea, when properly infused, have a delicacy of flavor and enough body to please the most fastidious. Some show the aroma and color of the finest wines, and this accounts, in part, of the great increase in imports.

In 1890 the total receipts in the United States, of Ceylon and India teas, were less than the re-exports from the United Kingdom to this country in 1893, during which year 4,211,075 pounds came to the United States and Canada; while in 1895 the receipts in the two countries were 9,283,144 pounds, or nearly double; of this quantity 6,343,096 came to the United States. This is making grand progress. The success of the enterprise is largely due to the intelligent efforts of the two commissioners, Messrs. Mackenzie and Blechynden, whose labors have been carried forward with discretion, skill and a perseverance to command admiration.

From now on the pace forward is likely to be a much livelier one, and will be watched with intense interest by the tea traders of three continents.—*American Grocer*, March 11.

TEA IN EUROPE.

It is evident that tea was known in Europe as an economic plant in common use among the Chinese many centuries before it had a place as a commercial commodity with the nations of Europe. Just when and how it was first introduced has not been settled. Mention of the plant and the tea-drinking customs of China are found in the records of the earlier travellers.

In the eighth century, Moorish adventurers made mention of the of China in their journals. In the year 1600 a Spaniard, "Texeria," noted tea as being as being used by the natives of Malacca. It was in general use in Persia in the seventeenth century, being mentioned by "Olearius" in 1633, as having been brought overland by the Usbeck Tartars.* Possibly tea may have been known in Europe in the fifteenth and sixteenth century, through travellers. Marco Polo resided in China for years in the fifteenth century, and it is not unlikely that, being a merchant, his attention was drawn to the universal use of tea in that country, and he prompted to send or take some to friends in Venice. The ships of the King of Portugal found their way to China in 1517, and it is scarcely supposable that the Chinese custom of drinking tea escaped notice.

The earliest positive record of the appearance of the fragrant leaf in continental Europe was after the formation of the Dutch East India Company, in 1602. This supposition is supported by a record made in 1588, by Father Giovanni Pietro Maffei, who, in alluding to his travels in China, says:

"They yet press out of a certain herb a liquor which is very healthy which is called *chia*, and they drink it hot, as do the Japanese. And the use of this causes them not know the meaning of phlegm, heaviness of the head, or running of the eyes; but they live a long and happy life, without pain or infirmity of any sort."

Another sixteenth century author, in a book published in Milan in 1596, and which was translated into English, says:

"They have also an herbe, out of which they presse a delicate iuyce, which seruos them for drinke instead of wyne. It also preserues their health, and frees them from all those Euills, that the immoderate vse of wyne doth breed into up."

It is significant that Doctor Venner, in his "Via Recta at Vitam Longun," published in 1638, makes no mention of tea. The work treats of dietetics, and mentions the nature, character and dietetic value of the foods and drinks then in use in England. Lumb, who for fifty years was Master Cook to the Kings and Queens of England, makes no mention of tea in his "Royal Cookery; or, the Complete Court Book," published in 1710. It was advertised that year in the *Tatler*; or rather, a "Bohea Tea, made of the same Materials that foreign Bohea is made of, 16s. a Pound."

"A Poem in Praise of Tea" was issued in 1712 by an East India warehouseman, as follows.

"From boist'rous Wine I fled to gentle Tea:
For, Calms compose us after Storms at Sea.
In vain wou'd Coffee boast and equal Good;
The Chrystal Stream transcends the flowing Mud.
Tea, ev'n the Ills from Coffee sprung, repairs,
Disclaims its Vices, and its Vertue shares.

"To bless me with the Juice two Foes conspire,
The clearest Water with the purest Fire,
Wine's Essence in a Lamp to Fowel turns,
Exhales its Soul, and for a Rival burns.
The Leaf is mov'd, and the diffusive Good,
Thus urg'd, resigns its Spirits in the Flood.

"In curious Cups the liquid Blessing flows,
Cups fit alone the *Nectar* to enclose,
Dissembled Groves and Nymphs by Tables plac'd,
Adorn the Sides, and tempt the Sight and Taste,
Yet more the gay, the lovely Color courts,
The Flavor charms us, but the Taste transports,"
ect., etc.

Other bits of poetry of the same period indicate a general knowledge of the world's most famous leaf, as follows:

The muse's friend, Tea, doth our fancy aid,
Repress those vapours which doth the head invade,
And make the palace of the soul serene —
Fit on a birthday to salute our Queen.

—Pope.

And thou great Anne whom these realms obey,
Doth sometimes counsel take and sometimes Pay.

—Pope's Ode on Tea to Queen Anne.

There is plenty of evidence to show that it was an article of trade and commerce in England in the seventeenth century, and in general use early in the eighteenth, there being treatises on tea bearing date in 1730 and earlier.

In September 1658, the following advertisement appeared in different London journals: "That excellent and by all physicians approved *China* drink, called by the Chinese *Tcha*, by other nations *Tay* alias *Tee*, is sold at the *Sultanness Head*, a *cophee* house in *Sweetings Rents* by the Royal Exchange, London." This gives credence to the story that Oliver Cromwell had use for the teapot, which was found in the possession of an English collector.

There is preserved in the British Museum a hand-bill supposed to have been circulated between 1658 and 1660, by one Thomas Garway, "tobacconist, and seller and retailer of tea and coffee," and who thus described the famous leaf:

"That the virtues and excellencies of this Leaf and Drink are many and great, is evident and manifest by the high esteem and use of it (especially of late years) among the Physicians and knowing men in France, Italy, Holland, and other parts of Christendom, and in England it hath been sold in the Leaf for six pounds and sometimes for ten pounds the pounds weight, and in respect of its former scarceness and dearness, it has only been used as a Regalia in high Treatments and Entertainments, and Presents made thereof to Princes and Grandees till the year 1657. The said Thomas Garway did purchase a quantity thereof, and first publicly sold the said Tea in Leaf and Drink made according to the directions of the most knowing Merchants, and Travellers into those Eastern Countries; and upon knowledge and experience of the said Garway's continued care and industry in obtaining the best Tea, and making Drink thereof, very many Noblemen, Physicians, Merchants and Gentlemen of quality have ever since sent to him for the said Leaf, and daily resort to his house to drink the Drink thereof.*

In A. D. 1660 the British Parliament imposed a duty of 8d per gallon on all tea made and sold in coffee-houses, and by an act framed in the same year the duties of excise on malt liquors, cyder, perry, mead, spirits and strong waters, coffee, tea, sherbet and chocolate, were settled on the King for life. That year tea sold in England at three guineas per pound. Mr. Pepys, of the Admiralty, in his diary, under date, of September 25, 1661, says: "I sent for a cup of tea, a Chinese drink, of which had never drunk before." In 1662, Princess Catherine of Portugal became the bride of Charles II, and being accustomed to the use of tea in her native land, made it a popular beverage in her adopted country. The event was noted by the poet Waller, in a birthday ode to Her Majesty the Queen, in these lines:—

The best of queens and best of herbs we owe
To that bold nation, who the way did show
To the fair region, where the sun doth rise.
Whose rich productions we so justly prize.

Tea was brought into England from Holland in 1666 by Lord Arlington and Lord Ossory at a cost of 60s per pound. In 1667 the East India Company sent 100 pounds to England. In 1669 the quantity imported into the United Kingdom was 143½ pounds, at an average price of 60s per pound. No further record of imports was made until 1678, when 4,713 pounds were imported at the same declared value. Between 1669 and 1678 the records of the East India Company show imports of small volume in 1670-71 and 1673-74. From 1697 to 1699 an average import of 20,000 pounds was recorded,

* Authority: China: official report to Queen Victoria by R. Montgomery Martin, 1847.

the tea being subject to a duty of 5s per pound and 5 per cent on the value, which was 30s per pound. The initial move to make tea an article of direct commerce with China was made in 1680, but a previous shipment from Java in 1668 formed the import of 133½ pounds recorded in 1669, it consisting of two canisters. From that small beginning has arisen a trade that now imports over 200,000,000 pounds annually, and where the consumption is seven pounds per capita.—*American Grocer*, Feb. 26.

THE ALLIANCE TEA COMPANY OF CEYLON, LIMITED.

DIRECTORS' REPORT.

The directors have pleasure in submitting the general balance sheet and profit and loss account for the year ending 31st December, 1895, duly audited. The net amount at credit of profit and loss account is £1,250 17s. An interim dividend at the rate of 10 per cent. on the capital was paid on 2nd October, amounting to £1,630 2s 8d. It is proposed to pay a final dividend for the half-year ending 31st December, at the rate of 10 per cent. per annum (making in all 10 per cent. per annum, free of income tax), which will absorb £2,500; and to carry forward to next year a balance of £120 14s 4d.

An amount of £791 1s 9d spent in development of the estates, viz., on new tea clearings, additions to buildings, machinery, &c., has been charged to the profit and loss account, in lieu of writing off an amount for depreciation of machinery and plant for the year, and the directors have, subject to the confirmation of the shareholders, written off the whole amount of preliminary expenses, viz., £1,103 5s 11d to profit and loss account, instead of spreading it over three years, as they were empowered to do by the terms of the prospectus.

The directors, therefore, trust the shareholders will join them in considering the result of the first year's working of the Company to be eminently satisfactory.

The following is the total acreage of tea now in bearing, forest and waste land, and the crops secured in 1895

	Tea in bearing.	Tea not in bearing.	Forest Waste Grass.	lb. of tea.
Aberdeen ..	387	—	93	112,372
Calsay ..	305	46	36	118,495
Luccombe ..	717	—	200	221,698
Gleneagles ..	190	25	7	78,780
Uda Radella..	380	40	135	141,547
Thornfield ..	160	15	15	121,626
Total..	2,239	126	485	821,498

and the latest reports from the Agents and Managers in Ceylon are of a satisfactory character as regards the condition and yielding powers of the properties, so that, if other conditions continue favourable, the directors anticipate an equally good return for the current year.

The Auditors, Messrs. W. B. Peat & Co., chartered accountants, retire from office, and offer themselves for re-election.

TEA IN AMERICA AND THE CONTINENT RETURN OF MR. J. H. RENTON.

We extend a hearty welcome to Mr. J. H. Renton, so well-known in commercial circles as a member of the firm of Messrs. Bosanquet & Co., and to Mrs. Renton on their return to the Island. It is almost twelve months to a day since Mr. and Mrs. Renton left the island for home. Seven months out of the twelve have they been travelling in America, Canada and the Continent. Mr.

Renton, to some extent has combined business with pleasure, and has been keenly alert in watching the progress Ceylon tea has made in the countries, where most it needs pushing. Speaking to an *Observer* representative he said, "I think the progress made in America is decidedly encouraging, and we have no reason to complain. Still, it will be a very long time before Ceylon or Indian tea holds the market. You can quite understand that big houses in America who have got holdings in Japan and China are not going to give up an article from which they are making money. Still many of the big wholesale houses, speaking of our tea, say, "We have got to carry it as our customers may ask for it, and we have got to have a certain amount of Ceylon tea in hand. It will be a long time before we oust green teas, but as regards black teas we shall knock them out as we have done elsewhere, and we are doing it now. We must try to supply the very best—light flavory teas—and take to packing in Japanese packages. I mean the oblong packages containing about 60 lb. net. This is very important in a country where the article has to be transported thousands of miles. I am very much pleased with the growing use of tea in Germany. Broken pekoes and orange pekoes are most in demand, in fact all the teas used in Germany are blended. In north and east Germany especially, they drink a lot of it now, and very fair tea they give you. I have lived in Germany, and I am very much struck with the great advance which has been made since 30 years ago." Mr. Renton regrets that he was unable to go to Moscow, as he had intended, but, from inquiries made on the Continent, he learned that much progress had been made and that there is a growing tendency on the part of Russian tea merchants to take pekoe souchong in place of light flavory teas. It was, he added extremely difficult to gauge the increase of the consumption of Ceylon tea in Russia, as the bulk of it went through Hamburg and Bremen, and was not credited to Russia. In the course of their travels Mr. and Mrs. Renton visited New York, Baltimore, Chicago, Boston, and made a short tour in Canada, their visit to the New World extending over two months. At Mentone, Mr. Renton met his brother Mr. A. V. Renton, who will visit Vichy and other watering place on the Continent, after which he proposes to make a trip to Jamaica, returning to Ceylon about ten months hence. Mr. J. H. Renton was not altogether fortunate in his journeyings, for, when in America where a temperature of 120° was registered one evening at 7 p.m. he had a touch of fever from which, we are glad to say, he has now recovered.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed during the week ending 21st March, 1896, under the provisions of Act V of 1888.

For a sun protector for horses.—No 99 of 1896.—Gerald John Campbell Tovey, stamp dealer, of 68, Bentick Street, Calcutta, and Richard Clark, master mariner, of 57, Amherst Street, Calcutta, for a sun protector for horses.

For a cheap and efficient method of making irrigation and other wells in India.—No. 275 of 1890.—Rai Bahadur Ganga Ram's invention for a cheap and efficient method of making irrigation and other wells in India, and which will be designated "Ganga Ram's patent well." (Specification filed 15th December 1890).—*Indian and Eastern Engineer*, April 4,

THE DUTY ON TEA.

WASHINGTON (D. C.) "POST."

The importers "call at the wrong shop" when they ask a Republican House of Representatives to tax tea. The policy of that party is to impose protective duties, not duties "for revenue only." We could get \$100,000,000 a year out of tea and coffee, which do not compete with our home industries, and let our markets be overrun by foreign manufacturers which do compete with our own labor and capital. This is the English revenue system, and it has a few advocates in this country. It is in high favor with the Mugwumps. But, as we have seen, the Democratic revenue reformers did not venture to tax tea or coffee. Instead of being logical, they preferred to be Populistic, and adopted the income tax,

MILWAUKEE (WIS.) "JOURNAL."

Any duty on tea, coffee and other goods not produced in this country at all, is a revenue tariff, pure and simple. That is, the entire tax goes to the Treasury and none of it to private parties. This is the way free traders would raise revenue—by taking only those things on which there is no competition, which are of general use in all parts of the country. But this demand does not come from free traders, nor is it asked for the revenue it may yield; it comes from the dealers for the purpose of excluding a poor article, even at the cost of higher prices. This is the curiosity of it all. It is expected that the protectionists will oppose any such tax, and there is little show that it will be considered by Congress. But it gives food for thought

CHATTANOOGA (TENN.) "TIMES."

There is no doubt about the fact that we import a good deal of mischief, in the form of cheap, adulterated, verdigris-poisoned teas. But the main point is that we need the revenue that ought to be raised from this ideal article for taxation. It and our coffee imports ought to yield nothing less than \$30,000,000 to the Treasury. Add another to the dollar now levied on each barrel of beer, and we get say a round \$35,000,000. A total of \$65,000,000. This, we say, is the main point; but we need for the protection of the people against fraud and swindling and deleterious trash, a more thorough inspection of teas, coffees, wines, liquors, etc., imported from the other continents. And a stiff duty on all of them will not make the system complete. Inspection of the most rigid kind ought to go with the tax—be a part of the custom system.—*American Grocer*, March 11.

AMERICAN-MADE CAFFEINE.

Ever since caffeine came into such general use in this country, there has been more or less said about the possibility of its being made here some day. So long as the supply of the sweepings in London was ample for all the requirements of the makers of caffeine in England and Germany, and the price for the alkaloid remained low, it was realized that it could not be made here profitably, even with the protection of twenty-five per cent. ad valorem afforded by the tariff. The question was thoroughly investigated by interested parties here, who decided to wait for a more opportune time. The rapid increase in the demand for caffeine last year, which sent the price up to very high figures, and caused a shortage in the supply of tea sweepings in London, set the statisticians at work once more, and we learn, as a result, that a plant has been established in a nearby New Jersey town, to make caffeine and place it on the New York market. The gentleman who is the moving spirit in the undertaking is a chemist of note, who has had a wide experience in Germany in the manufacture, not only of caffeine, but of all of the finer chemicals used in medicine and the arts. What effect the product of this plant will have on the price depends somewhat on the amount that can be produced. Somewhat over a year ago, when a report was in circulation that caffeine was being made here, we made a thorough investigation with a view to dis-

covering just what quantity of the sweepings could be secured here or contracted for at a price that would permit of the profitable manufacture of caffeine. The result of our investigation was published in our issue of December 3rd, 1894. We ascertained that possibly one hundred tons of Japan tea dust could be secured per annum, at about four cents per pound. Allowing for a yield of two per cent. of caffeine, four thousand pounds of the alkaloid could be obtained, and this amount we now learn is about the amount the new plant will produce. The first cost, therefore, would be two dollars per pound, to which must be added the cost to manufacture, which is comparatively light, as water is used as a menstruum. The market price of caffeine has declined materially since the article above alluded to was published, owing to the use of cheap teas to make up to some extent for the shortage in the supply of sweepings, but even at present prices there is a fair profit in making caffeine here, under the protection of the duty, providing the tea dust is available in the quantity and at the price we have stated. It must not be forgotten that some chemists constantly obtain a greater yield of the alkaloid than others do, and without a doubt the gentleman who is an aspirant for the honor of establishing a new industry in this country of the character indicated is one of this class.

It will be claimed that four thousand pounds is not a great quantity of caffeine to offer, and that it cannot possibly affect the price, all of which is quite true. It may, however, set the other makers guessing, and tempt them to lower their prices, especially if they are assured of an ample supply of cheap raw material. In the light of the past it does not appear likely that the price will be as low as it was in October, 1893, when caffeine sold in this market at two dollars and ten cents per pound, so long as the consumption remains at the present high-rate mark. There is one element in the situation which we have not touched upon, and that is the possibility of the new American maker being considered, at some future time sufficiently formidable to be taken into the English-German combination.

Over a year ago it was understood that caffeine was being made here, but subsequent events revealed the fact that there was no foundation for the claims put forth.

There is some effort being made to have a duty placed on tea, with a view to furnishing the Government considerable revenue. Should its advocates score a success, there is no reason for believing the cost of the tea dust would be increased for the making of caffeine. No doubt an arrangement could be made with the Government similar to that in vogue in London by which the sweepings are denatured.

The outcome of the new undertaking will be watched with much curiosity by those who are interested.—*Oil Paint and Drug Reporter*, Feb. 24.

THE PLANTING PROSPECTS OF SELANGORE.

Mr. Robert Fraser writes to the local "Times":—With reference to the "Selangore land fiasco"—as it was recently so designated—concerning which so much has appeared in the public prints, and the outcome of which cannot be anything but inimical to the planting interests, and the future development of the coffee enterprise in the several protected native states of the Straits Settlements, I hope you will permit me space for a few lines in defence of that country, which, from experience, and having been engaged in planting there for three years, I can speak of with some degree of confidence.

It is much to be regretted that without thorough perquisition in the first instance, the land acquired by Messrs. Christie and Forsythe should have been taken up by them, as, from what has now transpired, and been given publicity to, intending investors in the Straits will naturally conclude that the bright prospects and inducements held out to

them to take up land for coffee have been over-rated, and that the country generally is not adapted to the successful and remunerative cultivation of this product.

It is a great blow to Selangor, Messrs. Christie and Forsythe's opinion and judgment of the unsuitability of the land for coffee cultivation, as it will, for the time being, hold intending investors in check.

Why Selangor should have been chosen by so many investors in preference to the States of Perak and Sungei Ujong, it is difficult to understand.

It has certainly been proved that the estates in the immediate vicinity of Kwala Lumpur, have done exceedingly well, and have yielded large profits to the several proprietors, and that the coffee properties a little further removed, have, one and all of them, also been a great success.

There is no paucity of magnificent land most suitable for the cultivation of Liberian coffee in the State of Selangor, so there is no reason why any investor should choose low-lying and swampy, or "peaty" land in the direction of Klang, while there are so many thousands of acres to be had on the further side of Kwala Lumpur, and in the vicinity of "New Amherst" and other flourishing estates.

There, the land is undulating, affording natural drainage, the soil good, and the forest heavy, while transport cannot be considered a difficulty, with so many roads intersecting the country in all directions, and being within a comparatively short distance from a line of railway.

But on the other hand, Perak, has, I consider, a great deal in its favor for investors intending to open up either Arabiau or Liberian coffee, "Waterloo" estate, the property of Sir Graeme Elphinstone, affords ample proof of the success of the former, while equal success with Liberian is evidenced by what "Kamuning" estate (the property of Mr. Hill), about twelve miles from Kwala Kangsar, has done.

When in 1892 I paid a visit to this estate, I was much impressed with the splendid soil, the lay of the land, and the enormous crop trees of from three years old and upwards were bearing. The branches were, without exaggeration, actually borne down with their weight of crop.

The only difficulty and the hindrance there then was labour, although, I believe, this defect has since been remedied by a free influx of Tamil labourers.

There are thousands of acres of very fine land in the Kwala Kangsa district most admirably suited for the successful cultivation of Liberian coffee, which I have myself personally inspected; while on the Blanda Marbok side of Taiping, I must confess to never having seen land, forest, and soil, to equal it anywhere.

There is no lack of limestone either in the district of Kwala Kangsa, and it is a notable fact, that while the roads between Taiping and Kwala Kangsa are metalled with limestone of the ordinary light description, the roads beyond Kwala Kangsa are all laid with *black* limestone, which latter abounds in the vicinity of "Kamuning" estate.

In the States of Selangor and Perak limestone is to be found in abundance, and should manuring at any time be deemed necessary there are many facilities for making excellent composts.

In both States there are caves where very extensive Bat dung deposits exist—a licence, or permit, and a small fee to Government being all that is necessary to put one in possession of the manure.

The rainfall of Perak is, on an average, about ninety inches, equally distributed. It is a land of sunshine and shower all the year through.

Liberian coffee crops from estates in the protected Native States of the Malay Peninsula.

A circular issued by the Government of Perak in 1891 gives the following particulars:—

	Cwt.
"LINSUAM" estate in Sungei Ujong, average per acre for 4 years in full bearing ..	9½
"S'LIAM" estate in Sungei Ujong, average per acre for 3 years in full bearing ..	10½
"WELD'S HILL" estate in Selangor, average for 4 years	8½
"BATU CAVES," Selangor, one year in full bearing	11½

Surely these figures are proof conclusive that coffee is a paying concern in the Straits.

With these few remarks I will meantime end up; but if you will permit me space, I will write to you further on this subject.

DR. D. MORRIS ON SISAL FIBRE IN THE BAHAMAS.

After experiencing many disappointments and not a few heavy losses the Bahamas Sisal growers seem at length to be getting rid of their difficulties, and are now fairly started on the high road to making the business a permanent and a lucrative one. As was stated by the Assistant Director of Kew Gardens in his address before the Society of Arts last evening, the industry has had to pass through several very trying experiences, but the ultimate issue is decidedly promising. Dr. Morris has just returned from a visit to the Colony, where he has been investigating the subject at the invitation of the Colonial authorities. It seems clear that the plants were introduced into the Bahama Islands fully half a century ago, and found there a congenial soil, but, strangely enough, no one appears to have taken sufficient interest in them to see that they were of great commercial value if properly looked after. In 1851 Mr. Nesbitt, the then Colonial Secretary, reduced a number of Sisal leaves into fibre, and samples were placed in the Museum at Nassau, New Providence. This, however, did not stimulate anyone to follow up the matter with the object of starting a new business, and the plant, therefore, was for a long time looked upon as a mere curiosity, fit only for hedges. That it is now recognised as a valuable marketable commodity is entirely due to the action taken by Sir Ambrose Shea, the late Governor, in energetically advocating the cultivation of Sisal plants for trade purposes, the industry being started so recently as 1857. But in the short period which has since elapsed the fibre trade has witnessed great fluctuations in prices. When the Bahamas first embarked in business prices were on the rise, the average price per ton in 1879 being £24, and four years later £27, and still going up. Immediately it became evident that the little-known Colony in the south-western corner of the Atlantic was a suitable field for operations there was a rush of capitalists, who, feeling assured of a handsome fortune, spent money recklessly on developing the new trade. Indeed it has been said that under the feverish excitement of the moment at least four times as much money as necessary was invested in the business, and still things looked rosy, for by 1889 the price of fibre, thanks to an American "corner," had gone up to an average of £50 per ton, the highest price attained during that memorable year being £56 10s. Then followed the usual reaction after the interference of "corners;" prices went down with a run, so that in 1894 the average was £17 10s., and last year it was little more than £14. Such a violent change as this was enough to discourage the most enthusiastic of investors, but the lesson has not been without effect. Experience, dearly bought, has taught those directly concerned in the cultivation of Sisal that it can be carried on profitably only by economical methods in farming and in the preparation of the fibre for the market. Notwithstanding the decline in prices, the acreage devoted to Sisal growing is steadily increasing year by year. In 1891 about 4,000 acres had been planted, next year 8,000, in 1893 it was 17,000, and by last year it had risen to 25,000 acres. Notwithstanding this extension of the industry the Mother Country does very little to encourage it, 90 per cent of the produce going to the United States and only 5 per cent coming to England. But this is by no means singular, for it is a curiosity of our trade in fibres that foreign nations supply us with about 90 per cent of the raw material we require. In other words, we pay foreigners £15,000,000 per annum for various fibres, while our own possessions receive only £5,000,000. This is not altogether our own fault. We are certainly to blame for not having officially recommended settlers in our numerous possessions to undertake certain kinds

of farming for which the soils were suitable, and the products of which would be required for home manufactories. On the other hand, the Colonists have been at fault in contenting themselves with practically standing still, troubling themselves about nothing else than growing corn and breeding cattle. There is not a single British possession in the Tropics or in the Temperate Zone that is not suitable for one or more fibre-producing plants. Both Canada and New Zealand can grow some of the finest flax in the world, but it is most difficult to get people to devote a little attention to the matter. It is really absurd to find that while for raw flax alone we pay foreigners more than £1,000,000 annually, our Colonies supply less than £1,500 worth. This is certainly not as it should be, but we must hope that with the improved prospects of the Bahamas other Colonies will take courage, and endeavour to add to their present industries those which will enable them to compete successfully with foreigners in the English markets.—*Morning Post*, March 19.

THE PINE APPLE.

BY MRS. G. T. DRENNAN, MISS.

This fine tropical fruit neither grows on Pines, nor resembles an apple, therefore the conclusion is that the name is conferred from its resemblance to a Pine-cone, though much larger than any except the cone of the long-leaved Southern Pine.

Of tropical origin, it is only in the extreme Southern limits of Florida and California the fruit can be grown in the open air. But under glass it is frequently brought to perfection by those who delight in the attractive winter garden of the conservatory. We read of flourishing and extensive "Pineries" in England, where hundreds are raised for the tables of the nobility. In our own country, fruit of all kinds finds its natural element somewhere, in one section or another. Extreme artificial culture, such as the English people bestow upon the pine apple, is not necessary here, as exchanges between sections equalizes the supply and demand of all kinds of fruit.

Profitable culture of the Pine Apple for utility, and on a large scale, taxes the skill, ingenuity, and watchful care of the most experienced horticulturists. But for the pleasure of seeing a few specimens grow, as decorative plants in the conservatory of the amateur, not more extra care is required than for tropical plants in general. Experts say 70° or 100° in the day-time, and 70° at night suits the Pine Apple, with strong bottom heat.

The Florida Pine Apple growers, who raise thousands of the very best quality, propagate the plants in two ways: One is from the crown of leaves on the top of each fruit, the other is from the side shoots or suckers, which they freely produce. In either case they are allowed to dry, a few days, before setting them in the soil. This allows the scar to heal, where it is detached from the plant or the fruit, and prevents decay. Like the Cactus, the Pine Apple roots more readily if thus allowed to dry.

If for ornament, plant in a handsome jar or pot, in rich earth, well watered, and set in a warm place, shaded for some time, till well-rooted. The long, serrated leaves, resembling those of the Aloe, are striking in appearance from the first, therefore it is well to select, for planting, the handsomest crown or sucker. Among a dozen Pine Apples there will be some naturally fine in leafage, and others less so. The plant is herbaceous and will put forth new leaves from the centre forming a crown until the second or third year, according to the variety and then the fruit will appear.

Thoresby, the celebrated antiquary of Leeds, who kept a leaf of the Pine Apple in his museum as a curiosity, described the fruit as a "pulpy strobilus, composed of coadunate sections, and crowned with a tuft of serrated leaves." It was in the early part of the eighteenth century, but the pyramidal shape of the fruit, and the "coadunate sections" each with an eye have not changed, although the quality of the favorite varieties of the present day may be finer.

The several varieties are alike, in main characteristics of delicate golden or amber flesh, of exquisite nutty fragrance and indescribably delicious flavor; but in size and manner of growth there is difference enough to decide some persons in favour of one variety, and some of another. The Ripley Queen of our markets, simply the "Queen" of English growers is perhaps the best for amateurs. Like the exquisite Sugar Loaf it is golden in hue, and very sweet. Porto Rico and the famous Old Jamaica are fine varieties. For cultivating among decorative greenhouse plants the Red Spanish is handsomely colored, and a fine grower. It is the common Pine Apple of commerce, and not so luscious nor sweet as Ripley Queen or Sugar Loaf.

Among decorative plants the Pine Apple never fails to attract attention. The foliage is rather stiff, and never of a bright green. The dull, bluish-green, "saw-tooth," pointed leaves form a crown that is rather peculiar, and not ungraceful. Those who admire the Century-plant will admire the Pine Apple. It has more plant grace than the Aloe, and is more delicate in structure, however.

If Pine Apple Plants are kept growing steadily they will fruit, that Ripley Queen and Sugar Loaf, in about 18 months. Two years is ordinarily the time allowed for the common run of varieties. No Pine Apple bears more than one fruit. When the one fruit matures, and is cut, depend upon new plants for more.

From the crown, or suckers, it requires to be kept growing straight ahead. Fluctuating degrees of heat, and inconsistent watering the soil, will tell upon the vigor of the plant. It takes a long time to rally from any kind of a back-set. Like the orange, banana, and other sub-tropical fruits, it is easy enough to cultivate, but resents neglect. Keep it growing steadily, by rich soil, moisture, and heat, and the pine apple will prove an interesting decorative plant, and can be depended upon to perfect fruit.

At exhibitions a pine apple plant with a handsome fruit is sure to have observers around it. Few fruit-bearing sub-tropical plants are so interesting. One thing in its favor is the reasonable size at which it bears. Planted in an ordinary tub it will not exceed one and a half or two feet in circumference, and three feet, or perhaps four, from the base to the tuft of leaves that crown the fruit, in height.

Before closing the plea is entered that a dear lover of this fragrant, refreshing and wholesome Queen of the Tropics, be allowed to call attention to the manner of preparing it for dessert or luncheon: Cut away the tough peeling deep enough to remove the base of the eyes. Then with a silver fork separately dislodge each section, leaving the hard unnutritious core attached to the tuft of leaves on the crown. The core of the Pine Apple is as much to be rejected as the cob of green corn. Sometimes it is sliced through, in circular slices, but as this includes the core, detracts from the luscious, as well as the wholesome, properties that lie in the outer sections. These can be grated or sliced, and it is there the sweetness, the fragrance, the flavor, and the juice, that is like nectar, are all concentrated, ripened, and perfected by the alchemy of the sun.—*Mayflower*.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, March 19th

OILS (Essential).—Citronella, malted. At auction 4 drums from Colombo were bought in at 2s 3d per lb., and 3 cases of Winter's brand realised 2½d per oz. For fine heavy Cinnamon bark oil 4s per oz is asked.

SEEDS (Various).—Amatto-seed has been arriving freely lately, and at auction 75 bags were placed in sale. For fine bright Madras 6½d was refused, the lot being bought in at 8d per lb. Good bright has sold lately at 5½d per lb.

THE AMSTERDAM MARKET.

At the Java cinchona auctions, which will be held in Amsterdam on March 26th, 615,770 kilos of Java bark, representing 32,901 kilos of sulphate of quinine, will be offered. The average content of the manufacturing bark is 5.41 per cent.

THE REPORT OF THE COLOMBO COMMERCIAL COMPANY.

Our London Letter (see page 760) makes reference to the report of the Colombo Commercial Company, Ltd., which we were enabled to publish a short time ago. We have always deemed the annual reports of this Company to demand special attention. One reason for this regarding these documents has been that the Colombo Commercial Company occupied what may be termed an unique position with respect to the leading industries of this Colony. It is both a trading and a planting Association, though perhaps the second function is dependent upon and has sprung out of the first. As the result of the mixed interests in which it engages, it has always been thought wise by the directors to withhold details of the Company's proceedings from the public. Nor are the shareholders taken more into confidence, at least so far as the reports annually presented to them are concerned. It is impossible therefore for us in any degree to discuss the details of the year's proceedings. We do not raise any objection to the course the directors think it best to pursue. We can readily assent to the view that the very essence of the business transacted necessitates and demands a considerable amount of privacy. The report last published is, of a very exceptional character. Since the previous one was issued a complete change has been made in the constitution of the Company. Indeed that with which we have for so long had acquaintance has altogether ceased to exist, and that which has taken its place has been registered with Articles of Association differing in several important respects from those upon which its predecessor was founded. The report affords us no light as to the reason why this course was resolved upon early in the present year. It has, however, been made known to us that altered conditions of trading in Ceylon rendered the original articles unsuited to present requirements and unduly limited the scope of the Company's operations and the discretion of the directors in dealing with them. Absence of fuller information denies us the power of further remark upon the change now entered upon. It can only be said that this appears to have been made at a time when the business to be transferred was in a thoroughly sound condition, if we may judge as to this by the dividends announced. For many years this long established Company had to contend against serious difficulties, in part due to the transition from the coffee to the tea enterprise and partly to the litigation it became involved in with the "Great Roller Case." That suit terminated recently with a verdict in favour of the Company, and the ground thus became fully cleared for the change that has just been made.

THE DELGOLLA ESTATE COMPANY.

Kandy, April 10.

ANNUAL MEETING.

The annual general meeting of the Delgolla Estate Company was held here today. The report of the directors was adopted.

The meeting was well attended by the shareholders most largely interested, and there were present Messrs. H S Rix, J B Bishop, A Melville White, E S Fox, Gordon Pyper, Frank M Laurie, H A Tipple, J Muntun, H J Vollar; Messrs. W H Bailey, Buxton Laurie, and W Forbes Laurie, E S Tench, A E Wright, Deane, Smith being represented.

The report was as follows:—

The Directors submit herewith the Balance Sheet and Profit and Loss Account for the year ending 29th February, 1896, duly audited, and regret that they are not in a position to recommend any dividend being declared. The Directors have still to deplore the prevalence of low prices for cocoa,—with high rates of exchange and a reduced crop.

Cocoa.—The crop gathered was 440½ cwt., and, though the early appearances justified anticipations of a yield of 700 cwt., which was thought a reasonable estimate for the season, and 155½ cwts. less than previous years, the crop fell short of these expectations by no less than 259½ cwt. Despite an average rainfall being made up, the season was not propitious. In July and early August rain was very much needed, and though it fell later in abundance with visible improvement to the trees, before the middle of September a serious attack of thrip appeared and acres of cocoa were for a time denuded of leaf. From that time reductions of crop estimates were considered, but only at latter end of the season's gathering was the full shortage realized. Not only thrip caused the loss, but the excess of rain following after the dry weather, had resulted in young pods turning black and falling off.

LIBERIAN COFFEE.—38½ cwts. were secured against an estimate of 60 cwts., but as noted in last season's report, the age of trees, condition of shade and old land were not favourable.

COCONUTS.—The number of nuts gathered was 99,156 against an estimate of 103,000. A fresh census having been taken shows that very few more trees are actually in bearing than were so last year, but a large number of trees are in blossom now for the first time and fruit not yet set.

CLEARINGS are all progressing favourably as regards Coconuts and Cocoa, but the Liberian Coffee is backward and disappointing.

CULTIVATED AREA.—A statement for information of Shareholders is submitted below.

PROSPECTS FOR 1896-97.—Estimates of crop and expenditure point to improvement in the coming year.

DIRECTORATE.—In accordance with the Articles of Association Mr. E. S. Fox retires from the Directorate, but being eligible offers himself for re-election.

The election of Auditor for the ensuing year rests with the meeting.

By order of the Board.

J. MUNTUN,
Agent & Secretary.

MEMORANDUM OF CULTIVATED AREA—APPROXIMATE.

309 acres	old cocoa, 25 interspersed with Liberian coffee, and 140 acres with coconuts
16 do	cocoa 5½ years old with coconuts
30 do	cocoa 3 years old with coconuts and Liberian coffee
60 do	cocoa 2 years old with coconuts and Liberian and coffee
25 do	coconuts 4 years old with Liberian coffee
102 do	coconuts 60 acres 6 years and 42 acres 4 years with cocoa planted last year in 60 acres
60 do	cocoa at Isabel
75 do	grass and old land

677 acres.

Prior to the adoption of the Report, the CHAIRMAN went fully into explanations of the causes of disappointment in the year's results alluded to in the Report, referring to the visitation of "thrip" and the disease which is at the present time forming a fresh feature in the consideration of cacao cultivation though not, on these estates, necessarily of alarm; and after reference to the hope that the sight of the Delgolla coconuts inspired, when cacao was depressing both in crop and prices, reserved any further remarks until he had an opportunity of replying to any inquiries of the shareholders such as he hoped might be forthcoming.

Mr. A. MELVILLE WHITE inquired about the policy of the Directors regarding the Isabel estate and the

CHAIRMAN expressed his pleasure that the subject should have been introduced by a shareholder, as the Directors had considered the matter and had proposals to make.

Mr. MELVILLE WHITE also sought information in regard to items of annual accounts, management, &c.; and Mr. H. A. TRIPLE in reference to shade trees, manure, &c., elicited expression of opinion and statements of much interest to the shareholders, in which Mr. VOLLAR also gave the benefit of his experience, and Mr. VOLLAR led a discussion as to the coconut, their condition, age, planting, bearing, &c., and referred to the recent census of coconut trees in bearing at Delgolla and spoke generally of the future prospects of this cultivation, which offers to atone in time for the present disappointment in the returns from cacao.

Mr. PYPER proposed the adoption of the Report, and Mr. T. B. BISHOP seconded.

Mr. E. S. FOX was re-elected Director, and Mr. Guthrie auditor.

TEA FACTORIES IN THE KELANI VALLEY.

Tea factory building in the Kelani Valley has of late been going on vigorously to meet the demands of a district which is steadily developing. A new factory on Weoya has just been completed. This factory which has almost unlimited water power is entirely driven by that agency. The installation of machinery consists of a "Dessicator" and a large "Paragon" drier with the customary complement of rollers and sifters. The accommodation and power of the factory are equal to turning out from half a million to 600,000 lb. of tea annually. The new factory on Mahaoya completed recently has just got into working order. The machinery in it is driven by water power though a steam engine from the old factory on the top of the hill has been installed as a sort of stand by. When working at full capacity, the factory which "makes" the leaf grown on Walpola and Mahaoya will be capable of turning out quite half a million lb. annually. A new factory has also been started on Ivies estate, near Yatiyantota. The factory is a very compact one. Steam power is employed and the installation of machinery consists of a couple of Jackson's economic rollers, a driver of the "Dessicator" type, a Michie roll breaker and separator and a Michie tea sifter. Important extensions are at present in progress, on Yataderia factory which when completed, will give the premises a capacity for turning out fully three quarters of a million lb. per annum. The additions to the buildings are considerable, and in addition to other machinery we hear that a large turbine has been indentified for.

A new tea factory is about to be erected on Sarnia Estate, Badulla. The new factory will also serve Dotlands Estate.

THE KELANI VALLEY TEA ASSOCIATION, LIMITED.

REPORT OF THE BOARD OF DIRECTORS.

Incorporated under the Companies Acts, 1862 to 1883.

DIRECTORS:—George W. Paine, Cotswald Lodge, Upper Norwood (Chairman); Donald Andrew, 16, Philpot Lane, E.C.; Leopold F. Davies (Gow, Wilson & Stanton), 13, Rood Lane, E.C.; Dudley A. C. Scott, 45, Eaton Square, S.W.

MANAGING DIRECTOR:—Robert Porter, Midlothian Estate, Ceylon.

BANKERS:—The National Bank of India, Limited, 47, Threadneedle Street, E.C.

SECRETARIES AND OFFICE:—Lyaal, Anderson & Co., 16, Philpot Lane, E.C.

The Directors have pleasure in submitting to the shareholders the report and accounts of the Company for the past season.

The total acreage of the Company's Estates remains unaltered, but in addition to the clearings planted last year, which are doing well, about 65 acres of jungle have been felled on Degalessa and will be planted this year.

The total crop secured from the four estates amounted to 597,185 lb., against an estimate of 525,000 lb., and showed an increase compared with that of 1894 of 180,538 lb. of tea.

During Mr. Mitchell's absence on furlough Mr. Tait had charge of Degalessa and Dover, and the thanks of the Directors are due to him and to the Managers of the other estates for their efficient working of the properties.

In consequence also of Mr. Mitchell's absence, considerable additional work was thrown upon Mr. Porter, to whose careful management the shareholders are much indebted.

The factories and machinery continue in efficient order, but the directors have, as on previous occasions, written 10 per cent off their cost for depreciation, and the amount, £678 4s 4d, appears in the accounts.

The mortgage over Wereagalla for £4,000, which fell due on the 31st December last, was paid off on that date, and the directors propose towards meeting this payment that £2,000 of the year's profits be transferred to a special account to be afterwards dealt with.

The Company's net profits for the year, after deducting the sum of £678 4s 4d written off for depreciation, amount to £4,385 11s 1d, which with £579 8s 1d brought forward from last account, leaves £4,964 19s 2d to be now dealt with, and this it is proposed to appropriate as follows:—

Amount as above	£4,964 19 2
Interim Dividend of 5 per cent paid in September absorbed	..	£813 5 0	
It is now proposed to pay a final dividend of 10 per cent (free of Income Tax), making 15 per cent for the year	..	1,626 10 0	
To pay bonus of 2½ per cent for the year (also free of Income Tax)	..	406 12 6	
And to place to special account	..	2,000 0 0	
			4,846 7 6

Leaving a balance to carry forward of £118 11 8

In accordance with the articles of Association, Mr. D. A. C. Scott retires from the Board, and being eligible offers himself for re-election.

Mr. J. B. Laurie, C.A., also offers himself for re-election as Auditor.

G. W. PAINE, Chairman.

16, Philpot Lane, London, E.C., 25th March 1896.

THE "IRRIGATION STATES" OF NORTH AMERICA.

The *Century Magazine* for March contains a history of the rise and progress of the "irrigation farms" of the arid belt of North America. The writer, Mr. William Smythe, describes nothing less than a reconstruction of agriculture on a new basis. It is no longer confined to certain valleys of California and Colorado, but has spread over the whole length of the United States, from the Canadian line in Montana to the "staked plains" of Lower Texas, which the waters of the Pecos River are now turning into a garden. In a few years hence a region ten times greater than Lower Egypt, worked by prosperous Anglo-Saxon freeholders, and irrigated by dams, canals, and more commonly by windmills standing on the farms themselves, from the drainage of the Rocky Mountains, will be added to the productive

area of the new world. The new system has restored the prestige of agriculture among the most progressive people in the world. But the discovery has done far more than provide competence and comfort for the new population of the "arid" States. Economically, the system is ideally perfect; socially, it exactly meets the pressing needs of a particular phase of civilisation. It offers an escape to better things to the overgrown town population of the Eastern States, and gives this alternative in a form which pays, which gives permanent homes, progressive incomes, and is of almost unlimited capacity for the reception of the urban overflow. In view of the complete failure of Australia, the prairie area, and the Argentine plains, to attract this population, and of the rapidity with which, in spite of their want of inhabitants, the surplus lands of Canada, the States and the Southern Republics have passed into private ownership, the reason for the "population capacity" of the arid belt of the United States, when irrigated, needs some explaining. The surplus lands of the rest of the New World and Australia present the apparent contradiction of having failed to provide new homes for any great number from the old countries, and yet of being already completely "occupied" in the sense that all paying land is now private property. It is not a contradiction, in fact, because their development has been in precisely the opposite direction to that most to be desired. The system has been precisely that which is most wasteful of land-area and most exclusive of the small settler. In Australia the big squatter "ate up" the little squatter, and then sold his interests to banks and land-companies who joined run to run, and cut down management expenses until the small settlers ceased to exist. On the pampas of the Argentine Republic, the size of the branches has continually tended to expand, while on the corn-growing prairies the size of the farms increases while the cultivation becomes less efficient. Even in the old-fashioned Eastern States of North America, the hard-working New England farmers are increasing the size of their farms, because, by cultivating much land ill, they run less risk of complete failure than by cultivating a small farm well. Here, then, was a hopeless outlook. In Europe and America a town population, dependent mainly on weekly wages, and for these on the chances of commercial success or failure, menaced every year by some great catastrophe such as a general war—a population spending at least 70 per cent of this wage, when in work, on food, clothes, and shelter—were yet debarred from return to agriculture by its economic failure in the old countries, and the monopoly of capitalists in the new ones, a monopoly not maintained selfishly, but due to the fact that on the existing system, whether of cattle, sheep, or corn farming, only great areas could be made to pay.

The irrigation farming of the "arid States" has solved this problem for many years to come for the artisans of the United States. It pays, it provides a life not only of competence, but of positive charm, and it is essentially economical, not only of labour but of area. Small farming pays best. As the system grows more perfect, the size of the garden-farms decreases, while the produce doubles and trebles. The utmost possible crop is produced by these garden-farms of from five to twenty-five acres. Thus in California a single great estate of four hundred thousand acres has now been split up into thousands of these farms. "The Anglo-Saxon has at last thrown himself into the study of the new methods with as much enthusiasm as he bestows on electricity and new mining processes, and the men who are doing this are being mainly recruited from the millions engaged in the industries of the Eastern States and towns." "The Western labourer is his own employer. He is also his own landlord. These two facts constitute ideal independence. But there is, in his case, the practical side. From his ten or twenty acres, insured against failure by flood or drought, first by its aridity and second by irrigation, he can systematically produce almost every item of food which his family consumes. Western rivers and lakes abound with fish which can be had without cost; salmon are abundant in all the streams which enter the Pacific." Trout are kept in immense numbers and artificially

fed in the farmers' pools and dams. "In average years on a twenty-acre farm there is a comfortable surplus. It may be said that the same results are yielded by the agricultural industry elsewhere; but it cannot be done with equal certainty nor on an equal area without irrigation." The "water-farmer" has no bad seasons, and the small size of the farm prevents that curse of the Eastern States farmers, the year-long strain of physical overwork. Any analysis of the means by which these results are reached, strengthens the conviction that the elements of the system are sound and permanent. The basis of agricultural depression is, first, the over-production of the staple produce, corn and cattle, and secondly, the fact that they are the production of what is in each country the least-skilled class of labour. The irrigation farmer does not aim at growing corn, or even cattle—except as a dairyman; and his farm is a mechanical manufactory of luxuries, of choice fruits and vegetables for sale with a reserve of grain, cattle and poultry, mainly for household consumption. He thus avoids competition with the peasant corn-producers and the unskilled labour of the rest of the world; in other words, he is above the level of conditions which produce agricultural depression. He raises from three to six crops a year, according to climate and the kind of crop he plants, and by singular good luck or good judgment he has found a fodder-plant specially suited to "intensive" cultivation. This is the alfalfa, a species of lucerne, which will, in the South, produce six crops a year, and is eaten not only by cattle, but by poultry and swine.

The home question at once suggests itself. Are the benefits of this astonishing revival confined by climate to the regions on either side of the "Great Divide," the mountain chains of the United States, or are they applicable in part to the fields of England? The answer must be sought in reference to the area to which the system is now applied in the United States. There it is not limited to the "arid belt." It has spread northwards to latitudes as high as that of the St. Lawrence and the cities of Lower Canada, and has passed the latitude of New York. It has spread from the barren wastes of Lower Texas and New Mexico to the temperate climate of the North, and it is the experience of Montana and Wyoming which will be most eagerly scanned by the farmers of England. Here we shall do well to quote Mr. William Smythe verbatim:—"The evidences of the triumph of irrigation might be multiplied a hundredfold by reference to the story of the valleys of arid America. But there is a wide difference between the agriculture, and especially the horticulture, of the Salt River Valley of Arizona, and the Yellowstone Valley of Montana. The one produces oranges, figs, and pomegranates; the other only the hardiest fruits (English fruits). The same conditions influence the size of the farm and the methods of applying the water, but the fact remains that without irrigation neither Arizona nor Montana would have any agriculture worthy of the name, while with irrigation both support farming populations which may be vastly multiplied." In Wyoming the new system has won a most complete triumph over the old. Wyoming lies south of Montana and has an English climate. There was an "organised stock interest" of large cattle-farmers, who resisted the new idea of agriculture almost by armed force. They were beaten. Circumstances were too strong for them, and Wyoming is on its way to become an "irrigation state." "There will be more cattle in the aggregate, but distributed among a multitude of small owners living in the irrigated valleys. There they will raise the diversified products necessary to their support, and great crops of winter fodder (on irrigated fields) for their cattle. This process has begun, and it results in the elevation alike of the men and their industry."

Here, then is the lesson for English agriculture. Water-meadows, irrigated on a primitive plan, are even now worth double the rent of ordinary grass-land. Alfalfa will grow on English soil, and the average duration of sunlight is calculable, though not constant. Each year more land is laid down to grass in a land of rivers and ponds. Millions of pounds have been spent in draining away the stagnant waters which injure the land, yet the knowledge, common to every

West of England farmer, that water passed rapidly over the surface at the proper season gives three grass-crops instead of one, has been used, not in England, but in America. There its proper application is the result mainly of scientific experiment. "It was sought," says Mr. Smythe, "through the medium of agricultural colleges, experimental farms, and neighbourhood associations. We have thus approached, by gradual steps, true scientific methods which are producing results unknown before in any part of the world." Never was in agricultural experiment of such gigantic dimensions so quickly successful. Its geographical limit is not yet reached in the New World, and is clearly indicated as within the scope of English farming. The County Councils of every shire should devote part of their technical education grant to send qualified inspectors to the northern irrigation area, and publish the results of their inquiry for the benefit of English agriculture.—*Spectator*, March 7.

INDIAN TEA ASSOCIATION.

Abstract of proceedings of a meeting of the General Committee held on the 9th March, 1896:—

Letters of 31st January and 7th and 14th February with their respective enclosures and accompaniments from the Secretary, Indian Tea Association, London, were brought up for disposal having been previously considered in circulation. The Committee noted what had been done by Mr. Blechynden under the authority of the London Committee in the way of advertising and subsidising in the United States. The letters were ordered to be recorded.

In response to a telegram received from the London Committee £1,800 had been remitted to London on the 5th March. The available balance on account of the American Market Fund left in Calcutta was now reduced to Rs.3,197-12-1.

Considered minute by the Chairman and Mr. Ormiston with reference to their recent interview with the Hon'ble Mr. Woodburn on the question of the appointment of a scientific officer to enquire into various matters connected with Tea, on the lines suggested by Mr. Buckingham. The above gentleman stated that Mr. Woodburn was not able to give them a definite idea as to how far Government would assist the Association, but their impression was that Government might probably permit Dr. George Watt to supervise from Calcutta whoever might be appointed and also allow the free use of Government laboratories in Calcutta, but all salaries and travelling expenses would have to be borne by the Association, though it might be possible to obtain a grant for materials and instruments. Under these circumstances it became a question for the Association to consider whether a special fund could be raised for the purpose, as apparently no further progress could be made in the negotiations with Government, unless this were done. It was decided in the first instance to send a copy of the minutes to the Chairman of the Assam Branch for his information, and his opinion was to be asked as to what further steps would be taken in the matter.—*Indian Planters' Gazette*, March 28.

THE AMERICAN TEA SUPPLY.

The last mail brought us a few figures relating to the American Tea Supply, which are very interesting. The imports during 1894 were 102,083,702 pounds, whereas in 1895 they were 97,883,051 pounds, which shows a decrease of 4,199,651 pounds in spite of the efforts being made to wean the Americans from fancy iced drinks and induce them to transfer their thirsty patronage to the cheering cup. The exports amounted to 768,143 pounds, which leaves a balance for home consumption of 97,114,908 pounds. The bulk of this was supplied by China and Japan, the former contributing about 53 per cent. of the total, the latter slightly over 41 per cent. The remaining 6 per cent. was obtained from the United Kingdom and other countries, a little over 3½ million pounds going from England. In this, doubtless Indian and Ceylon tea predominated, but it is quite evident that

a vast amount of headway has yet to be made with British grown teas in the American market, ere the China and Japan supply is lessened. Still a beginning has been made, and the efforts of the Indian Tea Association and its representatives are not likely to be relaxed. As we pointed out in a recent issue the fact that during 1895 the consumption of British grown tea outside the United Kingdom showed an increase of no less than nine million pounds, is in itself, a most significant sign of progress.—*Indian Planters' Gazette*, March 28.

NOTES FROM OUR LONDON LETTER.

LONDON March 27.

THE COLOMBO COMMERCIAL COMPANY, LTD.

It was recently written you that the issue of the report of the Colombo Commercial Company would be somewhat delayed this year consequent upon the reconstruction determined upon. (We published the report received locally sometime ago). Ed. C.O. You will see that it mentions that the new company took over the concern as from the 30th September of last year, to which date the balance-sheet presented is made up. The directors announce that the working of the year had been satisfactory, and they pay not only the full interest of 6 per cent on the Preference Shares, but one of like amount on the ordinary shares, both free of income tax. One change made in the mode of drafting the balance-sheet seems to recommend itself for adoption by all companies trading in the East. The transactions due to Exchange are now dealt with in a novel form, all current Rupee Trading Assets and Liabilities appearing in that balance-sheet at their equivalent in sterling calculated at the exchange of the day. We believe that a good many Ceylon companies that publish their reports in London still follow the method now abandoned by the

Commercial Company, with the result that to non-expert readers their accounts may possibly be difficult of full comprehension and estimation.

THE NAHALMA TEA ESTATE CO.

The report of the Nahalma Tea Estate Company, was presented yesterday at the annual general meeting of the shareholders. (We published it a few days ago—*ED. C.O.*) An interim dividend of 3 per cent was paid in October last, and a further one of 5 per cent is now proposed, making a total of 8 per cent for the year, free of income tax. Provision is also made for placing £625 to the credit of the Debenture Redemption Fund, while £168 goes towards the expense of a new turbine erected last year. With these two provisions taken into account the dividend would appear a very satisfactory one. Somewhat exceptionally, the tea crop of 1895 exceeded the estimate made of it, the excess being nearly 36,000 lb. The estimate of the present year's crop is 240,000 lb. Testimony is borne by the report to the substantial character of the new turbine erected by Messrs. Walker Sons & Co. of Colombo and Kandy.

A third report sent you by this mail is that of

THE KELANI VALLEY TEA ASSOCIATION,

published on Wednesday last. It proposes to the shareholders a final dividend of 10 per cent (free of income tax). An interim dividend of 5 per cent was paid in September last, so that the total division for the year will amount to 15 per cent. But in addition to this very substantial payment the shareholders are to obtain a bonus of 2½ per cent (also free of income tax), so the profit for the year will be represented by 17½ per cent, a result upon which all interested may well congratulate themselves. That this result could be obtained after setting aside £2,000 of the year's profits towards the clearance of a mortgage on one of the Company's estates, is sufficient to demonstrate the soundness of its financial position, a demonstration the general investing public will not fail to appreciate when considering investment in your tea enterprise. The crop secured is reported to have been largely in excess of the estimate, having been 597,185 lb. as against 525,000 lb. only. The increase as compared with 1894 is 180,538 lb. Further extension of clearing for tea planting is announced.

One of the Indian Tea Companies, the Balijan, has also issued its report this week. It proposes a 5 per cent dividend which added to the interim division of like amount will make a total of 10 per cent for the year.—*London Cor.*

MARKET FOR TEA SHARES.

Thursday evening, March 26th, 1896.—A strong buying inquiry still characterises the market in Indian tea companies' shares, and again the "official List" shows advances in no less than eight of the quoted shares, while in some cases, notably that of the Assam Company, shares cannot be had even at the higher quotations in the list.

MINING LANE closes steady to firm for both Indian and Ceylon tea, and most of the former are now printed as "last of the season," so that there can be no more for sale for two or three months, after which the new season's teas arrive.

FRESH ISSUES.—Nothing except occasional transactions in Dimbula Valley Prefs. at 66.

QUOTED SHARES.—East India and Ceylon Ordinary were first put up in the official list a fractional point, then put down again, and now close at their previous quotation, without, however, any actual business. The Prefs. have been taken at 13 3/8th, and now ask more money.

CEYLON SHARES.—C. T. P. Co. Ordinary are said to have changed hands at an even higher figure than that quoted last week, while the Prefs. are wanted at about 17.—*H. and C. Mail*, March 72.

THE TEA MARKET.

The Tea market is slightly firmer on the week for British growths, as supplies have not been on a large scale, and for Indian the season is over. China Tea is neglected, for quality is of the poorest, and some rubbish sold down to 1½d. per lb. What is wanted is Tea suitable for home consumption, not the ideal Russian style. New Travancore Teas are arriving, and are of useful description. The late report of Acting Consul Fox, Wenchow, shows that China Tea can be produced to compete successfully with that of India and Ceylon. He states:—Black Tea, costing \$14 to \$16 per picul (which, at an exchange of 2s 3d the dollar, costs in sterling under 3d per lb.) that Chinese made large profits, an important statement, and of encouragement to those engaged in the trade. From that port were formerly shipped the Sinchiene Kye and Flowery Pekoe, that obtained notoriety as the "Caravan Teas" sent overland via Kiachta to Russia—*L. and C. Express*, March 27.

PLANTING AND PRODUCE.

THE UNITED STATES AND THE TEA DUTY.—The enterprise shown by Indian and Ceylon tea planters in pushing the sale of tea in the United States—of which, by the way, we shall have something to say next week—has perhaps stimulated the movement for increasing the import duty on tea in America. A representative committee of tea importers recently appeared before the Ways and Means Committee at Washington. Mr. Willard, of New York, recommended that a specific duty be imposed upon importations of tea, sufficient to correct certain evils which could not be avoided under present regulations. He pointed out that today the consumer paid the retailer nearly as much per pound for tea as in 1873, but received tea of much inferior quality. A duty would retard the importation of poor tea. Mr. Mead stated that a duty of from 10 to 15 cents per pound would be sufficient. Mr. Charles U. Sheperd said that he had been experimenting with tea-raising in South Carolina for years. Tea could be grown there, but not to compete with the low grades grown abroad. The placing of a duty on tea would make its cultivation in the Southern States probable and profitable.

AN OLD STORY.—The idea of fostering the cultivation of tea in the Southern States by imposing a stiff duty on the importation of high grades of tea would naturally commend itself to the American political mind, but the idea of tea cultivation assuming anything like the proportion in the Southern States is not an alarming prospect. Apropos of American tea cultivation, there used to be a story told in Mining Lane on this subject. It was to the effect that one morning a well-known firm of brokers received a mysterious package, which proved to be two or three pill boxes containing something which, on being looked at through a microscope, turned out to be tea. It had been grown in one of the Southern States of America, and the grower, who had a firm belief in himself, his country, and his tea, had delivered himself on paper of a pious aspiration to the effect that the samples sent contained evidence of the greatest blessing that the Almighty had ever bestowed upon the American people, and he hoped that Mining Lane would appreciate the samples. This happened some years ago, and a gross or two of pill boxes would perhaps hold all the American-grown tea now produced. But the American people when they set their minds on an enterprise can accomplish nearly anything, and they may one day conquer the difficulties of the labour question and other matters, and cultivate tea on a large scale. But even then we will hope that they will need a

large proportion of India and Ceylon to give it a flavour. Meantime the work of pushing the sale of these teas go along merrily.

TRY NORWAY AND SWEDEN.—As a scheme is on foot for opening an exhibition at Stockholm on a large scale, an opportunity will be afforded of pushing the sale of Indian and Ceylon teas in Sweden and Norway. The exhibition will comprise engineering, building, industry, machinery, implements, transport, shipbuilding and navigation, electricity, fisheries, military sciences, sport, travelling, fine arts, education and instruction, hygiene reproduction of drawings, etc., slögd, scientific appliances, etc.—*Home and Colonial Mail*, March 27.

TEA IN AUSTRALIA.

Business in China tea has been rather quiet. Sales are reported of 400 half-chests panyong at 4½d, 300 half-chests panyong, at 6d to 7d, 200 heavy weights choice panyong, 100 quarter-chests buds at 5d, and 370 half-chests kooloo at 5½d to 8d, Ceylons have been in good demand, and sales of about 800 packages (partly for export) have been made at prices ranging from 6d to 1s 1d. A catalogue of 152 packages Ceylon, ex Valetta, was offered at auction on Tuesday, and sales were made, publicly and immediately after the auction, of 130 packages at 5½d to 8d, prices being a shade easier.—*Australasian*, March 28.

CEYLON TEA IN RUSSIA.

Mr. Philip, Secretary of the Planters' Association, has sent us the following copy of a letter received from Mr. M. Rogivue reporting on his work in Russia:—

Moscow, January 1896.

A Philip Esq., Secretary to the Ceylon Thirty Committee, Kandy (Ceylon.)

Dear Sir.—I now have the pleasure of giving you some amount of what I have done for the advertisement of Ceylon Tea in Russia up to the end of 1895 making use of part of the grant allowed me by the "Thirty Committee" last summer for this purpose.

What I have done is as follows:—

1. The large announcement, examples and translations of which accompany this letter, has appeared four times in each of the six leading daily papers of Russia, size about a quarter page. See example marked A. *Novoe Wremya* once, also ¼ page in the official *Police Gazette*. The same has been printed in a somewhat smaller size in eleven provincial papers twice in each, see example marked "B" "*Preazovskie Krai*" issued at Rostoff on /Don, the ones chosen being those of the largest circulation in their respective Governments.—Cost about R1,500.

2. Besides 1,000 new placards of my firm for Ceylon Tea (specimen herewith) two thousand coloured pictorial transparent placards, one of which with translation of the wording is sent herewith, have been procured for affixing in the windows of my customers and own magazines or elsewhere available, and also in the trams wherever I can obtain permission.—Cost about R2,000.

3. A Calendar for 1896 with a view near Colombo reproduced by photographic process on the one side, and my price list for Ceylon tea and coffee on the reverse.

These to the number of 2,000 were distributed at X'mas and the New year here in Moscow and through my provincial agents.—Cost R150.

4. 3,000 price lists and 50,000 "Brochures" or pamphlets setting forth the advantages and many good qualities of "Ceylon Tea" have been printed and are in process of distribution (example herewith).—Cost R350.

In hand now I have a smaller newspaper advertisement which is appearing in sixtyone leading periodicals and daily papers, in addition to those of St. Petersburg and Moscow. In each large town of every Government throughout Russia where local newspapers are issued the best have been selected and matters so arranged that every day throughout

the year 1896, an advertisement of "Ceylon Tea" shall appear in at least, two papers (of two separate places) and so covering the whole area of this country.—Cost about R3,500.

Further particulars of this advertisement with specimens I will forward with my second report.

I am also getting a *van* with "Ceylon Tea" advertised on the sides to go round Moscow with supplies of my tea for the various shops and customers, and to and from the Railway stations.—Cost R300.

At the Nijni-Novgorod Exhibition (in May next.) I purpose having a *pavilion* for the distribution of Ceylon Tea in cups and in packets as samples etc.—I expect to spend there about R3,000.

As this Exhibition is exclusively for Russian produce and manufactures I am not permitted to exhibit, but believe I can manage by the above method to make good use of the opportunity to spread the knowledge of Ceylon Tea. Of the money granted me I have already spent about R1,000 as shown above in the margin besides extra *discounts*, and liberal *bonuses* granted to induce fresh people to take up the business in new places.

My detailed accounts will follow as soon as I have received all the particulars. I will now try to give you some idea of the direct result of what I have done during the past five years as apparent to me here, I am presently able myself to dispose of about 300,000 lb. Ceylon Tea in packets in a year which shows a tremendous advance as compared with the previous year, a large amount of which is no doubt due to the greater freedom of action, I have been able to enjoy through the increase of capital obtained, when I was last in London, Mr. Dowling having as you have heard joined the business; and not only with capital, but also with his thorough knowledge of tea etc., and his personal services be greatly assisted the cause of Ceylon Tea in Russia.

I look for a large increase during 1896 and hope that I shall dispose of nearly half-a-million pounds, but though my customers are numerous they are, as a rule only able to take such small quantities and are at such a distance, that the cost frequently balances or even exceeds the return.

In addition to my own magazines in Moscow, Nijni Novgorod and Warsaw, I have agents in 17 large towns. St. Petersburg, Kiev, Charkow, Rostow, Don, Odessa, Vitno, Minsk, Berditschew, Uman, Jaroslawe, Twen, Witebeck, Orel, Pensa, Gitomir, Michailowka and Tanbow, who in many cases have numerous shops in the small towns of their surrounding districts, and I have regular customers all over the country.

I am now taking steps to open another magazine here in Moscow, making in all five in this city, and also intend about June next to open one in Twanova Vosnesensk, a large manufacturing town, between Leu and Nijni, called the Manchester of Russia.

I have been especially trying to gain customers among the many co-operative societies, railway camp, big manufacturing companies, etc., which exist in the country, and several now have begun to take the Ceylon tea. The army is well represented on my books by several regiments, the "Faculty" by some hospitals, and the "Church" by many priests and a few of the Monas Perico.

To give you some idea of the area which I have worked, I now send tea to Welsk the farthest point North that the railway system at present extends to, and in South Russia in Tiflis and many towns of the Caucasus I have numerous customers, and have just secured another in Askabad which is some way South-east of the Caspian Sea. I have also many clients in Poland and the South West of Russia and in the East, I supply Ceylon tea as far as Kolland and Margalan in Turkistan as well as to several places in Buchara. My agents have nearly all increased their business this last year and here in Moscow the consumption shows good progress. But though I have got the article introduced in so many places, the demand to begin with is so very small and requires such constant working up and the various agents and customers want such liberal terms in the way of discount etc., apart from the substantial *bonuses* and free carriage, I have been giving to encourage buyers of larger quantities and

new connections which alone amounted to about R3,000 this year, that you will easily understand the cost is barely covered, while these small quantities only can be dealt in and the expenses of trading in this country are so heavy.

As to the general import of Ceylon tea into Russia, I must leave the figures which appear in your papers and the custom (of London) returns bear witness as to the general result of my work since 1890 when your article was quite unknown here.

As however a large amount of the tea exported from London to Russia comes through German ports it is impossible to calculate the exact quantity, and at the Customs here Ceylon and China tea are classed together under the one heading of "Tea."

Though I am at most the only one selling any quantity of Ceylon tea pure in packets, the use of it for blending with China tea is generally admitted to be greatly on the increase, and it is noticeable that some more Russian firms have started selling a so-called "Ceylon" blend in addition to their China, showing that a demand for Ceylon tea has been experienced by them.

I am being much annoyed still by some firms who are selling a very inferior article in packets, the wrappers of which are an almost exact facsimile of mine. I hear "Lipton" is opening a shop in St. Petersburg and has already rented premises for the purpose.

I had the pleasure, the other day, of a visit from Mr. Gepp, the well-known broker of Colombo, and should much have liked to show him more of what has been done and given him some further information about Ceylon tea in Russia, but most unfortunately he had no time at his disposal, and in my short conversation with him I was not able to say very much, but I have no doubt you will hear all about it from him. I only wish some of your Ceylon folk *would* come here and see for themselves what I have done.—I am, dear sir, yours faithfully,
(Sgd.) M. ROGIVUE.

MR. CHARLES LEDGER AND THE DUTCH GOVERNMENT.

Mr. Chas. Ledger, the cinchona pioneer, now living at Goulburn, N.S.W., writes that he has received the following reply from the Dutch Minister of the Colonies at the Hague, in answer to his request for a further grant on account of his services in procuring from Bolivia, in 1865, seed of the Ledgeriana tree, from which most of the Java cinchonas have been raised:—

The Hague, December 1, 1895.

In answer to your letters February 6, March 20, October 25, 1895, in which you appeal to the generosity of the Government of the Netherlands to receive a reward for your services rendered in view of obtaining the cinchona-seed Mr. George Ledger furnished in 1865, I beg to inform you that the transaction in the matter having been entirely of a commercial character, and duly finished on this side by even repeated liberal payment, I don't feel at liberty to take your appeal into consideration.

The Secretary of the Colonies for the Minister,

The Secretary General,

(Signed) A. E. ELIAS.

We regret the result, but as the planters and traders to whom we appealed on Mr. Ledger's behalf have practically done nothing for him, we are not surprised that the Dutch Government also feel disinclined to assist.—*Chemist and Druggist*.

TEA IN AMERICA.—Messrs. F. C. Larkin & Co., the well known importers of tea in Toronto, have sent us a letter which we publish today. They have done excellent service in advertising Ceylon tea; and at the Colonial Exposition, which is to be opened next month, they are likely to have a good exhibit of our staple product.

VARIOUS PLANTING NOTES.

NEW MACHINERY.—Most opportunely, notes the Calcutta *Planter*, as the manufacturing season approaches, Mr. Jackson enters the field with an improved rolling machine, which he asserts will still further reduce the time occupied in that operation. Another machine termed a "perforated roller" has been tried with highly satisfactory results in the Durrung district, but until protected by patent rights will not be brought before the public: to comment upon its presumed merits, therefore, would be premature. Another labour-saving apparatus for sorting green leaf, is to be brought out, which, if effectual, will save both time and labour in the final classification. Many makeshifts have been resorted to for dealing with the coarse leaf unavoidably brought in, but none have hitherto answered thoroughly, though great expectations are cherished of the present one. The new plucking machine is being manufactured at home, so that it is not likely to come into play much before the middle of the season. The main difficulty, I understand, has been to combine delicacy of touch with ability to withstand jolting over freshly broken up or uneven ground.—*Planting Opinion*, March 28.

THE "CITRONELLA OIL QUESTION" has entered upon another phase. It appears that, in addition to the parcel on which the award was recently given in Mr. Treatt's favour (for there is now no reason to keep back the fact that Mr. R. C. Treatt was the seller, and Messrs. Domeier & Co. the buyers), Messrs. Domeier purchased from the same seller, but through a different broker, yet another lot of citronella oil. This was tendered last week, acceptance declined on the same grounds which led to the refusal of the first parcel. Arbitration was thereupon proposed, but an application (given in the law-notices under the heading "In re Treatt and Domeier") was made yesterday before a Judge in Chambers. We understand that the object of the application was to allow Messrs. Domeier to bring the case into court without resorting to arbitration, as provided by the wording of the contract. This application was refused, and the matter is now to be heard in the ordinary way by Mincing Lane arbitrators. It is quite possible that the defeated party will then try to bring the matter before a court of law.—*Chemist and Druggist*, March 21.

COFFEE is the principal article of export from Aden. There are two countries that furnish this coffee—Abyssinia, in Africa, and the province of Yemen, in Arabia. The Abyssinian coffee is brought by camels through Somali Land, and thence by boats to Aden. From the reports the natives bring from that country, it would seem that all the coffee brought from Abyssinia grows wild, yet the berries are as large as, if not larger than, the cultivated coffee of Arabia, and its flavour is excellent. With the soil of that country producing such magnificent coffee without cultivation, one may naturally expect the natives will soon turn their attention to the proper cultivation of the plant, when remarkable results may be expected. The province of Yemen, in Arabia, is the natural home of the coffee plant, as it was there its use was first made; and from that day until the present the coffee of Yemen has been in great demand, for of all the different kinds produced the far-famed Mocha is considered the best. Because of the fact that no travellers are allowed in the interior of the country, no information as to the cultivation of this plant can be obtained, except from the Arab caravans that bring the coffee to market, and these reports are not reliable. But, unlike the Abyssinian coffee, all the Arabian coffee is cultivated. The greater portion of the coffee brought to Aden, according to an official report, is in the pod. The pod is removed by passing the coffee between two revolving stones, thus breaking, or crushing rather, the shells. Women are then employed to clean and sort the coffee, the best of which is exported, the inferior berries and the pods being sold to the Arabs for their own use.—*The Home*, March 11.

COFFEE CULTIVATION IN B. E. AFRICA.—The *British Central Africa Gazette* of Feb. 1st says:—Mr. John Buchanan, C.M.G., has been asked by H. M. Commissioner to forward 60 pounds of seed coffee to H. M. Agent and Consul-General at Zanzibar, for experimental cultivation in British East Africa.

The *Honkong Telegraph* says:—We have received a small parcel of Liberian coffee grown by Mr. Korczki on the Victoria estate, near Kulat, North Borneo. It appears to be of very excellent quality, and is marketable at from \$40 to \$50 per picul in its raw state. Mr. Korczki started this estate a few years ago, and it is now in full and regular bearing. He informs us that he will shortly add considerably to the area under coffee at Kudat.—*British North Borneo Herald*, March 16.

THE HEALTHINESS OF THE WYNAAD.—This subject is again dealt with editorially in the *Madras Mail*. The article is in reply to criticism by Mr. J. W. Hockin, a planter of Vayitiri, South Wynaad, who seems to have been accusing our contemporary of indulging in personalities. The concluding part of the article is as follows:—We have given it as our opinion that tea can be successfully cultivated in the Wynaad, basing our conviction on what has been done with imported labour in the Doors and the Terai in Northern India and in the Kelani Valley in Ceylon. We have asked any Wynaad planter who disagreed with us to furnish facts and figures to controvert our statement, but such gentlemen as have written have contented themselves with vague generalities and gross imputations. A sufficient acreage is now under tea in the district to prove in three or four years how far we are right; meanwhile we adhere to our expressed belief, supported in it by having recently seen it stated that a planter of South Wynaad, who has been reported to regard malaria as fatal to tea, is now himself interested in the cultivation of the product.

THE FUTURE OF BRITISH FARMING.—Professor James Long, lecturing on this subject at the Society of Arts, said that so long as it was possible for every farmer in Canada and the Western States to provide bread for 300 people upon every acre of virgin soil which he adds to the world's great farm, so long would prices remain low and our British systems of agriculture remain at a disadvantage. So we must abandon the idea of grain production in England, but we could continue to provide live stock for meat, milk for our congested population, butter and cheese of the prime quality for the thousands who would continue to pay for it, malting barley for our brewers, poultry and eggs, fruit and vegetables for sale at our doors, and even hay and straw where good crops were available. What were the conditions under which these products could be successfully turned out in the future? First came "intensive agriculture" upon smaller farms. The soil scientifically treated was capable of yielding vastly more than at present. Then the farmer must have security for his improvements, and less restriction on his cropping and sales. Extended ownership in the land by the actual cultivator would also stimulate production. Professor Long suggested Government loans at three per cent., with repayments extending over twenty years. Grass land must be improved. Liberality, skilled management, and judicious manuring in grass farming would enable our farms to carry more stock. The arable land must also be improved by scientific methods, and in this connection the lecturer referred with hope to the prospect of utilising atmospheric nitrogen for the improvement of manures. The cost of production might also be reduced in several ways, and the breeds of dairy cattle be improved. He emphasized the necessity of extending the smaller industries of poultry breeding and fruit and vegetable farming. Personally, he had every faith in the future regarding the present period of tribulation as an "experience of transition." Lord Belhaven and Stenton, who occupied the chair, and other gentlemen took part in a subsequent discussion.—*Daily Chronicle*.

8 CWTs. AN ACRE.—It has been said that though two or three acres could be made to yield extraordinary average crops by special treatment, on large areas it would be impracticable. The answer of the intensive school has been: try it, and we may point to the example recently cited by the Coorg correspondent of a Madras paper as a case in point. The estate is 157 acres in extent, and last year it received about half a ton of artificials per acre, besides cattle, jungle top soil and lime. The result was 8 cwt. per acre of crop, with prospects of a similar crop this year.—*Planting Opinion*, March 28.

BOOKS ON COFFEE CULTIVATION.—A correspondent writes:—"One of your correspondent was enquiring I think for a good work on Coffee Planting. The following I have personally read, and I can recommend them:—Graham Anderson's 'Jottings on Coffee,' and 'Shade Trees in the Coffee Lands of Mysore' by the same author. 'Gold, Sport and Coffee Planting' by Robert Elliott, and 'Coffee Planting in Ceylon and Southern India' by Hall. I may remark that in the last author's book the important item of *digging* is strangely lost sight of and omitted altogether. If your correspondent can pick up some old volumes of the 'Tropical Agriculturist,' he will find abundance of valuable information in them on this subject as well as other products."—*Ibid*.

LEGUMINOUS TREES FOR MANURING TEA.—We would commend to the notice of tea planters the great interest that is now being taken by coffee-men in using leguminous trees as shade. The loppings and leaves, &c., form, it has been claimed with a great show of truth, all that is needed for the plant-food of coffee, thus dispensing with the need of extraneous manures. Tea, of course, cannot be shaded in exactly the same way as coffee, but very little harm would be done if the land was sparsely planted up with leguminous trees. In the tea-districts of Northern India, the merits of *sheshams* and *sa*, both leguminous trees, are freely admitted, the only danger being in the shade growing too dense. Most gardens on these hills suffer both from poor soil and exposure. Were wind belts of suitable leguminous trees—in our last issue we recommended trying "black wattle"—planted systematically over the whole area, the benefit to the tea would be very great. The wood itself could be used as fuel, and the leaves carefully applied as manure. Young tea especially is said to be benefited in Dehra Doon by planting *sheshams* between the rows.—*Planting Opinion*, March 28.

THE PROPOSED DUTY ON TEA IN THE UNITED STATES.—The Washington correspondent of the *American Grocer*, writing on February 25th, says:—The effort to secure the passage of a law levying a duty on tea is meeting with much opposition from the minority of the Ways and Means Committee, while no great enthusiasm is being displayed by the majority members. As I have before pointed out, it is a part of Democratic creed not to invoke the taxing power for any purpose except to derive revenue, and this objection is being used against the filled Cheese bill, as well as the bill to place an import tax on teas. There is an advantage, however, in the situation, so far as the Tea bill is concerned, that it provides a customs duty which would net from ten to fifteen million dollars per annum, and at a time when the condition of the Treasury demands additional revenue. The failure of the Dingley bill, which has been discounted for some time, necessarily improves the prospect for the passage of independent measures, and no proposition yet advanced commends itself to both sides of the House and Senate with as much force as does the tax on tea, regarded from a revenue standpoint. To the Democrats it is acceptable, for the reason that it does not supply protection to any industry; while to the Republicans it is convenient and available, as it does not open up any industrial controversy, which would fill the halls of the Capitol with representatives of less favored enterprises.

THE PLANTERS' ASSOCIATION OF
CEYLON.

MEETING OF THE "THIRTY COM-
MITTEE."

Minutes of proceedings of a meeting of the Thirty Committee held at Kandy on Saturday, the 11th April 1896, at half-past 7 o'clock in the morning.

Present:—Messrs. A. W. S. Sackville, Chairman; A. Philip, Secretary; A. Melville White, F. G. A. Lane, A. A. Bowie, H. J. Vollar, James G. Macfarlane, Joseph Fraser, J. N. Campbell, R. A. Galton, R. S. Duff-Tytler, H. V. Masefield, J. H. Starey, Gordon Pyper and W. D. Gibbon.

The notice calling the meeting was read.

The minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy on Wednesday, the 29th January 1896, were submitted for confirmation. Resolved:—"That they be and they hereby are confirmed."

Read letter from the Secretary, Ceylon Chamber of Commerce, Colombo, intimating that the following gentlemen had been appointed to serve on the "Thirty Committee" for the current year, viz.:—Messrs. F. M. Mackwood, F. W. Bois, C. W. Horsfall, F. F. Street, G. F. Traill, D. W. Skrine.

Read letters from the Manager, National Bank of India, Limited.

Read letters from the Treasurer of the Colony. Resolved:—"That the request of the Treasurer be complied with." Resolved:—"That the attention of Government be drawn to the circumstance that the amount of the Tea Cess for February and March does not appear to have been paid into the Bank up to date."

Read letter from Government acknowledging receipt of the minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy on the 15th November 1895, and notifying that the copy of minutes of proceedings forwarded on the 18th November had also been received.

REPRESENTATIVE IN AMERICA.

Read letter from the then Chairman (Mr. A. Melville White) to Government asking the approval of Government to the expenditure of a further sum of £3,000 sterling by the "Thirty Committee" for the purpose of advertising Ceylon tea in the United States.

Read letter from Government notifying that the Governor has been pleased, with the advice of the Executive Council, to sanction the expenditure of a further sum of £3,000 by the Committee of Thirty for the purpose of advertising Ceylon tea in the United States.

Read letters from Mr. Mackenzie to Mr. White dated respectively London, 17th January; 24th January; 31st January; New York 8th March, 1896.

Read Mr. White's letters to Mr. Mackenzie dated respectively 4th February; 5th February; 11th February.

Read letters from Mr. Mackenzie to the Secretary dated respectively London 31st January; 7th February; 14th February; New York 24th February. Submitted Newspaper cuttings, Advertisements, and other printed matter as received.

Read letter from the Manager, National Bank of India, Limited, Colombo, enclosing Letter of Credit No. 31/10 in favour of Mr. Wm. Mackenzie for £2,000—current till 31st December 1896.

Submitted Cablegrams despatched and received. Resolved:—(1) That the Committee hereby confirms the official and semi-official letters that have passed since last meeting, and also the cablegrams; (2) that the Secretary do obtain from the Bank a fresh letter of credit for £3,000 sterling, and forward same to Mr. Mackenzie; (3) that the Chairman be authorized to obtain the approval of Government to the expenditure of a second sum of £3,000 sterling; in the United States of America on the lines laid down in the letter of instructions to Mr. Mackenzie dated

31st May, 1895, already approved by Government; and in accordance with Mr. Mackenzie's letters of the 24th & 31st January, 1896.

Read letter from the Ceylon Association in London.

CEYLON TEA AT THE INTERNATIONAL EXHIBITION
AT GENEVA.

Read letter to Government from the then Chairman (Mr. A. Melville White) dated 5th February, enclosing extract of a letter from Mr. Mackenzie on the subject of the International Exhibition at Geneva, and asking sanction to an expenditure of £200 sterling by the "Thirty Committee" for the purpose of assisting in pushing Ceylon Tea on the Continent by means of that Exhibition.

Read letter from Government stating that if this application of the proceeds of the levy under Ordinance No. 4 of 1894 is duly desired and determined by the Committee of Thirty, the Governor in Executive Council will be prepared to approve it on a formal vote of the Committee being sent to Government by the Chairman or the Secretary.

Read letters from Messrs. J. Tetley and Co.

Read cablegram.

Read letter from the Secretary the Ceylon Association in London, and enclosure from Messrs. Joseph Tetley & Co. Resolved:—"That the expenditure of £200 sterling as arranged is hereby determined and confirmed by the Thirty Committee for the purpose of pushing Ceylon Tea on the Continent, and that a copy of this Resolution be forwarded to Government as directed.

CEYLON TEA AT THE EMPIRE OF INDIA AND CEYLON
EXHIBITION, LONDON, 1896.

Read letters from the Secretary, the Ceylon Association in London and enclosures.

Read letters from Mr. E. Ernest Green, making and withdrawing his application for support in conducting a Ceylon Tea House at the Exhibition, the concession desired having been given away to Messrs. Spiers & Pond. Submitted cablegram on the subject.

Read letter from the Secretary, the London Exhibitions, Limited. (For the correspondence see next page.)

CEYLON TEA IN RUSSIA.

Read letters from Mr. M. Rogivue giving an account of what he has done for the advertisement of Ceylon Tea in Russia up to the end of 1895, making use of part of the grant allowed by the "Thirty Committee." Resolved:—"That on receipt of detailed accounts of expenditure under the grant of £1,000 Sterling, the "Thirty Committee" will be disposed to favourably consider a further application for funds to be used strictly on the lines already laid down by Government, and that Mr. Rogivue be advised accordingly.

Read letter from Messrs. John Tyndall & Co., London.

CEYLON TEA IN SWITZERLAND, AUSTRALIA, AND ITALY.

Read letter from Mr. Charles Oswald, Winterthur, reporting on the transactions in Ceylon since 1889. Resolved:—"That the letter be acknowledged with thanks."

CEYLON TEA IN NORWAY.

Read letter from Mr. A. Floor to the Chairman in reference to making known Ceylon Tea in Norway.

Read letter from the Ceylon Tea Company Limited. Resolved:—"That the "Thirty Committee" hereby confirm the Chairman's action in granting and arranging for the shipment of 500 lb. of Ceylon Tea for Free distribution in Norway."

CEYLON TEA IN SMYRNA.

Read letter from Mr. G. A. Marinitsch. Resolved:—"That consideration of the application be postponed until next meeting when it is hoped that representatives of the Ceylon Chamber of Commerce may be present."

The Thirty Committee then adjourned.

A. PHILIP,

Secretary to the "Thirty Committee."

THE EMPIRE OF INDIA AND CEYLON
EXHIBITION.

The following is the correspondence on this subject referred to in the minutes of the "Thirty Committee" :-

4th Mincing Lane, London, 28th Feb. 1896.

A Philip Esq., Secretary Thirty Committee Kandy, Ceylon.

Dear Sir,—I beg to acknowledge receipt of your telegram of 26 inst. "Please advise Tetley & Co., Mackenzie's application of £200 granted for Geneva Exhibition" I at once advised Messrs. J. Tetley & Co. and I enclose copy of their reply, I also enclose copy of letter from Mr. E. E. Green and of my reply thereto in regard to a proposed Ceylon Tea House at the Empire of India and Ceylon Exhibition 1896 the Earl's Court.

I apprehend that there will be no difficulty in granting moral support to an old planter like Mr. Green. The Indian Tea House conducted last year by Mr. Langdale, with whom Mr. Green is now associated, was a great success on the occasion of my only visit to the Exhibition, the door of the Indian Tea House was besieged by a crowd struggling to get in, myself I had to give it up and go elsewhere.

I have today from Mr. Rogivue a long and interesting report on his doings in Russia, the original of which has I understand has gone to you.—I am, yours faithfully,
(Signed).—W. MARTIN LEAKE.

Copy. Customs Chambers, 14th St Dunstan's Hill, London, 27th February 1896.

W. Martin Leake, Esq., 4, Mincing Lane, E.C.

DEAR SIR,—With reference to our interview this afternoon, as I then explained to you we are in treaty with the Exhibition Directors for the conduct of a Ceylon Tea House at the coming Empire of India and Ceylon Exhibition 1896. At present affairs are at a stand-still owing to opposition from the refreshment contractors, Messrs. Spiers & Pond, who wish to run the house on their own account.

The Directors are, however, I believe anxious that the Ceylon Tea House should be conducted by some representative of Ceylon, and on this account are willing to give us the concession on condition that we can obtain the moral support of the Planters' Association of Ceylon. The matter having to be definitely settled at once, there is no time to communicate direct with Ceylon. But we think that a letter from you in our favour would carry great weight with the Directors of the Exhibitions.

I may mention that I am myself a tea planter of 15 years' standing in Ceylon and am a member of the Pundaluoya branch of the Association.

Mr. E. F. Langdale, one of our partners in this concern, as you are doubtless aware, very successfully conducted the Indian Tea House at the last Exhibition.

It seems to us a great pity that the representation of Ceylon should be left to the care of mere refreshment contractors, as we are informed would be the case failing the acceptance of our offer.

You will understand that we ask merely for the moral support of the Association towards the Tea-house. But at the same time we should be very glad to arrange and conduct an Exhibition staff of Teas, and other Ceylon Produce if the Planters' Association would vote us some pecuniary assistance for this latter purpose, and send us Exhibits.

With this view I am by this mail writing to the "Committee of Thirty" and I should feel greatly obliged if you would also send them your views on the subject, and kindly ask for a "wire" in reply to our request for support.

With reference to the Tea-house, we are prepared to submit to you for your approval samples of the Tea that we propose to supply to the public.

Kindly address your reply to me as above.—Believe me, dear sir, yours truly,

(Signed) E. ERNEST GREEN.

Copy.

The Ceylon Association in London, 4 Mincing Lane E.C. 28th February, 1896.

E. Ernest Green Esq., 14th St. Dunstan Hill, E.C.

DEAR SIR,—I have your letter of yesterday in reference to the proposed Ceylon Tea House at the coming Empire of India and Ceylon Exhibition 1896. I have been for some time desirous of finding some one connected with Ceylon who would undertake this venture; and I shall be very glad to hear that you have obtained the concession of which you write.

As regards, the moral support of the Planters' Association of Ceylon, I have every reason to think that this will be accorded you. I write today to Mr. Philip, the Secretary of the Association, in support of your application to the Thirty Committee.

The fact that you are associated in the venture with Mr. Langdale who so successfully ran the tea House for India at last year's Exhibition, will no doubt have great weight in Ceylon; and as an old tea planter, connected with the Planters' Association for many years, you are in a favourable position to obtain support.—I am, dear sir, yours faithfully,

(sigd.) WM. MARTIN LEAKE, Secy.
(Copy) 5 and 7 Ferndale House St. London,

26th February 1896.

W. Martin Leake, 4 Mincing Lane E.C.

Dear Sir,—We are in receipt of yours of today's date, informing us that your Association in Ceylon have granted Mr. Mackenzie's application for a subsidy of £200 towards our expenses at the forthcoming Geneva Exhibition.

Will you be so good as to convey to your Association our sincere thanks for this very liberal assistance and our assurances, that we shall use it to the best of our ability in promoting the interests of Ceylon tea.—We are dear sir, yours very faithfully,
(Signed). JOSEPH TETLEY & Co.

Copy. Bearsted-Maidstone Kent, 28th Feb. 1896.
Alex. Philip Esq, Secretary Planters' Association of Ceylon.

DEAR SIR,—I shall feel greatly obliged if you will bring the following communication before the Planters' Association of Ceylon.

I have today had an interview with Mr. W. Martin Leake in connection with the representation of Ceylon at the forthcoming "Empire of India Exhibition 1896." Mr. Loake is I believe writing to you by this mail on the same subject.

I must inform you that in Association with Mr. E. F. Langdale who so successfully conducts the Indian Tea House at the Exhibition of 1895, and under the auspices of the Indian Planters' Association, I am prepared to carry on a Tea House worked on the same lines in the interest of Ceylon. Having heard that the Planters' Association of Ceylon had not directly moved in the matter and were unwilling to take upon themselves the risk and expense of such a concern, we recently approached the Directors of the Exhibition proposing to conduct a Ceylon Tea House at our own risk and expense. This proposal they seem inclined to entertain if it is backed, as we hope it may be by the support and approval of the Ceylon Planters' Association. Otherwise the concession is I believe to be given to the Refreshment contractors Messrs. Spiers & Pond who could scarcely be expected to pay much attention to the interests of Ceylon.

As the time at our disposal was so short we thought it best to apply to Mr. J. L. Shand, who referred us on to Mr. Leake for permission to work under the auspices of the Planters' Association. This Mr. Leake informs us, he is not exactly in a position to give without previous reference to the Parent Association in Ceylon. But he expresses himself as strongly in favour of our scheme, and promised to write you to that effect, and ask for the nominal support of the Association.

As we are greatly pressed for time, we should be greatly obliged if you would telegraph to (Mr. Leake) the assent or dissent of the Planters' Association to our proposals. We have no wish or intention to move in the matter contrary to the approval of expressed wishes of the Association.

Should we obtain the concession, we propose to select a blend of tea that is likely to meet the public taste and submit samples of the same to Mr. Leake (or some other authorised representative of the Planters' Association) for approval. It is intended that the Tea House should not be identified with any special marks of tea, but should be worked strictly in the general interest of the Ceylon industry, to which end as mentioned above an approved *blend* only will be used.

The Exhibition authorities have set aside a very convenient and suitable site for the Ceylon Tea House (or "Ceylon Bungalow" as it will probably be styled) The plan of the building itself will be decided upon by the Exhibition Architects, but would be erected by us at our expense.

The Tea House (or Bungalow) would be under the personal supervision of Mr. Edward Langdale who has considerable experience in such business, and whose highly successful management of the Indian Tea House last year gave complete satisfaction to the Indian Planters' Association and the Exhibition authorities.

It is proposed to give the bungalow a picturesque appearance by the verandahs and open spaces of ornamental plants commonly found in Ceylon Gardens.

We should at the same time be very glad to arrange and maintain a separate Exhibition stall for Teas and other Ceylon products, if we can obtain pecuniary assistance for the purpose. We estimate the erection and maintenance of such a stall at from £100 to £150, which would include the cost of show boxes, Exhibition bottles, labels and attendant. Mr. Leake suggests an application to the Committee of Thirty for assistance in this matter, should this proposal be favourably considered, we should hope to receive early information to enable us to secure adequate space for the exhibits, and intending exhibitors should be urged to despatch their exhibits without delay. I may mention that we have information, that a suitable site would be allowed us for this purpose upon application. Besides exhibits of produce, we should be glad to receive photographs and artwork, and objects of general interest. Samples of Teas should be of half to one pound each, and should be specially selected for appearance. There would be no tasting of samples, as I believe, no awards are made at this Exhibition. Teas would not be sold at this stall which would be set apart for Exhibition purposes only. All exhibits should be consigned to Messrs. French and Langdale of 14th St. Dunstan's Hill, E.C.—I am, &c.,

(Sgd.) E. ERNEST GREEN.

The Exhibition opens on 1st May.

Copy Bearsted, Maidstone, Kent, 13th March 1896.
A. Philip, Esq., Sec., Planters' Association of Ceylon.

DEAR SIR,—With reference to my letter of 28th ultimo, I regret to inform you that the concession for the Ceylon Tea House at the forthcoming "Empire of India and Ceylon Exhibition 1896" has been given away from us (Mr. Langdale and myself) in favour of Messrs. Spiers & Pond, the refreshment contractors.

I therefore beg to withdraw my application for support, nor shall I now be in a position to arrange for an exhibition of Ceylon products.

With apologies for troubling you.—I remain, sir, yours faithfully. (Signed) E. ERNEST GREEN.

Copy 4, Mincing Lane, London, 20th March 1896.
A. Philip, Esq., Kandy, Ceylon.

DEAR SIR—I have to thank you for your letter of 26th ult. with copy of letter to Mr. W. Mackenzie.

I also have to acknowledge receipt of your telegram of today "Association supports Green" which I forwarded to Mr. Green.

I fear that it will not now avail to get him the concession which he was seeking. He has, I understand, written to you direct on the subject—Yours faithfully, (Sgd.) WM. MARTIN LEAKE, Secretary.

(Copy) Kandy, 26th March 1896.
To Martiu Leake, Esq., Secretary, Ceylon Association in London, 4, Mincing Lane, London, E.C.

Dear Sir,—I have to acknowledge receipt of your letters of the 31st January and 28th February which shall be duly laid before the "Thirty-Committee."

As regards Mr. Green's proposal in connection with the Empire of India and Ceylon Exhibition 1896. I sent you a cablegram "Association Supports Green." The Chairman of the Planters' Association (Mr. A. W. T. Sackville) in consideration of Mr. Green's claims, and your endorsement of his applications took the responsibility, and he is further prepared to move that the "Thirty-Committee" do grant £100 sterling in aid of the Ceylon Tea House referred to.

I have no doubt that you are in communication with Mr. Green, and I need only add therefore, now that a reply shall be sent to his letter after the Meeting of the Committee in April.—I am, &c.

(Signed) A. PHILIP,
Secretary, Thirty-Committee.

THE BATTALGALLA ESTATE COMPANY, LIMITED.

SIXTH ANNUAL REPORT.

Directors.—Edward H. Hancock, Charles A. Reiss, Adolf Zimmern. Secretary.—Albin B. Tomkins.

In presenting to the Shareholders their report on the past year's working of the Company, the Directors are pleased to be again able to give a satisfactory account.

There has been an increased yield of tea, and the selling price has been well maintained. The quantity of tea sold in London during the year has been 126,951 lb., realizing nett £4,967 9s 6d., against 117,209 lb., realizing £4,591 5s 11d in 1894. Sales in Colombo amounted to 39,958 lb., realizing R17,904.33, against 25,455 lb., realizing R12,158.57 in 1894.

The total crop was 170,560 lb., selling at 9.97 per lb., against 141,891 lb., selling at 9.35 per lb. in 1894. The average price realized in London has been 10.44 per lb., against 10.50 per lb. in the previous year, and 6.25 per lb. in Colombo, against 5.00 per lb.

Exchange has continued on a low level, the average for Drafts having been 1s. 1 11-16th d., against 1s. 1 1/2d. per Rupee in the preceding year.

The Company's advance to the Olapane estate has been repaid, and the security discharged.

After deducting 10 per cent., or £366 6s 11d., from the amount at debit of Machinery and Factory Account on 31st December last, payment of Interest on Debentures and income tax for the year, there remains at credit of profit and loss account a balance of £2,393 12s 10. The Directors propose to appropriate from this amount £2,250, for the payment of a dividend of 15 per cent., free of income tax, and to carry forward £143 12s 10d.

In accordance with the Articles of Association, Mr. A. Zimmern retires from the Board by rotation, and, being eligible, offers himself for re-election.

The Directors again desire to express to the Superintendent, Mr. G. C. R. Norman, and to the Agents in Colombo, Messrs. Benham and Bremuer, their appreciation of their valuable services.

51, Lime Street, London, E.C., March 21st.

PLANTING NEWS.

BALANGODA, April 13,

What a change since last I visited this district! Then a scene of desolation scarcely equalled anywhere even during the darkening seventies when I carted away the last European, suffering sadly, from sheer ennui to relieve which he had probably tried too many "horns."

The locality was one of the very first to be tackled by the European planter. So early as 1838 the native coffee attracted attention and Pettiatenne, Pettigalla, Massena, Bamberabotuwa, &c. was the result, Bamberabotuwa was the first to abandon hope. Even Hop well itself ceased within a year to longer "lippen" to provide. The chief causes were the want of shelter belts as a protection from the terrific blow with which the S.-W. opens, and the too liberal rainfall. The wind simply whirled the poor coffee plant round till its neck was injured and there the rain drowned it. There was again a little spurt in the district about 1860 when W. Webster opened Laukabarony on the tableland to the east of the Resthouse. A sort of planting

Gamalliel was Webster, at whose feet the Sinne Dories sat and learned to plant *a la* Saffragam. In those days Keenagaha Ella was opened and Auchiu-toul attempted, but the locality really never came to much as a coffee district.

Old Pettiagalla was the best, and continued to give paying crops for a quarter of a century, only succumbing to the general collapse.

Today, the scene is changed, and the district has come to be better entitled to its name—"a good lookout"—than ever before. Thousands of acres have been carefully planted with a good jat of tea, and now promise exceedingly well. It was fortunate for the present proprietors that they resolved to profit by the sad experience of the pioneers in the matter of wind belts, and also that the time had come when the importance of good jat is fully realized.

Meddekanda estate has made much progress during the past year, nearly 400 acres having been successfully planted on the land where poor Lewis planted a little—and yarned a good deal—30 years ago. Here planting has already begun with the April rains of this year, and I note that on the more exposed portions the plants have been pegged down, a good idea, not so practicable with coffee.

Bamberabotuwa is again a scene of activity, opening out extensively under the energetic supervision of Mr. Ingram; here there is room for 15,000 acres of tea equal to any in the island. Young's excellent trace Ratnapurward is likely to be adopted after so many years by that rising firm of pushing planters, Finlay Muir & Co., who intend utilizing it for a tramway.

Shades of poor Robt. Dawson! Who could have thought that this district in which he lost a large fortune would yet come to be worth R1,000 per acre? As a few years hence it is doubtless destined to be.

What a perfect tea season we have had all over. Around Kandy there has never been three weeks without copious showers, albeit the heat has been unusually trying at times. Last night (Sunday) we had a delightful drizzle amounting to about 5 in. which proved very refreshing bringing down the temperature by 3° to 77° during the night. This afternoon it certainly looks as if the little monsoon is approaching.

What *has* come over our old friend McCombie Murray? Surely he must have quite sung away his native *Smeddum*. There has been a great deal of incoherent writing on the subject of this American invasion, but in the language of his mother tongue, this letter of McC. M. "Cows the gowan." QUID NUNC.

THE COCCIDÆ OF CEYLON.

From Mr. Philip, Secretary of the Planters Association of Ceylon, we have received the following copy of correspondence with Government regarding Mr. Green's proposed Book on the Coccidæ of Ceylon:—

(Copy.) Kandy, 26th February, 1896.
To the Hon. the Colonial Secretary, Colombo.

Sir,—I have the honour to submit for favourable consideration, and it is hoped liberal pecuniary support from Government as therein indicated, copy of Minute and Resolutions passed by the Planters' Association at a recent meeting of the Committee on the subject of Mr. E. Ernest Green's Book on scale insects, "The Coccidæ of Ceylon."

As directed in the second resolution I beg to transmit for easy reference a copy (printed) of the correspondence referred to that took place between February and October 1894 regarding the appointment of a Government Entomologist for Ceylon (printed also at pp. cxxvi to cxxxi Book of Proceedings of the Planters' Association of Ceylon for the year ending 17th February 1895) and to point out that Government was then clearly impressed with the importance of the matter, but regretted that no proposals involving additions to establishments could be entertained. In the present case all that is asked from Government is the grant of a subsidy to Mr. Green in aid of the production of the work now being arranged for.

The Planters' Association, it will be observed, is doing what it can, and for the information of Government, I enclose a copy of the printed circular letter addressed to all District Associations inviting their support also in aid of Mr. Green's work.

I further beg to send for perusal under separate cover by post, a copy of Messrs. Dulan & Co.'s Prospectus as received with Mr. Green's letter to the Planters' Association.—I am, sir, your most obedient servant,

(Sgd.) A. PHILIP,
Secretary to the Planters' Association of Ceylon

(Minute and Resolution referred to)

Scale Insects "The Coccidæ of Ceylon" by E. Ernest Green.

Read letter from Mr. E. Ernest Green on the subject of his book above mentioned. Resolved:—
I. "That the Planters' Association do subscribe for two copies of Mr. Green's work and that a copy of the letter be sent to the various District Associations strongly urging on them the importance of the work to all planters." II. "That Government be urged to review the correspondence that took place between February and October, 1894, regarding the appointment of a Government Entomologist for Ceylon and to grant a subsidy to Mr. Green in aid of the production of the work now being arranged for."

(Copy)

Colonial Secretary's Office, Colombo, 10th March, 1896.

Sir,—I am directed to acknowledge the receipt of your letter of the 26th February, 1896, relative to Mr. Ernest Green's book "The Coccidæ of Ceylon" and to state that the matter will receive consideration.—I am, sir, your obedient servant,

(Signed) J. J. THORBURN, for Col. Secretary,
The Secretary, Planters' Association of Ceylon.

(Copy)

Colonial Secretary's Office,

Colombo, 8th April 1896.

Sir,—Referring to my letter of 10th March 1896, acknowledging receipt of your communication dated 26th February last regarding Mr. E. E. Green's book on "The Coccidæ of Ceylon," I am directed to state that the Government having fully considered the request therein made have resolved to give the same support that the Planters' Association are prepared to give to the work and will therefore subscribe for two copies.

2. As regards the proposal that Mr. Green should be appointed Government Entomologist the Governor has no objection to making a purely honorary appointment on the understanding that if Mr. Green is required to perform any duties in connection with his office, his services should be rewarded by means of fees to be paid by the persons benefited.—I am, sir, your obedient servant,

(Sgd.) J. J. THORBURN,
for Colonial Secretary.

The Secretary, Planters' Association of Ceylon,

CASTOR-OIL SHADE.—A correspondent asks elsewhere whether castor-oil would do as a temporary shade until the permanent shade trees have grown up. In poor soil, it is strongly objected to on account of its greedy feeding, but if a rule is made to cut down and *bury* the young trees before they seed, we fail to see how anything but good can come of the proceeding. On rich soil the same objection applies with less force still, and if the trees are cut down *before* they seed and the foliage, etc., buried, only beneficial results should accrue. What a plant takes from the soil it retains in its wood, bark and leaves, and the only direct loss the soil undergoes is when the nitrogenous crop itself is removed. If, however, the castor seeds were allowed to ripen and the oil expressed on the estate, the resultant poonac being religiously restored to the soil, no possible harm could accrue. The oil itself is only another form of carbon, derived from the carbonic acid of the air. As most quick-growers require a large supply of water, it is highly probable that the castor-oil plant is a greedy water-drinker.—Ibid.

IMMUNIZATION AGAINST SNAKEBITE; AND VENOM.

[Abstract of lecture by Professor T. R. Fraser,
F.R.S., before the Royal Institution, March
20th, 1896, reported for "Ceylon Observer"

by R.H.F.]

Snake-bites have become so common in tropical countries whenever snakes have either received an injury or have been expecting one that the "enmity" prophesied in Genesis III, 15, between serpents and the human race, may be said to have been fulfilled. If you meet with a snake and manage only to bruise his head, he will probably turn and bruise thy heel, or any more accessible part of the body.

From the time of Pliny onwards we find remedies suggested for snake-bites. But after studying these I am forced to the conclusion that they are one and all of no effect against poison, but are merely legendary traditions handed down through the ages. Nevertheless from a remote period of time the belief has existed that a power may be acquired by men of handling venomous serpents and then of counteracting their poison; and in more modern times the same belief is found in the writings of natives, especially those of New Guinea. Among the Hottentots they squeeze out the poison of snakes, they kill and drink it saying it is a protection thereafter against that snake. Dr. Cumchbleiger (?) relates an incident in this connection. A certain fakir had been bitten by a serpent, a very poisonous one. News was brought to the Dr. who at once sent remedies. On visiting the bitten man afterwards he was surprised to find him alive and well, (as he had doubted his remedies would have been in time) He attributed the cure to the remedies he had sent. But he found them untouched, the fakir said he did not believe the snake could harm him. He allowed it to make a second bite; no harm resulted. Then the snake was allowed to bite a fowl; the Dr. took the fowl home and it died in 3 hours.

It may be instructive to associate with this belief the fact that venomous serpents are themselves protected against bites from their own and other species. Venom must somehow have been introduced into their bodies from other serpents. We are convinced that it must have some power of protection caused by the direct result of the absorption of venom into the system. Experiments therefore would be able to prove this.

By a succession of minute doses, animals became able to receive a portion of venom without any injury. For some years I had to relinquish these experiments until I received further consignments of venom from friends in India and some from the India Office. From America I have got venom of a species of a rattlesnake, and also from Australia a considerable number of venoms of different serpents.

The result of the inoculation of toxins as well as protoxins of vegetable substances suggested that toxin of venom might be similarly experimented with.

Sewell and Henty succeeded in proving that certain animals such as pigs and rabbits thus experimented on might safely receive more than the lethal dose is, the minimum amount necessary to kill a small animal.

In 1894 Calmet published evidence containing the results of earlier investigations showing that he had succeeded in safely administering to rabbits about 35 milligrammes each, after 8 or 9 months working with gradually increasing doses.

Here I may mention that hypochloride of calcium is a good antidote to poison.

The venoms that have been used are four, namely those of,—(1) the cobra; (2) the *crutilus horridus* (?) an American snake; (3) the colubrine serpent from Australia. (4) the *Haemacetes* from Africa. These were chosen to represent the difference in the venoms of the serpents of the four countries.

The minimum lethal dose for a guinea-pig, a rabbit, a white rabbit and a frog, showed considerable differences. For a frog the dose was $\frac{1}{4}$ milligrammes; for a cat the somewhat large dose of 5 milligrammes was required, a kitten needed about $\frac{1}{2}$ of that amount; while one of the innocuous grass snakes needed the

relatively large dose of 6 times that amount. The venom here used was the cobra venom which takes a position among the most active of known substances.

These facts have been used to render animals proof against the lethal dose or even 5 or 6 times that amount. Notwithstanding difficulties rabbits might at last receive as much as 10, 20, 30, or even 50 times the lethal dose, without manifesting any symptoms of injury. But these results were obtained only by the administration of very gradually increasing doses, each succeeding dose rendering the animal more and more capable of receiving poison with safety; eventually the increments not be less gradual so that as much as 50 times the lethal dose would be reached in considerably less than twice the time required for 24 times the lethal dose. That is to say one animal, operated on thus far, might receive enough poison to kill 50 unprotected animals of the same kind and weight in 2 hours; and the highest amount reached in the case of any one animal was 370 times the lethal dose. The time this protection will last has not yet been generally ascertained. A rabbit received 4 times the lethal dose, and 20 days after the same amount failed to produce any toxic effects.

A few experiments were made with animals which had reached a high degree of protection. It was found that safety could be secured by drying the blood serum of animals thus protected using it as an antidote; being 1-10th of the weight of the liquid and retaining its antidotal properties for 8 or 9 months, it was very convenient for storage. To it we gave the name *antivenine*. The chief interest in this substance is that it is likely to be used in a few years in the treatment of snake-bites for man.

In dealing with a horse I proceeded very cautiously, giving it at first a great many doses below the lethal dose for 52 days, and after 169 days I found it extremely difficult to go beyond 20 times the lethal dose; but by the use of antivenine I was able to go much higher.

In using the antivenine there are four ways of applying the poison and this antidote by introducing it into the skin:

(1.) When mixed outside the body and then introduced into the skin.

(2.) When introduced in opposite sides of the body.

(3.) When introduced into the same place one after the other.

(4.) When introduced into the same place one after the other with 40 minutes' interval between the poison and the antivenine.

In the first method with the minimum lethal dose it required $\frac{1}{25100}$ part of a cubic centimetre of antivenine—i.e. $\frac{1}{150}$ part of a drop, to counteract the effects of the poison. But when one comes higher the amount of antivenine has to be more than proportionately increased. Nevertheless the amount still remains wonderfully small, only 3 cc. being necessary to prevent injury from 10 times the lethal dose. By the second and third methods similar results have been obtained. These results are in marked contrast to those obtained when an antidote acts because of its physiological properties suggesting that the change in the system produced by introducing a poison and an antidote is of a chemical rather than a physiological nature. By the fourth method we see the antidotal power of antivenine. .65 cc. introduced 30 minutes after the lethal dose of venom prevents harm, and after $1\frac{1}{2}$ hours interval 3.2 cc. of antivenine will stop the lethal dose of poison from being fatal i.e. $\frac{1}{2}$ an hour before remedy would be too late.

Here again the extraordinary difference in the required quantities of the antivenine and the poison point to a chemical change in the system as the effect of the combination.

To discover the stomaclic effects of the poison, it was mixed with milk and rats were given it to drink.

Results:—(1.) We succeeded in discovering that complete immunization against venom could be produced by gradual doses in this way.

(2.) We were able to discover the amount of antivenine to counteract the minimum lethal dose in similar circumstances.

Both these facts showed us again the charge must have been chemical; that it was not a mere tolerance of the body that was produced physiologically. [Here, a portion of the lecture left out.—Reporter.]

Human life might be saved in a considerable if not a large proportion. 20,000 deaths from snake bites occur annually in India, but this does not include the many thousands in the other tropical and sub-tropical regions of the world.

Here is how one of the London dailies reports the lecture:—

SNAKE-BITE AND SAFETY.—At the Royal Institution, Professor T. R. Fraser, F.R.S., who has been conducting investigations for some time past into the question of immunity from the after-effects of snake-bite, gave an address on the subject. The lecturer explained the laborious experiments which have been conducted during the past few years. Briefly, it was found that if animals, such as cats, rabbits, guinea-pigs, and the like, are inoculated by gradually increasing quantities of cobra and other deadly snake poisons, they ultimately acquire a complete immunity. The investigators next set to work to study the effects thus produced upon the blood-serum of the inoculated animals, an ultimately by cultivation in serum of horses a powerful "anti-venine" was obtained, which gave most surprising results when injected into other animals. The effect was to give complete immunity against any fatal effect from snake poison. If cobra venom were previously mixed with the anti-venine in a glass and then injected into an unprotected animal, the toxic effect of the venom entirely failed. But beyond this it was found that if swallowed and taken into the stomach the anti-venine produced the same effects as if it were injected. This pointed strongly to the theory that its action was not so much physiological as chemical. In conclusion, the lecturer remarked that he had discovered in an old number of the *Lancet* a communication from a medical man in South Africa describing the practice of snake venom swallowing followed by the Kaffirs, and stating that these natives appear to be rarely affected by snake-bites.

THE INDIAN TEA CROP ESTIMATE : AN INCREASE OF 8,800,000 lb.

A special telegram to a local paper states :—The Indian tea crops is estimated at 144,250,000 lb., being 8,800,000 lb. over the actual outturn of 1895. About 128,250,000 lb. will be available for export to Great Britain. Since the estimates from the various districts were compiled, severe hailstorms have occurred in Cachar, and excessive drought in Darjeeling, Terai, and Dooars, which may have an appreciable effect on the outturn. The estimate for the crop of 1896 should, therefore be considered a full one.

BRITISH NORTH BORNEO AND ITS RESOURCES.

INTERVIEW WITH MR. W. C. COWIE. BY OUR SPECIAL COMMISSIONER.

When British capitalists take over more than 30,000 square miles of territory from an effete native ruler, and have to be responsible for the good government of the country, they must not expect an immediate return on the capital invested. The shareholders of the British North Borneo Company have waited long and waited patiently, and just as their patience was becoming exhausted a ray of light has appeared on the cloudy horizon which has hung over the State for the last fourteen years. It was in 1877 that the territory was granted in perpetuity to Baron Overbeck, Mr. Dent and their friends, and in

conferring upon the British North Borneo Company in 1881 a Royal Charter, Earl Granville, in the course of his despatch, remarked: "The experience of three years shows that the peaceful and intelligent development of the great natural resources of the country is steadily increasing, and there is every reason to believe that a sound and liberal system of administration will be established by the company, which will spread the benefits of civilisation among the native population, and open up new and important fields to British trade and enterprise and to the commerce of all nations." Since that date over a million of money has been sunk in the attempt to develop this huge territory, and the paid-up capital of the British North Borneo Company £500,000—divided into shares stands in the market today at less than £200,000 which is under the amount asked for by the promoters of many an undeveloped Westralian mining enterprise. When one comes to think about it, the whole thing is in the highest degree absurd. But there are brighter times in store for the British North Borneo Company, which, by the way, owes its initiation largely to the enterprise of Sir Alfred Dent, who is today one of the Court of Directors.

With the object of ascertaining some information as to the present position and prospects of this chartered company, I waited the other day upon Mr. William C. Cowie who has been connected with the company from its inception, who is well acquainted with the greater portion of the vast territory, and whose advise as a member of the Board has proved most valuable to his colleagues. He has been 19 years in in the country. He started the first trading stations on the east coast, and it was largely owing to his influence that the concession was granted and the territory peaceably occupied.

The interview took place in the Board room, and Mr. Cowie, in order the more thoroughly to show the huge extent of territory and explain the present developments, had unrolled the large map of British North Borneo, which covers one whole side of the spacious apartment.

"I am very pleased to meet you," he said, and if only City people knew more about the natural resources of this enormous territory the British North Borneo Company would be in a vastly different position to what it is today. However, I am glad to say that we are now making headway. As in the Malay Peninsula, so in British North Borneo, the construction of roads, telegraphs, and railways will prove the salvation of the country. We are now engaged in making all three. We are constructing a telegraph line right away from the west coast to the east coast, and already over 200 miles have been completed. I need hardly tell you that a telegraph line is the pioneer of all exploration work, and that a thorough line of communication will mean the opening up of much valuable land in the interior."

I quite agreed.

"Now," said Mr. Cowie, "I would ask you to follow me on the map in the observations I wish to make, and your readers who are desirous of information regarding the field which British North Borneo presents for the profitable employment of English capital will have no difficulty in following you if they will also consult a map of the the territory of the British North Borneo Company."

"Go ahead."

"Well, on the left you will note, on the north-west coast of the island, Brunei Bay. This is a

safe harbour for vessels at all times of the year, being partially land-locked, and is capable of accommodating not only the whole of Her Majesty's navy, but also nearly the whole of the British mercantile marine. There is no bar at its entrance, and the depth of water is sufficient in almost any portion of the bay for the largest vessel afloat. You will observe that it is practically on the highway of vessels trading between Europe, India, China, and Japan. Its distance from Cochin China is 600 miles, and Hong Kong 1,200 miles."

"Truly a magnificent harbour; and is there coal there?"

"Yes; there are two coal mines, one producing 5,000 tons of coal a month, and the other 3,000 tons."

"Surely you have advised the Admiralty, then, as to the advantages of Bunei Bay as a coaling station for Her Majesty's fleet?"

"Yes; we contend that the Bay, fortified and protected by torpedo-boats, would make a magnificent harbour of refuge, and with its unlimited coal resources would constitute an unrivalled basis in time of war."

"And what about the railway which I understand you have at last decided to build?"

"Well, the first eight miles of rail were shipped on February 29. We start from Batu Batn, at the entrance of Padas Bay, and work down to Sepitong, thence to Sapong, and eventually right away to Cowie Harbour. The connection of Sepitong with the hills will provide a fitting sanatorium for troops, the distance inland being 52 miles. The proposed line to Sapong will pass through a gorge only 70 feet wide in the central range at an elevation of 550 ft. This gorge being the only practicable pass to the interior from the bay would form an important strategic point in connection with troops stationed in the Pagalan valley—the finest tract of and in North Borneo, and already cleared. In the event of egress by Brunei Bay being cut off by hostile operations the proposed railway would afford an outlet for troops, stores, &c., at Cowie Harbour, which has been described as one of the first in the company's territories."

"Ah, I see they could enter at the northwest and get out by the east."

"Exactly so."

"And when do you expect this railway to Sapong will be completed?"

"In about two years."

"Of course it will open up a vast extent of country."

"Well, we reckon it will help to open up between 3,000 and 4,000 square miles. We have now decided to make the railway without any outside aid at all. The Moss Bay Hematite Steel Works are supplying the material, and it will be what is known as a pioneer railway, with rails 30 lb. to the yard. The material will be shipped as fast as it is required."

"And now with regard to the country which the line will open up. What are the products that will be developed?"

"Well, first of all, there is tobacco. That, I may say, is our principal product. We exported last year over \$1,000,000 worth, to Amsterdam principally. There was a shipment sent to London, but the trade simply boycotted it, and it was re-shipped to Holland, where the same people who might have purchased it direct bought it for double the figure. A great deal of our tobacco is transhipped to America. We ourselves, made between £7,000 and £8,000 worth of cigars last year, about £5,000 of which were sold by a syndicate. This shows what can be done in regard to tobacco.

"And your next most valuable product?"

"Is sago; of which we exported last year 8,744 tons."

"Tons?"

"Yes; it may sound to you a lot, but that was our export of that particular product, which in many tropical colonies is classed amongst the 'minor' products."

"Then you go in largely for coffee, do you not?"

"Well, the area under coffee is increasing, and undoubtedly will increase, but the export at present is not very considerable. The Development Corporation are cultivating 300 acres, and last month they sent out from their estate five tons, and the Taritipan Company expect to pay a dividend in 1897, at which I should not be surprised, for their coffee has realised as much as 98s per cwt. one of the top prices."

"And next to coffee?"

"I should place the jungle produce. Here is a specimen of our catch. The Bakau Syndicate, located in Glasgow, exported in 1894 \$96,350 worth, and no doubt it sold for a good deal more. This catch is made from the boiling down of the mangrove bark."

"You have splendid timber, I believe—useful for a variety of purposes?"

"Yes, our forests are very extensive. In 1894 we exported timber to the tune of over \$71,000, principally to China. The freight has hitherto killed the trade to London. But we are getting many inquiries here for our bilian wood, which is likely to come into competition with Australian hard woods for paying purposes. It is better in every way, and there is no reason why it should not be put upon the market as cheaply, seeing that we are some 3,000 miles nearer. When we get the railway built there will be no difficulty in bringing the wood down. Here is a specimen of wood which is used for panelling and decorative purposes, and one firm has promised to take all that we can supply during the next three years."

"And what are your other products?"

"Well, there are what is known as edible birds' nests, so much prized by the Chinese as an article of luxury, beeswax, blachan, camphor, cocoanuts, copra, damar, guttapercha—which will be largely increased when we open up the country—indiarubber, rice—and here I might mention that we have just put on a protective tariff of 10 per cent., hoping to get the natives to grow their own paddy—rattans—the cane of commerce—seed pearls—which the Chinese grind down and swallow—sharks' fins, beche-de-mer, and tortoise-shell. The export of all these will, of course, be largely increased as soon as we get things organised, and especially will there be an increase in timber, as three-fourths of the territory is forest land."

"But I understand the company is now showing some improvement?"

"Yes, undoubtedly, we have turned the corner; but you will understand the improvement better when I tell you that in 1891 we had a deficit of £11,579; in 1892, £7,418; in 1893; £11,057; in 1894, £2,895; whereas 1895 shows an excess of revenue over expenditure for the first time in the history of the company."

"But were there not two small dividends paid a few years ago?"

"Yes; but those were paid out of the proceeds of land sales, not out of any excess of revenue over expenditure."

"Then I gather from you, Mr. Cowie, that there are plenty of openings in British North Borneo for the introduction of British capital?"

"Abundant, and be it remembered that the land regulations are most liberal, the climate is perfect for a tropical country, for we have land available up to an altitude of 10,000 ft. Large areas of land, similar to those which have produced the tobacco from which the North Borneo State cigars are manufactured, as well as lands suitable for the growth of coffee, sugar, and other tropical products, can be purchased at reasonable rates, but to young men with a capital of £2,000 and upwards the company is prepared to issue a limited number of free grants of 500 acres each for the cultivation of coffee, tea, cinchona, and other products. I may add that the prospects of the Liberian Coffee Estates now under cultivation are most encouraging."

"And as regards labour?"

"At the present time the native labour is sufficient for all requirements, but we import Chinese from time to time as required. The white population all told numbers 300,30 being in our own employ."

"By the way, I was forgetting one most important question. What about gold?"

"Well, we have found plenty of payable alluvial gold; that the precious metal exists in the stone of the country you will note by the case of specimens on the table, which are from the Darvel Bay district. A syndicate has been formed to locate the reefs, and work the alluvial in the Sabahan River."

"And who is your present Governor?"

"Mr. Beaufort, who has succeeded Mr. Creagh, and I may say that it has been impressed upon him that while maintaining efficiency he must keep down expenses and make the company pay. I may also tell you that the corrected estimates for the present year show a surplus of over \$20,082, the revenue being set down at \$393,958, and the expenditure, including this office, at \$364,876."—*Citizen*, March 21.

"THE EMPIRE OF INDIA AND CEYLON EXHIBITION 1896."

The circular issued by the directors of the above-named exhibition conclusively demonstrates that although they are denied official co-operation by our authorities they are preparing to include representation of Ceylon in their program for the current year. We can see no possible objection to this being done. It was mentioned in our London Letter that the *Observer* was reported to have written adversely to any participation in this show being taken by the Colony. We most emphatically disclaim any intention of the kind. What we intended to do was merely to point out the necessity for some guarantee that the interests of those who might desire to exhibit should be safeguarded. The publication of the names of gentlemen who will constitute the Committee for Ceylon, we believe, should afford this. Any exhibits that parties in Ceylon should desire to forward will, we are sure, be contributed on the guarantee of these names. While Government may not undertake any financial responsibility in connection with the Exhibition we do not see that there is anything to prevent it (as indicated in J. F.'s letter which we published on Saturday) from furthering a Loan Collection illustrative of Native Industries or of lending any buildings available from Chicago; and we re-echo the hope expressed by our senior (who, after enquiries on the spot, is confident that the Exhibition will be

a great success and afford a grand advertisement for Ceylon, her products and her industries that H. E. the Governor may yet see his way to promote the Exhibition in the way indicated, and that the Planters' Association and Thirty Committee, will see that a good show of Ceylon teas, coffee and cacao is made; while Colombo merchants will forward plumbago, cinnamon oil &c. It is but too well known that gentlemen often lend their names to enterprises of the nature of this contemplated Exhibition without duly weighing the responsibility they thereby accept, and also that it frequently happens that they consider they have done enough in merely doing this. We are sure however that the Ceylon Committee will take an active and watchful part in the Exposition, feeling that it will be upon the assumption that this active part will be taken by them that exhibitors may be inclined to come forward to assist. We do not doubt the *bona fides* of the management in the least; and we hope to have an encouraging report soon from Mr. E. B. Creasy, the local agent, of the support which the Exhibition is receiving from Ceylon.

HORTICULTURE IN NEW ENGLAND.*

The evolution of the art of horticulture in New England is naturally contemporaneous with the colonisation of that country by English emigrants in the seventeenth century. The Indian tribes whom our adventurous forefathers succeeded had done but little towards cultivating the land, but no sooner had the youngest English settlements been founded, than it became necessary to till the neighbouring country in order to obtain a future supply of food. The Indian women had grown corn in small quantities, clearing the ground with their clam-shell hoes, hiding the produce in *couches* in the earth from the greedy eyes of what a seventeenth century writer, quoted by Mr. Slade, calls their "gormandising husbands," and the woods and hillsides and valleys produced quantities of wild berries and roots; but the white men, especially those later colonists who came over when the first difficult years had been surmounted, had leisure to remember the fair gardens and stately pleasaunces of their native land, and began at once to make orchards and to plant gardens, and to import trees and seeds from the Old Country to the new England over the sea. There is a love of discovery and adventure in the Anglo-Saxon race to which the history of the early British settlements in North America must especially appeal; what youthful reader need be content with a fictitious Robinson Crusoe or Man Friday when he can state his imagination with the true adventures of the Pilgrim Fathers and their faithful Indian Squanto? The settlers, in spite of many hardships for want of proper food and shelter from the rigorous New England winters, found themselves before long in a land flowing with milk and honey, the shores of Massachusetts Bay and the adjoining country yielded abundant crops when cultivated and manured, Indian fashion, with fish; and fruits and vegetables, native and imported, grew as well or even better than in the Old Country. There are many references to the planting of orchards and fruit-trees in early New England records, but Mr. Slade says (p. 112) that "few records exist of the horticultural progress during the succeeding one hundred years," and a paper written by the Hon. Paul Dudley in 1726 speaks of the cultivation of fruit and vegetables in Roxbury, but makes no mention of flowers. Boston always seems to have been celebrated for its gardens. Wood writes about 1633:—"This Towne [Boston], although it be neither the greatest nor the richest, yet it is the most noted and frequented, being the Center of the Plantations where the monthly Courts are kept. Here likewise dwells the

* *The Evolution of Horticulture in New England*. By Daniel Denison Slade. London: G. P. Putnam's Son

Governour. This place hath very good land, affording rich corne-fields, and fruitfull gardens: having likewise sweet and pleasant springs." The references to these old gardens are provokingly slight and unsatisfying. We would rather have had one clear presentment of an old-world garden revived for us than all Mr. Slade's careful and precise *catalogue raisonné* of the early residents in and around Boston, who were celebrated for their "places,"—

"And as imagination bodies forth
The form of things unknown, the poet's pen
Turns them to shapes, and gives to airy nothing
A local habitation and a name,"—

but Mr. Slade is not only the reverse of poetical or imaginative, his literary method is confused and rambling, and his style awkward and common-place, as the following passage will show:—

The gardens of Boston, in the fullest acceptation of the term, combining the useful and ornamental, the orchard, the vegetable and flowering plants (*sic*), were found in the first half of the eighteenth century, mostly attached to the residences of the more wealthy citizens. References are occasionally and briefly made by writers to a few which existed many years previously. Thus the house of Governor Winthrop, which stood nearly opposite the foot of School Street, was with the garden attached called 'The Green.' We obtain a mere glimpse of the disposition and size of the garden from any accounts extant." Even of the "most extensive and highly embellished" garden belonging to Gardiner Greene, where was seen one of the first greenhouses in Boston, Mr. Slade only says, "The entire grounds were adorned by both nature and art."

It was after the Revolution that the New Englanders had once more leisure to cultivate their gardens, and in 1801 a Botanic Garden was established in Cambridge, and a professor of botany appointed at Harvard College. Improvements in gardening and the cultivation of plants were also greatly fostered by the formation of horticultural societies, as they had been in England by the efforts of the Royal Horticultural Society and its frequent exhibitions. We cannot follow Mr. Slade into his disquisition on the three forms of modern landscape gardening, which he defines as the Gardenesque, the Picturesque, and the Formal or Geometrical. We would rather say with Addison:—"I think there are as many kinds of Gardening as of Poetry: your makers of Parterres and Flower-Gardens are Epigrammatists and Sonnetters in this Art; contrivers of Bowers and Grottos, Treillages and Cascades, are Romance writers. Wise and London are our heroic Poets. . . . As to myself, you will find by the account which I have already given you, that my Compositions in Gardening are altogether after the *Pindarick* manner, and run into the beautiful wildness of Nature, without affecting the nicer Elegancies of Art." He had already said that he was looked on as "an Humourist in Gardening," and we can imagine the delightful surprises and unexpected vistas that might be expected from such a character. We fear that Dickens would have immortalised in *Martin Chuzzlewit*, had he seen it, the extracts from an address read before the Massachusetts Horticultural Society on suggestions for the ornamentation of burial-grounds, given by Mr. Slade, with all due seriousness, on p. 144, where we read that—

"The skill and taste of the architect should be exerted in the construction of the requisite departments and avenues; and appropriate trees and plants should decorate its borders; the weeping-willow, waving its graceful drapery over the monumental marble, and the sombre foliage of the cypress should shade it; and the nodding daisy should mingle its bright and glowing tints with the native laurel of our forests."

Even a "Humourist in Gardening" could hardly imagine the "wee, modest, crimson-tipped flower" mingling its "bright and glowing tints" with those

of the native laurel of any forest; but we heartily concur in the sentiment conveyed by the author of this flight of imagination, that churchyards and cemeteries may become pages in the book of daily life decorated with flowers and tender memories, instead of bare records of our dead, into whose arid and deserted ways we could not look without a feeling of desolation. The planting of trees as memorials of a family or in commemoration of some event are the most abiding links between one generation and another. Surely nothing could better recall our common ancestry to the New Englander of this century than the contemplation of trees planted by the early settlers, such as the apple-tree "planted by Peregrine White, the first child of the Pilgrims, at Marshfield, in 1648; the pear-tree imported by Governor Prince in 1640, from England, and planted on his estate at Eastham; another pear-tree in Yarmouth set out by Anthony Thacher in 1640, and which was bearing fruit in 1872." The most indifferent and the most quarrelsome of men will bury their differences over the growing of roses and lilies, and the verdict on the white rose on the red rose side need not necessarily lead to civil war. Flowers are civilisers and hereditary peace-makers, and a great nation like the United States does well to assist at the spreading of knowledge on such a subject. The New Englanders may honestly be proud of their improvements in horticulture during the last century as recounted by Mr. Slade; at the same time we could have wished the noble art a more interesting, though possibly not a more painstaking, exponent than the author of the volume in question.—*Spectator*, March 21.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed during the week ending 28th March 1896, under the provisions of Act V of 1888.

For Improvements in or connected with Machinery or Apparatus for Drying Tea Leaf or the like.—No. 108 of 1896.—William Jackson, engineer, of Thorngrove, Mannofield, Aberdeen, North Britain, for improvements in or connected with machinery or apparatus for drying tea leaf or the like.

For Improvements in Bicycles.—No. 112 of 1896.—Albert Sheldon Weaver, piano manufacturer, of the city of Hamilton, in the county of Wentworth, and the province of Ontario, Canada, and William Jefferson Goold, Clerk, of the city of Toronto, in the county of York, and said province of Ontario, for improvements in bicycles.

For Drying and Warming all Sorts of Oil-seeds by Steam Power.—No. 118 of 1896.—Temulji Dhunjibhoi, mill manager, now residing at No. 125, Hurrogunge Road Salkia, Howrah, for drying and warming all sorts of oil-seeds, by steam power.

For Clearing and Separating Cells of Seeds, by Steam Power or Manual Labour.—No. 119 of 1896.—Temulji Dhunjibhoi, mill manager, now residing at No. 125, Hurrogunge Road, Salkia, Howrah, for cleaning and separating cells of seeds, by steam power or manual labour.

Specifications of the undermentioned inventions have been filed under the provisions of Act V of 1888.

For Improvements in Apparatus for Rolling Tea Leaf and the like.—No. 38 of 1896.—William Jackson, engineer, of Thorngrove, Mannofield, Aberdeen, North Britain, for improvements in apparatus for rolling tea leaf and the like. (Filed 23rd March 1893).—*The Indian and Eastern Engineer*, April 11.

THE KEW BULLETIN FOR FEBRUARY CONTAINS:—Cold Storage of Fruit; Decades Kewenses: XXVI.—XXVII; Dominica; New Orchids: 16; Two African Holarrhenas; Natural Sugar in Tobacco. Miscellaneous Notes.—Botanical Magazine.—Hooker's Icones Plantarum.—Hand-list of Orchids.—Water Supply.—The British Honduras Pine.—Beetle Larvæ attacking Orchids.—*Solanum torvum* in Assam.

PLANTING AND PRODUCE.

TEA IN THE CAUCASUS.—The Russian Government is about to put into practice the knowledge acquired about tea some months ago, when it sent a scientific expedition to China and Japan to study the national tea industry. This expedition has now returned with a numerous staff of Chinese and Japanese workmen, who are to initiate the Russians in all secrets connected with the growing and handling of tea. The expedition has also arranged for importing a large number of young tea-plants into Russia, and there is talk about making the Caucasian tea industry felt on the European markets.

TEA CIGARETTES.—The description given in an American paper of the effects on the smoker of a tea cigarette is not enticing. You first make your cigarette, then you smoke it and await the result. The process of making the cigarette is comparatively simple—the effect is distinctly complex. Tea leaves are dampened enough to make them uncurl, and then are rolled in paper. The first cigarette produces a feeling of dizziness, and is sufficiently nasty to, as a rule, choke off the beginner. But with perseverance the feeling of dizziness passes off, and is succeeded by intense exhilaration, which lasts as long as the cigarette. Then comes the penalty. According to the American authority mentioned, the reaction is said to be agony, for the smoke of the tea is inhaled into the lungs, and is succeeded by a horrible nausea. Food then becomes absolutely distasteful, and a cup of tea is the first thing that can be taken. Shortly after all the disagreeable effects have passed off, there comes a craving for another cigarette, which is generally surrendered to, and so the round goes on. This smoking is utterly ruinous to the nerves, and someone with a passion for statistics has calculated that twenty tea cigarettes a day equal to forty cups of tea as regards quantity, or to two hundred as regards strength.—*H. and C. Mail*, April 3.

MARKET FOR TEA SHARES.

Thursday Evening, April 2, 1896.

The approach of the Easter vacation has tended in some measure to narrow the volume of transactions in tea companies' shares, but notwithstanding this there has been a fair business in progress, and the market stocks closed with no weakening whatever in quotations.

Mincing Lane also closed firm and looks like renewed advances after Easter. "Last of the season" invoices continue to appear in the catalogues which foretell an early finish of the Indian sales, while Ceylons also seem to be in rather diminished quantities.

Fresh Issues.—There is nothing further in Dimbula Valley Pref. nor in the Ordinary.

Quoted Shares.—East Indian and Ceylon Ordinary have been marked up in the official list, where they now close $10\frac{1}{2}$ to $11\frac{1}{2}$; but there are sellers at a shade over 11. The Prefs. have been done at prices varying from $13\frac{1}{2}$ to $13\frac{3}{4}$ or thereabouts.

UNION ESTATES CO. OF CEYLON, LD.

At the first annual ordinary general meeting of the United Estates Co. of Ceylon, Ltd., held on the 18th April, the report and accounts, as published, were adopted, and a dividend of 5 per cent for 1895 was declared. There were present Messrs. C. Young (in the Chair), G. W. Carlyon, G. H. Alston, W. D. Gibbon, Directors; Messrs. J. Wilson, A. Thomson, H. Tarrant, E. S. Anderson, W. Moir, C. A. Leelunan, W. H. Figg; Mr. G. Walker, Major G. L. Gwatkin, Messrs. A. Deane and S. E. Tench (by their Attorney Mr. W. D. Gibbon), and Mr. J. MacLiesh (by his proxy Mr. E. S. Anderson.) It was mentioned at the meeting that in this week's *Government Gazette* a notice appeared assessing the estates in the district for the extension of the Deniyaya road 5 miles in the direction of Hayes estate.

THE REPORT

is as follows:—

	ACREAGE.						
	Tea in full bearing.	Tea in partial bearing.	Tea not in bearing.	Cocoa in bearing.	Cocoa not in bearing.	Total Cultivated.	Grass Jungle & Waste land.
Hayes	405	11	—	—	—	416	790
Gongalla	90	12	—	—	—	102	471
Dea Ella	111	78	50	31	39	309	177
	606	101	50	31	39	827	1438
							2265

(On Dea Ella 260 acres of tea are interspersed with coconuts planted 30' x 30'.)

The Directors have pleasure in submitting to the Shareholders the Accounts of the Company for the past year.

Since the Company was formed the Directors have purchased, in addition to Hayes and Dea Ella (which cost R280,000), Gongalla Estate, as from the 1st June for the sum of £800 (R14,524.84), as well as acres 12 3.32 of land adjoining Hayes for the sum of R288.50. These latter purchases now form part of Hayes Estate.

The crops secured last year and the net average prices realized were as follows, viz:—

From Hayes	168,600 lb. tea average	cts. $41\frac{3}{4}$ per lb.
Gongalla	10,660 " "	" $41\frac{3}{4}$ "
	(7 months)	
Dea Ella	67,965 " "	" $39\frac{3}{4}$ "
"	44 cwt. cocoa	" R30 per cwt.
"	3,320 coconuts	" " 30 per mille

whilst the sum of R6,020.47 was obtained on Hayes by receipts for manufacturing tea for other Estates.

The prices realized for a large portion of the Hayes crop were disappointing, owing in a great measure to loss of market in consequence of the very defective means of transport from the estate which necessitated the teas being stored there for long periods and brought the bulk of the crop for sale when prices ruled low. The question of improving the outlet from the estate to the main cart road, a distance of 11 miles, has engaged the earnest attention of the Directors, and Government has already sanctioned the construction of a cart road on the grant-in-aid system for one-half the distance, whilst improvements to the remaining $5\frac{1}{2}$ miles are being made on estate account. Application to Government has also been made for the construction of an outlet road (about 4 miles in length) for Dea Ella estate.

Excluding the cost of forming the Company the profit realized was equal to $9\frac{1}{2}$ per cent per annum for the $7\frac{1}{2}$ months since the capital was called up. The net profit available for Dividend, after writing off interest to Vendors all all charges incidental to the formation of the Company and making ample provision for depreciation of Buildings and Machinery amounted to R17,276.69, or 5.40 per cent on the paid up capital, and the Directors now recommend the payment of a Dividend of 5 per cent for the period under review.

A balance of R1,276.69 will then remain to be carried forward to the current year's accounts.

The estimates for the current year are 265,000 lb. Tea and 60 cwt. Cocoa on an expenditure of R87,065, which sum includes the cost of manufacturing tea for another estate in the Hayes factory and upkeep of young products on Dea Ella.

The capital account expenditure on Hayes Estate is estimated at R11,500 for a clearing of 12 acres tea, extensions to buildings and additions to machinery. The contribution payable by Hayes for the cost of the road above referred to has not yet been assessed.

In terms of the Articles of Association all the Directors now retire, but are eligible for re-election.

Correspondence.

To the Editor.

TEA IN AMERICA.

THE BRITISH ASSOCIATION MEETING; THE PROPOSED COLONIAL EXPOSITION.

Toronto, March 5.

DEAR SIR,—We read with much interest the letter of "T. A. C." in your issue of Jan. 23rd, and as we are greatly interested in any advertisement that Ceylon teas can have in Canada, we take the liberty of correcting him as to the place in which the British Association will meet, which will be at Toronto, Canada, not at Montreal.

"T. A. C." also seems to be under the impression that the proposed Colonial exposition is to take place next year, but this is to take place this year, commencing in May next, and as soon as we are satisfied that this proposed exhibition, which is under "private auspices," will be a success, we will make arrangements to have a good Ceylon tea exhibit there.

We have been in communication with Mr. William Mackenzie about this for the last six months, and you can depend upon it that if this exhibition takes place, and is at all likely to be a success, an exhibit will be made worthy of the stand.—Yours truly, P. C. LARKIN & CO.

NEWS FROM MR. McCOMBIE MURRAY.

200 W. 41st St. New York, March 11.

DEAR SIR,—I am ashamed to refer to the date of the last kindly letter addressed to me by you. To save humiliation and space in explanation I will ask you to let "that flea stick to the wa." You requested me to write from America. Let me *now* do so, and let bygones be bygones. I shall endeavour to interest you and your readers, and, if successful, I am at your command in the future.

My ten years' absence from Ceylon must necessarily present me to the planting community as a comparative stranger, particularly as I have ceased to act as an adviser and prophet. I remember well my last letter written at the time of the formation of the first Company represented by Mr. R. E. Pineo—and the notification of my retirement as correspondent therein contained. Once again I, wrote regarding Mr. Elwood May, and since then I have been content to look on—but I doubt if anyone has reviewed with keener *latent* interest the evolution of *theory*, born of Ceylon, into results as a practical American Campaign. You must know of course somewhat of my own experience from beginning to end, how that I fought my own battles in Philadelphia from date of arrival till the end of 1889, when I ceased to exist as a Firm and that for another year I tried to work out my own salvation at a desk in Shannon's Old Tea Store (now V. R. Harkness) in Philadelphia. What I went through in experience and money is a matter of past personal history, which did not appear at the time to interest Ceylon planters very much, and certainly cannot benefit them in any way now. They have so many able writers and talkers to express like experiences in later years who are even now in their midst that I may be considered a back number.

One fact however remains to me as a solace when I look back upon the past.

I can read every letter I wrote, which appeared in your columns from the time I first advocated a Ceylon Tea Syndicate, before leaving Ceylon, to the date of my last writing, without withdrawing one single expression of my views as they are now.

Not that I would not do so willingly, and without feeling ashamed of error in judgment, for I would

be excused—but I have no reason to alter my opinions as expressed in the past, and therefore refer to all *past* arguments as applicable to the introduction of Ceylon Tea in the United States today.

To return to the date of my retirement from the Ceylon Tea business, say 1891, I, as you probably are aware, gave my attention to music as a profession, and studied "the Voice" as a specialty. I was comparatively successful, and have some reputation as an authority on the subject. As you have in your community a percentage of musicians, I will take pleasure in sending you such matter as will shew how the march of science is clearing jungles of mystery which have obstructed the light of understanding in the art of voice production.

I can do so with the assurance that I am "up to date" in my information, as I am in constant attendance at the Columbia College, New York, where scientific investigation is now being carried on by a newly discovered process which is attracting the universal attention of vocalists and prominent teachers in the profession.

When I say I have the public criticisms &c. handed to me for answer by the authorities at the College, you will be more likely to rely upon my writing, all of which passes through their hands before publication.

Until September 1st 1895, I remained in Philadelphia. I think I sent you copies of my professional circulars with cuts of my choir—in itself an innovation, as having vested girls instead of boys as choristers. Even in this, I had my battles to fight. The idea was discontenanced as "unchurchly," "unscriptural"—by some—"High Church" and "Ritualistic" by others who were of Low Church persuasion. By winning over the authorities, however, a trial service was granted, and being well prepared, the music was not only acceptable, but the appearance of the innocent little girls in their vestments banished prejudice in all but those who "would not have it, or would leave the Church."

They *did* so—for the choir was unanimously adopted (with but one dissentient) within 20 minutes of the dismissal of the congregation which was the largest ever gathered together in the Church since its erection.

Others followed, and now I presume at least half the Episcopal Churches in Philadelphia, and many in New York and other large cities, are supporting mixed vested choirs.

To leave this choir, the result of my personal training of, principally, Sunday school children of whom six are now receiving good salaries, nearly broke my heart, but after five years' service I made up my mind to make a change, and, by coming to New York, look out for a larger and unlimited field for the creation of a greater choir, built upon the same principles. I therefore tackled "Trinity," and while the Rev. Dr. Morgan Dix does not as yet see fit to increase the present appropriation of \$13,000 for music, I have not given up all hopes of at some future time getting in my work there among the 3,000 girls who are taught to *sew*. Meantime, I am honored with the position of Baritone Soloist in the Choir, and am known to most of the prominent ministers in New York City, as the advocate of the early training of young *girls* as choristers in every church. I have also been successful in introducing Ceylon tea to Dr. Dix, and while he is, of all men, the most conservative, I am *hopeful* he will recognize merit in this one *new* thing, even if he gets it through his grocer, who, he tells me has provided him with tea for 25 years.

This brings me to present interest in connection with Ceylon tea, and to the subject I will devote another, but more important chapter.—Faithfully yours,

J. McCOMBIE MURRAY.

II. CEYLON TEA IN AMERICA.

200 W., 41st St., New York.

With tea merchants, grocers and all such as handled Ceylon tea in Philadelphia, I had become personally acquainted.

Albeit I was searching for churches in New York, I could not forget my old interest. I settled down

comfortably in rooms on 45th St. West of Broadway, and in course of time became acquainted with the district. I called for Ceylon tea at three grocers' before I found it, and when I did so, I got a package—familiar—so familiar to me in appearance. I crossed over to a drug store for some medicine and what should stare me in the face, but the same package. Within two weeks I found two other drug stores exhibiting the same, and I thought to myself "there is life in the old dog yet." I had of course heard of the wind up of the Ceylon Planters' Tea Company, and could scarcely understand where the life emanated from. I called upon Mr. William Groves, whose office I had occupied for many months in Philadelphia. I knew he had put \$10,000 hard cash in the enterprise, and thought he would probably know something about it. He seemed resigned, wonderfully so, and while I was sorry for him, I admired his pluck. He told me Mr. May was carrying on the old brands on his own account, and spoke highly of him, suggested I should look him up, &c. That the Company failed to find the enterprise profitable was no surprise to me, but to find Mr. May surrounded by walls of oriental drapery all alone, with some 10,000 lb. of tea in stock, and all the packing paraphernalia of the business in the immediate vicinity, was like a dream of by-gone days.

This, then, was the "old dog" who was slow to die. "Yes—I have the tea in 110 drug stores in New York and Brooklyn. 'Here are today's orders, this for 120 lb., another for 25 lb. and so on. My year commenced in, May, and I will have sold about 25,000 lb. by August but next year, I hope to reach 50,000."

That sounded well for Ceylon tea, but as it goes direct to consumers, thought I, suppose Mr. May had not persevered, and thrown over the whole thing as a thankless and unprofitable interest, who would serve me with the tea I wanted? How comes it that American capitalists who cannot sleep at night in their anxiety for opportunity to invest money to advantage, are leaving Ceylon tea unrecognized?

"How about it, Mr. May?"

"I have made it my interest for life"—was his answer to my question to this effect. "I am not losing by it, on the contrary making it profitable; but as I am independent of revenue from this source, I put all profit back into the business, that is, advertising."

"Do you recollect," I asked "of my discouraging the attempt to cover all the United States as a field for introducing the tea, and arguing for concentration of attention to New York city alone as the centre of all channels into the country?"

"Yes, and that was my idea also, but most of the money was gone before I held the reins."

"How about the blends? Did I not argue with the planters from the first, the necessity of presenting the tea in this form, as well as pure?"

"Yes, and here they are."

Oh, how hard it is to convince the English, Scotch or Irish of truth when it does not stand out as the interpreter of personal opinion. For the Britisher to allow that "nationality" embraces variety of ways, means and manners, as "country" does climate and clothing is an effort if not a condescension.

I forgot who Mr. May mentioned (but I think it was Mr. Mackenzie) as having remarked after his experiences at Chicago, when he met him at Broadway: "Ceylon tea isn't wanted in this country."

Nor is it, Ceylon tea is *not* the tea to "treat" the American to, *at present*. I don't care how carefully it is made, or how good the quality, 19 out of 20 don't like it, and the other one is not American. We, of course tell them they don't "know," and they are generally courteous enough to admit it, but at the same time honest enough to say they can live without the knowledge and still be happy. That won't do. We force it on them until they find us tiresome and shew it.

If they use it for a time, they of course acquire the taste, but what a business to engage in for life with only one life to live!

Now, we British claim that if we are blunt we are honest and just, and after a long silence during which

I have watched the crusade, I want to stop into the ring once more.

During the season of the exposition, and previous to that, Ceylon tea was, as a figure of speech in everybody's mouth, and I really thought it would soon find a home in their stomachs. It was "getting there," and grocers *had* to have it; there was "so much talk about it you know."

All of a sudden, something happened. A general feeling of *pride* had seemed to characterize the remark "Oh, yes, I've tasted it, *fine* tea and more to it than China tea" &c. but *something* happened, and I don't hear anything or see anything about it any more—except through Elwood May's channels.

As I was returning on the elevated railway after leaving Mr. May's office, I thought of the Ceylon tea enterprise in the light of an English Company who built such a track at great expense, ran a few decorated and illuminated trains up and down at odd intervals, composed of cars to which the people were not accustomed, and then left them standing for the American people to laugh at while they allowed other companies to run their old cars on their semi-abandoned plant.

I really feel sorry for Ceylon, and I am honest in expressing my sympathy with Mr. May in his determination to keep at least one of the new cars running.

If it is suggestive of the failure of the entire train which was lately seen and the trumpet calls which proceeded from it, it is not Mr. May's fault? It was a British train, and the bulk of the capital that built the plant was conjured out of the pockets of Americans by Mr. May? This is *true*—and Ceylon planters *must*, in common *justice*, acknowledge that through Mr. May they got 30 times more advertising for their tea than was ever paid for out of *their* pockets, and while he saved his money, I have yet to understand how he *made* any. One thing is certain. He gave his *time*, and so many years of his life to an undivided interest in the introduction of the most unpopular article that was ever put on the market. So did I, and my money too—but I was interested as one of the pioneer planters and "inebriated by the exuberance of my own verbosity" as such. I had a real tea estate of my own planting, and I am glad to hear that somebody is getting out the rupees that I put into it. What amazes me is that the planting community have to all appearance, retreated from the bombardment of America on the failure of the attack of a small force (assisted by American interest) to subjugate the whole country, leaving an American to shoot away at his own people with their abandoned guns.

Why don't you ask this gentleman to come out to Ceylon? I haven't asked him if he would go at your *invitation*, but did advise him to take the trip. He said as much as that it was not on account of lack of interest that he *didn't*, as he felt that he could meet the planters face to face and command their confidence in himself and in his line of *tactics*, while dealing in his own country with American people. "But" he said, "I have been subjected to a great deal of unjust criticism, and if I am told to mind my own business after what I have done, the time may come, and *will* come, when the aspect of our position generally will be changed. You may be surprised if I tell you that the gentleman who had just gone out as you came in, and he is in a position to know, told me that I sell more tea in packet than any other 'packet' firm in the country—including Tectley and Lipton, and I take pride in keeping up the standard which is more than can be said of all 'packet' dealers."

Now, however, comes an argument which will give everybody, *so* disposed, a chance to open fire on Mr. May, and *yet*, let me say *hold!* He says "Why will they deny *me* any personal benefit, if, by suggesting a means whereby *they* are themselves benefited, I came in for *my* share? If they will back *me* up, I will guarantee benefit to them. For instance suppose they sent me \$500 every month for five years, and had a bond from the American Surety Co. indemnifying them for every dollar that was not expended in accordance with such agree-

ment as they and I myself would formulate, what better protection could they have? No salary or incidental expenses are involved.

Great suggestion, you will say, for Mr. May to make! Who gets the profit on the tea sold by our advertising? Who *wouldn't* go to New York and set up business on these terms, even in Ceylon tea? Just so. You would *pass over* the result of such expenditure to yourselves as a community because the retail profits all fall to one man. You forget that you are by the expenditure of \$500 monthly, selling your tea at a profit and establishing a market in New York City. You are not yourselves secured against overproduction, unless you secure yourselves by providing a market, and if you fail in New York, you fail in America.

Let me say, right here, that I am not influenced by Mr. May in writing this letter which may appear to be penned in his interest. Mr. May has my respect as a man who is *really* interested in Ceylon tea, and his ideas have been laid before me without reserve subject to my judgment as having lived for years with Americans, and knowing how they receive it on first acquaintance.

I know Ceylon planters, and am one of them. I only wish I was back, like every man who ever set foot on the soil. Give me a chance and pay my passage and you won't have to cry your eyes out before you can see me.

I will refer to the Hon. Mr. Grinlinton or Mr. Mackenzie whether the principles employed in my argument throughout are not substantially correct—apart from *individual interest* questions which do not concern me.

I do of course look upon Mr. May as *one* who is most peculiarly and pre-eminently suited to represent the planting interests in America. I never met a man more talented in the art of seducing *American* people from pre-conceived ideas of what they believe to be—say—their own *taste*. He knows their weak points, and all he wants is the *bait*. He knows where to *place* it. He is a bait himself if you use him, but you should *fatten* the bait so he can tempt the fish.

Let me illustrate. Mr. May made a remark which I thought was rather a reflection upon the planters, and really called for, although, said very incidentally. "Mr. Murray, don't you think I have shewn a good deal of the interest in Ceylon, as a stranger, and pulled the same purse strings of my friends pretty freely in the interest! And yet I have never received a vote of thanks for anything I have done since the Company was wound up. Is this so?" Now may I suggest a plan (without being looked upon as too officious) by which you can recognize him, and bring your produce before the cream of American Society? The idea is suggested by another—viz. his own—which was to have a magnificent set of elephant's feet placed in Tiffany's window representing 'The introduction of Ceylon Tea in America.' Merely an *idea* of course, but an idea which would be impressed upon the minds of *American Society*. Now why not recognize *him* officially in some such way, and put his *name* on it. Has he not, as a matter of *fact*, been instrumental in diverting about a quarter of a million dollars from the Stock Exchange into the pages of the American papers in the interest of Ceylon Tea? That the money was *lost* to those who invested, is to be regretted, but who are those who received the benefit? The tea was sold, and who sold the tea? The planters are *indebted* to Mr. May, and they should show their appreciation of the fact. Whatever you do or don't do, let me advise you not to ignore a man who has done and is doing so much for Ceylon.

It is easy to see that he feels very sore about it, and it is "the last straw that breaks the camel's back." It is not for me to dictate to the planters as to who they shall or shall not trust as their standard-bearer over here, but I think it would be to their interest to at least invite Mr. May out to Ceylon, pay his expenses, and look him all over yourselves. Then you need seek no one's advice, as you can all form your own judgment of him. I agree with him that it is not in the range of possibility for an Eng-

lishman to work out the introduction of Ceylon Tea *successfully* in America. I myself could not have done what Mr. May did. Mr. Pineo worked hard with plenty of your money, but with little effect. Mr. Grinlinton can speak for himself, and his failure in America stands out in strong contrast with his success as a businessman elsewhere. Mr. Mackenzie divided his interest with India, and of course did not fully represent Ceylon.

This policy was surely rather an injury to Ceylon than otherwise?

Let me say once for all. It is not the short-lived method of noisy advertising alone for six months that will accomplish what you want in America, but it is the constant "'Ammer, 'Ammer, 'Ammer, on the 'ard 'igh roads'".

Some one *must* represent you in constant daily watchfulness year after year, and the sooner you realize the necessity of appointing some one to represent you in this capacity, the better for you and your interests. Messrs. Thompson or Geo. White & Co.—I forget which—published in their price current a few months ago, the following:—That while the exports of Ceylon tea had increased during the past year as a whole, the exports to the United States had shewn a falling off—and this, mark you, on the heads of the largest expenditure yet indulged in to win the American market.

If you can hold out any hope that my conveying what I know to be facts to you, will bring about any practical result, command me in the future.—Very faithfully yours,

J. McCOMBIE MURRAY.

I have recently heard that the estimate crop of Ceylon tea for the ensuing year is 100,000,000 lb.! What are you going to do with it? J. McC. M.

BRITISH NORTH BORNEO: ERRATA.

Sandakan, North Borneo, March 15.

MY DEAR "OBSERVER,"—Your P. D. has made an awful hash of my letter on British North Borneo to Mr. Duff Tytler, printed in your issue of 1st Feb., by inserting the words *bad* and *yams*. What I wrote was "*good soil*" and "*any amount of game*."—Yours sincerely,

HENRY WALKER.

[We greatly regret the blunders; but are glad that Mr. Walker is able to write and point them out, having, we hope, quite recovered from his recent illness.—ED. T.A.]

THE SALUBRITY OF SOUTH WYNAAD.

Kandy, April 2.

DEAR SIR,—Referring to Messrs. Parry & Co.'s and my advertisements of land for sale in South Wynaad, and wishing to have an authoritative opinion from the former on the salubrity of South Wynaad, I received from Messrs. Parry & Co. a letter, extract from which I send you for publication, and which no doubt will interest your readers. Thanking you in anticipation,—I remain, yours faithfully,

W. D. GIBBON.

(Extract from Messrs. Parry & Co.'s letter dated 21st March.)

"With regard to the controversy which you refer to, and which is going on in your local papers and ours as to the unhealthiness of the Wynaad, we would point out that we have invariably had as many coolies as we required in the Wynaad during the so-called feverish months of April and May, and they have not died off like "rotten sheep." We contend that the reason why coolies leave in March for their homes, is on account of there being little or no work for them, the Wynaad being at present a *coffee* not a *tea* district. As regards Europeans, we can name several who live right through the year in Wynaad without going away.

"The disparaging reports, which have of late been about regarding the unhealthiness of the Wynaad, have been spread by men who do not desire to see any development of the Tea Industry in Wynaad, as they fear if large openings are made labor will become expensive. In this they are mistaken, as we are satisfied there is ample labor to be had near at hand for any amount of openings at same labor rates."

THE LADYBIRD BEETLES FOR GREEN BUG.

Ohiya, April 2.

DEAR SIR,—I have just heard from Prof. Henry Tryon, of Brisbane, with reference to my application for the larva of the ladybird beetle, and I enclose for your perusal his letter, which you may make what use of you like, as it was through the courtesy of your Mr. John Ferguson that I learnt to whom to apply for the beetles. I am writing to Prof. Tryon to send me a consignment of the *Cryptolæmus Montrougierei*, and I trust that success will attend its introduction.—
Yours faithfully,
GEO. H. GREEN.

N.B.—Probably by the time they arrive, my brother Mr. E. E. Green will be back in Ceylon and able to take charge of them.

Letter referred to.

DEAR SIR,—Your letter of 25th October, addressed to Mr. C. A. Bernays of this city has been referred to me on my return from a protracted visit to New Guinea. With reference to your application for predaceous beetles that you may test their efficacy in coping with the "Green Bug" that attacks your coffee. I may mention that I could only obtain here but few of either *Vedalia Cardinalis* or *Norius Kœbeli* and indeed not many of *Rhizobius ventralis*. There is, however, a fourth scymnid beetle, *Cryptolæmus montrougierei* whose existence and predaceous habits I first directed attention a few years since, that occurs here in plenty. This I shall be able to procure for you in a few months' time and will do so should you wish it. *Cryptolæmus* has already been introduced to Honolulu by my friend Albert Kœbele, and has already rendered great benefit to planters there by destroying some of their worst pests. Whilst apologising for not being able to at once comply with your wishes, I am, dear sir, faithfully yours,
HENRY TRYON, Entomologist.

THE RE-EXPORT OF TEA.

Colombo, April 8.

DEAR SIR,—There are a few points in your interesting article under the above heading to which we would like to reply. The figures although encouraging prove conclusively that as yet Ceylon tea has no real share in any of the great markets beyond those of the United Kingdom and Australia.

Dealing with your surmise that probably some of the 2,288,895 lb. exported to Germany found its way into Holland,—you will find that nearly the whole of this quantity was exported to Königsberg, clearly indicating its destination to be Russia. Any supplies reaching Holland through Germany would be sent from Hamburg; but there is no necessity for tea going from London to Holland to touch Germany, for there is a constant regular service of steamers between London and Rotterdam; and you may take it that all the tea drawn from London reaches Holland in this way. The reason of Holland taking more Indian tea than Ceylon is explained by the fact that the largest dealers in tea there will not buy Ceylon and is a very large buyer of Indian; and moreover before Ceylon teas makes much progress in this and the German markets, some improvement must be made in the general make and style of the leaf of medium Ceylon pekoes and pekoo souchong. The same complaints about appearance are made both in the States and Canada, and many American firms are buying Indians today

on account of the superiority of their leaf alone. Rough-leaved teas, however good in liquor, will not be taken in the States where they have got accustomed to the wiry well rolled leaf of Japan tea. This is a question worthy of planters' consideration: for there is no market in which leaf is not an important point. To turn to the figures of America upon which you lay special stress, we find from the American Customs returns that rather over 80 million pounds of Japan and China tea were imported as against four of Indian and Ceylon. Taking the figures of Messrs. Gow, Wilson & Stanton as reported by you, viz: 1,423,573 of Ceylon, this leaves 2½ million pounds of Indian, which is far more in accordance with what our own experience would lead us to imagine were the relative proportions of the consumption of the two grades. Reducing the domestic averages down to ounces per capita for comparison this gives

Coffee	144
Japan and China tea	20
India and Ceylon	1

proving what a large field is offered in this one market alone for Ceylon tea, and how small the progress at present made. We have no official Customs returns before us of Canadian Imports, but we know many firms there who are using four chests of Indian to one of Ceylon—again entirely owing to the superiority of the leaf of the Indian. To get a real share in these markets, it is essential that more tea should be sold locally of a suitable character, and the grades chiefly required are as follows:—Good leafed low grown teas, and as an example of leaf and general style, we would quote Vogan, the manufacture of which does great credit to the manager of the estate. Well made pekoo souchongs and pekoes with Ceylon flavor, and under this heading such teas as Glasgows, Glentilts, Glassaugh, Brownlows, Tientsins, High Forests, may be quoted as examples.

Wiry leafed orange pekoes such as Dunbars, Agra Ouvah, Ottery, Stamford Hill, for which grades the local market is by far the best. Dusts of all kinds and good leafed broken pekoo free from dust.

Why so much prejudice against printing locally should exist amongst planters, we cannot understand, and we return to this point again at a time, when London prices may emphasize what we have previously written upon this point.

From the London Circulars of March 20th it will be seen that the great bulk of low grown pekoo sou realized from 4½d to 5½d per lb. and for Ceylon flavored grades of the same description—fine liquoring teas—5½d and in a very few instances 7½d low grown pks. 5½d to 6½d. Ceylon flavored pekoes 7½d to 8½d; and these prices rule in face of favorable re-export returns and a strong home statistical position. What prices would have ruled had not a large proportion of last year's increase been sent to other markets? Each year, what is taking place now in London occurs, dealers naturally refusing to hold stock in anticipation of the large exports of the next few months. It is generally estimated that there will be a further increase in the exports this year, of 10 per cent and we feel sure that planters will at no very distant date have to face even lower prices than those at present ruling, if what we advocate is not adopted, which is the only true method of forcing Ceylon Tea into Colonial and Foreign Markets. Of about 20 million pounds sold last year in Colombo, a proportion of which was unsuitable for any market outside Great Britain, and only there at a very low price, 12,200,000 lb. were exported direct to countries other than England, and a further large quantity was transhipped at London and sent without being landed, to America, the Colonies and the Continent. It is at this increasing trade that the Dock Company's unwise circulars to oversee charges is directed. The existing high London charges have already removed from London to Hamburg, the great bulk of the China tea for distribution in Germany, Holland etc., and if persisted in, the tea now going in English bottoms to London for transhipment, will go in the excellent German or other foreign steamers at the disposal of merchants and the transhipments will take place at Hamburg or Antwerp instead of, as hitherto, London. The present London rates on tea

are far too high and instead of being raised, ought to be distinctly reduced; but as long as they are maintained even at the present level, the only chance of competing with Japan and China is by selling locally, and getting the teas to the countries of consumption, without being handicapped by having to pay the heavy impost incurred in London Dock and Landing Charges.

Apologizing for the length of this letter,—We remain, yours faithfully, CROSSFIELD, LAMPARD & Co.

TRADE IN BRITISH NORTH BORNEO.

DER SIR,—It will interest such of your readers as are on the outlook for fresh fields to invest money in to hear how trade progresses in British North Borneo. Trade Statistics' (Export and Import) are very cheering:—

In 1895 the Exports show an increase of \$334,815 over 1894.

In 1895 the Imports show an increase of \$263,839, over 1894.

Total increase \$598,654, which is fully 19 per cent.

The exports are naturally the more interesting. Tobacco exports have increased by \$132,666. Coffee by \$13,295 (for this product the cultivation is young) Copra \$15,000, the same remark applies to this as to Coffee, Rice and Paddy show an increase of \$6,265. The *British North Borneo Herald* points out in reference to Copra "that with the numerous Coconut Plantations coming into bearing, this important industry is provided with a permanent yearly increase."

The construction of the Telegraph Line from the East Coast to West Coast is making good progress. Seven miles of Railway on the West Coast are to be constructed at once. Yours truly,
W. D. GIBBON.

INCREASING THE CONSUMPTION OF BRAZILIAN COFFEE.—The *Rio News* of the 10th ultimo has the following:—

The recommendations of the commission appointed by the several coffee-producing States to report on means for increasing the consumption of coffee, will probably be approved by all the States in question. It is a popular fad to employ commissions and artificial means to settle all such questions, and discussion therefore may be hopeless. We shall venture, however, to characterize the whole proceeding, from inception to conclusion, as a serious mistake and certain failure. It is not the first official propaganda of this character which Brazil has known, but no lessons were learned from them, and consequently no one will oppose a repetition. If the published unofficial report of the commission's recommendations is correct, fixed commissions are to be sent to Europe to ask people to buy and drink Brazilian coffee, and 2,000,000\$ will be expended in this way the first year. After that the expenditure will be reduced to 1,000,000\$ a year. Besides this, foreign governments are to be asked to reduce their import duties on Brazilian coffee. In view of the 11 per cent export duty imposed here on this same coffee, which it is not proposed to change, such an application will hardly be considered seriously. It is to be regretted that so important a question is treated so superficially. There has been no discussion of its merits, everyone taking it for granted that it is wise and timely. But is it wise and timely? Is it wise to encourage the extension of this one industry, particularly at a time when production is being everywhere increased and is overtaking consumption? Is it wise "to keep all our eggs in one basket," or to develop one industry alone? Would it not be wiser to encourage some other industry and leave coffee to take care of itself? Is it timely to incur such an expense just now when the country is meeting so many financial difficulties? And is it just to take public money, contributed by all classes and occupations, for the benefit of one particular industry? A candid answer to these questions will probably show that a mistake is about to be made.

THE ART OF IRRIGATION.

CENTURY MAGAZINE.

Irrigation as a practical art is generally misunderstood in localities where it is never applied. Even in parts of the West where it is sorely needed the prejudice against it was formerly so strong that its advocacy was repressed as scarcely better than a traitorous "libel" on the country. Irrigation, at first thought, seems like a somewhat sorry expedient to remedy the shortcomings of the weather clerk, and is quite generally regarded as a crude Western device of merely local interest. These impressions completely reverse the facts of the matter. Irrigation is a perfectly natural and familiar process. The man who waters his plot of grass, and the woman who waters her dooryard pansies, are irrigators in a rude and humble way. The citizen who grumbles at the sight of withered lawns in a public park during a dry summer yearns for irrigation without knowing it. The Western farmer who has learned to irrigate thinks it would be quite as illogical for him to leave the watering of his potato-patch to the caprice of the clouds as for the housewife to defer her wash-day until she could catch rain-water in her tubs. A generation which has harnessed the lightning should see nothing incongruous in the ancient process of storing the rain and distributing it to meet the varying needs of plants which nourish human life.

But although irrigation is both ancient and universal, the Anglo-Saxon never dealt with it in a large way until the last half-century, when he found it to be the indispensable condition of settlement in large portions of western America, Australia, and South Africa. Through all the centuries of the past the art has been the exclusive possession of Indian, Latin, and Mongolian races. Its earliest modern traces in this country are found in the small gardens of the mission fathers of southern California. They brought the method from Mexico and taught it to the Indians. But the real cradle of American irrigation as a practicable industry is Utah. A treasured historical painting in Salt Lake City shows the pioneers of 1847 in the act of turning the waters of the mountain stream now known as City Creek upon the alkaline desert. This picture commemorates the opening scene in the new industrial drama of arid America. In the hands of the Indians and Mexicans of the Southwest irrigation was a stagnant art, but the white population has studied it with the same enthusiasm which it bestows upon electricity and new mining processes. The lower races merely knew that if crops were expected to grow on dry land they must be artificially watered. They proceeded to pour on the water by the rudest method. The Anglo-Saxon demanded to know why crops required water, and how and when it could best be supplied to meet their diverse needs. He has sought this knowledge through the medium of agricultural colleges, experimental farms, and neighbourhood associations. He has thus approached by gradual steps true scientific methods, which are producing results unknown before in any part of the world.

The earliest method of irrigation is known as flooding, and is generally applied by means of shallow basins. A plot of ground near the river or ditch from which water is to be drawn is enclosed by low embankments called checks. These checks are multiplied until the whole field is covered. The water is then drawn into the highest basin, permitted to stand until the ground is thoroughly soaked, and then drawn off by a small

gate into the next basin. This process is repeated until the entire field is irrigated. This is the system practised on the Nile, where the basins sometimes cover several square miles each, while in the West they are often no more than four hundred feet square. There is both a crude and a skilful way to accomplish the operation of flooding, and there is a wide difference in the results obtained by the two methods. The Indian and Mexican irrigators, in their ignorance and laziness, seldom attempt to grade the surface of the ground. They permit water to remain in stagnant pools where there are depressions, while high places stand out as dusty islands for generations. All except very sandy soils bake in the hot sunshine after being flooded, and the crude way to remedy the matter is to turn on more water. Water in excess is an injury, and both the soil and the crops resent this method of treatment. The skilful irrigator grades the soil to an even slope of about one inch to every hundred inches, filling depressions and levelling high places. He "rushes" the water over the plot as rapidly as possible, and when the ground has dried sufficiently cultivates the soil thoroughly, thus allowing the air to penetrate it. The best irrigators have abandoned the check system altogether, and have invented better methods of flooding the crops. Cereals and grasses must always be irrigated by flooding, but the check system seems likely to remain only in the land of Spanish speech and tradition where it was born. In Colorado wheat and grass are generally irrigated by a system of shallow plow-furrows run diagonally across a field. The water is turned from these upon the ground, and permitted to spread out into a hundred small rills, following the contour of the land. Some farmers bestow great pains upon this method, and succeed in wetting the ground very thoroughly. Another method of flooding fields is now much used in connection with alfalfa, a wonderful forage-plant extensively cultivated throughout the arid region. This produces three crops a year in the North and six crops in the South, and is not only eaten by stock, but by poultry and swine. To find the best method of watering this valuable crop has been the object of careful study and experiment in the West. It is now accomplished by means of shallow indentations or creases which are not as large as furrows, but accomplish the same purpose. These are made by a simple implement at intervals of about 12 inches. They effect a very thorough and even wetting of the ground.—*Public Opinion*, March 27.

TRADE OF BRITISH NORTH BORNEO. IN 1894-1895.

As a rule, trade returns are very dry reading, but the comparative statements of Imports and Exports from and to foreign countries which we are able to publish are of great value to all who take an interest in the State of North Borneo. Our requirements and products are shown in alphabetical order under the five different stations, Sandakan, Silam, Kudat, Gaya and Padas. The increase or decrease is given for each heading. This is done with a four-sided object, *viz.*, not only to show the ups and downs, but to enable officers to explain the latter, and if possible to arrest them. The figures are as follows:—

	1895.	1894.	Increase.
Imports ..	\$1,962,350.19	1,698,543.91	263,806.28
Exports ..	\$1,663,906.64	1,329,066.86	334,839.78
Volume of Trade	\$3,626,256.83	3,027,610.77	
Increase ..			\$598,646.06
			or over 19 per cent.

Does this look like "declining trade" as some misinformed correspondent referred to in our last issue stated? We will let the figures speak for themselves. "The slight correction" which we gave in that issue gave the increase for Sandakan alone at \$323,000 odd dollars, but as will now be seen from the Returns those figures were under the mark by nearly \$20,006. The increase for the whole territory is \$598,646, but what is more satisfactory is the fact that every station contributes largely to make it.

The imports are given under 35 headings, of these 23 show an increase.

The chief imports and increases are rice, grain and flour \$58,233, cloth \$58,683, iron-ware \$23,406, spirits and wines, \$18,247, treasure \$14,943, kerosine oil \$9,062, live stock \$6,472, opium \$20,580, damar \$21,481, fruits and vegetables \$90,80.75 and sundries \$29,477.

The Exports are also given under 39 different headings of which 26 show large increases; the more important being under tobacco which has improved by \$132,667, damar \$23,116,utch \$17,710, gutta \$16,187, india-rubber \$13,670, coffee \$13,295, rice and paddy \$6,255, dry fish \$5,181, sundries \$36,398. The most remarkable increase is in coffee which has sprung from \$1,559 in 1894 to \$14,851 in 1895. It should also be noted that this is exclusive of the local consumption. Coffee is indeed coming to the front as one of our most successful agricultural products. Gambier is also very promising and after providing for local consumption \$966 worth was exported. Cotton has made a fair start and before long we hope to see this and other fibres largely grown and exported. The Government are very wisely giving every encouragement to the pioneers of these fibres and sugar. It is not a case of experimenting or any risk of capital; cotton may be seen thriving under the most advance circumstances even amongst grass 2 feet high.

North Borneo is offered as a home for ramie or China grass or sisil. As for sugar, one has only to look at the luxuriant growth round almost every native house to be satisfied as to its future.

For young men with a capital of not less than £2,000 free grants of 500 acres for the cultivation of these products which have been proved to grow with success *viz.*, coffee, tea, cinchona, tapioca, &c. If any reader thinks we are digressing—that this is not trade—our answer is, we may as well show how trade can be further increased. Copra has increased by \$1,500 and with the numerous cocount plantations coming into bearing this important industry is provided with a permanent yearly increase. The heavy increases shown under bees-wax, camphor, damar, guttapercha, and India-rubber go to prove that our jungle produce is not exhausted; on the contrary. Telegraph roads and railways are being made.

It is true that there is a falling off of \$12,135 in rattans; but why? is easily answered; the natives, especially in the interior stopped cutting them in order to help to make the Telegraph. There are other decreases which we will try to explain.

Blachan that curry condiment which represents in the animal kingdom what a preserved durian does in the vegetable (we always like to be a long way from both) shows a decrease of \$910. Here there seems to have been a falling off as the Revenue from it, so far as ascertained, is also short for 1895.

Sago and sago flour exports have fallen off by about \$12,000; this is also due to the Telegraph and roads.

The sea produce under seaweed, seed-pearls and trepang show a decrease of \$8,852.13. As regards seed-pearls the season had not arrived but the people are now working at the banks. Under trepang the falling off is due to Kudat, and if we mistake not is owing to want of proper record, the collection of the export duty being farmed by a Chinese firm. The few headings of decreases compared with those showing such large increases when compared with 1894 proves that the progress is solid at every station and \$598,646 better on the total.—*British North Borneo Herald*, March 16,

BLACKSTONE ESTATE COMPANY,
LIMITED.

A special meeting of the shareholders of this Company was held in the Registered Office, Baillie Street (Messrs. Carson & Co.'s) on the 17th April. Mr. J. N. Campbell, Chairman, presided, and present were: Messrs. H. Creasy, G. J. Jameson, E. R. Waldoxk, F. Macindoe (by his attorney, Mr. Jameson), Messrs. Carson & Co represented by Mr. Jameson, and Mr. F. A. Fairlie (by his attorney, Mr. J. N. Campbell.)

Notice calling the meeting having been read, it was resolved on the motion of Mr. JAMESON, seconded by Mr. H. CREASY:—"To sanction the increase of the Capital of the Company to R160,000 (Rupees One hundred and Sixty thousand) by the issue of Three hundred New Shares of Rupees One hundred each fully paid."

Proposed by Mr. CAMPBELL and seconded by Mr. WALDOCK:—"To sanction the purchase of Kenilworth Estate by the Company".—Carried.

Proposed by Mr. CREASY and seconded by Mr. JAMESON:—"To authorise the Directors to borrow a sum of R15,000 (Fifteen thousand Rupees) for the purpose of the Company."—Carried.

INDIAN AND CEYLON TEAS IN AMERICA.

Those who are responsible for the active branch of the work of pushing the sale of India and Ceylon teas in the United States are carrying on the campaign with vigour and ability. The newspapers are opening the eyes of the tea consuming public in America to the advantages of India and Ceylon teas over those of China, and facts as well as figures are printed from time to time to the same purpose. It is no doubt a big task to combat the opposition of those who control the trade in China and Japan teas and capture the market from them. It is no easy matter to break down prejudice and win over the consumers, but this is being attempted with energy and tact. The *American Grocer* is instructing the trade on the subject, and may be regarded as an advocate of the Indian and Ceylon tea industry in the best interests of the American tea trade. In a number of the *Shipping and Commercial List and New York Price Current* just received, the tea question is dealt with at great length, and the remarkable growth in the consumption of India and Ceylon tea in America, as well as the work of Messrs. Blechynden and McKenzie, are acknowledged.

"INCREASE IN THE CONSUMPTION."

Under this head the journal referred to says: "From the official figures just at hand from the shipping ports of Colombo, Calcutta, and London we find that in 1890 the total consumption in the United States and Canada was 2,364,152 lb. while in 1895 it had grown to 9,283,114 lb. Most marked had been the increase during 1895, as compared with the previous year, it reaching almost 4,000,000 lb. or an increase of 72 per cent.

"The year 1891 showed an increase of less than 300,000 lb. over 1890. During 1892 there was a gain of less than 600,000 lb. In 1893 the increase was slightly over 1,000,000 lb. In 1894 the gain made was a trifle larger than in the previous year, but the last year was the one where the most material increase was shown. It should be understood, also, that the year 1895 was the only year that these teas were energetically pushed by the representatives of the tea planters in this country, who have followed a consistent and liberal advertising policy as well as an intelligent and judicious one. India and Ceylon teas are gradually taking the place of the China black teas, and as the people come to understand that no foreign colouring substances are used, and that in the matter of preparing them for

the market they are manipulated entirely by machinery, they, of course, grow in popular favour. The taste of the American tea drinkers has been educated to green teas, and it will take a long time to educate the people of this country to India and Ceylon teas, but the work is progressing, and if each succeeding year shows the same proportionate increase it will not be many years before the teas from what was once a great coffee-growing country will be a very important factor in the tea business of this country. The diversion of trade from China and Japan teas to India and Ceylon in no way menaces the material interests of the tea dealers of this country, for even now there are few houses that do not handle them."

There is also an article with the head,

"TO EXCLUDE INFERIOR TEAS."

"A plan has been sketched out by Appraiser Bunn, of this port, to restrict or prevent the entry of inferior teas instead of resorting to tariff measures. He admits that the present law is inadequate. It has been an utter failure, and the official examination of teas, accompanied by so-called arbitration, could never be considered anything but a farce. Mr. Bunn refers particularly to the bogus teas, which are not grown but manufactured from spurious leaves, tea dust, decayed vegetable matter, gypsum, earth, and colouring material. The mixture is made to look quite handsome to the inexperienced eye, and its sale returns good profits to unprincipled retailers. A chromo thrown in with every purchase makes the ignorant consumer apparently satisfied. There is no question about the legitimate trade being injured, and Mr. Bunn proposes to regain lost ground by needed legislation. He is not prepared to say that the imposition of a duty would keep out the objectionable grades, but he says emphatically that the administration of the present law is defective by failing to protect consumers. Ever since March 2nd, 1883, it has been unlawful to import any tea adulterated with spurious leaf or exhausted leaves, or which contained so great an admixture of chemicals or deleterious substances as to make the tea unfit for use. The statute is all right so far as it discriminates in quality, but the provision on arbitration is all wrong, and it has caused considerable friction between the examiner, the arbitrators, and importers. Rejected teas find their way to interior markets without difficulty by being exported, as required by law, and then coming back to another port, where inspection is not so rigid.

"The proposition before the trade is to limit the number of ports where teas may be entered and examined. The necessity for such action will be made apparent when it is stated that there are at least seventy-one ports for the entry of merchandise, with appraisers at thirteen. Tea examiners are to be found only at New York, Chicago, and San Francisco. It is recommended that the Government establish standards, taking five samples of Pingsuey teas, such as extra, first, low grade, pea leaf, and young Hyson; also samples of low grade Congou, Amoy, Japan, Formosa, Ceylon, Assam, and low grade Japan dust. An expert examiner is wanted at every port, and instead of the shiftless method of arbitration now in practice it is suggested that a board of five arbitrators be appointed to serve at each port where tea is entered, the appointment to be made by the Secretary of the Treasury, and the members of each board to have had an experience of ten years in the tea trade. Finally, a Government office to be created for the supervising examiner, whose duties would be to see that the law in relation to tea was being enforced everywhere.

"These suggestions of Mr. Bunn are a vast improvement over the present system, and they deserve more consideration than the tariff proposition. As the latter is practically buried in the House of Representatives it would be well for the tea trade to agitate the necessary reform in admitting tea, so that something definite could be undertaken and pushed through before Congress adjourns. If Mr. Bunn is too conservative or too radical in his views another plan of operation can be drawn from his timely hints.—*H. & C. Mail*, April 3.

TEA IN THE UNITED STATES.

THE STORM IN THE TEACUP.

CONTRIBUTED BY AN AMERICAN CORRESPONDENT.

"Oh, that mine adversary would write a book." Well, he has not done so, but he has made a confession. The leading importers of China and Japan teas have admitted, in a report to Congress, that they are unable to supply the country with clean uncoloured teas. Does not this also imply that they have been importing bad and filthy teas for years?

The difficulty they now admit has not arisen suddenly. Importers into England, Australia, and many other countries found it out long ago. It was a curious question to inquire into the subtle probings of the importing mind which prompted this confession at this juncture. Can it any way be connected with alleged holdings of immense stocks of cheap Amoy, as some cynics assert, or has the importing conscience been stirred by parallel movements in municipal government tending towards purification of the streets, closing of saloons and brothels, the weeding out of police, &c.? There is no doubt when a sudden enthusiasm for cleanliness and purification sets in, it sweeps by eddies and side currents into channels which it was hardly expected to reach.

Explanation of the phenomena might well be sought in that direction but we are inclined to ascribe it rather to bitter disappointment on the part of the small importing body because after honest and strenuous efforts maintained for years to procure clean and wholesome teas from the far Orient, they find it is impossible. The habits and circumstances of the owners of the small tea gardens in China and Japan are such that cleanliness in manufacture is unattainable. The temptation to colour teas artificially by the addition of plumbago and many other substances is irresistible and in the absence of rolling and firing machinery, these operations must be carried out by filthy and sweating hands, arms, and feet, often covered with dangerous sores. No wonder that one of these importing gentlemen says, "The tea testers would as soon quench their thirst from a Chinaman's bath as swallow the stuff they supply to the public."

But, as these importing gentlemen have now made confession, we must credit them with the intention of amendment; and setting aside the question of why they have so long clung to these unclean teas, let us see whether there is any truth in the alleged difficulty of obtaining the pure and wholesome article. At the price they admit such teas have been sold wholesale, viz., 10c per lb, we at once admit the difficulty. From 10c subtract profits here, charges in importing from China, export duties there (which are heavy), cost of re-firing and packing at shipping port, profits of middlemen who buy the teas from the small farmers in the interior, &c., transport from interior, and it will be seen that its original grower cannot get 2c per lb. for his tea. Can Jap or John be blamed if for such a price he is not over concerned as to the quality?

The average amount of leaf gathered daily by a labourer is about 16 lb., which gives 4 lb. of dry tea. Supposing the wage paid be only 4c a day, this reduces the grower's price by half, or leaves him 1c per lb. and it is well known that this is about the amount he gets on an average.

The Chinaman's garden is anything from a quarter of an acre upwards. The European planters in Ceylon and India own gardens running from 200 acres to thousands of acres. On these they erect large factories equipped with rolling, firing, and sifting machinery. The fully-equipped factory costs about 40 dol. per acre on planted area. Good India and Ceylon teas grown on a large scale, and manufactured by steam-driven machinery, cannot possibly be laid down in New York at a price which would enable importers to sell at wholesale at 10c, nor even at 12c or 14c. Very low grade teas, unsuited for the English market, are occasionally brought over and sold here at 12c to 14c; but, excluding dust and fannings, which are little used here, the average

price of clean machine-made tea in the London wholesale market is about 9d to 10d, while fine teas may run up to 1s 6d or even 2s. Fair average teas can be landed here at 18c to 22c, and might well be retailed profitably at less than the 50c which the importers of China and Japan teas say is the usual retail price for the trash they admit they sell wholesale at 10c. If importers are sincerely anxious, as they aver, to supply the public with pure tea, they will not grudge the prices mentioned at which the teas can be procured without any difficulty; and seeing that from their greater strength such teas go nearly twice as far as Japan or China, much less being required in the pot, they are really more economical than the cheaper coloured teas.

The following figures show that pure teas are making their way in the world. From Ceylon thirteen years ago 1,000,000 lb. were shipped; in 1895, 98,000,000 lb., of which 78,000,000 lb. were consigned to England, and 20,000,000 lb. to other countries. Indian teas entered in Britain in 1874, 18,000,000 lb., now 118,000,000 lb. In 1879, 186,000,000 lb. of China tea were consumed in Great Britain, now the quantity is about 26,000,000 lb., yet the total consumption of Britain is some 80,000,000 lb. more than in 1879.

In the United States and Canada the following figures show that the people are beginning to discriminate and follow the lead of other countries.

1892	3,200,000
1893	4,300,000
1894	5,380,000
1895	9,280,000

Tea is a soothing, upholding, and invigorating beverage, and drinkers of it should buy the best, say from 60c. to 1 dol. per lb. Of these pure teas, as they are very strong, much less should be put into the pot, and the tea should be poured into the cup within four minutes. People accustomed to China and Japan teas may not like the first cup of pure machine-made tea, because of its novelty, but the second they will find tolerable, and after the third they will want it, and there will be no relapse.—*H. & C. Mail*, April 3.

THE NUWARA ELIYA TEA ESTATES COMPANY.

The first statutory meeting of this Company was held on the 25th ult. under the presidency of Mr. C. A. W. Cameron, who explained how far the statements in the prospectus had been carried out and stated that the whole of the capital had been placed without payment of any underwriting or other commission.

THE TEA MARKET

closes for the Easter holidays for a better tone and favourable prospects for future business, as prices rule at so moderate a range. It is from Ceylon that new supplies will reach in any quantity till the new season, meanwhile the stock in bond must be drawn from largely to meet the ever increasing demand. This market at the present is the cheapest in the world, and affording shippers every facility to supply their wants, be they large or small.—*L. & C. Express*, April 3.

CEYLON TEA IN AMERICA.

From our Tea Delegate in America we have received three papers which show how largely our staple product is being advertised in the West. A lot of valuable facts is given in the notices, and several of them are illustrated; One has a rather attractive sketch of a drawing-room from which representatives of Japan and China are taking their exit thus addressed by the hostess—"Go: We now use Ceylon tea exclusively, because of its purity. It has a

equal. We say 'pure teas or none'. Another has a reproduction of the well-known picture of a Ceylon maiden picking tea. In another paper there is also an article of which it is only necessary for us to quote the headings:—"Big nations drink tea; It's the favourite beverage of the bravest peoples; new sources of supply; Ceylon and India now take precedence of China and Japan as producers." From another source we have copies of Canadian papers containing attractive advertisements of "Salada" tea.

THE AGRICULTURAL MAGAZINE.

The April number of this periodical contains a number of interesting articles, as will be seen from the following table of contents:—Season notes; The Nitrogen Question again; Occasional Notes; Rainfall at the School of Agriculture during the month of March; The Peaty Deposits in the Kurunegala Tank; The management of Dairy Cattle; Paddy Pests; The Preserving of Fruit; Soil Analysis; Household Hints; The Nutritive Process in Plants; Rhea Fibre; Correspondence; and General Items.

The nitrogen question is one that affects the interests of all cultivators of land, and the reference to the influence of the "sensitive plant" on coconut soils indicates that there is a good deal yet to be learnt about the utilization of our so-called "weeds" for useful ends—viz., as an economic source of nitrogen for our cultivated crops. We hope to refer to this subject at greater length. Mr. Modder's paper on the Peaty Deposits in the Kurunegala Tank is also a valuable contribution from a careful observer.

THE STANDARD TEA COMPANY OF CEYLON, LIMITED.

Offices: 25, Fenchurch Street, London, E. C., Directors: Messrs. Alex. Brooke (chairman), Robert Kay-Shuttleworth, Norman W. Grieve, and William Rollo. Secretary: A. Trafford Brooke.

The following is from the report of the directors to the shareholders, to be substituted to the general meeting to be held on Tuesday, the 21st April:—

The profit and loss account show a profit on the working of the estates in Ceylon of £13,748 9s 2d, which, with amount brought forward from last year, less interest and home charges, shows a sum of £13,109 7s 4d available for division. In July, 1895, the directors, under the powers entrusted to them, distributed an interim dividend for the six months ending June 30th 1895, of 5 per cent (10 per cent per annum), absorbing £2,800. They now recommend a dividend at the rate of 10 per cent (making 15 per cent for the year), absorbing £5,600, the placing £1,500 against depreciation of machinery, £2,500 to reserve, and the carrying forward to the next year £709 7s 4d. The favourable results again have been aided by coffee at high prices and by a good exchange. The coffee produced in 1895 was about 680 cwt, which realised above £2,900.

The average exchange for the Company as drawers in Colombo was 1s 1½d, against 1s 1 13-32d in 1894, and against an average of 1s 3 7-32d in 1893. The rate was 1s 5 1-8d in 1891, when the Company began operations. The tea from the Company's Uda Pusellawa properties sold during 1895 averaged, in Mincing Lane, a higher price than any Ceylon estate or group of estates producing above 200,000lb. During the two previous years these teas held the same distinguished position in the market. For this much credit is due to the manager at St. Leonards. The directors have to report, with deep regret, the death in July last of their esteemed colleague, Mr. Peter Moir. To succeed him Mr. William Rollo was appointed in accordance with the articles of association. The Company's properties are now

of 3,298 acres, with 1,470 acres of tea considered in full bearing, viz.: In Uda Pusellawa—St Leonards, 725½ acres, 238 acres tea bearing; Liddesdale, 844 acres, 140 acres tea bearing; Eskdale, 235 acres, 210 acres tea bearing; Gordon, 365 acres, 74 acres tea bearing; Tulloes 450 acres 175 acres tea bearing; in Upper Maskeliya—Gouravilla and Upper Cruden, 706 acres, 633 acres, tea bearing. There are also 127 acres tea in partial bearing, and some 621 acres in addition planted with tea. On St. Leonards, Gordon, and Tulloes estates there is still a certain amount of coffee interspersed through the tea. Mr. Alexander Brooke, the director who retires by rotation, being eligible offers himself for re-election.

THE PANAWAL TEA COMPANY, LIMITED.

ANNUAL REPORT.

The Directors have the pleasure to submit the general balance sheet and profit and loss account for the year ending December 31st, 1895, duly audited—

	£	s	d.	£	s	d.
The net amount at credit of Profit and Loss Account, including balance brought forward at 31st December 1894, after providing for general expenses, Directors' and Auditors' Fees						2,991 3 8
An interim Dividend of 4 per cent on the ordinary shares for the half-year ending 30th June, was paid 21st September 1895 amounting to	680		0 0			
It is proposed to pay a final Dividend on the ordinary shares from 1st July to 31st December 1895, at the rate of 6 per cent (making a distribution for the year of 10 per cent free of Income Tax), which will absorb	1,020		0 0			
Dividends on the 7 per cent Cumulative Preference Shares were paid for 1895 in full, amounting to			371 0 0			
It is proposed to write off part of the cost of New Extensions, Machinery, &c, completed during the year	796		10 10			
Leaving to be carried forward to next year a balance of			123 12 10			
	£2,991		3 8	£2,991		3 8

The Directors recommend the distribution of a dividend at the rate of six per cent on the ordinary shares of the Company from 1st July to 31st December 1895, making, with the interim dividend paid to the 30th June 1895, a distribution at the rate of ten per cent for the year.

The acreage of the Company's properties on 31st December last was:—

	Acres.
Tea in full bearing	443
Tea in partial bearing	67
Tea under two years old	67½
Tea under one year old	100½
Jungle	379½
	1,057½

The Ceylon Manager visited the estates on the 14th, 15th, and 16th January 1896, and reports them in good order.

With a favourable season, the crop for 1896 is estimated at 200,000 lb.

Owing to the considerable increase of acreage in bearing and the prospective early large increase, the two existing factories on Ernan and Glassel estates would not be adequate for the work which would

develope upon them. The Directors considered it would be more economical apart from the question of control, to construct, work and maintain a large central factory worked by water power, of which there appears to be an ample and almost constant supply, than to construct a small third factory upon the Rangegama estate.

The construction of this central factory with large withering space is now well in hand, and the machinery from the other two factories will be used with some additions in its equipment.

It is proposed to pay the cost of this new factory, estimated at R40,000, out of profits, spreading the repayment of this expenditure over some two or three seasons. To enable the Company to do this, the Directors decided to offer to receive money upon deposit at interest for periods of 6 and 12 months and upwards, repayable thereafter at three months' notice on either side. They very quickly received £1,170, which they deemed sufficient for their present requirements. While they congratulate the shareholders upon being in the position to raise the required funds so easily, and without being to the expense of a debenture issue, they believe these deposits present a very high class security, being practically the only liability upon the Company's estates, which are estimated as worth £30,000 at the least.

The Directors considered it advisable, in order to strengthen the position of the Company, not to use the sum set aside last year for "Reserve Fund for Machinery, Depreciations, &c.," and have treated it distinctly as Reserve, taking it out of the Company's business and investing it in New South Wales 3½ cent stock, 1918.

Mr. Henry Wallace Hornby, the Director retiring by rotation, being eligible, offers himself for re-election.

Messrs. Fox, Sissons & Co., Auditors to the Company, offer themselves for re-election.—By order of the Board,
J. HOLGATE BATTEN, Secretary.

London 30th March 1896.

THE RANGALLA TEA COMPANY OF CEYLON, LIMITED.

Report of the Directors for the year ended 31st December, 1895, to be submitted at the annual general meeting of shareholders, to be held at the Company's Offices on the 26th March, 1896.

The Directors have the pleasure to submit the balance sheet and profit and loss account to the 31st December, 1895, duly audited.

From these it will be seen that a total nett profit of £3,372 5s 10d, including the balance of £1,811 2s 8d brought forward from last account, has been realized, out of which there have been paid a dividend of 7 per cent., free of Income Tax, for the year 1894, and an interim dividend at the rate of 8 per cent per annum, free of Income Tax, for the half-year ending 30th June, 1895, and the Directors now recommend a further and final dividend at the same rate, leaving a balance of £72 5s 10d to be carried forward to the present year. The result of the year's working has been satisfactory.

The Company's produce has been disposed of as follows:—

Tea	..	7,235 lb. sold in Bombay.		
"	..	194,396 " " London.		
Total of Tea	..	201,631 lb. sold, realizing	£5,803	1 10
Cardamoms	..	1,260 lb. gross 1,160 nett sold locally in Ceylon and realizing	91	1 10
"	..	1,100 lb. gross 1,012 nett, sold in London	69	4 7
Cinchona Bark	..	34,802 lb. sold in London for	52	5 9
			£6,015	14 0

The sales of tea show a nett average price per lb. of 6·90 pence, equal to 51·83 cents per lb., the exchange for the Company's drafts during the year having averaged 1s 1 5-16th d.

The Acreage of the Estate is—

Tea in bearing	..	591½ Acres.
Tea not in bearing	..	112½ "
Cardamoms	..	65½ "
Grass and Fuel Timber	..	25 "
Forest and Waste Land	..	446½ "

1,241 Acres.

the yield of tea per acre having been 340 lb.

The balance sheet shows an additional expenditure on capital account of £500 1s 4d, embracing extension of area under cultivation, and additional machinery, as well as the final payment to Government in respect of the cart road referred to in last year's Report, which has now been satisfactorily completed.

During 1895, 215 acres were manured with Castor cake and bones, and Messrs. C. Young and W. Sinclair continue to send most encouraging reports of the beneficial effects from the manuring done during the two past seasons—not only in the enhanced yield, but also in the greatly improved appearance of the tea bushes. It is proposed this year to go over again the 50 acres manured in 1891, and later on another 126 acres will be done as on account of 1897.

The Company's properties are in excellent order and good condition, and, with a favourable season, promise well for the current year.

THE BANDARAPOLA CEYLON COMPANY LIMITED.

The third annual ordinary meeting of the Bandarapola Ceylon Company, Limited, was held at the offices of the company, 16, Philpot Lane, E.C. on Monday March 30th, 1896, at twelve noon, Mr. G. W. Paine (chairman) presiding.

Notice convening the meeting having been read by the Secretary,

The Chairman said he supposed they could take the report and accounts as read. The amount on which they had to declare a dividend was £900 larger than last year, which was accounted for by the call of 10s per share, which had been made in 1895. Another call of 10s had since been made, and the ordinary shares were now £45 paid. He was sorry that the net profits were £811 less than last year. The decrease of crop as compared with 1894, 8,578 lb. was caused by the severe drought experienced in the early part of the season, and also he thought to a certain extent by the prevalence of fever and dysentery in the Matale district. Unfortunately Mr. Hugh Fraser, the managing director, had through ill-health to give up the personal charge of the company's property, but they had been fortunate in being able to again secure the services of Mr. James Anderson as manager, the latter gentleman being now in charge of the properties. Together with the deficiency of tea secured, they, in common with many other Ceylon companies, had experienced a decrease in prices, the average price for 1895 being 6·788d against 7·692d for 1894.

Mr. Paine then gave particulars of a new water supply that had been arranged for the Bungalow and the Coolie lines, and which had turned out a great success and it was hoped they would now have much less illness among the coolie labourers. He remarked that Sir George A. Pilkington, a director of the company who is now on his way home from Ceylon, recently visited the estate, and reports in a letter just received by the mail that the Mucundeniya clearing (the first one undertaken by the company after acquiring the property) is the most successful that he has ever seen, while the Managing Director writes to the board as follows:—

"Most things are progressing satisfactorily, the growing tea is looking well, the factory additions are in progress, and the Mucundeniya clearings are very promising. This year's clearing, about ninety-six acres, was burnt off, and the digging out of lantana roots, roading, &c., were begun.

"This year's clearing is likely to be as good as its predecessors, and when it is planted up, which it will be in the course of a few months, there will be about 400 acres of tea planted with fine jats (to give leaf in due course), exclusive of 200 acres cocoa, planted since the formation of the company.

"Last year's clearing is progressing very favourably, and to all appearance very little supplying will be required."

He was very pleased to report a considerable increase of crop to March 7th this year. To that date the crop secured is 53,559lb, being 25,421lb ahead of last season to same date. This year's crop to March 7 was equal to that of last year up to May 4, and nearly double that secured to March 7, 1895.

They had, as the shareholders knew, exhausted all their available capital, and to provide for the additions to the factory, which is being practically rebuilt, and the further development of the estate they proposed shortly to issue fresh capital. They had not yet decided on the amount nor the manner in which it would be issued, but probably it would be as before—viz., half in shares and half in debentures.

The Chairman then proposed "that the reports and accounts as presented to the shareholders be received and adopted."

In seconding this resolution Mr. C. J. Scott said the crop was no doubt disappointing, but in addition to the causes mentioned, he thought the large decrease was partly owing to the large acreage pruned last season, but no doubt there would be a large increase this year, and the new clearings promised excellently.

A few questions having been asked, the resolution was put to the meeting and carried unanimously.

Mr. G. W. Paine proposed, seconded by Mr. C. J. Scott, "that a final dividend of 3½ per cent, free of income tax, be declared payable, forthwith, making in all 6 per cent for the year." Carried unanimously.

On the motion of Mr. C. J. Scott, seconded by Mr. Andrew, Mr. G. W. Paine was re-elected a director of the Company.

Mr. L. F. Davies proposed, Mr. John Vicary seconded, and it was carried unanimously, that Mr. John Dalgleish, C.A. be re-elected auditor for the ensuing year.

Mr. C. J. Scott moved a vote of thanks to the Ceylon and London staffs for their efficient working of the company's property and business, and spoke in highly commendatory terms of both. Mr. Andrew seconded the motion, and the Chairman said he fully endorsed what had been said with regard to the staffs. Carried unanimously.

A vote of thanks was also passed to the chairman and directors.

Mr. Paine replied to the compliment, and the proceedings then terminated.—*H. & C. Mail*, April 3.

SUNNYGAMA (CEYLON) TEA ESTATES COMPANY, LIMITED.

Capital £70,000 divided into 2,000 preference shares, 5,000 ordinary shares of £10 each, of which 500 preference shares and 5,000 ordinary shares have been issued. Directors: Messrs. James Orichton Kinmond (chairman), William Forsythe, Robert Lyall, and R. B. Magor. Secretaries, Messrs. George Williamson & Co, 138, Leadenhall Street, London, E.C.

The following is from report submitted to the shareholders at the third ordinary general meeting held at the Company's offices yesterday (Thursday.)

Crop.—This shows a substantial increase over last season—viz.: Sunnycroft, sold in London, 1894, 284,550lb; average price, 6½d; 1895, 342,583lb; average price, 6½d. Sold in Ceylon, 1894, 48,349lb; 1895, 37,740lb. Pambagama—Sold in London, 1894, 200,115lb; average price, 6½d. 1895, 274,959lb; average price 6 11-16d. Sold in Ceylon, 1894, 25,525lb; 1895, 17,919lb. Total 1894, 558,559lb; average price, 6½d. 1895, 675,201lb; average price, 6 11-16; while the average price obtained also shows improvement. Reports from the managers are very satisfactory in regard to the im-

proved condition of the old gardens through careful treatment and pruning, while the large area of young plant is most promising, and should add very largely to the outturn of the estates during the current and succeeding years as it comes into full bearing. The accounts show a profit of £5,578 3s 2d which it is recommended to apply as follows: Interim dividend paid in September, 1895, at 4 per cent., £2,000; final dividend now recommended at 8 per cent £3,000; dividend on preference shares for half-year at 6 per cent per annum, £150; leaving a balance of £128 3s 2d to carry forward, which makes the amount at credit of revenue account, after debiting a proportion of preliminary expenses, £358 13 5d.—*H. and C. Mail*, April 3.

TEA IN AMERICA.

New York, March 25.

This market continues in the same unsatisfactory condition it has been in for months. Demand is conservative, and the general tendency of the market is in favor of buyers except on fine Formosas and low grade Japan. Greens rule steady.

Last week the Montgomery Auction and Commission Company sold 8,316 packages teas as follows: Moyune—98 Hyson, 5¼ to 7c; 729 Young Hyson, 7 to 22½c; 441 Imperial, 9 to 14½c; 516 Gunpowder 9¼ to 24½c. Ping Suey—99 Young Hyson, 8½c; 1,406 Gunpowder, 6½ to 14c; Japan—333 Pan Fired, 9 to 20c; 1,581 Congou, 7¼ to 25½c; 248 India and Orange Pekoe, 12½ to 20½c. Oolong—649 Foochow, 7¼ to 9½c; 2,532, Formosa, 12½ to 40c.

Today at noon the Montgomery Auction and Commission Company will sell 5,685 packages, viz: 1,428 half-chests Moyune, including desirable chops; 596 boxes Pingsuey; to half-chests Japan, 180 half-chest Japan, basket-fired; 1,190 half-chests and boxes Congou, including all grades; 169 packages India, Java, and Ceylon Pekoe; 2,122 half-chests and boxes Formosa, new season's.—*American Grocer*.

AGRICULTURE IN TRINIDAD.

Mr. C. W. Meaden, Manager of the Government Farm, Trinidad, writes under date 19th March:—

I beg to enclose my annual report for last year. I get your valuable magazine and frequently find most useful hints in it, in my particular line. You will observe that we are particularly fortunate in the health of our animals, and obtain good prices for them generally.

The farm land is in natural grass which is in excellent heart owing to the amount of good manure it receives from the artificial feeding the stock get. We have 250 acres under pasture sub-divided into convenient sized fields.

We have one or two Ceylon people here who are not favourably impressed with Trinidad in comparison with the "Fragrant Isle of Spices." We do not seem to have the energy here that obtains in Ceylon and which has been able to carry your Colony so surprisingly to the front with *tea*. Hoping the good success will continue.

PERAK NEWS.

From the Kuala Kangsar Monthly Report for February in the *Perak Government Gazette* we quote the following:—

Mr. R. L. Rankin put an application for 500 acres for coffee planting. Mr. Farrest, who worked for many years under Sir Graeme Elphinstone in Ceylon, has been requested to select the land and will probably obtain the management of the estate, the whole of which it is proposed to open up in the next three years.

In the Batang Padang Monthly Report for February it is stated:—

On the 21st Mr. Jansen, Manager of the French Tin Mining Company at Temoh, applied for 300 acres of land near the Company's concession, for coffee planting.

IN THE KUALA KANGSAR LAND OFFICE NOTICE, IT IS NOTIFIED.—No. 77.—AGRICULTURAL LEASE TO BE CANCELLED.—Notice is hereby given that owing to the failure of the lessees to comply with the conditions under which they acquired the below mentioned Agricultural Land, viz:—A *bona fide* commencement to open to be made within twelve months from the date of the lease—*i.e.*, from the 15th October, 1894:

In accordance with the terms and conditions contained in Government Special Circular dated Taiping the 22nd April, 1891, and the provision of Clause 8a of Order in Council No. 6 of 1891, the said lease will be cancelled and the land revert to the Government of the State on the expiration of three months from the date of publication of this notice in the *Government Gazette*, if within that time good cause be not shewn to the contrary.

—China Overland Trade Report, April 9.

THE KALUTARA COMPANY, LD.

The prospects of this Company has been issued, the properties to be acquired being Pallegodde Estate comprising 250 acres of tea in full bearing, 67 acres of tea planted in 1895, 38 acres now being opened for tea, 7 acres of coconuts and arecanuts, and 338 acres of forest.—total 700 acres more or less: price £13,000 sterling. And the adjoining estate, St. Columbkille, comprising 177 acres of tea in full bearing, 47 acres of tea planted in 1895, 5½ acres now being opened for tea, and 186 acres of forest, etc.—total 385½ acres: price R155,000.

The first issue of shares, all of which have been subscribed for is R400,000.

MALAYA AND CEYLON PLANTERS.

The paper read by Mr. Swettenham, the newly-appointed Resident-General of the Protected States in the Malay Peninsula, appears to have been, as a paper, of much general interest. But for us in Ceylon it was possessed of a particular interest. Mr. Swettenham's references to the part taken by Ceylon planters in the endeavour to introduce a planting interest into that peninsula will be read with attention by one and all of these. The lecturer was apparently driven to the admission that, in a degree—and that a sensible one—the Government of the Straits Settlements has not hitherto offered any inducement sufficient to attract or retain intending settlers from this island. The experience of those who have pioneered the industry in the peninsula has not been such as to induce others among us to fully follow the example set. Unfortunately, Mr. Swettenham would not seem to have particularized the respects in which the regulations as to land, &c., have operated adversely to success. It would have been a satisfaction to us in Ceylon had the time at his disposal admitted of his doing this. But we have to content ourselves with the statement made in general terms that the conditions as to settlement offered do not suffice to attract European settlement. The lecturer put forward a very striking test by which such an inducement might be gauged. There are no instances, he said, among the Europeans who have opened up land there for planting purposes, of any of them having realized wealth by their enterprise. Indeed, so far as we may judge from what was said on this point, it must be held that, hitherto, those who have started planting in Perak and the other protected States have not had their hopes realised. Apparently Mr. Swettenham attributes this failure to two main causes. These are—firstly the terms on which land may be acquired and held, and, secondly, the ever-present difficulty as to labour. As to this second obstacle, Mr. Swettenham appears to think that much might be done to attract the Indian coolie to the States. For ourselves we cannot but think that so long as the intending native emigrant from India can obtain all that he wants by merely crossing the streak of water that divides him from Ceylon, he will not care to venture farther afield. For a very long time to come it is doubtful if the needs of the Ceylon planters for this kind of labour will be more than met. Until the supply exceeds the demand here, there is little chance, we think, of any overflow seeking settlement in the Straits. We conceive that the lecturer, when advocating the location of natives from India therein, had chiefly in mind their establishment as local cultivators of the soil, apart from work upon estates owned and worked under European proprietorship. We should say, however, that the latter condition must precede the former. Passing from this point of the address it may be remarked that very complimentary allusion was made by Mr. Swettenham to the Civil Servants of Ceylon. He contented himself with making the claim that those of the Straits were not the inferiors of their brethren in Ceylon. Unfortunately some other speakers were not so modest. One of them at least asserted that the members of the Straits Civil Service could not be equalled as public servants throughout the world! We regret that this tendency to undue glorification should be sometimes too apparent during the discussion that follows papers read on colonial topics. It is a mistake to "protest too much." Undoubtedly Mr. Swettenham and his

fellow officers deserve encomium for what they have accomplished under circumstances of exceptional difficulty, but Mr. Swettenham would be the last to endorse the high superiority claimed for them by less responsible speakers.

COCONUT OIL IN AMERICA.

CEYLON.—It is reported that the Edmonton, with 700 tons, had put into St. Thomas in distress, which in all probability will delay its arrival for a month or six weeks at least. So far, however, the market has not changed, for the reason that those interested have had no cable replies to their requests for information as to the amount of damage sustained. Should this prove later on to be more serious than at first expected an upward turn in values will in all probability occur, as it is known that the bulk of the 700 tons, as well as the 300 tons of Cochin on board, is sold for consumption, and its non-arrival will be the source of inconvenience to many consumers who were daily expecting the arrival of these supplies to meet their current needs, which now in all probability they will be obliged to purchase at a higher figure. Already several orders are in the market at a shade under 5½c., though most holders are asking 5¼c. Sales are reported of 25 tons at 5½c. and 10 tons in lots at 5¼c.—*Oil Point and Drug Reporter.*

THE SPRING HARVEST IN BENGAL.

It appears from an Indian contemporary that taking all the principal crops together, including that is to say tobacco, sugar-cane, opium and ganja, the spring harvest in Bengal this year will be less than that of last by an area of 163,000 acres or about 1½ per cent. The general quality of the harvest is put at 11½ annas against 13½ annas, which was the figure last year. As in other provinces the autumnal drought was the cause of less land being sown, and the absence of rain since accounts for the inferiority of the crops.

MR. CHARLES LEDGER.

It is not generally known that we have still amongst us (at Konmore, near Goulburn, New South Wales), Mr. Charles Ledger, famous in two hemispheres for the introduction to Java, after most perilous adventures, of the most valuable variety of any species of Cinchona. To the last generation of Australians his name was very familiar as the introducer of alpacas and other animals into New South Wales, only accomplished, like his previous venture, after much vicissitude and actual peril.

It falls to the lot of a very few men, either in Australia or out of it, to have been the means of doing so much good to their fellow-men as Mr. Ledger has been able to effect by his introduction of Cinchona Calisaya, var. Ledgeriana. The old gentleman is still hale and hearty, and it occurred to me that this journal would be a particularly appropriate medium by which to remind our raisers of "new products" in New South Wales of the Cinchona enterprise, which, although forty years old, should be fresh in the memories of the present generation.

As regards the Cinchona, Messrs. Howard and Sons, the great quinine firm, wrote to Mr. Ledger quite recently:—"It is not too much to say that it is entirely owing to the seed received from you that Java is now supplying the world with quinine. Some of the cultivated Bolivian bark is of quality equal to the Java bark from your seed, but it seems that the cost of cultivation is much greater than in Java."

To which Mr. Ledger remarks, in a note to me:—"The expenses of cultivation are not greater in Bolivia. It is the distance from port of shipment that causes greater extra expense than in Java. From

where cut, the bark is carried on the backs of Indians out of the Monte at least 20 to 100 miles, then from 300 to 1,200 miles on donkeys or llamas to La Plas (city of 60,000 inhabitants); there it is put up in packets of 150 lb net of bark, covered with half a bullock hide (no return allowed for hide when sold), and carriage to Tacna by mules, 285 miles, then 40 miles by rail for shipment at Arica. Export duty in my time, or up to 1853, 20 dollars per quintal of 100 lb."

Messrs. Howard & Sons again write:—"There is certainly no doubt of the importance to the Dutch plantations in Java of the seed supplied by you in 1865. Almost the entire supply of bark from Java is sold as Ledgeriana, and comes from that supply. The only complaint that they could make would be that it has turned out so rich that they are supplying too much for the world to consume. C. succirubra from India and Ceylon is rapidly becoming a thing of the past. English Government plantations apparently fail to propagate your seed to more than a very small extent, and a great deal of Ledgeriana, which is grown in Ceylon, is from Java seed. It is difficult to give exact figures, but the quantity of bark from your seed now produced per year cannot be far short of 10,000,000 lb."

Although infinitely less important to the world than the Cinchona venture, Mr. Ledger's alpaca expedition has rendered him better known to Australians, and the story of the alpacas is familiar to people who lived in Sydney thirty or forty years ago.—*Agricultural Gazette of New South Wales.*

THE CEDAR FORESTS OF MOUNT MLANJE.—One of the earliest acts of Sir H. H. Johnston's administration as Commissioner in British Central Africa was to declare the great mountain mass of Mlanje, in the south-eastern corner of the British territory, Crown property. The Commissioner's main object in doing so was to protect the remnants of the magnificent cedar forests that were still found on Mlanje, and that this policy was a wise one is shown by the report which has just been addressed to the Commissioner by Mr. John M'Clounie, who is in charge of the Government's forests in that district. In this report Mr. M'Clounie says:—"I have now been all over the Ruo plateau and the Luchenya, and the Likubula gorge, and the Tuchila plateaux. The district round the source of the Tuchila is by far the best and most timbered part of the mountain. A few straggling trees are seen near the source of the Ruo and only one of any size, while the Luchenya is dotted with cedar along its slopes. The Likubula is well wooded, but the forests are almost inaccessible. On the plateau round the source of the Tuchila the ground is covered with compact cedar forests and may be estimated at 700 to 800 acres, on that around the Likubula about 200 acres, and a further 100 acres round the Luchenya. Giving the number of trees to the acre as 150, the total number of full-grown existing trees should stand at 150,000, with an average of 40 cubic feet of timber each. At the present value of 3s per cubic foot the total value of these trees would be £900,000. But if this timber was sold, as it ought to be, at 6s a cubic foot, the wealth would be doubled. As I have gone all over the woods and noticed quantity and quality, these figures may be taken as near the mark. It is no exaggeration to say that five or six years' more delay in the assumption of control over the remaining patches of cedar forest would have meant the entire extinction of this unique conifer, which there is abundant evidence to show was once indigenous to all the high mountains and plateaux in the southern part of British Central Africa. Up to the present I have cut up nothing but dead wood which, in most cases, is in good, seasonable condition. The supply of timber yearly might be considerable and not materially affect the forests for many years, especially as there are large numbers of young trees growing up in all the woods which must now be protected from fire. I have this season sown a large quantity of cedar seed which should be ready in a year to transplant. The ground to be planted must be thoroughly hoed and cleaned to remove grass, etc., and prevent fires."—*London Times*, April 1.

TEA IN AUSTRALIA.

A good business has been done in China tea, sales comprising 459 half-chests common congou, 2,850 half-chests panyong at 4½d to 5d, 300 half-chests good panyong at 6d to 6½d, 800 quarter-chests buds at 5d to 5½d, 70 quarter-chests fine buds at 8d, 200 quarter-chests S.O. pekoe at 6½d to 7d, and 200 half-chests kooloo. Ceylons have been in fair demand, and sales are reported of 500 packages at prices ranging from 6½d to 1s. Of Indians 90 packages have been sold at 6½d to 8½d. At the auction sale on Tuesday there was a good demand for Ceylon teas at steady rates. Out of 328 chests and 60 half-chests offered, sales were made of 249 chests and 69 half-chests; pekoe (123 chests and 60 half-chests) at 6½d to 8½d, and pekoe souchong (126 chests) at 6d to 7½d. Of China tea, 4,699 packages were offered, but bids in most cases were below reserves, and only 310 half-chests and 49 quarter-chests were sold at 4½d to 5½d for good common to medium panyong, 6½d to 7d for fine panyong, and 5d for buds.—*The Australasian*.

CEYLON TEA IN AMERICA.

Copies of two American papers have come to hand, containing attractive advertisements of Ceylon tea, by Messrs Bottomley & Beling. One says:—

Measure it—one teaspoonful makes three cups—it's all tea—lasts longer—a pound means more—that's your interest more than ours. It's a delicious tea, you'd buy it if it only went half as far.

In another we read:—

Sallow cheeks—too much coffee will make you bilious—try a change—tea—no, not ordinary tea, that might be worse—but pure Ceylon and India tea—Machine rolled, clean, delicate.

VARIOUS PLANTING NOTES.

ENEMIES OF CINCHONA IN CEYLON.—At a meeting of the Entomological Society on March 18:—Mr. E. E. Geen exhibited the eggs of some species of Locustidae extracted from the stem of a young cinchona tree at Punduloya, Ceylon. He said the species of the parent insect was undetermined; it was possibly either a *Cymatocera* or a *Cyrtophyllus*, both of which possess large sabre-shaped ovipositors. A slit half an inch deep and more than two inches long had been cut into the hard wood, in which the eggs had been symmetrically deposited, edge to edge, with the coloured part inwards. The greater part of each egg was of fine texture, and coloured green; but at the extremity from which the young insect would make its exit the egg-shell was soft, pliant, and beautifully reticulated. The row of flattened green eggs lying side by side resembled an acacia leaf, but as they were concealed within the stem the resemblance was apparently without motive.—*The Athenæum*.

INSECTS AS AN AID IN SURGERY.—One of the most curious uses to which insects are put was related at a recent meeting of the Linnean Society of London. It was stated that the Greek barber-surgeons of the Levant employed a large species of ant for the purpose of holding together the edges of an incised wound. The ant, held with a pair of forceps, opens its mandibles wide, and is brought near to the cut being treated, so that it can seize the two edges, which are held together for the purpose. As soon as the unfortunate ant has obtained a firm grip of the cut, its head is severed from its body. Mr. Issigonis, of Smyrna, who described the operation to the Linnean Society, said that he had seen natives with six or seven ants' heads holding together wounds in the course of healing. A similar observation was made some years ago in Brazil, which fact is interesting from an ethnological point of view, as showing the independent existence of the same custom in countries so far apart as Brazil and Asia Minor.—*Public Opinion*.

THE HYMENOPTEROUS FAUNA OF CEYLON.—At a meeting of the Zoological Society on March:—A communication was read from Lieut.-Col. C. T. Bingham on the hymenopterous fauna of Ceylon. The paper was founded mainly on the collections made in that island by Col. Yerbury and Mr. E. E. Green, and dealt only with the Monotrochous Hymenoptera, of which 335 species were recorded. Of these seven were now described as new. The author observed that this number was far less than what must actually occur in an island with so varied a climate and flora. Most of the species, as was to be expected, likewise occurred in India.—*The Athenæum*.

NOTE THE GROWTH OF CEYLON TEAS.—

The total export in 1873 was but 23 pounds; in 1883, 1,665,768 pounds; in 1892, 71,869,465 pounds, and in 1894, 85,000,000 pounds. At one time the staple industry of Ceylon was coffee, and a grand coffee, Lanka, produced by the enterprise and industry of the European planters, cultivated in the mountain ranges of the interior at from 2,500 to 5,000 feet above sea level. This industry was, however, almost destroyed in the course of a few years by the ravages of a fungoid pest known as "leaf disease," and the planters at once, with the patient energy and skill characteristic of their countrymen in Ceylon, as elsewhere, set to work to plant their lands with tea. How quickly successfully this done may be gathered from the above results.—*Grocers Criterion*, March 16.

TEA COMPANIES.—Elsewhere we publish the reports of several Tea Companies. With regard to the Panawal Company an interim dividend of 4 per cent was paid in September last, and one is now recommended of 6 per cent, making a total of 10 per cent for the year. It is a satisfactory feature of the balance sheet that close on to £800 is assigned for writing off cost of new extensions and machinery completed during the year, it having been a common practice with some companies in the past to carry such expenditure to the capital account. The estates embrace 1,057½ acres, of which all but 379½ are under cultivation with tea. The new central factory of the Company is reported to be well-advanced, and the expenditure upon it is to be spread over some two or three seasons. For the half-year ending 30th June last the shareholders of the Rangala Tea Company received an interim dividend at the rate of 8 per cent per annum, and now the directors recommend a further dividend at the same rate. The reports with regard to the result of manuring are very encouraging. The shareholders in the Standard Company are to be congratulated upon receiving a dividend of 15 per cent for the past year and upon the strong position of the concern. Coffee at high prices and a good exchange have been important factors in the favourable result. The shareholders in the Snyyama Company have also to be congratulated. In September last they received an interim dividend of 4 per cent, and now the directors have recommended a final dividend of 8 per cent, the dividend on preference shares for the half-year being at the rate of 6 per cent per annum. In this issue we also quote a report of the Bandarapola Company meeting at which a dividend of 6 per cent for the year was declared. A variety of causes contributed to a decrease in the amount of profit, but the prospects of the crop for the present year seem very good. The first statutory meeting of the Nuwara Eliya Tea Estates Co. was held on the 25th ult. when a full statement was made of the position of the Company by Mr. C. A. W. Cameron who occupied the chair.

THE TRINIDAD GOVERNMENT STOCK FARM.

The annual report on this institution for the year 1895 has reached our hands, and indicates that it is in a flourishing condition. Unlike our own Government establishment, not only cattle, but also horses and poultry are kept on the farm. The daily stock consisted at the end of the year of 258 animals; 133,308 quarts of milk were supplied to the hospitals and jail; the daily average of cows milked was 73; and the daily yield per cow throughout the year was just 5 quarts. The health of the stock, says the report, was perfect during the year. The stud at the end of 1895 consisted of a stallion, 16 mares in foal, 7 colts and fillies, 3 foals. Says the report:—"During the year 8 foals were born, three of which died from scrofulous antritis. The foals which died were born in May and June, most rainy months, when it is very difficult to obtain bedding and secure the cleanliness and comfort so necessary to foals in their early days. This points out that a close season is essential, the period to cover say May to the end of October. There has been no loss when births take place outside these months. No cure is known for the above disease or the exact cause of it." This information is important as the outcome of practical experience, and should be noted by intending breeders in Ceylon. But as regards the stud we are told that the interest in horse-breeding in Trinidad is not keen and is apparently declining so far as the breeding of useful animals is concerned; and this is shown by the fees for stud purposes only aggregating £26 for the year. In connection with the poultry department we read that 17,735 lb. of poultry and 5,798 dozen eggs were purchased for the hospitals. Here also there was apparently perfect health, and it would appear that Trinidad enjoys special advantages in the suitability of its conditions for successful stock and poultry farming. The net profit on the entire transactions of the Farm for the year under review was £1,146 or 10 per cent of the capital cost.

PARA RUBBER IN THE KALUTARA DISTRICT.

An interesting experiment in the cultivation of Para rubber is being made on Halwatura estate in the Kalutara district. About a year ago Messrs. Finlay, Muir & Co. purchased some 50,000 plants which were planted on Halwatura by Mr. Hendry. The trees, we are informed, show a surprising growth and like those on the Government experimental plantation in the same district promise well.

THE TEA MARKET.

In the tea market business is but partially resumed at firm prices. The extraordinary plethora of money (almost unendable) and the diminution in the import of staple products at this period of the year should keep market firm, as, indeed, is now the case. Export business is more extended to Russia, doubtless in view of the Coronation festivities. —*L. & C. Express*, April 10th.

MARKET FOR TEA SHARES.

THURSDAY EVENING, April 9.

The Easter holidays have considerably curtailed business in these shares during the past week, which has been really limited to three working days only. The demand especially for preference shares, still continues, and the prices of this class of share seem likely to go even higher.

MINCEING LANE market has not yet opened after the Easter holidays.

CEYLON SHARES.—C. T. P. Co. Ordinary, after changing hands at 28, are now reported buyers at 28½. Business is said to have been done in the Prefs. at 17½.

Lanka Plantations have been put up in the official list to £56s, thus bringing them however, into line only with their actual value.—*Home and Colonial Mail*, April 10.

LANTANA SCANDENS.

Lantana Scandens, or the scandalous *lantana*, as one may fairly be permitted to translate it, forms the subject of Commercial Circular No. 4 of 1895, issued by the Reporter on Economic Products to the Government of India. It appears that *lantana* spread so rapidly in Berar as to threaten the very existence of the forests. In the Annual Progress Report of the Forest Department, Hyderabad Assigned Districts, for 1893-94 the following remarks appear:—"This shrub will grow and rapidly spread at almost any elevation in Berar and in almost any soil. It covers the ground in dense masses, climbs trees to a height of twenty feet, and though it kills all grass, it thoroughly prevents the production of any tree growth. *Lantana* does not act as a bar to fire: it burns freely in the hot weather and shoots up vigorously from the roots after being burnt over." People who have witnessed *lantana* on the Western Ghats will hardly need to be told this, nor yet to learn that it grows so densely as to become perfectly impenetrable by men and cattle. *Lantana scandens* or *camara* is one of 40 species, chiefly natives of tropical and sub-tropical America, comprised in a genus of rambling shrubs belonging to the natural order *Verbenaceae*. The history or its introduction into India is curious. Mr. McKee, now a Conservator of Forests in the Central Provinces, but at one time in Coorg, states that some thirty years ago it was brought to that Province in a flower-pot by a Missionary, and used as a hedge plant. But, he adds, "it soon advanced from the hedges to the fields and hill sides and is now so fully established in the province of Coorg that it would be quite impossible even by spending lakhs of rupees to eradicate it." Mr. Prevost, a Forest Officer in Coorg, observes:—"Hundreds of coffee estates have been abandoned owing to *lantana*." Surely he is confusing cause and effect. We are under the idea that the estates were abandoned before *lantana* came in. While it is very clear from the correspondence published in this Circular that the Forest Officer must always regard the shrub as an enemy, the evil it does so far outweighing any good it may effect, the planter, on the other hand may under certain circumstances look up on it as a friend. The fact is nowhere disputed that *lantana* is a wonderful soil-improver. Owing to its shade-giving properties and density it exercises a markedly renovating effect on the land, and by rapidly overgrowing deforested tracts, such as abandoned coffee estates, it serves to retain the humus in the soil. The belief was at one time prevalent that once an estate had been overgrown by *lantana*, it was thenceforth worthless for cultivation, and surprise was expressed at the way in which tea or coffee threw on land which had been reclaimed from this shrub. We have it on the authority of experts that this success was not fortuitous, but that land becomes valuable from being under *lantana* for a certain number of years. However there is one bad result alluded to by Mr. Dickinson, formerly Conservator of Forests in Coorg but now in Berar, who writes:—"In Coorg, where the plant has spread, the natives say that the country is turning unhealthy and the water is spoiled by it. I myself fully believe this to be the case." His opinion is supported by successive analyses of water taken in Berar when a collecting basin was covered by *lantana* and at different periods after clearance. Unfortunately, we are not told in what way the growth is detrimental to water, whether by its density encouraging the breeding of the malarial microbe, or in acting directly on the water supply in some manner peculiar to itself. *Lantana* may be placed in the same class of pests as the prickly pear of the plains, the Australian rabbit and the West Indian mun goose, though it has not yet attained the same proportion of unrestrained evil as any of these, and further it possesses one markedly good point, its power to renovate the soil.—*Madras Mail*, April 22.

PLANTING AND PRODUCE,

THE MAGNITUDE OF THE INDIAN TEA INDUSTRY.—

Mr. O'Connor's statistics on tea cultivation in India, particulars of which we gave in our issue of February 7th, have had the effect of impressing people at home with the importance of the tea planting industry in India. The *Gardener's Magazine* calls the attention of its readers to this. It says: "Tea cultivation forms one of the greatest industries in the India Empire, yet few imagine the enormous areas of land devoted to the tea plant. According to information published by the Revenue and Agriculture Department of the Indian Government, it appears that at the end of 1894 not less than 422,551 acres were planted with tea, the principal districts being Assam, Cachar, Sylhet and Bengal, with smaller areas in the Punjab, Madras, Travancore and Cochin. During the past ten years the area has increased nearly 49 per cent., and during that period the tea produced has increased over 88 per cent. In 1894 383,505 persons were permanently employed on the plantations, in addition to 156,120 others who received employment temporarily. Of the total Indian tea production about 96 per cent. is exported to the United Kingdom. The home consumption of tea in India is estimated at seven million pounds, and of this quantity about two and a half million pounds are foreign produce, although one million pounds of the latter is from Ceylon. Roughly speaking, the Indian consumption per annum is one-fortieth of a pound to each person, while in the United Kingdom the annual consumption per head is from 5½lb to 5¼lb." Taking its cue from the same source, the *Board of Trade Journal* states that the prices of tea in Calcutta have fluctuated greatly since 1873. Taking the price in March, 1873, to be represented by 100, it appears that until 1884 the level was well above that point, varying from 110 to 148. Coincidentally with the great fall in exchange and in general prices in 1885 the level fell to 99, and though in 1886 it rose to 96, a low level was maintained in the following years until 1894. In 1895 the level rose to 97. These figures all represent the course of prices of fine Pekoe in January of each year as given by the Bengal Chamber of Commerce. In the Statistical Bureau the average prices of the various descriptions of tea sold at the public sales held in Calcutta during the tea season have been computed for some years past, and the results are regularly published in the review of the trade of India.

MORE FIGURES.—The *Gazette of India* contains a note by Mr. O'Connor on tea cultivation in India, which shows that the area under tea is somewhat less than half a million acres, about two-thirds of which is in the Brahmaputra and Surma Valleys—that is, in Assam, Cachar, and Sylhet. The figures given by Mr. O'Connor show that tea cultivation is almost wholly confined to Bengal and Assam, the tea gardens elsewhere being only 7 per cent of the area under tea. At present the cultivation in India is concentrated almost entirely in districts with a damp and equable climate, where repeated pickings are possible. One point brought out clearly by the returns is that for years past there has been no check to the growth of the industry, which annually shows a considerable expansion. Every year since 1885 has seen an increase in the area cultivated, ranging from over 9,000 acres in 1889 to nearly 27,000 acres in 1894; and the percentage of increase is growing. The largest increase of all, Mr. O'Connor observes, was in 1893 and 1894, "the former of these being the years in which the mints were closed, an event which was regarded by some as the herald of disaster to the tea industry." One table given by Mr. O'Connor shows how completely the tea gardens of India are dependent on the external demand, the consumption of India being trifling in comparison with the whole production. Thus, in 1894 nearly 125 million pounds of tea were produced in India, of which all but 4½ million pounds were exported. If to this be added the amount of Ceylon tea consumed in India—nearly 2½ million pounds—it is seen that the population of India consumes about 7 million pounds a year, or about one-

fortieth of a pound per head, or one-hundredth part of the consumption of the United Kingdom. Indeed, if the quantity consumed by the small European population of India, including the army, be deducted, there would not be very much left for the native population. Mr. O'Connor, however, records that the consumption of tea is increasing amongst the native population in the larger towns especially amongst the Mohammedans.

INDIAN TEA IN SOUTH AFRICA.—*Apropos* of foreign markets a gentleman formerly connected with planting in Assam, who has recently returned from South Africa, has been much impressed with the possibility of establishing a new market for British-grown tea in that part of the world. In a letter addressed to Indian Tea Association he says:—"I have lately returned from that country; and cannot understand how it is that it should not have been discovered as an outlet for British tea before. You have an ever increasing British population in that country, and everything in favour of it becoming a very considerable relief to the London market. To begin with, you have in South Africa an essentially tea-drinking population, which is the reverse to the American taste, who, I believe, prefer green to black. During my stay in South Africa I had exceptional opportunities for finding out whether tea was really wanted. I have no hesitation in saying that the people of South Africa will only be too glad to get good tea if it is only brought to them, and will pay well for it. But unless it is pushed they will be content to drink the present inferior China and Natal tea or none at all. In Johannesburg you have a large mining population, and Rhodesia is fast becoming the same, and, as everyone knows, the miner prefers tea to alcohol, and with liquor at the enormous prices it is he will drink more tea if he can get it good."—*H. and C. Mail*, April 10.

CEYLON TEA.

(From the *Grocer*.)

At this season of the year it is the custom with some of the leading brokers interested in Ceylon tea to take a review of the trade in that article for the previous eight months, the period for the heaviest shipments to the United Kingdom being nearly over, whilst the time is drawing nigh for much lighter supplies of tea to come forward from that island. From the different statements that have been prepared we gather that the total quantity disposed of in London by auction during 1895 was 950,000 packages, as contrasted with 876,000 packages in 1894, and 834,000 packages in 1893. The equivalent weight of the last year's supply in pounds avoirdupois was about 80,000,000 lb, in comparison with 74,000,000 lb. and 69,000,000 lb. in the other seasons; while the average price obtained was only 8½d to 8d in 1894 and 1895, and 9½d per lb. in the preceding year. This depreciation in value was, of course, due to a deterioration in the character of the earlier arrivals, which contained a larger proportion of inferior grades than before; and, in the glut that followed the liberal importations of common sorts of Indian teas later on, prices were constantly beaten down to very low points. Where, however, the quality possessed any degree of strength, or was fairly rich in cup, it was sure to command special attention, more particularly so when exporters were in the market as competitors for the higher class descriptions, and medium to fine growths of pekoe and pekoe souchongs went at relatively firm rates, whilst anything that was exceptionally choice and scarce withal fetched a decided advance.

The most astonishing fact, however, in connection with the industry in Ceylon tea is the rapid and extraordinary rate at which the article has been produced. For it was no longer ago than 1876-78 that the first consignments arrived in this country, and these, too, were very petty, comprising in the three years only about 5,500 lb in all. But in 1881-82 the parcels imported increased to 623,000 lb; again every year afterwards the supply was doubled or trebled, till in 1887-88 it was augmented to 15,614,000 lb; and, leaping forwards with gigantic strides, it reached

34,000,000 lb in 1889-90, fully 50,000,000 lb in the succeeding year, above 72,000,000 lb in 1893-94, and ultimately reaching (as estimated) no less than 85,000,000 lb for 1895-96. These are enormous amounts, equalled only by the consumption itself, which has followed closely upon the heels of production, the deliveries lately averaging about 6,500,000 lb. per month, or 78,000,000 lb. per annum; and the stock on hand at this port now forms an aggregate of 17,575,000 lb., against 17,482,800 lb. at the end of March, 1895. The quantities of Ceylon tea passing through the United Kingdom for transhipment to places abroad likewise constitute a feature of growing importance to the trade in general. During the year 1895 the total clearances hence without paying duty expanded to 7,093,000 lb., in lieu of 5,124,000 lb. in 1894, and 4,066,000 lb. in 1893. A great proportion of the exports penetrate into remote parts of Russian territory, where the taste for Ceylon tea is being more widely cultivated every year.

With regard to the future Messrs. Geo. White and Co. observe that "The gradual falling-on in the consumption of China Congon, which will possibly be intensified in the near future, should help the sale of British-grown tea as the demand for the colonies and America, as well as Russia and other places, is steadily expanding, consequent on the persistent efforts made to that end in those countries under the auspices of both the Indian and Ceylon Tea Associations. Without such aid production bids fair to outstrip consumption, as is already the case with some other articles from the East. The unsatisfactory results of Calcutta and Colombo purchases, especially where they have been held over, are in a measure attributable to the non-keeping qualities of a large portion of the year's shipments—more apparent in the produce of an unfavourable season than when the liquor is rich and full in flavour. Invoices printed on 'importers' account' do not, in busy times, receive the same attention from London buyers as direct shipments from the gardens, and as purchasers often only taste the latter, the question of having a separate time for the sale of these has been mooted. In the event, therefore, of an increasing output in the chief producing countries, it will be desirable, if possible for attention to be directed to the make of choice descriptions, with the special characteristics for which certain districts have already secured a reputation." The power to push and extend the sale and consumption of Ceylon tea undoubtedly rests with the London buyers, who have a motive for searching out new market when the supply is greatly in excess of the immediate requirements of the home trade.—*H. & C. Mail*, April 15.

THE GRIEVANCES OF THE COFFEE TRADE.

Last week there was a meeting of importers, exporters, home trade dealers, and brokers connected with the coffee trade held at the Commercial Sale Rooms, Minicing Lane, London, to consider a memorial which it is proposed to send to the Chancellor of the Exchequer (Sir Michael Hicks-Beach, M.P.) on the subject of formulating a system for the better working of coffees in bond. Mr. Robert Wales (Messrs. Moffatt and Co.) presided, and amongst those present were Messrs. G. Rouse (R. J. Rouse and Co.), chairman of the Coffee Brokers' Association, Brown (Carey and Brown), J. A. Davies (Peek Bros and Winch, Ltd.), Keeble (J. Travers and Sons, Ltd.), Boyes (E. Boyes and Co.), Asser (Asser and Co.), and J. C. Sanderson (Sanderson and Co.), hon. sec.

The Chairman said a fortnight ago those interested in the trade met and formed a committee to draft a memorial to be sent to the Chancellor of the Exchequer in regard to the objects which they had in view. The considerations which guided them in drawing up the memorial were that they should be brief and practical, and that the views they held should be put before the Chancellor of the Exchequer in the best possible way. But what they urged very strongly was the abolition of the duty as the most

effective method of doing away with the difficulties which at present existed in the trade.

Mr. Sanderson then read the draft of the memorial proposed to be sent to the Chancellor of the Exchequer, as follows:

"In your reply to the deputation which waited upon you at the House of Commons on February 27th last, you stated that you were willing to consider any suggestion the coffee trade wished to put forward for a rearrangement of the present system of working coffees in London. In order to ascertain the general wishes of the trade, a meeting was held at the London Commercial Sale Rooms on Thursday, March 12, when the following resolution was unanimously carried:—'That a Committee of importers, exporters, home trade dealers and brokers be formed with the object of formulating a system for the better working of coffees in bond, and that the Committee do report to a general meeting of the trade the result of their deliberations, prior to placing it in the hands of the Chancellor of the Exchequer for consideration.'

"The committee appointed was as follows: Mr. Oscar Schwartz, representing Messrs. F. Huth and Co.; Mr. Ed. Landsberg, representing Landsberg and Co.; Mr. Robert Wales, representing Moffatt and Co.; Mr. J. A. Davies, representing Peek Brothers and Winch, Ltd.; Mr. Geo. Rouse, representing R. J. Rouse and Co.; Mr. E. A. Rucker, representing I. A. Rucker and Bencraft; Mr. J. C. Sanderson, representing Sanderson and Co.; Mr. Julius Ehemann, representing Edmund Schluter and Co.

"This report has been drawn up and approved by the trade; it is now placed in your hands, and your petitioners trust that you will give it a favourable consideration. Our present system of handling coffee is an antiquated one, suitable perhaps to the conditions of trade current years ago, before the opening of the Suez Canal, when coffee arrived in sailing vessels, before cost and freight and arrival business were in vogue, and when London as an *entrepot* was on the up-grade, and not subject to severe competition. No individual in the coffee trade can remember the period at which our present system, with its restrictions, became inaugurated, so antiquated is it. The following figures show how the coffee trade of the United Kingdom has declined during the last twenty-seven years: The total imports into Europe from all countries in 1879 was 337,654 tons, of which 77,416 tons came to the United Kingdom; in 1888 (the year the Emancipation Act in the Brazils was passed) the European imports were 381,700 tons, of which 47,700 tons came to the United Kingdom, while in 1895 European imports had increased to 490,800 tons, and the United Kingdom imports had fallen to 38,800 tons; or, in other words, in 1869 our imports were about 23 per cent of the total European imports; in 1888 they had fallen to about 13 per cent; while in 1895 they were only about 8 per cent.

"Your petitioners state that the present system of working coffee by the Customs is as follows:—1. Coffee is landed, banded, and weighed under the eye of the Custom House officer. The last operation is done after the package is closed up, and any weight over the even pound is not taken account of, thus the importer usually suffers a loss in weight, which, with a change of system, may be avoided. 2. As each import is kept by the rotation number of the ship, with marks, piles, and numbers, the Customs will not permit an importer to mix together lots of similar quality and marks (unless they are imported in the same ship), either at the time of landing or afterwards, without petitioning the Customs, which operation entails serious delay, and is too costly, especially in the case of small parcels.

"As regards the necessity for facilities, we point out that the tendency is for coffee to arrive less and less in a condition for the roaster; that in the Brazils, since the abolition of slavery in 1888, the huge crop, averaging 400,000 tons of coffee, of which we get the absurdly small portion of about 5,000 to 8,000 tons, comes in a far less prepared state than it was wont to do, and that from other countries partly

owing to labour difficulties, the tendency is markedly in the same direction.

"It is, therefore, necessary to apply a free port principle to the London docks and wharves, because our arrivals, Germany, France, Belgium, Holland, Austria, &c., are placed as follows:—Germany: Hamburg, a free section of the port adjoining the Elbe, where the Custom House official has no *locus standi*. In Germany certain firms in the interior are given every possible facility, coffees in their own warehouses being still in bond. France: Differential duties against all European competitors and ports, subsidised steamer lines, the producing countries and New York being the favoured place, Bringing in New York as not subject to the differential duty is clever. In France the ports become practically free, because a shipper sending his coffee there secures all options of other ports, and yet saves the differential duty if it eventually suits him to sell his produce in France. Belgium: Antwerp, coffees invoiced in and invoiced out of warehouses without any reference to ships, marks, packages, &c. Stocks taken at intervals, on notice being previously given, the warehouse keeper being subject to a fine of ten times the ordinary duty on any weight of coffee missing. What a wise action on the part of the Belgian Government, as otherwise the whole trade would have gone to Holland: No duty. Austria Trieste, practically a free port.

"We would therefore humbly suggest: (a) That the import or the owner should have facilities, so as to handle coffee in any way he may desire, in order to put it before the buyer in a condition agreeable to each special market and each special buyer. (b) That he should be allowed to dry, pick, bulk, or mix, blend, and polish coffee in the same manner as owners can in Continental ports. (c) That he should be able to roast, grind and pack any quantity in bond, with the option of using it either for export or for home consumption. (d) That all packages should be weighed to an even pound, and closed up after the weight is taken. (e) And that the system of taring should aim at giving, as near as possible, the actual tare of a package.

"In fact, the owner of the coffee should have absolute freedom in handling and working, either in the public docks or private warehouses owned by firms of repute, such firms to give guarantees or a bond for the due fulfilment of carrying out what they undertake. The committee recommend that the Antwerp system should be adopted.

"In England, especially in London, there has existed for many years a policy of *laissez faire*, but we maintain that abroad the greatest interest is evinced by the different Governments in the various trades with very beneficial results.

"In London we have cheaper money than anywhere else, and many things are more favourable than on the Continent for developing business, but we find our port is nevertheless decreasing rapidly as an *entrepot*, and we believe that as our market becomes smaller our home trade will be forced to buy in the Continental markets, and will eventually die a natural death.

"Take away the local market and, in our opinion, the consumption will further decline; we shall then require no facilities, and the Exchequer will suffer accordingly. Your petitioners, therefore, pray you will grant them the facilities asked if you still find it impossible to abolish the duty."

Mr. Keeble asked whether it was proposed to benefit the home trade or the export trade.

The Chairman replied that the object they had in view was to benefit the export and import and the home trade; therefore, they desired to do what was for the advantage of the whole trade.

A discussion took place on the question of over-weights, which Mr. Boyes averred went somewhere, but did not reach London, and also on the subject of the tare, and on the suggestion of Mr. Keeble the paragraph (e) in the memorial dealing with the latter was left out.

Mr. Asser said it was the practice of the Customs authorities to put weights against the sample of coffee which was taken out, and the buyer had to suffer the loss occasioned thereby. He thought

the bags ought to be weighed after the sample was taken out.

Mr. Rouse said that the question raised by Mr. Asser was one of the questions involved in the statement which they had laid before them. The trade as a whole suffered from certain grievances, and something must be done to remedy them if possible. These grievances were capable of settlement, and their object was to arrange a conference between persons acquainted with the coffee market and the Chancellor of the Exchequer on the various matters affecting the trade, with a view to their being thoroughly threshed out.

The Chairman said their main idea was to abolish the duty on coffee, but if they could not do that, to benefit the whole trade by improving its working.

It was resolved to add to the memorial the suggestion that all packages should be weighed after the sample was taken.

On the motion of Mr. Asser, seconded by Mr. Brown, it was unanimously resolved that the memorial should be forwarded with the alterations made.—*H. & C. Mail*, April 10

KELANI VALLEY TEA ASSOCIATION, LIMITED.

The tenth ordinary general meeting of the Kelani Valley Tea Association, Limited, was held at the offices of the company, 16, Philpot Lane, E.C., on Wednesday, April 8, 1896, at 3 p.m., the chairman (Mr. G. W. Paine) presiding.

Notice convening the meeting having been read, and the report and accounts having been taken as read, the Chairman, in the course of a few remarks, said that with regard to the new clearings 16 acres had been planted on Degalessa during the past year, and 65 acres of jungle had been felled, and would be planted up during this year. On Parusella 18 acres had been planted last year, and 12 acres were felled and burnt off this year.

The Chairman then gave particulars of the company's investments amounting to £3,000, and he said the shareholders would no doubt be glad to hear that their investments were today valued at £3,256. They would also be pleased to notice that they had been able to pay off the mortgage for £4,000 over Wera-galla on which 7 per cent interest was paid, and therefore the item of £280 for interest on mortgage would disappear from next accounts. With regard to the item "Sundry receipts in Ceylon," a small portion of the amount was derived from profits on rice supplied to the coolies, but the directors had agreed in future to sell the rice to the coolies at as near as possible cost price, instead of making a profit on the transaction as had been the case in the past, which would doubtless be appreciated by the coolies, and approved of by the shareholders. In profit and loss account there was a nominal increase of £48 19s 2d in "general charges," but the item of £508 17s 1d included the honorarium of £100 paid to the directors last year. The Chairman then gave details of the charges making up the amount named. The Chairman mentioned that the £2,000 placed to "special account" was treated in this way under the advice of the auditor, the money used in paying the mortgage already referred to having been for the present taken out of the immediate resources of the company. The 6 per cent debentures were rapidly falling in, there being only £850 bearing 6 per cent current, of which £600 expires on July 1 next, and £250 on January 1st, 1897. Those that expired during the past year had been renewed for a further period of three years at 5 per cent.

No questions being forthcoming, the Chairman then proposed: that "the reports and accounts as presented to the shareholders be received and adopted." The resolution was seconded by Mr. L. F. Davies, and carried unanimously.

Mr. G. W. Paine, seconded by Mr. D. Andrew, (proposed), "That a final dividend of 10 per cent free of income tax, making 15 per cent for the year, and a bonus of 2½ per cent for the year (also free of income tax) be declared payable forthwith."—Carried unanimously.

It was proposed by Mr. L. F. Davies and seconded by Mr. D. Andrew:—"That Mr. D. A. C. Scott be re-elected a director of the company."—Carried unanimously.

On the motion of Mr. J. W. Stocks, seconded by Mr. C. J. Scott, Mr. J. B. Laurie, C.A., was re-elected auditor for the ensuing year.

Mr. Paine moved a vote of thanks to the Ceylon and London staffs for their efficient working of the company's properties and business and commented on the high efficiency of both, which of course tended in a great measure to the successful position the company was now in. Seconded by Mr. C. B. Slee and carried with acclamation.

Proposed by Mr. Slee, seconded by Mr. W. W. Lord, and carried unanimously, "That a vote of thanks be and is hereby given to the chairman and directors of the company."

The vote of thanks was acknowledged by the Chairman on behalf of himself and his co-directors, and during his remarks it was suggested, and Mr. Slee proposed, "That a sum of £150 be given to the directors as an appreciation of their services."

This was seconded by Mr. J. W. Stocks, and carried.

The proceedings then terminated.—*H. and C. Mail*, April 10.

CEYLON TEA PLANTATIONS COMPANY, LIMITED.

ANNUAL REPORT.

Report of the Directors to be submitted at the ninth annual ordinary general meeting of shareholders to be held at Winchester House, Old Broad Street, E.C. on Thursday, 23rd April 1896.

The Directors have the pleasure to submit the general balance sheet and profit and loss account for the year ending 31st December 1895, duly audited.

	£	s.	d.	£	s.	d.
The net amount at Credit of Profit and Loss Account, including Balance brought forward at 31st December 1894, and after providing for General Expenses, Directors' Fees, Income Tax, &c. is				53,552	2	1
An interim Dividend of 7 per cent on the Ordinary Shares was paid 28th October 1895, amounting to ..	11,716	12	0			
It is proposed to pay a final Dividend of 8 per cent on the Ordinary Shares (making 15 per cent in all, free of Income Tax) which will absorb	13,390	8	0			
Dividends on the 7 per cent Preference Shares were paid for 1895 (less Income Tax), amounting to	5,486	17	6			
It is proposed to add to Reserve Fund	19,291	19	2			
It is proposed to write off for Depreciation	2,000	0	0			
And to carry forward to next year a balance of	1,666	5	5			
				53,552	2	1

For the ninth year of the Company's existence the Directors have pleasure in being able to declare a dividend of fifteen per cent on the ordinary shares.

It will be observed the Directors propose after writing off for depreciation the sum of £2,000, to carry to Reserve £19,291 19s 2d, and, with the addition of £708 0s 10d derived from profits on sale of investments during the year, this Fund will then amount to £70,000.

The yield of tea per acre was 437 lb. over a plucking area of 8,073 acres, as against 372 lb. for the previous year, being the highest average yield obtained since the formation of the Company.

The gross price realized for the Company's tea was 8'09d per lb. as against 8'84d in 1894, and the rate of exchange during the year was 1s 1'15-32d as against 1s 1'9-16d.

The crop for the year was as under:—

Estate Tea.	Bought Leaf Tea Manufactured for others.		Total.
lb.	lb.	lb.	lb.
3,530,737	665,603	1,110,564	5,306,904

The following is the acreage of the tea estates at 31st December 1895:—

	Acres.
Tea in bearing	7,955
Tea not in bearing	221
Timber clearings, forest and waste	2,154
Total	10,330

Subjoined are the acreages of the four coconut properties acquired by the Company as an investment for part of the Reserve Fund:—

	Acres.
Coconut trees in bearing	340
Do not in bearing	904
Liberian Coffee do	43
Forest and waste	946
Total	2233

The Balgownie estate of 118 acres tea and 203 acres of forest was disposed of as it did not suit the Company to hold this property.

The estates have been maintained in excellent condition throughout the past year, and from latest reports are likely to yield good returns for the current year.

The Directors again desire to record their great satisfaction with the manner in which the Ceylon manager and his staff have carried on the business of the Company during the past year, and with the results which their labours have so materially assisted to bring about.

Under clause No. 69 of the Articles of Association, Mr. H. K. Rutherford retires on this occasion from the Board, and being eligible, offers himself for re-election.

The Auditors, Messrs. Harper Bros., Chartered Accountants, also retire from office, and offer themselves for re-election.—By order of the Board,

WM. JOHNSTON, Secretary.

London, 11th April 1896.

THE CULTIVATION OF THE ORANGE is, it is stated, about to be tried in Ceylon, and should this prove successful, the capital of the island has all the advantages of regular fast lines of steamers, so that within a few years there is no reason why this flourishing British colony should not supply the English markets with oranges. As Jamaica is at the same time endeavouring to arrange for exporting oranges to this country, the outlook, from the consumer's point of view, is decidedly hopeful. The orange is a great favourite in this country already, and both Ceylon and Jamaica are certainly well favoured for the growth of the right sorts of this delicious fruit.—*Fruit Grower*, March 25.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears &c., no matter how severe or long-standing, will be sent post free.—Artificial Ears, srums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN; LONDON.

OUR TEA CONSUMPTION.

A REMARKABLE CHANGE.

In a bulky Blue-book just issued, giving a statement of the trade of British India for the past five years, some interesting figures are published concerning the British consumption of Indian and China tea. The United Kingdom, it is stated, continues to be the great market for Indian tea, as much as 92 per cent of the exports of the year having been shipped thither. Of the small quantity not shipped to the United Kingdom, Australia takes a considerable but unfortunately not an increasing share; Indian tea seems to make no headway in the colonies in competition with China and Ceylon tea. Persia during the last four years has been taking larger quantities. As regards the trade with Persia Her Majesty's Consul at Bushire writes in his report for 1894:—"There has been a strong demand throughout the year for Indian and Batavian teas, which seem to be steadily supplanting the China teas in favour with the Persian consumer. Heavy consignments, chiefly from India, were received by native merchants who found no difficulty in disposing of them at a good profit. It was, however, at the port of Bandar-Abbas that this trade received its most vigorous impulse, the import being more than double that of the previous year." Some of the tea at any rare imported into Bandar-Abbas was destined for consumption in Russian Asiatic territory, and it seems probable that the effect of recent fiscal arrangements, of the Russians will divert the transit trade to Batoom and the Trans-Caspian Railway. A new feature in the trade of the year is the largely increased export to Asiatic Turkey, and it is to be hoped that the exports to this country may become larger. Exports to the United States and Canada have also developed very greatly, though the aggregate is still relatively trifling. A good deal has been said in trade reports from China of the gratifying revival in the tea trade which marked 1894, and it seems that the quantity exported was slightly larger than it had been in the preceding year. China tea, however, has not succeeded in competing with Indian tea in that great market, the United Kingdom, which takes more than nine-tenths of our tea and nearly as much of Ceylon tea. Steadily and surely, year by year since 1886, the importation of China tea into England has fallen and that of Indian has increased, until last year close on three pounds of Indian tea were imported for every pound of China. This latter tea still retains its hold of the Australian and American markets where quality in tea is hardly yet appreciated except by a select few, and where Indian tea consequently has not been able to find its way in considerable quantity. Even the closing of the mints seems to have had no effect at all in stimulating the competition of the Chinese in the market for our tea, though it was freely prophesied that that measure would blast and ruin the Indian industry and restore Chinese ascendancy.—*Globe*, April 10.

TEA IN AUSTRALIA.

In China tea sales have been made of 650 half chests panyong at 4½d to 5d, 180 half-chests panyong at 6d, 300 quarter-chests buds at 5d to 5½d, and 300 quarter-chests S. O. Pekoe at up to 6½d. Of Ceylons 200 chests have been placed at 6d to 11d, and of Indians 100 chests at 8d to 10d.—*Australasian*, April 11.

A NEW GERMAN COLONIAL UNDERTAKING.—A new colonial undertaking has been launched at Berlin for the establishment of cocoa plantations in Cameroo and for the exploration of the rich guano fields in the Portuguese Province of Regola, principally in Mossamedes. The well known German African traveller, Dr. Lintgraff, together with the leaders of the new undertaking, Drs. Esser and Hoesch, are to leave Germany within a few days for the Portuguese Island St. Thome, opposite Cameroo, to study the climate and other necessities, whence they will leave for Cameroo and the backlands to investigate the question of providing the necessary labourers.—*L & C Express*, April 10.

INDIAN TEA SALES.

(From William Moran & Co.'s Market Report.)

CALCUTTA, April 22nd, 1896.

TEA.—Advices from Assam are generally favorable; while from Cachar we hear of further storms accompanied by hail. Terai planters report good rain in the last few days. There was a good shower about Darjeeling last week, but the gardens are again very dry. More rain is badly wanted in the Dooars.

A few invoices of New Season's teas have arrived, and some have gone forward to London. From the garden musters received, we are inclined to think the general quantity will be better than the first of last year's teas.

We are favored with the following by the Indian Tea Association:—

The General Committee have now the pleasure to hand you the following figures showing an estimate of the Indian tea crop of 1896.

ORIGINAL ESTIMATE OF CROP, 1896

		lb.
Assam	59,039,263
Cachar	19,519,860
Sylhet	23,834,683
Darjeeling	8,384,760
Terai	3,103,400
Dooars	21,225,560
Chittagong	787,200
Chota-Nagpore	238,800
Kangra	2,170,000
Dehra Dun and Kumaon		
(Estimate)..	2,000,000
Private and Native Gardens		
(Estimate)..	4,000,000
		144,303,523

being 8,824,461 lb. over the actual outturn of the crop of 1895. Estimating shipments to the Colonies and other ports with local consumption at 16 millions, (or say 2 millions more than last year), there will remain about 128½ million lb. for export to Great Britain:

P.S.—Since the estimates from the various districts were drawn up, there have been severe hailstorms in Cachar and excessive draught in Darjeeling, the Terai and the Dooars which may have an appreciable effect on the outturn. The above estimate of the crop for 1896 should, therefore, be considered a full one.

TOTAL QUANTITY OF TEA PASSED THROUGH CALCUTTA FROM 1ST TO 20TH APRIL.

	1896.	1895.	1894.	
Great Britain	49,099	140,807	155,909

THE
AGRICULTURAL MAGAZINE,
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for May :—

Vol. VII.]

MAY, 1896.

[No. 11.

SEASON NOTES.

EASTERN PROVINCE.—Maha crop harvested and preparations being made for yala cultivation. Vegetables generally scarce except in Colombo district and Rayigam

Korale. Crop prospects satisfactory except in Colombo district where the dry weather has retarded yala cultivation.

CENTRAL PROVINCE.—Maha crop harvested or being reaped. Crops good as a rule. Chena crops generally satisfactory. *Stock*.—Hoof-disease prevailing in Walapane.

NORTHERN PROVINCE.—Paddy harvest and dry grains good as a rule; in Panankaman a disease called "chental" is reported to have injured crops. Reaping and curing tobacco commenced in parts of Jaffna district, average yield expected, through in some places the plants have been attacked by a worm called alukanavan. *Stock*.—Hoof and mouth disease still lingering and a few cases of murrain reported.

SOUTHERN PROVINCE.—Operations for yala crop, principally sowing, going on under satisfactory conditions, except in Galle district where the germinating grain has suffered owing to the severe drought. Dry grains also being sown. *Stock*.—No disease reported.

EASTERN PROVINCE.—Munmari crops harvesting, yield satisfactory; preparations for pinmari. Dry grains fair in Trincomalee but damaged by rain in Batticaloa district. Tobacco crop in the former place good. *Stock*.—Hoof disease dying out in Batticaloa.

NORTH-WESTERN PROVINCE.—Paddy harvest practically over, and generally satisfactory; in Kurunegala reported a marked success. Chena crops also good.

NORTH-CENTRAL PROVINCE.—Some of the maha crops being reaped, others in various stages. Chena crops almost all reaped, with satisfactory results. Harvested chenas being sown with giugelly. Most of the tanks full. *Stock*.—Cattle murrain still prevailing everywhere except in Tamankaduwa.

PROVINCE OF UVA.—Maha paddy being sown or just over. Kurakkan harvest over, crops good or fair. Fruit and vegetable plentiful except in Bintenne, Udukinda, and Wellawaya. *Stock*.—Health good, excepting cases of foot and mouth disease along cart roads.

SABARAGAMUWA.—Maha harvest over, crops generally good, yala ploughing begun. Preparations for chena sowing. *Stock*.—Murrain occurred at Yatattawala, but apparently stamped out. Prospects of paddy and dry grain crops good.

RAINFALL TAKEN AT THE SCHOOL OF
AGRICULTURE DURING THE MONTH
OF APRIL, 1896.

Greatest amount of rainfall in any 24 hours on the 5th instant, 3·18 inches.

Recorded by M. W. R. BANDAR.

MINOR INDUSTRIES.

In spite of all the natural advantages we possess in regard to a wealth of raw products and in the way of cheap labour, minor manufacturing industries have not taken a hold in any part of the country. In this respect we are even far behind India. Practically the only occupation which the villager thinks seriously of as a means of sustenance is the cultivation of the soil, but as he is not engaged in this work all throughout the year, and his family have ample leisure between the sowing and reaping seasons, there is ample opportunity thus afforded for working at the minor manufacturing industries if they are so inclined. This is particularly the cases in interior villages. Along the sea coast where arable land is not available a few minor industries, notably carpentry and coir-work have sprung up, but even here there is a tendency to stagnation. And what is the reason of all this? It is not fair to attribute it to apathy and idleness, for which the Sinhalese villager is invariably blamed. In many instances it will be found that he will be only too glad to avail himself of a means of increasing his income and willing to work by night and day in some profitable employment which will not interfere with the cultivation of his ancestral holdings, were he not met by serious obstacles. The lack of technical knowledge and the inability to initiate new industrial enterprises are indeed the true causes which are responsible for the enforced idleness of the Ceylon goyiya. For who is capable of starting a new industry without possessing these qualifications? But given these conditions two others are also necessary, viz., the possession of sufficient capital to carry on the enterprise through its initial and experimental stage and the existence of a market for the produce.

The charge of laziness brought against Sinhalese villagers is often the result of a comparison made between him and the Tamil cooly. It is stated that the latter is constantly absenting himself from work on the excuse that he has to attend to his

own land at certain season, or again that he has to observe certain religious festivals, or even to perform such social duties such as attending weddings and funerals. The great difference in the domestic life and relations of the Sinhalese and Tamils must, however, be taken into consideration in making such a comparison, and due allowance made for the strong associations by which the Sinhalese villagers, from his environments, is influenced—perhaps to his misfortune. The force of circumstances thus works against his "shining" under so exacting a system of discipline as is involved in the management of estate labour. In this connection I would quote the opinion of a leading Sinhalese gentleman, put with much force, on the suitability or otherwise of cooly labour for the Sinhalese villager. He says: "I shall be as sorry to see the Sinhalese villager reduced to the condition of a Tamil cooly as delighted to find him elevated to the position of a peasant proprietor.....The magic of property turns sand into gold and converts a desert into a garden. It stimulates industry, helps the cultivation of prudent wishes, encourages thrift, and inspires one with a spirit of self-reliance. The economical, social, and political advantages which such peasant proprietorship in places circumstanced as Ceylon would secure are obvious. In short, one prefers a Sinhalese with the feelings and principles of a proprietor to one with those of a cooly. If he is transformed into a cooly, the results of his labours will be to confer advantages upon his employer out of all proportion to any which he will derive by the transformation. The advantages to him, if any, will be temporary and more seeming than real, and dependent entirely on the laws of demand and supply; and the operations of these laws will be eventually to the advantage of the employer."

To resume: there are, as pointed out, certain adverse circumstances that combine against the development of minor industries in the villages. The villagers have no opportunity of acquiring any knowledge of the methods on which these industries are based, or of the appliances which aid their development and the principles which control them. Assuming that the villager can read, there are no books in the vernacular to which he could look for enlightenment, while he has no opportunity of practically acquainting himself with the processes he desires to adopt in the manufacture of the various industrial products that fill the markets of the world and have to be imported into this Island. How, for instance, could he be expected to prepare dye stuffs or tanning materials as commercial articles when he knows nothing of the demand for them or the uses to which they are put? It would seem reasonable, therefore, to expect that those who are concerned in the welfare of the masses, and indeed of the Island itself, should devise means to clear away the obstacles that stand in the way of industrial development in its relation particularly to the vegetable resources of the colony. Some of the means that suggest themselves as likely to be of avail are the holding of industrial shows, establishing of industrial museums, and the distribution of pamphlets giving such information as will help the people. The former institutions need not be on a lavish scale, but carefully planned and economically worked with certain specific objects in view. Technical instruction, wherever

imparted, should not be confined to screw-cutting and lathe-making; it should aim at developing the natural resources of the Island, and the industries appropriate to it and suited to the conditions of the masses, and encourage the utilizing of local materials in the manufacture of industrial products. The extracting of tanning and dye-producing substances, the distilling of essences and oils, the treatment of gums and resins, mat-making of a superior kind, wicker and ornamental work; tile, brick and cement making, porcelain work, fruit-dying, apiculture,—these are some of the industries that strike one as being in the line of our village population. The material for such industries we have, but what is wanting is the technical knowledge necessary to work with them successfully and profitably.

W. A. D. S.

OCCASIONAL NOTES.

With reference to Mr. Frank Modder's interesting paper on the Peaty Deposits in the Kurunegala tank, we would offer some further remarks. Peat is an aggregate of vegetable growth—chiefly marsh-loving plants such as those enumerated in Mr. Modder's paper—closely interwoven and more or less compressed and decomposed, the colour varying often in the same bed from light brown above to dark brown or black below. The vegetable matter is not much changed. In the upper layers the peat is often found growing and is soft and spongy; a little further down it is somewhat firmer, but its vegetable structure is quite apparent; at the bottom the vegetable substance is more decomposed, and the peat becomes somewhat compact and is generally very soft, easily dug and cut. When dried the upper portions of a bed of peat are felt-like, somewhat resembling compressed hay, or more nearly, silage, while the bottom part may be tough and almost as compact as some kinds of lignite. The amount of ash varies very much—some varieties containing less than one per cent., others over 60 per cent. The most extensive areas of peat-moss occur upon flat-lying ground, where the layer of vegetable matter varies from a foot or so up to ten or fifteen yards. Peat is distributed over considerable areas in both the old and new world. A temperate climate is considered to favour most the growth of peat bogs, and growth is regulated by the supply of moisture and by physical conditions. Peat deposits are of very different ages,—some being of quite recent formation, while others date back to the glacial period. Most of the larger areas of peat are manifestly of ancient origin, the modern formations being nowhere so extensive as the older, since the conditions which favour its occurrence are more restricted owing to natural physical causes, as well as to the interference of man for economic ends—such as the amelioration of land for agricultural purposes, or it may be on sanitary or other grounds. Old peat deposits apparently do not occur in the Island, and it would seem that the conditions which favour the formation of peat locally are restricted to very limited areas. Indeed, the deposits which occur in such lowlands as the marshy portions of the Maturajawela fields and Model Farm hardly merit the name of peat. The question, therefore, of the availability of peat for fuel purposes practically does not affect us, but there are other

economic uses for which such local and limited supplies of peat,—if indeed it would be wise to encourage its formation—may be available. Unless in the neighbourhood of the deposits there is no special value to be attached to peat as an organic manure for mixing with poor thin soils, or the ash got from it on account of the potash and other mineral ingredients it contains, since it has no great advantage over ordinary organic refuse on the one hand or wood ashes on the other. Peat, however, is much valued owing to its great absorbent properties, and is very useful as a medium for absorbing liquid manure &c. Peat moss litter as exported from Germany is in fact largely used in England in byres and stakes, while it is also a very effective deodoriser.

In our last issue there appeared a letter signed "Cocopalmit" dealing with certain questions connected with coconut cultivation. Our correspondent is certainly very exacting as regards analyses of the various organs, and parts of organs, of the palm. For practical purposes, however, an analyses of the nut—husk, shell, and endosperm (albumen)—as representing the crop removed off the land, and the chemical constituents of which it would be in the interests of good cultivation to return to the soil as manure, should, we suppose, be sufficient, but it may be that our correspondent as a far-seeing agriculturist has special reasons for desiring so complex a series of analyses as he indicates in his letter, and we shall be pleased to hear more of the methods which direct his system of cultivation and the objects he has in view. We certainly admire the liberal advocacy of our correspondent for more room for the coconut-palm, and are greatly interested in the figures he gives (which will, no doubt, astonish many) in support of his recommendation that some 35 or 40 trees should be the maximum number allowed per acre. The structure of the stem of the coconut-palm (a monocotyledon) in which the fibro-vascular bundles are not concentrically arranged no doubt gives it an advantage over the dicotyledon, when either the outer or inner stem is more or less injured, but in any case, the palm must suffer materially from the interference that such injury would cause, with the full and complete exercise of its nutritive functions, with the ultimate result that must come sooner or later of a complete collapse.

We are in receipt of a pamphlet embodying the Rules and Constitution of the Tissamaharama Cultivator's Association, the objects of the existence of which are thus set forth:—

- (a) To systematize the cultivation of paddy and various other products at Tissamaharama.
- (b) To obtain the necessary help from Government on that behalf.
- (c) To do all things requisite for the general improvement of Tissamaharama.
- (d) To remove whatever causes there may be retarding the progress of Tissamaharama.

The statement of these objects is sufficient to show that the Association is built on a good foundation and has good cause for existence, and it is to be hoped that it is working well for the objects which it has set forth, further that while full of energy to fulfil these objects, it is not an aggressive body and does not go beyond its legitimate functions. As we have before stated, Agricultural Associ-

ations in Ceylon have no record to be proud of, but it is to be hoped that the interests of our cultivators will be better looked after in the future, and the springing up of such Societies as the Grama Raksha Samagama of Dalugama and the Tissamaharama Cultivator's Association is certainly a good sign. What we should like to see is a representative Central Agricultural Society with headquarters in Colombo and branches all over the Island. The amount of work before such a Society is prodigious; the interchange and distribution of seed alone being sufficient to give it something to do that will benefit our cultivators beyond measure.

MARSDENIA TENACISSIMA.

This plant, belonging to the order Asclepiadeae, is known among the natives as Muruvadul. Royle referring to it, states that it is remarkable that a plant which yields so valuable a fibre and a caoutchouc should be practically unknown. *Marsdenia tenacissima* is a climber, and is generally found in barren localities among bushes and small trees. A milky juice exudes from cuts on the stem, which thickens into an elastic substance or caoutchouc, which like India-rubber removes black lead marks. The fibre is got from the bark, and is fine, silky and of great strength—a line made of it breaking at 248 lb. dry and 343 lb. wet, as against hemp at 158 lb. and 190 lb. One of the chief features of the fibre is its great elasticity, and is, according to Royle, the second best of all the fibres in India. The sample shown at the Indian and Colonial Exhibition is said to have been universally admired, and, indeed, some of the experts are reported to have considered it a very superior quality of rhea. According to Messrs. Cross, Bevan & Kings' Chemico-microscopic examination of the fibre, it is very considerably superior to rhea. When compared with rhea, flax, wara and sun-hemp, it headed the list in percentage of cellulose, and lost considerably less than any of the others either under hydrolysis with caustic soda or in acid purification, while it held the third place in increased weight by nitration. These are facts the value of which cannot be overestimated. They point the fibre out as being, from a scientific stand-point, far more worthy of experimental cultivation than rhea or any of the other fibres with which it has been compared above. The one point of uncertainty regarding it, which practical experiments alone can solve, is its yield of fibre per acre as compared with the cost of cultivation—in other words, the price at which it can be put down in the textile markets. The ultimate fibres are 5 to 20 mm. in length, *i.e.*, nearly as long as those of flax, and two or three times as long as those of sun hemp or of jute, though of course very much shorter than the fibres of rhea. But from this point of view rhea stands by itself as its ultimate fibres (40 to 200 mm.), are far in excess of any other known fibre. Messrs. Cross, Bevan & King say of *Marsdenia*:—Next to rhea it must rank in point of fineness and durability, and we cannot urge its claims to the attention of Government in too strong terms. If it can be shown that the fibre could be cultivated at all, it might then become a question whether this or rhea could be produced the cheaper.

The shortness of the fibre ribbons, as usually met with, would, Dr. Watt presumes, be viewed as unfavourable, but since this is by no means a necessity, it might be well to adopt some process of decortication (such as that the Favier) that would produce ribbons the full length of the twigs.

The plant in Watt's opinion is too scarce and unimportant—looking for its merits to come by the usual "private enterprize" means to be recognised by the manufacturer. "It must be cultivated, and that too perhaps for a good many years, before a final opinion can be pronounced. It is a climber and does not appear to grow either rapidly or profusely, but there is no knowing what it might do under careful management. Very likely the allied species *M. Roylei* might be found a more suitable species for experimental cultivation, but of course in warm regions only. *Marsdenia* is however too valuable a fibre to be longer ignored, and it would serve a public good were the various Botanic Gardens and Agri-Horticultural Societies to take its experimental cultivation under their special charge. Were the cultivation of *Marsdenia tenacissima* to prove remunerative, the plant might be reared in every hedgerow in India, but being a climber difficulties exist with which the Indian cultivator of fibre crops has not yet attempted to deal. In order to avoid these difficulties—the expenses and trouble of constructing supports for a climbing plant—it would be as well first to ascertain whether it could be induced to crawl over the ground instead of requiring support."

COCONUT, GINGELLY AND CASTOR CAKE.

Coconut Cake.—Prof. Vœlcker in his Essay on *The Influence of Chemical Discoveries on Agriculture* remarks that Coconut Cake is better adapted for fattening stock than for young growing animals or store stock. The analysis of palm-kernel cake is given as follows: Water 9.50; oil 8.43; albuminous bodies 30.40 (containing nitrogen 4.50; mucilage, sugar, fibre, &c. 40.95; mineral matter (ash) 10.72.

Gingelly (Til or Sesamum) Cake.—According to Soubeiran and Girardin's analysis this cake contains of water 11 per cent; oil 13 per cent; protein compounds 34.81 (containing nitrogen equal to 5.57); ash 9.5 per cent. Prof. Anderson gives the following as the results of his analysis of the cake which he includes in a *List of the principal Varieties of Cattle Food*: Water 10.38; oil 12.86; nitrogenous compounds 31.93; mucilage, sugar &c. 21.92; fibre 9.06; ash 13.85. The article oil-cake in the *Encyclopaedia Britannica* shows the chemical composition of gingelly cake as follows: Water 8.06; oil 11.34; albuminous bodies 36.87 (containing nitrogen 5.90); mucilage, sugar, digestible fibre &c. 25.05; woody fibre 8.14; ash 10.54. Dr. Watt referring to the cake says: As a manure this cake would appear to be far less valuable than rape, castor or hemp, but as an article of cattle food it is probably very wholesome since the relation of oil to nitrogenised compounds is less arbitrary than in most oil-cakes. The seed also is very small, contains no indigestible husk, and is largely eaten in India as an article of human food—facts which all tend to confirm the opinion that sesamum cake is perhaps one of the most wholesome of all. The exports from India of the seed which yields this cake have year after year for some time

past been steadily increasing. That it is being employed by the cake-makers in the fabrication of what is known in the trade as certain qualities of linseed cake there would seem to be no doubt.

Castor-Cake.—In India this is one of the most highly-valued of all oil-cakes as a manure. In Europe it has acquired an evil repute as one of the most dangerous substances when used in the fabrication of inferior qualities of linseed cake. In commerce it appears to be sometimes designated *Jatropha* manure. Morton in his *Cyclopedia of agriculture* has the following passage:—This cake can only be used as a manure; for feeding purposes it is entirely unsuited, as the oil still remaining in the cake is exceedingly purgative and poisonous. This manure was recently analysed by Mr. Thomas Herapath who found it to contain in 100 parts: water 10.24; nitrogen in fresh cake 4.20; nitrogen in dry cake 4.68; ash 7.88. The ash itself contained in 100 parts: soluble salts 6.193; carbonates 21.07; insol. phosphates 53.554; silica &c. 19.183.

Perhaps a more instructive table of analysis of castor cake is that published by the late Prof. Anderson of Glasgow in his *Agricultural Chemistry*: Water 12.31; oil 24.32; albuminous compounds 21.91 (containing nitrogen 3.20); mucilage, sugar, fibre &c. 35.38; ash 6.08. The ash contained silica equal to 1.96, phosphates 2.81, and phosphoric acid in combination with alkalis .64.

SOIL ANALYSIS.

BY F. B. GUTHRIE.
(Continued.)

By the porosity of a soil is meant the fineness and number of its pores. We must distinguish between this and permeability to water; a coarse sand, for example, being permeable to water, but possessing properties exactly opposed to those of a porous soil. Humus soils are especially porous. On the fineness of texture depend the following characteristics:—

The capillary power, by which is understood the power of imbibing water. This property maintains a continual circulation of water within the soil, and consequent aeration. It is, moreover, largely through the agency of this circulating water, which is charged with carbonic acid and different salts, that the mineral, and in a less degree the organic matter, of the soil is rendered available for plant food and presented in solution to the plant.

The capillary power of a soil depends very largely upon the fineness of its texture. The nearer the texture approaches that of a sponge the greater will be its capillarity.

Humus has a very high capillary power, which is not possessed to any extent by either coarse sand or clay.

This property is determined by filling a tube of known length with the finely powdered air-dried soil; the tube is open at both ends, the lower end being closed by a piece of fine muslin, and stands in water. At the end of twelve or twenty-four hours the height to which the water has visibly risen in the tube is read off. The determination presents no special difficulty, and I will not waste your time with long descriptions of this or other methods mentioned here. They are all capable of being rapidly and accurately performed.

The capacity of a soil for water is also of special interest, and depends partly upon its porosity and partly on its content of organic matter. Peaty and humus soils, other things being equal, have the highest capacity for water, followed in order by marls, clay, loams, and sand.

The hygroscopic power—that is, the power of attracting water vapour—is of practical importance, in that it prevents undue evaporation, and prevents the soil from becoming parched up. It also serves as a guide to the absorptive power for other gases. This property, like capillarity, is due entirely to the fineness of texture, and the order is the same—humus, clay, loam, marl, sand, and coarse sand.

The absorptive power of the soil for salts is a factor of very great importance in determining the fertility of a soil.

This power which soils possess of removing saline matter from solution, and retaining it within their pores, is due partly to the chemical nature of the soil, resulting in a chemical interchange of basic constituents, and partly to its mechanical structure, the fineness of its texture, substances such as humus and clay possessing the power in a remarkable degree.

This property is determined by a method elaborated by Knop.

The absolute weight of the soil, though it has no bearing upon its fertility, is a point that should always be taken into account, since a heavy, sandy soil, though it may contain a smaller percentage of fertilising material than a light clay soil, presents a larger mass to the plant in the same space.

We now come to the most important property possessed by soils as affecting their fertility, and, at the same time, the most obscure, namely, their power of nitrification. This property depends upon a number of points, on some of which our information is not very clear.

From what we know of the process of nitrification, we can lay down with tolerable certainty the following conditions as being favourable to the process:—

We must have free access of air and moisture, a certain degree of warmth, the presence of nitrogenous organic matter, prone to oxidation (represented by humus). The presence of reducible mineral matter, such as sesquioxide of iron or metallic sulphates, is also favourable. A sufficiency of basic substances to combine with the nitric acid appears also to be advantageous to nitrification.

Putting on one side the bacteriological aspect of the phenomena involved, we shall find that the formation of nitrates within the soil is due to oxidation, and that within certain limits the power of oxidation which the soil possesses is also the measure of its nitrifying power.

We are, therefore, I believe, justified in assuming that the soil will be most favourable to the development of the nitric ferment which combines the following characteristics:—

- 1st. A fair proportion of humus.
- 2nd. A warm climate.
- 3rd. Provision for free access of air and of moisture (these depend upon its porosity, and are determined by its capillary power).
- 4th. Good drainage to prevent stagnant water accumulating.

5th. A certain proportion of basic substances.

It will be seen that, beyond the presence of certain mineral and organic matter, the conditions favourable to nitrification are those whose presence otherwise indicates fertility—namely, fineness of texture and absence of excessive water. If the capillary power of a soil is low, it indicates an unfavourable condition for nitrification.

It has recently been stated by a French writer that the presence of nitrates in the soil assists in rendering soluble the potash in such insoluble combinations as felspar, which is an additional mode by which the nitric organism promotes fertility.

Provided, then, that the condition of the soil, as indicated by the physical properties above enumerated, is favourable to what I may call the metabolism of plant food, its fertility will depend upon the amount of that plant food, and it is immaterial whether that plant food is now in a soluble state or not. If the mineral and nitrogenous matter are present in sufficient quantity, and the soil possesses high absorptive capacity, high capillary powers—in short is of texture, and possesses the conditions conducive to nitrification—it may, I think, be fairly expected to prove a fertile soil; and in cases where one or more of the conditions conducive to fertility are absent, we may look to improved methods of cultivation to attain that fertility.

The tabulated results of such an analysis as I have indicated would be as follows:—

Reaction of soil.

Weight of soil (per acre, 6 or 9 inches deep).

Capacity for water.

Capillary power.

Absorptive power for salts.

MECHANICAL ANALYSIS.

Gravel.

Sand.

Fine sand.

Clay.

CHEMICAL ANALYSIS (OF FINE SOIL).

Water.

Organic matter.

Nitrogen.

Soluble in strong boiling hydro- chloric acid	}	Lime.
		Potash.
		Phosphoric acid.

The quantity of organic matter (which is the volatile matter after deducting water and carbonic acid) afford a sufficiently close indication of the amount of humus present.

The nitrogen determined is total nitrogen. If nitrates are present, the modification of Kjeldahl's method is the most suitable.

I believe the above represents the fewest determinations upon which an accurate judgment can be based. I also believe that with the aid of the above data, practical experience, and a modicum of motherwit, thoroughly reliable and useful advice may be given as to the means to be adopted for ameliorating the soil.

The manures to be used and their quantities will to some extent depend upon the nature of the soil, and to a much less degree upon the quantities of the fertilizing ingredient found to be present, but principally upon the nature of the crop. Soil analysis in the past has been too much occupied with the notion that the amount of fertilizer required depends upon the quantity

already in the soil, and that nothing is necessary but to add so much of the particular ingredient in an available form as, together with what is already present, will produce a sufficiency for all requirements. I believe the principle is a sound one, which tells us to manure the crop and not the ground, and that the soil to be improved is to be improved, not by chemicals, but by proper cultivation, by deep-ploughing, draining, liming, green-manuring, and other means of improving the texture, without which it is impossible to maintain the conditions necessary to fertility.

THE PRESERVING OF FRUIT.

(Continued.)

In a general way it may be said that all fruits and vegetables that endure stewing without injury to flavour or the form of the fruits are suitable for canning. Oranges would thus have to be excluded because of the peculiar bitter principle which they develop in cooking. Some fruits again are unsuitable for the reason that in cooking they change form rapidly, becoming "sauce," on which account they soon become flavourless in the can.

The modern fruit can is said to be an American invention. Usually and preferably, so far as home work is concerned, it is made of glass with metallic covers. Tin cans with tight-fitting covers and a sealing of wax are sometimes used, but the objection to them is that the metal is often acted upon by acid fruits thus causing a flavour which is both disagreeable and injurious. There are of course many kinds of cans or jars, and each sort doubtless has points of advantage which will commend it to users. The patent cans known as the "lightning" and "Mason's" are among the best. The jars and ordinary cooking utensils are really all the appliances absolutely needed for canning. A tin funnel, with wide throat, for filling the jars is a convenience.

The following is a recipe for making wax for sealing fruit:—Melt one pound of resin over a slow fire. When hot add one ounce of beeswax and two ounces of tallow or other fat, stirring well till mixed. Let the mixture cool a little and pour into a greased can for keeping. When used heat till melted, and dip corks or covers into it, sealing instantly while hot.

Only the best fruit is worth the trouble of canning. None that are over-ripe, green, speckled or partly rotten should be used. The fruit should not be kept long after gathering before canning, and after peeling, pitting, &c, as may be necessary, it should as soon as possible find its way into the cans. Some fruits will require halving for convenience in cooking and handling, but flavour and appearance will be greatly improved by using the fruit in as nearly as possible its original condition as to form. Some fruit need no paring at all, and indeed lose flavour if pared. In regard to the subsequent operation of cooking, and the amount of sugar used in sweetening the fruit, it is sufficient to say that care should be taken not to overdo the former, while the amount of sugar used should be governed wholly by one's taste.

The following are the two methods of canning now commonly in vogue in America:—

(1.) This, considered to be the most perfect method, is the one employed exclusively by the canning factories. The fruit, neatly prepared, is packed as closely as possible into the glass jars, which are filled with a syrup made by boiling sugar and water together. Place the jar in a kettle or boiler of tepid water on a few nails or wooden sack with holes bored through, allowing the water to come up within an inch of the top of the jar. Put on covers lightly, cover the kettle or boiler and boil till fruit is done. Have some syrup ready on the stove for filling up the jars. When done, remove the jar from the water, place it on a folded wet towel, fill to the top with hot syrup, wipe off the neck and fix cover tightly by rubber and screw top or other means. Invert each can as a test: if not airtight the syrup will ooze out. If still hot, remove the cover, refill with hot syrup and re-seal. But if it has become cold turn out the syrup and refill the can again. Fruit that is cooled in the jars retains not only its shape, thus looking far more inviting, but also its delicate flavour.

(2.) The second plan is the one most used by the housewife in America. It is simply to boil the fruit in a syrup placed in a porcelain-lined stew-pan or kettle until sufficiently cooked, and pour it boiling hot into the cans, stirring about with a spoon to let the air bubbles escape. The can is now filled with hot juice or syrup and the neck wiped with a wet towel before sealing up as before. If the fruit is in pieces, they should be placed in the jar carefully with a fork or spoon, a little syrup put in first to temper the jar. If there is fruit remaining in the pan it should be carefully drawn to one side of the stove and not allowed to overcook while the filling process is going on; frequently fruit is spoiled in this way. The advantages of this method are that much more fruit can be put into each jar after shrinking by cooling them in the fresh state. A word of caution in regard to filling glass jars with hot fruit is necessary. The jar, while being filled, should be placed on a damp cloth, folded so as to completely fill the hollow in the bottom of the jar, and in it should be inserted a common table knife having a metallic handle, or a spoon, as an additional precaution against the sudden expansion of the glass and consequent breakage. Of course the knife is removed before the lid is finally fixed on. Again, it should be seen that the cans are thoroughly scalded out with hot water before using. Too much emphasis cannot be laid on this point. In the case of both methods above described, the jars, while their contents are hot, must be kept out of the reach of draughts of cold air, as otherwise the glass will contract suddenly, with the result that many will be broken.

THE NUTRITIVE PROCESS IN PLANTS.

Prof. J. Reynolds Green, D.Sc., F.R.S.

(Continued.)

The places where these permanent reserves are accumulated are more numerous than we are apt to suppose. Seeds, tubers, roots &c. readily occur to us as parts of the plant in which we may find them. In the short-lived plants, which we group together roughly as herbaceous in their habits, these are necessarily the most important reservoirs.

But it is different with trees and shrubs which last for many years, and which do not form fleshy receptacles. We have in these, stout stems or trunks, with numerous branches; large woody roots which continue to grow year after year, keeping pace with the parts above ground. Though the primary use of these members is not to store food products, yet they have work of this kind to do. A tree which has a trunk and a root which is growing in thickness is in need of a constant rather than an intermittent supply of food material placed near the actively growing regions. The growth in thickness of such a trunk or root is brought about by the activity of a layer of delicate living cells, which are constantly dividing to produce new wood and new bast, and which appear as a ring of what is called *merismatic* or dividing tissue, on the exterior of the woody mass. The new cells so formed need a constant supply of nutritive material, at the expense of which they develop the peculiar features of wood and bast respectively. The merismatic tissue itself which is called the *cambium layer*, is in great need of food, or it is perforce obliged to cease dividing, and so the growth in thickness of the tree is stopped. Cell division is indeed the result of cell-growth. When such a cell has reached its full size, it divides into two, each of which grows to its appropriate adult dimensions; some divide again like the ones from which they sprang; others become transformed into wood or bast cells. In either case an immediate supply of food is needed, and from the condition of things this supply must be near at hand. We must therefore expect a number of places near the cambium in which these materials may be laid down. We find them accompanying the cambium—either in the form of sheaths surrounding the whole ring of the new tissue or in the spaces called medullary rays, which are formed between the masses of wood, these rays being composed of cells which differ in shape from the typical forms of wood and bast cells.

In stems of smaller girth, which have not developed much wood, we find stores of food material laid up in the region just underneath the surface, which constitutes what is called the *cortex*, and which gives place later on to the complex formation which is familiar to us under the name of *bark*.

In studying these reserve materials, we have thus first to consider how they are originally formed from the simple substances which the plant absorbs from the air and from the soil, and then to ascertain how they are transported to the reservoirs in which we find them, and how they assume the definite shapes in which they present themselves.

The foliage leaf may be regarded as the chief laboratory of the plant, the place where, in the first instance, the chemical changes take place which lead ultimately to the construction of its organic substance. This organ is a winged expansion of an outgrowth from the stem, and is specially adapted to expose as much surface as possible to air and light. The midrib of the leaf is the continuation of its stalk or petiole, and takes no share in the constructive processes, serving only as the path by which fluids are conducted to it from the stem, and in turn are sent down from it into the axis of the plant. The structure of the wing or flattened portion is the most important part from our present point of view. The upper

and lower surfaces are seen to be covered by a layer of flattened, or brick-shaped cells, which contain little more than water, with the exception of certain ones to be described later. Between these two layers which constitute the upper and lower epidermis, is a mass of tissue in which the green colour of the leaf is formed, and running through this in all directions is a network of veins which are made of vascular tissue continuous with the vessels of the stem. The cells in which the green colour is formed differ in arrangement towards the two surfaces of the leaf. Those towards the upper one are arranged close together with very few spaces between them; they are oblong cells with their long axes placed at right angles to the surface. The cells towards the lower surface are not at all regular in their arrangement, but are very loosely placed, so that very large intercellular spaces are found there. These intercellular spaces are continuous with each other, and with others that extend through the leaf stalk, stem and root. The cells of the leaf tissue that abut upon these spaces have very thin walls, and thus allow readily of the absorption of the gases found in the interior of the passages by the cells bordering upon them. They at the same time allow a ready evaporation of water from the cells of the tissue. At many points in the leaf an intercellular space of large size can be seen to extend quite up to the epidermis, and close inspection shows that two of the cells of the latter layer have a small slit between them which allows of communication between the external air and the contents of the intercellular space system. The two cells that lie upon either side of the slit can have their shapes altered by variations in the quantity of the water they contain, and this causes the slits at one time to open and at others to be nearly or quite closed. These openings are called *stomata*, and the two cells bounding them are called *guard cells*. In a surface view they are seen to be somewhat kidney-shaped; being attached to each other only by their ends; it is evident that when filled with water, and consequently swollen or turgid, they open the slit by separating from each other along the greater part of their inner surfaces. When on the other hand they have lost their water, the strain on them is relaxed, they fall together and partially or wholly close the aperture.

It is however in the cells of the middle of the leaf that the chemical work goes on. If one of these is examined by the high power of a microscope, it is found that the green colour is not diffused, through the substance of the cell, but is confined to certain small bodies which are embedded in the layer of protoplasm or living substance which lines the cell. These small bodies are called *chloroplastids* or *chlorophyll corpuscles*, and it is to them that we must look for the actual constructive activity. They are eventually small masses of protoplasm which have loose or spongy arrangement of particles, so that there is in each a complicated meshwork. In the meshes of this spongy mass the green colour, known as *chlorophyll*, lies in the form of a solution. The work done by the chloroplastid is very complex, but we are able to distinguish to a great extent between the part played by the colouring matter itself and that which is discharged by its protoplasmic framework.

We have in this mechanism, then, a ready means of access of air to the interior tissue of the leaf,

It enters at the stomata, and of course fills all the intercellular spaces. The composition of the gases in these channels is not, however, the same as that of the atmosphere, as different gaseous interchanges between the cells of the leaf, and the spaces outside them are continually taking place. Nevertheless, whatever may be its exact composition, we know that it contains a small quantity of carbon dioxide, partly perhaps derived from the leaf itself, partly supplied by the small amount always present in atmospheric air. By virtue of its solubility in water it easily penetrates the delicate cells of the tissue, the walls of which are saturated with water, and so it comes into contact with the chloroplastids.

Not only is air thus admitted. We find that water taken in from the soil by the roots, containing various mineral and other constituents in solution, also easily reaches the leaf. No part of the constructing tissue is situated very far from a vein, and the woody portion of such vein being in direct connexion with the woody tissue of the stem, a path of ascent and distribution is readily afforded.

Thus the raw materials, which we know by experiment that the plant absorbs, meet each other in the cells of the leaf, finding themselves there in the presence of the living substance of the cell, and of certain differentiated bodies, the chloroplastids. These are the first conditions for constructive activity.

SORGHUM HALAPENSE.

This indigenous grass (identical with *Andropogon halapensis*) is referred to by Mr. Wm. Ferguson in his notes on the grasses growing in Ceylon, as being abundant on the banks of the Haragam-oya, about eight miles from Kandy. He states that some roots grown in his garden in Colombo were from eight to ten feet high. "I have not," he remarks, "tried it as a fodder grass, but should imagine that it is quite equal to the *Euchloena* (*Reana*) luxurians, *Androscopia gigantea*, or any of the gigantic grasses introduced to the Island and so highly recommended as fodder plants." It is said to be indigenous to Southern Europe, Syria, Cuba, and Northern Africa, and cultivated in the Brazils and Australia.

The February number of the *N. S. W. Agricultural Gazette* devotes a special article (from which we quote below) to this grass which appears to be most commonly known as the "Evergreen millet." It is best known as a fodder grass in the United States, and the following is a reference to its growth in that country by Vasey:—

"This grass is best adapted to warm climates, and has proved most valuable on warm, dry soils in the southern states. Its chief value is for hay, in regions where other grasses fail on account of drought. If cut early the hay is of good quality, and several cuttings may be made in the season, but if the cutting is delayed until the stalks are well grown, the hay is so coarse and hard that stock do not eat it readily. The seed may be sown at any time when the soil is warm and not too dry. Failures often occur from sowing the seed too early. If there is danger that the soil should dry out before the seed can germinate, soaking the seed may be resorted to with good

results. Thick seeding gives a heavier yield, and a better quality of hay. From 1 to 2 bushels are usually sown per acre, according to the quality of the seed. In case of failure to get a good stand, the crop may be allowed to go to seed the first year, after which the vacant spaces will be found to be self-seeded. On small patches, in such cases, the ground is sometimes ploughed up, and the underground stems scattered along the furrows over the vacant spots. In most localities it is generally considered desirable to plough the land about every third year, otherwise the root-stocks become matted near the surface, and the crop is more affected by drought. Ploughing causes it to grow more thickly and vigorously."

In another work, "Report on the Grasses of the South," Dr. Vasey further says:—"Mr. N. B. Moore has cultivated this grass for forty years, and prefers it to all others. It is perennial, as nutritious as any other, difficult to eradicate, will grow on ordinary soil, and yields abundantly."

"Horses and cattle are fond of it both in its dry and green condition. Probably no grass gives better promise for the dry arid lands of the west."

Sorghum Halapense is said to be common all over Northern India in cultivated and uncultivated ground, and is considered to be a good fodder grass both for grazing and hay.

The Department of Agriculture of Victoria distributed some of the seed of this grass to farmers in 1888, and following are extracts from the circular issued at the time:—"Superior both as a grazing and hay grass; has abundance of roots, which decay, thereby enriching the ground rather than exhausting it. The best results follow sowing the seed in August and September, enabling the seed to get a good root by the autumn, and forming a better turf the following season. Sow broadcast at the rate of a bushel an acre, and cover with a light brush, or sow just before a heavy rain. Three good crops the following season will be the result if the season is favourable."

Baron von Mueller quotes J. L. Dow, of Victoria, as stating that it keeps green in the heat of summer; also, Mr. Hollingsworth, that it is not eaten out by pasture animals. The Baron adds, "It will also grow in drift sand of the coast, and will keep growing during the dry season, when most other grasses fail, but improves much on irrigation; the roots resist some frost; three tons can be cut from one acre in a single season; it yields so large a hay-crop, that it may be cut half a dozen times in a season, provided the land be rich. All kinds of stock have a predilection for this grass."

The greatest objection to this grass is the difficulty of eradicating it, and care should be taken not to introduce it into fields intended for cultivation. It is also said to produce injurious effects on cattle if eaten when too young or when the plants are stunted by drought.

Duthie mentions that the seed of this grass is collected in some parts of India, ground and mixed with the flour of *Pennisetum typhoideum* (cambu) and eaten by the poorer classes.

IS A CHARGE OF BAD CULTIVATION ACTIONABLE?

This question was before Lord Kincairney on Tuesday of last week in connection with the action

brought by Alexander M'Keand, farmer, Port-William, Wigtownshire, against Sir Herbert Maxwell, Bart., M.P., for damages to the amount of £500 for alleged slander. The pursuer had for thirty-six years been tenant of a farm on the defender's estate. His lease expired at Whitsunday, 1895. He offered £200 as a rent for a renewal of the lease, but the defender refused the offer, but shortly afterwards let the farm to another tenant at that rent. It was in relation to this that the letters complained of were written. One letter, written by the defender to Mr. M'Connell, a neighbouring farmer, was published subsequently in the *Galloway Gazette*, but Lord Kincairney held that the defender was not responsible for its publication, and disallowed the issue under that head. There remained a letter and certain notes written by the defender and published by him in the *Galloway Gazette* of 22nd May, 1895. In these statements were made that the farm had been indifferently cultivated or managed; that, in consequence, it had been brought into an exhausted condition, which necessitated the application of a considerable amount of lime manure for six years. The pursuer sought to make out that these statements amounted to a charge of dishonesty. Lord Kincairney, however, held that it was impossible to maintain that an assertion that a man was a bad farmer could be innuendoed as meaning that he was a dishonest farmer. On the other hand, in his lordship's opinion, each of the letters, and also the notes, did import that the farmer had worked the farm unskilfully as a farmer, and that the farm suffered in consequence. Was such an allegation actionable? Now, the defender was at the time a candidate for the county, and it was in reply to an express demand made for an explanation of the circumstances that the defender wrote the letter of 14th May, in which he charged the pursuer with indifferent cultivation causing injury to the farm. Now, nothing more injurious to a farmer could be done, for the publication might probably prevent the tenant getting another farm in the neighbourhood, and so to some extent disable him from earning his livelihood in the business to which he had been bred. His lordship would be slow to think that the law afforded no remedy for so great a wrong. It was analogous to cases in which public statements that a professor or schoolmaster was unfit for his office had been held actionable. The law certainly did allow anyone on due occasion to criticise the work of a tradesman; but that was a different matter. The defender's defence was that his letter was a public reply to a public attack or public criticism—namely, the attack made on him when a letter, written by pursuer, was read at a meeting of farmers and electors, and he pled that as a candidate he had to explain the circumstances. Lord Kincairney, however, held that, seeing it was not admitted that the pursuer had anything to do with the publication of the statement at that public meeting, the defence failed. If it was proved that the pursuer was active in submitting the statement to the meeting of farmers, that would be a different matter. But, if that were not proved, he did not think that the pursuer's right should be affected by the unauthorised act of Mr. M'Connell. The issue to be sent to a jury in this case is, whether the letter and notes published by the defender in the *Galloway Gazette*, or any part of them, were of

and concerning the pursuer, and falsely and calumniously represented that the pursuer in the course of his tenancy worked Droughtag farm carelessly and unskilfully, and that the farm was left in an exhausted condition.

HOUSEHOLD HINTS.

In ordinary burns and scalds the only remedy required, is to thoroughly exclude the air from the injured part. Cotton batting will do this effectually.

Bits of toilet soap which are very small may be utilized. Make a bag of Turkish towelling about 9 in. square, and put in it all the small pieces of soap. When three-quarters filled, sew up the end and use it the same as if it were a cake of soap.

Preparation for Polishing Brass.—Pound fine and then sift half pint of rotten stone. Add to this half a gill of turpentine and enough sweet oil to make a thick paste. Wash the brass first in soap and water; wipe dry, and then rub with the paste. Rub with a soft, clean rag, and finish with a piece of chamois skin.

In cooking green vegetables, such as peas, beans, and asparagus, it will be found that by soaking them for an hour or two in cold water they will regain much of that fresh, delicious flavour which is the principal charm of country vegetables. Also a spoonful of salt in the boiling water in which they are cooked will preserve their green colour.

White sugar is an excellent application for cuts, wounds and bruises, quickly subduing inflammation. Salt pork, raw, is also good and in some cases easier to apply.

Matting should not be washed with soap and water. Lift it from the floor, dust well on both sides, and wipe it carefully with a fairly strong solution of salt water.

An ink splash on the carpet should be first washed out with milk, and cleaned up afterwards with warm and nice soapsuds.

Rusty black lace, which may have been long in the family, can be revived and made as fresh as new by the steam of green tea.

When the eyes are tired, or inflamed from loss of sleep, apply an old linen handkerchief dripping with water as hot as you can possibly bear it.

To throw water on burning kerosene only increases the danger by causing the oil to spread, but salt, flour, or cornmeal will quickly smother the flames.

Always keep the inside of your coffee pot bright to insure good coffee. Boil it out occasionally with soap, water and wood ashes and scour thoroughly.

To relieve pain from bruises, and prevent discoloration and subsequent stiffness, nothing is more efficacious than fomentations of water as hot as it can be borne.

Flour warmed before using it for mixing hastens the lightening process.

GENERAL ITEMS

Mr. Alexander Macdonald, a friend and fellow-student, has passed at an early age. He began life as a journalist on the *Elgin Courier* and later as assistant Editor of the *North British Agriculturist*. He achieved distinction in the agricultural classes in the Edinburgh University, and was afterwards Editor first of the *Mark Lane Express* and next of the *Farmer and Stock-breeder*. Later, we hear of his going to South Africa in search of health, and even here he was not idle to judge from an exhaustive report on dairying in Australia that reached our hands. The *Scottish Farmer*, referring to his death, says: "When but a little over the threshold of thirty years, Alexander Macdonald's career has come to an end. Energetic and daring to a degree, our late comrade bade fair, had his life been spared, to accomplish something worthy of his name."

Under the head of Practical Vegetable and Flower Gardening, the *N.S.W. Agricultural Gazette* writes as follows:—

The value of a thick mulch of animal droppings, rotten straw, &c., does not seem to be properly understood by many persons who desire to grow vegetables. It is surprising how many are under the impression that cow or horse dung will do injury if spread over the surface of the soil amongst the vegetables. This need not be feared, but, on the contrary, it will be found to be most beneficial. Farmers should have no difficulty in collecting an abundance of dung, both for digging into the soil and for a mulch. That for digging into the soil will be all the better for being decomposed or rotted before it be used. The manure had better be rotted under some kind of shelter, where the rain cannot wash through it and wash out some of the most valuable part of it. It should be kept moist whilst it is rotting, so that it may not become too heated and burn, for in such a case its value is considerably diminished. As much of the liquid excrement of cattle should be saved as possible if the best of manure is desired. The fresher the dung the better the manure will be, for old dung that has been lying about for months exposed to the weather is but of little value except for its mechanical effects in the soil or as an absorbant for saving liquid excrements. It is useful for a mulch, however. Liquid manure, which can be made from the dung of animals soaked in water, is of great value for vegetables, but should not be used over strong, especially if it has fermented, in which case it should be considerably diluted with water. Experience will soon show the best strength to use if the effects of various applications be noted carefully. Save all waste matter from the house, and it will be found of much value when the water supply is short. If liquid manure be used it should on no account be poured over the leaves of vegetables, but be applied to their roots only. This can most easily be done by drawing away the soil, or rather by making a little shallow furrow or trench, into which the manure can be poured, and when it has soaked into the ground the soil should be covered over again. There is but little trouble about this work, which can be effected very quickly with a hoe.

* The TROPICAL AGRICULTURIST *

◇ MONTHLY. ◇

Vol. XV.]

COLOMBO, JUNE 1ST, 1896.

[No. 12.]

LEHMANN'S FIBRE MACHINERY

GREAT quantity of fibre, suitable for the production of matting, carpeting, bagging, sacking, ropes, cords, nets, braids, and cloths for a variety of purposes, is destroyed annually, either from lack of knowledge of the manipu-

lation on the part of the manufacturer, or because the methods adopted in fibre growing countries are too slow and costly to be carried out on an extensive scale.

It is therefore evident that, if some machinery could be applied to the various processes necessary to convert the plant into the fabric, no small benefit would be reaped by fibre producers as well as by the machine maker.

Mr. Ernest Lehmann, an engineer of Chatham Street, Manchester, has turned his attention to this class of mechanism, and has succeeded in making machines which, he claims, combine all the most modern improvements for treating and working these fibres on an extensive scale.

The actual fibre-extracting machines may be classed under two heads, viz., for the extraction of leaf or stem fibre, and for coir fibre. The leaf or stem fibres include aloe leaves,

pita, henequen, sisal, abaca, Manilla hemp, istle, Mexican fibre, cabuya, jute, banana, or pineapple, rhea, sansiviera, piassava, bombax ceiba, majagua, or poa tree, earlindovica palmata and maoutia puva. For coir fibre or fibre obtained from the husks of the coconut, a machine of special construction is employed, differing entirely from the machine used for leaves or stems.

The order and process of manufacture are as follows:—The material should be regularly sorted

whether in leaves or stalks and, when operated upon, must be as uniform as possible. The stalks of rhea or China grass should be cut into equal lengths, and with pineapple, henequen, agave, sisal, abaca, aloes, &c., the leaves should be distinctly sorted, and each description separately treated. When there is a material difference between the quality of the fibre of the inner and outer leaves, each quality should be kept separate, and, before the actual extracting process takes place, the leaves or stems should be passed through the crushing or softening machine, which renders them pliable and takes out the sap. This machine is used to enhance the productive capacity of the extractor by at least 20 per cent. One crusher will serve 10 extractors.

After extracting, the fibre must be dried thoroughly, and then be subjected to a brushing action, either by being beaten against a post by hand or by

Lehmann's Plaiting Machine.

being brushed in a brushing machine. It is strongly recommended that planters should adopt the brushing machine, as carefully brushed fibre realizes much higher prices, an increase of from £2 to £4 per ton being obtainable. One brusher will suffice for 10 extractors, and an engine of 8-horse power will drive the whole. After brushing, the fibre must be made into small bundles of about 3 or 4 ins. in diameter, secured by a strand of the fibre, and then pressed into bales of 2 or 3 cwt. each.

The average market price varies from £22 to £28 per ton, and 1,000 leaves will usually produce from 50 to 60 lbs. of cleaned fibre.

The husks, having been soaked, are rolled or crushed to strengthen them and render them ready for the subsequent extraction of the coir fibre. That part of the fibre which is not drawn into the extracting machine is called "brush fibre." It is afterwards combed and prepared for brooms and brushes. When the husks are green and immature, and it is not required to keep the brush fibre separate, a special extracting machine is employed, which turns the entire husks into fibre. This machine is also employed for producing fibre from the bark of the fibre-bearing trees, the bark or husks being carried through the feed rollers and reduced to fibre by the action of the cylinder. Usually, 1,000 coconuts are estimated to give off from 90 to 120 lbs. of spinning fibre and from 15 to 25 lbs. of brush fibre.

After extracting, the fibre is passed through a willowing machine, which frees it from shorts, hards, dust, and other extraneous matter, one willow and one husk crusher serving 10 extracting machines.

The bailing of the fibre is performed by either hydraulic or screw presses, according to requirements.

All these operations being completed, the various fibres are ready to be spun into yarn and made into goods for the market.

Should the fibre have been made into bales, it requires opening out, an operation that is performed by a fibre-opening machine. The fibres are hackled or straightened with hand hackles, worked by women or girls. The next process is the spinning. This is done mechanically by a machine specially constructed for planters and small manufacturers. The prepared fibre is fed into the machine, and is made into yarn and automatically wound on to a bobbin, and, as soon as it is full, the bobbin is taken out and replaced by an empty one, the operator regulating the thickness of the yarn and the speed of the machine. The machine is stated to occupy only four square feet, and six machines are driven by 1-horse power.

Our illustration shows a plaiting machine for making plait for mats, but Mr. Lehmann also supplies improved power looms, besides, other fibre-manipulating plant, for weaving coconut matting, Manilla carpetings, and such like heavy goods from coir, Manilla, henquen, and similar fibres. The power loom is constructed in four distinct models of framing, to suit the various descriptions of goods it is intended to weave. Coconut matting is made on the heaviest models, and ordinary sacking or bagging on the lightest.

The loom is constructed in various widths, ranging from 30 to 80 ins. reed space, this depending upon the width of goods to be woven. The framing of the loom, as regards the strength of the working parts, is the same, whether for coir or Manilla goods, the only difference being in the taking-up motions for the woven fabric. For coir goods, the warp yarns are drawn from a specially constructed creel placed at the back of the loom, through cast iron fluted rollers, and the woven material is drawn out of the looms by means of two similarly fluted cast iron rollers. For Manilla goods, the warps enter the loom in the same manner, but the woven fabric is automatically wound on a beam furnished with spiked teeth, which maintain a firm grip of the cloth and effect an even folding. The sleys are made with shuttle boxes large enough to hold shuttles containing cops 15 ins. long by 2½ ins. in diameter for Manilla yarn. These cops are formed by a

specially constructed winding machine, which gives off the yarn from the inside of the cop, so that the whole may be woven with a minimum of waste.

Each loom is supplied complete with full set of reeds, harness, shuttles, pickers, and strapping up. For making figured or fancy goods, the tops of the looms are furnished with a "dobby" or Jacquard apparatus, which has a number of shafts corresponding to the pattern to be woven. All the motions are described as self-acting, the framework and the working parts being strong and heavy, and the sley so arranged that it can be made to beat up twice or thrice to each pick, according to the description of goods in the loom. When very heavy goods are being woven, the loom should be stopped after each pick, that is, after the sley has been knocked up to the required number of beats. This is done by the weaver placing his foot on a lever, moving the driving strap to the loose pulley, and thus stopping the loom. The weaver then draws up the web tightly with his hand and starts again. This operation ensures good and perfect selvages. When the lighter goods are being woven, this stopping is not necessary, as the yarns, being lighter, are more manageable. In the general arrangement of the looms, the parts are so well constructed that they are claimed to combine efficiency with a minimum of wear and tear.

In sacking and matting making, various other machines are employed, such as shearing machines, for cutting the pile of the mats, calendering machines, plaiting machines, such as that illustrated, and combing and measuring machines.

Generally speaking, coir yarn is exported in the spun state, the spinning being done by hand. With Mr. Lehmann's machines, however, the planter may effect a considerable saving in labour by doing his spinning mechanically.

The machines can be run by steam, water, or cattle power, a small, compact plant for producing about 280 lb. of coir yarn per 12 hours consisting of three machines arranged for spinning and one for doubling, which are supplied with cattle gear, intermediate motion, shafting, hangers, pulleys, all strapping, a set of hand hackles for preparing the fibre, and necessary bobbins, all complete. The operation of spinning is easily learnt, and is so simple that a native, with no previous knowledge of spinning, can learn to spin on these machines and become proficient after 14 days' experience. In spinning, the main point to be kept in view is that the fibres must be prepared by hackling by means of hand hackles, and the better they are prepared the better will be the quality of the yarn, both as regards strength and appearance, and the larger will be the production. When the fibres are more than 2 ft. in length, they should be opened out in the fibre-opening machine, which is made in two sizes—No. A for producing heavy yarns for ropes and No. B for spinning finer yarns for twines, cords, lines, matting, sacking, &c. Five feet by three is all the space occupied by these machines.

Each machine is perfectly independent in its working, thus obviating a great objection against spinning machinery working in sets, where facilities for repairs are few and far between and very expensive. Generally, female spinners are employed; their labour is cheaper, and, being lighter handed, they can produce better yarn than men. They soon learn to regulate the sizes of the yarn, so as to vary them according to requirements. When spun and doubled, coir yarn is made into hanks, by means of a small machine, called a hanking machine, which makes the contents of 10 bobbins into hanks, or 10 hanks at a time, ready for being baled for export.

We may add that these machines are constructed with the object of giving the planter or manufacturer the benefit of a larger production with a given quantity of machines, the designer having had a practical experience in this industry extending over a number of years. They are also specially constructed with a view to their being manipulated by natives, without the necessity for skilled labour.

(To be concluded)

WHITE-ANTS AND MANGO TREES.

If the bark of the trees is attacked by white-ants, it must be first scraped off at all parts where the animals have made tunnels, and painted with kerosin. Let the ground be dug between the trees as deeply as necessary, the soil turned over and watered with phenyl, if procurable; if not, with kerosene and water. In Ceylon, a decoction of the leaves of Mauritius hemp is used for expelling white-ants, but I fear, a correspondent writes, you have got into too bad a state for that to be efficacious. It has the advantage of being, of course, quite harmless to any trees. In using the phenyl, put some in a pail and add water till it is of the colour and consistency of good milk. Every plantation should keep phenyl. It is perfectly safe with foliage; carbolic acid and kerosene are not. It is exceedingly good for mealy bug. Corrosive sublimate and Paris green will both destroy white ants; dissolve in water and pour into the holes. But be careful not to poison the trees by putting these poison too close to the roots. Corrosive sublimate is very popular here, being used dry. The plantors have told me that one white-ant eats a grain, dies, and is eaten in turn by another who dies and so on till the nest

is exterminated. I cannot quite credit this, but the poison have a very strong effect on white-ants. Of course care should be taken in dealing with corrosive sublimate in bulk, as it is an exceedingly dangerous poison. After you have well poisoned the white-ants, remember to manure the trees well, so that they can have strength to recover. If it is possible to flood the plantation for a few days, the ants would have to retire, but this is rarely possible here at least. I do not think it would hurt the trees, as I have here splendid old trees growing in water. I should like to know the results of these suggestions should you find time to inform me, as I am collecting together all kinds of notes on destructive insects and methods of destruction.—*Indian Agriculturist.*

NOTES ON CURING COCOA FOR SMALL SETTLERS.

By W. CRADWICK, Superintendent of Hope Garden.

The first important point to be observed when about to cure Cocoa is that it must be quite ripe, but not over-ripe. The pods must have attained their full colour whatever it may be, but if the beans shake about easily then the pod is over-ripe. The reason is that if the beans are not ripe, the mucilaginous matter covering the beans is not properly developed into the stage when it will readily ferment. If left to get over-ripe, the mucilage commences to liquefy.

The best vessel in which a small cultivator can ferment Cocoa is an ordinary flour barrel. To prepare this for the reception of Cocoa beans, first bore about a dozen holes, each half an inch in diameter, in the bottom of the barrel, then place about ten inches of banana trash in the bottom of the barrel. Line the sides also thickly with trash, and have a sufficient quantity on hand to cover the beans when placed in the barrel. When the barrel is ready, break the whole of the pods and place the beans in the barrel covering with the banana trash. The beans must be left to ferment for two days, then remove one-third of the beans and lay them in a heap on the floor and mix them thoroughly. Remove the balance of the beans and mix them also, but do not put the two heaps together. After placing fresh trash in the barrel, put the beans which were at the top back into the bottom of the barrel and those which were at the bottom, place at the top. Cover with trash in the same way as before and leave for two more days, when the beans should be treated in exactly the same way as before. They should then be left for two more days, when they are to be taken out and washed thoroughly. On the day the beans are finally removed from the barrel the work should be commenced very early in the morning, so as to get all the sun possible on the first day, for the beans mildew very quickly. They should be washed immediately they are taken out of the barrel as this helps to keep them plump.

The proper amount of Cocoa to ferment in one barrel is the quantity of beans obtained from 1,000 ordinary sized pods. If many more than this number are put into one barrel, the fermentation is too great and the beans turn black.

If a less quantity, say below 700 pods, are to be fermented, the green trash and more of it must be used, and a weight not exceeding 25 lb. placed on the top which helps the fermentation.

When the Cocoa is being dried, it is not advisable to expose it after the first two days to the extreme heat of the mid-day sun, it is better to take it in about 9 o'clock, and then put it out again between three and four o'clock. Those who use evaporators are warned against an excessively high temperature.

Great care must be taken when removing the pods from the trees that they be cut off with a good sharp knife, not pulled off. If pulled off, the little knob at the base of the stem of the pod is injured,

and the tree will not bear from the same spot the following year. If the pods are cut off carefully, the trees go on bearing from the same spot year after year.—*Jamaica Bulletin*.

ON CERTAIN EXPERIMENTS MADE IN THE FOREST NURSERY AT BELLE-FONTAINE (NEAR NANCY).

BY E. BARTET, INSPECTEUR ADJOINT DES FORETS.

The facts set forth in the following notes are the results of experiments carried out in the Bellefontaine Nursery on the raising of plants for forest planting. The nursery which was established in 1863 in the Forêt de Haye, nearly four miles from Nancy, and whose situation is defective from several points of view, constitutes one of the experimental stations attached to the Nancy Forest School.

Whether the observations which I have collected contain anything new and hitherto unpublished, and whether the reader will find in them anything other than the confirmation of facts already made known, I do not venture to affirm, so considerable are the numbers of works carried out in France and elsewhere on the subjects herein dealt with.

ON THE USE OF SAWDUST AND PEAT FOR COVERING SMALL SEEDS.

At Bellefontaine, for covering small seeds, a mixture of mould leaves, well decayed manure and sifted earth, has for a long time been used. The preparation of such a compost is costly, the use of it has also other inconveniences, for when a period of drought follows after prolonged rain, it gets hard and forms a crust liable to interfere with the growth of small plants.

These considerations led me to try whether, for covering the seeds in question, sawdust and peat could not be used, these being two substances often obtainable in abundance and at a low price in the neighbourhood of forest land.

The first experiment to this end was made in April 1887:—six trenches each 30 feet long being sown with Spruce Fir. The following were compared:—

1. Sawdust of Poplar, alone.
2. Peat alone.
3. A mixture of one part Poplar sawdust and one part mould.
4. A mixture of peat and leaf mould, in equal quantities.
5. A mixture of peat and sawdust, also in equal quantities.
6. The usual compost consisting of one-fourth part leaf mould, one fourth decayed manure and one half well sifted mould.

Before using the sawdust, it was carefully saturated with water.

The results were quite as satisfactory in Nos. 1 and 2 as in the other lines and that as much so during the period of germination, as during the rest of the season of vegetation. It was even noticed that under nothing but sawdust, the seedlings of Spruce made their appearance earlier and more completely than anywhere else.

In the spring of 1888, another trial was made of the comparative effects on Spruce seed of sawdust alone and of the compost above mentioned, No. 6. The advantage was again on the side of the sawdust, although this had not been specially watered before using, it having been simply exposed to the rain for six months.

Finally, in the same year, 1888, the best and most conclusive results were furnished by a trial made on Spruce seed of very fine sawdust, not made from species such as Poplar, but from Oak. In spite of its being watered every two days, the working of the tannin into the soil in no way retarded either the germination of the seeds or the subsequent growth of the living plants.

It is therefore almost certain that sawdust derived from almost any species whatever might be employed in this way, provided that it is well saturated with water at the time of its being used.

When the sawings are made in lines, rather less than a pint of dry sawdust is required for a foot of trench

DESTRUCTION OF MOLE CRICKETS.

Ever since I have had charge of the Bellefontaine Nursery, I have had to deal with a formidable invasion of mole-crickets which has given me the opportunity of experimenting on the various methods recommended by experts for the destruction of these pests.

With the exception of hunting for their nests and for the holes in which they take refuge, the only method which has been successful is that which consists in placing small pots with smooth and almost vertical sides, in the earth, in such a manner that the insects may fall into them in the course of their nocturnal ramblings.

To place these traps along all the galleries would be practically impossible when one has to deal with thousands of these enemies. In such a case it is found best to proceed as follows.

The parts most infested should be enclosed with boards placed edgewise and buried 1½ inches in the soil, about 1 inch of their width remaining above ground. When the area thus enclosed is more than 120 square yards, it should be divided into compartments by a number of boards similarly disposed to those above mentioned.

It is then all along the sides of these boards inside and out that the pots are placed at 15 to 20 ft. distance one from the other, taking care that the edge of each pots is a little below the level of the soil and that it touches the board very exactly.

In constructing their galleries the mole-crickets run against the planks and turn aside along these until they fall into the traps laid for them and from which they can be collected every morning.

The pots of the shape of an ordinary plant pot are the best, they only need to be about 6 inches deep and about the same width at the top, the bottom having a diameter of about half that. The hole to receive these can be conveniently made with a piece of wood previously prepared to the required shape and size.

It is perhaps superfluous to add that if ordinary plant pots are used, the hole at the bottom must be plugged up with something sufficiently hard to prevent the insects getting through.

Pots with thick rims should not be used, as with these the edge of the pot cannot be placed exactly against the plank.

Finally, the pots must be kept free from earth, leaves and rubbish or the insects may escape.

TRIALS OF CHEMICAL MANURES.

.....The results were not conclusive, —*Indian Forester*.

TEA AND COFFEE CULTIVATION IN INDIA.

(Board of Trade Journal for March.)

From official statistics published by the Department of Revenue and Agriculture of the Indian Government it appears that the area under tea in India at the end of 1894 extended over 422,551 acres, a little less than two-thirds of this area (nearly 64 per cent.) being in the valleys of the Brahmaputra and Surma which contain as much as 268,796 acres, 154,234 in Assam (the Brahmaputra Valley), and 114,512 in Cachar and Sylhet (the Surma Valley). In extent of cultivation Bengal comes next, though the acreage is much smaller than in either of the divisions of Assam, the area under tea being 121,121 acres or about 29 per cent. of the whole. In the North-Western Provinces the area under tea in 1894 was 7,652 acres, in the Panjab, 8,921 acres; in Madras, 6,102 acres; and in Travancore and Cochin, 9,079 acres. There is, besides, a smaller area of 880 acres in Burma.

The area under tea has expanded from year to year without a pause during the last 10 years. In 1885 the area was 283,925 acres; in 1894 it had increased to 422,551 acres, the increase being in the ratio of 48.8 per cent.

The average of the acreage added in the last five years was very much larger (17,770 acres) than the average increase (12,444 acres) in the four preceding years. The largest increase of all, it may be observed in passing was in the two years

1893 and 1894, the former of these being the year in which the mints were closed, an event which was regarded by some as the herald of disaster to the tea-planting industry.

The quantity of tea produced has increased in 10 years in much greater ratio than the area under cultivation, for, while the area has increased by less than 19 per cent., the increase in production has been over 88 per cent.

In 1892 the production in Assam and Cachar declined, the decline in Cachar and Sylhet, especially being so considerable as to affect the general results, though there was a large increase in Bengal and elsewhere. In 1894 there was again a decline, but a smaller one, in Cachar and Sylhet, and in Bengal there was but a small increase.

The number of persons employed in the tea industry in 1891 is returned at 383,505 (permanently) and 156,120 (temporarily), or altogether a little over half a million people (539,625 persons), which would work out to about 1.28 persons to the acre. The accuracy of the figures is, however, open to question.

The tea produced in India is exported mainly to the United Kingdom, to the extent of about 96 per cent. of the average production. The subjoined figures give approximately the quantity of tea consumed in India, the figures representing the average of the five years ending 1894-95.

Indian tea:		lb.
Produced	121,971,905
Exported	120,439,095
Left in India	1,532,810
Foreign tea:		
Imported	6,789,337
Re-exported	4,311,044
Left in India	2,448,293

Thus the average consumption of all tea in India seems to be about seven million pounds, of which four and a half million are Indian and two and a half million are foreign. It may be added that Ceylon provides India with nearly a million pounds of the foreign tea imported.

This consumption comes to only 0.021 lb. per head of the population according to the census of 1891, or say one-fortieth of a pound, a quantity which contrasts strongly with a consumption in the United Kingdom of from 5½ to 5½ lbs. per head. Broadly, it may be said that the India consumption of tea per head is exceeded by the United Kingdom more than 200 times. Indeed, such as it is, the consumption of tea in India is to a substantial extent due to the European population, for more than one million pounds are taken by the Commissariat for the British army and at least an equal quantity must be consumed by the European civil population. However, the consumption is increasing amongst the population of the larger towns, especially the Mohammedans, and there is room for great expansion in this direction.

The price of tea in Calcutta have fluctuated greatly since 1873. Taking the price in March 1873 to be represented by 100, it appears that until 1884 the level was well above that point, varying from 110 to 148. Coincidentally with the great fall in exchange and in general prices in 1885 the level fell to 90, and though in 1886 it rose to 96, a low level was maintained in the following years until 1891. In 1895 the level rose to 97. These figures all represent the course of prices of fine Pekoe in January of each year as given by the Bengal Chamber of Commerce.

In the Statistical Bureau the average prices of the various descriptions of tea sold at the public sales held in Calcutta during the tea season have been computed for some years past, and the results are regularly published in the review of the trade of India.

Turning to the coffee industry, the same statistics show that there were, at the end of 1891, 289,080 acres of land under coffee in India, all of it with the exception of 10,746 acres in Burma, being in Southern India. The cultivation of coffee is in fact restricted for the most part to a limited zone in Mysore, Coorg, and the Madras districts of Malabar and the Nilgiris. In Mysore there are 132,052 acres, in Coorg 71,181 acres, and in the Nilgiris and Mala-

bar 45,652. If to these are added 6,587 acres in Travancore and Cochin it is seen that about 90 per cent. of the coffee-bearing area of India is concentrated in the hilly region above the south-western coast, where the rainfall is heavy and the climate generally approximates to that of the coffee-bearing area of Ceylon.

In the Madras Presidency coffee is not grown to any extent except in the two districts already mentioned, and in Salem and Madura. The only other province in which coffee is grown is Burma, mostly in Toungoo, and the industry there is of recent origin.

In the last 10 years the area in the Madras districts has fluctuated, remaining in 1894 at but little above the level of 1885. In Coorg there was a sudden and large increase in 1891, in Mysore there has been a steady and considerable increase, while in Travancore and Cochin there has been no advance; in Travancore, indeed, many coffee-growers have abandoned that industry for the less precarious cultivation of tea.

The yield has fluctuated greatly; in 1894 it was about 35½ million pounds, which was but little larger than in 1885, notwithstanding the increased acreage.

According to the returns, there were, in 1894, 37,903 persons permanently and 118,014 temporarily employed on the coffee estates, making a total of 155,917 persons, which is equal to about one person (1.07) to two acres, while in tea estates the average is over 2½ persons to two acres. The difference is explained by the much greater labour required in the repeated plucking of tea, and in the subsequent processes of preparing the leaf for the market.

The following figures show the average of the production and exports for the five years ending 1894-5:—

Indian coffee—		lb.
Production	34,414,087
Exports	31,595,514
Left in India	2,848,573
Foreign coffee—		
Imports	1,820,426
Re-exports	585,245
Left in India	1,235,181

It appears, therefore, that nearly 92 per cent. of the production is exported, and that of the coffee consumed in India foreign coffee represents less than half the quantity of Indian coffee. The rate of consumption is little more than half that of tea, amounting to only 0.014 lbs. per head of the population. It is said to be rather freely drunk by the native population in southern India, but that is certainly not so in northern India.

There is no trustworthy or complete record of the prices in India of Indian coffee; and it appears that there are no materials for the preparation of a record of prices, and that the prices in fact depend upon and follow the fluctuations of prices in London of Ceylon plantation coffee, the price of Indian coffee being about 5s per cwt. less than the price of Ceylon coffee. This being so, the prices in London, in February of each year of the last 10 years, of Ceylon coffee (plantation) are here subjoined:—

	Per Cwt.		Per Cwt.
	s. d.		s. d.
1886	56 0	1891	104 6
1887	77 0	1892	105 0
1888	72 0	1893	108 0
1889	90 0	1894	100 0
1890	99 0	1895	104 0

Ten years, from 1879 to 1888, of depressed prices combined with the havoc wrought by the borer and the leaf disease, greatly discouraged coffee-planting in India and Ceylon, and the prospects of the industry seemed so forlorn that both in Ceylon and India much coffee land was placed under tea. In 1889, however, there was a sharp rise in prices, and the level has ranged high since that year under the operation of speculative corners, political troubles in Brazil (whence the main supplies of the world are derived), and other circumstances. The maintenance of prices at their present comparatively high level has given to the Indian coffee planter a stimulus and an encouragement which were greatly needed.

THE STATISTICAL ATLAS OF INDIA.

The magnitude of the territory spoken of as British India is, we suppose, realized, in a way, by those who use the expression; and the vast and varied interests with which British rule is identified, are also, in a manner, appreciated by the intelligent student of contemporary history. For a full comprehension, however, of the gigantic responsibilities the English have undertaken on the vast peninsula under whose shadow we live, and of the manner in which those responsibilities are being discharged, few means are as effective, and at the same time attractive, as a study of the Statistical Atlas, the receipt of which from the Department of Revenue and Agriculture of the Government of India, we acknowledged a few days ago. The volume is admirably got up, in stout paper and binding which fittingly bear the weight of the heap of statistics enclosed between the boards; while the clearness of the letterpress and the ingenuity and neatness of the Maps and Diagrams invite the student to careful study. As a book of reference, it is invaluable; and we suppose it finds a place in every Collectorate and Public Department in British India. But its usefulness is not confined to India. Every country with trade relations with India, every civilized State, every Public Library which counts among its readers people whose minds can rise above the popular novel, and every private Library and newspaper office of any pretensions, has reason to be grateful that so compendious and attractive a volume is available for reference. It is a book of which the Government of India might well be proud—ingenious in conception, elaborate and clear in execution, but above all as a record of grand achievements and great and splendid progress.

On the accuracy of the work done and the statistics compiled, we are unable to express a definite opinion; but the names of the distinguished men responsible for the compilation in its several departments are a guarantee that every possible means must have been adopted to ensure correct and up-to-date information. The Statistical Atlas, as the prefatory note tells us, was first prepared in 1886 for the Indian and Colonial Exhibition; and care has been taken in preparing this second Edition for publication, to include in the record information obtained for the last census, while the scope of the work has been extended somewhat. Most people have a horror of statistics; and even those who feel a delight in interpreting their significance, are often deterred by the maze in which they are set, or disgusted by the awkwardness of their arrangement. In the volume before us, almost every branch of knowledge bearing on India is portrayed by a series of coloured maps, the significance of the tints being explained by a table of references at foot; and the Maps are supplemented in some departments by Diagrams, setting forth in columns and squares statistical information of the greatest importance and interest. It is impossible adequately to summarize the information thus presented, even in one department; but to illustrate the method of arrangement and treatment, we may mention the very first map. Its subject is Physical Configuration, and eight distinct tints indicate the distinctive features of the country—from a yellow which colours parts of the coast whose altitude is between 0 and 200 feet, to a blackish brown which represents heights over 20,000 feet, and by which several Himalayan peaks are distinguished. The explanatory letter press, before touching on the wealth and fertility which the Himalayas secure for

India, by arresting the vapour blown in from the sea and returning it in rains and fertilizing streams, invites the reader to endeavour to form some idea of the vast extent of British India by comparing it with some other parts of the world. A skeleton map of England and Scotland in a corner of each of the 25 plates which set forth the physical, geological, agricultural and other statistics of India, affords a striking contrast between the area of the kingdom and that of one of its grand possessions; but as quality, and not quantity alone, should be a factor in any comparison, Egypt, as, of all countries west of the Suez Canal, bearing the closest resemblance to India, is pressed into service. Taking Egypt as the unit, we are told that Bengal is about equal to 10 Egypts in extent, Madras to 6, and so on, until the total British provinces are the equivalent of 42 Egypts! This comparison excludes from consideration the native states, which aggregate about as many Egypts again. But while these states cover 712,000 square miles out of a total of 1,560,000, they sustain a population of only 66,330,000 out of a total of 287,223,000; and the explanation of the superiority in fertility and wealth of British India, is thus set forth:—

While your attention is thus directed to the inpour of the Himalayan waters you will observe what is perhaps the most important geographical feature of the Indian Continent, viz., the existence of a broad unbroken alluvial plain stretching from the north of Bombay through the Punjab, the North-Western Provinces and Oudh, and Bengal to Calcutta. If some convulsion of the earth were to raise the ocean level something more than 1,000 feet all this land would be flooded; the Himalayas would, as perhaps they once were, be cut off from the Continent of India by a new Mediterranean; the Bay of Bengal and the Arabian Sea would meet, and the Central Provinces, Bombay, and Madras would float as an Island, not bigger than Borneo, in the midst of the Indian Ocean. Now the reason why you are asked to acquire a vivid and permanent conception of this geographical fact is because a great part of the wealth of India is concentrated on this belt of alluvial land to which your attention has been directed. It is here that you may see unbroken continents of wheat, of millets, and of Indian corn, endless seas of rice and limitless prairies of sugarcane and indigo; it is here that you will find the teeming populations, the networks of canals and railways, the seething life of India. Down the ancient sea bed the tide of Muhammadan invasion ebbed and flowed, and up this same valley from the east the opposing force of British influence crept hand over hand. The battles of history were fought in the intermediate plains, until, step by step, the desultory conquerors from the North were beaten back or subdued by the stronger energies of the seaborne foes from the West, and peace and tranquillity were restored to millions of raiyat cultivators, who, while battle raged over their heads, ploughed and reaped annual harvests on this wide-spreading belt of fertile soil. Compare the first with the last map in this Atlas, and you will see how there are imbedded in this uplifted sea-valley four of the richest provinces of India—first Bengal, then the North-Western Provinces, then Oudh ("The Garden of India"), and, finally, the Punjab ("The wheat field *par excellence* of the Empire").

The last map, referred to in the above extract, is the only unstatistical one, portraying the various divisions which form the great peninsula, and separating them by distinct red lines—the portions tinted pink representing the different British provinces, yellow being the colour of the native states which run in and out of British territory, while one tiny white speck on the West Coast stands for the sole Portuguese Possession of Goa, and another on the East shows all that is left of what once belonged to

France in Pondicherry. The explanatory letter press supplies interesting information bearing on the Feudatory States, and is followed by a tabular statement in which we find the name of each State, its extent, population, Military Force, the name, age and title of the Chief, his date of succession, and the salute to which he is entitled, including those with territories less than 500 square miles in extent, the Chiefs number no fewer than 631—a fact which alone is suggestive of the immense responsibilities which must devolve on the Government of India. We can only briefly indicate the contents of the deeply interesting pages between the first and the last Maps to which we have referred. The Geological Map distinguishes, by means of bright colours, the six main formations which characterise the country—the alluvial and the archæan predominating. A large map and a series of eight charts are devoted to climate and rainfall, and distinguish the regions according to the rainfall, the varying influence of the cold weather and hot weather seasons, the incoming and retreating monsoons, the direction of cyclonic storms &c. The canal systems of India are illustrated in one Map, while diagrams show the area irrigated in the different provinces, distinguishing the acreage irrigated from Canals, Wells and other sources. Droughts and Famines; the Distribution and Nature of Agricultural Crops—a separate chart being devoted to each of the more important products, such as cotton, wheat, rice, barley, linseed, jowar, gingelly, bajra, tea, coffee, jute, and indigo; forest conservancy the tints indicating the different classes of Forests, and the lines the principal kinds of trees; horses and ponies and live stock; economic minerals; Railways, and almost every conceivable subject round which interest centres and which lends itself to illustration by Maps, Charts and Diagrams—all find a place in this excellent repertory of valuable information, in which facts and figures are set forth with marvellous lucidity and in forms which facilitate, and indeed invite, reference.

THE HIGHLAND ESTATES COMPANY OF CEYLON.

The estates, referred to in the *Observer* as having been acquired by the Highland Estates Company of Ceylon which has been registered in London are Glenorchy in the Nuwara Eliya District and Chrystlers Farm in the Dimbula District. The former is 184 acres in extent, 161 acres being in tea, and the latter 475 acres, 400 acres being in tea.

PLANTING IN BRITISH NEW GUINEA.

In a letter we have by this mail from Messrs. Burns, Philp & Company, Limited, Port Moresby, British New Guinea, it is stated:—

Interest in planting has fallen off for the time being, all being absorbed in the good news of discovery of gold-bearing country at the head of the Mimebare River not 60 miles from here as the crow flies. 47 ozs were obtained in 2 weeks. Only 3 or 4 settlers have so far tackled planting in earnest; one has 20,000 nuts planted at Dedde and another has or is planting 15,000 at Maiwa, whilst one or two are planting coffee and rubber. It may interest you to know that we have sent away about 6,000 lb. weight of rubber during last six months, which realizes good prices in London and Sydney. We pay 1/6 to 2/ per lb. locally. Indigenous tree, known as Maki.

THE TEA ESTIMATES FOR 1896.

The Secretary of the Indian Tea Association has placed at our disposal the following figures showing an estimate of the Indian Tea Crop for 1896. The total is put down at 141,303,523 lb., of which it is considered probable that 128½ million lb. will find their way to England. Bearing in mind that this statement is compiled from figures sent in about last November, and taking into consideration the protracted drought in several districts, the severe and general hailstorms in Cachar and other factors in what promises to be a late season, we do not think these estimates will be reached. It has been not unusual of late years to have early closing seasons; if 1896 does not prove an exception to what is more or less the rule, these figures will most certainly be found to be in excess. However, should a late and decidedly gloomy start be counterbalanced by a brilliant season and a late close, we may turn out our 144 odd millions, but we may be permitted to our doots. The I.T.A. gives expression to this doubt in its foot note we observe. We append the statement:—

ORIGINAL ESTIMATE OF CROP OF 1896.

	lbs.
Assam	59,039,263
Cachar	19,519,860
Sylhet	23,834,680
Darjeeling	8,384,760
Terai	3,103,400
Doors	21,225,560
Chittagong	787,200
Chota-Nagpore	238,800
Kangra	2,170,000
Dehra Dun and Kumaon (Estimate)	2,000,000
Private and Native Gardens (Estimate)	4,000,000

144,303,523

being 8,821,46 lbs. over the actual outturn of the crop of 1895. Estimating shipments to the Colonies and other Ports with local consumption at 16 millions (or say 2 millions more than last year) there will remain about 128½ million lbs. for export to Great Britain.—Yours faithfully, S. E. J. Clarke,

Secretary.

P.S.—Since the Estimates from the various districts were drawn up, there have been severe hailstorms in Cachar and excessive draught in Darjeeling, the Terai, and the Doors, which may have an appreciable effect on the outturn. The above estimate of the crop for 1896 should therefore be considered a full one.—*Indian Planters' Gazette*, April 18.

THE RONDURA TEA COMPANY.

A meeting of the Directors of this Company was held in Colombo on the 29th April to allot shares. On Broadlands estate belonging to this Company, the Colombo Commercial Company are at present erecting a large factory, which will have a capacity of output equal to about a quarter of a million lb. per annum.

NOTES FROM HOME.

DOVER, April 6.

It is curious how little some journalists realize the revolution of late years in the

TEA TRADE,

by which Indian and Ceylon has so completely ousted China. Here is the *Glasgow Herald* for instance, discussing Mr. Chamberlain's proposal for "Free Trade all round within the Empire" and giving the following as an illustration:—

"Then take such an article as tea, which is both a British and a foreign product. An inter-Imperial duty on China tea might be very agreeable to the producers of India and Ceylon tea, but if imposed it must have one of two effects, it must either

stop or restrict the imports into the British Empire of China teas in which case it would not have the revenue result desired; or it would raise the price to consumers of China tea and enable Indian producers to obtain a *pro rata* advantage without contributing to the Imperial funds."

The writer of the above does not seem to know how small a part of the imperial tea revenue is now contributed by China and that if the duty were to be abolished on Indian and Ceylon teas, with a simultaneous relaxation of the Indian and Colonial tariffs, the case of China could scarcely weigh one way or the other. Of course, the absurd Ceylon tax on Indian teas coming to Colombo would then be abolished, while it would stand good against any foreign teas like China or Japan.

A stupid mistake was made in one of my letters in speaking of the latest

DIMBULA TEA COMPANY

as "The New Dimbula Co., Ltd." Of course, in a sense, the Bearwell, Lippakelle & Co., Co. is the "new" Company; but the title is borne by the very leading and prosperous Company which includes the magnificent Diyagama property under the very capable management of Mr. J. A. Dick-Lauder and which has for its leading spirit at this end an old and esteemed Ceylon Colonist, Mr. W. Herbert Anderson. "The New Dimbula Co." was started in 1885, and occupies a foremost position among Ceylon Tea Companies.

The minutes printed and issued of the recent meeting of the

NUWARA ELIYA ESTATES CO.

have been withdrawn owing to some misconception regarding remarks made by Sir J. Grinlinton in reference to the possible competition of an increased supply of fine teas from India, not from Ceylon. For my part, I cannot see where in India, we are to expect any large additions to the class of teas grown in Darjiling and above 5,000 feet in Ceylon; but I may be wrong and it will be interesting to learn on what information the worthy Knight's remarks were based.

No amended report of the proceedings at the

NUWARA ELIYA TEA ESTATES CO.

has reached me; but I cannot think there is good authority for anticipating a special increase in the output of "Darjeeling" or other fine similar teas from India. Meantime, a City Broker reports on 9th his buying a few shares in the N. E. Co. a £13 5s and a few since on offer at £13. Others hold out for £13 10s. He adds:—"Of course no immediate dividend being in view there is not much doing." Of our

LEADING TEA COMPANY,

the same writer reports:—

"I have done Ceylon Tea Plantations today at £28½ and preference at £17½. These are fine prices, but the Report is most promising for a still further improvement. When I look over the number of clients I let in at £15. I only realize what fine profits they have made."

Our old friend

MR. W. G. INGLIS

—formerly of the O.B.C., now of the "Ceylon Tea Agency, Ayr,"—writes on the 4th inst. pleasantly as follows:—

"I see you are at home again on a well earned holiday which I hope you will enjoy. I have just had a chat with old Andrews about Ceylon, and he has favored me with your address. I hope you are not going back without visiting Auld Scotland, and I need hardly tell you how pleased I shall be to see you in Ayr by and by, and show you over the land of Burns, which, should the weather be favorable, you are certain to appreciate. I see nearly all Ceylon Tea Companies are doing well and returning fair

dividends. Business is very quiet in Ayr and the competition in tea getting keener every year. I wish I could get the Ayr physicians to follow the example of their brethren in Dover, and recommend their patients to drink pure Ceylon tea, high grade and high grown!"

I am sure all our tea planters wish well to Mr. Inglis and all who go in for promoting the consumption of Ceylon teas.

We have often referred in our columns to the valuable properties of

CINNAMON

and not long ago begged our medical authorities to take note of the news we gave from New Zealand of its curative use in treating cases of "cancer." I have heard no more of that; but the following is an extract from a scientific work (of old date, however, but no doubt reliable):—

CINNAMON AND INFLUENZA.—No living disease germ can resist for more than a few hours the antiseptic power of essence of cinnamon, even its scent will kill them. A decoction of cinnamon is often good to drink in localities where typhoid fever or cholera is prevalent.

This paragraph is worth repeating for ready reference in the next "Ceylon Handbook": let your Manager see it given there; for in the land of "cinnamon" at least, free use should be made of decoctions of the spice.

INTERESTING PLANTING NEWS.

April 29th.

The weather has been very fine in Upper Dimbula during the past week. Rainfall only .79 in. temperature averaging 72°. Flush coming on fairly well. Most estates in the district—notwithstanding shortness of labour—have secured more crop than at the same date last year. One crack estate of little over 200 acres has given 600 lb. per acre and a net profit of £3,760! Ambergamwa has had two days rain within the week. Gampola heavy thunder showers, and more coming.

April 30.

Dumbara has been having a few showers lately, but cacao is not looking very fit; evidently not to be the permanent product here that was at one time hoped for. Hundreds of acres are being planted in coconuts and tea, in order to have something more to fall back upon.

Ukawela and Matale still keep well to the front with cacao. Warriapola and Snduganga are pictures of cacao walks rarely excelled even in the West Indies.

Bandarapola continues to increase in size. A good supply of water has been laid on to the great delight of Ramasamy who can now get under a "peelee." Three new bungalows are being erected for Sinna Doreys and altogether it looks as if the portly director meant brisk business.

THE JAVA CINCHONA-INDUSTRY seems to be touching rock-bottom. The coffee and cinchona planting company "Paligaran," of Java and Amsterdam seems to be in a bad way. The directors have been compelled to propose a temporary suspension of the interest on the debentures, and the execution of a mortgage on the estates in favour of a financial concern, which is to receive the whole of the "Paligaran" estate's produce in consignment in return. The directors announce that unless the debenture-holders signify their acceptance of these proposals before June 4th, it is very likely that creditors will foreclose and sell up the estate. An improvement in the cinchona-prices, it is added, somewhat superfluously, would benefit the company greatly.—*Chemist and Druggist.*

NEW PRODUCTS IN FLORIDA.

CHAMPIONSHIP TO BE WRESTED FROM CEYLON.

The irrepressible Yankee is not easily floored. The effects of the freeze have been more disastrous than anticipated on orange cultivation, but with praiseworthy pluck he looks around him for other strings to his bow. With every confidence in himself and every faith in his matchless country, there is nothing possible on earth but what he thinks he is capable of, and nothing his soil cannot produce. True, no portion of the United States is altogether within the tropics, and to any other planter this would be a slight difficulty in dealing with purely tropical products. Not so to the Florida farmer. If his agricultural organs can be trusted even coffee of the first quality can be raised in any required quantity in a few months rendering them quite independent of Brazil or any foreign supply. Another "new product" much belauded of late is called the *cassabanana*; many have been the columns devoted to its praise and again and again the *Florida Farmer* returns to the subject saying "really the half has not been told particularly in regard to its usefulness." The writer compares it to a "Bologna sausage," but half repenting of the odious simile hastens to explain that the resemblance is only in shape. "The odour is indescribable—pineapple, quince, apricot all combined, are quickly referred to when the almost over-powering fragrance of a ripe *cassabanana* first greets the olfactory."

In this surprising fruit—the seeds of which are advertised at a premium—we recognise an old friend of the cucumber family, known to botanists as *Sicana odorifera*, specimens of which may be seen in the Museum of Economic Botany, Kew.

The next new product recommended by the "Florida Agriculturist" is even better known in Ceylon, viz. the coconut! which, according to this unquestionable authority, can be grown in Florida in such abundance as to wipe out any hope of Ceylon continuing to successfully compete with this well advertised Eldorado. Quite a mistake to suppose that frost will harm the coconut tree; it rather seems to increase its luxuriance and productiveness tenfold more than ever we saw in this poor bleak isle, or than ever was heard of out of an American paper.

But let the "Agriculturist" speak for itself:—

"THE INDUSTRY REMUNERATIVE."

"That the coconut is a purely ornamental tree in Florida, with little or no commercial value, is the general opinion. That its cultivation may be and will be made a remunerative industry is a certainty in the minds of many who have set out trees with its commercial value in view. In course of time these will be a source of considerable revenue. The grower quoted above says that he has never been able to supply the demand for sprouted nuts at from \$10 to \$15 per 100. Trees bear from 200 to 500 nuts yearly, and 80 per cent of the nuts will sprout and grow. The remainder may be marketed, desiccated, or preserved at home, prepared in various ways."

Think of this ye poor plodding coconut planters of Ceylon, content as you have to be with your 20 to 50 nuts per tree! "The trees have been known to bear for 200 years. In this climate, where they have never been hurt by cold, where everything is conducive to growth and bearing, and where choice lands are to be had at reasonable rates, the industry should thrive and pay. In addition to the citrus fruits, pineapples, guavas, truck, and sponges, the Biscayne Bay region may yet become the great coconut-producing center of the world, wresting from Ceylon its long-time championship.

"A Chicago firm operates large coconut farms in Ceylon for the purpose of utilizing the nuts for butter, and where the natives put it to almost every use under the sun, making houses, clothing, armor, weapons of warfare, utensils for household use and cookery, and even boats of it. About twenty five gallons of oil come from every 1,000 nuts. This is made into butter. The residue is a tallow-like substance, 25,000,000 pounds of which was imported here last year for the use of soap and candle maker.

Raw coconut oil sells for 5½ cents per pound. A factory is now in operation that turns out 20,000 pounds of butter daily."

Poor Ceylon! who is to be her next competitor? It is scarcely magnanimous of a great country like America to, all at once, crush out one of the most important and most ancient industries of the East.

SALE OF A COCONUT ESTATE.

Messrs. Finlay, Muir & Co. we understand have purchased an extensive coconut estate in the Chilaw district for R90,000. It is in extent 560 acres and is said to be a property that is full of promise.

MORE CEYLON TEA IS USED.

HEAVY INCREASE IN IMPORTS OF THE MACHINE MADE ARTICLE.

Good India and Ceylon teas, grown on a large scale and manufactured by steam-driven machinery, while commanding a higher price than the many inferior and unclean teas of China and Japan, are fast making their way in the world. From Ceylon 13 years ago 1,000,000 pounds were shipped. In 1895 the export footed up to 98,000,000 pounds, of which 78,000,000 pounds were consigned to England and 20,000,000 pounds to other countries. Indian teas entered in Great Britain increased from 18,000,000 pounds in 1871 to 118,000,000, while the importation of China teas decreased from 126,000,000 pounds in 1879 to 23,000,000 pounds. In the United States and Canada the following figures show that the people are beginning to discriminate, and to follow the lead of other countries: 1892, 3,200,000 pounds; 1893, 4,200,000 pounds; 1894, 5,380,000 pounds; 1895, 9,280,000 pounds.

People accustomed to China and Japan teas may not like the first cup of pure machine made tea, because of its novelty, but the second they will find tolerable and after the third they will want it and there will be no more relapse into the habit of using the other kinds. * * *—*Boston Herald*, March 28.

THE TAX ON TEA.

We all must admit that much of the time of our legislators at Washington is worse than wasted in the discussion of measures largely intended to serve personal or partisan ends. Occasionally, however, a realizing sense of their duty toward the public seems to impel the Representatives in Congress to take action upon some measures of real importance. In the "merry war" caused by the discussion of such measures, especially if they are contested vigorously, it frequently happens that valuable information is obtained that had previously been regarded somewhat as trade secrets. This applies particularly to industries desiring special protection and other concessions. Generally such advantages are wanted because of strong competition, and this same force exerts itself before the legislative committees, for there are always two sides to such questions.

The most interesting subject of that kind before the present Congress is the proposed imposition of a duty on tea. The various interests involved have sought to substantiate their claims with the usual mass of figures and so-called facts, until the lawmakers, especially the committee and others having this particular measure immediately under consideration, have found the matter not merely a "tempest in a teapot," but far more serious, involving as it does the healthfulness of a beverage daily consumed by almost every person in the land. It is practically admitted by the importers that it is impossible to supply this country with clean, uncolored tea from China and Japan. The conditions under which it is raised on small holdings, manufactured and packed by hand in the primitive way, do not admit of favorable comparison with the product of Ceylon, cultivated on extensive plantations of comparatively fresh soil that requires no fertilizing, and

manufactured and packed by steam-driven machinery. They avoid in that way contact with the hands and feet of perspiring native labourers. This admission alone should settle the question of superiority, and, when more generally understood, will doubtless lead to the almost universal use of Ceylon tea.

It is quite possible that many tea dealers were acquainted with these facts, and therefore served the best interest of their customers by encouraging the sale of Ceylon tea, for otherwise it is hard to account for the enormous increasing in its consumption recently, although during the last year the representatives of Ceylon have been actively engaged in disseminating information regarding their product. This resulted during the last year in the sale in this country of over 9,000,000 pounds, an increase of about 72 per cent. over the previous year. This means, of course a high grade of tea, for cheap teas are not handled by the Ceylon dealers, and they make no pretense of supplying them. Tea drinkers who are very careful of their diet are confined almost exclusively to this kind, and the increasing attention to sanitary and hygienic matter so redounds to the advantage of Ceylon tea that it is practically master of the situation—*The New-York, Freeman's Journal*.

TEA MARKET REPORTS.

OUR LONDON TEA LETTER.

(From Our Own Correspondent.)

March, 27.

MR. GORDON CUMMING v. DOOARS TEA CO.

Since my last, a case of considerable interest and importance to the planting community, *H. W. Gordon Cumming v. the Dooars Tea Co. Ltd.* came up for hearing in the High Court of Justice Queen's Bench Division, before the Lord Chief Justice (Russell) and a special jury. In this case the plaintiff claimed compensation for arbitrary and unjust dismissal, without due cause, contrary to custom and engagement reasonable notice not having been given. As a tolerably full and, under the circumstances, a most fair statement of the Court proceedings on this day has appeared in *The Home and Colonial Mail*, which paper I presume all your readers Mr. Editor see regularly as they certainly ought to I need not enlarge. As the case was arranged by compromise on the urgent recommendation of the Lord Chief Justice, evidence not having been gone into on either side, the defendants statement not having been heard, your contemporary no doubt felt bound not to make any comments, or even report the plaintiff's counsels opening statement quite as fully as he otherwise might, anything further I have to add must be under the same proper restraint.

The plaintiff's senior counsel was Mr. Dickens' Q.C. son of the novelist who opened his case with a singularly precise and lucid statement, considering that the matters referred to were so foreign to his experience. The substance of the learned counsel's speech was very accurately given by your contemporary. This need not be repeated or even summarised here. The Chief Justice, judging from the brief remarks he made as Mr. Dickens proceeded, had grasped the case pretty clearly before taking his seat on the Bench, and as counsel commenced to read the correspondence, his Lordship urged him to lead up to the main point as briefly as possible. Mr. Dickens while expressing some disappointment said he bowed to the ruling of the Court, and rapidly turned over numerous pages of his brief, and read an important communication from the London Board of the Co. to Mr. Verner their Superintendent in India, to the effect that if Mr. Gordon Cumming declined to accept the terms offered there would be no help for it but dispense with his services, in which case he was to receive the "notice customary in the district" or salary in lieu of notice—one or three months as the case might be, but in that respect to "err on the side of liberality." It seems only fair to the London Board of the Dooars Co. that

this omission in the report referred to be supplied otherwise after the memorable peroration by Sir William Hunter, (one of the Co.'s Directors), when presiding at the "Assam Dinner," in July last, when he appealed so earnestly in well chosen words of sympathy to "all those who controlled large tea companies and large affairs" to deal liberally with their employees and make their lives as healthy and happy as possible, (as reported in your issue of 3rd August last), the position of this Board of Directors might appear somewhat incongruous. As soon as this communication, and letter from Mr. Verner the Superintendent in the Dooars to Mr. Gordon Cumming, and Mr. Cumming's reply were read, the Chief Justice interposed saying that in the face of these letters it was useless for the defendants to contend for one month's notice that the case was eminently one in which the parties should "meet each other," and strongly urged a consultation and settlement in that way. The defendant Company's counsel, Mr. Robson, Q.C. then made a statement to the effect that he did not admit the plaintiff's statements that all the correspondence had not been read, and that he was prepared to prove *inter alia* that one month's notice (or one month's salary in lieu of notice) was customary in the Dooars district. The Lord Chief Justice thereupon remarked that if the jury had been deprived of "a treat" in not having had more of the correspondence read, he was entirely to blame for it. After some consultation, counsel announced that a settlement had been arrived at, and it had been agreed that a verdict should be given for the plaintiff with costs, for a sum to be afterwards fixed on the basis of three months' salary and commission down to middle of July 1895.

Though it is to be regretted that the case could not have been arranged without going into Court at all, in the public interest seeing it had gone so far (several witnesses having it seems been previously examined "on commission") it might have been well had the case been thoroughly gone into and an authoritative decision given. Yet, there can remain no doubt that both parties are to be congratulated on its having at last been so summarily disposed of. I have heard that on the spur of the moment, at the close of the court proceedings, Mr. Gordon-Cumming did not appear satisfied with the terms agreed to on his behalf by his legal advisers, but though the compensation would seem but very inadequate for one, especially a married man just returned to the gardens from furlough, so long filling as he did the important and responsible position in the company as proved with acknowledged efficiency, he is not the least to be congratulated on the termination of the litigation. It must be borne in mind that no employee single handed can fight a large public company on equal terms, and Mr. Gordon-Cumming had really no *written agreement*. On the other hand, no "tea company or other large office," can hope to be well served or retain good men, if they are subject to dismissal on one month's notice at any season of the year. It certainly behoves all tea concerns, as well as managers and assistants, to see to these matters. We all hear of the "glorious uncertainties of the law," and this must be especially great in regard to a case depending upon "custom" in a tea district tried in England or indeed anywhere. I can have no doubt Mr. Gordon-Cumming was well-advised by his counsel and agents, who must have been well able to make a very correct estimate of the utmost to be obtained from the court and jury had they for the defendant declined a settlement and proceeded with the case after the peremptory recommendation of the Lord Chief Justice. And above all, there can be no doubt at all of the moral victory for the plaintiff, though it is to be feared after all has been squared up the pecuniary result may not prove a satisfactory "compensation." On the contrary it is to be feared, that though the case might have dragged on its miserable course much longer and been merely worse, it will as it is be but another proof of the correction of the verdict finally arrived at by the old country man who had dabbled in litigation all his life, that "the winner loses but the loser loses most d...ly"

INDIAN TEA ASSOCIATION (LONDON.)

As you must have noticed Mr. Editor, at a recent meeting of this Association it was resolved (1) to resolutely push the sale of Indian tea in America for another year at least, and for this purpose a levy be made on the same terms of 1895; (2) to express appreciation of Mr. Blechynden's services during the past year; and (3) that companies and others who do not support the levy be approached by deputation or otherwise, and if possible induced to do so. As the figures which I formerly gave from Messrs. Gow, Wilson and Stanton's Report, and which have since been quoted in the Indian Tea Association Circular, it will be seen that progress in Foreign and Colonial markets has been most satisfactory especially last year. As Mr. Blechynden's appointment is in many respects far from being enviable, and the task he has in hand no light one it is but right and most be gratifying to him to find that his efforts are appreciated. Amongst the non-contributing defaulters referred to are the Assam Co., our premier tea concern, the Brahmputra Co. and the Lebong Co. It is taking a very narrow and erroneous view of the position to conclude that because the teas of some particular district or concern are unsuited for the American or Colonial requirements, that it is not the duty of *all* to aid in conquering new markets because a few million pounds of British grown tea, more or less thrown upon the home market makes all the difference between profit and loss to most growers.

GOVERNMENT STATISTICS OF TEA CULTIVATION.

In my last I called attention to some aspects in connection therewith stating that I could not think the average had in any case been *underestimated* as at close of 1894. I would again call attention to one point. The area under tea in the Dooars for 1893 is given as 42,955 acres, and for 1894, 43,133 acres, showing only an increase of 178 acres; that of Darjeeling District is given as 59,612 acres for 1893 and 70,038 acres for 1894, an increase of 10,426 acres. There must be some mistake here, and still I am at a loss to account for it. I might have credited an increase of 10,426 acres in the Dooars, and something not much over 178 acres (allowing for possible abandonments in the Terai) for Darjeeling. Certainly the increase in Darjeeling for 1893 to 1894 is very very much short, and that for Dooars must be immensely more than shown in Mr. O'Connor's tables. Can the area under tea in Darjeeling District possibly amount to 70,038 acres? Would 55,000 acres not be nearer it? It would seem as if the area of tea in the Terai had been by mistake added to that of the entire district, both hills and Terai included. It does not appear that the mistake could possibly have occurred by Mr. O'Connor transposing the figures in the Dooars and Darjeeling District Returns. Can any of your readers with full local knowledge clear up this point?—*Indian Planters' Gazette*, April 18.

COFFEE CULTIVATION IN THE STRAITS SETTLEMENTS.

From the Report of the Acting District Officer, Kuala Pilah (Mr. Leopold Cazalas), for the month of February 1896, as given in the *Negeri Sembilan Government Gazette*, we quote the following:—

I am glad to be able to report that an enterprising Chinaman has begun to fell for coffee a 25-acre block at Kuala Panting, an example which I hope will be followed by others. That Chinese will open a coffee garden so far away is a good indication for the stability of coffee cultivation.

On the 25th [Feb.] more applications for coffee seeds were received. The popularity of coffee planting continues. Now that Pedro Low's attempt is proving successful, many Chinese and Malays in Johor have been seized by the craze—if craze it be but to copy successfully a certain amount of intelligence and experience is necessary, and a few failures may divert the tide of popularity. For this reason I have supplied these men with seed from Sungoi Ujong, recognising the value of good seed.

From the Lower Perak Monthly Report for February, as given in the *Perak Government Gazette*, we quote as follows:—

I inspected all the Liberian coffee holdings in the Teluk Anson mukim during the month; some of these are now over five years old. I was first taken round them by the late Mr. Denison, in 1893, the trees were then of some 12 to 18 months growth; many were actually standing in water, the land in nearly every instance badly drained and in some places drainage was left to nature. It is wonderful to see these trees today, they are well-grown, and simply loaded with berries and the owners are reaping a good return. For swamp-land native planted coffee, I don't think it can be beaten. The soil is good stro g clay, no peat.

From the Matang Monthly Report for February, as given in the same paper, we take the following:—

On the 6th I took Sir Graeme Elphinstone (who had arrived over-night) to see the Jibong Estate, a walk of three and a half miles. On the way we carefully examined Peter Madrigal's little coffee estate which is in full bearing and looking very well. We found Mr. Stephens at home. His coffee, taking it altogether, is looking very promising.

During the month applications were registered and survey fees deposited for two blocks of 640 acres of land each for coffee cultivation. Messrs. C. L. Gibson and Aylesbury are the applicants.

DURBAN BOTANIC SOCIETY.

From the report on Natal Botanic Gardens, for the year 1895, by J. Medley Wood, A.L.S., Curator, we quote the following paragraphs:—*Cola acuminata*.—The receipt of seeds of this tree was mentioned in my report for 1894, and I am now pleased to be able to say that the plants have so far done very well. Some have been sent away for trial and we have still a few on hand. It is perhaps scarcely necessary for me to say that it is the tree which yields the "Cola" nuts of commerce which have lately come so much into use in the form of chocolate and other ways. *Theobroma cacao*.—Twice during the past year we have received seeds of this plant, the first time by the kindness of A. Whyte Esq., of Zomba, Central Africa, who brought them from England in the cool chamber of the steamer; the second time by favour of His Excellency Sir Hely-Hutchinson, who obtained them from West Indies. In both cases the seeds were well and carefully packed, but I regret to say that not a single seed germinated, though every care was taken of them. I shall therefore make an effort to obtain plants from Mauritius, and hope to meet with better success, so that the plant may have a fair trial in the Colony.

BLACKSTONE ESTATE CO., LTD.

An extraordinary general meeting of the Shareholders of this Company was held at the Registered Office of the Company, No. 21, Baillie Street, on the 1st May. There were present Messrs. J. N. Campbell (Chairman), H. Creasy, G. J. Jameson, E. R. Waldoek, F. Macindoe (by his Attorney Mr. G. J. Jameson), F. A. Fairlie (by his Attorney Mr. J. N. Campbell) and Messrs. Carson & Co. (by Mr. Jameson).

On the motion of Mr. H. CREASY, seconded by Mr. JAMESON, the following resolutions, passed at an extraordinary general meeting of the shareholders held on the 17th April were confirmed:—

To sanction the increase of the capital of the Company to R160,000 (Rupees One hundred and Sixty thousand) by the issue of three hundred new shares of Rupees One hundred each fully paid.

To sanction the purchase of Kenilworth estate by the Company.

To authorise the Directors to borrow a sum of R15,000 (Fifteen thousand Rupees) for the purposes of the Company.

A COLOMBO BROKER IN RUSSIA.

Mr. A. M. Gepp, the well-known Colombo tea broker, who returned to the Island on the 30th April after a twelve months holiday, in the course of his travels visited Russia, where, to a certain extent, he combined business with pleasure. Mr. Gepp in response to a request by an *Observer* representative was good enough to impart his views with regard to the progress which Ceylon tea is making in the land of the Tsar. When in Russia, Mr. Gepp visited Moscow and St. Petersburg. As a result of his observations, he is well satisfied with the progress that has been made, and he thinks the future prospects of Ceylon tea are good. China tea, he said, of course, still held the field though a good deal of mixing with Ceylon teas was going on. Expressing it in figures, he computed that about 10 per cent of the blend in which Ceylon tea was used was grown in Ceylon. One thing the Russians would not do was to use Indian tea, the objection taken to it being that it was too strong. Mr. Gepp is not inclined to put too much weight on the generally accepted opinion that only high class teas are acceptable to Russian taste. On the contrary he said there was a growing demand for teas which, if sold in the London Market would fetch from 6d to 8d per lb. Mr. Rogivue, he said, was doing a very good business in Ceylon tea, while, with a view to pushing the staple in Russia, his own firm had established an agency in Moscow. The new agency, Mr. Gepp explained, had just been started and from the way he spoke of it our informant has evidently high hopes of its success. In the course of his travels Mr. Gepp also visited Berlin but the time at his disposal did not permit of his gathering sufficient data to gauge how Ceylon tea is progressing in Germany. His holiday, for the most part spent in England was a thoroughly enjoyable one, and Mr. Gepp's many friends will be glad to learn that he was blessed with the best of health.

TEA GROWING IN THE CAUCASUS.

The phenomenal growth of the trade in Indian and Ceylon tea, and the immense profits to be made from it, if successful, have doubtless influenced the Russian authorities in the Caucasus to attempt something in that line for themselves. Indeed, they are, according to Mr. Consul Stevens, of Batoum, going to do things on a "large scale; and" it is fondly hoped that before long tea culture will become one of the most important industries of this Southern Province of Russia. So far as ascertained, the soil, climate, annual rains, &c., are all favourable. Several Russians have required lands for laying out tea gardens; and the Imperial Domains Department has also sent a special commission to India, Ceylon, China, and other tea-growing countries, to make a study of tea cultivation. Other capitalists will presumably follow. A Mr. Popoff is the only person at present really actively engaged, and he has three plantations. These are stated to be perfect models as far as the laying out of the grounds, the roads, buildings, &c. are concerned. He keeps his methods to himself. The young plants are said to be doing well.

The Imperial Commission sent out has already been through India, China, and Japan. It spent a whole month in a Chinese village near Shanghai, at which place the preparation of tea was studied and tea seeds and plants and machinery for the ten plantations near Batoum were procured. In Japan the expedition collected some valuable information respecting the soil and climatic conditions of the tea growing districts in that country. One or two members of the expedition have recently proceeded to San

Francisco to study the American system of culture, and the other members are to remain a short time longer in Japan for the purpose of engaging Japanese labourers and obtaining samples of Japanese tea plants and seedlings. What with the older fields of China and Japan, and the newer fields of Java and other parts, including the Fijis, Mauritius, and the Caucasus, with the great extension of tea-growing in both India and Ceylon, there seems to be an extended career for tea in the near future.—*Madras Times*, April 28.

THE HIGHLAND TEA COMPANY OF CEYLON LIMITED.

This company was registered on April 7th, with a capital £70,000, in £10 shares, to adopt a certain agreement, and to acquire, cultivate, develop, and carry on certain tea estates in the District of Dimbula, Ceylon. The subscribers are:—

	Shares.
G. G. Anderson, 16, Philpot Lane, E.C., mcht	1
A. W. Anderson, 7, Winpole Street, W., gent	1
J. F. Anderson, 16, Philpot Lane, E.C., mcht	1
Miss A. J. McGillivray, 5, Braidburn Crescent, Edinburgh	1
Miss J. W. McGillivray, 5, Braidburn Crescent, Edinburgh	1
Miss M. G. Anderson, 9 Braidburn Crescent, Edinburgh	1
M. J. Brown, Edinburgh	1

The number of directors is not to be less than three nor more than five; the first are Sir G. A. Pilkington, R. C. Bowie, and G. G. Anderson; qualification not stated remembrance, as the company may decide. Registered office 16, Philpot Lane, E.C.—*Investors Guardian*, April 4.

COFFEE IN GERMAN EAST AFRICA.

The planters of German East Africa have just shipped a small first crop from the Tanga district and they are awaiting anxiously to hear the result. I saw a sample and did not think much of it. It was not properly cured, nor dried well, being of a mottled colour. The plantations are about eighty miles in on the hills and the railway from Tanga has already gone in about forty miles. The Government is expected to take it over and push it on. As your readers already know leaf-disease broke out sometime ago but owing to the prompt measures taken it has only, as yet, affected the plantations slightly. The rains begin with them about the 10th November and are said to amount to 80 inches *per annum*. Labour is very dear, about £1 a month and very difficult to get at that while they are continually annoyed by boys running away. The land where the plantations are is heavy timbered forest land. Liberian coffee is being planted on the lowlands and cocoa is also to be tried.—*African Planter*.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed during the week ending 28th March 1896, under the provisions of Act V of 1888.

For improvements in or connected with machinery or apparatus for drying tea leaf or the like.—No. 108 of 1896.—William Jackson, engineer, of Thorngrove, Mannofield, Aberdeen, North Britain, for improvements in or connected with machinery or apparatus for drying tea leaf or the like.

For Drying and Warming all sorts of oil-seeds by Steam Power.—No. 118 of 1896.—Temulji Dhanjibhoi, mill manager, now residing at No. 125, Hurrogunge Road Salkia Howrah, for drying and warming all sorts of oil-seeds, by steam-power.

For Clearing and Separating Cells of Seeds, by Steam-power or Manual Labour.—No. 119 of 1896.—Temulji Dhunjibhoi, mill manager, now residing at No. 125, Hurrogunge Road, Salkia, Howrah, for cleaning and separating cells of seeds, by steam power or manual labour.

Specifications of the undermentioned inventions have been filed under the provisions of Act V of 1888.

For Improvements in Apparatus for Rolling Tea Leaf and the Like.—No. 38 of 1896.—William Jackson, engineer, of Thorngrove, Mannofield, Aberdeen, North Britain, for improvements in apparatus for rolling tea leaf and the like. (Filed 23rd March, 1896.)—*Indian and Eastern Engineer*, April 11.

COCONUT CULTURE IN VENEZUELA.

Coconuts are indigenous to the sandy soil of the sea-coast, requiring the warm and equable temperature of the tropics. The coast belt of Venezuela possesses not only these, and every other requisite condition, but unusual facilities for the shipment of fruit to some central point. For hundreds of miles the coast presents a narrow flat surface in many places extending some distance back; and the mountainous formation in other places is equally well adapted for the prolific production of the fruit. All the soap factories rely, to a great extent, upon their own groves for the oil from which they manufacture their product; but these groves are an insignificant patch, when compared with the waste and barren lands, unfit for any other agricultural purpose, and to be obtained at a very cheap rate. The Venezuela palm requires four years to attain the fruit-bearing period, after which time its producing power is enhanced year by year, until its full maturity is reached, about its eighth year; it then produces for 40 years. From 75 to 100 trees are planted to the acre, yielding fully 300 to 350 coconuts per annum. The profit of the small producer is not less than about 4s. per tree per annum. The large grower, handling and shipping his fruit, would it is said, double that figure. The palm, while a tree of exquisite beauty, yields one of the most nutritious and useful fruits known; as an article of food, it is greatly relished; industrially, its principal use is in the manufacture of an excellent quality of soap, the coconut oil being preferred to fat because of its ability to absorb much more water than the latter. The husk of the fruit is now used as fuel; and on this point the United States Consul says it would seem that, in countries such as Venezuela, where carpets or other woollen or cotton floor coverings are discarded, and nothing but imported mattings used, the manufacture of the fibre of the husk into cocoa matting on the spot would prove profitable. Such an enterprise, aside from the possession of its own inherent excellence and elements of success, would probably receive great assistance and encouragement from the Government.—*Journal of the Society of Arts*, April 10.

THE AMSTERDAM MARKET.

Our Amsterdam correspondent states that last Thursday's auctions of Java cinchona-bark in his city, of which a telegraphic report appeared in our last issue, passed off very quietly, but at the same time with a more general demand than has been shown for some months. The richest parcel of bark offered at the sales was a lot of 24 bales Ledgeriana stem bark in broken quill, produced on the Malawar estate. It analysed 11.03 per cent of sulphate of quinine, and sold at from 38½c to 38¾c per half-kilo. The quantity of bark bought in at the auctions represented an equivalent of 6,129 kilos of sulphate of quinine. The demand for pharmaceutical barks in fine bold quill or good broken quill was fairly good, and comparatively high prices were paid, whereas common kinds were quite neglected. The shipments of barks from Java during the month of March are ton yet known, but they are said to be moderate. It is also rumoured that the largest of the new

Java quinine factories now in progress of construction will not be in working order for some time, as certain conditions under which the funds were granted have not so far been fulfilled. The following statistics show the result of the first three auctions of the year 1896, 1895, 1894 and 1893:—

	Packages of- fered at the three Sales	Total Weight		Average Qui- nine Content	Quinine Sold	Quinine in bot.
		Kilos.	Kilos.			
1896..	21,040	1,937,808	101,938	5.14 to 5.53	81,306	20,632
1895..	22,751	1,963,134	92,289	4.63 to 4.91	49,194	43,095
1894..	16,869	1,363,134	61,005	4.61 to 5.12	56,899	7,106
1893..	17,516	1,468,971	61,936	4.23 to 4.55	39,537	22,399

The units were as follows:—

	1896	1895	1894	1893
	Cwt.	Cwt.	Cwt.	Cwt.
First sale	.. 3	2.70	3.95	5.80
Second sale	.. 2.82	2.50	4.40	5.60
Third sale	.. 2.80	2.85	4.42	5.23

—*Chemist and Druggist*, April 4.

MACKAY COFFEE ESTATE COMPANY LIMITED.

The prospectus of the abovenamed Company, which is new before the public, is worthy of more than a passing notice. It has been proved far beyond the realms of doubt that coffee of the finest quality can be successfully cultivated in localities favourable to its growth. That in our colony of Queensland there are many favourable spots goes without saying, and when guided by the experience and judgment of men who have spent many years at the business we need not hesitate in assisting to establish an industry which is destined to reach very large dimensions. Since the outset of the career of this journal we have been firm believers in our climate and soil being in every way suitable for coffee cultivation on a large scale, and we hope to see the time when we shall rival Brazil at least as exporters of the cheering berry. The prospectus before us is the result of the efforts made by Mr. John Dansey, an experienced Ceylon planter, who is profoundly impressed with the belief which comes of conviction, that for coffee cultivation Queensland is second to no country in the world. This conviction has been arrived at in the most natural of all ways. Mackay, he considers as a good coffee centre and the proposed Company will operate in that district. The capital of the Company is to be £6,000 in 12,000 shares of 10s each, and the payments are made so easy as to be within the reach of all. All the names on the directory are of a class as to give the public the fullest confidence. And as if to give a further assurance of the *bona fide* nature of the proposed Company the promoter or original mover, Mr. Dansey, is willing to accept shares equal to one-twelfth of the entire capital, which shall go against his salary as manager of the Company in instalments of 250 shares per annum. Mr. Dansey has been engaged for four years by the new Company.—*The Australian Tropiculturist* etc., March 21.

CEYLON TEA IN AMERICA.—In quoting two extracts about Ceylon tea in America on page 818, we omitted to mention that the papers had been kindly sent to us by our Tea Commissioner. The *Boston Herald* from which one of the extracts was taken also contained a prominent advertisement of our teas setting forth that "the great discovery of the X-rays by Dr. W. C. Roentgen was not needed to show tea experts the extent of the impurities in a chest of China and Japan tea," and that teas "absolutely pure wholesome and uncoloured artificially can be obtained from India and Ceylon." A similar notice also appears in the *Boston Globe*.

CINCHONA PLANTING IN SOUTH INDIA.

GOVERNMENT COMPETITION WITH PRIVATE ENTERPRISE.

We are not aware, says the *Madras Mail*, whether Government has yet taken any steps to put into effect its declared intention of obtaining fresh cinchona seed from South America in order to open out new acreages on its plantation on the Nilgiri Hills. As one or two events have happened during the past few months which may have caused delay in the matter, it is possible that it is not yet too late to utter one more protest against a line of action which in our opinion is indefensible in whatever aspect it is regarded. It was Charles Dickens, we think, who drew attention to the extraordinary difficulty of bringing together two people, one of whom had an article for sale, while the other wanted to purchase exactly such an article. He took for his text the advertisement columns of a newspaper, but a more striking illustration is to be found in the cinchona industry of the Nilgiri District. In one corner of that District Government is crying out that it cannot obtain sufficient bark for treatment at its quinine factory, and yet in other parts planters are groaning because the expense of shipment to England is too great to allow them to harvest their bark. There must now be several hundred acres of private cinchona on the Nilgiris and in South-East Wynaad of it very rich in alkaloids, which are practically valueless because the charges necessary to place the bark on the London market are so high that they would absorb all the money likely to be realised by the sale. This bark is available to Government at a price cheaper than it could be grow it for itself. Therefore so long as Government can obtain in the open market such cinchona as its quinine factory requires at a price as low as or lower than the cost of production, every anna spent on opening out new cultivation is wasted. It will very possibly be urged that these private plantations cannot last for ever, and that in view of the present state of the market planters will decline to go on cultivating cinchona. The first part of this assumption is true, but the latter part very problematic. Were it known that a certain quantity of bark would be required at Naduvatum every year for which the current market value would be paid, there is very little reason to doubt that it would be forthcoming. We write of course on the assumption that the factory is not treated as a source of public revenue. It has, we believe, been laid down that the sulphate is not to be sold below the current wholesale price; and this being so, Government can always afford to give the same price locally with manufacturers pay in Europe. Sir Arthur Havelock has already shown a sympathetic attitude towards the planting industry, and if he were only once and for all to put his foot down on this competition of Government with an impoverished private enterprise, he would do a real service. Since the days of Sir M. E. Grant Duff there has often been a talk of Government withdrawing from the cultivation of cinchona, and it only requires a little resolution—in both senses of the word—to bring it about. The matter is after all a small one, but it involves a great principle.

AFRICANA.

CROP PROSPECT 1896.

It will be gratifying to our planting friends to hear that a rough computation of the total crop for 1896, promises an outturn of over 300 tons, let us say from a minimum of 300 tons to a maximum of about 350. Of course the estimate is necessarily only a rough one as statistics are not to hand from all the plantations but we believe the figures given above will be found fairly accurate, always supposing that no untoward disaster intervenes between now and crop-time. In 1889 the yield was 5 tons, which amount was doubled in 1891. In 1893 the export of coffee had risen to

42½ tons, in 1894 to 74 tons and the 1895 output was calculated at 150 tons. We hope the Administration will soon publish the actual figures from Chiromo Customs returns. It will thus be seen that the 1896 crop is likely to double the estimated amount for last year and yet only a small portion of the planted area is in full bearing this year. Taken in conjunction with the high prices which our coffee obtains in the London Market where 111s, the record figure, was obtained by some of last year's crop it gives the best answer to those pessimists who would decry our staple industry. Our coffee appears in the Market reports as East African Plantation but as both German East Africa and Ibea may soon be placing coffee on the market it might be advisable to get the B. C. A. coffee classed as Nyassaland or some such distinguishing name.—*Central African Planter*, March.

TEA IN THE SHETLANDS.

"Three months of summer, and nine months of eternal rain." It is almost better to have it as we have it in Madras—summer all round, and the greater part of it a burning, skin-cracking, prickly-heat-bringing, boil-producing summer that scorches all the energy out of the body and all the vigour out of the soul. For the nine months' "rain" of the Shetlands means unutterable things. "Rain," in India means something delightful,—a refreshing shower that cools the air, at least for the time being, even though a steamy oppressive heat follows immediately. In a place like the Shetlands rain means a driving, sleety discomfort, such that nine months of it would tell a good deal on the negative side of the discussion as to whether life is worth living. In a hot region like tropical Madras, or in a cold one like the freezing Shetlands, the cup that cheers but not inebriates is largely indulged in; and, although "Auld Scottie" is a large item in the Shetlands, yet the love for tea is apparently profound; and it can be imagined, indeed, that the icy climate makes the warming cup a treat. According to an account in a home paper, the Shetland doctors say that the Shetlanders are on the whole healthy and thriving, the chief diseases being those that spring from a moist climate, overcrowded dwellings, and "an immoderate use of tea." But it is somewhat astonishing to go on reading that "Tea is said to be the cause of many local diseases, and among them that of delirium tremens, and of all sorts of ills." On this a Shetlander writes playfully:—"We have for long been told that tea was seriously injuring us, but we have taken no notice." The matter he says, has now reached a climax, and if the Shetlanders do not instantly reform they will become Mongolians to whom tea is an all-in-all. Indeed, we must be so already. It is stated, on medical authority, that owing to the use of biscuits and strong tea the Shetlanders have undergone a most unheard of change within the last 30 years, and have become quite another people. In speaking of the effects of tea-drinking, the scientific authority quoted calmly states that Shetlanders were formerly supposed, and in fact in the south are still supposed, to be the offspring of the early Norse, but their tea-drinking has quite debilitated them, and made them quite another people. This discovery, writes the Shetlander, adds a new and startling complication to the question of heredity. "Who we are now" he says "and to what race we belong is what every Shetlander is asking himself. Through our persistent use of tea we have drunk ourselves out of our ancestors and out of the race of Odin, and must by a natural law have fallen back on the aboriginal natives. It is believed that a Mongolian race inhabited at one time the north of Europe, and we must now be classed among the heathen Chinese. Our tea-drinking is a proof, and there are other proofs hitherto unexplained which at rare intervals have perplexed observant men. The only satisfactory element in it is that the problem of who built the ancient castles along our shores has been at last solved. Our fathers did it." The far Shetlands are evidently good customers for tea, but that reference to the heathen Chinese and the Mongolians makes it

look as if in their for northern and insular backwardness the Shetlanders were strangers to the Indian brand. Perhaps, after all, it is the 'Chinese rubbish,' stewed in British fashion, that is ruining their race, and that even the anti-tea Crusader of Shetland medical science would be converted to its excellence if he could know it aright?—*Madras Times*, April 21.

WOES OF NORTH INDIAN PLANTERS.

"Me Miserum" gives the following "Tea Agonies" to the *Calcutta Planter*:—

There is the excessive rain that makes the leaf "bhanga" and produces bad tea, with a consequent slashing from the brokers. Then the want of rain, which prevents the bushes from flushing, followed, of course, by short outturn and another slashing, only more so, from agents and proprietors. After this the clerk of the weather to satisfy the craving of mankind for novelty and change, thinks he must treat us to something different; so down comes a hail-storm tearing the bark from the bushes, destroying the leaves, and causing the unfortunate manager to swear solemn but emphatic oaths.

Now the weather becomes glorious (for tea). The leaf comes away, and we write cheerfully to the aforesaid agents and proprietors about first-class prospects for the coming month, and so on. Just as we have started a complicated calculation as to what the manager's commission on profits is likely to amount to, and are meditating on the best way of spending it, in stalks blight in every form and shape—red spider, mosquito, etc. etc., *ad infinitum*. Dr. Watt tells us there are some hundred and odd types of blight. I would guarantee a fortune to the man who discovers a really cheap and effective way of destroying the pest. There is no sight more depressing to a planter than to see three-fourths of his garden shut up with blight, with no earthly prospect of getting any more leaf from it during that season. Indeed, an absolute stranger looking at the bushes would imagine that the very life of the bushes must be extinct.

Probably the next bit of excitement will be a flood and a river that has hitherto been wont to flow some miles away from the garden takes it into its head to run through the middle of our best indigenes. Verily, the planter's life is not a happy one! The ten plagues of Egypt sink into insignificance when placed in comparison with our daily worries.

Last, but not least, comes the cooly, who is the very reverse of blight in every respect except that he likewise does his best to drive one to an early grave. He is very hard and very expensive to get hold of—it is very hard to keep him when you do get hold of him. If he does not abscond, you probably find he has no constitution, lingers on in the hospital and finally dies, having cost you a lot of money and never done a stroke of work. When two or three coolies begin to die, the prospect of a commission to enquire into the causes for the excessive death-rate stares you in the face. Scarcity of labour is, after all, the greatest difficulty with which the planter has to cope, and until something is done to put the cooly recruiting system on a sounder basis, this trouble will not only remain but increase year by year. The lack of combination among planters accounts chiefly for the unsatisfactory state of things that exists.

Add to all this that we have a climate in which malarial fever is all but a certainty, in some form or shape, to all except those whose internal machinery more resembles cast-iron than common flesh and blood. I often wonder how many Duars and Terai planters would have come out to India had they known what sort of a climate awaited them. Luckily for the tea industry, planters are caught young, at a time when they refuse to believe that any vagaries of climate can effect their health.

The above are but a few of our troubles, but your correspondent will now probably understand that our life is no more composed of beer and skittles than his own.—*Planting Opinion*, April 11.

COFFEE PLANTING IN B. C. AFRICA.

MR. SIMPSON'S VIEWS.

To the Editor of the *Central African Planter*.

Dear Sir,—As a young planter, it was simply with disgust and pity, I read Mr. Simpson's letter in the present issue of the *Planter*. From its tone one would certainly think that the said gentleman had an intimate and personal knowledge of every coffee plantation in the Shire Highlands. Has he? I, and many others, with me, will say: No! Now! I would like to ask Mr. Simpson; When, or how often lately, has he visited any of the coffee districts, *viz*: Zomba, Blantyre or Cholo?—(I leave out Mlanje, Sir, as it seems to have struck terror into the manly breast of Mr. S.) and I would also ask him, who gave him, or where did he get, the statistics he quotes?

From my own enquiries, amongst those who are able to speak with authority, seeing they have certainly had *experience in coffee planting*, and also from my own observations in certain parts, I can assuredly inform Mr. Simpson that his severe condemnations are quite out of place, and grievously in error.

I am afraid that our would be prophet has climbed the mountains too far, and, consequently, owing to the stormy winds that blew, they have carried the good seed sown, (I have no doubt, in good faith), A'WA!!! and so we have the sower, surely developing into a crusty old pessimist. Charity thinketh no evil!

I do trust that all of us who are engaged in coffee culture, and are determined to make it pay, will rather take courage from such senseless and unjustifiable criticisms as quoted in Mr. Simpson's letter, and pity, rather than blame, him, for, I am afraid, his lot, or rather plot, hath not been found in pleasant places.

When we read of our first pioneers, Messrs. Bushanan, Duncan and others, still steadily and cheerily piloting ahead and speaking so hopefully of the future success of Coffee (*vide* papers recently published)—not to speak of many others who are proving coffee culture not a failure, it's surely great encouragement for us all to go on working to reach the goal "Success." Nothing is to be gained without hard work and the person who wants to achieve success or make coffee culture a financial success in this country, must work, and that hard too; if he does, there is not the slightest doubt, he shall reap a big crop, and so gain his reward.

I think, Sir, and many will the same, that you deserve great credit for your timely and straightforward opinion of Mr. S's letter. It would have been a pity, and would have done us no good, whatever harm, if it had gone out to the world unchallenged.

Apologising for troubling you and thanking you in anticipation.—I am, etc. W. K. KELLER.

Namalango Estate, Blantyre, 3: 2: 96.

CEYLON AND INDIA TEA.

The tea trade were surprised at the remarkable growth in the imports of Ceylon and Indian tea into America, as set forth in recently published figures, *viz*., from 3,208,655 pounds in 1892, to 9,283,144 pounds in 1895. This growth of demand, in connection with the displacement of China by Indian and Ceylon tea in the United Kingdom, must be accepted as evidence that the change is on account of the merit resident in British-grown teas.

From the date of their first introduction in this country, our people have been averse to Ceylon and India tea. Upon studying the situation one cannot fail to arrive at the conclusion that this discrimination against Ceylon and Indian teas arises from ignorance as to the proper method of brewing these heavy-bodied teas. They are very much stronger than China or Japan tea, a given quantity making double, aye, treble the quantity of infusion, and hence those who first try them become prejudiced because of the heavy sweetish-flavored liquor.

We confess to that fault ourselves, and not until repeated tests were made did we find our prejudice disappearing. British-grown teas are made by machinery and not by hand, and therefore it is claimed the leaf cells are more broken, and their contents more susceptible to the influence of boiling water than tea manipulated by the hand or foot. This simply means that care must taken to properly infuse the leaf. An even teaspoonful of a straight Ceylon or Indian tea, infused for three minutes, is sufficient to make four teacupfuls of a delicious and fragrant beverage to such as drink tea without trimmings.

At the Chicago Fair, the Madison Square Garden and other food exhibits, we have been impressed with the fine quality and palate-tickling character of the Indian and Ceylon tea served, and invariably wondered why we could not secure like results at home. We have discovered that the fault was with our method rather than with the leaf.

There are fancy, fine, choice, good, indifferent and bad qualities of British-grown tea, as there are of China and Japan sorts. The British-grown teas lend themselves admirably to blending, and probably the bulk consumed in this country are used for that purpose. We have yet to learn the economy and desirability of using the better grades straight and without the "fixin's," which tend to rob the tea of its delightful aroma.

We suggest that *American Grocer* readers test this matter for themselves; draw Ceylon and Indian tea and become satisfied in their own mind as to their possessing body and fine flavor at less relative cost to the consumer than other teas.

A satisfactory article can be purchased from 18 to 45 cents; the finer the tea the higher the price, just as with other teas. A very fancy Formosa commands 75 cents, and a very fancy Ceylon or India quite as much, but one pound of Ceylon will go as far as two or three of the China sort.

It is evident that a great future is opening for Ceylon and India tea in this country. Having more body and more pronounced flavor than the delicate tea of China or Japan, they will grow in favour with those who now use beer or coffee at every meal. The testimony of some of our best retail grocers is that consumers soon acquire a taste for these teas, it being, to some extent, an acquired taste, owing to American consumers having become addicted to the use of other kinds.

If those interested will address a request for samples of Mr. R. Blechynden, Room 41, No. 133 Front street, we have no doubt he will take pleasure in having the same forwarded. Although not a dealer himself, he is the accredited agent here of the Indian Tea Association, representing the tea industry, and ready to advance its interests in any way that is practicable.—*American Grocer*, March 25

LOCUSTS AND COFFEE BLOSSOM.

To the Editor of the *Central African Planter*.

Dear Sir,—I would like to know what other planters have observed in regard to locusts and their periodical visits during our blossoming season and give the following as my own.

On the 5th, 6th, and 7th October, we had 1.10, 2.25 and .50 inches of rain, making a total of 4.12 inches which brought out a blossom (our best and largest for the season) averaging on good coffee 2½ cwt. per acre, which opened during the night of the 15th October.

About noon on the same day a cloud of locusts came along and settled upon the greater part of the blossom devouring the flower so quickly that there was no time to drive them off, moreover any attempt made was useless. The result was in half-an-hour not a flower was to be seen except where no locusts had lighted. Not only was the flower eaten off but in many instances the greater part of the newly formed berries, which of course resulted in a total failure of the blossom attacked.

I watched the result most carefully and after about three weeks the wood upon which this identical

blossom was (and it *only*) began to turn black and die off

It might be attributed to drought but it, in my opinion, cannot be, as there was plenty of moisture in the soil! only the wood on which that identical blossom was died and this also in moist, low, damp places, in shade and out of shade.

My firm belief is the wood was poisoned by the locusts when they found coffee blossom disagreed with them.—Yours, etc.,

HENRY BROWN.

Dunraven, Mlanje, 24th Jan., 1896.

[We know of one case in which a Planter attributed the failure of blossom to locusts and there is no doubt they do a lot of harm to young coffee shoots by nipping them off and eating them half through. We would hardly think however they *maliciously poisoned* the young wood but rather that they injured it in their endeavours to eat it.—*Ed. C. A. P.*]

WILL COFFEE PAY?

To the Editor of the *Central African Planter*.

Dear Sir,—I have not yet received my copy of the *C. A. P.* No. 6 as I am on the river, but I am told that there is a question as to what I have based my average crop on for the whole of our plantations.

I cannot give my figure still I go back to my estate, but sufficient to say that I based my calculations on export of coffee, acreage in bearing and length of time of acreage in bearing.

I shall be glad to find that my average is too small if any one will be good enough to try the calculation and publish it in the *C. A. P.*

We cannot base the prosperity of our coffee industry on any particular plantation or special crop, or on maiden crop, but on the output compared with the acreage in bearing and taking an average for a period of years. I do not think our extension of acreage is founded on the basis of paying results in the past, but of a conviction that we are methodically wrong and that when we find out our errors, we possess in our extensions, a good thing?

We all say coffee is paying, but where are the exports to show it? Imports abnormally exceed our exports.—Yours faithfully,

A. C. SIMPSON.

—*Central African Planter*, March.

THE CITRONELLA-OIL DISPUTE.

Another chapter of the Treatt-Domeier citronella-oil dispute has been concluded this week. As we mentioned in our issue of March 21, Messrs. Domeier & Co. were the purchasers of a second parcel of citronella oil from Mr. R. C. Treatt, in addition to the one previously commented upon. The arbitrators appointed under the rules of the London Produce-Brokers' Association have decided that Messrs. Domeier & Co. must accept and pay for the first parcel tendered, although the oil was admittedly adulterated to the extent of about 42 per cent. and a Judge in Chambers has ruled that a dispute must be submitted to arbitration, according to the conditions of the contract, before recourse can be had to the law of the land. Under these circumstances this evolution of the dispute concerning the second parcel of oil (the first, we understand, having been accepted and paid for, is considered as a terminated transaction) has been awaited with much interest in Mining Lane circles. The arbitrators were Mr. W. W. Green (of the firm Brookes & Green), for Mr. Treatt, and Mr. French (of French & Plucknett), for Messrs. Domeier & Co, and the case was heard on Tuesday, the proceedings occupying two hours. Both parties to the dispute were represented by their legal advisers, and among those present at the hearing were Messrs. C. and C. J. Umney and Edward Horner, who gave evidence for Mr. Domeier, and a representative of Messrs. S. Figgs & Co., the brokers who sold the citronella oil. The fact that the parcel was adulterated by the same means, and to almost the same extent, as the first, was not denied, and Mr. Treatt relied exclusively upon the *caveat emptor* principle which

has so powerful a hold upon the Mincing Lane brokers' sympathies. The arbitrators gave their decision in Mr. Ticcatt's favour, finding that the citronella oil, or, rather, the compound, supplied was "equal to sample," and setting aside all other considerations. They also refused Mr. Domeier's application to state a case for the consideration of a properly qualified legal tribunal. "Let the buyer beware" is their shibboleth, and unless the law comes to his aid, Mr. Domeier must swallow "the mixture as before." But the case is not likely to end here. The defeated side can, if they choose, appeal to the committee of the Brokers' Association, as they did in the case of the first parcel, but Messrs. Domeier & Co., have probably had enough of broker-arbitrators, and we understand that they are going to try to set the award aside at law.

In Mincing Lane the case has evoked an extraordinary amount of feeling, in which, unfortunately, the personal element enters largely. Each side, of course, has its friends and enemies, and while practically the whole of the produce-brokers are on the side of Mr. Treatt, the drug trade emphatically support Mr. Domeier.—*Chemist and Druggist*, April 1.

TO EXCLUDE INFERIOR TEAS.

The plan sketched out by Appraiser Bunn of the New York port of entry, to restrict or prevent the entry of inferior teas, instead of resorting to tariff measures, is summarized and made clear by the New York *Shipping and Commercial List*. He admits that the present law is inadequate:

"It has been an utter failure and the official examination of teas, accompanied by so-called arbitration, could never be considered anything but a farce. Mr. Bunn refers particularly to the bogus teas, which are not not grown, but manufactured from spurious leaves' tea dust, decayed vegetable matter, gypsum, earth and colouring material. The mixture is made to look quite handsome to the inexperienced eye and its sale returns good profits to unprincipled retailers. A chromo thrown in with every purchase makes the ignorant consumer apparently satisfied. There is no question about the legitimate trade being injured and Mr. Bunn proposes to regain lost ground by needed legislation. He is not prepared to say that the imposition of a duty would keep out the objectionable grades, but he says emphatically that the administration of the present law is defective by failing to protect consumers.

"Ever since March 2nd, 1883, it has been unlawful to import any tea adulterated with spurious leaf or exhausted leaves, or which contained so great an admixture of chemicals or other deleterious substances as to make the tea unfit for use. The statute is all right so far as it discriminates in quality, but the provision on arbitration is all wrong and it has caused considerable friction between the examiner, the arbitrators and importers. Rejected teas find their way to interior markets without difficulty by being exported, as required by law, and then coming back to another port, where inspection is not so rigid.

"The proposition before the trade is to limit the number of ports where teas may be entered and examined. The necessity for such action will be made apparent when it is stated that there are at least seventy-one ports for the entry of merchandise, with appraisers at thirteen. Tea examiners are to be found only at New York, Chicago and San Francisco.

"It is recommended that the Government establish standards, taking five samples of Ping Suey teas, such as extra; first, low grade, pea leaf and young Hyson; also samples of low grade Congou, Amoy, Japan, Formosa, Ceylon, Assam and low grade Japan dust. An expert examiner is wanted at every port, and instead of the shiftless method of arbitration now in practice it is suggested that a board of five arbitrators be appointed to serve at each port where tea is entered, the appointment to be made by the Secretary of the Treasury, and the members of each board to have had an experience of ten years in the tea trade. Finally, a Government office is to be created for a supervising examiner, whose duties would be to see that the law in relation to tea was being enforced everywhere.

These suggestions of Mr. Bunn are a vast improvement over the present system, and they deserve more consideration than the tariff proposition. As the latter is practically buried in the House of Representatives it would be well for the tea trade to agitate the necessary reforms in admitting tea, so that something definite could be undertaken and pushed through before Congress adjourns. If Mr. Bunn is too conservative or too radical in his views another plan of operation can be drawn from his timely hints.—*Interstate Grocer*.

FORESTRY IN ANCIENT TIMES.

Though measures were adopted for the Conservation of Forests so early as 1871, the organization of the Forest Department as it now stands was a work of much later date. The department is yet in its infancy, and it is very gratifying that within so short a period it has risen to the position it now occupies.

Whilst admiring the rapidity with which the department is beginning to be useful both to the Government and the governed, and speculating what a larger sphere of usefulness it will attain when it reaches manhood, one cannot help going far back and enquiring was there anything like conservation of forests during the time of the Kandyan kings, or were the subjects who were mostly cultivators allowed to clear forests at their own sweet will. I opine not. The very fact that there existed at that time an officer, called "Kela Korala," shews that there was conservation of some kind or other.

The Kela Korala (literally Forest Officer), or according to Ferguson, Conservator of Forests, was an honourable office in the Sinhalese régime, but that it was not a very emolument one is certain from the fact that we do not read of it in Sinhalese History, or learn from tradition, that the sons of illustrious families sought or obtained this post, and no doubt if it was a lucrative one, some crafty Adigar or Dissawe would have prevailed upon his Sovereign, to bestow this post to him, in addition to the many he enjoyed.

In ancient days long before the cultivator's axe denuded the forests of the Central Province, the northern portion of the Island was more thickly inhabited than the rest, and the Central the least inhabited, consequently there must have been more forests here than in any other parts of the Island, but it is doubtful whether the Kela Korala had anything to do with the forests in the uninhabited wilds. His duties were the demarcation of boundaries, settling who should get the landowner's and headman's share of game that falls on disputed grounds, seeing that no more than what is granted by the Sovereign on sanasse to temples and other persons are appropriated. He had also to see that no one trespassed on forests set aside for the Royal Household for its fruit, such as Mora, Galsiyambala &c., to see that they were gathered and sent to the Royal Gabadawa (or store room) in due time. He was also supposed to know where game abounded, its breeding times, and to procure medicinal herbs if required by the Royal Physician, surely a multifarious lot of duties for one man, one would say, but no, he had his Athu Koralas or assistants who were responsible to him for their subdivided charges, and had to obey his orders and periodically report to him.

Some say there was a Kela Korala for each of the three divisions of the Island, the Phiti Mhaya and Ruhunu Ralles, others that there was one for every Desavoni (or District).

A sensible Kandyan gentleman informed me that when in time of civil war or foreign invasions it sometimes happened that the king was forced to bury his treasures, and the spot where these were buried, was known only to the Forester (Kela Korala), and he was bound by a solemn oath not to divulge the secret, excepting in the king's death, and then only to his heir, or some other person the king had named.

I was once told that the founder of the house of the De Soysa's, and the architect of their present princely fortune, rose to affluence by finding an immense treasure at Hanguranketa, buried by the King Raja Singha the Great, and this treasure it seems was pointed out by an Athu Korala to the late Mr. Soysa, not the gentlemen who died of hydrophobia, but his father in recognition of his having cured his (the Athu Korala's) son who was dangerously ill at the time.

I only quote the above merely to illustrate how prone the native villager is to believe the marvellous, himself apathetic and lacking in energy, it is hard to make him believe that sheer pluck, dogged perseverance, and making the most of opportunities raises a man from mediocrity to a big position. With him it is luck, some mysterious find, or accumulations of merits in pre-births, that makes a man rise.

Many persons, among them the late Mr. Ferguson, think that at no time was rice exported from Ceylon to India. Be that as it may, when we look at the network of tanks and elas in portions of the Island, there can be no doubt that a large quantity of rice was grown in Ceylon, at least sufficient for its own consumption if not for exportation, thus having a superabundance of rice, the people would not have cared to clear chenas for kurakkan, so the chenas they must have cleared must have been very small in extent, and surely the present destruction of forest land would not have taken place in those remote days. Further, this clearly proves that in bygone days the people did not make kurakkan their staple food.

The raid of the Tamils from the South of India, and removal of the seat of the Sinhalese Government to the Central and South of the Island caused the gradual destruction of the tanks &c. which the later kings vainly tried to restore, and at this time too commenced the wholesale destruction of noble forests. This state of things lasted even after the British Conquest, when later on Government put a restraint on chenaing by appointment of Foresters in charge of certain districts, and still later by the organisation of the Forest Department, which has begun, I believe, by paying its way, and which every one hopes will be not only self-supporting, but a source of revenue to Government.

Before concluding this short sketch, I must add that I obtained this information not by researches into History, or from those who constitute themselves authorities on the subject, but whilst resting in villages after my day's work.

I have been always in the habit of finding out the oldest and most intelligent of the villagers and conversing with them, and it is mostly these village patriarchs who have given me the most information.

P. N. CARRON,
Forest Guard, Dambulla.

—“Ceylon Forester.”

THE PANAWAL TEA COMPANY,

The fourth ordinary general meeting of the Panawal Tea Company, Limited, was held at the offices of the company, 39, Victoria Street, Westminster, on Friday last.

The chair was occupied by the Hon. Norman Macleod Sinclair, chairman of the board of directors.

The Secretary having read the notice convening the meeting, and the report and accounts having been adopted, the chairman proposed the payment of a dividend at the rate of 6 per cent. on the ordinary shares of the company from July 1 to December 31, making with the interim dividend paid to June 30 a distribution of 10 per cent. for the year.

The resolution was seconded by Mr. Arthur Marshall, and carried.

Mr. Batten then moved the re-election of Mr. Hornby as a director. The resolution was seconded by Mr. W. H. Haslam, and carried.

Mr. Marshall proposed the re-election of the auditors, Messrs. Fox, Sissons, and Co. The resolution was seconded by Mr. H. W. Hornby, and carried.

A vote of thanks to the chairman terminated the proceedings.—*H. and C. Mail*, April 17.

WHITE ANTS ON TEA ESTATES.

PAINT USED AGAINST WHITE ANTS.

The following is an extract referred to by Dr. Watt in a paper, which is commented upon editorially by the *Madras Mail*.

“During a brief visit to the Native State of Gondal, the writer recently gave this subject considerable attention. There seemed to be no doubt that his Highness the Takore Sahib, by his enlightened action in this matter, had effected a radical improvement. The trees throughout his State were all painted as described above, and not a single tree could be found that showed the mud encasements so characteristic of the presence of white ants. And very possibly, as a consequence of the care bestowed on these trees, they were healthy and vigorous, while those in neighbouring States were sickly and badly attacked with white ants. In consequence of these observations the writer asked for information as to the composition of the paint which had been used. He was informed that the red colour was merely to indicate the fact that the trees had been painted, and that it was for the most part red ochre but might also be made of the refuse of the *Al Dyo* works. The useful ingredients were said to be as follows:—1 part dekamali gum (the resin of *Gardenia gunmifera*), 2 parts asafœtida, 2 parts bazar aloes, 2 parts castor-oil cake. These are well pounded, mixed and kept in water for about a fortnight. When thoroughly united, and what may be called decomposed, into a thickened compound, water is added in order to bring to the consistency of paint and the colouring matter then added. The mixture is now ready for use, and if thoroughly applied for about two feet will check not only the attacks of white ants, but of red ants and other insect pests. Its effect will last for two years or more. The cost of the preparation comes to about 4 or 5 rupees per 100 trees.

But according to the information furnished from Gondal, *al* (Morinda dye) refuse possesses no special properties. From other parts of India the reputation is very general that it is of great value. Be that as it may the red ochre added to the above preparation may not only be useful as indicating the trees that have been painted, but give a needful consistency, if it does not serve to mechanically hold the other ingredients. It would, however, seem desirable to have the reputation of *al* as a preventive against the attacks of insects thoroughly investigated, even supposing it be admitted that experience in Gondal has proved that it is of no very special merit as a paint on trees.

The system of painting trees (as detailed above) might with great advantage be extended throughout India, especially in orchards; and it is even probable that the Tea and Coffee planters might find the system of great value in checking the depredations of insect pests. But there remains the issue, of no small importance, namely, the reputed property of *al* dye being thoroughly investigated, if it be actually a fact that it preserves the textiles so dyed from being

attacked by insects, that would be a powerful reason for its greatly extended use in all cases where lasting properties were essential. The writer would wish it to be distinctly understood, however, that in dealing with the subject of the preventive power of *al* against white-ants, he desires to give greater currency merely to a very generally-accepted Native opinion, and one which has not as yet been either confirmed or disproved by scientific investigation."

Since the above was written, says Dr. Watt, the subject of the red paint to be employed against white ants has attracted very considerable attention. So far the results obtained have abundantly confirmed the previous statements. I can confidently recommend the subject to the attention of planters troubled with white ants or other pests that attack the bark of the tea bush. The paint is perfectly harmless. The ingredients are all readily procurable. They are cheap. The effects of one painting are said to last for two or three years. The thorough or imperfect manner in which it has been applied can be readily seen owing to the red colour.

So far as I can discover, were tea bushes affected by white ants to be thoroughly cleansed, to have the earth around them deeply hoed even at the expense of cutting some of the roots, to have all ants' nests removed when found, and to have the stems and branches even some inches below ground and for two feet above, thoroughly painted with the Gondal preventive fluid, we should very soon hear comparatively little of white ants as a serious malady to tea cultivation.

THE EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

Directors:—Messrs. Ralph A. Cameron (managing director), Norman W. Grieve, C. J. Lindsay Nicholson, David Reid, Christopher B. Smith, and Edward Wahab.

The following is from the report to be presented at the ninth ordinary general meeting, to be held at Winchester House, Old Broad Street, on the 29th inst.

The directors herewith submit report and balance-sheet for the year ending December 31, 1895. The profit for the year (including £415 0s 2d balance from last account after payment of debentures for £14,000) amounts to £45,629 1s. From this has to be deducted: Interest on debentures, £7,577 1s 6d; debentures on new issue for £7,500 drawn and paid off, with bonus of 5 per cent, on December 31, 1895, £7,875; an interim dividend of 2½ per cent on preferred, and 1½ per cent on ordinary share capital, paid November 5, 1895, £4,595 17s, leaving a balance of £25,671 2s 6d, which it is proposed to appropriate as follows:—Final dividend on preferred shares, £18 16s 6d; final dividend on ordinary shares at 3½ per cent, making with interim dividend, 5 per cent for the year, £10,469 14 6d; to reserve fund, £5,000; balance to be carried forward as a provision for retirement of debentures in the current year, £10,182 11s 6d. As the shareholders are aware, the foregoing disposition of profits is now permissible by virtue of the special resolutions altering the articles of association which were duly passed at the extraordinary general meetings held for that purpose in July and August last; the effect of these resolutions being that after provision for dividend on the preferred shares, and for the annual payment of a minimum of £7,500 debentures, the remaining profits are available for such dividends on the ordinary share capital, additions to the reserve fund, or further payment of debentures as may be deemed expedient.

The directors have the satisfaction of stating that the old issue of 6 per cent debentures, which stood in the last report at £149,880, has been extinguished. Of this sum £19,880 was paid off, and for the remainder a new issue of £130,000 mortgage debentures at 4½ per cent interest, redeemable during ten years at 105, was substituted. In terms of the issue £7,500 of these debentures were paid off on December 31st, 1895, leaving a

balance of outstanding of £122,500. As shown on the annexed schedule, the company have 10,347 acres under tea cultivation, of which 9,192 are over four years old. The yield of tea in 1895 was 3,276,000 lb., being in excess of the estimate, the average gross sale price being 7-87d per lb. The estimated yield for 1896 is 3,458,000 lb. Kolapatana and Gongalla Estate, which was purchased in 1891 on account of its forest reserve, has been sold, without the forest, at more than its cost. In accordance with the articles association, two of the directors Mr. Ralph A. Cameron and Mr. C. J. Lindsay Nicholson, retire from office, and being eligible offer themselves for re-election.—*H. & C. Mail*, April 17.

AGRICULTURE.

COCONUT CULTIVATION.

Some people have an unconquerable aversion to the application of fibre dust to coconut trees. It is said to attract rootlets in large numbers which get quite matted in time and check the growth of the tree. Fibre dust is known to be as absorbent as a sponge, and it is difficult to expel moisture from it. For this reason the latest use which Science put it to was in electric batteries. A coconut tree is a large vegetable pump, and for its successful growth requires a large quantity of moisture. The centre of the tree is like a sponge almost from the base to top. For the development of the nuts, abundance of water is a necessity, and by the constant waving of the branches moisture is being exhaled. Under these circumstances, any substance which will supply the tree with a sufficiency of moisture in situations where moisture does not abound is to my mind a very desirable application, and such situations are in hard, upland, and in arid, sandy soils. Besides this, the application of a substance such as this plays an important part in improving the mechanical condition of the soil. Hard soils are rendered porous and friable by its application, and light, sandy soils get body. Any vegetable substance that improves the mechanical condition of a soil exerts a chemical effect as well, first by its decay and afterwards by the admission into it of gases caused by this decay and from the atmosphere.

To my mind the aversion to the application of fibre dust is due to its having been applied unskillfully. I would not heap up large quantities of it round the trunk of trees. I would spread it thickly in a radius of three or four feet and dig it well into the soil. I would use it chiefly as a vehicle of artificial manures and in the manufacture of cattle manure. Indeed, according to my thinking, it can supersede it entirely if the small quantities of fertilising matter to be found in cattle manure be added to it.

Mulching is a recognised branch of agriculture. It is practised successfully in European fruit-culture. It had adherents in the old coffee days. Those who did not believe in it said it had the tendency of attracting rootlets to the surface which would get scorched when the mulch (usually *musa grass*) had rotted off. These very people, who were so anxious of the fate of rootlets which are being constantly renewed, thought nothing of cutting numerous holes for their coffee trees near the stem with machetes and destroying for ever the primary roots. Mulch shaded the soil while it lasted and thoroughly opened it up; when decayed and become mould or humus it was beneficially dug into the soil with lime.

In coconut cultivation I have observed beneficial results follow mulching with the branches of the tree itself. This is only following the teaching of Nature, the safest guide. Observe the base of a tree which has not been attended to for some time, and you will see the ground in a radius of about 4 feet completely protected with the fallen fronds, which curiously in falling have their butt ends turned away from the stem. Anybody who has taken the trouble to examine the soil under the fallen branches, especially in upland situations, will find it quite perforated, raised up, loosened and covered with earth-worm castings. These unobtrusive and little-

natural agencies, together with the very destructive termite or white-ant, play an important part in tropical agriculture and in the formation of soil. During weather such as this, the latter are very busy in eating up every particle of decayed and decaying vegetable matter and using it in the making of the tunnelled chambers under which they work on the surface of the ground. I have never observed the results of using fibro dust as a mulch.

A great deal has been written on the use of salt as a fertiliser, especially for coconuts. It has been argued that it is a natural adjunct of the successful cultivation of coconuts. It is too patent to be denied that the natural home of the palm is the sea shore. It has been carried from one hemisphere to another on the sea and cast up on shore there to form natural plantations or topos. Shrewd observers as were the Dutch, opened the first plantations in the Island on the belt of shore between Colombo and Kalutara.* From there it extended, first along the coast and eventually inland. In carrying the cultivation inland, the natural conditions under which the palm grew were departed from, more especially as regards a salt-saturated soil. It has been argued on the other side that in a small Island such as this exposed to the force of two monsoons, there must be carried in the salt-laden air, sufficient saline matter for the requirements of the palm. Possibly so, but experience does not prove this, and what is considered sufficient for other forms of vegetation is not sufficient for coconuts.

I have heard it stated that if the sea-coast is the natural home of the palm, then the best palms must be met with there. This by no means follows. Salt is not the only constituent required by the palm. Where all the necessary constituents exist, plus a liberal supply of salt, there the best palms are to be met with. Nothing can be better than the trees met with on the belt of land between the sea and the road on the journey from Colombo Chilaw-wards, and in favourable situations.

I have heard disbelief expressed in the use of salt in coconut cultivation after the application of one cwt. the acre. This is hardly fair, considering that no one claims for salt wonderful or even appreciable results when applied in homeopathic doses. One and a half pound for a tree, that in its natural state grows in a salt-saturated soil and in a salt-laden atmosphere, is not anything like a dose one would use who expected beneficial results to follow. The wonder is that results were watched for. In Europe an agriculture and in the cultivation of roots and cereals 1 cwt per acre is the quantity used of so powerful a fertilizer as nitrate of potash or saltpetre.

The use of salt in agriculture or at least in coconut cultivation is effectually hindered by the shortsightedness of the Government. In a country such as this, where agriculture is in a primitive state amongst the natives, it behoves the Government to offer every facility for its advancement. What do we see instead? The Government barring the way by not removing the restrictions to the free use of salt. Fish-curing, a very promising industry which was bound to benefit those engaged in it, consumers, and the island generally, by keeping within it the million and a half of rupees expended in importing dried fish, was strangled in its infancy by the supineness of the Government and the want of interest shown in it by the responsible officers of Government once the novelty of it wore off. Government will never learn that elasticity in the enforcement of taxes becomes a necessity on occasions. Application had been made to it for salt at wholesale prices for agricultural uses or rather experiments. No, there was the possibility of its being used for human consumption. It was suggested that its application might be under the supervision of one of its

officers who was to be paid by the purchaser. That did not suit it. It was then suggested that it might be mixed with some objectionable substance such as night-soil. No, that too would not do, as chemistry had proved that salt cannot be successfully denaturalised and there was the possibility of its being purified and used for culinary purposes! What is possible is not of necessity probable. Natives would not study or practice chemistry or overcome their natural prejudices, to save a few cents a week. Inquiry will show that 3 cents worth of salt will answer a villager with a family of six persons for about a week. To save this, or a portion of this, for the practice of chemistry, not to speak of its study, will cost something, is it likely a native will consume an article mixed with dirt? Not only does the Government not sell salt at wholesale prices to agriculturists even with restrictions, but it actually sells its surplus salt for export at about R5 the ton and destroys at a cost above this (if my recollection of what I read in an Administration Report is correct) what it cannot sell. It seems hardly to realize the fact that by helping to increase the yield of lands it will eventually be repaid by increase of receipts at the Customs.

It is to be hoped that the Press will take up this subject in earnest and press it on the attention of our new Governor. B.

DRUG REPORT.

(From the *Chemist and Druggist*.)

April 11th.

ESSENTIAL OILS.—Citronella Oil is much easier, drums for April shipment offering as low as 1s 2d per lb., c. i. f. terms; but there are no buyers at more than 1s per lb., c. i. f. On the spot sales have been made at 1s 7d to 1s 7½d per lb. Lemongrass oil quiet at 2½d per oz.

THE AMSTERDAM MARKET.

Our Amsterdam correspondent writing on April 9th, reports that the Cinchona market has undergone no change. The March shipments from Java are not yet known, and it is expected that the next auction will be smaller than usual. On April 7th, 70 tons of Van Houten's No. A cocoa butter sold at firm rates, with good competition, at an average of 68 45c per half-kilo.

A LONG PRICE FOR QUININE.—I notice in the *Union Line Gazette* for March that Capt. Tyson, of the *Guelph*, speaking of the Asiatic plague in the Mauritius in the latter sixties, says, "Quinine was the only cure for it, and there was so little of this stuff to be got on the island that the price actually went up to 50l. per oz. and more." Rather different to its price nowadays!—J.B.

WILD COFFEE AND LEAF-DISEASE.

DEAR SIR.—With reference to the notes and correspondence in your valuable paper about "Wild Coffee," it may be of interest to your readers to learn the following:—

The year before last I paid a visit to Dr. Trimen, in the Ceylon Government Gardens, at Peradeniya, and among other things leaf-disease and the future of coffee cropped up. Dr. Trimen gave it as his opinion that coffee in most parts of Ceylon was a thing of the past, and gave as his reason for so saying the fact that the indigenous coffee in the jungles of which he said there are several varieties, were all infected with leaf-disease. The immunity said to be enjoyed by *Diplospora sphaerocarpus* from leaf-disease may therefore turn out to be more apparent than real.

DEVIKULAM, April 2nd 1896.

A. F. M.

[The question is this: Can *D. sphaerocarpus* not being in reality a coffee plant of any description, suffer from leaf-disease?—Ed.]—*Planting Opinion*, April 11.

* It would be more correct to say "the first systematic plantations," for the Portuguese engaged in or encouraged the planting of coconut palms, and converted Colombo into a dense coconut grove. During the great siege of 1655-56 the palms were all cut down to form fascines.—ED. C.O.

B.C. AFRICAN CURRENT CHAT.

We beg to congratulate the planters on the excellent prices the Shire Highland coffee is obtaining in the London market.

Report is again busy with the statement that Nyassaland is likely to become a Crown colony soon.

One of Mr. Moir's mango trees has fruited lately. The tree was only planted out in August 1893 (being brought in a box from the South) and the ripe fruit was eaten in December 1895. In order not to overtax the young plant all the young fruits except twelve were stripped off.

With reference to Mr. Swann's communication to the Administration journal it is interesting to note that a number of the Kazungu people have been working in the Shire Highlands with various planters for the last six or eight months. We sincerely hope the recent Administration action will lead them to come in greater numbers.

Commander Cullen's discovery of guano on certain of the Lake Nyasa islands is good news for planters and all interested in agriculture.

We hear that Mr. John Buchanan brought out the first plants of the Orange variety of coffee.

We hear H. M. Government have agreed to allow coffee manures to enter the country free of duty. Probably the next issue of the *Gazette* will contain a list of the articles which come under the category of coffee manures. We hear Mr. S. Steblecki has sold part of his Mpemba Estates for a handsome sum. Mr. James, formerly of Messrs. Buchanan Bros. is to be the first Superintendent under the new management. We understand a new and thoroughly sea-worthy gunboat is to be placed on Lake Nyasa. Mr. B. Bradshaw hopes to take a trip home this season. He has now 210 acres under coffee at his Mount Zion estate while 50 acres have been recently planted on his new Bloomfield estate. Mlanje district is suffering from a great scarcity of labour and the planters there have been considering the difficulty in council assembled.—*Central African Planter*.

THE INDIAN TEA ASSOCIATION.

The following are extracts from the proceedings of a meeting of the General Committee of this Association held on the 6th instant:—

Letters of 21st and 28th February, and 13th March, from the Secretary, Indian Tea Association, London with reference to the attempt on the part of the London and India Docks' Joint Committee to impose additional charges on cargo for overside delivery in the London Docks, were ordered to be recorded along with letters of 13th and 20th March, from Messrs. Begg, Dunlop and Co., Messrs. Finlay Muir and Co., and the Secretary, Bengal Chamber of Commerce, all upon the same subject. The General Committee had considered it desirable to issue a Circular warning Shippers not to accept Bills of Lading containing any stipulation for charges to be paid in London, which had not been hitherto paid by the receivers, and they noted with satisfaction from Mr. Tyes letter of 13th March, that in view of the strong opposition of London firms, the shipowners had declined to amend their Bills of Lading as desired by the Docks Committee so as to enable the latter to make delivery of all goods on the Dock.

In reply to the letter of 7th March, from the Secretary to the Chief Commissioner of Assam, asking for certain statistics as to the cost of production and prices of tea, the following information had been furnished:—

Average price of Assam Tea sold in Calcutta (1895-96)	R. 0 8 7
Average price of Surma Valley Tea sold in Calcutta (1895-96)	„ 0 7 4
Outturn of Tea for 1895-96 Assam Valley	57,104,127lb.
Outturn of Tea for 1895-96, Surma Valley	41,267,420lb.

Considered letters of 20th and 30th March, from Dr. George Watt, Reporter on Economic Products to the

Government of India, with reference to the question of the appointment of a special Scientific Officer to enquire into various matters connected with Tea. Dr. Watt suggested that the Association should now frame proposals on the matter and submit the same in an official form to Government. A letter which had been just received from Mr. Buckingham was also read, in which he stated that the expense attending the appointment of such an officer might be met by a subscription of one anna per acre under cultivation. The Committee, while approving in the main of Mr. Buckingham's suggestion, reserved the matter for further consideration pending further communications from him with reference to his branch Committees. The proposal was one which they considered would have to be dealt with by all Members of the Association.

Considered letters relating to the American Market Fund, from the Secretary, Indian Tea Association, London. The General Committee in London had recorded a vote of thanks to the Central Travancore Planters' Association for their energetic action and support. The Committee noted with satisfaction that the London Committee were of opinion that there should be a levy made for the season 1896-97 on the same basis as that for the last season, the proceeds of which should be spent in further work both in the United States and Canada, and possibly in similar efforts on the Continent and in Africa, and that a General Meeting of the Association would be called very shortly to consider the Committee's proposals. The General Committee on this side were unanimous as to maintaining the efforts now being made in America, which appeared at last to be meeting with success, and it was decided that, in the event of no definite decision on the part of the London Association coming by the mail due the next day, a telegram should be sent, suggesting that a new levy be asked for on the basis of 4 annas per acre of production and one anna per maund of produce, the rate for produce being double that of last year. The figures, recently published by Messrs. Gow, Wilson, and Stanton, showing the great advance in the quantity of British-grown tea taken by the United States and Canada in 1895 as compared with 1894, should, in the opinion of the Committee, act as an incentive to still more vigorous efforts to push the trade of Indian tea in America.

Considered letter from the Honorary Secretary, Cachar branch, enclosing minutes of a meeting of the branch held on 2nd March, at which the question of serving warrants on absconding coolies was again considered, and it was decided that no alteration of the existing law was required, but that the law should be more vigorously upheld, and papers in connection with a recent case bearing on the subject were forwarded for information. The rules for the re-settlement of Cachar had also been considered by the Cachar Committee, who were of opinion that there was nothing in them detrimental to the planting community with regard to the question of serving warrants on absconding coolies. The General Committee decided that they could hardly make a representation to Government on one case only, and the Cachar Committee were to be asked if they could furnish any others.—*M. Mail*, April 28.

MARKET FOR TEA SHARES.

Thursday Evening, April 16, 1896.

Since the resumption of business after the Easter closing there has been a continued strong buying of all the best-known tea companies shares, and the official list shows more than one advance in quotations—Dooars Ordinary, notably, having reached the "record" level of 18 to 19 for the £10 share. The Prefs., more especially, command marked attention, and few of the quoted ones can now be bought, to yield more than about 4 per cent. at the outside.

CEYLON SHARES.—C. T. P. Co. Ordinary are in demand, and 28 to 30 would be given. The Prefs. have touched 17½.—*H. & C. Mail*, April 17.

THE TEA MARKET.

The tea market rules steady for British grown, but for China there is little done privately in the generally poor supplies, despite the low prices at which teas are obtainable. One way to recover the lost trade is for importers in the coming season to send forward Teas with strength; generally there is no complaint as to want of flavour in China tea. The opportunity now offered is most favourable, seeing the deterioration in Ceylon Tea. As the year advances standard quality Tea becomes scarce, and early imports from whatever source must command a ready sale, backed up by the prosperous state of commerce.—*L. & C. Express*, April 17.

A CANADIAN GROCER ON TEA.

On Thursday last it was our pleasure to receive a call from Mr. John Sloan, of Galt, Ontario, Can., wholesale and retail dealer in crockery and groceries. Mr. Sloan has made a hobby of tea for the past fifteen years and keeps in stock some thirty varieties. Experience has taught that little dependence could be placed on books for a thorough knowledge of the article, and therefore he made the leaf his special study until he became thoroughly familiar with the peculiarities of the various sorts and the names of Indian, Ceylon, China and Japan teas. His rule is to buy on cup quality alone, making style a secondary consideration. In order to secure to customers an uniform article and to ensure their receiving the tea which pleases at each purchase, an indexbook is kept, in which are placed the names of all customers, together with a memorandum of the tea purchased and the date, and this is kept for ready reference whenever a customer buys tea.

Mr. Sloan has made a special study of Ceylon teas using them, however, largely for blending, as they work together exceedingly well with China blacks, particularly the different makes of Congou. He finds that tea from the same garden in Ceylon varies from season to season, and that one cannot rely upon the tea from a certain garden for uniformity simply because it has been a prize-winner for several successive seasons. Each lot of tea must be studied on its merits. Those Ceylon teas which are best adapted for selling straight must be of a very high order. They are popular in Galt, as are the blended Ceylons. He thinks the variation in the character of Ceylon teas from season to season is to some extent due to the soil, which is shallow, the owners of gardens neglecting to keep them up to proper condition, the result being tea of varying quality.

Mr. Sloan does not use Japans to any great extent for blending, preferring to sell them straight. He is not partial to basket-fired tea. In his district in Ontario the dealer has to contend against the water, which is strongly impregnated with lime, so that the teas which please in that section would not be in such great favor in other markets, even such as are as near as Toronto. Mr. Sloan finds, however, that customers who have become addicted to the use of any one particular sort are so wedded thereto that it is very difficult to induce the use of some other variety, even though it may be of much higher value and merit. When such consumers move away they send back to Canada to get some of the same sort of tea they formerly used.

Mr. Sloan is not at all friendly to package teas, finding they vary in quality, the standard of grade not being maintained; therefore, he favors buying tea on its merits, in bulk, and selling it loose, never putting it up in packages, except in three or five pound boxes for such customers as desire to purchase that quantity.

Mr. Sloan has also found that the heads of the tea departments of some of the jobbing houses are lamentably ignorant of tea and are unable to detect different varieties and to designate them from the leaf; they are also deficient in a knowledge of various matters connected with the cultivation and preparation of tea. Some cannot name the different sorts of Congou and tell in which part of the district they are grown.

This emphasizes the fact that to succeed in any line men must put their heart and enthusiasm into their work, if they are to become experts. It seems to us that our Canadian subscriber and friend, in these fifteen years of preparation, has been taking the only true course for such as would build up a profitable trade in tea—one which will command the confidence of consumers and which is proof against all manner of competition, whether it be local or transient. We certainly believe in the doctrine of buying tea on cup quality alone, for, after, all, it is the only true test for buyers as well as consumer. It is also evident that a retailer's tea trade is what he may elect to make it. He will know the character of the water in his section and its relation to the drawing of tea, and, finding which sorts show the best results, study to please the palate of his trade. He will not yield to the temptation of buying a line of tea not particularly adapted to his trade requirements, simply because it is cheap. He studies incessantly, for experience has demonstrated that climate, soil, amount of moisture, methods of cultivation, and manufacture vary from season to season, so that uniformity is only secured by care, watchfulness and constant testing. No dealer can do this who does not make a hobby of the tea department.—*American Grocer* March 25.

THE NUWARA ELIYA TEA ESTATES COMPANY, LIMITED.

Minutes of proceedings at the first (Statutory) meeting of shareholders of the Nuwara Eliya Tea Estates Company, Limited, held at Winchester House, Old Broad Street, E.C., on Wednesday, 25th March 1896.

DIRECTORS.—Present: Messrs. C. A. W. Cameron in the Chair, Oscar Thompson, C. R. Robson.

Messrs. A. L. Cross, R. W. Garrett, Sir John Grinlinton, Messrs. R. Porter, G. Todd, S. H. Smith, and C. Speed.

The CHAIRMAN:—Gentlemen, the Secretary will read the notice of the meeting.

The SECRETARY:—The notice that was issued for this meeting is as follows:—"Winchester House, Old Broad Street, E.C., 12th March, 1896. Notice is hereby given that in accordance with the Articles of Association of the Coy., the First (Statutory) Meeting of the Nuwara Eliya Tea Estates Company, Limited, will be held at the above address on Wednesday, the 25th day of March, 1896, at 12 o'clock noon. By order of the Board, Frith, Sands & Co., Secretaries."

The CHAIRMAN: Well, gentlemen, this being the Statutory Meeting of the Company, required to be held by law within four months of its incorporation, we have no accounts to lay before you. We are pleased, however, to see you here, and to have the opportunity of telling you of the extensions which have taken place in the operations of the Company since its incorporation in December of last year.

The Prospectus which was issued in December, mentioned that the Company had acquired the Park and Concordia Estates, and these properties have been worked on the Company's account since the 16th September, and the 1st October last year respectively. The Prospectus, you will recollect, mentioned that it was proposed to make further purchases of estates should favourable opportunities occur of doing so; and we are now glad to tell you that Mr. Megginson, our general Estates Manager in Ceylon, in conjunction with Messrs. Leechman & Co., our Colombo Agents, secured for the Company the offer of five additional properties, viz., Pedro, Portswood, Kenmare, Lovers Leap and Naseby, besides taking over the current leases of Fairyland and Hazelwood estates, which have to run for eight years longer. These estates have all been worked on the Company's account since the 1st January last, and the latest reports received from Ceylon are to the effect that the properties are all in first class order, and working satisfactorily.

The total purchase price paid for the estates (i. e., all the estates acquired by the Company) is £129,800, and to raise this sum £115,000 has been

issued in ordinary shares of £10 each, and £23,000 in 6 per cent. Debentures (terminable in ten years) of £100 each. This leaves a working capital, after payment of charges and incidental expenses, which is considered to be ample for all purposes of the Company.

It will be satisfactory to you to learn that the whole of this capital has been placed without payment of any underwriting or other commissions, and the only payments made in connection with the purchases of the properties and the formation of the Company, beyond the incidental expenses, have been the two sums of £100 mentioned in the Prospectus, and a commission to Mr. Megginson on a portion of the money paid for certain of the Estates. I believe I am correct in stating that since the Company purchased the Estates, the proprietors have, in several instances, received offers from other quarters representing an advance of fully 10 per cent.—that is to say, after we bought them; I believe offers were made of 10 per cent higher prices. As regards the prices paid for the Estates, the position is shortly this: we have properties comprising 1,341 acres of land under tea; 120 acres of forest available for tea; 100 acres of patna available for tea; and 148 acres of forest and fuel reserve and patna, on part of which we understand that brick-making is being done at a fair profit. We have no accounts with reference to this brick-making work, but we understand that it is being carried on at a fair profit. Besides these, we have an eight years' lease of 90 acres of tea, and several valuable bungalows and bazaars. Roughly, the value of the tea land works out in the neighbourhood of £89 per acre. This is no doubt a long price, but the position is a somewhat peculiar one in that the properties acquired are (with deference to the gentlemen here who are interested in other Ceylon properties) the very pick of Ceylon tea estates, both as regards their elevation of capabilities of growing the best classes of tea, and from their good and very deep soil, which makes it practically assured that as tea estates they have a very long lease of life before them. Further (and this is the most important point, I think), the area of land in Ceylon available for the cultivation of the high class of tea produced by these Estates is practically already all taken up and cultivated, and the whole supply of these fine teas from Ceylon must always remain comparatively restricted—of course, to our great advantage. Since the Company was formed, we believe that estates have been sold in Ceylon at prices running up to £110 and £111 an acre, as against our £89; and these are certainly no better estates than we have.

Taking all the circumstances into account, we consider, therefore, that your Company have secured properties at prices which it is reasonable to expect will enable satisfactory dividends to be paid; while, as regards the Estates themselves, they have been described to us as the Darjeeling of Ceylon.

As regards the future of the Company, I may state that in nearly every instance the vendors of the Estates stipulated that they should be allowed to apply largely for the Ordinary Shares, as also for almost the entire issue of debentures. Most of the Shareholders are personally acquainted with Mr. Megginson, through whose good offices the estates have been acquired, and I think I am right in stating that the highest opinion is entertained in Ceylon both of Mr. Megginson's capabilities as a practical planter, and of his judgment as to the value of properties in Ceylon. It was in view of the exceptional work that was done by Mr. Megginson, both in connection with securing these estates and raising the necessary capital to pay for them, that the Directors agreed to pay him the commission of 2 per cent. to which I have already referred, and which we consider a very moderate remuneration for the work done. As you are aware, he found the greater portion of the capital that was required and if that capital had been subscribed and underwritten here, probably the cost of raising it would have been a good deal more.

Gentlemen, I do not think I can tell you anything more, except that the Directors are very pleased to

see you here today. By the next time we call you together, we hope to be able to lay before you a satisfactory Statement of Accounts. The advance in exchange is an element against tea at the moment, and the London market prices for tea have of late unfortunately gone back instead of forward to meet the extra cost incurred by exchange. But I trust these may prove only temporary drawbacks. At the same time it will not, I think, be disadvantageous to the eventual well-doing of the tea industry if a slight set-back should occur now, so as to avoid the tendency of creating an increased cultivation of tea in Ceylon and India.

As I said before, this is only a statutory meeting, and there is no business to come before us, but, if any gentlemen like to ask me any questions, I shall be glad to answer them to the best of my ability.

Mr. G. TODD: May I ask what is the amount of debentures.

The CHAIRMAN: There are £23,000 debentures, of which £18,000 was taken by the vendors, and £5,000 only by the shareholders.

Mr. A. L. CROSS:—I think, Sir, what you say about the brickworks is correct. Sir John Grinlinton will bear me out when I say that there is a considerable field for making bricks in that quarter.

SIR JOHN GRINLINTON:—Well, Sir, I have been making bricks in Portswood for some years, and it is not my habit to proceed with any undertaking unless I see that I am making a profit. If I do not make a profit I stop. When these estates were taken over by your Company, in deference to my wish, my son, (who managed my property) would not accept any orders, as I did not know what your views might be, and I did not wish to do anything that might in the least compromise you in anything that is going on.

I wish to mention one thing which I think it is desirable that the Company should know, not that I have any interest in depreciating the intrinsic value of these estates, but I should like to say this; Although you have land in Ceylon of an altitude that can produce tea equal to the best tea that is produced anywhere, and although, as regards those estates that the Chairman has mentioned, I do not believe that any man, whether he is interested in other properties or not, would for a moment dispute the fact that he has stated viz, that they are the cream of the tea estates in the island, still, undoubtedly what you have got to do now is to contend with the very large amount of acreage that is coming into cultivation in India, and when that tea is brought into the market you will have it competing with you. Of course you cannot extend the tea cultivation in the Ceylon high altitudes by any purchases made from the Government; there is a limit to that, but you have got to contend with India, and I think it is just as well to bear that in mind.

The CHAIRMAN: There is a map that Mr. Megginson sent us of the estates.

(The map was handed round to the Shareholders.)

The CHAIRMAN: Well Gentlemen, I do not think I need detain you any longer.

A vote of thanks to the Chairman was proposed by Mr. A. L. Cross, seconded by Mr. G. Todd, and unanimously carried.

PLANTING AND PRODUCE.

THE TEA TRADE OF INDIA.—The references to the export of produce in Mr. O'Connor's review of the trade of India are encouraging. The Indian tea trade, we know, has increased by leaps and bounds, but it will be news to planters and tea proprietors on this side to learn that they expected to be ruined by the closing of the Indian mints. The speeches made at public meetings of tea companies in London at the time were not at all in this strain. Mr. O'Connor's review of the position shows that on the whole Indian tea planters are doing very well, and they deserve to succeed. In Great Britain they sell three pounds for every one of Chinese or Japanese. It is but thirty years since the proportion became worth tabulating, and then, in 1865, the Indian, in-

cluding the Ceylonese, was but 3 per cent., China supplying 97. Not till 1887 did the former amount to one-half, and that for only a single month in the year.

THE MARKETS FOR INDIAN TEA.—The United Kingdom, it is stated, continues to be the great market for Indian tea, as much as 92 per cent. of the exports of the year having been shipped thither. Of the small quantity not shipped to the United Kingdom Australia takes a considerable but unfortunately not an increasing share; Indian tea seems so make no headway in the colonies in competition with China and Ceylon tea. Persia during the last four years has been taking larger quantities. As regards the trade with Persia, Her Majesty's Consul at Bushire writes in his report for 1891: "There has been a strong demand throughout the year for Indian and Batavian teas, which seem to be steadily supplanting the China teas in favour with the Persian consumer. Heavy consignments, chiefly from India, were received by native merchants who found no difficulty in disposing of them at a good profit. It was, however, at the port of Bandar-Abbas that this trade received its most vigorous impulse, the import being more than double that of the previous year." Some of the tea at any rate imported into Bandar-Abbas, was destined for consumption in Russian Asiatic territory, and it seems probable that the effect of recent fiscal arrangements of the Russians will divert the transit trade to Batoum and the Trans-Caspian Railway. A new feature in the trade of the year is the largely increased export to Asiatic Turkey, and it is to be hoped that the exports to this country may become larger. Exports to the United States and Canada have also developed very greatly, though the aggregate is still relatively trifling. A good deal has been said in trade reports from China of the gratifying revival in the tea trade which marked 1891, and it seems that the quantity exported was slightly larger than it had been in the preceding year. China tea, however, has not succeeded in competing with Indian tea in that great market, the United Kingdom, which takes more than nine-tenths of our tea and nearly as much of Ceylon tea. Steadily and surely, year by year since 1886, the importation of China tea into England has fallen and that of India has increased, until last year close on three pounds of Indian tea were imported for every pound of China. This latter tea still retains its hold of the Australian and American markets, where quality in tea is hardly yet appreciated except by a select few, and where Indian tea consequently has not been able to find its way in considerable quantity.

TEA WARRANTS.—A Bill affecting the title of tea warrants is being promoted by the London Chamber of Commerce under the title of the Warehousemen's Certificates Bill. The chief object of the measure is to render the title of the holders of a warrant, in certain cases which are of frequent occurrence, more complete and secure than it is alleged to be under the present law. Under the law as it now stands, if a warrant is stolen and pawned, the goods can be followed and recovered. The Bill under notice is intended to secure for the holder of the warrant a good title against the original holder. The following is the principal clause on this subject in the Bill: "Every certificate or warrant shall be a document of title to the goods specified therein within the meaning of the Factors Act, 1889, and shall be transferable by indorsement, whether in blank or specially; and any holder of the certificate or warrant shall have the same right to the possession of that property in the goods on behalf of the holder of the certificate or warrant." Discussing the proposed measure from a trade point of view, the *Grocer* says: "Such a provision if it were to become law, could not fail to encourage fraud and theft by increasing the number of receivers of stolen property. When the custom of the trade in dealing with warrants is remembered the seriousness of the proposed change will at once be recognised. It is the custom of buyers of goods for which warrants are issued to send a cheque to the broker, and in many instances to take an order for the warrant to the merchant and carry the warrant to the

wholesale dealer's office. Thence the warrant is taken to the Clearing House or the warehouse; and this duty is frequently, in the hurry of business, entrusted to youths, who carry the warrants through crowded streets, where, of course, there are many chances of robbery. Such robberies do not now take place, because the warrant is of no use to the thief. The warrants when delivered to the warehouse proprietors are entrusted by them to their clerks; and here again, if the proposed Bill became law, a fresh temptation would be offered, as these clerks would be able to obtain money on them if they were so disposed. At present they could not so negotiate the warrants, for the reason that they do not carry a good title with them. Why such a Bill should ever have been promoted it is not easy to understand. It would certainly open a door for fraud by enabling advances to be obtained on stolen warrants. At present the banker or other financier is in the same position as the pawnbroker. If the latter makes an advance on stolen goods, the rightful owner on discovering their whereabouts can claim them. Therefore thieves do not find it easy to dispose of their booty through such a channel. Why should anyone who makes an advance upon stolen warrants be relieved of the same liability? The warehouse proprietors say they do not want the Bill; bankers, who have had the matter brought before them, say they do not want it. The retail grocer, who has to entrust his warrants with the wholesale dealer for clearing, certainly does not want it. It is to be hoped therefore, that such an objectionable proposal will not be further pressed."

PRODUCE AND THE BOARD OF TRADE RETURNS.—From the Board of Trade Returns for clearances of tea for home March we find that the use was considerably in excess of the arrivals, and the stock in bond was reduced, showing a deficiency of 2,492,500lb. As regards coffee, there was a plentiful supply, the clearances being moderate, and the stock nearly equal to that of last year. Cocoa came forward plentifully, and although the deliveries were good, there is a material excess in the bonded stock. There have been superabundant imports of sugar.

IMITATING THE TEA PLANTERS.—The coffee planters of Brazil seem disposed to imitate the methods of Indian and Ceylon tea planters in pushing the sale of their produce. A conference of delegates from the several coffee-producing states of Brazil has lately been held in Metropolis to consider measures for promoting the export trade in Brazil's most important product. The following recommendations were adopted by the conference: The appointment of a permanent executive committee in Rio de Janeiro, to be composed of one member from each coffee state; the establishment of cafes and permanent exhibitions for the purpose of increasing the consumption of Brazilian coffee in foreign countries; appropriations of 2,000,000 milreis in the first year and 1,000,000 milreis per annum thereafter for meeting the respective expenses (two-fifths to be paid by S. Paulo, one fifth by the State of Rio de Janeiro, one-fifth by that of Minas Geraes, one-tenth by that of Bahia, and one-tenth by that of Espirito Santo); an application to the Federal Government for negotiations with foreign Governments for obtaining a reduction in the import duties; and the co-operation of coffee planters with the permanent executive committee in the execution of this programme.

THE BRAZIL COFFEE MARKET.—The reports of the Rio coffee market furnish an illustration of the influence of low exchange in stimulating exports, even when it might be supposed that a comparative scarcity of supplies in the producing market, with reserve stocks in the consuming markets would, by raising prices, tend to check the outflow. Although the relatively diminishing supplies and prospects had the effect of forcing up Brazilian prices, the advance was in paper, and was, therefore, so far as the buyers for sale on a gold basis was concerned, counteracted by the decline of exchange. With a prospect of short supplies, therefore, the foreign, and particularly the American buyer, was induced to take advantage of the low exchange to

secure supplies at what, notwithstanding the advance in Brazil, would still be relatively low gold prices.

COCONUT CULTURE IN VENEZUELA.—With reference to the development of coconut cultivation in Ceylon it may be pointed out that in Venezuela the coconut tree thrives remarkably well. For hundreds of miles the coast presents a narrow flat surface, in many places extending some distance back; and the mountainous formation in other places is equally well adapted for the prolific production of the fruit. All the soap factories rely, to a great extent, upon their own groves for the oil from which they manufacture their product; but these groves are an insignificant patch when compared with the waste and barren lands, unfit for any other agricultural purpose, and to be obtained at a very cheap rate. The Venezuela palm requires four years to attain the fruit-bearing period, after which time its producing power is enhanced year by year, until its full maturity is reached, about its eighth year; it then produces for forty years. From 75 to 100 trees are planted to the acre, yielding fully 300 to 350 coconuts per annum. The profit of the small producer is not less than about 4s per tree per annum. The large grower, handling and shipping his fruit, would, it is said, double that figure. The palm, while a tree of exquisite beauty, yields one of the most nutritious and useful fruits known; as an article of food, it is greatly relished; industrially, its principal use is in the manufacture of an excellent quality of soap, the coconut oil being preferred to fat because of its ability to absorb much more water than the latter. The husk of the fruit is now used as fuel; and on this point the United States Consul says it would seem that, in countries such as Venezuela, where carpets or other woollen or cotton floor coverings are discarded, and nothing but imported mattings used, the manufacture of the fibre of the husk into cocoa matting on the spot would prove profitable.—*H. and C. Mail*, April 17.

BRITISH RULE CENTENARY IN CEYLON.

(Extracts from Mr. Justice Clarence's Paper.)

THE PLANTING INDUSTRY.

I pass to the rise and development of the planting enterprise, which the opening up of the country rendered possible.

Coffee had been cultivated to a small extent under the Dutch, and then allowed to decline in consequence of Java producing more than was thought needful. A little lingered on to our own times, and when the country had been opened up it attracted the attention of Englishmen with money to invest. In 1824 the first European coffee estate was opened. The enterprise grew, and about 1837-40 there was a great rush into coffee. The planting extended rapidly, passing through periods of inflation and depression, until much of the hill jungles had been transformed into trim plantations.

The land once cleared by Sinhalese axe-men, the actual coolie labour for cultivation was drawn from the Tamil districts of Southern India, and without this singularly convenient labour supply, cheap, docile and ready to hand, the enterprise could never have attained such success. Mistakes were sometimes made in opening land which proved unsuitable, but in the main the enterprise prospered, and the clearings climbed higher and higher up the roof of the island. The railway materially aided the planters.

About 1873 coffee-planting attained its real zenith, and then followed a period of unnatural inflation. A wild gambling speculation set in. Then disease attacked the coffee, and the unnatural inflation rendered the downfall all the more disastrous. About 1879 the fall was headlong. In 1882 the export had sunk from over 1,000,000 cwt. to about one-fourth. The planters and their creditors were at their wits' ends. The Courts were crowded with creditors, including mortgagees vainly seeking to realise. Estates went for nominal prices. Superintendents lost their salaries, and even coolies their arrears of wages at eightpence or ninepence a day. There were estates on which (excepting the weekly advances of rice for food) the coolies' wages had not

Yet the great mass of the planters never lost heart. Liberian coffee was tried, but with small success. Cinchona was introduced and prospered for awhile, saving many from sinking. Then disease and a fall in the price of the bark attacked that industry. Even then the planters were not to be beaten. They turned their attention to tea. Dead or dying coffee was cut out, and the land planted up with the new product. The planters had to learn, and then teach their employes, and entirely new industry, a new system of cultivation—*plus* the new processes of plucking the tea-leaf and working it up into made tea, a work requiring intelligence and unremitting attention. Fresh capital was needed for the new planting, as well as for expensive tea-making machinery. All this was successfully accomplished, and for many years now the tea has been thriving and paying its owners well throughout great tracts of land, including not merely the districts in which coffee once flourished, but others in which coffee was tried unsuccessfully, and also entirely new districts opened in the lowcountry. It would be difficult to speak too warmly in praise of this remarkable achievement. The success was won by a singular combination of dogged perseverance with alert and adroit enterprise in new departures, aided by the resolute and cordial manner in which the planters worked together for their common advancement.

That the stream of Tamil coolie labour from India should have returned after the crisis of 1879 argues two things. First, the poverty of the coolies in their Indian home, and secondly, that on the whole they are fairly treated by the planters.

Since tea-planting was extended into the lowcountry, Sinhalese villagers have shown more disposition to come in and work on the estates as coolies, though in an intermittent manner. Yet I doubt if the Sinhalese, who are attached to their own village life, will ever furnish a large labour contingent to the planter.

A little coffee lingers in diminishing amount. Cacao succeeds well within a restricted area. Tea, so far, has been a persistent and increasing success. Whether this success will endure, or whether tea will some day share the fate of coffee, who can say? There may hereafter be difficulties to surmount in the way of labour supply and fuel; but the poor soil and forcing climate seem more favourable for a leaf-product like tea than for a fruit-product such as coffee. At present there are absolutely no signs of a falling-off in the production. More than 300,000 acres are now under tea.

Excellent and meritorious as this planting enterprise is, its value to the native community may be, and often is, exaggerated. It is essentially a European enterprise, and its benefits in the main are for Europeans. The profits go to Europe, and are not invested in the island, and the larger part, though not the whole, of what is paid out by the planter goes to the Indian coolies and not to natives of the island.

Mr. J. L. SHAND:— * * * As regards the development of the country by the planting enterprise, Mr. Clarence has spoken pretty accurately up to 1873; then, he says, the wild gambling speculation set in. Now I was connected at that time with the planting enterprise, and I object to being set down as a wild, gambling speculator. Facilities for expanding the enterprise by the aid of borrowed money were everywhere opened up, money was sent out from home, banks were ready with advances; what a miserable creature a man would be, under these circumstances who did not take advantage of them! The enterprise came to grief by a mysterious fungus which attacked our coffee, and that, and that alone, was the sole cause of the failure of the coffee enterprise. I do not think there was any gambling or any wildness in that speculation at all. Then he draws rather a gruesome picture of our unfortunate circumstances at that time and lays what I think is undue stress on the fact that on some

estates labourers had their wages set back a few years. Now that sounds very dreadful, but there the food is really the only necessity of life which our Tamil labourers have; they live in perpetual summer, their children do not require any shoes, and food and food alone is the only thing really necessary to their existence. Any surplus money they use for arrack or melt down into ornaments for their wives and daughters or other female connections. I know many cases thus in which wages not being settled for 2 years was a mere figure of speech. They practically received 4-5th of their pay in food and advances for dry fish and curry stuffs. Depression set in and we were obliged to control our expenditure, and the manager called his men together and said he could not keep them at work for more than 3 or 4 days in the week, would they like to go? and they said "no, you give us food and we will stay here till good times come back." Then Mr. Clarence might have referred to English proprietors who went back to Ceylon and put their shoulders to the wheel and did their very utmost to meet their responsibilities to the labourers, and in 99 cases out of a hundred, the Tamil labourers did not suffer at all. Mr. Clarence congratulates the planters on certain things and one of them is that the immigration of Tamil labour was resumed and the labour relations *on the whole* became once more *fairly* satisfactory. Now I dwell on these words because in no country in the world have we such a perfect labourer as the Tamil cooly and more pleasant labour relations than they are now on the Tea Gardens of Ceylon. Then we are told about the profits which go to the English and the Indian coolies and not the natives of Ceylon. If Mr. Clarence went back, he would find that a very small portion of the British Capital has ever come back to India, and that Indian natives circulate their wealth through the island and spend it in the development of other native industries! So much has it been the case that very little British Capital returned home that I remember the common old riddle used to be "Why are the Kandian hills like Westminster Abbey?" Answer: Because they are the graves of so many British sovereigns! * * *

Mr. J. FERGUSON:—Lord Loch, Ladies and Gentlemen,—I must express my hearty appreciation of the able way in which the learned lecturer has endeavoured to compress into so small a space, so readable, useful and suggestive account of one hundred years of British rule in Ceylon. As a journalist and bookmaker in Ceylon myself, I know the difficulties attending such an effort. It was to be expected that as lawyer, judge and ex-editor, Mr. Clarence should be strongest and most suggestive in respect of legislation and administration of justice. But under other headings his paper calls for criticism and though neither judge nor planter, I must confess there was reason for much that was so eloquently expressed by Mr. Shand; for, I cannot but take exception to the picture presented of the general progress of the island and its people and of the influence on the latter of the planting enterprise. No doubt to anyone going to Ceylon now,—or even so far back as the first year (1873) of Mr. Clarence's arrival,—it is not easy to realize the marvellous change which has been effected in large districts if not several provinces solely through the planting enterprise. In one part the lecturer quoting from the history of the early part of the century admits much by stating there were no towns in the interior of the island. Now-a-days the visitor travelling by rail and admirable roads past towns and villages from

the sea coast to Kandy, Matale, Nuwara Eliya, Badulla, and finding the planters working apart in their own districts, might suppose the native towns and villages and indeed much cultivation to have been always there; whereas the fact is that nearly all we find of towns and villages in the Central and Uva, much of the Western and Sabaragamuwa and even Southern Provinces—where two-thirds of the population are concentrated—is the outcome of the influence of, and the capital and prosperity introduced by, planting. The best way of proving this is by quoting evidence much older than that of Mr. Clarence; the celebrated Orientalist and Missionary Spence Hardy worked from 1825 to 1845 in Ceylon and then left and returned in 1863. He was a true friend of the natives if ever there was one: he worked in the Western, North-Eastern, Central and Southern Provinces. He wrote the charming Jubilee Memorials of his Mission in 1863; and what did he say of the change in the condition of the natives:—

"Were some Sinhalese *appuhami* to arise who had gone down to the grave 50 years ago, and from that time remained unconscious, he would not know his own land or people and when told where he was, he would scarcely believe his eyes, and would have some difficulty with his ears. Looking at his own countrymen, he would say that in his time both the head and feet were always uncovered, but that now in the towns they cover both, or perhaps he would think that the youths whom he saw with shoes and stockings were of some other nation. He would be astonished at the heedlessness with which *appoos* and *naldas* roll along in their bullock bandies, passing even the carriage of the white man, whenever they are able, by dint of tail-pulling or hard blows. He would perhaps complain of the hard road, as we have heard a gentleman from Kalpitiya do, and say that soft sand was much better. He would wonder where all the tiles came from for so many houses, and would think that the high caste families must have multiplied amazingly for them to require so many stately mansions. In the bazaar he would stare at the policemen and the potatoes and the loaves of bread and a hundred other things no bazaar ever saw in his day. He would listen incredulously when told that there is no *rajakariya* or forced labour and no fish tax, that there are no slaves and that you can cut down a cinnamon tree in your own garden without having to pay a heavy fine." My lamented senior, the late Mr. A. M. Ferguson, landed in Ceylon in 1837; and I often heard him speak of the utter want of trade and life in Colombo with only a sailing ship or two in the harbour, and the absence of trade, and industry or comfort throughout the island over a great part of which he travelled in the "forties." Then we have now returned colonists like Mr. M. H. Thomas who recall their first ride North of Kandy in the "fifties" by a route without road, bridges over rivers village life or cultivation, where now there is alongside a first-class road, one long row of villages and continuous *native* cultivation, all fostered through the influence of the Planting Enterprise. In my own case I had the honour, as journalist and reporter, to accompany Sir Hercules Robinson when our Governor, on his first tour through Uva, and the change in the condition of that Principality or Province now and as it was 30 years ago, benefitting both Sinhalese and Tamil people alike, may be all put down to the introduction first of coffee and tea. It is absurd to suppose that only the people (coolies and Sinhalese artificers and servants) benefit

by planting. Apart from the rice and eart contractors and their dependents, the influence of British capital and interest as well as direct employment spreads far and wide. First come the planting district "boutiques," wayside shops, then the village and around this often a good deal of native cultivation in fruit or rice or tea gardens; while it is well-known that a great part of the Western and North-Western Provinces (the whole of the Mahaoya Valley) have been planted with coconuts through the capital diffused among native contractors, traders, &c., by the coffee enterprise in its prosperity. (Hear, hear.) The calculation therefore that I long ago arrived at, after due consideration of all the facts of the case, is, I think, a safe one, namely, that for every acre of coffee, tea, cacao or such like cultivation opened by the British planters in Ceylon (or India or I may add East or Central Africa) four or five natives, Tamils or Sinhalese men, women or children directly or indirectly derive their means of subsistence. * * *

COFFEE PLANTING IN SELANGOR:

THE RECENT WITDRAWAL OF CEYLON APPLICANTS FOR LAND.

In the *Selangor Government Gazette* of April 24th is printed the monthly report for February of the District Officer of Klang (Mr. W. W. Douglas), from which we quote the following remarks:—

During the month, Mr. E. V. Carey applied for one block of 500 acres on the terms of his agreement with the Government, and four blocks of 320 acres each on the west side of the Sungei Binji Road in the mokin of Bukit Raja. Mr. T. N. Christie applied for one block of 370 acres and a customary holding of 25 acres at Damansara. In the Kapar District, between the Kapar and the trace of the proposed road to Ijoh, there were five applications for blocks of more or less 300 acres each. These were made by Messrs. T. N. Christie, G. W. Welman, W. P. Metcalfe, A. Melville White and J. R. Rodgers.

It is to be regretted exceedingly that Mr. W. Forsthe, the owner of blocks 32, 33, 34, 35, 36, 41, 43, 44, 56, and 57, and Mr. T. N. Christie of block 37, all of which lie between the Jalan Kabun and the Langat Road, have considered it advisable to abandon their estates, known as Datu-Dagang, Sempang and Lanka Estates. The decision arrived at is attributed to the land having been found peaty and unsuitable for coffee culture. To say that the land would not grow coffee when thoroughly drained is, in my opinion, a grave mistake. From enquiry made of Haji Mohamed Tahir, the pioneer coffee planter of Klang, the former owner of the show piece of coffee, aged some 14 years, and the one man that set the example of coffee culture which has resulted in the district having now 3,224 acres under coffee cultivation and some 2,402 acres about to be opened up, I ascertained that the land on which he first planted coffee was, when first cleared, identically the same as that abandoned.

It is to be feared that very exaggerated ideas of the now supposed worthless Klang land will, in consequence of the lengthy correspondence in the papers on the subject, spread far and wide, and be the cause of keeping away many intending investors of capital. It is, I consider, therefore, due to the district that the facts of the present state of coffee culture within it should be made known generally, as well as the fact that the principal owner of the lands lately abandoned inspected his selections prior to the sale by auction, and on the date of the sale sent instructions by telegram for certain blocks (included in those abandoned) to be purchased.

NOTES FROM NYASSALAND.

MLANGE AND ITS SURROUNDINGS.

March 6th.—As one of the principal planting districts in British Central Africa, it might interest your readers to know something of it. Unlike the hill country of Ceylon, where mountains rise gradually, and the slopes mostly cultivated, Mlange mountain rises suddenly out of the plain, which is on an average of about 2,000 feet, and its sides, especially on the western side, rise like sheer stone walls to some four to five thousand feet. The highest peak is about 10,000, rising off the plateau, which is between 6,000 and 7,000 feet. The plateau is the sanatorium of the Mlange district, or at least will be so, when a road has been made up; at present the ascent, which can only be made in a few places, is difficult, and is a great undertaking, but once the plateau is reached, it recompenses one for the trouble of the ascent. On reaching the top a splendid view burst upon one: in front undulating country something similar to the Horton Plains in Ceylon, short grass land dotted with small prices of pine forest; while below the plain extends as far as the eye can see, and broken in few places only with small hills. The small pieces of pine forests on the plateau, which lie chiefly in the hollows are extremely picturesque, the trees being covered with drooping white moss, and the undergrowth consisting chiefly of large ferns and male bamboos. The peaks, which rise off the plateau, are sheer masses of rock with no verdure whatever, and as yet only two Europeans have ever reached the top of the highest peak. The southern side of Mlange is the source of three rivers, the Ruo Luchenia, and Chucheela, the latter two flowing into the Ruo some twenty miles north of Chiromo. The "Ruo falls" down the side of the mountain are a sight, especially during the wet weather, enormous volumes of water dropping some thousands of feet. From the edge of the plateau three plantations can be distinctly seen: Mount Zion, Landerdale, and the small clearing on the Nyassaland Coffee Company's land. On the northern side of the mountain is the Matapwerry country, which was only acquired a few months ago after the Matapwerry war. On this side the mountain is not nearly so precipitous, the sides being covered with forest, but unfortunately the elevation is too high for coffee cultivation, and the plain at the foot of the mountain has been cultivated for years by the inhabitants and consequently is divested of all its virgin forest. Speaking of the latter it must not be imagined that the plain surrounding Mlange is covered with virgin forest. Far from it; there are large portions of land which have been cultivated by natives for years, and owing to the limited quantity of forest land little new remains. The pioneers have had the pick of the land, and have not been slow to get all they could while the price was slow one resident alone owing 7,000 acres of the best land, the Nyassaland Coffee Company coming second with 3,500, and Mr. Carson third with 2,500. There are now in all six plantations comprising some 700 acres under coffee cultivation, most of which is quite young. The year's crop will only amount to about 45 tons. The next few years are likely to make a great difference, as large acreages will be put under cultivation.

Labor.—Even with the present acreage under cultivation there is a want of labor, especially during the planting season. Not because there are insufficient numbers in the country, but being entirely due to the nigger being an independent individual—he works when he likes. In many respects they are like the Sinhalese of Ceylon—lazy to a degree and sand only working for short periods when it pleases them. As long as a nigger has plenty of food and a little cloth to clothe himself, he is perfectly contented; when his cloth is exhausted he works for a month, perhaps two, and then remains idle for the rest of the year. In this district they have no ambition to earn money; cloth and beads are all they require. Local labor, of which there are large num-

bers, seldom work for more than a month at a time, although they get much higher pay if they remain on for three months, so that to depend on local labor is almost needless, as one never knows how many are likely to come. Every Saturday, which is called by the niggers "the day of pay," some people have to be paid off, and the superintendent has then to act the part of a drafter and doles out calico by the yard. Fortunately there is a yearly native hut-tax—3s. for every hut, and to pay this off the nigger is forced to work a month, for which he receives his tax paper, the money being paid by the superintendent to the district collector; this, of course, considerably adds to the labor supply, and it is to be hoped that the tax will be raised to 6s in the course of a year or two, when the nigger will have to work double the time. There is practically no permanent labor, the Atonga which come down from the lake stay on for for six or eight months, seldom more, but as they have to get extra cloth to buy food, their pay averages about 2d a day; and the Augoni which come down in large numbers during the dry months remain for three months only. Very large numbers are employed yearly in transport work, and as they prefer that to estate work, besides receiving higher pay, they flock to Blantyre from all sides.

And until good roads are made by the Administration, and cart transport substituted, the demand is likely to increase. Although there is a heavy tax, £1 on every ton of goods imported into the country, levied for roads and river dues, there is little to show for it, at least in the vicinity of this district. There is a track to Blantyre and another to Chiromo, but they can hardly be called roads, as in many instances they can hardly be distinguished from the surrounding plain, being so overgrown with high grass. The climate of Mlange, although not a health resort, might be a great deal worse. Like all tropical countries when the vegetation is heavy, there is a great deal of malarial fever, especially during the wet season, but a great deal can be avoided by careful living. There are, however, always exceptions to the rule. I know of one resident in Mlange who, for the last five years, has had no fever at all, while on the other hand there has been more than one case of Blackwater fever. Taking it all round, I think, there are many worse districts in the low-country of Ceylon, any many experience of the fever is that it is not so bad as the Ceylon low-country intermittent fever. It has, however, scared more than one Ceylon planter away from the country; but still I hope to see others coming, as it will tend to relieve the dreadful monotony of the lonely life out here. At the same time I would not advise men to come out on spec; but with a small amount of capital, they would probably do very well, provided they have pluck and energy. C. M. G.

—Local "Times."

TEA IN AMERICA.

New York, April 1.

A very quiet invoice and line trade, with the market steady and without new feature. The growing use of Ceylon and Indian tea is the noticeable feature of the season's business.

Last week the Montgomery Auction and Commission Company sold 6,200 packages teas as follows: Moyune—143 Hyson $5\frac{1}{2}$ @ $6\frac{1}{2}$ c.; 523 Young Hyson $7\frac{1}{2}$ @ 26c.; 232 Imperial $6\frac{1}{2}$ @ 17c.; 493 Gunpowder $9\frac{1}{2}$ @ 34c. Pingsuey—71 Imperial $11\frac{1}{2}$ c.; 585 Gunpowder $8\frac{3}{4}$ @ 17c. Japan—180 basket-fired $14\frac{1}{2}$ % 17c.; 1,559 Congou 9 @ 17c.; 169 India and Orange Pekoe $13\frac{1}{2}$ @ 20c. Oolong—220 Amoy $7\frac{3}{4}$ @ 9c.; 2,085 Formosa $13\frac{1}{2}$ @ 21c.

Today at noon the Montgomery Auction and Commission Company will sell 7,264 packages, viz.: 2,334 half-chests Meuyne, including celebrated chops; 1,342 boxes Pingsuey; 59 half-chests Japan, choice; 175 half-chests Japan, basket-fired—very desirable fancy leaf; 1,190 half-chests Congou, including some strictly fancy Ning Chows; 21 boxes Capers; 286 packages India, Java and Ceylon Pekoe, comprising some fancy lines, and including 107 packages Ceylon G ns and Ceylon Siftings; 45 half-chests Amoy;

50 half-chests Foochow; 1,837 half chests and boxes Formosa—a very attractive offering, all new season's and including a complete invoice of 731 mats, boxes and half-chests of strictly fancy new season's.—*American Grocer.*

HOW DUTY AFFECTS TEA.

The tea importers in urging the Congressional Committee upon Ways and Means to impose a specific duty upon teas, a moderate rate upon the pure and a prohibitive duty upon all that is colored and adulterated, take the position that the change would be a blessing to every consumer and particularly to the poor, who are the principal consumers of low grades, which bear the same relation to the good article that the coarse, outside, ground-trodden, worn caten leaves of the cabbage bear to the crisp and nutritious head in the center. It is argued that the imposition of a duty would result in an improvement of the quality of the tea exported to this country and that it would not only be a great advantage from a sanitary point of view by keeping out the poor grades, but would bring a large revenue to the government. The importers assert that good tea is a great deal more economical than the cheap grades, regardless of the difference in price; that the nourishing properties increase very rapidly as the quality of the tea improves and that the alkaloid therein, which is craved by all the human race, does not appear in the low grades to the sufficient extent to satisfy that craving. Therefore tobacco, snuff, morphine and liquor are resorted to. It is shown by statistics that there is far less intemperance in liquors, tobacco and opium where good teas are used.—*Interstate Grocer.*

TEA IN AUSTRALIA.

In China tea, sales have been made of 100 half-chests panyong at 5d., 200 half-chests fine panyong at 8d., 300 boxes fine panyong at $8\frac{1}{2}$ d., and 300 quarter-chests S.O. pekoe at $6\frac{1}{2}$ d. In Ceylons, 290 packages have been sold at 6d to 8d. Of Indians, 140 packages have been sold at 7d to 8d. At the auction sales on Tuesday there was good competition, and steady prices were realised. Of China tea, 1,530 half-chests were offered, and sales were made of 782 heavy-weights and 184 light-weights at 4d to 6d. The quantity of Ceylon tea offered was the largest which has yet been offered at auction on any one occasion in Melbourne. The catalogues amounted to 954 chests and 367 half-chests, and the quantity sold was 659 chests and 353 half-chests, as follows:—Orange pekoe and broken orange pekoe, 53 chests and 27 half-chests at 9d to $9\frac{1}{2}$ d; broken pekoe, 175 chests and 93 half-chests at $7\frac{3}{4}$ d to $1s\ 0\frac{1}{4}$ d; pekoe, 363 chests and 152 half-chests at 6d to 10d; pekoe souchong, 57 chests and 68 half-chests at $5\frac{1}{2}$ d to $8\frac{3}{4}$ d; souchong, 11 chests, and 13 half-chests at $4\frac{1}{2}$ d to $5\frac{1}{2}$ d.—*Australasian* April 8th.

THE TEA TRADE OF FORMOSA:

THE JAPANESE AND CHINESE CUSTOMS.

"Merchant" writes to the *Foochow Echo* saying that he is informed on good authority that the Japanese Customs in Formosa are now collecting export duty on Tea at the rate of \$1.12 per picul, and the tea is received and allowed to be exported from Amoy *free*, while the native-grown article has to pay an export duty of \$3.84 per picul. In commenting on the news the *Echo* draws attention to the grave importance of this statement. "Of course," it says, "it touches most nearly the shippers of Oolong tea from Amoy and this port to America, where this description of tea is chiefly consumed; and in a less degree the general shipper. Assuming that the Chinese will do nothing in the way of assimilating their duties with those of Formosa, the Chinese teamen will have to reduce their prices, or be prepared to hear the buyer say: 'I am quite willing to offer you Tls. 17. for this string chop, less Tls. 1.90, to

place me on the same terms as Formosa shippers as regards duty.' Unless something can be done it is patent that the tea trade in Formosa will increase very considerably while that in China will correspondingly decrease."—*N.-C. Herald*, April, 17.

CAMELLIA THEA.

(From a paper by Mr. D. O'Sullivan, read before the Pharmaceutical Chemists' and Apothecaries' Assistants' Association of Ireland.)

Tea is referred to by Confucius (550 B.C.), and by Yo Lu (618 A.D.) as having been taxed at the later date, showing that it was then in general use. In the seventeenth century tea was sold in England at 60s per lb. It was then known as "chaw"; at that time the yearly import under 100 lb. In 1891 the figures were over 91,000,000 lb. per annum for the British Islands alone. Green and black tea contain 26 per cent and 15 per cent of tannin respectively. Green tea causes giddiness and numbs the cerebral nerves, acting as a powerful brain-irritant. Tea alkaloid resembles strychnine in its effects. An injection of caffeine causes tetanus in the frog. In Northern Russia "brick tea" is meat and drink to the people, who first drink the infusion and then eat the leaves with mixed fat.—*Chemist and Druggist*.

PLANTING IN PERAK.

From the annual report (for 1895) of Mr. A. T. Dew on the Matang District, in the *Perak Government Gazette*, we quote the following:—

Estates in Matang.—Coffee.—There is at present only one estate under coffee, that of Mr. F. A. Stephens, at Jibong, of 640 acres, of which about 150 acres have been cleared and 90 acres planted up.

The young coffee, Liberian, appears to be doing very well, and has been favourably reported on by several exporters who have visited the estate.

There is also another estate of 640 acres adjoining Mr. Stephens' estate, on which work has just commenced, that of Mr. Allinson.

An application has also been received from Mr. C. L. Gibson for 610 acres of land in Sungai Tinggi mukim for coffee planting.

Sugar.—Messrs. Stewart & Kennedy have taken up 2,500 acres in Selinsing for sugar planting and the work of clearing will commence early in 1896.

A Manila man, Peter Madrigal, has a very well kept little estate of about 35 acres in Jibong, adjoining that of Mr. Stephens, which produces almost everything that can be grown in Perak. Liberian coffee being the principal article of culture.

He is probably the pioneer coffee planter in low, swampy ground in the Peninsula, and it was the flourishing condition of his coffee which induced Mr. Stephens to open an estate at Jibong.

TRINIDAD ROYAL BOTANIC GARDENS.

From the Annual Report of the Superintendent for the year 1895, which has reached us, we extract the following:—

CACAO.

It will be remembered that young plants of the Nicaraguan Cacao were imported in 1893, so that in July 1895, they were two years old. Shortly after this period several of the plants produced flowers, but none have as yet produced pods, our tallest tree being about 8 feet in height. One of the plants of Ceylon Cacao that was imported about the same time, has also flowered, and has now, at the time of writing, (December 1895) two small pods set upon it. This has long been desired for comparison with our own varieties, and to enable our planters to know really what the classing of the Ceylon kind should be in comparison with their own produce. The health of the trees of the Nicaraguan and Ceylon varieties is everything that could be desired.

Of the number of plants of *Cacao bicolor* only one is growing vigorously; but several others are growing slowly, and may do better later on. The plants of

Theobroma angustifolia are doing well, and I trust will, in a few years be large trees. During the year, a case of the Nicaraguan varieties was successfully forwarded to the Royal Botanic Gardens, Peradenya, Ceylon. These plants were a part of those brought by the Superintendent from Nicaragua in 1893.

COFFEE.

Our experiments with coffee during 1895 were principally directed to showing cultivators the best method of culture and mode of pruning for the ordinary *Coffea arabica*. Coffee growing, as carried out in Ceylon, Jamaica, Costa Rica and other coffee growing countries is but little understood by the planting community in Trinidad, and few can yet be induced to plant coffee by itself and for its own yield. Instead the usual course is to put in coffee where cocoa will not grow, or to put it, in fact, in ground that is useless for anything else, or to plant it in desultory manner through and amid other crops, or by the roadside of estates.

It cannot be expected that coffee planted and treated in this manner will thrive or pay the grower, even for the small amount of care he devotes to it.

To show what could be done, the culture of a small section of coffee trees in the Royal Botanic Gardens, was personally undertaken by the Superintendent, the Jamaica system of pruning and culture was fully adopted, and the trees kept down to a certain height. Although the practice only commenced eighteen months ago, the trees now bear evidence that the method we have adopted is one which should be followed if true success in coffee culture is to be the ultimate result. Trees under this system have given over four pounds, and one tree gave over seven pounds of clean coffee.

Lectures were given on the system during the month of August, and the trees were seen under crop by those gentlemen who attended. Later in the year I was invited to the Santa Cruz district to see the working of a small machine, which had been imported for pulping coffee, called the "Columbia pulper," manufactured by Messrs. J. Gordon & Co of London.

I found coffee was being grown on this estate in direct compliance with the instructions laid in the Departmental Bulletin, No. 14, July 1891, and in December, 1895, good crops of prime coffee were being reaped. The little machine was doing excellent work in pulping the coffee, and they had in use also, a small "Smouts cleaner and polisher," manufactured by the same firm. It was evident that these two machines are all that planters require for a small number of trees, and that by their use Coffee can be prepared in an excellent manner.

Coffea stenophylla. From seed of this new variety of Coffee, sent to the Gardens from Kew, a number of plants have been raised. Some of the larger plants have been planted in permanent positions, and are now over three feet in height, and, it is expected will flower in a few weeks, for the first time.

VANILLA.

In December we harvested a small quantity of Vanilla from the plants of Sion House and Mauritius varieties, *Vanilla planifolia*, Aud. On one bunch we ripened (51) fifty-one "beans" or "pods," weighing considerably over one pound when cut from the plant. The bunch of flowers from which these were produced were hand fertilized by Mr. Lunt, the Assistant Superintendent.

The quality of this Vanilla leaves no doubt that it is the best variety or species obtainable for West Indian cultivation.

RUBBER.

The demand for plants of *Castilloa elastica*, the Central American Rubber is increasing, and we have sold all we could raise. The tree thrives well in Trinidad, and I trust ere long that we may have an account of the actual yield of trees ready for publication, for the further guidance of planters.

J. H. HART, F.L.S.

Superintendent Royal Botanic Gardens.

CHINA VS. INDIAN AND CEYLON TEAS.

The heavy blows, military and financial, under which China has lately suffered do not seem likely to be atoned for by any great expansion in her staple industry, the tea trade. On the contrary, the rivalry of India and Ceylon, especially the former, is growing more formidable year by year. That the growth of the Indian tea trade is not based entirely on the excellence of the product, but is in great measure an illustration of the trite maxim that "trade follows the flag," is established by the fact that some ninety-two per cent. of the entire Indian export of tea is shipped to the United Kingdom. In the colonies and America, where tea-drinkers who can appreciate fine shades of quality are comparatively few, the Chinese product still holds its own, though in the United States and Canada the Indian trade, though as yet comparatively small, has of late years developed very rapidly. New markets for Indian tea are being opened up, however, in the Persian Gulf, in Asiatic Turkey, and even in Asiatic Russia, the import at Bandar Abbas in particular being last year double that of the previous year. Such facts as these offer a most encouraging prospect to all interested in the great Indian Cingalese tea-growing industry, which now occupies so commanding a position in some of the greatest tea markets in the world. How far the prospects of Indian tea in Russia, which is one of the greatest tea-consuming countries in the world, will be affected by the construction of the great Siberian railway cannot at present be foreseen, but unless Russian tariff arrangements prove prohibitive, an inexhaustible field for extension should be opened *via* Batoum and the Caspian Sea. Notwithstanding that a good deal has been said in trade circles of the gratifying revival of the last year or two in the Chinese tea trade, there seems every reason, therefore, to anticipate that the Indian product will not only hold its own, but will experience a steady growth in popularity throughout the world, with a corresponding advantage to its producers and to the great British dependency in which it is grown.—*Liverpool Post*, April 13.

UNITED STATES IMPORTS OF COFFEE, 1895.

The above table,* compiled by Worthington C. Ford, Chief of the Bureau of Statistics, Washington, D. C., affords a graphic and interesting history of coffee in the United States for ten years past. It will be noted that the total imports for the period do not indicate a remarkable increase in supply, for the imports in 1895; were only 11,998,187 pounds more than in 1892; 73,811,521 pounds more than the imports in 1889, which were only 13,689,921 pounds more than in 1886. Some countries, however, show a marked development of the industry, but the total supply does not show differences greater than would naturally arise from variations in crops. The general drift, however, is toward increasing supplies. Note, again, that the per capita consumption in 1886 was 9.36 pounds, against 9.20 pounds in 1895; while in 1892 it was 9.61 pounds. In 1888, a year of short crops, it dropped to 6.81 pounds.

A significant fact is that while Java coffee is sold everywhere, the total imports of coffee from the East Indies and the Netherlands were 17,895,525 pounds, or 2.7 per cent of the total imports. Evidently a supply of Java from some other countries is required to meet the demand.

During the ten years 1886-95, Costa Rica has increased its exports to this country nearly fourfold, or from 4,750,594 pounds to 17,332,632 pounds; Salvador has doubled its exports to the United States, and Mexico has more than doubled, the imports in 1895 being 35,262,229 pounds, against 15,764,902 pounds in 1886. Honduras has more than doubled, but Guatemala furnished only 2,889,113 more than in 1886 and only 584,384 pounds more than in 1887. Possibly the import tax levied under the Reciprocity Act sent considerable Central American coffee to Europe. The supply from Brazil has been very irregular, dropping

to 240,179,011 pounds in 1888, and reaching its maximum export to this country in 1892. It is evident that there is considerable coffee shipped and re-shipped into Europe that finally finds its way into consumption here. The tables* themselves afford amply study for such as are interested in keeping posted about the coffee supply.—*American Grocer*, April 1.

INDIAN PATENTS.

The fees prescribed have been paid for the continuance of exclusive privilege in respect of the undermentioned inventions for the periods shown against each:—

For improvements in the method of an apparatus for drying tea leaf.—No. 80 of 1888.—Henry Thompson, engineer, of Trinity Street, Gainsborough, in the county of Lincoln, England, for improvements in the method of an apparatus for drying tea leaf. (From 17th April 1896 to 16th April 1897.)—*Indian & Eastern Engineer*, May 2.

CEYLON TEA IN AMERICA.

THE VIEWS OF OUR DELEGATE.

Through the courtesy of the Chairman of the Planters' Association we are able to publish an interesting and important letter from our Tea Delegate in America elsewhere, and we trust that from planters and merchants it will receive the most careful consideration as coming from one who, in accordance with his commission, has made it his special business to study everything that tends to hinder, as well as all circumstances that are calculated to promote, the sale of our teas in the American market. Mr. Mackenzie writes cautiously, being anxious that "views," "surmises" and "opinions" should not be taken for facts which are difficult to get a hold of. It is because he is so cautious and so keenly observant that the planting community have so much faith in him as their delegate, and great weight will therefore be attached to all that he writes and reports regarding the ways and means of increasing the sale of our staple product in the great Western Continent. The progress we have already made is indeed gratifying, and the closing part of Mr. Mackenzie's letter in which he states "the sediment of fact" that there are many more dealers handling our teas pure and in blends than there were a year ago, and that "all are pushing energetically in the various methods Americans adopt," affords very reasonable ground for the hope, at all events, that there will be no falling-off in the rate of progress, if it is not increased by acting on the suggestions which are made as to green teas, for millions of pounds of which a ready sale can be found, and as to transshipping at London should the values based on samples sent a week before the teas leave Calcutta or Colombo, and wired from New York, be higher than the values placed on duplicate samples in London. We commend this part of Mr. Mackenzie's communication particularly to the consideration of shippers, and we shall be glad to hear whether they are prepared to give the plan a trial at least. Commenting upon the large increase in the imports of British-grown machine-made teas into the States and Canada last year our delegate is of opinion that this is attributable to the low prices which ruled having led to buying in excess of requirements; and there can be no doubt that if there is still any large quantity remaining unsold this will tell against the imports in the early months of this year; but, as we have already said, the energetic manner in which our interests are being attended to leads us to believe that our progress will be well maintained.
